All in all, Japanese teachers of English seem to be clinging to teaching methods that do not promote communicative skills, contrary to what the objectives in the Ministry's course of study. Teacher training appears inadequate, trainees do not receive any SLA theory teaching and a large number of teachers do not meet the minimum requirements set by the MEXT.
Teaching methodology

Taguchi (2005) conducted a survey in one particular prefecture in Japan followed by class observations in order to determine the characteristics of Oral Communication classes in public high schools. The responses of 92 high school English teachers who were interviewed revealed that listening exercises and dialogue practices were the most typical classroom activities, whereas activities promoting creative expressions such as speech and role play, received rather weak responses overall. Finally, grammar and vocabulary instruction was reported as the third most common activity.

Also, in a case study conducted in one of the two English-medium universities[15] in Japan at the time, Taguchi and Naganuma (2006) interviewed Japanese students who had graduated from regular high schools in order to evaluate how they adapted to a new English-medium university environment, where the English language would be used for actual communicative purposes. Understanding the teachers' instructions in a university class was the major challenge for all these students who attributed that to the lack of exposure to authentic English in high school. The students also reported lack of speaking practice in high schools, which also affected their adjustment in the new English-speaking university environment. Eight out of thirteen students reported that one of the major difficulties they had to face was the exclusive use of English, given that they had had almost no experience in speaking English in high school. Almost all students reported difficulties related to the amount of reading assignments. They reported that all texts they were exposed to in high school were rather short and all they were asked to do was provide word-for-word translations as well as understand the grammatical structures within a sentence; emphasis was placed on accurate and precise translation of each sentence, rather than comprehension. Ten out of thirteen students also had difficulty producing paragraph-level discourse, as their writing activities were restricted to translations, they had never had the chance to produce their own thoughts in a coherent way in writing.

Ishibashi (2008) conducted a research on the formal and informal learning of English among Japanese university students and found that they didn't know how to study the language effectively on their own, and they expected that their teachers would give them opportunities and help in order to study the language. These results are indicative of the teacher-centered direction foreign language education has taken in Japan, which does not allow for students to improve their study on their own.

---

[15] The English-medium University is a university in which all college-level courses in basic and advanced education areas, as well as language courses, are taught in English in order to improve academic proficiency in English (The Daily Yomiuri, 2004 cited in Taguchi, 2006).

Textbook selection process

All English language textbooks in Japan go through a screening process in order to be approved by the Ministry of Education, since only those are allowed in classrooms. Surprisingly enough, however, most of the books on the approved list fall short of the Ministry's commitment to developing students' communicative abilities.

Sakurai (2008) reviewed the Ministry approved "New Horizon", one of the most widely used textbooks in Japan (Hasegawa & Chujo, 2004). The book contains only supplementary chapters for skill development, which are left entirely up to the individual teacher to decide whether to use in the teaching process (Hasegawa & Chujo, 2004). McGroarty and Taguchi (2005) also found that most exercises, which appeared in a selection of five Oral Communication textbooks they examined were mechanical and structured, and did not provide cognitively complex language activities or engage the learners in any form of communicative activity.

Moreover, Rosenkjar (2007) made an analysis of one unit from the popular MEXT-approved Polestar textbook showing that the activities "are primarily form-focused, not communicative and not fully-oriented to developing students ability to read in English for communication" (Rosenkjar). Although several activities are described as "tasks," as the author notes, they fail to meet the definitions of "task" found in Lee (2000) or Willis (1996) since they hardly involve the students in "expression, interpretation, and negotiation of meaning" (Lee, 2000). He also reports that all activities related to developing reading skills simply target factual information explicitly stated in the text.
University Entrance Exams

In citing White (1987) Reesor (2002) points out that "for parents and students alike, getting good grades on the entrance examination is important above all else" (p.48). Lo Castro (1996) also states "passing examinations is the greatest source of motivation for English language study." (p. 47). Within this system English scores carry the highest weight among all subjects as they are considered to reflect the candidate's analytical and logical thinking abilities. (Yoko & Iino, 2004).

In citing Brown & Yamashita (1995), Reesor states that out of 21 Universities only 6 in 1993 and 4 in 1994 included even a listening component. In January 2006 the national Centre for University Entrance Examination administered the first exam (in its 26-year history) to include a 50-point listening component to the original 200-point pencil-and-paper section. Still, that held true in only 60 percent of all national institutions (Miyuki, 2008).

Within this context teachers also undergo great pressure regarding the results of the entrance examinations, since the students' performance reflects on their teaching. Lo Castro (1996) further underlines that "the entrance examination system can be said to have deleterious washback effect on methodologies and teacher education; classroom teachers are under pressure to teach 'exam English'" (p.47).

From the above it becomes evident that English education in Japan still has a long way to go. The teaching staff is not adequately prepared to meet the challenges and consequently the methodologies employed only adhere to old practices, which only serve the purpose of preparing students for the University entrance exams.
Greek Certificate of Language Proficiency (KPG) – An experiment

In order to assess the English language education students received in high school under the latest reform a test was conducted in a class at Kyoto University. The test selected was the KPG[16], an exam introduced by the Greek Ministry of Education in 2003 with the CEFR and the direction towards plurilingualism in education in mind. Apart from the candidate's linguistic competences, however, the

---

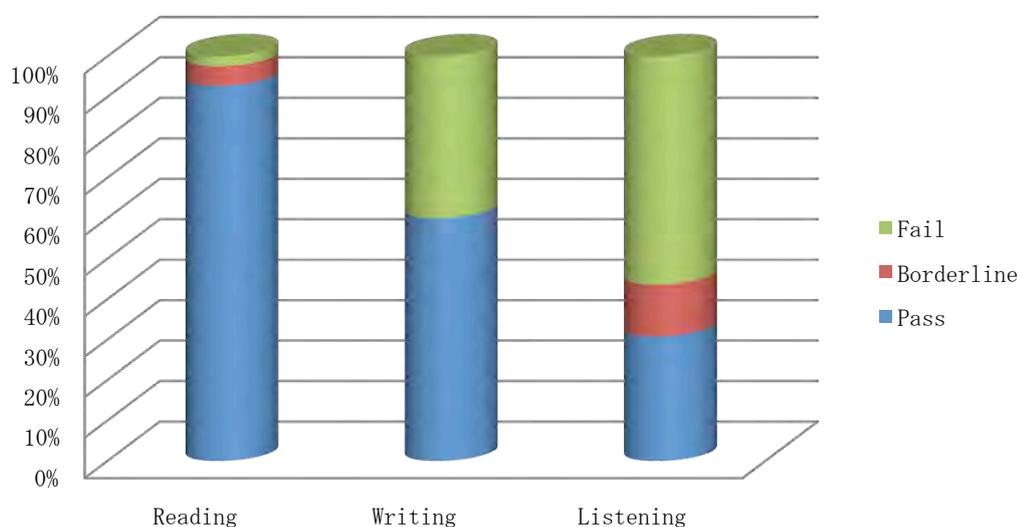
[16] http://www.ypepth.gr/kpg

exam also measures their ability to act as mediators across languages[17] thus testing their communicative competence as well. The exam consists of four modules, namely Reading Comprehension & Language Awareness, Free Writing Production & Mediation Skills, Listening Comprehension and Free Speaking Production & Mediation Skills.

A mockup KPG[18] exam was administered to a class of 39 students at Kyoto University during the spring semester of 2008. The exam materials were downloaded from the Greek Ministry of Education website[19]. The level that was selected was the one that corresponds to the B1 level on the CEFR scale as it was considered more appropriate for the students' abilities, while two Greek texts included were substituted by translations in English[20]. References to Greece were also substituted by Japanese equivalents. Three components were administered: Reading Comprehension & Language Awareness, Free Writing Production & Mediation Skills, and Listening Comprehension.

The students' responses were evaluated using the answer key available for download from the Ministry website and in accordance with the published instructions. In both the listening and reading components multiple choice questions were used with five additional open-ended questions at the end of the listening part. The total score for the exam is 100 out of which students can receive 1-25 for Reading Comprehension and 1-25 for Listening Comprehension, while for the writing part candidates can receive a score of 1-30. The remaining 25 points correspond to the speaking component, which was not tested. The 60 percent borderline score was maintained. As far as the writing test is concerned what was assessed was the ability to convey meaningful sentences with adequate argumentation focusing on the communicative aspect of language rather than strict grammaticality. However, grammar and syntax as well as coherence were also taken into account to the extent that sentences and the overall text did not interfere with comprehension.

Results and Analysis

From the results of the mockup exam in the reading component Japanese students fared quite well with an average score of 18.9 out of 25 credits (fig. 4). The high passing rate reflects the orientation of the Japanese education to date, having traditionally focused on developing students' abilities to process written texts. In this part of the test only one student failed, while two more students out of the 39 achieved borderline scores. From their answers, however, it becomes clear that the students had problems producing derivatives of the words given or determining what part of speech was required each time,[21] while about two thirds of the students had difficulty determining functional value when asked to fill in missing conjunctions in a short story or when asked to draw text-level inferences after reading a text instead of merely retrieving factual information, which was what they had been used to doing thus far.


In the writing part 16 out of 40 students were unable to achieve borderline score. The average score was 19 out of 30. Moreover, 3 students were unable to make even the 30 percent minimum requirement, probably due to the fact that in high school the students were mostly involved in passive, mechanical drill exercises, such as translation and reading with very little exposure to more creative forms of language usage.

Finally, the listening component seemed to be the most difficult one for the students to cope with, as the average score was 14.2 out of 25. More importantly, more than half of the students, that is, 22 out of 39, were not able to achieve a score of 60 percent while 5 more merely achieved borderline scores. More specifically, in most cases it seemed that the students didn't actually understand the content of the listening items, but rather guessed from the mention of certain words, which resulted in specific items receiving the same wrong answers from the majority of the students. However, the part where most students seemed to have great difficulty with was the final five questions, where they had to listen to a very short dialogue and fill in the missing words from 5 sentences out of the dialogue. 30 out of 39 students wrote a wrong word, while 6 students left them blank, which could be attributed to the fact that little –if any- emphasis had been placed on developing listening skills throughout high school. The number of students that failed in the writing component was 40 percent, in the listening component 58.9 percent while in the reading part only 2.56 percent. Although the Ministry has clearly stated the objective of English language education in Japan as being one towards cultivating students' communicative abilities the actual perception from these results is quite contrary to that.
Conclusion

From the above it becomes clear that the latest reform by the ministry of education did not bear significant fruits, mainly because the old practices are still prevalent across the country. The University entrance exams still shape the direction of English education, teacher training remains inadequate and the prevalent methodology employed is still Grammar-Translation in its core. The KPG test at Kyoto University confirmed that the education policy followed to-date has not given students opportunities to develop learning strategies, which could help them pursue their own learning. Japanese students acknowledge their lack of communicative competence yet they admit that they do not know how to study on their own in an effective way, still expecting the teacher to provide all knowledge. Although the MEXT objectives do mention that life-long learning is an important aspect of the Japanese educational system, there is no mention of any ways in which it might be achieved.

From the comparison of the educational policies in Greece and Japan it is evident that Greek teachers of English have a higher level of linguistic competence since they go through specialized training, which includes methodology as well as language and literature courses, all conducted in English. That itself makes them more confident to experiment with and embrace new methodological approaches to teaching. Another point worth noting is the direction of Greek education towards autonomous learning, which gives students the opportunity to become more confident learners and take control of the learning process and not be entirely and solely dependent on the teacher. The Japanese educational policy could benefit greatly if they were to invest in these two factors. The theoretical framework of both the ELP and CEFR may also play an important role to support the future of English education in Japan. The function of cultivating learner autonomy and monitoring the learning processes by reflecting the proficiency levels could be helpful for cultivating communicative competences. A number of factors need to be considered however in the process of utilizing the concept of the European portfolio in the Japanese context and several adaptations and adjustments are required before applying the ELP in the Japanese educational environment, based on the analysis of the theories and cultural differences. However, if utilized properly and with further research the ELP can prove a useful tool in the English language education in Japan for both teachers and students alike.

The Analysis of English textbooks in Finland and Japan

Mio Kamijo

THE UNIVERSITY OF TURKU, Education Science, Department of Teacher Education, Faculty of Education

Abstract:
The purpose of this study is to examine foreign language teaching in Finland in order to suggest the possibilities and limits for reform in Japanese foreign language instruction. The study examines how educational development in Finland has led to the adoption of the communicative language teaching method and a focus upon tasks rather than passive studying. General conclusion of this study is that English textbooks used in Finland provide a useful model for possible reforms in Japan.

1. Introduction

The present study examines foreign language teaching in Finland and Japan. Both Finnish and Japanese students have difficulties in learning English, as the vocabulary, pronunciation, and grammatical structures are very different from their own mother tongue. The aim of this paper is to promote English teaching methods and to highlight the need to carry through a reform in foreign language teaching in Japan. In order to find improvements and recommendations to be applied in teaching English in Japan, English textbooks are compared and analysed against the framework of a number of language learning theories.

Most language teaching methods are more or less tightly associated with a prevailing learning theory, and the switch from one method to another signals some kind of a change in the theoretical framework. The grammar-translation method is a purely linguistic method, while many other methods in the academic field are derived from different learning theories. One representative method is known as the Audio-lingual method. This method uses basic sentence structures and grammar to draw the students' attention, by teaching them systematically the pronunciation as well as drilling their oral skills. The Communicative Language Teaching has stated the construct of communicative competence; learners are able to accomplish the colloquial conversation and nonverbal communication. According to the interview with Professor Viljo Kohonen (see Appendix 1), English language learning has been changing for the past two decades. One huge development was the assessment proposed by the Common European Framework (CEF) in 2001. Finland therefore reformed its language curriculum based on the European model. However, the CEF was too broad a framework to follow that Finland then narrowed it down to suit its own academic system. Moreover, the European Language Portfolio (ELP) was also introduced in order to record how foreign language learning progresses and the intercultural experiences. This is also one substitute for foreign language learning in Finland.

1.1. The textbooks

Textbooks are a key component in language instruction and should be an effective part of language programs. For most teachers, textbooks provide the foundation for the content of lessons, the balance of the skills taught, as well as the kinds of language practice the students engage in during class activities. For students, they serve as the most important source of learning in the school. They provide the basis for language practice carried out in the classroom.

This study examines in what way the prescribed English textbooks used in Finnish classroom provide the necessary language learning tools and how English textbooks have changed over three decades from implementing Audio-lingual (behaviourist) theories towards functional, communicative and interactive language use. Moreover, the most recent textbooks used in Finland and Japan are compared and analyzed against the theoretical framework.

2. Research questions

The research questions were formulated to give an account of English instruction at the elementary school level in Finland based on quantitative and qualitative in eighteen (18) Finnish textbooks of English. The quantitative analysis of the common or unique textbook features consists of features, such as the number of pages, sentences, lexical unites, and characters. The qualitative analysis consists of the treatment and development genre, theme, task, and language functions. In addition, the process of

textbook publication is examined. This data analysis is based on publications of the Ministry of Education in Finland and Japan.

The research questions are:
   a) How have the language methods been shifted from passive studying to communicative studying especially in textbooks in Finland over 30 years? Can this help promote Japanese foreign language learning in the future?
   b) How have the national core curricula of Finland promoted the development of English Language textbooks within advancing theoretical frameworks?

3.   Methods

Foreign language learning curriculum both Finland and Japan are comparatively analyzed. Eighteen (18) textbooks were selected from the oldest in the 1970s to the newest 2009 versions in Finland at the 3rd, 4th and 5th grade levels and the latest two (2) textbooks at the 7th grade level were selected from Japan. These textbooks were widely used during each period. However, the selection is dependent on the teachers in Finland. Therefore, the analysis was especially based on the English textbooks from 3rd grade to 5th grade to track down a change and development through a historical overview.

The same grades between Finland and Japan are not directly compared. In Japan still English learning starts from age 12 so the lower grade textbooks are not published yet. Moreover, the latest version of textbooks was compared between Finland and Japan because it is helpful to find the factor of development of how and what English textbooks in Japan should be improved to motivate students to speak. The main focus is on the statistics of how the communicative tasks have been emphasised. Therefore, before going to analyse and collect all data, a questionnaire was given to Professor Viljo Kohonen at the University of Tampere to understand the insights of language teaching and textbook in Finland (see Appendix 1).

The features of textbooks

The textbooks have been categorized into 10 sections (see below) in order to find out the important factors of change. Textbooks differ according to the writing styles of different authors. Therefore, a list of criteria has been set to compare their teaching aims respectively.

Table 1. The explanation of features analysis

Settings are defined as where the interaction commonly takes place.
Intercultural settings are defined to be the sociolinguistic skill of learning to open your perspective widely in order to address globalization as well as multiculturalism.
Linguistic features are defined as formal language or informal language such as colloquial language or spoken language.
Main Characters are defined as who mainly takes part in the textbook.
Characters are defined as who mostly interacted.
Main Location is defined to be where the events take place.
Method is defined to be which language methods are selected and utilized.
Visual instructions are defined as what kind of materials are used in the textbook.
The number of Main Characters is counted.
The Character's age setting is examined to show the reflection of learners.

3.1. The classification of content

The theme of classification was based on Heidi Vellenga (2004) concepts. The functions and contexts classification (see Table 2) was used and based on the concepts of Eileen W.Glisan and Victor Drescher (1993) that applied their analysis on a speech corpus. Moreover, there is a descriptive category from the European Framework (2003).

THEME: Twenty-four (24) categories were used to investigate which themes were addressed in the contents of the textbooks:

Accept Invitation, Accept Requests, Apologize, Ask Permission, Ask Questions, Complain, Compliment, Correct, Express Regret, Give Advice, Give Instructions, Give personal details, Invite, Make Excuses, Make Introductions, Make Suggestions, Offer, Order, Promise, Refuse Invitations, Refuse Requests, Request, Threaten, Wish

TASK: Six (6) categories were used to investigate which tasks were focused upon in textbooks:
 Grammar, Listening, Reading, Speaking, Vocabulary, Writing

GENRE: Eight (8) categories were used to investigate which genres were emphasized in the contents:
 Article, Details, Dialogue, Game, Letter, Poem, Song, Story

LAYOUT: Two (2) categories were used to investigate which layouts were chosen for each page:
 Double, Single

Table 2. The classification of function and context categories

FUNCTION	CONTEXT
Giving personal information	Self-identification
Asking for/giving directions	Transportation
Asking questions	Personal information
Describing family	Family Greetings
Describing in detail	Work and leisure
Describing routine/leisure-time activities	Activities/hobbies
Greeting Expressing courtesy	Courtesy expressions
Hypothesizing	Object Pronoun
Making comparisons	Current events
Making purchases	Shopping
Narrating/describing in present, past, future	Education Economics
Ordering a meal	Restaurant , Café
Stating/supporting opinions	Politics Customs Religion

3.2. The sample of spoken words in everyday conversation
The spoken words were counted in order to investigate the colloquial words that would be helpful to show the important factors of how natural communicative competence would occur in the language. This research is based on the discourse maker theory. Furthermore, as a method to infer a conversational function from discursive characteristics, sociolinguists have utilized discourse markers (Schiffrin, 1988). Discourse markers are defined as single words or lexicalized phrases that are supposed to have a function of organizing discourse structure. Abbreviation words are one way of expression, showing the spoken words written and these interjection words are a natural and frequent phenomenon in oral language. The sources originate from the English textbooks in Finland and Japan. A sample is shown below:

isn't, don't, Oh, Yeah, Well, Thanks, Hmm, Shhh, Oww, Brr, Gosh, Mummy(Mum), Daddy (Dad), ...(Pausing), Huh, Oh dear, Phew, Wow, Youuuu, Yippee, Hah-hah, Zap, Gee

3.3. Quantitative analysis and features of the data
In comparing the textbooks the following units were observed: Total page, New vocabulary, Total words, Average of sentence length on each page, Average of word length on each sentence, and the page layout. These investigations are undertaken to see how the Finnish textbooks have been developed over 30 years and to clarify the differences between Finland and Japan.

The Genre
The classification of genre was categorized into eight (8) parts. The eight categories were analysed, counted, and chosen for each page. To indicate the result the following calculation was used, "The number of counted pages divided by the number of total pages times 100."

The Theme
The classification of theme was categorized into twenty-four (24) parts. The twenty-four categories were analysed, counted, and chosen for each page. To indicate to the result the following calculation was used, "The number of counted pages divided by the number of total pages times 100."

The Task
The classification of task was categorized into six (6) parts. The six categories were analysed, counted, and chosen for each page. To indicate the result the following calculation was used, "The number of counted pages divided by the number of total pages times 100."

The Functions and Contents
The classification of functions and contents was categorized into thirty (30) parts. The thirty categories were analysed, counted, and chosen for each page to indicate to the result. The number of pages was shown.

4. Results

First, the curriculum and foreign language education in Finland and Japan were examined to find similarities and differences. Second, the number of lessons was illustrated and compared and then moved to the comparative study of foreign language where instruction, objectives and contents were described. Third, it is illustrated how textbooks were planned, written and finally published. Lastly, textbooks were analyzed throughout the 20th century in Finland to discover the development of procedure in order to reform foreign language learning in Japan. Moreover, the current English textbooks were compared between Finland and Japan to define what needs to be revised especially in Japanese textbooks.

4.1. The Similarities and Differences of curriculum implement and language teaching in Finland and Japan

The general principle of curriculum organisation is changing from the idea of providing a centrally directed common education for all children. The educational circumstances reflect on what the council decides especially in Japan, whereas in Finnish schools principals and teachers are more in charge of controlling the curriculum than the council. This is a main difference between Finland and Japan. The shift towards decentralization has involved very different processes in Finland and Japan. From a historical perspective, the language learning and teaching agenda is influenced by the political policy in both countries. Moreover, a strong driving force for language teaching and learning is the globalizing working environment: foreign languages, in particular English, are needed in collaborations with overseas partner companies in both Finland and Japan.

4.2. The number of lessons in Finland and Japan

In Finland, foreign language learning starts at the age of 9 whereas in Japan it starts when students are 12 or 13 years old. In Japan, the Ministry of Education is trying to change the foreign language curriculum. The Japanese ministry already announced that in 2011 that elementary schools would start teaching English for an hour per week for age 9 students. Also, in 2012 junior high schools will reserve one more hour to teach English per every week. At present, junior high school students only need to learn 900 words annually. However, that will increase to 1200 words in 2012.

4.3. The foreign language curriculum in Finland and Japan

In general comparison one can note that the aims are not very different. Both countries encourage their students to learn to understand the language well enough to handle with a foreign language and culture. In Finland the emphasis has also been made to the early stages of the education.

English instruction seems very different and is likely to reflect the learning gap of acquisition between Finland and Japan. In Japan, the setting and situation are rather vague. In contrast, in Finland all instructions seem to encourage students to speak in everyday contexts.

In Finland at the early stages, grammar is not very much emphasized. In contrast, in Japan detailed instructions are given to indicate what kind of grammatical issues should be covered.

4.4. Finnish and Japan's School Textbook Examination Procedure
In Finland, there is no control over the production of materials and they no longer need to pass government assessment of their acceptability in respect of the curriculum content, although they are expected to adhere to the basic principles of state curricula for languages. However, in Japan the School Education Law enacted in 1947 created the current system of textbook approval. In this system nongovernmental publishers create textbooks and submit them for official examination and approval by the Ministry of Education. The books must meet the requirements of the Curriculum Guideline, a set of curriculum standards for Japanese schools. The Ministry of Education has already announced that this will be simplified in 2013.

4.5.   Text analysis throughout the 20ᵗʰ century in Finland
The features of Finnish textbooks were analysed over 30 years for 3ʳᵈ, 4ᵗʰ, and 5ᵗʰ grade textbooks and then the same features in recent Japanese textbooks were shown to observe the differences. The analysis of genre, theme, task, functions and contexts were investigated to find out the similarities and differences between the two countries. The interesting aspects of the textbooks were picked up and analysed in order to show how communicative Finnish textbooks were.

The Features of textbooks in the 3ʳᵈ grade in Finland
The biggest feature in the 3ʳᵈ grade is that the textbook has been improved to be like a fairy tale book. This feature might be due to the fact that students would enjoy reading like novels or story books. However, the content of the recent textbook published by Tammi "Let's go" (2009), has far more details than the other 5 textbooks such as a picture dictionary, new vocabulary translations and cartoons. In 1979, there are new vocabulary translations on each page. Then the translation disappeared until the most recent one, which came out in 2009. From stimulating the inner understanding, and the repetitive action like checking the word from a dictionary is necessary for beginners' learners to get used to studying a new language and developing a habit in doing so. The character's setting has been changed to have a mixed nationality. Intercultural learning method is the trend, this feature is not shown in the very first books but it is gradually appearing. Typically, the location of the events and characters is England (sometimes, the U.S., Australia or South Africa) and Finland has never been chosen as a location setting. Even the name of character is not Finnish at all. Here "Let's go" differs: they do not mention where the location is but make it a more imaginative place. The Audio-lingual Method was mainly used until 1980, and all the speech utterance is much more unnatural than in recent textbooks. Most of the interaction is performed between friends or family. The drawings have been greatly upgraded. The new version is more colorful and full of details. Learners therefore can learn from the text with the support of pictures.

The Features of textbooks in the 4ᵗʰ grade in Finland
According to the analysis in 1972 and 1981, there was no intercultural communication and linguistic feature was quite formal compared to the other textbooks. The Audio-lingual method was used at that time. From 1971 to 1981, the same textbooks were revised with some parts of the layout being reorganized and the publisher started to use some photographs to improve the layout. Since 1988, the interaction of language setting became more informal. Meanwhile, the method had also changed, which is why the interaction had become more varied. This had made the communication setting flowing and natural. The learner's age determines whether the contents to be formal or informal. Oral practices usually take place in a classroom and therefore, it is better that the informal language be simple for young learners. In 2005, Finland was being used the first time as the main location by the publishing house Tammi. A recent feature, in accordance with the intercultural view of learning, has been to send one of the main characters to travel around the world to show more places than before.

The Features of textbooks in the 5ᵗʰ grade in Finland
From 1973 to 2004, the settings have gradually decreased. This has made the recent textbooks to become more realistic. The number of the main characters has dropped compared to the 3rd or 4th grade textbooks. Since 1973, science and historical themes were introduced to English textbooks. Thus, not only the interaction between friends or family but also factual contents were included. In general,

the contents have obviously become more complicated and perhaps more demanding for the learner. The Audio-lingual Method was applied commonly in 1973 and 1982.

The Features of textbooks in the 7th grade in Japan
English textbooks in Japan are characterized by lots of details on each page. The Audio-lingual Method is still commonly used in Japan. Japan is always the main location and the take-off place to explorations to other countries. Factual contents relate to a society such as dog-caretakers or New Year's traditions. In addition to this, most contents are related to the Japanese culture. Finnish textbooks rarely deal with the Finnish culture. It is a sound pedagogical principle that titles and headings can be used as prediction activities and summaries, thus preparing the learner to accommodate new knowledge. In contradiction to the Japanese textbook, the headings and the story instructions are written in Japanese. An example of this is shown in Appendix 5. Even though it might be demanding for beginner's learners to read only in English, this positive approach can affect the beginners not only in preparing them to speak in English but also to think in English which might be a more practical learning method than reading in two languages.

The Analysis of genre in the 3rd grade in Finland
There is a dramatic increase in the introduction of new vocabulary from 1972 to 2009 and also more dialogues are gradually introduced in textbooks from 1972. However, the latest textbook in 2009 has considerably fewer dialogues than before. The total number of pages is more or less the same over nearly 40 years. The average word length in each sentence is up to 2.1 to 3.0.

The Analysis of genre in the 4th grade in Finland
New words are introduced 4 times more in 2005 than in 1972. Therefore, the total number of pages increases from 87 to 164 pages over 30 years. The length of the sentences is more or less the same as before but there are more details in the text. The page layout has been changed over 30 years. The single layout seems to be the trend, and the topics are more interesting and detailed. This might have helped motivate the learners, as they do not need to deal with the same topic for a long time. In addition to communicative competence, the percentage of "Dialogue" content is gradually increasing from 1972 to 2005. In general, 4th grade the learners are being introduced to not only "Details" or "Dialogue" but also "Poem" or "Letter."

The Analysis of genre in the 5th grade in Finland
More new words are provided, even though the total page count is nearly 130 pages over 30 years. The word length is nearly 4 words in each sentence. This means learners at the age 12 years make longer sentences than 3rd grade learners. The double layout was growing from 1973 to 2004. The percentage of "Dialogue" context is more or less the same over 30 years. It is nearly 28 % for all the textbooks. Overall, the number of "Dialogue" and "Details" drop to nearly a half by comparison with 3rd and 4th grade and the word dictionary parts occupy more space.

The Analysis of genre in the 7th grade in Japan
It is indicated that the two books have very similar structure, which is related to the fact the textbooks are authorized and controlled by the Ministry of Education and Council in Japan. It is shown that there are 211 spoken words in NEW HORIZON (2008) and 118 spoken words in NEW CROWN (2008). The majority of spoken words are such as 'Well' and 'isn't' in Japan, whereas the textbooks in Finland have more variety of spoken words such as 'Phew', 'Gosh' and 'Hmm'. Because of these variations, the sentences could become livelier with different levels of expressions. Moreover, in Japan, the vocabulary needs to be reformed because even 3rd grade Finnish students learn 100 words more than 7th grade Japanese students do.

The Analysis of theme in the 3rd, 4th and 5th grade in Finland and 7th grade in Japan
Most of the themes are either "Give Instruction" or "Ask Question" from 3rd grade to 5th grade. It is necessary for beginners to be aware of participating actively in class because this is important for them when learning a new language. The investigation of theme in Finland shows that more themes are introduced at 5th grade compared to 3rd or 4th grades, meaning that 5th grade learner's learning tasks are gradually becoming more complex. Japanese textbooks have more variations in themes than Finnish ones. In Finnish textbooks, it seems that at the beginning only one or two themes should be presented but once learners are progressing in their English, more themes should be introduced.

The Analysis of task in the 3rd, 4th and 5th grade in Finland and 7th grade in Japan
Studying "Grammar", "Listening", "Reading", "Speaking", "Vocabulary", and "Writing" have been implemented in each context and only little difference was found over the past 30 years. The speaking tasks were given more attention than other tasks. In Finnish textbooks, there are workbooks for practising new words and grammar, whereas Japanese textbooks have "Listening", "Grammar", "Reading", "Speaking", and "Vocabulary" learning in one textbook.

The Analysis of functions and contexts in the 3rd, 4th and 5th grade in Finland and 7th grade in Japan
The majority of data consisted of either, "Describing the details" or "Describing routine and leisure-time activities." Most of the communication takes place among friends, family, and the topics often varied. That is one reason why textbooks in Finland have more complex functions and context rather than separate functions or contexts. Therefore, the beginner's level students are not expected to learn any specific function or context.

Insights from interesting aspects in the textbooks
The textbook commonly uses the correct sentence. In the sentence below, the utterance first expressed "I" but after moment of pausing corrected to express "we" instead of "I". This utterance occurred in everyday life. The sample sentence is:

1) I …we are very happy you are all here and that you found Uncle Maxwell's treasure.

Moreover, the sentence below in a dialogue shows that the subject is omitted. If the grammatical order is strictly presented, the subject should not be omitted. These sentences show how Finnish textbooks accommodate with a spoken structure.

1) No more food (Omitted subject + predicate: There is)
2) Not enough honey in his coffee or too much to eat and drink (Omitted subject + predicate There is)

So, colloquial language is used in the Finnish textbooks. In Japan, the correct sentences are more strictly used rather than the spoken ones. A sample is:

1) Don't worry baby, I'm strong.
2) I sure will.

From the visual analysis, looking at Appendix 2, the introduction of greeting approach is quite different in Finnish and Japanese textbooks. The conversation seems to turn out very natural in the Finnish textbook because the sentences lined up orderly so that the learners read line to line. In Japanese textbook, it is quite unclear who is speaking. Moreover, Appendix 3 shows how the authors approached the same topic but in a different way. In 1973 the context was related to football whereas in 1992, the context looked at what players were doing and it became more communicative than earlier. In addition, the interaction between a teacher and students (see Appendix 4) was shown. In Finland, the topics are often more private than in the Japanese textbooks.

5. Discussion
Starting from the curriculum level, there are differences in foreign language instructions between Finland and Japan to encourage learners to speak. In Finland instruction prompts publishers to develop and adopt their unique points in the textbooks. For example, if the focus of language skills is on reading, activities should be taken from real-life materials such as, magazines, newspaper articles, or journals, accompanied by colourful visuals and well-illustrated materials. Since this was not found from the previous textbooks in the 1970s and 1980s. Most textbooks in Finland adopt more colloquial language than formal language. Japanese elementary schools should be careful to instruct the language by age, setting to whom the learners first speak. Nevertheless, in Finland the context are gradually becoming more complicated and colloquial language is used less at the higher grade. The Audio-lingual method is no longer in use in Finland

and therefore the contents became more natural and close to the reality settings. But the Audio-lingual method might be easier for teachers to accommodate. Yet, from Professor Viljo Kohonen's interview it became evident that the grammar translation method was a part of lessons even though it is hard to see from past textbooks. Furthermore, from the phonetic point of view, it is also wiser for Japanese textbooks to avoid using Japanese names, like Finnish textbooks but use English names instead. This allows learners to not conflict their pronunciation wrongly.

There are some drawbacks in Japan. While Finnish is not a similar language to English, the written form still uses the Roman alphabet. However, Japanese characters are very different from English letters. The social environment is different that there are two official languages, Finnish and Swedish. Swedish has the same roots as English. There are as well many English TV programmes with subtitles. In Japan all of foreign TV programmes are usually dubbed. The Japanese educational system is not as problematic as such. It acquired a high standard of education with regard to the PISA result. However, from an English communication skill and acquisition point of view, there is a need to reconsider and reorganize the English language curriculum and textbooks since attempting to use the Audio-lingual method. Moreover, the idea of equal education is different and its influence can be seen in the textbooks. Japanese education is meant to be the same no matter who teaches and learns. The guideline provides and guides what to do and textbooks follow this rule. In Finnish educational system, it is meant that everyone has equally a right to teach and learn. The guideline is in their hands and they can decide how they want to do this.

6. Conclusion

The argument is that if the learner wants to speak English fluently, it is suggested that more practical role-play exercises be included in the textbooks to allow more interaction in class. Pedagogically it is necessary to include grammatical points and standard vocabulary but it is also important to set the relevant language settings to motivate learners to speak. If the Ministry of Education in Japan is to improve the students' communication skills, they should take the example of the Finnish textbooks that the Audio-lingual method is no longer applicable when writing dialogues and that the contents should be more related to everyday life.

Appendix 1

1. What major changes have taken place in the general arrangements of language teaching during in the last 40 years?

   Moving from Grammar translation to Audio-Lingual and then moving from functional place of teaching and functional based of teaching. Since 1990, intercultural learning.

1.1. Since when are all students supposed to learn English (or another foreign language)?

   Foreign language learning started in 1960; everybody has to learn Swedish and a foreign language chosen among German, English, and French etc

1.1.1. What were the reasons for the changes and was there a debate on the official age to start language learning?

   In 1960, coming after that research recourses are available. Not knowing your mother tongue, you cannot learn the foreign language. Nationalistic prospective learning to understand your culture in better way. It was compromised.

1.1.1.1. How the pedagogical approaches of English teaching have changed during the last 40 years?

   Intercultural learning, it is also a global peace education, when you know something your neighbouring culture.

2. How have the English textbooks changed during the last four decades?

   Grammar translation, Audio-Lingual, communicative competence, intercultural learning

3. Who have been involved in making a new English textbook? (Elementary school teachers? subject teachers? university people?)

   Basically, teachers in the school, one university lecture might be included. Always one native speaker is included. WSOY, Otave are major publishers. In 1992 was the time of changing.

4. What have been the main reasons for the changes in English textbooks? (E.g. pedagogical approaches, commercial reasons, globalization?)

   Globalization, teaching development.

5. Are there any surveys or evaluation studies aimed at analyzing the impact of different English textbooks?

   You cannot isolate impact of textbook from student's and teacher's motivation. The research is not easy for this reason.

6. Who choose the textbooks and can teachers choose the books they want to use in their teaching?

   Restrict for teachers (2 major publishers in Finland WSOY and Otava)

7. Has the choosing of textbooks always been so flexible and if the flexibility has increased what have been the arguments for the change?

   Inspected by the national board of education in 1992, it is far more flexible that sense.

8. Do teachers get special training in using new textbooks?

   Promotional reason to have an exhibition but it is not the pedagogical reason.

9. Are there any new contents in the textbooks? Quizzes? Comics? Spoken language? Texts on economical/multicultural/ecological, etc issues?

   Contexts of textbooks are followed by the national board of education. This is also flexible. No one format.

10. How much does the Finnish government support the making of new textbooks in Finland?

    It depends on how many textbooks to sell.

11. Does Finland follow other countries' examples when making textbooks?

    International textbooks from any countries.

Appendix 4

8. Interesting answers

Miss Walker is Steve and Tracy's history teacher. She is giving back their test papers.

Miss Walker: Mark, this wasn't very good. Florence isn't in Spain and Leonardo da Vinci did not discover America!

Daniel: What did you get, Mark?

Mark: Twelve out of twenty. What about you?

Daniel: I got fourteen. She says she can't read my writing.

Miss Walker: Sandra, your test was poor. You have to try harder next time. And Janice, this isn't good enough.

Janice: Ten? Ten. Aagh.

Sandra: Don't worry, I only got eleven.

Miss Walker: Now I have two papers left. Tracy!

Tracy: I'm sorry, but I'm not very good at history.

Miss Walker: Oh, don't be silly. Your answers were excellent. You seem to know everything about Leonardo da Vinci's work. But I can't believe the story about the Mona Lisa's smile.

Tracy: Oh, it's true, it's true. I was there – I mean it was there, in a book.

Miss Walker: Well. And Steve. This was the best exam paper in the whole class. I didn't know that Leonardo invented the tank and the helicopter. It certainly wasn't in our history book.

Steve: But I saw the drawings in his notebooks – erm – in a TV programme.

Miss Walker: Ah. Well, congratulations both of you.

Tracy: Nineteen plus! Incredible!

Steve: Twenty out of twenty!

Miss Walker: Right, that's all for today. See you all tomorrow.

Janice: Tracy, wait! Tracy, can I borrow your history notes?

Three Festivals

Halloween
(October 31)

Halloween is the day before All Saints' Day. Long, long ago, in the land of the Celts, they called this time of year *Samhain*. It was the end of the year, and the beginning of winter. It was a time of ghosts and witches. People made bonfires to frighten the ghosts away.

Today, Halloween is a day for fun and games. Children wear masks and dress as ghosts and vampires, and they play "trick or treat". They go from house to house and collect sweets, fruit, or money. In America, people put candles inside large pumpkins – the pumpkins look like spooky witches!

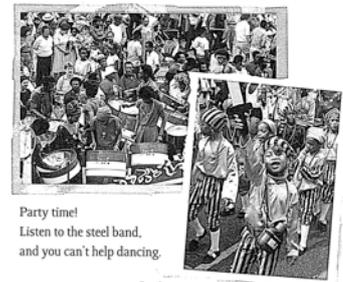
"Trick or treat!" Children dress in scary costumes and ask people for sweets.

St. Valentine's Day
(February 14)

February 14th is the festival of St. Valentine. Valentine's Day is a day when we remember friends and people we love. A long time ago, people gave little gifts, like gloves and spoons. Now Valentine's Day is a day for friends, and a day to send cards to people you love.

Here's a Valentine's Day poem.

I think you're cute,
I think you're fine,
Please make me happy –
Be my VALENTINE!

Many Valentine's Day cards contain a red heart, a sign of love. But who is it from?


The Notting Hill Carnival
(near the end of August)

The word "carnival" means "party", and every year in the streets of the Notting Hill area of London, they really have a big party.

It all started in 1964, when immigrants from Trinidad had a street party. The carnival gets bigger every year. There are processions through the streets, with calypso music from steel-drum bands, colourful costumes, dancers, and lots and lots of noise.

Party time! Listen to the steel band, and you can't help dancing.

Look at those costumes. Children love the Carnival, too.

B++
Good work, Judith!
I liked the card.
Did you know there is
a very good steel band
in Blackpool, too?

発達の最近接領域の概念を応用したライティング指導
－情動的側面を中心として－

山下　徹　(Toru Yamashita)
熊本大学 (Kumamoto University)
yamasita@kumamoto-u.ac.jp

Abstract

　ヴィゴツキーの「発達の最近接領域 (ZPD: Zone of Proximal Development)」の理論的枠組は、現時点で独力で問題解決できる知的水準と、他者の助けを受ければ解決できる知的水準の差の領域として捉えられており、足場かけ(scaffolding)の概念とともに、これまで主として、その認知的・社会的側面が注目されてきている。一方、ZPDの情動的(affective)側面は、ライティング指導等、言語教育への応用においても、あまり取り上げられていない。最近の研究は、ヴィゴツキーは、思考と学習者の意識における情動との関係にも着目しているとし、ZPDは人間の情動や欲求を反映した概念であることを提起している。また、学習プロセスの初期段階からの、情動的側面に配慮した教師と学習者、学習者間の協同的活動 (collaborative activity) における社会的相互行為（social interaction）が、ZPDの効果を高めるために必要であると指摘されている。このことは、情動的側面と認知的・社会的側面は相補性
(complementarity)の関係にあり、共にZPDの確立に寄与していることを示唆している。また、学習不安等の情動的
な問題も、認知的・社会的側面及びZPDとの関係において検討する必要があるといえる。
　EFL学習者が抱えるライティング不安(writing apprehension)を軽減するために、ライティング・プロセスの初期段階から、情動的側面を考慮したZPDの概念を、評価基準として共有化されたルーブリック、タスク、協同的活動、内省(reflection)に取り入れることが求められると考えられる。

本発表では、社会文化的アプローチとしてのヴィゴツキー理論の全体的枠組における情動的側面の役割を、ZPDとの関係において、改めて明らかにするとともに、ライティング不安を軽減し、自己効力感(self-efficacy)を高めるライティング指導と学習への応用を提起したい。

Intercultural competence and college level EFL/ESL reading and writing

Krystyna U. Golkowska
Weill Cornell Medical College in Doha

Abstract

Although many experts and teachers agree that intercultural competence is as important as communicative competence, more research is needed to determine how best to teach and assess it in ESL/EFL classes. The approach discussed in this paper, adopted to answer specific needs of students in the Pre-Medical Education Program at Weill Cornell Medical College in Qatar, proposes a pedagogical framework utilizing insights from discourse analysis and reader-response theory.

Nowadays it has been widely accepted in the field of ESL/EFL that intercultural competence is just as important for language learners as communicative competence; in fact, many would argue the two are inseparable. Experts in intercultural communication talk about the need to reach "the third place" (Kramsch 1993) or to assume a vantage point from which to examine critically both the target culture and one's own (Byram 1997, 2008). At the same time, it is true that not all students are ready for self-reflection or a critical analysis of their own culture; in extreme cases, emphasis on Western ways of teaching and thinking can be perceived as a tool of cultural indoctrination undermining religious and societal values. Overall, there are still many questions related to the issue of how to incorporate teaching intercultural competency into ESL/ELT curricula and how to measure student progress in acquiring it.

In academic writing classes students struggle with issues related to tone and voice even when writing in their native language. They often find it difficult to incorporate other points of view while maintaining their authorial voice or fail to keep the right balance between sounding too assertive and too tentative. These problems can be seen in many college level assignments ranging from a summary or a multi-source essay to a research paper. There can be no doubt that taking a stance and addressing the needs of the audience becomes even more challenging for ESL and EFL writers, some of whom may lack proficiency and need to deal with issues related to identity renegotiation. Stepping outside the culturally determined boundaries of the self can feel liberating but also frustrating and threatening.

The focus of the present discussion is the role of teaching intercultural competence (IC) in ESL/EFL classes to improve students' reading and writing skills. The approach that will be described here was adopted to address specific needs of Pre-Medical students at Weill Cornell Medical College in Qatar (WCMC-Q). In terms of acculturation, these students need to adjust to the so-called Western style of thinking and teaching, learn the explicit and implicit rules of the academia, and become familiar with the norms of the medical community. In other words, they need the knowledge, skills, and attitude that will enable them to function in the international community of WCMC-Q, complete their residency programs in the U.S., and develop their professional identity as future doctors. In Qatar, where English is used as a lingua franca and the official language of instruction in most high schools, many students still struggle with college level reading and writing assignments. Coming from a traditionally oral culture, they do not always see reading as an act of exploration that creates meaning; not surprisingly, they also tend to produce texts that are monologic rather than dialogic in nature. Literature has corroborated instructors' observations that Arabic students use fewer hedges and reader engaging strategies, which explains why they sometimes sound over-assertive and over-emotional (See Hinkel 2002 and Hyland 2005). What these students seem to need is increased awareness of the dialogic nature of all discourse and improved ability to engage other points of view. The proposed approach was based on the belief that focus on the writer-reader relationship in the text utilizing insights from discourse analysis and reader-response theory would help students develop both communicative and intercultural competence.

Recent years have seen growing interest in applying insights from discourse analysis in foreign language teaching. The concept of meta-linguistic competence has proved especially useful in teaching

English for Specific Purposes (ESP) and English for Academic Purposes (EAP), but it is easy to see how it can be applicable in ESL/EFL instruction. To discuss the linguistic manifestations of the writer's rhetorical appeal to the audience, researchers have used terms such as attitude (Halliday 1994), epistemic modality (Hyland 1998), appraisal (Martin 2000), evaluation (Thompson and Hunston 2000), stance (Conrad and Biber 2000), and more recently, metadiscourse (Hyland and Tse 2004). Metadiscourse, defined as "a cover term for the self-reflective expressions used to negotiate interactional meanings in a text, assisting the writer/speaker to express a viewpoint and engage with readers as members of a particular community" (Hyland 37) can have important pedagogical implications for ESL/EFL instruction. Incorporating Hyland's interactional model of metadiscourse into a college level writing course helps to demonstrate that the writer-reader relationship is not only constructed differently in different genres and disciplines but also culturally determined. This awareness can positively impact students' reading and writing skills.

While explicit reference to linguistic features of the writer-reader dialogue plays a significant role in improving students' comprehension and production of texts, the pedagogical implications of Iser's reader-response theory are equally important in foreign language teaching. For some time now, many ESL/EFL instructors who use literature as a resource for generating communicative tasks have been doing it under the umbrella of the reader-response theory. If the result is an "anything goes" type of approach validating expression of subjective feelings rather than attention to the text, gains in intercultural competence are negligible. Yet no-one would deny that discussions of literary works can also serve as a great source of cultural knowledge and intercultural skills. It seems reasonable to expect that exploring differences between the implied reader and the reader outside the text would facilitate discussions of cultural differences without resorting to stereotyping and thus offer students practice in reaching the "third place."

The above mentioned assumptions shaped the design of a module taught in WCMC-Q English for Academic Purposes class. The module was introduced in the first three weeks of the semester with the expectation that what students learn would be transferred to their own practice and resurface in later essays.

In the initial phase of awareness raising the students were introduced to the concept of metadiscourse and Hyland's interpersonal model of metadiscourse (Hyland 2005). A brief initial survey confirmed that the students viewed rules of academic writing as universal rather than culture dependent and were not aware that all texts, including scientific texts, use rhetorical strategies to appeal to the audience. Consequently, these two issues were the first ones to be addressed.

To begin with a brief overview, Hyland distinguishes between the interactive and interactional dimensions of metadiscourse. In his model, the interactive dimension has five sub-categories:

• Transitions (conjunctions and adverbial phrases signaling additive, causative and contrastive relations)
• Frame markers sequencing parts of the text or internally ordering an argument e.g. *first, at the same time, next*
• Endophoric markers (expressions which refer to other parts of the text) e.g. *see Figure 2, refer to the next section, as noted above*
• Evidentials (attribution to sources)
• Code glosses (rephrasing, explaining or elaborating) e.g. *this is called, in other words, for example, etc.*

The interactional dimension also comprises five subcategories:

• Hedges (indicators of degree of precision and certainty) e.g. *possible, might, perhaps*
• Boosters (words/expressions emphasizing certainty and thus closing dialogue) e.g. *in fact, definitely, it s clear that*)
• Attitude markers (signals of the writer's affective attitude) e.g. attitude verbs (*agree, prefer*); sentence adverbs (*unfortunately, hopefully*) and adjectives (*appropriate, logical, remarkable*)
• Self mention

• Engagement markers: words/expressions which focus on readers' attitude (e.g. pronouns *you* and inclusive *we)*, modals and words such which predict possible objections and guide interpretations (e.g. *by the way, you may notice*, *see, note, consider)*, and references to shared knowledge.

As Hyland points out, the first 5 subcategories in his interpersonal model of metadiscourse address reader's needs while the remaining 5 focus on reader's involvement (49).

The module discussed here emphasized the interactional dimensions of metadiscourse. Students were asked to identify and analyze the use of hedges, boosters, and attitude and engagement markers first in excerpts from their textbooks, and then in popularizations, conference abstracts, and scientific articles. Discussions revolved around differences between American and Arabic norms of academic discourse. Worksheets accompanying writing assignments promoted the use of hedges and engagement markers and discouraged frequent use of boosters, amplifying adverbs, second person pronoun, rhetorical questions, and modals *must* and *have to.*

While the first part of the module emphasized the writer's attempt to guide and engage the reader and aimed at giving students linguistic means to create a similar dialogue in their own texts, the second part focused on the implied reader. At this point the students were expected to have understood that reading is an act of active exploration in which meaning is created rather than simply located in the text. Now they were asked to consider the role of cultural knowledge and empathy in comprehension and interpretation.

A short review of terms began with drawing a distinction between the reader in the text and outside the text, the latter being a real person in the act of reading, or an abstraction, either the intended reader, the audience the writer could envisage when writing, or the generalized notion of the so called typical audience, encapsulating individual responses specific to a certain place and point in time.   The concept of the implied reader required more clarification. The reader in the text can figure in the text visibly (for example, addressed as "Dear reader" or "you") or can exist there as an idealized construct that "embodies all the predispositions necessary for a literary work to exercise its effect (Iser 34). In other words, to borrow Weinreich's term, the implied reader exists in the text as a "a contour or a shadow", " a set of competencies" needed to understand its meaning (7). These competencies include not only linguistic but also cultural knowledge; what is more, they pertain to the affective domain of intercultural communication, the ability to empathize and assume the perspective of the other. As Weinreich observes, if the gap between the implied reader and the text-external reader, the "consumer" of the text, is too big, the process of constructing meaning will not take place (8). At the same time, one could claim that it precisely the differences between the implied reader and individual readers of the text that are worth exploring in an ESL/EFL classroom. Filling out the contour and looking at themselves vis-à-vis the implied reader, students are encouraged to examine their own culture and gain insight into the "constructedness of their own self-understanding" (Thompson 1987: 218). In brief, they practice reaching "the third place."

In the pilot project in question, the students were given two short texts for analysis. The first one was a personal opinion essay from Newsweek, the genre easiest for learners to relate to. The author of the essay, Christopher Awalt, chooses to structure it as a dialogue with an adversarial reader inscribed in the text. The reader is envisaged as an individual opposed to the writer's argument, the claim that the homeless themselves are to be blamed for their plight. Except for the introduction and conclusion, each paragraph answers a question or objection raised by the reader; in most cases the question is explicitly stated at the beginning of the paragraph. Class activities involved having the students diagram the text by dividing it into stages of thought and writing down the question each section answered. Some questions in the essay are implied rather than stated explicitly and consequently they needed to be written out, but in most cases they could be quoted verbatim from the text.

It was easy for the students to notice how the questions of the inserted reader build the structure of the argument. They were also quick to point out that the "you", the inscribed reader, was in fact a straw man whose presence allowed the author of the text to advance his claim. Commenting on the degree of control of the authorial voice, they observed that it was not the author's intention to open up much space for a real dialogue with either the inscribed reader or the one external to the text. In other words, they discovered how a skillful use of engagement markers allows for manipulating the audience.

749

The next step involved determining the implied reader's competencies. In the essay in question, the topic of the homeless problem in the USA presupposed some personal experience with the homeless as well as a certain amount of information about the political scene, American institutions and public attitudes. Identifying what they would see as "information gaps" helped the students reflect on their own knowledge and led to enquiries into the issue of culture specific versus universal values and degrees of empathy.

The module ended with a very short excerpt from Sandra Cisnero's *The House on Mango Street.* "No Speak English" is about an intercultural encounter that results in a failure. Mamacita, a Mexican woman brought to the US by her husband after two years of his relentless pursuit of the American dream, refuses to learn the language or communicate with anyone in the neighborhood. She spends her days listening to Spanish radio stations and dreaming of going back home. The only words she says in English are "No speak English, " her standard reply to anyone trying to talk to her. In the concluding lines of the story these are also the words she utters when her baby boy breaks her heart by starting to sing Pepsi commercials.

"No Speak English" requires competencies related to affect and naturally lends itself to assignments asking students to rewrite it from different perspectives since the main character is presented from multiple points of view: of the first-person narrator, the main character's husband, and other members of the community. Depending on the perspective, she is a victim or a selfish, irritating and irrational individual. The point of view of the implied reader is supposed to encompass all these perspectives and validate the opinion of the first-person narrator, who has a lot of empathy for Mamacita. Yet more often than not, that is not what happens. The students I taught had very strong opinions about the situation as well as the characters, and many of them disregarded or clearly disagreed with the speaker in the text. It was thus quite illuminating for them to be shown to what extent their point of view was grounded in their personal experience and societal expectations in their culture. It was this moment of self-reflection and acknowledgement of real differences among real readers that made the process of engaging the text an intercultural encounter and illustrated Iser's central concept - the reader being transformed in the process of recreating the fictional reality.

In the goal oriented, proficiency driven classroom environment, it is important to ask what the students took away from the three weeks of considering textual and subtextual messages. The most important and tangible gain was a shift in awareness. Terms such as audience, stance or voice, frequently heard by students but rarely considered as anything more than abstractions, suddenly became real and meaningful. One could see that the students began to realize that their own text should include reader engaging strategies in addition to satisfying reader's needs for coherence and unity. There was a noticeable increase in the use of hedges and decrease in the number of modals such as "must" and "have to." The argumentative essay written immediately afterwards showed sign of engaging other perspectives or at least signaled such an attempt. Even more importantly, the students became more reflective and aware of their own practice as culturally determined. Last but not least, they also discovered that temporarily assuming the perspective of the other can be an enjoyable and enriching experience.

The approach discussed here does not in any way pretend to present a radical departure from a curriculum of many college level reading/writing courses; it merely proposes a shift in emphasis. Some gains that it affords are easier to assess, others are less tangible, though equally valuable. To quote Norton, "Since discourse analysis hones critical thinking skills, it offers language learners useful, practical, and, in indirect ways, perhaps marketable skills" (2). The same is true about responding to a work of literature. Although to some teaching norms of academic discourse may sound more relevant than teaching empathy and cultural sensitivity, they are not only equally important but also closely related. In today's global community both are indispensable.

The Relation between Domain Specific Knowledge and Linguistic Proficiency in EFL Academic Reading--Implications on the Teaching of EFL Academic Reading in Higher Education

Ms. Shu-Chen Wang
University of Essex
UK

abstractspace = Literature from the relevant field as well as the results from a pilot study conducted amongst Taiwanese college freshmen indicated the specific relation between EFL learners' basic linguistic knowledge of English and the magnitude of domain specific knowledge that can be 'executed' during the process of reading academic texts. To be more specific, there seem to be two linguistic thresholds--low and high--between which EFL students' domain specific knowledge plays a significant role during the process of reading the academic text. Before crossing the low linguistic threshold, students' domain specific knowledge was almost useless in helping them comprehend academic texts of their own subject fields. And after crossing the high linguistic threshold, the influence from domain specific knowledge became less prominent and students, no matter whether reading an academic text of their own subject fields, were somehow able to achieve comprehension without being significantly undermined by the lack of the relevant domain specific knowledge. Such a finding indicates the fact that for college students to be able to read academic texts in English successfully such as reading English textbooks, at least crossing the low threshold is essential, if broadening and building up one's knowledge of a given subject field by means of reading academic texts is an essential part of one's higher education. Also, if the goals of higher education are not merely to offer professional training of knowledge that one majors in but also to provide an environment in which one is able to explore other academic interests beyond his/her subject fields, crossing the high linguistic threshold becomes similarly paramount. Following theses considerations, the role of English language teachers as well as the objectives of academic reading courses in higher education become an area that requires refocus. Based on the results from the pilot study, therefore, this paper will discuss the issues and implications made above by drawing the situation of higher English language education in Taiwan as an example and see how all these can be furthered to generate more speculation on the role and position of English language training in higher education in non-English-speaking countries. In addition, with understanding college textbooks as the baseline, this pilot study has also tried to locate and define two such linguistic thresholds, based on which practical suggestions on carrying out an EFL academic reading course in higher education will be provided.

Intercultural Dimensions of Task-based Learning for
Authentic Communication: Rationale

David L. Brooks
Associate Professor, Kitasato University, Japan

Abstract: An important challenge for language educators in Asia is the difficulty of getting students to actually produce the language they are learning for purposes of authentic communication. This papers advocates an approach that is rigorous, long-term, cross-cultural, and, most definitely, qualitative in nature. A new intercultural framework for teaching methodologies and student learning for constructing instructional environments conducive to developing intercultural competencies is the focus of a task-based learning approach through collaboration.

Keywords: TEFL, intercultural, approach, metacognition, task-based learning

A central challenge for foreign language educators is getting students to actually produce, in particular to speak, the target language – that is, to be able and willing to use English, as it still remains the foreign language predominantly studied in Japan, they have learned for purposes of authentic communication, self-expression, and personal enjoyment. Achieving this goal becomes even more difficult when the students are from a country where the culture norms for speaking behaviors are quite different – even radically so – from the native-speaker teacher's home country. This paper addresses the most essential aspects of this important educational goal, which is both vexing and challenging to overcome for many language educators who come from English-speaking or European nations to teach in Asia.

By expanding teacher and learner recognition of the nature of intercultural barriers to classroom learning of a foreign language, and by gaining a deeper understanding of the problem's pertinent issues, a new collaborative framework for teaching and learning methodologies using this cross-cultural knowledge and employing intercultural competency for teachers and students alike can become a reality. Engaging educators in constructing instructional environments in Japan and across Asia with the fruits of this realization will result in school and university programs that are more conducive to the development of the cross-cultural competencies needed by all stakeholders in the educational process. By focusing on task-based EFL learning through intercultural collaboration as a vehicle for achieving this goal, the author hopes to 'forge a new plow' that can cross divided, and sometimes scorched, territories and cultivate a more responsive educational system for language education, leading Japanese and other Asian students to become more competent intercultural communicators, and gaining greater confidence as future leaders in a world that is vastly changed from the days of the Cold War race of a few superpowers.

The Pacific-Asian Region, where Japan has, heretofore, taken one of the lead roles, has quickly come into its own as a dominant force in the world's global economy and international political arena. Therefore, Asian countries must increasingly learn more effectively and competently how to deal with balancing the adoption of languages, cultures, educational values and processes from abroad, particularly from the Western nations, with the preservation of their own values, cultures and languages.

This monumental realization can only be scratched at the surface, so this investigation focuses broadly on the following educational tenets and actual instructional practices for establishing an intercultural approach to task-based learning:

1. Selling the intercultural collaborative task-based approach to reluctant speakers is the essential initial step.

2. Guidelines for electing, organizing, and managing authentic tasks and meaningful performances for large classroom groups will be introduced.

3. Preparing students for success in the performances involves effectively 'training' students unaccustomed to a intercultural task-based approach to gain the strategies, skills and confidence needed, both meta-cognitively and through actual instructional tasks.

A second follow-up paper in preparation will address the subsequent steps in this process:

4. Setting standards, selecting new methods for evaluation, and then incorporating self, peer and teacher assessment into the performance tasks are important parts of the process.

5. A brief demonstration of appropriate type of performance tasks and guidelines for maximizing student achievement and teacher efficacy will be discussed. These include model conversations, role-plays, simulations, poster talks, storytelling, action research presentations, pair discussions,

group debate, making video programs, speeches, dramatizations, and Internet-based collaborations.

6. Technology and classroom infrastructure, which enhance the instructional environment in achieving a task-based collaborative approach, will be briefly showcased.

The target audience is comprised of educational policy-makers, system administrators, institutional leaders, and practicing foreign language teachers, whose students in secondary schools and university are not yet accustomed to being asked to become actively engaged in the process of learning by 'doing.'. It may also be valuable for anyone who wants to learn more intercultural knowledge and meta-skills take shape in, and also be shaped by, the educational process.

Barriers to Communication in the Monolingual EFL Classroom

Learning a truly "foreign" language confronts students in a *monolinguistic* society is often a formidable challenge in transcending communication norms they are used to. Japan, perhaps more so than many other Asian countries, has many of the qualities that could be termed '*monolinguistic*.' The culture of the typical classroom at secondary and tertiary levels in Japan does not readily facilitate the acquisition of communicative competence in the target language. Moreover, certain forms of discourse, which may be paramount to communication efficacy in English, have less and often no avenues for development in the native language. In particular, Japanese culture, as evidenced by its ambiguous linguistic exponents and complex social conventions for avoiding conflict, does not value the same type of argumentative discourse that is clearly integral to communication among speakers of Western languages (Brooks, 2000).

The term *monolinguistic*, as used in this context, is meant to convey the idea of language usage and language policy practices that go beyond simple monolingualism. Japan is a society that absorbs enormous amounts of foreign vocabulary, as well as foreign products and ideas, although extremely few foreign people are admitted as immigrants. These adopted words (concepts) borrowed from other languages are ultimately 'japanized,' i.e. the Japanese equivalent of anglicizing the words or concepts. One effect of this '*japanization*' of borrowed language, which might strike the outside observer as somewhat natural on the face of it, is to appear to de-value cultural diversity and deny the respect for 'otherness' that may be derived from true and competent second language acquisition. It has often been theorized that Japan's 400 years of prolonged – not quite complete – isolation from the rest of the world during the Edo Period had a profound effect still evident today. A type of general inferiority complex about the Japanese people's own self-perception about their ability to learn a foreign language seems to be one of these effects.

Details of the latter are discussed elsewhere (Brooks, 2000; McVeigh 2002). However, there are several factors to account for the characteristics of this monolinguistic communication environment:

1) students expect to only "attend" a teacher-directed content lecture
2) a low level of teacher-student and student-student interaction is the norm
3) classroom learning is viewed as the passive acceptance of knowledge where students depend on the teacher as the main dispenser of information
4) learning performance is considered to be part of the final examination only, instead of a summation of the responses and interaction during a series of lessons, which demonstrate cognition and acquisition of new language patterns, cross-cultural behaviors, or communicative strategies
5) talking is less the norm than listening in the Japanese classroom
6) the concept of individual identity and exchange of information about one's self are very different from the culture of the target language, which is internationalized English,
7) allegiance to one's peers means not saying or doing anything to distinguish one's self or to appear self-serving
8) harmony and congruence with the opinions and will of the group take imminent precedence over individual opinion or wishes, therefore variance in opinion and argument are submerged.

Though anthropologists and cognitive linguistics researchers may have collected data to support these assertions, this list of characteristics is derived from the author's own experience as teacher and learner in Japanese educational institutions. Leaving the sociolinguistic and discursive analysis of Japanese language to other researchers, this paper focuses on how undergraduate, graduate and faculty researchers at universities and a research hospital near Tokyo are provided with a language learning environment for contextual and metacognitive training in aiding their acquisition of second language communication strategies and intercultural communicative competence.

Rationale for intercultural communicative competency approach

   In this age of increasingly greater interdependence between nations through the globalization of the economic, information, and media infrastructures, and the cross-border political ramifications of almost every decision made or the international policies introduced by a single nation, modern language teaching is being conceived increasingly as a "complex, combination of valuable knowledge and skills" which must be recognized as not simply foreign language mastery which, in effect, is almost an impossibility for most of our students, but rather as intercultural communicative competence or ICC (Corbett, 2003, p.31). Michael Byram has attempted to codify what he refers to as '*savoirs*', the five essential constituents of knowledge and skills necessary to mediate between cultures (Byram, 1997). These five *saviors* incorporate a deeper intercultural curriculum on the framework of communicative language curricula, transforming its goals. The learner of a foreign language must develop, beyond the ability to imitate native speaker utterances, an accumulation of useable facts about the target culture and, most importantly, a sense of how people from the target culture are expected to behave. To make the goals more readily attainable, the ICC curriculum should train foreign language students:

   1) to gain an ethnographic perspective in learning to 'discover' essential cultural knowledge, values held and behaviors practices in the target culture,
   2) possess a critical stance that prompts comparisons and reflections rather than automatic imitation or adoption,
   3) attain and demonstrate the skills of de-centering beyond their own (or the target culture), valuing each for its own merits, and tolerate – if not come to appreciate – the differences between them. (Byram, et al, 2001)

In such a way might students of a foreign language be able to reach Kramsch's 'third place,' that vantage point, resulting from a well-planned and thoroughly executed intercultural communicative approach, from which language learners can understand and mediate between their home culture and the target culture they seek to become acculturated into (Kramsch, 1993 p. 235).

   As an important a realization as it is, it should be taken in balance as a pragmatic right arm of the dual-fisted goals:

   Promoting a global perspective and building intercultural communicative competency among foreign language students is not only feasible in our increasingly globalized world, but is also a central responsibility for all educators. Understanding and acting upon the knowledge of how culture, specifically beliefs, values, world view, use of language and nonverbal behavior, impacts one's communicative behavior is a crucial element (Samovar and Porter, 2001) which can be taught explicitly and experienced directly in a course where the teacher's culture is different from that of the students. (Brooks, 2006)

   Learning a truly 'foreign' language, one that is as culturally opposite in as many ways as Japanese and American cultures are, confronts students -- those from a monolinguistic society and with little direct contact with people outside their own culture, comprising the majority of students at institutions of higher education in Japan, -- with a formidable challenge in transcending communication norms. The cultures of the typical classroom in secondary and tertiary levels in Japan do not readily facilitate even the modest acquisition of low-level communicative competence in the target culture language – let alone any real measure of intercultural competency.

   The sad fact is that there is plenty of evidence to suggest that perhaps the opposite result is being achieved. Owing to the all-to-often conflict and unresolved misunderstanding that often permeates thousands of compulsory English language classrooms throughout the nation because of this intercultural gap, Japanese students may actually be dissuaded from pursuing real communicative competence (McVeigh, 2002, p.99), and may also be exposed to situations where intolerance for cultural diversity or downright rejection of the foreign native speaker's culture may take place. Certainly, this is not the case universally. But too often, while bespeaking a love of foreign culture and a desire to be able to speak a second language in order to make friends with people of another culture, student's actual behaviors and attitudes demonstrated that the converse is sometimes the result.

   This failure can be blamed in part to the disconnect between the foreign teacher's minority values about student motivation, grasp of their dedication to the quality of learning, and standards for excellence in individual performance – particularly in spoken language, and the values and expectations of the students in the majority culture, who may come to feel that the instructor does not understand their commitment or fully make use of their potential because he or she appears unable to transcend his American or British origins, or culture-based, and thus, biased educational training.

Factors on both sides of the teacher-student equation are likely involved this intercultural communication gap. The classroom environment becomes a type of 'no man's land', where the native-speaker instructor has to talk down to the 'local' students, who tend to freeze up or act passive-aggressively if their teacher cannot 'respond' with the same support and in the expected manner as their previous secondary school teachers have done.

It is a nonetheless a complex situation, only exacerbated by the university and Ministry of Education (MEXT) insistence, particularly in years passed, that all first-year students much complete a required set of English courses, often taught by a native English speaker, simply because English is the default language used for the majority of university admissions examinations (McVeigh, 2002).

Educational instruction and the learning that takes place in schools, including learning a foreign language, has been found to be influenced by a variety of factors, including attitude, motivation (of both the students and the teacher), age, personality, gender, learning styles, national origin, aptitude, cognitive skills, background knowledge and experiences, proficiency in the first language, perceived value, skills emphasis, and actual skill level in the second language, and the task requirements. It is also very likely that other cognitive factors, such as learning strategies and metacognition, play an important role (O'Malley & Chamot, 1990).

As equally important but not always more apparent are the social and psychological factors such as socio-economic group, communicative norms of behavior, communicative styles, and the general social environment, including issues of power and autonomy, which also greatly influence the way people learn to communicate in a second language. Finally, it seems absolutely certain that culture – especially the degree to which the target culture is different from the native one – pays a significant role in determining and shaping all of the above factors (Kramsch, 1998). Therefore, when the foreign language classroom is comprised of a group of monolingual students from a single, dominant culture whose teacher comes from the target language's culture, the possibility for cross-cultural conflict of values, differences in styles of education, classroom behavior, and learning modes and behaviors, including the divergence in communication behavioral norms between the two cultures, will be greatly increased.

When an American teacher, for instance, since North Americans are heavily represented among immigrant and visiting instructors in Japan, takes on the responsibility for organizing language instruction for a large, homogenous group of Japanese students, often occurring during their first few days at the university, the teacher brings into the classroom a set of cultural values that may be quite different, even oppositional, to those of the Japanese (or other native Asian culture) students. These American values can be characterized by sixteen core beliefs (Kohls, 1993; Cortazzi, 1990). The compiled list below, which includes this author's additions from having lived as a participant-observer in Japanese society for thirty years, also delineates parenthetically the parallel, and sometimes contrasting, value of the students' native culture (Japanese, in this case). Obviously, these 'values' can be over generalized and should not be construed to be stereotypes. There is no doubt that traditional cultural values are on the wane, which is some cases, causes increased opportunities for conflict because values among generations and sub-groups with the society are substantially different. We must surely also recognize and remain cognizant of the fact that – even when the logic of it may evade description – cultural norms, beliefs, practices and language of any culture group, most assuredly in post-economic 'bubble' Japan, are not at all static, but are undergoing dynamic renegotiation and reformation by the various groups' memberships. "Therefore, the core beliefs – and the language that articulates them – will necessarily change over time" (Corbett, p.20).

Comparison of 16 Core Values American and corresponding Japanese value (in parentheses)
1) People have control. (Fate in inevitable.)
2) Change is healthy. (Tradition and preservation of status quo are to respected foremost.)
3) Time flies, i.e. people are constrained by time and should stick to time schedules. (Life is long; things change slowly.)
4) All people are created equal. (Hierarchy, rank, status are important.)
5) Individual needs are of highest importance. (Group needs come before the individual's.)
6) Initiative/Self-help (Birth determines status, which can't be changed.)
7) Future-orientation (People must live for today or for their ancestors.)
8) Action-orientation, i.e. Our identity comes from what we do. (Being-orientation: Who we are is the most important thing in life; we don't define our identities by our actions, work, or accomplishments.)
9) Informality in dress, forms of address, social rituals and communicative styles.((Formality and outward form and appearance matters most.)

10) Directness and openness (Indirectness, ambiguity; avoid personal disclosure)
11) Honesty – We need to be honest no matter much it hurts. (Considering another's feelings and loss of face (status / stature / reputation) is the most important in deciding what to say about the 'truth', which is only relative anyway.)
12) Materialism (Spiritualism)
13) Friendliness: making people feel liked (Serious-minded respect is the most admirable quality in a person.)
14) Interactive Participation (Reflective Listening)
15) Personal Achievement (Self-serving immodesty is not good; not saying or doing anything to distinguish one's self above peers is how we should behave.)
16) Discussion and debate produce new ideas and critical thinkers. (Avoid confrontation to protect social harmony; accept group consensus.)

Contextual and Metacognitive Cross-cultural Training is a Viable Solution

In order to combat this cross-cultural gap between the learners and the teacher, an approach which focuses on learning real language in a meaningful context, as well as helping the students to understand and make appropriate adjustments in their language learning experience through contextual and metacognitive cross-cultural training is advocated. It will be efficacious here to look at the ideas of context and metacognition in the broadest possible views. At first glance, the principle of context is not very controversial or new to language teachers; however in actual classroom practice, it is still not universally adopted. Alice O. Hadley (1993) purports that the majority of language educators would agree that students must know eventually how to use language forms they have learned in authentic communication situations. Most would accept that this goal is more likely to be achieved when the forms of language are presented and practiced in communicative contexts, where the main focus in on meaning and content (p.125). Authentic language occurs in context since any given utterance is embedded in ongoing discourse as well as in some particular circumstance or situation. As pointed out by Widdowson (1978), "Normal linguistic behavior does not consist of the production of separate sentences but in the use of sentences for the creation of discourse" (p.22).

A second perspective on the concept of the context of language teaching is the realization that most language students undertake the study of a foreign language for "reasons which arise directly or indirectly out the perceived needs of the community to which they belong" (Tudor, 1996, p. 128). Tudor went on to explain that language study takes places in an educational framework that is shaped by the socioeconomic conditions of the existing culture and which reflects its attitudes, beliefs and traditions. For the great majority of secondary and university students in Japan, English has been a required subject since junior high school. For most, the real purpose for studying English has very little to do with authentic communication, but everything to do with increasing potential for passing the rigorous high school and university entrance examinations. That admission is key to their future economic status – at least, it had been until the advent of the new economic realities of today. As a result, the experience of learning English has been one that is rather grueling, often leaving students with a strong sense of inadequacy as foreign language learners. The examination-oriented curriculum in pre-university English education has focused their study on memorizing long lists of difficult vocabulary, mastery of complex rules of grammar and usage, and emphasis on word-by-word translation of English to Japanese. Little time was left for any authentic, particularly in communicating orally.

With such an educational context as a background of shared experience, it is not surprising that most students are so poorly prepared to undertake the learning of English as a vehicle for communication and cross-cultural understanding. The second aspect of the cross-cultural training to overcoming barriers to learning communication in the EFL monolingual classroom is metacognition. Metacognition is a conscious process and generally involves at least two related concepts: first, a knowledge about learning, and second, an ability to employ cognitive strategies intelligently. O'Malley and Chamot (1990, p.8) purport that language students without metacognitive approaches are basically learners without direction or the skills to plan their learning, to evaluate their progress, or to set new directions toward communicative competency because they do not monitor their learning. However, to be perceived in its largest sense, metacognition must also encompass not only the cognitive aspects, but also the affective aspects of learning. It should include the conscious knowledge of the feelings and attitudes that the learning situation evokes. It must, consequently, comprise a knowledge of the self (Williams and Burden,

1997, p.155). Therein, lies a difficulty since the Japanese notion of and identification of *self* tends to defy explanation.

To go one step further, beyond the awareness of one's personality, feelings, motivation, attitudes, learning style and cognitive strategies, the conscious awareness of the social environment and cultural context at any particular moment for the learner must be included within the concept of metacognitive awareness. Williams and Burden (1997, p.188) stress the presence of the appropriate environmental conditions for learning a foreign or second language to take place cannot be underestimated. Teaching a learner how to understand the demands and nuances of different social and cultural contexts is tantamount to helping that learner to act intelligently (Sternberg, 1984). At the same time, by providing language learners with the kind of learning environment which enables them to learn how to learn, to behave in linguistically productive ways in the foreign language classroom culture, and to develop as culturally effective learners in the target language, we foster a metacognitive process of inculturization that can have a profound influence upon the development of second language acquisition and the way in which it is used.

> One of the primary functions of a language is to describe our environment so that we
> can form an image of ourselves in relation to it. The better we can come to understand
> the cultural context which gives rise to the language we are trying to learn, the more
> likely we are to come to understand the essential differences between the way in which
> that language is used and our own. (Williams and Burden, 1997, p.188)

The classroom forms an essential habitat in the learner's ecosystem. It encompasses the domains of the learning environment: physical, social, instructional and psychological. The foreign language classroom is a culture that is affected by perceptions and realities of classroom structure, group processes, classroom climate and teacher-mediated activities. When a group of monolingual students forms a classroom for learning to communicate in a foreign language, especially when the teacher is from the target culture, there is the unusual situation in which the classroom culture is foreign to both the students and the teacher. It is an unknown culture to which both can and should learn to adapt in order to derive the benefits of learning a foreign language. Not simply the natural absorption of a new culture, normally referred to as acculturation, but rather the contextual and metacognitive cross-cultural training advocated here is an explicit, mutually-actualized, teacher-mediated process for intuitively *enculturating* the students and the teacher into this new classroom culture. Consequently, this process has been conceptualized with new terminology and is therefore called metacognitive inculturization (Brooks, 1999).

What is Metacognitive Inculturization?

The second part of this research, now in preparation, provides a detailed explanation of how metacognitive inculturization is carried out through contextual and metacognitive cross-cultural training program, including specific instructional guidelines for implementing the task-based learning approach. In order to provide a simple initial overview, an attempt to briefly define metacognitve inculturization will be made in summary. First of all, it is an instructional process that actively seeks to first introduce a new context for language learning and to then immerse learners in a new classroom culture in order to overcome the problem of cultural and metacognitive barriers to learning to communicate in a foreign language encountered in many monolingual classrooms. Metacognitive inculturization is a practical approach to cross-cultural training that assists language learners in consciously and unconsciously adapting their own culture to enhance the communicative environment of the communicative language classroom. Initially, students must be gently acculturated into the new classroom environment; however, there is the inevitable culture shock, which can be used effectively to nurture both their understanding of the process and their willingness to embark on a new journey of cross-cultural discovery and language acquisition. Later, they are equipped with a specific repertoire of individual, pair, small group, and whole class behaviors for formalizing new patterns of learning, cognitive strategies, and, most importantly, interaction between themselves and with the teacher.

Conclusion

The primary intent of this paper has been to establish the rationale for, the value of, and the methodology behind metacognitive inculturization, a new term conceptualized by the author. It is an explicit, mutually-actualized, teacher-mediated, practical instructional approach to cross-cultural training that assists language learners in both consciously adopting the new culture of the communicative classroom and unconsciously adapting their own culture to overcome barriers to communication in the monolingual EFL classroom. It is the attempt to amalgamate the various approaches to foreign language education into a intercultural communicative competency framework essential for language learning in

the 21st century. It began by describing the barriers to communication that haunt many English-as-a-Foreign-Language (EFL) classrooms in Japan and probably elsewhere in Asia. It then presented a rationale for devising a contextual and metacognitive approach to cross-cultural training that employs a multitude of teaching methodologies and instructional strategies, centering on a task-based intercultural competency approach as a viable solution for overcoming these cross-cultural gaps between foreign native-speaker teachers and the students in the local country, Japan, as well as between the EFL learners in Asia and their communication partners in the respective target language cultures. Finally, it defined the meaning of metacognitive inculturization and explained very briefly how it can be accomplished. Because of the limitations of delineating that full process, the significant details were excluded about the five stages of implementation: 1) contextual reframing, 2) incorporating old and establishing new patterns of social interaction, 3) building trust and areas of comfort and challenge, 4) teaching both communicative instructional tasks and the communication and learning strategies that enhance their mastery, and 5) evaluating reflectively the learning of both the communicative and the metacognitive content.

In future research publications and educational conferences, the author hopes to accomplish a more complete explanation of how the intercultural communicative competency approach can be better realized, and also hopes to actualize and support this work and that of other researchers, teacher-practitioners in Asian educational institutions. It is the aim to further develop this framework to achieve a more clearly useful body of understanding for an Asian intercultural task-based approach through the collaboration with educators from both Japan and other Asian nations. The cooperation of these teachers, along with EFL students themselves, and the learners of other foreign languages or those who study content areas through the medium of a second language, will also be actively pursued.

Cultivating Catholic School Ethos based on Ignatian Spirituality
Daphne HO
Eadaoin HUI

Introduction

The Catholic Church has a long history of running schools as a mission to the world in forming our young generation to be all-rounded people. The Catholic Church in Hong Kong has been administering more than 400 schools over the past 150 years. The sponsoring bodies of these schools have spent considerable resources in developing a richer catholic ethos in their schools so as to make them to be distinct from any other schools.

The Christian Life Community (CLC), a Catholic school sponsoring body which bases its education philosophy on Ignatian spirituality, has been launching teacher formation programmes in the schools they are running in Hong Kong so as to strengthen teachers' understanding of the essence of Ignatian Education. Besides, in one of its schools, the newly appointed principal has also tried to implement changes in the school policies and the daily operation so that the values of the spirituality could be more known and embedded in the mind and heart of the members in the school.

This paper attempts to look into the school as a case to examine how the school ethos based on the Ingatian spirituality has been cultivated, the process involved and the perceptions of teachers, parents and other stake holders on the vision and mission of Ignatian Education as the school's education philosophy. The study is not meant to measure the quality or effectiveness of the educational innovations that have been implemented in the school, but rather, to investigate the processes of change and the perceptions of the different stake holders in the school.

Understanding Catholic School Ethos

The Catholic Church has a long history of providing education for children and young people in every corner of the world. She regards education as one of her missions to the world and it is extremely important in the life of every man and woman. She considers her schools "as a privileged means of promoting the formation of the whole man, since the school is a centre in which a specific concept of the world, of man, and of history is developed and conveyed." (The Catholic School, 1977, nn.8) Clearly, people do have expectation on Catholic Schools and look for unique qualities and characteristics that are not to be found in other schools. However, over the years, it is not difficult to hear criticisms on Catholic education. In the context of United States, a strong comment was made by McBrien(1977). He said, "Catholic education is not Catholic enough". He accused that a lot of Catholic schools have adopted the most unsatisfactory features of secular education while neglecting many of the good traditions or practice. Similar criticism was also made on Australian Catholic schools. As quoted in Flynn & Mok (2002), Neal commented:

> I myself should rejoice more if Catholic schools were seen to be in many vital matters
>
> strikingly unlike other schools instead of being, as they generally are, conspicuously
>
> the same…I wish they would have the courage to stand alone…in unfolding to the
>
> world a strikingly unique style of education. (pp.12)

Everyone involves in the education ministry of the Catholic Church should regularly reflect on the criteria that should be fulfilled in order to name a school a "Catholic" school. Otherwise, it would be like the salt that has lost its savour. In short, Catholic schools should process some distinctive features that make them different from others. McBrien (1977) summarized a few elements which formulate a theory of Catholic schools.

1. The Faith Dimension of Catholic School—the special mission of the school is to become a sign of faith that reflects the power of Christian virtue.
2. Catholic Schools as Genuine Educational Institutions—the school should be a place that encourages the pursuit of excellence in all areas of development including the moral, intellectual, physical, social, aesthetic and spiritual aspects.

3. The Goals of Catholic Schools—the ultimate goal of Catholic schools should help students make reference to the Gospel and Jesus Christ in their lives.
4. Christian Community and Catholic Schools—the Catholic school should be a place where staff and students could be able to pray and participate in sacraments together as a community.
5. The Culture of Catholic Schools—the Catholic school should be a place where members could apply the teaching of Jesus into daily lives. The fundamental corner stones of Jesus' teaching, love, respect and service would be proclaimed. Special attention would be given to the promotion of justice and peace and also taking care of the marginalized in the society.
6. The "Catholic" Character of the Schools—the schools should have a close relationship with the Catholic Church.
7. Religious Education in Catholic Schools—the school should provide systematic programmes in which students are able to learn about the integration of faith and life.

The above elements have set a clear direction for the leaders of Catholic schools. Their task is to integrate them into the administration and running of the school so that the good tradition can be upheld or even enhanced.

Over the years, many religious have engaged in the education ministry, serving in the school as principals, teachers or pastoral worker. However, due to the decline in the number of religious in recent years, the leadership role   has gradually passed on to lay people. This phenomenon happens everywhere, including Hong Kong. There has been an increasing concern to strengthen Catholic ethos in these schools.

In facing the new millennium, the Catholic Diocese of Hong Kong held a synod to reflect on the role of the Catholic Church in different aspects of life and discuss the ways forward. In the area of Education and Culture, it was reckoned that the Catholic schools were facing far more challenges than before in helping young people develop an integrated life with faith and love. They realized one of the reasons behind was about the dropping numbers of Catholic students and pastoral workers in schools. In order to maintain the quality of formation given to young people, the yearning for strengthening the Catholic school ethos was made. As a result, a special team for promoting Catholic school ethos was set up under the supervision of the Catholic Education Office of the Diocese after the synod. From this, the determination on building stronger Catholic school ethos could be seen.

Ethos is a fashionable term and yet the real meaning of it is elusive. Donnelly (2000) believes that the definition of ethos has two perspectives. One represents the view point of a positivist and the other of an anti-positivist. From the point of view of a positivist, ethos is the objective phenomenon that presents social reality and thus "a formal expression of the authorities' aims and objectives for an organization." It is also seen as "the expressed wishes" of the management within an organization and that the members within are requested to act and behave accordingly (Torrington & Weightman, 1989).

An anti-positivist sees ethos as something that is more informal and is a product of social interaction. Allder (1993) tends to define ethos from this perspective:

> *(Ethos) is a unique pervasive atmosphere or mood of the organization which is brought about by activities or behaviour primarily in the realms of social interaction and to a lesser extent in matters to do with the environment, of members of the school and recognized initially on an experiential rather than a cognitive level. (pp.69)*

Should ethos be defined in this way, the views of members within the organization and how these members interact must be considered in the process of examination or investigation of it. However, the term ethos, climate and culture are often used interchangeably. Although the two concepts both associate with the behaviour of the members within a school or an organization, Donnelly (2000) stresses that ethos has a more specific meaning subsumed in the broader concept of culture. School ethos refers to "formal and informal expressions of school members and these expressions tend to reflect the prevailing culture norms, assumptions and beliefs." Torrington and Weightman (1989) also suggest the slight difference between the two concepts.

> *Organizational culture is the characteristic spirit and belief of an organization, demonstrated for example in the norms and values which are generally held about how people should treat each other…The ethos of a school, is a more self conscious expression of specific types of objective in relation to the behaviour and values. This can be in various forms. This can be in various forms such as a formal statement by the head teacher… (pp.18)*

The ethos of the school can be expressed in different ways. In many schools, the school goal and the vision of education tell everyone clearly what their philosophy of education is. However, should someone want to understand the deeper value and belief of the members within, only investigating the document is definitely not enough. What should be useful are carrying out in-depth interviews and long term observation. Donnelly (2000) suggested the following methods to help people examine the ethos of schools.

Table 1: Three Dimensions of Ethos (Source: Donnelly, 2000)

Description of Ethos	Dimension of Ethos	Manifested in…	Method of reseaerch
Superficial	Aspirational Ethos	Documents/statements from school authorities such as Churchs	Document reviews; semi-structured interviews with school authorities
	Ethos of outward attachment	School organizational structures; physical environment of the school; behaviour of individuals	Document reviews & semi-structured interviews with school members
Deep	Ethos of inward attachment	Individuals' deep seated thoughts, feelings and perceptions	In-depth interviews & informal conversations with school members and long-term observation of organizational interaction

In the context of Catholic schools, the ethos and climate of the school are of much importance. They are regarded as crucial factors that make it distinctive from any other school. Flynn (1985) drew such a conclusion from a longitudinal study in Catholic schools in Australia.

> *One of the most distinctive features of an effective Catholic school is its outstanding social climate which gives it a special ethos or spirit. This climate has a religious as well as educational character and is generated in an intensely relational environment in which persons are respected and ultimate questions such as life, love, death, faith and God are confronted. (pp.342)*

Despite the fact that Catholic schools have a particular ethos that grants them a unique identity, the ethos of each Catholic school might be varied since the schools are administrated by different religious orders or diocese. Every religious order has its own spirituality and tradition. These traditions are reflected on the culture and pedagogy and that can be reinforced through policy making and teacher training.

Ignatian Spirituality

For more than 450 years, the spirituality of Ignatius of Loyola, has drawn women and men into a closer relationship with God and a renewed energy in their service of others. (The Characteristics of Jesuit Education, 1986)

Ignatian spirituality has at its center the life, the teachings, the death and resurrection of Jesus, acknowledged as the Christ, and invites people to come to know, love, and follow Jesus more dearly, as Ignatius did. Ignatian taught people to seek God in all things and embrace the attitude of "magis", means more, in life. (The Characteristics of Jesuit Education, 1986)

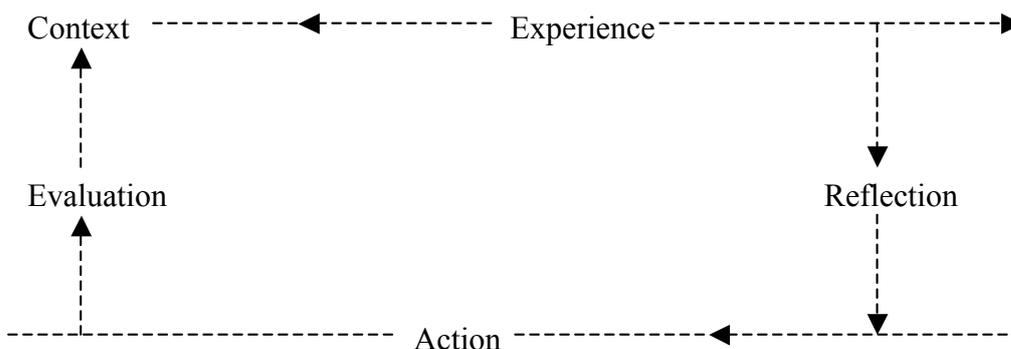
The Society of Jesus (Jesuits) was founded by St. Ignatius of Loyola in 1540. Since then, the Jesuits were engaged in the ministry of education. The first Jesuit school was established by Ignatius at Sicily in 1548. He recognized education as an apostolic and pastoral ministry. The Society of Jesus is a reflecting community. After running schools for more than four centuries, the Jesuits gathered together in 1980 to discuss different issues concerning their education ministry. After the meeting, an authoritative document, *The Characteristics of Jesuit Education*, was published. This is the fruit of four years of meeting, uncountable reflections and consultations. The document is a normative one and becomes the blueprint of the many Jesuit schools worldwide. It makes clear to the people who are involved in this meaningful ministry the characteristics of Jesuit education. It stresses on the importance of respecting every individual person and the love and acceptance for one another, especially to the poor and marginalized in the society. It also seeks to form "men and women for others" and the continuous pursuit of excellence.

The Ignatian Pedagogical Paradigm

Unlike methodology, pedagogy is the art and science of teaching. It is the way in which teachers become the companion of students in the journey of grow and development. It includes a vision of the ideal young people to be formed. It suggests some explicit ways for teachers to incarnate the Ignatian values in the process of teaching and learning. (Ignatian Pedagogy: A Practical Approach, 1995)

The Ignatian Pedagogical Paradigm (IPP), one of the characteristics of Jesuit Education, highlights the ways that encourage students' openness to grow and learn. The five steps include the context, experience, reflection, action and evaluation. These steps are best understood in the light of the *Spiritual Exercise* of St. Ignatius. Metts (1995) indicated that the Spiritual Exercises "stresses the continual interplay of experience, reflection, and action as the means for evaluating one's life and how one loves and will live it in a personal relationship with God." (pp.7). The experience of spiritual exercise is a personal encounter with the Spirit of Truth.

This mode of proceeding can become an effective ongoing process for learning throughout the lifetime.

Figure 2:   Ongoing Process of the Ignatian Paradigm


The document,*The Characteristics of Jesuit Education* has stated very clearly that the inspiration of the Jesuit heritage on education is not an exclusion of those who are not members of the Society of Jesus.

> *...Though the school is normally called "Jesuit", the vision is more properly called "Ignatian" and has never been limited to Jesuits...*
> *(The Characteristics of Jesuit Education, 1984, nn10)*

Thus, lay communities, which share the same spirituality like the Jesuits, have started running schools based on the Ignatian spirituality. These schools can be found in Hong Kong and South America.

Educational Innovation

Facing the fast changing world in the new century, people keep on looking for new ways to enhance better performance and create breakthroughs in organizations and in the society. Same in the education field, there have been reforms of all kinds over the past 10 to 15 years. Educators hold different views on education reform. Some claim that there have been too many changes at a time and they come too quickly. Others might see that it is the only way out for better education. Educational change is not an easy task. It involves different stake holders in the school settings. The dynamic is definitely a complex one.

The urge for change is clear. However, getting change happen is not easy. No matter how good visions we have, its implementation always defects us and the efforts are disappointing and ineffective. What are the problems out there?

There are many reasons that hinder the success of educational change. Hargreaves el at. (1996) have summarized a number of them based on the literature on change. (Fullan, 1991 & 1993; Berman and McLaughlin, 1977; McLaughlin, 1990; Rudduck, 1991; Huberman and Miles, 1984; Sarason, 1982 & 1990; Stoll and Fink, 1996). Some of the common ones are unclear objectives and process of change, wrong pace, the lack of resource and suitable coordination and structure to support and so forth. Concluding the many studies and researches in the past twenty years, Fullan and his teammates pointed out a crucial reason for the failure of implementing change. :

> *A missing ingredient in most failed cases is appreciation and use of what we call change knowledge Understanding and insight about the proves of change and they key drivers that make for successful change in practice. The presence of change knowledge does not guarantee success, but its absence ensures failure.*
> (Fullan, Cuttress & Kilcher, 2005 *pp.54)*

The change knowledge that Fullan (2004) suggested consists of eight principles. The first one is engaging people's moral purpose. It is about engaging educators or together with other stake holders to a commitment to increase the performance or productivity of their hard work. The second principle is capacity-building which involves bringing in new knowledge, skills, competences, resources and shared identity and motivation to people so that they can move the system forward. The next one is the understanding of the change process. This process is about creating the condition for continuous improving so as to persist and overcome obstacles during the reform. The fourth one is about developing cultures for learning. Since successful change involves learning during the process of implementation. It is important to establish a culture that members are willing to learn from each other and equip together. It is not only inevitable to develop the culture for leaning, but also the culture of evaluation. The fifth principle reminds us that greater achievement can be made if the schools increase their collective capacity to engage in ongoing assessment for learning. The sixth principle stresses on the leadership for change. The idea does not merely focus on the leaders themselves, but the ability of the leaders to foster success in others is of much concern since this is a key factor for sustainability. The seventh driver is on fostering coherence-making. It is about achieving new patterns of coherence that help people to pay more attention on how things interconnect. The last principle is cultivating tri-level development. This is about transformation of system in three levels. It is believed that the betterment of individuals would lead to the enhancement of organization and systems.

People in the education field might think that these theories are easier said than done and it is widely believed that educational change is really a difficult thing to deal with. Nonetheless, it is still worth trying because if we do not do so, we are meant to fail, especially in this fast changing world today.

The study

The present study aims at getting a deeper understanding of how the school has implemented the process of change in cultivating a stronger Catholic school ethos, and the views of different stakeholders on the vision and mission of the school. A qualitative approach to the research was used and a case study of a school was adopted in this study. The study started in 2007. Interviews, observation and document analysis are the tools to gather information for the investigation.

The Case school

The case school was founded in 1927 by a religious order. The sponsorship of the school has been transferred to another order in 1983 and finally, an International Catholic lay community associated with the Society of Jesus, became the sponsoring body of this school in 1998. In 2005, the former principal retired after thirty years of service. A new principal who is the alumna of this school took up the leading role since then.

This school was chosen for this study because of the following reasons:

- The vision and mission of the school is based on the Ignatian spirituality.

- The sponsoring body of the school aims at strengthening the school ethos based on the mentioned spirituality

- The principal was newly assigned to the school. She initiated the process of integrating the Ignatian values and pedagogy in the case school.

Preliminary findings

Integrating Ignatian values and pedagogy

The motto of the school is "The Lord is my Light". Respect for the dignity and value of each person is inherent in the philosophy of the successive Catholic sponsors of the school. The present School Sponsoring Body included the vision and mission of education based on the spirituality of St. Ignatius of Loyola as the School vision and mission. It aims at forming students to be people with Wisdom, Care, Love and Compassion and become "men and women for others". Students are also encouraged to work for magis—stirve for excellence in whatever they do.

These vision and mission statements appear in the school plan, students' handbook and the web page of the school. Moreover, they would be addressed in staff meetings and assemblies for refreshing members in the school from time to time. In order to reinforce the attention to some of the key features of the school, the initial name of the school and sponsoring body have been transformed into slogans and it is proved to be a success in doing so. Examples are as follows:

> *To achieve our Vision and Mission, our teams of teachers and supporting staff are*
>
> *M-iracle workers who work with*
> *P-assion and*
> *S-erve with smile.*
>
> *With teachers as their role models, students will learn to be*
> *C-aring*
> *L-oving and*
> *C-ompassionate.*
>
> <div align="right">*(Annual School Plan and Report, MPS)*</div>

The slogans of Caring, Love and Compassion were printed on banners hung in an eye-catching area in the school campus. This serves as a very good reminder for everybody in the school community. In the interviews to students, almost all students mentioned Care, Love, Compassion, the three qualities as the most significant characteristics of the students in that school. The student interviewees reflected that these qualities have been reinforced in lessons and daily contact by the teachers and that these concepts could be embedded quite deeply in their minds.

The sponsoring body encourages context, experience, reflection, evaluation, action and the search of excellence (Magis) as the ways of life. The thoughts of reflection and magis are placed very firmly in the hearts and minds of the teachers and students in the school. This has been done intentionally by the school principal. She mentioned it in an interview, "Every year, I focus on one idea only. For example, I used "reflection" last year. I put the word in my mouth all the time. I mention it in assemblies, in staff meetings, at the time I chat with the students and so on. I just make use of every opportunity to introduce this idea and I think my staff and students are able to grasp the idea and meaning quite well by now." This is true. In fact, the ideas are not only put into words, but also in daily practice in the school. Two examples could show the successful implementation of the idea. In a few class observations that were made, students were asked to reflect upon what they had learnt or the relationship of what they had learnt and their lives at the end of the lesson. Students were used to the practice. Some of them would share their reflections with their classmates and the reflections they made were not trivial ones. The other example is shown in the ways the teachers deal with misbehaviours. Basically speaking, the school does not have an explicit punishment system. When a student is found misbehaved, she would be asked to do a self-reflection and complete a reflection form. On the reform form, students need to write down what they did and their reflection from it. Moreover, they have to think about what they need to do then and how she can make use of her strengths to serve the others in the school community from then on. Students do welcome this practice and comment that it is a good way to help them learn what they have done wrongly and how they can improve themselves so as to love and serve others in a better way.

With the everyday use jargons and appropriate application of policies, students are able to immerse in an environment that are conducive to development of qualities aligned with the visions and mission of the school. Their hard work on the promotion of school ethos was certified by the External School Review Team from the Quality Assurance Division of the Education and Manpower Bureau in 2007. (External School Review Report, 2007)

The Process of Change
The case school has a history of more than 80 years. With the dedicated effort of the previous two sponsoring religious orders, the school has a strong tradition on religious love and care. At the time when the new sponsoring body took up the administration role of the school, it was of their hope that the good tradition on Catholic education could be upheld and the elements of the Ignatian Spirituality could be gradually instilled into the school. In the year 2005, the former principal retired and a new principal was appointed to take up the leading post. That became a golden opportunity to make their hope into reality.

The newly appointed principal has contributed a salient role in fostering the values and education pedagogy outlined in the school's mission and vision. In the past four years, different strategies have been employed and they can be summarized in the following:

1. Engaging staff to the change and building capacity
    To begin the change process, much time has been spent on helping the teachers and staff to understand the essence of the vision and mission of the school based on Ignatian Spirituality. This has been done in several levels. First, senior teachers were invited to participate in a four-year formation programme on Ignatian Pedagogical Paradigm which was conducted by an expert form the Loyola Institute of Australia. Participants could have opportunity to deepen their understanding on the Spirituality and exchange views on how to implement the concepts in their work with teachers from similar background. Second, a consultant on promoting Catholic school ethos was employed as a part time staff in school. She was responsible for providing development programmes for teachers. Since she had profound experience in working in schools with an Ignatian spirituality background in Australia, her support and knowledge given to teachers in the case school has helped them experience and recognize the beauty of the Ignatian spirituality. With

the deeper understanding of the mission and ways of pursuing such goal, members of the school have a clear picture on how to work together in new ways in creating a new culture.

2. Developing the culture of learning
As it is mentioned above, opportunities have been created for teachers to learn together. Apart from providing development programmes to teachers, the concept of "learning garden" was launched to the whole school. It pinpoints on different roles that members are playing in the learning community. Besides, the idea of supporting each other and learning from each other is widely spread.

3. Developing cultures of evaluation and reflection
The school started drawing up its school self evaluation (SSE) framework and process in 2003. The school culture on self evaluation gradually heightened and with the support of external training and school's internal sharing, their involvement on SSE was extended to the contribution of the Annual School Plan in 2005/06, School Development Plan in 2006/09 and School Self-assessment Report under the leadership of the new school principal. In striving for excellence and working for magis, the principal tried to include the element of reflection in the evaluation process in 2008. Although response from teachers is not all in the positive side, many teachers regarded this as a way for self understanding and improvement.

4. Empowerment of middle management
In order to make change sustainable, leadership must not be focused on one person only. Mintzberg (2004) has made a point on this:

> *Successful managing is not about one's own success but about fostering success in other.*   *(pp.16)*

The new principal was surely aware of this and she started formatting middle management team so that more can share the role of leading in school. She then restructured the functional teams in the school and the heads of the team would be arranged for special development programmes. In the interviews, some team heads revealed that they were empowered to make decisions on their own in the areas they were responsible for. Though some might express that they were not used to do that and were sometimes lack of confidence to do so, they welcomed this change since they felt more ownership in the work they do.

It is obvious that the new principal has tried to implement some changes in the school with an aim to cultivate a stronger school ethos based on the Ignatian Spirituality. In the past four years, she seems to have gained positive outcomes from that. The concepts of Love, Care, Compassion, Magis and Reflection were successfully implemented into the hearts and mind of the members of the school. She made the change work by arousing teachers' attention to the vision and mission of the school and inviting them to work hand in hand towards the goal. She has started to create a culture of learning and evaluation for the past few years so that members in the school would keep on striving for excellence and working for magis in every area of their work. Moreover, the teachers in the middle management level were empowered and it does helps to make the change more sustainable.

Conclusion

The aim of this paper is to explore how the school ethos based on the Ignatian spirituality has been cultivated, the process involved and the perceptions of teachers, parents and other stake holders on the vision and mission of Ignatian Education as the school's education philosophy. An in-depth case study of a school has been carried out.

The preliminary findings showed that the new principal has implemented necessary strategies to enhance the Catholic Ethos based on Ignatian Spirituality in school. The processes included engaging teachers to the commitment of change, creating cultures for learning and evaluation and the empowerment of teachers. Drawing on the four years of effort, they begin to see positive outcomes. Members in the school community have regarded the idea of Care, Love, Compassion, Magis and

Reflection as their characteristics and ways of life. Most teachers are pleased with the change process and are willing to work together for a better school and a better tomorrow.

It is for sure that going through the process of change is not easy. It brings much pressure, uncertainty and very possibly, more workload to teachers. However, in the new era, people are striving for pursuing betterment in all areas of life. By understanding the change knowledge and careful planning and implementation of the change process, people can make change a more fruitful and satisfying experience.

Regarding the education ministry of the Catholic Church, it is understood that the general environment for Catholic education is not as favourable as decades before. Should the leader(s) in schools are armed with faith and love, and equipped with new knowledge, the good traditions of Catholic schools and the Catholic school ethos are able to be maintained or even enhanced.

Toward to super aging society, the related issues on elders in Taiwan deserved to be explored and realized. Many well-developed countries have paid lots of attention on personal meaning of elders, especially in Japan. In Taiwan, the related themes on minds of elders are still neglected. Prager（1996）claimed that individuals would create their own self and personal meaning by the life circle, and further advocated those who owned higher personal meaning would get higher directedness, and try their best to achieve their life goals. Because of the enlightenment of related literature, the research on the situation and relationship of personal meaning and psychological well-being of elders in Taiwan was developed. To achieve the purposes of research, questionnaire survey was adopted. According the amount of elders in Taiwan, stratified proportional cluster sampling was used. 1090 copies were sent to the elders who were joining in the learning activities in their communities. 712 copies returned, and 710 were valid. 61.5% were female, but there were no difference between gender and personal meaning. Furthermore, gender had no effect on psychological well-being of participants. Health status and educational level were related with personal meaning and psychological well-being of the participants. Moreover, according to the analysis, we found that the personal meaning of elders in Taiwan was high, and the sources of personal meaning were mostly coming from social contribution and self-continuity. A strong association is found between personal meaning and psychological well-being.

Key words: personal meaning, psychological well-being

● **Background**

Toward super aging society, the related researches on elders were deserved developing and exploring in Taiwan. The emphasis on elder's life meaning of developed countries provided us the good example. In fact, exploring personal meaning of elders is the key point to realizing successful aging of them. Wong（2007）defined successful aging by different thoughts, and mentioned that the hidden part of successful aging was personal meaning, because keeping the positive meaning and life goal by the individuals themselves was beneficial to extend their lifespan, and promote life quality. Reker and Wong（1988）claimed that the related research on the source of elders' personal meaning can profit for the individuals themselves and the society. For the society, positive and vigorous personal meaning and successful aging can reduce the wastage of medical treatment sources. With the coming of aging society, more parts and organizations attached importance on elders' needs, including the developing of welfare systems, the influence of political economic, and the related themes on successful aging. Thus, various properties invested in providing and satisfying different needs of elders. Then the related researches on elders were growing and popular. If life is continuing, everyone will be aged and have to face the probable problems, because aging is an unavoidable fact for all of us.

This study aimed at exploring the relation between personal meaning and subjective well-being of elder learners. The setting and importance of this research contained two parts, just as follows: 1. establishing psychological well-being of elders is the goal of aging society, so how to help elders search out the sources of psychological well-being, build up their own values, personal meaning and life goals is the significant goal of aging society. Only when the individuals are affected by happiness,

it becomes meaningful to prolong life. 2. Personal meaning is the key elements of successful aging. It means lack of personal meaning and life goals, the individuals will suffer more burdens and pressures following the worsen health and body function. So facing the inevitable fact- aging, what we need are the aids of medical technology, accompanying of friends and relatives, and the most important is positive personal meaning and attitude.

Although high technology, well-developed medical progress, and disease-preventing strategies make people live better and longer, more elders suffered spiritual illness and got confused about their life goals and life meaning. Thus, the related elder policies in Japan and the related researches inspired us to pay more emphasis on this topic. Completely speaking, the purposes of the research contained to explore personal meaning and psychological well-being of elders in Taiwan first, and to analyze the related demographic factors with personal meaning and psychological well-being of elders, and try to provide some suggestions for elders and elder teaching organizations.

In order to achieve the purposes of this research, the definition, contents and the related factors of personal meaning and psychological well-being were explored and introduced first.

- **Definition of personal meaning**

The related research of personal meaning was less and less in Taiwan, but the concepts of 'personal meaning' and 'meaning of life' were always mingled together in western countries. Although there are really overlapped between the two concepts, personal meaning originated from transpersonal psychology, which emphasized that the individuals should bestow meaning, goals and values on their own life. Prager 1996 mentioned that the related researches on life-span, resources of personal meaning appeared these few years, and most of them interpreted the individual's thoughts by inductive reasoning or interpretation. In fact, human being was really complex, unpredictable and hard to be assorted. Personal meaning is really hard defined just like morality and values, but all related with personal belief, action, and relationship. The above-mentioned themes were the core elements of meaning of life. That's why it's really difficult to define personal meaning.

Prager 1996 believed that personal meaning was constructed by the individual himself through the life circle, and the person who owned high personal meaning must be with high directedness, and be good at achieving his life goals. Reker and Wong 1988 further explained that the individual possessed his own target, and did the best to attach it, if he got higher personal meaning. Kaufman (1987 114) asserted that we can explore the concept, personal meaning, from two layers, microcosmic and macroscopic. Microcosmic viewpoint means personal meaning comes from the recognition of human's own life and the explanation of other's meaning. Macroscopic viewpoint means personal meaning comes from the process of integration of history, culture and value. Moreover, Kaufman claimed if we can help elders find the sources of personal meaning, and realize how the individual combines them, it will be beneficial to go deeper in understanding the complicated parts of aging, and the truth of human's life course. And this was one of the mean purposes of this research.

Wong 1989 defined 'personal meaning' as a recognition system constructed by the individual, which meant the individual constructed his own personal meaning by his subjective value, life value and satisfaction, moreover, the basic elements of personal meaning concluded recognition, motivation and affection, three parts.

- Recognition: Human's belief, religion, and the interpretation for the world. Bestowing meaning by realizing life experience, and explaining the events, activities and the whole life.
- Motivation: The thrust to search for subjective values, needs, desires, and personal goals, and to make them come true.
- Affection: The satisfaction and achievement coming from the affirmation and realization to their own life-value.

To sum up, 'personal meaning' means the interpretation and recognition of himself, others, and the whole world under the social context by the individual himself, but not limited in recognition. What should be stressed on was the construction of personal meaning by the individual himself, and the process to set the goal, and to make dreams come true. Prager (1996) viewed 'personal meaning' by the outlook of existentialists, and took life as a whole which won't create meaning by life itself, but the individual himself create and construct his own meaning.

Just as the mentioned above, human's personal meaning, which is formed by the individual's explanation of life, value and the world, will be affected by the social context, the environment, customers and habits. Personal meaning doesn't exist primarily, but formed by the explanation and recognition of life events and life values, and by the process of achieving the targets. In fact, the process of constructing personal meaning will stir the individual to attain the goals enthusiastically and get self-affirmation and self-realization. R. F. Baumeister considered that personal meaning is stabile and constancy (Prager, 1998). Therefore, the individual can construct their own personal

meaning by integrating his life affairs in later life, and get the satisfaction and self-surpass. For the elders with personal meaning, life is a series of exquisite and abundant journey. Actually, if we can construct our personal meaning as soon as possible, we can find our life pleasure and free within our life.

- **Contents of personal meaning**

Personal meaning was affected by the topics created by the individual himself, and influenced by the explanation and valuation to his own life experience, and then formed self-concepts by the integration process (Prager, 1996). Prager (1998 explored the most important sources and the least important sources of aged 18-91 Israeli, and found that the relationship, valued thoughts and meeting personal needs were the most important sources of personal meaning. Wong 1989 claimed that many sources of personal meaning were threat by many reasons, such as jobs, social status, activities, and so on. The sources of personal meaning disappeared because of the threats, but some questions, such as 'why do I live?' aroused with the time passing by. That's because the health and life satisfaction of the individual was dependent on whether the existing needs were accomplished or not.

Scholars had different perspectives on the classification of personal meaning. Because the countries, races, and ages were different, then there were some odds on the sources of personal meaning, although the main sources may be similar. Reker explored the contents of personal meaning among different aged adults in Canada in 1988, and found that the most important contents of personal meaning included relationship, personal needs, personal growth, leisure activities, and permanent value, personal success, and altruism (Prager, 1996). Moreover, Prager's research confirmed three concepts: 1. Although culture may be different between Canada and Australia, he got the same results on personal meaning contents; 2. Only five of sixteen personal meaning contents differed because of age; 3. The most significant personal meaning contents were relationship, personal growth, basic life needs, joining leisure activities, and maintaining the value and concepts.

R F. Baumeister claimed that the exploring of personal meaning should start from the special part, and then extend to the universal, common and integrated levels. V. E. Frankl considered that there were three sources of personal meaning, coming from creativity, from experience, and from the attitude of the individual himself (Reker & Wong, 1988). Actually, the sources of personal meaning were various because of the differences among people. Hence, M. Rokeach classified personal meaning as four levels (Reker & Wong, 1988): 1. involving in searching for happiness and comfort; 2. investing more time and energy on developing personal talent and ability, just as personal growth, creativity, and self-realization; 3. surpassing personal interests and investing more energy to serving others, society and political affairs; 4. getting beyond self, and achieving the final goal.

Conclusively, scholars advocated that the contents and sources of personal meaning were consistent, including personal growth, relationship, altruism, hedonism, religion, spirituality, accomplishment, left behind, wisdom, respected and loved, persistent value and concepts, safety, creativity, continuity of life and generations. According to the results of the researches, some personal meaning, just like accomplishment, job, social status, joining activities, and self-control, will descend with age. Moreover, Penick 2004 pointed that the sources of personal meaning may be changed in later life, but the whole strength and significance of meaning won't be changed and vanished.

- **The related demographic factors with personal meaning**

According to the related researches and references, we found there are some demographic factors, such as gender, age, health status, economic situation, and marital status, related with personal meaning. The related findings were synthesized as followed:

- **Gender**

According to the researches (Bar-Tur & Prager, 1996; Holahan, 1988; Prager, 1996), female performed better and got higher score on safety, participation, and relationship. As the whole performance of personal meaning, gender difference was existed on personal meaning, especially the difference became more obvious among the elder women. There were still some researches having no comment on the relation between gender and personal meaning. As to the strength of personal meaning, there were medium variances between gender and the strength.

- **Age**

As to the relation between age and personal meaning, there were different results. According to the research of P. Ebersole and S. Depaola, we found that there were no difference between age and personal meaning of married women (Prager, 1998). Moreover, S. K. Baum R. B. Stewart confirmed that there were no difference among age, the sources and the strength of personal meaning in 1990. But according to the research of L. Bengston in 1975, it pointed out that different generations had various value and sources of personal meaning. For example, grandchildren emphasized on individualism value, such as practical skills, exciting life, searching for free life and

accomplishment; and grandparents stressed highly on concentration of authority's value, such as participating in religion, be loyal and patriotic, and keep friendship (Reker & Wong, 1988). Furthermore, based on Ryff and Singer's research (1998) indicated that elders' and middle-agers' intention to achieve the goal was lower than the young. In fact, many researches showed that those elders aged more than 75, whose sources of personal meaning were different from the others. As a whole, the strength and significance of personal meaning didn't decrease or vanish with age, but the advanced ager (especially those age above 85) who faced the decline of body function, and may be sent to nursing home, might have different sources and strength of personal meaning (Penick & Fallshore, 2005).

- **Health status**

   The sources of personal meaning may be changed with the development of life-course, but no matter what the content of meaning is, there was consistent positive relation between the strength of personal meaning and mental health (Prager, 1998). Yalom (1980) proved that the sources of personal meaning changed within life-course, and there was positive relation between the strength of personal meaning and health status. Johnson and Barer 1993 claimed that the elderly will reconstruct self-promotion actively for mastering their new life well. In fact, our own health status will affect our life-control ability, daily problem solving ability, and adaption, especially for the elderly. To sum up, health status will have big emphasis on the strength of personal meaning for elders.

- **Religion**

   According to the trend of life-course, religion played a big part on elders' life, but we also found that meaning of life descended with age (Prager, 1998 . On the development of life-course, the integration, searching for meaning, and self-accomplishment were the main task for elder people. So, religious belief, religion activities, and spiritual growth really played an important part on the elders' life. Testified by abroad counselling researches, consultants should realize if elders would like to surpass themselves or participate in spiritual growth, and then help them searching for the harmony and peace. By the development and growth of mind, it really can help elders face the changing sources of personal meaning, and provide them support and encouragement.

   To explore the sources of personal meaning of elders, this research tried to realize the situation of elders' personal meaning and the relationship between personal meaning and demographic factors, including gender, age, health status, religious belief, educational level, and marital status. Moreover, according to Bar-Tur and Prager's research, the strength and depth of personal meaning had large differences between community elder-elders and those living in the nursing home; moreover, the sources of personal meaning were really different between the elders Reker & Wong, 1988 . Hence, this research aimed at exploring the whole tendency of elders' personal meaning, and further discovering the relationship between personal meaning and demographic factors.

- **Elder's psychological well-being**

   The concept, psychological well-being, contained affection and recognition two structures, and the concrete contents concluded positive and negative emotion, happiness, life-satisfaction, life-goal, self-esteem, self-efficacy, and self-autonomy (Levin & Chatters, 1998). M. A. Okun viewed psychological well-being as subjective well-being, a meta-structure, which concluded the evaluation of life experience. The other concept, objective well-being, meant functional ability, including health status, and social status.

   Levin and Chatters 1998 pointed out that psychological well-being was always the index of elder's life quality. The recent ten years, gerontologists invested in the related researches on psychology well-being of elders, and the findings concluded that the factors, health status, social status, age, race, martial status, retirement, social-psychology situation, the relationship with the society, social support, life events, losing relatives, self-esteem, and adaption ability, were related ones with elders' psychology well-being. But the findings were really different because of the various participants, the various countries, and so on. Not all the factors mentioned above were really related with elders' psychology well-being. According the findings, we found that age, health status, and social-economic status were mentioned in the researches most, but social support, personality, world viewpoint, values, spiritual growth, and religion participation had no obvious relationship with elders' psychology well-being.

   Rowe and Kane 1995 explored the related factors with successful aging, and found that healthy life-style, social resources, religion, personal meaning, optimism, responsibility, and adaption were related with successful aging of elders. Moreover, they found that personal meaning was in the name of happiness, well-being, free of mentally deranged and depression, and the best index of successful aging.

Prager's research　1998　supported Reker' s findings in 1988, and they affirmed that the sources of elder's personal meaning were directed from philosophy, none the less, for the young and the middle age, their sources of personal meaning were most directed from self-identification, intimate relationship, productive and creative ability. To sum up, the mission of later life were tend to integrate the whole life and rebuild the sources of life meaning. Moreover, another important finding was that elders considered the high level sources of personal meaning was the most important for them, and they claimed to encourage the middle-aged to transcend their concern from selves to the future, to the younger generation, and to the society (Berquist et al., 1993). According to the researches, we found that the source of personal meaning, experiencing self-growth, was less significant with aging, because elders generally believed self-growth was no more important for them, and what became more worthy personal meaning was to strengthen their early-life growth and accomplishment, but not to achieve a new goal. In addition, elders wouldn't want to pay too much attention on their own achievements any more. Then according to Israel's investigation, the participation of religion was not the important source of personal meaning, but this finding was totally different from the same research in Canada. The difference may be caused by the social culture.

- **Method**

The data reported here are taken from a research project which mainly examined the relationship between elders' personal meaning and psychological well-being, and the situation of personal meaning of elders in Taiwan.

- **Subjects**

Mother sample: Respondents who were more than 65 years old living in Taiwan were joining various learning organizations or trying to participate in the community activities.

Table 1: Subjects and Sampling

Area	City/County	Elders more than 65		Sampling．005%
	2006	2,287,029		**1153**

subtotal		35268	1.54	13

Data: part of it retrieved from http://www.moi.gov.tw/stat/index.asp

According to Table 1, target population was 2,287,029, stratified random sampling was used. 1090 copies were sent to the community organization and then the respondents. Finally 712 replied, but two of them were not filled up well. So the rate of returning copies was high, 65.32%.The sample comprised 710 individuals, except 19 missing value, 266 men, and 425 women. It showed the fact that female participants are always more than male in Taiwan, but we still found male participants are adding comparing with the past researches.

● **Measures**

Survey research was adopted in this study. The survey instrument 'personal meaning and Psychological well-being Scale' was compiled according to the related questionnaires and the findings of literature. After the first draft of the scale was finished, it was sent to six experts for advices. There were some penetrating suggestions for the three parts, basic data, personal meaning questionnaire, and psychological well-being questionnaire. After modified and adjusted on some items, 102 samples from the population were contacted for conducting a pilot study. After that, this instrument was modified, according to the result of factor analysis, the questionnaire of personal meaning and psychological well-being got good respectable alpha value, and the internal consistency reliability was .89 and .90 separately.

● **Findings and Discussion**

Most of the respondents, 457 members, occupied 64.73 , who were under 70 years old, and there were also 28.32% respondents between 70 and 80 years old. Moreover, aged more than 80 occupied 6.9 . It showed that more and more elders would like to participate in community learning activities. As to educational level, there were 30.73% graduated from elementary school, and 38.18 of the respondents were graduated from high school. Furthermore, there were 16.57% graduated from college. It meant that the difference of educational level among the elders were really huge. As to marital status, we found that most of respondents who joined learning activities in their communities were married, up to 73.08%, but there were still plenty of divorced or widowed elders (accounting to 20.82%) joining in learning activities.

Table 2: The demographic data of the respondents

Variables	Item	Number	Percent
Gender	Male	266	38.5%
	female	425	61.5%
Age	Under 59 years old	200	28.32
	60~64	173	24.5
	65~69	84	11.89
	70~74	113	16
	75~79	87	12.32
	More than 80	49	6.94
Educational level	Learn by selves	82	11.61
	Elementary school	217	30.73
	Junior high school	108	15.29
	Senior high school	161	22.89
	Junior college and college	117	16.57
	Master or doctoral degree	10	1.41
Marital status	unmarried	27	3.82
	Married/remarried	516	73.08
	divorced	38	5.39
	Widow	109	15.43
	Living together with someone	9	1.27
Health status	Very good	7	0.99
	Good	36	5.09
	So-so	287	40.65
	Bad	228	32.28
	Very bad	141	19.97
Residence	Living alone	82	11.61
	Living with the spouse	262	37.11
	Two generations living together	185	26.2
	Taking turns living with kids	17	2.4
	Three generations living together	151	21.38

	Community nursing center	4	0.56
	Others	1	0.14
Economic situation	Very enough	21	2.97
	Enough	153	21.67
	Not very enough	479	67.84
	Really not enough	45	6.37
	Others	2	0.28
Religion participation	Yes	471	66.57
	No	96	13.59
	No answer	143	20.25
belief	Buddhism	307	42.06
	Civil faith	226	32.01
	Christianity	24	3.39
	Catholicism	27	3.82
	Others	13	1.84

On the dimension of health status, there were only seven aware of very healthy, and almost half of the respondents felt so-so, and not too bad. Moreover, over half of them felt not very well. As to their residence, most of them lived with their family, up to 87%, including living with their own spouse, Two generations living together, three generations living together, or taking turns living with kids. Compared with western countries, it's a special phenomenon, because of the thought and tradition of filial piety, and most of parents loving to live with their sons and grandchildren. As to religion participation, there were 66.3% of respondents possessing their own religion belief, and most of them believed in Buddhism or civil faith. But just 17.5% of them participated in the religious activities very often. As to economic situation, only 3% of the respondents expressed they had very enough money for living, and 21.5% of them considered they got enough. Anyway, there were still lots of respondents, up to 73.8%, felt they didn't get enough money or economic situation for living.

According to statistical analysis, the average of personal meaning of the participants was 3.6127, and standard deviation was .8485; moreover, we found that the average of self-extension and social benefit were higher, 3.8511(.9494) and 3.8046(.9727). The average of self-satisfaction was lower, 3.2864(.9263). To sum up, the awareness of personal meaning of elder participants was generally higher than the score of psychological well-being. Moreover, for our elders in Taiwan, concerning their next generation, passing down, and maintaining social benefits were their main focus. On the contrary, they paid less emphasis on self-satisfaction.

T-test and one way ANOVA were used to test the difference between demographic characteristics and personal meaning and psychological well-being of the respondents. Gender had no difference with personal meaning and psychological well-being by T-test. Moreover, there were no difference was found between gender, martial status, residence, and the score of personal meaning and psychological well-being. Educational level was found (t=.014*). Those who got higher degrees had higher scores of personal meaning than those who graduated from elementary school by Post Hoc analysis. Health status was found highly correlated with personal meaning (F=9.117***) and psychological well-being (F=14.158***). We found that those who felt very healthy and healthy got higher scores of personal meaning than those with poor health and very poor health. Moreover, it was more obvious that those who had good health got higher scores of psychological well-being than those with poor health. It convinced that health status played a very important part on personal meaning and psychological well-being of elders, so health status had high effect on personal meaning and psychological well-being. As to residence, we found that residence situation was only related with personal meaning of elders (F=3.558**), and those who lived with their spouse, or lived with other two generations, got higher scores than those who lived alone, lived with their kids and lived with kids by turns.

The average of psychological well-being was 3.4004 (.73322). As to the relationship of personal meaning and psychological well-being, we found that well-being scores were moderately correlated with personal meaning. It indicated that those with higher personal meaning got higher psychological well-being the same. Specially, we found that religion participation of elders had no difference with their personal meaning, and psychological well-being. That just responded to the related research in Israel.

- **Conclusion**
  Based on the above findings, concluding remarks are made as follows:
- First of all, most of the participants aged among60 to 80, and female were more than half. Actually, according to this research, there were more male elder participants than before. The

main cause probably formed by more and more elder leaning opportunities (ex. Elder college, community learning activities and active aging leaning trend) and actively arranged by elders themselves promoted by their hobbies and needs.

- Health status had the most obvious effects on personal meaning and psychological well-being of elder respondents among all demographic factors. Most of the respondents felt they still kept good or common health. Those who felt very healthy and healthy got higher scores of personal meaning than those with poor health and very poor health. Moreover, educational level had some variation on personal meaning and psychological well-being of elders. Higher education made elder respondents have higher personal meaning and subjective well-being. But gender, age and marital situation had no effect on personal meaning and psychological well-being of elders. We also found our elders preferred living with their spouse or living with their children and grandchildren. We supposed tradition culture affected people keep the desires to live with children and enjoy the family happiness that will let them feel their continuing life, and still be beneficial to others, and promote their personal meaning at the same time.

- Religion had no effect on personal meaning and psychological well-being for the elder respondents, and this result was just the same with Prager (1998). Although we assumed that religion participation was significant on the later life developmental stage, but Prager's research (1998) proved that elders didn't agree the relationship between religion participation and personal meaning with aging. In fact, the dependence on religion of elders may transfer to learning activities and other aspects because of the changing era, but it still needed to be examined.

- The positive relationship between personal meaning and psychological well-being of elder learners. Namely, the higher personal meaning was, and the higher psychological well-being was. Moreover, self-continuing and social benefit were the main sources of elders' personal meaning. Wholly speaking, self-satisfaction, self-reflection, social benefit and self-continuing were all the sources of personal meaning of elders. So, for elder educators, it's really important to encourage elders to search for their personal meaning and arrange learning activities for helping them build up their life meaning. It will lay more stress on the value of elder leaning.

Intelligence in a Sea of Data: Teaching and Learning in the Google Generation

John Koetsier

UBC

The science classroom is intentionally a place where learning occurs … where students are intended to come to know certain things about the nature of the world we live in. But what exactly does that mean? Merriam-Webster tells us that the word *science* comes, via various detours through linguistic byways, from the Latin present participle of *scire*: to know. While the etymology of a word does not determine contemporary connotation or denotation, it is the case that science is a (and probably *the*) dominant Western means of knowing, understanding, and therefore learning about the world today. But when just about anything anyone wants to know is a simple search away, what, specifically, constitutes education in the age of Google? And, is it enough to know *about*, without knowing *how*, or *why*?

A veteran science teacher that I interviewed broached this topic when I interviewed him recently. During our discussion of educational technology, I asked him if there are any ways that technology hinders learning. His answer is both insightful and revealing, for multiple reasons:

> At times it may end up giving people a real quick fix to a problem and they may not be actually forced to think it through. Since Google, students need an answer quickly, so they don't know how to use a glossary or index. They want something right away, and to look back to a previous paragraph is too much effort.[22]

He's actually saying two things here. First, that students in some cases are seeking quick answers that others have created – received wisdom, so to speak - so they don't have to undergo the intolerable mental stress of building interlocking edifices of conjectures that lead to principles. And second, he's saying that not only have students in some cases lost their desire to undertake the heavy intellectual lifting that is part of the traditional learning process … they've also even lost the ability to personally seek for answers. After all, why read or even scan an old-fashioned dead tree tome when a multicolored electronic butler will do it for you?

That's a serious challenge to an education system. Regardless of whether teachers are using digital or analog tools, if students don't want to figure out the answer and also won't strain themselves to find it personally, teaching anything beyond search and retrieval skills starts to sound like a significantly difficult uphill battle.

This veteran teacher's statement sounds eerily similar to comments reported by technology writer and author Nicholas Carr, who wrote the widely-discussed article Is Google Making Us Stupid[23] in mid-2008. In it, Carr cites pathologist and educator Bruce Friedman, who recently confessed that he has now "almost totally lost the ability to read and absorb a longish article on the web or in print.[24]" Carr himself has the same issue … he feels he is losing the ability to focus, to concentrate … "now my concentration often starts to drift after two or three pages." Is our ability to learn being negatively affected by our media technologies?

It's not just popular authors, either. Deep learning, the kind of learning that uncovers associations, connects theoretical frameworks, and gets behind the what to the why, may be at risk. Educational researchers have noted the tendency of science instruction to be more learning about than learning … more getting the answer than deriving it (Bencze and Bowen, 2009). Bencze and Bowen have shown that this may be partly due to the fact that knowledge *that* is easier to teach than knowledge *how* (2009). And this study focused on the science teachers … never mind the students.

What's happening here? Is it just the older generation complaining that things aren't the way they used to be, and the hard work they did in their day has been lost in the new era of the slacker student? Or, is there a fundamental shift occurring in the kinds of intelligence that our education – note I did not say *school* – privileges?

Marshal McLuhan, of course, taught us that technology, or media, don't just allow communication and conversation … they play favorites. Media are not neutral; they are more suited to certain communications, certain expressions of intelligence, certain types of learning, than others. In the famous phrase, "the medium is the message" (McLuhan, 1959). As David Olsen writes, ongoing

shifts in primary media over the past centuries have fueled "conceptual shifts" which have created "altered conceptions of mind and reality" (1988).

The logical question is: what do different primary media technologies privilege? Looking back and seeing the great shifts over centuries and even millennia from oral to literate to digital media, what are these altered conceptions? Clearly hyperlinked and searchable digital media technologies de-emphasize memory and privilege search and synthesis. Their easy accessibility may also reduce the primacy of formal education and boost the importance of informal learning. Some think so, and argue that this is a positive transformative change. Fischer and Konomi talk about technology and media helping us to "transcend boundaries in thinking, working, learning" by harnessing "distributed intelligence" (2007). In "Learning in the Age of Networked Intelligence," Tuomi postulates that blogs are more important than formal certificates, and immersive social games will become the textbook (2007). Others speculate whether libraries remain relevant in an era when video and audio production is in the ascendancy and people are less and less likely to read (Jeske, 2008). Wouldn't we be better off simply focusing on new technologies, new media, and providing information in ever-more convenient and digestable packaging?

Those who don't favor such progressive rhetoric, of course, can take comfort in the fact that for all of the societal change we've undergone in the last 50 years, and all the technology that has invaded the home and the enterprise in the last 20, few things seem to have disrupted the 18th century factory model of education, at least in most North American and European schools (Albirini, 2007). As Kritt and Winegar put it, it seems that "plus ca change, plus c'est la meme chose" (2007). Even with huge sums being spent on wiring schools, bringing in laptops, adding LCD projectors to classrooms, and installing smartboards … there have not really been significant gains in educational achievement, some argue, or even real change in the way education takes place. John Bailey, the Director of Educational Technology for the U.S. Department of Education, put it this way: "[T]here still is very little scientifically based research to gauge the effectiveness of technology" (Murray, 2002). Is that true, or are the more pollyana-ish – and more recent - predictions correct?

This is a critical question with varying answers. But what is clear – in my opinion - is that teaching and learning in a networked 21st century is a different proposition than teaching and learning in a paper 18th century … just as that was different than teaching and learning in an oral 5th century BC. Whether the nature of intelligence, or what it means to be an educated individual, has changed - that's a different question.

I have a lot of sympathy for these points of view, since I have been using and creating technology for many years. At a young age I was fascinated by technology - in elementary school we had a Mac or two adorning the back wall of each classroom. They came with a simple programming language named, appropriately enough, Basic, and we played with it, learning how to display lines on the screen, print out nasty things about the teacher, and generally have fun while learning. But that was pre-internet, pre-Google, and even pre-CD-ROM encyclopedia. "Networking" meant saving a document on a disk and walking it down the hall to another computer. Answers were available on this computer only if you chose to spend the effort necessary to find them yourself.

In my interview with a veteran science teacher, he referred to the need for students to also have the ability to work it out for themselves. "We're all tempted to take the path of least resistance," he said, but we need to be able to use all kinds of resources, including print, and be able to work from first principles to more complex knowledge. He saw the need for so-called "21st century" skills, including synthesis of many different resources to create something new, or at least a new perspective, but worried that "many don't do this."

In the already-mentioned article "Is Google Making Us Stupid," Carr travels back in time a few thousand years to Plato's Phaedrus. Socrates is lamenting the then-young science of writing, which he felt would be detrimental to the exercise of memory. Even worse, people could read the wisdom of others as codified in a written manuscript, parrot it to others, and then "be thought very knowledgeable when they are for the most part quite ignorant." Quel dommage! Very obviously, as another ancient writer wearily noted, there is nothing new under the sun: we have been complaining about how easy the younger generation has it for millennia.

But the point is worth considering. Whether in Science or English class, what good is it to educate, to teach, and to train, if students will simply search for someone else's answer? Is this the sort of intelligence that is privileged by technology … whether the means of transmission is an animal-skin manuscript or a networked relational database?

A caution here would be to distinguish between what technology *enables* and what it *privileges*. Certainly, digital technology enables re-use of existing knowledge. But is that all? The

Partnership for 21st Century Skills is fairly sure they know what skills technology enables, privileges, and, indeed, *demands* from today's learners.

The Partnership, of course, is an American coalition of businesspeople, politicians, and educators who together have formed a framework laying out the skills they see students needing in the future. Critical skills they identify include synthesis skills: skills to find information, manipulate it, assess it, and create new information based on it. The Partnership is very open about their purpose: building "effective citizens, workers and leaders.[25]" And the reason for their existence is no secret either: current educational models and practice are not meeting the need. As their mission states:

> There is a profound gap between the knowledge and skills most students learn in school and the knowledge and skills they need in typical 21st century communities and workplaces (Partnership, 2009).

While there's some reason to be skeptical of coalitions such as the Partnership, and to carefully consider not only their composition but also motivation, there is no reason to throw out the baby with the bathwater. Many researchers and practitioners agree, some going so far as to say that the old "3Rs" are not as relevant today as the new "3Rs:" rigor, relevance, and real world skills (McCoog, 2008). Alexander travels a similar path and discusses "emerging multiliteracies" in a connected, web2.0 world (2009).

The reality is, in my opinion, that the historically recent flood of data that inundates learners today is both qualitatively and quantitatively different from the media and technologies that we've had in the past. There is a validity to the need for new skills and abilities that will equip students for coping with an overload of information … and building strategies for sorting, evaluating, and using information.

The veteran teacher I interviewed recognized that as well. Technology has a plenty of worthwhile educational value in addition to its dangers. He particularly cited computerized lab simulations, which enable students to run in virtual reality what they could never do in reality – such as change the mass of planets and see how their orbits are affected. Particularly, he appreciated the fact that simulations can be run and re-run with different starting presets. These are fun, quick, and visual, he said, and that not only appeals to a certain type of student, it also makes "real" (in spite of the virtuality) what can be complex, abstract ideas. This, he said, accelerates learning. I agree. Shift is necessary in the way we teach, to some extent in what we teach, and also in how we assess knowledge.

And yet, caution is in order. Nicholas Carr quotes Tufts University developmental psychologist and author Maryanne Wolf, "We are not only what we read. We are how we read" (Car, 2008). Her point, I think, is broader than reading. It's a similar point – perhaps even the same, restated – as McLuhan's medium is the message. Using the digital oracle qua oracle *will* make us stupid – potentially causing us to resemble Orwell's remnants of the leisure class in The Time Traveller, the Eloi, who have relied so much on others to work and think for them that they have lost the ability themselves, and degenerated into a colorful, simplistic, almost non-sapient species.

We need to realize that instant search and retrieval is not intelligence; it is fuel for intelligence. That fuel can be utilized and harnessed with 21st century skills … but not at the cost of some very basic 20th century skills. For example, acquiring higher-level math skills without knowing, instantly and almost subconsciously, the basic math facts, is very difficult (Lee, Stansbery, Kubina, Wannarka, 2005). The challenge is that mental energy and limited short-term memory slots are expended on the basic math facts and are unavailable for the higher-order operations: it's simply too CPU-intensive. There are corollaries, I think, in many disciplines, especially the sciences. Data can't be efficiently used to construct higher order knowledge when none of it is readily, instantly available in the learner's own brain.

So here's the sythesis: we need 21st Century Skills … without losing some of the 20th century smarts. Without the "21st Century" skills, we will not be able to cope with the never-ending datastream. Without the 20th century smarts, we will not be able to do more than parrot, and sometimes rearrange, ideas that others thought before us.

This will help us learn in science, math, and all subject classes … and it will enable whatever it is that we call "intelligence." Even in the age of Google.

Questioning Omnipotence in the Information Society: From the Case Study of Social Education

Naoki DN ABE
Faculty of Education, Tokyo University of Social Welfare, Japan

Abstract

Formerly, an intellectual storage who is "well-informed like an encyclopedia" was one of the models for intellectuals especially in humane-social scientific studies. However, now that accessibility for information has highly promoted. As a result, from the non-specialist's side, storage model of an intellectual is supposed to be nothing. Actually we see people who ends up learning with saying "Oh, we can google it! That is enough". But being theoretically omnipotent is never identified with one's actual situation. This paper perceives this 'omnipotence' in information society as problem and would like to investigate theory of reflexivity and cases of social education.

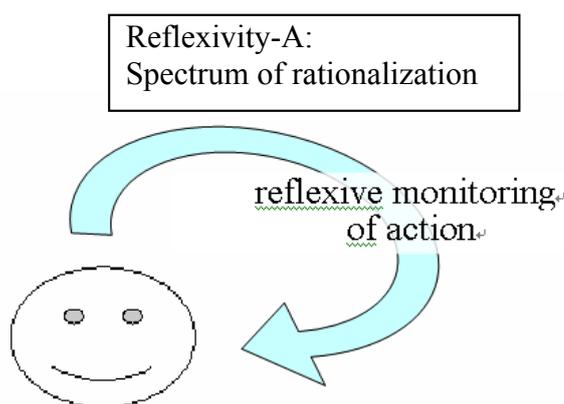
1. Omnipotence in information society

OVER-RATIONALIZATION AND CHANGING INTELLECTUAL MODEL
   Generally speaking, in the process of an education, rationalizing and innovating its course curriculum is an essential factor. We endeavor to realize highly efficient, calculable curriculum. However, on the other hand, as the sociologist George Ritzer insisted on his literature *The McDonaldization of Society* (1993), these kinds of requirement sometime may be puffed up and become too extreme. Nobody hope education process to be extended to over-rationalization like in manuals of fast-food restaurant.
   Similar over-rationalization is seen as a result of social change. Recently, we often confront a term "informatization" or "information Society" in various field. If this definition of "informatization" corresponds to utilizing ICT and to enhance accessibility to information, the ranges of the effects extend to all fields in the society without exception: e.g. private life, management, social welfare, and above all education.
   Formerly, an intellectual storage who is "well-informed like an encyclopedia" was one of the models for intellectuals especially in humane-social scientific studies. However, as mentioned above, now that accessibility for information of all people has highly promoted. As a result, from the non-professional's side, we can obstinately insist that the storage model of an intellectual is supposed to be nothing. Actually we see a student who ends up learning with saying "Oh, we can google it! That is enough".

OMNIPOTENCE IN LEARNING
   Undoubtedly more or less this tendency supported by information accessibility affects our recognition around memorizing. But being theoretically omnipotent is never identified with one's actual situation[i]. If we regard electrical storage as one's external brain, most of endeavor to memorizing become devalued except in primal education period. This paper perceives this 'omnipotence' in information society as problem. This extreme thought [omnipotence] might be harmful in education especially when it is seen as fields of knowledge production.
   Exactly same omnipotence is seen when companies adopt ERP (Enterprise Resource Planning) software on their management, which sometimes results in disappointment. We trust ICT so much that we forget the gap between theoretical (or rational) calculation and actual situation of our action. On the actual spot, various information systems are used by nothing but a human.
   However what is in background to be omnipotent? In half going along with technological determinism, omnipotence is based on rationality. Therefore below this paper investigates (1) sociological theories of reflexivity [in section 2], and (2) cases of social education in a school and other educational activity [in section 3] according to the context of "information society" below.

2.Two versions of reflexivity supporting rationality in information society

REFLEXIVITY-A
   In information society, we have to take reflexivity into account in the context of theoretical (or rational) calculation.

According to Giddens, the concept of reflexivity is classified into two versions　Giddens 1976,1992,1999　. First one is "reflexive monitoring of action" [reflexivity-A]. This reflexivity is so to speak a mechanism inside individual and this is　thought in agent frame level.


The most basic one is associated with action. To be an agent means understanding oneself as an agent, and others have to accept these actions and understandings. Giddens 1999: 203.

Reflexivity in this meaning indicates "individualistic, deliberate and intentional" "reflection" Lash 1993=1998, 364.Giddens calls this operation of reflexivity a "reflexive monitoring of action" according to ethnomethodology　Giddens 1976:156　1990a:36-8 Upward 1997

REFLEXIVITY-B

On the ground of above reflexivity-A, reflexivity in second version [reflexivity-B] come to an issue. This is so to say phenomena in general information environment and called institutional/social reflexivity.

The other meanings of reflexivity is social reflexivity, which is about living in a society where large amounts of information come to us, which we have to make sense of　Giddens 1999: 203

These reflexivity come from the fact that our recognition for society is always united with reflection and are applied to knowledge or meaning Obrien 1999, 25. As Scott Lash observes "Reflexivity is alike a reflex action"　Lash 1993=1998, 364, "This concept of reflexivity which is quoted for describing social life continually enter into and transform knowledge or meaning"[ii] Giddens 1992:28-9　. For instance from the dialogue of Giddens and George Solos, let's look at inherent instability which market has. Giddens says,

"They (borrowers, savers and speculators) are defined by how people understand the information they have and how they slot it back into the system. Everyone is trying to outguess everyone else, knowing that situation to be the case. These reactions constitute what financial markets actually are"　Giddens 1999: 203 .

In a market where players intend to forecast and bypass each other, everyone knows enough "others, like himself, are making expectation by using holding information". If only you can make rational selection among another irrational player, there must be absolute stability [although this is impossible assumption]. However, in actual market, being rational not always result in stability (expected conclusion). On the contrary, the more rational you analyze [or pay cost for expectation], the more anxious you become[iii]. Here emerges nothing but a dilemma "corrupts of rationality by introduction of rationality itself." This is outstanding feature of reflexive modernity [reflexivity-B].

"[our world become open and contingent] because of not in spite of, the knowledge that we have accumulated about ourselves and about the material environment"　Giddens 1994 58

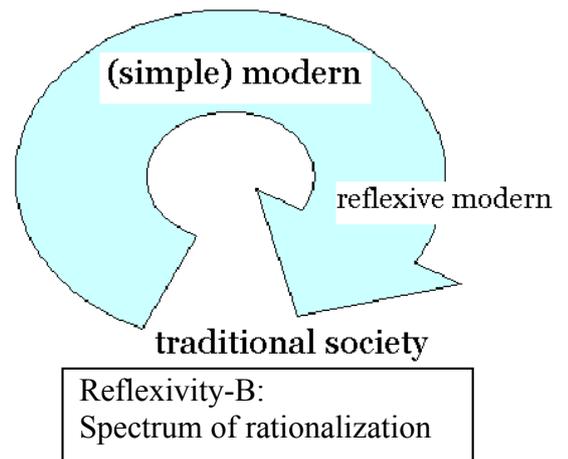
As we saw example of market, there are denial of rationality by rationality itself. Here the premise "the more we get knowledge about social and natural world, the we gain control for the world" no longer hold good[iv] Giddens 1994: 57. The fact is at all contrary. Possibilities of expectation often decrease.

> "As a result, principle of thorough skepticism reflects on that principle itself. Skepticism as a principle for action has possibility making confusion in daily life."   Giddens 1994: 346

Since "Methodological skepticism" which offers a ground for rationality fo professional knowledge reflexively enter against itself, possibility to expectation is gradually demolished. This is what we saw in dilemma of rationality. For example, let's suppose there new medical treatment using human genome was discovered. Even that medical treatment was on the ground of top level world medical science, we will wonder after rational consideration "Hey.. Is this 100% safe for human body?", "What about accident…", "Are there any risk ?" and so on. These kinds of instability occur all because we are being rational [as far as that risk is measurable]. This means rational and reflexive modernity started to reflect itself. "What if modernity start to reflect by itself, with having noticed extreme behavior and devastating conquest [mental, physical and social]?" Lash 1994: 210 Many principles itself which supported modernity will be doubted.

3. Related Cases and Conclusion

According to theory of reflexivity-B, nothing but "Methodological skepticism" offers a ground for rationality or theoretical calculation in this information society. Reflexively even enter against itself and sometimes destroy base of rationality itself. On these grounds of omnipotence in information society or technological determinism, let us take some cases in the fields of social education, and then summarize the paper. On the contrary to having omnipotency, cases we focus are located in remote place and poor information accessibility [TV, Internet, Mobile phone etc.].

Reflexivity-B:
Spectrum of rationalization


CASES OF YOUTH HOSTELS

We would like to focus cases of several Youth Hostels. With using little material available and based on participative observation, N.Abe (2009) gave description for the state of these hostels [and chronicles of old-time youth hostel in Japan]. With isolated environment, in these hostels, a sticky, human service together with the people called "Helper" is famous. They sing, play the guitar, dance, and make special atmosphere. The owner of youth hostel is called "Parent" (many youth hostels abolished this now). And "helper" is the person in charge of care.

Even though original evolution accomplished at each hostel is seen, the prototype of this kind of hospitality goes back to the youth hostel in bell époque [including the public hostels and the private hostels or National Children's Center in Japan]. Many youth hostels once used to wear a kind of partly "public" atmosphere. It could be identified with the nuance "social education" because (a) it had a strict rule and (b) a family modeled service in each facility[v]. As for (b), there was apparently a pseudofamily based on the "Parent = helper" system[vi]. As for (a), from strict punctuality to duty of cleaning works, hosteller is bounded by many rules during stay.

TURNAROUND OF VALUE

From the viewpoint of rational circulation, these hostels do not appear to be attractive. Rather, as a matter of fact, in spite of above negative condition far from omnipotence, they have been keeping their business providing special performance. There paradoxical turnaround of value has occurred.

Human factor is the key here. Due to geographic inconvenience shopping in the convenience store is impossible, not to mention poor accessibility to ICT is available. However in parting from consumptive lifestyle in the city and sea of information, people re-discover creative time for discussion, games or nature observation. These points are attracting travelers[vii].

SUMMARY OF THIS PAPER

In the age of information society featured with reflexive modernity (refrexivity-B), a way not necessarily based on rationality result in reasonable situation. To have omnipotence in the information society [and have 100% faith in technology] was only suitable in the age of simple modernity. We have to recognize the great distance between theoretical potentials of ICT and human as a user of ICT. As shown in cases of youth hostels human factor is essential especially in this age of reflexive modernity.

[i] It is often said that there are gap between just having information ["INFORMATION"] and having knowledge which has its purpose ["KNOWLEDGE"].

[ii] "This concept of reflexivity which is used to outline the social life continually penetrates in and changes knowledge or meanings".

[iii] Same situation is drawn in the theory "Double Hermeneutics" (Giddens 1976)

[iv] According to Giddens, even M. Weber who is famous for his pessimistic attitude went along this image.

[v] If we go back the history of youth hostel, this is understood well. The youth hostel (German name: Jugendherberge) originally was founded as a worldwide system of the movement and accommodations that started by purport of offering a safe, cheap accommodation to the travel of the youth.

[vi] As soon as arriving travelers are welcomed with calling "Welcome home !" because the guests of youth hostel are also contained in the pseudofamily. "Parent" treat the hostellers (=travelers) as if the family had come back even if he come the youth hostel at first time. After all meal on table are arranged by hostellers themselves, dish are taken all together on rigidly fixed time with a greetings "Let's eat" and "Thank you for delicious supper"[exception are hardly permitted]. Every hosteller take burden as dishwasher and a plate wipe.

[vii] Also, "Being bounded by a lot of rules" originally must have negative condition for tourists. However paradoxically, in the cases Abe (2009) focused, this handicap functions reversely to make an intimate and communal interchange. Garbage picking are good examples. In the course of cleaning work, travelers rediscover cleaning as more worthwhile and satisfying work in interpersonal relationship of the community. To have responsible works and to be relied from others could give a chance for self-reform at times, too.

Examining the effects of idiom teaching with Podcast for the elementary students

Shyu, Hsin-Yih

Tamkang University Technology, Taiwan

Liao, Wen-Shioung

Lin-Kou Elementary School, Taipei, Taiwan

Abstract

This study aimed to compare the effects of traditional idiom teaching and idiom teaching with Podcast, explore the effect of idiom teaching with different modes of Podcast, and investigate the levels of children¡¦s acceptability to Podcast. This study adopted the quasi-experimental method with subjects from the sixth-grade classes of an elementary school in northern Taiwan. A total of 103 students were participated, who were divided into three groups, the Control Group (35 students), the Experiment Group A (35 students), and the Experiment Group B (33 students). The Control Group was implemented with the traditional teaching method, and the Experiment Groups A and B both were implemented with Podcast teaching. Experiment Group A learned the lessons through PCs, and Experiment Group B learned the lessons through a combination of PC+MP4 players. A period of 12 weeks of treatment was implemented. The results were found after the experiments: (1) The children

 from both experiment groups performed better than the children from the control group; (2) No significant difference was found between the two experiment groups implemented with two different modes of Podcast teaching; (3) 89.77% of the children reflected the high level of acceptability to Podcast teaching for Chinese idioms; (4) The children had positive attitudes towards Podcast teaching. They felt good about Podcast teaching becasue it is convenient and helpful; it can access videos and let them know more idioms; it improve language ability; it is useful and interesting; it makes deeper impression (easier to remember), and thy can use Podcast to search those they have not learned before; (5) Students liked the way of learning through MP4 players, but they thought MP4 was for music and videos; using it for learning was the last option.

   This study is significant because it provides guidelines and suggestions to teachers and instructional designers for integrating Podcast into idiom and language teaching.

Education for Global Solutions: Fostering Globally Minded Students via Technology
Ms. Michelle Kawamura

Kwansei Gakuin University

Abstract
How do English as Foreign Language (EFL) teachers integrate intercultural awareness in their classrooms? How can intercultural communication be stimulated and developed in a single cultural environment? How can EFL teachers raise their students' interests in global matters and become empathetic with the world?

As the distance between countries gets closer due to technological advancement, socio-economical collaboration, and the rise of intercultural awareness, problems which seem immediate around us also affect other cultures and the global environment. The same technology that in part contributes to these global challenges can also provide opportunities to meet the challenges. Educators today are faced with new professional responsibilities to acquire knowledge from fair and global perspectives and to foster their students with the same mentality. A new professional identity should be realized among language teachers (Sercu, 2006) because foreign language studies have the potential to broaden the theory of language acquisition to a deeper understanding of and interest in other cultures.

Intercultural communication competence requires training and guidance in positive and logical directions. This calls for a new pedagogical recognition among teachers and the passion to research and study in order to design innovative curricula for our students. EFL teachers can build students' language skills by incorporating new kinds of activities in intercultural learning. Computer-assisted activities such as Web searches, face-to-face communication, and information exchanges are all great tools to aid in the process of intercultural understanding. However, teachers must be competent in using technology before undertaking intercultural projects in their classes. Most importantly, teachers must adopt the pedagogical understanding of guiding students through various cultural learning projects (Gersh, 2004).

Inquiry-based instruction with technology-enhanced global learning can be incorporated into EFL courses to raise students' intercultural interests. Topics selected by teachers should have the purpose of helping students make connections to their previous and current knowledge and arousing questions and interests for research. Technology-assisted global learning has enormous potential for EFL teachers to utilize in their curriculum.

Terms the writer uses for some example instructions are "guided research," "individual research," and "collaborative learning." In guided research, students browse the Web for sources related to the topic raised in class. In this case, the teacher is the center of the class, guiding the students by giving words and directions for Web exploration. This strategy is suitable for students who have access to a computer during class time. Individual research can be assigned as homework. Students explore the topic raised in class and search Web sites for further learning on this subject. Teacher-guided class discussion can teach students problem solving and critical thinking skills. Guided research and individual research are important in a single-culture environment, for the Internet is the fastest way to get to know different cultures. Finally, collaborative learning during which students can communicate face to face on the Web will raise their interest in learning more about the foreign cultures behind the people they meet online.

Introduction
The intertwining relationships between countries in the world make intercultural awareness a necessary knowledge. The progress of collaboration, interdependency, and involvement among nations in the world will continue. Four trends of growth and change in the world stated by Stward are (1) economy, (2) science and technology, (3) health, nature, and security issues and (4) change in world demographics (Steward, 2006). A local, regional, or national issue of a country could ultimately have an effect on a larger scale, such as the global change of climate. Global learning and intercultural awareness should be part of our education to prepare our future generations for a more developed and complex global reality. The Internet can be the window to the learning of cultures and global issues.

There are two reasons for cross-cultural and global learning via EFL courses with technology integration. First, English is the number one language presented online (37.2%), followed by Chinese (23.5%) and Spanish (32%) (Internet World Statistics, 2009). English is also the most studied foreign language in Europe (Sharma, 2008) and East Asia. (Adams &Hirsch,2007). The feasibility to use the Internet for acquiring new knowledge and cultural exchange in English among both English and non-English speaking countries remains greater than using

other foreign languages. This paper will discuss the teachers' role and students' motivation and will review the intercultural and global learning activities carried out in four EFL classes in a Japanese University.

English as a Foreign Language: Teachers' Role, Students' Motivation

Rapid globalization has given teachers of English as a Foreign Language (EFL) new responsibilities for their own learning of intercultural competence and fostering their students with the same mentality. The changing world and the growing relationship between countries have brought global issues to our doorstep and classrooms (VanReken & Rushmore, 2009). The speed of such socio-economic progress requires these teachers to expand their sources of teaching from textbooks to a more pragmatic method, such as the assistance of technology (Kraemer, 2006). The Internet is one source which brought the world closer by linking people of different languages and cultures through communication exchange and by reading the vast information available on international matters. With the expanding English learning all over the world, it is likely that the portion of English websites written by non-native English-speaking countries will increase and that it will become the main communicative language globally. English as a foreign language curriculum, once viewed as learning language skills, is now being realized as a connection to foreign cultures, which leads to intercultural awareness. This connection can be effectively linked by the wide and constantly updated sources of the World Wide Web and actual communication with people of different cultures. Intercultural awareness is the first step towards developing intercultural competence and the skill we need in this emerging globalizing world. EFL teachers are in transition from a language coach to a mentor who opens the door to intercultural awareness.

Japanese university students continue to study English after six years of compulsory English classes beginning in their junior high school or seventh grade. English is divided into basically four disciplines: grammar, reading, writing, and exam preparation. These detailed categories are designed to ensure the accuracy and proficiency of English; however, students do not have a clear idea of what English can be used for beyond fulfilling the compulsory requirement and passing the university entrance exam. According to the writer's survey of her university students' opinion of English usage, among 126 students, over 90 percent of the students wrote that English was primarily used for "travel" and "at the work place" (see Appendix A). There was no answer linking to socio-economic, cultural, or global issues. This lack of awareness leads to their lack of motivation in studying English. Motivation has been a topic of and continuous effort for educators in the English language field in Japan. It is natural for students to lose their interest in English after six years of compulsory studies and to continue to study it in university without knowing the possibility of its expansion. A purpose which can arouse student interest to use English in the future is needed to keep this knowledge alive. Using English as a tool to learn about the world can motivate learning and set a purpose for lifelong learning. With the current technology and its accessibility, the goal of learning intercultural matters can be realized via technology integrated in university English classes.

Defining globalization

At the beginning of fall semester, 2008, the author conducted a questionnaire among 126 Japanese university students on their definition and perception of the word "globalization." This questionnaire has two parts: a qualitative section in which students could write their answers freely and a multiple choice section that includes true/false questions as well (see Appendices A and B). In the qualitative portion, the author asked students to write any words that come to their mind when they heard the word "globalization." The top three most-written answers were "economy" (30%), "culture" (28%), and "foreign language" (46%). There were other answers as well, such as "sports," "music," "Internet," etc. (Appendix A). The other set of research questions, which included two multiple choice questions and five true/false questions, was then presented to the students (Appendix B). The answers selected from the multiple choice questions indicated that most students do not understand that globalization is more than just the interaction among people all over the world. The number of students who selected "international company relations," "government," "politics," "culture," and "environment" was relatively small (Appendix B). When asked if "surfing the Internet" can act as a way to learn about global matters and if foreign language learning is a process toward globalization, most students answered true (Appendix B). The writer found the true/false responses optimistic as an initial step toward possibly bringing intercultural learning into her classroom.

Discussion

Two discussion exercises followed the questionnaire. A class discussion was conducted after the small group discussion on the topic of globalization and how to learn more about the subject. Comments on the lack of exposure to intercultural input were expressed by most students in class. The result of the discussion indicated that students are aware of the importance of being interculturally competent and that technology can lead to vast cultural learning about the world. However, this exercise shows that teacher facilitation of linking students to an understanding of global issues is essential.

Practice of intercultural research and activities
Internet research activities on foreign cultures were assigned to foster Japanese university student independency and active leaning. The purpose was for students to search the information, analyze it, and become aware of the differences and similarities of other cultures. All tasks were carried out in English. In order to avoid stereotyping and giving preconceptions, the activities are student centered without lecture on the subjects prior to research. However, the teacher used guided research by listing useful related vocabulary and phrases pertaining to the research topic. One example of the activities was for the students to learn about the employment and social system of foreign countries. Instead of the traditional style of using a text and lecture, students were assigned independent research to search employment information of an overseas company through the Internet. Students were told that it was a hypothetical scenario to search for their future employment overseas and that there was no limit to the countries as long as the employment information was provided in English. Class discussions on their findings were the key to learning about different cultures. Students' research results led to the topics of labor rights, pension systems, company benefits, holidays, and many more. The class discussions aroused the comparison of the Japanese and foreign culture in the areas of working conditions, standard of living, and lifestyle. New knowledge made a more profound impression when the information was actively searched and discussed by the students. The teacher served as a guide, leading students to become the leader of their own learning.

The EFL teacher's challenges
EFL teachers have new challenges as the world changes rapidly. Added to the responsibilities of language skill delivery, another responsibility is to incorporate cultural learning in instruction in order to bring awareness of cultures other than the English-speaking countries into classrooms. It has become evident to this author that the larger the portion of intercultural learning and activities done in class, the more the changes in student attitudes and their preconception of the world; as a result of learning about new cultures, students become friendlier and more tolerant of differences. By learning the differences and similarities among cultures, students can re-examine their own cultures, draw new conclusions of their perspective, and empathise with other countries, not only the English-speaking ones (Larzen, 2005). This new challenge also requires self-evaluations of a teacher's personal and professional concepts and teaching practice (Lies, 2005). In order for teachers to promote intercultural competence, they need to be surveyed as to their degree of intercultural understanding and the methods of promoting it (Sercu, 2006). Teachers cross-culturally should take more active roles in conducting collaborative learning to raise intercultural awareness and English skills among their students.

Active researcher
Learning is an ongoing process for both teachers and the students. As world affairs continue to change and technology advances daily, the tasks for teachers to research new pedagogical methods, updated course materials, and technological exploration are inevitable. There is a need for more pragmatic methods of teaching foreign languages and their cultures (Kraemer, 2006). The vast and constantly updated information on the World Wide Web can assist EFL teachers in bringing intercultural awareness to their students. At the same time, teachers should conduct research on their students to examine the effectiveness of the curriculum for improvement or alternation. Such research can be conducted through questionnaires, discussion activities, observation, reflection, and analysis of the class. Educational research should be a continuous effort in order to strive for positive influences on our next generation.

Summary
The purpose and philosophy behind foreign language learning should be reconsidered in light of its socio-cultural responsibilities. Globalization is growing so rapidly that educators are challenged to design curricula that raise intercultural awareness and competence. Foreign language studies are evolving from merely acquiring language skills toward a depth that leads to tolerance, acceptance, and recognition of the world around us. The speed of intercultural development requires innovative teaching pedagogy in the foreign language curriculum. Information on the World Wide Web and via other technology can be incorporated into the curriculum to raise intercultural awareness and competence. Continuous effort in active research of the effectiveness of this philosophy on teaching and learning can lead to positive results both in student language skills and their perception of the world.

Appendix A
Globalization: Qualitative Questionnaire

1. When you see or hear the word "globalization," what 5 words or things come to mind?

Results

Economy	Culture	Foreign Language	Other
30%	28%	46%	0%

Note: These percentages overlap. The actual percentage of students who wrote all three words is only 17%.

2. When you see or hear the word "global," what 10 countries come to mind?

Results

Rank from the most answered countries:

1	U.S.		9	Germany
2	Great Britain		10	Italy
3	Australia		Others	Mexico, Brazil, Singapore
4	Canada			
5	Japan			
6	China			
7	Korea			
8	Russia			

3. What 3 issues concern us globally?

Results

Economy	Global warming	War	No Answer
30%	12%	7%	0%

Note: These percentages overlap.

4. What does it mean to be a global citizen?

Results

Over 90 percent of the students expressed that they did not know how to answer this question for two reasons: They have never considered or been taught the concept of being a global citizen, and thus they don't understand the question.

5. How do you think English plays a part in globalization?

Results

Forty-two percent of the students answered "communication." Other answers included "trade," "economy," and "travel."

Appendix B

Globalization Survey

1. Globalization is the interaction among
       a.   people all over the world
       b.   companies all over the world (international company relations)
       c.   governments all over the world
       d.   only the leading economic countries
       e.   not sure

Results

Percentage of answers selected among 126 students

a. 67%	c. 2%
b. 2%	d. 2%
e. 27%	

2. Globalization has an effect on
       a.   the environment
       b.   cultures
       c.   political systems
       d.   economic development
       e.   not sure

Results

Percentage of answers selected among 126 students

a. 11%	c. 12%
b. 8%	d. 4%
e. 65%	

3. Being eco-friendly is not part of globalization. T F

Results

Percentage of answers selected among 126 students

T (67%)	F (33%)

4. Internet surfing can be a way to learn about global matters. T F

Results

Percentage of answers selected among 126 students

T (89%)	F (11%)

5. Travelling, telephone communication, and the Internet is part of what makes up globalization. T F

Results

Percentage of answers selected among 126 students

T (92%)	F (8%)

6. Learning a foreign language is a process toward globalization. T F

Results

Percentage of answers selected among 126 students

T (68%)	F (32%)

7. Learning many foreign cultures is a good way to know the world. T F

Results
Percentage of answers selected among 126 students

T (88%)	F (12%)

Ethics Education in Business Schools: An Australian Perspective

Dr Roger March

Director Accreditation
Australian School of Business
University of New South Wales, Australia

Abstract

The Global Financial Crisis and corporate collapses due to unethical and corrupt behaviour has prompted calls for business ethics to be taught to tomorrow's business leaders. This paper provides a detailed overview of the ethics education debate in terms of the empirical, conceptual and pedagogical research. The main arguments and impediments against ethics education are also identified. A survey of ethics courses in Australian business schools provides context to the discussion.

Introduction

The Global Financial Crisis has triggered renewed debate and interest in the necessity and effectiveness of teaching ethics and corporate responsibility in business schools. In particular, the collapse of major financial institutions such as Lehman Brothers and Bear Stearns and the large government bailouts to corporate institutions such as Chrysler and General Motors raised questions about the degree that executive culpability and unethical and corrupt behaviour contributed to corporate mismanagement. The epicentre of the GFC has been the US and unsurprisingly the debate over the role business schools has been most intense in that country.

The debate over the responsibility of business schools is not new. Corporate excesses of the late 1990s and early 2000s prompted debate and reflection. A 1999 survey of Harvard Business School (HBS) alumni revealed that they thought that "morals, ethics, and values" were by far the most important subject that business schools should teach (HBS, 2009).

Some advancements were noted in the following years, particularly in the wake of the Enron and Worldcom scandals of 2002. The corporate collapses of 2002 prompted HBS to introduce a compulsory course, 'Leadership and Corporate Accountability' in the 2005-06 academic year. Some leading American business schools responded by developing their ethical oaths for students. In 2006, the Board of Trustees of the Thunderbird Global School of Management voted to formally assimilate an oath into the application process, the curriculum and at graduation, when students will be asked to sign it voluntarily. Hundreds of students have voluntarily signed a version of the oath in the past few years. The oath guarantees that Thunderbird candidates are aware that enrolling at the School means agreeing to share the community's core values (see oaths in Figure 1). In the same year, Columbia Business School introduced an honour code, devised jointly by the School students, the faculty and the administration. In 2009, MBA students at HBS developed and introduced their own oath to "create value responsibly and ethically" for graduation ceremonies. (See Table 1 below.) The students produced the oath partly in response to the challenge laid down by Harvard professors Rakesh Khurana and Nitin Nohria in a Harvard Business Review article in October 2008 – *It's Time to Make Management a True Profession* – that championed the crafting of a pledge that articulates the ideals and social purposes of management, akin to the Hippocratic oath taken by doctors. The original aim was to gather at least 100 signatories from among the 900-strong graduating class of 2009 yet the idea has struck such a chord with MBA students around the world that people from 115 countries representing 49 languages have also signed up (Businessweek June 11, 2009). According to the website www.mbaoath.com, 50 per cent of the class signed as of September 2009.

Business schools appear to have made some progress in teaching of ethics and corporate social responsibility (CSR) over the past decade. A 2007 study of ethics, sustainability, and CSR programs from the U.K's *Financial Times* top 50 business schools found an increase in the number of stand-alone ethics courses offered to 25 per cent of respondents, up from 5 per cent in a 1988 study. Over one-third of the business schools now mandate inclusion of all three subjects in their curriculum, while 84 per cent require mandatory courses in at least one of the topics (Christensen et al, 2007).

_____

Figure 1: Business School Oaths

Columbia Business School (2006)
"As a lifelong member of the Columbia Business School community, I adhere to the principles of truth, integrity, and respect. I will not lie, cheat, steal, or tolerate those who do."

Thunderbird Global School of Management (2006)

"As a Thunderbird and a global citizen, I promise: I will strive to act with honesty and integrity; I will respect the rights and dignity of all people; I will strive to create sustainable prosperity worldwide; I will oppose all forms of corruption and exploitation; and I will take responsibility for my actions. As I hold true to these principles, it is my hope that I may enjoy an honorable reputation and peace of conscience. This pledge I make freely and upon my honor."

Harvard Business School (2009)

'I promise:

- I will act with utmost integrity and pursue my work in an ethical manner.
- I will safeguard the interests of my shareholders, co-workers, customers and the society in which we operate.
- I will manage my enterprise in good faith, guarding against decisions and behavior that advance my own narrow ambitions but harm the enterprise and the societies it serves.
- I will understand and uphold, both in letter and in spirit, the laws and contracts governing my own conduct and that of my enterprise.
- I will take responsibility for my actions, and will represent the performance and risks of my enterprise accurately and honestly.
- I will develop both myself and other managers under my supervision so that the profession continues to grow and contribute to the well-being of society.
- I will strive to create sustainable economic, social, and environmental prosperity worldwide.
- I will be accountable to my peers and they will be accountable to me for living by this oath.'

_____

Despite these efforts and apparent increases in the teaching of business ethics, the criticism of business schools lack of ethics teaching remains strong. Penn State management Professor Denis Gioia observed in 2002 that "the teaching of ethics, corporate social responsibility, and other business-and-society courses has been marginalized – assumed to be some sort of trifling requirement that students should get out of the way quickly, so they can get on with the other 'more important' things" (Gioia, 2002, p.143). More recently, Harvard MBA graduate Philip Delves Broughton authored a searing indictment of MBAs in general and Harvard Business School in particular in an opinion piece in the London Times of March 1, 2009. According to Broughton, when the School celebrated its 100th birthday in October 2008, Dean Jay Light, in commentating on the impact of the GFC on the American financial system, said that '[w]e will leave the talk of fixing the blame to others. That is not very interesting. But we must be involved in fact in fixing the problem" (quoted by Broughton, March 1, 2009). Broughton suggested that "the very people who blew apart the world's financial plumbing (are) now demanding to fix the leak" (op.cit.). He pointed out that Larry Page and Sergey Brin (Google), Bill Gates (Microsoft), Michael Dell (Dell Computers), Richard Branson (Virgin brands) have no MBAs between them. Australia's most famous entrepreneur and one of its richest businessmen, Frank Lowy, who had little formal schooling co-founded the Westfield Group, now the world's largest listed retail property group with interests in 119 shopping centres in the US.

In June 2009 Joel Podolny, former dean of Yale School of Management and professor at Harvard Business School, and now vice president and dean of Apple Inc.'s Apple University, wrote that he was "angry about the inattention to ethics and values-based leadership in business schools" (Podolny, 2009). Podolny was angry at a number of things: that "the degree of contrition…at business schools…seems small compared with the magnitude of the offense"; about "disciplinary silos in which business schools teach management"; that "many academics aren't curious about what really goes on in companies". Podolny admits that people "just don't simply trust in business schools; they actively distrust them (Podolny, 2009, p.66).

Background to ethics education in business schools

Business ethics as an academic discipline is relatively young. De George (1987) contends that business ethics had become an academic field by 1985. By then, there were several journals on the topic, a number of bibliographies, and, most significantly, over 500 courses involving 40,000 students receiving academic credit for studying the field (George 1987, p.203). The Association to Advance Collegiate Schools of Business (AACSB) is the major and oldest accrediting body for business schools in the world, dating back to 1919. Its policies and dictates have a large impact on the way schools undertake curriculum planning and craft their pedagogical approaches. Over the years, AACSB's approach to the teaching of business ethics has shifted. The year 1974 was the first time it enunciated the requirement for ethics to be taught in the form of specific courses or learning activities in the core curriculum. These requirements were eased in 1991 when AACSB shifted to a mission-based accreditation approach. However, in the wake of the corporate scandals of the early 2000s, it

proposed new standards, urging business schools to give the teaching of ethics a higher priority (cited by Sims & Felton, 2006, p.297). This proved a false dawn for advocates of ethics education, with the new requirements focusing on embedding ethics education across the curriculum rather than on the development of individual moral reasoning skills in stand-alone courses. Swanson (2004) labelled the AACSB response as "dangerous myopia" and concluded that "AACSB's accountability for ethics education was weak to non-existent" (Swanson 2004, p.43). Two leading scholars of ethics education warned that the shift to 'embedding' ethical discussions across the curriculum without any foundation coursework may turn out to be "little more than Pavlov-like conditioning of students to fear legal penalties" (Sims and Felton 2006 p.298). One of the consequences was that the US-based Society for Business Ethics encouraged its members to write to AACSB in support of more stringent requirements.

One of the interesting developments of ethics education in higher education institutions has been the establishment of think tanks and research centres devoted to the field. Table 1 lists some of the main US centres. Centres such as these have been strong advocates of greater commitment to ethics education by universities in general and business schools in particular.

Table 1: Selected US Business School-Affiliated Ethics Think Tanks & Research Centres

Centre	Year Est	Institution	Mission
Center for Business Ethics www.bentley.edu/cbe	1976	Bentley University	To foster the creation of organizational cultures that align effective business performance with ethical business conduct.
Center for Corporate Citizenship www.bcccc.net	1985	Boston College	To establish corporate citizenship as a business essential.
Center for Ethical Business Cultures www.cebcglobal.org	1988	University of Minnesota	To foster the fairness and integrity of business relationships in the emerging global marketplace.
The Carol and Lawrence Zicklin Center for Business Ethics Research www.zicklincenter.org	1997	Wharton School	To sponsor and disseminate leading edge research on critical topics in business ethics.
Business Roundtable Institute for Corporate Affairs www.darden.virginia.edu/corporate-ethics	2004	University of Virginia	To renew and enhance the link between ethical behavior and business practice.
Institute for Corporate Responsibility www.business.gwu.edu/icr	2006	The George Washington University	To be the world's leading intellectual center for scholarship in the field of corporate responsibility and to be recognized as such.

The Debate over Teaching of Business Ethics

Proponents of the teaching of business ethics face a number of obstacles. These will be discussed here, with reference made to relevant empirical research and discussion papers.

Firstly, departments within business schools still teach in their disciplinary silos, according to the functions of management. Ethics is often ignored because it does not fit neatly into conventional academic disciplines. The incidence of cross-disciplinary approaches within the one department is rare. This so-called balkanization of business schools shows no indication changing (Podolny 2009). While there is a trend, particularly in North America, for cross-disciplinary teaching teams that attempt to reflect the organizational complexity of the modern firm, the success and the level of commitment has been mixed. Few business schools have an ethicist on the faculty (Oddo 1997; Bampton and Maclaglan 2004).

Secondly, academics tend to shy away from normative aspects of business and ethics appears qualitative, subjective and lacking a sound empirical base. While the argument is undeniable, strategies for 'training the trainers' have been proposed and tested. Baetz and Sharp (2004) argue resistance to teaching business ethics and CSR would be lessened if more teaching support were provided for training non-ethicists in teaching ethics. Brinkman and Sims (2001) urge the development of faculty-wide support systems for teaching business ethics rather than devolving responsibility to a small number of faculty.

A related criticism that ethics is difficult to teach and assess does not withstand scrutiny. One major contributor in this area has been KPMG with its T*he Ethical Compass – A Toolkit for Integrity in Business*, a multi-part toolkit of classroom learning materials developed in cooperation with KPMG's Ethics and Compliance Group and Dr Barbara Porco of Fordham University. The bulk of the teaching materials, scenarios and case-studies can be applied to accounting and non-accounting business students alike.

Thirdly, many academics believe that ethical behaviour cannot and should not be taught to university students; to be effective, the teaching of values and moral judgement can only be the preserve of the home or primary school. By the time young people reach university their values and moral compasses are generally determined (Hindo 2002). Moreover, Donaldson argues that that education about ethics can produce "unanticipated negative consequences that render ethics education ineffectual or counter-productive" (Donaldson, 2008, p. 301). Determining the ideal stage of an individual's cognitive development to teach ethics and moral reasoning is complex and beyond the scope of this paper.

What is clear is that the call for more ethics teaching is increasing. A Businessweek survey of its readers in 2003 found that 64 per cent thought that ethics should be a required, stand-alone course for MBA students, while 27 per cent think it should not be taught separately, but rather should be woven into existing coursework for disciplines such as accounting, finance, and marketing. Just 2.25 per cent of those who replied said MBAs should not receive ethics training. The key goal of any such course must be increasing the likelihood that these students will make ethical choices in the future (Williams and Dewett 2005; Bampton and Maclaglan 2005).

Fourthly, a major challenge facing educators of business ethics is convincing students, especially undergraduates, that ethical behaviour is important. There are two dimensions at work here. The first is the nature of the challenge. It may be possible that the 'typical' business school student is more predisposed toward unethical behaviour compared to his or her non-business counterparts. Lane, Schaupp & Parsons (1988) identified a 'winning is everything' mentality among undergraduate and postgraduate business students and concluded that the 'ethical' behaviour they displayed at university was determined largely by the desire to 'pander to professors'. McCabe, Dukerich & Dutton (1991) surveyed the values and ethical decision making of students entering an MBA program and those entering a law degree and found that the former made significantly more unethical choices than their law counterparts. The second dimension is how students can be encouraged to take ethics education seriously. In this regard, Lampe (1997) offers a number of pedagogical approaches that may increase the benefits of ethical understanding by business undergraduates.

Fifthly, even when ethics is taught, a number of content and pedagogical issues emerge. How should it be taught, either in scenarios, real case-studies, current newspaper stories or models of reasoning and ethical decision making? Should ethics be integrated into the curriculum or taught as stand-alone courses? And if the latter, should the course be mandatory or an elective? What is the goal of teaching ethics – to influence behaviour or to change thinking? What examples of unethical behaviour should be discussed – public policy and large corporations, which are the typical examples discussed by students or small and medium-size businesses that constitute the great majority of businesses and the working population? In terms of the debate around integrating ethics education into the curriculum versus stand-alone courses, a number of scholars have advocated the integration of ethics education (Dunfee and Robertson 1988; Gandz and Hayes 1988; Bishop 1992, Trevino and McCabe 1994; Kerr and Smith 1995; Molyneaux 2004; and Hawawini 2005).

Sixthly, serious doubts have been raised about the efficaciousness of the teaching of business ethics on a subsequent behaviour. For advocates of ethics education, this may be the most difficult argument to rebuff. A number of empirical studies over the last almost thirty years have shown no significant difference in ethical decision making between two groups of students, one of whom was exposed to ethics teaching and the other that was not (Martin 1981; Stead and Miller 1988; Pappas and Diskin 2001; Ritter 2006). Indeed, Lowry (2003) found that third year students, who had been exposed to ethics teaching had lower levels of moral awareness than second year students who were yet to receive ethics education.

A few years ago, HBS professor Scott Snook chose fifty students to participate in a detailed survey of their development until graduation in 2006. He reported that about a third of students tended to define right and wrong in terms of what everyone else was doing. "They can't really step back and take a critical view," he said. "They're totally defined by others and by the outcomes of what they're doing" (Broughton, 2009). A similarly unflattering insight was provided in a 2006 study of 5,331 students at 32 graduate schools in the United States and Canada that found that 56 percent of graduate business students -- most of whom are pursuing MBAs –had cheated, compared with 47 percent of graduate students in non-business programs.

A survey of empirical research into the teaching of ethics reveals four categories, as detailed in Table 2: Investigation into business student attitudes toward ethical issues; experiments on impact of ethics education; ethics education pedagogies and approaches; and views and surveys on ethics education. Other academic publications related to business ethics education fall under five categories and are detailed in Table 3: Integrating ethics across the curriculum; techniques for teaching ethics; pedagogy of ethics education; strategies for ethics education; and the importance of ethics education.

Table 2: Categories of Empirical research on Teaching of Business Ethics

Author(s)	Date	Research focus	Results
Experiments on impact of ethics education			
Martin	1981	Business seniors (treatment group) and engineering seniors (control group) were surveyed to test differences in ethical decision making	No significant differences in ethical decision making between the two student cohorts
Stead & Miller	1988	Surveyed students on impact of ethics courses on what social issues they viewed as important	No impact found.
Pappas & Diskin	2001	Comparison of students in different degrees who had taken and not taken ethics courses	No significant differences in ethical decision making between those who had studying ethics and those who had not.
Izzo et al	2006	Testing the effectiveness of interactive ethics teaching approach	Significant differences between treatment and control group in defining key ethical issues and moral judgement
Ritter	2006	Studied impact of ethics training on moral awareness and reasoning using treatment and control groups of business students	No significant differences in ethical decision making between the two student cohorts except for gender where women were more likely to make sound moral judgements after training.
Investigation into business student attitudes toward ethical issues			
Lane, Schaupp & Parsons	1988	Examines the impact of ethics education on undergraduate and postgraduate business students	Students believe in 'winning is everything' mentality and their behaviour at university is determined largely by desire to pander to professors.
McCabe, Dukerich & Dutton	1991	Surveyed values and ethical decision making of students entering an MBA program and a law degree	Entering MBA students made significantly more unethical choices than entering law students.
Stewart, Felicetti & Kuehn	1996	Business majors were tested about their attitudes toward teaching of business ethics	Respondents regarded ethics teaching as important and that they preferred integration into different courses rather than a stand-alone course.
Conaway & Fernandez	2000	Compared business leaders' and business faculty/students' responses to set of ethical scenarios	Significant differences on several scenarios, such as wrongdoing in the workplace and covering up flaws in merchandise or operations.
Lowry	2003	Survey of student levels of moral awareness	Found that final year students had lower levels of moral awareness than second year students.
Ethics education pedagogies and approaches			
Burton, Johnston & Wilson	1991	Tested impact on three different groups to varying ethics teaching methods	Teaching method has differential effect on students' perceptions and attitudes to ethical questions
Cowton & Dunfee	1995	Survey to gauge extent of internationalised business ethics courses in UK & US	Found less than 10 per cent of courses focused on global issues; also identified need for non-US cases.
Hosmer	1999	Survey of teachers' view of their promotion prospects as ethics teachers and researchers	Ethics specialisation counts for little in promotion 'stakes' and that little support is given by management
Macfarlane & Ottewill	2004	Examination of 'ethics' mentions in courses & programs in UK business schools	Small number made explicit mention of 'ethics' and concludes business ethics enjoys marginal position in most business degrees
Views and surveys on ethics education			
Cordeiro	2003	Interviews corporate executives on opinions of ethical standards in business and teaching of ethics	Strong belief that ethics are slipping and that the public believes ethics is slipping

Cowton & Cummins	2003	Survey of ethics teaching at undergrad and postgraduate courses in the UK	Signs that more ethics education is now offered, whether stand-alone courses or embedded in curriculum
Christensen et al	2007	Examined coverage of ethics, CSR and sustainability in leading US business schools.	One third of top 50 FT-ranked schools mandate inclusion of all three topics in curriculum; 84 per cent required mandatory courses in at least one topic.

Table 3: Academic publications on the Teaching of Business Ethics

Author(s)	Date	Main Issue(s)
Integrating ethics across the curriculum		
Dunfee & Robertson	1988	Explains model for integrating ethics into Wharton curriculum
Gandz & Hayes	1988	Business ethics should be integrated part of core curricula
Bishop	1992	Method for integrating business ethics into an undergraduate curriculum
Trevino & McCabe	1994	Advocates an approach of teaching ethics by embedding across courses
Kerr & Smith	1995	Techniques for embedding ethics in accounting courses
Molyneaux	2004	Argues for integrating ethics throughout the accounting curriculum
Hawawini	2005	Argues ethics/corporate social responsibility need to be embedded in core curriculum
Techniques for teaching ethics		
Reeves	1990	Applies Bloom's taxonomy to the teaching of business ethics
Lampe	1997	Strategies and considerations in teaching business ethics to undergraduate students
Schaupp & Lane	1992	Teaching method of ethics courses using real-life occurrences
Desjardins/Diedrich	2003	Explains method for teaching ethical dimensions of product marketing
Maclagan	2003	Discusses the effectiveness of case studies in teaching business ethics
Pedagogy of ethics education		
Oddo	1997	Discusses who should teach and how ethics should be taught
Herndon	1996	Argues for applications of models of ethical decision making
Painter-Morland et al	2003	Discusses benefits of a synchronous online ethics course across three continents
McDonald	2004	Considers the question of who teaches ethics and how it is taught to undergraduate students
Shoenfeldt et al	1991	Reporting AACSB survey of business school deans about teaching of ethics
Cragg	1997	Discusses the role of ethics in business and in business education
Rossouw	2002	Discusses 3 competency goals of ethics education: cognitive, behavioural & managerial.
Felton &Sims	2005	Discusses the goals of teaching business ethics and when it should be taught
Sims & Felton	2006	Posits the four principles of teaching business ethics regardless of level
Strategies for ethics education		
Brinkmann & Sims	2001	Need to build faculty-wide support for teaching business ethics
Sims	2002	Presents a framework for effective teaching of business ethics
Crane	2004	Empirical study indicates need for business ethics teaching
Crane & Matten	2004	Recommends broadening the scope of current ethics teaching
Baetz & Sharp	2004	Lack of teaching support for teaching ethics by non-ethics specialists
The importance of ethics education		
Swanson	2004	Discusses why business schools have been neglectful of ethics teaching
Bampton & Maclagan	2005	Arguments against sceptics about teaching ethics to accounting students
Williams & Dewett	2005	Dispels argument against teaching ethics; discuss 3 major goals of business ethics teaching
Giacalone & Thompson	2006	The 'worldview' of management needs changing before effective teaching of business ethics and corporate social responsibility is possible

Ethics Education in Australian Business Schools

The GFC had, arguably, the least impact on Australia (at the time of writing) of any OECD country in terms of corporate collapses in the financial sector and the exposure of corrupt business practices. As such, the calls for greater of teaching ethics to business students have been virtually non-existent. Instead, this study identifies the number of courses taught in leading Australian business schools at the undergraduate and postgraduate levels.

The presence of ethical considerations in the graduate attributes articulated by Australian universities is also investigated to assess the level of institutional commitment to the importance of ethics teaching.

The methodology involved identifying the courses dedicated to ethics that are offered by two groups: the five Australian business schools accredited by AACSB and the business schools of the G08 Universities not accredited by AACSB. (G08 is the elite group of so-called research-intensive universities in Australia.) It was noted whether the subjects were compulsory or offered as electives. A 'core' course could refer to a mandatory course in the core curriculum or in an undergraduate major or postgraduate specialisation. Courses that included ethics in the title but incorporated other content were not counted. The summary of results is shown in Table 4.

A number of observations can be made. First, the non-accredited schools offer, on average, more ethics courses than accredited schools. In fact this disparity is very large, because one of the accredited schools, the University of Technology Sydney (UTS), offers eight of the fourteen courses listed. Secondly, there are more core ethics courses at the undergraduate level. At face value, this suggests a belief in the efficacy and necessity of ethics education for young business students. It also reflects the early approaches to ethics teaching where such learning began at the first degree rather than in post-experience degrees such as the MBA (de George 1987). (For a survey of the presence of ethics, CSR and sustainability courses in MBA programs offered by leading US business schools, see the 2007 paper by Christensen at al.)

_____

Table 4: Ethics-specific Courses in Leading Australian Business Schools

	Undergraduate level		Postgraduate level		Total
	Core	Elective	Core	Elective	
AACSB-accredited business schools (n = 5)	4	4	0	6	14
Non-accredited G08 business schools (n = 6)	4	7	3	9	23
TOTAL	8	11	3	15	

_____

As a crude indicator of the level of commitment to ethics education, the number of mentions of ethics-related principles mentioned in graduate attributes articulated by Australia's universities was determined. (Graduate attributes is the term typically used in Australia to refer to desired learning outcomes/goals for graduates.) Of the thirty-nine universities in Australia, nine universities mentioned ethics in the profile of desired graduates. Of the thirteen universities with business schools listed in Table 2 above, only three specify ethics in their graduate attributes. They range from the brief and vague to the detailed and clear. UNSW "will provide an environment that fosters in our students…a respect for ethical practice and social responsibility" (UNSW 2003), while the University of New England states that "Graduates will be encouraged to ethical action and social responsibility. They will i) Acknowledge the social and ethical implications of their actions; ii) Appreciate the impact of social change; iii) Recognize social justice issues relevant to their discipline and professional area; iv) Demonstrate responsibility to the community; and v) Appreciate the importance of sustainable development (UNSW internal document, undated).

Conclusion

The teaching of ethics remains a vexed subject. On one side there is a constant call for dedicated courses from various organizations, educators and the community at large. On the other there are a number of issues around pedagogy, content, effectiveness, and timing of ethics education that remain, if not unresolved, still very much open to debate. In the US, critics of business schools, both inside and outside the system, have been vocal in demanding that schools accept more responsibility for the values, attitudes and even the behavior some graduates display in the marketplace. The GFC is but one crisis over the last two decades that has sparked debate over the responsibility business education plays in unethical corporate behavior. Even though the collapses of Enron and Worldcom in 2002 were landmarks in US corporate history, little progress has been achieved, or at least recognized, by business school critics. Moreover, the empirical evidence cited in this paper suggests that ethics education has little positive impact on moral reasoning skills of business students, perhaps because, as the empirical evidence again suggests, business students appear to commence their studies with fewer such skills compared to their counterparts in non-business degree programs.

Pedagogical research has predominantly concentrated on the integration of ethics education across the curriculum rather than on the planning and delivery mode of specific ethics courses. This may be in response to the flexibility that AACSB allows. More research into stand-alone course design would be useful. In Australia, business schools offer only a small number of ethics-related courses, despite the large number of universities that espouse 'understanding of ethical standards' as a learning goal for their students. The five Australian AACSB-accredited schools, with one exception, offer very few courses, and less on average than their non-accredited counterparts. On this evidence at least, improvement in the delivery of ethics education will be incremental, unless AACSB mandates the inclusion of ethics-specific courses in business degree programs. Such a dramatic change in policy would, of course, ignite passionate debate from among the AACSB membership. In the meantime, further research is recommended in the Australian context. What are the factors that explain the relative small number of courses in ethics education? And why do some non-accredited schools display a far greater commitment to ethics than their accredited counterparts?

Education in ethics and corporate social responsibility may be too important to be left to business schools. In 2007, the United Nations launched the Principles for Responsible Management Education (PRME) initiative to inspire and champion responsible management education, research and thought leadership globally. An international task force of sixty deans, university presidents and official representatives of leading business schools and academic institutions developed a set of six principles that will lay, it is hoped, the foundation for a global platform for responsible management education. As of September 2009, 255 business schools were signatories to the initiative.

ABSTRACT

Globalization influences major trends including those in education. It requires education institution to compete worldwide. Therefore higher education institutions in Indonesia must prepare for the global competition. There should be a strategic movement to reach international reputation as the ultimate goal. One important step to the goal is to develop business processes that aligned with international standard. This paper explored business processes development for higher education based on EQUIS and COBIT.

Key Words: Business process, information technology, higher education, EQUIS, COBIT.

I. INTRODUCTION

Nowadays, universities in Indonesia face many difficulties to compete with schools from foreign countries. In the *Times Higher Education Supplement* (THES) and *Quacquarelli Symonds* (QS) 2008, that contains 400 world universities ranking, there were only 3 schools from Indonesia. These 3 schools only got rank at 200th and below. National University of Indonesia was at 287th, Institute Technology of Bandung was at 315th, and Gadjah Mada University was at 316th. In the first rank was Harvard University from United States of America (http://www.topuniversities.com: 2008).

Whatever the rank system, universities -in this paper they will be set at school level- especially in developing countries must prepare well to compete globally. That is why the way they operate school must follow good practices that have been done by top schools. Those good practices should inspire the whole business process which is currently conducted.

On the other perspective, university reputation is not only influenced by academic activities, but also influenced by many support activities such as logistic, finance, information technology (IT), human resource, etc. Lack of support from these functions will give negative impact directly to the university reputation. Functions such as IT, finance, human resource, logistic, and marketing are the supporting functions that have significant role to assure academic activity as primary activity in university can operate smoothly and keep growing. This paper will focus on IT function related business processes besides main process in academic program.

Recently, role of IT in education institution become more important to support academic activities. The reason why IT becomes important is the business tendency that needs faster operations and decision making, so the need of computers, automation, and integration is more intensive.

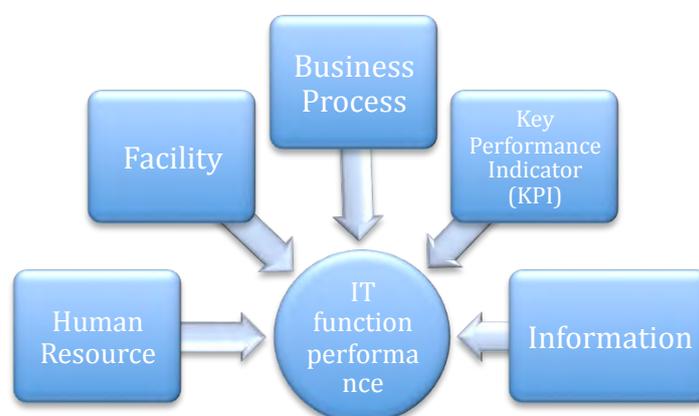
There are some factors that influence the performance of IT function as shown in Fig. 1. These factors are identified based on interview, observation, and literature study.


Figure 1. Conceptual Framework of IT Performance

According to Sparx System UML Tutorial: The Business Process Model, a business process is a collection of activities designed to produce a specific output for a particular customer or market. It has a goal, specific input and output, information, and uses resources. (www.sparxsystems.com.au: 2008). Based on this definition, it can be concluded that other factors such as human resources, facility, KPI, and information are basically embedded in the term of business process. If business process that becomes DNA of the whole operations has not been

well defined, the implementation of processes in human resource management, technology and information management, and evaluation of its KPI will not be efficient and effective. Hence, having well developed business processes is definitely required.

H. James Harrington, in his book, *Business Process Improvement*, describe "*Business process improvement will make the process from organization become effective (Give desirable output), efficient (Minimize resource), and adaptable (can adapt with changing needs of business and consumer).*" (1991:15). These benefits from having continuously improved business process are needed by many universities in Indonesia in order to compete worldwide. From practical aspect, well developed business process will ensure university to achieve their objective e.g. preparing students that match with the needs of industry. It also will help university to optimize resources that end with lower cost. To some extent, cost reduction will give more room for better school funding. Finally, well developed business process has incorporated mechanism to adapt with change of business.

Based on these issues, the challenge is how to develop or improve existing business processes at school level and at the same time they also comply with international standard or recognized internationally.

II. IBEST Framework

Basically good business process contains cross functional team or unit. Good business process do not only describe process flow, but also shows relationship among doers or functions who done the processes. Hence, good business process simply means a system that is integrated. For that reason, this paper proposes a business process design which is called IBEST (Integrated Business process for higher Education SysTem).

IBEST consists of two stage processes. First, it starts with the design of main business process, that represents academic related activities. It is believed that academic process is the core business at any education system. Second, design of supporting function such as human resource, finance, logistics, information technology etc. Practically there is no clear boundary between the stages. Processes are continually decomposed into sub-processes that required fulfilling the goal. After certain level of decomposition, processes that related to supporting unit will be identified. This paper only presents IT function related business processes.

III. Developing Main Business Process

To develop main business process, it is important to consider international standard framework. Hence, IBEST will comply with standard and criteria that required for international accreditation. As one of international accreditation, EQUIS (European Quality Improvement System) is used as the reference in developing main business process. According to EFMD (European Foundation for Management Development) as the institution that accredits EQUIS, "*EQUIS is the leading international system of quality assessment, improvement, and accreditation of higher education institutions in management and business administration.*" (http://www.efmd.org: 2008). Besides its international perspective, EQUIS is used as a reference for IBEST is due to the following reasons (i) EQUIS is developed to improve for higher education especially business schools (ii) EQUIS provides standard and criteria with details requirements related how business schools should manage all activities, and (iii) SBM-ITB has been decided to follow EQUIS as a guideline for improvement.

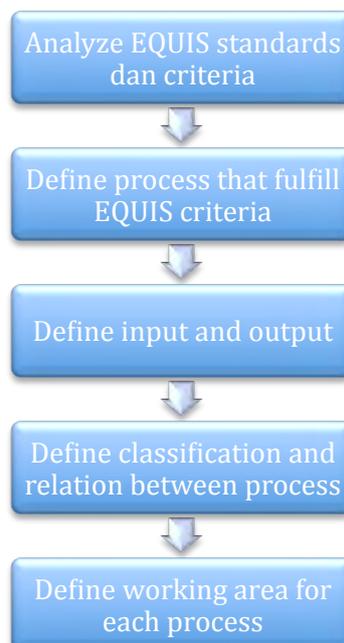
Figure 2 describes the methodology that was used in development of main business process. EQUIS standards and criteria will be the starting point to identify business processes required, input and output of the processes. Then all identified input, process, and output are classified in term of period when they will be executed. Finally, working area (function) for each process is determined as the base for establishing organizational structure.


Figure 2. Methodology of Main Business Process Development

a. Analyze EQUIS Standards and Criteria

EQUIS has standards and criteria in its assessment. Standard is a requirement that was needed by school to get EQUIS accreditation. Criteria are list of question that was used to assess, measure, and describe the standard. Based on EQUIS Standards and Criteria provided by EFMD, EQUIS has 10 areas of assessments in which each area can have one or more standards (2008: 2). EQUIS area of assessment can be described as follow:

1. Context, Governance, and Strategy
2. Programs
3. Students
4. Faculty
5. Research and Development
6. Executive Education
7. Contribution to the Community
8. Resources and Administration
9. Internationalization
10. Corporate Connections

Details criteria for each area are listed as clear as possible in order to ease business process identification in next step.

b. Define Process, Input, and Output that Fulfill EQUIS Criteria

For each item listed as assessment criteria, required processes are defined. Then input and output for the process are identified as well. Table 1 Shows example identified process, input, and output for one EQUIS criteria.

Table 1. Example of Process, Input, and Output

EQUIS Code	Criteria	Input	Process	Output
3.b.1	Describe the processes used to prepare students in advance of their entry into their course of study.	Admission test document, list of induction programs	Student Preparation Program	Prepared Students

In the Table 1, there is one criteria that already has a defined process. EQUIS code is used for administrative purpose and to make sure all EQUIS criteria have associated processes. EQUIS code 3.b.1 shows a criteria that come from 3rd area of assessment (Students), meanwhile next digit from the code shows criteria b.1 of Students area of assessment. That criteria requires a process that can assure the students' preparation in advance of their

entry into their course of study. The process is called "Student Preparation Program". This process uses admission test document and list of induction program as input, and then prepared students would be the output of this process.

Identified business processes in IBEST for this moment are only at global level, so that theses general business processes can be used by any schools that want to establish international standard business processes. IBEST is developed to define what is required to do, not how to do a process. The sub-processes to answer how to do a process in more details are unique from one school to others since it would be the differentiating process as a school strategy. Therefore, process decomposition is done only at certain level. Ministry of Forest and Range, British Columbia Government, in Process Modeling Guidelines, describe that "*The further the decomposition, the more difficult it is to prove uniqueness of lower level processes. Good quality, non redundant process diagrams are not very "deep". In process modeling, too much quantity means too little quality.*" (2009).

c. Define Classification and Working Area for Each Process

The next step is defining the classification and relationship among the processes. Each process is classified in cycle term that represents execution time and type of activity. This cycle was named as IBEST cycle. Fig. 3 shows IBEST cycle.

IBEST cycle classifies the business processes into 4 periods and type of activity. Four periods that are used:
1. 10 years (or at least more than 5 years), in general the vision and mission of an organization is spaced in 10 years.
2. 5 years, this is the period when curriculum is changed.
3. 1 year, in general the admission of new students is done once a year.
4. 1 semester (4-6 months), the time for students learning subjects.

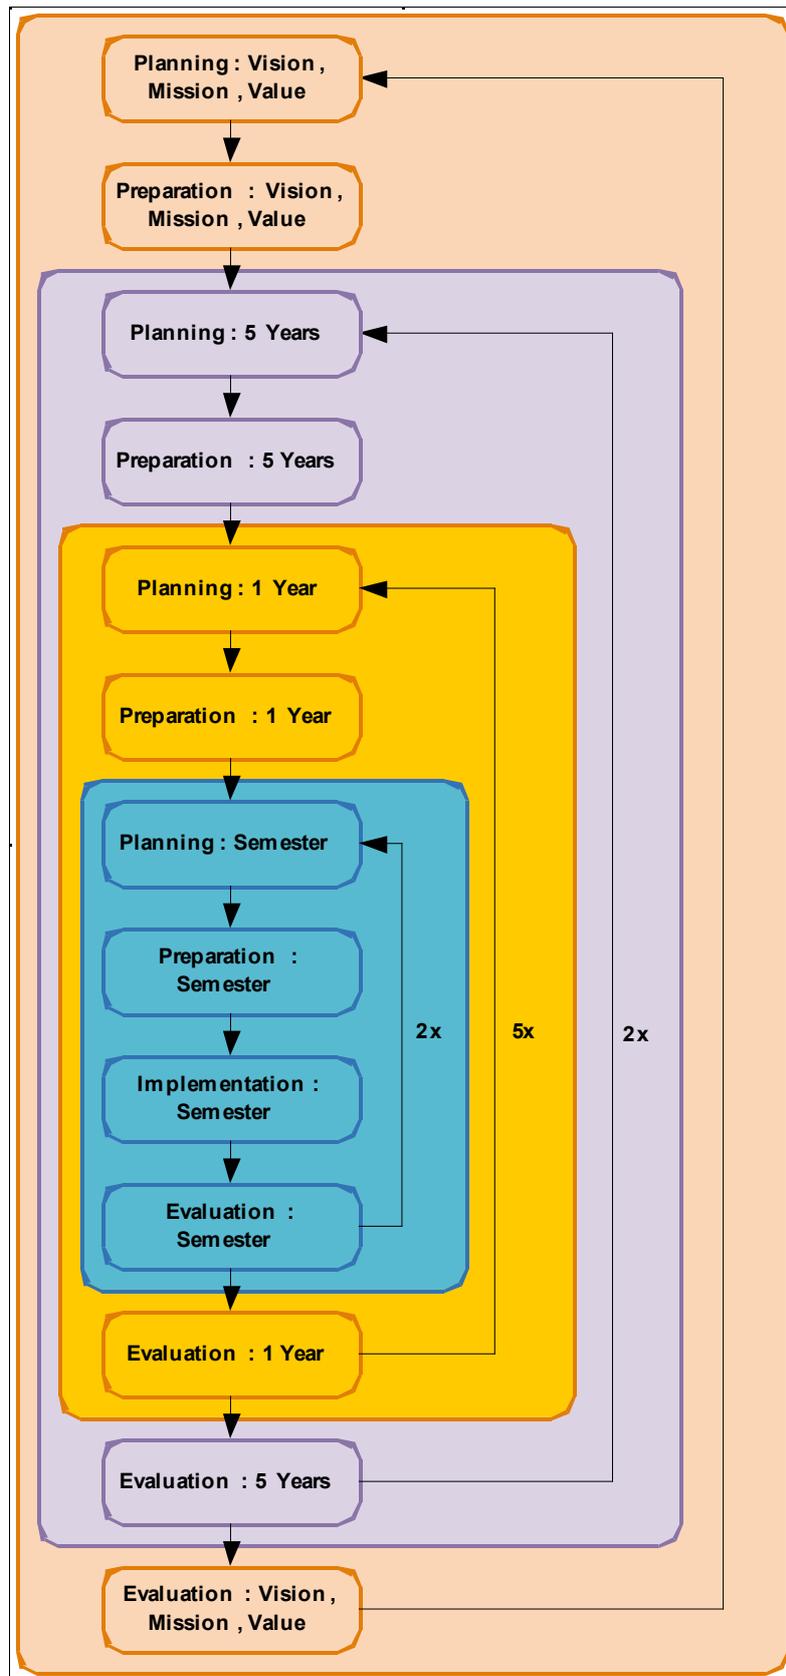
In addition to the period, IBEST cycle consists of 4 type of activity:
1. Planning: Stage which strategy, system, and analysis was developed to fulfill the needs of stakeholder in the long term.
2. Preparation: Stage which procurement of resource (money, human resource, facility, students) is done to realize strategy and implement systems which have been developed.
3. Implementation: Stage which the market and community needs is fulfilled. In this context, process of teaching and learning are conducted.
4. Evaluation: Stage which resume and evaluation for certain period are done.


Figure 3. IBEST Cycle

Fig. 4 illustrates example of sub-processes that are classified using IBEST cycle. It also presents function that related to the sub-processes by which supporting function is defined. Based on our analysis, it can be defined several working area or function that has role in doing the whole business processes. Identified supporting functions in this study:

1. Finance
2. Facility
3. Information Technology
4. Human Resource
5. Marketing
6. Internal Auditor

	No EQUIS	Input	Task Name	Output	Predecessors	Area Kerja Rev

Figure 4. Example of classified business processes and related functions

IV. Developing IT-related Business Processes

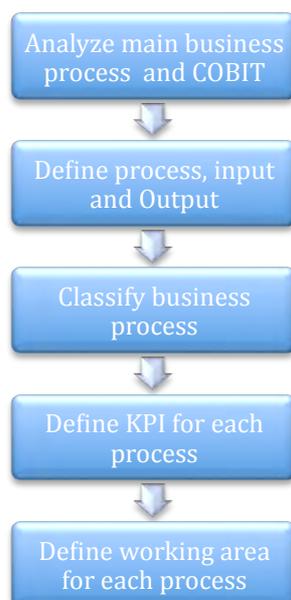
The development of IT-related business processes follows steps as shown by Fig. 5.


Figure 5. Methodology of IT-related Business Process Development

a. Analyze Main Business Process and COBIT

To develop IT-related business processes it starts with analyzing main business process that connected to IT function as done in the previous step. Since IT-related processes are common and have

continually revised standard, developing the process is better to follow standard instead of developing from scratch. In this paper, standard COBIT is used as guidance. *"COBIT or Control Objectives for Information and related Technology is a set of best practices (framework) with a set of generally accepted measures, indicators, processes and best practices."* (http://en.wikipedia.org/wiki/Cobit). There are some reasons to use COBIT as guidance:

1. COBIT is an international IT framework.
2. COBIT is recommended by Sarbanes-Oxley Act 2002 to use as internal control and reporting.
3. COBIT is designed to meet organization's goal as a whole, not to meet function's goal.
4. COBIT has orientation on process and information.
5. COBIT gives guidance to the organization about what to do, not how to do. (Hill, 2006). This philosophy is the same with the goals from IBEST, which only describe what is really needed to do by schools.
6. COBIT has wider point of view in its framework that can be used by any organizations. (Hill, 2006). This philosophy is the same with the goals from IBEST, which will give guidance globally, not only for certain schools.
7. COBIT is an integrator for the other IT standards, like ITIL, ISO 17799, ISO 9000. (Hill, 2006).

b. Define Process, Input, and Output

Based on COBIT framework and previously defined business process, sub-processes for IT function are decided. Input and output for each business process are also determined in this stage.

c. Classify Business Process

Since all identified processes are not structured in higher education context, it is necessary to group them according to IBEST cycle that classifies the process based on period and type of activity. Fig. 6 shows example of the classification. Decomposition of IT process into sub-processes and presented in flow diagram is shown by Fig. 7.

d. Define KPI

A set of input, process and output is not complete without Key Performance Indicator (KPI). Management cannot decide whether a process or an output is qualified or not. Therefore, KPI must be set for each sub-process in IT function. Table 2 shows the example of KPI for several item in "preparing software and system".

	Input	Task Name	Output	Predecessors
50		⊟ **Preparation: Semester**		**44**
51	**Document of technology analysis, Document of needed equipment**	⊟ **Prepare software and system**	**System, Software, Software's maintenance schedule, Software's knowledge, Document of software procurement**	
52	Document of technology analysis, Document of needed equipment	Prepare initial design that fulfill the needs	Initial design	
53	Initial design	Analyze software procurement process	Document of software procurement	52
54	**Initial design**	⊟ **Prepare the software with security aspect**	**Software prototype**	**53**
55	Initial design	Prepare software with clear authority	Software prototype	
56	Initial design	Do prevention, detection, and improvement to malware problem (virus, worm)	Software prototype	

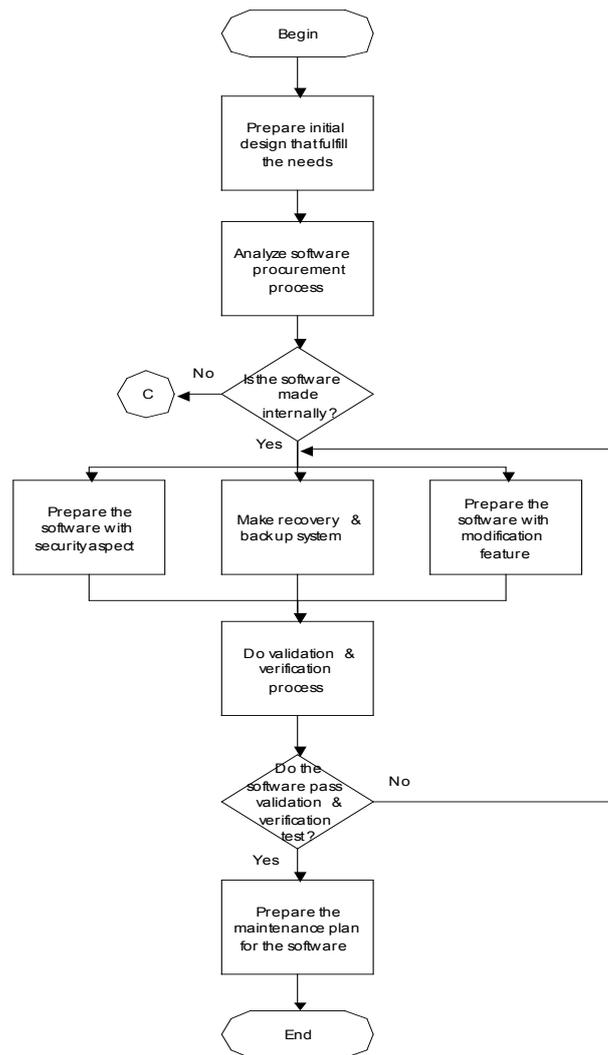
Figure 6. Example of business process classification


Figure 7. Example of Flow Diagram of "Prepare Software & System" Business Process Decomposition

e. Define Working Area

From IT-related business processes it can be defined working area as follow:

1. IT Function Planning
2. Software Development
3. Hardware Development
4. Software Management
5. Hardware Management
6. Service and Support
7. Equipment Audit
8. IT Function Audit

Table 2. Example of KPI

Function	KPI
Preparation: Semester	
Software and system	Duration of time needed to prepare software & system
	% Development finish on time and not over budget
	% Equipment give the desired result
Hardware	Duration of time needed to prepare software & system
	% Development finish on time and not over budget
	% Equipment give the desired result

Manual	% Accuracy of manual with real practices
	% Activity that is included in manual
IT function human resource training	% Training result appropriate with target result
Procurement of equipment	# Problem in procurement and after sales service
Acceptance of equipment	% Equipment specification appropriate with order specification
User training	% Improvement of work after training
Service and support	% Problem that is solved on time
	User satisfaction with the service and support
Problem solving	Duration of time that is needed to solve the problem
	% Problem that is solved on time
Configuration	Duration of time that is needed to do a configuration
	# Configuration that inappropriate with standard and needs of consumer
Physical environment management	# Equipment's failed because physical environment
	Satisfaction of worker

V. CONCLUSION

This paper presents IBEST approach to develop international standard business processes in business school. EQUIS is the reference used to develop general business processes. The developed business processes are still general to provide room for innovation to business schools to build their own uniqueness. Since IBEST was started with academic program as the main business process, its decomposition into more detail sub-processes will ensure all processes are interconnected. As an example of process decomposition for supporting function, IT-related business processes is presented as well.

The Political Economy Relating to the Allocation of Thailand's Budget from 1961 to 2006

Sujjapanroj, Wanida

Ramkhamhaeng university

Thailand

Background and Importance of the Problem

On 24 June 1932. Thailand was changed to democracy. While the government has improved the new management system in order to concordance with the new dominance by announcing the budget act year 1959. That is the mechanism for conducting the national budget. It goes according to the concept idea of Professor Frank P. Sherwood from Southern California U.S.A. that composes of (1) Budget Preperation (2) Budget Adoption and (3) Budget Execution (Frank P. Sherwood, 1964, P.18) with the expectation to allot the budget to solve the problem and response to the need of the people.

From that time the government party and the other parts of government officials have had the duty to prepare the income and expenditure budget by conducting the draft in the annual budget act according to the plan and the project that is important and essential for solving the problem in order to response to the need of the people. The parliament is the political and representative of the people, was elected from the people directly to administrate the country. They give the agreement or approve the budget by having the philosophy that "the budget is the people's money. To spend the money we need to have the approval from the people so we can use the money to expense" (Kraiyuth, 1985, pp.121-122). And the government party with the associate of permanent government official are the group to bring the budget to spend for administrate the nation and serve the public that returns to the people.(Announcement the Constitution for the Kingdom of Thailand in the Issue of 1997)

This time of study use the concept idea and theory of Political Economy according to the concept idea of Marxist and Neo-Marxist in analyzing the interaction of the power between the group of people and various classes of people in the procedure of conducting the budget in 3 steps. It is to make the understanding and to go deep into the root cause of the problem in order to study many dimensions in integration therefore we could see the wide picture in holistic and could explain the phenomenon that appears in the overall system apparently.

Results of the this study used those related to development of Thailand's budget system to improve Performanance. It will make the national budget no clog in one certain group, provide the public service and solve the problem to response to the need of the people. Apart from this, it will be use as the information for the study of the student, people and the interested person.

Objective of the Study

1.To study the procedure of allotting Thailand national budget in 3 steps: (1) Budget Preperation (2) Budget Adoption and (3) Budget Execution

2.To study the interaction of the power between the leading group of people that gain advantage and the community group of people who get disadvantage in the budget making

3.To reflect the picture of monopoly of the power and the advantage in allotting Thailand national budget in order to lead to the way to solve and have the effective budget management onwards.

Scope of the Study

        1.Time scope: study the procedure of allotting Thailand budget in the time period of 1961 - 2006

        2.Content scope: analyze the impact of allotting the budget that comes from the interaction of power that belongs to the group of soldier, the group of government official, the group of political, the group of academician, the group of vocational people, the group of press and the people group altogether 15 people.

Method of Study

        This time of research is the study in analyzing of historical approach by "descriptive" according to the reality in the procedure of allotting the budget in order to make the understand with the behavior and the relationship of the leading group of people who gains advantage and the community group of people who get disadvantage. It uses qualitative research, compiles information from the document, uses in-depth interview and uses observation participation. As the matter of fact the researcher is the subcommittee of national congress therefore we get the information from "the real situation" for study and analysis.

Power-oriented Interaction in Thai Society

        To conduct Thailand budget according to the democracy regime creates the power interaction between the group of political, the group of government official, the group of soldier and the group of businessman that use the government mechanism and the government power to strive for the advantage, build up the unfairness and prejudice in the society. Therefore the allotting the budget isn't go concordance with the problem and the real need of the people. It makes the leak of the budget in the large amount.

        In the normal situation that has no revolution there has the influential group in the procedure of the budget making that is the politician and the government political party. They allot the budget according to the party policy more than usual by associating with the government official in Bureau of the Budget. For the academician, vocational people, press and people group who are the majority group of people in the society but have less negotiation power in the procedure of the budget making, they have the advantage from the budget in the very little amount. On the other hand, in the time of revolution the soldier has the power and the influence in the budget making to the army in the high amount for buying the weapon or maintaining the army. Normally the politician has no role in allotting the budget. The representative society according to the democracy regime in Thailand isn't effective that makes the budget spending have no effective.It can't glorify the country as much as it should be as in the picture 1.

Picture1 Model to show the power-oriented interaction in allotting the budget

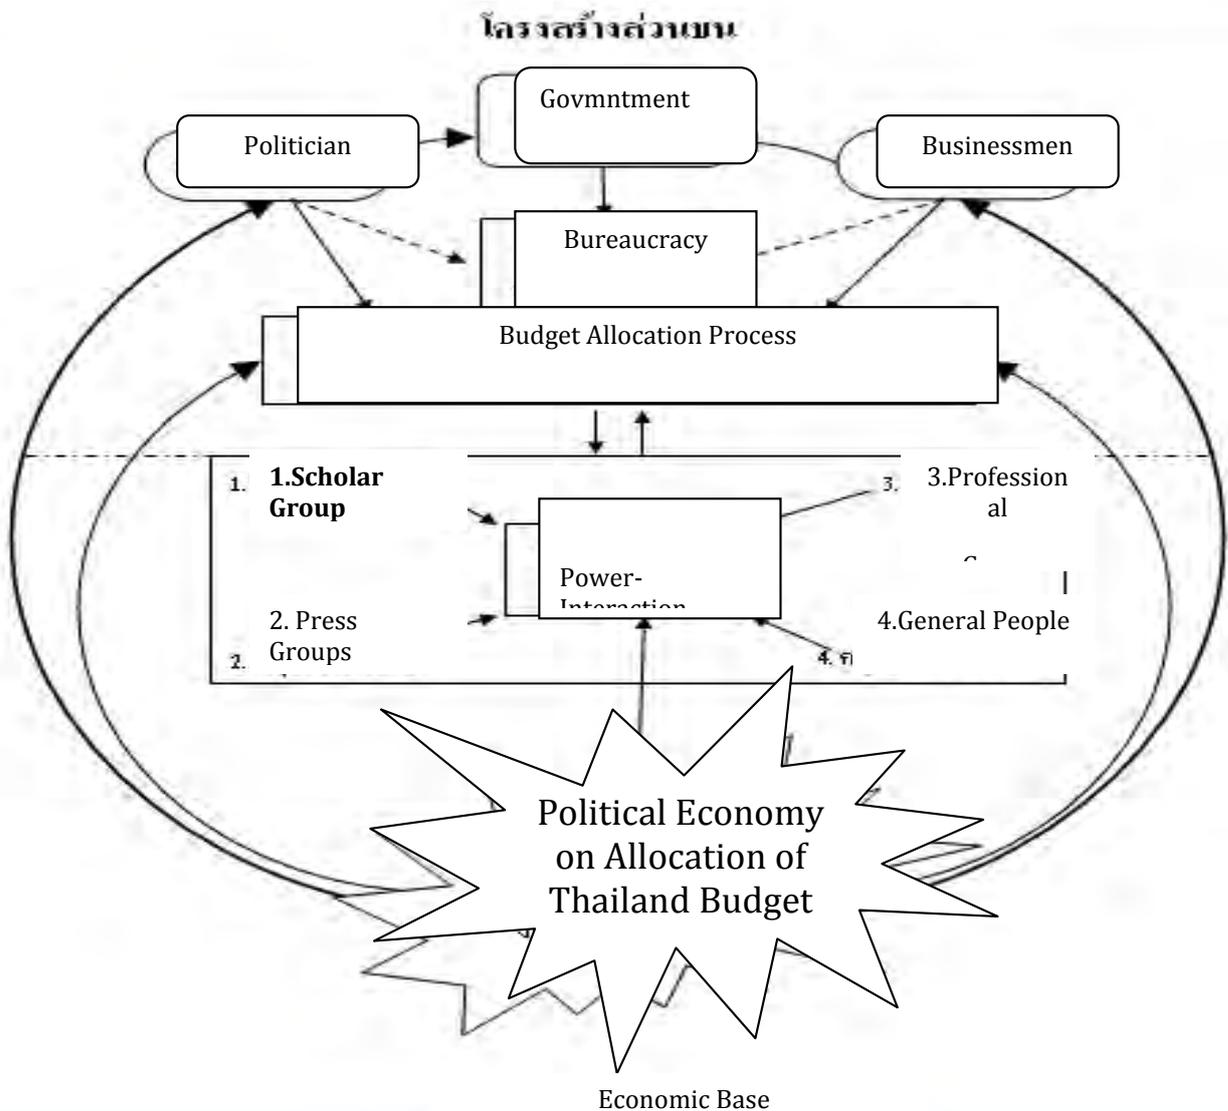
Allocation of Thailand Budget in Political market

        The concept of Political Economy is the foundation concept that Karl Marx gives the
importance to the study of analyzing the behavior and the relationship of various classes of people by
studying the power of super structure e.g. state, state mechanism, politic system, economic system,
religion, culture, norm and various laws together with economic base or mode of production e.g.
productive forces and production relation. (Karl Marx, 1979) Mode of production is the economic root
and the determination in last instant. According to this concept it gives the importance to the life of the
normal people as the important determination as in the picture 2.

Super Structure

โครงสร้างส่วนบน

Political Economy on Allocation of Thailand Budget

Economic Base


From the picture 2 the procedure in conducing Thailand national budget mostly occurs from the power interaction between political people and political party with the world bank, the government and the people, the government official, the soldier with the businessman and lastly the people. They interact in exchanging the product and the service in the political market. The people use the vote to buy the product and the public service from the government. Therefore the politician becomes the political businessman cooperating with the world bank in order to produce the product and provide the public service for the purpose of the vote as they can become the government once again. They mainly search for the maximum profit from the political business therefore they allot the budget to advantage them and their group. In the time of revolution, the soldier has the influence in conducting the national budget. The budget mostly is allotted to buy the weapon and maintain the army. The various advantageous groups who are in the procedure of conducting the budget use government mechanism and government power to grasp the advantage, monopolize the power in the time of allotting the budget, build up the unfairness and injustice in the society that lead to the corruption. It destroys the economy and the security of the nation strongly. (Jame E.Anderson, 1970)

Power-oriented Interactions in Budget Preparation

From the past to the present to prepare the budget creates the power-oriented interaction between the politician group, the military, government official group, Bank of Thailand, Office of the National Economic and Social Development Board, Bureau of the Budget, Ministry of Finance, government official from various offices, International Monetary Fund (IMF) and World Bank. They become to have role to set the direction and the amount of the money for usage in different aspects e.g. economy, education and national security etc. However the people, the majority group in the nation, don't take part with the influential group especially in the time of allotting the budget. It is because Thai politic mainly falls in the bad cycle that is frequently has revolution all the time. It makes Thai nation has the defective democracy along the time that effects budget allotment to have no effectiveness.

Government in the period of marshal Salid Thanarat prepared the budget to the influence of soldier in indicating the level of budget. The budget was allotted to protect the country for the advantage of the influential group of soldier in order to administrate the nation.

Government in the period of Senee Pramote came to the political power as to democracy regime that won the election. They formed the coalition. However they strived the budget in the preparation procedure and in the time of allotting the budget.

Government in General Kriengsak Chamanun had the revolution and become the prime minister. The soldier returned to have the political power again therefore soldier budget become in high proportion that its amount was near the education budget.

Government in the period of General Chartchai Chunhawon was counted as the businessman that become the prime minister therefore the budget was allotted for supporting the economy. It made the economy become up rise. The country was prosperous. Government could collect the tax for allocating the expenditure budget more.

Government in the period of Police Lieutenant GeneralThaksin Chinnawat prepared the budget in more complex way. It was the power interaction and the role of the advantageous group in the country and the group outside the country. The power belonged to politician group therefore the budget emphasized on the economy more. The role and the influence of soldier group were decreasing while the roles of the people in allotting the budget were increasing obviously. Whenever the project didn't have the advantage to the people and the nation, the people had right to object the government in the time of allotting the budget.

Announcement the Constitution for the Kingdom of Thailand in the Issue of 1997

On 17-20 May 1992. there had the *Prisapathamin* incident that made the people refuse the soldier government that preside over the people. The people didn't want the political power to fall in one particular group. They had awareness and call for the democracy more. This constitution made the power interaction of the various advantageous groups of people change largely from the past that can be indicated as followed: (The Constitution for the Kingdom of Thailand, 1997)

1.The role of the people is more than the past. The people participate in the procedure of allotting the budget. Any project that the people acknowledge doesn't create any advantage, that project could be objected from the people.

2.The role of the politician is decreasing. In some section of the constitution has the covenant to the role for the politician that they couldn't bring the budget to use for their own benefit and their belonging groups e.g. in the section 180.

E-Strategic Performance Based Budgeting System

Since the country had to face with the economic crisis in year 2540 B.E., it made the economic system stuck. The government couldn't find the income from tax collection to spend for the expenditure budget therefore the government had reform the new government service in 5 aspects as followed: (Office of The Civil Service Commission, 1997)

1.Plans to modify the role, the mission and the method of government administration

2.Plans to modify the budget system to the budget system that focuses on the work result and the result

3.Plans to modify the personnel management system

4.Plans to modify the law

5.Plans to modify the culture and value

When the announcement of the budget system focused on performance based budgeting strategy. Allow interaction between power-oriented interest groups to differ. The role of the government official decreases, they can't diversion payment the budget to use in the plan and the project that didn't indicate in the strategy. On the other hand, the role of the business-oriented political to play a role in increases especially the business group that was elected to be the government. They can set the strategic target in the direction that supports the business for the businessman.

Power-oriented Interaction in Budget Adoption

In consideration the agreement or the approval for the budget that belongs to the parliament in order to set as the draft of annual expenditure budget act together with the detail of the national budget expenditure, it requires to have the consideration from 2 parliaments. After the house of representatives have approved, the senate requires to give the approval to the draft of annual expenditure budget act within 20 days counting from the date of receiving the draft. In case of exceeding the set time, it counts that the senate approves the draft of annual expenditure budget act. This is to decrease the role of senate in the issue of budget. Since the senate couldn't edit or cut off the expenditure budget that the senate comments it inappropriate therefore the role of senate is very little in the issue of consideration the national annual budget.

Power-oriented Interaction in Budget Execution

Bureau of the Budget (The group of government official) has the important role because in every part of Thailand the government official requires the approval on annual expenditure budget from Bureau of the Budget. Therefore Bureau of the Budget has the direct role in inspection and consideration each expenditure to be approved or unapproved. Bureau of the Budget can cut off the expenditure budget that the government official asked for according to the law enacts. Apart from this, Bureau of the Budget also has the power as to the budget law to approve and change the expenditure budget that was approved from the parliament. The group of businessman has the role in the time of asking for each expenditure or each time of budget administration in the form of power interaction with the minister (group of politician) by proposing the project, construction material or heavy equipment that the businessman gains the benefit. Therefore the role of businessman group is in the low level that needs to depend on the group of politic or the group of government official in the time of allotting the budget in order to have the benefit for their own advantage.

Conclusion the Power-oriented Interaction and Suggestions

The various influential groups e.g. the military, the group of government official, the group of politician, the group of businessman, the group of academician and the group of people together with IMF and World Bank had the role in conducting annual expenditure budget in the procedure of preparing the budget, in the process of budget approval and in the process of administrating the budget.

Any particular group that had the enormous power in administrating the country in that certain time also had the important role in allotting the expenditure budget in that year.E. g. the group allotted the budget to their own group in the high proportion more than the influential groups that have little role or no role in administrating the country. (Kraiyuth, 1990)

Since the military played the important role in administrating the country, the budget was allotted to the soldier group or in order to protect the country. The proportion of the budget was near or sometimes higher than other expenditure parts that are more important than the soldier part.

In the group of civil society and politician, there has the allotment of the annual expenditure budget to the group of people (education part) more and more than the national security part. While in the group of government official (Bureau of the Budget) has role in allotting the budget from other remaining budgets e.g. soldier part, education part and economic part. However the community of people has the important role in administrating the country, it is because the constitution of Thai Kingdom in year 2540 B.E. indicates the right of the people to participate and comment in the policy of administration the country clearer and in more role. To allot any budget requires having the agreement and listen to the comment of the people before executing any action. Therefore power interaction of the various advantageous groups in allotting the budget has changed.

In the economic crisis in the year 1997. the government had to borrow the money from IMF and World Bank. Therefore IMF and World Bank become to have role in allotting the expenditure budget, they attempt to conduct the overbalanced budget in order to have the remaining budget to return to IMF and World Bank.

Business-oriented political group began to play a role in fiscal the period of the budget year 2001 - 2006. They allot the budget focusing on the economy by attempting to settle down the various projects and change from the state enterprises to the public company in order to support their business and their group.

Suggestions

Since the various advantageous group has benefit and influence in management and allocation in the annual expense budget of the country. Make appropriations in each side. Therefore cause leakage of expenditures in each fiscal year a number. You are required to resist the leakage of expenditures in each year less. Based on the power play or people to interact with groups. To close the budget allocation in step 3 You both key steps include e.g.(1) budget preparation process (2) Budget approval process. (3) budget management process.

ABSTRACT

The purposes of this study were to examine management components of agricultural machinery for expenses reductiion of rice production in Pichit province. Data were collected through various means, that is, in-depth interviewing members and administrators of rice farmers' group and administrators of farmer institutes, whose job performance were outstanding, as well as organizing a community stage for those involving with the administration of rice farmers' group. Data were analyzed and processed through descriptive statistics and Pearson Product-moment Correlation Coefficient.

The findings revealed that the management components of agricultural machinery for expenses reductiion of rice production in Pichit province consisted of three sections, that is, (1) the characteristics of agricultural machinery management should include outsourcing, co-investing, network building, and participatory maintenance, (2) in order to establishing rice farmers' group structure, a network of subgroups should be provided by setting an agricultural machinery co-ordinate service center as a planning station, and (3) fund and welfare should be provided in advance for agricultural machinery maintenance. The formula to calculate the returns is that net returns are equal to the returns, designated by the rice farmers' group based on its regulations, minuses the overall differences of effective value of agricultural machinery and equipment before and after using. If these three elements were well-managed, it would reduce the expenses of agricultural machinery in rice production from 46.00 percent to 29.90 percent of the overall expenses of rice production.

Key work: Production Expenses Reduction, Agricultural Machinery, Management Components,

Rice Production

INTRODUCTION

The current condition of the agricultural machinery management of the rice farmer groups in Pichit province was not successful according to the government's plan to promote working group to examine factors affecting rice production by the use of agricultural machinery. The groups gathered were reduced from 31 to 27 groups. There were 18 groups passing standard criteria while 10 groups failed because they did not run any businesses or services, have annual net profit, divide annual net profit, and have very few members in each group. There was only one out of five groups that was successful in managing agricultural machinery (Pichit provincial cooperative office, 2008). This resulted in abandonment of agricultural machinery and not ready to use, lack of financial liquidity among the rice farmer groups because they lacked financial disciplines, increased reserve fund, adjustment in work structure, appropriate adjustment in production factors, unstable and inconsistent support from the government (Cooperative auditing department, 2006). They also had low working satisfaction, the size of the machinery was not suitable according to their needs, skills of the administrators and staffs in administration and job performance were inadequate, and they also lacked of the development of farmer efficacy, attention from staff of related offices, and project administration planning in advance (Prasopsin Mantim et al, 2006). Problems mentioned above led to a research question: "What are the management components of agricultural machinery for expenses reductiion of rice production?" This study aimed to (1) examine the expenses of agricultural machinery for rice production and the needs for agricultural machinery, and (2) investigate factors related to agricultural machinery, and (3) determine to management components of agricultural machinery in rice production leading to the reduction of energy resources, and minerals use in rice production.

RESEARCH METHODOLOGY

This quantitative and qualitative study employed integrated research approaches conducted from April 2006 to December 2007. Data were collected through various means: structured interviewing 376 rice farmer group members regarding expenses and needs of agricultural machinery in rice production, in-depth interviewing 27 administrators of rice farmers' group in Pichit province and 33 administrators of agricultural institutes both inside and outside Pichit province, whose practices were outstanding in terms of farmer group management, regarding managing current agricultural machinery and factors related to agricultural machinery management. All data then were synthesized in order to draft management components of agricultural machinery for expenses reductiion of rice production. The possibility of the project was tested by organizing a public stage for 46 people involving the administration of rice farmer groups both inside and outside Pichit province. The appropriateness was tested by structured interviewing 43 people involving the administration of rice farmer groups within Pichit province. Descriptive statistics and Pearson Product-moment Correlation Coefficient were used to analyze the data.

RESULTS OF THE STUDY

1. Regarding the expenses of agricultural machinery for production of rice, which farmers in Pichit province mostly grow (Suphan Buri 1 rice seeds), the average expenses of agricultural machinery was 1,307.97 per rai (46.00 percent as of total expenses of rice production). The majority of rice farmers in Pichit province (82.98 %) needed agricultural machinery as public property for rice production. The most wanted agricultural machinery before harvest was a medium-sized tractor (14.93 %) whereas combine was the most wanted agricultural machinery after harvest (12.76 %).

2. Main factors related to agricultural machinery management were encourages management, which was positively related and statistically significant ($p < 0.01$), and three other factors—farmer group management ($r = 0.824$), farmer group fund management (0.754), and agricultural machinery management factors ($r = 0.745$) respectively. In addition, these three factors were also positively related and statistically significant ($p < 0.01$) to each other. The current condition of agricultural management in Pichit province and agricultural institutes with outstanding practices had agricultural machinery management in a number of ways—co-investing, outsourcing, network building, and

participatory maintenance. Information required in management were hiring expenses, working period, number of areas, distance, amount of fund, number of members, machinery parts and materials, objectives, readiness, and capacity of the farmer groups.

       3. Agricultural machinery management that can reduce rice production expenses in Pichit province should process through representatives of rice farmer groups appointed by three sectors—the government and academics, entrepreneurs, and rice farmers—in order to negotiate in purchasing, hiring, and using benefits from agricultural machinery that farmers need under a theme of "Agricultural Machinery Co-ordinate Services Center," which consisted of three components as follows:

         1) Managing agricultural machinery can be initiated by organizing informal group focusing on outsourcing since at the beginning, fund may not be enough, but the group should later be developed into a formal one in order to buy agricultural machinery through fundraising, and keep it for public use to maintain marketing mechanism of the entrepreneurs or other means that can be managed if group members, fund, areas, and others are ready.

         2) Controlling revolving fund and sharing benefits of the group should consider agricultural machinery management expenses in advance based on net returns that all types of members—agricultural machinery management board of committee, all levels of service officers, agricultural machinery owners, and purchasing/hiring representatives—receive equally. Furthermore, they should receive benefits on daily, monthly, and annually basis depending of their type of membership. This is equivalent to gross profit (100 %), as designated by the farmers' group based on its regulations, minuses Overall Equipment Effectiveness value (%) before using and after using.

         3) For effective and efficient agricultural machinery management structure, the farmer group structure should be established as a network for subgroups depending on types of agricultural machinery. Staff at coordinate service should consist of two departments—strategy and main operation departments. Strategy department administers all tasks of the group—setting goals, policies, and strategies of the organization, specifying characteristics of administrators and staff, approving, monitoring, financial auditing, accounting, setting wages and salaries, communication system and tools and machinery purchasing system, and establishing regulations of services. Main operations department were responses to the objectives of the group. This department consists of two sections—secretary, and machinery maintenance and development. Secretary is in charge of finance, accounting, wages, salaries, and dividends, as well as coordinating with offices inside and outside network so as to effectively and efficiently link the information to other offices. Machinery maintenance and development conducts research and development, as well as maintaining, and providing agricultural machinery services. This department may have officers positioned or outsourced on the network. It may also ask for assistance from public or private sectors. If these three elements were well-managed, it would lower expenses of agricultural machinery from 46.00 percent to 29.90 percent of the overall rice production investment.

DISCUSSIONS AND SUGGESTIONS

       In order to control expenses of agricultural machinery management at the lowest level, it is necessary to plan rice production, which is the most important element for decision making of activities and meeting the needs of working plan, policy setting, and selecting strategies for practices that effectively meet with the needs. As a result, in order to develop group and farmers' efficacy in agricultural machinery management, it is needed to provide knowledge of analyzing expenses in order to select an accurate plan for managing agricultural machinery according to the concept of increasing profit of products and services, which has been changed from traditional way of setting price based on profit and expenses of products or services to the reduction of expenses in production in order to make more profit instead by analyzing expenses of products or services in all respects and subtracts purchased prices (Thammathataree Y., 2007: 23-24) through the following formula.

$$\text{From:} \quad \text{Price} \quad = \text{expenses} + \text{profit}$$

$$\text{To:} \quad \text{Profit} \quad = \text{price} - \text{expenses}$$

The analysis of agricultural machinery management expense is a means to reveal break-even point for agricultural machinery management activity and to know whether what and how it should be monitored by finding relationships between expenses, quantity, and profit for investment decision making. This view is relevant to Chalermkarnjana K. (2004: 149-180), Komalathat D., et al (2004: 1-47) and Deere J. (1992) which pointed out that in terms of managing expenses for production or service in trade and free trade settings, which have technological advancement in production and multimedia, the manager must have knowledge and understanding the concept of analyzing expenses and profit which they will receive from organizing activities for the approval and investment on that particular project as it will be suitable and above the break-even point.

The concept of analyzing agricultural machinery expenses in order to reveal the break-even point is related to the findings of Jirarachawarow J. (2001) who examined appropriate patterns of water resources management for agricultural purposes. He found that the appropriate use of water could be performed by farmer group working who were water users. It, however, should be on the basis of purchased price of water, as well as having some profit for the investment of water users. In addition, the study results of Phromsaka Na Sakolnakorn T. (2008), who studied patterns in rural industrial production transfer management in northeastern part of Thailand, showed that factors were directly influenced by three independent variables—(1) production expenses, (2) management convenience and production effectiveness, and (3) efficacy of supplier. The factors of production expenses yielded the highest result while efficacy of supplier factors was the least. The independent variables that indirectly affected transfer management patterns were (1) policy and legal factors, which indirectly influenced important production transfer management through management convenience and production effectiveness, and (2) the environment of production transfer area, which indirectly influenced through efficacy of supplier.

This can be concluded that the analysis of agricultural machinery expenses is an important process in management plan since it can reveal expenses in agricultural management, break-even point, and appropriately set administration plans for agricultural machinery in terms of efficacy and ability of the groups and members. Moreover, it is a guideline for preventing a lack of financial liquidity in providing agricultural machinery at all times, and creating satisfaction among members.

Educate Children At Risk: Factors Affecting The Cohort Survival Rate

WENDELL GLENN P. CAGAPE, Ph.D.
College Board Secretary/Campus Academic Head
JH Cerilles State College, Pagadian City Campus, Balangasan, Pagadian City, Philippines
cagapewendell_gl@yahoo.com

Abstract:

Cohort Survival Rate is the measure of the percentage of pupils enrolled in the first grade who finishes Grade IV. Factors such as rural poverty, health issues such as nutrition and vitamin A supplementation, lack of school buildings, inaccessibility of schools are driving pupils away from schooling. This study was conducted in 10 disparity barangays in Zamboanga del Sur, covered under the 6th Country Program for Children by the UNICEF. Alternative livelihood helps resolve the concern.

INTRODUCTION:

The Philippine 1987 Constitution declared in Section 17 that "the State shall give priority to education, science and technology, arts, culture, and sports to foster patriotism and nationalism, accelerate social progress, and promote total human liberation and development" (Bernas, 2003). The emphasis placed on education in this context far exceeds the present-day interventions in relation to improved academic outcomes among pupils, but also encompasses the active participation of all elementary pupils and making them ready for higher educational opportunities by ensuring that they graduate in the primary or elementary level.

In the Philippine setting, almost all provinces and cities, including municipalities have elementary schools in operation however, there are much more to be constructed in barangays situated from far away localities. Zamboanga del Sur is not an exception. There are much to be desired in terms of classroom construction as well as the identification of barangays that needs teachers and classrooms to supplement the educational needs of the general populace. This may also be one of the factors that affects Cohort Survival Rate in the Province. Because of these realities, the study has been undertaken to understand the factors affecting cohort survival. This study was conducted in 12 areas namely, Barangay Bogo Kapalaran in the Municipality of Molave, Barangay Boloron, in the Municipality of Midsalip, Barangays Sta. Lucia and San Pedro in the City of Pagadian, Barangay Libertad in the Municipality of Dumingag, Poblacion in the Municipality of Pitogo, barangay Lumbog in the Municipality of Margosatubig, Barangay Benuatan in the Municipality of Dinas, in Barangay Lunib in the Municipality of V. Sagun, Barangay Salambuyan in the Municipality of Lapuyan, Barangay Diplo in the Municipality of Kumalarang and at the Poblacion in the Municipality of Lakewood.

REVIEW OF LITERATURES:

The National Statistics Coordination Board (NSCB) defined cohort survival as, "a measure of the efficiency and effectiveness of the delivery of education services in the country, and is defined as the percentage of enrollees at the beginning grade or year in a given school year who reached the final grade or year of the elementary or secondary level" (Virola, 2007). Based on this definition, the "cohort survival rate was at 69.84 percent in the elementary level. This means that about 70 students out of a hundred who entered grade one reached grade six. For the secondary level,cohort survival rate was at 65.83 percent" (Basic Education at a Glance, 2005).

The United Nations Statistical Institute for Asia and the Pacific defines this as "The percentage of a cohort of pupils enrolled in grade 1 of the primary level of education in a given school year who are expected to reach a specific grade (Survival rate to Grade 5)" (UNSIAP, 2005).

Based on these definitions, the cohort survival rate of the Province of Zamboanga del Sur from 2002-2007 as provided for by the Department of Education, as presented in this graph, revealed that since 2002, the combined Cohort Survival Rate of male and female elementary pupils are decreasing

however, it gains momentum from 2005, when the Province of Zamboanga del Sur and together with the Department of Education, has engaged in massive advocacy campaign in targeted disparity barangays to improve the Cohort Survival Rate among public elementary pupils within the Province of Zamboanga del Sur. In 2002, the combined rate is 60.65%, however in the succeeding 2003 and 2004, this has fallen to 54.34% and 54.29% respectively. Affected in this downtrend of the CSR is the male pupil's participation and completion rate as contrasted with their female counterparts. In the same years as cited above, female finishing and completing basic elementary education far exceeds the percentage of male finishing and completing the same educational level/grade. Disturbingly still, although the trend since 2005 is increasing, the male pupils have not equaled or surpassed the percentage of female pupils completing elementary, thus explains the sizable number of female students in secondary and college as well as pre-university in the in Zamboanga del Sur and in the Philippines. This data echoes the 2004 Human Development Report in which it states that the ratio of female as a percentage of male in the combined primary, secondary and tertiary gross enrollment is pegged at 104.9% (Human Development Report , 2009). Combined enrollment rate means "the ratio of the sum of elementary and secondary enrolment in the corresponding age group that should be enrolled at those levels to the sum of corresponding school age population" (Technical Notes on the Human Development Index, 2009).

These are caused by factors that are otherwise associated with the patterns of investments among the national government agencies as well as the local government units. The Local Government Code of 1991 has envisioned that services of government are to be decentralized and education has not been part of the devolution of these functions in accordance to the Local Government Code hence local government units across the region and in the different municipal local governments continually depend on their Internal Revenue Allotment (IRA) for education and other social services, and is constrained in establishing schools and constructing school buildings. It has been admitted by the local government units as well as the Regional Development Council of Zamboanga Peninsula that the LGU's dependence on the IRA "still constitutes around 55.7% of the Total Financial Resources (TFR) of the LGUs in the region" (Yebes, 2004).

The Zamboanga Peninsula Development Plan indicated that "LGU's expenditures in the region indicate that only Php 1, 652.57 is spent per person. However, of this amount 46.88% is spent for General Services rather than on Economic Services at 22.30% and Social Services at 21.43%, respectively." This pertains to the LGU's spending patterns relative to education which usually impacts the quality of educational services rendered.

Another is on the issue of rural poverty that also affects education. Even the Asian Development Bank mentioned in its policy on education that poverty "is both a cause and an effect of insufficient access to or completion of quality education. Children of poor families are less likely to enroll in and complete schooling because of the associated costs of attending school, even when it is provided free. The cost of uniforms, supplies, and transportation may well be beyond the means of a poor family, especially when the family has several children of school age. This means that choices have to be made, and the choice is often to drop out of school or, worse yet, to deny schooling to girls while enrolling the boys, thereby contributing directly to maintaining the inferior status of women. And as poor children who are enrolled grow older, the opportunity cost (their lost labor and the foregone income it may entail) becomes greater, thus increasing the likelihood of abandoning school" (Asian Development Bank, 2009).

Poverty in areas where schools are very

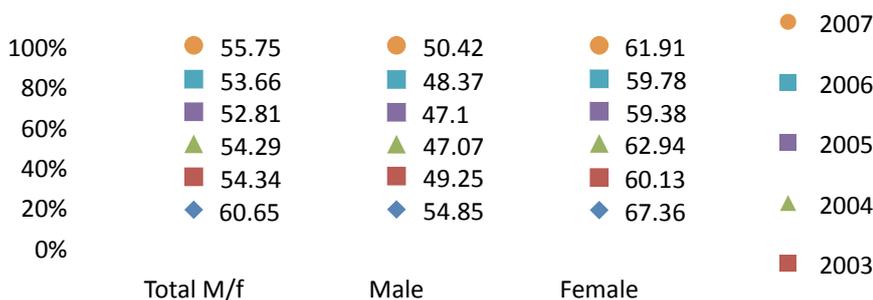
100% 80% 60% 40% 20% 0%


inaccessible drives lesser participation and thus affects survival through the elementary. As if to provide the impetus for a more driven approach to ensure that pupils in the elementary finished until secondary level, the Philippines passed Republic Act 6655 which expressly elucidated that in the Philippines, secondary schooling is free in public schools. Further, the Philippine government also provided temporary employment opportunities for youths and students to earn an income while on summer and/or Christmas vacation from school as enshrined in Republic Act 7323. Both laws have been widely observed however, there is still a dearth on data of actual implementation, one being that public high schools are also not present and is inaccessible in the barangay level while summer job opportunities under the Department of Labor and Employment can not at all, accommodate all those wishing to avail of the temporary employment. At the barangay level, these two landmark laws are not widely implemented, due to the geographic location of centers of actual opportunity. Usually, those barangays that have higher poverty indices, are located in distant areas, too far away from these opportunities thus, schoolchildren will still have to resort to the traditional way of earning an income. They will help their parents tend to the farm or herd the flocks to augment the family's income.

Another consideration why pupils in the elementary drop out of school is their health. Due to the inclement weather in the Philippines, pupils are forced to be absent from class whenever they got fever and other ailments. Compounding the problem is the lack of barangay health centers that carries a full range of medications that easily addresses these illnesses, most often, the child is usually, home-rested. Home rest is where the parents tend to their sick child with usually, no medical attention and prescription, but rather relied heavily on home-grown medications and homeopathy. The level of nutrition has something to do with active participation in schools too. Nutritional nourishment also ward off sickness thus enabling school children to focus more on school activities than pre-occupied with staying at home due to sickness. According to the Food and Agriculture Organization, "Protein-energy malnutrition (PEM) and micronutrient deficiencies remain the leading nutritional problems in the Philippines. The general declining trend in the prevalence of underweight, wasting and stunting among Filipino children noted in the past 10 years was countered with the increase in the prevalence rate in 1998. About 4 million (31.8%) of the preschool population were found to be underweight-for-age, 3 million (19.8%) adolescents and 5 million (13.2%) adults, including older persons were found to be underweight and chronically energy deficient, respectively" (FAO Nutrition Country Profile, 2001). Also, malaria is endemic in 65 of the 78 provinces, putting at risk a population of 11 Million, in mostly remote rural areas (Landey, 2004). Further, the report mentioned that twenty-five (25) of these provinces account for 90 per cent of all malaria cases.

The state of malnutrition in elementary school in Zamboanga del Sur from 2005 to 2007 revealed that the percentage of malnourished school children is 19.86, 14.60 and 18.18 respectively. The data is taken from the Provincial Nutrition Council of the province. In terms of nourishment through Vitamin A interventions, 2005 data revealed that in Buloron, Municipality of Midsalip it has a total of 220 children aged 1-5 years old. For Bogo Kapalaran, in the Municipality of Molave, it has 232 children. In Libertad, Municipality of Dumingag, it has 195 children. In Poblacion, Pitogo, it revealed that it has only provided Vitamin A supplements to at least 50 children from a population of 500 children. In Lunib, Municipality of Vincenzo Sagun, it has 210 children. In Lumbog, Municipality of Margosatubig, it has provided Vitamin A supplementation on 270 children. In Salambuyan, Municipality of Lapuyan, they have 45 children. In Diplo, Municipality of Kumalarang, it has provided Vitamin A to 326 children. In Poblacion, Municipality of Lakewood, it has provided Vitamin A to 590 children. And in Benuatan, Municipality of Dinas, it has provided the same to at least 80 children. There were no records for San Pedro and Sta. Lucia, both from Pagadian City under this category.

As of the 2000 census, Zamboanga del Sur had a population of 836,147, making it the 16th most populous province. The population density was 3,480/km², the 20th most densely populated province. However, a 2007 census revealed that the province has a total of 914,278. It has a total land area of 796,321 hectares. It was made a province on September 17, 1952 by virtue of Republic Act 711, making it the 52 province of the Republic of the Philippines, with 681 barangays in 26 municipalities with 1 independent city which is Pagadian City.

The province of Zamboanga del Sur is primarily agricultural. Its rich oil and terrain which consists mostly of considerably low, rolling hills are ideal for the production of a large variety of crops. Fishing and grazing are important industries of Zamboanga del Sur, with fishing offering relatively unlimited opportunities due to the presence of major fishing grounds (Luceno, 2001).

METHODOLOGY:

The study employs a survey method of gathering the data from the identified disparity barangays. These are identified by the Province of Zamboanga del Sur through the Provincial Planning and Development Office covered under the Sixth Country Program for Children, an intervention package for the children of Zamboanga del Sur delivered jointly by the UNICEF and the Province of Zamboanga del Sur. Of these areas, five (5) are located in the First Congressional District and seven (7) are located in the Second Congressional District.

It uses survey questionnaires in the survey. In gathering all the data, a research team was organized principally from the Provincial Government of Zamboanga del Sur. This study is a descriptive-qualitative survey thus uses simple percentages and frequencies. It uses random sampling technique.

KEY RESULTS:

From the areas identified as disparity barangays, the study has surveyed a total of 2,638 sampling size comprising 30% of the total population (household population) size of 8,794. The respondents are taken to represent per household and could either be the husband or the wife. Only one respondent is taken from one household.

Of these respondents, 76% are female and only 24% are male. This provided a total picture of the domesticity of female members of the household when the survey was conducted in the areas identified as disparity areas. The researcher has found mostly women tending to the household as men (husbands) are working, mostly on daytime. Of these, 90% of the respondents said they are already married. In terms of educational attainment, only 5% of these respondents said that they have finished college education compared to 24% of whom who said that they have "some elementary education", but was not able to graduate. In terms of employments, 54% were unemployed while 39% are self-employed, either as a store owner, peddler or farmer. In terms of age, most of the respondents were between the age bracket of 37-40 years old who earns less than Php 2,000 income per month (52%), roughly about US 41.57 per month in the most recent currency conversion, or US$ 1.34 per day. 38% of these respondents from San Pedro, in Pagadian City said they have the most number of school-aged children which totaled to 1,011 school children, followed by Sta, Lucia, still in Pagadian City with at least 926 school children. The areas covered with less number of school-age children in the household is in Salambuyan, Lapuyan with at least, 131 school-age children.

There are a total of 4,895 school-age children in the identified disparity barangays. By distribution, at six (6) years old category, of these school-age children, 321 are presently enrolled in Grade I. Among the 7 years old category, 419 of these are in Grade I and 146 are in Grade II, while 12 are not in school. At the 8 years old category, 218 children are enrolled in Grade I, 282 are in Grade II, 145 are in Grade III, 9 are in Grade IV while 5 are not in school. At the 9 years old category, 94 are in Grade I, 136 are in Grade II, 250 are in Grade III, 129 are in Grade IV, 8 are in Grade V and 10 are not in school. At the 10 years old category, 48 are enrolled in Grade I, 70 are in Grade II, 128 are in Grade III, 214 are in Grade IV, 118 are in Grade V, 8 are in Grade VI while 10 are not in school. At the 11 years old category, 17 are enrolled in Grade I, 45 are in Grade II, 57 are in Grade III, 111 are in Grade IV, 199 are in Grade V, 124 are in Grade VI while 8 are not in school and 3 are in First year high school. At the 12 year old category, 16 are enrolled in Grade I, 30 are in Grade II, 59 are in Grade III, 76 are in Grade IV, 122 are in Grade V, 208 are in Grade VI while 21 are not in school and 52 are in High School. In the 13 year old category, 10 are enrolled in Grade I, 13 are enrolled in Grade II, 30 are in Grade III, 31 are in Grade IV, 69 are in Grade V, 114 are in Grade VI while 22 are not in school, and at this age, 132 are in High school. At the 14 years old category, 2 are in Grade I, 6 are in Grade II, 15 are in Grade III, 21 are in Grade IV, 42 are in Grade V, 59 are in Grade VI while 19 are not in school and 119 are in High School. At the 15 years old category, 1 child is enrolled in Grade I, 1 in Grade II, 6 are in Grade III, 17 are in Grade IV, 19 are in Grade V, 34 are in Grade VI while 24 are not in school and 149 are in High School.

Among Grade I pupils being covered in the survey, the barangay that has the highest registered pupils is San Pedro, in the City of Pagadian with a total of 72 pupils followed by Barangay Poblacion in the Municipality if Pitogo. The least is Libertad, Dumingag which has only 8 pupils enrolled in Grade I.

Among the pupils in Grade VI, the highest areas with 11 years old presently enrolled is Sta. Lucia in Pagadian City with 27, briefly followed by San Pedro, still in Pagadian City with 26 pupils and Poblacion, Pitogo with 23 pupils. The least among the disparity barangays Salambuyan, Lapuyan with only 1 pupil enrolled at this age category. When asked whether their children goes to school, with no particular reference as which grade levels and in reference to children age between 6-12 years old, the respondents replied yes (98%) compared to those who said no (2%). Among those who said NO, the primary concern was *No money to spend on school* (63%), followed briefly by *No School uniform, No notebooks, papers and pencils, no schoolbag*, all at 32%. Another 30% said *Hard up times* is the reason why their children are not in school.

Although a huge percentage of those covered in the survey have children in school, the focus of the study is now pointed towards those who replied NO to the previous question if their child goes to school.

Among those who said that their child has stopped going to school, the concentration of those pupils who last attended school at a specific grade level is from Grade III, IV and V, the highest being in Grade V with 162 dropouts followed by Grade IV with 160 dropouts.

The main reason for those who decided not to go school is *poverty* (50%) followed by *high cost of education* (14%), although in the Philippines and even in these areas, primary education is free and relatively cheap. Poverty and high cost of education are two of the factors, considerably affecting school attendance and participation among pupils in school. These concerns are being addressed by one of the factors also that affect school attendance and participation and that is *earning a living* 11% and doing *farm work* 7%. These confluences are making it hard for pupils to stay in school after they had hurdle the academic rudiments of Grade I and II, respectively. Understandably, classroom requirements among Grades III, IV and V are also relatively more frequent as compared to the lower levels, thus compounded by poverty in the countryside, pupils easily gave up schooling to look for a living or undertake farm work to help the parents.

Among those who are in school, an overwhelming (98%) mass of respondents answered that their children do enjoy going and attending classes in the school, at whatever level they are presently in. Further, they responded that their children goes to school between 6:31-7:00AM (68%) followed by those whose children go to school between 6:01-6:30AM (27%) while only 0.1% who said that their children goes to school between 5:01-5:31AM and only 2% said that their children goes to school beyond 7AM. Considerably, the respondents do not accompany their children in going to school (92%) compared to only 8% of them said that they accompany their children in going to school. Usually, their children bring packed meals 'baon' (74%) to school to avoid being late because they had to go home for lunch. Also, 74% of these schoolchildren bring school bags to school for their books, notebooks, and for carriage of the packed lunches.

When asked if their children have incurred absences in school, 64% said yes and 36% said no. The causes of the absences of their children are as follows, *sickness* (55%), *rainy season* (days) at 22% and *no school materials* (11%).

One of the questions of the survey is whether their barangay has a barangay public elementary school, the respondents said they have (98%). The disparity barangays as identified is relatively near the Poblacion or in the Poblacion itself, therefore, presence of a public school is observed. The poblacion is a place where considerable concentration of economic activity is present, i.e. stores, public markets, churches, barangay offices and even municipal offices. Laudably, in Zamboanga del Sur, almost all municipalities have public schools strategically located and established in nearby barangays adjacent to a Poblacion, there is still an unmet barangay due to non-establishment of public elementary school, which unfortunately, were not covered under this study. For the 2% that they are located in a locale that do not have a barangay public elementary school, the furthest school is *less than a kilometer away* to as far as *1-3 kilometers away*. Usually, these schools are accessible by *paved/concrete roads* (51%) and *graveled road* (46%). In the entire province, most of the barangays are accessible although in some areas, there is a need for more infrastructures linking one area to the other. Further, majority of the school children *walk to school* (94%) as compared to those who do not because there are modes of transportation like motorcycle and public transportation system. In this context, the child usually walks since public elementary schools are closely located in densely populated areas and/or centers of economic activity, and these school children *wear slippers* in going to school (95%).

Although the Department of Education do not requires school uniform among public elementary schools in the country, this survey revealed that 96% of the respondents said that the schools that their children attended requires a school uniform. Further, the survey revealed that 78% of the respondents complied with the school uniform requirement and had their children wear uniform in going to school and 22% of the respondents commented that their children do not wear school uniform in going to school, although they have no idea that the Department of Education does not require school uniform among public elementary schools, among others as evidenced in Department Orders issued by the Department of Education.

In terms of the question of whether their children have enough books, it revealed that 64% of the respondents answered that their children have enough school books, although in this particular question, there was no indication if the books are owned or not, or whether the books are being brought to their respective homes or being used in the classroom. Upon evaluation, the responses revealed that it was rather based on the perceptions of these parents that their children have enough books inside the classroom, although the qualification as to how many is enough is absent.

91% of the respondents revealed that their children have time to study in their homes using the books prescribed in the class. However, when asked if their homes have provision of *electricity*, 39% of them said that they do not have electricity at home as compared to 61% who said they have. Of the 39% of the respondents who do not have electricity at home, their main source of light at night are the following, *lamparilla* (table lamp) 99% and *candle* (1%). For those who have electricity at home, when asked whether they have TV sets at home, the survey revealed that they have a TV set at home 62% as compared to those who have not. When asked how long does their child watch TV on weekdays, it revealed that their child watch TV for 1-2 hours daily (56%) and less than an hour daily (44%).

When asked whether their child makes homework or assignments at home, the survey revealed that 97% of them said YES compared to only 3% who said NO. In effectively participating in many school activities, we have asked if their children have enough papers to write on, 83% of the respondents said YES and 91% of the respondents said that their children also have pencils to be used in school.

According to the respondents, their children, while attending schools are required and has in their possession at least, 8 or more different notebooks (36%), followed by those who said that their children has between 6-7 different notebooks (24%) and between 4-5 different notebooks (20%).

Relatively, as to the question on the number of teachers the elementary school where their children went to school, the respondents said that it has 8 or more teachers (68%) as compared to those who said that there are only between 4-5 teachers in the elementary school where their child goes to (9%). When the respondents were asked whether they knew the school teacher of their children, they answered overwhelmingly with a yes (78%) as compared to those who do not know the school teacher of their children. Further, majority (96%) of the respondents said that the teacher of their children comes to school early. And when asked whether the *teachers conduct classes on a daily basis*, their responses are overwhelmingly yes (97%), only 3% of these respondents said that the teachers only have classes at least *four times a week*.

Considerably, these schools as located in the disparity barangays are not multi-grade schools instead, a complete barangay public elementary school as revealed by those who said that the school where their children attended are *not multi-grade schools* (95%). These schools, according to the respondents *have enough seats inside the classroom* (97%) and majority (97%) of the respondents revealed that their children have seats inside the classroom where they are presently enrolled.

CONCLUSION/RECOMMENDATIONS:

Cohort Survival Rate is affected by factors such as poverty, health, distance of schools, motivation as well as incentives of going to school. As evidenced in this study, the cause of low CHR in the province is rather poverty and the inability of the national government to construct more school buildings in strategic areas within the province. Construction of school buildings are still within the ambit of the national government rather than devolved to Local Government Units. In this case, as mandated by the Local Government Code, the proceeds of the Special Education Fund (SEF) usually go to the hiring of locally-paid teachers to augment much needed human resource. These teachers are placed on the payroll as locally-paid teachers until a permanent teaching position is made available. Also, rural poverty plays a critical role. Rural poverty is driving pupils away from schools since they have no sufficient meals to take before going to school and for mid-day lunch. The pangs of hunger always hinder their dream of finishing schooling in the elementary level. At first, they may have a head-start when they enroll in Grades I and II however, due to poverty, they do not often enroll in Grades III and IV. Also, improved nutrition among schoolchildren has to be intensified to ensure that they attend and finished schooling.

For an increased CHR in the province, an intensive intervention that targets rural poverty alleviation should be considered. Intensified alternative mode of living like planting of cassava, high value crops, fruit trees should be encouraged to allow farmers to earn more income to finance their daily needs, which includes meals for their children prior to going to school and the mid-day lunch. Cassava planting is a viable option to make livelihood in the barangay level work for every farmer since the cassava produce can be harvested after 10 months and it do not necessarily require huge open tracks of land for plantation purposes. This is also small-scale but the potential for earning additional income is higher.

Also, extensive and intensified intervention of the UNICEF and the Province will ensure improved CHR among pupils, thus ensuring more pupils enrolling in secondary and eventually, in the higher education sector.

**Trial Placement Provision in Early College Entry as a Novel Approach to Radical Acceleration:
An Introspection by a Radical Accelerand**

Ms. Mikaela Irene Fudolig

University of the Philippines

Abstract

At the age of 11, the author, then a science high school freshman, underwent an experimental type of early college placement program with radical acceleration at the University of the Philippines-Diliman (UPD). The program, titled the "Early College Placement Program (ECPP)" of UPD, features a trial placement period of one year, during which the capability of the student for college academic work and the student's emotional and social growth are observed and assessed. After each enrolment term during the trial period, the student has the option to push through with the program or to go back to high school. If the student decides to push through with the program after the last term of the trial period, the student's performance will be assessed for possible admission into the university as a regular college student. Subjects taken during the trial period may be credited towards the student's chosen degree program.

Because of this fallback option, the student must also take the college equivalent of high school subjects during the trial period. This is to make sure that the student will not fall behind other high school students in terms of academics even if the student decides to go back to high school. The design of the curriculum during the trial period is also of great interest, as one needs to balance the need to take high school equivalents, prerequisites in college courses, and assigning a reasonable academic load.

From the author's experience, the existence of the fallback option, previously unavailable in other programs, had a significant effect on her academic performance and social adjustment. The availability of the option to go back to high school, even though it was not taken, contributed to less social pressure on the author, which enabled her to focus more on her studies. Aside from the fallback option, the program also features a no-media-exposure policy, which also lessened social pressure on the author.

The author graduated at the age of 16, with a degree of Bachelor of Science in Physics from the University of the Philippines-Diliman, summa cum laude. She is now 18 years old, and is teaching physics at the same university while taking her PhD in the same field.

The Use of Questioning Techniques to Enhance Malaysian Student's Responses in the Language Classroom

Shanthi Nadarajan & Tan Yee Suan

University Malaysia Sarawak

Abstract

When education has a purpose and teaching goes beyond the delivery of content, it is important for language teachers to equip learners with the potential to ask and respond to questions. This paper looks at the use of questioning techniques by Malaysian language teachers and how it helps learners perform in the language. The study looks at a) whether teachers' questioning techniques vary according to students' level, b) questioning techniques help learners speak beyond textbook literalness, and c) teachers view questioning strategies as essential to helping learners learn the language. The study looked at four classroom interactions in relation to questions and answers over a period of three weeks. This was followed up with interviews and teachers written responses. The findings revealed that the teachers used a variety of questioning techniques such as redirecting, rephrasing, probing and prompting and this did enable students to respond actively in class. However, there was a preference for rephrasing questions and this affected the learning process. While most teachers agree that by posing more referential and probing questions, they could elicit useful information from their advanced students; such information were dismissed as distracting, disruptive and redundant since the examinations were central to teaching. Many teachers despite insisting that questioning techniques was a move towards the learner centered classroom tend to use questions for reinstating the teacher centered classroom. Teachers who used more democratic forms of questioning strategies managed to instill interest and help their students communicate meaningfully. The findings have serious applications and implications for progress of the learner centered classroom in Asia.

Keywords: questioning techniques, display questions, referential questions, prompting questions, probing questions

Introduction

Language learners make linguistic progress when given opportunities to speak and express themselves in different situations (Nam & Lewis, 2000). Questions and responses during classroom interaction help fule and drive student's thinking skills. Questions that require higher cognitive skills and open ended questions (where there are a number of possible answers) help students communicate, comprehend and grow. Regardless of whether the questions are simple or complex, meaningful, questions matter and should be seen as opportunities for teachers to address gaps in the learners' knowledge. This paper is concerned with the need to inculcate critical and creative thinking skills through questioning techniques and aims to investigate whether the questions posed in the second language classroom can help learners learn the language and use them appropriately.

Background

When discussing questioning techniques, Bloom's (1956) classification of levels of intellectual behaviour in learning is a good place to begin with. The taxonomy contains three overlapping domains: the cognitive, psychomotor and affective. Within the cognitive domain are six levels: knowledge, comprehension, application, analysis, synthesis and evaluation and each domain and level is considered crucial for developing critical and creative thinking abilities. It is believed that by managing questions and responses accordingly, teachers can help steer learners into the various areas and provide opportunities for learners to make decisions for their own learning process. To ensure that teachers remain aware of these needs, teacher training courses focus on this area of knowledge and it is assumed that teachers are knowledgeable about the various levels of questioning techniques, their importance and how it enables learners to think and apply learnt knowledge.

Within questioning techniques, questions intended for the knowledge and comprehension levels are termed as low-level cognitive questions while questions requiring students to respond at the knowledge, comprehension and application levels are considered high level questions. High level questions require students to apply, analyse, synthesize and evaluate and students are required to process information using abstract or higher level thinking skills. Closed questions generally, have a limited number of acceptable answers while open questions allow multiple interpretations and responses which often are anticipated by the instructor. Cotton (2001) insists that students' engagement in higher level thinking aids when remembering factual knowledge and enables them to be more analytical in their thinking. A number of questions allow for multiple answers. **Display** questions can be answered within a single phrase such as, "What is the past tense of eat?" They are low level question that evaluates students' preparation and comprehension. **Referential** questions refer to questions to which teachers do not have a single correct answer to such as "What will you do when you are twenty years old?" Referential questions require students to engage in higher level thinking processes and encourage students to think more deeply and critically, engage in problem solving skills, and stimulate students to seek information on their own. **Redirecting** allows teachers to ask a few students to respond to the same question such as "Young people are good with computers. What do you think about that?" These types of questions serve as an effective way of getting more students to speak out in class. Such questions also enable students to build on one another's ideas. **Prompting** questions refer to questions where the teachers probes the student to narrow the focus of the answer. Such questions are important because they help students analyze their initial error (Moore, 2003). **Probing** questions are important because they encourage students to complete and clarify responses (Wilen et. Al, 2004). They require students to speak beyond the single word response (Kellough & Kellough, 2003). Finally, **Rephrasing** questions refer to questions which are reworded to suit the learner comprehension level such as "how about similes? … do you see any similes in this story?" Rephrasing is necessary because successful verbal communication cannot be achieved without the student's ability to understand what is being said.

The Study

The research looked at students responses to academic questions posed in class. It is assumed that a case study is able to provide a more naturalistic investigation about the teachers' questioning styles which would be less possible if an experimental design were hosen. The researcher did not interfere with the proceedings of the lesson throughout the study.

Population

The 196 participants came from 4 Form Two classes [14 – 15 years of age] from an urban school in East Malaysia. The students came from three major backgrounds (Chinese, Malay and Bumiputeras [Indigenous]) and spoke different first languages and dialects (Hokkien, Mandarin, Malay and indigenous languages). The selected classes consisted of students with different levels of language proficiency, namely the advanced level (2F), the intermediate level (2H and 2 I) and the lower level (2A). The placement of students for each class was determined by the school and based on their achievement in their final examination for the previous year. Students who did well in their overall performance were also good in their English. Each class consisted of thirty five to forty five students. The more proficient students had scored an A for their English paper and were capable of using the English confidently and made minor errors in their speech and writing. Students who had scored a B and C for their English papers were placed in the intermediate classes and were said to be

able to communicate in the language satisfactorily. Sometimes, they were said to struggle with words in their speech and writings but were generally considered to be able to convey their meanings with an almost close meaning. As for the lower level students, these students had failed or were considered weak in the language. The students were seen as struggling students in the language. The selection of the subjects was based on convenience sampling and they were not sitting for any major national examinations and not under any undue pressure to perform for a particular subject. The two teachers involved in the study were between 30 to 32 years of age. Both teachers had a degree in the teaching of English as a Second Language and had taught the subject for at least five years They were teaching one proficient or intermediate group and one weak group. Both teachers were addressing the same topic, text and content from the syllabus. Data collection involved observation notes and a tape recorder.

Process

A total of sixteen observations sessions were carried out. Each class was observed four times and the data was collected over a period of four weeks. The researcher did not analyze the data for the first week as the student's responses could be affected by the researcher's presence. The researcher did not interact with the teacher nor the respondent throughout the sessions so as to ensure neither the students nor the instructors were influenced by anything that was mentioned by the researcher. The teachers provided their responses to the activities in class only after the study.

Data Analysis

Three questions were formulated for the purpose of this study which are as follows:

1. What is the frequency of questions used in class?
2. What are the types of questions used by language teachers in each class?
3. What kind of questioning techniques help build student's communicative skills?

For the purpose of data analysis, only academic questions (questions related to the subject matter being taught) were analyzed. The various questions were categorized according to two categories. The first category contained types of questions (display and referential questions) whereas the second table contained a list of questioning techniques (prompting, probing, rephrasing, redirecting questions). By referring to the observation notes, the researcher placed a tick against each question following closely to the columns that indicated the type of questions and analyzed them following the actual interactions in class.

Findings

Both teachers used similar questioning skills for each lesson. The questions were predictable after the second lesson. As such only four transcripts were chosen for the analysis.

Types of questions used by teachers in class

Both teachers asked a total of 181 questions for the 4 sessions. Of these, only 141 (77.9%) were academic questions. From the academic questions, a total of seventy two (51.1%) academic questions were directed to students in 2F. This was followed by 2I with twenty eight (19.9%), 2H with twenty six (19.4%) and 2A with fifteen (10.6%) academic questions. The average number of questions asked per lesson was pitched at thirty five questions which is equivalent to an average of about one question per minute in a forty minute lesson. The finding is closely related to Cotton (2001) who discovered that thirty five to fifty per cent of the teacher's instructional time was occupied by question and answer recitations.

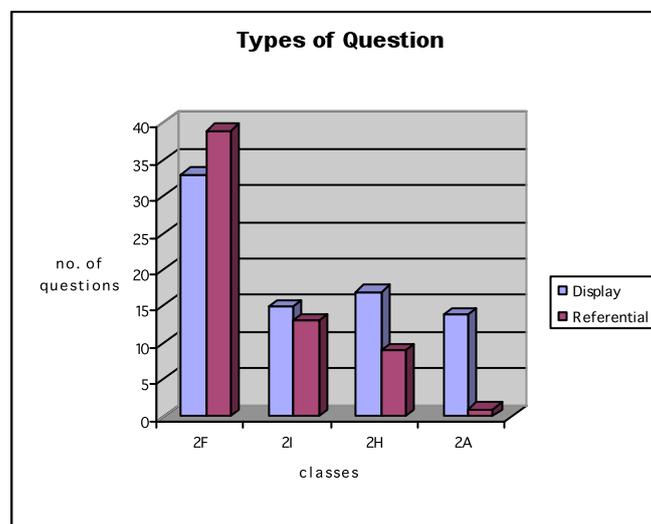
From the analysis, it was possible to state that both teachers used display and referential questions in all the lessons. The majority of questions asked in the intermediate and weaker classes were towards display questions (79 questions – 56%) and the remaining questions (62 questions – 44%) were referential questions. In 2I, 15 questions (53.6%) were display questions whereas the remaining 13 questions (46.4%) were referential questions. In 2H, 17 (65.4%) of the questions asked were display questions with the remaining 9 questions (34.6%) being referential questions. In 2A, 14 of the questions (93.3%) were display questions while 1 (6.7%) was a referential question. The findings of this study concurs with Shomoossi (2004) who found that the asking of display questions exceeded the number of referential questions. Refer Figure 1.


Fig. 1: Types of questioning techniques used by teachers in class

As for 2H, 33 questions (45.8%) of the total questions asked were display questions whereas the remaining 39 questions (54.2%) were referential questions.

During the period of observation, the teachers used numerous questioning techniques to encourage students to respond in class actively. However, rephrasing questions were the only questioning technique employed throughout the sessions. Redirecting was used to generate a wider variety of responses and this helped to shift the focus from teacher student interactions to student-student interaction. The researcher identified a total of seven redirecting questions. There were three questions posed to students in 2A (42.9%), two questions to 2F (28.6%) and two questions 2I (28.6%) but this was not observed in 2H. This is in line with Habsah (2006) who found that teachers seldom asked redirecting questions in classrooms. A possible reason for the minimal use of redirecting question being that when most questions are generally of a factual level, then students merely recite facts without much reflection. A total of twenty eight probing questions were used and the students in 2F were asked a total of eighteen questions while this technique was never applied in 2A. In getting students to respond to probing questions, the teachers often provided hints and clues to help students over difficult areas. There were a total of twenty three prompting questions and these were used in most classes except 2I. There was a tendency for teachers to provide hints by telling students where the answers could be found in terms of page, paragraph providing very little challenge for the better students. Sometimes, the teachers would continue to elaborate to an extent until it was impossible not to realize the answer. Rephrasing was well exploited by teachers in all classes. There were a total of thirty eight rephrasing questions in which thirty eight were asked in 2F (39.5%), ten questions in 2I (26.3%), eight questions in 2H (21.1%) and five questions in 2A (13.2%).

Nature of questions used by teachers in various classes

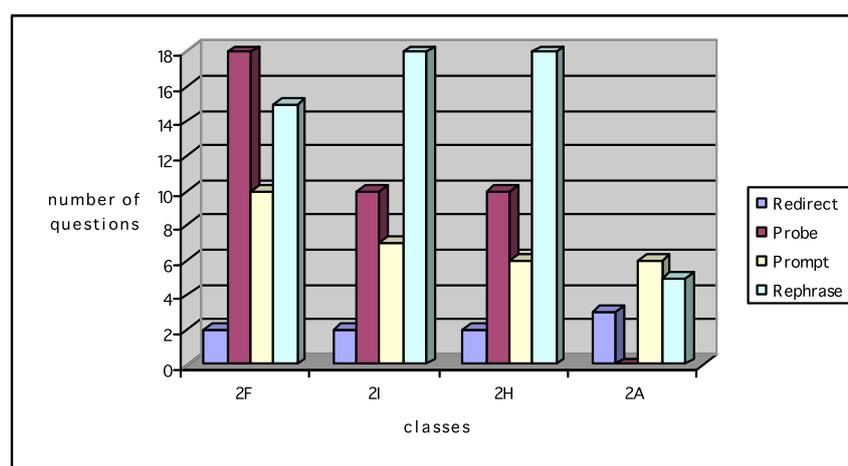
In the advanced class (2F), the teacher used more probing questions (18 question- 64.3%) compared to the other three classes as indicated in figure 2. Probing questions were used extensively because the students had the capability to answer the given questions with further elaborations based on their own interpretations. Hence the use of probing questions enabled the students to speak beyond a single word utterance. This was followed by rephrasing questions (15 question -39.5%), prompting questions (10 question -43.5%) and redirecting questions (2 questions -28.6%). Redirecting questions were given less emphasis even though the students took the initiative to participate in class actively. As for the intermediate classes (2H and 2I) both teachers used more rephrasing questions. Such questions helped students understand the topics effectively and this was followed by the use of probing questions (2 questions – 28.6%). Redirecting questions were not given much emphasis because the students volunteered and the teacher did not have to call on individuals. As for the weaker classes (2A), prompting was used widely to help students deal with an incorrect or incomplete answer so that they can acquire information systematically.


Figure 2: Types of Questions According to Proficiency

Questioning techniques that help build student's responses

Most students were able to answer the display question with minimal effort. In 2F, the teacher obtained accurate responses (100%) for all thirty three questions posed. As for 2A, the teacher collected thirteen responses (92.9%) out of the fourteen display questions asked and 2H answer fifteen (88.2%) out of the seventeen display questions. In 2I, the teacher obtained thirteen (86.7%) out of the fifteen display questions asked. However, it has to be noted that it was not possible to help student build on their language experience through such questions. The transcript below is an indicator of the limitation of display questions.

Excerpt 1 (Advanced Class)

(1) T : When did Dr. Mahathir become the Prime Minsiter? Chen Wei?
(2) S1: Yes?
(3) T : Answer me. Give me the answer.

(4) S1: 1959.
(5) T: 1956, that's wrong.
(6) S1: Okay.
(7) T : Where are you Philip? Louder, stand up, louder, stand up and answer.
(8) S2: 1981.
(9) T : 1981. Okay class, we answer together. What is the answer? (a students passes a book
          to another). Now, stop that. Do I allow you to copy? …okay, question 2, listen

          carefully….

In the excerpt above, the teachers was teaching about one of the nation's leaders. However, the teacher was merely reading out from a list of questions found in the text. There was no challenge in the questions because both questions and answers were made available in the text. Some students had already marked the answers in their text and that explained one of the students passing over his book to his friend to be copied. So, with display questions there were actually very little need to think in the lesson and resulted in the students becoming bored and restless.

As for the referential questions, almost all questions were answered. However, the referential questions   failed to generate new questions or challenge students to think beyond their existing experiences though there were opportunities to do so, because the teacher felt the need to continuously control the conversation as indicated below:

Excerpt 2 (Intermediate Class)

(10) T :   Nicholas, which country do you like to go if you are a sailor?

(11) S3:   Japan, Japan…

(12) T :   Japan? Why do you choose Japan? Why?

(13) S3:   Very nice, the coffee very nice…

(14) T :   That is not detailed enough. You can say a country like Malaysia is

             also very nice…

(15) S4:   Japan's very clean

(16) S5:   Teacher, Japan's food very fresh…

(17) T :   Yes, the food is very different.

(18) S6:   I won't go there for food.

(19) T :   Yah… the food is different. It is good. Both Korean and Japanese

             food are different. …. The food is not sour, it's not salty. It is all

             very healthy.

(20) S3:   That is good?

(21) T :   They take fresh vegetables, fresh fish, fresh meats. Everything fresh,

             Of course that is healthy and they live long.

The teachers were quick to interrupt whenever there was a brief silence. There little time for students to think and students were not able to pick up on a point raised during the process.   Many of the questions were mere fillers and   most   students were not expected to think much accept for the occasional "Yes" and "No" in chorus as in the excerpt below:

Excerpt 3 (Weaker Class)

(10) T: Next, we have "what can I learn?" This refers to everything… the moral
(11)   value or any lesson. So… can you fill in this part before you, before you
(12)   *finished reading this book? Can you? Let's say you read the book or the
(13)   storybook halfway. Is there any lesson from the … from your reading?
(14) S's: (in chorus) No.

In the above excerpt, the teacher required the students to fill in their reflections after having read a book as part of a reading program. The questions merely served to reaffirm a known fact. Most classroom discourses served to invite students to reinstate a previously known answer and there was no consideration for learner's opinions. Most of the questions failed to build any level any level of interaction except give venues for students to agree and accept teachers' comments.

With redirecting questions, it was possible for the teacher to get students to provide alternate responses and this was a fresh change in the intermediate class as indicated in excerpt 4.

Excerpt (4).

(15) T: Alright… in your life as well, we have a purpose. What is the purpose you come
(16)   to… why do you come to school? (nodding towards student C).
(17) S7:   for finding friends
(18) T: What about you (nodding towards another student)
(19) S8: Because our parents' force us …
(20) T: … and you? (knocks on Student's table)
(21) S9: To gain knowledge

In the above excerpt, the teacher makes an attempt to connect the various students learning experiences. By redirecting the same question to a number of students, the teacher gets a number of students to share their learning experiences. This also encourages the passive learners to speak up. This kind of questions are useful for large classes where there is generally few opportunities to engage in face to face interaction.   Another useful strategy   that helped students speak up were probing questions. This was evident even among the more proficient learners as indicated in excerpt (4).

Excerpt (5)

(22) T   :   What is the purpose you come to … why do you come to school?

                 (nodding towards student F)

(22) S10 :   … because parents force us
(23) T   :   Your parents force you" Why do you parents force you to come to school?
(24) S11:   Don't want us to be at home
(25) T   :   They don't want you to be at home? Why they don't want you to be at home?
(26) S12:   Because they are so noisy

(27) T :   There are a lot of places to send you. Why don't they send you to the market?
(28)   Why don't they send you to the jungle?
(29) S13:   Because here got principal.
(30) S14:   …here got rules

Here the interaction started off with a parallel topic in a more proficient class, but the teacher's happened to be more attentive to the student's response. This served as incentive for students to provide more original replies. To avoid superficial answers, the teacher probed the students and challenged them with additional questions. This helped the teacher address issues that might not have been included in the lesson otherwise. Similarly, rephrasing questions as indicated in excerpt (6) were also found to help students speak out but once again this was not used regularly and often ended abruptly.

Excerpt (6)

(31) T: How… make Malaysia well known internationally?
(32) S15:   (Points out the answer to the teacher)
(33) T: Not only that. There is more. Look further.
(34) S16:   He is vocal with his thoughts and opinions on world issues.
(35) T: Some more? A firm stand on…
(36) S15:   On important issues like…
(37) T: Yes, globalisation and terrorism. So number four is done. Give another five
                adjectives to describe him. Turn to page 34, question 5 here. List five adjectives

                to describe him. Are you ready? Are you ready? Jun Tzi, give me one. Refer to

                he textbook.

(38) S16:   Vocal.
(39) T: Any others? From your mind? You? For example, he is vocal, confident, diligent
                and intelligent. Then he is very innovative and creative. Now, you take out your

                exercise book, write this down. Copy down the questions and circle the

                appropriate answers. There are another 4 questions there. Now what does the

                phrase "flying colours mean?" You!

(40) S17:   What?
(41) T: Don't ask me. Stand! You stand as well.
(42) S16:   Hah? Why?
(43)T: I ask you to stand! (Class laughs). I tell you, when I am teaching, I don't want

                people talking in front of me. You think you have the freedom to talk in my

                class!

    Getting learners to talk beyond the words in the printed text was probably the least important aim of the lesson. The teacher was more concerned with getting the students to identify the accurate answer and write them down in the note book.

Discussion.

        Much of the language classes in the study looked familiar, with the teacher beginning with an explanation or teaching. There will be number of questioning activities and this provides opportunity

for a number of students to participate. The teacher call on a few students before summarizing the learning point.   This is not very different from the study of Benjamin (1997) on the Japanese classroom routines. Students contributions are recognized but few students get the opportunity to speak beyond a phrase or sentence. Students who volunteer are given recognition but it is generally the teachers who evaluates the response. This is probably unlike the Japanese classroom context, where students are given the role of judging their peers response (p.44).

Malaysian teachers play both the role of teacher and manager in the classroom. Where large classes are involved and students required to sit in class for several hours, teachers often find themselves playing dual roles as teachers and managers. This results in teachers posing a number of non academic questions that merely reinforces the teacher centred classroom contexts. From the above findings, it is also obvious that the teachers in the study spent a great deal of time asking questions. Unfortunately many of these questions were pitched at the lower level of Bloomfield's taxonomy and happened to be display questions. While questioning techniques (prompting, probing, rephrasing and redirecting questions) yield powerful benefits in terms of encouraging students to participate in classroom activities, teachers do not seem to deliberate over the types of questions that help learners think beyond what is already known. Teaching in Malaysia seems to be more concerned with getting students to provide accurate answers rather than address fluency. While there appeared to be some form of interaction for the more proficient class, it was obvious that helping learners to think creatively did not matter. Interaction seemed to getting students to agree with what they teacher saw as the answer. While it is necessary for learners to acquire some level of fluency before they can be made to speak in chunks, teachers over eagerness to complete students sentences whenever there was silence did not help. Second and foreign language learners generally need time to think and speak out and the teachers in the study seem to be depriving learners of that opportunity. This could be because teachers do not seem to value the learners' contribution to the learning process and there was little attempts to build on the students knowledge. Most questions served as fillers and responses were kept to either the word or phrasal level. While some questions may be better than no questions, teachers must make an effort to promote some level of thinking rather than merely expect learners to agree with the teachers' views. When opportunities to reconstruct meaning remain limited, fixed and obvious, learning can no be seen as engaging and the mind will begin to wonder. This explained many of the blank responses from students who were not following the lessons. Similarly, students do not run into difficulties when a question is directed towards them since the answers can be found in the books. Students are expected to copy the same information making learning a laborious task. By getting students to write down the same answers, the teachers seem to be creating a false impression that students have learned. Unfortunately, the opposite is said to occur especially when learners become over-dependent on the textbook and eventually find themselves being unable to speak beyond the literalness of the language of the textbook.

The learners were also not given an opportunity to ask questions themselves. It could be possible that the students were not used to asking questions since most of the explanations were already available in the text. Teaching and learning seemed to focus on theoretical knowledge rather than applications skills. There was also a predisposition for teachers to let students off easily when students failed to answer difficult questions. Rather than reformulate a challenging question, the teacher automatically provided the answer and moved on the next question with an excuse that they needed to get on with the syllabus. There were instances when the teacher began the lesson with a general question which the students responded to actively. The teacher followed up with a probing question in order to supply additional information but when there was no response from the students, the teacher immediately moved to a new simpler question to avoid the silence in class. There were instances when questions were asked and dismissed without any answers. This created an impression that it was alright not to know the answer, since the teacher would ultimately provide the answer which they will write in their books.

Rephrasing questions was a predominant technique in all lessons. It is possible that copious rewording of questions not only improved student's comprehension, but also maximized students' opportunities to provide correct answers. Even the weaker students volunteered to answer the questions but when questions failed to serve as a challenge, they choose to sit silently in the back or referred to some other print material. There were proficient students who took the initiative to answer regardless of whether the response was right or wrong but these   students were generally more

comfortable with the language. The weaker students continued to bury themselves in the book as if expecting some form of osmosis to take place from the book to the learner.

Implications

Questioning strategies help engage students actively in classrooms. However, the way teachers pose questions and elicit responses do not augur well for the learner centered classroom. These kinds of classroom discourse seem to proceed in a fixed order where the teacher performs a common ritual in a fixed order, where the teacher initates with a question, a student responds and the teacher evaluates (Filmore & Snow, 2000). Asking a question in the response slot can risk teacher censure (Zuengler & Cole, 2000). It is uncertain if the teachers taught about the implications of their questions that they posed in class. It is also necessary that teachers realize that it matters how a question is posed. When teachers have explicit knowledge of language forms and functions, they must realize that they have the tools for helping learners to think and discover in the language. While open and close questions matter, teachers need to be aware of the principles of questions and how challenging questions allow students to become actively engage in the learning process. Non academic questions posed should therefore not come across as intending to put learner down or instill teacher authority in class. Teachers must have access to basic information about how language works and also be prepared to equip themselves with sufficient knowledge in the field in order to serve as a bridge between language content knowledge. The teacher in the study did not seem to know an alternative answer, when the answer was not available in the textbook. It is possible that this teacher in not alone. It is important that language teachers read themselves and be interested in happenings in other fields as well. Teachers cannot continue remain contented with their initial university education as information in terms of teaching and learning is transforming at a rapid pace. Teachers must realize that the knowledge in the books within the books can be restrictive or limited (no matter how well it is designed) and may not be able to prepare students for the real world.

Finally, Malaysia and Japan shares some similarities that can be generalized to many parts of Asia. Most Asian countries share common core values that differ from practices that exist in the United States. Asian countries seem to place greater stress on discipline, character building and emphasizes on a structured culture that demands respect for authority, elders and allegiance to its leaders. In Japan the expectations and characteristics of education is under one nation rule by the Ministry of Education and Malaysia is no different. We are both closely bound in our cultural views, and great emphasis is placed on getting learners to do well in examinations so that they can get into the best schools. Interestingly, Malaysia and Japan are both see seeing education reforms that this conference is good evidence of what is taking place in the region.

Education reforms are in action in Japan, Malaysia and many parts of Asia and the spread of English in the international market is placing greater demands on the way foreign language teaching is addressed in Asia. In East Asia e.g. China, Japan and Korea, the motivation may be economic – where the expansion of international trade requires the population to become more proficient in English as the language of international business, commerce and finance (Kachru & Smith, 2009). South East Asia views maintaining English as important for diffusing rivalry and language conflicts (Ferguson, 1996; Shah, 1968). Within this context, it has been said that "Malaysia in its need to acquire greater technological skills in the shortest time possible" and education for employment rather than knowledge and enlightenment is causing Malaysian learners to become passive recipients rather than active seekers of information (Khoo, 2008). This situation might be reflective of a number of developing nations who are keen to improve their English level of their young population. However, these very same systems fail to realize that information once acquired has to be systematically processed and preserved for ready retrieval through systematic means that facilitate storage and retrieval . Therefore, questions in class should help learners access information, not regurgitate information because "information, once acquired requires creative application" (p.61). Fortunately, with increasing awareness many parents are becoming increasingly concerned with their children's happiness and development in broader activities such as general knowledge and the arts and presently, it is the Asians themselves who are most concerned that the current school system stifles the creativity of young adolescents and contributes to tragic incidents of adolescents bullying and suicide. Currently, with access to greater information and greater awareness, learner expectations have changed as well and it is no longer practical to expect learners to be passive recipients of knowledge. There is a need for greater democratic practices in terms of teaching and learning. Finally, while Asian school systems may have

come under great criticisms for some of the negative outcomes of their education styles, the system has also been greatly praised for many it positive characteristics such as school uniforms, diligence, intelligence and time on tasks. That being said, it is essential to decipher the characteristics of the system that must remain, and the ones that must be revised.   Undoubtedly, a number of well intentioned changes seem to have taken place and although reforms are taking place, it is important that they are made at a faster pace and the changes made more noticeable. Many Asian nations are under criticism that the changes in their education system are occurring too slowly   and there is doubt that in making the right changes, it is "too little, too late."

Abstract

The purpose of this study is to explore the impact of the learning styles and teaching styles preferences and the degree of the congruence and incongruence between them and its impact on learners' achievements among the English Major Students (EMSs) in foreign languages faculty in Azad University in Iran. The results revealed that connecting learning styles and teaching styles in an EFL classes in Azad University plays an important role in student's achievements.

 Keywords: Learning styles, Teaching styles, Match and mismatch, achievement

Today, one of the focuses of research in teaching and learning is of exploring the learners' strategies when they are involved in the learning task. There is also now more emphasis on how students handle learning problems, how they explore the strategies which help them to become successful learners and the effects of the teaching styles on students performance. (Dansereau, 1985; Weinstein & Underwood, 1985).

The premise behind this drive is the belief that, to be effective, ESL/EFL teachers to have knowledge about the learners' learning needs, individual differences in learning, the required teaching methods, learners' preferences as well as the necessary teaching materials required to meet the learners' needs in the educational setting. More specifically, recently, emphasis has also been paid to teaching and learning style. A gap in the literature pertaining to this particular group of learners exists, particularly when it comes to EFL learners in Iran.

Most of the research in this area is cross-sectional and dealt with the learning styles of students in higher education and how the dependent variables such as gender, age, university major, and personality influenced the learning styles (Severiens, 1997; Brew, 2002; Nielsen, 2005). The information on students learning styles can be useful when the learning styles implementation in adult education is related with teachers considering the learners styles versatility at different level and different subjects (Nielsen, 2005). This aspect of the adult learners normally is argued under the matching and mismatching of the teacher styles and their learners learning styles (Hyman & Rosoff, 1984; Beck, 2001; Zhenhui, 2001), and it is advised to be connected to the relationship between the learners learning styles and teachers teaching styles(Zhenhui, 2001).

The findings of past studies done by (Felder,1988;Goodwin,1995; McDonald,1996) explained that a learner's achievement in any class is managed by a few factors, such as native ability, and congruence level of the learner's learning styles and the teacher's teaching styles. Some studies have also found that congruence (matching) between the learning styles and teaching styles have a positive impact on achievement and satisfaction (Ester, 1994; Felder,1988; Goodwin,1995;Mcdonald, 1996). Matching and mismatching between learning styles and teaching styles exist in any academic setting. The mismatch happens when the students' preferred methods of processing information are not aligned with the teachers' preferred styles of teaching. According to Felder (1988) a possible reason for the poor performance is that students may become bored and demotivated.

De Vries (2005) advocated that college students from different cultures have different influences on their learning. Providing instructors with the necessary information about culture and its effects on student learning style preferences will enable professors to incorporate more preferred learning style methods into their teaching. Though a combination of methods should be used (Felder,1996) the incorporation of preferred styles in order to improve retention as well as achievement is important. Felder and Spurlin (2005) stated, "When mismatches exist between learning styles of most students in a class and the teaching style of the professor, the students may become bored and inattentive, do poorly on tests, get discouraged about the courses, the curriculum, and themselves, and in some cases change to other curricula or drop out of school" (para. 2). The objective of this study is to investigate learning preferences among the university students in Iran and its matching level with their teacher's teaching styles and its impact on student achievement. Based on its findings, this study hypothesizes that the appropriate teaching styles that are aligned with students' learning preferences will influence their achievement. Previous studies on teaching styles have been reviewed in order to explain the link which may exist between two variables (learning preferences VS teaching styles). This study reveals the specific learning preferences, which are fundamental for teaching styles in Iranian university setting.

Universities in Iran are also places in which English is taught. Universities in Iran also teach English in a range of independent fields of study, such as English language and literature, teaching English as a second /foreign language and English translation. The students in these fields are referred to as English major students (EMSs). A majority of EMSs in Iran has chosen its major with a certain degree of capability in language use, but there are some students who have a low proficiency in English. Every EMS goes through two years of training that covers general English, which is about the four main skills reading,listening,writing,speaking. In the next two years, the students focus on their specialized course of study. Some of the learners have problem in grasping the contents and concepts of the course given in English language, and this seems to be one of the problems that EFL students face in the target language. This can be explained by their inability or weaknesses in general English, which may have a

significant impact on their academic success. Passing some courses successfully is not the determining factor in assessing the students' overall performance in the language. After passing their core courses and graduating, Iranian EFL graduates still are not proficient and qualified in language use and its components as expected (Farhady et al., 1994). The teaching of English concepts is growing so fast in Iran that there is the need to understand at learners' and teachers' preferences have become central in English education in general and English teacher training in particular. In same line with this, Nunan (1988) stated that, "no curriculum can claim to be truly learner-centered unless the learner's subjective needs and perceptions relating to the processes of learning are taken into account." (p.177)

This research tried to answer the following questions:

1- What are the learning style preferences of EMSs learners and teaching styles preferences of the EMSs lecturers in university classroom setting in Iran?

2- Does the match or mismatch of teaching and learning styles impact on the achievement of EMSs learners in a university classroom setting in Iran?

Methodology

The research method that is used for this study is the quantitative approach using the survey method. Subjects were 310 EFL learners from one of the universities in Iran and four lecturers. The instruments were used in this study were :

1- Felder and Soloman(2006) Learning styles Index
2- Observation and Interview

Results and conclusions

Students learning styles preferences and Comparison in Achievement Scores between Matched Teaching-Learning Styles with Mismatched Teaching-Learning Styles across all four dimensions in Felder and Soloman (2006)

There are four dimensions in Felder and Soloman (2006) which are 1- Active/Reflective (LSP1),2-Sensing /Intuition(LSP2),3- Visual /Verbal (LSP3),4-Global /Sequential(LSP4). The dominant learning styles among the student in faculty of forieng languages are reported as below:

In LSP1 the Active dimension, in LSP2 the sensing dimension, where as in LSP3 visual dimension is preferred and finally in LSP4 the students preferences were Global dimension.

In order to overlook the impact of the match and mismatch on students achievement, analysis was performed using one-way ANOVA to determine if a relationship exists between matched teaching-learning styles with achievement across all the four learning style pairs. For that, the learners were categorized into five groups. The recoded variable was called Match. For learners, whose learning styles matched their teachers' teaching styles across all four LSPs, Match = 4, indicating that their learning styles had a perfect match with their teacher's teaching styles across all the four LSPs. Similarly, if a learner matched his or her teachers' learning style in three of the four LSPs, the learner was categorized into Match group 3, indicating that the learner matched his or her teacher's teaching style in three of the four LSPs. If there was complete mismatch between learners's learning style and his or her teacher's teaching style across all four LSPs, the learner was categorized into Match group 0.

Based on the categorization above, there were five groups under the variable Match. A one-way analysis of variance (ANOVA) was performed to determine if there were significant differences between the groups in the achievement scores. The means and standard deviations of the achievement scores for the five groups are as shown in Table 1. Table 2 shows the results of the one-way ANOVA. Table 3 shows the results of the Tukey HSD post-hoc multiple comparisons.

Table 1: Means and standard deviations of achievement scores for the Match Groups

Dependent Variable	Match Group				
	0	1	2	3	4
Achievement Scores					
Mean	13.47	14.00	14.78	16.79	17.57
S.D.	2.69	3.06	3.35	2.16	1.97
N	18	27	61	136	68

Table 2: One-way analysis of variance on achievement scores for the Match Groups

Dependent Variable	Source	Sum of Squares	df	Mean Square	F	p
Achievement Scores	Between gps	562.04	4	140.51	22.22	0.00*
	Within gps	1928.41	305	6.32		
	Total	2490.45	309			

*significant at $p < 0.05$

Table 3: Tukey post-hoc comparisons on achievement scores for the Match Groups

Dependent Variable	(I) GROUP	(J) GROUP	Mean Difference (MD) (I-J)	p
Achievement Scores	Match Group 0	Match Group 1	-0.53	0.96
		Match Group 2	-1.31	0.30
		Match Group 3	-3.32	0.00*
		Match Group 4	-4.10	0.00*
	Match Group 1	Match Group 2	-0.78	0.66
		Match Group 3	-2.79	0.00*
		Match Group 4	-3.57	0.00*
	Match Group 2	Match Group 3	-2.01	0.00*
		Match Group 4	-2.79	0.00*
	Match Group 3	Match Group 4	-0.78	0.23

*significant at p < 0.05

As can be seen from Table 1, the mean achievement scores for Match Groups 0, 1, 2, 3 and 4 are 13.47, 14.00, 14.78, 16.79 and 17.57 respectively. The results of the one-way analysis of variance, as can be seen from Table 2, showed a significant difference in the means, $F(4,305)=22.22$, MSE=6.32, p=0.00. Post-hoc multiple comparisons using the Tukey HSD tests showed significant differences between Match Group 0 with Match Groups 3 and 4, MD (Mean Difference)=-3.32, p=0.00 and MD= -4.10, p=0.00 respectively. Significant differences were also recorded for Match Groups 1 and 2 with both Match Groups 3 and 4. However, no significant differences in achievement were found amongst Match Groups 1, 2 and 3 or between Match Groups 3 and 4. The results indicate that Match Groups 3 and 4 outperformed the other Match Groups in achievement scores but their performance did not differ from each other. In short, the results imply that generally if teaching styles are matched to learning styles, achievement of students will be significantly better up to a point. The results in this section are consistent with that in the section above where it was found that when teaching and learning styles are matched for individual LSPs, performance would be much better than if they were not. The results of this study revealed that connecting learning styles and teaching styles in an EFL classes in Azad University plays an important role in student's achievements. Furthermore, it also showed that there is a match in some extent between the teachers and students styles in EFL classes, second when there is a match between the two group's so the achievement level positively is affected and finally, connecting learning styles and

teaching styles in an EFL environment is important in making accommodations and modifications within the course room of EMSs learners.

Implication

Instructors must first recognize that they have the authority to broaden their teaching styles in ways that meet versatility of their students' learning style preferences and that by doing so they play an important role in improving the quality of education in Iran. EFL/ESL methodologies have long been viewed as the ancestor to teaching methodologies used in other fields. EFL instructional practice can inform educators teaching in fields other than EFL about the effective ways to teach in EFL or any other field.Given that students are studying in a context in which EFL is the medium of instruction, all classes at Azad University (different faculties) from social sciences to natural sciences could benefit from using, at least to some degree, EFL methodologies such as altering teaching styles to reach a wider variety of learning styles by attending to the preferences of students. Findings from this study should serve as a glimpse into the process of how instructors can begin to improve the quality of education they provide in the practical sense. As the participants of this study demonstrated, the concept of learning style preferences in their EFL context is relatively new. The fact that students learn in different ways and the possibility that instructors can adapt their instructional modes has come both as a surprise and a relief to many educators at Iran. Results of the case studies revealed that instructors commonly fear about the idea of accommodating students' learning style preferences that might be impractical in their context given the large class sizes; lack of resources, etc. However, the results of this study revealed that students indicated students positive reaction towards their versatility needs to be met through the lecturers conducting different teaching styles.

Teaching Practices of Foreign English Instructors in China and the Students Response

Baoqi Zhang, China (Xingjian College Guangxi University, Nanning, China)

Key words: Academic Practices, Administrative Practices, English as Second Language Teaching, Teacher's Motivations, Learning styles

General Introduction

China's participation in an increasingly globalized world requires a high degree of English proficiency amongst citizens, which have attracted a large number of westerners. Some want to enlarge their overseas markets by coming to China to look for business partners and others are just eager to experience the realistic Chinese life. As a college student who is majoring English right now, the author of this article discovered that a large number of native-speaking English teachers (NSETs) come to teach in China.

It is believed that native speakers could provide students with a more authentic learning environment and as well students can benefit from more accurate pronunciation, intonation and tones. Furthermore, they may get more cultural influence due to the teacher's background. What is more, these foreign teachers brought some brand-new teaching styles which are quite different from those of Chinese teacher's[i]. Through both the survey study and interviews with the foreign teachers and students in Xingjian College, Guangxi University[ii], the author found that Students were confused by some foreign teachers' teaching methods and realized they learnt almost nothing in the foreign teachers' classes at the end of the semester.

However, the majority of them activate the Chinese students' interests for learning English by their novel, vivid, humorous and democratic classroom environment, and really make a great contribution to Chinese English teaching. Moreover, because NSETs are coming from different countries with different cultural backgrounds, personalities and experiences, the college administration is also facing problems in administering such a mixed team.

Before preparing to write this article, the author read many journals and books related to English teaching. Almost all of them spoke highly of the foreign teachers' instruction. In the article "The Differences of Teaching in Class between Foreign and Chinese Teachers"[iii], one of the authors Ms Yu, after observing some foreign teachers' instruction, saying from a Chinese English teacher's standpoint that foreign teachers are more responsible and cultivated than Chinese teachers, and their teaching methods are more practical. Through this article, the authors try to call the Chinese teacher-team to learn from the foreign teachers and get rid of the Chinese teachers' deficiencies to make the teaching work better in the future in China.

In another article "China EFL: Foreign teacher needed"[iv], the author referred that "China is a developing country and that its students need well-trained and reliable people to teach them English as the nation moves forward. It is lamentable that most foreigners coming to China are only looking out for a quick travel opportunity". With a combined 12 years teaching experience in China, the authors are very unsatisfied about the foreign teacher recruiting process in China and wish China could think deeply about how to regulate the recruiting system and what kinds of foreign teachers they really need.

However, this article is written from a standpoint of a Chinese student and maybe it's the first critical academic assessment of foreign teachers in China ever. Therefore, in this article, the author is going to analyze these problems and give some suggestions as a result of the analysis of interviews and survey study.

The benefits of this research are useful for potential teachers in China and other non-western countries that plan to teach outside their home-country and Chinese administrators as well to take

corresponding measures to prevent and solve these problems in order to hire the most suitable foreign teachers and enhance the English teaching worldwide.

Introduction of the Case study. Teacher's attitudes, teaching practices and motivations

The author interviewed 11 foreign teachers and asked some questions that are related to the main ideas of this article (See Appendix A: A list of the questions I asked the teachers). Specifically, the following questions are to be addressed.

1. When I asked Teacher A "what made you decide to come to China and be an English teacher" he said the following:

Well, it's the first job I got after I graduated. I graduated in 2006. I stayed for 4 years in the same city, with the same people and the same environment for my study. At one point, I got really tired, bored and I want to change for a fresh start. And then I thought maybe I should go to the other side of the world. You know, Asia is a mysterious place in almost all the westerners' minds. It's not only far geographically but far in the imagination. So this kind of thing attracted me to China.

This response reflects a "low-achiever's attitude". His motivation for teaching in China is just based on a random factor - "for a change" factor. There is no doubt that it is a stereotypical, superficial and not serious motivation. I am wondering now that he can teach English in China, why not a Chinese student teaching Chinese in Britain, Canada or any other countries around the world, with minimal teaching load, being paid five times more than the local people. Maybe British or Canadian students will take such a teacher seriously, will respect and listen to him/her. He/she might also want to have a new start and Chinese is the mother tongue as well, besides they could also have a college degree easily. Unfortunately, it is proved that they can't. Probably they could if they had at least a master degree with having passed many tests some day[v].

2. Teacher A also referred another reason of coming to China:

When I was young, I was playing some Chinese video games, Sanguo[vi] and mahjong. And one summer when I was in university, I started to read about Taoist, you know laozi, zhuangzi, I really got into it, but still I was not making plans to go to China. A few months before I graduated, I was found out that my uncle happened to teach in China! I stayed in touch with him and asked him to get me a job there. If he were teaching in India, probably I would come to India. But he was in China. It is a bit of luck!

It appears from these words that he has some serious cultural interest, but in terms of teaching, that is still a shallow reason. Moreover, it is "Guan xi"[vii] way rather than interest that makes him teach in China. What is the difference whether he got a job in China with the help of his uncle while a Chinese guy who was employed by his father's company and eventually proved to be an ineffective employee? This happens in China very often[viii]. The foreign teacher just takes it for granted that teaching English as a native speaker in China is a cake walk. This is a typical "low-achiever attitude and extreme cultural blindness".

Compared to the response of the foreign teacher above, Teacher B's answer is different. That is:

Well, this is a very interesting question. First, I went back to school at an older age and completely changed my major. When I was a young man, my first degree is Speech Communication, but then I never actually worked in that filed. When I was almost 50, I decided to go back to school and get a new degree. Because I knew I could continue working physically. I need to do something more mental. By the way, when I was 18 years old, I spent 2 years in Japan, which let me to a very high degree of interest in Asian cultures. I discovered then that so much Japanese culture actually came from China, especially during the Tang Dynasty. So I am always interested in Chinese culture. So when I went back to school, I had two goals that I had to go and increase my understanding of Asian culture, history and policies and I am also interested in teaching English as a second or foreign language. So my second major was a combined major. It is called Asian Studies and Second Language Acquisition.

Compared with the first one, this teacher's motivation is totally the opposite. He looks like and actually is a high-achiever with a serious attitude. From a standpoint of a Chinese student it can be figured out easily how much courage and steady faith one should have and how valuable this goal is to him if he went to school again at the age of 50. In reality, in America continuing education is common now, but the Chinese students still feel that it's a serious example and an admirable role model because in China a career change is very rare at an old age. This means he is very serious about this major and he will treat teaching as his career for the rest of his life. In a way, it also means a fresh start, but this is from a much higher level, because on the one hand, he has been falling in love with Asian culture since he was 18 years old and went to school again at 50 to study it as a major. On the other hand, the speech communication, which is his first major, is similar to the teaching degree. It is still useful to his dream career------teaching. To sum up, this is a typical "delayed self-actualization". It is still a much better motivation than just a superficial cultural interest.

These two cases provide the range within which all the foreign teachers that were interviewed can be easily placed in terms of motivations, second agendas and teaching practices. However, there is still another foreign teacher's reply that should be mentioned. Teacher C had already been dismissed at the end of the year 2008.

Actually I came to China the first time in 2003 to learn more about the Chinese culture and to meet a girl that I eventually married. I was very nervous about teaching English in a college. I am not a teacher by profession, I was a computer programmer and consultant for many years but I did have a lot of experience teaching computers in businesses. I also felt confident that my English ability was good enough to teach English as a second language and I love a new challenge, so in 2003 I came to teach in China. In 2007 I kept thinking about how much I loved my students in China and how much I loved this country, so I decided to change my career and become an English teacher and to leave my country and my previous career.

This teacher taught this writer for a whole year. What he did in class is quite different from what he said here. He talks in a serious way but acts in a totally opposite way. He often showed us girls' pictures in class and said "these are all my Chinese girlfriends and so on". Apart from girls, the writer can't see any serious motivation from him, not at all. This case should have been resolved at the level of recruitment. Trouble makers don't need to be hired in the first place.

Survey of Students' responses

In order to make a clear understanding of students' opinions to the foreign teachers and their identification to themselves, the writer did this survey. There are 4 big questions in the questionnaire and each one has 6 to 9 choices. 37 students in different classes joined in this survey and chose the answers with their personal ideas, besides the author also interviewed about 10 students randomly. All the results are following:

Table A. Foreign teachers' teaching methods and features

Methods and Features	Relaxed class atmosphere	Prolific contents	Cultivate the capability	Combine the culture	Humorous	Teacher-centered	Students-centered
popularity	94.59%	37.84%	35.14%	45.95%	81.08%	21.62%	64.86%

From Table A, it is clear to see that in the foreign teachers' class: firstly, they often set some practical, informative and highly culturally-inclusive scenes in order to draw students' attention. For example, the scene would be about how to make the interviewer feel that you are just the person they are looking for when having an interview and how to behave well in the public. Secondly, through some funny slang words and lively body language, they create a humorous and relaxed classroom atmosphere, where students could get rid of their nervousness and shy minds involuntarily. In such

classes, students answer questions enthusiastically, especially the Grade one students, although their English is not fluent yet.

Table B. Problems of foreign teachers' teaching

Problems of foreign teachers	Too many personal ideas, not formal	Many aspects but weak in stress	With too easy content	Speak too fast	Use textbook seldom
Percentage	78.38%	37.84%	43.24%	27.2%	40.54%

The Table B shows that in most students' opinions, what they have learnt in the foreign teachers' classes are lacking in unification and most are from the teachers' personal ideas that are not related to the books that the students have to buy and value. This makes those Chinese students who get used to studying with books step by step confused and at a loss. In China, it is defined clearly in the syllabus that teachers should teach and make exams in accordance with the textbooks.

Table C. Problems of students themselves

Problems of students	Narrow vocabulary	Grammar mistakes	Little cultural background knowledge	Shy and nervous	Not familiar with teacher' accent, behavior requirements
Percentage of Boys	86.49%	24.32%	75.68%	24.32%	43.24%
Percentage of Girls	83.78%	35.14%	56.76%	40.54%	48.65%

The Table C shows that students' vocabulary is not as big as it should be which makes them feel unconfident when practicing oral English. What is more, because of having little cultural background knowledge, they are always thinking of western literatures or theories with a Chinese mind and making mistakes eventually which are no surprise.

Form D. Students' expectation of foreign teachers

Expectation to teachers	Standard accent	Responsible	Humorous	Knowledgeable and competent	Tolerant
Percentage	81.08%	89.12%	78.38%	62.16%	70.27%

The Table D tells us that most students' expectations of foreign teachers are high. They wish to have responsible, humorous, knowledgeable, tolerant foreign teachers.

Suggestions for foreign teacher's regarding their teaching techniques.

NO 1. Make some extra rules and regulations related to teaching itself.

Colleges should set up clear requirements with regard to teaching details in the appendixes or additions to the contract (the contract is the same all across China)[ix]. For example, the colleges' requirements regulate the matters that can be called ethical such as every foreign teacher should not be

late for class or not leave. There is practically nothing or very little regulation concerning the teaching practices themselves, such as foreign teachers are not supposed to show movies in class for longer than 15 minutes or they have to use the book provided by the college at least 70% of the class time. This sort of regulations and requirements should be expended well into the teaching practices to show that the college is serious about those providing examples of good teaching methods, particularly bad teaching practices in order to avoid common mistakes. This will make the management of foreign teachers easier and also it will make quite clear for them to know what should or shouldn't do and the result would be a reduction in unnecessary troubles. The college should provide some handbooks that are related to teaching guidance. In the book 'The foreign teachers' hand book, A guide to living and working in Guangxi University', there is a chapter called Handing Teaching Accidents which only talks about the teaching accidents. In reality the guidance should go much deeper than this existing level. Nobody knows what teaching accidents are: there is no definition of it and there is no example of deducting of 500RMB and 6 points for first infraction, 6 points deducted for second infraction and so on (From the book). Which means it is not enforced and nobody cares.

They should tell the foreign teachers more details about how to teach in a Chinese classroom environment and what kind of materials to use or not to use and examples of lesson plans, syllabi, marking criteria just like the IELTS or TOEFL program provide. If the IELTS has very clear requirements how to teach and grade, why shouldn't Chinese colleges have them?

NO 2. Set up clear curriculum and exam requirements.

In order to keep classes running well and exams equal and meaningful, colleges should tell foreign teachers which parts in the textbooks must be mentioned in class and which might be taught by using their personal methods. This would prevent some foreign teachers from teaching totally by using their own ways and leaving the textbook far away. As to examinations, since one course may be taught by more than one teacher in different classes, it is highly necessary for them to reach a moderate work to the standard of the scoring.

NO 3. Office hours

Opening more office hours could provide more opportunities for students to communicate with foreign teachers. At first, students can practice their oral English. Secondly, students could probably get the knowledge of western cultural background when chatting. What is more, they could ask questions that they couldn't understand in class. At last, through the communication, students would feel closer to teachers mentally and which would be beneficial to create humorous atmosphere in the classroom. Further more, it is a good opportunity for foreign teachers to learn about Chinese culture, customs, national conditions and especially the Chinese education system through the communication with students. Perhaps after that, they may come up with a better teaching method which is more suitable for Chinese students.

Appendix A—Interviewed questions asked foreign teachers:

1. Did you teach before you came to China?

2. And what made you decide to come to China?

3. Do you think there are some differences between Chinese students and the students in your motherland in terms of their ways of learning?

4. If it indeed has this difference, so what is the strength of Chinese students in learning English and what is their weakness? Could you give me some examples? Thanks.

5. Will you change your teaching methods when meeting these differences, your Chinese students' weakness and how?

6. By which way that you refer teaching the students? Teaching in accordance with the textbooks or by your personal ideas and experience?

7. I am pretty sure that there are some lazy students in your classes. How could you deal with these students? Will you abandon them

8. There is a phenomenon I've noticed recently: Nowadays, Chinese students have more opportunities to go to college and which is good. However, some students who are actually not qualified enough to get a further education with many reasons are actually studying in the colleges because they gave a lot of money to the colleges. Such as, some got very low scores in high school and they always make trouble in class. It seems to me that education has become a business in China. What do you think? Is it good or bad?

Appendix B:

Teacher A is a 25 year old Canadian male teacher who came to China as an English teacher just after he graduated from a university in Canada with a bachelor degree. He has been in China for almost 3 years.

Teacher B is an around 60 year old American male teacher who was a teacher of migrant students in the USA for 4 or 5 years. He has been teaching English in many cities in China for 5 years.

Teacher C is a 58 year old American male teacher who was a computer engineer in Australia for many years and has been teaching in China for 2 years.

Collaborative Peer Teaching in the College ESL/EFL classroom

ABSTRACT

The idea of learner getting involved in their learning, instead of passively receiving information from a teacher, has been considered the essence of education. Incorporating peer teaching in the college ESL/EFL classroom can create an environment where students take more responsibility for their learning. This paper aims to discuss how peer teaching is used to teach a variety of language items. The effectiveness of the peer teaching is evaluated using student feedback questionnaires.

INTRODUCTION

Mastering English in college is vital as a means to coping in university courses that are taught in English. Learners in college pre-university English courses in Malaysia usually meet the minimum entry requirement in terms of English language proficiency; however, the learners are of different levels of proficiency. The learners are also struggling with the transition from school to college and meeting the objectives of the ESL courses that they have to pass in order to meet the university language requirement.

Learners from the Malaysian school system are taught English since primary school and are primarily exposed to the communicative approach of teaching. Hence, they are able to effectively communicate in real life situations. However, they lack the language skills required to handle academic tasks that involve specific rhetoric. Academic writing, the main focus of evaluation, is something that students find most challenging and this is due to their lack of mastery of selected language items. Hence, before focusing on the more academic tasks at hand, it is only right that the students' previous knowledge be reinforced.

The traditional method focusing on drills as well as teacher-centered methods is a disservice to learners who are preparing to move on to university. It has been well studied and documented that student centered methodology is far superior to that of teacher centered methodology. This paradigm shift is not a new development.

Peer teaching, a collaborative learning approach represents a significant shift from the teacher-centered milieu in college classrooms.

LITERATURE REVIEW

Collaborative learning is based on the assumption that learning is an active, constructive process. To learn students have to participate actively to gain new information, ideas and skills. Students are no longer receivers of knowledge, they are creators of knowledge. This explains the shift from the teacher-centered method to the student-centered method. Empirical studies have found that student centered methods to be superior to teacher dominated methods because they focus on application of concepts, problem solving, attitude, motivation, group membership and leadership skills. McKeachie et.al (1986) point out that one of the most effective methods of teaching is students teaching other students.

In the context of language teaching and learning, Nunan (1998, p.3) points out that learner-centered methodology focuses on providing learners with "effective learning strategies". The pedagogical approach of collaborative peer teaching can create an active learning environment where students become the producers of their learning rather than passive consumers. They become active learners

who learn by teaching. Thus, the learner-centered approach is regarded as an appropriate methodology for language learning (Tudor, 1997).

Collaborative peer teaching falls within the social constructionist framework which has established that knowledge occurs through social interactions. While working with their peers, students can learn and teach together (Asinder, 1991). Peer teaching, a learner-centered approach, is founded on the concept that the learner is central in the learning process. Learners are actively involved in their learning instead of acting as passive recipients of knowledge as they learn primarily because of what they bring to their classroom experience in terms of their perceived needs, motivations, interests and creative skills. In collaborative peer teaching, learners play an active decision-making role, often deciding what materials are produced and what activities can be used in the lessons (Campbell & Kryszewska, 1992).

According to Johnson, et al (1995), learning is a personal and social process, in which learners cooperate to construct shared understanding and knowledge. Collaborative learning is also promoted as individualistic and competitive learning conditions are perceived as discouraging active construction of knowledge (Johnson & Johnson, 1989).

Peer teaching is also commonly regarded as a form of self-regulated learning which primarily gives the learner an opportunity to play a major role in acquiring knowledge. It basically refers to students teaching other students as planned and directed by the teacher. In peer teaching, students learn through doing tasks organized by the teacher, by collaborating on various types of tasks and activities (Whitman, 1998).

Cohen, Sampson, & Boud (2001) claim that peer teaching, is a teaching method that is most effective. As a learner-centered method, it is regarded as far superior to teacher centered method especially in developing higher order thinking skills and problem solving skills (Biggs, 1999). MacKeachie, et al. (1986) stresses that in higher education, the development of critical thinking should be the focus of learning, not the learning of facts and theories. To develop critical thinking, they propose that the learning process include student discussion, problem solving using various methods as well as verbalization of methods and strategies. Basically, preparing to teach someone is seen as way to produce a more highly cognitive structure. Someone preparing to teach will recognize the materials for clearer presentation and while actively teaching may recognize and clarify material on the spot (Whitman, 1998).

Apart from promoting active learning and critical thinking, collaborative peer teaching is also believed to make learners take charge of their learning, which is considered an important aspect in the development of life-long learning (Miley, 2004). According to Benson (2003, p.305), "we cannot teach learners to become more autonomous" but we can create an environment with suitable conditions in which they can develop the autonomy they have.

Additionally, Rubin & Hebert (1998) state that peer teaching motivates learner and develops their leadership skills.

Motivation is an important aspect of any form of learning. Learners who are self-motivated are capable of being self-regulated learners. In fact, Meece (1994) says that self motivation, an essential aspect of self-regulated learning. Research indicates that self-motivation is a prerequisite for peer teaching, which is self-regulated learning. The level of self-motivation can be increased by giving students feedback that ability is an acquired skill rather than a fixed or inherent skill. Self-motivation can also be increased by giving a student self-confidence which leads to situation specific efficacy (Meece, 1994). Studies also show that in peer teaching, learners become self-confident, respected each other developed as critical thinkers taking responsibility for their own and others' learning (Spratt & Leung, 2000). Hence, peer teaching is seen as having cognitive and affective benefits.

Peer teaching leads to self-regulated learner. It is believed that self-regulated learners are unlike other learners as they make a stronger use of conscious selection and control over critical thinking and learning strategies, and they continually self-assess their progress and the effectiveness of their learning strategies (Zimmerman, 1989). Additionally, self-regulated learners are capable of constantly reflecting on the most effective way to achieve mastery of a learning goal. With regard to this, learners are more likely to self-regulate their learning when the choice of learning approaches includes rehearsing,

elaborating, modeling and organizing (Meece, 1994). Thus, a learning environment that incorporates these learning approaches will create an environment that is more conducive to students becoming self-regulated learners.

Integrating peer teaching in the college classroom is also founded on the basis that learners are diverse. Learners bring multiple perspectives to the classroom – diverse backgrounds, learning styles and experiences. When students work together on their learning in class, they are sharing different perspectives and employing different learning styles. Language learners are probably the most diverse learners and collaborative peer teaching is seen as an approach that can motivate them to become self-regulated learners. (Asinder,1991).

METHODOLOGY

The subjects in this study are 68 students who are enrolled in the Monash University Foundation year, a pre-university course that prepares students for university study. 62 of the subjects are Malaysian students and 6 of them are international students from Korea, Botswana, Somalia, and Sri Lanka. A diagnostic test was administered to identify areas in which students need reinforcement. The test consists of 40 questions covering language items such as tenses, conditionals, modifiers, pronouns, and basic sentence patterns. The diagnostic test revealed that students needed reinforcement of language items such as conditionals, the present perfect and past perfect tenses, use of correlative conjunctions, noun clauses, adjective clauses and adverb clauses.

Once the language items to be reinforced were identified, students we told to form groups and pick a topic they would like to teach others. The students were allowed to consult the teacher on the areas in which they needed clarification and were allocated 25 minutes to teach a selected language item. Students were given time to discuss and come up with activities that can help reinforce the language items. They were encouraged to use different types of teaching aids to present the lesson successfully. To illustrate what they were required to do, the teacher taught some of the language items so that students knew what was expected of them. They were given sufficient time to prepare and teach the language item that they had chosen. Students were encouraged to use various teaching aids available in the classroom and use different activities to illustrate the language items they have chosen to teach. Some activities that illustrated by the teacher include role playing, simulation, dramatization etc.

The peer teaching lessons were integrated into daily lessons in the second and their week of the semester so that students can successfully review the language items that they are unfamiliar before they are introduced to academic writing.

In order to study the students' perception of collaborative peer teaching and its impact on their learning, a questionnaire was designed and employed. The questionnaire is divided into two parts. The first part is a structured, Liker-scale questionnaire comprising 10 statements that measure the important aspects of the students' experience in peer teaching. Items are measured on a five-point scale, indicating the degree of agreement or disagreement, ranging from strongly agree (1) to strongly disagree (5). The second part of the questionnaire consists of 3 open ended questions for students to share their views on the peer teaching experience and its impact on their learning.

RESULTS

The value of Cronbach's Alpha based on the 10 items in the questionnaire is .89, indicating that the 10-item measure is a stable index of the students' perception of the value of peer teaching. Table 2 presents the items along with the mean scores and the percentage for responses given

Table 1. Learners' Perception of Peer Teaching

No.	Question	Strongly	Agree	Uncertain	Disagree	Strongly	Mean

		Agree (%)				Disagree	
1.0	Peer teaching is a learning method I find interesting	45.6	45.6	5.8	1.5	1.5	1.65
2.0	Peer teaching helps me to understand language items	35.3	45.5	14.7	1.5	3.0	1.82
3.0	Peer teaching helps me to remember language items taught	39.8	36.8	17.6	5.8	0.0	1.90
4.0	Peer teaching helps me learn From my friends	36.8	44.1	19.1	0.0	0.0	1.87
5.0	Peer learning makes me feel confident	38.2	50.0	11.8	0.0	0.0	1.74
6.0	Peer learning makes me feel I am in control of my learning	36.8	38.2	20.6	2.9	1.5	1.90
7.0	Peer teaching motivates me	42.6	41.3	13.2	2.9	0.0	1.71
8.0	I like to decide how language items should be taught	35.3	42.6	17.6	4.5	0.0	1.91
9.0	I like to be more involved in peer teaching	35.6	54.5	7.4	2.5	0.0	1.91
10.0	Peer teaching is a learning activity that I take seriously	32.4	44.1	17.6	4.4	1.5	2.04

The survey indicates that 91% of the learners feel that peer teaching is an interesting activity indicating that students highly value peer teaching as a fun method of revising language items. About 7% were uncertain if it is interesting and about 2% did not find peer teaching an interesting activity. In terms of understanding, 84% feel that the peer teaching method of revising has helped to understand the language items that they had to teach, but 1.5% did not feel that it has helped them in understanding the items that they were revising.

When it comes to retaining knowledge, 77% of the learners feel that peer teaching has helped them remember the language items they have taught, but 17.6% of the learners are uncertain of the effectiveness of peer teaching in helping them to retain the skills related to the language items they have taught and 5.8% feel peer teaching did not help them remember what they had learnt in order to teach their classmates.

About 81% of the learners feel that peer teaching has made it possible for them to learn from their friends, but 19% of them do not know if they have learnt anything from their friend through collaborating and preparing lessons.

In terms of confidence, 88% of the learners feel that peer teaching makes them feel more confident of what they know. However, almost 12% of the learners are uncertain if peer teaching has any effect on their level of confidence.

75% of the learners feel that peer teaching gave them some form of control over their learning, but 21% remain uncertain on whether peer teaching helped them be in control of their learning. 4.5% of the learners feel that peer teaching did not make them feel they were in control of their learning.

In terms of motivation, about 84% of the learners feel that peer teaching is a highly motivating activity, but 13% are uncertain if they were motivated by peer teaching and almost 3% do not feel that peer teaching had any effect on their level of motivation. About 77% of the learners agreed that peer teaching is a methodology that gives them the opportunity to make decisions on how lessons can be presented.

On whether they would like more opportunities to peer teach, 90% said they would like to be involved in more peer teaching compared to 7.5% who are uncertain if they would like to peer teach again and 2.5% who do not want anymore opportunities to be involved in peer teaching.

76.5% of the learners reported that they took the peer teaching activity seriously compared to almost 18% who are uncertain of their attitude towards peer teaching and almost 6% who did not take it seriously as a learning activity.

Summary of Responses to Open –ended questions

Question 1. What are your feelings about peer teaching?

Some comments made by the subjects include

- It is a rather challenging activity
- It motivates me to do more study on the language items so that my friends do not think that I do not know what I am teaching
- I like to share what I know; it makes me feel that I am smart and knowledgeable
- It is interesting because we see different people teaching everyday.
- I like discussing when we are planning the lessons because it makes me less nervous and my friends can give me more ideas.
- It feel it's a lot of work, but I also learn a lot. It is fun because we work in groups and what I do not know my group members can teach me so that when it is our turn to teach, we can do well
- Peer teaching is like playing teacher and I like it sometimes.
- I can cooperative with my group members while preparing the creative materials for the lesson that we had to teach.
- Students also have knowledge that can be used in the class so if the teachers can give them the opportunity to use that knowledge, students do not feel bored learning in the class.

Question 2. How does teaching others benefit you?

Learners shared how peer teaching benefit them:

- I feel more confident about what I know and in talking to my classmates. It is like doing an oral presentation.
- It is good for me because before I can teach someone I must know all about the topic so I must be well prepared and I must know my tenses and how to use them. If I am not peer teaching, maybe I will not need to know as much.
- I remember the language items that I have taught. This is because I spent time going through the structure when I am preparing the lessons with my group members and when I teach, I remember more.
- I think what questions others will ask, so my group members and I had to come up with different types of examples. It makes me feel like an expert knowing all my stuff and knowing what questions might be asked and having all the answers.

- I learn more because I just do not learn one item, but I see the links. When I had to teach the conjunctions (and, but. so, for . yet, or), I also learn how when using the conjunctions, we also have to learn parallel structure and how to punctuate sentences. Although my group chose to teach conjunctions, we all learnt how it was connected to other items. So I think I learn a lot even before the teacher had taught parallel structure
- I get to be more active in class instead of the teacher coming to class everyday and teaching us.

Question 3. What do you dislike about peer teaching?

Learners shared what they perceive as the drawbacks of peer teaching:

- I do not like it when my classmates ask unnecessary questions just to test my knowledge.
- I think it difficult because we do not have that much time to prepare.
- It makes me nervous because I might not know all the answers and I do not want my classmates to think I do not know what I am talking about.
- I feel pressured to do well although the teacher says we are not evaluated and it is just an activity to revise what we have already learnt. I still feel pressured to do better than the other groups.
- Teaching grammar is difficult. Maybe we can be assigned to teach other topics.
- It involves a lot of planning and group work and sometimes some group members do not cooperate with others

DISCUSSION

This study was designed to examine learner's perception of peer teaching and its impact on their learning. The study surveyed learners' reactions based on the peer teaching approach to language learning focusing on the revision of selected language items.

Several findings were obtained from this study. In examining learners' perception of peer teaching as a method to revise language items, it is clear that 88% of the learners' feel that it increases their confidence. This is an important finding which reinforces the advantage of peer teaching as a method to make students more confident in the ability. Confidence to direct their own learning is an important aspect of life-long learning skills (Miley, 2004).

The findings of the survey also show that most students perceive peer teaching as an interesting method of learning language skills. This is clearly indicated in their responses as 91% agree that peer teaching is interesting. When students are interested in actively participating in their learning, this will serve to increase their motivation. Peer teaching certainly allows for various experiences and aptitudes of learners besides allowing learners who have prior knowledge to demonstrate it, maintaining their interest in the language classroom. When students are given the opportunity to work with their friends to prepare the lesson and execute the lesson in any manner appropriate it adds to making peer teaching an interesting method. And having a different group of learners teaching a language item for each lesson adds to the diversity of the lesson which could also explain why most of the learners find this method interesting.

84% of the learners reported that peer teaching motivates them. This indicates that working in groups with others learners has a positive effect on their learning experience. Collaborating with others gives a learner the ability to share and learn as well feel they know the subject matter. Knowing what they have to teach can be motivating as they can confidently deliver what they already know. Learners can also be motivated as learner-produced materials add interest and spontaneity to classroom learning.

This motivation can further increase their self-confidence and make them more capable and willing to actively participate in their own learning, which leads to them feeling in control of their own learning. 75% of the learners have indicated that peer teaching makes them feel they are in control of their learning and this is something that fosters learner autonomy in the classroom (Allwright, 1988).

The survey results also indicate that students liked working with their friends and feel they have learnt from each other. Most (90%) have responded that they like more opportunity to peer teach. This is a

positive indication that learners can be oriented to play an active role on their learning if they are given the opportunity to do so.

Open-ended responses supported the other survey data, where most of the learners feel that peer teaching is interesting as this is a shift from teacher dominated lessons. It gives them an important role to play in the everyday running of the lessons and the opportunity to participate actively as opposed to being passive learners who sit and try to absorb lessons that are taught. It also seems that students take responsibility for their learning as they do not want to appear as not being capable of teaching the topics that they had chosen to teach. Although students knew that they are not going to evaluated as part of the course, they made a good effort in being well prepared as they did not want to look bad in front of their classmates neither did they want to be corrected by the teacher when they were teaching the topic they had worked on. Hence, they were motivated by external factors as well as intrinsic factors.

The learners also reported that having to teach a language item meant that they had to be answer any question based on that item. This motivated them to be well prepared and to anticipate possible questions from their classmates. They report that if they did not have to teach the language item, they might not have come to class prepared. In preparing to teach the language item that they had selected, they also discovered other related skills, which they highlighted in their lesson. Hence, another value of collaborating teaching is that learners discover new knowledge on their own or with the help of their friends. They can be self-regulated learners because they are able to take charge of their own learning.

Some learners (2.5%) feel that they did not want to be involved in more peer teaching as they found it challenging and they were intimidated by their friends' questions. They feel some students are evaluating their capability and felt threatened. Some had problems with group dynamics and uncooperative group members. They also feel that more time should be given for them to plan and teach the lesson. These responses are expected since some of the students are not as proficient as others and have less confidence. As mentioned earlier, they learners are of different proficiency levels although they have all met the minimum entry requirement. With better group distribution and facilitation, these are some problems that can be minimized. Despite these problems, 90% want to be given the opportunity to teach with their friends and that is a good indication that learners enjoy diversity in the language classroom.

There are limitations to this study as the students achievement is not tested after the peer teaching activity. Only student perception of the method is recorded. It would be interesting to see if there is a correlation between peer teaching and learners' achievement or progress in the language items taught. This is a possible area for further research. Another limitation is the peer teaching activity was only carried out at the beginning of the semester so the real benefit to the learners might not be clearly known.

CONCLUSION

Collaborative peer teaching in the language classroom can be used to reinforce students' prior knowledge. It is less threatening and demanding of the learners as it is founded on the assumption that the learners have some knowledge of what they are going to teach. The rationale of using this approach is to make all students learn in a motivating environment.

The clear advantage of peer teaching is learners become confident in the ability to direct their own learning, which is a prerequisite to life long learning skills. Students receive self feedback and acquire the skills to master the topics and as their confidence increases, so does their motivation. By increasing the range of learning opportunities, learners develop the ability to rehearse, elaborate and organize the topics they have to teach. Also, they feel that they have acquired knowledge on their own instead of depending on the teacher.

Learners reported that the peer teaching experience increased their understanding of the subject matter, enabled them to apply course concepts in new settings, and encouraged them to participate actively in the classroom and be responsible for their own learning. Hence, peer teaching is a valuable, even critical, experience for students in college.

"*What is happened?": A corpus-based analysis of L2 English unaccusative verbs

Liang-chun Wang
National Chengchi University

Siaw-Fong Chung
National Chengchi University

Abstract

The unaccusative verb phenomenon is often discussed in second language acquisition. While most previous studies tend to explain this phenomenon of L2 overpassivizaton errors, this study adopts a corpus-based and quantitative approach by comparing the use of *happen* in three different corpora. In addition, its comparison to a native speaker reference corpus in this word further provides an insight into the similar or different performances of Taiwanese local EFL learners regarding this unaccusative verb.

Key words: unaccusative verbs, *happen*, BNC, learner corpus, second language acquisition

INTRODUCTION

As proposed by Zobl (1989) and Yip (1995), the term 'learnabilty' refers to second language (L2) learners' learning process from one state of knowledge to another based on language input. The learning process may display L2 learning difficulty to acquire a certain linguistic form or language element in second language acquisition (SLA). Unaccusative verbs constitute one of the complicated language elements with various alternations in transitivity in different languages, and this makes mastering their native-like usages in L2 learning more challenging.

The Unaccusative Hypothesis, first posited by Perlmuter (1978), is a syntactic hypothesis claiming each of the two classes of intransitive verbs, the unaccusative and unergative verbs, possessing a distinctive syntactic structure, such as *The glass broke.* (from *John broke the glass.*) versus *John laughed.* (with no alternative form)**.** A large number of research later focused on the incorrect usages produced by L2 learners (e.g., **My father was died.* or **It **happened something** interesting.*) (cf. Balcon, 1997; Yip 1990; 1995; Yuan, 1999; Ju, 2000; Oshita 2000; 2001; Hirakawa, 2001; Park & Lakshmanan, 2007; Lozano & Mendikoetxea, 2008). Among these studies, the incorrect usage or error of overpassivization, such as **It was happened*, has been argued heatedly, even though to this date there seems to be no persuading evidence to explain why this incorrect usage occurs. Despite the generally discussed issue of overpassivization, the difficulty of acquiring the unaccusative verbs may also due to L1 transfer, i.e., the transfer of L1 linguistic features, such as auxiliary selection or word order to L2. Furthermore, the types and frequencies of incorrect usages with respect to every unaccusative verb, such as *break* versus *happen*, may not be similar. This preliminary study intends to use a corpus-based and quantitative approach to compare two reference corpora (the British National Corpus (BNC) for English and the Chinese Gigaword Corpus (GW) for Chinese, and they were contrasted to the LTTC Learner Corpus for L2 English (cf. Chung and Wu (2009)).[1] The work will investigate the unaccusative verb *happen* and its usages in four grammatical forms (*happen, happens, happening,* and *happened*) in order to discover other distinctive usages of this unaccusative verb *happen* between natives' and L2 English learners' production. With detailed L2 learner corpus analysis and its comparison to the two reference corpora, this paper will present similarities and differences between the natural occurring native data and L2 learner data in Taiwan so as to identify the local L2 English features and compare them with the global ones to find out a plausible solution and interpretation for the unaccusative verb *happen*. This study, further, focuses on the frequency, perfectivity, and word order of *happen* in English and its counterpart *fashen* in Chinese.

UNACCUSATIVE VERBS AND THEIR RELATED CORPUS-BASED STUDIES

Perlmuter (1978) originally proposed the distinction between the two classes of intransitive verbs—one is unergative verbs, involving willed and volitional acts (e.g., *run, walk, laugh,* etc.); the other is unaccusative verbs, involving unwilled and non-volitional acts (e.g., *melt, open, happen, appear, fall,*

---

[1] The British National Corpus (BNC) is a 100-million-word collection of written and spoken texts. For more information, see: http://www.natcorp.ox.ac.uk/. On the other hand, the Language Training and Testing Center (LTTC) Learner Corpus is an intermediate L2 English written texts collected from the General English Proficiency Test (GEPT), a formal English standardized test in Taiwan.

break, etc.) On the other hand, the variation among these unaccusative verbs can be further divided into the two subclasses, namely alternating unaccasative verbs/ergative verbs (e.g., *melt, open, break,* etc.) and non-alternating unaccusative verbs (e.g., *happen, appear, fall,* etc.). The examples of alternative unaccusative verbs, non-alternative unaccusative verbs, and unergative verbs can be seen in (1) below based on Park and Lakshmanan's (2007: 329) study.

(1)   a. Transitive of alternating unaccusative/ergative:
          <u>John</u> broke <u>the glass</u>.
          Suject   Direct object   (Grammatical roles)
          <Agent>   <Theme>   (Thematic roles)
      b. Intransitive of alternating unaccusative/ergative:
          <u>The glass</u> broke.
          Suject   (Grammatical roles)
          <Theme>   (Thematic roles)
      c. Intransitive of non-alternating unaccusative:
          <u>The car accident</u> happened.
          Suject   (Grammatical roles)
          <Theme>   (Thematic roles)
      d. Intransitive of unergative:
          <u>John</u> laughed.
          Suject   (Grammatical roles)
          <Agent>   (Thematic roles)
                              (Park & Lakshmanan, 2007: 329)

As illustrated in (1a) above, the agent of alternating unaccusative/ergative verbs in a transitive pattern is mapped onto the subject position and the theme is mapped onto the direct object position. However, when transformed into an intransitive pattern, as can be seen in (1b), the mapping of the subject is similar to that of non-alternative unaccusative verbs (1c), where the theme is mapped onto the subject position. This is different from the thematic role mapping of unergative verbs in the intransitive pattern (1d), where the subject position is occupied by the agent.

Owing to the complicated alternative/non-alternative patterns, related research attempted to investigate the interface between syntax (e.g., Sorace, (2000) on auxiliary selection) and lexical semantics (e.g., Levin & Rappaport Hovav, (1995) of unaccusative verbs, such as *a recently appeared book*. Some studies also explained the unaccusative mismatches of unaccusativity, i.e., the imperfect matches between the two classes of verbs either syntactically or semantically among languages (Levin, 1986).

Hence there are two main lines of the previous research emerging in SLA. The first research line has paid attention to the distinction between the unaccusative and unergative verbs in the intransitive pattern in order to see whether L2 learners accept the incorrect usage of unergative transitive, such as *She sang hoarse. (cf. Nakano et al., 2005; Park & Lakshmanan, 2007). On the other hand, the second line of unaccusative verbs is related to the unusual phenomenon of overpassivization in non-alternating unaccusative verbs, such as (1c) previously or **Mary's mom was died* (e.g., Yuan, 1999). The overpassivization is difficult because neither learner's L1 nor L2 has a possible input to cause it to happen. A Chinese-English example is shown in sentence (2) below:

(2)
   Zha gouqu de yinian zhongda xingan buduan fashen. (adapted from *GW*)
  in past of one year significant crimes constantly happen
  'In the past year, significant crimes constantly happened.'

Sentence (2) shows the usage of the Chinese unaccassative verb *fa-shen*. As Yip (1990) pointed out that neither English (*was happened) nor Chinese (e.g., *bei fa-shen '*be happened') can provide passivized unaccusative usages, and thus, searching for the cause of L2 English overpassivization of unaccusative verbs would be difficult. Another viewpoint proposed by Ju (2000) is that not every unaccusative verb would cause the same frequency of overpassivization. Ju also said that "the frequency of unaccusative verbs" (p. 102) in native use would not be definitely consistent with that of L2 learners, which indicates that the discrepancy between the frequently appearing language patterns of native speakers versus those of L2 learners may also generate difficulty for L2 acquisition of the unaccusative verbs.

However, most of the previous studies above rely on the grammatical judgment test, a test used to judge grammatical correction, to investigate L2 learners' grammar competence. While understanding L2 learner corpus is becoming more important, in recent years, two corpus-based studies were seen to have analyzed L2 learner corpus, and they provided more linguistic evidence for unaccusative mismatches and overpassivization phenomena in SLA.

Oshita (2000) conducted a corpus-based study through using the Longman Learner Corpus (LLC) containing Italian, Spanish, Japanese, and Korean L1 data. The study attested these data based on the following five main issues (p. 295).

(3)
    a. learners' L1 transfer of a compound tense/aspect auxiliary selection system
    b. overgeneralization of the adjectival passive formation in English
    c. nontarget lexical causativization
    d. identification of the passive morphosyntax with the lack of a logical subject
    e. nontarget overt marking of syntactic NP movement

These five issues reflect both semantic ((3b) & (3c)) and syntactic ((3a), (3d), & (3e)) concerns, though the author claimed that the syntactic theory of the nontarget NP movement (3e) would be the most feasible one on account of its simplicity without dealing with complicated semantic features of every unaccusative verb.

As for (3a) above, many previous studies (e.g., Falk, 1984; Sorace, 2000; Keller & Sorace, 2003) suggested that this would more appropriately explain the unaccusative verb acquisition among Romance and Germanic languages. The two perfective auxiliaries BE and HAVE are suggested to consist of the following antecedent: verbs of location (*come, arrive, etc.*), verbs of changes of states or appearance (*die, happen, appear, etc.*), verbs of existence (*stay, exist, etc.*), and verbs of process (*walk, run, etc.*), all of which are between the concepts of the uaccusative (*come, arrive, die, happen, appear, etc*) and unergative verbs (*walk, run, etc.*). Although the sentences (4a) and (4b) from Oshita's (2000) examples (pp.296-297) clearly identified the L1 French and Germany auxiliary selection as the transfer to L2 English as sentence (4c), their use are found lacking in other Asian languages, such as Chinese, Japanese, and Korean.

(4)
  a. *Trois garcons sont   arrives   á la gare*. (French)
   three boys **be 3pl** arrived   to the station.
  b.*Drei Jungen sind   am Bahnhof angekommen*. (German)
   three boys **be 3pl** to the station arrived.
  c. **The two girls are arrived at the bus stop*. (L2 English)

For this reason, a recent study of Chinese auxiliary selection by Liu (2007) found that the typological differences in languages make Chinese unaccommodated to Romance and Germanic auxiliary selection system because its semantic rather than syntactic differences. Thus, she suggested that the auxiliary selection of verb perfectivity could fit Chinese unacussativity analysis well. The imperfective aspectual auxiliary–*zhe* and perfective aspectual auxiliary–*le* in Chinese have been examined through the Chinese verbs. The verbs of location (e.g., *lai-le* 'come-perfective auxiliary') or the verbs of change of state in Chinese (e.g., *si-le* 'die-perfective auxiliary', *zhang-zhe* 'grow-imperfective auxiliary') typically selected the perfective aspectual auxiliary –*le* (5a), unless the change of the location or the change of state is indefinite or without a resultant state, in which either –*zhe* or –*le* would be possible (5b).

(5)
  a. *Nali lai-le/ *-zhe   hendou ren*. (adapted from Liu, 2007: 7)
   there come-LE/*-ZHE many people
   'There came many people.'
  b. *Tianli zhang-le/-zhe hendou zhong shucai*. (adapted from Liu, 2007: 8)
   Field-in grow-LE/-ZHE many kind vegetables
   'In the field is growing many kinds of vegetables.'

On the other hand, regarding (3d) mentioned previously, Lozano and Mendikoetxea (2008) used the International Corpus of Learner English (ICLE) to compare and investigate the non-native usages of postverbal subject order, such as **it happened a car accident*, produced by Spanish and Italian learners of L2 English learners. They found that L2 English learners generated postverbal subject order in the unaccusative verb structures. As can be seen in sentence (6a) below, Spanish allows postverbal subject order (*IIegado Juan* 'arrived Juan') in concordance with unaccusative verbs, and thus the L2 unaccusative mismatch in (6b) below may be transferred from L1 word order. Likewise, Chinese language has a similar postverbal subject order structure shown in (6c), and this may also influence L2 English unaccusative acquisition of Chinese learners.

 (6)
  a. *Ha IIegado Juan*. (Spanish)
   has arrived Juan 'Juan has arrived.'
  b.**I do believed that it will **exist a machine or something** able to imitate the human imagination*. (L2 English)
   c. *Rugua you renheren **fashen yiwai**, Zhashan ying fuze*.(Chinese, adapted from *GW*)
    If exist anyone   happen accident, Zhashan should manage
    'If an accident happens to anyone, Zhashan should manage it.'

From the overview of the literature of corpus-based L2 unaccusative verbs, two issues of the Chinese learners of L2 English acquiring English unaccusative verbs are still worth discussing. The first issue is how Chinese L2 English learners apply Chinese perfectivity to L2 English learning. This concerns how they display similarities and differences with regard to L2 English unaccusative verbs and Chinese counterparts. Since English uses auxiliaries (BE/HAVE) plus grammatical forms (*–ing/–ed* or *–en*) whereas Chinese uses the suffix-like auxiliaries (*–zhe/–le*) to display the distinction between imperfective and perfective aspectual concepts, we thus postulate that there exists a relationship between Chinese suffix-like auxiliaries and the L2 English grammatical forms in the incorrect usages of English unaccusative verbs. The second issue is whether the Chinese postverbal subject order (as in (6c) above) in unaccusative verbs will influence the usages of L2 English unaccusative verbs as well as the non-native overpassivized patterns discussed in most related studies.

The present study attempts to conduct a corpus-based research and incorporate a lexical semantic approach by focusing on a specific English unaccusative verb *happen* through the four mostly used grammatical forms (*happen, happens, happening,* and *happened*). With respect to the syntactic concerns, the contrast of the incorrect usages of *happen* from the LTTC Learner Corpus with the Chinese auxiliary selection system (*–zhe* and *–le*) and postverbal subject order (**fashen yiwai** 'happen accident') will be conducted. The possible L1 transfer of these features in Chinese to L2 English will be investigated and examined as well.

RESEARCH QUESTIONS

Based on the previous studies and the unclear explanation of L2 English unaccusative verb acquisition, we then propose the following two questions:
1. How are the distributions of the grammatical forms (i.e., *happen, happens, happening,* and *happened*) in a native versus a learner corpus?
2. How do the Chinese auxiliary selection (*–zhe* and *–le*) and postverbal subject order (**fashen yiwai** 'happen accident') influence the choices of the grammatical forms for *happen*?
These two questions will be discussed in the following sections.

METHODOLOGY AND GENERAL FINDINGS

The methodology section includes analyzing three corpora and erroneous sentence analysis. Each of the two sections would be elaborated and discussed in terms of the procedure as well as general findings.

Analyzing Three Corpora

We first compared the English reference corpus (BNC), the Chinese reference corpus (GW), and the LTTC Learner Corpus— in order to find out occurrence of *happen* in three corpora. With respect to the BNC and the LTTC Learner Corpus, we searched the grammatical forms (*happen, happens,*

happening, and *happened*) of the unaccusative verb *happen* and investigated the frequency of each grammatical form in order to compare the differences between native and L2 English usages. The erroneous rate of each grammatical form was taken into account in the LTTC English Learner Corpus so as to provide some evidence for analyzing the difficulty of acquiring *happen*. On the other hand, in the GW, we searched the frequency of the Chinese auxiliary selection (*–zhe* and *–le*) within the auxiliary-attached structures *fashen-zhe* (impefective) versus *fashen-le* (perfective) in order to investigate the perfectivity concept in the Chinese counterpart *fashen* of *happen*. The result would tell whether or not L2 learners apply a similar perfective strategy in learning English *happen*. Additionally, the postverbal subject order was also investigated in order to distinguish the different frequency of word order between English and Chinese.

Data from both Chinese and English are shown in Table 1 below. As can be seen in Table 1, there are some similarities and differences in grammatical forms in both the English reference corpus and the learner corpus. We can find that the most frequently used grammatical form of *happen* is *happened* in both the BNC (with approximately 42 % from 31245 instances) and the LTTC Learner Corpus (with more than 45 % from 62 instances). The *–ed* form which includes the past tense as well as the past participle in the perfective aspectual concept. However, in the LTTC Learner Corpus, the erroneous rate shows that *happened* possesses a higher percentage (75% from 28 instances), which probably reflects the difficulty of learning the appropriate usages of past tense and perfectivity in L2 English unaccusative verbs.

TABLE 1. Frequencies, percentage, and erroneous rate of the grammatical forms

Happen					
English Reference Corpus (BNC)			*Learner Corpus (LTTC)*		
	Freq.	**%**	**Freq.**	**%**	**Erroneous Rate**
happened	**13111**	**41.96%**	**28**	**45.16%**	**75% from 45.16%**
happen	**8472**	**27.11%**	**23**	**37.10%**	**52% from 37.10%**
happens	5693	18.22%	5	8.06%	0% from 8.06%
happening	3808	12.12%	6	9.68%	16% from 9.68%
others	161	0.51%			
Total	**31245**	**100%**	**62**	**100%**	**54% from 100%**

Although the second most frequent grammatical form in both corpora is the base form *happen*, the percentages show some differences. In the BNC, *happen* occupies 27.11% of 31245 instances, while, in the LTTC Learner Corpus, *happen* accounts for 37.10% of 62 instances. The erroneous rate of *happen* (52% from 23 instances) also reaches a higher proportion, indicating that the base form of the unaccusative verb *happen* may also have some potential problems in L2 learner data. Compared to the frequency of *happens* (18.22%) in the BNC, this form in the LTTC Learner Corpus shows only 8.06% of coverage, indicating that intermediate L2 English learners rarely use this grammatical form belonging to the third person singular agreement. This, however, may be due to the nature of the topic as well, as certain topics may require the use of more third person singular pronouns than the first or second person pronouns.

Concerning the Chinese auxiliary selection in the GW, compared to the imperfective structure *fashen-zhe* 'happen-imperfective auxiliary' with approximately only 2.16% within 18161 auxiliary-attached structural sentences (*fashen-le* and *fashen-zhe*), the perfective structure *fashen-le* 'happen-perfective auxiliary' returns more than 97.84% of these 18161 instances, which indicates that the Chinese counterpart *fashen* may frequently be combined with perfective aspectual auxiliary *–le*, and this also shares some similarities with the grammatical form *happened* of the perfective aspectual concept in English. Chinese tends to use more instances of (7a) than those of (7b), and this may suggest that students may mingle the perfective aspectual concept with the unaccusative verb *happen* in English. Unless when the time end point is not definitely clear as in (7b), the imperfective aspectual auxiliary *–zhe* in (7b) will be used.

(7)

a.….*Jiazhiguan dou **fashen-le   bianhua*. <GW:CNA19910108.0119>
　 moral Value all *happen-LE change*. 'The moral value has totally changed.'
b.…*Dalu jingji lingyu zhengzai ***fashen-zhe   fuza-de   bianhua*.<GW:CNA19930307.0117>

TABLE 2. Frequencies of the postverbal subject order in Chinese and English reference corpora

	fashen			*Happen*		
	GW			*BNC*		
	Freq.	**%**			**Freq.**	**%**
fashen+N	**187172**	**44%**	**Happen.*+N**		**139**	**0.44%**
Others	238051	56%	Others		31100	99%
Total	425223	100%	Total		31245	100%

The last part of the three corpora comparison focused on the frequency of the postverbal subject order in both Chinese and English. As shown in Table 2, the frequencies of this type of structure between Chinese and English display some differences. The Chinese postverbal subject order (*fashen*+N, e.g., ***fashen huozai*** 'happen fire') occupies 44% from 425223 instances of *fashen*, and, further, 5.7% out of 44% belong to a two-argument structure (N+*fashen*+N, e.g., *renheren ***fashen yiwai*** 'anyone happen accident'). This contrasts with the proportions of the English postverbal subject order for *happen* (e.g., *These things ***happen Danny***. <BNC:S:KPA>). Within 31245 samples of *happen* from the BNC, only less than 0.5% (0.44%) reflect this type of structure, indicating that the postverbal subject order is less frequent in English.

The analyses of the three corpora found that (a) the grammatical form *happened* was the most frequently used in both BNC and the LTTC Learner Corpus and this is also observed in the Chinese auxiliary selection *fashen-le* 'happen-perfective auxiliary' from the GW in terms of perfectivity; (b) *happened*, *happen*, and *happening* showed a similar order in terms of the frequency, while *happens* was found to show contrast in frequency between the BNC and the LTTC Learner Corpus; and (c) the postverbal subject order of Chinese (*fashen*+N, e.g., ***fashen huozai*** 'happen fire') is more frequent, compared to that of English (e.g., *These things ***happen Danny***.<BNC:S:KPA>).

Erroneous Sentence Analysis

In the second step of the methodology section, we extracted some erroneous examples in the LTTC learner data from the previous Table1. We categorized them as different types of errors as well as their frequency in the learner corpus. Our erroneous sentence analyses correspond to the data from the previous corpus analysis and show the L1 transferred linguistic features, such as the Chinese auxiliary selection or the postverbal subject order to L2 English.

TABLE 3. Frequencies, percentage, and examples of the erroneous examples in the LTTC Learner Corpus

Error Types	Freq.	%	Erroneous Sentence Examples and Possible Explanations
Type1-Subject-verb agreement or tense marker[2]	15	44%	8a. **How did this happened?* 0158.txt 8b. **Why the* 現象 *happened?* 1646.txt

---

[2] We group modal verb problems into this error type.

Type2-Infinitive usage	9	26%	8c. **But you may say what is the reason cause this happen*? 1577.txt 8d. **What make this happened?* 0340.txt 8e. **There are some reasons what cause it happening.*1165.txt
Type3-Present Participle usage	5	15%	8f. **To avoid this thing happen..*0477.txt 8g. **Because there was one thing happened about me..* 0300.txt
Type4-Passivized Unaccusative Verbs	4	12%	8h.**I think it is happen because the development..*1256.txt 8i. **Maybe it's happened because of the TVs ..*0158.txt 8j. **First problem is always happened.* 1269.txt
Type5-[+human] subject	1	3%	8k. *****This situation*** *I have never* **happened** *before!* 0100.txt
Total	**34**	**100%**	

As shown in Table 3, there are mainly five types of errors discovered in the LTTC Learner Corpus – 44% in Type 1; 26% in Type 2; 15% in Type 3; 12% in Type 4; and 3% in Type 5. Among these types of errors, Type 2 reaches the most various grammatical forms, including *happen, happened,* and *happening* (22.22%, 66.66%, and 11.11% respectively from nine instances). Type 1 occupies the most proportions of the erroneous sentences. Moreover, the grammatical form *happened* appears to be the most frequent grammatical form in every syntactic structure (61.76 % from all of the 34 erroneous sentences). This overuse of a certain form may be due to the L1 Chinese transferred perfectivity, as discussed previously regarding the prominence of the perfective equivalent *fashen-le* in Chinese. We also discovered that the first three error types were affected by L1 auxiliary selection. The Chinese suffix-like auxiliaries (-*zhe* or -*le*) seem to influence the selection of perfectivity in Englsih (–*ing* or -*ed*). However, L2 learners of English tended to ignore the English auxiliaries (BE or HAVE), which can explain the rare uses of the complete imperfective structure (BE plus –*ing*, e.g., *What is happening?*) or perfective structure (HAVE plus –*ed*, e.g., *The accident has happened.*) and the low frequency of the grammatical form *happens* in the LTTC Learner Corpus. Once L2 English learners made decisions on perfectivity (*happening* or *happened*) or the base form (*happen*), they might commit errors by persistently using a certain grammatical form across the various syntactic structures, such as wh-transformed questions as in (8a) or infinitives as in (8c). The uses of *happened* in performing the perfective aspectual concept, impacted by similar Chinese counterpart *fashen-le* (97.84% from 18161 auxiliary-attached structural sentences (*fashen-le* and *fashen-zhe*)), would be more salient in most L2 learner errors. Even in example (8b) with Chinese code-mixing *xianxian* 'phenomenon', *happened* can be persistently combined with Chinese characters, meaning that L2 learners of English follow the Chinese auxiliary-attached pattern (*xianxian fashen-le* 'phenomenon happen-perfective auxiliary').

The last two error types, yet with lower frequency, are likely to be affected mainly by the Chinese postverbal subject order, while the grammatical form *happened* transferred from the Chinese perfectivity still occurs. Type 4 is constituted by three out of four errors with *happened* and one with *happen*. We postulate that Chinese learners sense the passive voice in L2 English unaccusative structures similar to the alternative unaccusative structures in Chinese (*renheren* **fashen** **yiwai** 'anyone happen accident'), the passivized patterns would occur as in (8j) **First problem is always happened*. The can also explain the [+human] subject errors as in (8k) *****This situation*** *I have never* **happened** *before*.

DISCUSSION AND CONCLUSION

From the result above, we find some answers to the two research questions. First, among the four grammatical forms, *happened* occupies the most instances, and this high frequency can be discovered similarly in the BNC and in the LTTC Learner Corpus. However, the grammatical form *happens* shows

differences in the two corpora, suggesting that *happens*, representing the English third person subject agreement, would be difficult to elicit. The overuse of *happened* may be seemingly due to the transferred Chinese perfectivity. Along with the transferred feature from the Chinese postverbal subject order, the overpassivized errors would emerge.

Moreover, regarding the overpassivized errors, if one's L2 possesses prominent morphological change in languages such as English, these passivized errors are likely to become more frequent. On the contrary, if one's L2 possesses less prominent morphological change in languages such as Chinese, the passivized errors may become less frequent. Shan and Yuan (2008) proposed a claim of "availability of passive morphology" (p. 179) in typological differences among languages. Their study showed that L2 English learners of Chinese produced fewer overpassivized errors due to the less prominent morphological change in the L2 language (i.e., Chinese). The reason is that English has salient and visible morphological change in passive voice patterns, e.g., *Your letter has **been** received*, while Chinese does not always require a passive marker *bei* (e.g., *Nide xinjian (bei) shoudao-**le*** 'your letter (be) receive-perfective auxiliary.'). However, our data showed that L1 Chinese transfer may also influence L2 English unaccusative verb acquisition, since the overuse of *–ed* form (e.g., (8j) **First problem is always happen**ed**.*) and postverbal subject order (e.g., ***fashen yiwai*** 'happen accident') would not always frequent in L2.

On the other hand, with respect to the overuse of the *happened*, the principles of the *Aspectual Hypothesis* (Housen, 2002; Bardovi-Harlig, 1999) could be adopted. This hypothesis states that the unaccusative verbs (generally categorized in the verb type of achievement/accomplishment verbs) incline to be combined with the perfective aspectual concept. Thus, in terms of the unaccusative verb *happen* with the feature of achievement/accomplishment verb, *happen**ed*** with the perfective meaning tends to be used more frequently. From this perspective, the overuse of *happened* in L2 learner data is likely to be the result not only from L1 Chinese transfer but also, to some degree, from the specific verb type's aspectual tendency, implying that perfective aspectual tendency with the verb type of achievement/accomplishment verbs is possibly a universal phenomenon across languages.

As for the implications of this study, first, understanding the frequency of a certain lexical item in native as well as learner data would assist L2 teaching and learning, particularly in EFL contexts. EFL teachers can realize L2 learners' difficulty when they learn a lexical item belonging to a complicated group of verb system and then design a more appropriate teaching method based on the word frequency. Additionally, noticing the L1 transfer to L2 will also be useful in dealing with L2 learners' non-native usages. On the other hand, with respect to research on unaccusativity, it would be more holistic when one analyzes a specific lexicon and categorizes all of its usages, which will help broaden the room for SLA research areas.

The Nature of Turkish speaking English language teaching students' syntactic errors in their free writing

Yalcin, Isil
Kecik, Ilknur
Balpinar, Zulal
Anadolu University, Turkey

Abstract
The aim of the present study is to discover the nature of the syntactic errors in their free writing type of essays, which comprised a 9382-word corpus. According to the types of syntactic errors identified in a previous research of learner corpus (Yalcin 2008), the present paper focuses on describing the most frequent error types, namely the article use and the verb use. Totally 34 Turkish-speaking students at first-year and third-year classes at Anadolu University wrote the essays. After computerization of the texts, and native speaker identification and correction of the errors in the texts, relevant error tags were assigned to the errors for quantification and description purposes. The descriptive examination findings showed that the definite article and the verb tense constructed the most common areas of difficulty in the surface structures examined, regardless of the year level of the students.

Transfer Relationship of Writing Skills between L1 and L2

Master's Program in Linguistics, TESOL course
Graduate School of Foreign Studies
Sophia University

Introduction

In 1998, Ministry of Education in Japan announced that the Study Guideline of English was changed to put more emphasis on students' acquisition of the practical communication skills. Since this Study Guideline was enforced, English classes in Japanese junior high and high schools have tended to be communication-oriented. Now, teaching methods used in the classes are largely based on the Communicative Language Teaching (CLT) approach, and the acquisition of speaking and listening skills is stressed. Thus, there is little time assigned for writing activities, and if any, the activities are not related to English writing conventions but merely the tasks of translation from Japanese to English. Hirose (2005) pointed out that the first year university students in her studies lacked the experience of writing in English or taking writing instructions because Japanese schools did not provide them with such opportunities. Nevertheless, students need to be able to write English compositions for varying purposes in the future, and English writing instructions are necessary for Japanese students. The writing conventions are different between English and Japanese in terms of organizational patterns and logics used in the arguments, and therefore, there are some cases that the passages written by Japanese people are not correctly understood by English readers. It is true that there are many things to teach in EFL class. However, the knowledge about English writing conventions instructed in a small amount of time can surely improve students' writing skills. In addition, the L2 writing skills and knowledge will give some positive influence on their L1 writings. The present study examines the effects of English writing instructions on the improvement of Japanese students' L2 writing skills and how the improvement of L2 writings skills affects their L1 writing skills.

Literature Review

There are some seminal prior studies about the effects of instructions on students' writing skills. Fukushima (1985) compared English essays written by Japanese students before and after the writing instructions and found that their writings showed improvement in paragraph organizations and coherence. Hirose (1997) insisted that it was necessary for Japanese students to acquire the knowledge of English writing conventions because they were not accustomed to writing English essays although writing instructions had been criticized in that they would force students to use a fixed writing pattern and interfere with students' creative writing, according to Silva (1990). Murai (1990) also stated that Japanese students tended to be used to writing about personal feelings, and therefore, the presentation of the typical logic patterns and model essay organizations is necessary for them. Based on such assumption, Sasaki and Hirose (1996) examined the effects of teaching English writing conventions on the development of English writing skills of Japanese university students through a semester. They also conducted journal writing activities to make the students accustomed to writing in English. The quantity of their writings was increased because of the journal writing activities. However, their writing quality did not show much development except for the mechanics. The improvement brought about by the writing instructions was not exhibited in their essays. Hirose (1997) explained that it would take more time to improve their organizational skills.

There are also several studies on the transfer relationships between L1 and L2. Mohan and Lo (1985) found that students who lacked L1 writing strategies showed a similar lack of the strategies for L2 writing. Edelsky (1982) insisted that L1 writing strategies helped students' L2 writing. These two research showed that writing strategies were interdependent and transferred between L1 and L2. As well as writing strategies, students' writing skills were also considered to be transferred from L1 to L2 (Jones & Tetroe, 1987). Similarly, the contrastive rhetoric research was conducted to examine how students' L1 essay organizations or logical patterns were transferred to or different from their L2 writing organizations. Earlier studies in this field tended to focus on the difference between L1 and L2 essay organizations, but the recent studies paid more attention to the similarities. Kubota (1998) found that L1 and L2 compositions written by the Japanese university students had similar organizational patterns.

The Present Study

The present study has two focuses on students' writing skills. The first focus is the attempt to show that the writing instruction in a small amount of time can improve Japanese students' writing organizational skills although the researchers of the studies mentioned above stated that it took much time to improve students' organizational skills. The second focus is the transfer of the organizational skills learned through the instruction from L2 to L1. This study examines whether the transfer relationship can be established by the one-shot English (L2) writing instruction.

Research Hypotheses
Proposed research hypotheses for the present study are as follows:
1. The L2 writing instruction improves students' L2 writing skills even if a small amount of time is assigned for the instruction.
2. The students' L2 writing skills are transferred to their L1 writing skills and have some influences on their L1 compositions.

Method
Participants
The participants in the present study were six female Japanese sophomore students recruited from several universities. They had never stayed overseas, and thus, they had studied English as a foreign language. Their English proficiency levels were from low to low-intermediate according to their TOEIC scores. They had no experience of taking English writing instructions before this study, and their major studies were not related to English.

Procedure
Before taking the writing instruction, the students were required to write a 100-word paragraph in English and a 400-letter paragraph in Japanese. They were allowed to use dictionaries. The different topics were given to them according to the languages in order to avoid the translation from one language to the other. It was because, if they translated one into the other, the paragraph organization would not differ according to the languages. 20 minutes were assigned to compose a paragraph in both languages respectively. 20 minutes might be short for them to write a paragraph, but the quality of the written products made in 20 minutes is not significantly different from those written in 30 minutes according to Livingston (1987).

Afterwards, the students received a 90-minute instruction in Japanese on paragraph organization patterns of English essays and English writing conventions. Immediately after the instruction, they were asked to write a 100-word paragraph in English and a 400-letter paragraph in Japanese in 20 minutes respectively. The topics were different from those which had been given to them before the instruction in order for them not to merely correct their paragraphs written prior to the instruction. Then, the writings before and after the instruction were compared to analyze how they were changed.

Materials
The topic of a 100-word English paragraph written before the instruction was "There is a controversial issue that school uniforms are not necessary for students. What do you think of this issue?". The topic of a 400-letter Japanese paragraph was "There is a controversial issue that the legal age should be lowered from 20 years old to 18 or 19 years old. What do you think of this issue?".

The topic of a 100-word English paragraph after the instruction was "There is a controversial issue that mothers should quit their jobs and stay at home to raise their children. What do you think of this issue?". The topic of a 400-letter Japanese paragraph was "There is a controversial issue that the entrance examinations for universities should be unified into one common examination. What do you think of this issue?".

The questions for argumentative essays ordinarily ask writers whether they are for or against the given statements, for example, by saying "Do you agree with the idea?". However, such questions are considered to induce students to begin their essays with the statements of their positions toward the issues. This research intends to examine how they start their writings in order to see if their paragraph organizational skills are transferred or not. Therefore, the questions were made to be open-ended by asking "What do you think of this issue?" instead of "Do you agree with the idea?".

Instruction

The instruction was given to the students by the present author. The contents of the instruction are presented below.

First of all, the difference of organizational patterns between English and Japanese compositions was explained by comparing the reading materials quoted from the English and Japanese entrance examinations of some universities. The English passages consisted of three parts, which were called introduction, body, and conclusion. On the other hand, the Japanese passages had a conventional organization pattern which was called "*ki-sho-ten-ketsu*". The "*ki*" part contained only the introduction of main topics. The writers' insistence was presented in the "*ketsu*" part (Hirose, 2005). In other words, the Japanese writers tended to hesitate to take a position initially, and readers had to wait for their opinions until the end (Oi, 1986). It sometimes looks ambiguous and strange for English readers, and can be the cause of misunderstandings between the users of the two languages. (Naotsuka, 1980). By contrast, the English writers stated their opinions at the beginning of their essays and restated them in the last part again (Okabe, 1983). These explanations were presented in order for the students to recognize the difference between English and Japanese writings.

Secondly, the notion of essay organization patterns was narrowed down to the organizations at a paragraph level in both languages. The example paragraphs were presented to show that the same patterns as essay organizations also occurred at a paragraph level. Then, the details of an English paragraph were explained. An English paragraph has a topic sentence, supporting sentences, and a concluding sentence, and they have specific roles in a paragraph. It was also instructed that the persuasive supporting reasons for writers' insistences were important in English essays, and the refutation for counterarguments was effective to make their arguments more objective and convincing.

Finally, the students were given a list of essay topics, and they chose a topic and practiced to write an argumentative paragraph in collaboration. Since the activity seemed difficult for some students, the instructor (the present author) led their discussion and gave them some cues such as a model format of a paragraph.

Analysis
The paragraphs written in both languages before and after the instruction were compared to examine how they were changed and influenced by the writing conventions of the other language. The analysis of the English paragraphs was based on the holistic rating scale of Brown (2005) and Michigan Writing Assessment Scoring Guide (Hamp-Lyons, 1991). The former scale is a holistic scale which gives a single global rating from 1 (the lowest) to 5 (the highest) for an essay according to the overall organization, development of ideas, language use and so forth. The latter one is an analytic scale which gives ratings from 1 (the lowest) to 6 (the highest) for an essay separately in terms of ideas and arguments, rhetorical features, and language control. However, these rating scales were made to assess English essays composed of several paragraphs. Therefore, they were adjusted to the one-paragraph writings written in the present study. For example, the words used in the original scale, introduction, body, and conclusion were regarded as a topic sentence, supporting sentences, and a concluding sentence respectively.

The English paragraphs were assessed based on the two scales mentioned above by three raters. The mean ratings for each feature among the raters were calculated for each paragraph and compared between the paragraphs written before and after the instruction to see the effects of the instruction on the students' writing skills. The *t*-tests were not conducted in the present study because the sample size was too small to validate the results. The texts in both English and Japanese paragraphs were also analyzed in terms of the similarities and differences in composition styles. They were examined for what sort of characteristics of the languages, such as text organizational patterns, exhibited or were transferred from the other language.

Reliability
All the three raters had experience of teaching and rating English writings in some educational institutions, and they referred to the same rating sample based on the two scales above to confirm and share the rating standard among them before actually rating the paragraphs. The correlation coefficient of inter-rater reliability was calculated for the rating of pre- and post-instruction writings (See Table 1). The correlation coefficient of .60 above can be regarded as moderate or high correlations, and .49 (Rater 1 and 3 in the post-test) can be considered to show low correlations according to Brown (2005).

Table 1. Inter-rater Reliability

	Rater 1&2	Rater 1&3	Rater 2&3
Pre-test	0.84	0.68	0.79
Post-test	0.75	0.49	0.69

Results
The results of the three raters' ratings were collected and the mean ratings among them were calculated. The results were showed in the tables below.

Table 2.1 Holistic Rating

Holistic Rating	Student A	Student B	Student C	Student D	Student E	Student F	Mean
Pre-test	1.00	3.00	3.33	2.00	1.33	2.00	2.11
Post-test	2.00	4.00	3.67	2.67	2.33	3.33	3.00

Table 2.2 Analytic Rating 1. Ideas and Arguments

Ideas & Arguments	Student A	Student B	Student C	Student D	Student E	Student F	Mean
Pre-test	1.67	3.67	3.33	2.33	2.00	3.00	2.67
Post-test	2.33	3.00	3.00	2.33	2.67	3.00	2.72

Table 2.3 Analytic Rating 2. Rhetorical Features

Rhetorical Features	Student A	Student B	Student C	Student D	Student E	Student F	Mean
Pre-test	1.00	2.33	3.67	2.00	1.67	2.00	2.11
Post-test	3.00	4.00	3.67	3.00	2.67	4.00	3.39

Table 2.4 Analytic Rating 3. Language Control

Language Control	Student A	Student B	Student C	Student D	Student E	Student F	Mean
Pre-test	2.00	4.00	4.00	2.67	1.67	2.00	2.72
Post-test	2.33	3.33	4.00	3.00	1.33	3.33	2.89

The detailed descriptions and analyses of each student's texts and paragraph organizations are given below.

Student A
Student A's pre-instruction English paragraph did not have an elaborate organization. It started with her opinion, and it was followed by a somewhat subjective supporting reason for her opinion. Then, she finished the paragraph. A concluding sentence was not written, and transition words were not used, either.

Her post-instruction English paragraph showed much improvement in all the features. It started with a topic sentence which stated her opinion and ended with a concluding sentence which restated her insistence. Before giving supporting reasons, she wrote "There are some reasons for this". It was considered that she showed an outline of the paragraph based on her planning of the paragraph organization. She presented a counterargument and a refutation for it in order to make her argument more objective. Several transition words were used although some of them were not used appropriately. The supporting reasons were sometimes still subjective. However, the overall organization of her paragraph made much progress according to the improvement of the mean rating of rhetorical features from 1.00 to 3.00 (See Table 2.3).

Her pre-instruction Japanese paragraph had an English-like paragraph organization. She clarified her position at first, contrary to the traditional Japanese writing organization. She disagreed with lowering the legal age, and the supporting reasons were given based on the examples of the assumed problems brought about by lowering the legal age. Then, she restated her insistence at last.

Her post-instruction Japanese writing exhibited a similar organization. Her position was clearly stated at the beginning as well as at the end of the paragraph. However, the introduction of a counterargument for her position newly appeared although her refutation for it was weak in that she merely presented other supporting evidence unrelated to the counterargument and did not actually refute it.

Student B
Student B's pre-instruction paragraph in English was not logically organized. She stated her opinion that school uniforms were not necessary for students at the beginning and in the middle of the paragraph. However, the main point of her argument was gradually shifted to a different point, and the paragraph ended up with a different argument that polite behavior was encouraged not by wearing school uniforms but by students' sense of morals.

However, her post-instruction writing was well-organized in that it had a topic sentence, two supporting reasons, a refutation for a counterargument, and a concluding sentence. Her position was coherent through the paragraph. The transition words such as firstly, secondly, therefore, and however, were effectively used to connect the sentences naturally. Therefore, although the supporting reasons for her argument were abstract, her paragraph organization was considered to be improved according to the mean rating of rhetorical features (See Table 2.3).

Her pre-instruction Japanese paragraph was similar to her pre-instruction English paragraph in organization. It was not logically organized in that her main argument was shifted to a different perspective when the paragraph got to the last part. The supporting reasons and examples were not persuasive because they were from the subjective viewpoints.

However, the post-instruction Japanese paragraph became similar to the English paragraph organization. There were equivalents of a topic sentence, supporting sentences, and a concluding sentence. A refutation for a counterargument was also included. She clarified her position at the beginning and restated it at the end, too. The overall organization became much more logical than her writing prior to the instruction.

Student C
Student C wrote a well-organized English paragraph which contained a coherent argument even before the instruction. Actual examples were effectively used as supporting evidence.

After the instruction, she also wrote a coherent paragraph which had a similar organization to her pre-instruction one. However, supporting reasons were abstract, and no concrete examples were given in the paragraph. In spite of the lack of effective supporting evidence, there was a refutation for a counterargument, which made her argument more objective than the previous one.

Unlike the logicality in her English writing, her pre-instruction Japanese paragraph contained an ambiguous argument. She took a position to disagree with lowering the legal age, at first. However, she made a concession, and her argument became weaker and weaker. Then, finally, the paragraph ended up mentioning to the points to be careful when lowering the legal age would be enforced. It could be even interpreted that she accepted the opinions of her opposite side.

However, she wrote a logically organized post-instruction Japanese paragraph. It began with the statement of her position to disagree with one common entrance examination for all universities. It was followed by the description of the current situation in Japan and the disadvantages of the common examination. Then, a merit of the different examinations according to the universities was stated, and finally, she finished the paragraph with the restatement of her position.

Student D
In Student D's pre-instruction English writing, she stated her position to support school uniforms at the beginning of the paragraph. Then, she developed her idea by giving a supporting reason and, finally, insisted that school uniforms were necessary not only for high school students but also for university students. However, the process of the development of her idea was not logical because they were based only on her personal experience and subjective reasons. Transition words were not effectively used, and thus, some sentences were very long.

Her post-instruction English writing showed much improvement in the paragraph organization. The mean rating of the rhetorical features rose from 2.00 to 3.00 (See Table 2.3). Her main argument was coherent through the paragraph and supported by three reasons including a refutation for a counterargument. The supporting reasons were not exemplified by concrete examples. Nevertheless, her opinion could be comprehensible because logical development was clear in that transition words were appropriately used to show the connection between sentences, unlike her previous writing.

The organization of her pre-instruction Japanese paragraph was a typical "*ki-sho-ten-ketsu*" organization. At first, she presented a question about the current legal age, and then, she explained why she came up with the question. Finally, she showed her opinion that the legal age should be lowered to the age of graduating from high schools.

In the post-instruction Japanese writing, she did not exhibit the organizational change. She wrote it in the same organization as the previous one. She presented her own impression on the issue of the common entrance examination at the beginning and explained about it in the following sentences. At last, she clarified her opinion. However, one element similar to her post-instruction English paragraph was her reference to the general public opinions to introduce a counterargument for her position. She could not refute it logically, but this point showed the influence from English writing conventions.

Student E
In Student E's pre-instruction English writing, her position was clearly stated at first. Nevertheless, she stated "I do not have [a] perfect answer", which meant her position toward the issue was not established, in the latter part. Thus, her argument seemed unstable. After all, her paragraph ended up with her personal impression on the issue.

Her post-instruction English paragraph showed improvement in rhetorical features (See Table 2.3). She stated her position at the beginning as well as at the end of the paragraph. In addition, she presented the supporting reasons and inserted a refutation for a counterargument in the paragraph. These changes made her argument more logical and objective than the previous one.

Her Japanese pre-instruction paragraph showed a similar organizational pattern to that of her pre-instruction English paragraph. At first, she insisted on lowering the legal age. However, after giving some supporting reasons for her argument, she finally stated that lowering the legal age did not make any difference to the Japanese society. Therefore, her argument was not coherent.

Her post-instruction Japanese paragraph exhibited a coherent and more logical organization. The paragraph started with her disapproval of a common examination for universities and ended with the disadvantages brought about by the common examination. There was not a concluding sentence, but her insistence was coherent through the paragraph.

Student F
In Student F's pre-instruction English writing, there was a topic sentence which clarified her position. However, right after the topic sentence, she introduced a counterargument for her position and did not give any refutation for it. Then, she gave two supporting reasons for her insistence and closed her argument with the restatement of her position. The argument was not poorly organized, but there was a problem in ordering supporting sentences.

Her post-instruction English paragraph had a more natural order of supporting ideas. Two supporting reasons and a counterargument with a refutation for it were written between a topic sentence and a concluding sentence. Although the supporting reasons were abstract and the refutation for a counterargument was given from a subjective perspective based on a personal example, the improvement in rhetorical features from 2.00 to 4.00 showed that the overall organization made much progress (See Table 2.3).

Her Japanese pre-instruction paragraph was characterized by a typical "*ki-sho-ten-ketsu*" organization. The introduction of the main topic came at the beginning, and some problems of the enforcement of lowering the legal age were weighed in the following sentences. She also presented a point to be cared when the legal age would be lowered. Then, she claimed to be against the lowering the legal age at last.

However, her post-instruction Japanese paragraph organization was changed into that of English writings. Her opinion was stated at the beginning and end of the paragraph. She gave two supporting reasons and a refutation for a counterargument. Although her refutation was not logically convincing, the overall paragraph organization was considered to be more logically constructed than the previous one.

Discussion
Research hypothesis 1.
Since all the students had no experience to write argumentative essays in English, they did not know how to compose a paragraph before the instruction. All the pre-instruction English paragraphs except for Student C's exhibited problems of ordering their ideas and organizing a paragraph. All of them had a topic sentence which stated their positions at the beginning. However, only two of them (Student C's and F's) had a concluding sentence which restated their claims at the end. Student A's paragraph did not have a concluding sentence. The rest of them reached the conclusions different from the claims in their topic sentences.

However, all of their post-instruction English paragraphs followed English writing conventions and showed logical organizations. All the students were given higher ratings in holistic rating (See Table 2.1). Rhetorical features, which included the overall organizations, also showed improvement except for Student C, who had already employed an English organizational pattern before the instruction (See Table 2.2). They clearly stated their positions at the beginning by writing a topic sentence. Their claims were supported by some reasons and evidence given in the following sentences. They also presented a counterargument for their positions and attempted to refute it. It could be considered that they tried to make their arguments objective by assuming the contentions of the opposite side. Then, finally, they closed their paragraphs with the restatement of their positions by writing a concluding sentence. All the six students' post-instruction English paragraphs were characterized by this organizational pattern. The overall organization and the coherence of their paragraphs showed improvement.

However, not all the students showed improvement in the development of the ideas and arguments and language control (See Table 2.2 and 2.4). The supporting evidence given by them was not logical enough to convince readers because most of the evidence was based on personal feelings or examples which seemed hard to generalize. As for the counterarguments, they sometimes merely introduce the assumed opinions of the opposite side and did not actually refute them. The counterarguments should be refuted by pointing out their problems or disadvantages. Nevertheless, after referring to the counterarguments, the participants sometimes tended to insist on the merits of their own opinions which were unrelated to the counterarguments as if they refuted them. In addition, the accuracy of their language use did not show any significant changes because the instruction did not focus on this aspect and the present study allowed the students to use dictionaries.

As these analyses above showed, a 90-minute English writing instruction can be considered to improve students' writing organizational skills and enable them to write a coherent paragraph. However, their skills of making logical arguments and the accurate language use will take more time to develop.

Research hypothesis 2.
Their pre-instruction Japanese writings had various organizational patterns. Only Student A adopted an English-like organization in the Japanese paragraph although her English paragraph did not have such an organization. Student D and F wrote their paragraphs in a traditional Japanese organization called "*ki-sho-ten-ketsu*", and therefore, their opinions were stated in the last part. The rest of them wrote a topic sentence which clarified their positions in the first place. Nevertheless, the following arguments were not coherent, and they reached a conclusion which was different from their claims stated at the beginning. Student B and E wrote their Japanese paragraphs in the same organization as their English ones.

In their post-instruction Japanese writings, four of them (Student A, B, C, and F) adopted the English paragraph organization. Student E also composed his paragraph in a similar organization, except that it did not contain an equivalent of a concluding sentence. Only Student D did not show any organizational change and wrote a paragraph in the same "*ki-sho-ten-ketsu*" organization as used in her previous one.

Compared with the improvement of her English paragraph, Student A's Japanese paragraph did not show any organizational changes because her paragraph was composed in an English-like organization even before the instruction. The Japanese paragraphs of Student B and E made the same progress as their English ones. They could write coherent arguments in the post-instruction paragraphs in both English and Japanese. Student C and F employed the English organization pattern for their post-instruction Japanese paragraphs. Thus, the Japanese paragraphs of Student B, C, E, and F could be considered to show the influence from the English writing conventions in terms of their paragraph organizations. In addition, the other two students, Student A and D, did not show any organizational influence in their Japanese writings, but their post-instruction writings contained the presentation of a counterargument for their positions and an attempt to refute it. Consequently, it can be stated that the knowledge brought about by the English writing instruction can give some influence on students' Japanese writings, especially in the paragraph organization and construction of arguments.

Implication
The present study shows that a 90-minute instruction on English writing conventions and paragraph organizations can improve students' writing skills in some aspects, especially organizational skills. Teaching English writing conventions and showing the English organization pattern can be useful for Japanese students although it has been criticized for discouraging the creativity of students' writings, according to Silva (1990). Moreover, the organizational skills can be utilized in their Japanese writing. Since even the instruction in a small amount of time can improve such skills, it can be considered as meaningful to assign some time for writing activities in English class. However, this study has a limitation that its sample size was too small to generalize the results. Thus, it is necessary to conduct a study on the effects of writing instructions in larger size in order to verify the positive effects found in the present study.

Conclusion
The current English curriculum in Japanese schools does not emphasize writing skills. Most of Japanese students do not have experience of writing English compositions, and English writing conventions are not instructed in class. However, the knowledge of different characteristics of English and Japanese writings learned from explicit writing instructions have profound impact on their writing skills of English as well as Japanese. Therefore, writing instructions should be conducted in EFL class even if only a small amount of time can be assigned for them.

Development in teachers' profession: focusing on Korean cases

Hyun-Jun Joo
Joongbu University

Abstract

Teachers' professionalism has been recognized as one of the primary factors to reform public education. Educational leader's role has been recently emphasizing to support professional learning communities more effectively. Although academia of educational administration has increasingly recognized the significance of teacher's professional development, understanding on the educational leaders' role and contribution is quite limited and unclear. In this context, this study reviewed the structural and operational system and analyzed the strengths and weaknesses of professional learning communities provided in Korean society: the Association of Korean History Teachers & the Communities of Elementary School Classroom Management. In order to analyze two cases, Robey's organizational change model was used as a theoretical frame. Two research methods were mainly employed for the study: literature review (scholarly journals, official reports, policy papers, and information loaded on web-sites) and on-site interview (participants and organizers). The analyses found several strengths (easy accessibility, teachers' initiative and autonomous will, abundant and practical solution) and weaknesses (financial burden, lack of theoretical background, intermissive participants) that the Korean teachers' professional learning communities have. At the end, the study suggests three strategies for educational leader who has an important role in developing teacher's profession: 1) making an institutional effort to stimulate teachers' learning motivation, 2) creating a strong network of university professors and other experts to get career advice, 3) building synthesized and consolidated system to activate communities.

Key words: teacher, professionalism, learning communities

Introduction

The teacher's professionalism has been recognized as one of the primary factors to reform public education. In fact, the academia of educational administration and policy has argued that the teachers' acquirement of knowledge and skills through the professional development influence on teaching practices and student learning (Ball & Cohen, 1999; Corcoran, 1995; Dufour, 2004). Accordingly, it is not indisputable that how teachers learn the knowledge and skills and how educational administrators give them discretionary learning opportunities must be an important issue.

The emphasis on teachers' professionalism is not limited to Korea but other countries as well. Since *No Child Left Behind* in 2001, as well as schools in the United States, educational leaders' role has been dramatically changing. Especially, the shift in education accountability forces educational leaders to set high standards, to assess achievement, and to reward schools based on that. For this sense, as Obama administration stated, teachers' professional development is the most important factor in school reform. In Korea, the programs for teachers' professional development are expanding by the Ministry of Education and Science Technology. Government driven programs are efficient in providing general information and universal teaching skills for teachers.

A large number of educational researchers have been identified to build professional learning communities as a basis for teachers' professional development (DuFour & Eaker, 1998; Firestone et

al., 2004; Little, 2001). That is, whether formal or informal, teachers' collective opportunities for their professionalism are central to maintaining and enhancing teacher quality. Despite apparent evidence indicating that working collaboratively among teachers represents best practice, it is not understandable that teachers in many schools continue to work in isolation. Even in schools that endorse the idea of collaboration, the staff's willingness to collaborate often stops at the classroom door (Dufour, 2004, p. 9). Moreover, most previous studies heavily depend on formal condition for teacher learning within schools, districts, states or national contexts. For example, there are subject teaching associations, grade-level teaching associations, a state department of education, a national professional organizations and so on.

A major problem of the formal learning opportunities is narrow in scope and detached from real-time learning during the normal workday (Fullan, 1995; Knapp, 2003). It is because that mandated conditions make a compelling learning environment rather than spontaneous participation. Due to a top-down approach, it is not only easy to ignore teachers' individual context, but also vulnerable to develop more adaptive and prompt information for them. While teachers' professional learning communities under the formal condition are criticized for low relevance and passive participation, informal communities are less structured and planned with less coercive goals and objectives. Informal learning opportunities tend to be more spontaneous and reflective in that they are typically out of real-time experiences (Putnam & Borko, 2000; Smylie, 1995). For this reason, educational leader's role is recently emphasized in supporting professional learning communities more spontaneously.

However our understanding on how educational leaders induce teachers' spontaneous professional development is quite limited. In this context, the study focuses on spontaneous networks among teachers rather than compulsive context. With a belief that informal community makes a different in developing teachers' professionalism, the author makes an in-depth investigation of teachers' professional learning communities in Korea with overview the structural and operational system and examination of the strengths and weaknesses. Then, the author presents preliminary findings and implications for educational leaders.

Rationale

Why are more effective, rigorous, and spontaneous teachers' professional learning communities needed?

Reforming schools and improving student achievement basically depend on teacher quality. Several policies and institutional efforts have been undertaken for a long time under this assumption. Nevertheless, no one agree on the most effective way to improve teachers' quality and students' achievement. In fact, numerous studies has proposed teacher inputs, such as salary, education level, and certification requirements, in order to improve teacher quality. However, recent reports and meta-analyses asked a question the relationship between teacher inputs and teacher quality (Darling-Hammond & Youngs, 2002; Wenglinsky, 2000). On the other hand, other research suggests more interesting result that teachers' impact on student achievement is influenced not by teacher inputs, but by a function of daily classroom-level curricular and instructional decision-making (Joyce & Showers, 2002; Stigler & Hiebert, 1999; Wenglinsky, 2000).

Successful school reform depends on shared governance, transformational leadership, student concentrated teaching, teacher collegiality, and cultural change in schools (Barth, 2000; Caine & Caine, 1997; Glickman, Gordon, & Ross-Gordon, 2001; Gordon, 2004; Green & Etheridge, 2001; Kovalik & Olsen, 1994; Leithwood, 1992; Sweetland, 2001; Wilmore & Thomas, 2001). These are critical aspects for the teachers' professional development. In other words, the idea of reforming schools is closely related to teachers' professionalism and, thus plans on reforming schools should focus more on building up professional learning communities.

The meaning of the professional learning communities is that educators commit working collaboratively in ongoing processes of collective inquiry and communication to achieve better results for the students they serve. Namely, professional learning communities operate under the assumption that the key to improved learning for students is continuous, job-embedded learning for educators (DuFour & Eaker, 1998, p. 25-29). The characteristics of professional learning community are presented in Table 1 (Hord & Sommers, 2008, p. 9). Though some assert that professional learning communities do not pay attention to students' achievement, professional learning communities are focusing more on the student's achievement compared to other approaches.

Table 1 The Characteristics of Professional Development Community

Shared belief, value and vision
The staff consistently focuses on students' learning, which is strengthened by the staff's own continuous learning
Shared and supportive leadership
Administrators and faculty hold shared power and authority for making decisions
Collective learning and its application
What the community determines to learn and how they will learn it in order to address students' learning needs is the bottom line
Supportive conditions
· Structural factors provide the physical requirements: time, place to meet for community work, resources and policies to support collaboration
· Relational factors support the community's human and interpersonal development, openness, truth telling, and focusing on attitudes of respect and caring among the members
Shared personal practice
Community members give and receive feedback that supports their individual improvement and that of the organization

Schools composed of teachers and educational administrators as professionals try to improve school performance through educational inquiries and collaborative works (Astuto, Clark, Read, McGree, & Fernandez, 1993; Louis & Marks, 1998). Despite the advantage and necessity of professional learning communities, there are few studies of how to create, organize, and develop them. In the United States, the efforts to facilitate professional learning communities have been attempted in the mid 1990s. For instance, there are Creating Continuous Communities of Inquiry and Improvement as a national support and the Southwest Educational Development Laboratory as federal supports (Hipp, Olivier, Huffman, Beaty, Pankake, & Moller, 2001).

Where professional community exists, teachers share and trade off the roles of mentor, advisor, or specialist (Lieberman et al., 1988; Little 1990). There are some excellent professional learning communities now, but not nearly enough. Most programs are designed by school governance without considering the profound individual teachers' unique need. It is because that intended programs often

pay little attention to the teachers' autonomy. The school governing authorities have an influence on behaviors, motivation and climate both within and outside schools contexts.

The professional learning community model flows from the assumptions that the core mission of formal education is not simply to ensure that students are taught but to ensure that they learn. This simple shift-from a focus on teaching to a focus on learning-has profound implications for schools (DuFour, 2004, p. 8). Thus, teachers' professional development must be planned and embedded under teachers' spontaneousness, focus on student growth and supportive of reflective practice. As instructional leaders, educational administrators play a critical role in ensuring that their buildings support a learning-rich environment for both students and teachers(Barth, 1990; Donalson, 2001; Drago-Severson, 2004). That is, school leaders are the keys to establishing a positive organizational climate in their building and well-functioning professional learning communities.

Method

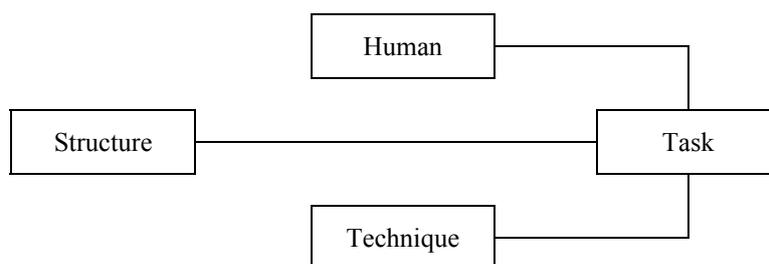
To overview the structure and operational system of teachers' professional learning communities, it needs a theoretical frame. The study chooses Robey's organizational change model that has been employed to review the organizational effectiveness. Robey (1986) suggested the more developed model than Leavitt's socio-technical perspective on organization and took account of the impacts and directions between factors (task, human, structure, and technique) of organizational change. According to Leavitt, the organization departmentalizes a certain objective, and its structure, human, and technique are used to accomplish it. Figure 1 presents Leavitt's idea. As Leavitt defines the factors of the organizational change as task, human, structure, and technique, he points out the change of human areas as the effective element for improving organizational performance.


Figure 1 Leavitt's socio-technical perspective on organization

While the relation between human, structure, and technique is weak, the factors of human, structure, and technique dimensions center strongly upon task. Based on Robey's organizational change model, the study investigates two Korean cases of professional learning communities in terms of structure and operation.

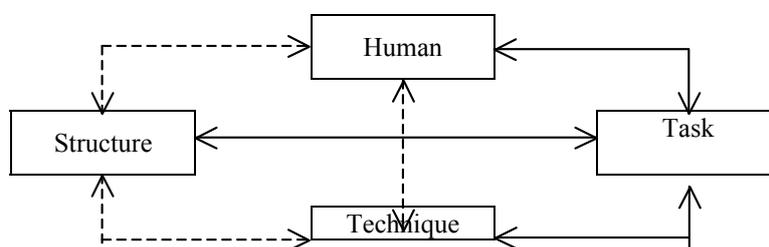
872


Figure 2 Robey's organizational change model

Data analysis included two Korean cases. One is the Association of Korean History Teachers (*afterward*, AKHT) which has intended to help history teachers who wish to get more professional development since 1988. The other is the Community of Elementary School Classroom Management (*afterward*, CESCM) which has been designed for the elementary school teachers since 1993.

Data were collected from literature reviews including scholarly thesis, official reports, articles, and information officially loaded on websites, and in-depth interviews. For in-depth interview, the author meets a total four of interviewees who have been involved with AKHT and CESCM : face-to-face interview and on-site interview. Interviews focused on re-identifying preliminary findings about the structural and operational system. Subsequent to the interviews, each informant was provided with a copy of the transcript of their interview and asked to check for its accuracy.

Findings

The Association of Korean history teachers

AKHT is designed for Korean history teachers for secondary school. AKHT is one of the noticeable associations amongst others. The main objective of AKHT is to share contents and methods for teaching Korean history classes. Table 2 summarizes the structural and operational characteristics of AKHT.

AKHT has 8,304 secondary Korean history teachers. The structure of AKHT is divided into operational teams and research membership which are tightly interconnected. AKHT provides materials, information training programs, organized study group and special lecture for novice teachers. All data and information are shared with members through the web site. AKHT handles off-line training programs during the summer and winter break.

Table 2 Descriptions of AKHT

Criteria	The Association of Korean history teachers
Human	Currently, AKHT has 8,304 members (middle & high school history teachers)
Structure	Operational teams: general affairs, research affairs, data & communications affairs, network affairs, public relation affairs) and research membership (regional research, teaching & lesson plan research, medium & material research, exchange research project research).
Task	Major tasks of AKHT are providing data & information, training & educating during summer & winter break, organizing study group, and giving a lecture for new teachers
Technique	Soft ware: data, information, skill, experience, knowledge related to teaching the history Hard ware: website linked with a private institution

The Community of Elementary School Classroom Management

CESCM has been intended for the elementary school teachers who wish to learn knowledge, skills, and information for teaching practice. Since 1993 CESCM has been initiated by the elementary school teachers and sustained in stable. Although external rewards such as incentive for promotion or financial support are not offered by Korean government, teachers organize the community based on their will and expectation. Table 3 describes the structural and operational characteristics.

The membership of CESCM includes elementary schoolteachers, principals, assistant principals, researchers, and school commissioners. CESCM is organized with operational membership, research & information membership, undergraduate student membership. CESCM waives the membership fee for all members except for research & information membership. All information is provided for all members. Pre-service teacher membership is eligible for undergraduate students of college of education. The main tasks include helping teachers and advising participants. All data are provided through the web site, and all members have the opportunities to participate in off-line training courses and seminars.

Table 3 Descriptions of CESCM

Criteria	Community of elementary school classroom management
Human	The number of CESCM is about 5,250 members (elementary schoolteachers, administrators, and researchers)
Structure	CESCM is composed of has operational membership (president, vice-president and membership), research & information membership, pre-service teacher membership.
Task	To research for teaching & lesson plan, to interact with aboard schools, to share data & information, and to conduct research projects.
Technique	Soft ware: data, information, skill, experience, knowledge related to teaching the subject, managing classroom, educating student behaviors Hard ware: website-based structure

Strengths and weaknesses

From the results, the author found several strengths of the Korean cases. First, teachers' professional development community is built by teachers' initiative and autonomous will. It is obvious that teachers-led approach to professional learning community is apparently a strong attractiveness. This plays a very important role in enhancing teacher professionalism. It is evidence in the AKHT member's comment.

I am comfortable enough. A culture of autonomy indeed is attractive. Honestly, getting

to know each individual teacher and asking them to work under formal system has

taken a lot of my time and it was quite tiring and nervous. This community has no place

for a climate steered by a superior institution nor for a culture of unwillingness.

Second, there are abundant information and data for developing teaching practice. It will be contributing to professional development for schoolteachers. In the words of one teacher:

It has shown me different resources that I didn't know before. It has helped me to learn how to teach students effectively… I learned a lot of skills on how to deal with students…This community has definitely helped me in developing my professional aspect…

Third, easy accessibility and practical problems-solving are met teachers' expectation and interests. It is possibly that teachers acquire knowledge and learn skills through not only web site but also training programs and seminars. The values are reflected in teachers' words such as:

Actually, I became more interested in it than I thought… When I first came, I didn't really take it seriously, but now, it became a very important part of my teaching practice. I asked them questions which were not solved in my classroom…having me some kind of knowledge I didn't realize before… Sometimes it makes me being able to answer them too. I was happy to find myself in position to help other teachers.

However, the two Korean cases reveal a couple of weaknesses that may affect the quality and effectiveness of teachers' professional learning. Those include the followings: absences of rigorousness of all members, financial burden, and a lack of theoretical background.

It is a limitation that communities tend to be managed by several members. Thus, the communities seem to fail to be interconnected. It makes the communities rather loose in the structure and operation. In this regards, one of teachers expressed a negative opinion in the following terms.

Data and information is obviously provided by a few members. Most teachers just got data free of charge… I believe that our community can be developed by working together…Each membership plays a very critical role for sustaining community…

Another critical problem is a lack of financial support. It possibly affects teachers' motivation. With regards to a negative aspect of communities, one of the teachers who is in charge of communities criticized:

I know that some teachers complained. It was not special for them. Because they have to pay a fee in order to join the seminars and training programs. Although we have financial support by Ministry of Education, Science, and Technology, it is insufficient to waive fees…

Furthermore, the theoretical foundation of communities is not solid. It is because that communities heavily depend on teachers' experiences and fail to provide academic theories and analysis. A schoolteacher who participated in the communities pointed out:

It did upset to see that they did not provide a theoretical knowledge. In fact, knowledge
and skills we shared are heavily depends on each own experiences. I think this is very
dangerous…

Based on the findings, Table 4 summarizes the strengths and weaknesses of professional
development communities in Korean society.

Table 4 A Summary of the Strengths and Weaknesses

Cases	Strengths	Weaknesses
Community of elementary school classroom management The Association of Korean history teachers	- building organizations by teachers' initiative and autonomous will - abundant information and data for developing teaching practice - easy accessibility and practical problems-solving	- management by several members - financial burden - lacking of academic aspects

Conclusion

The teacher's profession has an extensive and illustrious history. It is based on the idea of
accountability for students and to society. Recently, preference to school teacher job is increasing and
the environmental factors around schools are rapidly changing in Korean society. Indeed, teachers'
profession is a primary factor to reform public education.

In the contexts, this study underscored the structural and operational system and examined the
strengths and weaknesses of two professional learning communities in Korea. Our analysis of two
cases indicated that institutional design of professional learning community might be less effective than
teachers own initiatives. For collaboration to influence professional growth and development it has to
be promised upon teachers' willingness and autonomy. Findings from two cases offer several clues
about strategies for school leaders and policy makers who are committed to developing teachers'
profession.

First, teachers' professional communities must be equipped with strong networking and be shared
by the academic know-how. The evidence from two Korean cases illustrates that teachers'
communities, as a learning organization, could be nurtured when individuals reflect upon academic
theory and teaching practice. Teacher professional development is more effective if community is
closely connected to academic theory rather than simply helping each other. For example, university
professors or other researchers may contribute to build more theoretical foundation.

Second, schools or district units have to make an effort to increase teacher autonomy. The findings
from this study show that teachers' autonomy may encourage their participant in professional learning
communities. In particular, teacher collective autonomy is required for optimum professional growth.
Teachers' collective autonomy is more effective if school leaders support the teachers' learning
communities, rather than simply controlling them. It is entirely possible that administrative
organizations operate mandated or structured direction. Under this system, there is certainly conflict

and competition that ignores teachers' need and expectation. If administrative authority proves to be structurally, it does not promote the conditions necessary for teacher profession. Thus educational leaders can facilitate teacher learning motivation by reducing a top-down administrative structure.

Third, the primary role of school leaders is to decrease teachers' workload. Research evidence suggests that when teacher has the autonomy to learn about how to teach, there is a greater likelihood the change will be positive. In order to stimulate teachers concentrate on professional development, it is required for school leaders to make an effort to reduce teachers' workload stress.

Finally, the effectiveness of learning communities needs further financial supports. A finding of this study reinforces the results of some previous studies (Darling-Hammond & McLaughlin, 1995; David et al., 2000). For example, Darling-Hammond & McLaughlin (1995) found that the teachers' involvement in learning opportunities to acquire new knowledge and skills depends on the financial support for learning. Also, teachers in district which paid stipends for in-service teacher professional development are more likely to pursue reform idea grounded in curriculum and instruction (David et al., 2000). By having sufficient financial supports, educational administrators help to further enhance teacher profession for sustaining learning communities.

TEACHERS' PERCEPTIONS AND PRACTICES REGARDING DIFFERENTIATED INSTRUCTION

Prof. Dr. Sefik YASAR
Res. Assist. Ruhan KARADAG
Anadolu University, Faculty of Education, Eskisehir, Turkey

Abstract

Differentiated instruction is one of the teaching approaches that can meet the complex needs of students. The aim of this study is to determine teachers' perceptions and practices regarding differentiated instruction via semi-structured interviews. The study reveals that teachers do not have sufficient information about differentiated instruction, and they are not sufficiently proficient in the application of differentiated instruction.

Keywords: Differentiated instruction, teacher training, teacher perception.

INTRODUCTION

In today's classrooms, teachers are more interested in individual differences such as learning interests, learning profiles, learning needs and readiness. Due to variety of students' socioeconomic background, culture, ethnicity, and language, teachers face many diverse student characteristics and problems. Therefore, teachers use more student-centered approaches and instructional strategies to meet this broader range of diversity in their students. Differentiated instruction is one of the teaching approaches that can meet the complex and diverse needs of students.

Differentiated instruction is a philosophy of teaching based on the premise that students have individual differences based on learning styles, learning interests, abilities and learning necessities. Furthermore, differentiated instruction offers a variety of strategies for deeper individual understanding and expanded learning opportunities (Chapman & King, 2003, p.11). The main aim of differentiated instruction is to maximize the development of each student (Hall, 2002, p.1), establish a balance between a student-centered and teacher-facilitated classroom, and provide opportunities for students to work in a variety of formats (Heacox, 2002, p.1).

Differentiated instruction requires teachers to design a variety of teaching activities to enable students to achieve their learning goals (Smutny, 2003, p.30). Teachers accept that students have different learning needs depending on their interests, learning profiles, and readiness level in differentiated classroom, and thus they differentiate the content, process and product according to these different needs (Tomlinson, 1999, p.11; Anderson, 2007, p.50). In differentiated instruction, teachers should determine students' strengths, interests and learning preferences, and provide multiple teaching methods for them to construct knowledge. Teachers should follow current practices in the field of education, and have knowledge about how to apply these practices to individual students' needs (Kommer, 2004, p.15). Teachers should be clear about what students need to know (content), how they perform this (process) and the various products they create to demonstrate what they have learned (Theisen, 2002, p.2). Therefore, understanding what differentiated instruction is and how to implement it successfully in mixed ability classrooms are the requirements for teachers. Again, it is essential to determine teachers' perceptions and practices regarding differentiated instruction in order to help them use strategies for differentiated instruction in their classrooms. Based on this understanding, in this study it is aimed at determining the perceptions of primary school teachers related to differentiated instruction. Within the context of this aim, the following research questions were addressed:

1. What are the opinions of teachers about differentiated instruction?
2. Do teachers feel themselves competent at differentiated instruction?
3. Which differentiated instruction strategies are used commonly by teachers?
4. At which courses do teachers use differentiated instruction strategies commonly?
5. What are the common problems that teachers face in the application of differentiated instruction?

METHODOLOGY

Participants

The participants of the study were 25 primary school teachers. Based on their professional experience, the most experienced teacher was in his/her 24th and the least experienced was in his/her 4th year in their profession. Additionally four of those participants have M.A. or PhD. degree in primary school education.

Data collection

To get in-depth understanding about teachers' perceptions and collect the study data, the semi structured interview technique was used. Before the interviews, the researchers met with the participants of the study and informed them about the study. Meeting schedule was determined with the participants, and a written permission was taken from them before the interviews took place.

Data analysis

The interviews were recorded and then transcribed. An auditor examined verbatim transcripts of the interviews independently, providing a reliability check. Later, the data were loaded into Nvivo 8 qualitative software analysis program and were analyzed through content analysis. NVivo 8 was used to categorize the data according to themes based on each data source and data were also divided into categories. To test the reliability of the study, Miles and Huberman's (1994, p.64) formula was used and P = 92,7% was found.

FINDINGS

The main themes obtained from the interviews with 25 primary school teachers are shown in Table 1.

Table 1. Main themes obtained from the analysis of the semi-structured interviews

Opinions of teachers about the differentiated instruction approach
Reasons for implementing the differentiated instruction approach in teaching
Teaching methods and assessment techniques used in differentiated instruction
Proficiency perceptions of teachers regarding the application of differentiated instruction
Problems encountered in the implementation of differentiated instruction
Suggestions related to the application of differentiated instruction

As shown in Table 1, six main themes emerged from the data analysis. Afterwards, sub-categories were created for each main theme, and to reflect participants' ideas properly, direct quotations were also presented.

Sub-categories for the theme of "Opinions of teachers about the differentiated instruction approach" are shown in Table 2.

Table 2. Opinions of teachers about the differentiated instruction approach

A teaching approach for students with different learning strengths
A teaching model that takes the individual differences of students into consideration
Organization of different teaching environments according to students' intelligence areas
A teaching model that takes the interest and needs of students into consideration
New models and applications in the teaching-learning process
Different practices depending on the educational status of the classroom
A separate teaching application applied for each student
Teaching activities for low or superior level students

A rich learning environment that requires an effective teaching-learning process
I had never heard of this approach
I do not have any information about this approach

For example, one teacher (T10: 854-858) explained her opinions as "*I think this approach is a teaching model held by taking individual differences, interests, and needs of students into consideration because each student in the class has different interests and needs. All the students have different capabilities and perceptions. Individual differences are at fore front*". On the same theme, another teacher (T2:161-163) described it as "*differentiated instruction is a teaching model considering students' individual differences. It meets the needs of students who have different learning needs. It requires a rich learning environment for effective teaching-learning process.*" Again, one of the participants (T12:1044-1049) who never heard of this approach expressed her opinions as "*as a term, I had never heard of it. But I think I use different applications related to differentiated instruction. In my opinion, it means to observe and evaluate individual students according to their own development because children are not exactly the same, every child's learning rate is different*".

Sub-categories for the theme of "Reasons for implementing the differentiated instruction approach in teaching" are shown in Table 3.

Table 3. Reasons for implementing the differentiated instruction approach in teaching
Making abstract concepts more concrete in the science and technology course
Developing the multi-dimensional language skills of students in the language arts course
Eliminating the problems of students' perceptions in the mathematics course
Meeting the individual differences of students in the visual arts course

For example, one participant (T1:70-74) pointed out that she applied differentiated instruction in the science and technology courses more because "*It is difficult to understand some concepts in the science and technology course. For this reason, I usually applied differentiated instruction approach to make abstract concepts more concrete in this course*". Another teacher (T12:1085-1088) who applied this approach more in mathematics mentioned that "*As I believe that math is one of the intelligence units of people. I think everybody cannot do math. Mathematics has too many details and subjects. Diversification increases details*".

Sub-categories for the theme of "Teaching methods and assessment techniques used in differentiated instruction" are shown in Table 4.

Table 4. Teaching methods and assessment techniques used in differentiated instruction

Teaching methods	Assessment techniques
Small-group teaching	Portfolio
Group work	Self-assessment
Collaborative learning	Peer assessment
Independent study	Observations
Different assignments	Projects and performance tasks
Multi-intelligence applications	Assignment reviews
	Interviews

Teachers gave the following strategies as examples and indications for their applications of differentiated instruction in the classroom: "Making individual and collective activities", "Exploring students' various areas of interest", "Using different work sheets, reading texts, and other different materials", "Accessing information and communication technology".

Sub-categories for the theme of "Proficiency perceptions of teachers regarding the application of differentiated instruction" are shown in Table 5.

Table 5. Proficiency perceptions of teachers regarding the application of differentiated instruction
Teachers feel inadequate in:
Being aware of different methods and techniques
Managing student into groups
Guiding students
Organizing appropriate teaching activities for children

Child psychology
Implementing differentiated instruction methods and techniques
Assessment
Determining children's intelligence areas
Applying instructional methods and techniques suited to intelligence domain
Using technology

All participants indicated that they were not sufficiently proficient in the application of differentiated instruction and thus needed in-service training in it. As one teacher (T10: 903-910) proclaimed: *"I do not believe that I am sufficient because we have encountered with these new concepts, methods and techniques lately. Therefore, we need to follow something like that, need to get information about these new approaches in depth. This requires a certain time and education process. Therefore, people are going through a training process for some time but I do not know how much is enough. Therefore, I cannot say yes, I am proficient."* Another teacher (T6:560-567) also said: "*Now, I personally do not think I am proficient. But as far as I know, other teachers have not sufficient information on this subject. Based on my observation, I would say that I think other teachers do not know the differentiated instruction approach". I have information on this issue because I have a graduate degree. But most of our teachers are not knowledgeable on this issue. I find myself inadequate in the fields of the implementation of the strategies and assessment of students. I can implement strategies effectively if I learn. But I find myself insufficient as I have not learned the strategies. I feel inadequate."* This teacher bases her knowledge and skills on the opportunity to identify new methods and techniques that primary school education master program has provided for her.

One of the teachers (T12:1135-1139) who feels himself incompetent in the application of differentiated instruction said that "*I am incompetent in the field of both theoretical knowledge and application of the methods and techniques used in differentiated instruction. I was convinced that I would do it through trial and error. It actually took a great time for me as I had not received any training. It is a good idea to receive this training".* Another teacher (T8:756-762) who needs in service training to resolve the inadequacies stated her opinions on this matter as ""*For example, which methods, techniques or strategies are effective for the student groups? How should I determine student groups? How do I determine intelligence areas of the students? How can I apply the methods and techniques or differentiated instruction strategies in accordance with their intelligence fields? It would be more appropriate if such training were given as well as in the field of assessment. Actually I think that in-service teacher training in every field must be systematized*".

Sub-categories for the theme of "Problems encountered in the implementation of differentiated instruction" are shown in Table 6.

Table 6. Problems encountered in the implementation of differentiated instruction

Problems caused by families
Insufficient family income
Lack of acceptance of students' individual differences
Not being aware of children's developmental features
Being irrelevant and unconscious

Problems caused by students
Being teased by other students who are lower level learners
Not accepting each other's differences

Problems caused by the physical conditions of schools and classrooms
Crowded classrooms
Lack of materials
Lack of resources in the library
Lack of teaching environment appropriate to individual differences and needs
Not preparing textbooks and manuals in a format suitable for individual differences.

Problems caused by teachers and school administrators
Lack of information and skills about implementation of methods and techniques
Lack of information and skills about investigation of students' individual differences
Failure to provide classroom management appropriate for individual differences

Having trouble in spending a great deal of time in the application of activities
Failure to monitor children's developmental levels
Lack of information and skills about teaching activities appropriate for learning styles
Lack of information of school administrators about this approach

As shown in table 6, most of the teachers mentioned that they encountered some problems in the implementation of the differentiated instruction approach. One of the teachers (T7:657-670) commented about this issue saying "*generally families do not accept that children are different from each other. This is the biggest problem (...) Families who do not accept children's individual differences sometimes intervene in teaching process. And they want their children to work beyond the interests and levels*".

Another teacher (T8:746-749) explained that a family's economic status and education level affect negatively the implementation of differentiated instruction activities. She asserted that "*Family is a very important element and I think we need to develop it. Mom and Dad should be sufficient. Low economic status and educational level of families limit the effective manner of teaching activities. Because of the lack of awareness and guidance in the family, I'm having trouble in carrying out different activities*". Additionally, another teacher said (T14:1301-1306) "*I'm having problems stemming from physical conditions of school and lack of materials. Especially when we look at the profile of the parents, we have noticed that economic level of them is very low. That's why we face difficulties when we want students to bring materials into the classroom. It is financially impossible for teachers to supply the materials on their own. These are the reasons why we experience failures in the application of differentiated instruction approach*".

One of the teachers (T10:929-936) who has mentioned the problems caused by the physical conditions of schools and classrooms said that "W*hen we look at the classroom environment, because of the crowded classes, problems emerge in classroom management. And it is not possible for us to allocate time for each student. In addition to the crowded classes, limited physical space also causes problem for me*". With regard to the same issue, another teacher (T4:340-347*) said that "textbooks and manuals have not been prepared in a format suitable for individual differences. The biggest difficulty here, in fact, a child in advanced level immediately completes his/her work whereas a child in lower level cannot understand it, and s/he is bored. Also the questions in the books are not appropriate to the multiple intelligences. Some children answer the question with just a word. Some write at length. Here, individual differences are emerging*".

Sub-categories for the theme of "Suggestions related to the application of differentiated instruction" are shown in Table 7.

Table 7. Suggestions related to the application of differentiated instruction

In-service training programs should be organized by experts
Cooperation between the Ministry of National Education and universities should be enhanced
Family education should be provided
School administrators should be informed on this approach
Cooperation between school and family should be enhanced
Physical facilities of schools and classes should be improved
The number of students in each classroom should be reduced
Classrooms should be constituted according to students' interest groups
More books and resource materials about this approach should be provided for teachers

One of the teachers (T14:1339-1342) expressed his opinion as "*In-service training seminars related to differentiated instruction or individual differences may be developed. Cooperation between the universities and Ministry of Education may be enhanced. And we can get some information and sources relating this approach*". Another teacher (T9:845-850) said that "*instruments are very important. Also our classroom environment must be regulated according to this approach. Reduced class size provides students with many benefits and opportunities for participation in the learning activities. If teachers have the competence and the necessary materials and learning environment is prepared suitable for this approach, I think we can be successful in applying this approach.*"

One of the teachers (T1:151-155) suggested developing physical facilities of schools and classrooms and providing equipments. She mentioned on this matter stating "e*specially, we have expectations from*

school management about providing financial resources. I cannot supply the material to perform these activities. Many resources are insufficient in the library. It would be much better if books, materials and more resources were provided. Also, school administrators should be informed about this approach in my opinion". One of the teachers (T14:1337-1340) proposed that some informative seminars should be given for parents by adding "*First of all, parents should be conscious. At this point, the awareness of parents should be developed. Parents and teachers should be aware of individual differences, developmental characteristics of children, and child psychology*".

DISCUSSION, CONCLUSION AND RECOMMENDATIONS

This study investigated the perceptions and practices of primary school teachers related to differentiated instruction. Although the findings are limited by the sample size, the nature of the findings seems applicable to teachers in other settings as well.

The findings of the study revealed that the majority of teachers have not much information and they have not received any training about this approach previously. In this scope, Tomlinson (2005) emphasizes that teachers may not be familiar with the concepts involved in implementing differentiated instruction in the classroom.

The findings of the present study pointed out that teachers try to implement some different teaching and assessment methods and techniques to meet the needs of the students in terms of their individual differences, interests, learning levels and capabilities. However, the findings of the study underline the fact that teachers do not have enough theoretical and practical knowledge on teaching methods and techniques for differentiated instruction. While the findings of the present study are in parallel with the findings of Ham's (2001, p.109) study, they are not consistent with Christian's (2006) study. According to Ham's study, a majority of the responses indicates that only a very limited number of teachers use differentiated teaching practices that provide more opportunities for students to experience different learning opportunities that meet their learning style. The data obtained from Christian's (2006) study revealed that the majority of participants were successfully implementing differentiated instruction in the classroom.

The third significant finding of the study indicated that the teachers mostly apply differentiated instruction approach in courses of science and technology, language arts, visual arts, and mathematics to take their attention to abstract concepts, develop language skills of students as a multi-faceted, eliminate problems of student's perceptions, and also meet the individual differences of students.

Findings of the study show that the majority of teachers feel themselves inadequate. Firstly, teachers do not have previous knowledge about this teaching approach, and they are not informed through in-service teacher training. Just four teachers with master and doctoral degree in primary education feel themselves medium level sufficient on this approach. Therefore, it is possible to say that these teachers have found opportunity to receive training and track recent studies in the field of education. For this reason, it can be said that they have knowledge about this approach and they feel a bit more sufficient compared to other teachers. According to the results of Holloway (2000) study, teacher-education programs rarely address the differing needs of learners, and the supervisors of these teachers rarely encourage the use of differentiated instruction. Additionally, Ayers' (2008) study supports the findings of this study. Ayers (2008) found out that the majority of participants are using differentiated instruction, but in varying degrees.

The results of the study revealed that teachers have encountered a variety of problems while implementing differentiated instruction. Most problems encountered in the implementation of this approach are caused by families, students, the physical conditions of schools and classrooms, teachers and school administrations. Related literature supports the findings of the study. For example, Tomlinson (2001) states that to be successful, taking on the task of differentiated instruction approach requires support that comes from the students, the parents, the administration and the school staff. Leaders need to develop a more complete understanding of differentiated instruction, have more training on leading a change process, and learn about more effective staff development practices (Richardson, 2007, p.ii). The biggest constraint teachers reported was time and student-teacher ratio. Therefore, teachers may perceive that they do not have time to individualize instruction or develop alternative assignments for each student (Hensel, 2009, p.204-209).

The findings reveal that teachers feel many important educational needs on differentiated instruction. Teachers feel inadequate and they **need to be *aware of*** implementation of different methods and techniques, using technology, identifying and managing student groups, guidance, identification of appropriate teaching activities to children, child psychology, implementation of differentiated instruction methods and techniques, assessment, determining children's intelligence field and also application of instructional methods and techniques suited to intelligence domain. Moreover, this study revealed that teachers need in-service teacher training on theoretical and practical knowledge of differentiated instruction approach. Therefore, it can be said that there is a strong need for a systematic in-service teacher training programs to inform teachers about differentiated instruction. Related literature supports the findings of the study. Kraft's (2005) study indicates that teachers felt less efficacious in student engagement and instructional strategies and equally efficacious in classroom management. Ankrum (2006) found out that teachers need much more guidance about how to apply differentiated instruction. Additionally, Clarke (2006) and Ayers's (2008) studies solidified the necessity of teacher training in differentiated instruction. Similarly, Fahim (2008, p.8) points out that when it comes to implementing differentiated instruction, the proper education and professional development should be provided to the teachers. Tomlinson (2005, p.11) explains that teachers may need training and administrative support during the onset of implementation. Professional development and collaboration may be required to assist teachers and familiarize them with the use of strategies and classroom management.

Consequently, it can be said that teachers feel themselves inadequate in terms of differentiated instruction, and they need in-service training regarding differentiated instruction both theoretically and practically. These findings stress that teachers need to be informed and trained via both in-service and pre-service training programs. Based upon the findings of this study, the following recommendations are offered:

- Differentiated instruction approach should be addressed within the scope of special education methods courses in teacher training programs and prospective teachers should be informed about this approach in pre-service education.
- Teacher education programs should be developed in both theory and practice in terms of differentiated instruction.
- The administrators, principals and teachers should be informed about theoretical and practical knowledge by experts on this approach.
- Preparing in-service training seminars in which experts give abstract examples about how to use differentiated instruction in the classroom will be helpful to practice differentiated instruction effectively and successfully.
- Physical facilities of schools and classrooms should be improved; appropriate educational settings should be prepared and also the number of students in the classrooms should be reduced.

Habits of highly effective teachers

Mrs. Abaida Mahmood
Qurban & Surraya Educational Trust

Abstract

Teachers are considered as most significant contributors in the overall development of nation; their job is not only follow the official syllabi and textbooks but they should also contribute towards the intellectual, moral, social and academic development of children enabling them to become better citizens. Teachers are key players in the process of educational change and school improvement; they do not only deliver curriculum but they are engaged in defining and reinterpreting curriculum.
The 7 habits of highly effective people by Stephen Covey has inspired millions across the world, if those habits can produce effective managers or leaders then they can be applied to teachers as well.
Be Proactive ,Begin with the End in Mind ,Put First Things First ,Think Win/Win ,Seek First to Understand, Then   to Be Understood , Synergize,Sharpen the Saw ,Find your voice and inspire others

Good teachers are not born, they are made. It takes a number of years for teachers to acquire good teaching skills . Subject knowledge, warmth, friendliness, being supportive, having good communicative skills (being a good Listener in particular), being empathetic, being orderly and in control, having respect for the students, providing positive feedback to students, rewarding students for positive behaviour and being fair
are the qualities of a good teacher.

**ATTITUDE OF TEACHERS W.R.T THEIR ROLE IN INDIA- FACTOR ANALYSIS &
Strategies for Success**

Dr. Ruchi Trehan

Dr Justin Paul

Nagoya University of Commerce and Business

Japan

Abstract

Attitude is a major factor affecting behaviour. They influence the perception of objects and people, exposure to and comprehension of information, choice of friends, co-workers and so on. Attitudes are subjective attributes of people. They can be regarded as constructs in the sense that they are conceptualizations of human qualities that are formed on the basis of either rational consideration or statistical evidence. Thus, people may vary along each of a number of attitudinal dimensions. Keeping this measurement aspect into consideration, the attitudes might be defined operationally by describing the measurement systems that psychologists use to measure attributes. There are many methods of attitude measurement i.e. (i) self-report (usually elicited with questionnaires dealing with beliefs, feelings and behaviours); (ii) indirect tests (such as projective techniques and disguised approaches); (iii) direct observation techniques; and (iv) psychological reaction techniques.

This study aims at enquiring into Quality of working life differentials among teachers with a view to bring to the surface some of the conditions in context of job satisfaction categorically.

More specifically, following are the objectives of this study.

1. To analyse Quality of Working Life differentials among urban and rural school teachers;
2. To compare the urban and rural teaching environment on the basis of job satisfaction criteria like
       teaching and welfare facilities, job characteristics and leave welfare policies etc;

METHODOLOGY

  The research has been conducted in government schools in India. It was carried out with two samples of 200 teachers each from the urban and the rural area. For the selection of 200 teachers from the urban and rural area, the convenient sampling method was adopted and an attempt has been made to include all the young as well as the senior teachers. Similarly in case of rural area an effort has been made to include the teachers from the wider range of the border area schools.

  Keeping in mind the objectives of the study, the data were collected from primary sources. A questionnaire was formulated for the study, which was subjected to pilot testing and re-drafted. The questionnaire was of structured type. The questionnaire contained questions relating to different dimensions of QWL such as level of happiness or fulfillment in different aspects of life, satisfaction from the various job factors and job facilities, behaviour of boss, perceived growth, present pay, opportunities for promotion, working conditions, some common statements relating to factors affecting QWL and the determinants of QWL etc. the questions included in the questionnaire were open-ended, dichotomous and offering multiple choices.

Thus, this paper is, therefore, designed to study the attitude of teachers' w.r.to their role in the society and organization using Factor Analysis empirically.

The Study of Management and Operation Problem Level Following International Standards in Management: The Achievement of Thai Governmental Sector Work in Data System Number 1101 of Suratthani Education Service Area Office 1

Topic : Educational Management

ABSTRACT

This research was to study management and operation problem following international standard in management and achievement of Thai governmental sector work in data system number 1101 of Suratthani Education Service Area Office 1 in the viewpoint of high level executives and working staff. The attitudes of high level executives and working staff were compared. In this research, sampling group was 124 people in the office. This sampling group was divided into 11 high level executives and 113 working staff. Research tools used were 5-rating scale and open-ended questionnaire. Data were analyzed by using frequency distribution, percentage, mean, and standard deviation. The assumption was tested by t-test.

Research results found that problem level in management had mean at 3.23. This was in the moderate level compared to the criteria. The problem level in operation had mean at 3.54. This was in the high level. For the comparison, the attitude of the high level executives and working staff to the 1101 data system, it was found that the attitudes of the high level executives and working staff to the management problem level of the 1101 data system was generally statistically insignificant different at the level of 0.05. Also it was statistically insignificant different at the level of 0.05 for operation problem level.

Keywords : Management Problem Level, Operation Problem Level, Thai Governmental Sector, Data System Number 1101, Suratthani Education Service

Background and Significance

According to the law in the Constitution of the Kingdom of Thailand enacted 1997 (2540 B.E.) Section 75, The State shall ensure the compliance with the law, protect the rights and liberties of a person, provide efficient administration of justice and serve justice to the people expediently and equally and organise an efficient system of public administration and other State affairs to meet people's demand. In the 8th meeting of the Civil Service Commission in 2541 B.E. on September 14th, 1998, the Prime Minister was the chairperson and the meeting resolved that the State shall develop international standard for Thailand in the aspect of management and achievement of the State so that the State has a good management system different from the quality management system as defined by ISO. On October 27th, 2541 B.E. the meeting resolved that they agreed with the proposal by the Office of the

Civil Service Commission to develop Thailand International Public Sector Management System and Outcomes or P.S.O. [1].

P.S.O. is Thailand International Public Sector Management System and Outcomes. It is important for the increase in management efficiency so that the public sector can use this as a tool to reform and develop the economy, society, politics, poverty and the quality of life of the population. Moreover, it is aimed to create management system and governmental service in a fast manner, equally and in a fair manner in order that the people are highly satisfied [2].

Suratthani Education Service Area Office 1 has planned to develop the operation efficiency and applied P.S.O. in its work for a while. Therefore, it was interesting and led to the problem in this research that is "What is the problem level of the operation which follows such system as described by the high level executives and working staff in Suratthani Education Service Area Office 1.

Research Objectives

1. To study the problem level of the administration which follows P.S.O. or international standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 of Suratthani Education Service Area Office 1 as described by high level executives and working staff.
2. To study the problem level of the operation which follows P.S.O. or international standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 of Suratthani Education Service Area Office 1 as described by high level executives and working staff.

The Study of Management and Operation Problem Level Following International Standard

Kuntida Thamwipat and Ploenchom Chusawad

3. To compare the attitudes of high level executives with those of working staff towards the problem level in administration which follows P.S.O. or international standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 of Suratthani Education Service Area Office 1.
4. To compare the attitudes of high level executives with those of working staff towards the problem level in operation which follows P.S.O. or International Standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 of Suratthani Education Service Area Office 1.

Expected Outcomes

1.The problem level about the administration and the operation which follows P.S.O. or international standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 of Suratthani Education Service Area Office 1 as described by high level executives and working staff.

2. The high level executives and working staff of Suratthani Education Service Area Office 1 could use the research results in planning to improve, extend the administration and operation results according to P.S.O. or International Standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 in a more effective way.

Population and Sampling Group

This research was based on the population which composed of 124 persons in Suratthani Education Service Area Office 1. They could be divided into 11 high level executives and 112 working staff.

Table   1   The Population in this research as classified by group/departments

Group/Directors	Leaders	Working Staff		Total (persons)
		Head	Working Staff	
Administrator	1	-	-	1
Director	2	1	23	26

Statistics

Statistics used in this study were

percentage, mean, standard deviation and t-test

Results from Analysis of Personal Data

1. The results from an analysis of personal data as classified by positions of the persons in the office were shown below.

Table 2 Shows the personal data of the personnel as classified by the positions in the office.

Position	Number	Percentage
High level executives	11	8.90
Working staff	113	91.10
Total	**124**	**100.00**

According to Table 1, it was found that the majority of the persons in Suratthani Education Service Area Office 1 were working staff (113 persons) or 91.10% and there were 11 high level executives or 8.90%.

2. According to the analysis of the problem level in administration in terms of visions and missions as expressed by high level executives and working staff to operate the organization according to P.S.O. or international standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 of Suratthani Education Service Area Office 1, it was found as below.

Table 3 Summarizes the problem level of administration according to P.S.O.

Management Problem Level	Results from Evaluation			Rank
	$\overline{X}$	S.D.	Problem Level	
In terms of policies	2.88	1.16	Moderate	3
In terms of working personnel	3.19	1.17	Moderate	2

In terms of environment	3.63	1.04	High	1
Average	**3.23**	**1.12**	**Moderate**	**-**

The Study of Management and Operation Problem Level Following International Standard

Kuntida Thamwipat and Ploenchom Chusawad

According to the results from the data analysis, it was found that in overall the management and operation problem level in terms of visions and missions as expressed by high level executives and working staff to operate the organization according to P.S.O. or international standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 of Suratthani Education Service Area Office 1 was 3.23 on average. When it was compared to the set criteria, it was found to be at moderate level. When each item was compared, it was found that the highest management and operation problem level in terms of visions and missions as expressed by high level executives and working staff to operate the organization according to P.S.O. or international standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 of Suratthani Education Service Area Office 1 was about environment with average mean of 3.63. When compared to the criteria set, it yielded high level. The first runner-up problem level was in terms of working personnel with average mean of 3.19. When compared to the criteria set, it yielded moderate level. The lowest problem level was in terms of policies with average mean of 2.88. When compared to the criteria set, it yielded moderate level. These average means and standard deviations were shown in table above.

3. The results from an analysis of the data about the management and operation problem level following international standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 of Suratthani Education Service Area Office 1 for 9 criteria as expressed by high level executives and working staff were shown below.

Table 4 Summarizes the management and operation problem level following P.S.O.

Operation Problem Level	Results from Evaluation			Rank
	$\overline{X}$	S.D.	Problem Level	
All-inclusiveness of the data	3.70	1.00	High	2
Speed of the data	3.60	1.11	High	5
Accuracy	3.69	0.97	High	3
Link between data	3.17	1.24	Moderate	9
Data being up-to-date	3.69	1.05	High	4
Reliability	3.57	1.05	High	6
Easy access	3.22	1.17	Moderate	8
Verifiability	3.72	1.22	High	1
Ability to participate	3.56	1.17	High	7
Average	**3.54**	**1.08**	**High**	-

The Study of Management and Operation Problem Level Following International Standard s
Kuntida Thamwipat and Ploenchom Chusawad

According to the results from the analysis of the data, it was found that in overall the average score for the management and operation problem level following P.S.O. or international standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 for 9 criteria as expressed by high level executives and working staff was 3.54. When compared to the criteria, it was at high level. When each item was considered, it was found that the highest management and operation problem level following P.S.O. or international standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 for 9 criteria as expressed by high level executives and working staff was about verifiability with average score of 3.72. When compared to the criteria, it was at high level. The first runner-up problem level was all-inclusiveness of the data with average score of 3.70. When compared to the criteria, it was at high level. The lowest problem level was about link between data with average score of 3.17. When compared to the criteria, it was at moderate level. The average scores and standard deviations were shown in the Table 3.

4. Results from the analysis of the attitudes expressed by high level executives and working staff towards the management and operation problem level following P.S.O. or international standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 of Suratthani Education Service Area Office 1 were shown below.

Table 5 Analyzes the comparison of the attitudes held by high level executives and working staff towards the management and operation problem level following P.S.O.

Attitudes towards Management Problem Level	High Executives		Level Working Staff		t
	$\overline{X}$	SD.	$\overline{X}$	SD.	
In terms of policies	14.90	4.36	17.55	5.31	.30
In terms of working personnel	16.27	4.24	19.45	5.48	.18
In terms of environment	19.00	3.79	22.07	4.74	.97
Average	50.18	11.03	59.07	14.30	.45

With statistically significant difference at 0.05

The Study of Management and Operation Problem Level Following International Standard
Kuntida Thamwipat and Ploenchom Chusawad

According to the results from analysis, it was found that the attitudes of the high level executives and working staff towards the management problem level following P.S.O. or international standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 of Suratthani Education Service Area Office 1 were statistically insignificant different. When each item was considered, it was found that the management and operation problem level following P.S.O. or International Standard in Management and Achievement of Thai Governmental Sector Work in Data System Number 1101 of Suratthani Education Service Area Office 1 in terms of policies, working personnel and environment were statistically insignificant different (t = .30, .18, .97 respectively)

5. The results from comparative analysis of the attitudes expressed by high level executives and working staff towards management and operation problem level following P.S.O. or international standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 of Suratthani Education Service Area Office 1 were shown below.

Table 6 Compares and analyzes the attitudes expressed by high level executives and working staff towards the management and operation problem level following P.S.O.

Attitudes towards Operation Problem Level	High Executives		Level Working Staff		t
	$\overline{X}$	SD.	$\overline{X}$	SD.	
All-inclusiveness of data	17.27	3.97	18.62	4.39	.53
Speed of data	16.00	3.92	18.22	4.31	.55
Accuracy	16.72	3.55	18.66	3.50	.85

With statistically significance difference at 0.05

The Study of Management and Operation Problem Level Following International Standard
Kuntida Thamwipat and Ploenchom Chusawad

According to the analysis, it was found that the attitudes expressed by high level executives and working staff towards the operation problem level following P.S.O. or international standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 of Suratthani Education Service Area Office 1 were statistically insignificant different. When each item was considered, the operation problem level following P.S.O. or international standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 of Suratthani Education Service Area Office 1 in terms of all-inclusiveness of data, speed of data, accuracy, link between data, data being up-to-date, reliability, accessibility, verifiability and participation in data process were statistically insignificant different (t = .53, .55, .85, .09, .74, .06, .60, .83, .06, .46 respectively)

6. Summary of Attitudes and Suggestions
According to the summary, it was found that the personnel in Suratthani Education Service Area Office 1 had the following attitudes.

6.1 Attitudes expressed by high level executives were
- The whole system should be flexible.
- More research and survey should be done.
- The personnel in the office do not have compassion; working is just a stage to create self-image.
- Practice should follow guidance.
- Knowledge should be distributed to everybody and technology should be applied.
- The meeting should be held to inform the personnel of the policies along with documents for the personnel.

6.2 Attitudes expressed by working staff were
- The data in the office should be based on the same standard.
- The data should be up-to-date and easy to use.
- Manual should be prepared in a clear and academic manner.
- There should be honesty and strictness in some work situations.
- There are many details for P.S.O.1101.

The Study of Management and Operation Problem Level Following International Standards

Kuntida Thamwipat and Ploenchom Chusawad

Research Discussions

According to the analysis, it was found that the management problem level following P.S.O. in terms of visions and missions as expressed by high level executives and working staff to operate the organization to the international standard or international standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 of Suratthani Education Service Area Office 1 was 3.23 on average. When compared to the criteria, it was at moderate level. When each item was considered, it was found that the problem level about environment was high probably because high level executives did not show good attitudes towards the system and they had never been trained nor been to any study trip or seminars incessantly. Therefore, the office should promote the personnel by giving them training course, study trip or seminar. More importantly, high level executives as well as working staff should be encouraged to understand their roles. This complies with the research done by Somchai Kitkham [3] in that the office should have a role in promoting the roles and duty of the personnel in order that they do not have trouble working and planning for their operation.

According to the analysis in overall, the management and operation problem level following P.S.O. or international standard in management and achievement of Thai Governmental Sector Work in Data System Number 1101 for 9 criteria as expressed by high level executives and working staff was 3.54. When compared to the criteria, it was at high level. When each item was considered, it was found that the highest operation problem level as expressed by high level executives and working staff was about verifiability and the second highest problem level was about all-inclusiveness of the data. This was possibly because high level executives and working staff lacked understanding about systematic documentation, lacked verification, and did not operate according to the quality of the document. Moreover, there was neither campaign in the form of document nor accurate and important data about their roles and duty. This complies with Chanwit Yikusang [4] in that the personnel should understand their roles and responsibilities to operate. This will bring efficiency to the organization.

The Study of Management and Operation Problem Level Following International

Kuntida Thamwipat and Ploenchom Chusawad

Suggestions from Research Results
1. Research results showed that the highest management problem level was about environment. In other words, the personnel in the office were not motivated to work in accordance with P.S.O. Data System Number 1101 and the personnel lacked clarity in their work. Therefore, the executives should motivate them to work by, for example, giving a training course, budget and clear policies which facilitate the operation of the working staff.
2. Research results showed that the most seen operation problem level was about all-inclusiveness of data. Therefore, the office should provide clear policies in the form of document in a concrete manner. The document system should be in the same direction and be based on the quality of the document. The presentation and the campaign for accessibility should be encouraged so that both customers and stakeholders can access this kind of data.

Suggestions for Further Research
1. The quality of the organization in other aspects such as PMQA and 5S should be studied and developed so that the organization could work effectively in various quality systems.
2. The qualitative research methodology should be used for further study so that in-depth data could be achieved. There should also be more sampling groups in other education service areas to cover all 14 provinces in Southern of Thailand.

INTRODUCTION

All most all the countries of the world irrespective of their levels of development, realized that knowledge and skill will take crucial part in the process of sustainable development. It has now become evident that a high priority must be assigned to investment in human capital. Expenditures on education and training, improvement of health, and research contribute to productivity by raising the quality of population, and these outlays yield a continuing return in the future. While investment in human beings has been a major source of growth in advanced countries, the negligible amount of human investment in developing countries has done little to extend the capacity of the people to meet the challenge of accelerated development. Schultz(1962) rightly stated that an investment in the quality of the human factor through education is then as essential as investment in physical capital. An advance in knowledge and the diffusion of new ideas and objectives are necessary to remove economic backwardness and the policies pertaining to the development of human capabilities and motivations that are more favorable to desire economic progress of the third world countries.

Over the years, several steps have been taken to enhance the reach and content of education, but the system continues to suffer from infirmities. The lack of adequate financial resources, continuance of rural poverty and ever-increasing population have exacerbated in the constitution and the recommendations of many committees and commissions still remain unrealized.

UNESCO Report (1992) observed that the government spending on school education is low "In India, where between 60 and 70 children given primary education for the cost of training one university student, approximately half of the nation's children fail to finish primary school while the country as a whole produces more graduates than it can employ. Inevitably, one of the effects is a brain-drain of unemployed but highly qualified people to the industrialized nations.. In the way, a significant share of Government spending on education is used to benefit the rich nations rather than to achieve basic education for all which, as all experience suggests, is one of the corner stones of development". The report stated that there is an urgent need to expenditure on school education.

The public and private sector are playing major role in imparting education everywhere since time immemorial. The public sector is entirely under control of Government agencies due to financial dependency on civil estimates. On the other hand, the role of the private sector in catering education has substantially increased in recent years in the wake of India's New Economic Policy(NEP) as adopted by the GOI in August 1991, and characterized by Liberalization, Privatization, Globalization. The role of private sector in gross domestic capital formation in GDP has increased substantially from

13.1 percent in 1991 to 14 percent in 1998. Moreover, the increase in gross domestic capital formation in GDP since 1951 to 1991 has been almost negligible. Such increase in capital formation has certainly direct/indirect impact on educational development in the country. Now most of private educational entrepreneurs believe that schools are a good source of investment to make money, and it has become an important business to emerging private educational entrepreneurs in the country due to lack of provisions in educational policies on running the educational institutions, particularly at pre-primary, primary and upper primary stages. Money spent on running schools yield substantial dividends in terms of economic returns to the entrepreneurs. It is found even perceived by the teachers and parents that the private school management boards are a fund raising bodies giving rise to serious concerns of equity in case of poor communities in the present era, and is violation of NPE in regard to equal access and opportunity for all up to school stage and improvement of quality at all levels(GOI,1999). It is clear that the marginalized sections of the society are unable to bare the growing expenditure on school education. The private schools will have adverse impact on the weaker sections of the society and will prove to be disastrous for the political parties in power at the centre and state levels. If 50 million or so illiterate children along with their family unit and lobby against private schools for free education, no Government can afford to ignore their demand unless the party in power deliberately chooses to commit a political suicide. Being a sensitive instrument for human development, no Government can afford to deny the access of school education of satisfactory quality to the aspiring parents to educate their children.

ALLOCATION OF RESOURCES FOR SCHOOL EDUCATION

Gross Domestic Production from 1951 to 1998 increased many fold i.e. from 9445 crores to 1616033 crores. If we look in to GPDCF as percent of GDP it is also increased from 7.8 percent to 14.8 percent during the above said period. It is also observed that the educational expenditure as percent to GDP increased tremendously from 0.68 percent to 3.77 percent but still it will have increase further for better educational facilities. In the same way plan expenditure on school education per pupil is reported as Rs. 8.82 in 1951 and it has enhanced to 216.3 in 1998. This amount is also insufficient to meet the maximum educational facilities. This is a remarkable change on per capita expenditure on general education. It is estimated that during 1951 it is 0.74 percent where as it has been increased to 46.67 percent in 1998. Thus, it can be concluded that the per capita expenditure on general education is increased much.

The Economic Survey 2007-08 reported that the allocations to education made by union and the state governments together, as a proportion of GDP, have not been satisfactorily progressing during last few years. The ratio was above 3 per cent in 200-01, and ever since it has steadily declined to reach a low level of 2.69 percent in 2005-06. For example, the total expenditure on education incurred by the departments of education and other departments on education together constituted 3.7 per cent of GDP in 2005-06. The share of education in total government expenditure on all sectors declined from 11.3 percent in 2000-01 to 10 per cent in 2005-06. Even within the total social sector expenditure, the share

of education declined from 50 per cent to 47.2 per cent in 2005-06 and further to 43.2 per cent in 2007-08(revised estimates).

In February 2008, the total allocation for the education sector has been increased from Rs.28,674 crores in 2007-08 to Rs.34,400 crore in 2008-09, it constitutes just about 3 percent GDP, a far cry from the 6 percent that is being targeted, of this the Sarva Shikshya Abhiyan(SSA) is provided Rs.13,100 crores SSA, which aims at creating basic infrastructure in schools, the Government most ambitious scheme intended to provide education to all children in the 6-14 age group. Given the fact that the Government has a long way to go as far as SSA in concerned, with a vast number of schools still being devoid of basic facilities like class rooms, drinking water and toilets, allocation too will not be adequate if a serious effort is made to achieve SSA's goals. According to a recent report by the National University of Educational Planning and Administration(NEUPA) about 30 percent of elementary schools in the country still lack of pucca building for holding classes. Pertaining to elementary schools, where more than 80 percent are in the Government sector, reveal that a primary school has an average only 2.8 classrooms for classes I to V, while the minimum requirement is 5 rooms.

The report reveals that more than 60 children sit in one room in more than 16 percent of the schools. The Government has also provided Rs.8000/- crores for the midday meal Scheme, the decision extended their scheme to upper primary classes on 3479 educationally backward blocks and provide kitchen sheds in all the schools by 2006-07, only 29.30 percent schools had kitchen sheds.

The allocation for school education has gone up from Rs.17133 crore in 2006-07 to Rs.23142 crore in 2007-08 of this, SSA will be provided Rs.10671 crores. The allocation for strengthening teacher training has been increased to Rs.450 crores as against Rs.162 crores last year. Taking the cognizance of the Veerappa Moily oversight committee report, which proposed a national merit scholarship scheme for one lakh students from marginalized groups like the SCs and STs and Union Finance Minister proposed to introduce Merit Scholarship Scheme, selection for which will be made through a national test from among students who passed class-VIII with each selected student being given Rs.6000 per year to study classes IX,X,XI,XII.

Funding for secondary education has been doubled from Rs.1837 crores in 2006-07 to 3794 crores in 2007-08, while the allocation made for the school education sector looks importance the funding for SSA which is reduced from Rs.11,000 crores last year(2007) to 10,671 crores this year(2008) will be watched with interest as the funding this programme is to be shared 50:50 between the states and centre as against 25:75 last year(2007).

Per capita expenditure on education in 2003-04 is Rs. 598 and according to the budget allocation Rs. 997 increased in 2007-08. In the above said period all states in the country realized to increase the pr capita expenditure on education from Rs. 617 to Rs. 958.

SIGNIFICANCE OF THE STUDY

The study on school education is desired for itself as it opens up a vast world of opportunities and ideas to the educated persons. It is of great instrumental value in the process of economic growth

and development as to improve the quality of life of people through enhancing their well-being and provides them opportunities and choices to become productive assets in the society. The role of private sector in catering educational needs has substantially increased in recent years due to economic reforms. In this circumstances, the parents are forced to bear the expenditure on school education by sending their children to private schools where they expect that the qualitative of educational facilities are available in private schools.

OBJECTIVES OF THE STUDY

In view of the growing importance of expenditure on school education the present study "Expenditure on School Education : Indian Experience" is based on the field study which was conducted in a village in Karimnagar District of Andhra Pradesh, India with the following objectives:

- ➢ To explore the significance of education for economic development.
- ➢ To study the socio- economic profiles of the respondents.
- ➢ To examine the pattern of expenditure on school education.
- ➢ To assess the educational and infrastructural facilities, which are available in the school.
- ➢ To suggest some policy measures to overcome the problems.

FINDINGS OF THE STUDY

The findings of the field study are presented in the following paragraphs.

The population of B.C. community which consists more than 93 sub-castes representation is larger than other communities. Naturally the sample representation, the number of students are more in number in this community.

Out of 120 sample respondents 41.6 per cent are from BC community, which is the highest than others followed by SC, OC, ST with 30.8,18.4, 9.2 percentages respectively. Thus, the sample respondents are covered by all the castes in the study area.

Out of 390 students 43.6 percent are belonged to BC community, which is the highest than all other castes followed by SC, OC, ST with 25.6 percent, 16.7 percent, 14.1 percent respectively. Since, the number of respondents are more in BC caste the total children of that community is also higher than other communities viz. SC, OC and STs respectively.

It is an interesting observation from the field study that out of 120 respondents 75 percent of the respondents are literates and 25 percent are illiterates are reported among the parents of the children, it is a good progress in rural areas. Still there is a need to have more educated or 100 percent literacy among the parents in the villages.

More than 55.0 percent of illiterate respondents are unable to complete even primary education level, due to their financial constraints and lack of awareness about the benefits of education. However, all most all the sample respondents are very much interested to spend sufficient money on their children education.

There are 56.4 percent are male students and 43.6 percent are female children. Thus, even today the female children are less in number for their enrolment to avail educational opportunities. Out of 390 students 41.0 percent are at primary education level, which is the highest than the other levels followed by secondary, upper primary with 30.8, 28.2 percentages respectively. Thus, it is clear that the school going children of the respondents are spread over in primary, upper primary and secondary levels of education.

It is evident from the field investigation that more than 80.0 percent of the sample respondents are belonged to agriculture laborers, marginal farmers and small farmers categories.

The study shows that respondents belong to small farmers category are more literates and agriculture laborers category are more illiterates. It is an interesting observation that the literacy rate incase of agriculture laborers and marginal farmers categories of respondents are registered as low when we compare with the national literacy. The illiteracy rate is highest incase of ST community and the highest literacy rate is registered in SC community.

There are 58.3 percent parents who are sending their children to private schools and 41.7 percent parents under unavoidable circumstances, sending their children to government schools. In spite of their poverty and unemployment , they thought that spending the money on children education is a sensible expenditure. There fore, nowadays majority of the parents in rural areas are prepared to send their children to private schools only.

Most of the respondents of OC community are sending their children to private schools and the other communities like BC, SC, ST are incurring expenditure on school education in private management schools with 60.0, 48.7 and 45.5 percentages respectively. Thus, it is clear that the OC community, which are basically sound in financial matters are able to send their children to private management schools. It is very difficult to other categories of respondents whose income is insufficient to meet their minimum requirements.

It is focused that most of the parents as well as students are taking much interest to join their children in privately managed schools, where they expect that the quality education is available in private schools. Therefore, it is clear that the low income respondents of the sample area are also having a strong intention to join their children in private schools.

It is observed that the medium and big farmers categories of respondents are having their own houses. At present 35 respondents do not posses own housing facilities. The respondents those who are living in rented houses in the sample village are benefited through Indiramma housing scheme. The people living in rented houses and huts are also sending their children to schools.

Even today disguised unemployment problem is prevailing in rural economy. More than 50 percent of population income is up to 24000 rupees, which is not sufficient to meet their minimum requirements of subsistence living.

The less number of students pursuing their education in the village belong to higher income groups. And majority of them are staying in towns for taking good education.

The income earnings of BC, SC, and ST population is very low than OC community where the percentage of OC population is very marginal. Therefore, it causes growing income inequalities.

The expenditure on girls education is much more in secondary school than the expenditure on boys i.e. 1741.96 and 1315 rupees when it is compared with the average expenditure in primary education level. Therefore, it is concluded that expenditure on school education is increasing and more so particularly the expenditure on girls education is much more than the boys. The expenditure on school education is more in case of girls than the boys. Their parents are spending much money . All most all the parents opined that spending a little bit of higher money on girls education is quite natural and it is a sensible expenditure to meet their minimum compulsory requirements.

The study found that the OC community spending much money i.e Rs. 2234 followed by BC, ST, SC communities. It is clearly reported that the expenditure of OC and BC are above average and it is very low level incase of ST and SC students. It is quite natural that the capacity of OC community is much higher than the other communities. Therefore, the capacity to spend on their children education is very low among the parents of ST and SCs.

The expenditure on school education is more in case of girls than the boys. Their parents are spending much money . All most all the parents opined that spending a little bit of higher money on girls education is quite natural and it is a sensible expenditure to meet their minimum compulsory requirements.

Out of 390 students, a majority of the students pursuing their education at primary level followed by secondary school level students and upper primary school level with 120 and 110 students respectively. The average expenditure incurred on school fee, cloths and books is higher than the expenditure on other items. The average expenditure on secondary education is much more (Rs. 1649.56) than the upper primary as well as primary level of education. The lowest expenditure (Rs. 827.93) is incurred in case of primary education level, which is less than the total average expenditure.

It is an interesting observation from the field investigation that the average expenditure on school education in government schools is very low i.e. 512/- and this expenditure is much higher incase of privately managed schools which is worked out as Rs. 1558/- per month. It is also observed that school fee payment is very meagre amount in case of government schools. The common man unable to afford the private education to their children. Thus, even though the expenditure on school education is inevitable, but it is becoming a burden on the part of poor parents.

SUGGESTIONS

➢ The expansion of qualitative education in rural areas is still a challenging task to the society. The situation in India today is one of low achievement in education combined with significant inequalities across, sexes, regions, social classes as well as castes and communities. Tangible progress has been made in the last decade of the 20th century in school enrolment but the situation is far from satisfactory. Particular attention needs to be paid to the gender gap in educational achievements and to promote education of females.

➢ Teachers are , perhaps, the most important resource in a school education system. The schooling system in India needs more teachers to teach the Indian students at primary, upper

primary and secondary and senior secondary stages. The quality of infrastructural facilities in the schools is deplorable. It is clear that expansion of primary education requires large-scale expansion of basic school infrastructure in the schools and up grading of facilities in existing schools.

➤ Providing primary school educational facilities to all children requires huge amount of expenditure on primary education. The expenditure on education should be enhanced 6 percent of GDP to provide adequate quality and quantity of primary schooling compared to current expenditure of 1.5 percent on primary education.

➤ Since, there is greater demand for computer education, it is also necessary to allocate more funds for the purchase of computers and also recruitment of computer staff, to teach the school children in rural areas.

➤ The parent committees should also take active part in the functioning of Government and private schools in the rural areas.

CONCLUSION

A powerful knowledge society will emerge with the realization of dream "Education for all". Therefore the State and Central governments, the policy makers, the Non – Governmental Organizations(NGOs) and the civil society work together for the attainment of sustainable economic development through qualitative and quantitative educational achievements.

Do solar power systems initiate energy conservation in schools?

Stacey Tabert
Associate Lecturer of English
School of Policy Studies
Kwansei Gakuin University

Abstract:

This paper examines whether installing solar power systems is an effective catalyst for stimulating energy saving strategies in schools by investigating the findings from a mixed-methods program effects study of an Australian Solar Schools Initiative. The question of whether schools with solar power installations come to view and use energy differently from schools without renewable energy technology is examined and contextualised against another Australian energy education program that has achieved concrete energy savings in schools.

Keywords:

energy behaviours; energy conservation; energy efficiency, photovoltaics; renewable energy; solar schools

Introduction

As the world faces the effects of climate change, OECD nations are confronted by the challenge of how to rapidly adjust from a culture of excessive energy consumption and high greenhouse gas emissions to one of minimising their environmental footprint and achieving sustainability. Large-scale renewable energy infrastructure initiatives, such as solar school programs, are being promoted as a way to reduce national greenhouse gas emissions and increase awareness of the need for energy conservation.

There are currently 1,200 schools in Japan that have solar power systems, however, the Japanese government recently announced that it aims to increase that number to 12,000 by 2012, then to all 32,000 public schools by 2020 in an effort to reduce greenhouse gas emissions and increase acceptance of renewable energy technologies (Chan, 2009). Promoters of solar school initiatives claim that installing solar power on schools has educational, environmental, financial and social benefits for schools as well as the wider community. Stakeholder objectives for solar school programs include:
  • educating students about renewable energy sources (educational);
  • reducing school greenhouse gas emissions (environmental);
  • initiating cost-saving measures in schools (financial); and,
  • increasing societal awareness and acceptance of renewable energy sources (social).
However, due to a lack of program evaluation the impact of participating in solar school initiatives on how schools view (attitudes) and use (behaviours) energy is not known.

This paper examines whether installing solar power systems is an effective catalyst for stimulating energy saving strategies in schools by investigating the findings from a mixed-methods program effects study of an Australian Solar Schools initiative (2001-2006). The question of whether schools with solar power installations come to view (attitudes) and use (behaviours) energy differently from schools without renewable energy technology is examined and contextualised against another Australian energy education program that has achieved concrete energy savings in schools.

Making Energy a Priority in Queensland Schools

The Queensland Department of Education and Training (DET) 2007-08 *Annual Report* estimates that each student attending a state funded school in the Australian state of Queensland consumed just over 460 kWh of energy and produced 490 kg CO2-e/kWh of greenhouse gas emissions in 2006-07. In

order to manage energy use within schools and reduce greenhouse gas emissions, DET "has developed a *Strategic Energy Management Plan* to support the whole-of-Government Strategic Energy Efficiency Policy (SEEP)" (p. 66). Two key components of the *Strategic Energy Management Plan* are the Solar and Energy Efficiency Program and the *EnergyWise* initiative.

In 2008, the Education Department established the Solar and Energy Efficiency Program to reduce energy consumption and greenhouse gas emissions in state schools. This program has a budget of AUD$60m spread over three years, which will be used to install "a 2kW solar system where not already installed, smart metres, an information technology system and the installation of energy efficient lighting measures" in all 1250 state schools (Hunter, 2008). The program will also provide curriculum resources and professional development to support energy-related behaviour changes within schools.

The *EnergyWise* initiative, launched in 2007 in partnership with the Department of Mines and Energy, will allow 180 schools to participate in an energy efficiency program organised through the Queensland Environmentally Sustainable Schools Initiative (QESSI). Participating schools will undertake an energy audit and develop an energy reduction action plan for their school. QESSI "helps schools manage their resources more effectively, thereby reducing their ecological footprint through the reduction of energy usage, waste, water consumption and improvement of biodiversity within school grounds" (DET, 2008, p. 62). QESSI aims to foster environmentally sustainable behaviour by utilising a whole school approach to campus management.

The Queensland Government has committed a substantial amount of money and resources to energy-related programs in schools. The only way to predict whether these initiatives will result in the adoption of sustainable energy behaviours is by evaluating the efficacy of previous solar and energy efficiency programs.

The Energy Efficiency in Schools Program

In 2001, Education Queensland initiated the Energy Efficiency in Schools (EEIS) program, in partnership with the Queensland Environmental Protection Agency (EPA) and Ergon Energy. EEIS residential camps have been offered in varying forms at three Environmental Education Centres located in the South-East, Central, and Northern Queensland, with "the primary aim of the program for participating schools to consider possibilities of reducing energy consumption and thus minimise greenhouse gas emissions due to school activities and to create greater awareness of greenhouse issues" (Purnell, Sinclair & Gralton, 2002, p. 5). EEIS has accomplished program aims by introducing students "to the concepts of energy efficiency and offering practical ways of realising it, culminating in an action plan to reduce energy consumption in schools" (p. 4). Students learn first hand about energy efficiency practices and alternative energy produced by solar and wind as well as exploring issues such as greenhouse gas emissions produced by coal-fired powerhouses.

A major outcome from the EEIS program was a student and teacher generated energy reduction action plan which committed each participating school to reduce school energy consumption by 15% over twelve months. In 2003, a grant of AUD$5000 was selectively offered to participating schools in order to install energy efficient technology and an additional AUD$1000 was provided to support school energy, water and waste audits (Purnell, Sinclair & James, 2004). Study findings found that these financial incentives positively influenced students' and staff's energy behaviours and helped reduce school electricity consumption, with some schools exceeding the 15% target. The learning outcomes of the EEIS program had a direct and practical impact on the participants and their school communities – particularly through the implementation of school action plans to change energy behaviours and reduce energy consumption. The EEIS program was replaced by the *EnergyWise* program in 2007.

Queensland Solar Schools Initiative

Between 2001-2006, approximately 90 educational facilities in the Australian state of Queensland received solar photovoltaic (PV) installations through the *Solar Schools* initiative. This initiative was funded through a combination of federal and state government rebates as well as sponsorship from energy industry partners. Government and energy industry sponsors believe that installing photovoltaic

systems on schools provides a valuable educational resource for students while reducing overall school electricity usage costs as well as raising community awareness of renewable energy technology, thereby increasing the uptake of Green Power[3] products offered by energy retailers (ENERGEX, 2005; EPA, 2004, 2005, 2006).

Solar Schools Pilot Program (2001-2003)

The *Solar Schools Pilot Program* was developed by the EPA in order to install 2kW grid connected solar PV systems in sixteen schools across Queensland. Each solar system cost approximately AUD\$25 000 for equipment and installation (ENERGEX, 2005). The Queensland Government contributed AUD\$7 700 for each system, with an additional rebate of up to
AUD\$10 000 available from the Australian Greenhouse Office (AGO) Photovoltaic Rebate Programme (PVRP) for community use buildings. The remainder of the funds came from energy industry sponsors. A 2kW grid-connected system was deemed to generate sufficient electrical output to create financial savings for schools, reduce school GHG emissions, and still be cost effective. According to the EPA (2005, 2006), each solar PV system reduces 3.6 tonnes of greenhouse gases a year and saves the school approximately AUD\$500 on electricity bills.

Initially, the EPA partnered with energy provider Stanwell Corporation, who supplied technical expertise and equipment as well as training and educational components. Due to a change in Stanwell management, the energy provider pulled out of the pilot program leaving the EPA looking for other energy industry partners to sponsor the remainder of the planned solar school installations (personal email communication with N. Martin, EPA Senior Technical Officer, 10 October 2004; personal telephone communication with C. Robertson, EPA Consultant, 1 December 2005). In 2003, the EPA partnered with Ergon Energy. Under the *Solar Schools Pilot Program*, six solar PV installations were sponsored by Stanwell Corporation, five by EPA, and five by Ergon Energy.

Solar Schools Urban Program (2003-2005)

In 2003, the EPA launched the *Solar Schools Urban Program* in partnership with Ergon Energy and ENERGEX. Funding for this program came as part of an agreement with both energy distributors to purchase green energy for State Government Buildings. Schools could apply for an AUD\$8 000 PVRP rebate, to be received by the installer after installation. In addition to the educational objectives of the pilot solar schools program, this partnership brought with it the goal of increasing Green Power subscriptions. There is some indication that the uptake of Green Power products has increased in communities with solar schools but no definitive evidence that the two occurrences are linked (MACER, 2006). At the end of 2005, which marked the closure of the *Solar Schools Urban Program*, approximately forty schools had received grid connected solar PV systems.

Solar Schools Goes Bush Program (2004-2006)

In addition to the installation of solar PV systems on urban and regional state schools, the *Solar Schools Goes Bush Program* was launched in 2004. The Queensland EPA and the Australian Government jointly funded this program, which targeted diesel based remote, isolated and indigenous schools. Thirty-two schools received a 5kW solar PV system, which produces about 8 Mega Watt hours of electricity per year, reduces reliance on diesel, and save schools approximately AUD\$1 000 on energy costs (EPA, 2005).

Evaluating the Queensland Solar Schools Initiative

---

[3] Green Power is an Australian government accreditation program for renewable energy, which guarantees that the renewable electricity purchased from energy suppliers meets stringent environmental standards. Consumers can support the production of electricity generated by renewable sources by subscribing to Green Power products offered by their energy provider.

Government and energy industry sponsors believe that the Queensland *Solar Schools* initiative has educational, environmental, economical and social benefits by:

- providing an innovative, hands-on teaching tool about renewable energy technology;
- decreasing reliance on coal-fired electricity thereby reducing greenhouse gas emissions and saving schools money on electricity bills;
- raising community awareness of the benefits of renewable energy technology; and
- increasing Green Power subscriptions.

However, there is a lack of empirical evidence to support these assumptions.

There are very few evaluation studies of solar school programs, and even less investigating the impacts of exposure to renewable energy technology on school building user behaviour. This represents a serious gap in knowledge regarding the influence of renewable energy technology on school energy usage. Therefore, this paper will examine behavioural outcomes, such as the adoption of energy efficiency measures and energy conservation behaviours in solar schools in order to determine whether the installation of solar power systems has been an effective catalyst for changing the way energy is used within Queensland schools.

Survey of Energy Efficiency Measures and Energy Conservation Behaviours

The collection of data for this study, involved the administration of two separate surveys, follow-up correspondence with schools, school visits and observations as well as student focus groups and interviews with teachers. Qualitative data collected through a survey sent to fifty-five schools which participated in the Queensland *Solar Schools* pilot and urban programs (referred to as solar schools), is compared with fifty-five schools that did not participate in these programs (referred to as non-solar schools). Schools that participated in the *Solar Schools Goes Bush Program* were not included in the study population.

The survey contained questions about demographic information, energy costs, energy efficiency strategies and energy conservation measures. The survey questions were developed using information about energy saving practices outlined in a guide for school operations published in the United States (United States Department of Energy, 2004). Of the 55 surveys mailed out to solar schools, 19 usable surveys were returned – representing a 35% response rate. Of the 55 surveys mailed out to non-solar schools, 15 were returned – representing a 27% response rate. The following sections examine the survey results.

Part One: Demographic Information

Of the nineteen solar school surveys that were returned, 5 surveys were from schools that participated in the *Solar Schools Pilot Program* and 14 surveys were from schools that participated in the *Solar Schools Urban Program*. Thirteen surveys were from primary schools, three from secondary schools, two from P-12 schools, and one from a P-10 school. Of the fifteen non-solar school surveys that were returned, 8 surveys were from primary schools, six from secondary schools, and one from a P-12 school. Four solar schools and one non-solar school had participated in the Energy Efficiency in Schools program.

Part Two: Energy Costs

While the majority of respondents had access to school electricity bills and could see their energy usage patterns, 34% of respondents did not receive information about their power consumption, so were unaware of their energy usage patterns. The data indicates that energy costs have been continually rising in both solar and non-solar schools for similar reasons: higher tariffs; the installation of air-conditioners; additional computers; new buildings; and, more students. The Queensland Department of

Education, Training and the Arts 2005-2006 *Annual Report* admits that school energy usage is increasing due to the installation of air-conditioners through the *Cool Schools* initiative as well as the use of more computers, increasing student numbers, and new buildings – which was corroborated by the survey findings. However, 68% of solar school respondents felt that the installation of the solar PV system was helping to reduce overall electricity costs, even though school-wide energy usage continues to increase.

Although reducing energy usage is cited as a priority area for the Education Department, the survey results indicated that only 4 (21.1%) solar schools and 3 (20.0%) non-solar schools had implemented an energy policy on their own. Of the 7 schools with an energy policy, 2 of the solar schools had also participated in the EEIS program. Unfortunately, there was no question to determine whether solar schools had implemented energy policies before or after participating in the Queensland *Solar Schools* program or the EEIS program. However, only one solar school and one non-solar school had conducted an energy audit in order to ascertain how to improve energy efficiency and decrease electricity consumption.

The literature on implementing energy efficiency measures in schools (Dobbyn & Thomas, 2005; U.S. Department of Energy, 2004) and designing effective solar school programs (Colello, 2004; Hoffner, Pichumani & Wiese, 2002) indicates that it is important to first conduct a school-wide energy audit to determine base-line usage and indicate where energy efficiency measures can be made, and then develop an energy policy to reduce energy consumption by adopting efficiency measures and energy-related behavioural changes before installing renewable energy systems. The goal of the EEIS program was to assist Queensland schools with both these tasks. However, neither an energy audit nor an energy reduction action plan were parameters for participating in the Queensland *Solar Schools* initiative. While it is understandable that non-solar schools lack energy policies, one of the requirements of becoming a solar school should have been the development of an energy reduction action plan based on an energy audit (Colello, 2004). Since solar PV systems were installed by certified electricians and sponsored by energy providers, an energy audit could have easily been conducted prior to the installation.

Furthermore, the majority of staff and students at solar schools did not receive any training to help reduce energy usage and thereby energy costs in the school. According to the survey data, there were few differences between solar and non-solar school responses to *Part Two: Energy Costs*, indicating that the installation of solar power systems has not led to the implementation of energy reduction action plans in solar schools. This is in marked contrast with schools that have participated in the Energy Efficiency in Schools program.

Part Three: Energy Efficiency Measures

Energy efficiency is defined as a measure that reduces the amount of energy typically required. Energy efficiency measures are usually one-off financial decisions influenced by economic and contextual variables (Black, Stern & Elworth, 1985) as well as internal variables such as altruism for the environment (Clark, Kotchen & Moore, 2003). Barriers to the uptake of energy efficiency measures include a lack of information or knowledge, financial costs, low energy pricing, and institutional constraints (Sustainable Energy Policy Concepts, n.d.).

Respondents were asked to indicate from a given list, which energy efficiency measures have been implemented in their school. A comparison of the energy efficiency measures practiced by solar and non-solar schools revealed that there was very little difference in the types of measures adopted. The most prevalent measures were ones that are convenient, inexpensive, or already being practiced as part of the school's maintenance procedures, such as:
- replacing inefficient light bulbs
- using power-down features on equipment
- automatically setting room temperature, and
- regular maintenance of building systems.

The overall number of solar and non-solar schools implementing energy efficiency measures was also similar, which suggests that the installation of a solar power system under the Queensland *Solar Schools* initiative has not had a significant influence on the adoption of energy saving strategies.

Part Four: Energy Conservation Measures

Energy conservation behaviours involve repeated or continual actions that curtail the amount of energy normally used, and are influenced by personal variables such as obligation and self-efficacy (Woods & Skumatz, 2004) as well as values, beliefs and attitudes (Energy Saving Trust, 2007). Energy usage behaviours are typically routine or habitual in nature; thus changing wasteful energy consumption behaviours into energy conservation behaviours "involves the unfreezing of existing behavioural patterns" (Jackson, 2005, p. 115). In a school setting, energy usage behaviours are an evolution of social practices or acceptable social norms; therefore, "unfreezing existing behaviour patterns needs to take place in a group environment," so that preferred energy conservation behaviours are adopted throughout the school (Jackson, 2005, p. 116). That is, it is not merely a matter of individual choices but something that a group must take on and value.

A list of ten energy conservation behaviours related to energy consumption in the classroom was provided. Since the survey was completed by the school principal or person-in-charge of the solar project, respondents were asked to indicate the energy conservation measures staff and students were being *encouraged* to take rather than what measures were being practiced. Unlike the list of energy efficiency measures that generally require a one-off action, energy conservation behaviours require daily or even hourly diligence on behalf of staff and students. While respondents can indicate the type of behaviours being encouraged, they cannot definitively say whether all staff and students are actually practicing these behaviours. The list of energy conservation actions that were provided have been ranked below:

Table 1: Energy Conservation Measures Encouraged in Queensland Schools

ENERGY CONSERVATION MEASURES	SOLAR SCHOOLS (N=19)		NON-SOLAR SCHOOLS (N=15)	
	Staff	**Students**	**Staff**	**Students**
Turn off AC, fans, heaters in unused rooms	19 (100%)	13 (68%)	13 (87%)	09 (60%)
Turn off computers at the end of the day	18 (95%)	14 (74%)	13 (87%)	13 (87%)
Turn off computers when not in use	16 (84%)	14 (74%)	08 (53%)	10 (67%)
Close doors & windows when AC is on	16 (84%)	11 (55%)	09 (60%)	08 (53%)
Turn off lights in unused rooms	15 (79%)	14 (70%)	13 (87%)	12 (80%)
Use water sparingly	14 (74%)	10 (53%)	11 (73%)	09 (60%)
Use natural daylight wherever possible	14 (74%)	10 (53%)	09 (60%)	07(47%)
Turn off computer monitors not in use	13 (68%)	10 (53%)	10 (67%)	08 (53%)
Set air-conditioners at 25°C	11 (58%)	06 (32%)	09 (60%)	06 (40%)
Close blinds or curtains in warm weather	10 (53%)	07 (37%)	07 (47%)	04 (27%)

A comparison of the energy conservation behaviours being encouraged in solar and non-solar schools revealed that the number of schools promoting curtailment behaviours was above 50% for both sample groups; however, more solar schools tended to encourage energy conservation behaviours than non-solar schools. Teachers in both solar and non-solar schools were being encouraged to take energy

conservation actions that control classroom environment and ambiance, while students were being encouraged to take energy conservation actions related to the use of equipment. Since energy conservation measures require daily or hourly repetition, the encouragement of these actions within the school can significantly reduce energy consumption while at the same time foster habitual sustainable energy behaviours that staff and students may continue in the home.

Respondents were also asked to identify all of the ways in which students and staff were encouraged to reduce energy use at school. While the number of energy conservation actions being practiced in schools appears to be quite high, the ways students and staff were being encouraged to reduce energy use does not fare as well. The list of measures that were provided are ranked below:

Table 2: Ways Students and Staff are Encouraged to Reduce Energy Use

METHODS TO REDUCE ENERGY USE	SOLAR SCHOOLS (N=19)	NON-SOLAR SCHOOLS (N=15)
Reminders above light switches	9 (47.4%)	5 (33.3%)
School energy patrols	8 (42.1%)	5 (33.3%)
Educational programs offered to students	8 (42.1%)	3 (20.0%)
Reminders in computer labs	7 (36.8%)	7 (46.7%)
Reminders on school equipment	7 (36.8%)	4 (26.7%)
Reminders in school newsletters	4 (21.1%)	4 (26.7%)
Special recognition of energy reducers	4 (21.1%)	1 (6.7%)
Energy efficiency and energy conservation contests	2 (10.5%)	1 (6.7%)
Training courses offered to teachers	Nil	Nil
Training courses offered to school-based staff	Nil	Nil

Behaviour change theories suggest that modelling and prompts are two effective ways to aid in the diffusion of preferred behaviours, yet less than half of the schools surveyed used visible reminders or modelling to encourage energy conservation behaviours (Aronson & O'Leary 1982-83). Although it appears that staff and students were being encouraged to practice energy conservation behaviours, the data indicates that the use of reminders, modelling, and education as a means to foster reduced energy use was quite low.

On the whole, the survey findings indicate that the installation of renewable energy technology alone is not going to significantly increase the uptake of energy efficiency measures and energy conservation behaviours in schools.

Conclusion

The Solar and Energy Efficiency Program has taken over from where the Queensland *Solar Schools* initiative left off. While funding solar school programs is a step towards changing the way school staff and students view (attitudes) and use (behaviours) energy by raising the issue of how energy is produced and consumed in Australia, long-term energy conservation behaviours will only occur if barriers to energy-related behaviours are removed. According to behaviour change theories, the uptake of preferred behaviours tends to increase if barriers are addressed as part of the intervention, and participants are asked to pledge their commitment to the program (Burns, 1991; McKenzie-Mohr, 2000; Woods & Skumatz, 2004). Changing the way school staff and students view and use energy requires a combination of approaches that:
- identify and remove barriers to energy-related behaviours;
- unfreeze existing energy consumption patterns; and,
- replace counter-intentional habits with preferred energy conservation behaviours.

Findings from an ongoing study of the Energy Efficiency in Schools program (Purnell & James, 2006) have revealed that the development of energy reduction actions plans was a significant factor in ensuring success. Monitoring and follow-up conducted by the EEIS program organisers also provided positive outcomes. Additionally, saving money is important and reaping the benefits of savings contributes to the continuation of energy conservation behaviours within schools. Finally, authentic curriculum and assessment experiences for learners that reinforce connectedness to the real world and help students see that they make a difference within the school and their community are crucial. The

Energy Efficiency in Schools program provided educational and motivational incentives that support the uptake of effective energy reduction action plans in schools. The *Solar Schools* initiative, on the other hand, was more about the installation of technology rather than a means to encourage energy saving strategies in schools. Study results indicate that although some Queensland schools were initiating energy saving strategies, the installation of solar power systems did not directly correlate to the uptake of energy efficiency measures or energy conservation behaviours.

The installation of renewable energy technology, without an energy reduction action plan that includes an educational component and appropriate incentives and disincentives, will as the survey data suggests, only have limited influence on the adoption of energy efficiency measures and energy conservation behaviours in schools. It is necessary, therefore, to take a more holistic pedagogical approach to change school energy usage by installing renewable energy technology and providing school-wide energy education, combined with appropriate behaviour change incentives and disincentives. This evaluation of the Queensland *Solar Schools* initiative (2001-2006) in light of the Energy Efficiency in Schools program (2001-2006) has provided evidence to support a whole school approach to reducing energy consumption in schools. It appears as though the Queensland Department of Education and Training has established clear objectives for the development of comprehensive school energy policies through the Solar and Energy Efficiency Program which will hopefully overcome the institutional, organisational, financial and behavioural barriers to the implementation of energy saving strategies in schools.

Abstract

Title : The Construction of Multimedia Computer Program Entitled "Water Conservation for Life"
The Construction of Multimedia Computer Program Entitled "Water Conservation for Life"
which had the objectives as follows : 1.) To create Multimedia Computer Program Entitled "Water
Conservation for Life" for primary school students in Bangkok. 2.) To evaluate the quality of
Multimedia Computer Program Entitled "Water Conservation for Life" 3.) To measure the
effectiveness of learning by using Multimedia Computer Program Entitled "Water Conservation for
Life" 4.) To evaluate the satisfaction of the learners towards the media. The evaluation came from 6
experts, 3 in content and 3 in the media.The value of the Multimedia Computer Program Entitled
"Water Conservation for Life" quality was at 4.08 and 3.80 which was in good level. This
Multimedia Computer Program had been used with the 40 primary school students by using simple
random sampling. The test after using the Multmedia Computer Program showed that the students got
.05 which had the posttest score higher than the pretest score and the satisfaction of the students in the
Multimedia Computer Program was at 4.32 which was in good level too. The result showed that the
Multimedia Computer Program had enough quality and could be able to use as the stated objectives in
order to give knowledge about environment to help learners to love and reservate water with care and
bring the King Bhumibol Adulyadej' words about how to have sufficient way of life into reality.

Keywords : Multimedia Computer Program / Water Conservation for Life / Conserve Water /
          Sufficent way of life / Protect the world

1. Introduction

        Human beings and nature have relationship in terms of living together. Human beings depend
on the nature for survival and they repay the kindness of the nature by conservation so that the nature
sustains. However, at the present time, human beings are repaying the kindness of the nature by
exploitation of the natural resources without conscious mind. The nature has been destroyed without
considering the bad effects which will happen in the future. To illustrate, many forests are being cut
down and this results in floods and landslides every year. Using chemicals leads to air pollution,
including the Earth's atmosphere. There is also water problem-wastewater in many water sources such
as rivers and canals which look like trash for garbage and refuse. With the increase in population in the
community, the causes of water pollution seems to be irresolvable. In the past, many communities
protect their water sources in a clever way. Many pools were considered as sacred so bathing and
washing in such pools were not allowed. Still, people can take such water for drinking.
        With wastewater problems in Thailand, it was found that one problem is related to other
problems like global warming, which is the cause of many world natural disasters, even in Thailand
which is located in Southeastern Asia. Thailand also suffers from floods like any other countries in the
world.
        Water is important for occupations and survival for everybody because water can be used for
consumption and for agriculture. King Bhumibol Adulyadej stated one comment in Chitralada Palace
on March 17th, 2004 as follows: "…The main thing is to have water for consumption and for use, like
growing crops because life depends on water. Where there is water, there can be life. Where there is no
water, there is nobody. Without electricity, people can survive. Without water, people cannot
survive…" . Wastewater is one problem which concerns everybody in the sense that everybody must
take responsibilities together. Therefore, good conscious mind about making the best use of water as
well as conservation of water sources to keep its good condition is important, especially good
conscious mind in younger generations which are regarded as the future of the nation. Younger

generations will play an important role in developing the country to have advances in technology, environment as well as conscious mind about the importance of water because water problem is the problem which needs to be solved immediately.

The usage of technology for education like computer is one popular way. There are many features for computer media such as they can gain interests from learners, the contents can be presented with other advanced media and skills, unlike other media.

Multimedia Computer Program is regarded to be in accordance with the National Education Act 2542 B.E. in that all learners have abilities to learn and develop themselves. Moreover, learners are the most important. Therefore, the instruction must meet the interests and the aptitudes of the learners. The lessons and the activities must be based on the differences in individual to improve skills, thinking process and encountering situations. The application of knowledge must comply with the rapid changes in the society. Technology can create good and bad effects on modern life, resulting in more complexities. Therefore, the way of life must be changed so that it is valuable and leads to happiness.

According to the above-mentioned importance, the construction of multimedia computer program entitled "Water Conservation for Life" was an option to develop learning process so that it was beneficial for the project "Water Conservation for Life" held by Hadammara School. This program was based on the King's ideas and the project to promote conscious mind of the personnel inside the school about water conservation and nature conservation, especially wastewater management system and drainage system before releasing the water to Chao Phraya River, including the importance of water and the impacts of wastewater on themselves.

2. Research Objectives

2.1 To construct the multimedia computer program entitled "Water Conservation for Life"

2.2 To find out the quality of the developed multimedia computer program entitled "Water Conservation for Life"

2.3 To find out the learning achievement of learners who learn the developed multimedia computer program entitled "Water Conservation for Life"

2.4 To study the learners' satisfaction towards the developed multimedia computer program entitled "Water Conservation for Life"

3. Research Hypotheses

3.1 The effectiveness of the developed multimedia computer program entitled "Water Conservation for Life" is at least at high level.

3.2 After learning the developed multimedia computer program entitled "Water Conservation for Life", the learners show higher learning achievement for posttest than the one for pretest at the level of statistical significance of 0.

3.3 The learners' satisfaction towards the developed multimedia computer program entitled "Water Conservation for Life" is at least at high level.

4. The Scope of The Research

4.1 Population

The population in this research project was 120 sixth graders in Hadammara School in the second semester of academic year 2008 in Bangkok.

4.2 Sampling Group

The sampling group in this research project consisted of 40 sixth graders in Hadammara School in the second semester of academic year 2008 in Bangkok. They were chosen through simple random sampling method.

4.3 Experts

Experts were persons specialized in the contents about water resources and in designing contents and graphics with at least 5 years of experience to evaluate the quality of the developed multimedia computer program entitled "Water Conservation for Life". They were

4.3.1 Experts in multimedia had knowledge and skills in content design and graphic design. There were 3 experts to evaluate the quality of the multimedia computer program in 4 following aspects: texts, still images and animations, sounds and interactions.

4.3.2 Experts in contents had knowledge and skills in the contents about water resources. There were 3 experts.

4.4 Variables consisted of

   4.4.1 Independent variable which was the multimedia computer program entitled "Water Conservation for Life"

   4.4.2 Dependent variables which were

   - The quality of the developed multimedia computer program entitled "Water Conservation for Life"

   - The learning achievement of the learners who learn the developed multimedia computer program entitled "Water Conservation for Life"

   - The learners' satisfaction towards the developed multimedia computer program entitled "Water Conservation for Life"

   4.5 Tools Used in this Research

   4.5.1 The multimedia computer program entitled "Water Conservation for Life" consisted of the contents about water resource and would like to arouse conscious mind about the responsibilities and the importance of water resources including how to use the knowledge to achieve benefits in education and survival. The program contained the following contents:

   - Definition of water resource
   - Water life cycle
   - Types of water sources
   - Problems about water resources
   - Main causes of the water resource problems
   - Impacts of such problems
   - Principles in conservation of water resources
   - Approaches in conservation of water resources

   4.5.2 The quality evaluation forms for the experts in the multimedia and in the contents about the developed multimedia computer program entitled "Water Conservation for Life"

   4.5.3 The learning achievement test about the developed multimedia computer program entitled "Water Conservation for Life" was composed of pretest and posttest, each of which had 30 question items. Each item had 4 choices. The pretest and the posttest were intended for testing knowledge, remembrance, understanding and application.

   4.5.4 The satisfaction questionnaire for the learners of the developed multimedia computer program entitled "Water Conservation for Life".

   The quality evaluation form for the experts in multimedia and in the contents as well as the satisfaction questionnaire for the sampling group had 5-rating scales according to Likert's method as follow:

Level	Meaning	Average Score
5	The best/The highest	4.50-5.00
4	Good/High	3.50-4.49
3	Moderate	2.50-3.49
2	Mediocre/Low	1.50-2.49
1	Needs improvement/The lowest	1.00-1.49

5. The Development of the Tools Used in this Research

   Here is the process of the tool development:

   1. Theories, principles and concepts were studied. They were excerpted from academic textbooks, documents and related research works in order to gain information from various sources to be used in the development of the multimedia computer program entitled "Water Conservation for Life".

   2. The quality evaluation forms about the multimedia computer program entitled "Water Conservation for Life" were given to the experts.

   - Experts in multimedia had knowledge and skills in content design and graphic design. There were 3 experts to evaluate the quality of the multimedia computer program in 4 following aspects: texts, still images and animations, sounds and interactions

   - Experts in contents had knowledge and skills in the contents about water resources. There were 3 experts. After the quality of the multimedia computer program entitled "Water Conservation for Life" were evaluated by the experts, the multimedia computer program was used with the sampling group in the next step.

   3. Experiment with the Sampling Group

The researchers introduced the multimedia computer program entitled "Water Conservation for Life" to the sampling group first so that they understood this kind of instruction. Afterwards, the experiment followed.

Experiment
The experiment with the sampling group of 40 persons followed One Group Pretest–Posttest Design.

Pretest	Treatment	Posttest
T_1	X	T_2

Definitions
X   represents   Treatment or learning from the multimedia computer program entitled "Water Conservation for Life"
(One lesson takes around 3 hours.)
T_1 represents   Pretest
T_2 represents   Posttest

4. The satisfaction questionnaires were given to the sampling group. The opinion could be divided into 5 rating scales as follow: the highest, high, moderate, low, and the lowest.
5. The data from the quality evaluation results done by the experts in multimedia and the experts in contents, the learning achievement or pretest and posttest, as well as the satisfaction of the sampling group were used for analysis through mean, standard deviation and t-test dependent.

6.   Research   Results

The results were as follow:

6.1 The Quality as Evaluated by the Experts in Multimedia and the Experts in Contents
Table 1 shows the average score for the quality of the multimedia computer program entitled "Water Conservation for Life" as evaluated by 3 experts in multimedia.

Evaluated Items	Mean ($\overline{X}$)	Standard Deviation (S.D.)	Meaning
1. Still images and animations	4.20	0.35	Good
2. Sounds	4.06	0.46	Good
3. Texts	4.00	0.63	Good
4. Interactions	4.06	0.35	Good
Mean	**4.08**	**0.45**	**Good**

According to Table 1, it can be concluded that the quality of the multimedia computer program entitled "Water Conservation for Life" as evaluated by the 3 experts in multimedia was 4.08 on average with the standard deviation of 0.45. This means it was at good level.

Table 2 shows the average score of the multimedia computer program as evaluated by 3 experts in contents.

Evaluated Items	Mean ($\overline{X}$)	Standard Deviation (S.D.)	Meaning
1. Contents and presentation	4.00	0.43	Good

2. Images, sounds and language	3.80	0.23	Good
3. Tests	3.60	0.58	Good
Mean	**3.80**	**0.41**	**Good**

According to Table 2, the quality of the multimedia computer program entitled "Water Conservation for Life" as evaluated by 3 experts in contents was 3.80 on average with the standard deviation of 3.80. This means it was at good level.

Table 3 shows the average scores as evaluated by both experts in multimedia and experts in contents.

Evaluated Items	Mean ($\overline{X}$)	Standard Deviation (S.D.)	Meaning
1. Multimedia	4.08	0.45	Good
2. Contents	3.80	0.41	Good
Mean	**3.94**	**0.43**	**Good**

According to Table 3, the quality of the multimedia computer program entitled "Water Conservation for Life" as evaluated by 3 experts in multimedia and 3 experts in contents was 3.94 was average with the standard deviation of 0.43. This means it was at good level.

Table 4 shows the comparison of learning achievements between pretest and posttest for the sampling group of 40 persons.

Tests	Number of Persons (N)	Total Score	Mean ($\overline{X}$)	Standard Deviation (S.D.)	t
Pre-test	40	30	12.50	2.31	20.16**
Post-test	40	30	22.50	3.31	

* at the level of the statistical significance of 0.05

According to Table 4, the comparison of the average scores shows that the average pretest score was 12.50 with the standard deviation of 2.31. The average posttest score of the sampling group was 22.50 with the standard deviation of 3.31. The learning achievement of the sampling group for the posttest was higher than the one for the pretest at the level of the statistical significance of 0.05.

Table 5 shows the average score for the satisfaction of the sampling group towards the multimedia computer program entitled "Water Conservation for Life".

Evaluated Items	Mean ($\overline{X}$)	Standard Deviation (S.D.)	Meaning
1. In General	4.32	1.65	High
2. Presentation of Contents	4.31	0.65	High
3. Presentation Types	4.31	0.66	High
4. Tests	4.19	0.67	High
5. Summary	4.46	0.60	High
Mean	**4.32**	**0.41**	**High**

According to Table 5, the satisfaction of the sampling group towards the multimedia computer program entitled "Water Conservation for Life" was 4.32 on average. This means the learners were highly satisfied.

7. Research Result Summary

In this research, the quality was evaluated by 3 experts in multimedia and 3 experts in contents, totaling 6 experts, the learning achievement was determined and the satisfaction towards the developed program was done with the sampling group of 40 persons. The results were as follow:

7.1 The average score for the quality as evaluated by 3 experts in multimedia was 4.08 on average. When this score was compared to the set criteria, it was in the range of 3.50-4.49 or at good level.

7.2 The average score for the quality as evaluated by 3 experts in contents was 3.80 on average. When this score was compared to the set criteria, it was in the range of 3.50-4.49 or at good level.

7.3 The learning achievement from the pretest and the learning achievement from the posttest for the sampling group of 40 persons showed that learning achievement from the posttest was higher than the one from the pretest at the level of statistical significance of 0.05.

7.4 The average score for the satisfaction of the sampling group of 40 persons towards the multimedia computer program entitled "Water Conservation for Life" was 4.32. When it was compared to the set criteria, it was in the range of 3.50-4.49 or highly satisfied.

Teachers' Reflections Toward Improving Student Achievement
Quint Oga-Baldwin
Kyushu Sangyo University

Abstract

Teacher reflection has been shown to correlate positively with activities toward self-improvement and self-efficacy. Teacher self-efficacy refers to the belief that an educator can positively affect student learning. For teacher self-efficacy to have real meaning, positive self-efficacy judgments must line up with actual gains in student ability, requiring diligent and careful self-reflection. This paper outlines the factors which influence teacher self-efficacy and self-regulation, and how reflection works with teacher beliefs to improve pedagogy.

Introduction

Reflective practice has been posited as an integral part of teachers' professional development (Clarke, 1995; Kettle & Sellars, 1996; Wilhelm, Coward, & Hume, 1996). Many teacher-training programs now emphasize reflective practice (Atay, 2007; Lee, 2007; Brandt, 2008) and encourage future teachers to make formal self-evaluation a habitual practice. This paper will investigate the development of self-regulatory teaching practice by exploring teachers beliefs, self-efficacy, and perceptions of reflection as feedback on teaching practices.

Declarative beliefs and reflection

In discussing teacher reflection, it is primary first to briefly explore the idea of teacher beliefs. In discussing reflective teaching practice, it is important to consider teachers "as active learners who construct their own understandings" (Putnam and Borko, 1997, p. 1225). As a matter of course, teachers will develop their own systems of belief regarding what is and is not effective in the classroom. Kember (1998) has stated that through previous exploratory studies, teachers' conceptions of teaching have been well established in the literature, but that the relationship between beliefs, practices, and the formation of these beliefs has not been thoroughly explored.

For the purposes of teacher development, beliefs have been described as difficult to change (Murray and MacDonald, 1997). Martin and Ramsden (1993) noted that promoting staff development required slow training and retraining in order to promote improvements in teaching practice. Further, Kagan (1992) describes the necessary pre-requisites of programs looking to improve teacher quality:

> If a program is to promote growth among novices, it must
> require them to make their preexisting personal beliefs
> explicit; it must challenge the adequacy of those beliefs;
> and it must give novices extended opportunities to
> examine, elaborate, and integrate new information into
> their existing belief systems. (Kagan, 1992a, p. 77)

If teachers are actively reflective for the purpose of improving teaching, the first step would appear to be the active declaration of beliefs regarding the practice of teaching for the purpose of examining the veracity of those beliefs in relation with actual practice.

Reflective practice for self-efficacy and self-regulation

The theory of self-efficacy (Bandura, 1977; 1997) refers to an individual's belief regarding his or her ability to succeed at a specific endeavor. The theory claims that specific judgments a person makes regarding the degree of skill with which they are able to accomplish a task or activity can help determine, among other things, his or her motivation relating to the endeavor. It takes into account the person's experiences of success and failure, vicarious experiences from watching others, encouragement from others, and emotional and physiological engagement (Bandura, 1997). This construct has been shown to have strong connections with professional and personal motivation (Pintrich & Schunk, 2002), academic goal seeking behaviors (Elliot & Dweck, 1988), and academic self-regulation (Schunk & Zimmerman, 1994; Zimmerman & Schunk, 2008; Pajares, 2008).

Teacher self-efficacy is a specific application of the theory and refers to "teachers' belief or conviction that they can influence how well students learn, even those who may be difficult or unmotivated"

(Guskey & Passaro, 1994, p. 4). Several researchers have emphasized how teacher self-efficacy affects teachers' behaviors and attitudes toward student learning (Ashton & Webb, 1986; Gibson & Dembo, 1984). These same teacher behaviors affect student learning and engagement, (Assor, Kaplan, & Roth, 2002; Gordon, Dembo, & Hocevar, 2007; Reeve, Jang, Carrell, Jeon, & Barch, 2004; Roth, Assor, Kanat-Maymon, & Kaplan, 2007; Wild, Enzle, & Hawkins, 1992) with positive correlations between teachers with high personal and professional self-efficacy and student motivation levels and achievement. Less confident teachers tend to perceive external influences as more important, while more confident teachers believe they have control over students' attitudes (Tschannen-Moran & Woolfolk Hoy, 2001). Teacher self-efficacy has also been shown to correlate to teachers' engagement (Evers, Brouwers, & Tomic, 2002), professional commitment (Coladarci, 1992), and student achievement (Tschannen-Moran & Barr, 2004). This confidence often comes from mastery experiences early in teachers' careers (Tschannen-Moran & Woolfolk Hoy, 2007).

When discussing self-efficacy, professional development and motivation, one salient concept is that of a "will to learn" (Van Eekelen, Vermunt, & Boshuizen, 2007). One of the primary ways in which this "will to learn" can manifest itself is in reflective teaching practice, where the teacher utilizes one of a number of methods to concretely consider his or her teaching, its effectiveness, and methods of improving their professional practice (Jadallah, 1996). Research has demonstrated that reflective practice can improve teaching effectiveness (Clarke, 1995; Kettle & Sellars, 1996; Wilhelm, Coward, & Hume, 1996) thereby improving teachers' sense of self-efficacy. Research has also shown that teachers become more reflective with experience in the field, and use reflection to grow professionally (Chiang, 2008; Korthagen, Loughran, & Russell, 2006)—whether they continue to outside of a teacher training environment, remains to be verified. In order to develop positive self-efficacy beliefs, teachers must engage in reflective practice and be aware of feedback from students.

Numerous studies of teachers' reflective practices have focused on pre-service teachers and teacher trainees (Chiang, 2008; Lee, 2007; Wilhelm, Coward, & Hume, 1996; Wilson, Floden, & Ferrini-Mundy, 2002; etc.) and to a lesser extent teacher trainers (Kremer-Hayon & Tillema, 1999; Tillema & Kremer-Hayon, 2002). Studies investigating in-service teacher reflection have been less forthcoming, though some data does exist (e.g. Davis, Petish, and Smithey, 2006). In investigating teacher trainers, it was found that while teacher educators encouraged reflective practice as a part of their curricula, not all were actively reflective in practice (Kremer-Hayon & Tillema, 1999; Tillema & Kremer-Hayon, 2002). This would indicate that in service teachers are also unlikely to self-regulate through self-reflection.

Additionally, according to Marsh (2007), many university teachers do not continue to develop (i.e. reflect on their practice) after the first years of academic placement. Teachers did not change greatly over the course of his 13 year study (Marsh, 2007), which may indicate a lack of reflection in university teachers, or that teachers reflect at the beginning of their careers, but gradually begin to do so less as they gain in mastery experiences (i.e. positive feedback on job performance, student successes, etc.) and are less affected by their environment (Tschannen-Moran & Woolfolk Hoy, 2007). Since teachers are less likely to change after the first several years, and early experiences can build teacher self-efficacy, new teachers' willingness to reflect in order to build mastery experiences is extremely important for developing long-term teacher self-efficacy, and thereby more effectively self-regulate (Schunk & Zimmerman, 1994).

Reflection as feedback

This study posits that teacher reflection offers teachers a chance to investigate their beliefs, and receive feedback about processing of the teaching task and their self-regulation of their teaching, called FP and FR respectively (Hattie & Timperley, 2007). FP and FR are posited to have a powerful effect on the learning process, and can provide learners with ways of recognizing their errors through encountering impediments (Carver & Scheier, 1982; 1990), improved strategy use (Harakiewicz, Mabderlink, & Sansone, 1984; Wood & Bandura, 1989), improve self-efficacy (Earley, Northcraft, Lee, & Lituchy, 1990), and is a pre-requisite for effective self-regulation (Butler & Winne, 1995). Self-assessment is an important part of the self-regulatory process (Hattie & Timperley, 2007; Schunk & Zimmerman, 1994; Schunk & Ertmer, 2000; Zimmerman, 2000), exactly what reflection seeks to elicit. As noted by Hattie and Timperley (2007), timely feedback is one of the most powerfully effective concepts in education.

Conclusions and implications

The above studies all illustrate the importance of reflection in academic professional development. Knowing the necessity of declaring beliefs in order to properly examine them, we recognize that this marks the first step in teacher reflection and development. Deeply held beliefs are less likely to change (Murray and MacDonald, 1997), but deeply held beliefs that are based on faulty understanding of the effective teaching nonetheless require re-examination. By exploring their extant underlying belief structures about their own profession, teachers are better able to recognize and understand discrepancies between those beliefs and what happens in their classrooms.

If teachers are to develop a sense of self-efficacy, and thereby become more self-regulatory, reflection and self-awareness give teachers the chance to engage with their experiences and thereby improve their practice. Without proper reflection and change toward more successful practices, teachers' will not develop a sense of self-efficacy for teaching. This lack of self-efficacy stands in the way of self-regulation, which would in turn lead to decreased autonomy support for students (Roth, et al. 2007), decreased motivation orientation (Assor, et al. 2002), and a drop in student engagement and learning (Tschannen-Moran & Barr, 2004). While self-efficacy beliefs are often formed earlier rather than later in academic careers (Tschannen-Moran & Woolfolk Hoy, 2007), intervention for professional development can have an effect on teaching practice (Martin and Ramsden, 1993).

Educators and administrators interested in improving the quality of teaching within an institution can do so by giving teachers time to reflect as a group. Due to the high likelihood that teachers will not reflect on or change their teaching (Marsh, 2007), intervention seems necessary in order to improve quality of teaching. As is discussed by Kagan (1992a; b) the systematic declaration of teachers' beliefs about their pedagogy is instrumental in providing self-assessment feedback. Helping teachers to do this in such a way that they are not threatened is crucial for the learning process (Boekaerts & Niemivirta, 2000). The optimal format would be a peer guided reflection system by which teachers would work with colleagues to reflect on and share experiences regarding the process of their teaching. This guided reflection format would allow teachers to regularize reflection and incorporate it into their classroom activities. While the process of retraining in-service teachers is not quick nor a lightly undertaken project (Martin and Ramsden, 1993), it is a worthwhile one that promises improvement in both teacher motivation and student achievement.

Collaborating for Development

Mr. Alan Bessette
Professor
Poole Gakuin University
Hitomi Kwon
Assistant Professor
Poole Gakuin University

Abstract
In Japan, the term team teaching usually refers to two teachers, a Japanese teacher of English (JTE) and an assistant English teacher (AET), teaching in the same English language classroom in secondary educational settings. Japanese universities usually do not employ team teaching. However, our department implemented team teaching in 2008. All required English classes (Listening & Speaking, Reading & Writing, and CALL) for the first two years are taught by teams of teachers, native English speakers and Japanese EFL teachers. Our goals are to provide a variety of teaching styles, take advantage of the strengths of individual teachers, foster cooperation and collaboration and improve teaching and to help realize those goals, we hold monthly meetings and use a website for communication about classes and students. An initial investigation to evaluate team teaching demonstrated that for the most part team teaching has been successful (Kwon 2009). Teachers' fea
 rs that team teaching would result in a larger burden were not realized and most felt that it had positive effects on their teaching. Although students' perception that teachers were working in teams was not strong, they appreciated having a variety of personalities and teaching styles. In that paper, Kwon (2009) quotes a number of advantages of team teaching from the literature, specifically, improvement in the quality of teaching, promotion of professional growth, coherent teaching, and improvements in morale. Whether our goals and those advantages are being realized is the focus of paper. Using questionnaires and interviews it will report on teachers' perceptions and attitudes and evaluate how team teaching has, or has not, affected their teaching.

Local Solutions for Global Problems in Teacher Professional Development: Focus on Japanese Approach of Lesson Study

Mohammad Reza Sarkar Arani, Ph.D.
Seijoh University Center for Studies in Higher Education & Faculty Development Researcher
Japan

Abstract

In the early 21st century, educational researchers and practitioners shifted to put more emphasis on learning-oriented strategy for change and to focus on empowerment of teachers and self-sustaining restructuring in school. Consequently, teacher quality has developed into a core innovation issue of school education in many countries as a global movement.
Recently Jugyou Kenkyuu as a Japanese approach of 'lesson study' and local solution has become an alternative model of core innovation of school education and improving teaching-learning process in the world. This model of classroom-based research and school-based teacher professional development has been examined as an effective approach for empowerment of teachers to design more attractive lessons and to improve teaching in many countries based on their culture and educational context.
This paper examines the process of 'lesson study' in practice and the main challenges to sustaining momentum in Japanese lesson study include the educational system and school cultural issues. The intention is to clarify why and how Japanese model of lesson study has been examined as an effective approach for teachers to design more attractive lessons and to improve teaching in many countries based on their culture and educational context.

Self-invented languages in second language learning

Mrs. Karen Guo

University of Victoria, Wellington, New Zealand

Abstract

Observations of the use of languages of second language young learners identified the invention of a new language by these learners. The new language resembled neither their first language nor the new language in the learning setting. This presentation draws on this finding of a PhD study on Chinese immigrant children's learning experiences in New Zealand early childhood settings. Through focusing on the children's invention of 'a new language' this presentation explores what this focus can tell us about the new language learning experience of young children.

Building on both the psychological and sociolinguistic approaches of language learning, the presentation puts forward personal and social lens through which the invention of a new language can be viewed. Within these concepts, the interplay of inner and outer determinants forms the basis of a new language learning process and outcome. In line with this thought, the aim of this presentation is to show how the sociocultural surroundings and children's inner desire for learning set conditions for their development of a new language. The invention of new languages by these young learners as seen in this study is the result of their exposure to the new language social settings and their determination to learn the new language through self-exploration. The presentation argues that the social practice in which children participate directly or indirectly shape the experiences of their language learning. Educators' insight and knowledge about second language young learners' str
engths and needs influences their possibilities for supporting these learners. Therefore, this empirical finding also implicates a challenge to pedagogical thinking of teachers.

A Sociological Critique of "Chinese-English Bilingual Education" in Mainland China

Guangwei Hu
Nanyang Technological University

Although organized promotion of English-medium instruction in mainland China started only at the turn of the century, this form of language provision has gathered great momentum and is sweeping across the country. Drawing on Bourdieu's sociological theory, this paper presents a critical review of the reform initiative. It examines the driving forces behind the runaway expansion of English-medium instruction and analyzes the implications and consequences of such instruction for mainland China.

The last two decades have seen much policy attention to the linkage between the quality of education and mainland China's further development in economic, scientific, political, and sociocultural domains (Chinese Communist Party Central Committee & State Council, 1993, 1999; Ministry of Education, 1998). Various top-down and bottom-up initiatives have been promoted and implemented at an ever quickening pace to reform education at all levels and to achieve the goal of quality education (Hu, 2005b). One recent initiative introduced in the name of educational reform and quality education is English-medium instruction in non-language school subjects at the primary and secondary levels. This type of language provision is widely known in mainland China (hereafter China) as "bilingual education/instruction." The so-called Chinese-English bilingual education is provided for majority language students and differs from what is traditionally regarded as bilingual education in China, namely the education of ethnic minorities in their native languages and Chinese, the majority language (A. W. Feng, 2005; X. Ye, 2003; W. J. Zhang, 2002; Zheng, 2004). It also differs from most forms of bilingual provision that are typically denoted by the term in international contexts (Baker, 2006; Hu, 2008).

Although only a few well-resourced schools located in socioeconomically advantaged areas were experimenting with English-medium instruction as a means of improving the quality of English teaching in the 1990s, organized promotion of Chinese-English bilingual education started at the turn of the century as part of Shanghai's drive to become an international metropolis (Hu, 2002; W. Lin, 2001; Shen, 2004). Within the space of several years, this form of language provision has gathered great momentum and is sweeping across the educational landscape of China. It has become one of the hottest topics in the Chinese language education literature. As an illustration, an online search through the Periodical Database of the China National Knowledge Infrastructure Net – the largest database of academic periodical publications – found 1,817 bibliographic entries for the period of 2000 to 2005 that matched the descriptors "bilingual education/instruction" and "English language teaching." Indeed, as A. W. Feng observes, "from kindergartens to tertiary institutions, bilingual education has become part of the everyday vocabulary not only of educationists but also of ordinary people" (2005, pp. 529-530).

The promotion and spread of English-medium instruction have met with skepticism and criticisms from a small minority of educators and researchers (e.g., Gu & Dong, 2005; Gui, 2004; Xu, 2004). Some of them have drawn attention to a multitude of constraints that can frustrate the optimistically envisioned goals of mass Chinese-English bilingual education and turn the initiative into a disastrous waste of human and economic resources. Others have raised concerns over its potential negative educational and sociocultural consequences. Their voices, however, have been drowned in an overwhelming academic discourse constructed by an ever growing contingent of vocal advocates (e.g., A. Y. Huang, 2005; H. D. Jiang, 2002, 2003; Qian, 2003; Qiang & Zhao, 2000; Sun, 2002; B. H. Wang, 2003; Wen, 2001; Zheng, Tian, & Li, 2006; Zhu, 2003). Those advocates hail Chinese-English bilingual education as the vanguard of educational reform, a cornerstone of quality education, a vital means for China to interface with the rest of the world, and an indispensable resource for the country's endeavor to achieve national development and modernization in the era of globalization.

This paper presents a critical review of the Chinese-English bilingual education initiative from a sociological perspective. It consists of three major sections. The first section briefly discusses French sociologist Pierre Bourdieu's (1986, 1991) theoretical work which informs the current critical review. The second section examines some of the major driving forces behind the runaway expansion of

English-medium instruction. The final section analyzes the implications and consequences of such instruction for China.

Bourdieu's Theory of Social Practice

As this paper draws on Bourdieu's sociological notions of capital, field, and distinction, it is useful to outline at the outset these notions and their relationships as formulated in his theory of social practice. Bourdieu (1991) uses field (and sometimes "market") to refer to a structured social space in which individuals or institutions act. This structured multidimensional space is "constructed on the basis of principles of differentiation or distribution constituted by the set of properties active in the social universe under consideration" (p. 229). The set of properties current in a field are comprised of material and immaterial resources, or various forms of capital, that "govern its functioning in a durable way, determining the chances of success for practices" (1986, p. 242). Thus, Individuals or groups are "distributed … according to the overall volume of the capital they possess and … the relative weight of the different kinds of capital in the total set of their assets" (1991, p. 231). For this reason, a field is also an arena of struggles in which the occupants seek to preserve or change the status quo, that is, the current distribution of capital. The composition and volume of capital, "like trumps in a game of cards, are powers which define the chances of profit in a given field" (1991, p. 230).

In Bourdieu's sociological theory, there are several types of capital. Economic capital comprises material goods and resources that can be quantified and thus have numerical values in the form of money. It can be accumulated, bequeathed, and invested. Cultural capital consists of knowledge, competencies, and other cultural resources that individuals come to possess. It can exist in one of three states: "in the embodied state, i.e., in the form of long-lasting dispositions of the mind and body; in the objectified state, in the form of cultural goods (pictures, books, dictionaries, instruments, machines, etc.) … and in the institutionalized state [i.e., in the form of qualifications, certificates, and credentials granted by authorized institutions]' (1986, p. 243). The acquisition and accumulation of cultural capital require socialization and inculcation as well as investment of time and economic capital. Cultural capital "derives a scarcity value" and "yields profits of distinction for its owner" (1986, p. 245). Social capital "is the aggregate of the actual or potential resources which are linked to possession of a durable network of more or less institutionalized relationships of mutual acquaintance and recognition – or in other words, to membership in a group – which provides each of its members with the backing of the collectivity-owned capital, a 'credential' which entitles them to credit" (1986, pp. 248-249). Simply put, social capital consists of resources afforded by social networks and group membership.

An important property of the various types of capital is their mutual convertibility. Thus, cultural capital in the form of academic qualifications can be cashed in for economic capital yielded by lucrative employment or social capital that a powerful position affords. For various types of capital to be current and to be deployed to procure profits, they must be acknowledged by players in the field as having convertible value and symbolic power in the form of prestige, status, and reputation. In other words, they need to be recognized as symbolic capital, "the form assumed by these different kinds of capital when they are perceived and recognized as legitimate" (1991, p. 230). Symbolic capital then is "another name for distinction" (p. 238). In this definition, distinction is nothing but capital recognized as legitimate. Importantly, holders of distinction, or symbolic capital, "are able to impose it as the only legitimate one in the formal markets (the fashionable, educational, political and administrative markets)" (pp. 56-57) and thus secure "a profit of distinction" (p. 55).

Bourdieu's constructs of capital, distinction, and field, together with their interrelationships, offer a sociological vocabulary for analyzing, and a useful framework for understanding, the propagation and spread of Chinese-English bilingual education in China. Knowledge of English has become cultural capital par excellence and one of the most powerful forms of symbolic capital in the country. Access to such knowledge is inexorably intertwined with the availability and deployment of other types of capital, creates relations of power, and leads to both symbolic and material profits.

Driving Forces Behind the Bilingual Education Craze

Researchers have identified several driving forces behind the craze for bilingual education in China. Hu (2008), for example, discusses two major driving forces: 1) an entrenched modernization discourse that links national development to English proficiency and 2) a misleading academic discourse that embraces bilingual education unreflectively. This sociological critique focuses on another group of

driving forces: the vested interests of stakeholders and major players in the field of English language provision.

In light of Bourdieu's theory, it is not difficult to see that Chinese-English bilingual education in China is a field of struggles in which different stakeholders and players compete to maximize their various forms of capital and to redefine their relative positions in the economic, educational, and sociocultural markets. It can be argued that major promoters of Chinese-English bilingual education, such as local governments in Shanghai and Guangzhou, have been driven by a desire for a maximal profit of distinction and to maintain their positions as centers of power. These large urban centers were able to occupy their leading positions because of their economic power. However, a large crop of cities have been quickly catching up in the last three decades as a result of the central government's reform and opening-up policies. To distinguish themselves from the upstarts and to take the lion's share of the available capital (i.e., capital as conceptualized by Bourdieu), these older power centers are determined to join the rank of international metropolises rather than remain merely domestic centers, knowing that capital accrues to the most powerful (Bourdieu, 1991). An obvious strategy for them to retain their powerful positions is to exploit their existing advantages. One such advantage has been their much greater resources for ELT. Thus, as current holders of distinction, they have imposed English proficiency as a legitimate and prestigious form of symbolic capital. This strategy is clearly reflected in the discourse of the Shanghai Education Commission's action plan for the 21st century: "To develop world-class foreign language teaching programs in Shanghai is a prerequisite for turning the municipality into a world-class international metropolis" (cited in Hu, 2002, p. 33). The upstarts, however, have refused to be mere onlookers.

The same psychology of distinction also underlies the strong enthusiasm for Chinese-English bilingual education showed by district educational departments and prestigious schools. Thus, the principal of a highly prestigious school in Shanghai gloated about his school's high quality bilingual program on the one hand and insinuated at the low quality of startup programs elsewhere (W. Lin, 2001). Other schools struggle to set up bilingual programs because their interests are at stake. For example, the principal of another school in Shanghai knew that his school would remain on the periphery of the field if it did not take action to offer bilingual programs (Pi, 2004). Similar vested interests sent universities vying to offer bilingual courses after the Higher Education Department of the Ministry of Education announced that the number of bilingual courses offered would be taken into account in the assessment of universities (Zheng, 2004). This led to 48 bilingual courses at Fudan University, 164 at Zhejiang University, and 216 at Wuhan University (W. Huang, 2004; L. F. Wang, 2006; Zheng, 2004).

Many teachers welcome Chinese-English bilingual education because it brings with it opportunity for them to procure more economic, cultural, and symbolic capital than they normally can hope for. These are typically junior teachers who have not established themselves and have to slog their way slowly and patiently up the professional and social hierarchy. Thanks to their possession of greater English proficiency than most of their more senior colleagues, bilingual education offers them a much sought-after opportunity to appreciate in value, to attain "distinction" (Bourdieu, 1986) in the eyes of their superiors and colleagues, to be recognized, and to be better remunerated. All these are possible because to encourage teachers to teach bilingually, most schools offer various incentives: honorific rewards, promotions, salary increases, bonuses, subsidies, favorable formulae for workload calculation, sponsored training at home or abroad, grants for Chinese-English bilingual education research, and many other rewards (Li, 2006; Shen & Feng, 2005; Xu & Zhang, 2003; Zheng et al., 2006).

Parents and older students support Chinese-English bilingual education because English proficiency has become a most valorized form of cultural capital (Bourdieu, 1986, 1991). It is a passport to a host of economic, social, educational, and professional opportunities and resources (Hu, 2005b; Li, 2006). For example, promotion for professionals depends crucially on passing a national English test. "Failing in this test," Y. J. Jiang (2003, p. 4) bemoans, "even a Nobel Prize winner will be rejected for promotion to professor, senior researcher, chief physician, or even class-I teacher in a school." Consequently, parents, especially those from a middle-class background, want their children to learn English well for an improved future (J. Lin, 2003). They are willing to pay higher school fees or donate generously in order to get their children into bilingual schools (A. W. Feng, 2005). Two incidents show how the signboard of bilingual education can work wonders for schools because of parents' eagerness to give their children a head start in English learning. A kindergarten in Beijing was on the brink of closure because of its small enrolment (Liu, 2002). To get out of the difficult situation, the kindergarten declared itself a bilingual education kindergarten and did some publicity work. Immediately parents

queued to enroll their children in the kindergarten. In the second incident, 1,000 parents were queuing up in the sun outside of a little-known primary school in a small town for places in an 'experimental bilingual education class' (J. Lin, 2003). Some of them had rushed there the night before from large cities like Guangzhou and Shenzhen!

Finally, many other individuals, organizations, and businesses have self-interests in Chinese-English bilingual education because it is a gold mine. Indeed, English proficiency has become a very expensive commodity in China. According to Y. P. Zhang (2003), there were 3,000 English language tuition centers in Shanghai alone. In a tuition center that had an enrolment of more than 2,300, a 48-hour course charged ¥7,300 (more than US$900). Another tuition center charged ¥9,980 for a 6-month course. These were hefty amounts in a country whose GNP per capita was below US$1,000 in 2003. The New Oriental School in Beijing, the largest private English-teaching school in China, had an annual income of US$25 million in 2001 (Y. J. Jiang, 2003). In the craze for English, publishers also make big money. According to a report quoted in Niu and Wolff (2003, p. 30), "of the 37 billion yuan annual book sales, ESL [English as a second language] takes up as much as 25% of market share." The drive for Chinese-English bilingual education has also created a highly profitable market for reprinting textbooks published overseas. Given the huge economic profits, it is little wonder that various Chinese-English bilingual education services have been springing up everywhere (W. Lin, 2001; Nian et al., 2002).

Consequences of Bilingual Education for China

Because of the driving forces discussed above, there is no sign that the Chinese-English bilingual education craze will dissipate or even abate in the foreseeable future. The runaway expansion of English-medium programs requires serious consideration of the consequences of bilingual education for China. What educational, economic, and sociocultural consequences has it already produced? What potential consequences may it give rise to? This section tries to answer these questions.

Educational Consequences

Chinese-English bilingual education has been promoted ostensibly to make English learning more effective and to greatly raise students' English proficiency. Has this objective been attained by the extant bilingual programs? At first sight, the few available formal evaluations suggest that this would be the case. However, as Hu's (2008) critical review makes clear, the studies suffered many of the problems plaguing evaluation research on bilingual education discussed in the literature (Greene, 1998; Swain, 1978; Willig, 1985). A close scrutiny of the studies raises doubts about the validity of their findings and suggests that the effectiveness of the costly bilingual education efforts fell far short of the claims.

What, then, are the chances for the goal of mass Chinese-English bilingualism to be achieved in the foreseeable future? A rational answer would be in the negative, given the poor English proficiency of most 'bilingual' teachers, the actual extent of English use in the classroom, the dubious quality of bilingual learning materials, the lack of curricular standards, the general lack of professional training in bilingual education among teachers, the lack of a threshold English proficiency in students to benefit from bilingual instruction, and so on. Research (e.g., Swain & Johnson, 1997) suggests that only under favorable conditions can the potential benefits of bilingual education be reaped, and a full additive bilingualism achieved. Cummins (1998), a strong advocate of bilingual education, has pointed out that students from French immersion programs - programs widely considered in China to be models of highly successful bilingual education - lag behind native speakers of the immersion language in spoken and written competence, especially in the grammar of the target language. If this is the case in Canada, it is more likely that Chinese students will develop half-baked bilingualism, or semilingualism, given China's limited resources for Chinese-English bilingual education.

It is also important to consider how Chinese-English bilingual education, now a synonym for quality education in China, may affect students' academic achievement in the long run. Although there is no report of systematic longitudinal research conducted to examine the effect on academic attainment of learning non-language subjects in English, there are already some indications that the use of English as

a medium of instruction may very well affect students' academic achievement negatively. One of the few evaluation studies admits that bilingual instruction may "injure subject learning" and calls for strategies to prevent this from happening (Shen, 2004). Many teachers have also complained that they have to reduce or simplify curricular content to accommodate bilingual instruction because their students lack the academic language competence to understand complex topics and engage in higher-order thinking in English (Pi, 2004; B. Z. Ye, 2002). Jin and Zhuang (2002) report that in one school after half a semester of bilingual instruction in mathematics, the teachers had to re-teach major topics in Chinese because the students had performed poorly in assessment. Such examples suggest that Chinese-English bilingual education is carried out at the expense of curricular content. As Liu (2002) observes, while bilingual education has been pushed forward as a way of correcting the evils of "costly and ineffective" approaches to English language teaching, it has made the teaching of other school subjects costly and ineffective. In light of Hong Kong's unsuccessful English immersion education, Gu and Dong (2005) draw attention to potential problems that may result from a mass shift in the medium of instruction and calls for great caution in promoting Chinese-English bilingual education in mainland China.

There are other real and potential consequences of great concern. Safty (1992) argues that in evaluating bilingual education programs, it is important to examine wider educational issues such as school integration, teacher employment, and staff morale. There is every possibility that the craze for Chinese-English bilingual education will bring along, if it has not already done so, unwelcome consequences in these respects. To solve the problems of bilingual teacher shortages, many local governments and schools have redefined what it takes to be a qualified teacher. As A. W. Feng (2005, p. 540) points out, "qualified educators from preschool up to tertiary levels now need to be bilinguals who can teach their subjects in a foreign language, particularly English." In some schools, teachers are classified according to their ability to teach bilingually: those who are "qualified," those who are "sub-qualified," and those who are "probationers" (Shen, 2004). While such policies create golden opportunities for the minority of teachers who possess the much sought-after English proficiency, they can pose serious threats to the majority who do not have such capital. The latter's prowess is threatened with depreciation because they cannot display it in English. Thus, they face losing their symbolic capital in the form of professional recognition and reputation (Bourdieu, 1986, 1991). Marginalization and dislocation loom real. All this can have a demoralizing effect on teachers who cannot hope to teach bilingually and cause resentment for those who occupy privileged and envied positions afforded by bilingual education. "Divergence of interest and conflict within the group," Safty (1992, p. 27) notes, "will result if a segment is perceived as having acquired prestige and social mobility not previously available or accessible to the rest."

Economic and Sociocultural Consequences

Massive promotion of Chinese-English bilingual education in China also has huge economic and financial consequences for the central government and local governments at various levels. It entails tremendous governmental spending because of its requirements for teacher training, teacher employment, instructional facilities, and learning materials development (X. Y. Zhao, 2004). Su (2003b) reports that between 2000 and 2003, Shanghai alone sent nearly 2,000 teachers to English-speaking countries for training and recruited about 1,600 expatriate teachers for its primary and secondary bilingual programs. In addition, 400 teachers were sent to universities in Shanghai for training. This translated to governmental expenditure of millions of dollars. Bilingual education also means more expenditure on the part of schools. For example, Zhejiang University spent more than one million yuan in 2002 in setting up bilingual courses (W. Huang, 2004). Schools that are serious about bilingual education have to expend their often limited financial resources on school-based training for their bilingual teachers, on wage hikes, bonuses, and/or subsidies for their bilingual education teachers, on recruiting new staff for their bilingual programs, and on equipment and other facilities needed to create an 'English environment' conducive to bilingual education (J. Lin, 2003). Even some advocates admit that bilingual education is expensive and suggest that it should be implemented on a restricted scale (Su, 2003a; Sun, 2002; Zhang & Liu, 2005). It is difficult to justify the huge spending on bilingual education, whose effectiveness in China has yet to be proved, when numerous schools in the vast rural areas of the country are poorly equipped for basic education and when the great majority of children in these underdeveloped areas do not go beyond a nine-year compulsory education (Hu, 2005a).

Even more disconcerting are some of the sociocultural consequences following from the drive for

Chinese-English bilingual education. Even before Chinese-English bilingual education was officially promoted, English proficiency was already a commodity of strong exchange value (Bourdieu, 1986) and a gatekeeper of opportunities to procure various forms of capital, economic, cultural, and social (Z. J. Feng, 2002; Hu, 2005b). The Chinese-English bilingual education craze has further consolidated its status as symbolic capital, that is, as a most valorized form of cultural capital. Mastery of English has come to be regarded as a defining characteristic of talents in the 21st century (A. Y. Huang, 2005; Shen & Feng, 2005), an essential part of "a perfect character" (Qian, 2003), and a sign of distinction. It is now a widespread belief that "everything is low but English is high" (Xu, 2004). This belief is well illustrated by a news report of a group of children standing under the Oriental Pear, the television tower in Shanghai, and shouting in unison "No English, no future!" (Y. J. Jiang, 2003, p. 3). Hu (2005b) provides a further example of how English has been perceived as synonymous with competitiveness and quality as well as how the demand for English has often been created artificially.

Conclusion

It is all too obvious that English has become the language of social and economic prestige and has the power to confer greater possibilities on those who can command it. On the face of it, the explosive growth of Chinese-English bilingual education seems to offer opportunity for a large segment of the Chinese society to acquire the scarce symbolic capital of English proficiency. However, this opportunity exists only in theory. Researchers (e.g., Valdés, 1997; Walsh, 1995; Yau, 1988) notice that it is generally students of higher socioeconomic levels that benefit most from successful bilingual education programs in USA, Canada, and Hong Kong. Expectedly, there are also indications that Chinese-English bilingual education in China is becoming a service to the elite (Gill, 2004; P. Zhang, 2002). This is happening because, as Bourdieu (1986, 1991) points out, the educational system serves as a principal institution for the accumulation, production, distribution of cultural capital and for the reproduction of social inequality. Thus, at the school level, a minority of elite schools can take advantage of their much greater volume of various types of capital – greater financial resources, excellent infrastructure, wider social networks, well-trained staff, and high-caliber students – to offer bilingual programs of a quality that the majority of schools with limited capital cannot hope to emulate. At the personal level, students from higher socioeconomic backgrounds can benefit more from bilingual programs than those from lower socioeconomic backgrounds because of the much greater resources their families can invest in creating conditions of success for them (A. W. Feng, 2005). Thus, Chinese-English bilingual education not only perpetuates the existing unequal and hierarchical distribution of power and access to cultural and symbolic capital but is creating new forms of inequality and further differentiating the Chinese society.

Globalization and language learning: Strategic bilingualism in the age of globalization
Dr. Lee Yuhshi
Wenzao Ursuline College of Languages

Abstract

 The purpose of this study is to examine the relationship between globalization and the education, and language learning of Asian immigrant students in the United States. Students today are being influenced by globalization. It is a phenomenon that comprises multiple changes in educational, economic, political, and cultural terms. Globalization influences the way people position themselves in the world. With globalization and mass immigration transforming local and homogeneous communities into global communities (Singh, 2002), people have a different sense of being and ways of identifying themselves in the world. Many people move or aspire to move all over the world in search of the symbolic capital that globalization awards (Banks, 2006; Ong, 1999, 2004; Castles, 2004). However, research has not specifically described the effect of globalization on the education, and language learning, and identity of Asian immigrant children in the United States. Using ethnographic research methods, the researcher examined 6 Asian immigrant parents living in the northwestern part of the United States. This study examined how globalization, English as a global language, the mass migration of immigrants around the world, and transnationalism influenced the ways the parents strategically structured their children's education and language learning. The researcher found that globalization changed the conditions under which language learning took place. It changed not only the Chinese immigrant parent's motivations and choices about which language(s) their children should learn, it also affected the resources and practices the parents allocated for education. The researcher argues that in the age of globalization, Asian immigrant parents are situating their educational and linguistic practices on a global scale, beyond the local context in which their families are situated.

Local Problems, Global Solutions?
Using popular cultural texts in the humanistic classroom: How Japanese stories can work for Hong Kong students

Amy Lee Wai Sum
Hong Kong Baptist University
Email: amylee@hkbu.edu.hk

Abstract

With the increase in university student numbers over the world, university education has changed from the elite to the general. University education has also changed from a kind of gentleman-training to career oriented training and shifting to more general humanistic training today. The education sector has called for changes not only in the content but also the approaches to university education in view of the changing environment (i.e. globalization, the internet age, etc.) and the changing people that are produced by this environment. To adequately teach the new generation of young people and prepare them not only for the work life but life in general, we must get to really communicate with them. To do this, designers of curriculum need to comprehend how they think, how they relate to the world, and what kind of decisions they tend to make in given circumstances. Educators must do some research to understand the youth culture before they can utilize suitable and effective strategies to create a learning experience for this generation of young people.

One of the most effective ways of doing this would be to get through to students via the cultural world they inhabit, and ideally borrow insights from those texts they enjoy. In Hong Kong, for example, comics, animation, games and popular reading are most important components of their cultural life. I propose to use a Japanese literary text which is very popular among youngsters in HK to illustrate how we can perhaps make use of popular texts welcomed by young people in our classrooms. Yumemakura Baku's *Onmyoji* series is first a successful popular novel series, then adapted into comics series, and film adaptation and TV mini-series have also followed. I hope that through a textual analysis of this Japanese literary series and its other products, I can show how interdisciplinary, cross-cultural, and even bilingual teaching and learning materials can be created for use in a humanistic classroom.

Keywords: Literary Studies, Japanese Popular Culture, Cross-Cultural Text, Fantasy Literature, Onmyoji

Introduction

The idea of this presentation comes from my own experience of teaching humanities courses to both Humanities majors and students from out-of-discipline groups taking humanities subjects to fulfill their general education requirements. Teaching a class of mixed backgrounds has always been challenging because of the difference in students' knowledge level and their expectations concerning the mode of teaching and learning. But in teaching humanities courses, there is an extra dimension to this challenge – how do teachers convey the significance of these subjects in the globalized world and their relevance to life in the 21st century when the tendency is to look forward rather than looking back? Today educators are well aware that we are dealing with a group of students who were born in the internet age, who are more familiar with reading and writing on the net than writing on paper and who are not trained to have the patience to read traditional texts within the humanities. At the same time, they are probably accustomed to seeing a university education as a training to prepare them for a profession. This is indeed very far from the original Renaissance understanding of a humanistic education – to give the elite class the necessary training so that they will exhibit a learning as well as a gentlemanly civility which befits their class and heritage. In a world so fundamentally different from the Renaissance, what can the teachers do to impart such knowledge to the new group of youngsters? The purpose of this presentation is to share some of my ideas and to invite further suggestions from fellow educators.

William Paulson had painted a rather bleak picture of the situation of the literary culture in the 21st century in his book *Literary Culture in a World Transformed: A Future for the Humanities* (2001). The literary classics, he wrote, whether in book form or even in filmic adaptations, are no longer a part of young people's life, and it is not easy to cultivate an initiation in the students today to approach the literary culture as a relevant subject to be studied. If we want to make "literary culture's mode of engagement with the life of the world" (Paulson, 2001, 76) more satisfactory, we must do more than just a casual modernization of the curriculum, as in teaching the film adaptation of literary classics; but instead go back to rethink the fundamental worth of the literary culture, what it can do, as well as its limitations in the real world today. That is why he suggested that on the one hand we have to admit that "grand syntheses and worldly interventions will often lie outside the scope of literary culture" (76), but on the other hand we should recognize its ability to help us understand and articulate the issues around us. He said,

> Without knowledge of what has been said in the past, without experience of how reading and writing can nurture thought and imagination, without a sense that the fictional and poetic are no less part of our technologies for encountering the real than any supercomputer, efforts to understand and act on the world will be poorer and more reductive than they need to be. (76)

Although the material world has changed a lot in the generations between the teachers and the learners today and even more between the Renaissance and the globalised 21st century, it is still a world inhabited by human beings, and thus the dreams and fears, desires and anxieties remain essentially human. Forty years ago, R. B. Perry defined the humanities as signifying "a certain condition of freedom" which "certain divisions of knowledge or parts of a scholastic curriculum", or "certain human institutions, activities and relationships" seek to create (Perry, 1969, p.4). These subjects, activities, or relationships should enable us to realize our human capacity to the full, and to further humanize us in the process of learning so that we can live up to the ideal of being human. Perry further pointed out that humanities today is different from its origin in the Renaissance only in the much increased number of people who can have access to it and not the nature and purpose of the learning. This expansion of the population who has access to humanistic learning only confirms its relevance to our world and not the opposite. More people can have access to such learning only means more people can have the chance to become more humane – which is a significant antidote to the complaint about the unfeeling and segregated world that we are living in today.

The inherent value of the humanities to any human being aside, even when considering a humanistic education from a "practical" perspective, its value to a person working in the new century is still not to be doubted. Daniel Pink argued in his book *A Whole New Mind: Why Right-brainers will Rule the Future* (2005) about a "seismic shift now under way in much of the advanced world", and urged a change of the mindset inherited from the previous century which appreciates left-brain competence. He claimed that:

> The future belongs to a very different kind of person with a very different kind of mind – creators and empathizers, pattern recognizers, and meaning makers. These people – artists, inventors, designers, storytellers, caregivers, consolers, big picture thinkers – will now reap society's richest rewards and share its greatest joys. (Pink, 1)

He observed that globalization ships a lot of the work of the "knowledge worker" to previously third-world countries, at the same time when technologies have helped to eliminate certain kinds of work, resulting in major labour redistribution. The world has evolved into a new stage which requires new qualities to sustain and move forward, thus the approach to training workers need to be changed in order to meet the new demands coming from a new world. These "new qualities" may be very different from what was perceived in the previous century as important qualities, but they are certainly not qualities newly appearing in the human world. In fact, those qualities mentioned by Pink are very similar to those possessed by the ideal humanized being who have received a humanities education as defined by Perry.

Seeing that training in the humanities is a fundamental humanizing process to us all, the following presentation will attempt to illustrate how a text from popular culture, in this case Japanese writer Yumemakura's *Onmyoji* narrative series, can be called upon to facilitate Humanities learning for Hong Kong young people. Although the narrative series have been translated into many different languages, in this presentation I am referring to the Taiwan-published Chinese translations of the fiction and the manga, as they have both enjoyed enormous popularity among Hong Kong young and adult readers. The choice of the Chinese translation is also a logical one considering the closeness and the historical interaction between the Chinese and the Japanese cultures. A lot of the Japanese beliefs and values mentioned in the *Onmyoji* narratives can find understanding and identification in the Chinese readers because of similar beliefs and values in the Chinese culture.

Yumemakura's *Onmyoji*: Some background information
Onmyoji in Chinese is literally the "yin yang master", referring to someone skilled in a traditional Japanese esoteric cosmology, onmyōdō, which is based on the Chinese philosophies of "wu xing" and "yin and yang". Since their introduction into Japan in the 6th century, this cosmology had been accepted as a practical system of divination. Over time, Taoism, Buddhism and Shintoism all played a part in the evolution of this originally Chinese philosophy, resulting in a uniquely Japanese system called onmyōdō. This was taken by the Japanese so seriously that the Japanese court had set up an individual office to be in charge of such matters and employed its own official yin yang masters. Abo no Seimei is the name of an official yin yang master serving the Japanese court during the Heian period (794-1192) and Yumemakura Baku uses him to be the main characer in his fiction series which contain adventures describing him dealing with beings not of this world but which cause problems to the living.

Yumemakura's *Onmyoji* narrative series started as short stories published in newspapers and literary magazines. In 1988 a number of these short stories were collected into the first volume of what is now known as *Onmyoji*, a collection of short stories with a couple of extended novel-length narratives using the same protagonists of Abe no Seimei and his aristocratic warrior friend Minamoto no Hiromasa. After the publication of the first few volumes, because of their popularity with readers of different age groups, a manga series was created with the collaboration of the author and comics artist Okano Reiko. In 2001, the first film adaptation of the fictions appeared, featuring the same main characters who engaged in a series of adventures taken from the various short stories. To date, 12 volumes of fiction, 13 volumes of manga, 2 films, and a TV miniseries have already come out of this series and all of the books have been translated into different languages and become an important element in Asian popular culture.

Besides Abe no Seimei, the main characters in *Onmyoji* include Minamoto no Hiromasa, an aristocratic warrior who is also a famed musician, and other important officials in the Japanese court then. Both Seimei and Hiromasa were historical figures of the Heian period, with Seimei recorded as being born in 921 and Hiromasa a few years his senior (918-980). In the context of ancient Japanese history, the Heian period is a relatively stable and peaceful period, allowing literary, cultural, and artistic interests to flourish and creating a glorious period of classical learning and culture. Many of the Japanese literary and cultural treasures were produced during this period, among which include *Genji Monogatari* [The Tale of Genji] of the early 11th century, believed to be written by Murasaki Shikibu, a female courtier, although some believe that it was the work of collective authorship. *The Tale of Genji* is the earliest epic fiction in Japan, not only does it start a whole new tradition, but to many it is among the greatest literary work ever written in world literature. The early 12th century *Konjaku Monogatari Shu* [Tales of Times Now Past], although unfinished, contains a vast variety of tales from different cultures and lands, and is the source of many of the best modern and contemporary Japanese literature. Yumemakura' *Onmyoji* stories also draw many of their basic plots and characters from it.

"A Biwa Called Genjou Is Stolen by an Oni": The original and rewritten versions

To make the presentation more focused, the following discussion will only take one story from the first collection as an example: "A Biwa ("pipa" in Chinese) Called Genjou Is Stolen by an Oni ("ghost" in Chinese)",[4] which is a rewriting of a short story of the same title from *Tales of Times Now Past*. The rewritten story keeps the basic story structure of the classical tale – a precious biwa called Genjou, which belonged to the emperor, was reported lost and one night Hiromasa heard music played by the biwa and he followed it. He found that Genjou was in the possession of a ghost and demanded its return. Although the precious biwa was successfully restored to the palace, it appeared to have acquired human emotions after its adventure outside the palace, and would variously sulk or remain silent depending on the skills of its player. In Yumemakura's *Onmoyji*, this basic story is expanded, and contains interesting details which not only give the characters more substance and the plot more development, but also render the story a more relevant piece of narrative to contemporary readers.[5] While I agree completely with Reider that this modernized and expanded version of the story probably holds an appeal to the Japanese readers because "the humanization of *oni* portrayed in Onmyoji is a reflection and expression of contemporary Japanese feelings about, and attitudes towards, themselves – and by extension the uncertainty of their lives" (Reider, 119), the fact that these stories enjoy such popularity in societies other than Japan indicates that they embody values, attitudes, and descriptions of life conditions which have a much wider appeal. The appearance and success of the manga version further confirms the ability of the rewritten story to transgress cultural, age, and gender boundaries.

In Yumemakura's expanded version, Hiromasa came to pay Seimei a visit, having heard that he had just returned from a month-long trip to faraway monasteries, obviously intending to share with him some news from court. Hiromasa waited outside Seimei's house, wondering if he was in, and as usual, remarking on the unkempt condition of the courtyard. Immediately he was invited into the house by an attractive young lady coming out of nowhere, but who was really a shikigami[6] controlled by Seimei. Hiromasa asked Seimei about his trip and was told that Seimei went all the way to the monks to discuss the issue of the "zhu" ("spell" in Chinese). In return, Hiromasa told Seimei that about 10 days ago Mibu no Tadami[7] committed suicide after a long period of depression resulting from a defeat in the waka competition in the palace. Since then there had been reports of his ghost haunting the palace, still reciting his poem which failed him in the competition. Although this was an intriguing incident, Seimei knew that was not the reason for Hiromasa's visit, and urged him to move on to the main reason for his visit.

Five days ago, the precious biwa called Genjou was discovered stolen from the palace. No one knew who or when or why it was stolen. But two nights before his visit, while Hiromasa was on duty in the palace, he heard music played by the biwa and traced the source of the music to outside the palace where it stopped. It was not only the familiar sound of the biwa that attracted him, but also the mysterious and profound music piece which was played. It reminded him of the music that he waited outside the dwellings of a monk everyday for three years just to have a chance to hear. The next night he heard the music again and again he followed the music to the city walls. This time a human eye dropped from above and he was scared that whoever got the biwa would destroy the precious instrument, so he came back and invited Seimei to go with him. Seimei agreed, and they brought along the monk-musician whose music Hiromasa was reminded of. They followed the music and this time

---

[4] About the potential meanings of "oni" in the Japanese culture, Noriko Reider in the paper "Onmyoji: Sex, Pathos, and Grotesquery in Yumemakura Baku's *Oni*" has given a clear and comprehensible explanation. As the focus of the present discussion is not about the complexities of the concept of oni in the Japanese culture, and also because the Chinese translation is being used as the basis of reference in this paper, a relatively simple concept of "ghost" or "spirit" will be taken as the central meaning of the Japanese word "oni" which is translated as the Chinese character "ghost" [鬼]. Ghost here will be referring to the spirit of a human being left behind in the human world after the person's death if the person does not die naturally, or still has some unfinished business that he or she wants completed.

[5] Reider has discussed the modern pathos of Yumemakura's version of the Seimei stories in the article "Onmyoji: Sex, Pathos, and Grotesquery in Yumemakura Baku's *Oni*", but it was specifically geared towards a discussion of contemporary Japanese attitudes and values. Here in this discussion, the implication of the stories, both in their fiction version and the manga version, is considered in a wider perspective to include different groups of Chinese readership.

[6] Shikigami refers to spirit summoned to serve a practitioner of *onmyōdō*. It was believed that these spirits could not be seen by ordinary people, but they could also be made to appear in various shapes and forms under the command of the onmyoji. Abe no Seimei was believed to be particularly skilled at manipulating shikigami, and in Yumemakura's narratives, Seimei even had them performing odd jobs around the house.

[7] Mibu no Tadami was a Japanese nobleman and a famous waka poet during the Heian period. His poems were collected in several imperial poetry anthologies and he was highly considered at his time.

the mysterious player spoke to them in a foreign language. Seimei was able to converse with him and found that he was a musician from India, and had settled in China for a time before travelling to Japan and staying to work as a biwa maker. He was killed by burglars and his spirit wandered around, yearning for his home country. He wandered to the palace and saw a maid who looked very much like his wife, but instead of abducting her he took the biwa Genjou, which was one of his creations, to relieve his yearning. Now that Seimei wanted the biwa back, he wanted to spend a night with the girl in exchange. Seimei agreed. So they brought the girl the following night to get the biwa. Everything went well, and the biwa was handed back, except that the girl was armed and the foreign spirit felt betrayed. He killed the girl and threatened to eat Seimei and Hiromasa. Hiromasa was paralyzed by the foreign spirit but Seimei was able to overpower the foreign spirit and coax it into attaching itself to the biwa instead. Genjou was finally restored to the palace although it was felt to have acquired human emotions and would vent its discontent when its player was not professional enough.

Using *Onmyoji* in the classroom: The partners in detection
One of the first things that are noticed in reading the *onmyoji* stories is the Seimei-Hiromasa pair as a contemporary rendition of the Holmes-Watson partnership (Moro, 323) with a cultural and supernatural twist. A typical story in the series will have Seimei expecting a visit (because of his magical power) from his friend Hiromasa, to share with him a piece of news from the court, or a problem that someone has put into the hands of this kind gentleman. The two will engage in small talk, and then Hiromasa will present his problem and enlist Seimei's help. Seimei will usually say yes and invite Hiromasa to join him in his investigation, which unfailingly ends with the problem solved and Seimei commenting on human nature and some inevitable problems caused by such nature. The Seimei-Hiromasa partnership in detection and the overall detective-mystery format that the narratives adopt make them attractive to young people because they remind them of famous detective fictions and at the same time offer a very interesting variation of that popular genre. A classroom experience of discussing the *Onmyoji* stories with Sherlock Holmes stories in the background makes meaningful comparisons which can enhance understanding of the literary texts as well as their relevance to our life.

The "detective" figure
Although strictly speaking Seimei is not a detective in the sense that Sherlock Holmes is one, he investigates and he always leads both Hiromasa and the readers to the truth. A comparison with Sherlock Holmes, arguably the prototype of the detective figure in this genre, can yield interesting results concerning this individual in the following aspects:

- Seimei shares with Holmes a link to official authority and yet somehow subverting it – Holmes is a former policeman in Scotland Yard although he has left to start a private practice. Seimei is an important official onmyoji and he serves the Emperor and his court. But he is totally unconventional and does not act according to the accepted mode of behaviour. In the stories, he keeps referring to the Emperor as "that man" (much to Hiromasa's frustration) and he is seen to be playful even in the most serious moments. In accepting Hiromasa's invitation to meet the mysterious player of the music, he even brings with him wine despite the potential danger involved, for he sees the trip as a chance to appreciate good and profound music!
- Holmes sees detection as an art of its own and will resort to the most unusual methods to find out the truth – disguise, spying, lying, threats, tricks, even unlawful behaviour. Holmes is something of a bohemian, a musician and a drug user. Seimei's method of handling trouble is also highly unconventional, besides pretence, lying and tricks, he also cast spells and use his magic to manipulate people. In the story of the biwa, he lied to the Indian ghost about his real name so that the spirit could not control him when he found he was betrayed. After releasing the Indian spirit from it host, he persuaded the spirit to enter the biwa which would be restored to the palace. This can be risky for he is introducing a ghost into the palace, but it in turn gives an extra dimension of humanity to the already well-made biwa, making it an even more profound instrument.
- Both Seimei and Holmes are good readers of the world around us and their investigation very often succeed because of their profound understanding of the parties involved in the cases. While the Holmes stories put a lot of emphasis on clever and logical interpretation of material evidence, Seimei draws attention to the emotional and psychological reactions of parties involved.
- While Holmes is described as an exceptional individual because of his disregard for conventional behaviour, the Seimei character is made into an even more extreme individual. In the manga version of the biwa story, even his human identity was called into doubt. There were rumours that his mother was a white fox, making him half-human and half-fox. This feature, together

with the highly androgynous appearance (readers' attention is repeatedly drawn to his pale complexion, red lips and long fingers in the fiction) he is given in the manga version, makes him the ultimate individual character who is perpetually an outsider. This aloneness becomes a personal style, an indication of his exceptional power, but also appeals to contemporary readers because it is also an aspect of contemporary life.

The detective side-kick – the gentleman and our point of identification
One of the major differences between the two detective partnerships is the role of the side-kick. Watson is the "narrator" of the Holmes adventures because he faithfully records all the adventures he has with Holmes, and very often he shares his personal comments on the cases with the readers too. Hiromasa, on the other hand, is as much a character in the story as Seimei, known to us through the voice of the writer Yumemakura. But apart from this major difference, Watson and Hiromasa have very similar symbolic meaning in the context of the stories.

- Both Watson and Hiromasa are down to earth, approachable and kind. They are the point of identification for the readers because they are humanly fallible – both are rather naïve concerning human nature, especially towards ladies. Hiromasa's obsession with good music is also a weakness that can put him in danger. He stood outside the monk's dwellings to wait for a chance to hear the legendary secret music everyday for three years, and he followed the sound of Genjou to come face to face with the Indian ghost.

- But they are also exemplary "gentlemen" in their own societies. Watson is a professional doctor, he has served in the army, loyal to his friend, and is willing to take up arms and fight when there is a need. Hiromasa also embodies all the best qualities that a gentleman in the age of classical Japan requires: courage, loyalty to the court, gentlemanly knowledge about music and poetry, civility to everyone asking for his help, and honesty. To top it all, he is the grandson of the emperor and thus literally of noble blood. A comparison of these two gentlemanly figure can reflect the expectations of the Victorian England and Heian Japan towards gentleman behaviour.

The narratives as the unconscious
Although the nature of the problems they deal with are very different, with Holmes-Watson investigating crimes (murders and thefts) and Seimei-Hiromasa trying to unfold mysteries crossing the realm of the spiritual, their adventures happen around human beings and reveal much about the human world.

- The investigation in both narratives comes down to a close reading of the material world and the human subjects involved. Holmes emphasizes attention to details, including both material details and emotional details exhibited in the human subjects. Seimei's approach to these mysteries is always informed by the human emotions and desires of the parties involved. The person who stole the biwa from the palace and played it for all to hear must have something to say; the ghost longing for his home country wished for a permanent place to settle; and the failed poet whose poem did not win the prize only wanted to claim a name for his prided work. Seimei's success in all the cases is a complete revelation of the story of human desires and emotions hidden in the background.

- The basic pattern of the detective fiction creates a layered structure for the reading of the stories. The crimes in the Victorian stories and the mysteries in the contemporary Japanese stories are both the manifest symptoms of problems hidden below the surface. While the Victorian crimes reveal the hidden greed, desires, hatred, and insecurity buried in the minds of the criminals, the spiritual trouble-makers are very often revealed to be the deeply buried anxieties and fears of the living world. In this sense, the mysteries is actually a creative articulation of the repressed problems troubling our world. Presenting the stories is drawing our attention to them, and hopefully handling them to eliminate the anxieties.

The role of language
Detective fiction is a genre that relies particularly on special qualities of language for plot development and the construction of the investigation. At the simplest level, interrogation is a scenario of the investigator trying to using clever questions to trick the suspects into revealing the truth, whereas the suspects will choose words or ways of representation to hide or mislead without resorting to lying. It is a battle fought in language.

- "The Speckled Band" is one of the more obvious Holmes stories where the key to solving the crime lies in the correct understanding of a word or a sentence. In the *Onmyoji* series, Seimei repeatedly discuss the concept of the "spell" with Hiromasa because he sees it as the key to understanding the human condition. In the biwa story, he refused to reveal his real name to the Indian spirit because he regarded a person's name as the world's shortest spell, which revelation

would put the person under the control of the name-caller. In the end of the story, Hiromasa was paralysed by the Indian spirit because it called his name and he responded. Refusing to yield his real name, Seimei was free and was able to overpower the spirit. Finally he even "cast a spell" by tenderly persuading the spirit to settle in the inanimate biwa for good, explaining that the most powerful spell in the world was the most tender words because people would comply.

- Elsewhere in other adventures Seimei demonstrates that the power of language comes from its capacity to create another world. Indeed language is a man-made system human beings create to refer to the physical world. The connection between this symbolic order and the touchable world is totally arbitrary, and the symbolic order can even exist outside the physical reality. Literature is the most obvious demonstration of this power of language to create a completely detached and independent world.

Narratives as historical texts

The Victorian age gives birth to a tradition of detective fiction because of a culmination of historical, cultural and social factors. Although the Victorian period is now remembered fondly by many as one of the most glorious periods in British history, a more careful examination of the period will reveal economic and political problems at various points in the long period. Migration to the urban areas for jobs creates the Metropolitan as we know it today: overcrowded, impersonal, highly nervous, and insecure. The human identity assumes a new meaning and faces challenges never encountered before in this place of high crime rate. The detective fiction in a way reports the horrendous crimes found in the city but also describes a general hope in the figure of the intelligent detective who can always find out the truth. Sherlock Holmes is one of the most famous icons coming out of the Victorian period just as Jack the Ripper is the symbol of the intense terror felt by the mass living in the Victorian society. Thus detective stories to a certain extent serve as a historical document of the Victorian period: surveillance and policing, the transgressive detective image, protocols of behavior, gender relations, crime and justice, etc. are all discussed in the creative texts, just as the workings of one's unconscious can be gleaned from a study of his dreams.

In this sense, the *Onmyoji* stories are more interesting because they are a revisiting of classical Japan. Using historical figures and even events from the Heian period, the modernized version embodies not only facts from an important period of Japanese history, but also contemporary understanding and attitudes towards this past. Yumemakura starts the series by commenting on the "darkness" of the period, where human beings share the same living space with the spirits, and where spirits have the power to cause disruption to human affairs. The emphasis on this murky spiritual atmosphere and the co-existence of the spiritual world and the human world in the fictional text is not only an enhancement of the historical setting, but also an allusion to the intense insecurity that contemporary 21st century people are feeling again at the cusp of new times. We may not believe that ghosts are parading on the streets ("Hyakki Yako"[8] in Japanese, "Night Parade of One Hundred Demons" in Chinese), but we certainly feel akin to the characters in the stories when Seimei explains to them that the ghosts are just manifested symptoms of their repressed desires and illness inside. In other words, the ghosts in the Heian stories are symbols of our internal turmoil, and seeing them relieved, dissolved, and liberated has a therapeutic value for contemporary readers.

Conclusion

The above presentation is an attempt to illustrate how texts taken from the popular culture can be used in the humanities classroom to create a meaningful learning experience for young people today. Although the 21st century globalized world has changed many aspects of our life, such as the mode of communication, our sense of values, human relationships, and even habits of reading and understanding, the core value of a humanities education is still valid to the human beings and the world today. To facilitate the teaching and learning of the humanities in such a changed material environment, materials that appeal to the young learners can be useful because they are part of the youth's culture and embody ideas and beliefs that young people can identify with. From the above discussion using Yumemakura's reinvention of the classical onmyoji stories as an example, it can be seen that this series of Japanese narratives can have a meaningful interaction with Hong Kong readers through a comparative reading of the Japanese stories with detective fiction and a cultural comparison

---

8 "Hyakki Yako" was a Japanese folk belief. It was said that the Japanese supernatural beings will group together and walk the streets during summer nights. Anyone who comes across the procession will die, unless protected by some Buddhist sutra. In a way this is very similar to the Chinese ghost festival in the 7th month of the Lunar Calendar. It is believed that every year on the 14th day of the 7th month (also the summer time), the gate of the underworld will be opened, and the ghosts will come to the living world. People usually avoid staying on the street until late on this day for fear of bumping into ghosts.

of the similar features in the Chinese and Japanese culture. Yumemakura's stories creatively articulate the contemporary world and the issues surrounding us through the resolution of personal problems faced by characters in the stories. In other words, the author, true to his namesake ("Baku" refers to a mythical animal which eats up nightmares), has presented us with imaginary narratives that dissolve our repressions as we follow them to their conclusions.

Hong Kong Preschool Teacher's Perspectives of Using Portfolio to Assess Young Children's Learning and Development

Ms. Wai Man Leung
Yuk-ching LAI
Joyce HO
The Hong Kong Institute of Education/Lecturer

Abstract
Portfolio assessment is a collection of children's work and classroom from a variety of sources to document and monitor the individual learning progress in terms of their growth, progress, and effort over time (Hanson, & Gilkerson, 1999; Losardo & Notari-Syverson, 2001). It utilizes many traditional assessment strategies for monitoring progress regularly and offers a systematic procedure for information collection in an extended period of time (Appl, 2000).

This study employed both quantitative and qualitative methods to investigate the capability of Hong Kong preschool teachers in using the portfolio to assess young children in all six developmental domains which are emotion, social, language, arts, physical, and technology and science. Regarding to the quantitative data, a total of 37 teachers from three preschools responded in the five-point Likert Scale questionnaire ranging from 'very satisfy', 'satisfy', 'average', 'unsatisfy' and 'very unsatisfy'; and 'very able to', 'able to', 'partly', 'not able to' and 'not very able to'. In order to enhance the reliability of the study, nine of the 37 preschool teachers were interviewed to collect their perspectives of using portfolio assessment. The findings revealed that the satisfactory level of teachers using the portfolio and how they reviewed the preschool curriculum and teaching methods with the documentation from portfolio. In addition, the teachers indicated that the portfolio enhanced the parents-teachers communication to maximize the benefits of learning and development of young children.

Elementary school teachers' motivation toward web-based professional development and their Internet self-efficacy

Chia-Pin Kao, Ying-Tien Wu, Chin-Chung Tsai,
Department of Child Care and Education, Southern Taiwan University, Taiwan
Department of Science Application and Dissemination, National Taichung University, Taiwan
Graduate School of Technological and Vocational Education, National Taiwan University of Science and Technology, Taiwan

ABSTRACT

This study was conducted to explore the relationships between teachers' motivation toward web-based professional development and their Internet self-efficacy. By gathering questionnaire data from 484 elementary school teachers, this study indicated that the teachers' Internet self-efficacy and their motivation toward web-based professional development were significantly positively correlated with each other. The results probably suggest that educators should try to find some effective ways to improve teachers' Internet-related capabilities in the Internet-based environments.

Keywords: motivation; web-based professional development; Internet self-efficacy

1. Introduction

In the past, the role of an individual's motivation on his/her learning has been highlighted by many educators and researchers (Kauffman, 2004; Rau, Gao, & Wu, 2008). In particular, it has been revealed that motivation bears a reciprocal relation to learning and performance; that is, motivation influences learning and performance, and, on the other hand, what learners do and learn also influences their motivation (Morris, Finnegan & Wu, 2005; Schunk, Pintrich & Meece, 2008). Recently, some pioneering studies have also focused on how learners' motivation is related to their learning outcome and learning experience in Internet-based learning environments (Artino, 2008; Saadé, He & Kira, 2007).

For teachers, their professional development is crucial for the improvement of their teaching practice. Loughran (2007) has proposed that teachers should view themselves as learners in their professional development. Recently, teachers have more opportunities to learn and advance their professional development on the Internet. However, while teachers have more opportunities to learn and advance their professional development on the Internet, studies about the nature of teachers' web-based learning have not kept pace with their usage of the web-based learning (Kao & Tsai, 2009). Similar to the important role of student's motivation in their Internet-based learning, teachers' motivation may also play a significant role on their web-based professional development. In other words, teachers' motivation toward web-based professional development can be an important issue for investigating. However, still little research addressed the aforementioned issue. Therefore, this study aimed to investigate elementary school teachers' motivation toward web-based professional development.

In addition, what are the important factors influencing teachers' motivation toward web-based professional development may be another essential research issue. "Self-efficacy" refers to an individual's beliefs and expectations in his/her capability to perform a task (Bandura, 1996). In motivation research paradigms, it has been revealed that individuals' motivation is influenced by his/her self-efficacy in conventional learning contexts (Fives & Buehl, 2008; Schunk, Pintrich & Meece, 2008). Recently, learners' "Internet self-efficacy", which refers to their self-perceived confidence and expectation of using the Internet, has been highlighted (Huang & Liaw, 2007). Similar to the findings derived from the aforementioned research conducted in conventional learning environments, it is plausible to hypothesize that teachers' Internet self-efficacy may affect their motivation toward web-based professional development. To examine this perspective, this study examined the relationship between teachers' Internet self-efficacy and motivation toward web-based professional development.

In sum, the major purpose of this study was to probe teachers' motivation toward web-based professional development. To this end, a new questionnaire for assessing teachers' motivation toward web-based professional development was developed in this study. In addition, teachers' Internet self-efficacy was also examined. Then, the possibility of using teachers' Internet self-efficacy in predicting

their motivation toward web-based professional development was examined. By gathering questionnaire responses from 484 in elementary school teachers in Taiwan, this study addressed the following questions:

1. What motivation toward web-based professional development do the elementary school teachers have?
2. Will the teachers' background characteristics, such as gender and age, make any difference to their motivation toward web-based professional development?
3. What are the relationships between the teachers' Internet self-efficacy and their motivation toward web-based professional development?

2. Method

2.1 Sample

According to the statistical data from Minister of Education (2008), the numbers of female teachers were more than male teachers in Taiwan. The participants of this study were randomly selected from 30 elementary schools in north region of Taiwan. The final sample included 484 Taiwanese elementary school teachers of which 151 (31.2%) were male and the remaining 333 (68.8%) were female. Among these teachers, 109 (22.5%) were less than 30-years-old, 217 (44.8%) were 31-40 years-old, 158 (32.7%) were more than 41-years-old.

2.2 Instruments

To assess the teachers' motivation toward web-based professional development, Internet self-efficacy, two instruments were implemented in this study.

The Motivation toward Web-based Professional Development Survey (MWPD) administered in this study was developed on the basis of some relevant studies (e.g., Boshier, 1991; Mulenga & Liang, 2008). As a result, the initial pool of items in the survey included a total of 36 items, which were presented by using a seven-point Likert mode (ranging from 1, "strongly disagree" to 7, "strongly agree"). Six scales were designed for MWPD. The details of the six scales are as follows:

1. Personal interest: People who score high on this scale participate in web-based professional development for its own interest. That is, they care about the inherent joy of web-based professional development that impels their participation. A sample item of this scale is "I learn for the joy of it while participating in web-based professional development".
2. Occupational promotion: People who score high on this scale participate in web-based professional development mainly because of maintaining current job or getting a new job. That is, web-based professional development is a way to advance professionally. A sample item of this scale is "I participate in web-based professional development for getting a better job".
3. External expectation: People who score high on this scale participate in web-based professional development because of the expectation from someone at work. A sample item of this scale is "I participate in web-based professional development to be influenced by colleagues' encouragement".
4. Practical enhancement: People who score high on this scale are committed to "doing good" in education. That is, they think web-based professional development helps them do good work in education. A sample item of this scale is "I participate in web-based professional development to help me acquire better instructional ways for students".
5. Social contact: People who score high on this scale participate in web-based professional development because of the joy of interacting with others. A sample item of this scale is "I participate in web-based professional development to make more friends with the same interest".
6. Social stimulation: People who score high on this scale are usually lonely or bored in regular life or teaching and they participate in web-based professional development to meet others and to grapple with problems in their social life. A sample item of this scale is "I participate in web-based professional development to take break from routines".

The second instrument of this study, the Internet Self-efficacy Survey (ISS), was implemented from Kao and Tsai's (2009). They proposed two factors of Internet self-efficacy, including a total of 16 items presented with bipolar strongly confident/strongly unconfident statements on a seven-point Likert scale. The details of the two scales are as follows:

1. Basic self-efficacy scale: measuring teachers' perceived confidence at a basic level of using the Internet, such as using Internet-related tools. That is, the higher the scores, the better basic self-efficacy toward the Internet. A sample item of this scale is "I feel confident of printing the content of a Website."

959

2. Advanced self-efficacy scale: assessing teachers' perceived confidence and self-expectations of Internet-based interaction or advanced usages of the Internet. In other words, the higher the scores, the more perceived confidence about advanced usage of the Internet. A sample item of this scale is "I feel confident of playing online games on the Internet."

2.3 Data analysis

To fulfill the main purposes of this study, factor analysis, correlation and ANOVA were conducted as the statistical methods in this study. The factor analysis was utilized to reveal the scales of the instruments on the teachers' MWPD. In addition, this study also gathered teachers' information about gender and age. By t-tests, gender differences on teachers' MWPD were analyzed. Also, the scales were examined via analysis of variance (ANOVA) to analyze age differences. Moreover, correlation analysis was utilized to examine the relationship between teachers' Internet self-efficacy (ISS) and their motivation toward web-based professional development (MWPD).

3. Results

3.1 Factor analysis

Through the factor analysis, the final version of the MWPD consisted of 29 items with six scales. The reliability coefficients for the scales respectively were 0.91 (personal interest, 5 items), 0.84 (occupational promotion, 4 items), 0.89 (external expectation, 6 items), 0.90 (practical enhancement, 5 items), 0.91 (social contact, 5 items) and 0.90 (social stimulation, 4 items). The factor loadings for the retained items are shown in Table 1. The alpha value of the whole MWPD questionnaire is 0.94 and these scales explained 75.39% of variance totally. Therefore, these scales were deemed to be sufficiently reliable for assessing teachers' motivation toward web-based professional development.

Table 1. Rotated factor loadings and Cronbach alpha values for MWPD scales

Scale	Factor 1	Factor 2	Factor 3	Factor 4	Factor 5	Factor 6
Factor 1: External expectation, α=0.893, mean=4.79, S.D.=1.27						
Expectation 1	0.820					
Expectation 2	0.821					
Expectation 3	0.611					
Expectation 4	0.852					
Expectation 5	0.682					
Expectation 6	0.682					
Factor 2: Personal interest, α=0.905, mean=6.02, S.D.=0.74						
Personal 1		0.804				
Personal 2		0.896				
Personal 3		0.674				
Personal 4		0.847				
Personal 5		0.832				
Factor 3: Social contact, α=0.905, mean=5.43, S.D.=1.09						
Social 1			0.771			
Social 2			0.814			
Social 3			0.767			
Social 4			0.649			
Social 5			0.666			
Factor 4: Practical enhancement, α=0.902, mean=5.78, S.D.=0.89						
Practical 1				0.558		
Practical 2				0.613		
Practical 3				0.837		
Practical 4				0.770		
Practical 5				0.795		
Factor 5: Occupational promotion, α=0.841, mean=5.33, S.D.=1.15						
Occupational 1					0.780	
Occupational 2					0.689	
Occupational 3					0.859	

Occupational 4				0.668	
Factor 6: Social Stimulation, α=0.900, mean=5.47, S.D.=1.26					
Stimulation 1					0.696
Stimulation 2					0.782
Stimulation 3					0.678
Stimulation 4					0.617
Percentage of variance	41.22	10.69	8.73	7.13	4.01	3.61

Overall α=0.944. Total variance explained is 75.39%

3.2 Teachers' scores on the scales

For the MWPD as shown in Table 2, teachers' mean scores on six scales of MWPD were over 4 points on a seven-point scale. Teachers attained high scores on the personal interest scale (mean=6.02), the occupational promotion scale (mean=5.33), and the external expectation scale (mean=4.79), the practical enhancement scale (mean=5.78), the social contact scale (mean=5.43) and the social stimulation scale (mean=5.47). The results indicate that the teachers tend to base on personal interest for participating web-based professional development, advance their professional ability from using web-based professional development, serve in education from using web-based professional development, meet some friends demonstrate when using web-based professional development, and change their living style while using web-based professional development. But their relatively low score on the external expectation scale (with comparatively large standard deviations) still implies that some teachers express their personal willingness to participate web-based professional development.

Table 2. Teachers' scores on the scales of MWPD and ISS surveys

Scale	Mean	SD
Internet self-efficacy		
Basic	6.61	0.61
Advanced	5.64	1.40
Motivation toward web-based professional development		
Personal interest	6.02	0.74
Occupational promotion	5.33	1.15
External expectation	4.79	1.27
Practical enhancement	5.78	0.89
Social contact	5.43	1.09
Social stimulation	5.47	1.26

Table 2 also shows that the teachers' mean scores and the standard deviations on the ISS scales. The teachers had high scores on the two ISS scales, scoring over 5 points on the seven-point scale. On average, they attained higher scores on the basic self-efficacy scale (mean=6.61) than on the advanced self-efficacy scale (mean=5.64). This result implies that the teachers in this study tended to display high confidence and expectations of using the Internet for both basic and advanced purposes, but they had comparatively higher confidence and expectations of using the Internet for basic than for advanced purposes.

3.3 Background differences on MWPD scales

In this study, t-test and ANOVA tests were employed to examine the background differences such as gender and age on the MWPD scales. First, a series of t-tests were performed on the gender differences of teachers' mean scores for the MWPD. Among the variables examined in Table 3, no significant differences were found on the scales of teachers' motivation of participating web-based professional development between two genders.

Table 3. Gender comparisons of the scales of MWPD survey

Scale	Male (mean, SD)	Female (mean, SD)	t value
Motivation toward web-based professional development			
Personal interest	6.08(0.84)	5.99(0.69)	1.30(n.s.)
Occupational promotion	5.44(1.16)	5.29(1.14)	1.32(n.s.)
External expectation	4.64(1.30)	4.85(1.25)	-1.70(n.s.)
Practical enhancement	5.78(0.92)	5.78(0.89)	-0.01(n.s.)
Social contact	5.56(1.02)	5.37(1.12)	1.76(n.s.)
Social stimulation	5.46(1.32)	5.47(1.24)	-0.05(n.s.)

Moreover, in order to compare the possible differences derived from age, we categorized the teacher respondents into three major groups: <30 years, 31-40 years, and >41 years. The ANOVA tests, presented in Table 4, indicated that age did not show any significant differences in teachers' motivation toward web-based professional development. These findings suggested that teachers across different age groups tended to possess statistically similar motivation toward web-based professional development.

Table 4. Teachers' motivation toward web-based professional development among different age groups

Age Group	(1) Less than 30 years (mean, SD)	(2) 31-40 years (mean, SD)	(3) 41+ years (mean, SD)	F(ANOVA) Scheffe Test
Motivation toward web-based professional development				
Personal interest	6.06(0.74)	6.03(0.71)	5.97(0.78)	0.53(n.s.)
Occupational promotion	5.42(1.02)	5.36(1.10)	5.25(1.29)	0.75(n.s.)
External expectation	5.08(1.23)	4.69(1.32)	4.73(1.19)	3.83(n.s.)
Practical enhancement	5.80(0.90)	5.74(0.93)	5.85(0.82)	0.74(n.s.)
Social contact	5.52(0.96)	5.40(1.13)	5.42(1.13)	0.48(n.s.)
Social stimulation	5.59(1.17)	5.38(1.33)	5.51(1.22)	1.11(n.s.)

3.4 Correlation motivation toward web-based professional development and Internet self-efficacy

The Pearson correlation coefficients shown in Table 5 indicated that the scales of the MWPD and the ISS were significantly positively correlated with each other ($r>0.12$, $p <0.01$), except the result that no statistical correlation was found between ISS and external expectation. These results in general, supported that teachers expressing higher Internet self-efficacy would display stronger intention to learn for their own interest, to make occupational promotion, to enhance teaching practice, to make more social contact, to adapt social stimulation toward web-based professional development. In particular, teachers' responses on the occupational promotion, social contact and social stimulation scales were relatively more highly correlated with those on the advanced self-efficacy scale ($r=0.32$, $p <0.001$). This implied that higher advanced Internet self-efficacy may help the teachers attain higher motivation of web-based professional development particularly for promoting occupational status and creating social interactions.

Table 5. Correlation of the teachers' motivation toward web-based professional development, Internet self-efficacy and the beliefs about web-based learning

	Personal interest	Occupational promotion	External expectation	Practical enhancement	Social contact	Social stimulation
Basic self-efficacy	0.23***	0.12**	-0.06	0.12**	0.14**	0.12**
Advanced self-efficacy	0.19***	0.35***	0.11	0.24***	0.34***	0.32***

** $p < 0.01$. *** $p < 0.001$.

4. Discussion and Conclusion

This study aimed to explore elementary school teachers' motivation toward web-based professional development. To this end, a questionnaire to assess teachers' motivation toward web-based professional development (i.e., the MWPD) was developed in this study. The results showed that the MWPD developed in this study was sufficiently reliable to assess elementary school teachers' motivation toward web-based professional development.

Gender and age differences in motivational issues have always been highlighted by researchers (e.g., Chouinard, Karsenti & Roy, 2007; Meece, Glienke & Burg, 2006; Steinmayr & Spinath, 2008). Conducted in conventional learning contexts, previous research concerning gender differences in motivation, in general, has shown that male students' had higher learning motivation than female students (Corpus & Lepper, 2007; Warburton & Spray, 2008). However, in this study, with the MWPD, no gender difference in teachers' motivation on web-based professional development was found. It seems that both male and female teachers perceived similar levels of motivation toward web-based professional development. In particular, as revealed by their high scores on MWPD, both male and female teachers may tend to view their personal interests and the enhancement of teaching practice as the major reasons to attend web-based professional development. In other words, many of them, either male or female teachers, were driven by their personal desire and the enrichment of instructional practice while participating in web-based professional development.

Besides, this study revealed that the teachers' motivation toward web-based professional development were not significantly different across ages. And the result is consistent with the perspective proposed by Mulenga and Liang (2008) that age had no significant on adult learners' motivation for distance education. It seemed that younger and older teachers expressed similar motivation toward web-based professional development.

This study also demonstrated that the teachers' Internet self-efficacy was positively correlated with their motivation toward web-based professional development. Teachers with higher Internet self-efficacy would express better motivation of personal interest, occupational promotion, practical enhancement, social contact and social stimulation for web-based professional development. It suggests that, to improve teachers' motivation toward web-based professional development, teachers' Internet self-efficacy should be highlighted.

In addition, researchers have proposed that the positive effects of training programs on learners' self-efficacy regarding the Internet (Lagana, 2008; Markauskaite, 2007). The results probably suggest that educators should try to find some effective ways to improve teachers' Internet-related capabilities and practicing relevant tools in the Internet-based environments. It may be practicable for educators to enhance teachers' Internet self-efficacy by utilizing useful training programs.

This study is quite helpful to facilitate the understanding of teachers' motivation toward web-based professional development. By using the MWPD questionnaire, educators and researchers can assess and review teachers' motivation toward web-based professional development in a more effective way, with possibly higher validity.

Factors Affecting Kindergarten Learning and Teaching in Hong Kong:
A Multiple Case Study
Wai Ling Chan

Department of Early Childhood Education, The Hong Kong Institute of Education.

Introduction

Teachers internationally are faced with the challenge of implementing educational reforms and adopting new teaching approaches. Teachers in Hong Kong's pre-primary institutions are no exception. In addition to dealing with the new quality-assurance mechanism introduced by the government, they are also adopting new educational approaches to attain high-quality learning and teaching.

Some research suggests that pre-primary educational quality is closely related to teachers' educational and professional backgrounds (National Research Council, 2001; Oden, Schweinhart, & Weikart, 2000; Phillips, Mekos, Scarr, McCartney, & Abbott-Shim, 2000; Whitebook, Sakai, Gerber, & Howes, 2001). Teachers with higher levels of education have been shown to facilitate positive short- and long-term achievements in children (Kontos & Wilcox-Herzog, 2001). Documents published by the Hong Kong Education Commission (1998) demonstrate that quality teachers and effective school management are the prerequisites of quality education (Rao & Koong, 2000).

Whitebook (2003a) averred that professionalism among principals strengthens teachers' abilities, and positive reactions from parents instill confidence in those abilities. When teachers have greater confidence, they are more effective, and children are more likely to learn. Further, when teachers are more knowledgeable about the concepts and practice of pre-primary education, they use fewer traditional teaching methods. In fact, research suggests that teachers' academic and professional preparation is key to quality pre-primary education (Curriculum Development Institute, 1996, 2006; Rao, 2002; Rao & Koong, 2000, 2003).

Learning and Teaching in Hong Kong Kindergartens

The quality of Hong Kong's pre-primary education is primarily monitored by government authorities, who provide curriculum guidance and conduct annual inspections. The government began to promote Kindergarten Quality Assurance Inspections enthusiastically in 2000, when it established performance indicators for these institutions. Kindergartens have adopted different teaching approaches to raise their level of competitiveness and teaching quality, although many of them have adopted the Thematic Approach promoted in the 1984 Guide to the Kindergarten Curriculum. Others make use of the Project Approach, which is also very popular in Taiwan and mainland China, and puts emphasis on "how children learn" rather than "how teachers teach."

Although the Hong Kong Education Bureau's (EDB) 2005/06 quality-assurance inspection report indicated that, of the 35 kindergartens assessed, the majority were actively implementing new teaching approaches, then-Permanent Secretary of Education Fanny Law (2006) stated that half failed to understand the self-assessment concept being promoted by the government. In the 2006/07 report, the overall performance of 40% of the kindergartens was found to be unsatisfactory. Many of the schools were found to be overly reliant on traditional modes of teaching. Some were criticized for overly difficult and age-inappropriate curricula and a lack of teacher training and monitoring, and few allocated time for activities, such as music and physical exercise, that would support the all-round growth and development of children (EDB, 2007). Most of the institutions emphasize children's learning outcomes on the basis of academic achievement, which reflects difference in quality assessment standards in Chinese and Western education.

Influence of Teacher Beliefs and Training on Learning and Teaching

Many research studies have shown that teachers' knowledge, beliefs, values and interests affect the decisions they make about teaching programs and approaches and that their concepts of reality influence their professional thinking (Roopnarine and Johnson, 1993; Eisehart *et al.*, 1989; Clark & Peterson, 1986; Spodek, 1991). At the same time, teachers' qualifications have been found to be

strongly related to child outcomes, as teachers with more training have more time to interact with children and engage in more varied teaching activities (Ruopp *et al*., 1979). Abbott-Shim *et al*. (2002) demonstrated that teachers with a lower educational level held inappropriate beliefs, thus leading to inappropriate teaching approaches. Teacher training therefore has an indirect effect on educational quality through teacher beliefs. Western ideas on teacher training hold that highly qualified teachers create a high-quality classroom environment (DOE, 2004), and many curriculum advocates believe that the ability of a curriculum to exert a positive influence on children depends primarily on teachers' qualifications. Therefore, in recent years, increasing numbers of pre-primary education advocates, such as Barnett (2003), Barnett *et al*. (2005), the National Research Council (2001), and Trust for Early Education (2004), have requested that teachers of children aged three and four possess at least a Bachelor's degree with a major in pre-primary education. There is also some indication that Hong Kong's pre-primary educators are striving to upgrade teachers' qualifications, although at present the EDB only encourages principals to possess a Bachelor's degree.

In terms of international trends, a report by Early *et al*. (2006) shows that many public kindergartens have followed the suggestion that teachers gain higher-level qualifications. According to research from the National Institute for Early Education (Barnett *et al*., 2005), of the 38 U.S. states that have pre-primary programs, 17 of them require all kindergarten teachers to possess a Bachelor's degree, and 12 of them require at least some of their teachers to do so. Research indicates that there is a relationship between teacher qualifications and (i) classroom quality and (ii) children's learning outcomes (Burchinal *et al*., 2002; de Kruif *et al*., 2000; Howes *et al*., 1992; NICHD ECCRN, 2002b; Scarr *et al*., 1994). On the basis of this research, it appears that if the aim of an educational program is to improve children's learning outcomes, then improving teachers' qualifications seems a suitable starting point.

In the present qualitative study, the beliefs of teachers and principals with varying levels of qualifications at Hong Kong kindergartens of different degrees of quality were explored through interviews and document analysis. The training received by the principals and teachers involved is shown in Tables 1 and 2, respectively.

Table 1: Training Received by the Three Principals

School A Principal 1(P1)	School B Principal 2(P2)	School C Principal 3 (P3)
1987 QKT	1986 QKT	1988 QKT

2006 start CE training (part-time)	2004 start CE training (part-time)	2003 Higher Diploma (part-time)		

Methods

Data Collection Procedures

i)   Three principals and five teachers were interviewed (Appendices 1-2) to determine the teaching conditions, teacher beliefs, and factors affecting teaching, and the interviews were recorded and transcribed.

ii)　　Teacher beliefs were assessed using 25 statements about behavior, ranked on a five-point Likert-type scale ranging from 1 (never) to 5 (all of the time).

iii)　　Questionnaires (Appendix 3) were distributed to the teachers to obtain information about their teaching beliefs and the factors affecting their teaching.

iv)　　Classes covering the same theme, "the Green Lawn," were observed for three hours each day on three consecutive days in each school.

Participants

The participants were five kindergarten teachers (T1 and T1a from School A, T2 and T2a from School B, and T3 from School 3), the three principals of these schools (P1, P2, and P3), and 79 K2 students (aged 4-5).

<center>Results</center>

Questionnaires on Teacher Beliefs

The findings from the questionnaire show the beliefs of the teachers to be very similar, as can be seen from Table 3. The three items receiving the highest scores show that the teachers in all three schools agreed that learning should be fun, that children should learn through games, and that learning should match the individual needs of the child.

Table 3:　Teacher Beliefs in the Three Schools

	School A	School B	School C	Mean	Std. Dev.
1. All children are able to learn.	4.14	4.67	4.10	4.27	0.94
2 Children should be treated equally, as a matter of justice.	4.93	5.00	4.70	4.88	0.42
3. Activities should be systematically adjusted to accommodate children's needs and interests.	4.93	4.22	4.80	4.70	0.64
4 . Children should be given praise and recognition for what they have learned.	4.86	4.56	4.60	4.70	0.81
5. Children will be successful in exercises and problem-solving if they obtain adult help.	4.57	3.11	3.50	3.85	1.12
6. Children have the self-motivation to learn.	4.43	4.00	4.20	4.24	0.87
7. Teachers should impose an integrated early childhood curriculum, instead of a subject-divided curriculum.	4.23	4.22	4.33	4.26	0.86
8. Teachers should cultivate the inner aspirations of children and not enforce too many limitations and physical obstacles on them.	4.29	4.44	4.60	4.42	0.87
9. Teachers are guides and arrangers, not instructors, in the classroom.	4.29	3.44	4.20	4.03	1.13
10. Teachers should be responsible for both what is and isn't learnt by children in the classroom.	4.00	3.89	3.60	3.85	0.87
11. The curriculum should be chosen by the child, rather than imposed by the teacher.	3.50	3.89	3.60	3.64	0.90
12. Children should be respected as individuals who can decide and learn independently.	4.71	3.89	4.20	4.33	0.82
13. Learning should be fun.	4.93	4.22	4.90	4.73	0.80
14. Children learn best when their physical needs are satisfied and they feel safe.	4.71	4.38	4.00	4.41	0.84
15. Children learn through social interaction with other adults and other children.	4.71	4.67	4.60	4.67	0.78
16. Children are able to learn through play.	5.00	4.67	4.70	4.82	0.64
17. Children's interests and curiosity can be the motivation for their learning.	4.79	4.44	4.40	4.58	0.75
18.The curriculum should promote interactive learning and constructive knowledge.	4.71	4.56	4.67	4.66	0.70
19. Lessons should be meaningful for children	4.71	4.67	4.50	4.64	0.74
20. Lessons should be relevant to children's lives	4.71	4.33	4.50	4.55	0.87
21. Lessons should be of interest to the children and the teacher.	4.71	4.44	4.70	4.64	0.82
22. Lessons should be based on the current knowledge and ability of the children.	4.21	4.56	4.50	4.39	0.83
23. Lessons should encourage active learning and allow children to make meaningful choices.	4.57	4.67	4.50	4.58	0.75

24. Lessons should foster children's exploration and inquiry, rather than focusing on "right" answers and "right" ways to complete a task.	4.50	4.78	4.30	4.52	0.76
25. Lessons should promote the development of higher abilities, such as thinking, reasoning, problem-solving, and decision-making.	4.50	4.67	4.40	4.52	0.83

Interviews Results on Teacher Beliefs

In line with their answers to the questionnaire, the interviews with the teachers revealed that they all believed that children learn through play and that learning should be fun, with several of them stating that these are the goals of their classrooms. The teachers also emphasized encouragement and the provision of "warmth and love." However, the questionnaire indicated that only T1 and T2 were able to put their beliefs into practice. For example, the mean score of the three schools for the question "children learn through social interaction with adults and other children" was 4.67, with an SD of 0.78. T1's interview responses match this belief better than those of the other teachers:

> *The interaction among children and the teaching approach adopted by teachers are very important . . . . As we only have 19 children and 2 teachers, the teacher-student ratio is satisfactory, and we can frequently use interactive supervision.*

In discussing the curriculum, T1 highlighted that innovation is key:

> *I use concrete materials to stimulate children's senses, and it's easy to get them to participate in the learning. When children are interested in a topic, they will learn naturally. The use of concrete materials helps children to perceive abstract concepts easily.*

> *I think that the experience of children consists of what they have done, including their success and failure. It is very important for children to acquire problem-solving ability through settling things by themselves during group activities.*

T1 also talked about the importance of incorporating Developmentally Appropriate Practice (DAP) into her curriculum, and spoke of the importance of free play in pre-primary education because "that's how they [children] learn, through play." She also emphasized that play is important in the socialization process. When asked why she had chosen a family role play game for a certain topic, her answer was "Because the children like that!" This is indeed vital: children's interest is the key point of consideration, and teachers should therefore respect children's personal interests.

The interview with T2 also indicated that she managed to put the beliefs she indicated in the questionnaire into practice in the classroom. For example, in response to the question, "You should compliment and recognize the outcomes of children's learning," she agreed:

> *If the children have done something good, then we should praise them, as it can encourage them to improve . . . .*

T2 also stated that her school has adopted the Project Approach, which she believes allows her to better cater to children's individual needs. This approach also allows her to ask the children questions rather than telling them answers and facilitates the incorporation of activities that actively engage the children more effectively than traditional approaches. She explained:

> *As children are not robots, their learning speeds are different. The children with lower learning abilities are given some extra help. This enables them to catch up with their peers in the learning process. In this way, children can learn together and this is the aim of education.*

> *[In] project learning, I focus on asking children questions, instead of telling them the answers. This method is more open to feedback from children.*

> Children are assigned different roles. Some of them are responsible for designing, whereas others are responsible for making teaching materials. Also, after the group work, we go out and sing. Children have to alternate between musical instruments during the activities.

The classroom observations in Schools A and B support the assertions of these teachers that they are putting their beliefs into practice in the classroom. However, it is clear that teachers' stated beliefs are sometimes in conflict with their practice. For instance, T3 said she believes that children should learn through play, but in practice the activities she arranged were very boring. She offered the following explanation.

> We barely have time to teach and explain in the lesson . . . When we find that children are interested in a topic, we further elaborate our teaching on that topic.

> How can we put all the content of a textbook into our curriculum? Sometimes, we may supplement certain additional content in our teaching. However, we don't have enough time to teach, as there are so many holidays over the year.

Further, although T3 stated that she believes small-group teaching to be more effective, in practice she teaches using the whole-group mode. She considers herself to fulfill the role of "teacher" most of the time, and believes instruction to be very important:

> The children are still young; they will mess things up if they have only been provided with direction but no instruction. For example, when they are told to line up, they tend to fall over one another, huddle together, and complain about each other.

It was observed that T3 did not convey a sense of enthusiasm in carrying out her tasks. Nor did she adjust to the behavior of individual children, which is important in effectively communicating with young children.

Principals' Beliefs about Learning and Teaching

In the interviews, both P1 and P2 elaborated on their teaching beliefs, with P1 emphasizing that she takes a firm stand on the teaching beliefs that should be put into practice. She said:

> The EDB appreciates our insistence on our teaching beliefs, as we do not follow trends aimlessly. This insistence allows us to take a diversified thematic approach that involves children, parents, and teachers.

P1 has led her school, School A, in implementing the Thematic Approach and reminds the teachers not only to teach the children to read, write, and calculate, but also to let them play wholeheartedly and freely and try to reach their teaching targets through games. An important component of the Thematic Approach is the establishment of "learning corners," and P1 asks the teachers to supplement the materials in these corners frequently, thus enabling children to learn from them. Teachers are encouraged to gradually reduce the amount of direct teaching they do and increase the time the children spend in these corners.

P1 is certain that corner learning cultivates and integrates children's abilities and can satisfy children's demand for wide and deep learning. She stated that a well designed and richly arranged corner can provide children with basic and balanced learning. P1 believes that children's experience and interaction with one another and the teaching approach adopted by the teachers are both very important.

The interview with P2 focused on better understanding the reasons for the improvement in teaching performance, as assessed by the EDB, that has been realized in her school, School B. She thought the two main reasons for the improvement were the implementation and promotion of professional and school-based training and greater parental involvement. To improve management and organization, the school has established working plans, carried out self-evaluations, and arranged more training for teachers. P2 believes in the importance of continuing improvement and professional knowledge, and so she began studying for a Bachelor of Education (Early Childhood Education) (BEd (ECE)). She has also arranged for the teachers to visit local and foreign schools to learn more about the methods of the Project Approach, which the kindergarten has adopted, and has held related seminars for the teachers. She also emphasizes class observation and encourages the teachers to further their own education.

In line with the tenets of the Project Approach, P2 regularly visits the parents to discuss their children's learning and invites them to participate in project activities each month. Through these endeavors, many of the parents have gradually accepted the school's new teaching and learning approach.

The interview with P3, in contrast, highlighted some of the difficulties already witnessed in the interview with T3 from the same school, School C. When asked about her view of DAP, she admitted that she did not know what it was. This answer was somewhat surprising, as it is now one of the fundamental theories of pre-primary education, but it serves to explicate the aforementioned gap between teaching beliefs and practice in this school, as well as why its teachers tend to stick to traditional teaching methods.

Classroom Observation
In general, the teachers in the three schools hold similar beliefs (Table 3). In the questionnaire, the teachers from School C stated that they believed children should learn from games and should have a happy learning experience. However, their practice did not reflect this. T3 said she believes that she needs to use concrete materials to teach, but she did not actually do so. This does not mean that she does not hold this belief, merely that she could not actualize it. Alternatively, it may be that what she said did not reflect what she actually believes.

Of the three teachers, T1 and T2 showed some consistency between words and behavior, whereas T3 showed varying degrees of contradiction between theory and practice in all of the classroom observations. T1 and T2 spoke of the importance of professional development, of being lifelong learners, and stated that this was part of their career path as teachers. However, there was a difference between their stated beliefs and their classroom practices. Li (2004) noted that kindergarten teachers in Hong Kong who have received in-service training are often criticized for being unable to put theories into practice. She said she believe that teachers in pre-primary education place too much emphasis on teaching and discipline during lessons and that they neglect learning, which should be seen as integral.

In the nine lessons that the researcher observed in the current study, all three teachers used whole-class teaching much of the time. The other common activity witnessed was that they put the children into small groups to finish tasks. During the whole-class teaching, children could ask or answer questions only upon the teacher's instruction or approval. However, T1 and T2 did put more emphasis on encouraging children to cooperate with their peers when they carried out the tasks in groups.

T2 put more effort into preparing the teaching materials than did T3, and used authentic objects, posters, and picture cards. She also provided a greater variety of materials. Whereas T3 mostly used pictures from the textbook, for example, T2 used pictures from other sources, such as magazines and self-prepared materials. T2 said she believes that using authentic objects motivates children, and she claimed to have evidence of this from the children's responses, which further supported and consolidated her belief. According to the personal belief system of Kindsvatter *et al.* (1998), this implies that T2 constantly examined her professional belief as an on-going procedure.

At the time of the study, School C had no visual displays, and the researcher witnessed virtually no dramatic play or constructions centered on the topic being studied. The classroom environment was very teacher-directed, with limited learner autonomy. T3 demonstrated the greatest dissonance between belief and practice in the areas of teacher control and classroom management. Not only did teacher-directed activities predominate in all of the classroom observations, but the teacher-child interaction was inappropriate.

It was observed throughout the lessons that T3 failed to put her beliefs into practice. She frequently asked open questions and always read directly from the textbook, and she urged the children to memorize by repeating what she told them. These examples show that T3's purported belief that "children learn through play" did not inform her practice. Another problem was that not all of the children performed the tasks cooperatively, and many did not do them as expected. T3 played the role of knowledge transmitter, and failed to provide opportunities for the children to learn through exploration and inquiry. As it was also her belief that children need to practice more to learn, she gave them additional exercises to do. T3 stated that if she did not bring authentic objects to use as teaching materials during class, then the children might be bored. However, she failed to bring any such objects to class during the lessons observed.

All in all, the evidence from the nine observed lessons reveals that T3 did not use the same teaching approach as the teachers from the other two schools. Her belief statements indicated a superficially stronger commitment to appropriate practice than did her actual behavior in the classroom, which leaned more toward a traditional or didactic approach to the curriculum. Much of what T3 discussed as being important and relevant, or what she ranked as being extremely important in the beliefs questionnaire, was contradicted by what was actually observed in her classroom.

Discussion

The results of the interviews show that the teachers in all three schools have "ideal" teaching beliefs, in that they hope the children will learn in a good environment. The interviews also revealed that the teachers place great emphasis on interaction between children and teachers and on paying attention to individual needs and the learning environment. It is clear that they believe the teacher's role is to design the environment and encourage children to learn by arranging discovery and exploration activities, that is, by allowing the children to learn through play. The class observations revealed that T1 and T2 came closest to designing activities that accorded with their beliefs, and these teachers encouraged and allowed the children to learn happily by interacting with them. Schools A and B both achieved the target of a good level of interaction between teachers and children, but there was little such interaction in School C. Although the teachers there exhibited conscientious attitudes, they rarely smiled. As noted above, with the opinions expressed by T3 in the interview differed completely from her classroom performance. She had a positive belief in theory, but in practice made the children engage in repetitive practice, repetitive learning, and didactic rote learning. She usually took up the traditional "teacher" role by asking the children to be obedient and follow the rules, and she did not allow them to talk in class. It is very clear from her example that teachers' performance affects the teaching quality of a school.

The interviews with the three principals revealed them to hold different beliefs and play different roles in the implementation of teaching approaches. P1 and P2 stressed that children should learn freely from games, and stated the importance of the arrangement of the environment and materials and of interaction between teachers and children. P2 believes strongly in boosting parental participation, and holds that teacher training can improve both learning and teaching. P3 was found to have no knowledge of DAP and to only follow the theoretical perspectives of the school; she also complained that the teachers do not use authentic materials during class.

T1 and T1a expressed clear teaching beliefs. They believe that they should compliment the children, that curriculum and activity design should be innovative, and that they should have an open attitude toward the children, use real and concrete teaching tools to allow children to learn, and build up children's problem-solving skills. They placed great emphasis on DAP, and agreed with their principal's opinion that they should arrange different learning corners in which the children could explore their own interests. They expressed satisfaction with the process and outcomes of the Thematic Approach. T1 further stated that it is important to accept children, and that teachers should show patience, love, and attentiveness toward them. T2 expressed very similar teaching beliefs and also stressed that children should not be given too many limitations, but should be provided with a safe environment.

The findings of this study show a close relationship between effective classrooms and teachers' teaching beliefs. The formation of these beliefs and the practical conditions that teachers create in the classroom were, in turn, found to be connected with professional training, which gives teachers different levels of knowledge. This finding is supported by the work of Shulman (1986), who posits that there are three aspects of teachers' basic knowledge that are important in the education process: their understanding of thematic content, their teaching approach, and the programs that they devise.

In addition to these three aspects, Beattie (1995) includes a fourth category, "personal practical knowledge," which is the knowledge that teachers gain from their professional experience, such as understanding children's learning modes, interests, needs, strengths, and difficulties, and their own teaching and lesson management skills. Elbaz (1983) points out that practical knowledge is, however, "informed by teachers' theoretical knowledge of subject matter and of areas such as child development, learning and social theory" (p. 5).

Teaching theory and belief, which are the main components of teachers' basic knowledge, directly affect their ability to understand, manage, and use information (Clark and Peterson, 1986; Munby,

1982) and represent "a set of conceptual representations which signify to its holder a reality or given state of affairs of sufficient validity, truth or trustworthiness to warrant reliance upon it as a guide to personal thought and action" (Harvey, 1986, p. 660).

Attaining a higher educational level helps pre-primary teachers to implement quality education programs. For example, teachers with a better educational background can often provide children with easy and understandable guidance and introduce novel, non-repetitive, and high-level activities (de Kruif *et al.*, 2000) to encourage children to participate on their own initiative in activities that can promote their social and linguistic development and their intelligence (Howes, 1997; Bowman, 2000). Teachers who have completed an early childhood teacher education program will not only possess a certain degree of knowledge about appropriate teaching approaches and child development, but will also know how to implement developmentally appropriate practices to help children develop their basic knowledge and skills (Helburn *et al.*, 1995; Kontos & Wilcox-Herzog, 2001).

Few of the teachers from School C had had the chance to attend a CE (KG) course, and this situation is likely to be reflected across kindergartens in Hong Kong, many of which are still unable to fully utilize the further education allowances given to teachers every year under the government's Voucher Scheme. Kindergartens need to make appropriate use of subsidies for school-based training to improve their teaching quality. In addition, it is hoped that the government, in addition to devising policies to improve the professional qualifications of principals and teachers, should also pay attention to the situation of training quota provision.

While such teachers are waiting to enroll in a further education course, their personal training and sense of self-value need to be strengthened. For example, it was discovered in the interview with T1 that she has been waiting for eight years for the chance to enter the CE (KG) program at her own expense. However, in the meantime, she has received support from P1, who has provided a working environment that allows teachers to develop fully. P1 also emphasizes teachers' experience, and encouraged teachers to develop a greater interest in teaching. It can thus be concluded that formal teacher training and the school-based training provided by principals are equally important.

Recommendations

The Voucher System currently implemented by the government eases the economic burden of parents to a certain extent, and it also increases opportunities for teachers to engage in further education. The system has also reduced the waiting time for admission to CE(KG) programs for teachers. Since 2007, the system has provided only a four-year professional teacher training subsidy, and only a portion of the vouchers' face value goes toward supporting the professional development of principals and teachers. However, starting with the 2011-2012 academic year, their entire face value will be used to subsidize tuition fees for teachers. As has been discussed, improved professional training helps teachers to develop appropriate teaching beliefs and practices, and yet the government provides only a four-year subsidy for further education at present. Oden *et al.* (2000) found that early childhood teachers with four-year degrees were better able to articulate their beliefs about their practices with young children and were twice as likely to provide "cognitively focused" rationales for their curriculum choices than teachers with less education. Similarly, Doherty *et al.* (2000) found in their study of Canadian child care that the highest level of education "in any subject" was directly related to the quality of care in the providers they studied. Hooks *et al.* (2006) further pointed out that "research does indicate that professional preparation is important – teachers with degrees and specialized training do provide higher quality early education experiences for children" (p.400).

It is doubtful whether a mere four years will allow sufficient on-the-job training to raise all teachers up to CE(KG) standard. The government suggests setting the minimum entry requirement for kindergarten teachers at the diploma level, but this requirement is far lower than the entry requirement for primary and secondary school teachers. Many studies have shown that children of 0-8 years old are in the "budding" stage of learning, yet the government is treating pre-primary as the "less-loved daughter." The government should thus consider extending the period of subsidy so that teachers can be subsidized with vouchers for longer, or it should set up other further education funds for in-service teachers.

At the same time, the government must also increase its funding to pre-primary teacher training institutions so that they can increase their quotas. Although the government has pledged to provide at

least 1,000 subsidized places on CE courses and suggests that all newly admitted principals should hold a Bachelor of Education (Honors) (Early Childhood Education) degree by 2011-2012, the professional upgrading and recognition of teachers should still be allocated more resources to improve the quality of pre-primary education. The professed aim of the government in implementing the Voucher System is to improve the quality of pre-primary education, and yet it sets the target qualification of kindergarten teachers only at the diploma level. On the one hand, the government demands high-quality education, but, on the other hand, it will commit to only four years' worth of money. This seems unreasonable. The government should confirm the requirement that teachers of pre-primary education possess a Bachelor's degree in line with the requirements for primary- and secondary-school teachers, and should treat all teachers within the education system alike. Research, including this study, has indicated that the education of pre-primary teachers significantly affects the quality of early childhood programs (Cost, Quality and Outcomes Study Team, 1995; NICHD, 2003).

Assessment using young children portfolio: A case study in Hong Kong preschools

Ms. Wai Man Leung

Yuk-ching LAI

Joyce HO

The Hong Kong Institute of Education/Lecturer

Abstract

Educators, professionals and parents emphasized the promotion of young children's learning and development, in particular, the competence of children and their ability to make meaning out of their learning experiences (Herbert, 2001). Therefore, a call for change in the education evaluation system: from a testing culture to an assessment culture (Struyven, Dochy, Janssens, Schelfhout, & Gielen, 2006). Hence, portfolio assessment of children at preschools has become increasingly prominent in the last 20 years for providing multi-dimensional assessments of young children in their environmental context for emphasizing their strengths instead of deficits (Vacc, & Ritter, 1995).

Starting from 2006, the Education Bureau (EDB) (former called Education and Manpower Bureau) of the Hong Kong encouraged preschools to use portfolio assessment to keep track of young children's development and growth (EMB, 2006). The aim of this paper is to share the teachers and parents of young children the experiences of how to implement a special project on children portfolio in three preschools managed by a charity organisation. By participating in designed activities, the development and learning of young children could be enhanced. The teaching effectiveness of early childhood teachers could be promoted. The parents of young children could benefit the knowledge and skills of educating their children's development and learning.

Quality of life and motivational issues for Asian medical students studying in New Zealand

Quality of life and motivational issues for Asian medical students studying in New Zealand

Marcus Henning, Susan Hawken, Jessica Zhao, Christian Krägeloh

Abstract

There is a dearth of research into the links between quality of life and motivation with respect to Asian medical students.

This study surveyed 4th and 5th year medical students and utilised the abbreviated versions of the World Health Organization Quality of Life questionnaire and the Motivated Study for Learning Questionnaire. Multivariate statistics were incorporated to consider the intertwining connections between these dependent variables and demographic variables including gender, enrolment status (international versus domestic), year of study, and age.

The paper considers the findings and the implications for quality of life, medical education and the Asian student community. The conclusions and discussion will have definite relevance for this conference theme of 'Local Problems, Global Solutions?'

Introduction

According to the New Zealand 2006 census (Statistics New Zealand, 2007), the ten most cited ethnicities in New Zealand were New Zealand European, Māori, New Zealander, Chinese, Samoan, Indian, Cook Islands Māori, Tongan, English, and Korean. The New Zealand population profile indicates a multi-ethnic and multi-cultural society. The New Zealand European grouping (67.6 %) accounts for the largest proportion of the New Zealand population, followed by Mäori (14.6 %), Asian (9.2 %), Pacific peoples (6.9 %), and other ethnicity (11.2 %) (Statistics New Zealand, 2007).

Asian students (e.g., Chinese, Korean, South East Asian, Indian, and Japanese) tend to be considered as high achievers (Kember, 2000; Ng, 2003). In New Zealand, the census statistics indicate that 32% of the Asian group had post-secondary qualifications and 16% of the Asian group achieved a bachelor degree qualification (Statistics New Zealand, 2006). Furthermore, a large proportion of medical students are from an Asian background. Fitzjohn, Wilkinson, Gill and Mulder (2003) indicated that, in the Auckland Medical School, 30.5% of medical students were Asian and more recent anecdotal statistics show this proportion is increasing, as it is in the USA (Akins, 2007).

The Asian student population is comprised of both domestic and international students. Each student group is likely to have their unique needs and characteristics. International students comprise a significant proportion of the Asian medical cohort (Fitzjohn et al., 2003). Sam (2001) found that Asian international students, studying in Norway, expressed themselves as having low satisfaction with life. Lack of meaningful social networks and social support systems contributed to this perception, as well as experiencing racial discrimination. In more general terms, domestic and international Asian students also have a strong sense of being a part of a collectivist culture and are likely to experience a lack of perceived control over their experiences in the host country (Sastry & Ross, 1998).

Furthermore, there are numerous studies reviewing and investigating the study-related experiences of Asian students both domestic and international (Holmes, 2005; Kanagawa, Cross, & Markus, 2001; Kember, 2000; Leung, 2002; Yip & Chung, 2005). For example, in a study of Asian students in Hong Kong, Yip and Chung (2005) found student perceptual differences between high achievers and low achievers in the university environment in terms of concentration and motivation. A more in-depth New Zealand experiential study was conducted by Holmes (2005), who explored the learning experiences of an ethnic Chinese population that came from China, Hong Kong, Malaysia, and Taiwan. Holmes suggested that the Chinese student group, inherently influenced by their Confucian heritage, differed from their New Zealand student counterparts in terms of communication practices and expectations about classroom etiquette. They, thus, revealed behaviours and perceptions that were interpreted as placing a high value on education and a strong belief in effort and willpower. The student group also appeared to have strong systems in place to enhance memorization and rote learning. Other studies, have also suggested that Asian students appear to emphasize a need for understanding material being taught (Kember, 2000). Consequently, Asian students often embrace a deficit model of learning whereby they consider things they do not know and consider how these aspects of learning could be improved (Kanagawa, Cross, & Markus, 2001; Leung, 2002).

Holmes (2005) also reported that Asian students are pro-active but quiet in the classroom environment. They tend to form study groups and networks outside the lecture theatres. Leung (2002) also revealed that Asian students reported that they have a low sense of confidence and interest in their studies, which is related to their notions of modesty and humility. Moreover, Holmes' (2005) suggested that Asian students have a collective sense of self and embrace notions of loss of face, silence, and harmony. This learning praxis is manifested in terms of passivity and attentiveness to what is being taught.

Issues linked with the notion of quality of life amongst medical students have been well documented (Gupchup, Borrego, & Konduri, 2004; Mitmansgruber, Becka, Höfera, & Schüßlera, 2009; Robotham & Julian, 2006; Ross, Cleland, & Macleod, 2006; Srivastava et al., 2007). In addition, aspects of motivation amongst medical students have been documented (Pelaccia et al., 2009). The need for universities to measure quality of teaching and learning in the medical environment is paramount (Hays, 2007). Nonetheless, within this area of research, the Asian medical student cohort has not been investigated in any depth.

In reviewing the literature on Asian medical students' motivation, very few studies were located. Nevertheless, many Asian medical students follow medicine as a career choice as a response to parental expectations and these expectations, especially for international students, may be linked to status orientations and residency options in host countries (Dundes, Cho, & Kwak, 2009). Interview data presented in a pilot study suggested that Asian American students tend to study medicine because it relates to their parents' ideal of academic achievement and was part of a family tradition (Akins, 2007). There is, thus, suggestion of a strong external locus of control in terms of motivating medical students to learn.

The aim of the present paper is to explore the relationships between motivation, and quality of life with respect to the Asian medical student context. The conclusions and discussion will have definite relevance for this conference theme of 'Local Problems, Global Solutions?'

METHOD

Participants

A larger study involving 274 medical student participants (out of 344) completed the questionnaires, generating a response rate of 80%. From this sample pool, this study examined the responses of 97 self-identified Asian participants (51 female, 46 male) who voluntarily participated in the study. The average age of the sample was 22.00 years (SD = 1.43). The sample comprised of self-selected volunteers chosen from two clinical years (65 from 4th year, 32 from 5th year), comprising both international and domestic students (40 international, 57 domestic).

Procedure

This correlational study was conducted during Semester 1, 2009. Students were asked to fill in a demographic survey, the Australian version of the World Health Organization-BREF questionnaire (WHOQOL-BREF) (Murphy, Herrman, Hawthorne, Pinzone, & Evert, 2000) and a shortened version of the Motivated Strategies for Learning Questionnaire or MSLQ (Pintrich & De Groot, 1990). The students were requested to fill in the questionnaires in classroom environments and collection of data occurred directly after class time. The researcher, and three assistants, collected participants' completed questionnaires.

Measures

Three main measures were incorporated into the study design, namely background details, WHOQOL-BREF, and MSLQ data.

The demographic survey included for this paper related to:

1. Year of study
2. Student status (Domestic; International)
3. Age
4. Gender

The Australian version of the WHOQOL-BREF is an abbreviated version of the WHOQOL-100 (WHOQOL-Group, 1998). The WHOQOL-BREF has 26 items, which includes two global items about health-related quality of life and 24 items relating to four domains (physical, psychological, environmental, and social quality of life). The physical domain has 7 items, psychological well-being 6 items, social relationships 3 items, and environment 8 items. The respondents rate the items using a 5-point Likert interval scale and the temporal frame of reference is within the last two weeks. Three of the 26 items are reverse coded, and a low rating towards 1 suggests a negative evaluations and a high rating towards 5 indicate a more positive perception of quality of life.

An earlier version of the MSLQ (Pintrich & De Groot, 1990) was considered appropriate for this study. This version has 44 items and five sub-domains, namely self-efficacy, intrinsic value, test anxiety, cognitive strategy use, and self-regulation. These five sub-domains are categorised within two domains, specifically motivational beliefs and self-regulated learning strategies. Due to the constraints of time, the shortened and earlier version of the MSLQ was selected in preference to the 81-item version (Pintrich et al., 1991). It was deemed that the 44-itme MSLQ would adequately envelop the domains of interest related to the present study as used elsewhere (Ackerman & Beier, 2006).

Data analysis

For this study, four computational phases were conducted.

1. The descriptive WHOQOL-BREF data for the Asian group were generated and compared with some established data.
2. The domestic and international Asian medical students were compared.
3. Zero-order correlations were calculated for the Asian sample for WHOQOL-BREF and MSLQ domain measures.
4. The demographics variations were considered employing a multivariate analysis approach.

RESULTS

Phase 1

The descriptive WHOQOL-BREF data for the Asian group were generated and compared with some established data of New Zealand university students from a variety of different faculties (Hsu, Krägeloh, Shepherd, & Billington, 2009; Lewis, Krägeloh, & Shepherd, 2009). For reference purposes, Study 1 refers to the present study; Study 2 is the Lewis et al. (2009); and study 3 refers to Hsu et al. (Hsu et al., 2009).

Table 1a shows, for the three studies, the mean and standard deviations of the domain scores that were transformed according to the WHOQOL-BREF guidelines (Murphy et al., 2000). Z-test scores were computed for the comparisons between the present study and each of the other two studies. When compared with study 2 (Lewis et al., 2009), Asian medical students scored significantly lower in terms of the psychological and social domains. In comparison with study 3 (Hsu et al., 2009), the Asian medical students scores were significantly lower on the social and environmental domains. Hence, in relation to all two studies the Asian medical students were scoring significantly lower on the social domain.

Table 1a. Means and standard deviations of the WHOQOL-BREF domains by datasets

Domains	Study 1 (n=97) M (SD)	Study 2 (n=281) M (SD)	Study 3 (n=316) M (SD)
Physical	69.00 (13.42)	72.10 (14.40)	67.62 (15.67)
Psychological	61.44 (15.86)	67.13 (14.23)**	62.22 (14.54)
Social	60.13 (20.58)	70.43 (20.53)**	65.98 (20.32)*
Environmental	66.05 (14.56)	65.65 (15.00)	55.48 (14.61)**

*p< 0.05
**p<0.01

Table 1b shows the Likert response means and standard deviations for the social domain. Using t-test evaluations, no differences were noted between the international and domestic groups for each item. The lowest response means were shown for item 21 - How satisfied are you with your sex life?

Table 1b. Means and standard deviations of the WHOQOL-BREF social domain items

Items	Domestic (*n*=57) *M (SD)*	International (*n*=40) *M (SD)*
20. How satisfied are you with your personal relationships?	3.60(.91)	3.35(1.09)
21. How satisfied are you with your sex life?	3.34(.98)	3.06(1.05)
22. How satisfied are you with the support you get from your friends?	3.76(.95)	3.92(.66)

Phase 2

Table 2 shows the mean scores and standard deviations for the domestic versus the international Asian medical students on the WHOQOL-BREF domains (using the Likert 1 to 5 measures) and the MSLQ sub-scale scores. The scores were lower for the international students on all four domains. Employing a t-test for comparing the two independent samples on the WHOQOL scores, only environment yielded a near significant difference ($t(92)=1.93$, $p=.06$). In comparing the MSLQ scores, self efficacy ($t(95)=2.53$, $p=.01$) and test anxiety ($t(95)=-3.31$, $p=.001$) yielded significant differences. These results suggest that international students experience lower levels of self-efficacy and higher levels of test anxiety than their domestic students counterparts.

Table 2. Means and standard deviations of the WHOQOL-BREF domains by status of enrolment.

WHOOQOL- domains	Domestic (*n*=57) *M (SD)*	International (*n*=40) *M (SD)*
Physical	3.84(.52)	3.72(.54)
Psychological	3.52(.70)	3.46(.51)
Social	3.57(.76)	3.46(.77)
Environmental	3.74(.61)	3.51(.50)
MSLQ - subscales	*M (SD)*	*M (SD)*
Intrinsic value	3.94(.48)	3.81(.37)
Self-efficacy	3.48(.60)	3.17(.57)**
Test anxiety	2.68(.80)	3.24(.85)**
Cognitive Strategy Use	3.65(.51)	3.58(.37)
Self-regulation	3.58(.52)	3.46(.40)

**p<0.01

Phase 3

Table 3 below presents zero-order correlations for the WHOQOL domains scores against the MSLQ sub-scale scores. Significant associations are noted for self efficacy on all domains, test anxiety on three of the domains (physical, psychological and environmental), and intrinsic value (physical) and self-regulation (psychological) on one domain. These results suggest that self-efficacy and test anxiety are two areas that produce critical associations with quality of life variables.

Table 3. Summary statistics and Zero-Order Correlations for the WHOQOL domains and the MSLQ sub-scales

WHOQOL Domains	MSLQ sub-scales				
	Intrinsic value	Self-efficacy	Test anxiety	Strategy use	Self-regulation
Physical	.309**	.431**	-.302**	.071	.191
Psychological	.155	.456**	-.479**	.163	.304**
Social	.152	.258*	-.329	.187	.146
Environmental	.122	.267**	-.395**	-.088	.118

Note. $N = 94$
*$p < 0.05$
**$p < 0.01$

Phase 4

A MANCOVA was computed, including the nine dependent measures (four WHOQOL domains and five MSLQ subscales) and the three independent measures of years of study, gender, and status of enrolment (domestic; international) with age as a covariate. Using Wilks' Lambda, the multivariate statistical analyses showed a:

1. Non-significant 'year*gender*status' result, $F(9, 75) = .72$, $p = .69$;
2. Non-significant 'year*gender' result, $F(9, 75) = .68$, $p = .72$;
3. Non-significant 'year*status' result, $F(9, 75) = .84$, $p = .59$;
4. Non-significant 'status*gender' result, $F(9, 75) = .54$, $p = .84$;
5. Non-significant 'gender' result, $F(9, 75) = 1.35$, $p = .23$;
6. Non-significant 'year' result, $F(9, 75) = 1.15$, $p = .34$;
7. Significant 'status' result, $F(9, 75) = 2.13$, $p = .04$.

Reviewing the status effect further, the only significant results was in the area of test anxiety, $F(1) = 4.72$, $p = .01$. The means and standard deviations for the test anxiety sub-scale indicated a higher level of anxiety for international students compared to their domestic counterparts ($M_{international} = 3.24$, $SD = .84$; $M_{domestic} = 2.68$, $SD = .80$). No other significant results were noted.

DISCUSSION

The following investigation aims to evaluate the quality of life and motivational factors associated with Asian medical students within the New Zealand context. The present study has generated some interesting and significant findings. First, in relation to other studies in New Zealand the Asian medical students scored significantly lower on the social domain. Second, with respect to the domestic and international students groups, self efficacy was significantly higher for the domestic students and test anxiety lower. More complex analyses were computed to consider any confounding effects. The test anxiety sub-scale finding indicated a higher level of anxiety for international students compared to their domestic counterparts. Third, self-efficacy was positively associated with all of the quality of life domains, and test anxiety was negatively associated with three of the quality of life domains (physical, psychological and environmental).

In relation to the first finding, Asian medical students appeared to score lower on the social domain than that found elsewhere (Hsu et al., 2009; Lewis et al., 2009). The differences found between the Asian medical student group and the two studies on New Zealand university students indicate an important disparity, namely in the area of social relationships domain which encompasses the ideas of satisfaction with personal relationships, social support, and sexual activity (WHOQOL-Group, 1998).

981

Asian medical students versus others

The present study's finding showed that New Zealand Asian medical students consistently scored lower than the other New Zealand students. The comparison university cohort (from Auckland) are representative of a multi-ethnic and more generic university population encompassing undergraduate students from various faculties (Hsu et al., 2009; Lewis et al., 2009). Moreover, the Asian medical student sample results showed no difference between the international and domestic students on each of the three items. The low scores on this domain suggest that Asian students perceive themselves to be less satisfied with their personal relationships, social support and sexual activity than other students in general. There are several possible explanations for this finding.

First, Asian medical students may be more interested in academic study than other students and thus have less time to develop, or think of developing, social relationships (Kember, 2000; Ng, 2003). Ng suggests that in Chinese cultures there are strong familial networks as well as family and social obligations. Chinese students have strong academic goal orientations that tend to be performance-based, highly competitive, and tend to mastery so that they can outperform others and gain high achievements. As such there is less emphasis on developing personal relationships and friendships akin to a Western perspective, let alone a satisfying sex health, but rather the focus is on developing pragmatic networks to forward their academic goals (Holmes, 2005; Leung, 2002).

Second, Asian students emphasise developing modesty and humility, in addition to being well focussed on the study requirements at hand (Holmes, 2005; Leung, 2002). As such Asian students may find the notion of sexual activity and personal relationships as being counterproductive to developing academic excellence. The results may indicate a perception that they have of low satisfaction with life on the social realm, but in reality the magnitude of their perception may be misleading (Sam, 2001). Asian students may, thus, underplay their level of satisfaction with life.

Third, Asian students may feel isolated and may distance themselves from majority cultures (Sam, 2001). This may be especially true of the international Asian students who may find the development of social relationships difficult. In New Zealand a large proportion of the international medical student population are Malaysian and the Malay student group have different religious norms to the majority culture group. Hence, questions like sexual activity may in fact be offensive to this group. This would be an interesting area for further research. International students may also feel less empowerment over their social situation and environment given the likelihood of higher levels of uncertainty and lack of familiarity with the Western system (Sastry & Ross, 1998). If students have a sense of isolation and lowered empowerment, and the results somewhat confirm this, this would have important implications for university personnel involved in pastoral care.

Self efficacy and test anxiety

The next major finding of note relates to the problems associated with self-efficacy and test anxiety. The international students appear to be less self-efficacious and more test anxious than their domestic student counterparts. Moreover, for all the Asian students surveyed, higher self-efficacy significantly correlates with higher levels of quality of life. In contrast higher levels of test anxiety correlate with lower levels of quality of life.

These findings pose important implications for educationalists, university administrators and those involved in pastoral care and academic learning. There is likely a familial and parental factor that strongly influences Asian medical students and this is likely to be more pronounced for international students, as Asian with domestic student status are more likely to have acculturated to the New Zealand mainstream culture (Dundes et al., 2009). Parental pressure is strongly focussed on achieving academic success and putting in long hours of work (Akins, 2007). The thought process is often outcome oriented as this hard work will pay off in dollar terms especially if the students can gain a medical degree. In Akins' study all interviewees, emphasized family as a primary motivating factor for studying medicine, and that many students were under a sense of obligation to do well. This pressure and goal orientation is interesting given that the medical profession has an inherent obligation to service the needs of the people in terms of maintaining and promoting well-being. This is a fascinating area of study and the New Zealand Asian medical student community could be investigated in more depth using a similar approach.

In addition, international students have more pressure to perform as they pay higher fees than domestic students and thus accrue larger debts and outgoings (Fitzjohn et al., 2003). The annual student fees for domestic students studying Bachelor of Medicine and Bachelor of Surgery - Year 2 onwards are $ 11,324 compared to the international students' fees of $55,650 for the same programme (The

University of Auckland, 2009a, 2009b). This fact alone will likely create intense familial and financial pressure on many students, particularly those studying abroad.

The pressure of family and finance will likely combine with the need to save face, and the belief that willpower and effort will achieve results will likely impact on self-efficacy and test anxiety. If students believe in their competence and ability to achieve a specific outcome, they will have high self-efficacy (Bandura & Locke, 2003). Pintrich (2003) proposed that if students believe that they will do well and believe they have the right skills and knowledge, then they tend to implement more effort and have a high likelihood of achieving their goals. Hence, there is likely to be a bi-directional causal relationship, whereby self-efficacy leads to appropriate outcome but poor outcome will likely lead to low self-efficacy. In addition, the findings of this study suggest that physical, psychological, social and environmental factors are correlated with the notion of self-efficacy (Table 3). It is not surprising then that if Asian students are unable to achieve their academic goals then their quality of life will probably suffer and this effect will be greater than for other ethnic groupings given the intense familial and financial pressure they are under (Akins, 2007; Holmes, 2005). Similarly, this will likely impact on the way they cope with test anxiety.

An issue for university personnel involved in pastoral care is to be sensitive with respect to the communication differences between Asian students and other ethnic groups. Holmes (2005) suggested that there are likely to be power differences between teachers, administrators and students making it more difficult for Asian students to communicate problem issues to those in authority given the different educational expectations of the Western self-directed approach to learning. As one student in Holmes' interview survey stated, when "reflecting on his teachers in medical school in China, summed up this relationship: 'The lecturer[s] they help you in every area, not only the practicing, the training, even the homework. They help you with everything''' (Holmes, 2005, p. 298). Other areas of difficulty include English language competency, the ability to interact with others within the lecture theatre or when on clinical placement, the ability to express honest opinions and ideas, being interactive within small groups, and interaction with teachers.

Holmes (2005) has indicated ways to meet the needs of Asian students and in particular international students. These are important considerations given the emphasis on recruiting overseas students into domestic academic programmes. Areas of importance include building trust and recognition of differences. Developing intercultural communication signifies improved service and an equitable process and intent that will likely enhance teaching and learning by promoting understanding and creating a sense of global consciousness (Kanagawa et al., 2001; Kember, 2000). It is also a key step towards addressing potential and existing local issues and at the same time providing global implications and solutions to broadening views of educational praxis within university settings.

Collaborative Health – A New Concept in Educational Psychology

Håkan Sandberg

Mälardalen University

Sweden

Abstract

Based on research about teamwork in human service organizations in Sweden, such as e.g. example education, the concept of collaborative health, CH, is introduced and found to be a relevant expression in educational psychology for the physical, psychological and social health resources that the individual uses in teamwork and that are, simultaneously, influenced by the teamwork.

Collaborative health is examined in this article through a social constructivistic approach and viewed in the perspective of earlier concepts in social psychology and working life research, such as psychosocial stress and burn-out.

The need for a holistic team theory as a prerequisite for future research in this area is emphasized. A core criterion in, and an indispensable part of, this team theory is the access to relevant and logical concepts, one of which is collaborative health.

The article concludes that the concept of collaborative health has a role to play in a relatively new research area. There is even a need for this concept in the complex collaborative and co-operative teamwork of education and other human service organizations of today.

Key-words: Teamwork, education, working climate, collaborative health, human service organizations

Introduction

This article focuses on and introduces the concept of collaborative health (CH), a concept not previously used as a theoretical concept in today's working life research. As far as the author is aware, collaborative health has no meaning or independent significance outside the meaning given to it in this article. The concept as used in this article has its current base in Scandinavian teamwork research

published 1995-2008 (Sandberg, 1995; 2004a,b, 2006, 2007, 2008; Berlin & Carlström, 2004), and it was first presented in a research report 2004 (Sandberg, 2004a), with the Swedish term "samarbetshälsa", and defined as (p. 97)

> … the physical, psychological and social health resources that the individual uses in teamwork and that are, simultaneously, influenced by the teamwork.

Briefly, collaborative health is synonymous with the health aspects of co-operation within a working group of frequently interacting colleagues, i.e. a team of professionals, e.g. in education.

The aim of this article is to describe the findings making the concept collaborative health a logic consequence of inductive reasoning and to point out applications for this concept as an important theoretical tool. A self-evident reflection upon this theme of presentation is that the question of collaborative health exists all over the world, in every organization where co-operation and collaboration exist. So it is indeed a global question with local applications.

The article is structured primarily by first pointing out the inductive reasoning leading to the concept and possible definitions by giving some examples. Secondly the concept, originally created by inductive reasoning, is examined through a theoretical construction, more precisely a social constructive approach. This second step in illuminating the concept of collaborative health is a way of further conceptualising in a context-related way by describing the concepts of psycho-social stress and burn-out. Thirdly, the core concept in this article is discussed in terms of justification and usefulness, thereby illuminating the arguments behind the creation of the concept and its pragmatic aspects. Finally, this article will provide the reader with theoretical reflections that may have implications for adequate research areas.

Inductive origin of the concept Collaborative Health

Starting 1995, various research publications have indicated and finally explicitly expressed collaborative health (in Swedish: samarbetshälsa) as a conceptualization from empirical studies of teamwork in the welfare sector in Sweden commented by various theoretical studies from working life in general (Sandberg, 2004a; 2006). The studies referred to clearly indicate the influence teamwork has

upon team members' wellbeing. Since self-reported wellbeing indicates an important aspect of the individual's psychological health, the link between health and teamwork seems to be out of question.

Looking at the nature of teamwork clarifies which aspects of teamwork have a general connection to wellbeing. These connections are found both on a theoretical level, in how teamwork is defined, and in empirical studies. On a theoretical level, a core definition of teamwork made up of certain criteria is used and the criteria serve as points of reflection. In this section I will mention some core criteria, generally accepted as such, and leave other, more peripheral criteria aside. The criteria are divided into the essential/functionalistic qualities, structural qualities and process qualities (Sandberg, 2004b; 2006). Though it is possible to make a distinction between them for analytical purposes, there is no sharp line between them, which the following will show.

The essential qualities are mainly two: The team creates synergies and there is a distinct goal-orientation in the teamwork. Without these qualities, there may be an active working group, but it is certainly not a team. When these two qualities are added to each other, I propose the use of the term and concept functional synergy (Sandberg, 2006). Theoretically, both synergy and a distinct goal-orientation can consume energy as well as provide energy of a psychological as well as a physical kind. Which one it is largely depends on the circumstances surrounding the teamwork. Below are two examples from Swedish child and youth psychiatric teams entailing different consequences for the team members' CH (Sandberg, 1995). These examples are followed by an example from teamwork at a university.

The first team is located in a small town. Four therapists work in the team. One of them is physician, two are psychologists and one is a social worker. They all apprehend their resources and patients as well as the organisation as reasonable. They further judge the co-operation and working climate within the team as a strong support for successful work. CH in this team is an obvious resource for the professionals, supporting a successful teamwork and manifested in personal well-being. The other team is located in a suburban area of a big city. Fifteen therapists work in the team. Six of them are psychologists, two are physicians, five are social workers and two are nurses. They apprehend their resources as limited, feel that the patients are too many and experience heavy conflicts within the team. The team is often divided into formal or informal sub-teams.

The two teams described above differ according to the way they can create functional synergy. Looking at the teams from the outside, an inductive conclusion, supported by empirical data,

is that their well-being differs in favour of the small town team. The co-operative prerequisites or premises for co-operation differ between the teams in a way that influences the team members' well-being. It is reasonable to hypothesise that the CH is of a significant different kind in the two teams. Kira (2003) investigates and comments upon current working life conditions with such possible outcomes.

Nancarrow (2004) provides an example of one of the aspects of teamwork influencing functional synergi. She states that prior research has pointed out overlapping roles as a threat to the confidence within the team, but her study did not confirm this. On the contrary, the team members were not threatened by overlapping roles, and recognised confidence in their own roles. An understanding of the roles of other workers was necessary to avoid feeling threatened. Nancarrow (ibid.) concludes that intermediate care can promote role overlap across a range of workers. Team members' role overlap can enhance clinician confidence in their own area of expertise whilst optimising patient care.

These examples show that achieving functional synergy in teamwork requires a set of supporting structural and process factors. These factors are e.g. the mentioned working roles and other organizational prerequisites, the clients' needs, general resources, competence, internal support and working climate etc. By using the concept of confidence, Nancarrow (ibid.) points to a "well-being direction" associated with co-operative qualities within the team.

Inductive reasoning from another example also makes the concept of CH plausible. In this example a university lecturer describes two totally different kinds of co-operative situations from a working climate perspective (Sandberg, 2004a). In the first situation, a group of university teachers discuss the organization and content of a course in occupational therapy: We talked in a very open manner. No one tried to prove that she or he was right. … We could be critical but constructive. We shared goals and objectives and had similar professional experiences. … One did not felt manipulated; one's knowledge was used in the discussion …. One could be oneself. It was very satisfying …. There was an open space. The other situation, describing co-operation with the manager, is experienced in a very different way: Neurosis combined with bureaucratic thinking. Decisions are implemented through manipulation … and opposition leads to isolation and exclusion from courses and conferences. … The working group is made to some kind of family. An academic discussion is experienced as a way to … destroy good climate. … You have to survive somehow.

As shown by these examples there is no doubt that experiences of teamwork and the accompanying working climate are sources of well-being. To state that these experiences have importance for the team members' health seems reasonable and logic. However, stating that the aspects of health involved in these certain contexts have such specific characteristics such as to make it meaningful to isolate a new concept, scientifically and pragmatically, is a different statement. It surely demands a logical reasoning upon solid empirical studies. This paper shows the outlines in such a process.

Collaborative Health – a constructivistic approach

In the previous section, the concept and term collaborative health is "invented", through inductive reasoning, as adequate in relation to empirical studies. There is prima facie no known connection to the notion that CH possibly could be a successor of related working life concepts. As a way to create a clearer picture of CH as a concept and avoid misunderstandings, a comment to such possible connections will be made here. The constructivistic approach is a perspective motivated by the fact that this concept is not born in a vacuum. It is created in a scientific context where humans express themselves in a way that, by inductive reasoning, is adequate for a phenomenon which otherwise would be "silent". As a researcher, I design a research study, and when concluding my findings construct relevant concepts in order to generalize, to make findings visible and communicative and construct a theoretical reference for further studies – in short making the research findings meaningful.

The constructivistic or social constructivistic approach in this case refers to the fact that society and its organizations with e.g. teamwork are created by humans in interaction. Teamwork in this case is not given by nature, but can be seen as a construction in the interaction between the labour market parties, an interaction which also might use scientific reports and research as arguments added to ideological, political and directly labour related points of view. From this perspective collaborative health can be viewed as a construction in the interaction between employees in the public sector and me as a researcher, who at the same time interact with (texts written by) other researchers and the academic environment. The creation of such an idea as collaborative health is depending on the usefulness in the current context consisting of teamwork and research upon teamwork. In this context, the creation and use of collaborative health is a way of spotting a figure. This also means that the concept has a power limited not only to a certain physical and social context but is also restricted in

time.   The concepts we us in everyday life or as scientific concepts are ways of making reality comprehensible or understandable. The social processes of teamwork and doing research upon teamwork are a basic prerequisites for the construction of collaborative health as a concept, and from this perspective an analytic and critical attitude follows, based on the contextualisation of CH (cp. Burr, 1995).

Working life concepts associated to CH in earlier decades were "detected", "constructed" or "invented" depending on the labour market situation, political and ideological influences, current research, media priorities etc. Two such concepts have been psycho-social stress and burn-out. Stress originated out of Selye (1956) and was contextualised in the industrialized countries the following decades as psychological stress or psycho-social stress. The working life research tradition with this origin, e.g. in Sweden, has an emphasis on the combination of high demands, low control and a lack of social support as constituents of psycho-social stress (Gardell, 1986; Theorell & Karasek, 1996). The concept of burn-out is a sign of the shift from the dominating industrial sector in the Western countries to the expanding service sector (Freudenberger, 1974; Leiter & Maslach, 1988). Emotional exhaustion has been shown to lead to depersonalization which subsequently leads to diminished personal accomplishment. Interpersonal contacts between staff in the organization were related to the development of burn-out at each stage (Leiter & Maslach, ibid.). For both the above mentioned concepts, social circumstances play a major role, both as causes, symptoms and as a way to solve the unwanted situation. By developing teamwork over the recent decades, these social determinants have become even more important.

Discussion

Core concepts in behavioural sciences come and go. The need for a holistic team theory in e.g. education is understood as a way of giving an injection of energy to the development of team research, a field of research that is so far fairly limited since the current team concept in working life is a young phenomenon. Olsson (1998) notes that building scientific knowledge about group processes requires scientific concepts. These concepts describe important aspects of the "invisible construction made up from the group as a whole" (p. 63, authors translation) and at the same time are applicable to the concrete and visible. Olsson refers e.g. to Cartwright & Zander (1968), Forsyth (1990), Yalom (1975) and West (1996) and "frames" the meaning of different kinds of small group research by dropping

concepts used in this research, e.g. leadership, group-goal, uniformity, attraction, conflict, norms, power, sub-grouping, climate, communication, feedback etc. It is in a process like this that collaborative health (CH) takes place as a concept and thereby creates and emphasizes a meaningful perspective.

During the past hundred years of behavioural sciences, concepts such as "unconscious", "conformity", "mobbing", "demand-control" and "social support" etc. have summarized findings in social psychology and working life research with relevance for the educational sector, making us take new perspectives and starting new research traditions and debate. Now, what can collaborative health (CH) bring? Teamwork in the welfare sector, in the human service organisations, has in general not, or to a limited extent, been described and analyzed in a systematic and scientific way. From a pragmatic point of view, the creation of a team theory with relevant general and specific context related concepts is a necessary tool in team research to come. CH is a part of this foundation and at the same time offers a bridge to earlier more familiar concepts related to health and working life. To focus on CH brings in its turn into focus a question of importance for the well-being of the team and each team member, as well as for the success of the team. It's a part of a new discourse relevant for the human service organizations. It's about not only producing welfare for others but also achieving welfare for the team member.

Lawson (2004, p. 234) finds that "collaboration … takes many years to develop and even longer to institutionalize. It is very costly". With reference to Shrader (2001), Lawson (ibid.) concludes that collaboration has several costs, viewed as transaction costs. From the perspective of the findings in the research described in this article collaborative health is undoubtedly a transactional cost, or a "gain", with importance for the team member and the teamwork. Following this, collaborative health is an important support for the team member, if it has a positive value, and a way to ruin the team member and the team work when having a negative value.

Reflections and conclusions

To accept the concept of collaborative health (CH) as a) relevant, b) useful and c) generative requires a reliable scientific foundation and insights into the possibilities of further applications where this concept plays a major role, both in practice and theory. From my point of view and by describing CH the way I do, collaborative health has an important role to play as a major health related concept

connected to the highly professional team workers in education and elsewhere in the human service organizations. The use of the concept of collaborative health instead of e.g. co-worker health is related to the fact that empirical data leading to this concept are based on collaborative and co-operative working situations in teams of professionals within human service organizations. The major supporting argument is the way a new perspective, expressed as collaborative health, is emphasised in a relatively new area of research, team-research in working life, a research still in search for theoretical and methodological tools. In conclusion there is a need for a scientific concept such as collaborative health (CH), considering the demands in e.g. education with complex phenomena, focus on quality and results, new ways of collaborating and co-operating as well as competing, a need for sustainability on a social, economic and environmental level and activities that require a high degree of research-based knowledge and competence. The concept of collaborative health is also obviously relevant globally and locally. Still the main argument is the logic inductive reasoning from a solid research ground and an apparent usefulness of the concept, scientifically and in practice – an argument this paper have had the ambition to show.

Theories and Models Related to Learning Needs or Motivation
– A Psychological Perspective

Wan-Jeng Chang
The Overseas Chinese University (OCU)

ABSTRACT

The paper focuses on establishing an understanding of the current state of knowledge about theories and models related to learning needs or motivation from view of psychology. It includes need / drive theory, expectancy / value theory, Wlodkowski's model, Maslow's theory, achievement motivation theory, social-learning theory, self-efficacy theory, attribution theory, self-worth theory, Keller's model, personal causation theory, situated motivation, as well as classification of motivation. The purpose of this literature view is not to attempt to prove which theory or model is the best, it is to provide a general overview and highlight implications for future research in the related field.

Need / Drive Theory

Psychologists found that needs and drives compose motives (Sprinthall & Sprinthall, 1981). One way to classify needs is to divide them into two groups, primary and secondary (Parsons et al., 2001). Meeting primary needs is vital for physical survival such as food, water, and oxygen. Secondary needs are important for psychological well being and happiness such as companionship, prestige, and status.

Murray (1938) defined need as "a construct which stands for a force in the brain region, a force which organizes perception, apperception, intellection, conation and action in such a way as to transform in a certain direction an existing, unsatisfying situation" (pp. 123-124). He listed seven classifications of human psychogenic needs:

1. Needs associated with the inanimate: acquisition (e.g., to gain property), conservance (which means conserving attitude, e.g., to protect against damage), order (e.g., to be scrupulously precise), retention (e.g., to hoard), and construction (e.g., to organize and build).
2. Needs expressing ambition: superiority (e.g., to gain power over people and high social status), achievement (e.g., to overcome obstacles), recognition (e.g., to demand respect), exhibition (e.g., to attract attention to one's person), inviolacy (based on pride and personal sensitiveness), infavoidance (e.g., to avoid failure), defendance (which means defensive attitude, e.g., to justify one's actions), and counteraction (e.g., to select the hardest tasks).
3. Needs related to human power: dominance (e.g., to influence others), deference (e.g., to serve gladly), similance (which means suggestible attitude, e.g., to agree and believe), autonomy (e.g., to strive for independence), and contrarience (e.g., to be unique).
4. Needs constituting the sado-masochistic dichotomy: aggression (e.g., to murder) and abasement (e.g., to surrender).
5. A need involves inhibition: blamavoidance (e.g., to avoid blame).
6. Needs have to do with affection between people: affiliation (e.g., to join groups), rejection (e.g., to be discriminating), nurturance (e.g., to express sympathy), succorance (e.g., to cry for help), and play (e.g., to relax).
7. Needs occur with great frequency in social life: cognizance (which means inquiring attitude, e.g., to ask questions) and exposition (e.g., to give information).

Based on the needs presented by Murray et al. (1938), Edwards (1959) developed 15 personality variables for the Edwards Personal Preference Schedule (EPPS). These 15 variables are: achievement, deference, order, exhibition, autonomy, affiliation, intraception, succorance, dominance, abasement, nurturance, change, endurance, heterosexuality, and aggression.

Parsons et al. (2001) explained that need is a force, and drive is the desire to act. When needs are activated, one is forced to act in ways that decrease or satisfy that need. Accordingly, three possible reasons can explain the low motivation of some learners. First, a learner has a low felt need toward a certain activity. Second, some activities are more appealing than others. Third, a learner lacks the skills to perform the activity. Hence, Parsons et al. suggested that teachers need to know the needs state of the students and how to decrease competing needs while increasing the need to achieve.

Expectancy / Value Theory

Vroom (1964) observed that the central problem of motivation is "the explanation of choices made by organisms among different voluntary responses" (p. 9). He outlined a conceptual model which guides the interpretation of his research. The main concepts in the models are: valence, expectancy, and force. Valence is identified as "affective orientations toward particular outcomes" (p. 15). Expectancy means "a momentary belief concerning the likelihood that a particular act will be followed by a particular outcome" (p. 17). Force refers to "a monotonically increasing function of the product of valence and expectancy" (p. 19). An approach motive represents that the ideal outcomes have positive valence (an individual prefers attaining it to not attaining it). An avoidance motive indicates that outcomes have negative valence (an individual prefers not attaining it to attaining it).

Feather (1982) asserted that the particular characteristic of the expectancy-value models is the "attempt to relate action to the perceived attractiveness or aversiveness of expected consequences" (p. 1). Parsons et al. (2001) indicated that expectancy is the action leading to goal attainment, and value means the goal is worthwhile. Parsons et al. stated that motivation is a product of expectancy and value. Motivation exists when an individual values the goal of the activity and believes the task can be completed successfully.

Based on expectancy theories of motivation, Porter and Lawler (1968) developed a theoretical model to explain the relationship of managerial attitudes to managerial performance. They hypothesized that "the greater the value of a reward and the higher the perceived probability that effort will lead to this reward, the greater the effort" (p. 31). Further, higher effort is expected to lead to higher performance; "ability and traits" and role perceptions also determine one's performance. Additionally, a person would exert effort to gain a high level of performance while he/she sees a great connection between his/her performance and his/her rewards. Finally, when high performance decreases the gap between the perceived equitable level of rewards and the amount seen as being actually received, then high performance will lead to high satisfaction (Porter & Lawler, 1968).

On the basis of the expectancy-value model of motivation, Pintrich and Groot (1990) proposed three motivational components: expectancy, value, and affective component. Expectancy refers to learners' perceived ability to perform a task and perceived responsibility for the performance. Learners who think they are able to perform the task usually are more likely to persist at a task than are those who do not have that belief. Value relates to learners' goals and beliefs toward the significance and interest of the task. In other words, this component concerns learners' reasons for performing a task. Learners who believe the task is interesting and important often engage in more effective effort management than do those who do not have that belief. Affective component involves learners' emotional reactions to the task. One of the most relevant affective reactions in a school learning context is test anxiety (Pintrich, 1990).

Wlodkowski's Model

Wlodkowski (1978, 1981, 1985) regarded each learning situation as a whole with beginning, during, and ending time stages. Attitudes and needs are the two motivation factors in the beginning time phase. Stimulation and "affect" are the two motivation factors in the during time phase. Competence and reinforcement are the two motivation factors in the ending time phase. Wlodkowski (1978) encouraged educators to use these six general motivation factors in any motivational plan.

Maslow's Theory

Maslow (1987) argued that there are seventeen propositions about motivation:

1. Holistic approach: "The individual is an integrated, organized whole" (p. 1). For example, a person wants food, not his/her stomach; Food satisfies a person's hunger, not his/her stomach's hunger; when people are hungry, their perceptions, memories, emotions, and the content of thinking also change.
2. A paradigm for motivational states: For example, the desires for clothes, friendliness, and praise.
3. Means and ends: There is one major characteristic of the average desires in people's daily lives, that those desires "are usually means to an end rather than ends in themselves" (p. 5).
4. Unconscious motivation: It is necessary for sound motivation theory to consider the unconscious life.
5. Commonality of human desires: The fundamental or ultimate desires of all human beings are more alike than one would think.
6. Multiple motivations: It is uncommon "for an act or a conscious wish to have but one motivation" (p. 6).
7. Motivating states: A motivational state should be "constant, never ending, fluctuating, and complex" (p. 7).

8. Satisfactions generate new motivations: Human beings are always desiring something. When one desire is satisfied, another one comes up. However, the "wants" are in some sort of hierarchy of prepotency.
9. Impossibility of listing drives: To once and for all to make atomistic lists of drives is unreasonable. There are several reasons. First, "there are great differences in probability of appearance of the various particular drives" (p. 8). Second, drives are not isolated. Third, a listing of drives is normally made on a behavioral basis and ignores the dynamic nature of drives. Fourth, drives arrange themselves in a hierarchy of specificity instead of an arithmetical sum of discrete members.
10. Classifying motivation according to fundamental goals: Any list of drives in the ordinary sense of instigation, certainly motivated behavior, and the specific goal object are not good bases for classification of the motivational life of human beings.
11. Inadequacy of animal data: Animal data needs to be used cautiously and wisely. It is sensible that motivation theory be anthropocentric rather than animalcentric.
12. Environment: Sound motivation theory has to consider the situation in which the organism finds itself, but must never turn into pure situation theory.
13. Integrated action: The organism behaves ordinarily as an integrated whole when life is easy and successful. The organism behaves in a disintegrated manner when the threat is overwhelming or when the organism is too weak to handle it.
14. Unmotivated behaviors: Not every reaction or behavior is motivated.
15. Possibility of attainment: People yearn for things that can possibly be actually attained. Nevertheless, the factor of possibility of attainment depends on cultures.
16. Reality and the unconscious: John Dewey believed that the characteristic impulses in adults "are integrated with and affected by reality" (p. 13). However, ". . . the occurrence of fantasy impulses . . . exist without regards to reality, common sense, logic, or even personal advantage" (p.13).
17. Motivation of highest human capacities: Motivation theory must concern the finest people as well as the weakest people.

The most famous hierarchy of needs was developed by Maslow (Oxford and Shearin, J. 1994). The hierarchy of needs begins with biological/physiological needs and moves upward to psychological/social needs (Ericksen, 1974; Oxford and Shearin, J. 1994). Maslow observed that humans are motivated to satisfy needs, and deficiency and growth needs are two classes of needs (Parsons et al., 2001). Deficiency needs are the lower four needs in the hierarchy; they are: physiological, safety, belongingness, and esteem needs. Growth needs are the higher three needs: need to know and understand, aesthetic, and self-actualization needs. The seven needs above are arranged in order of precedence, and the higher needs generally manifest themselves only when the lower needs have been satisfied. Deficiency needs cease to be motivating once they are satisfied; however, growth needs continue to expand and are never completely met(Parsons et al., 2001).

In the academic setting, Maslow "recognized that studious preparation in depth was prerequisite to a student's personal development and the ultimate satisfaction of his self-actualizing needs" (Ericksen, 1974, p. 71). In the foreign language learning setting, needs are often related to emotional or psychological security (Oxford and Shearin, J. 1994). When the learners' needs are satisfied in the second level of the hierarchy, students experience needs related to the third, fourth, and fifth level of the hierarchy (Oxford and Shearin, J. 1994).

Although the hierarchy of needs theory is well-known, Parsons et al. (2001) found that oversimplification might be one of the most common criticisms of Maslow's theory. Woolfolk (1995) indicated that most people move back and forth among the different types of needs and a behavior might reflect the perception of several needs at the same time.

Based on Maslow's theory, Alderfer (1969) proposed E.R.G. theory. E.R.G. represent three core needs of a human being. E refers to existence needs which involve all the different forms of physiological and material desires. R refers to relatedness which relate all the needs of relationships with significant others. G refers to growth which concerns all the needs of making creative or productive effects on oneself and the environment.

Achievement Motivation Theory

The achievement motivation probably is the most discussed and researched acquired motive among educational psychologists (Sprinthall & Sprinthall, 1981). The theory of achievement motivation is "a theory of achievement-oriented performance" (Atkinson, 1964, p. 241), which concerns "the relationship between performance and individual differences in strength

of achievement motive" (p. 240). This theory applies when a person knows that he/she or others will evaluate performance, and the result will be either success or failure. It assumes that every person has a motive to achieve success (a general disposition to seek success) as well as a motive to avoid failure (a general disposition to avoid failure). If one's motive to achieve success is stronger than the motive to avoid failure, the tendency to perform an act is strongest when the probability of success is fifty percent. In the other case, if one's motive to avoid failure is stronger than the motive to achieve success, the tendency to perform an act is strongest when the probability of success is either very high or very low (Atkinson, 1964).

The hope of success and the fear of failure are the two determinants of whether an individual will move forward or away from achievement-related tasks (Weiner, 1972). Hope of success has three components: the need for achievement, the probability of success, and the incentive value of success. Fear of failure also contains three elements: the motive to avoid failure, the probability of failure, and the incentive value of failure (Weiner, 1972).

Usually, individuals with strong achievement motivation have self-confidence and are willing to take responsibility in a controllable situation (Alschuler, Tabor & McIntyre, 1971). They set challenging goals, make long-range plans, look forward to concrete feedback, and enjoy the sense of accomplishment (Alschuler et al., 1971). Students with high needs for achievement are usually more intrinsically motivated than are those with low achievement needs (Parsons et al., 2001).

Hermans (1970) synthesized the relevant literature and proposed the following characteristics of achievement motivation. First, aspiration level: Students with low needs of achievement selected tasks that were either very easy or very difficult, while students with high needs of achievement preferred the difficulty of tasks to be in between. Second, risk-taking behavior: When the performance was dependent mainly on chance factors, students with high needs of achievement preferred lower risks than those with low needs of achievement. Third, upward mobility: People who seek occupational stratum promotion usually had high needs of achievement. Fourth, persistence: Students with high needs of achievement persisted longer than those with low needs of achievement when the probability of success approximated .50. However, students with low needs of achievement persisted longer than those with high needs of achievement while at the extreme probabilities. Fifth, task tension: Students with high needs of achievement recalled more unfinished tasks than those with low needs of achievement. Sixth, time perception: Students with high needs of achievement regarded time as dynamic, while students with low needs of achievement regarded time as static. Seventh, time perspective: Students with high needs of achievement tended to be more future oriented than those with low needs of achievement. Eighth, partner choice: Students with high needs of achievement were more likely to choose the competent, but unsympathetic, partners than those with low needs of achievement. Ninth, recognition behavior: Students with high needs of achievement strove more for recognition than did those with low needs of achievement. Tenth, achievement behavior: There was a close relationship between needs for achievement and performance tasks.

Social-learning Theory

Social learning theory holds that humans are driven by a continuous reciprocal interaction of personal and environmental determinants (Bandura, 1977). Moreover, learning occurs by direct experience, as well as by observation. "The capacity to learn by observation enables people to acquire large, integrated patterns of behavior without having to form them gradually by tedious trial and error" (p. 12). In fact, some complicated behaviors, such as linguistic skills, can be learned only through the aid of modeling. By observing different results of the actions, people acquire information which serves as a guide for future action. Further, people are motivated by the prospective consequences (Bandura, 1977).

Self-efficacy Theory

Self-efficacy involves the beliefs about an individual's competence in a particular situation (Parsons et al., 2001). Gredler (1986) indicated that perceived self-efficacy influences one's choice of activities, the quality of performance, and persistence in difficult tasks. People are more likely to be involved in a task if they feel capable of doing it (Pajares, 1995). "The stronger the perceived self-efficacy, the more likely are persons to select challenging tasks, the longer they persist at them, and the more likely they are to perform them successfully" (Bandura, 1986, p. 397). People with low self-efficacy may think that things are more difficult than they really are, while people with high self-efficacy have feelings of serenity when facing hard tasks (Pajares, 1995).

In Bandura's theory, an anticipated outcome will occur when both outcome and efficacy expectations are met before an individual enacts a behavior (Driscoll, 1994). When a person can be sure that certain activities will result in certain outcomes, those expectations are so-called outcome expectations. Efficacy expectations refer to the self-assessments of whether a person can perform the required activities (Driscoll, 1994).

There are four sources of self-efficacy information (Bandura, 1986). First, enactive attainment: repeated successes develop strong sense of self-efficacy while repeated failures lower it. Second, vicarious experience: seeing other people's success in similar situations may raise self-efficacy. Third, verbal persuasion: people who are persuaded verbally may mobilize sustained effort. Fourth, physiological state: people usually expect success when they do not experience aversive arousal (Bandura, 1986).

Schunk (1989) offers a similar approach. Schunk argued that observing people succeed could increase observers' self-efficacy, which motivates them to attempt the task. In reverse, observing people fail could lead observers to think that they lack the ability to succeed, which could discourage them from trying the task (Schunk, 1989).

Attribution Theory

Although there are different types of attribution theories, they all involve "perceptions of causality, or the perceived reasons for a particular event's occurrence" (Weiner, 1980, p. 280). In other words, attribution theorists try to explain "the attempts of ordinary people to understand the causes and implications of the events they witness" (Ross, 1978, p. 338). "Attribution theory concerns the allocation of responsibility for an event" (Heckhausen & Weiner, 1974, p. 56), because it guides subsequent behavior (Weiner, 1974). Attribution theory assumes that thoughts guide behavior (Weiner, 1980). Weiner stated that people "seek to maximize pleasurable stimulation and to minimize painful experience" (p. 275).

Heider has been recognized as the founder of attribution theory (Weiner, 1972). Heider (1958) clarified some basic concepts about naive descriptions of behavior. The center of his analysis was the discrimination between personal and impersonal causality (Jones & Davis, 1978). He believed that the result of an action was dependent on a combination of effective personal force and effective environmental force (Heider, 1958). The effective personal force was composed of a power factor and a motivational factor. Ability was a main characteristic of a person that affects his/her power. The motivational factor referred to a task a person was trying to do and the degree of the effort he/she expended. The combination of the power factor and the effective environmental force was the "can" of an individual, while the motivational factor was the "trying" of him/her. Consequently, if one could do something and he/she tried to do it, in that case, this person would take action (Heider, 1958).

"Can" may be attributed to the person or to the environment (Weiner, 1980). For instance, success may be ascribed to high ability or to the ease of the task, whereas failure may be ascribed to a lack of ability or to the difficulty of the task. In addition, the performance of others influences the attribution of the person or the environment. If a person succeeds/fails when most others meet the same outcome, the results are attributed to the ease/difficulty of the task. If a person succeeds/fails when most others do not do, the outcomes are ascribed to the person. Furthermore, the attribution to the person or to the environment is significant for the learning of students. For example, if a student attributes success to high ability, he/she might anticipate performing well in other courses, which raises his/her level of aspiration (Weiner, 1980).

According to Schunk (1989), when people attribute their accomplishments to their ability and efforts, they take pride in what they have done. When people think that they failed because of low effort, they tend to self-critical. Similarly, students may have a low sense of efficacy for performing well and be unmotivated to study harder when they attribute their successes to teacher assistance (Schunk, 1989).

The causes of success and failure could be ability, effort, task difficulty, luck, mood, fatigue, illness, or other people (Weiner, 1980). These causes are inferred based on the following factors: specific informational cues (e.g., past success history), casual preferences, rules that relate causes to effects, reinforcement history, and communications from others. Besides the causes of success and failure, Weiner further generalized three dimensions of causality: locus of causality, stability, and controllability. Locus of causality refers to internal or external sources of causality. Stability differentiates causes on a continuum from stable to unstable (perceived as relatively fixed or not). Controllability distinguishes causes from controllable to uncontrollable as perceived by the individuals.

Three assumptions guide the study of the intensity and the persistence of behavior in attribution theory (Weiner, 1980):

1. Behavior is mediated by both expectancies of success and the anticipated emotional reactions to these outcomes. 2. Expectancies are influenced by attributions to the stability dimension of causality. Any causal ascription for failure to unstable causes . . . will augment intensity and persistence more than ascriptions of failure to low ability or task difficulty. Effort attributions for failure seem especially facilitative because effort is subject to volitional control.

3. Affects also are influenced by perceived causality. In achievement domains, feelings of adequacy-inadequacy are particularly important determinants of action. Hence, attributions of failure to low ability are especially detrimental to future performance, compared to ascription to bad luck, lack of effort, and so on (p.381).

In achievement-related contexts, one may ascribe his/her success to effort or high ability and may regard failure as consequent to a lack of effort or low ability (Weiner, 1974). Individuals with high achievement needs attribute failure to a lack of effort, so they will work harder to strive for a previously unattained goal. On the contrary, people with low achievement motivation attribute failure to a lack of ability which is stable and not under personal control. Attribution theory has great implications for the educational process, because the attribution process is a decisive factor in learning and performance in the classroom. The causal attributions influence the possibility of trying achievement activities, the intensity of work at such activities, and the degree of persistence when confronting failure. These behaviors have influence over the degree of individual learning in educational settings (Weiner, 1974).

Attribution theory involves an individual's explanation of the factors impacting his/her success or failures as influencing his/her motivation and behavior (Parsons et al., 2001). Accordingly, understanding student attributions can lead teachers to know student motivation. Gredler (1986) found three basic assumptions of attribution theory in the classroom setting. First, "the search for understanding is a source of motivation" (p. 293). Second, a person's beliefs about the causes of past outcomes can determine his/her behaviors in new situations. Third, "the beliefs and reactions of others are important contributions to the development of students' causal attributions for success and failure" (p. 293). For example, a teacher may influence students in three ways: "the specific feedback given to the student about the performance, the teacher's nonverbal affective reaction, and the teacher's subsequent behavior toward the student" (p. 294).

Self-worth Theory

Self-worth theory presumes that "a central part of all classroom achievement is the need for students to protect their sense of worth or personal value" (Covington, 1984, p. 5). That is, personal worth depends mainly on one's accomplishments. Moreover, performance level, self-estimates of ability, and degree of effort expenditure are the factors affecting one's sense of worth. Perceptions of ability play an important role in one's self-definition. High effort and failure cause humiliation and the perception of incompetence. Thus, high ability is widely perceived as a major cause of success, and low effort is usually perceived as a major cause of failure (Covington, 1984).

Keller's Model

Keller (1983) proposed the motivational-design model for instructional designers to produce interesting, meaningful, and appropriately challenging instruction. This model assumes that there are four basic categories of motivational conditions: interest, relevance, expectancy, and satisfaction. Interest concerns the arousal of learner's curiosity. Relevance relates to personal need satisfaction in the learning situation. Expectancy involves the perceived possibility of success. Finally, satisfaction includes the combination of extrinsic rewards and intrinsic motivation (Keller, 1983).

Personal Causation Theory

Personal causation, which is influenced by the theory of achievement motivation, is the fundamental assumption of deCharms' motivation theory (deCharms, 1976). It means that the cause of one's behavior is the person himself/herself when this person decides to act from personal commitment. Two motivational states, origin and pawn, are basic to personal causation. An origin state refers to an individual who feels that fate is controllable and the cause for his/her behavior is within himself/herself. A pawn state refers to an individual who feels the locus of causality for his/her behavior is external. The origin is positively motivated while the pawn is negatively motivated. To help a student to be an origin is to help him/her develop purpose and commitment so that his/her desired outcome can be reached (deCharms, 1976).

Personal causation involves the combination of doing, thinking, and learning (deCharms, 1984). People are origins at times and pawns in some cases. To maximize students' motivation, deCharms made some recommendations. First, teachers have to trust that all students can be origins. Second, teachers pursue the optimum amount of structure to fit the needs of the class and the individual by giving choices and creating atmosphere (deCharms, 1984).

Situated Motivation

Paris and Turner (1994) held a concept called situated motivation, that is, students' personal motivation in different situations. This concept has four critical characteristics. First, motivation is an outcome of the cognitive assessments (expectancies, values, and probabilities of potential goals, rewards, and satisfactions) that students provide in situations. Secondly, "cognitive interpretations of events are constructed, which means that they are open to distortion by virtue of age, bias, and defensive interpretation" (p. 215). Thirdly, "motivation is necessarily contextualized because individuals create unique interpretations of events, goals, and probabilities in different situations" (p. 215). Fourthly, "situated motivation is necessarily unstable" (p. 216).

Analyses of students' thoughts, feelings, and actions in specific contexts can help teachers create optimal situations that enhance students' motivation (Paris and Turner, 1994). Thus, Paris and Turner further indicated four characteristics of tasks that may promote students' motivation for learning. These important characteristics are choice, challenge, control, and collaboration.

Enhancing self-determination is one way to promote learners' intrinsic motivation, and one of the general methods for enhancing students' feelings of self-determination is to give them choices (Lepper & Henderlong, 2000). After all, the ability to choose is the essence of motivated action (Paris and Turner, 1994).

In Csikszentmihalyi's (1975) model of the flow state, people are aware of the opportunities which challenge them to act and of their capacity to cope with the situations. When the demands for action are much greater than one's capabilities, a state of anxiety ensues. When the demands for action are fewer, but still over one's skills, the experience is worry. When opportunities for action and skills are in balance, the experience is flow. When skills are more than the opportunities for action, the state of boredom occurs (Csikszentmihalyi, 1975).

After students choose personally interesting and challenging tasks, they have to show control and autonomy to reach their goals. Finally, students need to have opportunities to collaborate with others, which are also fundamental to motivation.

Classification of Motivation

According to Woolfolk and McCune-Nicolich (1984), psychologists are likely to have three views of motivation: the original causes of an individual's initiating a certain action, the causes of an individual to move toward a particular goal, and the causes of an individual to continue trying to reach that goal.

Brophy (1987) classified motivation as a general trait and a situation-specific state. On the one hand, general motivation to learn refers to "an enduring disposition to strive for knowledge and mastery in learning situations" (p. 206). In this situation, students usually find learning intrinsically rewarding. On the other hand, specific motivation to learn occurs "when the student engagement in an academic activity is guided by the goal or intention of acquiring the knowledge or mastering the skill that the activity is designed to teach" (p. 206).

Nolen (1988) proposed three motivational orientations. First, task orientation: a person is interested in performing, and disregards the performance of others. Second, ego orientation: an individual has a desire for better performance of a task relative to others. Third, work avoidance: one has a desire to endeavor to do as little as possible and get away with it.

Cronbach and Snow (1977) categorized motivation as constructive and defense. Constructive motivation refers to learners' need for achievement. Defense motivation concerns learners' facilitating anxiety.

Another distinction in motivation theories is primary versus secondary motivation. "Primary motivation is derived from physiological needs such as sleep, hunger and pain avoidance. Secondary motivation is learned and includes higher level needs such as those obtained within a profession" (McNeese-Smith, 1999).

Promoting Taiwan's Adolescent's Learning Motivation in Classroom Contexts through Positive Thinking and Positive Emotion

Ms. Hsun-Chih Huang,
(post-graduate student)
National Taiwan Normal University,
Taiwan

Abstract

This article is based on recent research approaches of educational psychology that combine cognition, emotion and motivation. In this article, positive thinking means cognition and positive emotion means emotion. Due to more and more academic stress, young students in Taiwan get less and less learning motivation. By reviewing relevant literature, this article is to, from positive and preventive perspectives, investigate how to apply the concepts of positive thinking and positive emotion to promote Taiwan's adolescent's learning motivation in classroom contexts.

This article attempts to encourage teachers to help students establish and maintain learning motivation in two major ways. First, teachers cultivate students' positive thinking. Specifically, teachers may guide students to learn how to use Seligman's ABCDE model to dispute pessimistic thoughts and to change negative explanatory style to positive explanatory style when they encounter frustration during learning. For instance, when students don't understand some concepts in class, teachers can encourage them to attribute the sake of the trouble as "temporary ", "specific", and "external". So, they would like to keep learning. Besides, teachers can help them set reachable and practical goals in order to promote students' self-efficiency. Second, teachers cultivate students' positive emotion. It means that, during learning, teachers help students discover and well use their strengths, such as perseverance, ingenuity, etc. Also, teachers may help students e
xperience flow to make sure that they are toward a wonderful positive emotion state. Furthermore, to help students experience flow, teachers should ensure that, during learning process, tasks' difficulties match one's capability. In this way, students would learn happily and grow up healthfully in classroom. Their learning motivation would be promoted.

In conclusion, there are two major ways teachers can promote adolescent's learning motivation in classroom contexts in Taiwan: positive thinking and positive emotion cultivations.

Abstract

Investing in the growth of teachers has become a major facet of current federal and state reform initiatives. The advancement of professional growth of teachers is a valuable tool in school improvement. The most effective way to improve student achievement and advance school success is to increase the quality of teaching occurring in the school through quality professional growth activities. According to research, increasing the education of teachers is the investment that yields the greatest increase in student achievement (31st Annual Phi Delta Kappa, 1999). Schools and students benefit from having quality educators, as teachers acquire new skills and knowledge and "reconnect with what it means to learn and grow" (Duke, 1993, p. 712).

The most valued product of high quality education is an increase in student achievement. The ultimate goal of the professional growth of the teacher is to foster student success. To investigate the issue of teacher professional development and the impact of successful student achievement, a National Science Foundation (NSF) Math and Science partnership grant between the Regional Educational Service Agency II (RESA II) and Marshall University titled MATH was procured and designed to increase the math knowledge of practicing teachers. The research design of the study was a pretest-intervention-posttest experimental design. There was a teacher control group (30 participants) and a teacher experimental group (30 participants) that were matched with about half of the participants in each group being special education teachers and about half being regular education math teachers with similar educational degrees, age, gender, and background characteristics. A total of 364 exper

imental students (students of the experimental teacher participants) and 466 control students (students of the control group teacher participants) took both the pretest and posttest that were comprised of 20 problems dealing with algebra.

The interventions involved in the research study were a summer institute (two weeks in length) and four mini-institutes. The topics covered in the interventions dealt with a DNA blood spatter reenactment and the math involved in estimating the measurement of angles of impact, lines of best fit, and height of impact. The participants were also taught algebra content that centered on intersection of lines, parallel and perpendicular lines, slope, and trigonometry ratios. The topic of problem based learning (PBL), Excel spreadsheet in the classroom, use of graphing calculators, and TI-84 Plus and TI-Navigator were taught during the institutes.

The teacher participants in the experimental group increased their achievement test scores by 15.91% while the teachers in the control group did not have a change in their pretest to posttest percent

scores. Students of the experimental teacher participant group increased their scores by 3.93% compared to an increase of 2.40% for the students in the teacher control group.

Abstract. In the Far East the abacus is widely used as a teaching tool. It is argued that a computer- based abacus could provide a useful teaching aid in the UK for children with mathematics difficulties. This paper will outline research undertaken in UK schools to examine teaching and learning needs of children aged from 5-7 in the area of mathematics. Current design work and future evaluation of a computer-based abacus will be described.

Keywords: Computer-based abacus, mathematics difficulties, dyscalculia, interactive multimedia, multi-sensory learning

1   INTRODUCTION

Research suggests that 6-7% of school children in the UK have mathematics difficulties (Butterworth, 2005). Difficulties in language and mathematics appear to be closely related (Chinn and Ashcroft 1993) and many children with dyslexia are found to have difficulties in mathematics as well as language (Miles and Miles 1992, Bynner and Parsons, 1997).

Dyscalculia is a specific learning difficulty that results in problems understanding and learning mathematics (Rittle-Johnson et al., 2001). In the UK, dyscalculia is defined by the Department for Education and Skills (2001) as:

> *"A condition that affects the ability to acquire arithmetical skills. Dyscalculic learners may have difficulty understanding simple number concepts, lack an intuitive grasp of numbers, and have problems learning number facts and procedures. Even if they produce a correct answer or use a correct method, they may do so mechanically and without confidence."*

In information processing terms, the child may have problems with short term (working) memory (McLean & Hitch, 1999), retrieving arithmetic facts from long term memory (Bull & Johnston, 1997), visuo-spatial perception (McKenzie et al., 2003), sequencing (Geary, 2004), spatial awareness (Gifford, 2005), problem solving (Geary, 1994) and perceptual motor difficulties (Staves, 2001) and directional confusion (Geary, 2004). As a result, children who have dyscalculia may have difficulty with calculations, and with rapid processing of maths. They may find it hard to understand the concept of numbers, to add and subtract, remember sequences, and may reverse or transpose numbers (Dyscalculia Centre).

Research suggests that the area most commonly found to create difficulties is 'memory for arithmetical facts' (Dowker, 2004). This refers to the ability of a child to grasp simple mathematical concepts, thinking about numbers and the relationship between them (e.g. $8 + 5 = 13$, $24 - 13 = 11$, $6 \times 9 = 54$).

Children experiencing difficulties, often rely on counting strategies (e.g. counting fingers/objects); whereas unaffected children at the same age are able to rely much more on fact retrieval (Ostad, 1998; Cumming and Elkins, 1999). Other common mathematics difficulties include use of the language of mathematics, basic numeracy concepts such as the immediate recall of simple number bonds, learning multiplication facts and tables, as well as sequencing and directional problems.

There is little research on dyscalculia in general, and those studies carried out, have not received wide publicity (Dowker, 2004). There is a much stronger focus in the research literature on literacy problems (Cohen Kadosh & Walsh, 2007). However, it is argued that poor arithmetic skills are in fact, more of a handicap in the workplace than poor literacy skills (Bynner and Parsons, 1997). Struggling with mathematics can be common amongst children without specific learning difficulties, so is an important area for attention. Despite this, there has also been little in the way of recent design developments specifically targeted at children struggling with mathematics during the early school years.

1.1   Cross cultural transfer of teaching methods

The literature indicates there is limited cross-cultural transfer of teaching methods from East to West (Bishop, 1988). Fuson (1992) suggests that there is a need to develop and test new ways of teaching mathematics and specifically to test and adapt approaches from cultures that seem to be more successful in mathematics teaching.

Research findings reveal enormous discrepancies in young children's levels of mathematics competencies, and these discrepancies appear to be larger in Western countries than they are in some other countries in the Far East (Starkey & Klein, 2008). Although no formal research been undertaken regarding the prevalence of mathematics difficulties in the Far East, in general, pupils in the Far East perform well in international comparisons of mathematics achievement (Geary, 1996; Wang and Lin, 2005; D'Ailly, 1992).

One mathematics tool widely used in the Far East, but rarely seen in use in the UK is the abacus (Fuson et al., 1988). The abacus is a device used to perform operations in mathematics, mainly addition and subtraction. At a more complex level of operation it can also be used for multiplication and division. It does not require pen and paper to perform calculations, but is solely based on the visual representation on the counting board or frame. It can be used for any base number system (Young, 2004). There are various formats of the abacus from the ancient counting table, to a frame with strung beads (bead frame). There are 3 main forms of abacus still in use today; the Chinese abacus (Suan-Pan), the Japanese abacus (Soroban), and the School abacus (originated from the Russian Schoty) (Pullan, 1968). The Japanese abacus is pictured in use in Figure 1.

Figure 1. School children in the Far East performing calculations using an abacus.

The validity of the abacus as a mathematics teaching tool has been demonstrated for 'normal' students in the Far East (Chen et al., 2006). Chen et al (2006) demonstrated that changes to the brain occur with intensive training and practice on the abacus. This study used fMRI brain scanning to explore the brain activation differences between abacus experts and non-expert subjects. They found that solving computation-based problems involved more visuo-motor imagery processing, and very low level use of executive function in a group of expert abacus users compared to a group of non-experts. They also demonstrated that abacus experts tended to use fewer and more effective strategies in mental computation, which may account for the outstanding computational skills of abacus experts.

The evidence suggests that as a teaching aid, the abacus does not result in high levels of dependence. In fact, skilled abacus users are able to visualise a mental image of the abacus, and performing rapid mental calculation by manipulating imaginary beads in their brains (Stigler, 1984). As a result the users develop effective mental calculation ability.

In Sudan, Irwing et al. (2008) have shown the abacus to improve mental arithmetic and reduce dependence on rote learning and memorisation. They showed that abacus-based training supports mental arithmetic and provides benefits to working memory which are advantageous to the performance of other mental processes. As a result they believe that the abacus can provide a greater emphasis on problem solving skills which may lead to an increase in general intelligence.

Cotter (1996) reports findings that show using the AL abacus may help children develop a mental abacus as well as to develop arithmetic concepts such as place value and mental computations. AL abacus is a physical plastic frame that introduces simple number representation. The visual representation of an AL abacus such as the arrangement and colour help children understand the structure of numbers in an easy and effective way and avoid a reliance on counting.

Furthermore, a Japanese study showed that given the right circumstances, abacus-based learning can promote motivation and achievement in school mathematics, and general attitudes towards the subject (Shwalb et al., 2004). The research on use of the Japanese abacus explored its influence on mathematics learning and motivation in formal school settings. It was found to have a positive influence on mathematics education. The existence of the mental abacus was supported by the reports of many children, and was seen to be related to motivation towards mathematics and calculation skills.

Despite the emerging evidence of the benefits of the abacus, we are not aware of any existing research demonstrating use of the abacus for children with mathematical learning difficulties, or indicating extensive adoption within the UK. It is likely to be an appropriate tool to support children with learning difficulties because it conforms to the principles of tactile learning; provides a visual aid; and enables left to right reading avoiding confusion (Shen, 2006).

1.2   Computers and mathematics education

The use of computer-based learning or ICT (Information and Communication Technologies) is widespread in the UK (BESA, 2008) and strongly recommended within the National Curriculum (2009). The availability of ICT impacts how children learn mathematics (Yelland, 2001). It can enable experimentation, logical thinking and problem-solving. It can help children observe, explore and

explain patterns in numbers, shape and data, and develop mathematical vocabulary and language (National Curriculum, 2009).

It has extended benefits of motivating and engaging children and encouraging confidence and independence in learning (Higgins, 2003; Yelland, 2001; Valentine et al., 2002). However, there are few available programmes aimed specifically at mathematics and specifically dyscalculia (Parliamentary Office of Science and Technology, 2004). It is proposed that an ICT-based abacus could offer significant advantages to children with mathematics difficulties in the UK.

1.3   Aims

The literature indicates that mathematics difficulties are a significant problem in the UK. However there has been limited attention to research and development in this area. Here, we suggest a novel way of supporting UK children through the development and introduction of a Far Eastern teaching tool. A computer (or ICT) based abacus is proposed as a way of capitalising upon, and updating this traditional mathematics aid.

Through this study it is aimed to explore user needs for an ICT-based abacus through a user-centred design process (Stanton et al., 2005) and determine the feasibility of the concept for teaching children with mathematics difficulties. Here, the initial user requirements research stage is described. We then go on to describe current design work and future evaluation.

2   METHODOLOGY

A user-centred design process involves extensive consideration of the needs, wants, and limitations of the end user at each stage of the design process. This methodology adopted involved the collection of teacher and child needs in the design of a novel teaching aid for mathematics difficulties. This was undertaken through a review of existing products, observation in the classroom, and 1:1 interviews with teachers. Classroom observation was carried out to gain an understanding of mathematics difficulties and see current teaching methods in use. Interviews were used to follow up the observation sessions and gain a more in depth understanding. Ethical approval for this element of the research was obtained from Coventry University Ethics Committee.

2.1   Participants

Observation of 14 teaching sessions with 7 different teachers was observed. Group teaching was observed in 3 main stream schools (7 sessions). This included classes of 11-25 pupils, at least 2-5 pupils per class experienced mathematics difficulties, some of which were severe. Small group teaching, of up to 5 children per class was observed in 1 special education school (2 sessions). Five, one to one teaching sessions were observed at a dyslexia centre. The length of each teaching session lasted between 45 and 90 minutes.

Interviews were undertaken with 8 dyslexia teachers in the UK (with 5-15 years experience), 7 of which had been observed teaching. A further interview was undertaken with a Malaysian teacher with experience of running her own learning support and intervention service in Malaysia. All of the teachers were female.

2.2   Procedure

Informed consent was gained from the teachers, the children and their parents involved in the research. A protocol was developed for structuring the observation. This included focussing on pupil difficulties, the teaching methods employed, physical or computer-based tools in use, and students' responses to the teaching (e.g. motivation and attention). The observation sessions lasted between 45 and 90 minutes.

Interviews with the teachers were held following the observation sessions. A semi-structured interview format was followed, this comprised of questions relating to problems and strengths of children experiencing mathematics difficulties, teaching materials and methods they employ, and their views on current product/tools that are available. The interviews were taped and written notes taken.

The observation and interviews enabled identification of the teaching tools and techniques available for children with learning difficulties. This process was supplemented with a literature and web search. These tools were reviewed by three of the teachers and the first author based on criteria such as ease of installation, use and control, sound and graphics quality, learning objectives, teaching methodology appropriateness for children with mathematics difficulties.

3   RESULTS

The findings from the research reported in this paper highlight pupil difficulties, teaching methods and tools currently in use, as well as pupil responses to these. The research focused on Key stage 1 in the UK education system (typically age 5-7 years) as the literature about early child development indicated that this was the time during which a basic foundation should be developed to enable later building of more abstract concepts of number and arithmetic.

3.1   Challenges to pupils

The research revealed that many students struggle with elements of mathematics, particularly numeracy concepts, and practical mathematics skills needed to function in everyday life. Other common challenges included:

- counting
- properties of numbers and number sequences (e.g. counting numbers reliably forward and backward up to 100; knowing the number names and reciting them
- place value and ordering (read and write numerals up to 100; understand 23 is made up of 2-tens and 3-units etc.)
- estimating
- simple calculations (to solve problems using counting, addition, subtraction, doubling and halving)
- using mathematical language (read, write and order numbers)
- remembering times table

It was observed that the answers to mathematic problems often seem more important to children than the working steps of calculation. This makes it difficult to determine whether they understand the rationale of the calculations, and hold knowledge that can be built upon.

3.2   Teaching methods

The teaching tools and techniques currently employed in the UK have been identified and analysed. Many different teaching methods are used to deliver numeracy concepts. Most of these tools are physical artefacts, rather than ICT products.

The existing methods can prove impractical for problems with high values, or for use in formal exams (e.g. counting fingers and objects). Some of the teaching aids can lead to reliance, so that children reach the correct answer without understanding the rationale (e.g. Number-line & 100-square).

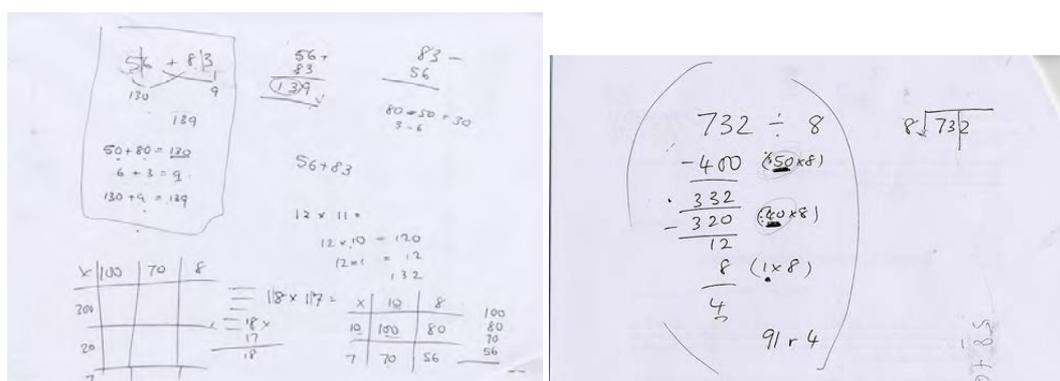
Some teaching methods were reported to be confusing, requiring students to perform many steps to complete the task (for example see Figure 2.). This is challenging for students with short term memory deficits, as is often the case for children with learning difficulties.


Figure 2. Complicated calculation steps may lead to confusion.

The teachers interviewed were willing to try new and varied methods to suit individual children, and specifically developments for children with dyscalculia. They all felt that they do not currently have adequate tools for improving mental arithmetic. As a result, some had developed their own methods to help pupils grasp numeracy.

The abacus is not widely used in the UK for teaching mathematics, and has not been explored for children with learning difficulties. Only 3 teachers had used a western abacus in teaching, and just for counting numbers. They were not fully utilising the functions of an abacus and were unaware of how it could further facilitate early numeracy. They were, however keen to explore this further.

3.3 ICT

The literature indicates that computer-based learning is attractive and motivating to students (Rieber, 1996). The classroom observation and interviews with teachers indicated that the graphics, animation and independent working are engaging and motivate child participation. This is important to raise confidence and self-esteem, which often dyslexic children are lacking.

Despite the advantages offered by this format, most of the tools used are physical artefacts. The available computer programmes (e.g. NumberShark®), are mainly game based and dyslexic children can be distracted by the colourful graphics and sound effects (McFarlane & Latorella, 2002).

4   DEVELOPMENT OF A COMPUTER-BASED ABACUS

In the Far East the abacus is widely used as a teaching tool. It has been shown to improve mental arithmetic and reduce dependence on the calculator. It conforms to the principles of tactile learning; provides a visual aid; and enables left to right like reading avoiding confusion and so may provide benefits to children with learning difficulties (Shen, 2006).

The area most commonly found to create difficulties for pupils with dyscalculia is developing an understanding of fundamental numeracy concepts and the relationships between numbers (Dowker, 2004). Mathematics and numeracy is a sequential subject which builds upon early knowledge and skills. Therefore remembering the fundamental numeracy concepts are essential and a tool for supporting this would be of value.

4.1   Rationale

It is proposed that in an ICT format, the abacus could add to the advantages offered by the physical abacus by offering an engaging and motivating learning experience. Therefore a computer-based abacus for supporting pupils with mathematical learning difficulties is being developed.

The tool will be directed at Key stage 1 in the UK education system (typically children aged 5-7 years). At this stage it will enable building of mental arithmetic, and most children are able to follow rules and methods.

4.2   Software development

The abacus is being designed using Macromedia Flash software. It will run on both Microsoft Windows and Apple Macintosh machines. This will enable interaction using a mouse, touch screen and keyboard.

This platform will enable use in class for demonstration, and practice on a smart board, or at home by the pupil.

4.3   Abacus design and layout

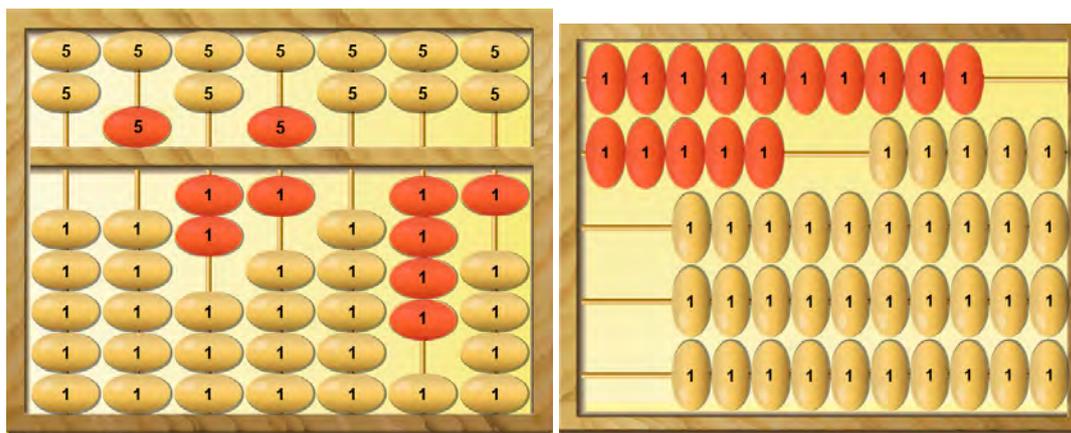
The interviews indicated that the Chinese and Japanese abaci formats were not familiar to teachers and were complex to learn in the West. The beads represent different values (e.g. upper deck beads representing values of 5, lower deck beads representing values of 1) (see Figure 3.). This requires a certain amount of basic mathematical knowledge (i.e. the relative worth of 1 and 5, and the ability to count in 5s). Operation is also dependent on the capacity to hold information in the working memory when performing calculations which involve carrying and borrowing. These would present specific challenges to young children and those with mathematic difficulties.


Figure 3. Eastern abacus (left) vs. Western abacus (right)

Therefore the software abacus has been developed based on the Western model. This is more straightforward, as each bead represents a value of 1, arranged in blocks of 10. This facilitates simple counting strategies reinforcing the properties of numbers as discrete units. Simple sums are readily visualised, and the concepts of tens and units and borrowing can be demonstrated.

Whilst it is not used widely in schools, the format is familiar to most children and teachers.

The physical Western abacus however cannot be used in such an advanced manner as has been demonstrated by the Chinese and Japanese abaci in the East.

4.4   Abacus activities

The advantage of ICT is that the format can be enhanced to enable additional tasks and functionality built in and it enables a log of performance to be retained. The computer programme will incorporate a resource of different learning tools designed around the abacus concept.

It will focus on different sub-sections of the curriculum standards set by 'National Literacy & Numeracy Strategies: Curriculum Standards'. In particular, the exercises will focus on developing mental images of quantities, strategies, and mathematical operations and understanding basic sets and numbers (e.g. ordering, steps of the sequence i.e. every number, every second number, and grouping) (Department for Education and Skills, 2002).

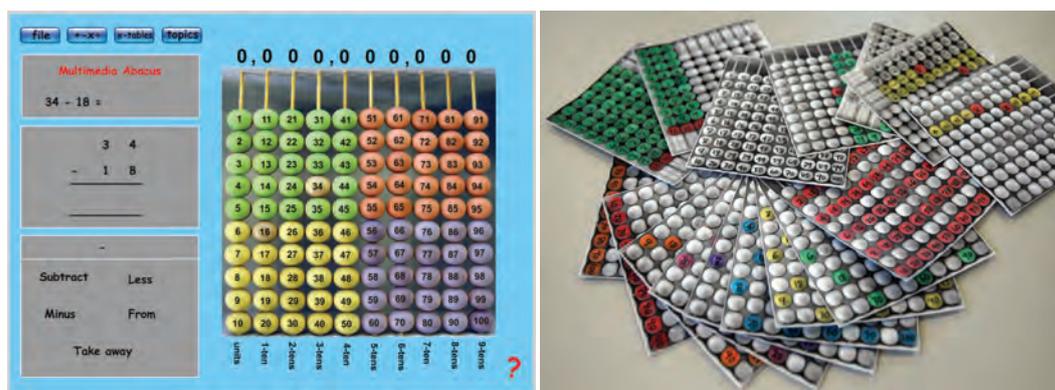
The programme will offer a combined suite of tools building on existing physical tools used in schools. It will incorporate abacus-based activities for children to grasp number sense and numeracy concepts. Figure 4 shows some early paper prototyping to explore the tasks and activities. The final design will incorporate tasks that focus on the development of early numeracy concepts and arithmetical facts. It will enable a child to practise counting, place value, recognition of odd and even numbers, addition, subtraction, multiplication and division.


Figure 4. Paper prototyping explores the possible abacus activities.

4.5   Learning support

The presentation of multi-sensory information within the abacus programme will meet the needs of children with varying learning styles and reinforce the learning experience (Orton-Flynn & Richards, 2000). Furthermore, the provision of graphics, sound and tactile interaction (through the touch screen) will support spatial thinkers and visual and kinaesthetic learners (Doyle & Rutherford, 1984).

The programme can be personalised and therefore set for the different needs of children in regards to topic, level of difficulty, complexity, visual needs, background knowledge and interest. The activities undertaken can be saved and performance over time logged for each child. Activities can be flexibly set in terms of time frame needed, repetition of visual representations, instance feedback, and rewards in order to support the learning curve.

4.6   Future Work

Evaluation of the ICT abacus in UK schools in due to begin in October 2009. An iterative user-centred design approach is being adopted (Stanton, 1998). This will involve evaluation of whether the learning objectives have been met by the programme, and an assessment of the programme's usability.

Usability evaluation is an essential validation phase that considers the extent to which a product achieves its specific goals, with effectiveness, efficiency and satisfaction (ISO, 1998). Initially a mock up will be evaluated informally with teachers in terms of the usability of the system.

Once reliability and usability has been established, a working prototype will be taken into schools and the impact of the tool on children's level of understanding, and learning of basic mathematics concepts will be evaluated. Children at Key stage 1 will take part in the study, as well as children identified to have specific mathematics learning difficulties. This stage of evaluation will also involve qualitative feedback on the engagement and motivating qualities of the software and usability assessment, to ensure ease of use is achieved for both teachers and children.

5   CONCLUSIONS

This paper has described initial research undertaken in the design of ICT for children with mathematics difficulties. Based on the transfer of a teaching tool used widely in the Far East, a computer-based abacus is being developed. A user-centred design approach is being adopted to build in activities based on National Literacy and Numeracy Strategies to address Key stage 1 learning outcomes. The resulting tool will cater to the needs of children with learning difficulties and offer the benefits of conforming to the principles of multi-sensory learning, providing a visual aid allowing tactile exploration, and enabling left to right reading. Ongoing work involves the iterative design and evaluation of the resulting software.

Abstract

Lesson study is a hot issue in the world. Many researchers conducted several studies and reported their results to say how they improved their lessons by the way of teacher's reflection or students' learning portfolios. A big problem is that it is difficult to evaluate student's engagement scientifically. Therefore, how to measure the active learning attitudes and students' learning effect in Mathematics lessons is still a very important issue in Taiwan. This study is to explore the characteristics of "Flanders' Interaction Analysis System" and then apply this technique to analyze a video tape of mathematics lesson. We cut the 37-minutes video tape into 1163 units and then used 10 category, 22-category and 18-category systems to analyze the video and paper data. Finally, we got 1174 codes totally to span some tables. After the data analysis, we found that: the value of "Percent teacher talk" is 54.94 (norm=70); "Percent student talk" is 36.54 (norm=19); "Teacher response ratio" is 79.95 (norm=35); "Teacher question ratio" is 68.75 (norm=20); "Pupil initiation ratio" is 39.39 (norm=35). All the evidences indicated that it was a typical dialogue teaching. The teacher used questioning to guide classroom discussion. Both Percent student talk and Pupil initiation ratio shows the students were active during the teacher-student interaction. A continuing challenge for this study is to modify the evaluation category for mathematical teaching and to identify the content and thinking elements to reinforce the interpretation power of "the content cross ratio".

Abstract:

Students in the pre-college Foundation Program (FP) at Qatar University study Mathematics in English. In such circumstances would the assessment method impact the learning process? This paper explores two approaches that were experimented with 217 students to determine if the exam delivery method has an impact on student performance. One assessment method was completely paper based and the other fully computer based.   In this paper we will explore the benefits and shortcomings of each method.

6   PARTICIPANTS

In this paper, the selected sample is from Science, Engineering & Pharmacy track consisting of two semesters of intermediate algebra, pre-calculus & trigonometry (Math3 & Math4).

This study took place in the Department of Math and Computer (DMC), Foundation program at Qatar University. There were 217 students from 11 math groups participating in this study. All enrolled in the first level (Math 3). This sample is made of 4 Male groups with a total of 78 students and 11 female groups with a total 139 students. The sample is a combination of repeating students and newly enrolled students in the course.

7   INTRODUCTION

Web based exam WBE also known as Computer-Based Testing (CBT), e-exam, computerized testing and computer-administered testing, "is a method of administering tests in which the responses are electronically recorded, assessed, or both. As the name implies, Computer-Based Assessment makes use of a computer or an equivalent electronic device (i.e. handheld computer)." (Source: *Wikipedia*).

The mission of the Foundation Program (FP) is to prepare high school graduates to meet the minimum common entrance requirements in English language, Mathematics and computing skills, as set by Qatar University, and specific entrance requirements, as set by the University colleges.

In order to enhance the performance of Science & Engineering students and to encourage them to work continuously during the semester the DMC introduced an additional set of exams called *mini-exams*.

Mini-exam duration is 50 minutes with the possibility for a student to have a second chance (i.e. take the exam a second time but with a different exam version) in the event that s/he fails the first attempt.

Each mini-exam is held once a month and is worth 3 percent of the overall student total grade for the course. It is the responsibility of the student to register for **three** mini-exams during the semester. Each mini-exam is worth **three marks** totaling **nine marks** of the course grade.

Each mini-exam is administered outside regular classroom hours during two days which are specified by the DMC at the beginning of the semester and published in the syllabus as well.

Different exam versions are always administered for each trial. By passing the first try the student will earn the full 3 points of that exam. Passing on the second try will result in earning only 2 points. Failing both tries but with a combined score of 70% or more for both attempts will result in earning only 1 point; otherwise no points are earned for that mini-exam. Students are not allowed to take both tries within the same day.

8   WHY COMPUTER WEB BASED MINI-EXAM?

These mini-exams are administered by the DMC for over 700 students (2 math levels). It requires large resources such us classrooms, tutors, and proctoring staff. The three main challenges facing the DMC during mini-exams are:

1. Exam papers should be graded and posted for students within 48 hours after exam. This will give time to students who failed to prepare for the second trial.
2. Since grading is done in a short period of time for a large number of students, errors in students' grades were always reported.
3. Some versions of the mini-exams have different degrees of difficulty and this is unfair to students and consequently the results do not reflect exactly the students' levels.

In order to meet all of these challenges and to administer the mini-exams efficiently, the DMC moved the paper-written mini-exam to a Web Based Test using Learning Management System Blackboard. In order to make students familiar with this new system, the DMC has implemented in the computer course level 1 syllabus the features, tools and functionality of Blackboard. In addition, the use of Blackboard for all math courses is mandatory starting fall 2008.

 A committee was assigned the task to create test pools consisting of questions consistent with the syllabus. This mini-exam Implementation Committee, MIC, was tasked with the transformation of both Math3 (first level intermediate algebra with trigonometry) and Math4 (second level intermediate algebra with trigonometry) paper based exams to randomly generated Computer Based Exams using the Learning Management System on Blackboard.

After three months of having been handed the task, in spring 2009, MIC had reached its first objective. It had delivered the mini-exams online to Math3 students. To meet the pedagogical concept of delivering a variety of question types to students, MIC has created a large number of test pools which

were populated with an appropriate variety of question types: true/false, multiple choice questions, multiple answers questions, hot spots, and fill in the blanks.

At that point the exam had been run six times (both try1 and try2) successfully and had received great feedback from students and faculty members. The MIC continues to work on the second objective to get the same results for the Math4 course.

9   MINI-EXAM E-REGISTRATION (MEE)

The online registration system developed in the University has been designed to smooth the process of mini-exam registration. It gives the opportunity for students to select the exam date, time, and location that are convenient to their course schedule. MEE is a web application that allows online registration by functioning as a web server that accepts and responds to the requests made by the users. In short, students can organize their mini-exams schedules through the internet.

10   GOING TO LEVEL 2 COURSE: THE VISUAL APPROACH

In the Foundation math program, Math3 is a rather technical course centered on studious algebraic manipulations and is, therefore, extremely abstract.   For this very reason it was relatively straight forward process to build the test bank for Math3 in 3 months' time.

On the other hand in Math4 the content (Functions, Reading Functions, Transformations, Quadratic Functions, Operations on Functions, Exponential & Logarithmic Function and Trigonometry) calls for both algebraic **calculations** and the concept of **visual** interpretation of results. Therefore we use a different approach which is to teach students techniques that help them interpret the solutions based on mathematical reasoning combined with visualizing the problem. This approach also functions as a critical thinking method to help students' reasoning capabilities.

 In our approach we lead students to visualize, and to represent intuitively and easily, various functions starting with simple cases and progressing to complex cases. In this way, the ***techniques*** of problem solving are acquired incrementally. Students gain strength, confidence and insight into investigative methods, ***naturally***, by handling the solution of simple to complex tasks in stride. With our method, students are not blind-sided by the sometimes daunting invasion of algebra into the realm of calculus. With our technique, students identify the class to which a function belongs and step by step trace what seems easier (basic functions), then gradually reconstitute the given expression.

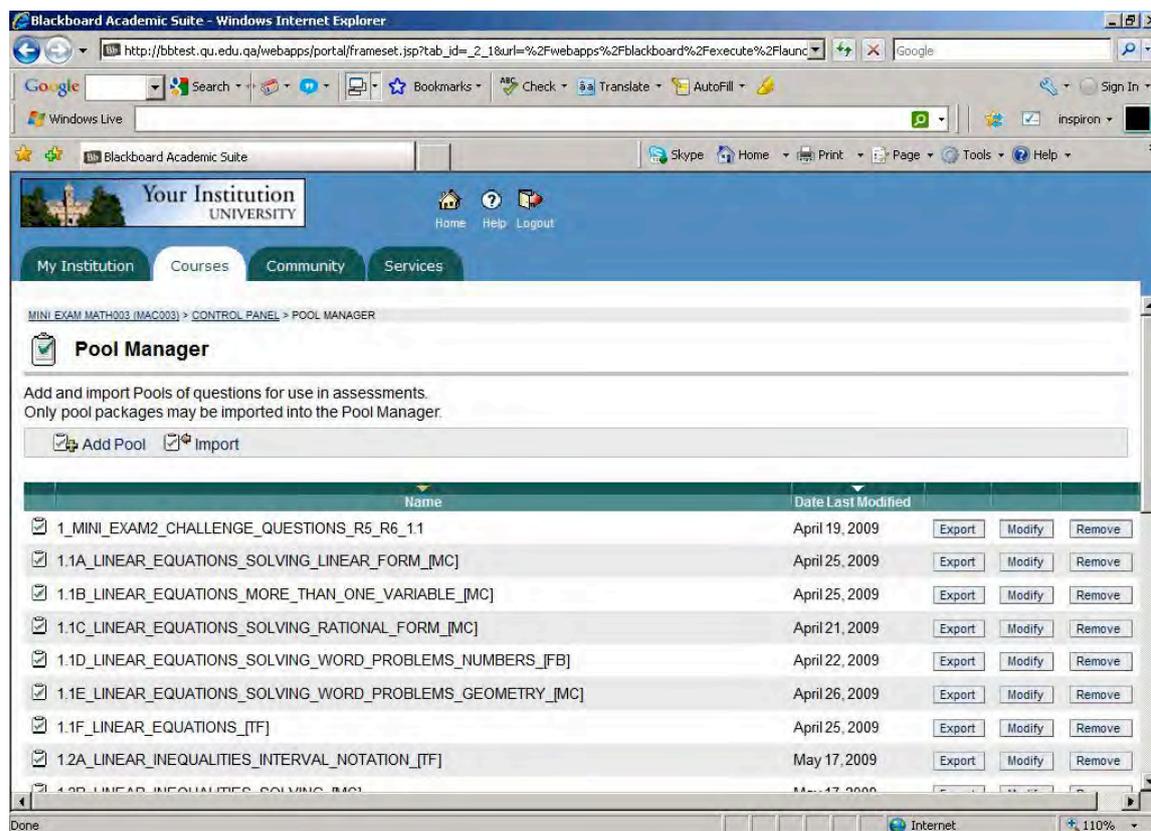
11   WEB-BASED INSTRUMENT

To generate high quality of graphs for the mini-exam test bank, the authors chose the software **Acrotex** [1] which consists of Adobe's **Acrobat** software and the mathematics typesetting system **Latex.** For instance, you may look at samples of resources online [2] where students can find mixed assortment of course files. These on line course materials were designed to help students to practice and get prepared for mini-exams, midterm and final.

A sample of question using Acrotex tool.

12   WEB BASED TESTING

The search for a suitable testing tool to give the joy of seeing good and clear pictures to students was a top priority to authors in designing the test bank for Math4. If we neglect the visual aspect of problem solving, and put more emphasis on algebraic methods, our exam delivery efforts may not fully be beneficial due to algebra's abstract nature. A significant amount of calculus concepts can be taught more effectively using visualization especially if supported by graphs.

The following image shows the pool manager of questions following a specific syntax, for example 1.1A_LINEAR_EQUATIONS_SOLVING_LINEAR_FORM_ [MC] represent a pool of questions that covers the section linear equations and the type of questions [MC] stands for multiple choices.


Two samples of questions chosen from the Math 3 (level 1) pools

Below a sample of a question chosen from the Math 4 (level 2) pools of questions.

13   COMPARISON RESULTS

In this section, we compare Math 3 students' results of Mini-exam 2 (ME2) done using paper-pencil during the term spring 2008 and web based exam done during the term spring 2009. The sample of students is almost identical with a slight higher number of female students during the spring 2009. There were almost no changes in students' results.

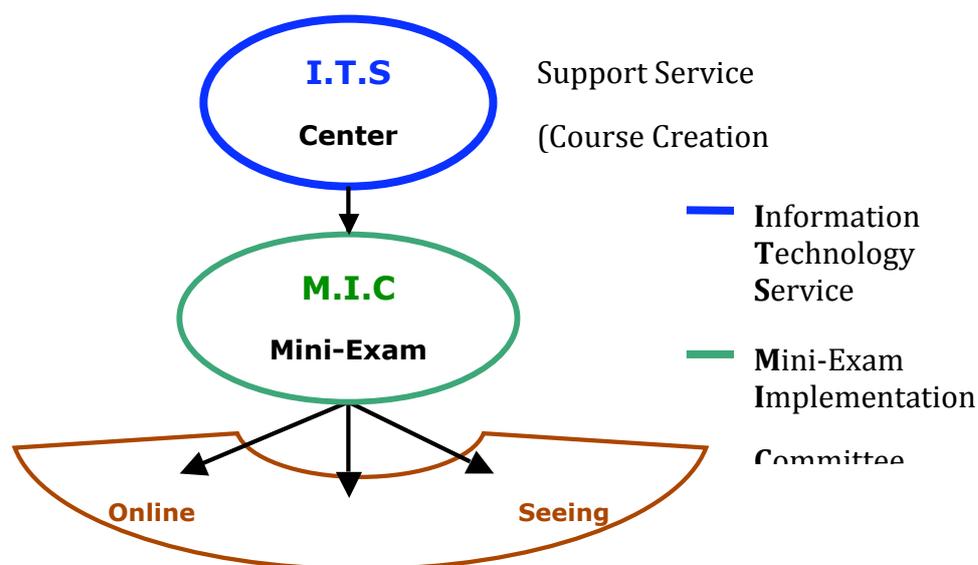
The following organizational chart helps to understand the structure of the WBE process at FP, Qatar University.


14   CONCLUSION

This pilot project was started during the semester of spring 2009 and the MCD is continuously evaluating and studying the impact of this new method of assessment in the student learning process. For the fall 2009 semester, MCD will run online mini-exams for both levels. More data will be collected and therefore the authors plan to make a thorough comparison of students' results with pencil-paper vs. online mini-exams. This will be the subject of the next paper.

Automating the Mini-Exam leads to students' error free grades, less paperwork, and the student is able to see his/her grade and feedback right after submitting the test.

.

In this paper, the authors have reported the results of a great team work. The help of QU Information technology Center staff was remarkable and efficient. All tutors and teachers within the DMC contributed to facilitate the process and the logistics in all mini-exams.

Different solutions ? Teacher professionalisation in an era of reform in Scotland and Hong Kong

Professor. Janet Draper
Hong Kong Baptist University
Professor Jim O'Brien
University of Edinburgh

Abstract

How professionalised is teaching ? Debates on this topic have raged for many years and more recently in many parts of the globe teachers' work and professional status has been under pressure from economic and educational reforms. While in some places reform has been understood to threaten and undermine teacher professionalism, in others (reform through teachers rather than reform of teachers) evidence has emerged of teacher autonomy and professionalism being maintained and even enhanced by reforms (Tatto, 2006). There are of course many facets to professionalism including control of access to the profession through qualifications, standards and regulation, teacher autonomy, commitment to improvement and recognition of the complexity of judgement inherent in teaching . This paper draws on research by the authors in Scotland and Hong Kong, looking at the different paths to professionalism which have been followed in these two contexts, with a particular focus on professional formation and teacher development from initial teacher preparation through early induction into teaching to opportunities and support for continuing professional development and professional leadership. It will draw on theories of professionalism and critically consider the contribution of these to an understanding of the professionalism journeys. It will consider the extent to which the processes in place to support the development of teachers reflect distinctive local solutions to a global shift towards teacher professionalisation

Teacher Development in an Asian Context

Hector Luk
Gerald Williams
Jonathan Aliponga
Midori Sasaki
Keiko Yoshida
Kansai University of International Studies

Abstract

This research-funded project focuses on teacher development with the aim of establishing a teacher development program. The ongoing project is being implemented at selected tertiary schools in Japan, Vietnam and Thailand. It seeks to equip teachers with the necessary knowledge and skills to meet the specific needs of the students, and to develop learner autonomy and critical thinking. A significant part of this is the development of a non-prescriptive teacher self assessment guide.

Background

For the past few years, students at the authors' university have been involved in study abroad programs in Vietnam and Thailand. At the same time, we had the opportunity to observe English classes in local schools and we noticed that teachers in Japan, Vietnam and Thailand had similar teaching practices. It also became apparent that many teachers were not getting what they expected from their students, that is, to be able to communicate in English. With the aim of helping teachers to improve their teaching and to develop their own materials, we formally began our research with class observations of English classes in Japan, Vietnam and Thailand. Along with the class observations, we conducted interviews with the teachers before and after the lessons observed. In September 2008, the findings from these sessions were presented at a teacher seminar in Vietnam. Teacher concerns and needs raised at the seminar led to the development of a Teacher Self Assessment Guide. This guide is currently being trialed in schools in all three countries.

Literature Review

Teacher development, like professional development as emphasised by Diaz-Maggioli (2003), is an ongoing learning process in which teachers voluntarily learn how best to modify their teaching to the learning needs of their students. As expected, the role that teachers play in the classroom is vital, and Carey (2004) and Haycock (1998) have emphasised the increasing recognition that teachers are the most important factor in student achievement. However, Smith and Gillespie (2007) pointed out that regardless of whether it is the teachers' background and qualifications, teaching methodologies, or alignment of standards with curriculum and accountability that leads to learner success, each of these depends on effective training and preparation of the teachers. Marva Collins (1992), an American educator and National Humanities Medal recipient, put it succinctly when she said, "Don't try to fix the students, fix ourselves first" (p. 9). Indeed, well-informed teachers pay attention not only to the conduct and behaviour of their students but also to their own actions. In fact, Ur (1997) pointed out that self-reflective observation of classroom practices is a necessary part of the teacher development cycle. Kayler and Weller (2007) emphasised the idea of self-reflection as one component of a cycle, stressing that improvement should be continuous. In reviewing their own practices, not only are the teachers able to detect any areas of their teaching that may be deficient or problematic, there is also increased awareness of the impact of their teaching on their students (Kayler & Weller, 2007, p. 143). When teachers initiate changes to better themselves professionally, they are also making meaningful contributions to the students' learning experience, and this in turn would be reflected as growth on the program or institution itself (Hrach, 2001-2002, pp. 6-7). Furthermore, self-evaluation is not only valuable for improvement of the teachers, students and the program, it also gives the teachers ownership, individual voices and control of their own teaching (Contreras, 2000; Fritz, 2001; Kayler & Weller, 2007).

Project Framework

The aim of this project is to develop a teacher training program in Japan, Vietnam and Thailand. The first stage of this project involved classroom observations at selected public and private primary, secondary, and tertiary schools in the three countries. This was done to explore classroom processes relevant to language use, content focus, content control, skills focus, and type and source of materials

used (Spada and Frohlich, 1995). As a result of the interviews and observations, many participating teachers came to realise that there was incongruence between their teaching beliefs, their expectations from a classroom and what actually took place in the lessons. In the second stage of this project, the data from the observations and interviews were presented at a teacher seminar in Vietnam with over 80 local English language teachers and graduate students of English teaching. Common basic questions and needs among the participants of the seminar were identified, leading to the development of a Teacher Self Assessment Guide. The third stage, trialing the self assessment guide, is currently taking places in schools in the three countries. Throughout the stages, this project does not seek to prescribe any particular teaching methodology. Its objective is to encourage teachers to be to self reflective in their teaching so that they are able to design and develop their own materials that are supported by their teaching philosophies and suited to the needs and interests of their students.

Participants

The participants in this study comprise of selected public and private primary, secondary, and tertiary teachers in Japan, Vietnam and Thailand. They were chosen using the non-probability sampling, specifically the availability or convenience sampling. In each country, we received assistance from teachers with whom we have established professional relationships. For example, in Japan, we sought permission to carry out classroom observations from our University, schools of our colleagues, and high schools we had visited for our University's high school visit program. In Vietnam, the Office of International Affairs of the University of Social Sciences and Humanities (USSH) in Ho Chi Minh City obtained permission for us to observe classes of their English teachers. The same Office also facilitated our classroom observations at primary and secondary schools with which they have connections. In Thailand, we made contact with individuals from Thammasat University with whom our University has an international exchange agreement. For our teacher seminar in Vietnam, an open invitation was sent to our colleagues and their associates, as well as teachers the teachers who participated in our class observations and interviews.

Stage 1 – Class observations and interviews

In trying to understand the nature of interactions in the language classroom, two types of instruments were prepared. One is a pre-lesson interview questionnaire. It asked teachers about their education background, teaching methods, philosophy of teaching, problems encountered in the classroom and solutions to the problems, student performance assessment, use of homework, and expectations from students. The second instrument is Spada and Frohlich's (1995) Communicative Orientation of Language Teaching (COLT) Observation Scheme. The scheme was designed to describe the complexity and diversity of instructional events in L2 classroom settings. This includes the variety of activities and modalities used, the type of language that learners produce in pair or group work, the types of questions teachers and students ask each other, the kinds of verbal interactions which take place within different tasks, the lesson's content focus, the control of content and even the type of source of materials used. The original COLT observations scheme has two parts, but only Part A was used in this project. Part A, the macro-level analysis, involves real-time coding that details classroom activities on five levels (Yu, 2006). These are *activity type* (kind of tasks and exercises that students need to perform during the lesson), *participant organisation* (teacher-centered or student-centered activities), *content* (code-based or meaning-based), *student modality* (time spent on listening, speaking, reading, and writing), and *materials* (type, length and sources of texts used). The scheme was not modified for this study.

Before the classroom observations took place, permission was sought from the schools, teachers and their students. In Japan, we visited schools where we taught previously and also observed classes at our university. We also visited high schools that are part of our university's high schools visit program. Formal letters were sent to the principals for approval. In Vietnam, we explained our research objectives to the Office of International Relations of USSH, followed by a formal letter to the Office asking for permission to conduct classroom observations. After permission was granted, the Office contacted teachers from USSH, and the principals from different public and private primary and secondary schools about our project. The same procedure was followed in Thailand. Only teachers and students who had given their agreement to be observed, recorded on video and allow us to publish materials based on their classes were observed. We confirmed this agreement with the teachers and students before each class observation.

For the observations, each of us observed classes separately when possible. The lessons were recorded with a video camera. Using video analysis to study teaching and learning resources has some advantages (Stigler, Gallimore & Hiebert, 2000). It allows for in-depth examination of complex activities from different points of view. It also preserves classroom use of teaching and learning materials by many people with different kinds of expertise, making possible detailed descriptions of many classroom lessons. Furthermore, it increases the opportunity to develop powerful theoretical observational systems to analyse the use of resources in the classroom and learning situations. During the observations, besides recording in the COLT scheme and by video, we also made observational notes or anecdotal notes to record anything that may not have been within the scope of the COLT scheme and not captured by the video camera. After the observations, we also conducted post-lesson interviews with teachers to clarify any questions we may have had about their lessons.

In analyzing the classroom activities, data from the COLT scheme was used to determine the language teaching and learning nature of the lesson. For example, the teacher spent 15 minutes teaching a new grammar point, then spent 5 minutes on activity explanation, and students spent 15 on the activity. This data was first examined against the teacher pre-lesson interviews and then the post-lesson interviews. In most cases, the teachers had expressed in the pre-lesson interviews that they wanted their students to be able to speak more in English. However, many of the lessons involved the teachers teaching or explaining to the students, effectively decreasing the time and opportunity for students to use and practise English. When this was mentioned in the post-lesson interviews, many of the teachers expressed that they simply did not realise that this was the actual situation. Some teachers did not accept the situation as applicable to them until they were shown the video recording. Notwithstanding, it was established that there was significant differences between teaching philosophy, what teachers believe they were doing in lessons, and what was actually happening in lessons. Also, teacher self assessment was an essential component to be incorporated into the teacher development program.

Stage 2 – Teacher seminar and discussion

In September 2008, we held a seminar at USSH (Vietnam) to present the findings from the observations and interviews. Teachers were invited to participate in an open discussion about the findings and their applications to language teaching. The seminar was not limited to teachers involved in the original observations. When teachers from different backgrounds came together, there was the opportunity to learn from each other's different experiences. This was an important component of the teacher development program as it acted as an invaluable resource for the teachers and the information was diverse, current and personal.

In the seminar, it was established that that teaching, as in other professions, has standards that ensure the quality of its members. Although Davidson (2002) suggested that English teachers be treated as other professionals (like doctors and lawyers) to the extent that they can be held legally responsible for the lack of quality service provided to their students, there are some deterrents to teachers upholding or meeting such standards. Many of the teachers at the seminar expressed that working conditions were sometime poor to the extent that they did not have access to essentials like chalk and dusters. This was also often the case in Thailand. In Japan, limited access to computers and printers discouraged some teachers from realising their plans. Teachers also stated that another reason that may deter them from trying harder is the rigid pay scale for teachers. In Japan, Vietnam and Thailand, many of the teachers we interviewed (particularly part-timers) found it necessary to hold two or three teaching jobs to earn a sufficient salary to support their preferred lifestyles in their respective countries. Although it seems that the system in which many teachers work does not encourage personal growth or change, teachers do spend time and effort on self-improvement. This could be observed in teachers spending their own time and money attending language teaching conferences and seminars.

Although most teachers expressed that their classroom aim is for their students to be confident and be able to use English beyond the textbook and examination context, this aim is actually not part of most teachers' requirement as a language teacher. Most teachers agree that the aim of their classes set by their institutions is to help students pass entrance examinations. However, most of these examinations test only reading, writing and grammar. Many students who pass these examinations cannot functionally use English outside the classroom. While the teachers' actions are influenced by their respective Ministries of Education, the students' parents and the society, their desire to develop student

competency in English is in fact what motivates them to continue to develop themselves as professional teachers (Hosokawa, n.d.).
However, even though students' ability to use English is not a course objective in itself, many teachers make it a personal goal for their classes.

Teachers at the seminar and those we interviewed conveyed personal satisfaction in their jobs when working with highly motivated students, especially those who actively utilise the teachers as a learning resource. In contrast, students with low motivation is a result of the students' own lack of interests. In other words, motivated students are viewed as the teachers' own success, while unmotivated students are seen as being responsible for their own failures. A point to be made is that motivated students are "good" students regardless of the teacher. Students who read ahead in the textbook are progressing at their own pace regardless of the teacher's pace. Students' own personal interests in the target language can also affect the students' achievement (Gardner and MacIntyre, 1991). However, students who are unmotivated or disruptive are often classified as "bad" or "lazy". The use of these labels conveniently avoids placing responsibility on anyone but the students. Teachers do not feel it necessary to change their own behaviours because it is the students' bad behaviours, determined by factors outside the classroom, that need changing. Collins (1992) sees this often-typical situation and remarks that "the good ones [teachers] are constantly trying to find answers; the poor ones are constantly making excuses" (p. 11).

Stage 3 – Teacher Self Assessment Guide (TSAG)

It was determined at the seminar that a key aspect of effective teacher development and successful language learning is the importance of teacher awareness. The teachers must first understand and be actively aware of what is happening in their classes, and only then can they make effective changes in the classroom. Our Teacher Self Assessment Guide (TSAG) is one way of having a written record of what happens during a lesson. *Appendix A* shows a possible layout for the TSAG. It is intended to be easily understood by the teachers who use it and could be used without being time-consuming. There are 5 Teacher Self Assessment Guides: reading, speaking, listening, writing, and grammar. Each TSAG, planned to fit on an A4 size sheet, has four sections, including a pre-lesson and post-lesson section.

The pre-lesson section includes a list of common *Objectives* for the particular skill, plus space to write in other objectives. The list of objectives gives the teachers a list from which they can decide what they will teach in the lesson. It also serves as a checklist to remind the teachers of the variety of objectives that can be taught within one skill. Frequent use of the TSAG for a specific skill provides a record and a broader picture of what has been taught over time. *Activities* directly related to the objectives are also in the pre-lesson section. This provides for a clear connection between the objectives for a lesson and the activities done to achieve those objectives. Explicitly stating the class activities also encourages the teachers to reflect on the lesson.

The post-class section includes space for *Reflective Notes*. Reflection is valuable for growth in education. Teacher diaries (Jeffrey, 2004), peer coaching (Benedetti, 1997), portfolios (Johnson, 1996), weblogs (Hall, 2006), and collective reflection (Dong, 1997) could all be beneficial to varying degrees. However, these types of reflection may be considered by teachers as being too time-consuming. Brief and detailed notes are suitable for the *Reflective Notes* section of the TSAG.

A final section is *Student Observation*, to record notes on one particular student during class. As discussed before, achievement by self-motivated students does not necessarily show teacher success. For the purpose of assessing the effectiveness of a lesson, choosing a less motivated student or a student who ranks average or just below average in the class would provide a more accurate representation. Awareness of that student's attitude, behavior and how they are responding to class activities could help teachers reflect on their teaching.

The TSAG was developed to be used easily and quickly. It is currently being tested by our teacher partners in Japan, Vietnam and Thailand. We have encouraged them to use it frequently to give themselves a better understanding of their teaching practices, not only for one lesson, but also throughout the course of a class (or classes). It is hoped that as teachers incorporate the Teacher Self

Assessment Guide into a routine of self-reflection, that they will see an improvement in their students' competency as well as their own teaching.

Conclusion

Rogers (1940) asserted that "when we become English teachers, we take on responsibilities to our subject and to our students" (p. 397). We regard self-reflection by teachers as a vital part of undertaking those responsibilities. Teachers' active awareness of themselves and their students is essential for professional development. We believe that the TSAG is a helpful way to develop this awareness. With the feedback from the participating teachers, we expect to introduce a comprehensive TSAG kit. Beyond that, we plan to have discussions on developing materials for good teaching practices.

Teacher Development in Cambodia

Libby Cohen
Linda Gan
Isabella Wong
National Institute of Education
Singapore

Kaye Bach
Caring for Cambodia
Siem Reap, Cambodia

Overview

This case study depicts professional development activities of primary teachers in four schools located in Siem Reap, Cambodia, in child development, health and hygiene. In March, 2009 the National Institute of Education (NIE) in the Republic of Singapore was commissioned by the Singapore-based Temasek Foundation to fund a capability-development programme in Siem Reap, in collaboration with Caring For Cambodia (CFC). CFC is a non-profit, non-governmental organization, which focuses on improving the education and lives of more than 5,000 Cambodian students within the Siem Reap region. The brief was to make available a training programme for CFC which would enhance primary teachers' pedagogical and content knowledge with regard to child development and to improve the standards of health and hygiene of the children in their care. In addition to the CFC teachers, three representatives of the Ministry of Education, Youth and Sport of the Kingdom of Cambodia also attended the workshops.

During a six-month period, teacher educators at NIE worked intensively with CFC to assess teachers' professional development needs, create relevant, meaningful and engaging professional development activities, implement training, and evaluate outcomes. There is an enormous gap in research related to the professional development of teachers in Southeast Asia. This paper contributes to the emerging research literature.

Extreme poverty, poor sanitary conditions, contagious diseases, and low levels of education are pervasive throughout the country. CFC has concentrated on providing sustained, coherent, and relevant professional development for teachers. Prolonged engagement and three visits to Siem Reap, Cambodia allowed teacher trainers to gain some understanding of the educational needs of the community, engage in conversations with teachers and administrators, and visit schools and villages.

Glorious Past and Current Conditions

Cambodia's past reveals a flourishing civilization, with a vibrant culture. From the 9th to the 15th century the Khmer Empire built glorious palaces and temples. The center of the civilization was the Angkor Wat temple complex, near Siem Reap and the Great Tonle Sap Lake.

In the 1970's, internal strife resulted in genocide during which more than one million and half people were annihilated and the culture nearly destroyed. Educated citizens were targeted for extermination and this led to the loss of a generation of teachers and educated leaders. According to Benveniste, Marshall, and Araujo (2008), the Royal Government of Cambodia estimated that individuals killed included 75 percent of teachers, 96 percent of university students, and 67 percent of primary and secondary school students. The government, along with non-governmental organizations (NGOs), is striving to rebuild the educational system.

Today, most people live under dire conditions. The country has a high poverty level, low levels of education, poor sanitation, and high infant mortality.

Not every family has access to clean water and adequate sanitation. Many families do not have enough to eat and therefore expect young children to work. This affects school attendance and the risk of dropping-out. Children are frequently required to help their families by minding siblings, working in the rice paddies, gathering firewood, sweeping, washing clothes, cooking, and other similar tasks. Families often lack an understanding of child development and the skills required to prepare children

for school. There may be little connection between home life and the knowledge and skills needed for learning. Many families lack an understanding of child development because it has not been taught to caregivers.

Within the Siem Reap region, there are abundant water resources including the great Tonle Sap Lake, Mekong River, and the coastal areas of the Gulf of Thailand. However, most people do not have access to clean, sanitary water resources. Tonle Sap and parts of the Mekong River and coastal areas have high pollution levels. The lack of sanitary water contributes to the high childhood disease level and mortality rate.

Childhood mortality (Collins, Lewis, & Stenberg, 2007) is attributed to neonatal causes, water borne illnesses (such as diarrhoeal diseases), infectious diseases (such as malaria and measles), and malnutrition and under-nutrition. The World Health Organization (WHO) estimates that approximately 60,000 children die every year in Cambodia from preventable and treatable diseases (Collins, Lewis, & Stenberg, 2007).

Structure of Primary Education in Cambodia
The main content areas covered in primary schools are mathematics, Khmer language, literacy, social studies and science. Primary education is available from the age of three. Table 1 shows the structure of primary education.

Table 1. Structure of Primary Education in Cambodia		
Grade Level	Age of Entry	Hours of instruction per week
Lower Kindergarten	3 year olds	8:00 – 10:00 daily, 8 hours per week
Middle kindergarten	4 year olds	8:00 – 10:00 daily, 8 hours per week
Upper Kindergarten	5 year olds	8:00 – 10:00 daily, 8 hours per week
Grade One	6 year olds	24 hours per week
Grade Two	7 year olds	24 hours per week
Grade Three	8 year olds	24 hours per week
Grade Four	9 year olds	24 hours per week
Grade Five	10 year olds	24 hours per week
Grade Six	11 year olds	24 hours per week

All government schools work on half day sessions, six days a week. Students attend either a morning session or an afternoon session of four hours in duration. The morning sessions take place from 7:00 a.m. to 11:00 a.m.; afternoon sessions are scheduled for 1.00 pm. to 5.00 pm. The daily schedule is reversed each month, allowing students who attend morning school one month to attend afternoon school the following month. Teachers remain with their class in the rotation system. Students are not promoted to the next grade unless they pass the annual government tests. Summer school has been implemented in many schools which allows students who failed the end-of-year tests to participate in additional studies so they can retake the test at the beginning of the new school year in the hope they will pass and be promoted to the next grade.

Preparation of Teachers in Cambodia
Many teachers lack formal training and skilled school administrators are in very short supply. Teaching conditions are poor and morale tends to be low. The average teacher salary is one U.S. dollar per day. Teachers typically receive lower salaries than most other workers. Government schools receive a yearly budget based on the number of pupils, which is approximately U.S. $1.50 per student per year (Benveniste, Marshall, & Araujo, 2008; VSO, 2008).

Local teacher training programs are typically two years in duration. The average age of applicants is between 18 and 22 years. Most trainee teachers have graduated from the government high school with a diploma. The college classes are large, and generally use a didactic mode of delivery. More recently, Cambodian teacher colleges have enlisted the expertise of overseas educators to provide professional development for their teachers.

Research Methodology
Our study of the CFC schools is consistent with the design orientation of a case study as it is an example of a unique instance and seeks "understanding of this particular case" (Stake, 2000, p. 437) by investigating the complex dynamic and unfolding interactions of events, human relationships and influences in this school context (Cohen, Manion, & Morrison, 2000), focusing specifically on the interplays of culture, beliefs, engagement and pedagogy.

As Stake (2000) points out, a case study does not intend to tell the whole story but attempts to present the unity of the case, seeking to understand and communicate the complexity of the "bounded system " (Stake, 2000), the single entity, the unit around which there are boundaries and what the focus of the research is. For the purpose of this study, the "bounded system" is the CFC schools. It is bounded by time, personnel, curriculum requirements, and CFC's particular mission and goals.

The focus is on situating the research in a context so that there are mutual benefits for researchers, schools, and students (Belanger, 2006). Images add to the richness of understanding of processes, relationships and events. In this instance, the methodology purposefully integrates such richness by combining both images and narrative. Van Leeuwen and Carey (2001) described the importance of using images as documentary evidence of people, places, and events. Collier (2001, p. 35) wrote that images can "be both creations and concrete reflections of what is visible within the scope of the lens and frame." Using the camera to make records involves subjective choices influenced by identities, intentions, and relationships.

All data were methodically collected, rigorously analysed and triangulated or 'crystallized' (Richardson, 2003). The data analysis and conversations among the NIE team and the CFC Director of Teacher Training confirmed findings, and also highlighted perceptions and generated valuable questions for additional research. Mutual collaboration among researchers, stakeholders, and educators (Guba & Lincoln, 1989; Stake, 2007) is an essential aspect of this project. The program was structured so that the research provided mutual benefits for researchers, schools, and students (Belanger, 2006).

Data Sources
Multiple data sources were used in the development of the case study. Extensive use was made of collecting data through photos because of a language barrier. The NIE team members are not fluent in Khmer, the local language, and many teachers lack familiarity with English. During each of the three visits, the NIE team and CFC staff members sought to document their visits and collect information and evidence that informed the teacher development activities. The images also documented the condition of school buildings, classroom settings, materials available, professional development activities, home and village environments, and portraits of children and adults living in Siem Reap, Cambodia.

A needs assessment team from NIE visited CFC schools from 23 to 28 January 2009 to gather information for training on child development which was scheduled for April and June 2009. Researchers gathered preliminary information during the first visit to the Siem Reap region. Interviews with the teachers revealed a range of educational backgrounds. Some teachers had attended the teacher training college in Cambodia, while others had only a primary school background. Repeatedly, the teachers indicated that they recognized the need for training and wanted to learn more about how to teach and promote their children's learning.

The team observed classrooms in which teaching and learning occurred. While frontal teaching predominates, some observations were made of teachers and children working in small groups and engaging in learning. However, there were classrooms in which little creativity and learning was apparent. In several instances, teachers were observed just sitting in classrooms with little teaching taking place.

During the needs assessment site visit, the Director of Teacher Training related the dire conditions of education of the CFC schools in 2007:

In 2007, when CFC began implementing a training program for the teachers in four government schools, the classroom environments were dismal and deteriorating. The classroom structures were either concrete or wooden. Many of the doors and windows were damaged and the rooms were not secure. Most of the government schools at this time had no toilet facilities.

Classrooms had no windows only wooden shutters, and because the playground was a dust bowl for most of the year, the classrooms were impossible to keep clean and free of dust. There was no evidence of children's work in any of the classroom environments. This would have been impossible to achieve as there were no resources with which children could create work.

Many of these classes were crammed with 50 plus students sitting in wooden desks together in rows. The desks were often broken, and five or six children shared a space designed for three. Each classroom had barely enough space to walk between the rows due to overcrowding. The teacher's wooden desk would be sitting at the front of the room resting on a rubble of broken concrete.

Classes were conducted in a very didactic way. The teacher could be seen standing at the front of the room, and children were involved in rote learning. It appeared that the louder the students recited the facts the more successful the learning. Classroom management was based on a very authoritarian disciplinary system, with students being reprimanded in front of their peers for wrong answers or non compliant behavior.

On many occasions teachers would not be present in the classroom during learning time, but could be found socializing with their colleagues. Students would often be sitting waiting for their teachers to arrive and instruction to begin.

There was little or no equipment for either students or teachers in most classrooms. Each child (if they were fortunate) brought an exercise book with them to school, a small pencil, a piece of chalk and perhaps an individual blackboard. Those children who came without these tools were left to just sit; no work was completed by these students. Teachers were operating in bleak classrooms with minimal or no resources. Teacher morale was low; this was evident when we visited the school and interacted with the staff. When CFC asked the Cambodian teachers what support they most needed and wanted at this time, they made a plea for teacher training. It was based on this request, and the combined professional knowledge of teachers involved with CFC back in Singapore that the teacher training program was developed.

Narrative data were collected during each visit. The researchers met frequently, documented their conversations, and shared information. Simultaneously, on-going conversations were conducted with CFC leadership and CFC's Director of Teacher Training. Drafts of professional development materials were reviewed and revised.

As a result of the professional development activities, CFC produced several newsletter articles as well as a report of the training. These documents were also used as data sources. Evaluation of training activities consisted of post-training conversations with CFC teachers and administrators, and accompanying notes. On-site evaluation of training activities occurred 3 to 4 weeks after the training was completed.

NIE Training Programme
During the needs assessment site visit, the CFC Director of Teacher Training explained her vision for the upcoming training. When working with teachers she advised the NIE team to minimise theory and actively involve the teachers in their own learning and to use the same training model for each of the three levels: kindergarten–grade 2, grades 3–4, and grades 5-6.

The CFC Director of Teacher Training provided the Cambodian Ministry of Education syllabus and the "Table of Self-Assessment of the Implementation of Child Friendly School Programs at Primary Schools" for the trainers' reference when developing the subject content. The deliverables of the programme were for the CFC teachers to effectively teach a selection of lessons from the teaching programme to their pupils using local resources and to help teachers acquire the confidence to act as model teachers for their colleagues in school. The April and June workshops consisted of three days of training for each year level. Each workshop lasted six hours each day.

The aims of the programme were to convey how children think, act and feel at different ages and stages of learning and to equip the teachers with the necessary understandings and pedagogical skills to nurture their pupils holistically in terms of physical, intellectual and emotional and social growth. The programme was predicated on a constructivist approach to teaching and learning – one in which learners develop increased competency if they are actively involved in constructing their own knowledge about the world, and interacting with one another to exchange and compare ideas.

The content of the training material comprised a set of developmentally appropriate lessons for teachers to use at all three year levels. The specific subject areas covered were language, self and social skills, and science (including health and hygiene) for both the April and June workshops with numeracy also being included for June. These lessons were based on the themes "I'm Special" and "Water." The lessons provided blueprints for the teachers to develop their own lessons for future use with their pupils. They included specific instructional objectives and procedures, pupil and consolidation activities and resource lists. The NIE trainers modeled the pedagogical skills necessary during the workshops and then discussed some of the theoretical constructs underlying such practices using slides to scaffold the teachers' understanding. CFC provided the necessary resources to support implementation of the lessons in classrooms.

Cascading of the Training

A total of 94 teachers participated in the trainings. Many innovative ideas were introduced to the teachers. The training resulted in considerable changes in classrooms, teaching strategies, and family and community practices. Following the workshops, the CFC Director of Teacher Training and CFC Mentor teachers set-up in hygiene corners in every classroom. These corners consist of a personal cup tooth brush, soap, and hand towel for every student. Daily hygiene routines were put in place.

As a result of the training, there has been a significant improvement of health and hygiene in all CFC schools. The teachers improved their pedagogy through the implementation of interactive strategies and small group learning. Hygiene lessons have been offered in the community. In one local village, mothers and small children were given instruction on teeth brushing and hand washing. Adaptations of the training have been offered at the preschool level. Selected images document professional development activities (Figures 2, 3, 4, and 5).

Figure 2. Teacher learning about brushing teeth

Figure 3. Child practising brushing teeth

Figure 4. Teacher demonstrating hand washing

Figure 5. Children practising hand washing

At the local village preschool, mothers and small children have received instruction on brushing teeth and hand washing. Parents have visited the Teacher's Resource Center to learn from the preschool coordinator. The preschool coordinator has also adapted the lessons learned during the April training for education purposes in the preschool. This cascading effect is powerful amongst the parents of the village. Currently, 20 mothers attend this preschool where the emphasis is on health and hygiene

Evidence of Transferable Learning

On an informal visit to one school at the beginning of June, 2009, a kindergarten teacher had prepared an innovative model of a germ. During the April workshops teachers were shown how to make a "germ" using a sock puppet. This kindergarten teacher had adapted this for her junior students by making a flannel puppet depicting a "germ". She had also made models of a germ using recycled water bottles. This teacher was asked to share her innovative ideas with her kindergarten team at a subsequent weekly team meeting.

A one month follow-up questionnaire was presented to twelve teachers who had participated in the training. The teachers were very positive about the training. They conveyed that the training increased their personal knowledge about health and hygiene. They viewed the topic as particularly relevant area for the students due to very poor home hygiene conditions.

One teacher wrote: *I enjoyed learning about Health and Hygiene most. Before I knew little about this subject, and now I know a lot more, and I can teach my children more about this topic.*

Although the training achieved its primary aims, some challenges remain. The level of Cambodian teachers' professional knowledge is very low. It required much reflection, intense planning, preparation and reviewing by both CFC and NIE to deliver a workshop that met the teachers' needs. Very few teaching resources are available to teachers. The trainers therefore had to think creatively and to plan lessons with the minimal resources available. Language was a barrier since the trainers did not speak Khmer. Certain educational terms are difficult to translate and meanings were lost in translation. Much repetition and reinforcement was needed to ensure that new learning was understood and would be implemented in the schools.

A key component of the training was that the Director of Teacher Training was able to follow-up and reinforce new learning in the classrooms on a daily basis. Accountability and evaluation of new learning was essential to the success of the programme. However, it was found that the transfer of learning to new content areas or new situations was difficult for these Cambodian teachers, because they take learning at a very literal level. When asked to present a lesson for evaluation they were cautious about planning anything which deviated from the original plan. Interactive, "hands- on" learning and children working in groups are new concepts for them. Assimilating such concepts will be a slow process and will require a lot of reinforcement in further training sessions. It was recognized that for such sessions to be effective, the same pedagogical understandings will need to be repeated but used in different curriculum content areas.

The positive effects that have come about as a result of this training in terms of teacher motivation are far reaching. The teachers who participated in the programmme are keen to take on the new ideas and practices introduced to them. It is important to harness their enthusiasm, build on their confidence and to continue to support them in developing new pedagogical skills. It is a challenge we are all committed to in the future.

To be or not to be: Shifting motivations in Chinese secondary school English teachers' career narratives

Dr. Gao Xuesong
Hong Kong Institute of Education

Abstract

As English is now promoted as an academic subject in primary and secondary schools, creating an enormous demand for qualified English teachers in China, there is a need to understand English teachers¡¦ motivation and commitment to the teaching career. In this paper, I report on a life history study of twelve teachers who taught in schools in Chinese hinterland areas so as to understand why they first joined and then left the teaching profession. Through interpreting their professional experiences, I came to understand their ambiguous attitudes towards the teaching profession and their fascination with the English language. Initially, many of them were unwilling to become teachers but were attracted by the teacher education programmes to learn more English. Many of them became more committed to teaching after they had positive professional experiences. However, their sense of satisfaction and achievement were undermined by the challenges that they had to cope with as well as an awareness that they were unable to sustain their professional competence. In order to retain such teachers in the profession, there is a need for teacher educators and educational administrators to work out strategies to support teachers¡¦ demand for linguistic and professional improvement in remote rural areas on the Chinese mainland.

Northeast Tohoku by Southwest USA: Language/content instruction in higher education

Robert Thomas CONNOR
Akita International University

Abstract
The local problem of how to effectively implement content courses in a nonnative language has a global solution; the universities of Asia and the United States have much to gain through a greater awareness how identity shapes the stakeholders in nonnative language content education. By presenting historical and contemporary lessons from specific locals cases in the Southwest United States, this presentation provides avenues for developing better English content instruction in local contexts in Asia.

Introduction
Myths and mistaken beliefs about language and education abound. Here are just a few expressed by university students in Northeast Asia:

> *When students explain something which is related to study [at the university], it is better to use the technical term in English.*

> *Students speaking two languages poorly is caused by the so limited knowledge that they have in each language that they are unable to translate one to another.*

> *Students should wait to learn English because the amount of space for each knowledge is limited.*

Many universities across Asia are struggling with the role and scope of offering content classes in English. From Hanyang University in Korea to Akita International University in Japan, Northeast Asian universities are offering varying amounts and qualities of content courses (e.g. economics, mathematics, history, etc.) in English. Some mandate that teachers must teach a certain number of courses in English, regardless of the students' and professors' English proficiency; others offer all content courses in English with the tremendous teaching and learning assistance resources that this entails. Still others, like the Songdo Global University Campus seek to bring universities from around the world to one location. This local problem of how to effectively implement content courses in a nonnative language has a global solution; the universities of Asia and the United States have much to gain through a greater awareness of the rewards and difficulties of nonnative language content education in the southwest of the United States. The experience of nonnative language content courses in the southwestern United States point to *identity* as a key ingredient in the successful implementation of these programs. While identity may at first seem rather innocuous as the economic pressure to implement nonnative language content courses increase. The lessons of nonnative content instruction in the Southwest United States reemphasize the importance of identity for students, professors, and the community. The respect for native languages, the efficacy of professors, and the utility/inutility of English all rely on identity to develop specific goals and proficiency that makes language content instruction effective.

I will examine the present situation in Northeast Asia and compare it to the present and historical sitution in the Southwest United States. I start with some hesitancy since any comparison of people and place is always problematic, but I proceed with some confidence since these two areas are linked by a unique set of linguistic and social circumstances. One important area to consider in the Southwest United States is Louisiana, where Spanish, French, and English have performed a delicate dance of langauge change and shift over the past 250 years. The other principal area of investigation is Texas where Spanish and English have pushed and pulled for dominance. In Northeast Asia, I will principally examine institutions in Japan and Korea. Higher education institutions in these countries, while by no means having a monopoly on educational innovation, have made important changes that respresent a future direction of worldwide education. This study details the commonalities and differences in the Asian and American experiments in foreign-language content instruction. Through a

study of the identity issues that learning in a second language has had in the Southwestern United States, this study presents a view of the prospective difficulties and solutions for the future of English content education in Northeast Asia.

The terms identity and nonnative language content instruction should be carefully defined. The identity that I discuss and advocate in this paper is not a an essentialized pre-existing notion, rather it is a social process that results from negotiation in society. Language plays a large role in this construction, and I will end this paper by suggesting how the stakeholders in education can usefully and comfortably integrate native and nonnative language. I use the term nonnative (English) language content instruction to describe courses such as history or microeconomics that are taught in a language that is not native to students. This type of teaching is inherently a form of immersion education which is a type of bilingual instruction. In Northeast Asia, this language content instruction is usually English content instruction where English is the medium for the teaching of a subject. This type of instruction is especially prominent in graduate schools and business and engineering-oriented universities where more than twenty Japanese universities offer English content courses, if not also English content degrees. A better name for this would perhaps be 'content instruction in English' reflecting that the purpose is to teach the content in this latter case while 'English content instruction' places the emphasis on learning English. This distinction raises an essential question: Is the purpose of the course to learn a type of English used by a certain domain, or is the purpose to learn the domain through the expression of English? This difference is key because it determines how the stakeholders should act when the content and pedagogy of the course conflict. Without resolving this difference, how is the administration to know which way is best, or how should the professors structure the course? The purpose of these courses is often not established by the teachers, students, and institutions, so the goals, and hence, the terms of the debate are ambiguous. I try to clarify the de facto status of these courses and provide some solutions to make the course better fulfill the goals of all the stakeholders.

Brief History of English Content Instruction
Historically, universities in Asia are relatively new to the Western university system. The first Western-type universities began in Japan in the late 1880's (Cummings and Amano, 1977). After the World War II, English instruction gained prominence as the America-Japan connection was strengthened by the occupation. This is especially true among the foreign universities in Japan. As opposed to the Phillipines and Singapore in Southeast Asia, Korea and Japan in Northeast Asia did not have an extensive colonization period by English-speaking countries. Their colonization is of a much more subtle form where voluntarily, or perhaps through subtle pressure, English influences crept into their lives forming what Krucha (1997) calls the 'Expanding Circle' of English.

As the higher educational system evolves in Japan and Korea the utility of English proficiency has been recognized as significantly important, an English as a foreign language (EFL) model could no longer handle the proficiency required to achieve the desired level of English. Japan recently instituted English courses in elementary schools as a way to improve English proficiency, and the creep of English into the universities is another example of how the English as a foreign language model has crept into becoming English as a second language (ESL). Such ESL systems are fine, but to be able to use English in professional fields, a new level of specificity for domain and audience was needed; English content instruction was needed. Content courses in English provide the specific knowledge of discourses required to converse within a profession. Essentially providing the type of study abroad experience that students have been seeking for some time. This English content instruction advances the learners' knowledge in both language and content. The implementation of English content instruction brings significant challenges that should not be overlooked primarily: the goals of the program, the target English variety, measuring progress, and maintaining qualified instructors. In fact, few universities consider the full ramifications of beginning English content instruction.

English content instruction often takes the form of professors teaching a course in English that they would traditionally teach in the students' native language. Often the professors were trained in a language other than English and so, perhaps, this is the first time to integrate their linguistic and occupational competencies. For the students, this experience is also their first time learning both the content and the language of instruction for this domain. For the administration, this arrangement means that they can use their existing resources to appeal to a larger audience of study abroad students and claim some higher level in international rankings.

Fortunately, the issues in English content instruction are not unique in history, and other situations have dealt with these issues in the past. Bilingual and immersion programs at the primary and secondary level have a primary emphasis on balance and identity. The Southwest United States has had a number of historical and contemporary movements to provide content instruction in a nonnative language. The United States is also dealing with how to incorporate Spanish content instruction in its unversities. The history lessons of the Southwest United States point to specific issues that must be avoided in order to have respectful identity development.

The Southwestern United States
English in the Southwest United States is a collection of dialects, principally Southern White English, Rural African-American English, Creole English, and Cajun English. While these dialects do not play prominently in this analysis, it is important to remember that the languages spoken and the langauges learned in education are by no means monolithic.

Lipski (2008) details the varieties of Spanish in the United States, their origins, and adaptions. The Southwest United States has always been a dynamic mix of English and Spanish, but considering these langauges as unified wholes would tell only part of the story. Each variety of Spanish and English in the United States has struggled with its identity and continuity. In the Southwest United States under investigation in this work Spanish from the Islenos, the Brule, Mexican, and New Mexican origins all play roles. In addition to this push-and-pull of varieties of Spanish and English, the dance of French and English is a long and storied history (Connor 2006, Leumas 2009).

Louisiana's (churches) switch in English Education
Beginning with English instruction in the 1800's, the state of Louisiana used English content instruction when French and Spanish were the native languages of the populace. Based on archival research at Louisiana State University, English instruction in Louisiana was originally an endeavor for elite schools. Much like a modern model of English as a Foreign Language (EFL), letters from prominent Louisiana families reveal English learning in order to be more cultured and to travel abroad.

 This EFL model is similar to most instruction of languages with small numbers of speakers. Economic incentives exist, but lacking proficiency does not hinder common educational or occupational advancement. At this point in identity development, English is little more than a game or fantasy for those inclined to languages, having little to no impact on professional life.

However economic reasons soon changed the situation. The best examples of how this worked is to examine the responses of the closest thing to a modern transnational company at the time, the Catholic and Protestant churches. Global interactions and trade are one of the prime motivators for proficiently learning a new language at this ESL stage. Language at this stage is no longer a leisure or a pleasure, and the audience is now known. Under an EFL environment, you could never be sure who is your target or what should you be learning. Is learning literature better than business correspondance? In contrast, at this new transnational environment your target is known and fixed. Their language needs are no longer distant concepts; they are specific known goals. Returning to the Louisiana situation, each of these churches found themselves unable to meet the needs of the new English-speaking immigration to Louisiana from Ireland. In business terms, they were not able to serve new markets and old markets were changing. In the same way, Northeast Asia is feeling the increased economic incentive to be fluent in English. The new tasks range from mundane BPO tasks to engineering design and include educational and occupational immigration and connecting with nonnaitve English-dominant countries.

The transnational (ecclisial) response at the time (1800's) was to import English speakers to perform the task while sending priests for on-the-job English immersion and increased lessons at the university. This turn very much parallels the increased demand in study abroad and English proficiency requirements in Asia universities. Also it explains contemporary programs to import English speakers as liaisons in business and education. So, at this point the language variety and social context is known and the transnational entities have adopted the strategies of importation and increased training. This is the situation in Northeast Asia over the past decade as more training is required in English and more

native speakers from abroad (or, more commonly, highly proficient nationals from postings abroad) are brought to meet the demand.

Finally, the last stage is occurring as we speak in Northeast Asia, in the late 1890's the Louisiana bishop (transnational executive) would not allow anymore priests to come to Louisiana who did not have English proficiency. In the same way, English proficiency is reaching a point in Asia that business and education simply cannot be done without adequate English proficiency. To meet this demand, universities are offering content courses in English that combine the insight of a known domain and audience. English content instruction is the natural response to language shift in the same manner that the language shift affected the churches in Louisiana.

Equally importantly to the process of shift is the reaction to the shift. As the switch to English became necessitated, this stage is where there was the most pushback from the priests who were required to learn it. The intial (EFL) stage was simply open to those with inclinations to learn languages. The second (ESL) stage included importation and increased requirements that created some resentment. The final (English content instruction) stage of requiring proficiency had profound impacts. Asian universities are in the second stage and the resentment of the final stage is beginning to show.

The Louisiana pushback was carried out on both a personal and community level. Some priests refused to switch languages or continued to carryout work in their own language (Leumas 2009). Some whole communities pushed back if the education was not in their native language, such as the Spanish Brule community. This resistance is as an immergence of self-awareness in the language community brought about because the "threat" of another language.

Texas's resurgence of non/native language content instruction
Later English content instruction was implemented for Spanish speakers in a variety of bilingual models in states from Texas to California. Presently the United States is struggling with the legacies of these historical implementations and the identity issues that the students and teachers must negotiate. Many bilingual education models were attempted in this area, in order of the amount of respect for the native language: heritage, early-exit bilingual instruction, late-exit bilingual instruction, and dual language immersion. While these models primarily have an implementation in primary and secondary schools, some attempts in higher education are also noted. Examining these various implementations of bilingual education, the primary variable is how much respect the implementation gives to language and identity. So the idea of bilingual education in the historical Southwest United States revolves around identity as much as methodology.

Recently higher education has an extra twist, the Southwest United States is working to define the role of Spanish content instruction for native Spanish speakers at the university level and progressing on the implementation of English content instruction that respects the heritage of indigenous speakers such as the Navajo and Cherokee nations. That is, just as Japan and Korea are introducing English content classes, the Southwest United States is introducing Spanish content classes and to a very limited extent indigenous language content classes. These present issues parallel the situation in some areas of Japan and Korea but are especially pertinent in countries with a more profound English link such as the Philippines and Singapore.

The US is gradually coming to terms with its Spanish langauge instruction that supports those with Spanish backgrounds at their current level, instead of at the beginner level. Spanish for Spanish speakers is an example of the type of programs available at the university level. These programs have recently extended to the degree level with the creation of a Bachelor of Business Administration that is conducted entirely in Spanish and accessible across the country. This assessibility is in contrast to most Spanish content programs that are intensely regionally focused. Examining these programs from a country-wide perspective, the programs are miniscule. Examining them from a internal view that values the local identity, and the impact is clear. Language dynamics are always intensely local and must be viewed from inside.

Northeast Asia
These historical implementations parallel the language identity and usage issues currently occurring with the implementation of English content courses in Japanese and Korean Universities. Specifically

how does the university respect the native language of its professors and students while recognizing the utility, and at times inutility, of English instruction?

Current interviews with Northeast Asian students have shown distress of not developing their native language ability. Among these students, the myth persists that any time devoted to English diminishes the knowledge of native language, as if bilingualism is a zero-sum game where no knowledge transfer is impossible. This language ideology is prevalent in the debate over instituting English, among students, parents, teachers, and even professors.

With this background in mind, how does identity affect the implementation of English content courses? Professors are found to have some pushback against presenting their courses in English often creating de facto bilingual education models. They use the native language to explain difficult concepts or to go over routine administrative tasks while reserving English for content aspects. This routine is noted not only for native speakers but also for nonnative speakers.

Uniting the experiences to move forward
An imperative exists for the implementation of specific goals for native and target languages. Before embarking on the implementation of English content instruction, institutions must decide the purpose of such implementation. At Akita, the guiding principles are to use English as a tool in internationalization.   Thus, the identity of the institution stays Japanese with a distinctive international flavor. In Hanyang the principle to improve English fluency. A distinct difference where one institution focuses on changing to a international flavor while the other keeps an Asian identity while advocating a simple language proficiency goal. The Songdo Global University Campus is on the other extreme from Hanyang where total internationalization is the goal. So, here are three examples of implementation: internationalization rooted in culture, language targets within the national framework, and complete internationalization. Each presents challenges to the identity of the professors and the learners. While complete internationalization may seem the most threatening, and indeed has drawn the most ire from professors, with complaints about location and culture, even simple language targets are a threat to identity if the goals are not explicitly stated. The parallel of this issue is the implemention of bilingual programs in the US where immersion programs that benefit native speakers are less threatening than dual language immsersion which is less threatening than one-way bilingual programs.

Once the explicit goal of the content instruction is set, the next step is settling the professor issue. The native speakers of the target language are indeed the language experts, but the nonnative speakers are the cultural examples. The native speakers can set the language goal, but the nonnative speakers set the culture goal. If the nonnative speakers are uninhibated and comfortable in their level of proficiency, they can be role-models for the students. Comfort in nonnativeness.

Realizing the goals of the program and settling the professors in their roles rely on a foundation of identity. By presenting historical and contemporary lessons from the specific locals cases of the Southwest United States, this presentation provides avenues for developing better English content instruction in local contexts in Asia.

Readers Theatre: Dramatising environment issues for oral skills development

Patrick Ng Chin Leong
University of Niigata Prefecture, Japan

Abstract

Readers Theatre was introduced to a class of Japanese students studying intermediate-level English in an international university in Japan. The aim of the study is to investigate **whether Readers Theatre enhances the oral skills of Japanese students as they negotiate an environmental issue in English.** In my presentation, I will demonstrate how Readers Theatre is implemented in class and the comments by students will be analysed and discussed during the presentation.

Introduction to Readers Theatre

Readers Theatre ((hereafter, RT) is an oral presentation of a story using scripts by two or more readers**.** Routman (1991:68) defines RT as "creating a script from a narrative text and performing it for an audience. Readers first read a story and then transform it into a script involving several characters. The script can then be performed with a minimum of preparation, props or scenery. Unlike traditional theater, RT emphasizes mainly on oral expression of the part. It involves learners in understanding their world, creating their own scripts, reading aloud, performing with a purpose, and bringing enjoyment to both themselves and their audiences. In general, there are five basic characteristics of RT:

(a) There is selective and limited use of scenery and costumes

(b) Voices, retrained gestures and facial expressions project the mood

(c) A narrator usually describes the setting, action, character or mood

(d) The reader uses a physical script

(e) There is a close relationship between the performer and audience (Shanklin and Rhodes :1989).

RT is easy to implement in class because it does not require full costume, stage sets and memorisation of scripts. To implement RT in the classroom**, r**eaders first read a story, and then make selective and analytical choices in transforming the story into a script through social negotiation. The readers then formulate, practise and refine their interpretations, and finally perform for an audience, reading aloud from hand-held scripts.

Drama and oral language development

One of the main concerns in L2 acquisition is how to provide students with "real-life" language experience. Felton et al (1988) observe that drama provides opportunities to use language for a wider range of purposes than compared to language use in the traditional classroom. They believe that compared to the informational talk in a typical lesson, there is a higher incidence of interactional and expressive talk when drama activity is included in the classroom. While the interactional talk focuses on people rather than things, expressive talk focuses on feeling and thinking. Needlands (1992) proposes that if the teacher and students are able to use drama to create roles and situations, there will be a greater variety of different contexts for talk. Maley and Duff (1978**)** also support the use of drama for language development as he feels that involving students in the negotiation and construction of drama provides them with allows students to link the language they are learning with the world around them. Wilkinson (1988:12) suggests that experiential drama aid language development in the following ways:

greater use of language for a wide variety of purposes

more frequent opportunity for otherwise rarely used expressed language greater use of abstract thinking and language evolving from expressive language greater understanding of language as a powerful tool enabling its user to "act upon" rather than "be acted upon."

Jordan and Harrell (2000:74) recognise RT as an effective drama activity for providing authentic speech practice especially in teaching reading fluency (rate, accuracy, phrasing, pitch, stress and expressiveness) as well as comprehension to emergent readers. They suggest that "involving students with enjoyable and exciting active reading procedures provide the key to fluency and higher levels of

comprehension gain, through a natural process of repeated readings and interactive transactions with language." Rosen and Koziol, Jr (1990) examined the relationship of drama activities to the improvement of oral communication skills, knowledge, comprehension, and attitudes. Their study showed that drama had a great influence on oral communication skills. Berlinger (2000:1) recognising the benefits of scripted dialogues in encouraging English expressions states that scripts have long been employed in ESL instruction because they permit students to actively acquire the vocabulary, idioms, grammar and syntax of English speech. As they involve all aspects of language, scripts that are rehearsed in class can offer students a dynamic encounter that comes closest to real communication. However, Kao (1994) identifies three common negative attitudes towards drama in the L2 classroom:
(a) Drama activities as "party time" or "easy-pass course"
(b) Students' sceptical view and distrust of drama
(c) Students with low self-esteem or poor language proficiency levels became discouraged by their active and confident peers in their struggle to learn.
Wagner (1998) states that although drama has been instrumental in expanding the range of registers and styles among language students, new studies are necessary to describe more fully the structure of drama teaching to determine which teacher strategies and interactions are critical to oral language development. The objective of this study is to investigate whether RT improve the oral skills of Japanese students as they negotiate environmental issues in English.

The Study
RT was introduced to EFL Japanese students studying Intermediate English in an international university in Japan.In Intermediate English 1, students study how English is used to communicate ideas about various global issues. The course content is organized around a broad global issues theme focusing on environmental issues. The class consisted of twenty around the ages of 18-20. The average TOEFL score of students is about 450.

Reasons for using RT in the classroom

Japanese EFL learners generally experienced difficulty in reading and understanding the prescribed environmental reading passages. There were too many new words for them to handle. As a result, many learners could not appreciate the topics in the reading passages. Students also felt that the text did not allow them much opportunity to practise their spoken English in class. The attention to details and analysis of word usage gradually led students to become slow, passive and dictionary dependent learners. RT was introduced to motivate EFL learners to appreciate expository text as well as generating interest in discussing environmental issues.

Implementation of RT in class

A reading passage on the Kyoto Protocol (see appendix) was first given to students. Vocabulary was pre-taught. After that, students read the passage individually and discussed their responses to the topic. After students had gained sufficient background knowledge of the topic, they were put in various groups of three or four. They were then given the task of writing a script on the topic, guided by a problem-based scenario:

Problem Scenario
Kyoto is well known for its historical sites and cultural centers in Japan. However, the city council wants to 'modernise' the city but needs to develop a new environmentally friendly power station. There are several groups in Kyoto (city council, developers, residents, environmentalist, entrepreneurs, historical society and farmers) which may agree or disagree with the plan to build a power station. Suppose you belong to one of the groups. How would your voice your arguments to support or oppose the plan?
Students were told to write a script (at least 1 page and involve at least 4 groups) to portray the different groups and show the main arguments and all possible responses to the construction of the power station: *city council, developers, residents, environmentalist, entrepreneurs, historical society and farmer*. Students were told that they should follow the problem scenario for writing the script. After students had finished writing the scripts, they read and rehearsed their roles. When they were ready to perform their scripts, teacher recorded their performance in a tape recorder. (Note : The

implementation of the RT activity requires two to three teaching periods depending on the language proficiency of students.)

Data Collection
In an attempt to investigate whether RT improves the oral skills of Japanese students as they negotiate environmental issues in English, data were collected from a questionnaire survey of learners' reaction towards the use of RT. The survey questions were designed to explicitly elicit students' opinion and comments on the use of RT.

Results
The results of the survey showed that a majority of students in the class enjoyed the RT activity and commented positively about their experiences:

Student 1
I enjoyed his activity because speaking English is so interesting for me. But sometimes it is difficult for me to express my ideas in English. So I need a lot of times to practice speaking English. That is why this activity is important for me.

Student 2
I enjoyed this activity because I could write the script by myself and also act. I think its good for us to improve our English skills like writing or speaking. We have to practice the pronunciation more, so this activity is good. If I have an opportunity to try this activity again, I want to speak more clearly. I had a very good time.

Student 3
This activity was very interesting for me because I could understand what my friend thinks about the environment. We became more friendly to each other after the lesson. I think English class should be like this. I want to use English to communicate with my friends from now.

Student 4
I find it difficult to speak about environmental issues because it is difficult for me to use English in my daily conversation. I want to improve my speaking skills!

However, several students maintained a sceptical view and distrust of drama (Kao:1994). Two or three students feel that the activity is good but acting out the script was not interesting as they feel that everybody merely read the script. They would prefer to perform without reading the script. In addition, students with lower language proficiency levels tend to be passive during the negotiation of scripts.

Discussion
On the whole, RT is able to develop the Japanese students' spoken English as they engage in negotiation of environmental issues in class. Students are keen to use English as they work on the scripts based on the environmental problem scenario. A great deal of spoken English on the environmental discussion was generated as students make multiple negotiations to decide what lines to keep, where to edit and revise, and how lines should be said to show the main arguments and all possible responses to the construction of the power station. As students negotiate their script, they engage in different language use functions such as asking and answering questions, solving problems, expressing their opinions, arguing, persuading (Kao, 1994). They also learn to experiment with vocabulary, register and speech patterns as they take on different roles (Wager, 1998). As a result, they gain tremendous confidence in using spoken English. In the process of script negotiation, students are also challenged to use language in new and creative ways. As students collaborate to produce a script, they also take ownership of their own learning and are intrinsically involved in developing dialogue to ensure that a script is produced. RT provides richness and energy in the classroom because students are experientially involved in performing a piece of literature on an environment issue. Through dramatising the environmental issue, students realise that the same environmental problems and situations could also happen in their hometown or country. As a result, they become engaged and develop a sense of investment in the lesson because they are not only merely performing an academic assignment but also engage in problem-solving tasks that could surface in real life. It is also energising

for the teacher as they watch students read, interpret and perform the problem scenario, knowing that students are holistically involved in the process of learning environmental issues.

Observation by Teacher

Although several students were not active during the script negotiation, in general, RT generated students' interests in appreciating text on environmental issues. Previously, a majority of students were not able to discuss environmental issues in English due to insufficient vocabulary and a lack of background information on environmental issues. But through RT, students were able to explore roles, ideas and situations pertaining to environmental issues. They learn to manipulate language in order to activate prior knowledge on environmental issues. Through the script negotiations, individual student could express freely their views and opinions on the construction of the power station, and this further allows other group members to share their ideas and attitudes on the topic. The negotiation of meaning pushes students to practise the target language as much as possible. In addition, students' vocabulary on environmental issues was reinforced through the negotiations of script (Kao:1994). A lot of discussions were observed in class as students were keen to express their views on the pros and cons of building a power station in Kyoto. The class became more energised as students voiced their opinions on the various problems that could result from the construction of the power station in Kyoto.

Conclusion

Except for several students, a majority of students have positive response in using RT to discuss issues on the environment. At the same time, RT also helps them to experience the satisfaction of writing to share ideas with interested readers on environmental problems and issues. However, there can be limitations to using RT in class, particularly if students have no familiarity with theatre as a genre, or they may not have the linguistically ability to produce their own scripts. In the case of Japanese EFL learners, who have just been immersed in a totally English-speaking environment, getting them to write scripts was a rather tedious task. The teacher has to proofread and edit their scripts several times before they were ready to perform. Some degree of initial inhibition and resistance to acting was encountered. However, despite these limitations, RT has the potential to become an innovative teaching approach to motivate intermediate and advanced Japanese EFL learners to discuss environmental issues in English.

APPENDIX: **Japan and The Kyoto Protocol (in-class reading)**

1   The Kyoto Protocol is now a part of the United Nations Framework
2   Convention on Climate Change (UNFCCC) and is intended to cut global
3   emissions of greenhouse gases. When Japan played host to the signing of the
4   Kyoto Accord in 1997, the symbolism seemed apt since Japanese people saw
5   themselves as global environmental leaders.

6   Eight years later, however, Japan is finding it difficult to comply with the
7   greenhouse-gas limits of the Kyoto Protocol. As the treaty took effect in
8   2005, the hosts found themselves in the same internal battles that have
9   affected other countries on the Kyoto issue: disputes over taxes, spending,
10 government rules and corporate behaviour. As the homeland of the Kyoto
11 Accord, Japan was expected to become a model for other countries,
12 environmentalists say. Instead, its greenhouse-gas emissions have increased
13 greatly in recent years.

14 Rather than placing tough limits on its domestic industries, Japan is planning
15 to meet its Kyoto obligations with more practical steps, including the
16 purchase of emission credits from China or Russia. Under the Kyoto Accord,
17 Japan pledged that by 2012, it would reduce its greenhouse-gas emissions to
18 6 percent below its 1990 level. However, the latest government reports show
19 Japan's emissions were already 8 percent above the 1990 level in 2003, and
20 forecasts suggest that the country will not come close to achieving its 2012
21 goals.

22 In response, the government has been forced to revise its official plan. The
23 latest effort -- expected to be approved by Japan's cabinet in May 2005 --
24 seeks to meet its Kyoto pledge with a combination of emission cuts, new
25 forests and the purchase of emission credits.

26 "We're very disappointed by the plan," said Yurika Ayukawa, climate-change
27 officer at the Japan office of World Wildlife Fund. "At least 1.6 percent of
28 the reduction, and maybe more, will be bought from credits from the carbon
29 market. This means that the government already admits its failure to meet the
30 Kyoto target with domestic reductions. They don't want to introduce any new
31 policies to bring Japan's emissions to a downward trend. This is a failure of
32 domestic climate policy and we're very regretful about it."
33
    Another Japanese environmentalist, Mie Asaoko, was in the conference room
34 in Kyoto in 1997 when the Accord was signed, and she remembers the
35 excitement in the room. "I thought it was a historic moment," she said. "But
36 we've made less progress than I expected. If we can't meet our 2012 target, it
37 will be a disgrace. It will be a failure for Japan and for the Kyoto Accord,
38 and it will affect the whole world. Japan should be an international leader."

Abstract

Since Medgyes' principle thesis in his 1994 work, many studies have shown that both native and non-native speakers are equally effective instructors (Braine 1999; Kamhi-Stein 2004; Llurda 2005). In the past decade in particular, researchers have delineated the complexity surrounding the NNEST-NEST dichotomy, and many have warned of the danger in reducing the complexity of the issue (Cook 1998; Duff and Uchida, 1999). Nevertheless, it is generally understood that learners prefer native English-speaking teachers (NESTs). However, as Mahboob (2004) indicates, this issue needs to be explored further. This study puts the learners at the center, and attempts to examine the learners' preferences for and perceptions of their teachers in the Japanese context.

In the first study, a 3-item questionnaire was given to 161 first-year students enrolled in Japanese universities. The questionnaire asked them to express their preference for NNESTs, NESTs, or no preference and to describe what respective advantages they thought NNESTs and NESTs had as language teachers. Results showed that while learners could identify areas of perceived respective strengths, students at lower level proficiency overwhelmingly preferred NESTs, whereas students who were at a higher proficiency level and had exposure to both NNESTs and NESTs overwhelmingly expressed no preference. In the follow-up study, a similar 3-item questionnaire was given to180 high-proficiency level students at the beginning and end of their first year's term at a Japanese university in which they would receive instruction from both NNESTs and NESTs. Preliminary results along with exit interviews show that the learners again could identify respective strengths, but as a whole they experienced a major shift from preferring NESTs to expressing no preference.

This presentation will briefly summarize previous research regarding the NNEST/NEST issue, explain the questionnaire responses of the two small studies, summarize the interview results, and discuss the implications.

Improving "international understanding" in and beyond English Language Teaching

Suzuki, Ayako

Waseda University, Tokyo

Abstract

This paper explores the issue of fostering "international understanding" in English Language Teaching (ELT), and discusses the need of building links between the teaching of English and other subjects, such as history and geography, in order to develop students' balanced worldviews.

The growth of second language (L2) users of English has started to change the central orientation of ELT in many countries where English has traditionally been learnt as a foreign language (EFL), including Japan. In these countries, English is now taught as an "international" language (EIL) rather than as a "foreign" language: a language for communication between people from different lingua-cultural backgrounds. Teaching EIL has brought about a new objective in ELT: to foster students' appreciation of people from different cultures, or international understanding, through teaching EIL.

Japan is one of the countries where fostering international understanding through EIL is advocated as a principal aim of ELT. However, in this country, what students learn as EIL is, in practice, the English used by native speakers of traditional varieties of English (NSs) (e.g. American and British English), whereas they have little opportunity to learn about the essential international aspect of EIL, i.e. its L2 users themselves. As a result of the reduced and partial representation of EIL that they receive, students' worldviews tend to be biased. They see NSs as the most important members of the international community and have a diminished view of its L2 users.

Considering this situation, some scholars argue that informing students of the very existence of L2 users would help to improve their biased understanding of EIL, resulting in balanced worldviews. However, there have been few studies that investigate whether teaching about L2 users in traditional EFL countries actually helps students develop more balanced understanding of the world, and thus, we do not yet know the extent to which such instruction is effective in these national contexts.

In this paper, I take Japan as a typical country where ELT assumes a responsibility to foster students' international understanding through EIL. Focusing on university students in Tokyo who participated in a course dealing with L2 users, I discuss my finding that teaching about L2 users in ELT is not, on its own, sufficient to develop an impartial international understanding. Based on this finding, I argue that what is needed is curriculum change; in particular, the building of links between the teaching of ELT and subjects such as history and geography, in order to encourage more truly global worldviews.

Contesting the Culture of the Doctoral Degree

Judy Maxwell

RMIT University

Abstract

This paper explores candidates' experiences of the culture of three doctoral research degrees in the School of education, RMIT University. The research design was underpinned by Bourdieu's theory of practice and three meta-themes were developed: tensions between and within the field; challenges to autonomous principles; and the importance of habitus and cultural capital in doctoral study. Five recommendations were proposed, aimed at producing a vibrant doctoral learning community with a deeper understanding of candidates' issues.

Introduction and context

This paper outlines an exploration of candidates' experiences of the culture of three doctoral research degrees in the School of Education, RMIT University: the Doctor of Philosophy by thesis, the Doctor of Philosophy by project and the Doctor of Education. RMIT is a university of technology with a focus on 'real world' research. Until recently, the School of Education had two doctoral degrees: the Doctor of Philosophy (PhD) and the Doctor of Education (EdD). The PhD in this School can currently be studied either by the traditional[1] mode of a thesis or by project. At RMIT, the PhD (thesis) consists of a single research study completed under supervision, the outcome of which is a thesis. It differs from the EdD in that the latter had a smaller research element which was preceded by four one-semester coursework units. The EdD has now been disbanded. The PhD by project is relatively new to the discipline of education, being offered in the School for the first time in 2000. It consists of research that is usually completed in the candidate's workplace, and a durable record of the project which includes an exegesis. Candidates are also examined orally.

The focus of the EdD and the PhD (project) is clearly on professional or work practice. EdD candidates undertake 'studies and professional development in depth in a significant part of a field of professional activity' (RMIT, 2008, p. 14). However, for PhD (project) candidates, the link to the workplace is usually more entrenched: the aim is to produce change and a tangible outcome in the workplace by using action learning or research approaches within the framework of a research project (RMIT, n.d.).

---

[1] While Pearson's (2005) point that there is an 'uncritical acceptance of there being a "traditional" PhD' (p. 123) is taken, 'traditional' as used here merely describes the PhD by thesis with research methodology being the only coursework involved, which is common to Schools and Faculties of Education, among others.

The literature on doctoral degrees and candidature

Increasingly, candidates are seeing the value of the research degree not as a passport to an academic position, but to engage at a high level with the professions and industry; Boud and Tennant (2006) argue that universities are now being seen as 'producing workers for the knowledge economy' (p. 294) and that the new focus on learning in the workplace has led to doctoral education reforms.

There has been much research showing the particular issues of postgraduate research candidates (Barnacle & Usher, 2003; Conrad & Chipperfield, 2004; Harman, 2002; McAlpine & Norton, 2006; Pearson & Ford, 1997). Attrition problems, for instance, have been shown to be multifaceted (Evans, 2002; Golde & Dore, 2001; Lovitts, 2001). Latona and Browne (2001) sum these up by pointing to three broad factors: science-based candidates, who are often supported within a team and have a sense of belonging, are more likely to complete; individual supervisory factors, including having a clear understanding of relevant roles and responsibilities, have the capacity to impede or assist progress; and the individual characteristics of candidates, for instance, those who have a prior Honours degree are more likely to do well.

Supervision practices have also been well-researched. Much of this literature relates to the tension between 'the irreconcilable poles of pupil and independent researcher' (Frankland, 1999, p. 9). For instance, although Sinclair (2004) found that a direct interventionalist approach taught the competencies needed for successful completion, this functionalist approach was found to be too narrow by Lee (2008). In her study, other approaches such as critical thinking, enculturation into the disciplinary community, emancipation and developing a quality relationship were more important.

However, there is little research available on identifying how doctoral candidates themselves perceive the culture of doctoral study. This is particularly true of doctoral study outside of the 'traditional' PhD, and especially from the perspective of a comparative study of candidates' experiences of three doctoral degrees in one School. What is needed is a study that looks to understand the candidates' emotions, and their 'bodily dispositions' and 'practical consciousness' (Bourdieu, 1990) of their habits and activities within the particular cultures of each of the three programs.

Aims and research design

This research aimed to answer the question: How do candidates perceive the respective cultures of traditional, practice-based and professional doctoral education? To answer this question, semi-structured, in-depth interviews were conducted with six candidates from each of the PhD (thesis) and PhD (project) programs and five EdD candidates, along with two supervisors from each program. All participants were from RMIT's School of Education and candidates were either current (in their final year) or had submitted within the previous year. Participants were allocated a pseudonym and identified with the type of doctoral program and identification as candidate (C) or supervisor (S) in brackets, for example: Sally (project, C); Tina (thesis, S). To allow analysis of candidates' experiences and the doctoral structures within which their practice resides through one critical lens, the research design was underpinned by Bourdieu's theory of practice (Bourdieu, 1977, 1990).

Bourdieu's key concepts are habitus, field and capital. Habitus is a general disposition that develops through life by adjusting to the various fields, producing a cultural trajectory in the individual. Conversely, it also influences life outcomes because the changes are biased in favour of our past

experiences, limiting the possibilities to those viable for the social context of that person. The field is a site of struggle for power between the agents who inhabit it. By power, Bourdieu means those who have the defining capital and who determine membership in that particular field. Bourdieu (1993) points out that educational institutions privilege particular social capital (strategic networks) and cultural capital that students bring with them, and that institutions 'endorse and normalize particular types of knowledge, ways of speaking, styles, meanings, dispositions and worldviews' (Margolis, Soldatenko, Acker, & Gair, 2001, p. 13).

Summary of results

The case study data revealed an ambivalence regarding the types of cultural and social capital appropriate for doctoral candidates not aiming to work in an academic environment where these are in conflict with the workplace. Three meta-themes were developed: tensions between and within the field; challenges to autonomous principles; and the importance of habitus and cultural capital in doctoral study. These are now discussed.

Tensions between and within the fields

Fields and sub-fields can be seen as sites of continuous struggle. Agents with a greater amount of the types of capital valued by the field will occupy higher positions. It can be argued that in the broader field of doctoral study, the capitals most valued are cultural and social capital. Assumptions can also be made that supervisors will have more capital than candidates, particularly when these capitals are of a symbolic nature, with the relevant prestige attached. Further, supervisors themselves will have varying amounts of these capitals relative to other supervisors. Those who are professors or associate professors, for instance, or those who have long-established and valued practices, command significantly more capital than others. In other words, power rests with the dominant agents.

This has ramifications for practice when those who become dominant in sub-fields are not those with the power in the larger field. While Bourdieu (1988) spoke of academia generally as being contested territory, with agents struggling to 'determine the conditions and the criteria of legitimate membership and legitimate hierarchy' (p. 11), more specifically in this study, tensions are seen within a sub-field in demise, within a relatively new sub-field struggling to establish itself, and between the fields of academia and the workplace.

The lack of coursework choice in the latter stages of the EdD effectively robbed candidates of what McWilliam et al. (2002) argue can be a useful transition point into the rigour of doctoral research. The effects on EdD candidates were profound and produced lasting trauma. For some candidates interviewed, three or four years had passed since they had completed their coursework units, yet they still felt disenfranchised: *It's like I'm lost in the Sahara and there are no directions [...] I've never felt so unsafe – like, I'm on a trapeze and there's no safety nets anywhere* (Lyn, EdD, C); *It's like being a kite – you're buffeted around in different directions* (Alison, EdD, C). While some found the coursework a useful way to build contacts with lecturers and other candidates and thus were able to build some social capital in the field, this was negated by the administration problems and frustration felt in spending valuable time studying courses in which they had no interest.

The tensions here spring from competing values between an autonomous field focused on those who possess scientific, 'scholastic capital' and a heteronomous field of those possessing the administration power of 'academic capital' (Bourdieu, 1988). Universities are businesses and there is

need for them to rationalise their spending. In this context it is important to remember that the boundaries of fields and sub-fields are fluid and as fields converge with each other, social space becomes layered. In the case of the EdD program, the numbers of candidates fell. This left those within the EdD sub-field with the scholastic capital, who still saw the educational value of the program, powerless against and dominated by agents within the broader doctoral field of the School, who possessed sufficient academic capital (who were in turn, of course, powerless to act on a lack of Government funding). Thus the sub-field, no longer recognised as viable, disappeared, leaving no-one with sufficient scholastic cultural capital to plan for the program's demise and ensure the candidates were not disadvantaged.

New and developing sub-fields also show tensions within and between those and other fields. As outlined above, for a program to survive there must be a critical mass of agents with sufficient cultural and symbolic capital who believe in the program. However, comments by some supervisors show an undercurrent of unease about the PhD (project). Tina (S, thesis), for instance, expressed concern at an instrumentality and lack of rigour in the PhD (project). Another supervisor was made aware of a very senior staff member's disparaging remarks about the program. Further, during the period of this research, several agents with substantial levels of symbolic and cultural capital in the PhD (project) sub-field left the School, with the result that supervisors of other programs have now begun to supervise candidates in this program. There is a danger if too many agents with the required amount of capital in that sub-field are replaced by other agents who might show little acceptance of its worth (lacking the required 'illusio').The PhD (project) sub-field could find itself in a precarious situation if there are insufficient 'game players' with enough symbolic capital within the broader School doctoral field who believe in the 'game'. The fluid boundaries and converging fields produce a very real danger of the sub-field collapsing or being reconceptualised.

Confusion within the PhD (project) is also seen regarding various aspects of the program, particularly regarding the exegesis. It seems there are no clear guidelines for candidates or supervisors in terms of defining principles; that is, what is acceptable or valued content and structure. Although both supervisors interviewed did not see this as a problem (except for the low word limit), candidates with supervisors both inside and outside of the School of Education reported a sense of bewilderment because their supervisors seemed also to lack any concrete advice. The two supervisors from this sub-field also pointed to the exegesis as problematic. Although for Paul (project, S) this was more to do with his students lacking appropriate academic writing style, with Pam (project, S), it was more related to the structure of the program. She identified a number of her candidates as having difficulty in identifying what content belongs in the exegesis, compared to the artifact. It seems that the PhD (project) subfield has not established a doxic praxis (the accepted way of thinking and acting in the field), although with some supervisors from other programs questioning the legitimacy of the PhD (project) and others finding difficulty negotiating a path, it is important that it actually become orthodoxic: in other words, the elements, parameters, scholarship and values of the sub-field need to be discussed and agreed to by the key agents.

Other tensions identified in this study have been resolved with a change in field. Two candidates, for instance, whose research was cross-disciplinary and who were in dispute with their original supervisors in the School of Education were provided with supervisors from other schools. In each case, as the candidates' research plans were accepted by their new supervisors, there was a palpable increase in the candidates' level of capital as they felt accepted in their respective new 'games'. In each case their previous workplaces were more aligned to the new fields and their habitus' undoubtedly enabled them to have a better 'feel for the game' in these fields.

Conflict between the fields of the workplace and the university are also seen. Some candidates' habitus, for instance, was more appropriate to their workplace. For instance, Lyn (EdD, C) had a very senior position in a large corporate workplace and was embodied by a substantial amount of cultural and symbolic capital there. However, as she attempted to 'play the game' in the doctoral

field, her lack of recognised capital in that field, shown, for instance, in her inappropriate business-style dot-pointed writing, put her in a dominated position, causing a considerable amount of distress.

Further tensions between the university and the workplace are possible in the PhD (project). These include the difficulty for the candidate in dealing with conflict in the workplace following implementation of the project and the risk of the candidate losing his/her job before the research is completed. Although neither of these was reported by the candidate respondents, Paul (project, S) identified them as issues that have occurred with candidates he has supervised. The former produces a dilemma for the candidate. To see the true value of the research in terms of both an academic and a practical achievement (and perhaps to gain some cultural capital), it must be implemented; however, the workplace field is the enduring field for the candidate and the degree to which there is an increase in cultural capital as a result of the research depends upon how the research is received. There are also potential intellectual property issues whenever research is located and perhaps sponsored by a workplace, while still part of a university doctoral degree. Although the issues were resolved, two PhD (project) candidates experienced some degree of unease, one, Boris (project), felt the need for his industry manager to acknowledge ownership of the research to Boris. There are similarities here of a more global issue of the power relations between Government regulations and requirements pressuring universities to address uniform processes and standards and the candidates' need for a more responsive doctoral program aligned with his or her workplace. The irony here, of course, is that the Government itself has indicated a need for more workplace research. Universities are caught in the middle.

Challenges to autonomous principles:

Autonomous principles are seen to be challenged both in terms of fields and pedagogy. For instance, the general autonomous field of doctoral study with its underpinning values derived from the field itself is challenged by the heteronomous field of Government regulations regarding submission time. While the Government seemingly (mis)understands doctoral candidates to be young, male and studying science, this view does not allow for doctoral candidates valued in Schools and Faculties of Education such as women and those who are working and maintaining part-time study. Completion rates are now performance indicators for university faculties and schools and tied to funding. Similarly, heteronomous intrusions into the general field of doctoral study, for instance, the Government focus on the 'products' of research such as generic or employment-related skills and research output for institutions, conspire against the 'processes' of research and the researchers' engagement with these.

There are also challenges to autonomous principles of dialogical pedagogy, which includes an over-emphasis on the master/apprenticeship model of supervision (Moriarty, Danaher & Danaher, 2008). Paul (project, S), for instance, strongly argues for team supervision over what he perceives to be sub-standard master/apprenticeship practices with their power imbalances and lack of accountability. He argues that in the PhD (project) it is not possible to be an 'expert' in each workplace. However, as he points out, group supervision does not fit within the performance requirements. While the master/apprenticeship model with its clear lines of accountability and responsibility is appealing for heteronomous interests, the candidate is always dependent, 'affirming an asymmetrical power relationship' between candidate and supervisor, and confirming what for many candidates is 'an almost instinctive sense of being an impostor, somebody who is yet to show that s/he really is entitled to a position within the field of knowledge production that research constitutes' (Moriarty, Danaher, & Danaher, 2008, p. 438).

However, this needs to be tempered with the understanding that not all candidates appreciate a dialogical approach from their supervisor. In the present study, for instance, Trang (thesis, C) construed the egalitarian approach from her supervisor as over-familiarity, finding it to be disturbing.

She preferred an approach where she understood her supervisor to be the master. This is echoed by Moriarty, Danaher and Danaher (2008), who point out that some candidates from a Confucian heritage based on authority and deference 'might find dialogical pedagogy so unsettling as to be ultimately destructive' (p. 439). Once again, the importance of habitus is shown, which is now discussed along with cultural capital.

The importance of habitus and cultural capital in doctoral study:

Two assumptions can be made with regard to doctoral candidates' habitus and cultural capital. First is that previous university study, even at Bachelors or coursework Masters level, will have provided candidates with cultural capital appropriate to the doctoral field and that the amount of cultural capital they present with will be incorporated within a habitus geared towards postgraduate study, thus assisting them in their doctoral studies. The second assumption is that they are aiming to build on their cultural capital by gaining legitimate membership of the 'doctoral club'. These assumptions were tested in this study and found not to be true for all candidates. They came with unequal amounts of cultural capital and varying habitus, varying in their ability to succeed in an educational research practice of which most have little prior experience. Further, for some, the capital gained from the credential was secondary to personal and professional development.

Habitus is an important element in Bourdieu's theory. It is an organising principle for actions, norms of behaviour, attitudes and perceptions, and as such, carries the cultural capital that individuals acquire through early socialisation. Because it influences positions and position-takings in fields, it is a defining element in an individual's success or lack of success in various fields in which they find themselves. It is the habitus that enables some candidates to have a 'feel for the game' of doctoral study (although there were few of those in this study), other candidates to persevere against difficulties and ultimately reach success, and others to struggle painfully until they decide to withdraw.

Mills (2008) argues for the habitus' 'transformative potential' (p. 79). Along with her fellow researcher (Mills & Gale, 2002), she identifies two types of habitus: reproductive, in which individuals accept their social status and constraints; and transformative where they have the ability to change and improvise. A reproductive habitus was clearly seen in some candidates. Lyn (EdD, C), for instance, despite not having been allocated a supervisor for many months, accepted it as the norm. Despite her high-level managerial position, she still has an unshakable belief that things do not ever work out in her life outside of work. The administration staff seemed to feel there were no problems because she did not complain, which then became an act of symbolic violence, thus further perpetuating Lyn's belief that things do not work out. Evidence of a transformative habitus is also seen in candidates. Personal growth was a key factor with candidates in most programs. Boris (project, C), for instance felt that while his research topic was important to the community, the personal development he felt he was gaining was *vitally important* to him personally. Similarly, when Sally (project, C) was determined to understand difficult concepts in her research methodology unit, she found a perseverance she did not believe she had before. Having 'dropped out' of many activities she had previously found difficult, this new-found determination has seen her through some very difficult times in her doctoral studies. Knowing when to constrain a habitus is also useful. Although Helen (thesis, C) is predisposed to discuss her research because she understood how much she learned by being able to articulate elements, she keenly felt her inability to discuss her studies in her school workplace. She understood clearly that not only was the PhD not valued as cultural capital in that field, but also to mention it would have had the reverse effect.

In attempting to show an assumed mass of cultural capital, Julie (thesis, C) owned up to being a 'confessed snob', denigrating the EdD in comparison with the PhD (thesis, C). With a history of doing particularly well in her research Masters degree and a habitus clearly aligned with doctoral

studies, she saw the value of the PhD only if it was difficult to accomplish. Both Boris (project) and Lyn (EdD, C) also commanded a great deal of cultural and social capital, but in the fields of their workplace, not the university. However, each showed a different habitus, with Boris showing determination to somehow bring academic capital into his workplace, whereas Lyn, despite her high-powered corporate position found her work-perfect habitus with natural, high level social and oral communication skills to be of little use in doctoral studies.

Some candidates felt that there was an expectation by their supervisors that candidates come with sufficient capital to enable them to function fully in doctoral study. Where this attitude was apparent to candidates it affected them in varying ways. Both Lyn (EdD, C) and Jennie (EdD, C) felt such a lack of understanding that it rendered them powerless to ask their supervisors questions because they felt it would reflect badly on them. A somewhat different reaction was Sunee's (thesis, C) inability to ask questions because she did not know what questions to ask. As discussed earlier, the lack of any sense of learning culture left very little chance for candidates to develop cultural capital even as they neared the end of their trajectory. Being largely isolated meant they had little conception of the field as a whole, much less their program sub-field. Many candidates from all programs called on their social capital and found it easier to discuss their issues with a 'critical friend' who was successful in this field or to ask another expert, which showed a disposition for finding alternatives, arguably a useful trait in doctoral study.

Candidates who work, particularly those working full-time in senior positions and studying part-time, clearly have a habitus geared toward success in their careers, which may be different to that required for doctoral study. They also have often built up large amounts of cultural, social and symbolic capital in their workplaces. They attempt to 'play the game' in the doctoral field, but entering the game implies an acceptance of the rules, both explicit and implicit, of the game. Players with the required habitus and cultural capital, such as those in this study who have a close cultural relation to the academic field, possess a 'feel' for the game which brings with it the practical ability to perform. Those who lack the recognised capital in this field find themselves in a dominated position, and if also working, can find it difficult and confusing to develop their habitus in the required ways.

Conversely, those who are studying full-time and not working, particularly those who study on campus and have regular contact with supervisors and other research candidates, are in a better position to develop a habitus suited to the research environment. If there is a collective habitus of successful doctoral candidates it would seem to include motivation bolstered by personal and family pride coupled with a determination to succeed coming from a perspective of having something to prove.

A new look at supervisor pedagogy

The clear message in terms of supervisor pedagogy is that all stakeholders need to be aware that teaching at a skills level is a necessary but insufficient strategy to move candidates through their trajectory to becoming full members of the doctoral field. While there needs to be a pedagogical focus in the supervisor/candidate relationship, it needs to be understood as being more than merely teaching research and academic writing skills. Candidates need to be acculturated into the field of research – into the ways of thinking, doing and reflecting, in order for their habitus to become transformed so they can increase their level of cultural capital.

Supervisors also need to be reminded of the power imbalance between themselves and their candidates. Because most candidates in this study were employed practitioners, often in high-level

positions, and often older than their supervisors, there is evidence that even when supervisors attempt an egalitarian pedagogical and social space with their candidates, some candidates are very aware of their own lack of cultural and symbolic power – a recognition that in all social spaces are subject to the influence of power. There must be some scaffolding to not only build the candidates' knowledge of the rules of the game, but to gradually induct them so their research knowledge becomes second nature to them; that is, to develop their habitus by imbuing it with cultural capital valued in the field of doctoral study.

This is more likely to happen when candidates feel they are part of a learning community where they can share their learning with others – with other research candidates and other lecturers and supervisors. This needs to be done formally, through, for instance orientation sessions in which candidates learn the explicit 'rules of the game', and watching and giving regular presentations at School research conferences (which is currently the case) where candidates can identify the expected standard. However, just as important is to provide ongoing opportunities for informal meetings where candidates can gradually get a 'sense' of the game. In this situation it might be possible to transform their habitus and develop cultural capital, gradually learning to 'walk the walk and talk the talk'.

However, there may still be an issue in terms of candidates in practice-based doctoral programs such as the PhD (project). Being inducted into and immersed within the academic environment may produce contradictions in candidates who do not wish to remain part of this field. Although they need to be seen (at least by supervisors in the final stages and their examiners) as having developed some degree of cultural capital in their topic area within the doctoral field, some are clearly attempting to build capital in their workplace as well. It is interesting that in 'playing the game', candidates have presupposed an 'illusio' (Bourdieu, 1990, p. 76), believing in and accepting the value of doctoral studies, despite not wishing to remain part of the major field within which the doctoral studies sub-field is part.

Conclusions and recommendations

There is clearly a problem inherent in emerging sub-fields that challenge traditional modes of research. These larger issues will only be resolved when those with the symbolic and cultural power in this broader field of power are willing to engage in the ideologies and possibilities of this new sub-field. The PhD (project) exists because of Government demands for industry-relevant programs. However, sub-fields cannot be developed within a broader field with the expectation that all activity will fit neatly into the original field. This requires a change of attitude, expectations and regulation changes from those with substantial amounts of cultural capital in the broader field, that is, those who write the 'rules of the game' at government and university levels and those who are likely to be called on to examine candidates.

Based on the findings of this research, the following recommendations are made:

- Develop a set of best-practice principles or guidelines for supervisory practice within each of the School's doctoral programs, and provide professional development related to this to all supervisors in the School.
- Provide on-line and face-to-face opportunities for candidates to participate in networks or clusters with other candidates and supervisors to allow candidates to develop social and cultural capital.

- Explore alternative supervision practices as a way of developing learning communities**.** These could include a mix of individual and group sessions where supervisors bring groups of their candidates together on a regular basis.
- Develop a supervisor pedagogy aimed at habitus transformation. Although the habitus is difficult to change and does not change quickly, it is important that candidates with a habitus likely to constrain rather than enable success in a research project are exposed to pedagogical strategies aimed at attempting to develop it. This would need to include work on candidate identity as a researcher.
- Ensure supervisors and learning support staff develop awareness of the effects of relative amounts and types of cultural capital in candidates.

It is clear that the fields of academia and the workplace will continue to develop strong ties with each other, but it is important to understand the tensions between the fields and the potential effects of these on doctoral candidates. Bourdieu (1977) argues that it is necessary 'to abandon all theories which explicitly or implicitly treat practice as a mechanical reaction, directly determined by the antecedent conditions and entirely reducible to the mechanical functioning of pre-established assemblies "model" or "roles"' (p. 73). Far from a mechanical reaction, insights from the data in the present study reveal the emotionally-charged process of succeeding as a doctoral candidate, with the on-going struggle to balance feelings of despair and inadequacy with a dogged determination to succeed.

Supporting locally to participate globally: Lessons learned from NNES international doctoral students' overseas academic experiences

Ms. Yu-jung Chang
University of Washington
yujung@u.washington.edu

Abstract

International graduate students are key players in facilitating cross-cultural communication and providing research productivity and leadership across national boundaries (Nettles & Millett, 2006; Tardy, 2004; Zimmerman, 1995). However, in the international research community where English is the common language, nonnative-English-speaking (NNES) international students' academic endeavor has often been examined through emphasis on their linguistic, social, and cultural challenges (Angelova & Rizantseva, 1999; Cho, 2004; Deem & Brehony, 2000; Morita, 2004; Schneider & Fujishima, 1995; Tardy, 2005). Especially for those studying in English-speaking countries, alternative views to the challenge-oriented analysis and possible diversity in students' learning experiences are seldom presented in previous literature. Thus, the simplified and largely negative depiction of NNES international students has often masked the students' heterogeneous needs to succeed in their overseas academic pursuits.

With a goal to enrich our understanding of NNES international doctoral students' experiences overseas, this study used interviews and shadowing observations to examine three NNES students' learning trajectories in three graduate programs at a U.S. graduate school. Through the lenses of communities of practice (Lave and Wenger, 1991; Wenger, 1998), forms of capital (Bourdieu, 1977 & 1991), and learning investment (Norton Peirce, 1995), the study situated the students' experiences at the nexus of multiple personal and contextual factors, including family backgrounds, academic resources, future aspirations, and the culture and practices of each disciplinary community. The findings demonstrated that the NNES international students underwent a selective process of learning and made strategic use of their resources to position themselves favorably amongst their peers. Moreover, despite their shared label of NNES and international, their experiences were individualized by their different histories, resources, learning objectives, and the disciplinary contexts. On the other hand, the findings showed that prior to their overseas study, the students often did not receive sufficient guidance in preparing for the issues and academic demands they were about to face in their host communities. Furthermore, their host communities (including the community members) were not always aware of the NNES international students' diverse needs or ready to scaffold them to reach their learning goals.

In acknowledging the critical roles NNES international graduate students play in the international academic community, this study offers pedagogical implications based on the findings: It urges higher education institutes in international students' home as well as host countries to offer tailored and genre-specific support 1) to foster students' aspirations and academic competence in different skill areas before their academic quests, and 2) to attend to their learning objectives and needs during their overseas study. Detailed discussion of implications will be offered at the presentation and audience will be invited to participate in the discussion.
keywords = communities of practice, cultural capital, academic investment, Nonnative-English-Speaking international graduate students

Consolidating Doctoral Degrees along Functional, Rather than Disciplinary Boundaries

M.O. Thirunarayanan
Florida International University
College of Education
Miami, FL 33199
Email: thiru@fiu.edu

Abstract

Doctoral degrees are currently typically awarded along disciplinary boundaries. For example, a person can earn a doctoral degree in economics, or psychology, or physics, to name a few disciplines. Such practice has resulted in the proliferation of many types of doctoral degrees.

The author suggests that doctoral degrees be awarded along functional instead of disciplinary boundaries. The functional areas could consist of the following – a few more could be identified and added later:

- Leadership
- Management
- Philanthropy
- Practice
- Research
- Service
- Teaching

As an example, a doctoral degree that is offered in leadership in engineering could be listed as Ph.D. (Leadership – Engineering).

The author will discuss some of the advantages of consolidating doctoral degrees along functional rather than disciplinary boundaries.

Benefits and prerequisites of collaborative and cooperative leadership: A case study of a teacher education program

DeLacy.Ganley@cgu.edu *
Anita.Quintanar@cgu.edu *
Lisa.Loop@cgu.edu*
Claremont Graduate University
USA

Abstract

Written by a team of three women who have collectively and cooperatively co-directed a teacher education internship program in Southern California since 2003, this article narrates the origins of their unorthodox leadership structure and chronicles what they perceive to be the benefits of shared leadership. Also discussed is the group's belief that creating an effective co-leadership team takes far more than arbitrarily assigning co-titles to a group of individuals. It necessitates a number of prerequisites, including the members of the team holding the belief that shared decision making is advantageous and being equally committed to the same vision. This reflection is admittedly idiosyncratic and ethnographic in nature. The authors do not purport that their insights are universal in their applicability. Instead, the authors are presenting their experiences with and understanding of collaborative and cooperative leadership for heuristic consideration.

Introduction

Collectively and cooperatively we have been co-directing a teacher education internship program in Southern California for nearly seven years (since 2003) This article first narrates the origins of our unorthodox co-structure. Next we highlight the indicators that suggest the program has thrived under our leadership. Believing that the success of the department largely stems from our co-leadership structure, we then chronicle what we feel are the benefits of our collaborative and cooperative leadership. In doing so, we argue that effective shared leadership needs to be purposeful. As key prerequisites, we feel members of the team need to hold the core belief that shared decision making is highly advantageous and need to be equally committed to the same vision. The article concludes with a series of yet-to-be answered questions that stem naturally from this understanding of shared leadership: *What happens when a member of the shared leadership team needs to leave? What are the challenges associated with such a transition, and how can a team prepare for this inevitable reality?*

Historical context: The origin of our leadership structure

In 2003, nearly seven years ago, the three of us collectively assumed the responsibility of our graduate university's teacher education program. The circumstances related to our ascent to leadership were a bit unprecedented and the result of an institutional crisis. There was an unexpected and sudden void of leadership in our teacher education department. Without forewarning and in a matter of days, our supervisor and mentor stepped down from her position of director and returned to the faculty. Knowing that our department is of vital importance to the financial stability of the School of Educational Studies (SES) and, hence, tacitly knowing that if Teacher Education faltered, so would SES, the core SES faculty called an emergency meeting and looked us in the eye. They asked, *"Can you handle Teacher Education? Can you provide leadership, at least on an interim basis? Do you have the wherewithal to provide the stability we need?"*

Their candor likely reflected the cut-to-the-chase talk that often happens in crisis situations but also the soundness of the preexisting relationships the three of us had with the group. After all, we were known entities. Lisa Loop had been involved in Teacher Education for 17 years and was the Assistant Director. With a background in accounting, she knew the ins and outs of the department's budgets, grants, and fellowships better than anyone. She also had an exhaustive institutional memory of teacher credentialing in the State of California. We sometimes would joke that Loop could be awoken in the middle of the night, asked how the State mandates of the 1980s were different than those of 2000, and she could explain the nuances (coherently) without a moment's hesitation. Dr. Anita Quintanar had a background in K-12 schools in California, starting first as a Kindergarten teacher and finishing as a principal responsible for opening a school. While earning her doctorate from SES, she had done various projects for Teacher Education, including directing a highly successful career ladder grant that supported teacher's aides in their quest to obtain a Bachelor's degree and then subsequently a California teaching credential and MA in Education. Like Quintanar, Dr. DeLacy Ganley had earned

her doctorate from SES. While pursuing her doctorate, she had done some work in Teacher Education but had also been a Teaching Assistant and Research Assistant for a number of SES's core faculty. Her background was in teaching English and working with non-native speakers of English, both domestically and abroad. Given their co-terminus faculty status, Quintanar and Ganley were already attending the monthly SES Faculty meetings as colleagues. Loop was also an integral part of these faculty meetings as the Assistant Director of Teacher Education.

Loop, Quintanar and Ganley were no strangers to each other. Because our supervisor and mentor had simultaneously been the Director of Teacher Education *and* the Dean of SES *and* was a productive faculty member, she had been incredibly busy and the day-in, day-out running of Teacher Education was already largely our responsibility. Since 2002 (a year prior to this crisis), the three of us had been working elbow-to-elbow full time and had, as one of our first projects as a team, written a massive document to show how our program was aligned to new State mandates for teacher preparation (Senate Bill 2042). At this time, as noted above, Loop was the Assistant Director and, as an administrator, kept all the parts of the Teacher Education machine moving. She handled the accounting aspects of the office, kept the pulse of student enrollment and recruitment, managed financial aid, and coordinated the nine-person office staff. In 2002, Ganley and Quintanar had long formal titles: Director of Research & Advancement and, respectively, Director of Student Programs & School Relations. Combined, they were the academic leads of the department, responsible for stewarding the university-based coursework and the program's clinical components. Immediately upon joining forces, the two worked together to revamp the program's curriculum and refocus the program's anchor assignment, an ethnographic narrative project that served as the candidates' MA theses.

Given our already successful working relationship and our understanding of the department's idiosyncrasies, when the core SES faculty asked us if we could "(wo)man" the ship as a team, the answer was a quick yes. Accordingly, from the beginning, our leadership was conceived as being non-hierarchical. We were all, collectively and cooperatively, assuming the responsibilities of the directorship while still maintaining our previous, subordinate positions.[1] Our base salary remained the same for our Director positions, and we all were given a small stipend for assuming the Co-Directorship. The stipend was admittedly minuscule: we evenly split the 2/9 stipend that our former supervisor was given for the administrative work associated with the position. As such, our promotion didn't cost the department any additional funds. For each of us, the compensation annually came out to be approximately what an adjunct faculty member would earn to teach a single course. That we didn't advocate for greater compensation commensurate with the increased work and responsibility largely reflects the fact that everything was happening so fast and that we thought our leadership would be short-term, perhaps as short as three months.

Immediately upon hearing that we accepted the challenge, three core (seasoned and highly respected) SES faculty members volunteered to act as an advisory group. Their advocacy of us was palpable and appreciated. They made sure that the successes of our department were known by others, and, in many senses, their formal support helped to legitimize us and our unorthodox structure.

When the department's new leadership structure was presented to the University, Human Resources raised a red flag. HR asked, *"Who is ultimately in charge?"* That the metaphorical buck stopped with all three of us was deemed problematic, and it was determined that Loop would, in name, be the Interim Director but that the leadership was, in fact, collectively shared. Suggesting understanding that the department was co-led, most if not everybody within Teacher Education and SES now referred to us collectively by our new "nickname," a short-cut acronym that represented the friendly nature of our collective partnership: LADs (Lisa, Anita, and DeLacy).[2]

At a LADs meeting about a year after the formation of the team, Loop pointed out that it was ridiculous that she officially held the title of Interim Director given that the directorship was so clearly shared among the three of us. The title, she said, felt disingenuous. At this time (approximately 2004) the internal decision was made that we would refer to ourselves simply as the Co-Directors of Teacher Education and in the process remove any semantic hierarchy. Although we started using this new designation, the title change wasn't yet "registered" with HR.

---

[1] As such, Ganley is now both a Co-Director of Teacher Education *and* the Director of Curriculum & Research; Quintanar is now a Co-Director *and* the Director of Faculty Development & School Relations; and Loop is now a Co-Director *and* the Director of Administration & Advancement.

[2] Emails are often sent to the three of us and start with "Dear LADs…" In meetings colleagues will say, "What do the LADs have to say about this issue?" And across our own calendars will be "LADs Lunch" or "LADs meeting." Abbreviating to "LADs" is so much easier than saying "Lisa, Anita and DeLacy."

Then, in 2005, approximately two years after the crisis that brought about our co-directorship, the core SES faculty unanimously voted (and the Provost agreed) to lift the provisional status of our leadership arrangement. In truth, we hadn't been operating as if our leadership was in any way temporary; we were too enthusiastic about what we were doing and too busy with the work. No external chatter about being provisional ever pulled our focus, and there hadn't, for example, been discussion about a search for a permanent director or any publicizing of the position. Our enrollments were strong and all indicators suggested that Teacher Education was thriving under our care.

It is also likely that having consistent leadership in Teacher Education provided a sense of solace and stability to the School as a whole. SES's own leadership was in flux. Reflecting the School's practice of anointing deans by looking around the table of core SES faculty and seeing whom among themselves was willing to "sacrifice" for the administrative duty, the School had had four deans in four years time. The weakness of this practice was becoming increasingly evident (as fewer and fewer members of the faculty were able or willing to step up to the plate), and there was more and more talk about needing to look outside our own walls for a fulltime dean.[3]

Currently our structure is now somewhat normalized. We have been leading collectively and cooperatively now for seven years. No longer are we incessantly being asked, *"Which one of you should I email about "X"?"* Internally people now seem to understand that budgetary and administrative questions are best handled by Loop and questions related to curriculum, student concerns and/or academic issues are best fielded by Quintanar and Ganley. Perhaps most vital, however, is that within the institution there is now the understanding that anytime a question is posed to any one of us that the question or issue is in turn shared with the others. Understanding the high degree to which we communicate with one another seems to lessen people's anxiety about making sure their initial message is sent to the proper recipient.

The remainder of this article uses our experience with collaborative and cooperative leadership to address what we feel are the benefits of such a structure and the non-negotiable attributes of our effective team. Admittedly, this reflection is idiosyncratic and ethnographic in nature. We do not purport that our insights are universal in their applicability. Instead, we are presenting our experiences with and understanding of collaborative and cooperative leadership for heuristic consideration.

The benefits of leading collaboratively & cooperatively

There are a number of indicators that the department has thrived under our leadership:

- Steady enrollments. While other internship-based teacher education programs in Southern California are reporting that their enrollments have severely declined (some even needing to close shop) because of the depressed economic situation, we have been able to maintain our enrollments around 100 interns per cohort.
- Significant increase in the cash contribution to the School. When comparing the cash contributions of the department in the 2001-2002 school year (just prior to our assuming leadership) to the contributions made in the 2008-2009 school year, Teacher Education has increased its cash contribution to the School by 42.9%.
- Securing of grant funds. In the last five years, we have secured over $5 million in grants from the federal government, the state and private foundations.

Besides there being indicators of institutional strength, we can also report personal fulfillment in our jobs: we have a shared sense of responsibility; feel like we can take risks and be innovative; feel like our efforts are worthwhile and, hence, feel accomplished; and enjoy our work environment and like the people with whom we work.

We believe that the success of the department stems in large part from our leadership arrangement. Stated differently, we don't think our department would be doing so well if it weren't being led collectively and collaboratively and that our program's success speaks to the strength of such a leadership structure. When compared to a leadership structure with one person at the helm, our structure has provided our department with greater stability; better and more innovative decision making; and more efficiency and effectiveness in the implementation of ideas. To illustrate this, consider the transformation of the program's pre-teaching experience.

At the time we accepted the directorship, we recognized that we were most concerned about the part of the program with which we had the least control: the pre-teaching experience. The pre-teaching experience is in the very first part of our program (during Phase 1, the "pre-internship" phase).

---

[3] This era was also a time of change for our University as we had a new-to-the-institution president who came on board in July 2005. His arrival created a stir almost immediately, and he would resign from his post just four years later in 2009.

It involves our candidates working at school sites under the tutelage of experienced teachers. The goal is for the veteran teacher to provide mentorship and support in order to develop the candidate's effectiveness and overall readiness to assume the responsibilities of his/her own classroom (which happens in Phase 2 of our program, the "internship" phase). In their pre-teaching settings, candidates assume greater and greater responsibility until they are able to teach independently. At the end of the experience, the candidate must be deemed competent enough to be a fully responsible, fully paid teacher of record in his/her own classroom under intensive university support. With this designation made, the candidate can advance to Phase 2 of the program (the "internship" phase).[4]

When we assumed leadership, our candidates' pre-teaching placements were determined by our district partners. We would contact a wide number of school districts and ask if they would be willing to host a few of our candidates. District administration would then select the specific "Cooperating Teachers" to whom we'd pay a small stipend. More times than not, we were grossly unsatisfied with the lack of quality experiences our candidates were having. Although some of the district-selected Cooperating Teachers were stellar, many were not. Sometimes we had the sense that our candidates were being placed in a particular classroom to augment an ineffective teacher instead of to learn from an expert. At times our candidates were being viewed as gofers to make copies or run errands, and in other instances they were handed the keys on the first day and the Cooperating Teacher was never seen again. There was insufficient quality control. We had no influence over which classrooms our candidates were being placed and scarce influence over the Cooperating Teachers. The result: We were dissatisfied with how the pre-internship experience was serving our candidates. How we dealt with this predicament illustrates the benefits of our leadership structure.

We believe that three heads are better than one. As such, when there is a decision to be made or a problem to be solved, we talk about the issue collectively, looking at the situation from different angles, pitching different perspectives and solutions. We each bring our unique expertise to the table to answer a plethora of questions. First we discuss the problem or situation itself: *What are the systemic factors at play that brought about this problem? Is it akin to anything we've seen before? What other problems are related to this issue?* Then we start circling in on different solutions, scrutinizing various possibilities: *What does research say? How is this in line with our values and mission? What have we done in the past? What is the out-of-the-box solution we aren't yet thinking of? What solution best serves the people involved? Are there financial implications?*

We keep asking questions of each other and postulating answers, whittling away at the issue. This process necessitates having genuine respect for each other's thinking, skills, and perspectives. Most typically, a solution is proposed and then somebody else takes that idea and elevates it. The solution keeps evolving, and with every iteration the idea comes closer and closer to the mark. The final solution, once hit, no longer "belongs" to any one of us individually and is typically immediately recognizable as "it."

In the case of the pre-internship experience, we went around and around. Eventually we articulated what we wanted: less variability, greater quality, and more control. We wanted to better align the work the candidates were doing at their pre-teaching sites to their university coursework. We wanted the mentoring teachers to be the best in our area schools and to provide a visual embodiment of our program's vision in action. We realized that if we could be in a defined relationship to a core group of teachers, selecting, training, and supervising them for a number of years, that we would have the desired influence over the pre-teaching experience. As such, we decided we needed to convince a select number of districts to allow us to build our own relationship with a core group of their teachers who would, during the pre-teaching experience, be simultaneously employed by the district and us. The idea was that we would work with these "CGU Master Teachers" on a long term basis, providing them with significant professional development and compensation (which besides an honorarium included the opportunity to take a class which could be applied to a doctorate in Education at Claremont Graduate University). With this goal identified, Loop looked at the budget and determined, with some adjustments and reallocations, that the plan was financially feasible.

Now that we had a goal, we needed to make it all happen. This would be no small undertaking. We didn't want yet another cohort to have the old, flawed pre-teaching experience. This meant that we had to get district buy-in immediately. We'd need to pitch the idea to our district friends and work with them to vet the project with Superintendents, Boards of Trustees, teacher Unions, and department heads. We'd need to interview, select and train the Master Teachers and process their contractual agreements…and we would need to do this in a matter of a few months. We were under a

---

[4] During Phase 2 (aka: "the internship phase") our candidates are deemed highly qualified under No Child Left Behind and are in their own classes as the named teacher of record. They coached in their classrooms by our faculty and attend classes with us at the University on Saturdays.

time-crunch. Having three of us, though, allowed us to accomplish the job at hand faster and more efficiently. We could do as a team what no single entity could.

In October we called together friends from the school districts with whom we have some of our closest relations and whom we meet with every several months. The group mostly consisted of Human Resource personnel, instructional leaders, teachers and principals. We shared with them our idea, and immediately friends from four districts said they were excited. Each of us then partnered with the friends from a different district, looking at how the program could be custom-fit to each district's own situation. In this way, we extended the circle of our shared leadership to include our district partners. From them we elicited ideas and worked together to create a win-win situation.

By having each of us meet with a different district, discussions advanced quickly in triple-time. We were dividing up the workload (and hence could metaphorically be in more than one place at the same time). Vital was that each of us individually carried ultimate authority and credibility. District leaders knew that each of us had the power to negotiate and problem solve and could make on-the-spot agreements to adjust to the idiosyncratic context of a particular district. Decisions didn't need to be postponed because they needed approval from a "higher up." By "dividing and conquering," we could be nimble and responsive and, as such, we were able to get the needed district buy-in within the constricted timeframe. Some, particularly our colleagues who know how slow-moving districts can be, marvel at this accomplishment in and of itself.

When it came time to interview and select the Master Teachers, we again played to our structure's strength. We converged upon a district, each of us holding interviews in a different room with a separate group of perspective Master Teachers. In one district alone we collectively interviewed 60 teachers in 2 days. Three days later we had a team of Master Teachers in place, ready to start their training that next weekend. This could not have been possible if we weren't working as a collective and cooperative team. We simply could not have covered so much ground.

In 2008 the first group of our candidates had the new pre-teaching program. The benefit was immediately evident. Our faculty and Master Teachers were talking to one another so now when a literacy strategy was discussed at the University there was the likelihood that the Master Teacher was modeling it at the school site. The result: alliance between the clinical and the theoretical and, accordingly, greater candidate understanding. The faculty who coached the candidates in their internship jobs (during Phase 2 of our program) reported that the cohort was much more ready for the challenges of being the teacher of record. And, the number of candidates-in-crisis was down. Interestingly, the benefits weren't just to our own candidates. The Master Teachers were reporting that the experience invigorated them, and district leaders were saying their best teachers had jumped their game to an even higher level after being a CGU Master Teacher. One district also reported the arrangement benefited their pupils, saying that academic test scores were far higher in the classrooms hosting our pre-teaching candidates.

From hindsight, this new approach to the pre-teaching experience seems obviously sensible but it was groundbreaking, not just for us but also for our district partners. We had been handling the pre-teaching this same way for over twenty-five years. Our new approach simply did not follow status quo; it was deemed innovative and now some peer institutions are considering following suit.   Perhaps we have also set a new standard by which to measure university/school district relations and collaborative efforts.

Quintanar often says that everybody has a blind spot because one can only independently see three walls. To see the fourth wall behind, one needs a partner. With three of us on sentry, we ensure that we have a 360° view. Furthermore, each of us brings a unique perspective to help understand the situation. Accordingly, because there is shared responsibility, we are more aware of and responsive to the situation at hand and, as a result of our increased vantage and the information it yields and because each has different skill sets and perspectives, we are able to make better decisions. As such, we really believe the sum of our collective effort is far strong than the sum of our individual parts.

We also believe that our structure not only lets us set better goals and gives us the ability to implement these goals more effectively but that it also leads to greater stability for the program in part because a change of leadership isn't as likely. Prior to our leadership, there had been a history of crisis and subsequent leadership change. The typical modus operandi was for a single director to oversee all aspects of the department, for personnel to get overwhelmed, for the program to go into a tailspin, and for a change in leadership to ultimately occur. Typically directors didn't last more than 5 years.

Under our care, the program is doing well and none of us is feeling overwhelmed. When we start to feel stressed, we have sufficient power to rethink our needs and resources. Together we shoulder the challenges and stresses that come hand-in-hand with being responsible for any program of our size and quality. Our structure has also allowed us to accommodate "life's happenings" with less

impact to the program: we've weathered deaths and one director was able to step out for two different six-week maternity leaves.

Our staff and faculty agree that our leadership structure is advantageous. When asked to anonymously comment upon a shared leadership structure, we received the following feedback:

- "[Such a structure] works well. The structure allows those needing assistance the ability to discuss the issue/problem with those who specialize or have experience in a certain area."
- "I think [such a structure] is good because it brings more strength to the team and the work is divided. Also [it is] easy to bounce off of and feed on each other's ideas…There is always someone to talk to if you have a question, concern or need help with something."
- "[It is] fabulous – I see the best of all of them. Their talents seem to be featured. Each of their creative sides is recognized, and they model incredible respect and cooperation…"
- [It is] fantastic! They make an excellent trio. They work together to meet the needs of the program…The advantages are that they can divide responsibilities so they can focus primarily in these areas and do them well. They still contribute in all areas, but their strengths are evident."
- "It works well when all…are interested and driven to achieve [the] same results as stated in philosophy. It helps that each has a different background/area of strength so together they meld the ideology, philosophy, and practicality…Three heads are better at problem solving and keeping program <u>balanced</u>. In any problem, on any given day, someone is there at CGU to help."
- "I believe this is the best structure I have seen in my career. Having three people with each having their own special expertise in a specific area of the program is better than having one persona and a watered down expertise on each of the three areas of the program…The advantages are that each has a certain responsibility of the program and as such can put all your efforts in that area. As they say "three heads are better than one." Each of you is very dedicated to the overall success of the program. As each of you performs your duties and responsibilities to the best of your abilities, when it comes together it is like sweet music. It is obvious that it is working as we still have a high number of students in the program. I am sure that higher management sees this. As they say, "if it isn't broken, why fix it?" I see how great the three of you work together and that is because the goal of the three of you is to make the program the best possible. Keep up the great work."
- "I feel the advantages of this structure are: 1. More ideas because there are three different views and vantage points; it gives issues and decisions that seem to be cut and dry a new life with new ideas. 2. More flexibility. Because there are three different directors, there is always someone to fill a hole when emergencies/life comes up. 3. More calmness and resources. With the three directors there is an ability to split responsibilities; therefore all decisions and responsibilities do not sit with one person and most of the time we are able to deal with a dilemma when it occurs."

When pushed to articulate a drawback associated with shared leadership, most noted that a lot of time needs to be devoted to communication (i.e., that shared leadership was time intensive), and dialogue is necessary to be on the same page.

The prerequisites of leading collaboratively & cooperatively

Although the benefits of such a leadership structure are varied, creating an effective team involves much more than simply assembling a group and giving them co-titles. We believe the "magic" doesn't happen serendipitously. Obviously, the members of the team need to share the fundamental belief that the group can accomplish more collectively than could the members individually. Additionally, there needs to be a genuine respect for each other's expertise, skills, perspectives, and talents. Likewise, each member must have transparent and effective communication skills; be gracious and patient; and have the self confidence to celebrate collective accomplishments while relinquishing the need for personal glory. Perhaps, though, the most critical prerequisite is having a common vision.

We feel that a commitment to a common vision (and passion for that vision) is absolutely key. There needs to be crystalline agreement regarding the overarching direction of where the team wants to go. There will be (and should be) debates about how best to get to this destination, but the end-goal in and of itself cannot be something that isn't clearly, unanimously and vigorously endorsed. The manifestation of this vision has to be "the calling" of each individual.

We are united in our belief that teachers can (and should) be transformational figures in the lives of their students, that it is what teachers do (or conversely don't do) that determines the academic success of a student. We resonate with hopeful data that show that teachers can cultivate stellar academic success among poor, non-white, non-native speakers of English. We believe that variables like poverty and language fluency are challenges but not barriers that legitimize a student's failure or that justify teachers lowering their expectations. We believe that such variables can and need to be addressed via well-informed, explicit and purposeful instruction. As such, we seek to prepare teachers who believe it is a myth that certain kids "can't do it," to prepare teachers who strive and are able to cultivate academic success in all, including the most disadvantaged, marginalized, and disenfranchised. The endorsement of these ideas is, for us, unwavering. We don't quibble over this vision and instead focus on how to align our decisions and actions to this vision. We feel that because we are in total agreement of the end goal, our efforts are more productive and focused.

We also find that being united in our vision makes our involvement with each other energizing. Each feels as if our own individual calling is being advanced because we are surrounded by each other, by kindred spirits. Stated differently, our commitment is nurtured in each others' care. We find that because we are united in our calling and committed, our work together is often in a state of what Mihaly Csikszentmihalyi would call flow (Csikszentmihalyi; 1997; Nakamura & Csikszentmihalyi, 2009). We feel as if our efforts, time, and energy together is advancing our own individual cause (which is also the collective cause) and as such is not tiring nor burdensome. And although we ourselves call our routine convenings "LADs meetings," the term "meeting" really isn't applicable because they don't feel akin to the stale standard meetings typical in most organizations. Instead, our work is rejuvenating, invigorating and self-propelling.

Being energized by each other and our collective endeavors is fundamentally important because the process of sustainable collaborative and cooperative leadership isn't "efficient" or quick in terms of time. It necessitates an extreme degree of communication and group sense-making. We continually meet, continually dialogue. If we didn't look forward to our interactions with the team or were depleted by them, these frequent interactions would be overly taxing and eventually avoided. But, in our case, nobody comes to the table begrudgingly or feeling like they are impatient to get to their "real work" – because the meeting at hand is the real work. To be clear: None of us love meetings for meeting's sake. But when we get together, the time goes by quickly and enjoyably, and we part company feeling productive, accomplished. Because of this, there is the needed willingness to devote time to the process. The long and short of it is: Effective collaboration takes time but the results are worth it.

Lastly, because we all have a common vision that simultaneously corresponds to our own individual calling, our work ethic is equally strong. We are all outcome driven individuals and are willing to do what it takes to get the desired results. Having a similar work ethic is likely a fundamental prerequisite to shared leadership because it keeps tit-for-tat comparisons and resentment at bay. Knowing the degree to which each of us works tirelessly for the good of the department and the advancement of our mission, none of us thinks of another as a "slacker" who isn't carrying her share of the load. In truth, it is more typical that we try to remind each other to maintain a sensible pace and a balanced life in order to prevent exhaustion and burnout (thus illustrating yet another prerequisite: genuine care for the members of the team).

Conclusion

In summary, we feel that there are a number of benefits to collaborative and cooperative leadership but that crafting an effective team doesn't happen by chance. There are a number of prerequisites, including members holding the belief that shared decision making is advantageous and being equally committed to the same vision. Accordingly, effective collaborative and cooperative leadership takes far more than the arbitrary giving of co-titles to a group of individuals. Given this understanding, a number of questions naturally arise: *What happens when a member of a shared leadership team needs to leave? Should the team try to find a new member or reconfigure its current model (i.e., a trio now becomes a duo)? Either way, what are the challenges associated with this type of transition, and how can a team prepare for this inevitable reality?* These are relevant questions for our particular team. How we address the inevitable temporariness of our trio will need to be chronicled in a future publication.

Introduction

In May of 2008, the Illinois State Board of Education (ISBE), which regulates the K-12 public schools, and the Illinois Board of Higher Education (IBHE) which regulates the public and private universities in Illinois initiated a process to revise the universities' preparation programs for building level principals across the state. These state agencies were reacting to two separate issues when the decision was made to begin the revision process. First, they were addressing the Levine Report (2005) which criticized principal preparation programs, nationally, for having inadequate curricula, low admissions and graduation standards, faculty disconnected from the K-12 schools, and insufficient quality control. Second, ISBE and IBHE were reacting to the fact that in fiscal year 2007, 2402 principal level administrative endorsements were issued in a state that had just over 400 administrative openings at the principalship level (ISBE, 2008). These agencies also touted the need to shift the emphasis of these administrative preparation programs from a management approach to more of a leadership approach.

A task force was initiated, which subsequently met several times over the next year, to propose improvements and revisions in the principal preparation programs across the state. There are currently thirty-two public and private institutions of higher education which operate principal preparation programs in Illinois. Many of these institutions were represented at the inaugural meeting of the task force which was held on May 29 and May 30, 2008 in Bloomington, Illinois. Other participants included teachers and public school administrators, Regional Superintendents of Education, representatives of the two major Illinois teachers unions, the Illinois Education Association (IEA) and the Illinois Federation of Teachers (IFT), and representatives of the Illinois Principals Association (IPA) and the Illinois Association of School Administrators (IASA), which represents superintendents in Illinois. The participants in the first task force meeting were greeted by both the Superintendent of the Illinois State Board of Education and the Director of the Illinois Board of Higher Education. It could certainly be stated, with authority, that the major leadership in Illinois education was represented at the first meeting convened by IBHE and ISBE.

The first two day meeting was utilized to establish the rationale and to lay the groundwork for the future work of the task force, which operated under the title of "Working Together to Prepare School Leaders." An historical background was given by Dr. Steve Tozer, from the University of Illinois at Chicago. He outlined the findings of a report released in August of 2006 by the Commission on School Leader Preparation in Illinois Colleges and Universities entitled, *School Leader Preparation: A Blueprint for Change* (2006). This Commission submitted its report to the Illinois Board of Higher Education. The Illinois Board of Higher Education joined forces with the Illinois State Board of Education and the Governor's office to initiate a joint resolution in the Illinois General Assembly. This resolution created a task force charged with moving the *Blueprint* agenda forward. This task force, entitled "The Illinois School Leader Task Force" was chaired by Dr. Tozer and met six times between October of 2007 and January of 2008. When this task force submitted its report to the Illinois General Assembly in February of 2008, the report contained three major recommendations:

1. State policies must set high standards for school leader certification that align principal preparation, early career mentoring, ongoing professional development, and master principal recognition with those standards, so that by 2013 all new principal preparation would be

taking place through programs approved under these new standards (Report to General Assembly, 2008, p. 7).

2. Formal partnerships must be established between school districts and principal preparation programs affiliated with state-accredited institutions to support principal preparation and development (Report to General Assembly, 2008, p. 8).

3. Refocused principal preparation programs must demonstrate that they develop and rigorously assess in aspiring principals *the capacities that are most likely to improve student learning in PreK-12 schools.* These capacities should (a) form the heart of the new Illinois School Leadership Standards previously recommended and (b) reflect the vision of school leadership identified in the Illinois Distinguished Program (Report to General Assembly, 2008, 8).

The "Working Together to Prepare School Leaders" task force, addressed in this paper, was formulated to address the recommendations to the General Assembly and to flesh out the skeleton developed by the previous task force.

National Reform Efforts

Unlike many other countries, the United States does not have a federal system of education. While the United States Department of Education can exert some influence over state departments of education through funding, federal dollars typically account for less than ten percent of most school districts' budgets. The federal government can also influence the various states through legislation, such as the No Child Left Behind Act of 2001. Overall, however, the individual states are in charge of their respective educational systems.

Illinois was not the first state to address the issue of principal reform programs and other states have been concurrently reviewing their programs in the same time frame as Illinois. During the initial May 2008 meeting of the new task force, participants were given information regarding the reform of principalship preparation programs in Alabama and Iowa. The principal preparation reform movement in Alabama began in November of 2004 when Governor Bob Riley and State Superintendent Joseph B. Morton convened a Governor's Congress on School Leadership in Montgomery. Over one hundred selected delegates represented K-12 education, higher education, State Department of Education, foundations and agencies, professional associations, business, and other community leaders (Alabama Instructional University Redesign, 2008, p.3.) It was determined that rather than just competing a series of courses, candidates for the principalship would need to complete a program that addressed all of the Alabama Standards for Instructional Leaders.

The hard work on this process began in earnest in September of 2006 when all thirteen Alabama principal preparation institutions were invited to participate in a two-day training based on lessons learned from redesign efforts conducted in other states. This training was conducted by the Southern Regional Education Board (SREB). The SREB is a nonprofit, theoretically nonpartisan organization that helps government and education leaders in its sixteen members states work together to advance education and to improve the social and economic life of the region. SREB is governed by a board that consists of the governor of each member state and four gubernatorial appointees, including at least one state legislator and one educator. SREB is supported by appropriations from its member states and by funds from foundations and state and federal agencies (SREB, 2009). It was determined that through collaborative K-12 university partnerships, all universities in Alabama should work with local school districts to redesign their instructional leadership programs to address new state requirements. Four institutions, designated lead institutions, were to submit their revised programs for approval in 2008 and the remainder were to submit their programs for approval in 2009.

Reform of principal preparation programs in Iowa began in 1999 with the development and adoption of the Iowa Standards for School Leaders (ISSL), an adaptation of the ISLLC standards (Hackman & Wanat, 2007, p.8). All Iowa programs interested in certifying principals had to submit proposals to the Iowa Department of Education which met the new Iowa requirements. This proved to be a very rigorous process. According to Hackman and Wanat (2007):

> Nine applications were submitted in May 2003: seven proposals from higher education institutions currently offering approved programs, one new proposal from a higher education

institution, and one new proposal from a state professional organization. One higher education institution currently offering an approved program did not submit an application, thereby terminating its program. The national panel reviewed programs through multiple program drafts and meetings with program faculty. By August 2003, they had recommended five programs to the Iowa Department of Education for approval: four from universities and one from an in-state professional organization. The four unsuccessful applicants were provided an opportunity to withdraw their submissions rather than to have their programs officially denied; all four elected to withdraw their applications (p.9).

Armed with this backdrop of information from two other states, the new Illinois task force began the process of developing recommended changes in the requirements for principal preparation programs in the state. Illinois differs from both Alabama and Iowa in terms of population. Not only are there many more students and schools in Illinois than in the other two states, but Illinois also had thirty-two principal preparation programs at the beginning of this process, which was more than triple the number of programs in Iowa and nearly triple the number of programs in Alabama.

Illinois Revision Process

After the introductory meeting held in May 2008 in Bloomington, Illinois, the facilitators asked for volunteers that would be willing to continue working on the revision process in subsequent meetings. A core group of individuals agreed to continue serving as members of the new task force and subsequently met another half dozen times over the ensuing summer and the next academic year. All meetings were held in Bloomington, Illinois, which was centrally located in the state.

In order to better manage this major revision effort, it was decided to distribute the work among five distinct subcommittees. Each of the following five subcommittees was co-chaired by a public university representative and a private university representative:

1. New Structure for Leadership Certification & Endorsements.
2. School/University Partnerships & Selection Process.
3. School Leadership Standards.
4. Residencies & Internships.
5. Assessments of Candidates & Graduates.

All of the ten co-chairs of the subcommittees were members of the Illinois Council of Professors of Educational Administration (ICPEA). Many other subcommittee members were also ICPEA members. The ICPEA, an affiliate of the National Council of Professors of Educational Administration (NCPEA), is a collegial group of educational administration professors which meets quarterly to work on the betterment of educational administration programs throughout Illinois. The group works cooperatively on a variety of topics. The ICPEA positioned itself to play a critical role in the redesign of the principal preparation standards.

The thirty-two principal preparation programs in Illinois are very disparate in nature. In 2008, the enrollment in these programs ranged from a low of four students in one program to a high of 1063 in another (ISBE, 2008). Perhaps ironically, the three universities with the largest enrollments were small private universities. While a few universities offered their programs primarily online, a significant majority still offered traditional face-to-face programs. Other universities offered a combination of face-to-face instruction and blended coursework, which included both online and face-to-face instruction. A clear trend in principal preparation programs has been the move to off campus cohort or satellite programs. There has also been a move to an increasing percentage of online and blended instruction. Both the off campus courses and the online instruction have been seen as ways of attracting graduate students in an increasingly competitive market in Illinois. In order to staff the increased number of off campus sites, in particular, many universities have moved to an increased use of adjunct professors in their principal preparation programs.

The various subcommittees also had non-ICPEA members. The two major Illinois teacher unions were represented as well as the Illinois Principals Association, the Illinois Association of School Administrators, and at least two Regional Superintendents of Schools. The director of the Illinois Education Research Council, an independent research group located at Southern Illinois University Edwardsville was involved, as were members of Illinois State Action for Education Leadership Project

(SAELP), funded by the Wallace Foundation for the purpose of identifying and implementing recommendations to strengthen education leadership potential throughout the state. Illinois SAELP is housed at Illinois State University. During all of the half-dozen work sessions, each of the five subcommittees typically had eight to a dozen individuals actively involved in the work effort. In addition to the subcommittee members, ISBE and IBHE staff circulated among the five groups and acted as ex officio subcommittee members. The typical process for task force work involved working in independent groups for several hours, and then returning to a plenary session to share the subcommittee work products with the entire group. There were often modifications made in the respective subcommittee work products as a result of the plenary sessions. Periodically, throughout the process, ISBE and IBHE staff would communicate with the various subcommittee co-chairs between task force meetings and modifications would be made in the subcommittee work products. However, these proposed changes were subsequently sent to all task force members for comment and input. A somewhat unique strategy employed by the ISBE and IBHE was to bring in constituent groups, after the task force had done its work, to critique the proposed principal preparation changes and to give input regarding the recommendations. One of the most active constituent groups was the group representing students with special needs. This group was successful in inserting a number of items regarding dealing with special needs students.

During the summer of 2009, the ISBE and IBHE leadership held a number of informational meetings across Illinois to share the recommended changes with interested parties. The ISBE and IBHE leadership continued to receive input and recommended changes and modifications from the participants in the regional meetings. The agendae of these meetings were all based upon a PowerPoint document included on the ISBE website. The link to this document was as follows: http://www.illinoisschoolleader.org/documents/PrincipalPreparationLT7-8-09.ppt .

Major Illinois Modifications Recommended

Some of the recommended changes for Illinois principal preparation programs proved to be fairly noncontroversial. For example, it was recommended that principal certification should be expanded to cover Pre-Kindergarten through grade twelve, rather than K-12. Many Illinois public schools now house both pre-kindergarten at risk programs as well as special education programs for three to five year olds. It was also recommended that a component currently housed outside of principal preparation programs, now offered as a two-day workshop entitled "Introduction to Evaluation of Certified Staff" be incorporated into new principal preparation programs. There was also a decision to incorporate the five major strands of the Illinois Principal Association's "Distinguished Principal Program" (IPA, 2009) into the new requirements. These five strands are listed below:

1. Creating and Living the Mission, Vision, and Beliefs.
2. Leading and Managing Changes.
3. Developing Deep Knowledge About Teaching and Learning.
4. Building and Maintaining Collaborative Relationships.
5. Building and Sustaining Accountability Systems.

Another area in which it proved to be fairly easy to achieve consensus was the number of years of teaching experience needed before a candidate could be granted principal certification. Virtually all task force members believed that the existing requirement of two years' teaching experience was totally inadequate. This requirement enabled beginning first year teachers to immediately enroll in principal preparation programs and complete their programs with only two years of teaching experience. Not only did this enable candidates with little experiential background and little to offer to class discussions to enter graduate programs, it also led to very inexperienced individuals receiving their administrative certification. Task force members believed that as long as all programs were held to the same standards, then the number of teaching years required prior to certification should be increased. The primary discussion revolved around whether the minimum required should be four years, or five. Four years of teaching experience was ultimately selected.

Other recommended changes proved to be much more controversial and generated hours of conversation and discussion among the task force members. Some of these were structural, in terms of the delivery models to be employed by the state's principal preparation programs. One issue addressed by task force members was that of online instruction. It was determined that 51% of the program,

exclusive of field experiences, clinical experiences, and the residency experience, must be conducted in a face-to-face fashion. In other words, over half of the coursework would need to be offered in a face-to-face fashion. During the discussion phase, some task force members argued for a larger percent of face-to-face instruction, but the group compromised at 51%. Another area of initial disagreement was whether programs should meet the Educational Leadership Constituents Council (ELCC) Standards or the new 2008 Interstate School Leader Licensure Consortium (ISLLC) Standards. This was essentially an issue between those institutions which were members of the National Council for Accreditation of Teacher Education (NCATE) and those which were not members. NCATE member institutions were aligned with the ELCC standards. Requiring these institutions to align their principal preparation programs with the ISLCC Standards would essentially require Illinois NCATE member institutions to operate under two similar, yet separate sets of standards. Ultimately, it was determined that the ISLLC Standards would be better aligned with the needs of principal preparation programs, so the ISLLC Standards were recommended by the task force.

Another delivery-oriented issue addressed by the task force dealt with staffing levels for the state's principal preparation programs. Previously, the levels of staffing and the faculty status and qualifications of instructors had been left to the respective institutions. This area would change radically under the proposed guidelines developed by the task force. Somewhat in reaction to lightly staffed programs enrolling large numbers of candidates, the task force recommended the following guidelines in terms of staffing (ISBE, 2009, p.15):

- There must be a minimum of two full-time (as defined by the institution's faculty handbook) faculty dedicated to the program for the first 50 candidates and the institution must add one full-time additional faculty member for each additional 25 candidates.
- The total faculty must be based upon the number of principal preparation program completers.
- No more than one-third of candidate experience with the curricular program can be taught by any one instructor (excludes clinical experiences).
- No more than one-third of the program can be taught by adjunct faculty.
- University field supervisors must hold the equivalent endorsement to that which candidates are seeking (general administrative or principalship).
- Adjunct faculty must be engaged in the program.

These new recommended requirements would require substantial changes in those programs relying heavily upon adjunct professors and those programs delivering a majority of their programs with one or two instructors.

In another change, which was implemented after outside groups were brought in to the process, ISBE and IBHE recommended that universities needed to strengthen content understanding in their programs by increasing their foci upon school law, special education law, use of technology for administration, teaching and learning, social emotional learning standards, and bullying and school safety. Additionally, universities were encouraged to include instruction on a three-tier instruction and intervention model, commonly called Response to Intervention (RTI) in the United States. This model is used primarily with students with special learning needs. In a very bold move, ISBE and IBHE went on to require the following components in all coursework:

- PK-12 focus,
- Focus on all students (special education, bilingual education, and E.S.L.), and
- Working collaboratively, building teams to focus on instruction, curriculum, assessments, and district needs for school improvement (ISBE, 2009, p.11).

New principal preparation programs would also have to include formal partnerships with one or more public school districts. While universities may have previously been involved in partnerships with particular school districts, the newly required formal partnerships would be much more rigorously defined than in the past. Other entities, beyond the university and the public school district could be subsequently added to the partnership. Partnerships must now have written agreements, sometimes called memoranda of understanding, with focus upon collaboration to design programs, internships, candidate selection, etc. Historically, much of this type of work was primarily completed by the higher education institution, with public school input coming later. Now, the public schools must be truly involved from the beginning of the process.

Candidate selection would also become much more rigorous under the new system. Students would only be admitted to a principal preparation program after a face-to-face interview with program faculty members. In another major change, candidates would need to submit a comprehensive portfolio, demonstrating their competence in the following eight areas:

1. Commitment to supporting all students to achieve high levels of learning.
2. Accomplished classroom instruction.
3. Significant leadership roles in the past.
4. Strong communication skills (oral and written).
5. Analytic abilities and dispositions needed to collect and analyze data for school improvement.
6. Demonstrated respect for family and community.
7. Strong interpersonal skills.
8. Demonstrated knowledge about curriculum and instructional practices (ISBE, 2009, pp. 16-19).

Obviously, it may prove difficult for some inexperienced teachers to meet all eight of the portfolio requirements listed above.

The area of change with the most impact upon students, principal mentors, and perhaps universities would involve modifications in the nature of the internship. Historically, a vast majority of principal candidates in Illinois have come from the ranks of full-time teachers. Thus, the internship has usually proven to be problematic in terms of length and quality. Interns have found it necessary to gain their experience working with mentor principals before and after school, during their planning periods and during school breaks. Most Illinois universities have required interns to acquire between 150 and 300 clock hours, typically spread over one or two semesters. Many programs have also required a varying level of other clinical experiences, often imbedded in program coursework. University supervisors would typically visit each intern, in the field, between one and four times (Personal communication, ICPEA meeting discussion, 2007). It has not been unusual for universities to require interns to address either ELCC or ISLLC standards during their internships.

The proposed new standards would thrust all university principal preparation programs into a totally new universe. There would be a variety of multiple field experiences spread across the program connected to courses. These accumulated hours could not be counted toward the internship year. The actual internship would be spread over a 12 month period and would include a minimum of four weeks of full-time residency experience. Each of those four weeks would consist of a minimum of five consecutive days and the weeks may or may not be consecutive. An additional minimum of 200 clinical hours would be required throughout the 12 month internship year. Principal candidates would need experiences working with all levels of teachers, including pre-kindergarten, kindergarten, elementary, and secondary, as well as all levels of special education teachers. Candidates would also be required to be involved in the hiring, evaluation, and supervision of special education teachers during their internships. Principal candidates would be required to have experiences working with schools with cultural and economic diversity, pre-school through high school students, and parents, school boards and community partners. Other requirements would include three summative assessments, four face-to-face meetings on site for the university supervisor, and three seminars to bring candidates back together during the internship year. No university supervisor would be allowed to work with more than 36 interns during any one year period, and the assessment process would be very prescribed by ISBE and IBHE.

Discussion of Implications

Many of the changes proposed as a result of the principal preparation revision process in Illinois make theoretical and educational sense. The move to expand the training and certification to include pre-school education is very logical, since many Illinois principals already have pre-school and early childhood special education programs in their buildings. This trend is likely to continue in Illinois, as well as in other states. It is also difficult to argue with the move to require four years of successful teaching experience before allowing an educator to receive certification as a school principal. Educationally, expanding the required experience level made sense, and politically, it was not an issue if all programs were to be held to the same standard in this area.

The proposed requirements regarding staffing levels and structures among principal preparation programs generated a considerable amount of discussion throughout the process. A number of issues were addressed in this area. Two of the most prominent were thoughts regarding actual staffing levels and discussions regarding the use of adjunct professors. There was ultimately consensus that a minimal level of staffing was necessary in order to provide candidates with a diversity of opinion and experience in their programs. No matter how excellent a particular professor might happen to be, having one or two professors deliver an entire program was not considered pedagogically sound in this type of program. The requirement that no more than one-third of the coursework could be taught by any one individual was an attempt to establish a baseline, or floor, in this regard. In terms of adjuncts, there was strong sentiment that adjunct professors add richness to principal preparation programs. Most of these individuals have traditionally been current or former practitioners and often share first hand knowledge with the principal candidates. However, there is also a need for a sound theoretical basis in principal preparation programs. The balance of two-thirds permanent staff and one-third adjuncts was the compromise reached by the group. The requirement for adjuncts to become fully engaged in the program was a reaction to past experiences in which adjuncts were employed to teach and were sent forth with little direction and little contact with the university program. There is little doubt that the staffing levels and adjunct guidelines will have a major impact upon the smallest principal preparation programs across the state.

The requirement for partnerships between the universities and the public schools is also very logical in the theoretical sense. While many universities have been involved in partnerships with school districts, some even operating under formal memoranda of understanding, few have allowed the degree of public school input called for in the newly proposed guidelines. Not only is it likely that some university programs will chafe at the degree of public school involvement called for, but it is also likely that this involvement may prove to become a tremendous time commitment on the part of public school personnel.

Finally, there can be little doubt that the greatest impact on candidates and public schools would be the new internship requirements. These new requirements would place a significant workload on the mentoring principals in the public schools. The required activities are so specific that it many be impossible to address all of them, even in a year. In some cases, it seems that the interns would be usurping the role normally played by the principal. While admirable, the goals on diversity may prove to be virtually impossible to meet in some geographic locations. It would also be very unlikely that any one principal could mentor more than one candidate in a twelve month period. This could have the impact of denying the opportunity for some candidates to engage in their internships in a timely fashion.

In conclusion, Illinois is a very political state. It will be instructive to see whether any interest groups are able to successfully lobby against parts or all of this reform package when it reaches the Illinois General Assembly. It the event that it does become law, it will be interesting to determine whether the new process will reduce the number of candidates being prepared by the various programs and whether the quality of the principal candidates improves over time.

Managing education in rural Myanmar:
Local solutions towards national goals

Abstract

In Myanmar, a high value is traditionally placed on education, and at the time of independence, it boasted one of the highest literacy rates in Asia. Today, though net enrolment rates are estimated at 99% at primary level, and 43% at secondary level, the quality of education has been constantly declining. Obsolete teaching methods and materials, a curriculum ill-adapted to local learning needs, and poorly trained teachers, are some of the factors which lead to only 69.9% of children who begin primary school actually reach the final grade (UNICEF 2005)[5].

One of the six national goals devised by the Myanmar Ministry of Education is for all children to complete basic education. In remote areas, access to education can remain highly problematic: some rural schools do not have any teachers, or the school may be too far away for a child to walk. The Ministry of Education also emphasizes improving the quality of education, strengthening education management, and ensuring the provision of early childhood and non-formal education. However, schools and communities are generally not provided any means or resources to reach these goals. Though the government seeks to retain control over education, its own under-investment in social services means that communities are searching for alternatives.

The alternatives to state-run education include private and religious schools, whether secular, monastic, Christian or Muslim. Non-government initiatives for education have reached a high degree of popularity, especially as many Myanmar youth feel that the national education system does not prepare them adequately for the world of work[6]. This paper presents a case study in four rural communities of Shan state, Myanmar, where Aide et Action (AEA) developed a non-formal education program in the form of village libraries. AEA's strategy for working in Myanmar is to partner with a local organization, as well as to engage civil society actors from the communities for the management of the village libraries.

The case studies in the paper show how, with sufficient external support, local level stakeholders can devise strategies among themselves, using their own resources and contributing their time voluntarily, to ensure the provision of education in their village. Local solutions are defined for reaching the goals set by the Ministry of Education. With community actors being responsible for the organization of their village library, the latter becomes better adapted to local learning needs and on the path to sustainability. As village chiefs, students' parents, and village elders discuss the management of the village libraries, processes of civil society development and democratization are gradually entrenched.

I. The initiative to raise the quality of education in Shan state

A deteriorating state education

Education is traditionally highly valued in Myanmar. Nicolo Manucci, a Venetian who travelled in Burma around 1700 A.D. described the country as "a kingdom governed by the pen, for not a single person can go from one village to another without a paper or writing"[7]. In the late 1940s and 1950s, Myanmar boasted one of the highest literacy rates in its own language across Asia. This was largely due to the monastic schools that had always played, and continue to play, a major role in educating the poorer sections of society. Today, Myanmar retains a very high literacy rate, with 89.9 per cent of adults and 94.5 per cent of youth considered literate in 2007[8]. There are 11 years of primary and secondary education, which culminate in the matriculation examination.

Myanmar has been under military dictatorship since 1962. In 1988, demonstrations in which students played a key role shook the country. For the first time, the junta was challenged. The '88 Generation Students Group encouraged people to write to the government describing their everyday problems, including lack of access to education and inflation. These demonstrations were violently repressed. In September 2007, following the Saffron Revolution, several teachers and students were imprisoned, and educational institutions were shut down, including monastic schools and universities[9].

Today, the military rulers seek to retain control of education, and see schools and universities are seen as nests of dissent. At the same time, education and aid experts are increasingly alarmed by the deterioration of the quality and accessibility of state education in Myanmar, especially in rural areas.

In 2001, education expenditure only represented 1.3% of the Gross Domestic Product, and 18.1% of total government expenditure[10]. Experts estimate that these rates remain similar today. Rampant corruption, an impoverished population, and armed conflict in some ethnic minority areas also contribute to the deterioration of state education. Many parents see their children growing up far less knowledgeable than they.

The current curriculum, introduced in 1998, is overloaded with factual knowledge that lends itself to rote learning. The joy of learning is stifled from the outset of a child's life.

Brief overview of challenges facing education in Myanmar

- Gap between urban and rural areas, including lack of teachers in rural areas
- 'Hidden' costs related to schooling: school uniforms, textbooks, meals, corruption of teachers, etc. School admissions fees have been reported to cost 2,500 kyat for primary school, which is far beyond the means of many families.
- Low rate of survival to last grade in primary school: in 2004, 67.8% for boys and 72.1% for girls[1]
- Lack of infrastructure, including access roads and roofs
- Lack of basic teaching and learning materials
- Poor training of teachers
- Outdated curricula and schoolbooks
- Obsolete classroom practices do not allow for analytical, creative thinking or free discussion.
- Repetitive teaching methods, teacher-centred

Realizing the right to education in Myanmar

What alternatives to state education are available in Myanmar? Since the opening up of the economy in the late 1980s, the emerging middle class are increasingly enrolling their children in private schools[11]. Away from the cities, ethnic minority groups are also involved in the provision of education. In Loi Talang, Shan State, the opposition Shan State Army – South (SSA-S) provides education to over 1,000 children in areas under their control[12]. Religious institutions, mainly Buddhist but also Christian and Muslim, retain a strong connection to education. Finally, local and international non-government organizations (NGOs) play a strong role in education in Myanmar. Aide et Action (AEA), international NGO specialized in education, in one of them.

Education is a major lever for development. AEA considers the right to education as a fundamental right, necessary to the realization of all other rights, including economic, cultural and social rights, and political and civic rights. This position is supported by General Comment No. 13 of the United Nations Committee on Economic, Social and Cultural Rights:

> Education is both a human right in itself and an indispensable means of realizing other human rights. As an empowerment right, education is the primary vehicle by which economically and socially marginalized adults and children can lift themselves out of poverty and obtain the means to participate fully in their communities.[13]

In Myanmar, the government is extremely suspicious of all educational activities conducted by non-state actors. For this reason, AEA has focused on non-formal education. Village libraries, or community learning centres, can be an effective non-formal education means. For direct implementation of the project, AEA opted to partner with a local non-government organization, the Rural Development Society (RDS). RDS has been working for the development of Shan state since 1993. It is well connected and respected in the area. This factor was fundamental to a smooth collaboration with communities and village chiefs, from establishing trusting relationships to being able to resolve problems jointly. AEA's strategy is to engage civil society actors in the education sector

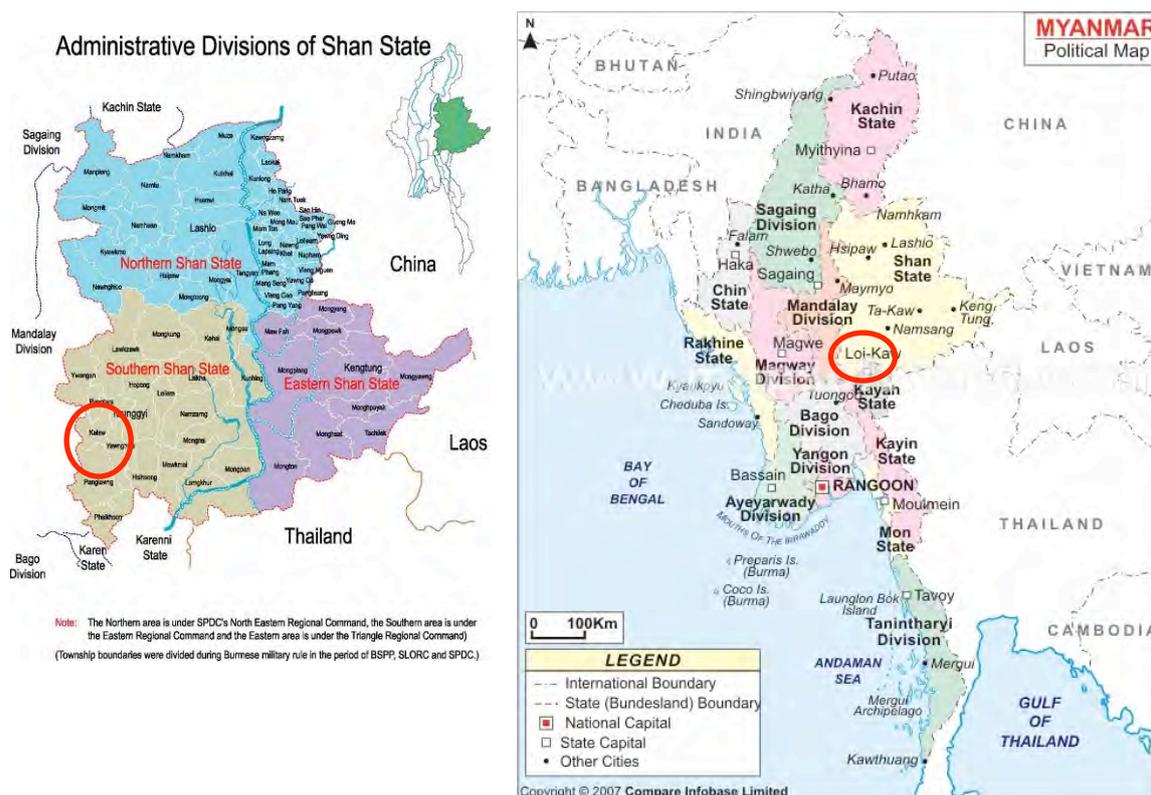
through its projects. This can be seen as a starting point for gradually transforming Myanmar's authoritarian political culture. At the same time, AEA is building the capacity of RDS in resource mobilization and monitoring.

II. National goals, local solutions

Based on the Dakar Education for All (EFA) framework for Global Action and the Millennium Development Goals, Myanmar formulated the following six national EFA goals in 2002[14]:
- Ensuring that significant progress is achieved so that all school-age children have access to and complete free and compulsory Basic Education of good quality by 2010
- Improving all aspects of the quality of Basic Education: teachers, education personnel and curriculum
- Achieving significant improvement in the levels of functional literacy and continuing education for all by 2015
- Ensuring that the learning needs of young people and adults are met through Non-Formal Education, Life Skills and preventive education programs
- Expanding and improving Early childhood care and education
- Strengthening education management and educational management information system

These goals are in line with the 30-Year Long-term Basic Education Development Plan developed by the Myanmar Ministry of Education.

To face these national goals, communities are often left to their own means. In many rural areas, the government education system is non-existent. Where it exists, it is not sufficiently equipped to provide quality education. There may be a school building, but no teacher. Village libraries were built and opened between 2006 and 2008 in four communities of Shan state: Myinka, Thit Hla, La Maing Kyin and Inn Khaung. The communities are all characterized by their remoteness. In terms of access to information and technology, they are completely disconnected from the rest of the world.


[14] UNESCO (2007) Myanmar EFA Mid-Term Assessment, accessed July 2009, http://planipolis.iiep.unesco.org/upload/Myanmar/Myanmar_EFA_MDA.pdf

Map of Myanmar and Shan state

The village libraries are multifunctional learning centres, intended to promote learning through reading and play, communication among children, communication between children and adults, interaction between different ethnic groups, to preserve minority cultures and also to act as an incentive for children to attend school.

In the four villages where a village library was built, the state education cannot be considered to cover minimum societal needs. The next section looks at these four communities, and showcases how each community has identified and engineered its own local solutions to provide education for all.

Myinka village: a village library to address local needs

Villagers building Myinka library

Myinka is a village of approximately 125 families situated near Kalaw, in southern Shan state. Average family size is 5 persons. Income averages at 90,000 Kyats (90 USD) per month, and there is approximately 1 buffalo per 2 households. Most villagers grow rice for family consumption. The sudden drop in the market prices of ginger and garlic, traditionally grown in Myinka, has led farmers to diversify their crops to other fruits and vegetables to sell on the market. The majority of farmers do not use any systematized irrigation system, therefore weather conditions permeate their lives.

In Myinka, school exists only up to grade 4. Good students may continue their studies in the nearby school in Kalaw. Myinka village library was set up in 2006 on a land parcel donated by one villager. Village men and women contributed their labour to the construction of the library. As the library takes shape in their own hands, villagers develop a sense of ownership. This is a key factor to ensure the sustainability of the library. The willingness of the villagers to participate to the maintenance of the village library today is linked to this sense of ownership.

Each library supported by RDS and AEA engineers its own management system. This depends, among other factors, on the village's economic and demographic situation. In Myinka, the library committee has decided that only adults can borrow books, and they must pay. Children are free to consult books within the library. All Myinka families contribute an equal sum towards supporting the library. The village librarian is from the local community. With the village library committee, she decides on new books to purchase according to the library users' learning needs.

Library books are on a variety of topics, including health, hygiene and agriculture. Books on traditional medicine, such as herbal remedies to cure malaria, are very popular. Guides to pesticides, fertilizers, and new farming technologies are requested by farmers. Popular novels include the stories by the Burmese author Thein Phe Myint (1914-1978). Through reading, children improve their knowledge, spelling and reading skills. Oftentimes, the village library becomes quite crowded from the number of children rushing in after school!

Some new land has recently been donated for a library extension. Plans are also underway to set up electricity in the village. The villagers have split themselves into two groups, poor and middle income. According to their group, families will contribute two instalments each for setting up electricity. The

village library's opening hours will then be extended until 9 pm. This will be especially helpful for adults who work in the fields until sunset.

Voices from Myanmar: Lin Aung's family

Ling Aung and his family

Lin Aung is married and has one daughter aged 2. He and his wife are expecting their second child. Their main livelihood is generated from cultivating cauliflower, tomatoes, and eggplant. The income fluctuates with market prices and weather conditions. Recently, heavy rain and flooding caused nearly half of the village crops to b entirely lost. Both Lin Aung's parents come from Myinka village. He considers that his life is easier than his parents' was. Now there is now to the market towns. He can take a 'public transport' motorized vehicle to sell his products, while his parents would walk down muddy paths for hours.

Ling Aung's family recognizes the importance of education. Ling Aung is particularly interested in improving his knowledge of chemistry, including pesticide use. He has found such information in the village library, and has read nearly all the other books too! As the eldest among her siblings, his wife dropped out of school early to look after her younger brothers and sisters. The library resources help her maintain her basic literacy skills. Ling Aung hopes that his daughter will pursue her learning as far as possible, including going to Kalaw town to pursue schooling beyond grade 4.

Thit Hla village: non formal education to support an isolated primary school

Memory game in Thit Hla library

Thit Hla village is situated on the mountain tops of southern Shan state. There is no road to access the village; several hours of walking are needed to reach the nearest town. A primary school building was recently renovated in Thit Hla with support from RDS and AEA.

The school principal shared that they hardly ever receive any visit from the local authorities. She has no expectations for any support from the government, neither in the education sector, nor in health nor agriculture. Teachers use the village library to borrow teaching and learning materials. Educational management is entirely taken over by the community: children clean the school and fetch the water. Parents are mobilized when something needs repairing.

The village library is managed by monks from the nearby monastery. They run the library everyday from 8.30am to 11am, and from 1pm to 3.30pm. Once a year, they collect 2,000 Kyats (2 USD) from each family to purchase new books, including exercise books for the schoolchildren. Thus children from the poorest families, who cannot afford the school supplies, are able to acquire the learning materials like their classmates. Religious leaders act as leaders in reinforcing the education of the young, and also pass on values and principles of moral or social nature.

During the summer break, Pa-O language classes are organized to support children's knowledge of their own native language. A voluntary villager teaches these classes. The village library is rich in resources to preserve the Pa-O culture and tradition. These Pa-O language books have been donated by generous villagers and the nearby monastery.

Voices from Myanmar: Hnin Si, Librarian training officer of RDS

In the library

Hnin Si is a project officer with the Rural Development Society, partner of AEA in this project. She began working as a librarian, and became the librarian training officer in 2008. On two occasions, Hnin Si received training in Cambodia from the local non-government organization Sipar (Soutien à l'Initiative Privée pour la Reconstruction) Sipar is a partner of AEA in Cambodia since 2004. Their collaboration has led to more than 30 village libraries throughout the country. As an expert in village libraries, Sipar provided trainings to future librarians and trainers such as Hnin Si.

Each librarian receives a three-day training as foundation. Hnin Si teaches the librarians the basics of library management, book labelling, classification, and book borrowing systems. The importance and role of the librarians are explained. Depending on the librarian's educational level, further trainings may be necessary, for example on animating library activities. Such activities include reading groups or drawing sessions. During its visit to RDS in Myanmar, Sipar provided many more advices such as for building the wooden bookshelves, maintaining hygiene and security in the library, drawing daily timetables during busy times such as summer holidays, etc.

La Maing Kyin village: the Village Library Committee, a model for civil society development?

Village committee members in La Maing Kyin

After the first year of the library existence, AEA and RDS stop financially supporting the librarian's salary. The community must then devise a system for supporting this cost, and for the purchase of new books. In La Maing Kying village, families contribute 200 Kyats (0.20 USD) per month towards the village library. This system has been agreed upon collectively by the community.

The library committee is formed through a democratic process: a meeting is called, and those who attend are invited to elect the committee. Six people form the committee including one woman, the librarian. Committee members do not receive any financial compensation for their work. They are responsible for overseeing the affairs and accounts of the library. They also ensure that the resources are adapted to the learning needs of the library users. Monthly meetings are open to all. This participative mode of management increases the effectiveness of the library. As administrators and leaders, members of the committee can act as real agents of change.

One issue observed is the lack of women in the committee. Committee members justify this imbalance by saying that more men volunteer to be elected in the committee. Women can give their opinion during committee meetings. However, the committee is committed to increasing the number of women among them. Community organisation actions often shed light on the role of women. For instance, many women seek books on maternal and postnatal health, and it is usually women who transmit this request to the committee.

AEA and RDS facilitate exchange of skills and networking between the village libraries. Experience exchanges are organised for the librarians, enabling them to pool their knowledge and ideas. Members of the different village libraries committees share views on anticipated political, social, and economic changes, and how these will impact the provision of education. The village library committee can be considered an example of civil society in action: "Civil society refers to the arena of uncoerced collective action around shared interests, purposes and values"[15]. Due to the discursive procedures of decision-making and the horizontal networks engaged, it can be assumed that such organisations may generate democratic values.

Voices from Myanmar: Ma Pupya, young drop-out

Ma Pupya in the library

According to the librarian, the library enables children to enjoy learning. As Myanmar's formal education system is characterized by rote learning, the library in contrast offers educational games and colourful learning materials. Almost all literate villagers use the library. For some children, the village library is the only source of learning.

Ma Pupya is 14 years old. She comes to the library every late afternoon. Her favourite activity in the library is reading books especially short stories. She dropped out of school last year, after finishing grade 8. Though she enjoyed studying, she must help her parents who grow cauliflower and cabbage. Before the library was set up, she would just go straight home from the fields and help her mother with the house chores. But now, her parents are happy to see her go read instead. And when they have time, they come to the library too!

Inn Khaung village: involving the local authorities

Children immersed in the joy of reading

For education to be successful in promoting sustainable development, particular roles and responsibilities devolve to a number of groups at different levels: local, national and international. At each level, stakeholders may be part of government, civil society and non-governmental organisations, or in the private sector.

RDS and AeA maintain cordial relationships with township level authorities in Myanmar. They tolerate the NGOs' activities and, at times, show willingness to participate. At the district and national levels, there is no relationship or official recognition of activities from the Ministry of Education. In Myanmar, education is mainly under the responsibility of the Ministry of Education. The educational policy is to provide basic education equated with livelihood and within the reach of all. The administration process throughout the education sectors is centralized.[16]

According to UNESCO, governmental bodies have a key role in policy-making, promoting public campaigns and consultations, the production of educational and informational materials, and the mobilisation of resources[17]. The provision of education by governmental bodies must also be equitable, i.e. not favouring certain groups. However, the work of the Myanmar Ministry of Education is not monitored nor is it accountable to the citizenry.

Field experiences clearly point to the inequalities in access to quality education. A village may be advantaged in receiving government support for welfare and services provision just thanks to its location. There are three army camps in the Inn Khaung village area. This explains the interest of government officials in the Inn Khaung village library. Army officers are among the users of the library.

The township authority allocated the plot of land for building the library and provided their encouragement. Officers from the Department of Social Communication have distributed reading materials to be added on the shelves. These books and journals constitute political tools for the military regime, teaching readers the 'right' way to think and behave.

The village library committee has learned to negotiate with government officials to receive support in the education area. In 2010, non-formal education classes will be set up in Inn Khaung library for approximately 90 illiterate or semi-literate villagers. Classes will be in the evening when field work is finished. An educated elder is the volunteer teacher. The township

---

Voices from Myanmar: U Aung Tun, Department of Social Welfare

The Department of Social Welfare is under the Ministry of Social Welfare, Relief and Resettlement. U Aung Tun works for the Department of Social Welfare, at township level in Shan state:

"The library works well and is much appreciated in this village. For community leaders, it makes a difference when people are educated. Youth can come learn something here, rather than fouling around in the fields. For me, this library helps to close the gate of the jail. It is also useful for civic education. So now we are thinking of improvements to the library environment. For example we will add a fence to separate from the road and some trees for shade outside.

Before the library, there were two bookshops in the surrounding areas, where borrowing a book cost 200 Kyat (0.2 USD) per day. The village library fee is 50 Kyat (0.05 USD) to borrow a book. The impact of this library on formal education is greater than we expected. School enrolment has increased: last year, 24 students completed the final year of high school. This year, there are 30 students. Many of the available books are related to the curriculum, the students take turn to borrow them. While in the past knowledge could be sought only from textbooks, now more references are at hand."

III. Conclusion: from local to global solutions

Involving the key stakeholders of education

Non-formal education through village libraries presents the kind of adaptability needed in rural areas of Myanmar. Villagers can access learning and reading materials in their own time, according to their interests.

AEA and RDS developed a broad framework for management of the village libraries. This framework enabled responsible, participative leadership by the villagers. After one year of operation, the community takes full control of resource mobilization, planning and management of the village library. The early involvement of local actors in the village libraries is fundamental to their sustainability.

The 2007 Mid-term EFA Assessment for Myanmar noted that in early childhood care and development, it is local communities that generate most of the necessary resources[18]. The experiences documented in this article show that this is the case even for basic education.

Civil society actors are able to fill in some of the gaps left by the state education system. However, it is clear that civil society cannot be expected to provide a full-scale substitute to a functioning state education system. The outcome of a child's education depends on the relationship between the parents and the teacher in the wider context of the community and nation.

Three main recommendations emerge from this paper:

- Collaborative relationships between teachers, government officials, and civil society leaders must be built to improve access to quality education. International donors and NGOs should develop strategies that allow local stakeholders to connect to one another, in order to pool resources and skills.
- It is necessary for international NGOs and donors to engage civil society actors in the field of education. This means that NGOs and international donors must be flexible as civil society actors often find it difficult to comply with complex donor guidelines. Civil society participation should strengthen community organisation and empowerment.
- The national education system should be open to a flexible curriculum based on local contexts. Local level education systems should play more active parts in the elaboration of programs closely adapted to local needs. When seasonal cropping time is reached, school terms can be arranged so that a rural family can make full use of the manpower without having their child drop out.

But what is the added-value of the involvement of international actors in education in Myanmar, in contrast to national actors? In what way does the involvement of an international NGO lead to global solutions? Can local problems be really addressed without global strategies?

Beyond local solutions? Looking forward

In 1991, Myanmar signed the International Convention on the Rights of the Child, of which article 28 states that education shall be free[19]. This international commitment gives NGOs a strong argument for holding the government accountable for the provision of free education. Institutionalisation of certain strategies and activities at the national level allows a guarantee of their sustainability. For example, the institutionalisation of Library Committees could ascertain their future existence, and open up avenues for their financial sustainability using state resources.

As an international NGO, AEA has the international network and presence to connect local organizations for collaboration and mutual benefit. In this project, AEA coordinated the sharing of expertise between Sipar and RDS. AEA organized a mission of Sipar to Myanmar and trainings for RDS staff in Cambodia. Possible future areas for involvement by AeA include connecting RDS with other NGOs specialized in other areas, such as agriculture and other livelihood-supporting activities.

In the politically difficult context of Myanmar, NGOs can play a vital role as a bridge between donors and beneficiary communities. Most importantly, in countries where higher education is inaccessible to a majority of the population, international NGOs can engage in capacity-building and training of local NGOs, such as RDS, government staff, and the general population.

International actors also have a fundamental role in disseminating information and lessons learnt from the field. In this regard, AEA plans to take stock of best practices in promoting gender equity for the development of gender-balanced Library Committees in Myanmar. There is also a need to see how the village library committee can mobilize parents around access to education, especially in the case of dropped-out children. Finally, the next step in the project involves consolidating the network of libraries for book exchange with other libraries in Shan state.

Leadership and partnership of PTA: A Hong Kong case

Anson Yang, Ph.D.
Principal
King Ling College
Hong Kong
klc.principal@ymail.com

Abstract

As teachers, we always consider ourselves professionals, because we underwent training, and obtained diplomas and attended refresher courses every now and then. However, applying what we learned in teachers' training courses to classrooms and school work is a challenge. For one thing, we learned well how to work out a lesson plan, how to handle unruly students, but never did we learn how to conduct an assembly, how to carry out administrative work, and how to work with parents. Our profession also depends a lot on other bodies working with us, the community, past students association, to name but a few. An important element in a child's education is the parents.   Parent-Teacher Associations (PTA) have been around for more than a century; its functions changed over the year. PTA has become a partner in education; some schools even include PTA members in the school management. Although it began as an American model, PTA around the world has plenty of local colours, owing to a country's cultures and emphasis its government places on education. This paper explores the changes in PTA function, and how this partnership can further promote learning in Hong Kong, where both parents work and leave education to the school and tutorial schools. It begins by examining the activities conducted or co-conducted by PTAs in four schools in Hong Kong. It continues to discuss how parents' profile enhances or impairs the work PTA is doing in the school. Finally, it proposes areas which PTAs should reinforce, in order to strengthen the partnership in education.

University speed-dating for mature-age students: 21st century processes of engagement and learning in higher education

Rob Townsend,

La Trobe University,

Australia

Abstract

Most mature age students in Australia return to university after a major transition in their lives. This paper will reflect on recent research that has identified that mature age students present with pre-existing competing priorities when entering higher education which can then create greater complexity when attempting to integrate university study into their lives.

Introduction

Successfully integrating family, work and other personal commitments with studying has been referred to by students as a juggling or balancing act, one that has the potential to create more stress during this life transition. This means that mature age students often cannot socialise and network on-campus, they are too busy with academic tasks, but that doesn't mean they don't want to socialise or network. Research internationally supports the notion that making connections into university life, either by means of academic support services or the creation of social networks, has a positive impact on the university experience and on academic outcomes. Peer mentoring programs can provide immense assistance to mature age students and provide insight into academic life and learning which can take an entire undergraduate course for some to master.

New La Trobe University mentoring programs have used a version of 'speed dating' at lunch-time and evening events to allow mentors to connect to current mature age students and to 'jump start' a networking and support process that is being used to enhance high education learning and graduate career development. Engaging with mature age students means addressing their learning, social and career needs by facilitating learning activities outside of the lecture theatre and classroom. 21st century peer mentoring and peer tutoring is currently being trialled in various Australian universities and has implications locally, regionally and globally for the challenge of educating adults across the age and cultural spectrums. By facilitating programs that connect students with students using new technologies and new processes, higher education institutions can be applicable to all age groups and be relevant locally, regionally, nationally and globally.

A research project conducted in 2008-2009 explored how mature age individuals interacted with higher education programs at La Trobe University, Bendigo as a way of managing various transitions in their lives. In total ten staff including Social Work lecturers and staff from Student Support Services were invited to discuss issues that they felt face mature age individuals in this regional area, both in applying and successfully completing their chosen course. The interviews were of an informal nature and university staff were encouraged to talk from their own experiences of teaching mature age individuals. A survey via email was sent to all mature age individuals enrolled within the School of Social Work and Policy. They were asked to make general comments about the positive and negative aspects of being a mature age individual at the Bendigo Campus, twelve responses were returned.

In February 2009, mentors were recruited for a mature age mentor program for first year students within the Social Work course at Bendigo. An interesting development was that the Nursing Mentoring Program for mature age students and the Oral Health/Dentistry Mentoring Program for students from non-English speaking backgrounds wanted to join this research project because the coordinators believed that their mentors would benefit from the philosophy and direction of a mature age oriented program. Eighteen Social Work mentors, twelve Nursing mentors and ten Oral Health/Dentistry mentors attended mentor training in March 2009. Following this training, each discipline then organised their own framework for connecting mentors with mentees. A week following the mentor training, a session of 'mentor speed dating' was held for social work students; 17 mentors and 14 mentees attended. This was a popular and successful way of introducing mentors to mentees.

Context

The regional community context of Australian society is significant with census data highlighting emerging trends in regional communities involving significant social change (ABS: 2007). The more recent redistribution of Australia's regional population via internal and international migration *reflects a highly mobile population*

responding to a range of triggers including employment opportunities, housing costs and lifestyle preferences. These trends… suggest some major challenges for policy and service provision in regional education and employment (Mission Australia: 2006: 11). Currently there are immigration programs targeting humanitarian entrants for resettlement in regional and rural Australia. Skilled migrants can fill skill shortages and there are opportunities for guest workers to come to Australia to fulfil specific employment contracts in regional and/or rural communities (Broadbent, Cacciattolo & Carpenter: 2006; ICEPA: 2006).

The experiences of social inclusion and exclusion by individuals residing in a range of Australian communities are influenced by a variety of compounding factors. This includes mobility and migration experiences, population demographics, the history of specific communities, government social and economic policies, local, state and federal political environments. Most of the students participating in this research project had been searching for and creating a sense of 'place' and 'community', a sense of belonging to somewhere outside the realm of pre-existing familial and cultural experiences. This search for something 'other than' appears to be a function of age-related life transitions, no longer satisfied or dependent on the same social connections that have sustained them in the past; they have been seeking some meaning to their individual lives rather than solely that of financial gain or familial stability.

Communities in regional Victoria where 16% of the population have been born overseas are significantly less diverse than Melbourne, where 36% of the population are born overseas (DVC: 2006). Issues of cultural and social marginalization motivate many people, especially newly-arrived migrants to choose to reside within the greater social diversity of urban areas. However, in recent years a number of regional municipalities in Victoria, and around Australia, have actively welcomed more diverse groups into their communities for a range of economic and social reasons.

Higher education and mature age adult transitions

Defining 'mature age' within the context of higher education is one dilemma faced, with current research indicating that mature age refers to any individual aged 21 or over and/or who enter education from a variety of pathways other than the traditional school leaver pool (Stone: 2008; Kenny, McLennan, Nankervis, Kidd, Connell and Buykx: 2007; Cullity: 2006; Richardson: 1994). The major themes consistently reported in current literature were about the motivations and challenges that mature age individuals face in entering education, how the personal, societal and economic commitments and obligations appear to impact on an individuals overall success, and how learning processes and cultures impact on successful transition and what attempts education institutions have made to improve transition and integration of individuals within student life (Stone: 2008; Kenny, McLennan, Nankervis, Kidd, Connell and Buykx: 2007; O'Shea: 2007; Stone: 2000; Fulmer & Jenkins: 1992).

Rendon (1994) as cited in O'Shea (2007) comments that there now appears to be a 'tapestry of differentiation' among first year individuals, and it is this variation between and through different individual cohorts that makes truly understanding the mature age individual trajectory difficult. This can create difficulties in making generalisations about this group, as most studies on mature age individuals, considered differing demographics which either excluded or included several different variables. The difficulty in finding literature on specific individual groups suggests that future research should be based on 'particular individual cohorts rather than generic groupings' (O'Shea: 2007).

Stone (2008, p. 269) identified that there appears to be some sort of 'catalyst for action, some event that had occurred which then led, directly or indirectly, to the decision to study.' McGivney (2006, p. 85) circumstantiates this notion and suggests that a variety of reasons prompt adult learners to consider education, including factors such as the need to deal with an immediate situation or crisis in their life (life transition, illness, redundancy, bereavement, divorce). O'Shea (2007) identifies in her research on females who were the first in their family to study that the decision to study, was related to some sort of recent catalyst which was both personal and work related.

Kenny et al (2007, p.13) however, identified a major reason that prompted mature age individuals within nursing to return to study *is the desire to expand their education as a means of enhancing career/employment options*. Whilst this may be true for a large proportion of mature age individuals, Harper and Kember (1986) as cited in Richardson (1994) believe that in particular, older mature age individuals might be more likely to be studying out of interest or for pleasure rather than for vocational reasons. Motivation to study and motivational factors were considered higher in mature age individuals. Kenny et al (2007, p.18) states that as a group, they appear to have a strong commitment to study' and that motivation is intrinsic within them.

Extensive research has been carried out on the issues or challenges that mature age individuals face which differentiates them from the traditional school leaver group (Stone: 2008; Dawson: 2007; Kenny, McLennan, Nankervis, Kidd, Connell & Buykx: 2007; O'Shea: 2007; Trott: 2007; Cullity: 2006; Stone: 2000; Scott, Burns

& Cooney: 1996; Fulmer & Jenkins: 1992). The major challenges for mature age individuals in regional and rural communities included family responsibilities whether to a child or other family members, financial and work commitments and an overall lack of time to successfully balance these competing commitments in their lives.

Cullity (2006) believes that it is the personal, social, attitudinal, educational, cultural, vocational and financial circumstances that can impact on beliefs about academic study. Stone (2008, p.275) identified the major challenges experienced by mature age individuals in her study as that of *financial struggles; lack of time; difficulties with organising and prioritising; dealing with changes in relationships with partners and children; and balancing the needs of study with the needs of family, home, partners and children.* Reat reported that mature age adult lives have a very different focus, that is, a balancing act between academic, economic and domestic responsibilities (Reat: 2002, as cited in Kenny, McLennan, Nankervis, Kidd, Connell and Buykx. 2007, p. 20).

Trott's (2007) research on recognising the expectations of mature age individuals commented that *adult learners are rarely in a position to remove themselves from their day-to-day work and family commitments to immerse themselves in an on-going campus existence* (2007, p. 53.). Lack of time has been identified as a major contributing factor that impacts an individual's decision to discontinue study and comments such as this are of particular importance when studying the impact of learning procedures and culture and what part this plays in the successful transition of mature age individuals to education.

Interestingly, the motivational factors that propel individuals into education can have both constructive and/or detrimental repercussions. The possibility of increased economic stability appears to play a determining role in some individual's decision to return to study. However increased economic instability, due to reduced working capacity and the expenses studying creates, can influence an individual decision to discontinue (Bexley: 2008; Kenny, McLennan, Nankervis, Kidd, Connell & Buykx: 2007). Bexley (2008) identified that 40% of individuals surveyed considered finances were an important reason in an individual considering deferring or discontinuing study.

Kenny et al (2007, p. 21) identified that most mature age individuals were *unprepared for the time and financial commitments that undertaking further study will require of them.* They identified that along with family responsibility, financial stress did play a major role in a mature age individual's decision to discontinue study. Furthermore, Kenny et al (2007) identified after extensive research on financial constraints that mature age individuals with children are seen to be more financially vulnerable, having more complex financial problems.

Evident in several research studies was the impact that gender plays and how this influences belief about study. Scott, Burns and Cooney (1996) explored the reasons why female mature age individuals with children discontinued study. In particular females in this study expressed that the greater responsibility for domestic and child rearing work played a substantial role in their decision to discontinue study, this in part had to do with in built cultural expectations of the traditional roles of mothering and motherhood.

Also worth noting is that there appears to be a strong link between lower socio-economic class and a persons beliefs or ideals about what were appropriate gender roles in the literature. These cultural expectations did not always support furthering educational opportunities for women (Cullity: 2006; Scott, Burns & Cooney: 1996; Fulmer & Jenkins: 1992). Cullity (2006) and Fulmer and Jenkins (1992) reinforce this in saying that the poor self-concept developed and held especially by women in their research, found that it was derived from a mixture of social and cultural reasons which includes within it perceived priorities of women which reflect gender, class and ethnicity.

Initially mature age individuals can have significant fears and place unrealistic expectations on themselves in regard to commencing study. O'Shea (2007) identified that commencing education studies can initiate feelings of anxiety, unfamiliarity and self doubt in individuals. Others have commented that the most common anxieties identified was that of self doubt, fear of repeated failure; or exposure to ridicule, alongside feeling overwhelmed and intimidated during this transition process (Stone: 2008; McGivney: 2006; Cullity, 2007).

Bolam and Dodgson (2003) comment on past research which indicates that individuals felt unprepared for assignments and admitted feeling that they lacked basic study skills necessary. Martins and Anthony (2007, p. 58) comment on the 'impostor syndrome' that most mature age individuals feel when commencing education, which likely stems from a general lack of confidence in their ability to succeed. When exploring what impact learning processes and culture have on transition, fears that individuals present with can also be compounded by the discourse and jargon that sometimes is often used in academic institutions. Cullity (2007, p. 2) identified that *the unexplained use of academic language can disengage individuals from the learning process.* This can then lead to a very real gap in the almost assumed requirements and expectations that faculty staff have and the interpretations or assumptions individuals make of those expectations (Street: 1996, as cited in Cullity: 2006).

Furthermore, in exploring studies that identified the entry of individuals through alternative entry programs it was found that simply assimilating individuals into education can reinforce the 'dominant/elite culture' often associated within higher educational circles. However, utilising programs that gradually immerse individuals into academic culture can increase their overall academic capacity to succeed (Cullity: 2007). By gradually increasing an individuals understanding of the literary and academic skills required can promote academic confidence which in turns assists the development of deeper learning strategies that need to be fostered successfully in adult education (Cullity: 2006). Not understanding what is required or how to achieve what is required, coupled with individuals feeling insecure in approaching teachers or lecturers, only compounds fears that are present when commencing study.

There has been an increasing focus within literature on the significance and benefits of successfully engaging mature age individuals through the transition process in adult education. Heirdsfield, Walker and Walsh (2007) comment that establishing social networks is clearly important in individual transition, how individuals make the successful transition to university life has been studied extensively by Tinto (Erskine: 2000). In fact, Tinto (1993) as cited in Erskine (2000: p. 44) commented that individuals who integrate into university tend to stay, while those who are not integrated tend to withdraw, and his conceptual model is the most widely recognised and reported in research. In exploring his work, he has synthesised research on individual departure, emphasising the role of the institution and social/academic integration of individuals attributes, skills and dispositions and the institutions academic and social systems and found that individual's departures were mainly related to isolation and incongruence. Of particular note from Tinto's 1987 investigations was that when individuals feel a sense of belonging and acceptance they are much more likely to make the effort required to continue studying (Tinto: 1987, as cited in Stone: 2000).

Experiences of mature age higher education students and staff

The majority of staff and students in this project, talked about the various struggles that mature age student's face both initially and throughout their studies. Attempting to successfully integrate family, work and other personal commitments with studying was referred to as a juggling or balancing act by most and one that had the potential to create more stress during this life transition. Contributing factors were described in terms of personal, financial, domestic, societal and other work related obligations. One staff member commented that it was *all the complexities that go with trying to integrate family, study, work.* Similarity half of the staff interviewed expressed that they themselves struggled with this dilemma and also mentioned that *finding the time and having to juggle study on top of everything else* was a hindering factor in their own experience. Half of the students surveyed reported analogous thoughts to that of staff. One student spoke about the difficulties; *combining study with work and family commitments; this was very difficult at times, especially around childcare arrangements. I had to find time to study and felt that I was neglecting my family at times. It was difficult finding an even balance between study, work, and family. I had little time to unwind myself'* .

However, only two staff identified other complexities that these students present with when entering higher education and the impact that this can have on their ability to successfully assimilate into university study. One staff member commented that *major life disruptions can lead people here.* Another staff member made similar comments and felt that often students returned to study due to personal crises in their lives such as unemployment, divorce or change in health status and so 'bring baggage' alongside often other personal expectations they may have in regard to study. Comparatively, three students identified additional emotional stressors as a significant factor that impacted upon their journey through university.

Both staff and students made the observation that mature age students in general, entered university with higher expectations and a greater commitment toward studying. Staff spoke about the fact that mature age students were more willing to participate in conversation and generally displayed higher motivational and commitment levels toward subjects. One student made comment on this and stated that mature age students *in general had higher expectations of both themselves and the university.* Interestingly, staff identified fear and lack of confidence as factors that might prevent students from applying to university, but fear was not ranked high as a contributing dynamic from the students who responded.

Creating connections once enrolled was seen as an essential component of successfully integrating into university culture. Half of the staff interviewed felt that students who utilised academic skills support and student support services were more likely to successfully integrate and go onto succeed within the first year. Likewise several students attributed their own success partly from acquiring skills and knowledge gained from accessing such resources. Furthermore, the majority of staff felt that students who had a sense of connection to the university community remained enrolled and went on to successfully complete courses. Both staff and student identified that the *issue of connectedness* was a contributing factor in their own personal journey as a mature age student. The majority of both staff and students stated that *making new friends* and *increasing their own personal support networks* were positive aspects of their university experience. One staff member when

commenting on his own experience referred to the support of other mature age students as providing *a sense of comradely.* Just under half of the staff acknowledged that a student's life experience brought a greater sense of 'richness' into the classroom dynamic and others agreed that mature age students were often more 'conceptual' in how they then applied this academically.

Overwhelming most students spoke about the significance of their own prior life experience and how they were able to relate this into coursework. One student made comment that; *these experiences also enabled additional insight and understanding when tackling social work issues.* Another student mentioned that; *I remember on many occasions the younger students not being aware of certain life experiences and learning from the older students....such as childhood development, pregnancy, parenting and experience in the workforce, organisations and team work and managerialism.*

Conclusions

Australian higher education reforms of recent decades have led to an expansion in the number of higher education institutions that service populations living within so-called 'rust belt' areas of major cities and urban sprawl suburbs. This has been occurring alongside the growth of multi-sector adult education institutions and the expansion of Australian higher education programs and services into most Asian countries. The new Rudd Labor Government has released the Bradley Report on Higher Education Reforms (DEEWR: 2008) which has recommended a package of reforms regarding new national targets for educational attainment, more comprehensive individual support, higher quality accreditation and systems management within institutions and specifically, greater funding in regional and rural areas.

Direct recruitment of individual mature age adults, specifically those from rural communities, and individuals from diverse backgrounds and abilities is an issue for all higher education institutions. Mature age individuals often want answers to complex questions with regard to part-time study options, timetables, key support services, flexibility and academic support services. The information they require about these issues is often more detailed than currently provided and appointing key academic staff to act as contact points via email and telephone for mature age individuals during the initial application timeframe can make a significant difference to whether an individual applies for entry into a course. A key conclusion is that higher education institutions need to commission significant research about the information and processes that can and do encourage mature age individuals to engage with the process of entry into a university course.

The literature undoubtedly states that life and education transitions are significant issues for mature age individuals and especially so for those living in rural and regional communities. Most Australian higher education institutions and La Trobe University in particular, do not provide comprehensive transition support for mature age individuals accessing university. Programs such as summer school academic skills workshops and pre-entry counselling services could make all the difference to the self-confidence and skill base of mature age individuals wanting to access university courses, at both regional and urban campuses. These types of programs are common place in the community college sector of the U.S.A. (Tinto: 1993). Mentoring can be provided as a key resource for prospective mature age individuals with current students able to act as mentors in the intervening period between applying to gain access to a university course and beginning their first semester, a period of time when life and education transitions become key issues for mature age individuals.

One of the key outcomes of the mentoring program outlined in this paper was to provide broad based learning support to new mature age university students around the resources that are available on campus. These resources include the equality and diversity officers, academic skills staff, counselling services and library liaison staff. The feedback given during the follow-up mentor-mentee sessions was that information given by mentors about accessing academic skills and student counselling services was invaluable to the first year experiences of Social Work, Nursing and Dental/Oral Health students. Academic skills and counselling staff related that that during semester 1, 2009 more first year students were accessing services than ever before, meaning that mentoring for mature aged students advantaged both the students and the support staff. Student support staff were more fully informed of the common first year experiences.

One of the main purposes of mentoring for first year mature age students was to develop a more effective way of developing social networks for these students who often do not spend much time on campus outside of attending lectures and tutorials. Connecting students via a Faculty facilitated 'speed-dating' type process resulted in students quickly connecting to current students in their own discipline. Facilitating specific events where individuals are encouraged to 'chat' with each other in an informal manner, with food provided encourages social networking. La Trobe University is now utilising this model to develop peer mentoring programs for first year students, mature age students and graduate students. These and other types of transition and social networking programs will make universities relevant to diverse groups in Australian society, fulfilling a policy and social agenda that goes back to the 1970's.

New Trends in Continuing Higher Education:

Who Attends the Privatized Executive Master's Programs and Why?

The Israeli Case

Abraham Yogev
Tel Aviv University
Israel

(E-mail: HYPERLINK "mailto:Yogev@post.tau.ac.il" Yogev@post.tau.ac.il)

Abstract

The recent marketing of public universities due to budgetary cuts has resulted, among other things, in the opening of unsubsidized executive master's programs in a variety of fields. Such programs were recognized by Slaughter and Rhoades (2004) as an essential part of 'academic capitalism', or the market and market-like conduct of universities in the neo-liberal economy. These programs replace traditional frameworks of adult continuing education in the universities, since they are considered more attractive and profitable. Indeed, they have been criticized as "the celebrated cash cows of academe" (Gould, 2003). The common notion is that students of the new master's programs usually originate from established social classes, and that they join such programs while working merely to receive their master's degrees quickly in order to advance themselves in their work careers. However, these conventions have not yet been empirically tested, and therefore the contribution of the new privatized master's programs to the labor force remains unclear.

In order to address this issue we concentrate on the Israeli case. Two public universities in Israel situated in the geographical center, thus close to potential clientele, pioneered the move toward privatized executive master's programs in the early 2000s: Tel Aviv University, and the religious Bar-Ilan University. We concentrate on Tel Aviv University, which has opened until now16 such executive programs, mainly in the social sciences and humanities. These programs come in addition to more traditional privatized professional master's programs, such as the Executive MBA. The students of these new programs enroll in one-year studies, for two days a week, pay at least twice the subsidized tuition, and constitute over a quarter of the total master's degree recipients on a yearly basis.

Our survey consisted on the students in seven executive programs which run parallel to the same or similar regular master's programs which require two years of study. The survey is based on questionnaires administered in 2006 to 254 students of the executive programs and 178 first year students of the parallel regular programs.

We first compare the social and demographic background of the students in the two program types. The comparison, aimed at the issue of who attends the executive programs, is based on the students' gender (55% of the executive students are male vs. 37% of the regular master's students), age (the mean age of the executive students is 36 vs. 31 in the regular ones), region of residence (37% of the executive students are from the Tel Aviv metropolitan area versus 53% of the regular students), religiosity, ethnicity (Jews vs. Arabs and Ashkenazi vs. Mizrachi Jews), parental education, undergraduate studies in universities vs. independent colleges, occupational prestige, income level, and managerial position (46% of the executive students, vs. 25% of the regular ones, supervise 4 or more people in their work position).

A logit regression of program type on all these variables shows that students of the executive programs are older, and indeed have higher income and occupational prestige, but they also originate from more traditional families and tend to have their undergraduate studies completed in the less prestigious independent colleges rather than in the universities. These last findings point to the fact that despite their presently higher occupational status they tend to originate from lower social backgrounds than the regular master's students. This is also indicated by the bivariate comparison of parental education – a significantly lower percentage of either or both parents of the executive students have academic education in comparison to parents of the regular students – 22 vs. 38 percents.

Is it possible, then, that the executive students tend to consist of adults who went on working after graduation as they could not afford to devote the time to full-scale graduate studies offered by the regular master's programs? This possibility can be further explored by comparing the study motivations of the two groups of students. As earlier said, the conventional wisdom is that the executive students are only interested in advancing their professional careers by obtaining an 'easy' master's degree. We compared the study motivations of the two groups by their answers to thirteen 5-point attitudinal items regarding the influence of various factors on their decision to continue their graduate studies. A principal component analysis revealed three independent factors, listed in order of importance (i.e., item variance explanation): social-normative (major items: "the norm is to get a master's degree"; "my colleagues at work have higher degrees", and "to gain status and prestige"); professional (major items: "to improve my chances in the labor market"; "to advance in my work" and "to raise my wages"); and personal development (major items: "to develop myself" and "to study a subject that interests me").

Comparing the distribution of scores of the two study groups on the three motivational factors we found no significant differences between the executive and regular students. In other words, the executive students are not merely degree seeking individuals who wish to advance their careers, but rather students who, similarly to the

regular graduate students, maintain a balance among social, professional and personal interests in pursuing their studies. Indeed, Tel Aviv University has recently recognized that potential, and now allows excellent students of the executive programs to go on with their Ph.D. studies.

   In conclusion, our study clearly indicates that the privatized executive programs are not simply attended by rich and affluent executives who can afford the tuition. Their clientele consists of older middle-range executives who could not afford the regular study schedule. They tend to originate from lower status families than the regular students, yet they have similar motivations for graduate studies. Such programs may indeed be criticized from various respects, especially the creation of double standards for identical or similar master's degrees within the same institution (Yogev, 2009), but not from the viewpoint of their clientele. By initiating such programs the university has actually expanded the educational opportunities for lower-status groups which advanced themselves through work, and can now afford to re-enter the university to complete their graduate studies. Therefore, the new trend of privatized master's programs may have, in the long run, a significant positive effect on the educational qualifications of the mid-range executive labor force.

Preparing for future professional work: The development of university students' work expectations during their student years

Professor Maarit. Valo
University of Jyvaskyla
Finland
maarit.valo@jyu.fi

Abstract

The relationship between university-level higher education and professional working life varies across both national higher education systems and fields of study. Higher eduction systems tend to have disciplines or study programmes that do not prepare students for professional expertise that can be clearly defined in advance. In the Humanities, Social Sciences and Economics, for example, students frequently orientate themselves towards broad-spectrum careers that are open for a variety of working possibilities. How do such students conceptualize their future professional identity? How does their understanding of their prospective work develop during their student years?

University students' expectations of their future professional work has been recently investigated in a number of international studies (e.g. Reid et al. 2008; Abrandt Dahlgren et al. 2006, 2008). However, the development of students' perceptions in parallel with their studies has not yet been explored. The aim of this paper is to examine the formation and possible changes of the expectations of the students whose future line of work cannot be foreseen. The study focuses on Finnish students of Speech Communication who, after receiving their masters' degree, work in a variety of communication professions within education, business, administration, politics, and cultural life. In all, 34 students were interviewed once a year during their four to six years of studentship. The data comprise 162 follow-up in-depth interviews which were analyzed qualitatively.

The results indicate that in their first year the students contemplate their future work in terms of a repertoire of explicit occupational titles. They cherish the diversity of career possibilities. However, typically in their third year they start to express concerns about their future competence in working life, or they even fall into a minor or major crisis about their future. In their fourth year they begin to feel responsible for finding their own special way into the world of work. Finally, in their fourth or fifth year they grow to become aware of their individual expertice. When characterizing their growth process they report having been backed by their off-campus work practice and/or the study courses that have close connections with working life. However, the students differ considerably from one another: some are insecure about their future potential from the beginning of their studies and stay that way, some gradually gain confidence in their employment opportunit
ies, while others feel confident of their success from their first year on. The results are discussed from such perspectives as curriculum contents and structure, partnership of study programmes and working life, and student counseling.

'Whether the hen or the egg came first…':
integrating work-based learning and Personal Development Planning within the UK foundation degree curriculum

Helen Corkill
University of Bedfordshire
United Kingdom

Abstract

This paper sets out to explore some issues of graduate 'employability'. Central to the discussion is the local problem of integrating Personal Development Planning and work-based learning within foundation degrees in the United Kingdom. 'Joined up' thinking and curriculum change are required if students are to be prepared for lifelong learning and working in a world of uncertainty and change. This is a challenge confronting universities worldwide.

> *'We live in a world where change is exponential and we are helping to prepare students for jobs that don't yet exist, using technologies that have not yet been invented, in order to solve problems that we don't know are problems yet'.*
>
> *(Kumar, 2007: xi)*

Introduction: a local problem?

This paper sets out to explore the integration, or otherwise, of Personal Development Planning (PDP) and work-based learning in foundation degrees in the United Kingdom (UK).   That is the on the micro level. On the macro level, the problem becomes how to maximise the 'employability' skills of students so that they can both articulate and transfer higher level learning into (or further into) an increasingly globalised marketplace.

> 'Graduates are in demand across the economy and those with strong employability skills are more likely to succeed in finding employment in an increasingly competitive jobs market. Universities must do more to ensure students acquire the generic transferable skills they will need in their future career…alongside the core academic content of university courses. The teaching of these skills should not be viewed as a discretionary 'add-on' – they are vital to enable graduates to apply their degree skills to the workplace'. (CBI, 2009: 26).

This may challenge practices in the academy, 'HE has a preoccupation with a knowledge and skills agenda while ignoring the fact that what increasingly matters is what people do with that knowledge and skills' (Barnett and Coate 2005)

Within the supercomplex world of twenty-first century higher education there are many types of interface between higher learning and the workplace. The experiences gained from activities which integrate learning in a classroom with learning in a workplace contribute significantly to advancing students' academic, professional and personal development, and thus their 'employability' skills.   In 2006, a major UK government report on the state of the nation's skills was released (Leitch, 2006). It did not immediately paint an encouraging picture,

> 'Our nation's skills are not world class and we run the risk that this will undermine the UK's long-term prosperity. Productivity continues to trail many of our main international comparators. Despite recent progress, the UK has serious social disparities with high levels of child poverty, poor employment rates for the disadvantaged, regional disparities and relatively high income inequality. Improving our skill levels can address all of these problems'.
>
> (Ibid: 8)

This suggests a paradox that there is an increasing number of graduates in Britain as well as an increasing skills deficit.

The British higher education system expanded suddenly and exponentially between the end of the 1980s and the middle of the 1990s, taking it in the space of a very few years from an elite to a mass system (Trow, 1974). The age participation rate of young people in full-time undergraduate education suddenly doubled to over 30% and the size of the total student population increased by more than a half. By the late 1990s the participation figure had risen to around 39%, similar to 2009, despite the much-publicised New Labour target of 50% of 18 – 30 year olds in first-time higher education by the year 2010. A government cap on student numbers in summer 2009 has effectively halted domestic expansion of full-time higher education for the present, despite the unprecedented numbers applying for places this year. A plentiful supply of higher education students is coupled with a low attrition rate of around 13%. A large number of graduates are therefore annually entering an increasingly changing, competitive and globalising employment market.

Recent research by the Confederation of British Industry (CBI, 2009) confirms some of these challenges specifically in relation to higher education. While there is an over-supply of graduates emerging from UK universities, employers are still voicing concerns ranging from levels of basic skills and a lack of transferable and 'employability' skills, to the lack of priority given to 'real' work experience. The CBI has demanded once more that universities do more to ensure that students have the necessary skills required for the workplace and that they are able to articulate and demonstrate these skills. The CBI also calls for universities to prioritise work experience in undergraduate programmes.

There is therefore an immediate problem to address in preparing students for jobs that do exist. What about preparing students for jobs that do not yet exist? As Kumar (2007) clarifies,

> 'In short, we have a responsibility to prepare our students for a lifetime of uncertainty, change, challenge and emergent or self-created opportunity…preparing our students for a lifetime of working, learning and living in uncertain and unpredictable worlds that have yet to be revealed is perhaps one of the greatest responsibilities and challenges confronting universities all over the world'. (ibid: xi)

In England, the appropriate blending of Personal Development Planning (PDP) with work-based based learning within foundation degrees offers one illustration of a possible solution to part of this problem. Which is the hen and which is the egg or does it actually matter which comes first?

'Wicked problems'?: Personal Development Planning (PDP), foundation degrees and work-based learning

Initially it is necessary to view the problem within the UK higher education context. The University of Bedfordshire, a medium-sized university some thirty miles north-west of London, has extensive experience of developing degree programmes that meet the needs of employment and the local economy. Complementary to this, the University has built an acknowledged reputation for supporting the personal and career development of its students. In 2005, the University was awarded substantial government funding to extend this work throughout the undergraduate curriculum and to establish a Centre for Excellence in Teaching and Learning, the Bridges CETL. The CETL aims to bridge student learning and the world beyond university, providing smoother transitions into life beyond undergraduate study and into the global workplace. The CETL has spearheaded work in varying aspects of linking higher education with the workplace, including the development of innovative new business and management learning spaces and linking e-portfolios between university and employers. Ways of working with employers to provide more flexible and relevant work-based or placement learning opportunities are currently in progress and much work has been undertaken with work-focused foundation degrees.

Personal Development Planning (PDP)

The introduction in 2000 of Personal Development Planning (PDP) to the higher education sector was a recommendation of the Dearing Report (Dearing, 1997). This was designed to assist students in articulating and evidencing the acquired skills, abilities and competencies they claim to have developed during higher education. PDP should help students prepare for an increasingly complex and uncertain world,

> 'The implementation of PDP is a 'wicked problem'. By that I mean the problem or challenge continually emerges from all the technical, informational, social and cultural complexity that characterizes teaching and learning' (Jackson, 2007, xiii)

Some twelve years after the Dearing report, the Quality Assurance Agency for Higher Education (QAA) now defines PDP as a,

> 'structured and supported process undertaken by a learner to reflect upon their own learning, performance and/or achievement and to plan for their personal, educational and career development. It is an inclusive process, open to all learners, in all HE provision settings, and at all levels' (QAA, 2009: 2).

and further suggests that

> 'Effective PDP improves the capacity of individuals to review, plan and take responsibility for their own learning and to understand what and how they learn. PDP helps learners articulate their learning and the achievements and outcomes of HE more explicitly, and supports the concept that learning is a lifelong and life-wide activity'. (ibid)

PDP is therefore a framework for learning through reflection and action. Reflective learning is a key component of PDP, designed to promote deep rather than surface learning. The development of reflective abilities are integral to work-based learning, as is the planning and monitoring of personal objectives and achievements. PDP should therefore be preparatory to and complementary with various processes of work-based learning, particularly where that learning is negotiated and has to be constructed.

Foundation degrees

Foundation degrees, also launched in 2000, were like PDP a direct result of the Dearing report. Modelled on associate degrees in the USA, foundation degrees were the first new type of higher education qualification to be introduced in the United Kingdom for over a quarter of a century. There are now some 100,000 students undertaking foundation degrees in the UK. Like associate degrees, foundation degrees are 'short-cycle' awards and have both an exit qualification and transfer function. However, unlike their American counterparts, foundation degrees are equivalent to two-thirds of a bachelor degree in England. They also have certain key characteristics that differentiate them from traditional bachelor degrees and from the long-standing vocationally-orientated Higher National qualifications. They must: involve employer partners in the design, delivery, assessment and review of the programmes; ensure provision of designated progression directly onto the final year of a bachelor programme; include work-based learning as mandatory.

In the last seven years, the University of Bedfordshire, like many other UK institutions, has seen a significant period of expansion and development in its foundation degree provision, mostly run in partnership with local colleges, organisations and employers. Initially hard practical experience of developing foundation degrees was that the engagement of employers in the design and delivery of these work-based programmes is the most challenging area, but also the one of the factors most likely to lead to successful development and delivery. Imprecise articulation of needs, poor understanding of each other's expectations and time-pressures are perceived as the main barriers to developing effective work-based programmes. Traditional boundaries of lecture-room and workplace are challenged. The challenge now is more to ensure that within foundation degrees, work-based learning is genuinely central and that work-based learning curricula are fir for purpose, providing appropriate learning opportunities both for the individual and the organisation.

Work-based learning

Work-based learning is essentially 'a set of relationships between the two fundamental human processes of working and learning' (Evans, 2009: 4), a fusion of personal, professional and organisational development. The various processes embedded within PDP should therefore be an integral part of any learning derived from the workplace. However, too often PDP and work-based learning are viewed as discrete areas of activity (Corkill, 2006) and sometimes also as areas of activity separated from the core academic business of higher education (Costley and Armsby, 2008).

As PDP and foundation degrees both date from 2000, work-based learning easily came first. As Garnett et al (2009) remind us, learning from work is very far from being a new concept, as it started to become more formalised from the middle ages where professions such as law and medicine began developing skills in practice and then took that learning into the academy. New recruits were thus inculcated both into the profession itself and to its corpus of professional knowledge. Subsequently similar models of working and learning were adopted by the healthcare, teaching and engineering professions and were also translated more widely into patterns of apprentice education. Workplace-located continuous professional development (CPD) gathered momentum in the later part of the twentieth century, often as professional-body prescribed education for post-qualification professionals. Other forms of work-based learning started to emerge at around the same time, including qualifications based on the concept of work-based learning as a field of study in its own right. Learning opportunities in the workplace have therefore been available for a long time, but they have not always been recognised, accredited or exploited with the same frequency as today.

As Costley (2000) identifies, the term 'work-based learning' has become ubiquitous and is often used rhetorically, along with a cluster of other concepts such as 'employability', 'lifelong learning,' and 'flexible learning'. The processes of combining work and learning are now characterised by a maze of terminology, contested definitions and confused understanding. In the UK alone there are anecdotally over three hundred definitions of workplace-derived learning in use. Two of the most helpful are,

> '(work-based learning is) a learning process which focuses on University level critical thinking upon work (paid or unpaid) in order to facilitate the recognition, acquisition and application of individual and collective knowledge, skills, and abilities, to achieve specific outcomes of significance to the learner, their work and the University' (Garnett, 2004, in Garnett et al, 2009: 4).

and the simpler 'learning for, through and at work' (Seagraves et al, 1996) or a variation 'learning for, in and through the workplace' (Evans, 2006:3). However defined, ultimately all learning experiences located in the workplace, whether good or bad, provide the means to relate theoretical learning to real experiences and should aid the processes of articulating and contextualising the learning drawn from these activities. Workplace experiences allow students to contextualise the problems of operating in the complex environment of a workplace and students should therefore gain a depth of understanding of the world of work which simply cannot be equalled within the confines of an academic classroom.

However well defined work-based learning and PDP may be, by 2005 anecdotal evidence was suggesting that in some programmes PDP seems to exist in isolation without contributing to the underpinning skills and competencies required for effective work-based learning. In other areas, work-based learning seemed to be masquerading as PDP and had little connection to either a workplace or the reflective processes also inherent in work-based learning.

Historical research: integrating PDP and work-based learning

To try to provide more than anecdotal evidence, in 2005/6 research was carried out by the University of

Bedfordshire to investigate the connections between PDP and work-based learning, in this case specifically within foundation degrees (Corkill, 2006). Several interesting anomalies were discovered. It was confirmed that there was considerable confusion as to what constituted 'work-based learning' within higher education in general and foundation degrees in particular; there was further lack of clarity as to the nature of PDP as a set of processes rather than as a product and there was further confusion still when the two combined or were even substituted for each other. In 2009/10 it is still instructive to take a brief historical look at this research as surprisingly little has been written in the interim to supersede this study. However, it is now better regarded as an instrumental case study, where the actual case is now secondary but helps develop understanding and knowledge of a wider problem.

The sample size for the 2005/6 research was forty-nine programmes located in a random selection of seven different university systems, and atypically of the foundation degree provision across England as a whole, 92% were full-time programmes and 8% part-time. None of the programmes was 100% workplace based, which in the elapsed years would be much more prevalent. Many programmes included a discrete work-placement and others offered work-related learning such as a simulated work experience. Although the subject of the study was clearly foundation degrees, the relevance to a broader undergraduate curriculum is evident..

Work-based learning is intended to be central to foundation degrees. The first problem in 2005/6, as now, was to identify what course designers and deliverers understood by 'work-based learning' and how this was made central to the programme. One third (33%) of the selected programmes contained at least 20% identifiable work-based learning activity or had work-based assessments firmly embedded throughout (*Figure 1*, WBL column). Just under

Figure 1: the work/learning relationship in the Foundation degree sample

WP_WS_WRL_WBL_None_ Discrete work placement;

no negotiated outcomes; no employer engagement with assessment; possibly no direct linkage with programme	***Work simulation****: all work related activity takes place in-house without external employer involvement*	***Work- related activities*** *taking place from an in-house base such as group projects, live briefs delivered in-house*	***Work-based learning*** *taking place as a negotiated activity located within a workplace; employer involvement with assessment*	*No direct work-related or work-based activity taking place*

Key to Figure 1

one third (31%) of programmes contained 20% or more of work-related rather than workplace based activity. A further 11% programmes contained 20% or more of work simulation, mostly located in in-house professional training facilities (*Figure 1*, WS column). Neither the work-related nor simulated learning activities contained negotiated or student centred learning. The work placements (*Figure 1*, WP column) similarly resembled traditional work experience placements rather than work-based learning opportunities. 11% of programmes (*Figure 1*) contained no overt work -related or -based learning for example in some computer networking courses where commercial vendor certification was substituted for work-based learning activity.

The diversity of interpretation of work-based activity was also reflected in the correlation of employer engagement to the various programmes. As already referred to above, there were no employer-led (EL) foundation degrees in this sample and although 29% of programmes included employer contribution to assessment, this was exclusively to formative methods of assessment. Employer engagement (*Figure 2)* with the design and delivery of programmes was surprisingly low for qualifications where there is a Quality Assurance precept covering this area.

The sample was then analysed for the inclusion of PDP within the programmes (*Figure 3*), but the research did not disaggregate between PDP as process or as product. 100% of the

Figure 2: employer engagement with and contribution to Foundation degree sample

programmes did include PDP in some format, ranging from discrete credit bearing provision to isolated one page reports attached to some assignments at the other.

Figure 3: Provision of Personal Development Planning (PDP)
within the foundation degree sample

The final and central piece of the analysis process was to look at ways in which there was a correlation between PDP and work-based learning. This analysis was flawed in the light of the findings illustrated in *Figure 1*, as only one third of programmes were found to contain some form of work-based rather than work related learning. The

Figure 4: the relationship between PDP and work related activity in the foundation degree
sample

percentages illustrated in *Figure 4* therefore warrant scrutiny. *Figure 4* shows the correlation between PDP and various types of work-based activity. Of the programmes classified as work-based in *Figure 1*, 25% had both PDP and work-based learning embedded throughout the curriculum. A further 30% which had discrete and credit bearing provision genuinely used PDP, particularly at Level 4, to help prepare students for work-based learning. The remaining 45% of programmes classified as work-based learning did not overtly connect with PDP. In a strange twist, it was also found that 14% of programmes included PDP as a mechanism to prepare students for work-based learning activity but did not then deliver the activity itself. It was also found that in 9% of programmes PDP was used as a substitute for work-based learning.

The findings presented here are from a relatively small-scale piece of research which might not be representative of foundation degrees as a whole. However, no nationwide piece of research is, to date, complete in this area. The conclusions from this research may be summarised as confusion and missed opportunity. Confusion arises essentially from a lack of understanding about work-based learning, and this permeates this piece of research. The lack of linking of PDP processes to work-based learning probably also stems from a similar lack of clarity, including how PDP has any meaningful relation to 'real' work-based learning.

Clarity: is there really a problem?

Since 2000 there has been a national policy in place designed to ensure that students engage with PDP and there is still a growing awareness of the value of PDP as a tool to support and promote 'flexible', 'lifelong' and work-based learning. Not only does PDP promote a pro-active self-directed approach to learning but it helps to develop the skills of reflection and critical thinking fundamental for the Recognition of Prior Learning (RPL) or Accreditation of Prior Experiential Learning (APEL), the starting points for many work-based learning programmes.

Problems arise however when, for a variety of reasons, the synergy between PDP and work-based learning processes are not realised or articulated. If PDP is regarded as simply a product, for example a means by which a 'progress file' repository is compiled or it is regarded as a completed act, 'we have "done" PDP in Assignment 2' there is little chance of this harmonising meaningfully with any construction of work-based learning,

> 'When I helped develop PDP policy in 1999 I believed that it had the potential to put students as self-regulating independent learners at the heart of the higher education enterprise. The reality has been that PDP processes often emphasise the instrumental features of action planning, record keeping and reflection on action and performance, while other important features of self-regulated learning are often implicit and happen by default rather than by design'. (Jackson in: Kumar, 2007: xi)

Similarly if work-based learning itself is conceived as a stand-alone placement or activity uninterested with the curriculum as a whole or where the workplace activity is perceived as paramount and not the learning being drawn from it, then it is not possible to begin to realise any transferability. PDP provides a framework that fosters the development of reflective practice and action planning. Work-based learning is grounded in reflective practice and the developing of 'meta-learning', learning to learn. The synergy between PDP and work-based learning is therefore crucial because ultimately they are complementary tools. They should work together to enable learners to recognise and articulate what they have learned, what they need to work on and how this can be used as the basis for assessment and an ongoing cycle of personal and professional development, potentially of benefit both to themselves and an employer.

Addressing the problem: one solution?

The work of the Centre of Excellence for Teaching and Learning (CETL) at the University of Bedfordshire has ensured that the needs of 'joined up thinking' in terms of developing graduates for the future workplace are kept at the forefront. The University has acknowledged the challenges of enhancing students' personal and career development, 'employability' skills. In 2007, the University developed a revised curriculum model, *Curriculum Review for 2008* (*CRe8*) (Atlay, 2007), based on embedding principles of PDP throughout the undergraduate curriculum. *CRe8*, while signalling a shift away from individual programme components towards a more holistic view of curricula as a whole entity, presents both challenge and opportunity to some of the University's workplace based activities. If the 'final learning experience is more than just the sum of the various parts' (ibid, p.2) this does present a requirement that all workplace learning activities are suitably integrated, scaffolded and assessed within curricula.

Underlying *CRe8* is a student-centred process for personalised development, *SOARing to Success* (Kumar, 2007). The *SOAR* model provides more of a student-focussed lens through which to view the personal development elements of *CRe8,* the latter being largely developed for staff to use both for and with students. There is considerable synergy between the *SOAR* model and the various cycles contributory to understanding work-based learning. Likewise, there are reciprocal processes between work-based learning and many elements of *CRe8*. The multiple concepts and processes of using *CRe8* and *SOAR* together to facilitate learning therefore complement all types of learning activity located within the workplace.

As the national developments of both PDP and foundation degrees in the UK have been systematic and policy-driven, so the drivers for real curriculum change within the University have also had to be policy driven and to encompass a whole-university focus. Eexperience has shown that you cannot seek to influence students if you cannot first influence the staff that engage with the students on a daily basis. Staff in all curriculum areas have had to be committed to the idea that developing 'employability' skills is key, and that the heart of this lies in well-developed communication skills, considered primarily as a 'curriculum' not a 'support' issue.

Both the institution and individual staff have had to accept that even within the confines of a mass higher education system there is a need to respond to individual learners' needs. Ultimately this can only be done by locating responsibility for development with the students' themselves. This in turn presents a challenge for ways in which subjects are traditionally delivered. Experience has shown that curricula based on PDP processes, and which emphasise the 'personalisation' of learning, need to be counter-balanced by activities which address the social nature of learning and social responsibilities.

The 'personalisation' that is at the heart of PDP and evidenced in other trends within the sector (e-portfolios, Web 2.0 applications) needs to be balanced by a consideration of 'socialisation' issues. The learning environment (physical, virtual, real or simulated workplace) has a significant impact on what is learned and how it is learned, and also has a significant impact on the psychology of the learning process. These are complexities which affect both staff and students.

Conclusions: global challenges?

The conclusions to be drawn from this brief exploration are in themselves 'supercomplex'. On a local level we could be doing much more within the higher education curriculum to ensure that students acquire the best possible university level education, while at the same time being able to develop the necessary 'transferable' skills to aid them (and employers) in the workplace. The introduction of the *Curriculum Review for 2008*, *CRe8*, at the University of Bedfordshire demonstrates just one way in which measures can be introduced cross-curricula to aid this process. The integration, or not, of PDP with work-based learning within foundation degrees again serves simply as one illustration of an area where the synergies between learning processes are not being exploited to the full. By having less of a preoccupation with an isolated knowledge and skills agenda (Barnett and Coate, 2005) and more of a concern with how new knowledge can be created and applied, 'employability' skills of students could be further enhanced to assist them in facing the demands of sustainable employment in the global workplace. This would serve to address the concerns of employers,

> 'Employers rank employability skills…as the most important factor…although these skills have traditionally been given low priority in many degree courses'.
>
> (CBI, 2009: 29)

In the UK, a large proportion of employers believe that universities must do much more than at present to prioritise work experience and placements in undergraduate programmes (CBI, 2009: 30). The value of well-constructed learning in the workplace must be fully recognised as an equal if different type of higher learning. This may present challenges to the traditional values of the academy and to the sanctity of subject specific knowledge, but it is increasingly important to both students and employers,

> 'Employers are … clear about the value-added benefit to students who have gained work experience by the time they graduate. More than half (54%) list it as one of the most important factors they look for when recruiting graduates. Work experience helps sharpen students' focus on the importance of employability skills and gives them the chance to develop these in a practical context' (CBI, 2009: 29)

The conclusions identified in the 2006 research (Corkill, 2006) were summarised under two headings – confusion and missed opportunity. The lack of linking of PDP processes, as opposed to products, with work-based learning probably also stems from confusion – a double piece of confusion: uncertainty as to what PDP really entails and also confusion as to how this has any meaningful relation to constructing work-based learning. Were research to be carried out in 2009/10 among a similar sample, it would be interesting to speculate what might have changed. The understanding of work-based learning may well have moved on in the interim, and certainly a new Quality Assurance Agency Code of practice has been introduced to take account of such advances (QAA, 2007).

To ensure that higher education does have 'joined up thinking' and where appropriate, can make the necessary changes to the undergraduate curriculum, does call for a 'step-change' in thinking (Leitch, 2006). Perhaps it does not matter whether the hen or the egg comes first, as long as they effectively work together to produce the desired result.

> 'Preparing our students for a lifetime of working, learning and living in uncertain and unpredictable worlds that have yet to be revealed is perhaps one of the greatest responsibilities and challenges confronting universities all over the world' (Kumar, 2007: xi)

 HE – Higher Education
 Foundation degrees are part of the higher education system in England, Wales and Northern Ireland
only, with some differences in transfer arrangements within Northern Ireland. Scotland operates a
different system of higher education which currently only exceptionally includes foundation degrees.
 Bachelor degrees in England, Wales and Northern Ireland are given a credit value of 360 credits:
foundation degrees carry a value of 240 credits (respectively 180 and 120 European credits under the
Bologna agreement)
 Unpublished research data, fdf (Foundation Degree Forward), 2009
 Level 4 represents the first level of study for a bachelors degree. In a full-time award, it would
normally be equivalent to the first year.

"Soft" policy implementation in the curriculum reform:

What are teachers' perceptions?[1]

Paper presented at The Asian Conference on Education, 24-25 October, 2009

Jacqueline K. S. Chan

(The Hong Kong Institute of Education)

jaclo@ied.edu.hk

Abstract

The use of "soft" methods is a new approach to curriculum and implementation in Hong Kong where schools and teachers are supposed to take more responsibility for student learning when they are given flexible measures of support and coordination. Carried with a character of non-binding, "soft" policy is designed for multilevel systems of governance where there is relative autonomy at different levels of collective decision-making. The present study explored how "soft" policy has been realized in the recent large-scale curriculum reform in Hong Kong, in particular, how school teachers perceived these "soft" methods in their school contexts.

Introduction

"Soft" policy is a new concept that emerged from the field of studies in international law and international relations. Researchers in education have borrowed the concept to analyse government policies on the implementation of curriculum reforms. In a practical sense, "soft" policy is used to govern multi-level systems with a view to attaining considerable outcomes of the set policy. With major changes in the education system and curriculum in Asian countries during the new era, the new concept of "soft" policy has found a place for implementation aiming for better chances of success.

The use of "soft" policy has become the major trend of policy implementation in Hong Kong where the education system has shifted dramatically since the change of sovereignty from Britain to China in 1997. This shift has been accompanied by a major change in the school curriculum, the so called "Learning to Learn" reform (Curriculum Development Council, 2001). The shift was provoked by the government of the Hong Kong Special Administrative Region (HKSAR) pursuing policies to align education with the needs of a "knowledge based" economy. Under the current policy, various

---

kinds of resources, termed as "soft" measures", are allocated to the schools and teachers from the central government for implementation of the new curriculum at school and classroom levels.   In contrast to the past, where "hard" policy was the major policy used, these "soft" measures certainly have an important impact on schools and teachers.

The present study aims to discover the "soft" measures used by the government in the "Learning to learn" reform, and find out how these "soft" measures" are perceived by teachers.

The use of "hard" and "soft" policy in the curriculum reform

Traditionally, research on implementation policy models has analyzed educational innovation as either "top-down" or "bottom-up" (Sabatier, 1986). Neither of these approaches, however, is wholly adequate for understanding the implementation process. Recently policy has been conceptualized as "hard" and "soft" and this has implications for the way implementation issues are viewed.

Drawing from the fields of international law or international relations (Abbott & Snidal, 2000) and the policy analysis in relation to European Union Policy (Ahonen, 2001; Torenvlied & Akkerman, 2004), "hard" and "soft" policy approaches are now commonly used to consider multi-level systems of governance.   "Hard" policy refers to the use of legal structures to enforce compliance, and carries the threat of sanctions such as directives and regulations. "Soft" policy, on the other hand, denotes the use of non-binding instruments like guidelines, informational devices or voluntary agreements, and there are no enforcement or compliance mechanisms (Cini, 2001; Torenvlied & Akkerman, 2004). "Soft" policies are one of the distinctive features of policy implementation where there are multiple layers of collective decision making, and are considered as efficient means to coordinate policies across these multiple layers.

The application of "hard" and "soft" concepts to analyze current curriculum reform is relatively new, but has received attention in the field.   Chan, Kennedy and Fok (2008a) contended that "hard" and "soft" policy implementations were closely related to their respective educational contexts:

In the real context, the adoption of "hard" and "soft" policy depends on the nature of the structures of the system and the contextual factors of the society as well. For example, in the case of Hong Kong where the colonial regime utilized top-down bureaucratic structures, "hard" policy" fitted well. On the other hand, an increasingly complex, decentralized and open system suggests that "soft" policy would be a better option.   (Chan, Kennedy & Fok, 2008a, p.137)

However, the shift from "hard" to "soft" policy in the real implementation seemed difficult for the policy makers and implementers.   The most significant factor for implementation is the frontline teachers who are assumed to take an active role in the new curriculum reform by flexibly using allocated funds for effective teaching and learning.   However, teachers' roles were expected to be passive during the colonial period when "hard" policy was implemented (Chan, Kennedy & Chan, 2008a). Without filling the transitional gap from "hard" to "soft" policy by providing relevant contexts for teachers' professional participation in the curriculum reforms, the sudden shift of policy from "hard" to "soft" in a relatively short span of time has been in fact quite difficult.   The difficulties for "soft" policy were noted in a study on teachers' perception of "soft" policy by Chan, Kennedy and Fok (2008b).   It was found in the study that "soft" policy was ill perceived by the front line teachers. School teachers perceived that they had no choice but to implement changes according to the centralized reform, or their schools would be penalized by having a bad public image of refusing to innovate. This would in turn influence parental choice, and eventually the schools could experience decreased student enrolment and a consequent cut in government funding.   Similarly, studies by Fok, Kennedy and Chan (2005, 2008) revealed that "soft" policy formulated by the government was negatively perceived as "hard" policy by the teachers.   The results of the studies reflected that there was a gap between the perceptions of school personnel and the government, revealing an underestimation of the government policy in use.

The "soft" methods and classifications

It is of interest for investigators to search what and how "soft" policy is used in the government context. Ahonen (2001) argued that there has been no systematic analysis of 'soft' methods.   He tried to fill this gap by proposing three different methods of 'soft' policy making: namely, "regulative", "redistributive" and "allocative". These characteristically different methods are used in various processes generating effects from "stronger" to "weaker" (2001, p.2). A summary of this typology, with some adaptations, is shown in Table 1.

Table 1: Ahonen's typology of soft policy-making methods with adaptations

Method of 'soft' policy making	Communication Process	Approximate strength of each method/process		
		Stronger	*Intermediate*	*Weaker*
Regulative (conveys agreements that will affect users)	*Structural*	Soft law is institutionalised	Institutionalised standardisation, some benchmarking and evaluation mechanisms	Recommendations are institutionalised
	Two-way	*	Standards Some evaluations	Charters
	One-way	Soft law	General guidelines Some benchmarks Reference indicators, other indicators Some evaluations	Recommendations
Redistributive (targets users to influence and persuade)	*Structural*	Binding accreditation mechanisms	Some accreditation and benchmarking mechanisms Institutionalised expert exchange	*
	Two-way	Some accreditations	Some accreditations; Some benchmarks; Expert exchange	*
	One-way	Some accreditations; Incentives to the recipients to share information	Some benchmarks; Scoreboards, league tables; Unilateral secondment of experts	*
Allocative (increases the quality and quantity of information available)	*Structural*	*	Framework programming of activities; Observatories; Some international organisations;	Information networks with contact points; Information gateways

			Advisory committees and working groups	
	Two-way	*	Interest group dialogue; Consultation of Stakeholders; Work of advisory committees and working groups; Work of consortia in framework programmes	Peer reviews; Citizen dialogue; Information Exchange; Conferences, seminars, colloquia, round tables, symposia etc
	One-way	Incentives given by subsidies for recipients to acquire or generate information	Monitoring Observatory activities Certain types of; applied research; Programmed research, development, education and training	Self-evaluations; Dissemination activities; Unilateral acquisition of information

(Based on Ahonen, 2001, pp 4-5)

The typology is useful for analyzing the current situation of the large-scale curriculum reform operating in Hong Kong since 2001. Compared with the education reforms adopted in previous decades, the present government has now provided much more substantial support for reform (Education Commission, 2002, 2003, 2004). These substantial supports, termed as "measures and resources," significantly differ from the previous government's top-down policy. The Commission states clearly that a new policy has been employed in the reform, in particular to address local school contexts and offer support to local needs as far as possible (Curriculum Development Council, 2001, p. 99).

"We are especially aware of the concerns of teachers about the know-how to carry out the reforms and the workload which this will involve. Instead of the top-down linear model of "syllabus-teacher-training-inspection" used in the past, we recommend the following measures

and resources, which are flexible and diverse enough to suit the different needs of teachers and the varying contexts of schools." (Curriculum Development Council, 2001, p.99)

In essence, the "measures and support" provided to schools and teachers are stipulated in various coordination units at different levels of the system.

⇨ Systematic and community level – curriculum guides, examination reforms, curriculum bank, textbook review, learning and teaching resources, local and international consultancies, dissemination strategies and networks.

⇨ School level – on-site school-based support, collaborative research and development projects, library development, dissemination strategies and networks, partnership amongst all parties.

⇨ Teacher level – professional development programmes for teachers and principals, on-site school-based support, creation of time and space for teachers, dissemination strategies and networks.

⇨ Student level – making use of the "space" of learning.

(Curriculum Development Council, 2001, p.99)

Of these supports and resources provided to the schools, some are redistributive, i.e. to influence target users through distribution of information, while some are allocative, i.e. to increase the quality and quantity of information available (Ahonen, 2001, p.5). Kennedy, Chan and Fok (2006) used Ahonen's typology to analyze the "measures" provided by the Hong Kong Government according to the nature and strength of the 'soft' policy instruments as shown in the following table.

Table 2: 'Soft' methods used in the "*Learning to learn*" reform

'Soft' methods	Variety of 'soft' methods	Structural / one-way/ two-way	stronger	Inter-mediate	Weaker
Re-distributive	● Curriculum guides	Structural	✓		
	● Curriculum bank of authentic exemplars	one-way		✓	
	● Textbooks	Structural	✓		
	● Develop Learning and teaching materials (guidebooks, multi-media packages, CD ROM curriculum planners.	one-way		✓	

Allocative	● All concerned parties will collaborate with tertiary institutions to disseminate good practices	two-way		✓	
	● Seed projects	one-way			✓
	● Professional development programmes for teachers and principals	two-way			✓
	● Examples of strategies to support library development	one-way			✓
	● On-site advice to help schools to develop school-based curriculum	two-way			✓
	● Creating time and space for teachers, e.g. Capacity Enhancement Grant	one-way			✓
	● Dissemination and networking – e.g. learning communities, sharing experiences through REOs, etc.	two-way			✓
	● Experts are invited to give advice.	one-way		✓	

Source: Kennedy, Chan and Fok (2006), p.13-14

The "measures and support" provided to schools through "soft" methods is the current trend of the government policy to motivate schools and teachers in active participation for attaining the common goals of the reform.   In reality, what are these measures and supports in schools and how are they perceived by the teachers?

Methodology

This study is part of a large-scale research project entitled "Curriculum reform as 'soft' policy implementation: Theorizing curriculum reform processes and understanding curriculum as text".   The research aim of the present study is to investigate how policy implementation processes are conceptualized and activated from local perspectives using the new theoretical

framework drawn from the larger research project.   In particular, this study focuses on the following questions:

1. What are the measures and support allocated to schools by the government

   through "soft" methods?
2. How do teachers perceive these "soft" methods?

A broad range of qualitative methods was used to collect data, including interviews and documentary analysis. This range of research methods was necessary in order to triangulate and verify data from different sources.   The qualitative data were managed and analyzed by a data management tool, N-vivo.

Three local primary schools participated in the study.   Their participation was initiated by sending invitation letters to the schools.   Team researchers then visited the participating schools and conducted semi-structured interviews in the school contexts.   From each participating school, two school policy makers and two front line teachers participated in the interviews, making up a total of 12 interviews in this study.   The interviews were based on an interview guide, and each interview lasted approximately 45 to 60 minutes.   The interview data were then transcribed and the transcriptions were sent to the interviewees for checking and confirmation.   The transcribed data were then coded and analyzed.

Table 3: Backgrounds of the three primary schools and teachers in the study

School / mode of subsidy	Location of school	Teacher interviewed	Background of teacher
School S / government subsidized	New Territories	Miss Au	Department head of English, subject teacher of English & Religious Studies.
		Miss Chan	Subject teacher of Chinese, Physical Education and Mathematics

Findings and discussions

It was stated in the reform documents that the government would provide local schools with various measures and support (e.g. Curriculum Development Council, 2001). It is interesting to examine what these real measures and support are in the school contexts and how these measures and support are perceived by the teachers. From the interview data, the following themes emerged:

1. "Many reforms in our schools are derived from the government documents"
    Since the large-scale curriculum reform was launched in schools, the principals and teachers have continuously adopted different kinds and scales of innovations in their schools. These school innovations were actually drawn from major government documents such as "Learning to learn" (Curriculum Development Council, 2001,) including the four key tasks as mentioned in the documents; i.e. Moral and Civic Education, Reading to Learn, Project Learning and Using Information Technology. These initiatives stated in the government documents were followed closely by the schools in their adoption of various school-based curriculum changes.

    "Firstly we have to follow the instructions from the central government about curriculum innovations. Whenever there is something new from the EMB (Education & Manpower Bureau), we have to follow up the change in our school (Miss Au, School S, interview)

    Although schools were free to choose their own innovations that best suited their own school contexts, schools seldom followed their own way in adopting initiatives that were not mentioned in the central government document. In terms of resources, schools would often be allocated funds for trying out the new innovations in alignment with the central documents. Extra funding was therefore a strategy of the central policy used for attracting local schools to innovate and move towards the major goals of the centralized reform. Indeed, the government documents served as the "redistributive soft method," with a strong to intermediate effect designed to coordinate changes at school levels.

2. "There is not much information for us regarding how many resources we have and how this is allocated"
    While the schools received various resources and funds from the central government, the allocation of resources to internal units of the school was decided by the principals and middle-management. Front line teachers usually did not know where the resources came from, and what constituted the principles of allocation of these resources within the school.

"Usually the school administrators, i.e. the principal and the school management team made the decision for the school-based innovations. Sometimes there is influence from the school supervisors for decision making as well. After the decision has been made, the principal will put these ideas into concrete plans and then discuss with the teaching staff during staff meetings." (Miss Chan, School S, interview)

From decision making to concrete planning of school-based innovations, front line teachers did not receive any information about the situation of school decisions, the rationales for innovations and principles for allocating resources to certain changes in the schools. The teachers did not have a comprehensive view of what and how the school innovations would be supported. They only knew they would receive resources from time to time, and would then work on the assigned school innovations with the allocated resources.

3. "We do not know what it really means in the curriculum guidelines"

Although there were plenty of government documents for schools' reference, teachers did not know how to put them into practice. To the teachers, these documents seemed abstract and theoretical. Moreover, teachers felt that these documents were tedious, and they had no interest in reading through the contents.

"I think that "Learning to learn" (government reform document) is quite abstract and difficult to put into real practice. Although there are some examples given in the Curriculum Guides, there are still a lot of gaps to be filled by the teachers if it is to be adopted." (Miss Cheung, School T, interview).

On the whole, teachers did not consider the government documents as helpful to their work. Moreover, teachers were confused when the government documents were translated differently by various government officials.

4. "Direct money resources allocated to the subject departments help facilitating teaching and learning"

Teachers welcomed resources that they could flexibly use to enrich classroom teaching and learning. Some schools would directly allocate certain amounts of money to different subject departments of the schools. In this way, teachers could purchase teaching aids needed for various teaching activities without going through tedious application procedures. In practice, schools would ask the subject departments to set a yearly budget for the activities planned for that year. If the budget was approved, the departments would use the money to spend on planned activities and the claimed money would be reimbursed based on documentary evidence.

"There is budget for yearly planning in each subject department. Normally the school management can provide us the budgeted money for our yearly planning. For me, the money is quite okay for conducting the planned activities." (Miss Yu, School T, interview)

Other than that, one of the government purposes concerning the allocated resources to schools was to "create more time and space" for teachers. Schools normally used the funding to employ more staff to reduce teachers' loads. In general, teachers welcomed these measures and supports, although they did not exactly know which category of the government funding was in use.

5. "Support from external organization or personnel is often helpful"

Teachers were usually positive toward external organizations or personnel that helped facilitate classroom teaching and learning. In general, this external help came from expertise needed by the schools, such as native speakers of English and Putonghua (Mandarin) for creating suitable language context in the classrooms.

"We have employed two teaching assistants for Putonghua (Mandarin) teaching since last year. They are native speakers (in Putonghua / Mandarin) and usually co-teach with the Chinese language teachers. They also help to organize interest groups for students to learn Putonghua." (Miss Yu, School T, interview).

6. "Seminars and workshops might be helpful"

Teachers found the centralized organized seminars and workshops fairly helpful for understanding the initiatives of the reform. Compared to reading the tedious government reform documents, teachers preferred attending these seminars and workshops for obtaining a quick understanding of the centralized theme from the officials in a relatively short period of time. Other than that, teachers did not find these one-off seminars and workshops personally useful. They preferred more in-depth seminars and workshops that were organized into a series.

"I think that the one-off kind of workshops or seminars cannot help much. It will certainly be better if these seminars and workshops can be organized in series." (Mr Leung, School L, interview).

7. "School-University partnership is helpful"

Teachers seemed to have positive attitudes towards the school-university partnerships organized in their schools. They perceived that the scheme had provided them with the opportunities for in-service professional development.

"Last year we had tutors from the local university to help us. They asked us about the most difficult parts of mathematics teaching. Then we worked together (on the problems) in preparing

lessons, observing each other's lessons and discussing after lessons. (Mr. Leung, School L, interview)

If teachers could benefit from school-university partners in teaching, they would certainly welcome this help from the scheme.

8.   "On-site school-based support might be helpful"
Sometimes schools would receive on-site school-based support from the central

"Last year the EMB (Education and Manpower Bureau) officials offered help to us on the new initiative of "project learning" launched in our school. They introduced an expert in "project learning" to us and then we worked together. During that period they came regularly to observe our work and students' work." (Miss Yu, School T, interview)

Usually teachers welcomed the on-site school support, but were uncomfortable in working together with the government officials, which they perceived as possible surveillance from the government.

9.   "We survive by keeping these school innovations rolling"
Although teachers welcomed most of the measures and support from the government, they were negative towards the extra work accompanying these resources and support. Strictly speaking, teachers saw they had to spend more time and energy on these allocated resources once they received them. Although teachers seemed to be reluctant to accept the resources and support, they and the school they were serving were required to take on the innovations suggested by the central reform. In order to survive, teachers had to use these measures and support to keep the innovations rolling in their schools. The dilemma was that the more allocated funds that teachers received, the more effort they had to make.

"To a certain extent, teachers are burdened. Maybe they feel that the work is necessary and yet they also feel that the work is extra for them. We would like to ask – why do we have to work so hard in addition to our normal teaching?" (Miss Au, School S, interview)

Since 1997 when the new government of Hong Kong came to rule, their use of "soft" policy to motivate schools to innovate their curriculum has obviously been an important move. Generally speaking, it is a good policy implementation for promoting the adoption of such large-scale and complex curriculum reform in schools. No doubt the government has played an important role in initiating and coordinating the work of various organizations at different levels through a range of

"soft" measures and support offered to schools and the community in large.   To the schools and teachers, however, these supports were not entirely helpful.

According to Ahonen's (2001) classification of 'soft' methods, the methods used by the Hong Kong Government varied from "regulative soft methods" to "redistributive soft methods" and "allocative soft methods".   The "regulative soft methods" included those measures on evaluations of student and school achievements with preset indicators.   In general, schools perceived that the evaluation results would have implications for future development of the schools; e.g. downsizing of classes or chartering of the school.   On the other hand, "redistributive soft methods" and "allocative soft methods" were largely used in the form of dissemination materials through government guidelines, textbooks, exemplars, as well as various kinds of resources and support available to the schools and teachers.   These methods were mostly welcomed by the teachers and seemed helpful to classroom teaching and learning.   Particularly, teachers welcomed methods that were most practical to their classrooms, especially those in the category of "allocative soft methods".   On the other hand, teachers seemed to be reluctant to receive these "allocative" sources of support as they were burdened with innovations in their schools.

On the whole, the various "soft" methods employed by the government have driven the schools and teachers to work towards the goals of the curriculum reform. However, the government should also be alert to the teachers' workloads and morale at work.   In most cases, teachers were burdened because their schools aimed to implement every innovation as stated in the reform, and they had to keep up with all the initiatives started in their schools.   If the effectiveness of schools were to be judged by the number of innovations taken, then the "soft methods" would not be considered as good policy for implementation.

Conclusion

This study has shown that the "soft" policy implemented by the government of Hong Kong has initiated curriculum reform and driven teachers' work in local schools.   Since teachers have felt much burdened by taking care of the various innovations adopted in their schools, the policy seems to have brought frustration to the teachers.   It is time for the government to examine the various conditions and contexts that the schools and teachers are now facing, and reconsider how these "soft methods" can be tailored so as to safeguard the successful implementation of the policy.

Gender differences in the dissolution and loss of key relationships

Stephen W. Kane, Ph.D
Lourdes Ferrer, Ed.D
University of Guam

ABSTRACT

A sample of 200 at risk Chamorro adolescents were surveyed with the Family Crisis Scale to measure the prevalence of loss in the past year. This at risk group had significantly higher frequencies when compared with a non conflicted sample. The conflicted males and females both shared the same top 3 categories of loss. A case is made for understanding how threats to the coherence of the family and embedded sorrow influence conflicted developmental paths.

INTRODUCTION

Alyssa Rheingold's landmark study (2004) initiated the inquiry into the prevalence of loss experienced by adolescents on the mainland, United States. Her sample of 4,000 adolescents produced baseline frequencies of loss in this age group with the accompanying observation that "there is very little understanding about the impact loss has on adolescent development" (p. 2).

The inquiry into adolescent loss in this region of the world, the Marianas and Micronesian Islands, was systematically initiated by a series of studies generated several years ago by Kane (2005), Kane and De Oro (2006), Kane and Garrido (2007) and Biggin and Kane (2009). These studies not only looked at the patterns of loss in specific sub samples of adolescents and young adults on the island of Guam but likewise attempted to respond to Rheingold's (2004) query into the vagaries of loss on the adolescent's psychological development.

In this study, aspects of Kane and Garrido's (2006) sample of "at risk" adolescents displaying oppositional and conduct disordered traits were surveyed with the Family Crisis Scale (Kane, 2005) to reveal the most frequent categories of loss and attachment traumas experienced in the previous year. While the categories of loss were the same for both males and females the frequencies of loss were not in the same order.

Implications of these results are discussed following an overview of the recent relevant literature in this region and a description of the Family Crisis Scale.

REVIEW OF SELECTED LITERATURE

While Rheingold's (2004) position held that very little is understood regarding the relationship of loss and adolescent development on the mainland it is clear that prior to 2006, there were no similar studies conducted in this region of the world.

In (2006), Kane and De Oro examined persistence patterns of non traditional high school dropouts attempts at securing a high school diploma at Guam Community College. Using the Family Crisis Scale each of the 60 respondents were able to identify a pattern of losses they experienced in the previous year and to "rank order" all 9 items of loss from the scale. Their participation resulted in the Chamorro Family Crisis Scale and led DeOro and Kane (2007) to provide these "at risk" learners opportunities to scaffold successful coping responses to loss in the past year to present attempts at handling adult responsibilities to secure their diplomas. The Chamorro Family Crisis Scale likewise demonstrated differences when compared to the mainland Family Crisis Scale with "a move has occurred but not all family members included" – representing deployment for military families on Guam, and "a terminal illness/injury of a family member" – representing anticipatory grief preceding death of a loved one. Both of these indicators were ranked higher or, more serious for Chamorros when compared with the mainland Family Crisis Scale ranking.

Kane and Garrido (2007) surveyed 200 "at risk" adolescents at an alternative middle and high school on the island of Guam. This "at risk" group had displayed a pattern of oppositional and/or conduct disordered behaviors in the past year which resulted in their referral to this alternative program.

Their study was the first attempt to replicate Rheingold's (2004) study in this region of the world and provided data in response to her research questions which included the following:

- What percentage of adolescents experienced the death of family member in the previous year?
- What percentage of adolescents experienced the death of a friend in the previous year?
- What percentage of adolescents reported both family and friend deaths in previous year?

They likewise added Rheingold's recommendations to glean an understanding of the "closeness" of the lost relationship and whether the loss was sudden or expected. Their results indicated that overall, the "at risk" adolescents experiences of loss on Guam exceeded the mainland adolescent's experience of loss, with Guam females demonstrating higher levels of stress in response to the death of a friend when compared to their male peers.

Following up on these results Garrido and Kane (2008) likewise went ahead to promote a death curriculum for "at risk" adolescents in alternative settings and prompted the suggestion that the notion of embedded sorrow be considered and included in the composition of variables to account for the development of oppositional and conduct disorders for adolescents in this region.

The construct of embedded sorrow was furthered developed by Kane (2009) in an paper entitled "Mariana's Lament" to portray disruptions in the Chamorro family structure in the past 60 years to argue that oppositional/conduct patterns be viewed as short term developmental occurrences with questionable reliability in predicting later adult antisocial behavioral patterns. In this paper unique Chamorro structures of the family and culture to include the elevation of the female in the Catholic context and matrilineal lines of honor and respect are portrayed as mitigating factors on the expected progression of conduct to antisocial behaviors for these troubled youths on Guam.

Most recently (2009) Biggin and Kane studied young adults at the University of Guam to examine the pattern of losses they experienced in the previous year. While the patterns of loss were not as elevated as Garrido and Kane's (2006) conflicted sample these university students frequencies of loss still exceed Rheingold's (20004) mainland sample.

Altogether it is becoming clearer that adolescents and young adults on Guam, conflicted or not, are likely to experience elevated patterns of loss in their lives. Another study in progress includes an examination of the efficacy of the frequency of attachment traumas and loss as a sufficient and reliable variable identifying a path leading to conduct and antisocial behaviors.

The following section focuses on the Family Crisis Scale (Kane, 2005) which was used to collect data to compare both conflicted and non-conflicted samples. For the conflicted sample, gender difference was investigated as well as the ranking of the most frequent losses identified by the males and females in the previous year.

THE CURRENT STUDY: ATTACHMENT TRAUMA AND FAMILY CRISIS

1.   The Family Crisis

Scale (FCS) was modeled after the Holmes-Rahe Social Readjustment scale which appeared in the Journal of Psychosomatic Research, (1967). While the Holmes-Rahe scale contains 43 stress generating variables, the (FCS) is comprised of only those stressors that occur within the context of the family and consequently has 9 items. A modified version of the (FCS) is shown below:

The items in the (FCS) are likewise considered attachment traumas because, regardless of their ranking for severity, they all represent an interruption in the quality of the bond or the actual dissolution or loss of the family bond itself.

The FCS was administered to 200 conflicted adolescents at an alternative middle and high school on the island of Guam. and 150 non-conflicted adolescents in the Guam public schools. To determine any significant differences between the conflicted and non-conflicted groups, an independent t-test was used. The table below and the graph that follows it show where the significant differences occurred.

Table 1: Differences between Conflicted and Non-conflicted Samples

No.	Item Description	Mean	t-value	Sig.
1	Family movement	C: 08.30 N: 04.13	4.33	.000*
2	Psychological distress in a family member	C: 25.30 N: 15.84	4.08	.000*
3	Someone in the family left for a while	C: 12.76 N: 09.86	1.91	.057
4	Threat to financial stability	C: 23.97 N: 08.77	6.78	.000*
5a	Threatening illness to immediate family member	C: 17.23 N: 13.07	1.62	.107
5b	Threatening illness to extended family member	C: 25.22 N: 22.53	0.96	.338
6a	Terminal illness / injury to immediate family member	C; 09.12 N: 02.66	3.63	.000*

6b	Terminal illness / injury to extended family member	C: 17.44 N: 08.21	3.84	.000*
7	Threatened dissolution of the family	C: 22.30 N:15.05	2.42	.016**
8a	Separation, divorce, abandonment in the immediate family	C: 15.87 N: 06.90	3.36	.001*
8b	Separation, divorce, abandonment in the extended family	C: 11.76 N: 08.40	1.40	.163
9a	Death in the immediate family	C: 06.83 N: 02.60	2.41	.017**
9b	Death in the extended family	C: 43.93 N: 31.41	3.87	.000*
9c	Death of a friend	C: 14.62 N: 09.37	2.85	.005*

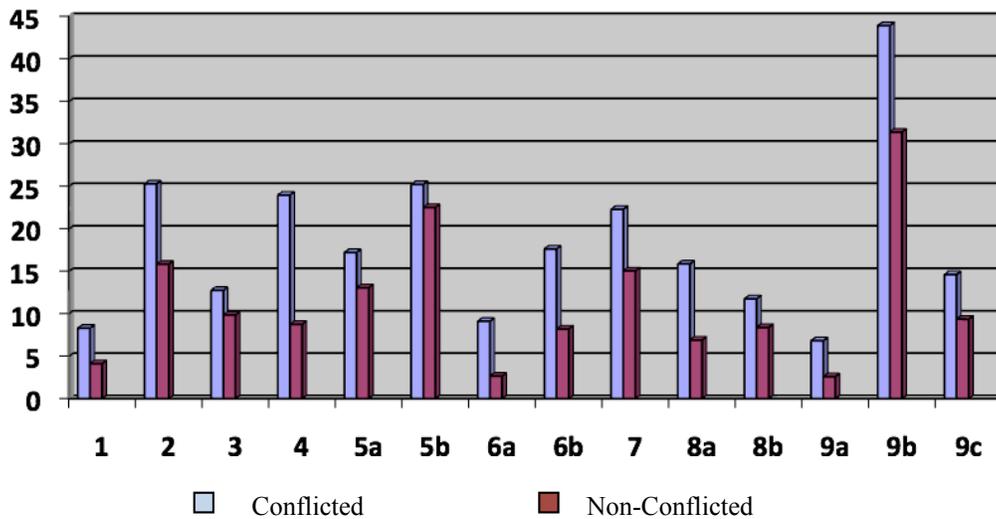
*p<.01   **p<.05


Figure 2: Means of the Conflicted and Non-conflicted Samples

The significant differences between the conflicted and non-conflicted samples are found in items 1, 2, 4, 6a, 6b. 7, 8a, 9a, 9b and 9c. The three items with large differences are item 4 (threat to financial stability) with mean difference of 15.2, 9b (death in the extended family) with a mean difference of 12.52, and item 2 (psychological distress in the family) with mean difference of 9.46.

Since there more incidents of crisis reported by the conflicted group, the study focused on the gender difference in this group. There were 144 males and 56 females representing the following ethnic groups on Guam - 80% Chamorro, 18% Filipino, 1.5% Micronesian and 0.5% other ethnicity. The data collected from these respondents were subjected to an independent t-test to determine significant gender differences. Of the nine items of the FCS, only two obtained significant t values – item 7 and item 8.

Item 7 had a t value of 2.91, p<.005. This significant t value is attributed to the means of male (18.46) and female (33.15). Item 7 refers to the threatened dissolution of the family, such as threats of divorce, separation, abandonment. Item 7 also indicates chronic conflict, sometimes violence and unharmonious atmosphere in the family. The females in this study had more traumatic experiences of threatened family dissolution and consequently more emotionally affected than their male counterpart.

Item 8 obtained a significant t value of 2.48, p<.016. This is due to the large difference in the means of male (12.15) and female (25.50). Item 8 is very much related to item 7. In item 8 a break in relationship occurs due to separation, divorce and abandonment resulting in geographical and emotional distancing of family members. Both item 7 (threatened family dissolution) and item 8 (actual separation of family members) are traumatizing events that may lead to psychological morbidity in the future.

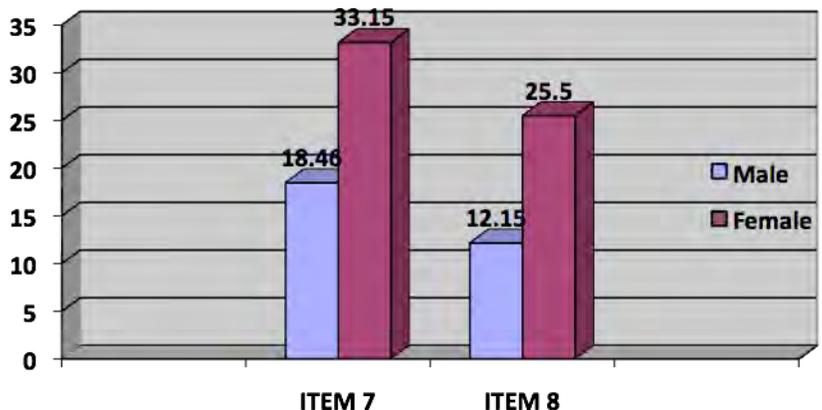
Figure 3 below shows the difference between the conflicted males and females in this study.


Figure 3: Means of Males and Females in the Significant Items

Although males and females in this study differed significantly in items 7 and 8, the most frequent categories of loss experienced in the previous year did not include items 7 and 8. While the categories of loss were the same for both males and females the frequencies of loss were not in the same order. The table that follows shows this.

Table 2: Frequency of Occurrence in the Different Categories of Loss

Gender	1	2	3	4	5a	5b	6a	6b	7	8a	8b	9a	9b	9c
M	62	91	72	83	51	76	23	53	48	28	31	14	107	59
F	23	28	19	72	17	23	11	13	25	17	9	8	36	22

Male	Female
1st – 9b (Death of extended family member)	1st – 4 (Loss of financial stability)
2nd – 2 (Psychological distress)	2nd - 9b (Death of extended family member)
3rd - 4 (Loss of financial stability)	3rd – 2 (Psychological distress)

Both males and females had items 2, 4 and 9b as the most frequently occurring events of loss in their lives. Of these top three items, item 9: Death of a family member (extended family member for 9b) was the most frequent event that happened among the male respondents. This item was second in frequency of occurrence among females. Item 4 for females was the most frequently occurring event. This was third among the males. The item refers to loss of status experienced by the family members which are manifested in such forms as loss of job, demotion, change in socio-economic standing and threat to family well being due to loss of financial stability. Item 2 was second for males and third for females in terms of frequency of losses. In this item, the family member experiences a developmental obstacle, anxiety, depression, identity conflict, developmental issues and psychological stress.

DISCUSSION

The aim of this study has been to measure the exposure of loss and attachment traumas in a sample of adolescent youth from the island of Guam. The participants were predominantly Chamorro. The Chamorro ethnic heritage is comprised of a mixture of Micronesian, Filipino, Hispanic and Asian lines. Rheingold's et al. (2004) study was used as a template to compare cross cultural patterns of family loss and attachment traumas between western adolescents on the mainland, United States with these Pacific Island youths on the island of Guam. The current study also investigated stress and patterns of loss between a conflicted Chamorro group identified as having oppositional and conduct characteristics with a comparable sample of non conflicted Chamorro adolescents showing no evidence of a history of disruptive behaviors.

Overall the exposure of loss and attachment traumas experienced by the Chamorro conflicted group greatly exceeded the prevalence of loss experienced by mainland adolescents in the states. And closer inspection to the patterns of loss, attachment traumas and stress levels of the Chamorro sample revealed that the categories of loss from the Family Crisis Scale that were frequently experienced were identical for conflicted males and females. They included death of an extended family member, change in financial security of one or both parents and one or more family members experiences significant personal problem (worry, anxiety, depression) but not in the same order.

And in keeping with the troubling nature of the conflicted group, when compared with their non-conflicted peers they demonstrated more frequencies of loss and attachment traumas in the previous year. Ten of 14 loss indicators were significant in favor of the conflicted group. Of these 10, three obtained large mean differences. They were family death, financial insecurity and a family member struggles with a personal worry. They were the same loss indicators experienced more often by conflicted males and females. These three losses or attachment traumas represent a) "death" – loss of the relationship and loss of love, b) "financial" – loss of family competency to maintain material security and c) "personal worries of family member" – loss of relationship. Likewise these losses and traumas are beyond the control of the adolescent. There is nothing or very little he/she can do to restore or repair the loss of love and the relationship that death brings, or the livelihood of family prosperity or the resolution of a family member's personal dilemma. These are beyond the adolescent's grasp, his/her means and the level of his/her cognitive capacity to organize a fruitful plan for resolution.

And along with these three key loss indicators in the past year, when these troubled youth are compared with their non conflicted peers on the remaining (FCS) variables, they have likewise experienced significantly higher frequencies of:

    #1 : The family moves
    #6a: Terminal illness / injury immediate family member
    #6b: Terminal illness / injury extended family member
    #7 : Threatened dissolution of the family
    #8a: Separation, divorce, abandonment
    #9a: Death in the immediate family
    #9c: Death of a friend

And, while a comparison with non conflicted adolescents regarding Family Crisis Scale losses revealed significant differences on 10 of 14 loss indicators, female sensitivity to the threat of family dissolution by separation or divorce and/or the direct experience of the dissolution contrasted their over representation when compared to their male "at risk" peers. Suggestions as to why this may be so were summarized by Kane and Garrido (2006):

> "In a study conducted by Petersen and White (1991), results indicated that females are more strongly
> affected than boys in terms of negative family affectivity. For example females reported higher
> levels of stress in response to a divorce between their parents. According to these researchers female
> vulnerability to negative family affectivity might be explained by the fact that:
>
> • "females are raised with a heightened sensitivity to family life" (p.8),
> • "puberty driven emotional changes occur earlier for females and with greater impact when compared to
>   males" (p. 8), and that

- "there is a decline in the affective relationship between females and parents during early adolescence particularly with father" (p. 8) which places them at a higher psychological risk." (p.3)

What is becoming clearer is that conflicted adolescents in this region of the world share a pattern of similar losses and attachment traumas. While loss is the experience of the death of family member, attachment traumas in this study are defined by the seven remaining items on the FCS. All seven of these experiences represent threats of potential family loss to varying degrees until the loss, (FCS) items 6 and 9, is experienced itself.

The compounded effects of attachment traumas vis a vis, the loss of control, loss of the relationship, loss of competency and love all within the family context are viewed as a another complicating overlay of debilitating stressors on an already considerably compromised adolescent.

Altogether and in conclusion this study has attempted to demonstrate the connection between family loss and the development of oppositional and conduct disorders and in so doing has begun to shed light on Rheingold's (2004) query into the impact loss may have on adolescent development.

Enhancing the first-year student learning experience through quality improvement of courses

Dr Sheila Scutter,

School of Health Sciences, University of South Australia

Abstract

The importance of the first-year experience has gained considerable attention in recent years in light of the growing evidence from studies in Australia and overseas showing a link between student engagement and retention. This research, combined with evidence of increasing student disengagement and a high level of attrition during the first-year, highlights the need for a planned and integrated approach to the design of the first-year curriculum. Such an approach provides for transition to university study, acknowledges the diversity of the first-year cohort and makes no assumptions about the "digital literacy" of the students. Despite significant research in this area however, there remains a recognised need for an integrated approach to course development and strategies for improving the quality of courses designed to enhance the first-year learning experience. This paper describes an Australian Learning and Teaching Council funded project involving the development of an online tool that provides a comprehensive approach to peer review and supports academics in the development of first-year curriculum materials. The web-based peer review system harnesses the collective wisdom of academics through communal processes involving reflective practice and the sharing of resources and exemplars. In exposing their work to such scholarly appraisal academics can also have their work affirmed and use this as evidence when seeking promotion or teaching awards.

Analyzing the International Students' Attitudes toward Online Learning

Chin-Wen Chang [1], Che-Hao Liu [2]

[1] Assistant Professor in the National Normal University, Taipei, Taiwan.

National Normal University, 162, He-ping East Road, Section 1, Taipei 10610, Taiwan,

Tel: +886935443568; email: cwc1104@hotmail.com

[2] The Legislative Yuan, Taiwan, Republic of China

Abstract

The purpose of this study was to identify international students' attitudes toward online learning at the university. The sample population consisted of international students who had enrolled in at least one online course in Spring and Summer 2008 semesters at the university. In this study, the research questions addressed various subjects, and a questionnaire was used as a survey instrument to collect data from international students at the university. The researcher designed the instrument, which comprised two parts. Part I gauged students' attitudes toward online learning while Part II was related to students' demographic status. Five research questions will guide the study's objective: Does the demographic status of international students affect their participation in online courses? Do online courses satisfy international students' expectations? Do international students experience difficulties in understanding the information in online courses? Why do international students enroll in online courses? Do online courses fulfill international students' academic needs? The data revealed that there were significant relationships among students' reported attitudes and demographic variables which were gender, nationality, college, and age. Based on the results, the university has somewhat satisfied the international students who enrolled in online courses. However, while most of the international students reported neutral or negative opinions about the question item of whether or not they have enough options for online course enrollment, there is definitely room for improvement in the number and types of courses available. Future research should consider international students who did not enroll in online courses. Their general perception of or attitudes toward online instruction and why they did not enroll in online courses should be evaluated. In addition, the international students' residential status could be part of demographic variable as well.

**The Effects of Online Instruction by Co-operative Learning Activities on
Case Study of Law and Ethics in Information Technology Lessons**

Dr. Surapon Boonlue, Assoc.Prof. Jariya Neanchaleay, Mr. Danai Damaau
Educational Communications and Technology
Faculty of Industrial Education and Technology
King Mongkut's University of Technology Thonburi
Bangkok Thailand

Abstract

This research aimed to construct and find the efficiency of online instruction with cooperative learning on internet network by comparing the effectiveness between pre-test and post-test online instruction cooperative learning. Also studied for students' satisfaction by using cooperative learning. The sample groups were composed of 3 universities students as follows; First group was 43 bachelor degree students (3rd year students) from King Mongkut's University of Technology Thonburi.   The secondth group was 44 (1st year students) from Naraesuan University and the third group was 25 (1st year students) from Silpakorn University. The total numbers were 112 students. These groups were divided into 14 sub groups and each group was composed of 8 students; 3 persons from King Mongkut's University of Technology Thonburi, 3 persons from Naraesuan University and 2 persons from Silpakorn University, respectively. The result of research showed that the efficiency of online instruction package got the value of E_1/E_2 equal to 80.22/84.22. The achievement by using pre-test and post-test from the activities of studying online instruction cooperative learning were found the statistical significance of 0.01. The sampling groups online instruction satisfaction with cooperative learning were rather at a high level.

Keywords : Cooperative Learning / Online Instruction / Law and Ethics In Information Technology Lessons

Background and Research Significance

In everyday life of each individual, new knowledge is the product of transferring old knowledge for the most part because no learning in our life is purely new. It must be based on more or less previous materials. According to the principles in education, instruction, curriculum and learning experiences in educational institutes, the curriculum developers and instructors hope that the learners can apply such knowledge in their daily life.

At present, the instruction is not suitable enough for learning and transferring old knowledge. The traditional approach for instruction is still based on the instructor at the center. Learners have only little roles in learning. Some learners neither understand nor have enough courage to ask the instructors or friends. This results in no motivation in learning. Therefore, a new instructional approach is needed so that learners can learn and meet all learning objectives of the course. The approach in which learners can express their opinions and have participation in learning activities in classroom is called Co-operative Learning.

Co-operative learning is a way that encourages students to learn in a co-operative manner. There will be activities which focus on the relationship among the group members according to the role of each student in such group. The characteristics of the co-operative learning are that all learners in a group will understand such topic equally and they will help one another to learn, to do assignments and finish them in time. The learners depend on one another in a positive way. That is to say, all learners realize that the success of an individual depends on the success of another in the group. Therefore, everybody must help, support and encourage one another. They will learn the skills to live in groups and do according to their responsibilities and roles. They can analyze the work done by group and improve the work to gain more effectiveness. The instructional approach which can be applied to achieve co-operative learning is problem-based learning [1].

The researchers recognized the importance of "Laws and Related Ethical Conducts about Information Technology" which played many important roles such as in education. The development of any media and any

instructional media must be based on ethical conducts during work and social ethics. This is to meet the demands of the enterprises where they need graduates who can design and create works in creative and lawful manners.

According to the principles and reasons cited above, the researchers decided to study and develop co-operative learning through internet network: a case study of laws and related ethical conducts about information technology. This was a co-operative learning through internet network where learners were not in the same place. This research was a joint project from 3 institutes as follow: (a) The Department of Educational Communications and Technology, Faculty of Industrial Education and Technology, King Mongkut's University of Technology Thonburi, (b) The Department of Educational Technology and Communications, Faculty of Education, Naresuan University, (c) the Department of Educational Technology, Faculty of Education, Silpakorn University.

Research Objectives
1. To develop and find out the quality of the co-operative lesson through internet network: a case study of laws and related ethical conducts about information technology
2. To find out the effectiveness of the co-operative lesson through internet network: a case study of laws and related ethical conducts about information technology
3. To study the learning achievement of learners who learn the co-operative lesson through internet network: a case study of laws and related ethical conducts about information technology
4. To study the learners' satisfaction towards the co-operative lesson through internet network: a case study of laws and related ethical conducts about information technology.

Population and Sampling Group
The population in this research consisted of all undergraduates from 3 institutes (the Department of Educational Technology and Communications) which participated in this project. There were 43 third year students in the first semester of the academic year 2008 from King Mongkut's University of Technology Thonburi, 44 first year students in the first semester of the academic year 2008 from Naresuan University, 25 first year students in the first semester of the academic year 2008. The total population was 112 persons.

Research Methodology
The research methodology to find out the quality and the effectiveness of the lesson, the learning achievement of the learners and the learners' satisfaction towards the co-operative lesson through internet network: a case study of laws and related ethical conducts about information technology was done with the whole population. The students were divided into groups of 8 students. In each group there were 3 students from King Mongkut's University of Technology Thonburi, 3 students from Naresuan University and 2 students from Silpakorn University. There were 14 groups of 8 students. The research steps were as follow:

1. Instructors from 3 universities contacted one another to meet and do the activities on the designated time.

2. The researchers introduced the developed learning management system to the sampling group so that they understood how to use the developed learning management correctly. The learning method was clearly defined to the sampling group so that they learned in the planned order.

3. After introducing the basic direction, the researchers let the sampling group register and apply online to log in the learning management system through internet network entitled "Laws and Related Ethical Conducts about Information Technology".

4. Pre-test was done by the sampling group of 112 persons. The test was in a choice format. The score from this pre-test would be used to find out the learning achievement of the learners.

5. The sampling group studied the lesson through internet network entitled "Laws and Related Ethical Conducts about Information Technology"

6. After the sampling group had studied in the planned order, the researchers let the sampling group do the post-test to find out the learning achievement of the learners.

7. After the sampling group had done the post-test, the researchers let them fill in the questionnaire on the learners' satisfaction towards the co-operative lesson through internet network: a case study of laws and related ethical conducts about information technology.

Research Results

According to the research results from the development of the co-operative lesson through internet network: a case study of laws and related ethical conducts about information technology, it could be concluded as follows:

KMUTT   Silpakorn University   Naraesuan University

Screenshots of the Online Lesson
        The quality of the co-operative lesson through internet network: a case study of laws and related ethical conducts about information technology as evaluated by experts in multimedia quality was highly suitable on average (EMBED Equation.3 =4.30, SD = 0.45) and the quality as evaluated by experts in contents was, in accordance with IOC, 0.89 on average.

Items	Number of students	Total Score	Scores Obtained	Effectiveness
Sum of test scores during learning from Part 1-3 (E_1)	30	30	722	80.22
Posttest score (E_2)	30	30	758	84.22

The effectiveness of the co-operative lesson through internet network: a case study of laws and related ethical conducts about information technology was 80.22/84.22, higher than the criteria set at 80/80.

Score	N	EMBED Equation.3	S.D.	**EMBED Equation.3**	**EMBED Equation.3**
Pretest	112	12.91	3.15	24.41**	0.000
Posttest	112	23.76	4.45		

**$p<.01$

As for the learning achievement of learners, it was found that the learning achievement of learners who learned the co-operative lesson through internet network: a case study of laws and related ethical conducts about information technology after learning was higher than the one before learning at the level of statistical significance of 0.01.

Items	Mean	S.D.	*Meaning*
Learning Management	3.81	0.41	High
Media inside the website to be used in instructional activities	3.77	0.42	High
Benefits from learning the co-operative lesson through internet network	4.02	0.47	High
Total Mean	3.84	0.68	High

The learners' satisfaction towards the co-operative lesson through internet network: a case study of laws and related ethical conducts about information technology was highly satisfied or 3.84 on average.

Research Discussions

The development of the co-operative lesson through internet network: a case study of laws and related ethical conducts about information technology shows that the quality of the lesson passed the hypothesis in that it was not less than the criteria set at 80/80. The learning achievement after learning was higher than the one before learning at the level of statistical significance of 0.01. The learners' satisfaction towards the co-operative lesson through internet network was at high level. This means that the developed lesson was of quality and could increase learning achievement.

According to the research results, the development of the co-operative lesson through internet network entitled "A Case Study of Laws and Related Ethical Conducts about Information Technology" shows that it passed the hypothesis criteria. This complies with the research by Seksun Saisisod [2] who studied the effectiveness of the internet-based instruction for Rajabhat University. It was found that the effectiveness of webpage lesson through internet on information technology for management (E_1/E_2) was 84.44/82, higher than the criteria set at 80/80. The learning achievement of learners after learning the lesson through webpage was higher than the one before learning at the level of statistical significance of 0.05.

According to the learning achievement of learners after learning the co-operative lesson through internet network: a case study of laws and related ethical conducts about information technology, the learning achievement of learners after learning was higher than the one before learning at the level of statistical significance of 0.01 because learners learned the co-operative lesson which was multimedia. There were texts, still images, animations for presentation and learning activities for cooperation. The learners could meet new friends and have fun. They were excited because new friends from other institutes came to participate in the instruction. There was collaboration in terms of sharing opinions. Each learner participated in sharing viewpoints and making decisions. The learners, therefore, understood the contents from the group. When the test was done individually, the learning achievement was higher. This was in accordance with the research by Suangsuda Parnsakul [3] who conducted the presentation of learning through creative problem solving inside organization on internet network. The objective was to study the learning forms used in co-operative learning which encouraged the personnel to use creative problem solving skills, create the creative learning forms used in co-operative learning in organization on internet network. The research results revealed that there were 5 steps for creative problem solving skills as follow: searching the truth, searching the problems, searching the ideas, searching the answers and searching the acceptable answers. The experiment results revealed that the sampling group had higher learning achievement for creative problem solving process after learning than the one before learning at the level of statistical significance of 0.05.

The learners' satisfaction towards the co-operative lesson through internet network: a case study of laws and related ethical conducts about information technology was at high level. The researchers used online lesson and co-operative learning to develop the online lesson, resulting in learners being satisfied with the lesson. They were satisfied

with the benefits derived from the co-operative learning through internet network the most because the lesson was interesting and it allowed learners to share opinions and help one another. Therefore, the learners were satisfied. Another related research work was by Jarunee Maneekul [4] who conducted the application of online lesson to support the skills in information technology and communications of graduate students in the field of Teaching English, Faculty of Education, Chiang Mai University. The results revealed that the students who learned the online lesson through internet were highly satisfied with the instruction through internet network.

Abstract

This paper described a system developed under mobile network, which aimed to facilitate the effectiveness and efficiency in situated learning from both student and teacher aspects. Experiments were carried out to determine how the system can be successfully applied in education. Surveys and feedback were collected from the subjects, while analysis showed the importance in motivating students, lightening teachers' loading in managing and sharing both during and after activity. Further feature enhancements were also evaluated.

Keywords: mobile learning, excursion, situated learning, secondary education

Introduction

Topics of technology-assisted learning have been studied by a number of initiatives worldwide. Governments in Asian region also supported technological teaching by proposing official policies, for instance, Hong Kong government started to encourage information technology (IT) in education from 1998 (Education Bureau,1998) and China planned to generalize IT instruction between five to ten years from 2001 (CERN, 2002). The rapid growth and increasing penetration of mobile technology and hi-speed network (CNNIC, 2009; OFTA, 2009) also enabled the enthusiasm of studies in mobile instruction and learning.

Studies on mobile learning advantages (Cortez et al., 2004; Grasso & Roselli, 2005) and shortcomings (Wang & Higgins, 2005) were discussed for years. Supporters proposed theoretical approaches (Frohberg et al., 2009; Lai et al., 2005) and experimental case-studies on how teaching effectiveness and efficiency could be enhanced by mobile technology. Mobile learning in situated learning (Holzinger et al., 2005; Lai et al., 2005; Tan & Liu, 2004) was one of the common topics since the activity-based learning, including out-door learning experiences, fit well with the characteristic of mobile technology.

Most of the systems proposed or implemented focus on building up networked depositories for learning materials (Liu et al., 2003; Milrad et al., 2005; Mitchell & Race, 2005), or interfaces for quizzes or exercises (Houser & Thornton, 2005; Jung, 2005). Evaluations of those studies always concentrated on students' learning (Lai et al., 2005; Tan & Liu, 2004), but the instruction enhancement and teachers' aptitude to the mobile technology were seldom discussed. Other side-development criteria should also be considered, such as the issues of functional integration into the existing teaching system, usability,

compatibility and computational power of various mobile devices, and even the coverage of wireless network in the desired deployment region.

Situated learning weighted on the participation in "authentic activity", followed with coaching and scaffolding from teachers, to let students learn through experiencing (Shen, 2008). Studies could be found under the area of evaluating learning effectiveness by mobile technology in experiential or situated learning process (Lai et al., 2005; Tan & Liu, 2004). Teachers' aptitude towards mobile technology was also discussed by Chao (2005) in a survey evaluation.

This paper described a prototype system, which was developing under the MObile Online COmmunity - Portable Learning Utility Solution (MOOCO-PLUS). MOOCO-PLUS was an applied research project developed and collaborated between the university and industrial entities. This system aimed to integrate past experiences in mobile learning with increased flexibility and applicability to fit the requirements of both teacher and student in instruction and learning.

This paper evaluated how the system favored both student and teacher by an experiment, and determined criteria for successful and globally applicable solution for mobile learning. Future development and feature enhancements were also discussed.

MOOCO-PLUS Platform

Traditional field-trip required students to carry stationery like paper and pencil, while digital camera and video recorder were becoming more important in the activities to record the data in multimedia format. When handling those various kinds of tools, students were easily distracted from the main learning purpose.

The advancing of computer technology allows teachers nowadays to prepare their learning materials and exercises much more easily. However, they still needed to design the layout of material, print the hard copies and distribute the copies to students manually. If teachers wanted to avoid plagiarism, they even had to prepare a few versions of exercise. Different from traditional classroom teaching, teachers also needed to give much more non-teaching efforts in out-door activities, such as managing students under the field environment, safety consideration and handling the logistics. As a result, they always seek for tools in order to lighten their instructional loading during the activities.

Furthermore, as coaching and assistance from teacher were important during the authentic activity, instant monitoring and communication were preferred, while in remote area, keeping in contact with every student and tracking their learning progress were difficult.

After activities, teachers might wish to discuss with students as soon as possible to consolidate, evaluate and share what they had learnt. However, time consumption in data collection and coordination resulted in discussion delayed for days or weeks.

MOOCO-PLUS prototype system considered the above problems to provide a solution that facilitates both teaching and learning by integrating multimedia functions in mobile phone to replace traditional stationery, simplifying the preparation of instructional materials, allowing central monitoring and communication with students, and automating the tedious data summarization process.

The basic components of the MOOCO-PLUS system were demonstrated in Figure 1.

Figure 1: Basic components and setup of
MOOCO-PLUS platform

Students' mobile clients and teachers' laptop were connected to the mobile wireless router to access the web server through 2.5G, 3G or Wi-Fi. If the system aimed to deploy in developed regions where the coverage of hi-speed network was comprehensive and the cost of connection is affordable, users could directly connect their mobile devices to server through wireless channel.

Students used the mobile phones, having the mobile client programme (written in J2ME) installed, to receive, record and upload data in different formats (Figure 2), while teachers could create assignment, generate report, send instant message and monitor students' status through a web interface (Figure 3). Moreover, to avoid plagiarism, the system allowed teachers to build up a question bank for each assignment, and randomly assigned a specific number of questions to student.

(c) Receiving instant message

Figure 3: Web interface of MOOCO-PLUS

Case-study

The case-study was carried out in April of 2009 on a field-study. The activity, consisting of a group of fifteen secondary school students, aimed to look at the residential pollution on river. Teachers set out several open- and closed-ended questions on the web server aiming to remind students keeping their eyes open to the key issues of investigation. Introduction of using MOOCO-PLUS mobile client programme was given to students prior to the field trip. The client programme was installed in each of the sample smart phones running Windows Mobile Professional 6.1 with touch-screen and without keypad. The smart phones replaced traditional stationery and digital camera to record all key observations according to the guidance downloaded from the web-server (Figure 4). Submissions from students were collected and the summary report was automatically generated for discussion on the same day (Figure 5).

Figure 4: Recording the observations
according to teacher guidance

Figure 5: Discussion after the activity

The subject group of fifteen students consisted of nine boys and six girls aging from twelve to fourteen led by one teacher. Two sets of survey were distributed to students and teacher looking for their responses on the effect of mobile technology on learning and instruction respectively. Nearly all students showed their positive attitude in mobile-assisted learning, in which most of them thought the mobile application could increase their learning interest and effectiveness, and they were expecting for higher involvement of mobile technology in future. Throughout the whole activity, students agreed that MOOCO-PLUS assisted in providing a more convenient and multimedia-rich manner to handle the information than the traditional way. However, they also expressed that the performance of the programme was below their expectation and they needed to wait for response after clicked a button. In the future, they expected that the programme could improve its performance and new functions supporting audio and video recording could be added.

From the instruction aspect, the teacher appreciated the instant interaction between teacher and students, which helped to notice the students who were falling behind and the instant response helped to monitor the learning progress and encourage critical thinking of students. Moreover, the teacher emphasized that familiarity in mobile phone operation of youngsters could stimulate the initiation of learning if using the phone as a learning tool. The new tool also encouraged students, who did not have good presentation skill, to participate the learning activities as they only need to write short sentences or record data in multimedia format. The confidence of students in learning could thus be improved and their observational skill could also be increased. However, the teacher also pointed out that the other built-in features on mobile phone might distract them to other entertainment functions, which might affect the learning process. He suggested that the developer could block the entertainment functions on the phone during the learning activities. While considering the efficiency of delivering

instruction, the teacher thought that the instant response and report generation were essential along with the original data collection method. At the same time, data and results could be shared among different groups of student, which encouraged discussion and peer-review. Last but not least, the teacher showed positive attitude to further involvement of the system in future learning activities, and hoped the prototype system could enhance by allowing the questions to be import from text file like WORD document in order to facilitate their preparation process while moving towards the application of mobile technology.

Results and Discussion

The main purpose of an education tool is to enhance learning effectiveness, while technological product is further expected to increase the efficiency in manipulating the instruction and motivating the learning interest of students.

Ritchie and Hoffman (1996) proposed instruction of learning should be a purposeful interaction to increase learner's knowledge or skills in a specific, pre-determined fashion. Thus, the interactions between user-to-machine and user-to-user together with a clear learning objective were important for every mobile learning tool development.

On the other hand, a good teaching-assisting tool, especially for mobile technology, needed to have its unique value (Soloways et al., 2001). For instance, it was not supposed to use the mobile phone in classroom for dropping note or doing quiz while using paper and pencil instead was more convenient.

Deployment of service was another problem where availability and the cost of wireless connection varied in regions. In the developed regions like Korea, Japan and Hong Kong, 3G wireless network was easily accessible and the cost of connection was relatively low, while the same technology was just announced in China.

Teachers' technical knowledge and their willingness to adopt mobile technology were also the major elements for popularize the mobile learning, while their attitude depends on the ease of use and the effect of tool on their workload and instruction process.

MOOCO-PLUS provided platform interface in simple and user-friendly fashion to increase students' learning interest. The platform also valued the interaction between teacher and student by equipped with instant messaging service. In order to provide a more convenient and effective learning atmosphere to students, the system turned mobile phone into an integrated tool to replace pencil, paper and other digital recording devices. To deal with the deployment difficulty where hi-speed wireless network was not available in remote area like those in China, the system allowed user to set a portable server in a laptop while using device of mobile wireless router to setup a local area network (LAN) and build up communication channels with the mobile clients.

From users' feedback, students showed their interest and positive attitude to the system as it increased their learning interest. Teachers also expressed their willingness to use the system in the future as it helped to automate and simplify the instruction preparation process. They also appreciated the data collection function that favored the post-activity session with the students.

Conclusions and Improvements

This paper proposed a case study using a prototype system of MOOCO-PLUS platform for teaching under situated learning environment. The overall feedback was enthusiastic, in which both teachers and students validated the value of the platform. Students thought that the system helped to improve the

learning effectiveness and increased their learning interest, while teachers felt that the system was easy to pick up with high applicability and really helped to lighten their workload and enhanced their instruction efficiency, especially for post-activity discussion session. The paper also discussed the criteria and necessary considerations for deploying a mobile learning system successfully.

As the prototype system was still under development, the performance was not optimized and some functions were not available yet, such as audio and video transmission, and question importation from text file. In the future, the platform will conduct more tests with local schools and collect user requirements for function and performance improvement. Evaluation on learning effectiveness of mobile instruction and learning under different types of activity will also be conducted.

ABSTRACT

A large quantity of interactive courseware has been developed in Malaysia, but a recent review has found that its uptake has been limited due to some reasons. In particular, the interface design quality was claimed as one of the key reason for this lack which is not appropriately designed in terms of quality of learning experiences. With this issue in mind, this research study reviews the current interactive courseware development process by defining a quality of interface design in order to enhance the learning experiences through a contextual document analysis and face to face in-depth interviews. This preliminary analysis revealed outcomes with some general misconceptions and the challenges faces by the developers apparently in relation to the current development process of interface design in Malaysia. These outcomes are expected will contribute to the improvement of interface design quality and courseware development, appropriately can enhance the interactive learning experience.

KEYWORDS: Interface design, Courseware development, Learning experiences

INTRODUCTION

Throughout the past two decades, Information and Communication Technology (ICT) and multimedia-based learning have come to play an important role in classrooms. It is widely accepted that computer software and the internet have great potential for making the teaching and learning process more assessable, fun and interesting (Segers, 2002; Gauss & Urbas, 2003). Therefore, computers and interactive educational products are being used worldwide in educational institutions to motivate students to learn meaningfully and encourage them to be active participants in the learning process.

As researchers worldwide have become increasingly aware of the impact of interactive courseware on learning experiences, there has been ongoing debate about its effectiveness in improving the quality of learning in primary education (for example Baharuddin et al., 2006; Fresen, 2005; Wagner & Kozma, 2005; Cantoni, Cellario & Porta, 2004; CHEA, 2002; Meyer, 2002; Clark, 2001). These researchers

have found that a broad range of factors, from availability and accessibility of the technology to the quality of the interface and interaction design in interactive courseware, affect the quality of learning experiences. In particular, it has been reported that poor interface design performance and lack of interactivity can diminish learning experiences (Rhee, Moon, & Choe, 2006).

In Malaysia, the Ministry of Education has adopted multimedia-based learning for an education reformation entitled *Smart School Project*. Since 1998, this pilot project has set out to improve Malaysian Primary and Secondary students' learning attitudes and achievements and to enhance teachers' performance by the end of 2020 (MOE, 2006). As a result of the project, thousand interactive coursewares has been developed in key learning domains, such as Bahasa Melayu (Malay language), Mathematics, Science and English, and distributed across numerous Malaysian schools.

Accordingly, the implementation of the interactive courseware provided was evaluated in various aspects by the Malaysian government from 2003 to 2008, such as looking on student performances and teachers preferences towards the courseware and the availability of the courseware itself. However, up to the recent report of this evaluation and researchers' reviews, the courseware provided has not been effectively used in schools and was under-utilised by teachers and students (MOE, 2008; MDC, 2007) due to several factors contributed.

For that reason, it was pointed out that much of this interactive courseware has been developed without deeply considering the various of interactions between students and the courseware, between students and teachers, and between students and students and there are a vital issues regarding the quality of interface design (MOE, 2006; MOE, 2006b; MOE, 2004; Puteh, 2004; Norhayati & Siew, 2004). In fact, most of them further claimed that lack of courseware uptake has resulted including the fact that the presentation forms of the courseware content are also problematic in terms of encouraging students to use them and this courseware also lacks interactive features in terms of multimedia presentations. This fact also has contributed to the students' poor attention status (Rohana, 2006; Baharuddin et all, 2006).

RESEARCH PROBLEM

Interactive courseware should motivate students to learn and encourage them to participate actively. Towards the goal, interface design should facilitate user's interaction and enhance user's experiences and thus will contribute to quality learning and teaching. However, as discussed above, it has been reported that much of the interactive courseware of the *Smart School Project* in Malaysia fails to achieve quality learning experiences for students and teachers during the execution stage. One of the key reasons is relating to the impoverishment of interface design which does not properly accommodate students' and teachers' needs and their interactions with the functions (MOE, 2008; MDC, 2007; Kamariah, 2006).

As such, from the preliminary review, most of the interface design within these interactive courseware's are designed exclusively by the developer appointed by the government and assume can

be used effectively by all students, but it was shown that often the developers are not realized the courseware's that have been developed by them are inaccessible by the end users. Within this context, this research is presuming that there is some disintegrate in the current development process of an effective interface design happened between the developer and the end-users involved (teachers and students) in order to produce an effective interface design that can accommodate the end user need and facilitating the quality learning experience.

Thus, focusing on the interface design of the existing Malaysian interactive courseware in the *Smart School Project*, this research will investigating and assessing how actually this interface design of the existing Malaysian interactive courseware for *Smart School Project* has been developed by the current developers and to what extend the Malaysian developers understand the important of interface design in the courseware development process. 2 guiding research questions have been identified in this investigation. The study will undertake to explore the questions:

(1)   What are the common developments processes of interface designs that have been endorsed by the Malaysian Ministry of Education and have been implemented by the developers in the current development of interactive courseware for *Smart School Project*?

(2)   What are the relationships between the main stakeholders: government, developers, teachers and students, in designing and producing the interface design of the existing interactive science courseware of the *Smart School Project?*

METHODOLOGY

A principal goal of this study is to examine the current development process of the existing interactive courseware of the Malaysian *Smart School Project* .In order to gain an understanding on how the existing Malaysian *Smart School* interactive courseware had been developed and how the developers really developed the interface design of the existing courseware, a formal contextual analysis and a face to face interviews had been conducted.

A field visits to the Ministry of Education had been conducted by gathering of existing government guidelines and others government report documents that related to this study. The guidelines that have been provided to developers by the Malaysian Ministry of Education and others document then were reviewed and analyzed.

Face to face interviews had been conducted with the selected courseware developers those involved with the development of the current existing Malaysian *Smart School* interactive courseware. 20 developers of interactive courseware were approached by phone and email in early April 2009 from Australia. The information letters and consent forms then were emailed to them in order to get their agreement. After a week, only 10 developers agreed to be research participants. A fieldwork in Kuala Lumpur, Malaysia was then carried out in May 2009 at developers' offices.

In this research study, face-to-face interviews have been conducted through open-ended questions and the use of standardized procedures, so that every participant will be asked the same questions in the same way. The interview focused on:

1. The involvement of the developers in the development of the interactive courseware
2. The development process of the existing interactive courseware

All of these face-to-face interviews were recorded by a digital video recorder with permission of the interviewees. Following this, all the interviews' audio data had been transcribed and analysed.

PRELIMENARY FINDINGS

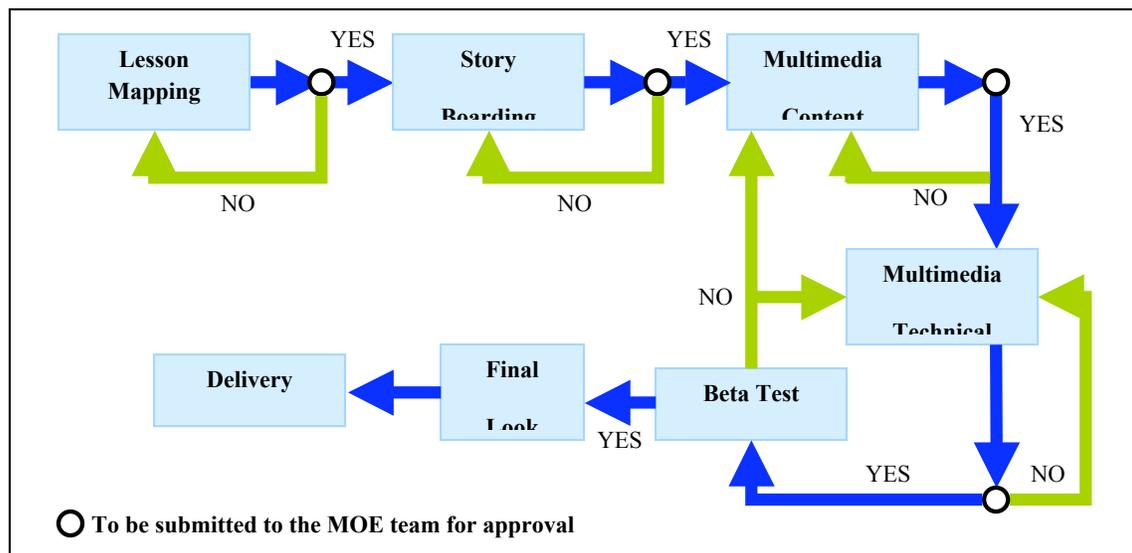
Based on the data gathered from contextual analysis and ten different developers that were interviewed, to date, the preliminary analysis has been revealed some interesting outcomes. Firstly, this preliminary analysis verified that the Malaysian Ministry of Education are provided a comprehensive flow-chart of the development processes in the guidelines that must be followed by each developers. Fig. 1 shows this process, which begins with the development of lesson mapping, followed by the development of a storyboard, then preparation of multimedia content and multimedia technical area. Then, potential courseware will go through beta testing in order to achieve the final look of the product, ready to deliver and be implemented by the school. Most of these stages however must get an approval from the Malaysian Ministry of Education team.


Fig. 1: Production Flow of Malaysian interactive courseware

Secondly, the preliminary analysis of the face to face interviews also shown that the current development process implemented by the developers is very similar to the generic classic waterfall model of educational courseware development that recognized in the international literature and shown in Fig. 2 below.

1

REQUIREMENT AND PLANNING

Understand scope of work to be done, the cost, schedule and tasks to be accomplished

2

ANALYSIS

Define the target user and determine an appropriate medium delivery

3

DESIGN

Storyboarding, Prototype and Media creation

4

DEVELOPMENT

Authoring and integrating of media element into a whole package and alpha testing

Perfection of the courseware

5

EVALUATION

Getting Content Approval from government

6

DELIVERY AND FEEDBACK

Final product implementation and installation

Fig. 2: The common development process implemented currently by the developers in Malaysia

From figure 2, it revealed that most of the developers (production team) begin their development process by undertaking detailed and careful planning. According to most of them, the planning phase includes:

1. Details of a development work schedule,
2. Tasks to be accomplished by the development teams and
3. Scope of work to be done by the team

During this planning stage also, commonly, the project manager will considers some factors such as the capability of the team, the budget constraints and completing the task within the time given. After completing careful logistical planning, development continues with the analysis phase.

Relating to the analysis phases, according to the Galitz (2002), there are 2 types of analysis should be conducted before the design process begins: a user needs analysis and a requirement analysis. However, in Malaysia, based on the data gathered, most of the project managers mentioned that their development teams only conduct a comprehensive requirement analysis of the tender document and standard guidelines from the Ministry. The analysis is just focusing on the specific media requirements

and instructional specifications identified in the Ministry's guidelines. Therefore they frequently will gather most of the relevant information from the existing printed textbooks and other relevant sources in order to achieve the requirements of these specifications.

The developers also were asked some questions relating to interface design requirements to ascertain whether their requirement and analysis phase provided a deep understanding of the user. In response to this question, it became clear that not one of the developers conducted a user need analysis before beginning the design process. As one of the project managers stated,

"If you conduct a needs analysis with the users, it will take more time. It is not easy to get permission from the school principal to enter their school. It will involve more additional work and will take you several months to get permission even though they are in the same ministry. Therefore, our concern is more to complete the process of the courseware development as early as we can, so that we can move on to another project." (Developer 3)

Another project manager also raised time constraints in response to a question about a user needs analysis,

"So far, we haven't yet conducted a user needs analysis with the students. This is because we are familiar with the Ministry project. We also don't have time to concentrate on that because we are not only taking a job from the government. At the same time we also have to complete other jobs." (Developer 1)

Another project manager argued that it was unnecessary, stating that:

"We are the developers of interactive courseware so we should know the basic requirements of the courseware. So I don't think we need to do user needs analysis". (Developer 2)

From this it was shown clearly that the current developers are not devoting enough thought to the importance of a user needs analysis in their development process. Surely, the users are the reason for producing an interactive product and so should be part of the development process (Shneiderman, 1998). However, the developers appear more interested in efficiencies. This can be read as the pursuit of making profits rather than providing good quality of courseware.

However, limitations on the time given were also been identified as a problem. One participant responded:

"According to the contract given, the period of time to complete the courseware is one year. But then, if you can see, it is not a one year project. In actual conditions we just have only 8 to 9 months to finish the project. So, we have to speed up." (Developer 3)

Another response that verifies the pressures of the limited time given, is,

"Some of the tasks we need to outsource if our team is otherwise occupied. The reason is we need to complete the MOE project commonly within 8 to 9 months. Frequently we will outsource the most complicated tasks that take a longer time to finish." (Developer 1)

The developer respondents also reported that they only conducted product testing within their own production team. This testing is performed to make sure that the interactive courseware has been developed according to the specifications and that it meets the requirements acknowledged in the tender document. They also said that this testing is primarily to perfect the functionality of the interactive courseware and also to identify the bugs. As stated by one of the project managers,

"When the lesson is completely designed, in house testing will be conducted by a team leader from different departments. Usually during this process we will make sure that all the functions are working properly. For example, if the voice said "this is a ball" the arrow must be pointed to the ball not other things."

(Developer 1)

This was supported by another response:

"We conduct product testing but only among our team in order to determine the weak points of the courseware and we shall modify it before sending it to the Ministry. Generally, this testing is more focused on evaluation of the courseware functionality." (Developer 3)

This preliminary analysis confirmed that the current practices of developers for the interactive courseware of the *Smart School Project* closely follows the production flow that is recommended by the Malaysian Ministry of Education in the guidelines. However, when discussing the problems faced in the overall process of development, most developers highly agreed that they are having some difficulties with this current production flow due to the oversight of the ministry. As one project manager summarized:

"There are lots of opinions, lots of reviews, and lots of contradictions in the process of completing this interactive courseware. Actually, the authorization of decisions, especially on interface design, is in the MOE hands, not ours." (Developer 4)

Recently, interactive courseware has emerged as an instructional technology with the potential to overcome limitations of traditional media and provide the prospect of learning environments with strong visual and interactive elements. Apparently, the important challenge for the Malaysian developers interviewed is how to provide high quality interface design while reducing the courseware development cost and time consumption. In this regard, most of the participants (7 out of 10 developers) claimed that is harder for them to provide a good quality product because the authority for time allowance and approval belongs to the ministry.

Indeed, the Ministry of Education requires interactive courseware must present particular aspects of cultural and moral values that can be guided by criteria in the curriculum. For instance, the design of a particular characteristic of interface such as layout, images, buttons, and colours must signify or reflect Malaysian looks without having any bias regarding ethnicity or religion. This is because of the diversity of a complex mixture of multicultural society in Malaysia. As such, visual symbolism for the 3 mains Malaysian ethnic groups (Malay, Indian and Chinese) must be considered.

CONCLUSION

From this preliminary analysis, it can be concluded that currently, many Malaysian developers assume that developing an interactive courseware is just a simple task. Additionally, developing quality educational applications also requires understandings of the interactive learning concepts by the team production. However, in this preliminary analysis it is revealed that many developers team lacking on this understanding where most of them depended on their previous experience only, rather than researching pedagogical approaches.

Moreover, it's was revealed that the level of the developers' involvement with the end- user in the design process of the interactive courseware is very limited because they do not conduct a comprehensive user needs analysis before begin the design process. As an effectives used of interactive courseware is the main factor that can contribute to the effective learning experiences, developers clearly need to be more aware of it from the user's point of view. While, successful development process by considering the user needs and experiences will result on effective courseware usage.

Concerning the implementation of production flow and development process that should be followed by them based on the guideline provided, this preliminary analysis shows that the challenges' faces by the developer is how to provide high quality courseware while reducing the development cost and time consumption. This has required them to take their own initiative in order to fulfil the requirements. It should be highlighted in the future research.

Potential Problems of Student Evaluation of Teaching (SET) in Off-shore Campuses in Southeast and East Asia and Suggestions

Dr. Ulas Basar Gezgin, PhD,
lecturer, macroeconomics course coordinator
RMIT University, Ho Chi Minh City, Vietnam

Abstract

This paper consists of 3 parts. In the first part, 5 problems of SET are discussed. These are biases due to SET (which refer to problems due to online surveys, equivalency of SET questionnaires, cognitive biases, and formative vs. summative uses of SETs); biases due to courses; biases due to students; biases due to teachers; and issues with feedback. In Part 2, problems that may be peculiar to off-shore campuses in East and Southeast Asia are discussed. These are; surface learners/teachers vs. deep learners/teachers; the validity of the questionnaires; curriculum and assessment tasks; and closing the feedback loop. In Part 3, suggestions are provided to weather these problems.
Keywords: Student evaluations of teaching, off-shore campuses, (South)East Asia.

Potential Problems of Student Evaluation of Teaching (SET) in Off-shore Campuses in Southeast and East Asia, and Suggestions

Student evaluations of teaching has a growing significance as they are increasingly used for personnel decisions (Stark-Wroblewski, Ahlering & Brill, 2007). SETs are commonly used for improving courses and teaching, appraisals of the teachers and accountability purposes (Kember, Leung & Kwan, 2002). For some, it is the magic wand that will automatically improve teaching. In the meantime off-shore campuses mushroom in Southeast and East Asia, and SET are widely used in these campuses accompanied with problems due to SET and others due to the nature of the off-shore education services. The first part reviews the research on the problems due to SET, the second part reflects on the problems that may be peculiar to off-shore campuses in Southeast and East Asia and the final part provides some suggestions.

I) Problems of SET[1]

Worthington (2002) lists 4 possible sources of bias in SET:
1) Factors related to the administration of SET.
2) Factors related to the course such as difficulty and workload.
3) Factors related to students such as age, interest in the course and expected grade.
4) Factors related to the teacher such as experience, appearance, gender etc.

It is not sufficient to have no bias in SET. In the ideal cases where no biases involved, how student feedback is used by teachers makes a difference. If teachers don't use feedback in an appropriate way, a non-biased survey will be of no avail. Thus the use of feedback is considered to be the fifth factor below.

1) Biases Due to SET

There are 4 biases due to SET. They are; problems due to online surveys, equivalency of SET questionnaires, cognitive biases, and formative vs. summative uses of SETs.

a) Problems Due to Online Surveys

A plethora of studies focused on the advantages and disadvantages of online surveys. One of the main reasons for a move from classroom surveys to online surveys is the fact that costs of printing, collecting, scanning, administration etc. are reduced by online surveys (Barkhi & Williams, in press; Dommeyer et al, 2004; Watt et al, 2002).
Classroom surveys have usually high participation rates compared to web-based surveys (Barkhi & Williams, in press; Dommeyer et al, 2004; Nulty, 2008; Symbaluk & Howell, in press; Watt et al, 2002). Nulty (2008) reviews various studies where the response rate for the latter is 30 odd% less than that of the former. The former is more representative since web-based survey participants have either very negative ('I hate my teacher') or very positive ('I admire my teacher') views (Symbaluk & Howell, in press). Thus, Nulty (2008) discusses the possibility that the online survey respondent characteristics may be different compared to nonrespondent characteristics, which will bias the data. Then the data may not be considered to be representative. This problem is independent of the low response rate. It corresponds to sampling bias. Furthermore, online surveys may be filled by the students who don't attend the classes (Dommeyer et al, 2002).

Dommeyer et al (2004) and Venette, Sellnow & McIntyre (in press) found no differences in student ratings of instruction with regard to the mode of response (ie online survey vs. traditional classroom survey). However, Venette, Sellnow & McIntyre (in press) found that students provided longer responses to open-ended commentary questions in online mode. It may be due to the fact that students would feel more anonymous in online surveys or that the traditional social barriers are removed in online responding as much as the flaming effect in internet use (Barkhi & Williams, in press). Consistent with this explanation, Barkhi & Williams (in press) found that more extreme comments came out by computer-mediated evaluations compared to classroom surveys confirming Symbaluk & Howell (in press). Diverging from Venette, Sellnow & McIntyre (in press) which found no difference in negativity and positivity of responses on online surveys, Barkhi & Williams (in press) found that on average, the course and the teacher received lower ratings on online surveys compared to classroom surveys, though the effect disappeared when course and teacher variables are statistically controlled. However, Barkhi & Williams (in press) also found that extremely negative evaluations are common on online survey and extremely positive evaluations are common in classroom surveys. Students who are not satisfied by the course are more likely to respond online (Barkhi & Williams, in press).

To boost online response rates, Dommeyer et al (2004) suggests grade incentives, but they may not be feasible since it will take more time to process extra marks.
Nulty (2008) lists the three most common ways to increase response rates for online surveys:

---

[1] In this paper the terms 'evaluation' and 'rating' are used interchangeably for practical purposes although "[a]n 'evaluation' implies a conclusion based on some direct definitive measure, whereas a 'rating' connotes data susceptible to interpretation" (Otto et al, 2008, p.365).

(1) repeat reminder emails to non-respondents (students);
(2) repeat reminder emails to survey owners (academics);
(3) incentives to students in the form of prizes for respondents awarded through a lottery (Nulty, 2008, p.303).

Nulty (2008) makes a list of other suggestions that emerge out of the review of previous research. Though the majority of these suggestions are implemented by default in the current settings such as brief questionnaires rather than long ones, and anonymity, one out of these is significant: "Persuade respondents that their responses will be used" (Nulty, 2008, p.305). However, this suggestion applies to any mode of survey. The students should be convinced that "their opinions do matter" (Spencer & Schmelkin, 2002, p.406) to boost the participation to SETs. Chen & Hoshower (2003) finds that contributing to the improvement of teaching and course are the main motivators for students' participation to SET. Students are more motivated if they are convinced that their responses will be used for improvement (Chen & Hoshower, 2003). Thus rather than behavioral motivators such as extra marks or prizes, cognitive motivators should be employed to make SET meaningful for students.

b) Equivalency of SET Questionnaires

Various SET questionnaires are used in different countries and in different universities in a single country. Some questionnaires include 5 items whereas others include more than 30 items.[2] Short questionnaires take less time, but they are less valid as the phenomena they are supposed to measure are inherently multidimensional. SET questionnaires are used to measure teaching quality or teaching effectiveness, but they may tap different dimensions. As a result, one should be cautious in interpreting the findings discussed in this paper. A comparative study is necessary where different SET questionnaires are administered to a local student population to check the consistency of the results.

c) Cognitive Biases

According to Barkhi & Williams (in press), the following cognitive biases may be involved in student ratings: Hindsight bias, confirmation bias, self-serving bias, recency bias and serial position bias. It seems that the latter three are the most relevant ones for a study of student ratings: Students attribute success to themselves and failure to teachers and other external factors (self-serving bias); since the recent events are more salient in human memory, students may be biased towards recall of recent weeks of the semester (recency bias) and the responses are affected by the order through which the questions are asked (serial position bias). Yorke (in press) adds 'acquiescence bias' or 'yea-saying' which involves the tendency of the respondents towards affirming answers. Yorke (in press) also mentions 'primacy effect' as positive items such as 'strongly agree' runs from left to right which means they are always read earlier than negative items. However Yorke (in press) could not find any evidence for ordering effect and acquiescence bias in his empirical study. Thirdly, 'indifference bias' refers to respondents' tendency to choose the mid value (ie 3 over 5-point Likert scale) or only one value in a uniform manner (ie 2 for all questions) (Yorke, in press). Indifference bias in the second sense is assumed to be eliminated by the use of negative items along with positive items, though it is not always eliminated.

As a further potential cognitive bias, Yorke (in press) discusses the mid-point in Likert scales. It may have three senses for respondents: It may refer to their true neutrality or ambivalence or non-applicability. Alternatively, forced choice items can be used (ie 4 items by removing the mid-point) but then this may cause a higher level of error since the respondents are not provided with the opportunity to be neutral or ambivalent (Yorke, in press).

More studies need to be conducted on these cognitive biases.

d) Formative vs. Summative Uses of SETs

---

[2] For examples of various SET questionnaires one can check Barkhi & Williams, in press; Cohen, 2005; Kember, Leung & Kwan, 2002; Macalpine, 2001; Neumann, 2000; Ogier, 2005; Shevlin et al, 2000; Venette, Sellnow & McIntyre, in press; Worthington, 2002.

One problem that stains student ratings is the fact that the evaluation process is summative, ie it is at the end of the process. Barkhi & Williams (in press) suggests that by utilizing the ease of administration of online surveys, the feedback process can be made continuous throughout the semester so that the teachers can improve their teaching quality based on more frequent feedback.

Nulty (2008) states that a response by even a single respondent is relevant to improve the teaching quality; however, teaching evaluation surveys are increasingly used for summative purposes and for performance evaluation which is untenable as the sampling requirements are not met in many of the surveys.

Since SETs are usually done at the end of the semester and the end of the semester is too late to improve the course based on student feedback, Spencer & Schmelkin (2002) suggests that SETs need to be complemented by mid-semester student feedback to boost the teaching quality.

To sum up, the disadvantages of online surveys, the equivalency of the SET questionnaires, cognitive biases and formative vs. summative uses of SET data should be addressed to obtain more valid and reliable SET results.

2) Biases Due to Courses

Using RateMyProfessor.com (RMP) data, Felton et al (2008) finds a positive relationship between course easiness and teacher's attractiveness, and course quality ratings. The second link demonstrates that halo effect operates in course evaluations. If students think that a teacher is attractive and course is easy, they rate the course as a high quality course (Felton et al, 2008). Bowling (2008) finds that easiness of the course is associated with favorable ratings in course experience surveys in low-ranked schools while the positive correlation is relatively lower for high-ranked ones. In both schools, the same correlation is observed at different levels. In other words, the easier the course, more favorable are the ratings. Bowling (2008) attributes this difference to the fact that students at high-ranked schools are more motivated to learn more, and thus easiness is not a very significant criteria for their evaluations of a course or a teacher. Likewise, Davison & Price (2009) and Felton, Mitchell & Stinson (2004)
found that high ratings are positively related to easiness on RMP data. In other words, professors teaching easy courses with low course load are rated highly positively (Davison & Rice, 2009).

A simple measure of easiness is the failure rates. In evaluating the teaching performance, failure rates should be considered to adjust the high ratings for easy courses and low ratings for difficult courses.

3) Biases Due to Students

Senior and junior students rate the courses and teachers more positively compared to sophomores and freshman students (Barkhi & Williams, in press). Students with higher GPAs tend to rate their teachers more favorably (Betoret & Tomas, 2003; Chen & Hoshower, 2003). Worthington (2002) found that students who expect a higher grade rated their teacher more favorably. Finally, students are more likely to rate their professors when they want to complain about them (Davison & Rice, 2009). To minimize the biases due to students, SET should include questions asking expected grade and current GPA. These questions are already part of some SETs (eg Worthington, 2002).

4) Biases Due to Teachers

Felton, Mitchell & Stinson (2004) finds that teachers who are considered to be attractive are rated more favorably. Though this finding is based on RMP data, it casts doubt on reliability of SETs as they may be subject to similar halo effects. Based on this finding, it may be inferred that elderly teachers are more likely to be rated less favorably.

Using RMP data, Symbaluk & Howell (in press) found that Teaching-Award winners receive higher ratings compared to Research-Award winners, although the latter still receives positive ratings. While this result may be trivially true, it points out a trade-off between teaching orientation and research orientation that is common in many higher education settings.

Ogier (2005) finds that teachers who are non-native speakers of English receive lower ratings for overall satisfaction with the course. This may lead to a halo effect for teachers who are native speakers of English. Furthermore, ESL students ie students coming from non-English speaking backgrounds (non-ESB) rate non-ESB teachers far lower compared to ESB students (Ogier, 2005). Finally, non-ESB students are found to rate their teachers more favorably in general (Worthington, 2002).

Shevlin et al (2000) finds that SET responses are largely affected by teacher's personal attributes such as charisma. Furthermore;

> [t]here is a high correlation between the ratings produced by students taking different course units taught by the same teacher, but little or no relationship between the ratings given by students taking the same course unit taught by different teachers. This suggests that students' evaluations are a function of the person teaching the course unit rather than the particular unit being taught (Richardson, 2005, p.389).

Whilst student evaluations provide a significant source of feedback for the university, it may have detrimental consequences. To boost the ratings, the teachers may be inclined towards lenient marking, as high grades will likely lead to higher student ratings (Stark-Wroblewski, Ahlering & Brill, 2007). Even worse may come out:

> If, for example, the student ratings reflect instructor charisma, sense of humor, grading leniency or entertainment value rather than learning, then instructors will be motivated to achieve something not in the interest of higher education (Otto et al, 2008, p.356).

Teachers who receive high ratings see SET as highly valid (Nasser & Fresko, 2002). "Instructors support course evaluation when it flatters them and oppose it when they are criticised" (Nasser & Fresko, 2002, p.197). Thus SET reproduces itself even if it may not be efficient. This point involves teachers' self-serving biases. They may falsely think that mastery of the subject guarantees quality teaching. In the lines of the attribution theories, just as psychologically healthy students attribute their failure to external and unstable factors such as effort and teachers; teachers may attribute students' failure to lazy or 'dumb' students, although in some cases, students' failure may be due to teachers' failure.

Stark-Wroblewski, Ahlering & Brill (2007) confirmed that SET scores were not a measure of learning outcomes. In other words, high scores on SET do not show whether students learned the topics or not. Learning outcomes explained the variances in grades more than SET ratings. Thus, Stark-Wroblewski, Ahlering & Brill (2007) suggests the use of learning measures along with SET in evaluating teaching effectiveness.

5) Issues with Feedback

Improvement in quality of teaching depends on how teachers receive, interpret and utilize SET responses (Ballantyne, Borthwick & Packer, 2000). Although students are not the only stakeholders in SET, the literature is flooded by research on students' perceptions and characteristics only. One exception is Shao, Anderson & Newsome (2007) in which a large sample of university administrators (deans and heads) are asked to rate the current state of 'evaluating teaching effectiveness'. In another exception, Hendry, Lyon & Henderson-Smart (2007) investigated teachers' perceptions of SET, whether they used them to boost teaching quality, and in what ways they did this, such as improving the slides, decreasing the number of topics covered in the course, reducing the theoretical parts, encouraging a higher level of participation etc.[3]

Seeing the drop of SET ratings for 3 departments throughout years, Kember, Leung & Kwan (2002) questions the quality of teaching in their university. They provide 5 possible explanations for this downward trend that are not mutually exclusive:
- A stable plateau is reached in the ratings. Kember, Leung & Kwan (2002) thinks that evidence for this explanation is insufficient.
- The use of feedback data is ineffective. This is a likely possibility.
- Incentives to use feedback data are lacking. This is another likely possibility. The majority of teachers feel that good teaching is not sufficiently rewarded.

---

[3] A third exception is Ballantyne, Borthwick & Packer (2000) where parallel items are used for students and teachers.

- Appraisal function of SETs crowds out its formative function. SET is considered to be an instrument for contracts and tenure rather than improving courses.
- Metric problems with SET lead to instability in ratings.

The last 4 points provide ways to improve SET results, though they don't automatically guarantee an improvement in teaching quality: Refined ways of collecting quality feedback need to be implemented; incentives should be used to encourage the use of student feedback by teachers; formative and summative functions of SET should be addressed in two different questionnaires if possible; and SETs should be revised for higher levels of validity and reliability.

II) Problems That May Be Peculiar to Off-shore Campuses in East and Southeast Asia

Four major problems are observed in off-shore campuses in East and Southeast Asia. These are the problem of surface learners/teachers vs. deep learners/teachers, the validity of the questionnaires, curriculum and assessment tasks, and closing the feedback loop.

1) Surface Learners/Teachers vs. Deep Learners/Teachers

A neglected factor in student evaluations is students' expectations for the course (Fisher & Miller, 2007). These expectations are more or less forged by education prior to tertiary level. Leung (2001) identifies 6 dichotomies that characterize mathematics education in East Asia, to some extent:
- 'Product vs. process': East Asian focus is the product of problem solving rather than the process of solving it.
- 'Rote learning vs. meaningful learning': The former is dominant over East Asia.
- 'Studying hard vs. pleasurable learning': Studying hard is highly appreciated in East Asia.
- 'Extrinsic vs. intrinsic motivations': East Asian students are more extrinsically motivated eg by exams.
- 'Whole class teaching vs. individualized learning': Whole class teaching is preferred in East Asia.
- 'Subject matter vs. Pedagogy': Mastery of the subject is considered to be sufficient to teach a topic in East Asian context following the traditional transmission model of teaching whereby teachers as authorities transmit their knowledge; and fill students' minds with their knowledge.

Almost all the students of off-shore campuses in East and Southeast Asia are Asian. As a result, they may come with different expectations of education which would be in clash with the teaching model underlying international universities. Following the dichotomies above, Asian students may expect to receive education where product, rote learning, studying hard, extrinsic motivation, whole class teaching and teacher as a high authority figure are valued which are squarely opposite to the notion of international education. A teacher who prefer the second pole of the dichotomies (ie process, meaningful learning, intrinsic motivation, individualized learning, and pedagogy)[4] may be rated lower on SET. In this vein, two points on Macalpine (2001)'s list of problems with use of SET are particularly applicable to off-shore campuses in Asia:
    - Some students may dislike being required to think rather than memorise by rote;
    - Some students may dislike being expected to answer questions orally (in their second   language), in class, rather than sitting passively (Macalpine, 2001, p.565).

Supposing that Asian students are harboring the first poles of the six dichotomies, the teacher and course which would get the highest ratings on SET would have the following properties:
- Guaranteeing passing marks by rote learning.
- Whole class teaching rather than asking questions individually.
- No innovative teaching as it would individualize the process.
- Multiple choice tests rather than essay-type exams.
- Written exams rather than oral exams.
- Sample questions to prepare for the final exam.

These characterize surface learners as opposed to deep learners. Surface learners which are common in East Asia may pull surface teachers as a magnet. Both deep learners and deep teachers would suffer. Surface learners will rate surface teachers more favorably within the current SET system. In this context, Lyon & Hendry (2002) finds

---

[4] The dichotomy of studying hard vs. pleasurable learning does not fit the situation well. It has to be elaborated further.

that Course Experience Survey widely used in Australia is based on a traditional education model and does not fit a problem-based education model. Thus SETs should be revised to embrace innovative education models.

Keeping in mind that SET results may be biased due to different conceptions of learning and effective teaching held by students (Hendry, Lyon & Henderson-Smart, 2007), SET questionnaires should be revised to detect these conceptions. To identify students' expectations, a formative expectations questionnaire is necessary. Secondly, as the use of multiple choice tests that are known to discourage deep learning (Struyven, Dochy & Janssens, 2005) furthers surface learning in international universities of Asia, essay type exams and alternative assessment methods that are known to encourage deep learning (Struyven, Dochy & Janssens, 2005) need to be promoted.[5] Finally, SET system should be clear on how rewarding of surface teaching/learning would be avoided. SET questionnaires which are based on the transmission model of teaching should be revised to cover alternative teaching methods.

On the other hand, Ballantyne, Borthwick & Packer (2000) finds that in general, teachers focus more on improving student learning, whereas students focus more on assessment. Therefore, the distinction of surface learner/teacher vs. deep learner/teacher and other issues discussed in this section may not be specific to Asia. More studies are necessary to compare expectations of Asian and non-Asian students.

2) The Validity of the Questionnaires

SET questionnaires are always validated in the central hub, but then they are used in off-shore campuses as well. They may not be valid for off-shore campus student bodies. Thus formal validation of the questionnaires in peripheral hubs is necessary.[6]

A second issue related to the first one would be the selection of SET questionnaire(s) for use. An option is having more than one SET questionnaire that would be valid in different campuses. A second option is using a single SET questionnaire that would be validated in all campuses. A third option is using a single questionnaire validated in all campuses along with a second SET questionnaire that will serve the local educational issues and needs. By this option, extra questions can be added for off-shore campuses such as satisfaction with the coordination across the off-shore campus and the central hub.

A third issue will be the language of SET. The reception of the SET questionnaire by off-shore campus students would be different, since it is in their second language. It is more likely to receive genuine feedback in their native language rather than English. Thus, off-shore campus students may be allowed to answer SET questionnaire in their native language. Although this will increase the administrative costs, it will worth the effort, as this may be another reason for low response rates on online surveys in offshore campuses.

3) Curriculum and Assessment Tasks

Assessment tasks prepared in the central hub may not fit the offshore campus. For one thing, the questions may be ethnocentric. Paralleling the issue of the validity of SET questionnaires across campuses, three options emerge:
1) Using all the materials and assessment tasks used in the central hub without considering any local feasibility problems.
2) Using materials and assessment tasks that are developed in various campuses.[7]
3) Using both central hub's national materials and assessment tasks along with materials and assessment tasks that will fit the local needs of the off-shore campus.

---

[5] Multiple choice tests are preferred since they are less time-consuming to administer and mark. However even a superficial cost-benefit analysis will show that the pedagogical costs of them weigh heavier than their benefits.
[6] An example is Byrne & Flood (2003) where CEQ (an Australian questionnaire) is validated for Ireland.
[7] This requires the switch of central hub to these internationalized materials and assessment tasks, rather than following its national materials and assessment tasks.

Where these problems are not addressed, student satisfaction will be reflected as low ratings for the teacher who will be a scapegoat in that case. Students would provide lower ratings not because the course has low quality, but the rapport between the central hub and offshore campuses is asymmetric or central hub is not sensitive to the local needs. These problems are intermingled with the issue of standardization whereby the off-shore campus students receive identical diplomas with central hub students.

4) Closing the Feedback Loop

Although it is easy to see SET's invasion of tertiary education as the injection of the Costumer Satisfaction Model into universities, the comparison is misleading. Customers will not be satisfied with a low-quality product. If the product does not come out as it is advertised, this won't make the customers happy. However, students may be satisfied with low-quality education as they may prefer to study less and guarantee a passing mark without effort. This problem is aggravating in off-shore campuses since the teachers may be a toast between the students and the central hub's administrative structure. Spencer & Schmelkin (2002) suggests that teachers' and administrators' evaluation of SET process should be carried to the equation for a further improvement of teaching. In the off-shore context, SET should be accompanied with teachers' and administrators' evaluation of teaching/learning, central hub coordination and off-shore administration. By covering all stakeholders, more genuine feedback will be collected.

III) Suggestions

Shao, Anderson & Newsome (2007) lists the following items that can be used for evaluating teaching effectiveness: Current in field, student evaluation scores, student written comments, Chair's evaluation, Teaching Awards, peer's evaluations, intellectual contributions, Teaching Portfolio, classroom visits, Dean's evaluation, class assignments, use of technology, alumni feedback, colleagues' opinions, grade distribution, course notebooks, course level (grad/undergrad), course type (required/elective), class enrolment, drop rate (Shao, Anderson & Newsome, 2007, p.361). None of them will be reliable to evaluate teaching performance by their own. A teacher may hold current knowledge in field, but this does not mean s/he has an appropriate pedagogical approach. Student evaluation scores and student written comments may be biased as discussed in previous parts. Dean's and Chair's evaluation may be misleading, as s/he may not have direct experience of the teacher's performance. The range of Teaching Awards is quite narrow as the recipients are just a few, and the jury may be subjective if clear guidelines and transparency are not the norm. Peer's evaluation may be subjective as much as self-ratings. Intellectual contributions are difficult to measure. Classroom visits are very useful; however they may not be representative of the teaching performance, compared to all the classes throughout the semester.[8] Class assignments, course notebooks, course level and course type, class enrolment and drop rate will not provide much information without the use of other methods. Finally, an evaluation of use of technology may lead to technology fetishism where technology would be deified at the expense of knowledge and skills. To weather the deficiencies of SETs, Macalpine (2001) suggests a combination of SETs, in-class peer evaluations and teaching portfolios. He states that deficiencies of the three will be balanced by the use of them together.

A major avenue to boost teaching quality is to improve SET methods. In this vein, Huxham et al (2008) compares the results of student ratings based on questionnaire, with ratings by other methods such as focus groups, student diaries, and rapid feedback.[9] Whilst the qualitative responses to course experience questionnaire highly overlapped with those by other methods, students considered the latter as time-consuming and too demanding. However, focus groups were favored for a deeper level of reflection on the course. Furthermore, some students also questioned the reliability of the course experience surveys (Huxham et al, 2008). Huxham et al (2008) stresses the significance of qualitative responses for formative evaluation ie to improve teaching, and that of quantitative responses for summative evaluation ie for managerial decisions.

In this paper, 5 problems of SET are discussed. These are
1) Biases due to SET which refer to
      a) Problems due to online surveys

---

[8] Macalpine (2001) discusses the problems with class observations.
[9] Rapid feedback refers to 3 general open-ended questions to be completed in 5 minutes.

         b) Equivalency of SET questionnaires
         c) Cognitive biases
         d) Formative vs. summative uses of SETs
2) Biases Due to Courses
3) Biases Due to Students
4) Biases Due to Teachers
5) Issues with Feedback

For Problem 1(a), incentives to boost response rates are necessary. In cases where they don't work, a cautious interpretation of the results is a must. The results should be considered with regard to the limitations imposed by low response rates (Barkhi & Williams, in press).[10]

For Problem 1(b), more studies should be conducted to ensure that different questionnaires of SET tap the same dimensions of teaching performance.

For Problem 1(c), more research is needed as the relevant studies are a scarcity.

For Problem 1(d), the formative and summative uses of SETs should be demarcated. To serve this purpose, two different SET questionnaires may be used. The formative questionnaire may cover qualitative responses while summative questionnaire may cover both qualitative and quantitative responses to double-check each other, following the suggestion by Huxham et al (2008).

For Problem 2, course easiness should be checked. This can be checked by failure rates. A simple formula can be used to adjust the high ratings of easy courses and low ratings of difficult courses based on failure rates.

For Problem 3, expected grade and current GPA can be asked in SET questionnaires.

Due to Problem 4, the following issues should be kept in mind while evaluating teaching performances:
- Teachers who are considered to be less attractive are rated less favorably.
- Elderly teachers are rated less favorably.
- Teachers who are not native speakers of English are rated less favorably.
Finally, the university should take measures against the abuse of SET where teaching quality is compromised to please the students in a move towards a boost of SET results.

Lastly, to address Problem 5, incentives should be provided for teachers so that they can use the feedback to improve the teaching quality.[11] Two papers worth mention in this regard are the following: Chen & Hoshower (2003) suggests that course syllabus may contain brief information about how SET results are used to improve the course. This will increase the perceived value of SET through the eyes of students as well as teachers (Chen & Hoshower, 2003). Secondly, Ballantyne, Borthwick & Packer (2000) reports the development of booklets on main issues such as interactive teaching strategies, teaching for learning, evaluating the quality of teaching etc based on SET responses and teachers' perceptions. This simple and brilliant idea can be applied in off-shore campuses as well.

In Part 2, problems that may be peculiar to off-shore campuses in East and Southeast Asia are discussed. These are:
1) Surface Learners/Teachers vs. Deep Learners/Teachers
2) The Validity of the Questionnaires
3) Curriculum and Assessment Tasks
4) Closing the Feedback Loop

---

[10] What level of response rate would be sufficient for the validity of the student ratings? Nulty (2008) provides a very useful table to answer this question –assuming that the respondents are randomly selected. However, convenience sampling rather than random sampling is used in course evaluation surveys (Nulty, 2008). Nevertheless, the table is useful since it sets the higher standard for the response rates. For instance, by a liberal statistical standard, 14 (48%) responses are required out of a class of 30 students while 29 responses (96%) are necessary by a stringent standard. As the class size increases, required response rates decrease. Eg for a class size of 2000, which is highly unlikely, 1% response rate is plausible under a liberal standard.
[11] The distinction between extrinsic and intrinsic motivation applies to teachers as well.

As to Problem 1, students' perceptions and teachers' perceptions may be different as shown by Ballantyne, Borthwick & Packer (2000). Therefore expectations of students and teachers should be clarified on the first week. The university should ensure that surface teachers will not be rewarded due to high SET results that do not reflect the teaching quality.

For Problem 2, cross-validation studies are necessary, whereas parallel decisions need to be taken for the cross-campus use of curriculum and assessment tasks developed in the central hub to manage Problem 3.

As to Problem 4, to close the loop, Betoret & Tomas (2003) lets teachers to evaluate their students by parallel items such as 'the students are (the teacher is) motivated' etc. Not only teachers, but all the stakeholders of off-shore education services should be part of the evaluation loop to improve the teaching quality.[12]

This paper makes practical suggestions whilst proposing new research topics for researchers. These suggestions should be tested by practice, and these tests will definitely lead to newer research topics.

---

[12] However, it should be kept in mind that SET poses ethical challenges as the managerial access to and the publicization of the results involve questions on confidentiality and violation of privacy (McCormack, 2005). McCormack (2005) lists the following ethical values relevant to SET: Autonomy and justice, respect for students' opinions, anonymity and confidentiality, and privacy.

Prompt Feedback: Expectations of Students and Faculty

Salvatore A. Sanders, Ph.D., Department of Health Professions, Youngstown State University; G. Andy Chang, Ph.D., Department of Mathematics and Statistics, Youngstown State University; C. Louise Sellaro, D.B.A., Department of Management, Youngstown State University; and Carolyn K. Mikanowicz, Ph.D., Department of Health Professions, Youngstown State University, Youngstown, Ohio

Introduction

Web-based or online learning environments have become commonplace in higher education and enrollment in online courses continues to grow (Allen & Seaman, 2008). Attitudes and priorities associated with pedagogy and andragogy have moved toward online teaching and learning. Traditional face-to-face classroom experiences continue while technology allows us to educate students at a distance through the use of completely online and hybrid courses -- offering a combination face-to-face and online learning environments. Classes may be also be conducted through synchronous, two way interactive video conferencing systems, synchronous and asynchronous online learning environments, or combinations of synchronous and asynchronous instruction.

Interaction with students plays an important role in learning. Interaction among students and between students and instructor is associated with students' satisfaction with distance learning and online learning in particular (Kim & Moore, 2005; Sanders & Hirschbuhl, 2007; Stein, Wanstreet, Calvin, Overtoom & Wheaton, 2005). Interaction between the course instructor and students has also been shown to have significant effects on learning outcomes (Chen, 2001; Chen & Willits, 1998; Gorsky & Caspi, 2005; Lemley, Sudweeks, Howell, Laws & Sawyer, 2007).

The seven principles for good practice in undergraduate education were initially published in 1987 and appear to have withstood the test of time as they have been discussed in terms of how they might be deployed using newer technology (Chickering & Ehrmann, 1996). These principles have also been employed in the evaluation of online courses (Graham, Cagiltay, Lim, Craner & Duffy, 2001, Ohio Learning Network).

One of the seven principles for good practice in undergraduate education is to give prompt feedback (Chickering & Gamson, 1987). Though prompt feedback appears to be important (Chickering & Gamson, 1987; Dennen & Darabi, 2007; Gaytan & McEwen, 2007; Lewis & Abdul-Hamid, 2006), a review of the literature did not produce any research indicating what amount of time is considered prompt in response to student communications and feedback on various assessments and assignments, so the authors began researching these expectations (Sanders, Mikanowicz, Chang & Sellaro, 2008).

The purpose of this study is to assess student and faculty expectations regarding the timeliness of communication and feedback regarding course assignments (papers, quizzes, tests and presentations) in regular courses that employ regularly scheduled meeting times (such as a traditional face to face course which meets every Monday) and Web-based courses without regularly scheduled meeting times (online classes without a regularly scheduled meeting time). The review of the literature as well as observations by the authors led to the formation of the following research questions:

1. Do students and faculty members have different expectations as to what constitutes prompt feedback on assignments and faculty members' responses to students' communications?
2. Do the response time expectations of students for feedback on assignments and replies to communications differ according to the course schedule (regular vs. Web-based courses)?
3. Is it possible to identify the response time expectations of students and faculty members for providing prompt feedback on assignments and replies to student communications?

Methods

A survey designed by the authors was used to obtain demographic information and estimates of the amount of time that participants perceived to be a prompt response to various communications and prompt feedback on assignments common to regular and Web-based courses. In 2008, after receiving approval from the University

Human Subjects Research Committee, this exploratory study was conducted at a Midwestern university. In summer 2007, the survey instrument was pilot tested by faculty and both undergraduate and graduate students who completed their degrees prior to the end of the summer term. The authors then revised the survey as needed for clarification. Eighty-five faculty members and 389 students volunteered to respond to our survey during the spring semester of 2008. Data was collected without participant identifiers through the use of an online survey service and also through a printed version of the instrument that was distributed in selected undergraduate and graduate courses.

Instrument

Two versions of the survey instrument were constructed – one for administration to faculty members and another version for student participants. The faculty survey consisted of three demographic items and a total of eighteen items requesting that faculty participants estimate the range of time that they perceive provides a prompt response to students' communications and prompt feedback on assignments to students in courses with and without scheduled class meetings. The student version of this online survey instrument was similar to that given to the faculty members. The survey provided to the student participants consisted of four demographic items and eighteen items requesting that student participants estimate the amount of time that they perceive provides a prompt response from faculty members to communications and provides prompt feedback on various assignments in classes with and without scheduled class meetings.

Data Analysis

Data analysis was performed using SPSS. Descriptive statistics were obtained and the Chi-square test of homogeneity and the Sign test analysis were conducted to provide exploratory data and to answer the research questions associated with this investigation.

Results

Responses were received from 85 faculty members and 386 students. Three student responses were not analyzed due to incomplete information. Some participants failed to complete all of the survey items. Student participants consisted of 342 (89%) undergraduate and 44 (11%) graduate students. Thirty-nine (48%) of the faculty participants were male. The majority of student participants 213 (55%) were female. One hundred and fifty-two (39%) students reported having taken at least one Web-based course and 22 (26%) faculty members reported having taught at least one Web-based course.

Table 1 compares the response distributions between faculty and student. For courses with regularly scheduled meeting times, the majority of the faculty (92%) and students (91%) responded that they preferred a response to students' emails within two days, 55% of faculty members preferred responding to student's emails in 1 to 2 days and 63% of the students preferred that their instructors respond to their email in 1 to 2 days. Among them, 37% of the faculty and 28% of the students preferred an immediate response to students' email. There was no significant difference in the overall response distributions between faculty and students for response time to email. The preference in responding to student's phone calls is similar to responding to students' emails. The results for responding to emails and phone calls in Web-based courses were similar to those in regular courses. Significant differences (p-value<0.01) were found for response time to Quiz, 1 page writing, 2-4 pages writing, and 5-9 pages writing for regular courses. For Web-based courses, significance was found in "No more than 5 sort essay items" and writing assignments consisting of 1 page, 2-4 pages and 5-9 pages. More students preferred to see the response to their quiz within 2 days. In general, more students preferred shorter waiting time for feedback than did faculty participants.

Table 2 shows that, when comparing Web-based and regular courses, students expected shorter waiting time for responses from emails (p-value<.05) in the Web-based course than in the regular course. The same results (p-

value<0.01) were observed for quiz, No more than 5 sort essay items, 1 page, 2-4 pages, 5-9 pages, and 10 or more pages writing assignments.

Table 3 shows the age effect on the perception of response time from students. The only significant difference was on response for emails in the Web-based course. Students between 31 to 40 years of age were more likely (79%) to prefer receiving responses to their emails in 1-2 days (p-value = 0.04) in the Web-based course. There were no significant differences in response preference distributions between different age groups from all other questions for both regular and Web-based courses.

Discussion

The limitations to this study that the reader needs to consider in reviewing the results include that the sample was one of convenience, so the results from this study cannot be generalized to other groups of students and faculty teaching and learning in other situations. The sample was obtained from courses at a single academic institution. Additional relationships may have been identified with a sample including multiple colleges and universities. The researchers did not account for student and faculty workload which may affect students' and faculty members' expectations of prompt feedback. Additional research is necessary to determine if there is a relationship between workload and the amount of time which students and faculty members consider appropriate when providing prompt feedback. Another factor that may play a role in how quickly one provides feedback on various assignments is the type of feedback provided. For example it takes less time to simply put a score on a paper than it does to provide meaningful comments. The type or quality of feedback provided to students was not addressed in this investigation and future investigations into this topic might wish to consider this variable.

There were statistically significant results in the differences between the feedback expectations of faculty and students who participated in this study. So for this investigation, the answer to our first research question is that students and faculty members do have different expectations as to what constitutes prompt feedback on assignments such as written assignments between one and nine pages and objective quizzes and assessments which include up to five short essay items. Generally speaking where there are differences in the feedback expectations, more of the student participants in this study perceived prompt feedback as being provided in less time than did the faculty participants. These results differ from those of an earlier investigation by the authors in which no significant difference was noted between the feedback expectations of faculty and students (Sanders, Mikanowicz, Chang & Sellaro, 2008). The difference may be due to the larger number of participants in this study resulting in an increased ability of the statistical tests to detect differences, or may reflect actual differences in the participants' perceptions. The descriptive statistics suggest that on average faculty participants in this study do not have different response time expectations for replying to student email and phone communications.

The results of the sign test suggest that more students feel that feedback should be provided sooner for objective quizzes, No more than 5 sort essay items, and writing assignments in Web-based courses than in regular courses which answers the second research question. More students also prefer faster response to email in the Web-based courses as compared to regular courses. These results agree with those reported in an earlier investigation (Sanders, Mikanowicz, Chang & Sellaro, 2008). These differences in students' response time expectations suggest that faculty members may need to reply to communications and provide feedback quicker on assignments when teaching Web-based courses to meet student's perceptions of prompt feedback. Failing to do this may lead to dissatisfaction for some students whose expectations for prompt communication and feedback are not met in Web-based classes. Faculty may find it useful to share their expectations regarding communication with students and providing feedback on various assignments up front perhaps as guidelines in the course syllabus. For example faculty may wish to tell students that they can usually expect a response to email within two days, or that while objective quizzes, in a Web-based course, may be scored and feedback provided immediately on completion, feedback on instructor graded writing assignments will generally be available within a week of submission.

In answering the third research question, this study has identified the most common response time expectations of students and faculty members for providing prompt feedback on assignments and replies to student communications for the participants in this investigation. Understanding these expectations is important and will be of great value to instructional designers, those providing training for faculty and students and faculty members engaged in education in regular, or Web-based learning environments.

Both Local and Global: a Case of International Distance Learning.

Sonia Mycak (University of Sydney) and Yasuo Nishizawa (Gifu University)

There is a growing need, both in Australian and Japanese universities, to internationalise curricula and student experience. Established forms of international exchange between universities normally require students to travel abroad for a significant period of time. International distance learning, however, offers a unique possibility: it can provide domestic students with an accessible international experience. In this sense, distance learning can impart a global educational experience at a local level.

In this presentation we will report on an international distance learning relationship which has been established between the University of Sydney, Australia, and Gifu University, Japan. Since 2002, the Faculty of Arts at the University of Sydney and Gifu University's Faculty of Education have participated in a lecture exchange programme through which live lectures are transmitted through web-based video conferencing. Lectures on Australian studies are transmitted from the University of Sydney; lectures on Japanese language, linguistics and culture are transmitted from Gifu University. The Australian and Japanese students enjoy specialist teaching in a cross-cultural learning environment.

This programme is a teaching and learning initiative, which we believe is the only one of its kind. Indeed, the National Institute of Multimedia Education (NIME), a Japanese government agency dedicated to research and development in e-learning/distance education in the tertiary sector, has reported that the current relationship between Gifu and Sydney universities is the only institution-to-institution programme of distance learning between a Japanese and an overseas university ("Current Status and Challenges of International Activities Using ICT in Japanese 4-year Colleges and Universities: Results of the Survey conducted in 2004" NIME Research Report 15, 2006). We therefore hope it will be of interest to conference participants to hear us outline how the programme was established, the ways in which it has developed, and plans for future growth.

Part 1: Designing the Foundation for International Distance Learning by Yasuo Nishizawa

While both the style and the content of international distance learning could, and perhaps should, embrace a whole set of their various combinations, we should be constantly aware that much depends upon the progress and innovations in the field of technology. Until quite recently, for example, we had to be dependent on ISDN and the use of eight telephone lines for a live communication of both image and sound, paying 80,000~90,000 yen per hour of connection. It was only in 2003 that Gifu University succeeded in connecting into Sydney University using Internet Protocol, reducing the cost almost to zero for communication itself. Now we are living in a new era: we are ready to concentrate much of our energy on the creation of a new system, a kind of platform for international distance learning.

In order to decide in which direction we should be heading for a further development of international distance learning, however, we must first examine, in some detail, what we already have and then decide which particular style or form of distance learning truly possesses the power of transforming higher education in the world.

Broadly speaking, we have three different technical categories by which we can classify the possible forms of international distance learning:

A. *Lectures delivered to individual learners by on- demand system*
With this style of learning, the lectures are not alive: the students will have no chance of asking questions and getting the answers from beyond the screen, because they are only recorded ones. Its merit for the students is that they can attend the lectures at home at any time of the day and as often as they want. Discussions between the lecturers and the students are possible only through the Internet.

B. *Live lectures for classes*
By combining the Internet and the TV conferencing system, lectures can be live or two-directional. Lectures could be very much alive, inspiring and even thrilling for both lecturers and students by allowing some time for heated questions and answers.

C. *Eclectic lectures*
With a series of lectures, A and B can be combined into a patchwork of lectures. The ratio of the combination could be changed according to the contents or the aims of each module of lectures.

Now let us try to classify the contents, in combination with proper styles in learning, that are prevalent in today's international distance learning. They would also seem to fall into three categories:

X. *A live exchange among students*
This type of learning is not a lecture but a kind discussion, often designed and conducted by the students but within the time frame pre-arranged by the teaching staffs of two universities. This type of learning could hardly occupy a regular place within the curriculum of any university. It would only be a sort of ultra-curriculum activity or an event.

Y. *An omnibus lectures delivered by a loosely organized lecturers*
This type of learning is possible in combination with any of the three technical categories (A, B and C) discussed above. This learning could easily occupy a part of a regular university curriculum. But it has its own limitations: since it usually consists of more than four or five lecturers of considerably different disciplines, the course as a whole would rarely be on an advanced level.

Z. *A course of lectures given by one lecturer*
This type of learning is similar to the traditional face-to-face lectures and it is highly likely to a most orthodox and most powerful type of learning because it could aim at any level of learning, from the lowest to the highest, and it could cover all sorts of studies while technically all three categories can be applied.

The effectiveness of the type X and the type Y is almost self evident. The unique good point of the type X consists in imbuing the students with a thrilling interest in a possible cultural exchange by any two groups of students living thousands of miles away from each other and in making them design the whole shape of discussion so that it would be a truly lively one. The type Y, on the other hand, craves an active participation on the part of the teaching staff seeking cooperative universities overseas. Its success very much depends upon a clever choice of topic too so that a band of famous lecturers could play their respective parts.

As for the type Z, no successful case has yet been reported in Japan so far as I know. A partial success of the type Z, however, was shown in the lecture exchange program which was signed and started in 2004 by the two institutions: Gifu University and the University of Sydney, based upon a " modular lecture-exchange system". On March 2nd, 2004, the Faculty of Arts of the University of Sydney and the Faculty of Education of Gifu University exchanged a memorandum concerning the lecture exchange program through distance learning systems, agreeing to exchange lectures with each other when they were judged to be worthy of being incorporated into an existing course the other party as part of its regular curriculum.

This lecture exchange program proved to be successful for years to come. The majority of the students who took part in this program could enjoy the benefit of its unique experience. Both teaching staffs and technical staffs cooperated with each other. Thus at least one teaching staff, teaching Japanese at the University of Sydney, kept receiving lectures on Japanese language or Japanese culture from Gifu University and at least one teaching staff, teaching English, kept receiving lectures on Australian multiculturalism from the University of Sydney.

But how are we to estimate this program in relation to the future of our international distance learning? Before that, however, we should be examining the exact nature of the program by asking such questions as "Who started it?", "What was the aim?", "How is it progressing now?"

In April, 2002, I was working as a member of a newly organized team at the Faculty of Education for a joint project between Gifu University and Gifu Prefectural Government. Our mission was to do a joint research on international distance learning by finding a willing and cooperative university outside of Japan, possibly one in Australia because of the short time difference with Japan.

Our final aim was to introduce at least one course of lectures from a university abroad, via Gifu University, to the International Network University of Consortium run by Gifu Prefectural Government. It had 17 local participant universities and colleges in Gifu area, including Gifu University. The aim and mission of the Consortium was to enhance the educational quality of the local area.

In early September of 2002, I sent an email to Dr Sonia Mycak of Sydney University, although a complete stranger, who promptly replied the next day saying she would be visiting Nagoya soon and would like to visit Gifu University to see us. Almost immediately she had consulted about our proposal with the head of English department, who supported our project and arranged a meeting of negotiation between the delegate members of Gifu University and those of the University of Sydney one month later.

After several meetings and several trial lecture transmissions, I decided to ask 1~3 of Dr Mycak's lectures to be sent from Sydney to be incorporated into my new course of lectures entitled *Cross Cultural Communication* which was to be opened in October in 2004.

I was expected to offer this course to the curriculum of the Consortium. And I acted accordingly, making one course available upon registration for every student belonging to the 17 local universities and colleges of Gifu prefecture. This was repeated until 2006, when I retired from Gifu University.

In March, 2008, Dr Sonia Mycak suddenly decided to seek the possibility of expanding international distance learning into the whole of Tokai Area: consisting of four prefectures: Aichi, Gifu, Mie and Shizuoka. Her wish was to deliver a series of 15 lectures to the same class beyond the seas in the style Z of live international distance learning.

I also had a dream of my own to establish a network of participant universities, starting with the Tokai Area. When Dr Sonia Mycak applied to Australia Japan Foundation toward the end of March for subsidy, she asked me to work together as an adviser. So we decided to work together. Toward the end of July she had come to Japan and saw the president of Gifu University. She explained to him about her plan. Then he showed some interest in it and even suggested to make use of the Consortium.

I had sent emails to several major universities in the Tokai Area, including Aichi University of Education, Aichi Prefectural University, Nagoya City University, Mie University and Shizuoka University. They were not against our plan. But they said they could not participate for several reasons.

It became clear, however, that one of the most serious problems was the cost. Not the cost of communication but the cost of several other things can not be ignored. For example, an academic labor of developing and delivering a whole series of lectures must be duly paid. And the cost for the work of technicians and the cost for the use of facilities should also be added in the bill.

What I would like to propose here is to set up a system which would ensure, for all supportive universities and colleges throughout the world, a kind of mutually beneficial service much like the one that exists between Gifu University and the University of Sydney, being specialized in international distance learning.

International distance learning, with its effective worldwide system of its own, should be a basic educational infrastructure for the world, based upon mutual responsibility and supported by mutual understanding.

But how are we to establish such a system? Is it not just a dream?

A prototype of that kind may be found in Gifu Station Course of English, a course of English open for the students of the 17 universities that belong to the Consortium. Imitating what I have done for three years from 2004, Associate Professor Tatsumi and Professor Hirota have offered one of the English courses for a trial course of international distance learning in which students, registering for the course, can choose to attend either the station class or the campus class.

This course, by the way, is again a product of collaboration between Gifu University and the University of Sydney. Only this time we are offering a class, consisting of local university students and citizens, an entire course, a series of 15 live lectures, sent from Australia. The main contents are the history of immigration in Australia and the historical and social background of multiculturalism.

An interesting point is that Gifu University decided to pay a high cost. If it should succeed as a regular course of lectures, from which registered students can get academic credits, it will be a historical success, and may trigger a series of similar attempts. Yet it may take several years or more for this project to get full recognition on the part of the citizens and students.

A profoundly significant message for all the universities in the world, however, will be that any lecturer of any university, including most famous or greatest professors, would be available even to a far off university simply by applying for a certain course of lectures that would be absolutely necessary to maintain its high level of education.

One big problem, of course, is the language barrier. English is an ideal common language for international distance learning because it is most widely used in the academic world. But every lecturer will have to make an utmost effort to speak clearly and distinctly and at a more or less slow pace when they speak to the students whose first language is not English, although there will always be a certain number of lecturers speaking in their own mother tongues, such as a Japanese lecturer speaking to foreign students majoring in Japanese.

Another big problem is the high cost to pay for the work of the lecturers and the technical supporters as well as for the facilities. Only a very rich university will be able to pay the cost by itself annually. But a network of universities could share the expenses and have the lectures sent to their campuses at a time, which is technically possible.

A truly global solution for these problems, however, rests on a mutually beneficial system supported by all the participant universities forming a network with rules.

One thing we should be doing, at an earlier stage of development, is to establish a rule that any university that offers a course of lectures to any participant university will obtain the right to get one course of lectures of its own choosing from one of the participant universities. Repeated international transference of money would be troublesome for any university, but a mutually beneficial system will effectively and drastically reduce the trouble.

Another thing participant institutions should be doing, at a little later stage of development, would be to exchange their academic information which tells about the academic career, with a list of selected publications, of every lecturer belonging to the participant institutions. Thus every participant institution will be provided, probably in a thick book, with basic academic data of information, which is absolutely necessary for any institution to search suitable lecturers when it decided to reorganize or improve its curriculum.

Part 2: The case of international distance learning in Sydney and Gifu universities by Sonia Mycak

The international distance learning project involves the exchange of lectures between the Faculty of Education of Gifu University and the University of Sydney's Faculty of Arts. Live lectures are transmitted through audio-visual links. From October 2002 and throughout 2003, trial lecture transmissions were conducted using both ISDN (Integrated Services Digital Network) dial-up circuits and IP (Internet Protocol) links. The latter proved to be both effective and cost-efficient. In March of 2004 an agreement was formally concluded between Gifu University's Faculty of Education and the Faculty of Arts at the University of Sydney for the continuing provision of such lectures. Each year lectures on Japanese language, linguistics and culture have been transmitted from Gifu University and incorporated into Japanese studies courses for Sydney University students. Lectures in Australian studies have been transmitted from the University of Sydney to Gifu University and incorporated into existing courses in cross-cultural communication and English as a foreign language.

This lecture exchange between Gifu and Sydney universities has been reported on in Gifu University publications and academic journals (for example, "An approach to international distance education through a module-exchange system" by Aoyagi, T., Imai, A., Ema, S., Kato, N., Kobayashi, K., Nishizawa, Y., Hirota, N., Matsubara, M., Yamada, T., and Mycak, S. published in the *Journal of Multimedia Aided Education Research* Vol 3, No 1, 2006, pages 9-18).

The project has generated considerable media interest, particularly in Japan. The inaugural trial lecture transmission from Gifu University to the University of Sydney was reported in the national newspaper, the *Australian* (13/11/2002). The formal signing of an agreement between the two universities was reported in Japanese television news broadcasts Japan Broadcasting Corporation (NHK) Gifu and Gifu BC, and in four Japanese newspapers: *Asahi* and *Yomiuri* (nation-wide), *Chunichi News* (regional), and *Gifu News* (local). The lectures transmitted from the University of Sydney have received press coverage in Japan, on television (*Rabu Rabu Waido Today* [11/1/05] and in newspapers: *Gifu News* (12/12/02); *Chunichi News* (12/11/02); *Chunichi News* (12/1/05); *Gifu News* (12/1/05); and *Yomiuri* (1/2/06).

My role within this project has been to coordinate the University of Sydney's involvement and develop and deliver lectures for transmission to Gifu University. It is from this perspective that I would like to discuss my experiences of teaching Japanese university students using this particular form of distance learning.

The content of my classes may best be classified as 'Australian Studies'. The broad aim is to introduce Japanese students to the history, society and culture of Australia. As the settlement of Australia includes the original Indigenous people, the arrival of the British in 1788, post-war immigrants from Europe, and more recently people from Asia, Africa, the Middle East and the Pacific, my lectures present the development of Australian society and culture from the perspective of Australia's British colonial history, Aboriginal Australia, and the history of immigration and the development of multiculturalism.

The objective is to learn about Australia from the perspective of multiculturalism and the cultural diversity of Australian society. The intention is for students to develop an understanding of how Australia has developed from a British colony settled in 1788 to one of the most multicultural countries in the world. We also explore the relationship between Australia and Japan.

While Australia is of particular interest to Japan given our strong trade and strengthening security relationships, multiculturalism is now increasingly relevant to Japan. Immigration and the settlement of foreign residents is one of the most critical issues facing contemporary Japan. This has been evident in recent debate within government and political circles about whether to implement greater levels of immigration as a response to a decreasing and ageing population. This question is most pressing for those in the Tokai area of Japan (to which Gifu prefecture belongs), as these municipalities have the highest number of foreign residents (due to employment in local manufacturing industries). The scholarly focus upon multiculturalism within my classes, together with special attention to the Australia-Japan relationship,

is intended to increase the Japanese students' understanding of cultural diversity as an increasingly shared interest with Australia.

My overall objective is to provide a positive educational experience through which Japanese university students will develop a basic although well-grounded understanding of Australian history, culture and society. It is hoped that as a result the students will be better equipped should they wish to pursue connections with Australia in their own fields of endeavour and throughout their own professional careers. In this sense, the ultimate purpose of this project is to deepen links between Japan and Australia.

Participating in this international distance learning project has required my developing specific teaching/learning materials: writing lectures and selecting accompanying textual and audio-visual material. The teaching/learning materials have been tailored specifically for a cohort of Japanese students. Rather than reproducing existing Australian studies material aimed at students in Australia, I have developed new materials for tertiary students who are non-native users of English, and have little or no prior knowledge of Australian history, culture and society. This also entails drawing upon cross-cultural pedagogical strategies and adapting them specifically to an Australia-Japan context.

Perhaps the most pressing pedagogical issue is the differing level of English language proficiency within student cohorts. The students of Gifu University are not native speakers of English, and even within the one group there can be varying levels of English language ability. The challenge is how to make the material accessible and comprehensible, given the language of instruction is English. In preparing and presenting the material, I try to use clear and concise language that would be easy to understand. I repeat the most important points two or three ways, using a different sentence structure each time. I avoid the use of jargon or figurative speech. In short, I need to use language that is not complicated, even when talking about quite complex concepts and ideas.

I employ a number of teaching methods, as I endeavour to incorporate key skill areas of listening, speaking, reading and writing. Depending on the number of classes I give, to some extent the students experience a variety of learning styles. Most often my classes open with a conventional 'talk and chalk' lecture, supported by a written copy. As I speak, the students can follow using their own printed text. At times I stop and direct the students to annotate their copy. Audio-visual material plays a very important role in both reinforcing the lecture material and introducing new subject matter. At times the students undertake responsibility for their own learning, as they are expected to complete a small research or assessment task outside of class. Active questioning is encouraged during class-time, and students also take up the invitation to email comments and questions following each class.

There are varying levels of student participation, depending upon the objective of the lesson. The more conventional lectures designed to provide maximum information are perhaps the most 'passive' in terms of the students' contribution to the learning environment. On the other hand, one of the most interactive lessons I have given was one in which I introduced the students to an Australian literary text that portrays cultural diversity and explores the issue of cross-cultural communication. The intention was to actively involve the students in the reading and comprehension of the text. To this end I selected an excerpt from a radio play, since this type of writing is designed to be read out aloud rather than be performed on stage. Since the students had been given a copy of the text, several could take on roles in the play, while the rest could closely follow the script. I gave some contextual information, explaining who the characters were and when and where the action was set. By prior arrangement with the Gifu University professor who was supervising the class, certain props were also obtained and brought into the classroom. Then we performed the play. The students seemed to find this enjoyable as well as informative. Discussion of the theme and issues raised in the play completed the lesson.

The distance learning arrangement between Gifu and Sydney universities has functioned according to what Gifu University colleagues have called "a module-exchange system", whereby a series of up to three lectures are transmitted from the sender university to be incorporated into an existing course taught by the receiving university. My classes in Australian studies have been received by professors Norio Hirota and

Toru Tatsumi and incorporated into their "Communication by Foreign Language (English)" course. Hence one audience for international distance learning classes at Gifu University has been learners of English as a foreign language within the Faculty of Education. As a form of content-based English language instruction, the value of such international distance learning lessons may be self-evident. Indeed, when Gifu University students were surveyed after taking the classes (in 2007) a majority of students (81%) concluded that international distance education is effective for studying English. A significant number (60.3%) stated that this form of tuition should be introduced (32.8% were undecided while only 6.9% disagreed). ("On the results of questionnaire measured in the class 'Communication using foreign language [English]' in 2007").

As a vehicle for exposure to native language use and specialist content and vocabulary, a module of international distance learning classes may, to a certain extent, stand alone. However the intention to provide such classes to students other than those who are studying English, to draw upon the distance education more for content than for language tuition, raises an important issue: incorporation within the existing Japanese syllabus. Whether it concerns the possibility of introducing an entire course or including a series of lectures within an already established course, an important factor in the success of distance learning is the degree to which it can be integrated into the existing curriculum.

My lectures on Australian culture and cultural diversity were included within a course entitled "Cross Cultural Communication" convened by Professor Yasuo Nishizawa. My brief was to provide a module of three lectures but those lectures needed to complement Professor Nishizawa's classes, and match the material already covered in the course. My aim may have been to give the students some understanding of the history of immigration and settlement and the reality that contemporary Australia is a place in which people from different countries and of different cultures live. However, this needed to be meaningful in the context of the entire course and relevant to the broader aims of study. There was scope for bringing out both points of similarity and divergence between Australian society and culture and that of Japan. Real benefit would come from the students developing a comparative awareness, and some insight into the ways countries other than Japan have experienced the interaction of cultures in a profound way. I needed to make such connections obvious, so that my module of lectures would not seem disconnected or incongruous. Therefore I introduced my series of lectures by citing the words of Kakuzo Okakura, a prominent Japanese intellectual whose work the students had studied during the course. Quoting from "The Book of Tea", I highlighted Okakura's concern for potential misunderstanding between cultures, but also his belief in the possibility of different cultures coexisting and 'supplementing' each other. Okakura's thinking had developed in response to Japan's relationship with the West, but his thoughts could also be insightful for understanding cultural diversity within other societies, such as that within Australia. Indeed he may have been surprised to find that Australia is now like "a tea-cup in which humanity has met". The interface of cultures provided a theoretical ground from which Professor Nishizawa could reevaluate Japan's 'cross-cultural communication', both in terms of ancient relationships with China and Korea, and Japan's more recent 'westernisation'. What I tried to bring was a meaningful contrast and comparison with Australia's post-war expansion in terms of industry, economy and population, and the development of Australia's multicultural society. Together Professor Nishizawa and I hoped the students' understanding of Australia's cultural diversity would relate to their exploration of the impact of cross-cultural communication upon Japan.

Aside from course content and pedagogical approach, other factors have been crucial for the success of the international distance learning classes: delivery quality and delivery techniques. Teams of technical support staff at both Gifu and Sydney universities have worked tirelessly to ensure smooth transmission and reception of the video-conferences. This reminds us of the need for strong institutional support, including expert technicians, video conferencing equipment and other technical resources. Unfortunately this also bespeaks the possibility of institutional constraints, given the lessons designed for international distance learning may not always be suitable for domestic students. Departments and Faculties may be limited in the resources they can assign towards developing distance learning units of study for use by students of other universities.

I have always been aware that the technology supporting the long-distance learning link-up between Gifu and Sydney universities could be taken advantage of to create an interactive learning experience. Various forms of multimedia have been employed, using a high visual component (video, photographs, images and the like). The use of real-time transmissions has maximised immediacy. Given there is no significant time difference between Australia and Japan, video-conferencing is a particularly effective vehicle for distance learning classes. Nonetheless there is more work to be done and our plans for the future involve investigating the technological possibilities for providing on-demand transmissions and E-learning technologies aside from video-conferencing. We will enhance and further develop forms of video-conferencing beyond the standard lecture format to include new strategies for student-to-student and student-to-lecturer interaction.

While certainly challenging, international distance learning is ultimately very fulfilling. Feedback from students has reinforced this fact. It was satisfying to learn, for example, that "Sonia's English was easy to understand" (email from student dated 12/1/05). It was rewarding to see careful consideration: "I read through the study material of today's class in the train back from university. And now I have questions from today's class…" (email from student dated 11/1/05). And of course I was pleased to hear my students say "I'm looking forward to meeting you again next week" (email from student dated 11/1/05).

The current project appears to address a growing desire within Japanese universities to internationalise curricula by (i) expanding the classes presented in English and (ii) providing domestic students with an accessible international experience. For Australian universities too, broadening the student learning experience has become an important aim, as has the need to raise awareness of Australia's place within the Asia-Pacific region. Both these objectives may be met through an international distance learning venture such as the lecture exchange between Gifu and Sydney universities. In fact, the broadest aims of international exchange can now be served through international distance learning, by allowing students a readily accessible but truly global educational experience.

Indigenous Curriculum: A local solution to global concerns

Dr. Colleen McMurchy-Pilkington
Head of School, School of Te Puna Wananga,
Faculty of Education,
University of Auckland,
NZ

Abstract

Since 1800s curriculum for Māori (indigenous people of Aotearoa New Zealand) has been controlled by non-Indigenous educators. Education became an instrument for conformity rather than a tool of empowerment. Despite Māori resistance, schooling was largely monocultural and based on English. Consequently Māori were disenfranchised and achievement was hindered.

Neo-liberalist policies of the 1990s meant the state reduced its involvement in people's lives and devolved some responsibility to local communities. In line with these policies the Ministry of Education (MoE) contracted out development of the first national curriculum policies. The Minister listened to the voice of Māori and agreed to support the development of curriculum in the Māori language. Although Māori writers' intentions were positive the resulting curriculum, albeit written in Māori, mirrored and was almost a direct translation of the English Medium curriculum

This presentation critiques the development of the first national curriculum in the Māori language and examines how MoE structures restrained Māori agency. The fact that Māori resistance brought about some changes to the MoE structures will be considered, along with Māori political and cultural reasons for engaging with the state in what was, at times, a dehumanising process for writers.

In 2007 the MoE decided to again revise all national curriculum policies. The new process saw a shift for Māori from 'curriculum as translation' to 'curriculum of the people'. The state worked in partnership with Māori in a more enabling process. Space for Māori community voice in the development of the newly introduced school based curriculum could result in a curriculum that is empowering.

Traditional College Students and Greek Students: A Comparison of Ethical Behavior

James Sottile/Professor
George Watson/Associate Professor
Dallas Brozik/Professor
Ruth Ann Murphy/Professor
Marshall University

Abstract

Traditional College Students and Greek Students: A Comparison of Ethical Behavior
    The goal of this research was to extend the literature in the area of moral/ethical development as related to traditional (non-Greek), sorority, and fraternity college student behavior. Identifying the moral or ethical level of traditional, sorority, and fraternity college students is significant in understanding the influences such a population will have on society and the work force. The impact of inappropriate or immoral behavior can have extensive negative consequences on both the individual and societal structure. By understanding ethical behavior at an early developmental period, appropriate interventions could be constructed to educate a person to engage in ethical activities. To address these issues, there were two research questions: (1) What are the differences between traditional (non-Greek), sorority, and fraternity college students' responses to ethical situations? and (2) What specific ethical categories exist between traditional, sorority, and fraternity
 college students' ethical behaviors?
    A novel survey was created to determine the ethical activities of the college students.   The survey had 20 questions and responses were determined by answering "Yes" or "No." Questions were divided into three general categories, civics, classroom conduct, and personal attitudes. In 2009 there were 84 sorority and 49 fraternity students who completed the survey. A total of 2718 surveys were completed in 1998 and a total of 1832 were completed in 2006. All the data from the 4683 surveys were analyzed for this study.

    There were prominent differences between traditional, sorority, and fraternity students regarding their responses to ethical situations. Results indicate that sorority students and traditional non-Greek students typically responded in a more ethical and conservative manner compared to fraternity students. College students will cheat when given the opportunity but fraternity students tend to cheat more (self-report) in academic situations than non-Greek students and sorority students. The most shocking data from this research is related to drug use and implied inappropriate behavior in a student's room. 76% of fraternity students would attempt to stop a friend from trying to encourage an intoxicated person to go back to his/her room to engage in inappropriate behavior. Almost all (96%) of sorority members would try to stop such behavior. 24% of the fraternity students would allow a friend to try to encourage an intoxicated person to go back to his/her room to engage in in
 appropriate behavior. In 2006- 84.79% of male and female college students would stop a friend from trying to encourage an intoxicated person to go back to his/her room to engage in inappropriate behavior. Back in 1998 only 73.05% of college students would stop a friend from engaging in inappropriate behavior. The 2009 data related to the fraternity students regarding this question was similar to the 1998 data for the same question. It can be debated that fraternity students are slow to change behavior when it is related to alcohol use and inappropriate behaviors.

Constructing Culturally Sensitive and Responsive Education

By Dr Qin Guo
Discipline of International Communication
Macquarie University
Sydney, Australia

Abstract
This paper addresses the concerns about the aim of education in the context of internationalisation and strategies to meet these aims. The dynamics and complexity of international education from the perspective of intercultural communication and the needs to integrate intercultural competence into the curriculum were discussed. A participatory teaching and learning model is articulated to demonstrate how intercultural competence can be developed in the context of international higher education.

1.   The aim of education

Internationalisation of education challenges education researchers and practitioners to rethink the question that has been asked for hundreds of years: What is the aim of education? Alfred North Whitehead asserted that the valuable intellectual development was self-development. He stressed that education should enable the child to make the learned knowledge his own and to apply the knowledge in the circumstances of his actual life (Whitehead 1929). Whitehead's emphases on the usefulness of education was apparent in his writings, which was shared by other education philosophers of his time (Cahn 1997, p261) and supported by many of the contemporary education thinkers.

Student oriented teaching and learning lies at the core of the conception of student self-development and usefulness of education. To date, student oriented teaching and learning is mostly informed by psychological theories and experiments. Underpinned with constructivist epistemology, psychologised perspective of teaching and learning recognises the active role of students (the learners) in constructing their knowledge. From the constructivist's point of view, teaching and learning is not a process whereby knowledge transmitted from the teacher to the learner. What is transmitted from the teacher to the learner is the message, which is produced by the teacher with the intention to transmit her (the teacher's) perception. The learner receives the message, but not necessarily the teacher's perception. She initiatively constructs her perception from her point of view and with her background (Guo, 2009). Learning is a subjective initiative of the learner that happens on the end of the learner. Knowledge is constructed by the learner in the process of learning. The teacher can not produce knowledge on the learner's behalf, nor impose knowledge on the student. However, the teacher is obligated to support learning and to facilitate bringing about useful learning. "In constructivist theory, different individuals coming from diverse backgrounds will see the world in different ways" (Kincheloe 2005, p9). Therefore, each individual learner constructs his/her knowledge differently. From the psychologised perspective, teacher is able and ought to diagnose and understand each student's needs for learning. Through accurate diagnosis and understanding of the needs of each student, the teacher is able to select appropriate methods, arrange relevant message and learning experience in order to bring about useful learning. Apparently, there are two rationales behind this theory. One is the recognition of the subjective initiative of the learner in constructing his/her knowledge. The other is the assumption that student needs can be diagnosed, therefore teaching methods and learning experience prescribed. While it might be arguable that there are certain general principles that are relevant to humankind, this assumption seems unconvincing where cultural diversity is of concern. In multicultural classroom, origins of student disparities are of cultural as well as psychological nature. Unlike most psychological factors (e.g. intellectual skills) which are measurable, most cultural factors are dynamic and unmeasurable. Differences of value systems, beliefs and customs, lead to variances of constructed knowledge as well as variances of the way of constructing. Therefore, the constructivism's approach of teaching and learning, which is satisfied with the teacher's identifying student needs and selecting appropriate methods to bring about useful learning, encounters challenge in international education. One may ask: By whom the teaching and learning methods are perceived to be appropriate and useful? How the

student's needs are understood? Why these needs are understood in this (these) way(s)? How true are the teacher's understanding of student needs to the needs felt by the students? These questions reflect the complexity of teaching and learning in multicultural classroom and demand a student responsive approach in education. It is beyond the capacity of constructivism theories to answer these questions (Guo, 2009).

Critical constructivism pursues understanding of production of knowledge as well as understanding of the way of production. People normally learn, judge and act in the way that they are accustomed to without reflection. Critical constructivism brings people "to consciousness the process by which their consciousness was constructed" (Kincheloe 2005, p11). Understanding the way of one's own construction, help one to identify and understand other people's construction, and bring insights to differences between construction of one's own and that of other people. These insights contribute to development of one's intercultural competence, i.e. the ability to recognize and attend to the challenges of cultural diversity (Barrera and Corso 2003, p33).

Globalisation increases the abundance of intercultural exposures, connections, interactions and interdependence. People of different ethnicities, religions, nations work, learn, trade, and live together in physical (cities, universities, workplaces) and virtual spaces (internet, satellite TV). This presents both opportunities and threats to harmony of human society. On the one hand, intercultural exposures and interactions without intercultural understanding imply more chances of intercultural conflicts and thus may be harmful to human harmony. On the other hand, globalisation enables intercultural learning to occur in real time and space and thus opportunity for developing better intercultural understanding and tolerance. In the process of intercultural exposures and interactions, a critical constructivist becomes aware of cultural diversity and acquires understanding of ways of doing and thinking that are alien to him/her. These awareness and understanding empower the critical constructivist to reflect on his/her own ways of doing and thinking and bring her to further understanding of the culture of herself and those of others, and thus eventuate in development of intercultural competence. In international education, teaching and learning occur in parallel with intercultural exposures and interactions. The context of international education allows intellectual and intercultural competences to develop concurrently. Both of these two types of competence are essential for a global citizen. Intellectual competence enables the educated to work successfully in the material world. Intercultural competence enables the educated to navigate smoothly and efficiently in multicultural globalising world. From this point of view, development of intercultural competence, like intellectual competence, forms part of the aim of international education. Supporting and facilitating intercultural competence development should be integrated in the process of teaching and learning.

2. Intercultural competence in international higher education

In intercultural communication discourses, one may find terms such as cultural competence, intercultural competence, intercultural intelligence, and cultural intelligence have been used alternately. In the context of international higher education, the term "intercultural competence" seems to be most appropriate. Firstly, using the word "Intercultural" instead of "Cultural" underlines the equality of all participants (oneself and others; teacher and student; local and foreign). This stresses the viewpoint that cultural differences exit between cultures, rather than as the result of comparing "other" cultures to the "dominant" culture. Secondly, using the word "Competence", instead of "Intelligence" as some scholar preferred (Peterson 2004), highlights that it is concerned with the quality of one's characteristic that links closely with moral and ethics. Under this conceptual framework, a holistic concept of intercultural competence should consist of three dimensions and under one premise. The three dimensions are the capability to understand and deal with one's own culture; the capability to understand and deal with "other cultures"; and the capability to negotiate between cultures of one's own and of others. The premise is that intercultural capability must be applied morally and ethically.

In intercultural encounters, the most apparent challenge is to deal with cultural differences. People of different cultural backgrounds view things differently and thus act and react differently. Being culturally competent means being aware of the differences, being willing to accept the differences, and being capable

to accept the differences in a moral and ethic way. Critical consciousnesses of one's own culture and of other people's culture support each other. When confronting cultural differences, one will naturally be aware of the difference of "others" and subconsciously used one's own culture as the standard to identify the difference of others. The lack of self awareness prevents insightful understanding of other people's culture. Brooks Peterson observed that "you can't learn about other people's culture until you develop awareness of your own" (Peterson 2004, p162). Cultural self-awareness equips one with the capability of introspection and empathy. The capability to understand and deal with one's own culture and the capability to understand and deal with "other cultures" are interdependent. One could not exist without the other, and development of one will enhance the other. The third dimension reflects the value of equality in intercultural education. All cultures of the world are justified and meaningful in their own contexts and deserve being respected, appreciated and valued. In international education, all cultures should be treated equally and without referencing to other power relations. In discussing multiculturalism and the "expanding community", Maxine Greene argued that:

> "No one can predict precisely the common world of possibility, nor can we absolutely justify one kind of community over another. Many of us, however for all the tensions and disagreements around us, would reaffirm the value of principles like justice and equality and freedom and commitment to human rights" (Greene 1997).

There should be no dominant culture in international education. That is no culture could claim absolute superiority over any others. Meanwhile, intercultural competence could not be reduced to cultural concession – regardless of concession of one's own culture or other people's culture, because upholding the value of justice, equality and freedom is the right as well as obligation of all. Intercultural competence, most importantly, is reflected in the capability of intercultural negotiation in moral and ethical way. In other words, intercultural competence is not about dealing with cultural differences, it is about successfully and smoothly navigating between cultures.

From the perspective of intercultural competence as an aim of education, the importance of intercultural competence development in international education is three fold. Firstly, intercultural competence is the premise for successful and fruitful teaching and learning in intercultural contexts. Intercultural competence is based on awareness, knowledge, understanding, respect and appreciation of cultural diversity and can be acquired in intercultural practices. Intercultural competence development means development of one's attitude, values, and behaviours towards cultural differences. These properties contribute to one's cultural entirety. In this sense, intercultural development is essentially a process of developing one's culture through intercultural learning and sharing. International education provides an ideal environment for intercultural learning and sharing. In international higher education, each student comes with a rich bank of knowledge accumulated in his/her past studies, works and life. The students also bring various perspectives and approaches that reflect their cultures and experience backgrounds. The richness of knowledge and the scope of viewpoints possessed by the students in multicultural classrooms are incomparable with those in mono-cultural classrooms. These are valuable resources for teaching and learning. Intercultural competent teaching and learning should aim to overcome intercultural barriers and to utilise these resources to enrich teaching and learning experiences. Secondly, intercultural competence should be an important graduate capacity in the globalising world. Teaching about culture is not an entirely new concept in education. Alfred North Whitehead pointed out decades ago that education should aim at producing "men who possess both culture and expert knowledge", because "expert knowledge will give them the ground to start from", and "culture will lead them as deep as philosophy and as high as art" (Whitehead 1929). Subject expert knowledge and culture, i.e. the entirety of one's attitude, values, beliefs, are the key qualities to be developed through education. Subject expert knowledge establishes the foundation of a graduate's capability. Culture guides the graduate's construction and application of subject expert knowledge. As discussed above, meaningful education should enable students to make what they were taught their own knowledge and to apply the knowledge into their practical situation. Therefore, the contents of the subject expert knowledge and culture, as the key qualities to be produced through education, evolve alongside with the evolution of the human society in order to be meaningful and useful. Graduates of today's education will enter a world where intercultural interactions and interdependences are prevailing and increasing. To

be successful in the globalising world, graduates of the global future need not only intellectual competence, but also intercultural competence. Thirdly, intercultural competence development may facilitate intellectual development. In the course of developing intercultural competence, students expose to and learned to view the world from various perspectives and approaches. They not only learn what the knowledge is, but also how the knowledge has been constructed, and furthermore, alternative constructions of knowledge. Through this dynamic and critical learning and development process, they gain broader and deeper understanding of the subject expert knowledge.

A crucial dimension of intercultural competence in international education is to accommodate cultural diversity. This demands a critical constructivism conceptualisation of teaching and learning, that values diverse ways of viewing and knowing. Inspired by Paulo Freire's concept of liberation education and ideas of critical constructivism, the author has been practicing the participatory teaching and learning approach in a international postgraduate program in recent years.

3.   Participatory Teaching and Learning - accommodating cultural diversity

The participatory teaching and learning method integrates principles of liberation education and critical constructivism to accommodate cultural diversity in the context of international education. The concept of liberation education opposes any power relations or authority in education. Teachers and all students are equal actors in the cognitive actions. Liberation education consists in actions of the "cognitive actors" rather than information transferral (Freire 1970). The epistemology of critical constructivism is the underpinning theory of liberation education. Critical constructivism is grounded on the constructivism notion that views knowledge as human construction. Knowledge is not, as objectivist claimed, validated truth that reflects the reality. Knowledge is constructed by human with the whole set of social, cultural, political and historical backgrounds. Under the critical constructivism theoretical framework, education is a process of knowledge construction, rather than knowledge transmission. Learning is, therefore, impossible without engagement of the learner in the knowledge production process. "A central dimension of teaching in this context involves engaging students in analysing, interpreting and constructing a wide variety of knowledges emerging from diverse locations" (Kincheloe 2005). The essence of the participatory teaching and learning method is to bring about meaningful learning in multicultural classroom through engaging students in cognitive actions that aim at construction of useful knowledge. In participatory teaching and learning, learning consists in dynamic cognitive actions of which the students are active actors. Knowledge is not transferred from the teacher, but constructed in the interactions among students and between students and the teacher. In participatory teaching and learning, students are given more autonomy in deciding what and how they prefer to learn. However, this does not lessen the importance of the teacher's role. On the contrary, participatory teaching and learning sets an even higher requirement for the teacher. It requires the teacher to be knowledgeable and flexible enough to meet the diverse and dynamic requirements of the students, and demands more preparation time for each class.

The subject chosen for the experiment of the participatory teaching and learning method is Development Communication. The reason to choose this subject is the correlation between the teaching and learning approach and the subject content. Participatory communication is an important concept in the field of development communication, and shares a common origin with Freire's liberation education. Development of students' knowledge and skills of participatory communication is identified as a key learning objective of the subject. The class has always been highly internationalised. In the second semester of 2009, the 20 students enrolled in the subject came from 10 countries, including students from Australia, Asia, Europe, North America and South America. It was expected that the participatory teaching and learning method could on the one hand accommodate the cultural diversity of the class, through engaging students in the knowledge construction process. On the other hand, it will enhance students' understanding of participatory communication, because the teaching and learning process followed and showcased by the author allows for praxis in participatory communication. The method is proved to be successful in facilitating critical learning and accommodating cultural diversity in multicultural classroom. Student learning experience evaluation in the past three years scored above 4 (of the 5 mark scale).The highest score was achieved in

the evaluation conducted in July 2008, scoring at 4.8. The participatory teaching and learning method is composed of the following four components.

Multicultural working and learning groups
Intercultural exposure and interactions in the context of internationalised education provide opportunity to enrich student learning experiences. The rationale of multicultural groups is to develop students' capability to work and learn cooperatively with people from different cultural backgrounds. Students are required to form multicultural working and learning groups in the first week of the semester. Each group is recommended to have 4 to 5 members and no more than two members in one group should come from one particular country. The groups are assigned with two major tasks. One is to design and present to the class a development communication campaign, using theories and concepts learnt in the course. Although this is the final project of the course, students are advised to start working with their groups from the first week, so that they start the multicultural experience from the beginning of the semester. The second major task is an ongoing one. The groups are required to take turns to lead each week's discussion session (normally one hour each week). This ensures the group work together constantly. While all students are required to prepare for and participate in each week's discussion, the leading group are in charge of facilitating participation and triggering discussions. Therefore, the leading group are assessed from two aspects: their preparation for the discussion topic and facilitating strategy. Working in a culturally diverse group gives students opportunities to interact closely with people from different cultures. While working cooperatively towards the accomplishment of the group project, they practice and develop their skills to express, appreciate, and negotiate cultural differences. Constant intercultural exposures and interactions in a supportive and collaborative environment enable development of intercultural awareness, understanding and capability, and thus lead to development of intercultural competence.

Student controlled learning process
Under the conception of liberation education, students do not passively receive the knowledge transmitted by the teacher. They take part in the cognitive actions as equal actors. Knowledge is constructed in the cognitive actions and dialogues that involve the teacher and all students. Participatory teaching and learning empowers student with the autonomy to determine what and how they prefer to learn. This ensures that meaningful and useful learning is brought about. The delivery of the subject Development Communication is designated as a weekly three-hour seminar. In the first week, students are informed of the objectives and expected learning outcome of the subject. Assessment components and criteria are also explained. From the second week, each seminar is started with a discussion session. At the discussion session, students will critically discuss the reading material and share their understanding. They may refer to specific experience of their own or of other students and explore the topic further. They may ask each other questions (e.g. how did the Chinese government promote the One Child Policy? What happened in mass communication reformation in Thailand?) The discussion session will generate a list of questions that interest the students and about which they want to learn more. The author prepares the lecture on PowerPoint slides for each seminar based on the learning objectives and frequent asked questions of previous students. Questions raised from the current discussion session are noted on the whiteboard and be integrated into the lecture. Relevant audio-visual materials may be used to expend student learning experiences and bring in new approaches and perspectives. Critical enquires are encouraged in the class. It is the author's undertaking to the students that they may challenge the lecturer with any questions that are interesting to them. The questions will be answered by the lecturer or may be further discussed in the class. If the lecturer could not answer the question on the day, the lecturer will conduct further research and answer it in the following week. After the seminar, the PowerPoint slides are updated to included questions of the day and uploaded to the course website, which is accessible to students enrolled in the course. Participatory teaching and learning is featured with student controlling and peer learning. The dynamic dialogue and critical analysis from the vast diverse perspectives ensure insightful knowledge construction and intercultural competence development.

Active participation by the students

The participatory teaching and learning approach aims to facilitate and support sharing and constructing knowledge among students. A central idea of critical constructivist teaching and learning is to engage student in producing knowledge of their own through processes of critical analysing and multi-perspective interpreting. Multicultural classrooms are without doubt ideal arenas for this purpose. Students from a wide variety of backgrounds view the world differently. Tossing together the diverse perspectives and experiences developed in various social, political, cultural and economic contexts, and geographical locations, reveals multiple ways of consciousness constructing. The participants construct their consciousness of the subject together with the consciousness of diverse ways of consciousness through the intercultural activities of sharing, analysing, interpreting, and communicating. Group dynamics invoke wider and deeper exploration and research. Additionally, the participatory activities in multicultural classroom are also praxis of intercultural expression and understanding. Most students develop their presentation skills and become more confident in speaking in the end of the semester. Active and inclusive participation of all students is crucial for the participatory teaching and learning model to work. It is recognised that students perform differently in classroom participation due to various factors of cultural and linguistic nature. For example, most European students seem to be more open and quicker to speak in the class, while Asian students normally are relatively quieter. The reason is mainly cultural rather than intellectual in nature. The barrier that prevents Asian students from speaking out in class is language. The two largest groups of non-native English speakers of the author's students are Thai students and Chinese students. Students of both groups said that they were willing to share their ideas, however, "the topic had changed when I realized what it was about" or "the topic had changed when I was ready to speak". When a non-native English speaker engages in communication in English, there are normally two internal translation processes to be completed, though the processes could be short and sometimes subconscious. The first process is to translate the topic of discussion into the student's native language (for example English-Chinese). The student will reflect and organise her/his ideas in her/his native language and then translate the ideas into English (for example from Chinese to English). If the communication involves complicate and unfamiliar concepts, the processes will take longer time. Therefore, most non-native English speakers find it is hard to follow the discussion pace of the whole class. The other major barrier to open and inclusive sharing in international classrooms is the fear of "losing face", or in other words, lacking confidence to speak out. For example, some students regard making mistake or improper comments in the class as losing face. Some students may feel awkward to directly contest against others. These misgivings prevent them from expressing their opinion openly and freely. They speak only when they feel "safe" and are well prepared. Therefore, it is not surprising that some students may keep quiet normally, however, when they do speak, they make good points.

Another barrier to engagement in discussion is the intention to avoid taboo or conflict with the majority. This is described as the "spiral of silence" by some communication scholars. It "is a reaction to taboo, fear and shame – for those who think differently than what they perceive others to be thinking" (Katz 2002). Spiral of silence might occur to people from any cultures. For instance, the author once found that an American student kept quiet most of the time in class discussions. This is apparently unusual for normally the American students are quite active in class discussions. The author found a chance to speak to him and found out the reason that he was usually quiet in the class. The majority of the class were Asian students. The student of concern was the only student from the United States in the class. He often found that his ideas were different from the majority and he did not want to upset his classmates by proposing opposite opinion.

In order to facilitate active and inclusive participation, a consensus of respecting, appreciating, and valuing diverse perspectives and opinions needs to be established. This is indeed easy to understand, but rather hard to achieve. First of all, an open, supportive and inclusive atmosphere needs to be fostered from the beginning of the semester through explicitly affirming the values of diverse cultures and opinions and the effort to respect and appreciate diversity. At group led discussion, the leading group are reminded of the requirement to engage the whole class in discussion. Supporting students with their preparation for the discussion is also essential. This includes foreshadowing the upcoming week's learning topic, recommending relevant reading material, and suggesting one or two questions for perusal. This has proved to be very helpful for students of EFL background. Additionally, during the discussion, an invitation for

individuals to express opinions on issues of their expertise can encourage those who are not used to speaking voluntarily.

Intercultural competence development
Intercultural competence development is an important component of education in the context of globalisation. It is the requirement of the globalising world on education and on the graduates. In participatory teaching and learning, intercultural competence and intellectual capability develop simultaneously throughout the whole process. Students gain intercultural awareness and understanding through participatory discussions. They theorise and logically organise their understandings through presenting and explaining them to others at discussions and presentations. They develop and practice skills of intercultural communication, appreciation, respect, negotiation, and collaboration through multicultural group learning and working activities. They develop personalities of intercultural openness, sensitivity, flexibility, toleration, and empathy while constructing and developing subject expert knowledge and skills, and thus prepare themselves for successfully entering and navigating the globalising world.

Internationalisation of education requires new ways of conceptualisation of education that is informed by teaching and learning practices and critical investigations. Pursuing excellence of education is itself a consciousness construction process which demands constant reflection on what is constructed as well as the way of construction. Based on this critical constructivist point of view, the above discussed participatory teaching and learning method is by no means a conclusive model, but a construction way of international education. Continuous critical research and investigation are required to expend the construction and thus develop wider and deeper consciousness of international education.

ABSTRACT

Valid and reliable assessment in Vocational Education and Training (VET) is very important for ensuring competent and employable k-workers. To ensure this, Department of Skills Development, formerly known as The National Vocational Training Council, is one of the agencies under the Ministry of Human Resource, that is responsible for the co-ordination and control of skills training as well as career development in skills training, and this include monitoring the assessment process among the vocational institution in Malaysia. There are two accreditation systems namely National Occupational Skills Standard (NOSS) based training system and National Dual Training System (NDTS) that awards students with Malaysian Skills Certification (MSC) Level Three after two years training. NOSS based training use National Occupational Skills Standard (NOSS), while NDTS uses the National Occupational Core Curriculum Unit (NOCC). This paper will discuss the similarities and differences between National Occupational Skills Standard (NOSS)-based training system and National Dual Training System (NDTS. The comparison of both systems is based on the general comparison of NOSS and NDTS curricula and the exemplary comparison of specific occupational curricula.

1.0   Introduction

One of the determining factors in accelerating the overall progress to an industry is skills development. This is because the level of skill possessed by worker will determine his/her ability to contribute towards the overall quality of the end product, the cost-efficiency of the product, productivity, the time span to complete the product and flexibility in adapting to changes. To support the development of a workforce with these skills and enhance industry competitiveness, the workforce development system must be adaptable, innovative, and well connected to the world of work.

In Malaysia, the Department of Skills Development, formerly known as The National Vocational Training Council, is one of the agencies under the Ministry of Human Resource, that is responsible for the co-ordination and control of skills training as well as career development in skills training, and this include monitoring the assessment process among the vocational institution in Malaysia. The skills training are accredited by two systems: National Occupational Skills Standard (NOSS)-based training system and National Dual Training System (NDTS). Both the accreditation body will award qualified students with Malaysian Skills Certification (MSC) Level Three after two years training. Although the certificate being awarded is identical, NOSS based training use National Occupational Skills Standard (NOSS), while NDTS uses the National Occupational Core Curriculum Unit (NOCC). This paper will discuss the similarities and differences between National Occupational Skills Standard (NOSS)-based training system and National Dual Training System (NDTS. The comparison of both systems is based on the general comparison of NOSS and NDTS curricula and the exemplary comparison of specific occupational curricula.

2.0   General comparison between National Occupational Skills Standard (NOSS)-based training system and National Dual Training System (NDTS)

NOSS-based system is an accreditation system that was established resulting from the report of the Cabinet Committee on Training dated 21 Mac 1990 ADDIN EN.CITE <EndNote><Cite><Author>Malaysia</Author><Year>2001c</Year><RecNum>30</RecNum><record><rec-number>30</rec-number><foreign-keys><key app="EN" db-id="zeexdew0asvtw4ex5eb52xtna99trd5rpdzr">30</key></foreign-keys><ref-type name="Journal Article">17</ref-type><contributors><authors><author>Malaysia, Government </author></authors></contributors><titles><title>Report of the Cabinet Committee on Training: Training for Industrial Development – Challenges for the Nineties. </title></titles><dates><year>2001c</year></dates><orig-pub>Kuala Lumpur: National Printing Corporation.</orig-pub><urls></urls></record></Cite></EndNote>(Malaysia, 2001c) in response to the training needs for the nation. The system outlines a comprehensive policy on training programme to ensure that training institute would response to the demand of workforce demand effectively. The accreditation system was adopted from the British National Vocational Qualification (NVQ) framework.

 The system comprised of two major elements: the establishment of the occupational skills standards in Malaysia known as National Occupational Skills Standards (NOSS) and the competency-based training approach (MLVK, 1992, p.21, MLVK,1993). The concept of accreditation was defined as "a procedure by which the NVTC (National Vocational Training Council as an awarding body for MSC (Malaysian Skill Certification), evaluated and approved any skills training provider as a accredited centre for undertaking training and assessment leading to the award of the Certification" (NVTC,2001). The accreditation system has quality control in three stages: the qualified accredited training provider, the assessment personnel and the assessment process.

The NDTS has evolved from the Dual Training System Project (DSP) which was formulated with the purpose of strengthening technical education and vocational training in Malaysia by incorporating the dual training system practiced in Germany (DSP, 2001). The DSP started with a study known as 'Basic Study on the Design of a Dual Vocational Training Scheme in Malaysia', undertaken by German consultants during 1997-1999 (Blumenstein,1999). The aim was to produce knowledge-workers or 'k-workers', in order to cope with globalization and rapid changes in technology and increasing complexity of work processes in Malaysia.. To train k-workers, the workplace is utilized as the prime learning environment, thus the collaboration between training providers and industries is essential. The Government of Malaysia decided on 19 May 2004 to implement National Dual Training System (NDTS) commencing 2005. The target was to produce 31,500 skilled workers by 2010 (MLVK, 2005a).

2.1   Qualification/Certification

Both systems will award the same Malaysian Skills Certification (MSC) Level Three to qualified students after duration of two years of training. The certification is based on the Malaysian Qualification Framework (MQF) which is an instrument that develops and classifies qualifications based on a set of criteria. In the NOSS Based training system, certification on skills can be accumulated from Level 1 to Level 3, however in NDTS the programme is conducted in a single tier direct to level three.

2.2   Philosophy and Purpose

The purpose of NOSS-based Training System is to provide an alternative and attractive career development path parallel with academic-based qualification framework. Training and learning can be undertaken on a modular basis each self contained competency can be separately assessed and certified.   Assessment is more flexible-throughout the duration of training.   This skills training system promotes the long life learning (LLL) to enable skilled worker in industries to upgrade their qualification in order to qualify for promotion or as an articulation in their career development. The skills certification is more accessible to trainee and skilled workers through the formal training and Accreditation of Prior Achievements (APA)

process (MLVK, 2007). APA is a process through which the achievements of students can be academically acknowledged, allowing them to receive credit from previous qualifications and experience. The output of the system is equipped with the skills, knowledge and good attitude to make them competent and qualified workers.

The NDTS philosophy is to produce a new type of skilled workforce known as knowledge-workers (k-workers) (Malaysia 2001b) and to look for approach that integrates training and workplace, involving the industries as the main driver. The purpose is to develop a workforce that could adapt to rapid technological and workplace changes, and to nurture creativity and innovativeness as well as thinking skills among trainees through student centered learning approach (Malaysia, 2001a). This is a dual system where the training is conducted in both the training institute and the industry. This is in line with the Third Outline Perspective Plan, 2001- 2010 as : To ensure that the school curriculum remain relevant to industry and include work-based learning components, a mechanism will be set up to link schools with industries (Malaysia, 2001a).

2.3   Curriculum

NOSS based training system

The NOSS based training system is introduced to improve the national vocational training and certification system in Malaysia (MLVK, 1992; MLVK, 1993). This system adopts NOSS as a standard in implementing the training. NOSS is defined as a specification of the competencies expected of a skilled worker who is gainfully employed in Malaysia for an occupational area and level and pathway to achieve the competencies (MLVK 2001). The characteristic of the NOSS are: it should develop based on the industrial occupational needs; followed the career structure in the occupational fields and developed by industry expert/practitioner. This curriculum was developed by using the Developing a Curriculum (DACUM) approach, which is defined as "a group consensus, structured, brain-storming process" (DACUM facilitation Courses).

There are three phases is the NOSS development: occupational analysis; job and task analysis; and validation. The NOSS development starts off with the first phase i.e occupational analysis where the purpose is to identify the job title, career structure and level or position of job title from the skills advisory committee or expert group in related field.
Then job analysis and task analysis is conducted. The job profile chart is the results from the job analysis, is a detailed and graphic portrayal of the skills or competencies (categories by duties and tasks) involved in the occupation being studied. Task analysis is then conducted to analyse selected tasks for steps. Each task comprises of three important elements that are skills, knowledge and attitude/safety in the tasks. There are several elements to task analysis, namely the title of occupation, related duty and task, the performance criteria / standard (what the student should achieved after finish such task as an outcomes for that particular task), sub task (is fraction of the task), enabling requirement where the knowledge, ability and attitude/safety required in the sub task and material, equipment and tools required in the task. The tasks analysis will be repeated for each task in the duty and other duty of the job profile chart. The third phase is the validation of NOSS which is conducted by the Skills Advisory Committee and Department of Skills Development.

In Malaysia, skills training based on NOSS is offered by various public and private training institutions. As at May 2007, a total of 1,151 different training institutions have been accredited to offer 6,575 training programmes based on NOSS, of which 363 centres are administered by public agencies and authorities, whilst the remaining 788 are privately run (Thomas, 2007).

NDTS

In contrast, NDTS uses the National Occupational Core Curriculum (NOCC) as a foundation for the implementation of training and assessment in industries and training institutes. The NOCC is defined "as the documented training structure to be carried out by the industry and the training institution comprising of the practical and theoretical of the changing technologies, to produce k-workers" (MLVK, 2005b). The concept of the NOCC has been based on the work process approach and concept of 'work process knowledge'. The characteristic is combination of the theoretical knowledge and practical experience in a

systematic way, as well as an orientation towards the entire business and work process of a company (Hoepfner & Koch, 2004b). The curriculum of NDTS is develop by using work process analysis approach by the relevant industry for specific training occupations, in which experts and practitioners identify the training subjects to be included for the training at the industry and training institute.

The NDTS Curriculum consists of the following components: Training Occupation (TO), Occupational Profile, Training Occupation (TO), and Occupational Core Work Processes (OCWP). First, Training Occupation (TO) is defined as a cluster of job areas in a specific sector selected for training in NDTS. It is based on work process oriented curricula to produce k-worker with occupational competencies comprising of technical competencies, social and human competencies as well as learning and methodological competencies. Second, Occupational Profile provides details of the work demands and conditions of a Training Occupation and describes the nature of work, working conditions, employment prospects and qualification awarded upon completion of training. And third, is Occupational Core Work Processes (OCWP) which is defined as a group of main work processes identified during the work process analysis and is commonly practiced in several companies dealing with the same Training Occupation. The OCWP consists of a group of about 8 – 12 Core Work Processes (CWP) of the Training Occupation.

The development of OCWP is carried out through Work Process Analysis. This involves the analysis of actual contents of core work processes and their relevance to the Occupational Profile and interrelations between technology, work and training. The Work Process Analysis is carried out to provide a clearer and more detailed picture of competence requirements associated with the Occupational Profile. This analysis will then form the basis for the construction of the Core Competencies. The elements of the OCWP are first Core Work Process which is a set of core work activities conducted in a complete action cycle (goal setting, planning, decision making, executing & monitoring and evaluating) which are commonly practiced by skilled workers across the industries of the training occupation. Every Core Work Process will produce either a product, service or decision. Each of them consists of: Description of Core Work Process, Details of Core Work Process and Core Competencies. Second element is Description of Core Work Process which is includes the Core Work Process, products/services and standards to be achieved in carrying out the core work process. Third element is Details of Core Work Process which is elaborated in the Details of Core Work Process under three main headings namely: Core Work Activities, Tools/ Technologies, Methods, Organization of Core Work Activities and Social Values and Social Skills. The fourth element Core Competencies (CC) which states the competencies required to carry out the Core Work Process. These competencies comprise the five stages of the complete action cycle, namely setting goal, planning, decision making, executing & monitoring, and evaluating. It also specifies the training venue where the competency should be acquired as well as the training duration.

In summary both curriculum, NOSS-based training and NDTS approaches are different from each other although it was developed from the same source i.e expert from the industries. The primary different is that NOSS focus on competency of the particular job, whereas NOCC is focus on a larger scope, such as the work process in the industry and the familiarization of the workplace environment.

2.4   Training/learning approach

As stated earlier, the NOSS-based training system was adopted the CBT as a training approach as the introduction of the accreditation system (MLVK, 1993). CBT approaches emphasize what a person can actually do in the workplace as a result of education training (Australia, 2003). It used the self paced concept where the students are allowed to proceed with new topics at their own speed and time, rather than progressing at the same time as all the others undertaking the same study. CBT is a student centered approach with the characteristics that firstly, achieved competencies should be identified, announce and verified earlier; second, competency encompasses skills, knowledge and attitude/safety; third, method and criteria for assessment should be explain and announced clearly and early; fourth, learning program provided for individual development and assessment for each competency and fifth, trainee can upgrade depends on their own capabilities by showing the identified previous competencies. In order to support the student centered approach the training materials such as Learning Guide, need to be developed and the training institute need to have a resource of references for the student.

In NDTS the action-oriented teaching, self-reliant learning (SRL) as well as learn and work assignments

(LWA) have been adopted as the fundamental of teaching and learning approaches in the training (MLVK, 2005b). The action-oriented teaching is a way in which human being set goals and create a plan in their mind before bringing it into various steps of action (GMI 2005). The processes of action-oriented learning approach encompasses of, setting goals, planning the pathway for the action, decision-making regarding utilization of plan and resources, executing the action process and monitoring and evaluating action and its result (GMI, 2005). SRL is a process for solving learning and work assignments by follows the action-oriented approach steps. LWA is an integration of the actual work place related assignments with the steps of the action oriented learning process. It is very much like problem based learning; the LWA will see apprentices solving real-life problems faced by the industry (GMI, 2005).

Various aspects of the self-learning approach are applied dependent upon the complexity of the lessons or work assignments, and they cover the following steps or activities:

Goal setting – apprentices must achieve the goal or objective (according to the assignment) they had set for themselves.

Planning methods of actions – the apprentices plan the work steps either individually or as a group. They work on several variations for the plan. The coach gives hints and makes them aware of information sources.

Decision-making based on the plans and use of resources – the apprentices, together with the coach or team-mates, will decide on whether to continue with the agreed plans or not. The coach will points out the mistakes and recommends the correction

Execution and observation – the apprentices will execute their plans and observe the developments and results. The coach will only step in if the situation is unsafe.

Appraisal of the action and results – the apprentices will grade and analyse the processes and methods to complete the task and record based on the assessment form provided by the coach. The coach will verify the assessment. The apprentices will also be ready to present the results obtained by the LWA.

The training approach is similar for both system, whereby both NOSS-based training and NDTS use the student centered method. However, in terms of the implementation, NOSS-based training uses the CBT which do not have a systematic method to achieve the student centered approach; while NDTS use the self-reliant learning (SRL) approach which consists of a clear and systematic step to do the learning as a didactic approach.

2.5   Assessment

The NOSS based training system uses both formative and summative assessment. The trainee will be assessed after each module and it is carried out continuously until all modules finished. Using the CBT approach, student is allowed to repeat the module tested until he/she is competent in the module trained. Each test consists of theoretical and practical component.   In theoretical component, students are assessed by using written test such as multiple choice, essay, matching and others; whereas in the practical component, assessment may be in the form of demonstration, oral, individual project and group project. Student will also has to attend the final examination at the end of the semester.

The use of tests and examinations is to ascertain that the performance standard stated in each task in the NOSS is accomplished. All the tests and examinations questions should comply with the three assessment principle such as valid, reliable and sufficient. Valid is when the test actually assesses what it is supposed to assess, reliability is when the test is able to produce similar result although it is to be used at different times, by a range of teachers, with a range of students; and sufficient is when the test comprises all the skills, knowledge and attitude/safety stated in the module. The instructor will assist students to develop their own portfolio where all the assessment evidence is recorded in it.

 The objective of the assessment are, firstly, to shape a transparent, fair, comprehensive and valid assessment which fulfil the requirements set in the NOSS; second, to develop the responsibility behavior among the personnel quality assurance on assessment; thirdly, to develop the competitiveness among the student to getting a better result; and finally produce the competitive and skilled workforce.

Criterion-referenced testing is used to test the performance standard in each task in the NOSS. The student will repeat the test until they achieved the specific competency level. Assessment process is conducted by the assessment personnel such as assessor, internal verifier, external verifier and accredited center assessment panel. The roles of external verifier also increase instead of as an external verifier for the continuous assessment they also should act as an examiner during the final examination by assisted of assessor and internal verifier in the related Accredited Center.

The component for assessment is different for each level. For level one, two and three the components assessed are course work (40%) and final examination (60%), and they should pass the core abilities assessment. However, for level four or Diploma level and level five or advance diploma level, three components are assessed: course work (40%), final examination (40%), and final project (20%). On top of that, they need to pass the core abilities and on job training assessment.

Whereas NDTS used LWA as a main approach of assessment where the student given the LWA then he/she should finished the related task by doing either individual/team by follow the SRL step by step for the core competencies. The LWA for workplace and training institute comprise of: Assignment Sheet and Assessment Sheet. LWA is a document that is developed for the purpose of training. It consists of an assignment considering the complete action cycle which covers the Core Work Process to be carried out in the actual working environment at both the workplace and training institute. Assignment sheet is an assignment sheet states the work assignment that has to be carried out by the apprentices. It consists of information sources, guiding questions, hints and instructions to guide the apprentices in completing the work assignment and assessment sheet is a sheet states the areas and criteria to be measured by either apprentice for self assessment and/or coach/trainer to assess the apprentices' performance based on identified work process performance in completing training.

Beside the continuous assessment through the LWA, NDTS has a final examination which is develop by the company and conducted whether in the company or in the institute whichever suitable (MLVK 2005b). The final examination is divided in two parts theoretical and practical examination and both of them contribute 40% of the entire mark. Both parts need to pass in order to pass the final examination. The examination is conducted by the assessment panel which is appointed by Department of Skills Development.

3.0   Exemplary comparison between NOSS and NDTS using Automotive Mechatronics curricula

3.1   Curriculum
After both systems is compared in general in terms of qualification/certification awarded, their philosophy and purpose, curriculum, training/learning approach and assessment, a more specific comparison will be made using specific training occupation. In this case, we will use a curriculum in Automotive. It is difficult to find an identical name but we use a arrive with Automotive Mechanic with the code P-159 in NOSS based training and Automotive Mechatronic with the code AT01 in NDTS.

P159 is a job occupation in the industry which is a mechanic, whereas, AT01 is a name of a process or training occupation in the industry. P-159 has 10 duties; this means that in order to become a mechanic the student needs to be competent all the duties. Similarly, AT01 has 9 Occupational Core Work Processes (OCWP) which are needed by the apprentice to accomplish. In the NOSS based training, the duty is stated in the active verb and it can stand alone in modular form (together with its own set of skills, knowledge and attitude/safety.) In NDTS, the first four OCWP is common in all the training occupation where the purpose is for the trainees to be familiar with the organization. However, the remaining OCWP is core to the specific occupation. Although the number of OCWP in NDTS is less compared to duties in NOSS based training, scope of the training is more comprehensive because it based on the work process in the workplace. Table 1 shows the comparison between the duties of NOSS and Occupational Core Work Processes (OCWP) of National Occupational Core Curriculum (NOCC).

Table 1: Comparison between the duties of NOSS and OCWP of NOCC.

	Duties in the P-159 - Motor Vehicle Mechanic	OCWP in the AT01 - Automotive Mechatronic
1	Perform Work shop practices	NDTS and Organisation structure and Procedures
2	Perform Vehicle Maintenance	Industrial Standards and standards Operating Procedures
3	Perform Engine Repair	Administrative services and Warranty
4	Perform Fuel System Services	Standard Services
5	Perform Vehicle Electrical System Repair	Troubleshooting, Diagnostic procedures for Wear and Tear and Minor Repair
6	Perform Vehicle Manual Drive Train Repair	Troubleshooting, Diagnostic procedures for Rectification of Mechatronic System
7	Perform Vehicle Brake System	Troubleshooting, Diagnostic procedures for major repair on aggregates and components
8	Perform Vehicle steering System Repair	Repair of Aggregates : Engine and Gearbox
9	Perform Vehicle Suspension Repair	Troubleshooting, Diagnostic procedures and rectification of Standard Accessories
10	Perform Vehicle Air Conditioning system Service	

3.2   Content of training,

To compare the content for NOSS based training and NDTS, we obtain an example where both system need to perform similar task. In this case, the example we use is *Duty 3* and *Task 4* of NOSS that is *Carry Out Engine Top Overhaul,* and OCWP 8 of NDTS that is *Repair of Aggregates: Engine and Gearbox.* Table 2 shows the comparison in detail. From the table, it can be observed that NOSS content is very specific in what to be achieved compared to the NOCC whose content is more general. For example, the task in *Performance Standard* of NOSS is similar with Core Work Processes (CWP). The difference is in NOSS, the task *carry out engine top overhaul* is divided into smaller task (sub task) such as *distinguish type of engine; drain water coolant and engine oil;, remove cylinder head assembly; examine condition of engine cylinder, head assembly; install cylinder head assembly; replenish engine oil and coolant; and check ignition timing* is very specific. On the other hand, the OCWP of NOCC which is *Repair of aggregates: Engine and Gearbox* remains the same and is not broken into small task. The advantage of using NOSS is that it is easier for students to follow the steps in NOSS. However, the NOSS should be revised more frequent to include technology changes. Although NOCC is more general but it has a Learn Work Assignment (LWA) to support and guide the student to do the job. The advantage is that although there is a change in technology the same standard can be used.

Table 2: Comparison between Content of the NOSS and NOCC for similar task

Duties 3: Perform Engine Repair	**OCWP 8: Repair of Aggregates : Engine and Gearbox**
Task 4: Carry out engine top overhaul	

PS: PERFORMANCE STANDARD: (Actions, Conditions, Criteria) Carry out engine top overhaul using service manual, special tools, measuring tools, hand tools, timing light, tachometer, valve grinding paste, valve grinding stick, replacement parts, lubricant, and fluids so that types of engine determined; cylinder head assembly removed, examined, and installed; and ignition timing checked are in accordance with the manufacturer's specifications.	CWP : Engine and gearbox are overhauled and the function of the vehicle is restored. Dismantling of components, failure investigation of parts through inspection and measurement according to manufacturer's specifications are carried out to determine the amount of repair. Prior to this, adequate test and measurements (emission test, compression test, pressure test, and noise analysis) have to be carried out for troubleshooting. The determination of wear limits and tolerances are required. Fault tables are applied.
Sub Task: 1. Distinguish type of Engine 2. Drain water coolant and engine oil 3. Remove cylinder head assembly 4. Examine condition of engine cylinder head assembly 5. Install cylinder head assembly 6. Replenish engine oil and coolant 7. Check ignition timing	CW Activities: 1. Testing of aggregates 2. Overhaul of aggregates: 3. Quality control Core Competencies: 1. Determine defects by performing testing on the aggregates. 2. Carry out overhauling process.

3.3   Training materials & aids and learning conditions

There is a difference in how NOSS listed training materials & aids and learning conditions from NOCC. In NOSS, this section is divided *Tools/Equipment/Materials* and *Enabling Requirement*. Training materials and aids are listed very specifically and in detail under the *Tools/Equipment/Materials*. In the *Enabling Requirement*, knowledge, skills and attitude that is required to complete the task is stated very clearly in NOSS. In NOCC, the term *Tools/Technologies,* is used to list the training materials and aids and learning conditions. Items listed on *Tools/Technologies* are quite broad and general. However, this compensated with *methods used, organization of Core Work Activities* NOCC uses. On top of that there is *requirement in terms of social competencies of Core Work Activities* added in NOCC. The comparison can be seen in Table 3.

Table 3: Comparison the Training materials & aids and learning conditions used in NOSS and NOCC

Sub Task	CWP
1. Distinguish type of engine	Testing of aggregates engine manual gearbox automatic transmission gearbox emission test compression test pressure test noise analysis
	Tools / Technologies, methods used, organisation of Core Work Activities
TOOLS/EQUIPMENT/ MATERIALS	Tools / Technologies Computerized customer / car database

1. service manual 2. hand tools 3. special tools 4. measuring tools 5. timing light 6. tachometer 7. valve grinding paste 8. valve grinding stick 9. replacement parts 10. lubricant and fluids 11. fender cover ENABLING REQUIREMENTS (Knowledge, Skill, Attitude and Safety) Knowledge on: 1.1 Engine types and classifications 1.2 Engine construction 1.3 Purpose of engine main component 1.4 Principles of engine operation Ability to: 1.1 Identify type of engine 1.2 Interpret construction of engine 1.3 Interpret principles of engine operation Attitude/Safety: · Use fender cover · Correct way of disposing used oil · Correct way of disposing water coolant · Disconnect negative cable from battery · Use personal protection equipment	Service documents Repair documents Technical information systems (fault tables) Standard and special tools Measuring and testing equipment . **Methods used** Emission test Compression test Pressure test Noise analysis Service and repair procedures according to manufacturer's specifications. Cooperation with other departments **Organisation of Core Work Activities** Setting of testing equipments Conducive working environment. Worker - oriented organization. Responsible for work control prior to delivery to customer.
	Requirements in terms of social and learning competencies of Core Work Activities
	By customers (Internal and/or External): Advice with regard to time and cost of repair Efficient service Customer oriented deadlines and delivery. Service process in consideration of function safety Quality work **By company:** Abide to safety regulations. Abide to Standard Operating Procedure (SOP) Quick and reliable to determine required repair tasks Efficient teamwork Quality work **By skilled workers:** Application of manufacturer's work procedure. Adherence to regulations on occupational health and safety, dangerous materials and substances, waste disposal as well as company guidelines.

	Customer oriented deadlines and delivery Effective communication with colleagues and other departments. Quality work

3.4   Learning environmental

NOSS based training is an institute based, therefore the training is 100% in the institute while NDTS is industry based with 70 % training done in the industry and 30 % in the institute. The advantages of the NDTS in term of the tools, equipment and materials, the apprentices can used the real equipment in the workplace and indirectly this can be reduce the cost for the skills training institute. From Table 3, we observe that NOSS present its curriculum in a very specific manner. For example, in the subtask 1 (Table 3), the enabling requirement consisting of knowledge, ability and attitude and Tools, Equipment and Materials (TEM) is very specific. However, in NOCC the details presented under the *tool and technology, method and the organization of the core work activities* is quite broad. However, the social values and social skills are spelt out clearly for each CWP. Furthermore each of the CWP also has its own core competencies which should be accomplished through the five step action in the LWA.   Meanwhile, NOSS based training uses learning material which is known as Learning Guide (LG) and Course of Study (CoS) to guide trainee learn through various activities.
LG is used for students to provide guidance to learning via a various activities listed, enable the student to identify their level through the self assessment and a method for trainer to assess the student performance. Meanwhile CoS is guide for trainer to implement the materials in the training (MLVK, 2006a).

4.0   Conclusion

Although both NOSS based training system and NDTS award students the same Malaysian Qualification Skills Level Three, both systems are different in terms of philosophy and purpose, curriculum, training approach and assessment procedure. Both systems have their own strength and weaknesses, and students have a choice which type of training they would be able to cope and excel to fulfil the country needs for competent workers.

The Role of Community Colleges in Northeastern Thailand in Supporting and Creating Vocational Networks in Communities

Dr. Narat Wattanapanit
Ramkhamhaeng University
naratw@gmail.com

Abstract

Thailand has about 63.4 million populations as of 2009. The northeastern part of Thailand occupies the largest land area of Thailand with approximately 21.2 million populations which is nearly one third of the total population of Thailand. Many people, especially the youngsters, fled from the area because of the arid land and poor economy to struggle for jobs in other parts of Thailand and send money back to support the elders and young children they left behind. This situation breaks thousands of families apart. Hence, this region is the largest pool of labor to businesses and factories throughout the country. The downward trend of the current economic condition results in shrinkage of many industries. A lot of labor forces are laid off and have no choice but return to their home towns where there are limited numbers of employments. They need to develop self-employed careers for living. These workforces need training for such purpose. The Thai government has established community colleges to provide knowledge and trainings with the emphasis on the development of vocations for people in local communities.   These community colleges have an important role in providing short courses to offer knowledge in making professions. The aim of this research project was to investigate the role of community colleges in supporting and creating vocations' networks within and among communities. In-depth interviews were conducted with directors of community colleges in northeastern part of Thailand together with administrators of vocational programs as well as leaders in communities. Data were content analyzed and inductively interpreted. Results suggested that communities are keen in building network with other communities but they need community colleges' assistance in linking to organizations.

Introduction and Background of the Study

The Institute for Population and Social Research of Mahidol University (2009) reported that the total population of Thailand as of 2009 was estimated at 63.4 million. Out of this, northeastern region housed the largest number of population, 21.2m compared to 6.7m in Bangkok, 15.3m in the central, 11.7m in the northern, and 8.4m in the southern regions. The northeastern region of Thailand consists of nineteen provinces which covers one third of the area of Thailand. The U.S. Central Intelligence Agency's world factbook (2009) reported that Thailand's GDP per capita was USD 8,500 in the year 2008 while the per capita income in 2008 was USD 4,125 (U.S. Department of State, 2009). The northeastern region occupies the largest land area but has the lowest income among all regions (Bank of Thailand, 2009; National Statistical Office, 2009; Office of the National Economic and Social Development Board, 2009). Many people, especially the youngsters, have to migrate from the area because of the arid land and poor economy to struggle for employment in other parts of Thailand and send money back to support the elders and young children they left behind. The poverty situation breaks thousands of families apart.

Community College

The Thai government tries to cope with poverty situation by distributing aids and introducing vocational training courses through several agencies. Community colleges are higher education institutions that manage learning and offer certificates and diplomas to adults. The Bureau of Community College Administration (2008) reported that, as of 2008, there were 19 community colleges in all regions of Thailand. The purposes of community college were to offer formal degree education and vocational training. Formal degree education is offered so as to provide opportunity for those who could not attain education during their childhood. Holzer & Lerman (2007) argued that community colleges in the US have an important part in training workers for businesses. The situation is similar in Thailand. Furthermore, students could use the degree granted to pursue further study in the higher level. The objective of vocational training courses, which is the focus of this research project, is to assist local people to learn skills to start their own vocations and become entrepreneurs.

The community colleges are governed by the Bureau of Community College Administration. Each college appoints a board of trustee composing of academicians and community members. The role of

the college is to analyze vocational needs in the local area and create courses to satisfy those needs. Most participants requested for courses that teach skills to make handicraft products and services. Many participants earn their living through selling of handicraft products and they want knowledge to produce other products so they request the college to organize courses for them. Participants form a group of approximately 20 people and request the college to open vocational courses they need. Some participants become trainers for other communities. They have the same vocations and make similar products, hence, it is very likely that they form network among themselves. The objective of this research project was to examine the role of community college in supporting and creating vocational networks among members in communities. (Bureau of Community College Administration, 2008).

The target group was adults who incorporate their personal goals and vocational proficiency in their learning (Kegan, 1994). It is important that the planning of adult education should incorporate more direct and practical vocational knowledge rather than only theories. Training programs are flexible and adapted to each locality's needs. Community college was established on the belief that everybody has potentials and should receive proper guidance to unleash these potentials. The focus of education was on practical knowledge so that people could build their vocations (Nong Bua Lampoo Community College, 2008).

History
        The first community college in Thailand was established in 1977 in the Phuket campus of the Prince of Songkla University. The college was reverted back to the university in 1984 due to the educational reformation during the period. In 1994, 77 specific-purpose educational institutions throughout Thailand such as agricultural college (governed by the Ministry of Agriculture), art college (governed by the Ministry of Culture), and other colleges were combined into the umbrella of community college authority. Again, the process failed and the schools were returned to the original authorities in 1996. That ended the early attempt to establish community college in Thailand (Bureau of Community College Administration, 2008).

In the year 2002, the Thai government revived the community college idea and established 10 colleges in all regions of Thailand. By the year 2009, 19 community colleges were established; four of these were in the northeastern region (Bureau of Community College Administration, 2008). The aims of community colleges were to provide low cost education to assist poor people in local communities to start their own occupations and provide formal degree for those who lacked opportunity to study in the childhood. Community members' opinions are surveyed in order to plan for curriculum and design appropriate teaching programs. The participation could lead to innovation and proper utilization of the community's potentials (White, Nair, & Ascroft, 1994). One of the strategies of community college was to create network with members in the community, i.e., business organizations and other government authorities such as the Local Development Authority, The Water Authority, and others to find assistance in facilitating the participants' vocations.

Networking
        King Rama IX of Thailand had introduced the sufficiency theory that promotes self-contentment and the creation of networks among members in and among communities. The sufficiency network could create strength for Thailand and help to reduce the vulnerability of dependency upon other economies (Subcommittee on Sufficiency Economy, 2005).

Network is characterized as having several nodes connecting individual and group to each other. Inter-organizational networking can increase competitiveness of organizations and the group (Morris, Bessant & Barnes, 2006). Porter (1998) suggested that network can be categorized along the value chain into horizontal network among firms in the same level of value chain and vertical network among firms in different level of value chain. Goold & Campbell (1987) reported that Japanese firms normally do networking with each other to increase their competitive advantages. Exchange of information, or networking, is a popular practice among Japanese companies (Nonaka, 1990). Networking of firms can create clusters of industries which can enhance and create collective strength among members.

Thai society is characterized as a collective society (Hofstede, 2001). Although, the urbanization may drive people to be more individualistic but people in the provinces are still collectivistic. With such characteristic, networking behaviors are likely to occur, especially in less urbanized areas. Iacobucci and Zerrillo (1996) explained that network occur in the individual, dyadic, or group relationship where members connect to others. Individuals are motivated to get into relationship with each other in order to obtain needed resources (Pfeffer and Salancik, 1992). Members within the same community with similar vocations are likely to establish network with others. Individuals and organizations in a network would exchange information for the common purpose of the network through both formal and informal communication for the benefits of the professions and societal development (Kemm & Close, 1995). Modern businesses need to pool knowledge and expertise from others (Mankin and Cohen, 2003). Clarke (2006) suggested that commitment in the network was an important contributor to overall performance of members in the network. Martin (2009) suggested that interpersonal communication is an important element for entrepreneurial success. Social network among entrepreneurs provides opportunities for social support (Hogg & Adamic, 2004). The communicative and transformational learning approaches for adult learning enhance the intimacy among members and results in strong network.

Johanson and Mattsson (1992) explained two levels in network as the network of exchange relationship and the network of production system. The network of exchange relationship refers to the resource exchange process among members while the network of production system refers to the collaboration among members for the production of goods and/or services. Members in a network possess something of value and exchange those with each other in a reciprocal manner. Blankenburg et al., (1999) argued that the exchange process would bring about the development of knowledge among members. Trust could be developed along with the exchange (Hallen & Johanson, 2004). The longer the history of exchange, the more solid the trust became. The collaboration could combine complementary skills which could enhance the effectiveness and efficiency among network members (Powell et al., 1996). Chiu (2009) supported that network competence resulted in innovation performance.

A developmental network aims to improve career growth and members' learning (Higgins and Kram, 2001; Lankau and Scandura, 2002). This type of network draws relationship from various individuals and groups. Whitely et al. (1991) reported that developmental network played an important role in the enhancement of individual's career advancement.

According to the Subcommittee on Education System Structure and Knowledge Network (1990), network has 4 components:
1. the transfer, exchange and dissemination of modern knowledge and local wisdom to apply and create new knowledge relating to each community.
2. the stimulation of intelligence, spirit to develop the community and participation in community development.
3. the exchange of information relating to developmental projects of private and public sectors to keep members abreast of each other's activities.
4. the co-ordination of resources, materials and equipment, facilities and budgets among various units.

Methodology

This research was designed as an exploratory research to gain an in-depth understanding of the roles of community colleges in the creation of vocational network among members of communities. The northeastern region of Thailand was selected as the location for this study. There were four community colleges in the region at the time of study.

The researcher applied for approval from the central authority, the Bureau of Community College Administration, to conduct the study. The Bureau approved and gave names and contact numbers of the directors in the four community colleges in the northeastern region. The directors were informed by the Bureau about this study. The researcher made appointments with directors to conduct in-depth interviews with director of each college. In-dept interviews were also performed with personnel who were responsible for the vocational training short-courses in each college. These personnel were the main link between the colleges and community members. They mingled with the locals to study their needs and design programs

to satisfy these needs. Leaders and members in communities were asked to participate in focus group interviews. These participants included leaders of the local administrative authorities, members of the community who were trainers, active members of the communities and local business organizations. Each focus group consisted of 4-6 members. The researcher also went to visit some groups' businesses such as weaving and home-stay groups. Most interviews took place at the meeting room of the community college except one which was performed at one of the community leader's orchard.

Question protocol used with directors included questions relating to curriculum development, curriculum management, assessment, general policies and practices, and roles in creating vocational networks in the community. Particular interest was about their roles in creating or supporting vocational network among members in the communities. Question protocols for community leaders and members included questions relating to degree of participation in curriculum development, needs for advices in vocation and networking, credibility of the community colleges, trust in the community colleges and their collaboration with the colleges. These question protocols were assessed for content and face validity by experts in the Ministry of Education who were knowledgeable about the operations of community colleges before the interviews.

Results and Discussion

One of the colleges' chairman of the board of trustee said that *"The survival of community colleges lies in the creation of network, without network we can do nothing."* Community colleges were small organizations that did not have many resources. The strategy was to become a broker connecting various groups together. In the capacity of an educator, the colleges seek for academic assistance from universities, business assistance from local business organizations, and development assistance from other governmental units such as the Water Authority or Electricity Authority of Thailand. There were courses organized for a local sugar factory to train farmer in sugarcane growing and harvesting, and to train factory workers in sugar production. Participants were both workers and members in the community. In other cases, professors were invited from a university to teach in a college's computer program of study and the graduates could further their study at a university. A director asserted that *"Ubonrachathani University offered a quota for our 2-year business computer graduates to enter the university without taking entrance exam"* and *"Lay people are not able to gain access to some units, we serve as the links."* Another college had a course for managing home-stay businesses. The college acted as the link to ask for supports from Thailand Tourism Authority for the community.

The proximity to communities makes the colleges prudent in social network. Personnel visit communities in order to survey their needs. Hence, they become close to many community members. This social network provides assistance in two folds, one is in the training need assessment process. The need assessment becomes more accurate. Members in the community can request for courses they really want. Sometimes, the personnel may suggest courses that can benefit community members and discuss with them whether they want those courses. The second advantage is in the recruitment of trainers for courses. Trainers include professors or experts from organizations and local wise men depending on the characteristics of each course. Due to limited budget, some trainers could be recruited from wise men in locations close to training stations to safe transportation costs. Social network helps the college to identify knowledgeable local wise men for this purpose. The result is that these trainers become nodes in the community network that links several groups to each other, a horizontal network.

Some groups networked long before the colleges came into existence. One community leader said *"We have several active local networks going on for more than 20 years…there is no need for the college to help us networking."* Some groups offered handicraft training courses by themselves. In such case the college assisted in making the training programs more systematic and added theoretical knowledge into the programs. The colleges helped in the application of technology to the handicraft system such as the assistance in computer graphic for the designs of weaving groups and packaging. Before a course could be opened, the program organizers had to write up proper documentation and asked for approval from the colleges' academic and the administration boards. The documents must spell out the rationale, background, material needed, formulas or recipes, budgets, and curriculum. Usually, local wise men did not have exact recipe or formulas so the personnel from the college had to talk to them and extracted their knowledge into formal documents or turned implicit knowledge into explicit knowledge as proposed by Nonaka and

Takeuchi (1995) for knowledge management. When a program organizer want to open a course for fertilizer production, they had to convert the approximate ingredients into recipes to be included in booklets and curriculum and submit the curriculum for to the academic board and then to the college's board of trustees.

Currently, the colleges emphasized on the production side. Little assistance was offered for marketing of products or services. Members of several production groups would participate in trade shows throughout Thailand taking with them products of members in the groups. Friendship and loyalty in the community created trust, commitment, and cooperation among members in the network (Pesamaa & Hair, 2007). The colleges were trying to link groups from different courses together such as organic fertilizers groups with rice growing groups. Those in computer classes might be asked to setup website to distribute handicraft products from several groups.

A few participants complained that *"some of the new teachers don't know who we are and they treated us like we knew nothing."* This reflects the hierarchical nature (Hofstede, 2001) in the rural area where governmental authorities, with their higher education than laypeople, who did not have formal education during their childhood, perceive laypeople as unintelligent. Actually, these laypeople, though some could not read or write properly, possessed a lot of life and work experience. Some of them were very intelligent. This misperception created a large gap between laypeople or wise men and authorities. Those authorities who were in the field long enough get to know these people and could handle them properly. It is important to have an induction program to introduce new authorities to the nature and conditions of members in the communities else they will not be able to bridge the traditional gap between government authorities and communities. Some dissatisfaction were evident during one of the interview when a government authority from other unit called one of the participant on her mobile phone and asked if she would attend a seminar. She declined right away and told us later that *"I scheduled an appointment with them already, why should he ask me again if I would go or not, it is as if he did not trust my words."*

Conclusion

Communities do not need community colleges to assist in forming horizontal network with other communities. Thai people have the tendency to link to each other and call other a cousin (Komin, 1991). People in the same community are related in some ways or another either as cousins, neighbor, or others. Community members have similar needs and wants. They are in similar conditions and speak the same language. Networks exist naturally even across communities. Community colleges play a significant role in the vertical networks that link communities with organizations especially government's. Community members feel that they have to be submissive to government authorities due to the hierarchical nature of Thai culture (Hofstede, 2001). Community colleges should act differently from universities that emphasize academic knowledge and formal teaching and learning. They also should behave differently from governmental units that provide aids and assist in development. It would be appropriate for community to act in between both and be closer to local people than other governmental units and bride the hierarchy between community and government authorities. Community college should act as a center for trainer networks and locator of academic assistance. Community members interviewed expressed their appreciation and satisfaction in the role of community colleges in supplying them with practical knowledge for their occupations. Future research should seek to identify the structure and pattern of network used by community colleges. Research into the efficient management of network by community members is warranted.

Abstract

This study explored the relationship among student's learning motivation and performence of tourism education in technological and vocational education system in Taiwan. In addition, the difference between on-job students and full-time ones was also investigated. Students who study in the Taiwan Hospitality & Tourism College (THTC) were selected as the respondents. A structured 5-points Likert questionnaire composed from Huang(1992), Kirkpatrick(1994), and Lee & Huang(2007) by the authors was completed by 216 THTC's students. The results of this study show that the on-job students have more learning motivation and perforence than the full-time students. It also has shown that the strength of learning motivation is related to the level of the learning performance; there is significant relationship between the level of learning satisfaction and the performance of learning. On these grounds we have come to the conclusion that the experience of work and the time limitation before graduated will direct the students to value the importence in learning.

Keywords. Student motivation, on-job student, learning performance

INTRODUCTION

Taiwan has seen a marked increase in the number of hospitality related programs and departments in higher education institutions since 1998. The increase is even steeper from 2000 onward. As of academic near 2003, universities and colleges have established a department or graduate institute for hospitality, tourism, or leisure and recreation, of which 64 are bachelor degree programs, 17 are master degree programs, and one is a PhD degree program (Horng, 2003). This trend is continued now, as the fewer babies born trend in Taiwan going, the more competition in colleges. It will become a trend that department will rename and found into tourism area.

The same observation applies to the policy of Taiwan Government. The Tourism Bureau (TBRoc, 2009) declare the「Development Plan for Six Key Emerging Industries」 policy, the tourism plan also named: Project Vanguard for Excellence in Tourism on the list. On the other words, the promote of manpower quality in tourism is the key fact to competed with others. The Performance of students who major in Tourism degree will be one of the potential issue in tourism industry development. Cole, Cole and Ferguson(2006) study results confirmed that Parks, Recreation, and Tourism(PRT) students were more likely to have changed majors. Although PRT students reports lower ACT and GPA scores, but no significant difference was found between the two groups in their motivation to learn. Many scholars believe that there is obviously relationship between student's learning motivation and performance, but most most studies focus on the teaming motivation and satisfaction but few studies focus on the learning ability of students. Therefore Tzai-Zang Lee & Li-Yang Huang (2007) targeted their research on the students of the In-service graduate program. They finded that stronger of the student's learning motivation, the more effective they are at learning, and the students of In-service students have the strong attitude towards learning. With the exception of this studies, few studies focus on the college student who major in Tourism; and even conduct on the difference between the on-job students and full time students.

Therefore, this study will focus on the students of the Taiwan Hospitality and Tourism College(THTC) as example. THTC localed in Hualien, is a professional tourism-training college, which mainly put our emphasis on the six departments−Department of Food and Beverage Management,

Department of Hospitality and Hotel Management, Department of Travel Management, Department of Leisure Management, Department of Chinese Culinary Arts, Department of Western Culinary Arts, and Department of Tourism−Five-Year Division. With the exception of normal college, THTC also have the divison of night school, continuing and extension education. Most of the full-time students come from anywhere of Taiwan, but the on-job students who major in night school or continuing education are live in local country. The study aim at the students who are play the role of on job or not, distinguishing the difference between their learning motivation and learning performance. And finding the relationship and influence among the students who are on job or not for the reference of THTC's job-based curriculum design goals.

LITERATURE REVIEW

Learning Motivation

In recent years, the cognition orientated motivation theory focus on the goal and way of approach on personal achievement behavior. Rezabek(1998) was made a study of the motives, barriers, and enablers affecting participation in adult distance education class in an Iowa community college. The study shows that the key factors would influence on student's learning effort, one is the way of teaching, and the other is students learning motivaion. The centrality of motivation to learn in Figure 1 reflects its importance for any training or development program. Motivation to learn refers to the desire of the trainee to learn the content of a training program (Noe, 1986).

Mahon and Dannells(1998) from the view of teachers, conducted a survey of 278 academic advisors from six four-year colleges and universities determined differences in advisors' attitudes toward students matriculating at their institutions, transfer community-college students, and students coming from other four-year colleges. Advisors viewed transfer students as less prepared, less motivated, less knowledgeable about requirements and procedures, and less able to adjust to an upper-division academic environment.

Motivation to learn is generally defined as an internal state that arouses us to action, pushes us in particular directions, and keeps us engaged in certain activites (Ormrod, 1999, p.407). In psychology, there are many theoretical perspectives for studying motivation. Motivation has been studied extensively over the years using the Expectancy-Value Theroy. Pintrich & Schunk,(2002) holds that a student's motivation to meaningfully engage in an activity depends on two primary components: (1) the students' expectation for successfully completing the task and (2) their perceived value for that task. For example, Pintrich & Schunk,(2002); Wigfield & Eccles,(2000) used Expectancy-Value Theory to investigate whether there were differences in motivation to learn between PRT(park, recreation and tourism) students and students majoring in other fields. Harlen & Crick(2003) presents motivation is considered as a complex concept, closely aligned with the will to learn, and encompassing self-esteem, self-efficacy, effort, self-regulation, locus of control and goal orientation.

To sum up authors' view, the learning motivation will divided into six items(Tzai-Zang Lee & Li-Yang Huang, 2007): (1)the purse of learning; (2)the development of career; (3)refuge and stimulate; (4)social service; (5)external expectation; (6)relationship of society.

Learning Performance

Learning Performance is an index that not only measuring the result of learning, but also judging the quality of teaching. The top four performance determinants of a learning course and the learning thereof, pointed-out by Honore (2003), are course design, individual need, interaction and technology. The evaluation of learning performance also could be develop from Kirkpatrick's (1994) techniques for evaluation training programs' four-level model. According to Kirkpatrick's (1994) four-level model for assessing training effectiveness, evaluation should always begin with level one, and then, as time and budget allows, should move sequentially through levels two, three, and four as Table 1 showed. The levels are: level 1 – reaction, a measure of participants' initial reactions to a course, usually assessed through surveys;level 2 – learning, a measure of the amount of information that participants learned, usually assessed using criterion-referenced tests;level 3 – transfer, a measure of the amount of material learned that participants actually use in everyday work, usually assessed using observations and interviews with co-workers and supervisors; and level 4 – value to the organisation, a measure of the financial impact of the training course on the bottom line of the organisation, assessment for this level is not clearly defined.
Table 1 four-level model for assessing training effectiveness

Level	element	Meaning	Contents
Level 1	Reaction	a measure of participants' initial reactions to a course, usually assessed through surveys	courses、lecturers、meterial and approach, etc.
Level 2	learning	a measure of the amount of information that participants learned, usually assessed using criterion-referenced tests	*learning situation and efforts
Level 3	Behavior	Behavior Transfer and working performance	participants actually use in everyday work, usually assessed using observations and interviews with co-workers and supervisors
Level 4	Results	a measure of the financial impact of the training course on the bottom line of the organisation	value to the organisation

Steven (1997) translate the performance of company's trainee events and process outcomes into the quantification. According to the quantification evaluation, researcher could identified the pros and the cons of training plan, judged the benefits of learner and the learning satisfacion of course design and appraisal, etc. These evaluation will be the reference of education planing exculative(Noe, 2003).

The question is There is no reserch focus on the relationship between college students' learning motivation and performancce. T. Z. Lee & L. Y. Huang (2007) targeted study on the students of the In-service master program. They found students in-service master program have the greatest inquisitive attitude towards learning, but didn't compare with the full time students. On the other hand, they found the stronger of graduated student's learning motivation, the more effective they are at learning, but we still don't understand the college students will be the same situation relative with the graduated students. Thus, this study is presented as an exploratory study to investigate this issue. The three research questions guiding this study were:

　Do on-job students differ from full-time students with regard to gender and other background characteristics?

　Do on-job students differ from full-time students with regard to learning motivation and learning performance?

　Is students' perceived learning performance related to their perceptions of learning motivation?

METHODOLOGY

The purpose of this study was to integrate motivation theories, and learning performance researches into a comprehensive model to explain the difference between on-job students and full-time students. As Figure 2 shows, we design a integrated questionire based upon an adapted version named 「The motivation of participated contiuning education Scales」by T. Z. Lee & L. Y. Huang (2007), F. S. Huang(1992), and two levels of Kirkpatrick's (1994) four-level model.

The survey asked students to rank the extent to whick they felt their learning motivation's in 26 questions from six divisions, such as the pursue of learning, the development of career, refuge and stimulate, social service, external expectation and relationship of society; and included a more general range of scales about their majors and learning performance via 15 questions. The items under each scale, their means, standard deviations, and the scales' reliabilities scores are listed in Table 2. The "Learning Motivation" scale was measured with six 5-point items with 1 representing "strong disagree with me" scale and 5 representing "strong agree with me". Overall, respondents reported a relatively high level of agreement with the six items of the "Learning Motivation" scale and the two items under the "Learning Performance" scale. Reliabilities of the scales were examined using Cronbach's alpha. The "Learning Motivation" scale had a Cronbach's alpha of 0.9357, while the "Learning Performance" scales that have a Cronbach's alpha of 0.9324. According to Nunnally(1978), scales that have a Cronbach's alpha of at least 0.70 are considered reliable. The questionnaire also included questions regarding students' gender, academic level, their current major and some family situations.

A total of 286 surveys were sent out to all college, data was collected from undergraduate students enrolled at the Taiwan Hospitality and Tourism College during the 2008/2009 academic year. All total of 216 students completed the questionnaire, a total response of 83.1% completed surveys, of which 39 were on-job students and 177 were full-time students representing 6 majors from across campus.

Table 2. Mean Scores, Standard Deviations and Reliabilities of Sacles

items		Means	Standard Deviations	Cronbach's α
Learning Motivation				0.9357
	the pursue of learning	3.6566	0.6780	0.8799
	the development of career	3.6350	0.7145	0.8646
	refuge and stimulate	3.3488	0.8333	0.7514
	social service	3.4097	0.7128	0.8139
	external expectation	3.5220	0.7559	0.8068
	relationship of society	3.5278	0.8148	0.7885
Learning Performance				0.9324
	learning	3.5313	0.6858	0.8888
	behavior	3.5212	0.7417	0.9087

(N=216)

RESULTS

Table 3 details the demographic profiles of on-job and full-time students. A significantly larger group of on-job students than full-time students were female respondents (X^2=0.041, P<0.05), Chi-square test results indicated that either on-job or full-time students were large amount of Freshman & Sophomore than Junior & Senior's at school.

Table 3. Respondents' Profiles

Scale	Items	N	%	X^2 value
Gender				0.041*
On-job	Male	13	33%	
	Female	26	67%	
Full-time	Male	91	51%	
	Female	86	49%	
Class Level				0.003*

On-job	Freshman & Sophomore	24	62%
	Junior & Senior	15	38%
Full-time	Freshman & Sophomore	147	83%
	Junior & Senior	30	17%

(N=216)
*$p < 0.05$; ** $p < 0.01$; ***$p < 0.001$

From the view of Scale of learning motivation, there were three significant difference item. Female respondents had strong pursue of learning and more care about their development of career than male students (t = -2.6096, P<0.01; (t = -1.8288, P<0.05). As Table4 shows, on the other hand, male students had strong refuge and stimulate on learning motivation than females((t = 1.7063, P<0.05). However, there was no significant difference in terms of gender between the scale of learning motivaion items, social service, external expectation, and relationship of society. In the same way, there was no significant difference stand on gender between the scale of learning performance's items.

Table 4. Comparison of students' gender perceived Learning Motivation and Performance

Scale	Items	Mean	SD	t value
Learning Motivation				
the pursue of learning	Male	3.5321	0.7643	-2.6096**
	Female	3.7723	0.5660	
the development of career	Male	3.5433	0.7337	-1.8288*
	Female	3.7202	0.6885	
refuge and stimulate	Male	3.4487	0.8358	1.7063*
	Female	3.2560	0.8238	
social service	Male	3.3726	0.7813	-0.7369
	Female	3.4442	0.6444	
external expectation	Male	3.4519	0.7601	-1.3151
	Female	3.5871	0.7494	
relationship of society	Male	3.5032	0.7883	-0.4263
	Female	3.5506	0.8415	
Learning Performance				
learning	Male	3.5048	0.6737	0.2931
	Female	3.5558	0.6991	
behavior	Male	3.4849	0.7752	0.2449
	Female	3.5548	0.7110	

(N=216)
*$p < 0.05$; ** $p < 0.01$; ***$p < 0.001$

The mean scores of perceived learning motivation and learning performance for on-job students and full-time students are list in Table 5. With regard to research question 2, F-tests were conducted to examine the differences in learning motivation and learning performance between the twe groups. Results of F-tests revealed that there were significant differences in learning motivation sacle's items: "the pursue of learning (F=18.5922, P<0.001)" and "the development of career(F=12.1615, P<0.001)", on-jobstudents were strong intention than full-time students. In the same way, there were significant differences in learning performance sacle's items: "learning (F=10.2533, P<0.05)" and "behavior (F=5.9396, P<0.05)", on-job students were strong deed than full-time students. On the contrary, "social service(F=4.2332, P<0.05)" in learning motivation scale was presents that the full-time students(M=3.4562) have vigorous intent than on-

job students(M=3.1987).

Table 5. Comparison of on-job and full-time students' perceived Learning Motivation and Learning Performance

Scale	Items	Mean	SD	F value
Learning Motivation				
the pursue of learning	on-job	4.0641	0.5628	18.5952***
	full-time	3.5669	0.6696

To address research question 3, regression analysis were conducted between students' perceived learning motivation and learning performance. Results of the correlations are displayed in Table 6. The correlations between learning motivation and learning performance were significant, especially between the learning motivation's items of the pursue of learning(r=0.0576 and r=0.3876) and social service.(r=0.1646 and r=0.2139) for the learning and behavior of learning performance.

DISCUSSION

This paper has presented the findings of a study into the relationship between learning motivation and performance via on-job or full-time students major in hospitality and tourism management in Taiwan

Hospitality and Tourism College. The study highlighted the problem that, we hypothesize on-job students would have stronger motivation and better performance than full-time students, but it couldn't be proved from survey. In other words, on job students have a strong motivation to learn, but there is no remarkable learning performance compare with full-time students. The on-job student cohort on hospitality and tourism courses in Taiwan is diverse, having variable levels of related skills, training and employment experience in the hospitality and tourism sector when they embark on study.

This explorative study has revealed that, the scale of learning motivation present high predict on "the pursue of learning", "the development of career", and "social service". Therefore, the students own the strong pursue of learning, like service with others, and have interest in career development, who will be a good performance student as prediction. The findings of this study have generated a number of questions and propositions that could usefully be the subject of future study. However, results of this study did not show that on-job students' motivation to learn was significantly lower than that of full-time students. For both groups, their perceived learning motivation and learning performance was significantly correlated.

Not only did this study show that on-job students were no less motivated than full-time students, it also suggested that there is a stronger relationship between on-job students' perceived learning motivation and their performance of learning, compared with full-time students. Given these results, tourism instructors may want to be particularly sensitive to creating an environment that supports students' motivation of learning via career development, social service, while also easing student interest and an enhanced sense of importance and usefulness of the academic material covered in the major. Tourism educators and advisors may want to focus full-time students' attention on how they should be pursue for the learning to ensure positive outcomes of teaching.

This study only demonstrated that Taiwan Hospitality and Tourism College's on-job students and full-time students as an example, another limitation of the study is that this sample may not truly represent the student population on campus as on-job student respondents. Educators in tourism should pay special attention to these differences in order to develop effective strategies to motivate students to learn.

We hypothesised that we might be dealing with different groups within the sample: those who see the on-job experience developed within their motivation and performance in learning; and another group for whom full-time students would be focus on learning motivation for career. We suggest that further research is needed on this view of our students' working or intern experiences to try to identify further connections between the expectations and career aspirations of our students.

Coaching for self-study on the opensource e-portfolio system "mahara"

Mr. Shin-Ichiro Kubota

Kumamoto University

Abstract

Our laboratory members discuss research project face-to-face for a week. In that discussion, though our laboratory students report about their research activities, they don't have the evidences to report, report papers, reference papers, andso on. Hence, we cannot discuss their report and promote their research project.

In the future, we hope that our students will forward their research project by their plan. It is well known that the Self-Regulated Learning(SRL) helps for researching students to promote their research. In the SRL processes, the "goal setting" is a start process, and the "self-evaluation" is a last process.

We have coached the setting personal goals and the reflection for their every reporting after discussion. In these coaching, the opensource e-portfolio system "mahara" has used. This e-portfolio has the functions, "setting goals", "blog" to record their evidences and "storage" to save various files. This e-portfolio offers individuals these functions after authenticated by ID and password. At first, for our students, we give instructions to record all their search results and their thoughts in their blogs. Therefore, our students have become to show us the evidence for research activities naturally. Next, for our students, we give instructions to reflect by themselves after the face-to-face discussion. Because of this coaching, we have efficiently promoted research project and coached our students on time.

We indicate that our laboratory students cannot record their artifact and don't know the reflections. In this report, for solving these practical problems, we show our practical approaches to introduce the e-portfolio system and to give instructions for how to record and how to reflect.

Performance of uni directional LMS synchronization in various networks capacity

Achmad AFFANDI*, Arif FIRMANSYAH*, Bekti Cahyo HIDAYANTO*,

[†]Laboratory for Human Interface in Cyber Communications, Kumamoto University, Japan,
www.hicc.cs.kumamoto-u.jp

Abstract - A uni-directional synchronization is implemented within different type and capacity of networks between the master and client LMS. Obtained results shows that variation of network capacity (56 kbps - 2 Mbps) results time synchronization from 9199 seconds upto 236 seconds for a volume of file about 50 Mbytes. This result shows that to overcome problems in learning object development and maintenance can be solve by automatic sharing and updating thoughout LMS synchronization.

Keywords
Distributed LMS, Uni-directional Synchronization, content synchronization

1. Introduction

LMS is a system that supports the implementation of electronic learning (e-Learning) to provide learning materials, instructions the learning done by students, materials evaluation, and results of the learning process [1]. Currently, many applications Learning Management System (LMS) at the commercial and general public licence are developed [2]. One of the popular system of General Public Licence is Modular Object Oriented Dynamic Learning Environment (Moodle) [3], onwhich the synchronization system is run.

The usage of e-learning expands the capability of education with distance and asynchronous ways of learning. While development of information and communication infrastructure still relatively behind comparing progress of technology in developing countries. Organizing higher education courses, for example, in universities located in eastern part of Indonesia is challenging works. In order to achieve successful learning, lectures should be highly motivated within limited environments, including infrastructure and facilities, capacity of human resources and availability of good course contents and materials. [4]

In addition to fully utilize the capability of e-learning, building and maintaining costs of learning objects should be also minimized while the security for protecting personal information when using a Learning Management System (LMS) should be considered.

A single LMS can not provide sufficient accessibility if many of learners access to this LMS from distance connected with limited bandwidth networks.. In such a case, solution may be proposed by providing an LMS server within a local network with broad bandwidth in individual educational institutes in distance. Then its LMS contents necessary are necessary to be synchronized. Hence, to overcome both problems, a dynamic and automatic synchronization of the learning objects within multiple LMSs are required.

2. Distributed LMS

Synchronizing learning objects within multiple LMS can be considered as implementation of distributed LMS. Two approaches of synchronization was proposed, namely bi-directional and uni-directional synchronization [5]. Bi-directional synchronization approach is applied to all master LMS data (tables). They are synchronized between those of the master and the client one. This synchronization affects to all data is completely. But a uni-directional synchronization concerns only to learning objects of the client LMSs with ones in the master LMS; while the learners' information including the discussion and other interactive activities among learners and teachers, is not synchronized between LMSs in order to provide the separate operation for each educational institute.

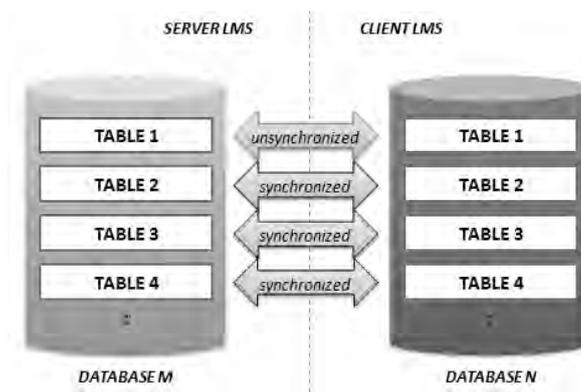
Figure 1 shows the uni-directional synchronization system, the specified learning contents only on the server LMS are retrieved and the differences are taken with the previously synchronized contents. Those differences are send to the specified client side either immediately or at specified timing and they are uploaded to the client LMSs. The synchronizing learning contents does not include learners' personal information; all contents posted by learners, all records of activities between all of server LMS and client LMSs.


Figure 1. Uni-directional synchronization of LMS

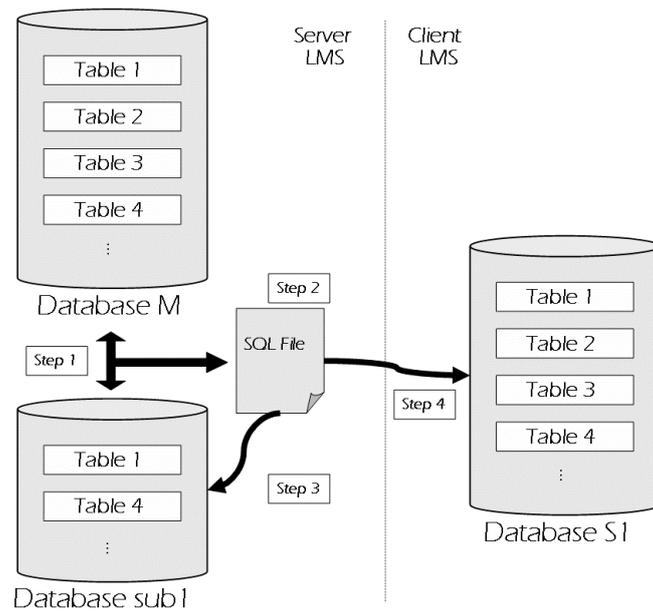
Whlist both LMS synchronization approaches are carried out as described in Figure 2. Specified database tables are compared between master data (database M) to the copy of client's data (Database sub1). Then SQL commands to update / remove /add records to make M and sub1 identical are directly generated. The following step is SQL commands are copied from server LMS side to the specified client LMS side. The copied SQL commands are applied to client LMS's Database S1. Finally based on the acknowledgement from client LMS, Database sub1 is updated. [6]


Figure 2. LMS synchronization concept

3. Scenario of Experiment

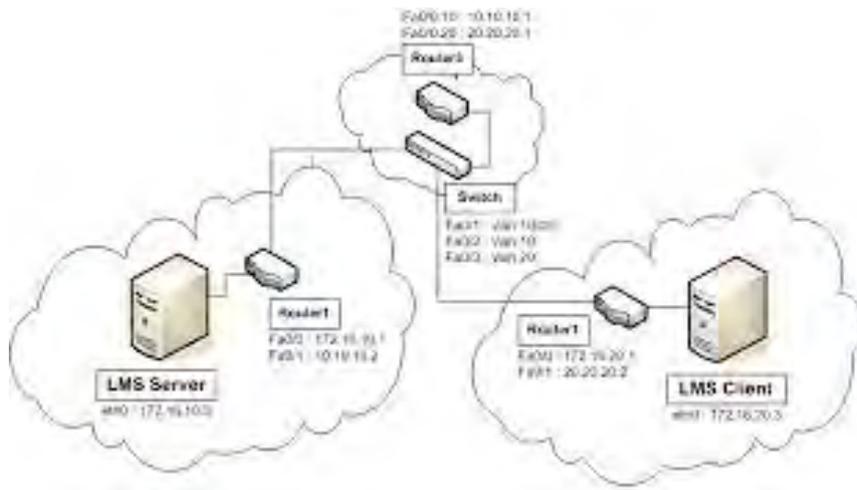
Scenario of experiment on the performance of LMS synchronization is designed for two types of network media, namely cable and wireless networks. The first experiment concerns on the difference of both type of networks in the various available bandwidth (56 kbps up to 2Mbps), where topology of both networks test bed are shown in Figure 3 and 4.


Figure 3. Cable Network topology
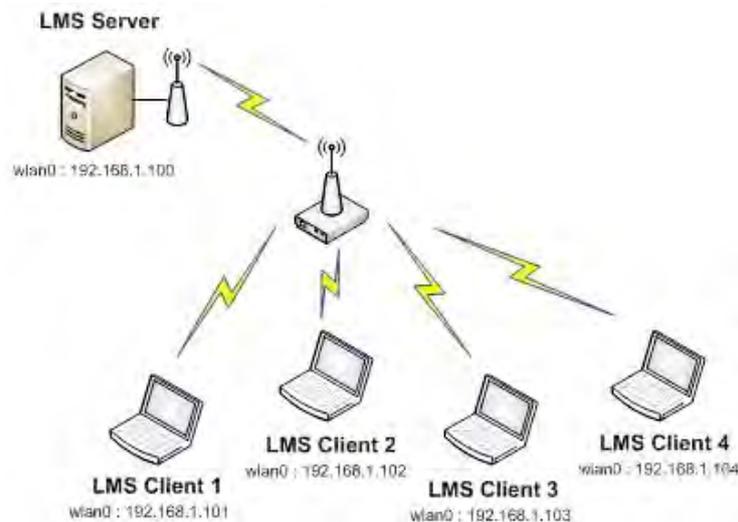

Figure 4. Wireless Network topology

Observation is focused on various available bandwidths in the networks will impact to the LMS synchronization performance. The bandwidth availability varies from 56 kbps, 384 kbps, 512 kbps, 1 Mbps and 2 Mbps. This LMS synchronization experiment is carried out to transfer a content about 50 Mbytes, and configurated by applying with and without other traffic in the networks. A Wireshark protocol analyzer is employed to monitor such a network performance and time synchronization [7].

4. Performance Evaluation

Obtained measurement results of LMS synchronization performance parameters within different capacity of the network backbone, are presented here including throughput during synchronization process and synchronization time between Master LMS and Client LMS. Due to limitation of test bed scale and number of LMS clients, this experiment is considered as an ideal connection performance environment.

Results of average throughput performance in cable networks for various bandwitdh given in the table 1, varies from 50.70 kbps to 1919.01 kbps, with deviation standard of 0.86 kbps to 16.45 kbps. When the bandwidth is limited, it shows that the variation of throughput become important 1.70% of the average, rather than that in the broadband of 0.86%.

Table 1. Throughput in cable networks for various bandwidth

Address A	Address B	Bandwidth				
		2Mbps	1Mbps	512Kbps	384Kbps	56Kbps
172.16.20.3	172.16.10.3	1928,95	982,51	507,25	377,58	50,39
172.16.20.3	172.16.10.3	1930,93	982,08	508,61	376,60	51,01
172.16.20.3	172.16.10.3	1891,31	978,96	513,08	377,94	51,88
172.16.20.3	172.16.10.3	1916,54	980,40	511,27	378,47	49,53
172.16.20.3	172.16.10.3	1927,29	980,24	508,33	375,20	50,70
		1919,01	980,84	509,71	377,16	50,70
		16,45	1,45	2,40	1,29	0,86

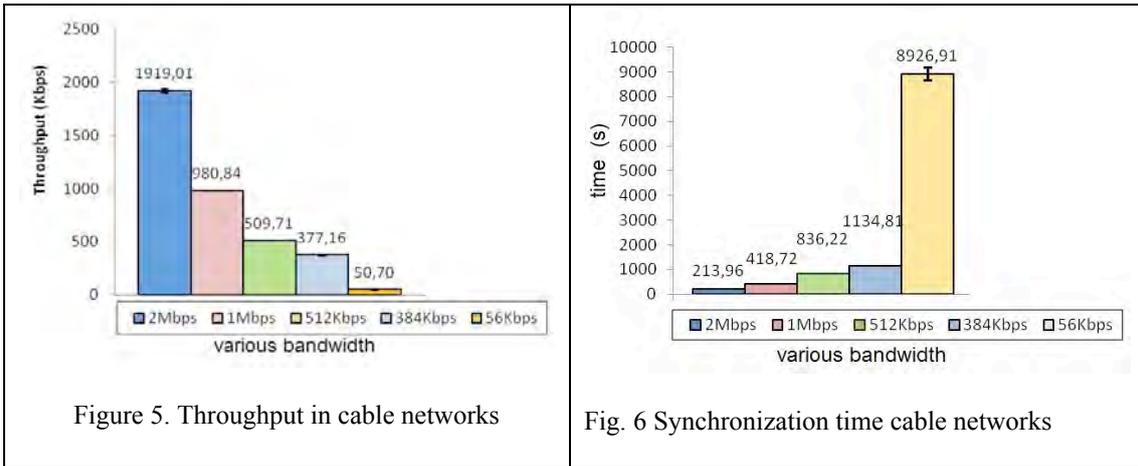
Figure 5 and 6 shows both throughput and time synchronization of LMS synchronization in cable networks in various bandwidth. The important of variation in small bandwidth seems more clear in the picture, especially for the time synchronization performance in 56 kbps networks variation may reach 2.88% of its average.


Figure 5. Throughput in cable networks
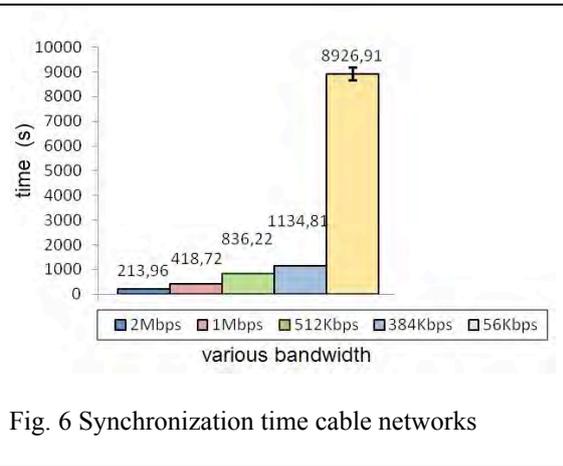

Fig. 6 Synchronization time cable networks

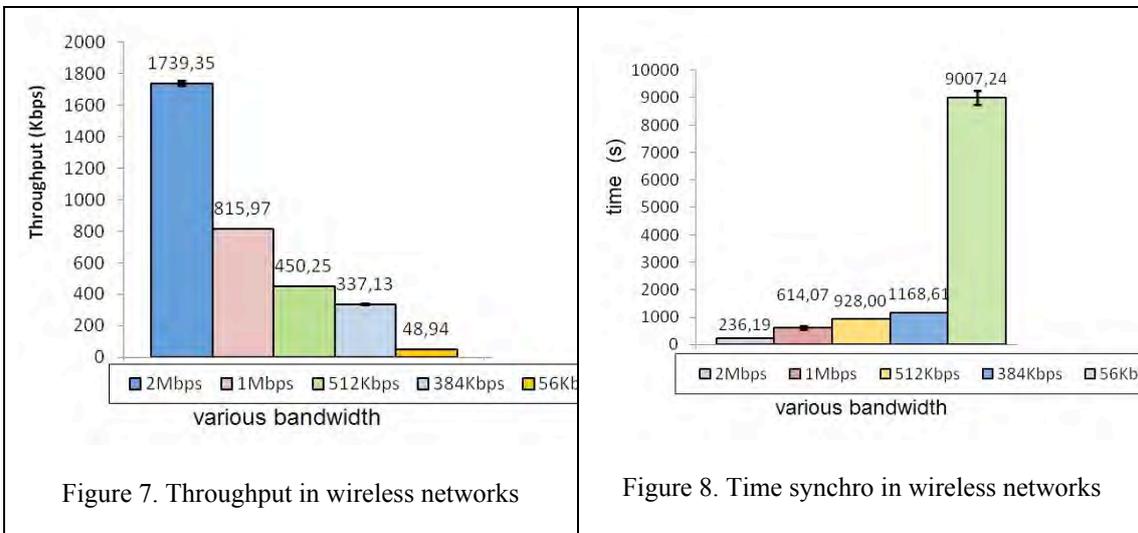
Other key important of implementation in different network media, i.e. cable and wireless. The performance of LMS synchronization in wireless networks for both parameter are shown in the Figure 7 and 8. The difference of throughput performance of each bandwith in wireless and cable networks increases (from -3.60% to -20.21%) when the bandwidth is inchrease (from 56 kbps to 1 Mbps). However, due to higher variation in the 2 Mbps bandwidth (3,85% of the average), this increment could not be confirmed in such a bandwidth. Hence performance in wireless networks is worse varying from 3.6% to 20.21% of network capacity (56 kbps to 2 Mbps) in cable.


Figure 7. Throughput in wireless networks
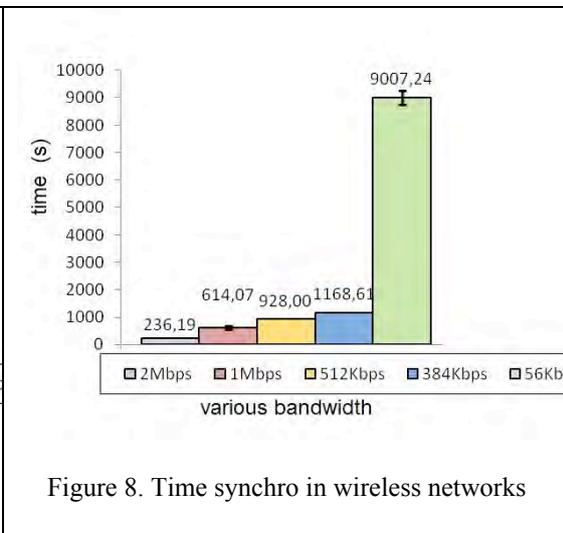

Figure 8. Time synchro in wireless networks

Whilst in the point of view synchronization time, the above statement may not be applied to the time synchronization between both LMSs. In the wireless networks, increase of bandwidth will not much vary in standard deviation of time synchronization (about 3% for all bandwidth). This may be happened due to difficulties of propagation environment, in consequence the variation to the average time synchronization is not important comparing the bandwidth increment.

5. Conclusion

Based on the measurement and evaluation presented above, some point may be addressed as followings:

1. LMS synchronization performance depend on the type of networks media and available bandwidth of the networks.
2. In general, better performance will be obtained using cable networks with higher available bandwidth.
3. Use of wireless networks will drop significantly of LMS synchronization comparing the cable one, but variation of bandwidth capacity (with reference of its average bandwidth) will not vary with the increase of available bandwidth.
4. Care must be taken, in the future, when the connection of the networks is not stable enough to maintain the communication. Such a research may be offered by considering real condition of networks in the community.

PoSTech, Front-End to AltaVista Search engine: A Case Study

Seyedarabi, Faezeh

Institute of Education,

University of London (postgraduate student)

Abstract

This poster describes the design and development of a Personalised Search Tool for Teachers called PoSTech!

PoSTech was developed as part of an iterative case study to investigate the decisive factors that individual teachers look for when searching online for resources. This search tool is a front-end to AltaVista's search engine or repository, aimed at UK teacher practitioners at primary, secondary and post-compulsory levels.

PoSTech comprises of twenty two search options from which seven are classified as being 'Research in Progress' options. The 'Research in Progress' options are search options that were preferred or highlighted by individual teachers in our previous case study but not currently supported by AltaVista.

With PoSTech, search results are presented to teachers in two separate windows; these windows are positioned next to each other and are made visible to teachers after clicking on the 'Search' button. The window on the right hand side of the webpage is designed to return personalised search results to teachers from the AltaVista's search engine/repository and the window on the left hand side retunes non-personalised search results.

Personalising search engines or repositories to teachers' needs and preferences and indeed the development of search tools like PoSTech place importance in the way in which teachers (and other group of end-users) embark on using generic search engines to pursue their online searching activities. Seeing that, with the invention of the internet in particular Web 2.0 and the UK government's call for an increased use of online resources and online based tools in classroom teaching, teachers are now incorporating digital resources into their lesson plans and have began using collaborative tools such as 'wikis', 'blogs' and 'podcasting'.

Moreover, teachers are the main (and perhaps the most important) end-users in the government's ICT policy agenda. They are the first group of users exposed to new teaching practices and technologies in education. These new practices are often enforced on the teachers through compulsory teacher trainings and new curriculum standards. This, therefore, makes teachers the pivotal point of all the government's policies and indeed the key implementers of their system given that, teachers are the facilitators and mediators between students and the new educational technologies outlined by the government.

Hence, the concept used for the design and development of PoSTech can easily be replicated around the world by search engine developers and/ designers to create other personalised search tools (front-ends) for their teachers; to develop search tools that sit in front of other generic search engines or repositories, rather than having to restrict teachers' search results to educational and or specialised search engines only.

Teaching Future Jordanian Information System at university

Dr. Ibrahem Tadros

Al-Balqa Apllied Science

ITSalah Al-Zobi

IT Dep. Salt College

Mohamad Al-Laham

Al-Balqa Applied university

Abstract

Teaching Information Systems (IS) to Jordanian tertiary students has become increasing problematic with many of them relying on a surface level approach to study. This will surely affect their understanding of IS material and in turn affect their effectiveness in the workplace.

Teaching Information Systems to future Jordanian Information System (IS) professionals has become significantly more challenging over the previous past years, for many different reasons, the changing nature of technology, the needs of industry and the student population differentials.

One of the main challenges is that the Jordanian university structure and style tends not to promote a deep level understanding of the information given to the students. This is concerning as students then take this poor approach into their working lives as IS professionals.

To assess whether this assertion is correct and explore possible solutions to it, the authors looked at a particular unit within an IS degree taught at a University within Jordan.

This paper examines the issues behind this trend and considers Learning Problem as an aid to counteract it.

EFL Reading and Writing through a Critical Literacy Perspective

Dr. Shin-ying Huang
National Taiwan Normal

Abstract

Despite the obvious importance of a critical literacy stance in a people's language and literacy practices, whether it be their native, second, or foreign languages (Hammond et. al, 1992; Hood, Solomon and Burns, 1996; Rice, 1998), there has been few research that discusses critical literacy in English-as-a-foreign language (EFL) classrooms, although the implementation of critical literacy in language classrooms in many English-speaking nations (e.g. Australia, Britain, and the United States) has already received extensive attention and wide documentation (Brown, 1999; Fehring & Green, 2001). Indeed, critical perspectives are still being overlooked in many EFL classrooms more than 10 years after the "critical turn" (Kumaravadivelu, 2006) in language education during the 1990s. Albright et al. (1999) also observe that most of the work on critical literacy has involved academics rather than practitioners and classroom teachers. This is particularly true in many
 Asian EFL settings, where critical literacy remains outside of mainstream practice (Falkenstein, 2003; Kuo, 2006). This paper therefore reports on an action research study which explored ways to include a critical literacy perspective in an EFL classroom. The purpose of this study was to gain insight into how critical literacy could be incorporated into an EFL reading and writing course. Particularly, this study attempted to understand the ways in which students responded to texts when encouraged to read critically. Ultimately, the goal was to investigate the possibility and practicality of a critical literacy framework for the teaching of English in EFL contexts in Asia.

   The research was undertaken at a university in northern Taiwan in a semester-long elective course focusing on EFL reading and writing. 35 non-English majors in their second, third, and fourth years enrolled in the course. Data collection lasted from September 2008 until January 2009. For the critical literacy component of the course, students were encouraged to respond to texts critically, and several questions were suggested as possible angles through which to consider texts. Towards the end of the course, students were also asked to write a short paper in which they reflected on various aspects of their learning. Data for this paper include students' written responses to three texts and students' reflections of critical literacy. Findings suggest that when provided appropriate materials and instructional support, students were able to question the voices that have been silenced and interrogate the perspectives that have been omitted in the texts that they read. The
 paper also discusses the angles through which students were able to examine texts of varying topics, including those more directly relevant to their lives and also topics of less personal relevance. Implications for future practice of critical literacy in EFL classrooms and suggestions for future research directions are also addressed.

Current Situation of Medical English Education in Japan

Eiko Kawagoe
Kobe City College of Nursing
kawagoe@tr.kobe-ccn.ac.jp

ABSTRACT

This paper reports on the current situation of medical English education at medical schools in Japan, based on: (1) Strategic planning in Japan, (2) Four medical colleges that received grants, (3) Activities of three associations in Japan, (4) Examination of Proficiency in English for Medical Purposes, (5) Nationwide questionnaire survey on medical English and (6) ESP teaching materials for medical students in Japan.

1. INTRODUCTION

Japan is facing an unprecedented aging society, and the roles of doctors are becoming more important than before. At the same time, we are facing global pandemics such as the global outbreak of influenza A (H1N1). We need to have medical doctors who can respond to global outbreaks quickly. We need doctors with a high level of medical English and the ability to exchange information with other medical professionals around the world.

Table 1 Rate of Japanese Papers in First Class Medical Journals
(University of Occupational and Environmental Health Library, 2004)

Impact Factor	Journals	Number of Japanese Papers	Total Number of Papers	The Rate of Japanese Papers
34.833	N Engl J Med	9	2,411	0.37
30.979	Nature	98	7,879	1.2
29.162	Science	78	4,125	1.9
21.455	JAMA	1	4,435	0.02
18.316	Lancet	45	8,605	0.52
12.427	Ann Intern Med	8	1,041	0.76
7.209	BMJ	1	4,739	0.02

However, the number of Japanese medical doctors who are recognized world-wide is very limited. For example, the rates of Japanese papers in the first class medical journals in the world are very low. (Table 1) This is the undeniable fact, though we have many talented persons in medical schools in Japan. One of the causes of this status is insufficient medical English education at medical schools in Japan.

It is very important to understand English education in Japanese medical schools today to assess what is still needed to improve medical English education. This paper reports on the current status of medical English education in Japan, categorized into six points: 1) Strategic planning in Japan, 2) Four medical colleges that received grants, 3) Activities of three associations in Japan, 4) Examination of Proficiency in English for Medical Purposes, 5) Nationwide questionnaire survey on medical English and needs of English in medical education in Japan and 6) ESP teaching materials for medical students in Japan.

2. STRATEGIC PLANNING IN JAPAN

The Ministry of Education, Culture, Sports, Science and Technology in Japan announced an action plan to cultivate "Japanese with English abilities" in 2003. This action plan proposes a system for "cultivating Japanese with English abilities." The university graduates are required to have 'English language skills for specialized fields or for those active in international society.'

The ministry provided subsidies to universities which had plans for good education to achieve this goal. This subsidy program called 'Good Practice' has six categories among which it has "cultivating Japanese with English abilities." In 2004, 74 universities or colleges applied for this subsidy under this category, and in 2005, 70 applied. 13 were selected in 2004, and 11 in 2005. In 2 years, 144 applied, and the total number of universities or colleges which got the ministry's special subsidy to cultivate Japanese with English abilities was 24. Among these selected 24 programs, the number of the programs aiming at the special fields is very limited, while most of them are aiming at general English abilities. The programs focused on special fields which were adopted are medicine (4 cases), engineering (2 programs), science (2 programs), business (1 program), and marine affairs (1 program).

3．FOUR MEDICAL COLLEGES THAT RECEIVED GRANTS

Four medical schools, Tokyo Medical and Dental University, Tokyo Women's Medical University, Tokyo Medical University, and University of Fukui got the subsidies. Medical schools are the recipients of the largest number of subsidies among the schools aiming at special fields of ESP and each school received a large amount of money (20 to 30 million yen, or 200 to 300 thousand dollars for each school).

3.1 Tokyo Medical and Dental University
The ultimate aim of Tokyo Medical and Dental University is to foster students with the same abilities as Harvard graduates. Their students receive training by visiting professors from the U.S. in such areas as techniques for interviewing patients, examining patients and presenting case studies. After arriving in the U.S., students receive orientations by Harvard Medical School professors. During the stay in the U.S., they can receive guidance from their school in Japan through TV conferencing.

3.2 Tokyo Medical University
The integrated English education system is continuous through six years, and two years for residency. 1st and 2nd year students learn basic medical English education. 3rd and 4th year students learn clinical medical English. 5th and 6th year students have chances to experience practicum at overseas hospitals. The emphasis is on 'hearing' and 'conversation,' throughout the eight years. Long-distance education with universities in North America, via optical fiber communication, is also available.

3.3 Tokyo Women's Medical University
The program called "I Am Your Doctor Project" aims to develop students' ability to communicate with patients, using such expressions as "I am your doctor. How may I help you?" Their students can learn English anytime with newly developed communication tools and native teachers. They also learn medical examination procedures in English, through the use of mock examinations, which are evaluated by native teachers. Moreover, international exchanges, including inviting interns from overseas, are promoted.

3.4 University of Fukui
Students listen to lectures regarding the importance of English language proficiency by clinical doctors and nurses, by young doctors on overseas experiences, and by overseas specialists. Basic medicine and clinical medicine are taught in English lectures. Some faculty members visit medical facilities in English-speaking countries to observe medical English. Students learn English anytime in the room called the E-clinic, where they can do mock examinations, present papers, or hold conferences in English.

4．ACTIVITIES OF THREE ASSOCIATIONS IN JAPAN

4.1 JSME (Japan Society for Medical Education)
JSME consists of teachers at medical schools in Japan. They study medical education in general. In 1994, however, it created a special committee for foreign language education. The committee held workshops for English teachers teaching at medical schools, and performed a questionnaire nationwide to survey English education at medical schools in Japan. The committee found out that English education was poor at medical schools, and determined that it was critical to teach medical English at medical schools to raise the level of medical care in Japan.

4.2 JASME (Japan Society for Medical English Education)
    The JSME members launched a society for medical English education study in 1998. This society was promoted to an association called JASMEE in 2001. JASMEE has especially focused on medical English education. This association consists of medical doctors and English teachers teaching at medical schools, pharmaceutical schools, nursing schools and other schools related to the filed of health sciences and interpreters. It is a very unique association because teachers and researchers who have different specialties get together and research only medical English education.

4.3 JACET (Japan Association of College English Teachers)
    JACET is an association consisting of English teachers at colleges in Japan. Members of this association study English education at colleges in general, but it has a special society for English for specific purposes (ESP society). The members of this society are English teachers at medical schools, pharmaceutical schools, nursing schools, engineering schools, aviation schools and other specialized schools. They have to teach English for specific purposes to their students. They study how to teach ESP and publish many English textbooks necessary for these special fields.

5．EXAMINATION OF PROFICIENCY IN ENGLISH FOR MEDICAL PURPOSES

    In response to the great need for medical English, and based on the research on medical English education, JASMEE had decided to create a special proficiency test for medical English. The first exam was held on April 13, 2008. 579 people nationwide including medical students, pharmaceutical and nursing students, medical doctors, pharmacists, and nurses took the examination. The number and percentages of test takers of the first examination for Proficiency in English for Medical Purposes are shown in Table 2.

Table 2 Test Takers of the First Examination for Proficiency
in English for Medical Purposes

MediEigo, (2008)

	3rd level	4th level
Number of test takers	401	178
Medical doctors (%)	26.9	6.7
Medical people other than doctors (%)	17.0	17.2
Medical students (%)	21.2	39.3
Interpreters, Translators (%)	11.7	6.7
Others (%)	23.2	30.1

    This new examination carries the heavy weight of high expectations for improving the status of medical English education in Japan.

6．NATIONWIDE QUESTIONNAIRE SURVEY ON MEDICAL ENGLISH

    I performed a questionnaire survey which was funded by the Japanese Ministry of Education, Culture, Sports, Science and Technology. The theme of the research was 'A Systematic Study of Actual Conditions and the Future: A survey of ESP Education in Medical Schools and Nursing Schools.' I surveyed English education in all medical schools in Japan.

6.1 English education in medical schools in Japan
    I sent a nationwide questionnaire to the presidents of all medical colleges, and the deans of all medical schools in Japan, a total of 80 institutions. I received replies from 53 institutions (66.3%) This very high percentage for this type of questionnaire shows that the interest in English education is very high among administrators of medical schools in Japan.

As for the questions focusing on ESP, the percentage of medical schools that teach medical English is 86.8%. The percentages of medical schools where teaching lesson ESP content are taught are shown in Table 3.

Table 3 Rates of Medical Schools Teaching ESP

(Kawagoe, 2005)

	Reading English Medical Papers	Daily English Conversation	Medical English Conversation	Writing English Papers	Presenting Papers at Conferences
Teaching in Medical Schools	81.1%	69.8%	49.1%	30.2%	52.8%

'Reading English Medical Papers' and 'Daily English Conversation' are taught in medical schools. But, 'Medical English Conversation' 'Writing English Papers,' and 'Presenting Papers at Conferences' are taught less compared with the two previous items. So we must improve these areas of teaching.

About half of medical schools offer students chances to study abroad. The main purpose of going abroad for medical students is 'Practicum.' For 'Practicum,' the students have to learn a lot about medicine before going abroad. So the greatest number of students going abroad is the 6th year students, followed by 5th year, 4th year, 3rd year, 2nd year and 1st year students. The greatest number of students visit the U.S. followed by U.K., Canada, Australia, Holland, Germany, France and Thailand.

As for the cost of going abroad, the most common case is that the student personally bears the expense for going abroad. It is frequently over \300,000 or 3,000 dollars. It is a very heavy burden for the students. Table 4 shows the number of schools which responded to the survey about the cost. The greatest problem for going abroad for the students is 'money.'

Table 4 Number of Schools about Cost of Going Abroad
(Kawagoe, 2005)

Total	Less than \100,000	\100,000 \200,000	\200,000 \300,000	Over \300,000	Not written
School Only	1	8	2	1	0
Student Only	0	2	3	8	9
School + Student	0	1	0	2	4
Other (donation etc.)	1	5	0	0	3

The number of credits for English is shown in Table 5. As for the core curriculum, the total number of credits is 6.3 credits. As for optional credits, the number is 1.7 credits.

Table 5 Number of Credits for Medical Students to Take
(Kawagoe, 2005)

Core curriculum	
Public schools	5.2 credits
Private schools	7.7 credits
Total	6.3 credits
Optional curriculum	
Public schools	1.7 credits
Private schools	1.7 credits

Total	1.7 credits

This survey reveals much about the current status of medical English education in Japan. This is vital data for improving English education in the medical schools of Japan.

7. ESP TEACHING MATERIALS FOR MEDICAL STUDENTS IN JAPAN

I surveyed textbooks for medical students published in Japan. The results of the survey are shown in Table 6. We have many good quality reading and writing textbooks for medical students. We have several good speaking textbooks, but there are few listening textbooks for medical students in Japan. We also need to make audio materials and E-learning materials.

Table 6 Textbooks for Medical Students Published in Japan

(Kawagoe, 2005)

Type of textbooks	Number	Rate
reading	74	34.4%
writing	50	23.3%
speaking	31	14.4%
listening	2	0.9%
comprehension	5	2.3%
dictionary	36	16.7%
vocabulary	17	7.9%
Total	215	100%

I have been teaching medical English at medical schools in Japan for more than eight years, and have used the following E-learning materials.
(1) E-learning for medical conversation
    Net Academy, Medical Course, ALC, Tokyo, 2002
    Students play the roles of doctors and converse with computers on which voices of patients are recorded. They learn English expressions necessary for doctors to converse with patients, and medical vocabulary related to the conversation. In the following class, they are given quizzes on the expressions and medical vocabulary they learned the previous week.
(2) E-learning for TOEFL
    English Special Program, NTT SOFT, Tokyo, 2005
    As an assignment outside the class, students are required to have training for taking the TOEFL test.

The following figures show the results of the questionnaire to medical students. Figure 1 shows the responses of the medical students to the question, 'Are you motivated in the class with the textbook 'ER' and the materials, 'e-learning for medical conversation?' Figure 2 shows the responses to 'Is the class meaningful?' Figure 3 shows the responses to 'Is the textbook of "ER" or "e-learning for medical conversation" interesting?'As shown in figures, 'e-learning for medical conversation' motivates students far more, makes classes more meaningful and is more interesting than the textbook 'ER.' 'ER' is also a very nice text book, but 'e-learning for medical conversation' is a much more effective material than the textbook on ER. 'E-learning for TOEFL' is also an excellent material, and it is very beneficial for improving students' English abilities.

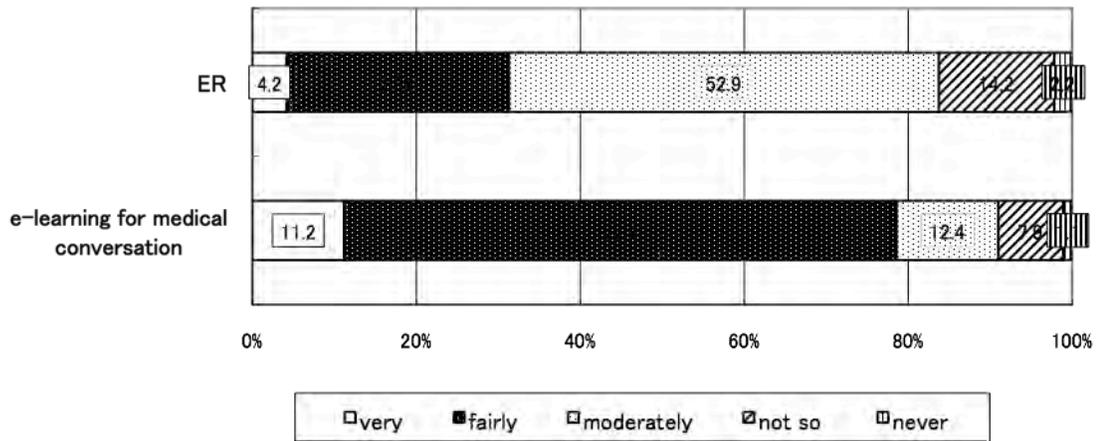
As mentioned above, e-learning materials are very effective for medical students, so we need to make good quality e-learning materials. In addition, medical students are very busy studying medicine, so e-learning materials which can be studied anytime at home are very convenient for medical students.


Figure 1 Are You Motivated?
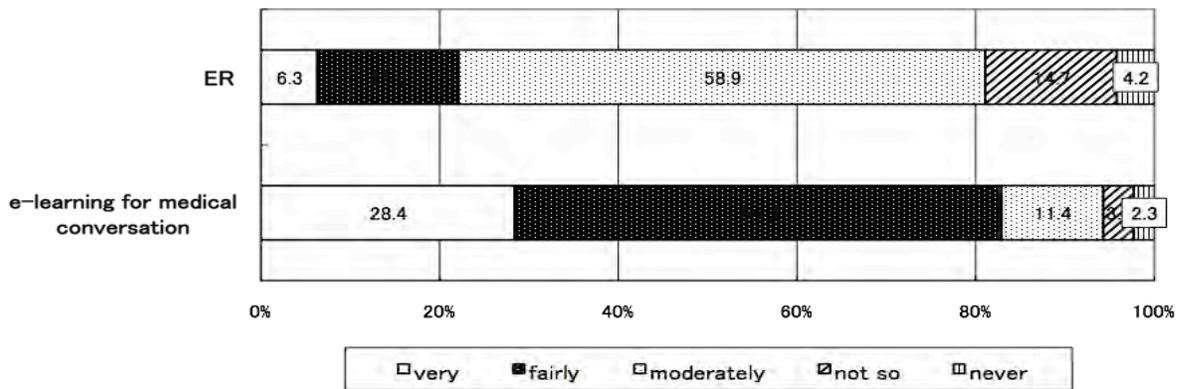

Figure 2 Is the Class Meaningful?
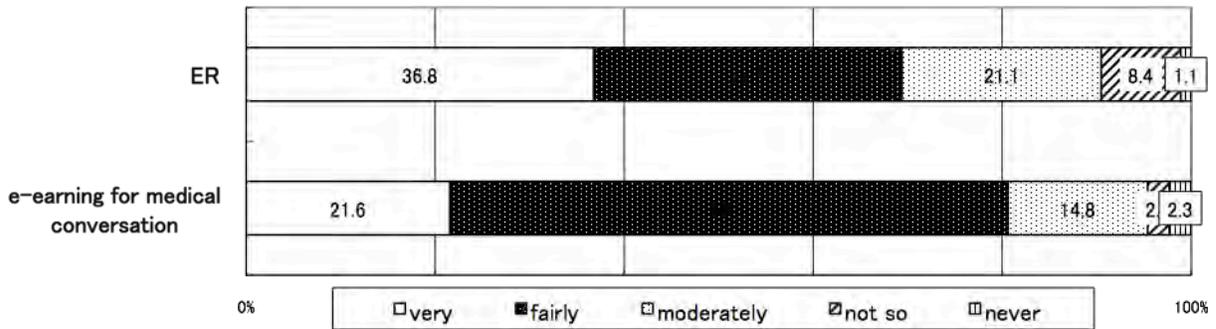

Figure 3 Is the Material Interesting?

8. CONCLUSION

I have overviewed medical English education in Japan categorized into the six points above. The Ministry of Education, Culture, Sports, Science and Technology in Japan, medical schools and three associations have recently been focusing more on medical English education. Medical English education is gradually getting better, though it is very urgent that we continue to see it improve, as shown in the results of my nationwide survey. Examination for Proficiency in English for Medical Purposes which has just begun will play a great role to improve medical English education. I have also shown that e-learning is a very effective method. We should develop e-learning materials for medical English education in Japan. Fortunately, I received a grant from the Japanese Ministry of Education, Culture, Sports, Science and Technology to develop e-learning materials. I will do my best to develop these materials for medical

English education in Japan. At the same time I desire to make known the need for the improvement of medical English education in Japan, and I also hope to continue cooperating with medical doctors and English teachers teaching at medical schools for the improvement of medical English education for the future of Japan.

EFL College Students' Self-regulation:
Results from an Experimental English Course

Yu Ping Chang & Ching Jung Wu
Yu Da University

Abstract

The purpose of this study was to investigate the effects of an experimental English course with self-regulated learning activities on students' English performance and self-regulation. 107 college students in a Taiwan college participated in this study for a semester. The instruments utilized in this study included an English achievement test, Self-regulated Learning Inventory, and an experimental English course. The collected data were analyzed by Statistical Package for the Social Sciences.

Introduction

In the 1970s, research on learning and instruction was mainly focused on cognition, whereas motivation and high level of control were seldom mentioned. Yet, through educational reform, individual differential variables, and innovative technology, researchers gradually shifted their research focus towards students and factors affecting their learning motivation. Among them, self-regulated learning was the most valuable term and the most attentive topic—it emphasized the process through which learners take charge of their own learning. A great deal of research has been focused on their studies related to self-regulated learning (e.g. Paris & Byrnes, 1989; Zimmerman, 1989, 2000; Paris & Newman, 1990; Pressley, 1995; Winne, 1997; Pintrich, 2000; Schunk, 2000).

Based on theories of self-regulated learning (e.g. Pintrich, 2000; Zimmerman, 2000), students have no longer treated as passive respondents but rather considered them as active participants. Throughout the entire learning process, students can stimulate learning performance through self-regulation, and teachers can simulate students' self-regulation and improve their learning performance through various self-regulated activities rather than passively cooperate with students on invariable psychological ability and social environment to teach students.

Many EFL college students in Taiwan have shown high level of learning motivation at the beginning of the first college year. Gradually, they have low motivation to learn English due to lack of verbal practices through social interaction along with increasing difficulty of learning contents. To promote students' English learning and to provide more effective English teaching, more must be known about self-regulated learning in Taiwan. This study attempted to investigate the effect of an English course designed with self-regulated learning activities on English performance and meta-cognitive regulation of college students in Taiwan.

Research Questions

The main purpose of the study was to explore the effect of an experimental English course on English performance and meta-cognitive regulation of a group of EFL college students. Students in the experimental group adopted an English course with self-regulated learning activities; students in the control group adopted an ordinary English course. The following two research questions were proposed to accomplish the purpose of the study:

1. What are the differences among students in the experimental and control groups with respect to English performance?
2. What are the differences among students in the experimental and control groups with respect to meta-cognitive regulation (e.g. self-monitoring, self-evaluation, self-correction, and strategy use)?

Literature Review

Definitions of self-regulated learning are vary depending on each researcher's theoretical perspective. Studies related to self-regulated are also vary ranging from behaviorism to modern psychology. In the past two decades, a great deal of research has been done related to self-regulated learning on cognition, meta-cognition, and behavior (e.g. Corno & Mandinach, 1983). In the past ten years, it has been changed to focus on a constructivist perspective on self-regulated learning (e.g. Paris & Byrnes, 1989), on social foundations of self-regulated learning (e.g. Zimmerman, 1989), on developmental changes in self-regulated learning (e.g. Paris & Newman, 1990), and on instructional tactics for promoting self-regulated learning (e.g. Bulter & Winne, 1995). Recently, many researchers focused their studies on an educational psychological perspective on self-regulated learning (e.g. Zimmerman & Lebeau, 2000; Phakiti, 2003; Whipp & Chiarelli, 2004, Zimmerman, 2008).

Since self-regulated learning is multifaceted, this study mainly focused on metacognitive regulation. Meta-cognitive regulation concerns the awareness and control of one's thought processes. Zimmerman's (1989) self-regulated theory is composed of six different self-regulated learning theories, including behaviorism, social cognitive, action control, cognitive constructivism, phenomenalism, and Vygotskyism. The six perspectives all share the same emphasis—through active manipulation of cognition, motivation, action, and meta-cognition, learners can achieve better results.

According to Pintrich (2000) and Zimmerman (1999, 2002), meta-cognitively, self-regulated learners are able to plan, organize, monitor, evaluate, and modify their learning process for achieving better performance. In other words, they are also able to use a variety of meta-cognitive strategies in their learning, such as self-monitoring, self-evaluation, and self-correction. Self-monitoring strategies included checking learning processes regularly and comparing goals and current accomplishments (Schunk, 2000). Based on Mace, Belfiore, and Hutchinson (2001), self-evaluation, self-correction, and self-monitoring occur almost at the same time. Self-regulated learners decide whether to change or correct the way of using meta-cognitive strategies, keep the efforts going, or exert more efforts based on the results of comparing goals and current accomplishments.

Method

The population involved in this study was 107 college students. The students were randomly assigned into the experimental group or the control group using random numbers. 54 out of 107 students were in the experimental group and 53 students in the control group. Students in the control group adopted an ordinary English course; students in the experiment group adopted an English course with self-regulated learning activities.

Instruments used to assess EFL college students' self-regulated learning in this study included Self-regulated Learning Inventory (SLI), English Achievement Test, and an experimental English course with self-regulated learning activities. SLI used in this study was developed by Wu and Chang in 2006, which is especially developed to elicit the frequency of self-regulated strategy use by EFL students. English Achievement Test used to test students' English performance was also developed by Wu and Chang, which included listening, reading, and writing. The experimental English course with self-regulated learning activities was developed by the researchers. This course was designed based on Zimmerman's (1986, 1989, 1990, 1999) studies, theories, concepts, and perspectives of self-regulation learning.

Results of the Study

Descriptive statistics (e.g. mean scores and standard deviations) and ANOVA were used to answer the two research questions of this study. In this study, for all statistical analyses, the significant level was set at $p < .05$. The results were as follows.

Research Question 1

Research question one is, "What are the differences among students in the experimental and control groups with respect to English performance?"

(1)   After the English course, students in the experimental group (M = 73.92) had higher English performance than students in the control group (M = 72.47).   In addition, students in the experimental group improved their English performance (pre-M = 69.46; post-M = 73.92); however, students in the control group did not improve their English performance (pre-M = 73.38; post-M = 72.47).

(2)   The results of three-way mixed-design ANOVA revealed a statistically significant difference of English proficiency on English performance ($F = 111.31$, $p < .001$).   Moreover, two-way ANOVA results revealed a statistically significant difference between groups and stages ($F = 5.73$, $p < .05$) on English performance.

Research Question 2
Research question two is, "What are the differences among students in the experimental and control groups with respect to meta-cognitive regulation (e.g. self-monitoring, self-evaluation, self-correction, and strategy use)?"

(3)   After the experimental English course, students in the experimental group (M = 22.36) used more self-monitoring strategies than students in the control group (M = 19.94).

(4)   Three-way mixed-design ANOVA showed that there was only a statistically significant difference of English proficiency on self-monitoring ($F = 8.27$, $p < .01$). Two-way ANOVA results also revealed statistically significant differences of groups and English proficiency ($F = 4.27$, $p < .05$); groups and stages ($F = 4.95$, $p < .05$) on self-monitoring.

(5)   No statistically significant difference was found among students with good English proficiency on self-monitoring in both experimental and control groups; however, there was a difference among students with poor English proficiency ($F = 9.20$, $p < .01$).

(6)   No statistically significant difference was found in the experimental and control groups on self-monitoring in the pre-stage; however, there was a difference in the post-stage ($F = 4.82$, $p < .05$). There was a statistically significant difference among students in the control group on self-monitoring in the pre-stage and the post-stage ($F = 8.64$, $p < .01$).

(7)   After the English course, students in the experimental group (M = 22.06) used more self-evaluation strategies than students in the control group (M = 19.33) when facing some problems or getting some new information.

(8)   The result of three-way mixed-design ANOVA showed that there was only a statistically significant difference of English proficiency on self-evaluation ($F = 20.00$, $p < .001$). Two-way ANOVA results also revealed a statistically significant difference of groups and stages ($F = 5.98$, $p < .05$) on self-evaluation.

(9)   No statistically significant difference was found in the experimental and control groups on self-evaluation in the pre-stage; however, there was a difference in the post-stage ($F = 6.05$, $p < .05$). Also, there was a statistically significant difference among students in the control group on self-evaluation in the pre-stage and the post-stage ($F = 4.04$, $p < .05$).

(10)   After the English course, students in the experimental group (M = 22.84) used more self-correction strategies than students in the control group (M = 20.25) when facing learning problems.

(11)   The result of three-way mixed-design ANOVA showed that there was only a statistically significant difference of English proficiency on self-correction ($F = 10.52$, $p < .01$). Two-way ANOVA results also revealed a statistically significant difference of groups and stages ($F = 7.57$, $p < .01$) on self-correction.

(12)   No statistically significant difference was detected in the experimental and control groups on self-correction in the pre-stage; however, there was a difference in the post-stage ($F = 4.61$, $p < .05$). Also, there was a statistically significant difference among students in the control group on self-correction in the pre-stage and post-stage ($F = 5.31$, $p < .05$).

(13)   After the English course, students in the experimental group (M = 18.94) tended to use more strategies than students in the control group (M = 16.84).

(14)   The result of three-way mixed-design ANOVA showed that there was only a statistically significant

difference of English proficiency on strategy use ($F = 7.93$, $p < .01$). Two-way ANOVA results also revealed a statistically significant difference of stages and groups ($F = 6.71$, $p < .05$) on strategy use.

(15)   No statistically significant difference was found in the experimental and control groups on strategy use in the pre-stage and in the post-stage. However, there was a statistically significant difference among students in the control group on strategy use in the pre-stage and post-stage ($F = 5.66$, $p < .05$).

Conclusions

Several conclusions were drawn from the results of this study.

(1)   The coefficient alpha of the SLI was .94, which indicates that the internal consistency was acceptable.

(2)   As for English performance, there was a statistically significant difference between the experimental and control groups. Also, students who adopted an experimental English course with self-regulated activities showed a higher achievement than others in an ordinary English course. This means that the experimental English course was effective in improving students' English performance.

(3)   From the study of meta-cognitive regulation, although no statistically significant differences were found between both experimental and control groups on self-monitoring, self-evaluation, self-correction, and strategy use in the pre-stage, there were significant differences in the post-stage. This means that the experimental English course was effective to students' meta-cognitive regulation. Students in the experimental group tried to use meta-cognitive strategies to monitor, evaluate, and correct their English learning process towards the best.

Recommendations

This study has presented crucial information about self-regulated learning. Although the subjects were limited to a specific college, the findings did reveal some potential issues related to the EFL learning in technological and vocational colleges throughout Taiwan. The following recommendations are derived from this study.

(1)   The English achievement test used to measure students' English performance in this study included listening, reading, and writing. The results of students' English performance need to be replicated with other measures, such as speaking, so that the findings might be validated.

(2)   The subjects in this study were limited to one college in Taiwan. It may not be applicable for different technological or vocational college students in Taiwan. Therefore, more subjects covering a wider range of colleges are strongly recommended in future work.

(3)   The current study was based on college students. Future research may focus on junior high school students, senior high school students or university students in Taiwan as subjects.

(4)   Future or further research needs to explore other variables that may influence the use of self-regulated learning strategies. Wigfield (1994), Shin (1998), Pintrich (1999), and Jakubowiki and Dembo (2002) indicated that self-efficacy, time management, and effort management all might influence the use of self-regulated learning strategies.

(5)   Intensive studies are essential because they can help language teachers understand why and how individuals use the specific self-regulated strategies in the language learning processes. They also can help English teachers provide incentives, which directly or indirectly help learners to use a greater variety of self-regulated strategies to improve their English learning.

(6)   English instruction should emphasize students' active participation and strengthen the bond between recognition and implementation. Technological and vocational college teachers in Taiwan should receive well-designed training in self-regulated learning strategy use.

(7)   Most students had shown tremendous interests in English learning between age six to 12 in Taiwan (Wu & Chang, 2006). Gradually, their interests started to waver and many of them even gave up due to the difficulties of English. It was necessary to improve students' learning habits in order to

maintain their learning motivation. Every student is unique. Students have different preferences of self-regulated learning strategies. Therefore, if technological or vocational college teachers in Taiwan want to train their students on the use of self-regulated learning strategies, they should take each student's personal characteristics into account. Self-regulated learning strategy training should not be limited to the classroom; it should go beyond the classroom. The purpose of this effort is to help learners experience and develop a range of effective self-regulated learning strategies and then guide them to apply these strategies to their own learning outside the classroom.

Reflections on EFL teacher quality in Japan: A case study of elementary and secondary schools

Dr. Shoichi Matsumura
Julian Chapple
Ryukoku University

Abstract

Japan, like many other EFL countries in Asia, has implemented a variety of reforms to English education policies and relevant action plans in an effort to promote oral communication skills (Lamie 2004). In 2002, the Japanese Ministry of Education set the desired standard level of English proficiency for secondary school English teachers at a minimum of 550 points in the TOEFL and 730 points in the TOEIC. In addition, all English teachers are now required to take intensive in-service training for five years in order to improve their overall English proficiency and practical teaching skills (The Ministry of Education, Culture, Sports, Science and Technology, 2006).

　Despite these growing demands for high-quality teachers, recruiting such teachers has become increasingly difficult for several reasons. First, the overall academic level of Japanese university students is expected to decrease due to the implementation of more relaxed educational policies in secondary schools in recent years. Those who are enrolled in teacher preparation programs are no exception. Second, there are a large number of baby-boomer teachers who will retire in several years, which will naturally lead to a high demand for English teachers. This demand will further expand, particularly when English education is implemented in elementary schools in 2011. Given these sociopolitical changes, what matters is the increased demand for English teachers together with the limited supply of high-quality teachers, resulting in a situation in which even low-quality teachers could be easily hired. Therefore, it is critical to investigate and determine the minimum required s
 tandards, in terms of not only English proficiency but also knowledge level of second language acquisition and foreign language teaching techniques, for prospective teachers.

　In this presentation, we will discuss, drawing on interview and questionnaire data collected from current English teachers working for elementary and secondary schools, discrepancies between teacher qualities sought in teacher preparation programs, those assessed in the EFL teacher recruitment exams, and those that are needed in real-life classrooms situations. We will also discuss whether their thinking and philosophies about teaching were changed when preparing for the exams, and if so, how the change affected their teaching practices in the actual classroom. In so doing, we will examine what perspectives are missing regarding teacher quality in the current teacher preparation programs, and what to look for and how it should be measured in the employment exams, as well as how in-service training should be connected to the newly-hired teachers' educational background.

Soft Power on the Higher Education Front: A Link between Hegemony and Self-determination

Mr. Yat Wai, William Lo
The Hong Kong Polytechnic University
will.lo@polyu.edu.hk

Abstract

Over a quarter-century ago, Philip G. Altbach adopted the centre-periphery model to describe the global landscape of higher education. He pointed out that academic resources are unequally distributed in the contemporary world where prominent higher education institutions in the developed world, mainly referring to Anglo-American universities, occupy and control most of the means and resources of knowledge production, whereas those in the developing world can only play the role of consumer and follower in the global academia. Such an unequal pattern has been further strengthened under the impacts of globalisation. Some even argued that globalisation has caused a convergence trend that merely means a process of re-colonisation, resulting in reproducing and copying western practices. Recent studies however suggest that nation states still play a determining role in developing infrastructure and initiatives of higher education. In addition, the rapid economic growth has brought a tide of massification and of the quest for world-class excellence in higher education sectors in some newly industrialised nations, such as Japan, China and the four East Asian tigers. Building "centres in peripheries" becomes a common measure adopted by countries in the region in response to the global competition in higher education. In this regard, the question "how much is hegemony and how much is self-determination?" is the focus of discussion in the dialectic of the global and local.

    The purpose of this paper is to distinguish the line or to identify the link between hegemony and self-determination by adopting the scale of power developed by Joseph S. Nye. It argues that the recent emergence of world university rankings represents a "missing link" in the transition from hard power to soft power and between the global and the local. While it agrees that nation states are still the dominant actor in higher education policy, it believes that individual higher education systems are affiliated to a homogenization-heterogenization matrix that restricts state strengths and the scope of state functions in high education governance in the globalised world. On this basis, the paper suggests that states in peripheries are strong and proactive in directing their higher education systems but weak and passive in the relationship and communication with the centre university systems.

Keywords: Soft power; globalisation; university ranking; centre-periphery; hegemony

Research Performance in Taiwan's Higher Education Institutions

I. Research Backgrounds and Purposes

For centuries, universities have been playing two major roles: the role of creating knowledge and the role of disseminating knowledge. Both knowledge dissemination and knowledge creation rely on research to create endless knowledge; hence it can be said that research is right at the core of university education.

With the current world-wide trend of increasing competition among universities and colleges in higher education systems, more and more people have started to care about "institutional diversity." On the other hand, the popularization of higher education has also reflected the heterogeneity between students and courses or institutions. With the trend of higher education development, it has become increasingly important to enhance the openness of politics in higher education institutions to understand the diversity and heterogeneity of higher education. At present, there are two methods around the world to increase the openness of higher education. One is horizontal classification, which classifies a higher education institution on the basis of its function, assignment, and characteristics to increase the understanding of the differences among the properties of higher education institutions. Another is vertical ranking, which ranks the same category of institution or curriculum according to its reputation or performance to acquire rankings from different evaluations. Although current international university classifications and rankings have suffered criticisms from college social groups, the emergence of various types of classifications and ranking systems has not been influenced, and has been increased gradually instead.

Based on the above, the purposes of this study are as follows:

1) To understand how to evaluate the research performance in Taiwan's higher education institutions.

2) To analyze the rankings of research funding among universities and colleges in Taiwan.

3) To propose relevant suggestions according to the research conclusions.

II. Literature Review

Literature review of this study contains the methods of research performance and overseas related studies.

The methods of research performance primarily rely on some techniques. First is called bibliometric data, which extensively includes the quantity and citations of published research theses and review papers (King, 2004). Thomson-ISI (Institute for Scientific Information) is the provider of these data; it provides three kinds of citations, namely, the Science Citation Index Expanded, the Social Science Citation Index and the Arts and Humanities Citation Index. Each index provides the citation mapping of single article from 7,000 journals.

Thomson-ISI indicates the most highly cited research among 21 academic areas. Individuals received as the most highly cited researchers represent they are listed top 250, according to their published articles, in a specific period of time. Thomson-ISI also provides raw data of publication on authors, organizations and nations.

Second, the prestigious academic awards are open and useful data, which help to distinguish relatedness between institutions and rewarded persons. Besides that, researchers can utilize other famous scholarships and fellowships, such as Fulbright Scholar Program, The Royal Society Fellowship, or Academy of Arts and Sciences, as indicators of rankings of research funding.

In Australia, New Zealand and UK, there are quite many materials published by local governments and the allocation unit, including graduate student enrollment and graduation situation by institutions & fields of study. In addition, teacher materials (e.g., the number of full-time faculty by institutions and fields of study, proportion of faculty owning degree of doctor), external research income (e.g., competitive research award passing ration) and research creative income are used to be tools for evaluating research performance of higher education institutions. In some English-speaking countries, such as Australia, Canada and US, they usually collect research creative income data through regular surveys, including certificate in technology, creative income from certificate, patents and real profit of subordinate companies.

According to overseas related empirical studies, Australian Department of Education, Training and Youth Affairs (1998) once used cluster analysis to classify domestic colleges by adopting grand scope of teaching and the research materials from 1996/1997. There are over 20 indicators used to be six predictable dimensions, for example, scale, overseas orientation, diversity, internal/full-time orientation and financial research orientation. Based on these six performance measurements mentioned above, the universities and colleges are divided into 4 to 7 groups and ranked by each indicator.

Abbott and Doucouliagos (2003) also adopted data envelopment analysis to estimate the efficiency of universities and colleges in Australia by using non-parametric techniques. The items of output contain teaching and research dimension. The former consist of numbers of equivalent full-time students, enrollment in tertiary education, numbers of awarding bachelor, master and doctoral degree of undergraduate and graduate schools; the latter consist of research funding, research expense, and so on. Regardless of the influence of output-input mix, results found that universities in Australia were highly efficient on the whole.

Using research performance as a prediction to evaluate universities' performance is proven to be a controversial issue. Not only needs to consider the quantity of research output but also quality. de Groot, McMahon & Volkwein (1991) surveyed universities in America, which were evaluated by the items of research output (bibliometric) and research quality (peer review). Meanwhile, Athanassopoulos and Shale (1997), Johnes and Johnes (1993) used the weighted index of research publication to assess the quantity and the quality of research. Johnes and Taylor (1991) used traditional measurement indicators, such as publication, citation and research income, to evaluate universities performance.

In some research, it applies citation to measure research quality, such as annual Social Sciences Citation Index (SSCI). However, if we completely use SSCI to evaluate the quantity and quality of research performance, it may cause bias for mostly research papers could not be published on SSCI journals. Harris (1998) also supports this similar claim.

Another kind of evaluation method is using the external research income of a university as a basis to evaluate research performance. Cave, Hanney & Kogan, and Tomkins & Green suggested that the fund of research funding reflects the market value of that research; hence it can be viewed as a kind of index of research performance (Valadkhani & Worthington, 2005). However, Johnes & Johns (1993) indicated that the fund of funding is a kind of expenditure rather than output.

Although the three kinds of methods for research assessment mentioned above all have their own advantages and disadvantages, they are still important methods which are often used in research assessment.

III. Research Method

This study performed document analysis and secondary data analysis in order to find out the rankings of research funding among universities and colleges in Taiwan. This study adopted four data to inspect institutions' research performance, by searching National Science Council (NSC) Database and Ministry of Education website, including the number of pieces of NSC Research Projects, the number of people who gained important awards, such as NSC Outstanding Research Award, National Academic Award and National Chair Professor Award.

IV. Results Analysis and Discussion

The number of pieces of research projects which passed the screening of NSC was analyzed, including two aspects: total number of pieces and the average number of pieces per teacher.

This study was based on the four items mentioned above to analyze total academic productivity and the average academic productivity per teacher. Appendix A shows that the average academic productivity per teacher and ranking from 2003 to 2007. However, due to the limitation of the length of context, we only discuss the average academic productivity per teacher.

First, as far as total number of pieces of NSC research projects is concerned, the top 10 universities and colleges are in the following order (see Table 1): National Taiwan University (國立台灣大學), National Cheng Gung University (國立成功大學), National Chiao Tung University (國立交通大學), National Tsing Hua University (國立清華大學), National Central University (國立中央大學), National Chung Hsing University (國立中興大學), National Sun Yat-sen University (國立中山大學), National Chung Cheng University (國立中正大學), National Taiwan Normal University (國立台灣師範大學), National Taiwan University of Science and Technology (國立台灣科技大學).

As to the total number of people who gained NSC Outstanding Research Award, National Academic Award and National Chair Professor Award, the ranking displays a little bit different (see Table 2), but entirely speaking, there exists positive correlations between the four academic productivity items. Table 3 shows that Pearson's correlations (the average number of pieces or people of academic productivity per teacher); Table 4 indicates Spearman correlations (ranking of the average of academic productivity per teacher).

V. Concluding Remarks

Based on the above results, concluding remarks are made as follows.

First of all, the top three universities with the best overall strength to win the researching funding of NSC Research Project are National Taiwan University (國立台灣大學), National Cheng Gung University(國立成功大學), and National Chiao Tung University (　　　　). Moreover, the top three universities with the best average faculty strength to win the research funding of NSC Research Project are National Tsing Hua University (國立清華大學), National Chiao Tung University (國立交通大學), and National Taiwan University (國立台灣大學). Comparing these two results, it could be found that both National Taiwan University (國立台灣大學) and National Cheng Gung University (國立成功大學) acquire advantages with their large-scale. It is therefore suggested that when evaluating the strength of a university to win research funding, both overall strength and average faculty strength should be considered to avoid the unfairness towards universities of smaller scale. In fact, when evaluating the research performance of each university in Taiwan, it should be considered that how to avoid the absolute advantage caused from different scales.

Secondly, in terms of academic productivity per teacher by NSC Research Project, NSC Outstanding Research Award, National Academic Award and National Chair Professor Award, there is consistency among higher education institutions. Thus, we can make a tentative conclusion that using the number of NSC Research Projects per teacher of a university is a reliable measure of research performance.

The challenges of exporting Hong Kong's higher education services to the Asian Markets

Dr NG Shun Wing
Hong Kong Institute of Education
swng@ied.edu.hk

ABSTRACT

Internationalization becomes increasingly important in higher education in a globalized world. Exporting higher education services by recruiting overseas students is an integral facet of internationalization of higher education. It not only helps develop the place as an education hub but also facilitate internationalized environment of higher education. Alongside this global trend, Singapore, Malaysia and Hong Kong are of no exception and have embarked on the process of internationalizing their higher education campuses by recruiting more non-local students, striving for achieving the policy goal of developing themselves into regional education hubs .

According to the Organization for Economic Co-operation and Development (OECD, 2007), Asian students will dominate the global demand for higher education in the next decades. In forecasting global demand for international higher education, Bohm, Davis, Meares & Pearce (2002) have found that the global demand for international higher education is set to grow enormously. Within Asia, China and India will represent the key growth drivers, generating over half of the global demand in international higher education by 2025 due to their blooming economies. Since there is a great demand for higher education among Asian countries, it is strategically important for Hong Kong to embark on her internationalization process by recruiting students from the region.

Hong Kong has no doubt had some comparative advantages over other Asian competitors in the region but there are several major hurdles she needs to overcome before she can develop herself to be a regional education hub. This paper reports a territory wide study in order to highlight major strengths and weaknesses of exporting Hong Kong's higher education. Policy recommendations at both institutional and system levels in relation to its potential of being a regional education hub in Asia are made. The findings suggest that to overcome the weaknesses requires a well-organized and strategic orientation towards developing Hong Kong as an education hub. It is suggested that further studies is required to understand the market situations.

DETERMINANTS OF QUALITY IN HIGHER EDUCATION?

Bangladesh Perspective through Private Universities

SUMMARY: Private higher education in Bangladesh witnessed a rapid growth in the last decade, although it is facing quality issue challenges in financial sourcing, standards compliancy, qualified faculties and market demand for skilled workforce. This paper explores the issues that influence and determine quality and performance of private universities, analyses the internal and external quality assurance policies with focus on quality of teaching, quality intake, sources of revenue and makes certain policy recommendations to ensure quality in higher education.

INTRODUCTION

The private universities are fastest growing segment in higher education in Bangladesh. This is true particularly in terms of number of institutions. In fact, private universities outnumber public universities. Despite this growth, private universities can enrol much less number of students than the public universities and the quality of their courses, strengths of their faculties, quality of graduates, etc are concerns of further introspection. On top of these, cost factor in private university education is also subject to social scrutiny. It is therefore critical to examine and ascertain the factors that contribute to attain better performance in some private universities in comparison to others in terms of education quality, teaching-learning capacity vis-à-vis cost involvement in higher education with view to justify emergence and future expansion of private universities. This paper is based on a qualitative research conducted in 2008 and purpose is to highlight the mechanism within the policy practices that creates variation in their performance and issues that act as constraint in quality education.

The discussion is structured into four parts. The first part explains the reasons behind the emergence of private universities in Bangladesh and regulatory issues. Current situation of private universities are discussed in part two. The third part highlights the findings and comparative analysis carried out on the selected universities and how the internal policy and other issues affect their performance. The final part presents the general conclusions and addresses the required policy changes and measurements to ensure quality and performance of private higher education in Bangladesh.

PART 1. EMERGENCE OF PRIVATE UNIVERSITIES IN BANGLADESH

After the independence of Bangladesh, in 1971, higher education was provided by state, just like other sector. The immediate reason for thinking of a private university was to allocate a large number of students unable to gain access to admission due to limited number of seats in the public universities. And Public universities were unable to expand and satisfy the growing social demand for higher education in terms of number and type of programs offered due to funding constraints (Varghese, 2002). This vacuum has created a demand for private universities. Therefore, the previous system of education has adopted the legislation that allows for the development of private higher education.

Another factor for establishing private universities in Bangladesh is due to continued political unrest and violence in the campuses of public university. The presence of political affiliation in the public universities, among the teacher, students and authority resulted in a continual session jam and significant delay in the holding of university exam. And private universities are the assurance to give a politics - free educational atmosphere to complete the education in due time (Alam and Haque, 2004; 64-65).

Thirdly, there was a change in the country with more reliance on market forces for development, the decline of centrally planned economies and created conditions conducive to the growth of private universities (Siddiqui, 2002; 161 -165). The impact of privatisation policy and expansion of the private sector created new demand for courses and subjects of study that are mainly market driven. As a result in the early 1990s private sector initiatives with the establishment of private universities became a new phenomenon in the country to fulfil the demand of the market. These perceptions, market demand and the growth of private higher educational institutions has resulted in the enactment of Private University Act in 1992(PRUA) by the Bangladesh government. Originally the state did not plan to set up new universities in the public sector with this new orientation. To fulfil the demands of the new labour market, private universities are considered as a superior option by the government to fulfil the demands of the market.

The "Private University Act of 1992" and "Amendments in 1998" paved the way for establishing higher education degree awarding universities in the private sector. Within a period of 14 to 15 years there has been a greater number of private institutions created in the country than public ones and has become an integral part of higher education. The first government approved private university NSU (North South University) started operating in January, 1993 (Siddiqui, 2002; 162).

1.1 QUALITY ASSURANCE AND POLICY PRACTICES:

Private universities are supervised by the administrative and academic rules set by the University Grants Commission (UGC), the regulatory body under the Ministry of Education of Bangladesh. The Ministry of Education (MOE) is the policy making body and the UGC works as the administrative agency. UGC also acts as the intermediate body between the government and the universities in Bangladesh. The UGC has been mandated by the Private University Act 1992 as the monitoring and supervising authority for higher education of the country. It works as the "approving authority'' because without its recommendation, the Ministry of Education does not grant permission to establish a private university. The approval of UGC legitimises the operation of private universities. The UGC creates standards, makes recommendations to the Ministry of Education, sets faculty qualification guidelines and monitors compliance of the Private University Act. UGC works towards supervising, assessing needs and coordinating the activities of universities (source: UGC website). The UGC also regulates the plans and programs of different private universities. The UGC publishes annual reports that supply basic information on the operation of both public and private universities. UGC also defines the administrative, financial and other parameters for these private universities and is responsible for over viewing quality. UGC works as a mechanism to ensure the quality of private universities in terms of minimum level of standards of legal requirements. The Private Universities Act of 1992 provided for complete autonomy in the matters of academic function and the recruitment of teachers and staff for the private universities. Curriculum of private universities requires prior approval from the UGC. They also enjoy financial authority to charge tuition fees and salaries to hire faculty members (Alam, Haque and Siddiqui, 2007; 27).But both public and private universities in Bangladesh have no external system or agency until now to review the academic programs of institutions.

PART 2. CURRENT STATUS OF PRIVATE UNIVERSITIES IN BANGLADESH

The total number of private universities in Bangladesh is 51 (UGC Annual Report 2006) with a total number of 124,267 students (498 foreign students) in comparison to 29 existing public universities with 1,241,352 students (171 foreign students). The intake capacity of private universities has a steady rise according to the national education survey of 1999. The highest number of students was found in Stamford University to be 12,342 and the least in Green University of Bangladesh with only 118 students. The aim

of these universities is to facilitate skilled manpower, creating ability to respond market demand, students with opportunities, resources and expertise to achieve academic, personal and career goals within a stimulating and supportive environment with academic excellence and quality education.

Table SEQ Tabel * ARABIC 1 Five Years Student Enrolment in Private and Public Universities in Bangladesh

Year	Number of Institutes	Total Students	Change From Last Year	Change in Percentage

_Private_Public_Private_Public_Private_Public_Private_Public__2002_37_15_34432_92152_+7187_ -410_+26_-0.44__2003_52_19_46080_104736_+ 11648_+12584_+34_+13.66__2004_53_19_62856_112327_+16776_+7591_+ 36_+6.76__2005_54_19_88669_116397_+25813_+4070_+ 41_+3.62__2006_51_23*(excluding National and Open University)_1,24,267_153249_+35598_+36452_+ 40_+31.66__**Source: UGC Annual Report 2006**

There is no clear policy on income and expenditure (tuition, administrative and other, salary of faculty members etc) of private universities in Bangladesh. Therefore the tuition fees and salary of staff differ vastly from one university to another. According to UGC report (2004) the fees charged by different universities vary from TK 200 or approx. USD 2.90 (USD 1 = BD TK 68, 4 Nov 2009) to TK 7500 or approx. USD 109 per credit (Masum, 2008; 20). The private universities mainly offer four-year bachelor's degrees and two years masters programs on a limited number of subjects. None of the private universities offer doctoral programs (PhD and MPhil) like the public universities in Bangladesh.

Courses offered by Private Universities:

Private universities are different from public universities – their purpose of establishment and orientation of operations are totally different. The academic system in public and private universities is different thus the assessment of quality is also different from public to private universities (UGC Chairman, 2008). As many of the private universities are self-financed through revenues, the courses they offer depend on market opportunity and demand. Commercial consideration is one of the primary objectives that reflect on the curriculum of these institutions. The top ranking private universities in Bangladesh like North South University, East West University and BRAC University offer degrees mainly in Business Administration, Economics, Information Technology, English Language, Economics and Environmental Studies. Very few universities offer courses in music, fashion, product design, interior architecture and hospital management.

Management and Administration:

Private universities are based on two-tier administrative structure: The Board of Governors is in the 1st tier and the Vice Chancellor, Dean and Registrar and other administrative staff at the 2nd tier. The Board of Governors is the highest executive authority and trustees of the sponsoring foundation. A Chairperson elected by the members of the board is responsible for policy decisions regarding development, long-term financing and overall management of the university. Matters relating to assets of a private university and its finance are to be taken care of by a finance committee of at least five members headed by a treasurer. The Registrar is the top administrative official. They also have different committees responsible for day to day activities, admission of student, recruitment of administrative and academic staff, scheduling of courses and examination. Other important academic and administrative positions in a private university include deans of faculties, a controller of examinations and chairpersons of departments (source: website of Banglapedia).

Financing Arrangements and Physical condition:

In the initial stages of private university boom, most of them started functioning with limited capital funds and were dependent on part-time faculty members who were hired from public universities. Private universities don't receive any fund from government like the public universities. The universities run their

operation based on the collection of academic charges and student fees (Alam, Haque and Siddque, 2007; 23). Compared to public universities the physical conditions and facilities in private universalities are usually better in terms of class room, library, computer centers and Internet access. Most of the class rooms are air conditioned and has audio-visual equipment. Multimedia is used by many teachers who are trained abroad (Hopper, 1998).

Faculty profile in Private Universities:

Many of the private universities are operated by part-time faculty and a limited number of full-time teachers. Reliance on part-time faculty is a common phenomenon in the private universities of Bangladesh due to the lack of available full-time qualified teachers. In some leading private universities different departments are headed by professors from public universities. The following figure shows that out of about 4,000 faculty members, roughly 60% are full-time faculty; therefore a significant number are part-timers. Another important aspect revealed by the figure below is that the majority of the faculty is young aged professionals, i.e. lecturers (56% of the total full-time teachers). Among the part-time teaching staff, the professor category (i.e. the most senior faculty) dominates.

In comparison to the private universities, there are 7,905 faculty members in the existing 25(except National university and other affiliated colleges) public universities (UGC Annual Report, 2006).

Teacher and Student Assessment:

All private universities have introduced terms and semester systems. They offer courses that are calculated in credit hours (US standard). Students are evaluated and graded from A-F for each course. The total grade is calculated using the weighted Grade Point Average (GPA) system. Students are also given the flexibility to take courses according to their interest which is different from the public universities where the perceived prestigious courses are reserved for the most meritorious students. This flexibility of course intake option allows a student to take two to five courses per semester in a program. Some private universities in Bangladesh have systems of faculty evaluation by students. Variety of assessment procedures are followed in these universities for both student as well as teacher evaluation. Students scoring Cumulative Grade Point Average (CGPA) between 1 and 2 after the first two semesters in private universities are generally placed on probation for the next two semesters. If a student can't improve their grades within two semesters, they face dismissal from the university.

Capacity in Research:

Research is a personal concern of the faculty members in most of the private universities in Bangladesh. Private universities neither encourage nor discourage the faculty members and usually there is no research grant available (Aminuzzaman; 9).

Job Placement of private university graduates:

The state level agencies like Bangladesh Bureau of Statistics (BBS) and University Grants Commission do not keep any record of job placement of the private university graduates. The two leading private universities, North South and Independent University of Bangladesh from their internal record reveal the following pattern of job placement among their graduates:

The graduates are mainly entering the private sector jobs and firms like manufacturing, textile, financing and banking institutions, telecommunication, software, multinational/ multinational agencies.

The average income level of these jobs are significantly higher than the counter parts from public universities (except the graduates from Institute of Business Administration under the University of Dhaka) (Alam, Haque and Siddique, 2007; 33).

UGC Overview on All Private Universities:

The present situation of the numerous private universities at large is questionable as far as quality education is concerned. Regardless of the rapid increase in the enrolment of students in the private universities for the last 15 years, quality of education has remained a cause of concern. Most of private universities have failed to meet the minimum requirement set by the University Grants Commission (UGC), (Aminuzzaman; 2). These include insufficient number of qualified academic staff, absence of strong administrative and financial control, poor quality intake, infrastructural facilities and market acceptability of graduates. According to UGC survey conducted in 2004, out of 52 private universities roughly nine universities (NSU, BRAC, EWU, IUB, AMA, UDA, Stamford, Daffodil, IIUC) are performing highly satisfactory. Based on the academic standards of UGC, it singled out 35 universities as they failed to meet the minimum requirements. UGC appointed a fixed time-limit for these universities to improve their performance so they could meet the standards. The committee also recommended cancellation of the permission of the remaining eight universities. The report, undoubtedly, gave an impression that conditions are not satisfactory in the majority of the private universities (Prothom Alo, November 2004).

The following section of this paper reflects on the findings of the recent study from a comparative perspective followed by some policy suggestions.

PART 3.COMPARATIVE ANALYSIS OF THE SELECTED UNIVERSITIES

This section provides comparative analysis of four selected universities and compares their quality assurance mechanism and performance variation. The four universities selected for the research study were based on the UGC survey and evaluation list. Two of the universities were amongst the top 9 that met all the minimum set of UGC standards. The other two universities were selected from the broad category listing of UGC. The broad category lists universities that have some limitations and weakness in view of UGC standards. There is a third category of listing provided by UGC that was not looked into because universities in this list are soon to be shutdown as a result of receiving government legal show-cause warnings. Additionally some common selection criteria were applied when choosing the universities. These common criteria were locality, courses offered, sources of revenue (tuition fees), cooperation to supply information and accessibility.

All the selected universities have their own individual policies and practices and operate within the national framework of UGC to ensure quality education. Quality is also determined in terms of their individual aims and objectives of the universities as stated in their mission statements. The comparative analysis of these private universities reveals a number of issues which acts as constraints towards ensuring quality education and variation of performance amongst them. It has been noted that lack of this creates variation of performance. Admission policy, faculty recruitment policy, scholarship opportunities are vital elements of internal quality assurance mechanisms and the practice of these elements are setting apart the better performing universities from the rest. The implementation of the various elements of quality assurance mechanisms requires financial resources. Even when the internal quality assurance mechanisms are similar

to the successful universities, the major cause of failure of the policies lies in implementation. This results in inconsistency of academic standards.

Admission policy and selection of student

Student selection and admission policy of the satisfactory universities create variation of quality in providing higher education. Because of the internal policy differences the quality of input (student intake) has a direct affect on the quality of output (graduates). Poor quality intake results in poor academic performance and finally acceptance of graduates in the market. To ensure quality, the strict admission selection systems (admission tests, higher requirements) are enabling some of the private universities to ensure higher quality student intake. Established and proven universities have more strict requirements when it comes to new student admissions than newly founded universities. The demand to get admitted in such universities is high because of reputation and market acceptance of graduates and have set minimum admission requirement to GPA 3.00, which is more than the UGC minimum requirement of 2.5 for admission eligibility. One of the selected satisfactory private universities has been following the strict admission policy of GPA 3.0 requirement from the beginning of their establishment. In addition to written admission exams satisfactory universities also require face-to-face interviews for the final selection of candidates.

On the other hand less satisfactory universities do not have strict admission requirements like the satisfactory one.In Bangladesh, most private universities depend on tuition fees as revenues which restrict their intention to ensure high quality student intake.Revenue and financing is an important factor for newly founded universities and to maximize student enrolment their admission requirements is also lower. Lower admission requirement policies can be seen to have a direct correlation with quality.

Scholarship Opportunity:

The study also reveals that there is a lack of meritorious student enrollment in private universities; as such students prefer public universities as their first choice of application. One of the major reasons for preferring public universities is that talented students often face difficulties financing their education in private universities (student's opinion in focus group discussion). Private university education costs can be as high as 20 times when compared to public universities in Bangladesh. The assurance of scholarship opportunity in the admission policy also determines the provision for bright meritorious student to study in private universities. This mechanism creates variation of quality among private universities. As Masum (2008;25) has stated, getting admitted in private university with full tuition waiver and after graduating with high CGPA can help financially disadvantaged students get high-end jobs. Scholarship opportunities for students are available more in the established and proven universities in comparison to other universities. In case of satisfactory one, the increasing investment in scholarship provision is helping the institute to attract more meritorious but financially disadvantaged students who otherwise would not have been able to afford the cost of private higher education. There are also innovative strategies (like full tuition waver towards students achieving top scores in admission test, top ranking HSC students), taken by satisfactory universities attract meritorious student who need financial support. The provision for financial assistance to attract meritorious students (top ranks in tests) from middle class families who are unable to pay large tuition fees was incorporated in their policy from the beginning of its establishment.

Faculty Recruitment, Promotional Criteria

The study found that private universities in Bangladesh face a number of issues in terms of quality assurance practices. One of the major constraints is adequate number of qualified faculty members which has a deep correlation to the quality of teaching. Faculty quality is generally accepted as the most important determinant of the overall quality of higher education institutions (World Bank, 2000; 65). However the improvement of quality of teaching and the presence of qualified faculty in these institutes is also related to their internal quality assurance policy practices such as recruitment policy, long-term faculty development plans and promotional criteria.

Satisfactory universities emphasize more on the recruitment of foreign trained faculty members than any other private universities in Bangladesh. It is very much visible in their recruitment policy and maintained that practice so far. Satisfactory universities do not allow teachers without a PhD to teach in the Master's program. Masters Degree from USA, UK, Canada, and Australia are mostly preferable for recruiting lecturer in the undergraduate level.

Selected satisfactory private universities view international training and publication as criteria for academic staff promotion. The recruitment and promotional criteria in those universities for faculty selection emphasizes more on working experience, involvement in research activity and publication in international journals. However, most of the universities have their internal policies (such as presentation and interviews) to evaluate faculty members through student evaluation, peer review, administrative involvement and academic contribution.

Based on the comparative analysis, the full-time and part-time faculty ratio of all the private universities does not meet the UGC criteria. This has also been confirmed from the UGC Annual Report 2006. Though the full-time and part-time faculty ratio does not meet the UGC requirement it could not be established if the part-timer trend lowers the quality of teaching. In reality the most satisfactory university of the study had more part-time faculty members than the less satisfactory ones. In all cases the institutes benefit from the presence of qualified and experienced teachers even though they work as part timers (based on opinion of university authorities and students).

Investment in Research:

According to UNESCO (2007;38) expenditure on research is an important indicator for quality assesment in higher education and indicates institutional performance.The involvement in research activity among the universities varies from one to another. In most cases research activity is more of an individual effort than institutional provision (Aminuzzaman; 9). Despite the fact, the investments in research of satisfactory universities are considerably more than the other universities. It is also visible in the UGC report (2006).In the faculty promotional policy of established universities research is given the most important criteria. Therefore research activity is high in the satisfactory universities and is a significant reason for higher investment in that area compare to the unsatisfactory one.

Financial Resource:

Finally, the above mechanisms of the universities are directly or indirectly connected to the financial resources (sources of revenue). Financial sources play a dominant role in ensuring quality. As Masum (2008; 27) stated, quality is a function of investment and management. Financial resources are required for recruiting qualified teachers with adequate salary packages, improve academic facilities (library, lab), investment in research and development, and providing learning materials to students. Private universities that have enough funds for hiring can attract qualified faculty members from other public universities to their own institutions. Universities that depend solely on tuition fees while charging less to students cannot afford to recruit internationally trained and qualified faculty members.

To summarize, private institutes that perform better in terms of providing quality education has sustainable financial resources, they maintain the minimum standards of UGC and additionally implement their own innovative strategies.

PART 4. POLICY RECOMMENDATIONS AND CONCLUDING REMARKS

Quality in higher education has become the prime agenda of countries worldwide with the changing context of globalisation and economic activities. Many countries have been pressurised to assure quality in higher education compared international standards at the national level. Consequently various countries initiated "national quality assurance mechanisms" and many more are in the process of evolving a suitable strategy (Stella, 2002; 13). Therefore ensuring quality in private universities should be of concern nationally as the

numbers of private universities are greater than public universities in Bangladesh. Based on the above analysis, the paper addresses some required policy changes and measurements to ensure quality and performance of private universities in Bangladesh.

To ensure more access of financially disadvantaged but meritorious students in private universities, Banks and investment institutes can offer various student financing packages to help students meet their education costs. The financial institutes can work with the private universities to provide this kind of service for students. At current there are only a limited number of such services available in Bangladesh. Availability of student loans and financing can help deserving and meritorious student's opportunities for study better in terms of providing quality education has sustainable financial resources, they maintain the minimum standards of UGC and additionally implement their own innovative strategies.

Large and established companies can also play a part to increase quality of private higher education in Bangladesh. For example, in US there are various foundations (The Ford Foundation, Rockefeller Foundation, and more) that provide grants towards universities and students.

There should be some guidelines to restrict the number of part-timers. In PRUA 2007 Act there is provision for part-timer rules which should be implemented to improve dedication of full-time faculty members towards their parent institutions. The crisis might deepen with expansion of private universities in Bangladesh and unavailability of qualified teachers resulting in lower quality of education. To overcome the possible challenge for private universities, the government needs to consider and asses the current supply of qualified faculty before approving the establishment of any new private university.

Private universities should publish an annual report with details of the infrastructure and facilities available, profiles of the trustees and the administrators, the academic qualifications and experience of the staff, the courses offered, the number of students, the results of the examinations, the amount of funds available to the university and the sources of funding etc. In addition, every educational institution must get itself rated by an independent rating agency and publicly announce its rating to prospective students to enable the students to choose the institution they want to enroll. And above all, the implementation of the proposed accreditation council for the promotion of quality and quality assurance is must in Bangladesh.

The significance of higher education is increasing in Bangladesh as new employment opportunities are being created by the emerging private banks, telecommunications and IT sector and manufacturing industries. Private universities can fulfill this demand in the market place by ensuring quality graduates. The advantages of private universities compared to public ones are based on the following key aspects: collaboration with other international universities, no academic session delays, politics-free environment, and international standards based grading systems (CGPA).Therefore ensuring quality in private universities should be of concern nationally as the numbers of private universities are greater than public universities.

The aim of this paper is not to provide solutions for ensuring quality in higher education, but an attempt to address the issues that act as constraints within the policy assurance mechanisms that affect quality. Highlighting these issues, it is hoped that both the government and private universities will consider them for enhancing the standard of quality in higher education.

In 2005 the number of private universities in Bangladesh was 54. The Government appointed authority asked five universities to close their operation. Two new universities got approval at the end of 2006 so the final number of private universities is 51 now (UGC Annual Report 2006).

The UGC listed minimum requirements like physical infrastructure, own campus, outer campus and its description, student number per course and semester, teacher student ratio and details of fulltime faculty members and ratio of part time and fulltime faculty members, detailed description of VC, Governing body, syndicate and academic council, salary structure, financial statements, etc.

The UGC survey in 2004 was conducted based on some selected criteria like physical infrastructure, own campus, outer campus and its description, student number per course and semester, teacher student ratio and details of fulltime faculty members and ratio of part time and fulltime faculty members, detailed description of VC, Governing body, syndicate and academic council, salary structure, financial statements, etc and universities were evaluated based on their performance in fulfilling those criteria.

MAKING THE DIFFERENCE:
SUPPORTING DISADVANTAGED STUDENTS TO A SUCCESSFUL OUTCOME

Sue Jackson
Senior Lecturer in Disability Support
London College of Communication

Abstract
In the UK, universities have noticed an increase in the disclosure of mental health issues among the student population. Recent legislative changes affecting equal opportunities in Higher Education and a strong government policy imperative to "widen participation" (reaching out to disadvantaged minority groups, who have been traditionally excluded), makes it a key time to effect improvements in provision and change the ways of delivering the curriculum so that students have better access and equal opportunities.

In the past Higher Education in the UK has been the privilege of the few. In the last twenty years, the number of students starting university has increased rapidly and in the UK, there have been legislative changes as part of a government agenda of social inclusion to "widen participation". The government set itself a target to have university places for 50% of its school leavers by 2010 and put in place a new system of student loans and grants to assist with the financing of this project.

"After a decade of campaigns to get more students into university, especially those from the poorest backgrounds, Labour's "widening participation" policy has taken off this year. There has been a 10% increase in applications, fuelled in part by a population rise and in part by older applicants seeking to escape the recession." (Curtis, 2009)

Reaching out to minority groups, who have been traditionally excluded, has highlighted the need to make effective changes to provision. Students may come from low income families; students who come from families where no one has been to university before; students who have not had a traditional educational experience etc. Although this is mainly a social class issue, "widening participation" has also offered the opportunity of a university education to students with disabilities, who may have previously been disadvantaged.

With the rise of the number of students, teaching groups have become very large. Research shows that there are declining resources per student which increases the stress that students are under. [Trowler, 1998]. Yorke and Longden [2004])

"While it is … easier …. to pretend that all is well, there are clear emotional consequences to working in these large groups for both students and lecturers. For instance, students may experience powerful feelings of alienation, anger, and envy in large groups and compensate in various ways, some of which will be antithetical to achieving effective learning and a stimulating educational experience. Similarly, lecturers can also seek to cope with their own feelings of fear and uncertainty by behaving equally maladaptively." (Hogan and Kwiatkowski, 1998)

There is less help from tutors, whose time is constrained and we have found that students who may be from a disadvantaged group, suffer more and are indeed, more "at risk" of not completing their courses or not achieving their potential.

"With dropout rates above 25 per cent at 13 universities, ….. some say it is all but inevitable that standards will slip, almost as a prerequisite for financial security……Since 1989, universities have seen resources per student fall by 37 per cent. The student-to-staff ratio now stands at 23:1. …The sector is also taking on thousands of overseas students, who place different pressures on standards with

divergent learning cultures and, often, language problems. And as the drive to get half of all people under 30 into higher education by the end of the decade continues, universities outside the oversubscribed elite will have to increasingly rely on students with more limited preparation for higher level study." (Times Higher Education Supplement, 2004)

In order to examine the nature of the difficulties experienced by students, this paper will look at one disadvantaged group and how the universities can change to accommodate the needs of these students.

With "widening participation", and new legislation supporting people with disabilities, many more students with a variety of difficulties have now entered Higher Education. The impairment that has caused us growing concern in recent years in our study support team at LCC, is mental health. At the London College of Communication, which is one campus of the University of the Arts London, (the largest university dedicated to the creative arts in Europe,) since 2003, there has been an increase of 24%. Indeed this past academic year over 50% of all students who declare a disability, disclose a mental health issue.

Academic Year	Total no of disabled students (not including dyslexia)	No. of students disclosing mental health difficulties	Percentage
2003-2004	104	32	31%
2004-2005	175	60	34%
2005-2006	207	78	38%
2006-2007	214	100	47%
2007-2008	195	91	47%
2008-2009	234	127	54%

All UK universities have noticed an increase in the disclosure of mental health issues among the student population. It is not entirely clear why this should be. Whether it is because of the amount of stress that students are under trying to juggle their studies alongside paid employment; combining studying with supporting a family; or whether it is due to drug related issues; or because mental ill health has lost some of its stigma and students feel less concerned about disclosing their difficulties, we are not sure.   Whatever the reason, the Disability Discrimination Act, 2005 says that colleges and universities have a duty to take into account the needs of disabled people when making decisions or developing policy and to make reasonable adjustments so that they can have a successful outcome to their studies. The DDA defines a disabled person as someone who has a "physical or mental impairment which has a substantial and long term adverse effect upon his ability to carry out normal day-to day activities" (Disability Discrimination Act, 2002). This includes students with mental health difficulties. To qualify, the disorder has to be a form of mental distress which is "clinically well-recognized" (DDA, 2002) even if it is controlled by medication. These disorders include depression, bipolar disorder, schizophrenia, phobias, obsessive compulsive disorder and eating disorders. Students with hidden impairments such as mental health difficulties do not want to be labelled as "disabled" but they have to accept this, in order to gain reasonable adjustments.

This paper will take a number of examples of case studies to show how we are trying to support students with mental health issues and to ensure that they are not disadvantaged either by their disability or our university systems.

Case Study 1 - Nicola

Nicola is a mature student having worked for many years and not had the opportunity or financial means to study. For some years she has suffered with depression and anxiety and has regular therapy. Nicola has moments of panic, when she feels totally overwhelmed by her deadlines which result in inertia. At other times she can sit for hours furiously writing down ideas and then getting lost in her chaos. Her work is excellent and her tutors have no idea that she suffers so much and they continue to encourage her to do more and more, which actually exacerbates the problem, as she feels she needs to push herself to achieve everything they suggest.

When Nicola first came to see me during her first year, she was ready to give up. In fact she often says she is going to stop because it is all too much for her. "I am exhausted by the constant struggle," she

said. Nicola asked me to keep her difficulties confidential. She had not disclosed her impairment partly because she thought she should be able to manage alone and partly because she did not want anyone to think she was making an excuse for her "laziness". I explained to her that the university offers her the right to confidentiality. This meant that although she had told me her difficulties, I did not have to disclose the nature of them to anyone else, unless I was concerned that she might be a danger to herself or anyone else. With her agreement I put her on our disability register which then entitled her to double the loan time for resources from our library, and regular study support meetings with me, where we can talk about the stress she feels and plan to alleviate it.

As a mature student, Nicola feels that she should be able to manage this herself and she feels terribly guilty when she makes an appointment to see me. She has not taken advantage of the possibility of weekly meetings but when we meet, we plan her essays together, organising her ideas into meaningful chapters and I give her maximum word counts for each part of her assignments. She finds this useful as she has been known to write double the number of words required and then spend hours editing her work and missing her deadlines.

Nicola is about to start her third year, which requires a 9000 word dissertation. She has a number of ideas and knows that the writing is not the problem, but keeping herself on track and not being distracted by her interest in other subjects is a huge worry for her. She has finally agreed to apply for Disabled Student Allowance which is a government funded resource that will give her hardware, software and the opportunity to have weekly study support to ensure she is able to keep to her deadlines. She has allowed me to discuss the issue of flexible deadlines with the teaching staff and they have agreed that she can have an automatic two week extension for all her written assignments. Having a safety net will provide her with the security that if she is paralysed by her mental health at any time, she is still able to hand in her work for assessment.

Jackson and Blythman believe this kind of flexibility offered by the university is part of the structural and cultural changes needed by a university:

"In University of the Arts London, academic support for students with mental health difficulties is located within an academic unit rather than within a student services unit. This has a number of advantages. It means that we are recognized and respected (mainly!) by other faculty as fellow teachers. We often have more teaching experience and pedagogic knowledge than many of our colleagues elsewhere in the university who have been appointed for their disciplinary expertise rather than their knowledge of teaching and learning. These factors mainly make much easier any negotiations around changes in the way a course is delivered although there can occasionally be difficulties with faculty whose approach to teaching is radically different from ours."   (Jackson, S and Blythman, M. (forthcoming*))*

There are often comments from tutors like "Well if she can't manage a deadline here, how will she manage in the real world?"   Those that struggle daily with their impairment will find a way round this issue. But it is our duty, under the DDA, to ensure that these students are not disadvantaged by their disability as a result of the university's inflexibility.

Case Study 2 – Masako

Masako came to LCC from Japan to study Photography. She was often absent from her course and eventually when she was confronted about her lack of attendance by her teachers, she broke down and cried. She then started to shout and talk irrationally. The teaching staff were concerned about her unusual behaviour and they called for my assistance. It was clear to me that Masako was having a breakdown and I referred her to our mental health advisor who was instrumental in getting Masako the medical intervention she needed but had resisted for so long. She had not disclosed to anyone that she had been suffering from any kind of mental impairment. She was clearly embarrassed. She spoke of having "emotional epilepsy" and that other members of her family had this difficulty too. It wasn't until after her return to Japan that she sent me a letter from a doctor which said she suffered from a personality disorder.

Student behaviour can be difficult to understand and this behaviour may raise the anxiety levels of teaching and non-teaching staff. Sometimes it is difficult to know whether a student is unwell or just behaving badly. Staff worry about how to respond to students with mental health difficulties who

express such high levels of anxiety in a variety of explosive ways. These students require a lot of extra time and work and teaching staff are often pressurized and under a lot of stress themselves. Providing suitable boundaries for the student with mental health difficulties is very important. Their lives are often in chaos and one way of alleviating their fears is to ensure that they feel contained, knowing where to come to if they have a problem, safe in the knowledge that very few staff will be involved. This lowers their levels of anxiety and embarrassment. At LCC, staff are happy to allow me to take over that role and leave them to concentrate on their teaching roles and other responsibilities.

 We are attempting to make a difference to the learning experience not only of students with mental health difficulties but to all students. Of course, students with mental health difficulties generally need to receive extra support to help them to cope with the environments that they find themselves in. However, to achieve the right balance, both the students and the institution need to be helped to change and adjust. Higher education institutions need to look more carefully at the flaws in the learning environment as well as the support of individual students.

Teaching and Learning
There is now a general re-thinking of university teaching and learning methods and the realization that good practice for one group of students is often best practice for all. Course directors are now more willing to adapt the curriculum, offer a variety of forms of evaluation/assessment, modify the delivery of teaching, put lecture notes on the university intranet, give clear handouts, allow students to tape record lectures, offer extra time for assignments and make special arrangements for exams. All this has also helped to improve the situation for students with disabilities (Riddell, Tinklin, and Wilson, 2005).

Funding
HEFCE (The Higher Education Funding Council for England) awards funding to Higher Education institutions on the basis of the number of UK students applying for DSA (Disabled Student Allowance) in their first year of a degree course and this information is reported by HESA (Higher Education Statistics Agency). However as students are not obliged to disclose that they have a disability, these statistics are not necessarily representative of the total student population. Also the University of the Arts London attracts a large number of overseas students, some of whom have mental health difficulties, which often manifest during the course of their educational programme, as in the case of Masako. These students are not able to apply for funding, nor does the institution have a stream of funding available for their support. At LCC we do support these students by offering extended deadlines for assignments, extended library loans and 1:1 academic and emotional and/or study support. Along with other disabled students their needs are assessed and recommendations made to the course teams. We are not able to recoup the money, but we feel that we would not be offering them an equal opportunity if we did not adopt this strategy.

Case Study 3 – Joe

Joe disclosed his mental illness as soon as he arrived in his first year at LCC. He said he had a diagnosis of paranoid schizophrenia but as he had a medical team around him, regular therapy and was on medication he felt ready to start his course in Graphic Media Design. He did not want his course tutors to know of his difficulties but felt extremely isolated from the beginning:

"In the first lesson we were asked to get ourselves into groups of three…..I couldn't do this. For me to speak to someone was just too much. In the end I was put with the other "losers" who were also too shy or too scared, which did not help our communication at all."

Then the group was asked to go out into the area surrounding the campus and find 20 pieces of packaging, for their first assignment. Joe came to see me quite distraught. He explained: *"My mother has schizophrenia and she picks up rubbish daily and piles it in our house, under my bed etc. I do not need to come to university to do such things…….."*

This required some negotiation on my part with the course team who were quite shocked that they had upset the student and why. They had been considering that students had financial worries and did not want them to go out and buy 20 items, so they had suggested finding items that had been left by others. The university lecturers had never considered that this task might cause anyone anxiety, but when I pointed it out to them they were able to think of any other number of ways of gaining the same

information that they required for their assignment. I stressed that by giving the students choices this allowed everyone to find their own best method of working. I also recommended that for the first few weeks that they put the students into groups rather than suggest that they find their own, as this would encourage them to talk to different people, and also be more inclusive.

Other stressful situations that Joe faced included being with large groups of people, group work, presentations, examinations, having to absorb information under pressure and having rigid deadlines. He avoided group trips to exhibitions as it was terrifying for him to travel on the London Underground. Universities are now required to be proactive in identifying barriers and work to remove them. Offering all students a variety of ways of achieving the same learning outcomes would take away another pressure from the student who does not wish to be seen as being different and singled out. With Widening Participation there is more encouragement to support students for whom being successful at a university is really problematic

Other Institutional Barriers
The Admissions experience is one that is constantly being thought about. It is no longer acceptable to ask students to complete a form disclosing information without saying what will happen to that information.

"The university recommends early disclosure and provides reassurance that this will not affect the application process….[However] this attitude ignores the valid reasons for non-disclosure, such as fear of unfavourable treatment or the wish not to be treated differently to their peers." (Tinklin and Hall 1999)

On the one hand we want students to disclose their disabilities so that we can ensure they get the support to which they are legally entitled. However unless they have a medical diagnosis, or an educational psychologist's report in the case of dyslexia, their disability will not be accepted by the government for funding purposes. In the case of mental health this is problematic. Students often do not realize they have a difficulty until they are living away from home and placed in situations outside their normal experience. Families will accommodate their needs but once they are in the outside world, others will think that they are strange, their behaviour odd, and the student may become increasingly isolated and distressed.

Confidentiality
Confidentiality is another barrier. At what point does disclosure breach the confidentiality clause? Having now been at LCC for 7 years, most staff will now accept without question when I explain that I am not able to give details about the disability. Some staff members feel that they cannot help a student who will not give out any information, but students with mental health issues do not wish to be singled out and treated differently, which is why we need to find a more inclusive approach.

Sharing information in a university setting is difficult. Computer systems are often out dated and many staff are part time practitioners rather than trained teachers and may not even use a university email address. It can cause a huge amount of added stress and distress, when students have to continuously explain their difficulties to each member of staff.

Case Study 4 - Matthew
Matthew, a mature student, on a part time MA course, with a long history of bi-polar (manic depression), reported that his class presentation had been judged as "performance art" by his tutor. Although the information had been sent to the course director, the member of staff assessing the presentation had not been informed of Matthew's mental state and how his medication might affect him. As a result he felt that the tutor had judged his manic state instead of his work, that he had been treated "like a joker". He was completely demoralised and he was very scared of having to do another presentation. I asked him to allow me to speak to his tutor on his behalf as he felt too embarrassed to be part of the conversation.

I met with the tutor and explained how Matthew's mental state might affect his behaviour and what kind of strategies she could put in place to help him. Matthew was given an alloted time to speak and he managed his medication accordingly. If he took it too early he was likely to be too drowsy to speak. By taking it after the presentation he was able to calm down quickly and be less manic. On the

previous occasion he had been asked to change his time at the last minute and this upset him considerably. The tutor was pleased to help and Matthew felt supported and was able to manage his second presentation more successfully and indeed he completed his Master's degree.

"Once disclosure has taken place to a member of staff then in legal terms the whole organisation is deemed to know. However, if the disabled person has not given permission for this information to be shared with the rest of the organisation then this would impact, in legal terms, on what the organisation could reasonably have done for the student. Under the DDA it is up to the organisation to have effective channels of communication to pass information to relevant staff. It is not up to the disabled person to fulfil this requirement." (Understanding the DDA 2007, Section 3.2 p.80)

The law is clear. Universities are often huge institutions and managing this information is often a barrier that must be overcome.

Assessment / Evaluation

Students cannot be treated less favourably for a reason relating to their disability. The university has to make reasonable adjustments. Reasonable adjustments can be either an individual adjustment for a particular student such as the right to present an assignment in an alternative format, often called accommodated assessment, or it can be an anticipatory adjustment where, for example, the university offers a variety of assignment formats to all students. Reasonable adjustments could include changing standard procedures, adapting the curriculum, adapting teaching delivery or providing alternative forms of assessment/evaluation. It can also involve adapting facilities, and providing additional services like materials in alternative formats or indeed 1:1 academic support. It also involves training staff to understand their responsibilities. If these adjustments could be open to all students instead of making "special arrangements" then this would normalize things for students with difficulties.

Research at Plymouth University in the UK (SWANDS, 2002), has shown that by offering all students a choice of type of assessment that has been agreed before the start of the course, then fewer adjustments, if any, need to be made for disabled students. These types of changes require cultural change as well as structural since such changes in teaching and learning can only work with the co-operation of faculty and administrators. Shevlin, Kenny, and McNeela (2004) point out that there are issues of both attitude and awareness.

Time out

Students who become ill during their courses may need time out to recuperate. Universities need to have a more flexible approach to allow for this. Recent research, in the area of social class participation but equally applicable to students with mental health difficulties, suggests that the UK is not good at this (Quinn et al, 2005). Currently, universities and colleges in the UK are rewarded financially and in terms of reputation for getting students through in the minimum period, which is three years for a Bachelor's degree in England. The United States, with a different history of participation in higher education, has a more adaptable approach with its modular system, which might be one way forward to be supportive to students. At LCC staff are helpful in this regard but the complicated procedures involved in coming back to the course, both by the institution and the funding authority are extra barriers to negotiate.

Finance

Administrators and funders need to understand that some students cost more to educate than others because of their additional support needs. "The universal student" does not exist. Now that we are opening up our universities to all students from all backgrounds it is important that the needs of some students are seen as a question of social justice.

Promoting Change

Change is always a challenge and people fear change. Making changes to the Admissions policy, for example, to ensure that no one is prevented from doing a course of their choice for reasons of their disability, was a relatively easy policy to put in place. But who knows what fears the staff have and the emotional effect on them, when they are confronted with a student who discloses at interview that he

has a diagnosis of bi-polar (manic depression), for example. Change is always complex and there will always be unpredictable situations which will require some thought. We cannot expect everyone to take these changes on board as we cannot vouch for the experience of the university staff: academic, technical and administrative.

Michael Fullan (2001) believes that most people do not develop new understanding until they are involved in the process. We know that staff have said that they would like more training and yet when we are dealing with mental health it is true to say that it is never totally clear what action should be taken. What is important is that boundaries are put in place to lessen the chaos and conversations need to take place with everyone concerned both staff and student to ensure that the best possible outcome ensues.

Generally, widening access for disabled people into higher education is a success story. In the last decade the number of disabled students entering universities has doubled. Fullan (2001) believes that the way forward for a university to ensure that it includes all its students whatever their difficulty, is to change the culture through continuing professional development. However there is not only one answer to suit the global problem. Without face to face conversations with the people involved, the local problem is unlikely to be resolved. I hope that by continuing to support staff to recognise the needs of disadvantaged students and to think about their practice, assessing the impact of all activities, we will manage to become an "inclusive" university for all.

Impact of Multiple Dimensions of Diversity on Pre-service Teachers

David P. Fuller, Ph.D., Associate Professor

School of Education, Macon State College

100 College Station Drive, Macon, GA 31206-5145

david.fuller@maconstate.edu

Abstract

Given the dramatic shift in the demographics of our society, our schools are serving an increasing number of students from diverse backgrounds. The fact that teachers need to be prepared to teach these diverse students is unquestionable. However, how to prepare these teachers is under constant debate. When addressing diversity in teacher preparation programs, institutions generally limit training to six specific diversity traits: race, age, gender, sexual orientation, abilities/ disabilities, and ethnicity. Anecdotal data indicate that when pre-service teachers identify the aspects of diversity having the greatest impact on their lives, the majority of traits chosen are not among those included in teacher preparation programs. These findings raise the question of whether educational institutions have been focusing diversity training on the wrong dimensions of diversity, and should we expand diversity training to include more of what is actually affecting the lives of others?

This session will describe anecdotal data from the exploration of multiple dimensions of diversity. At the end of the session, participants will be able to:

　1. Describe the various dimensions of diversity;
　2. Develop a better understanding of the importance of diversity and its impact in the lives of pre-service teachers;
　3. Engage in a dialogue about the expansion of dimensions of diversity addressed in higher education.

Social justice, low ses schools and a postgraduate class.

Vicki M Carpenter
University of Auckland, New Zealand

(Note: this paper has been accepted as a chapter in an edited book, title yet to be established, on innovations in University teaching. The chapter title will be *Worlds and words: education for social justice in a postgraduate course*).

Keywords = Freire, social justice, urban, postgraduate, pedagogy

Abstract = 'Low Decile Education' is a new Masters level course which was first taught in the Faculty of Education, University of Auckland, New Zealand during 2008. During classes students critically examined theory, politics and practices concerning both international and New Zealand's urban schools. An emphasis was placed on Freirean philosophy and teaching practices and the theoretical basis of the course encouraged students to be critical educators (Shor 1992).

Twenty students were in the first cohort. Most were Pasifika (of Pacific nations descent) or Maori (indigenous New Zealanders), with student ethnicities largely reflecting that of local urban school populations. All students were professionally involved in urban schooling; they were primary and secondary school teachers, a mentoring coordinator, and Ministry of Education staff. Most were drawn to the course by a passion for education and a strong concern for social justice.

The course was taught using an empowering pedagogy – students were invited to teach alongside the lecturer with the premise students' world knowledge (practice based) is complementary to the word (as in theory) (Shor & Pari 1999). Dialogue was intense; students always sat in a circle formation and both informal and formal (assessed) tasks required full group and/or class involvement.

The presentation and paper critically examines the 2008 course, based largely on the lecturer's reflective diary, with theoretical support. Her argument is that this kind of postgraduate class pedagogy, underpinned by critical theory which promotes agency within and beyond the class, has the potential to promote social justice in wider educational contexts.

Shor, I. (1992). Empowering education. Critical teaching for social change. Chicago: The University of Chicago Press.

Shor, I., & Pari, C. (Eds.). (1999). Critical literacy in action. Writing words, changing worlds. Portsmouth, NH: Boynton/Cook.

Introduction:

The twenty students who enrolled in the post graduate course, "Low Decile Education" (LDE), brought their worlds into the evening classroom. Most were primary and secondary school teachers from low decile schools (schools in low socio-economic–SES-areas). The few non-teachers worked in support of such schools; in mentoring programmes, Special Education Services or the Ministry of Education. As fulltime workers, all arrived each evening tired, but passionate and ready to learn. All came as graduates with academic ambitions, and as emerging intellectuals (Kanu & Glor, 2006).

The 'normal' lecture/tutorial format of postgraduate course delivery was inappropriate for this new course. Various New Zealand government initiatives had had little success in raising student achievement in low decile schools, this course was designed, therefore, to provide an opportunity for intellectual reflection, innovation and positivity regarding teacher agency.

I planned, developed, and then lectured on the LDE course during its initial delivery. In the classroom the students met one another, me, interacted with some visiting speakers, examined various research reports, and engaged in dialogue. As part of, and integral to all of this, they read and reflected on the inspirational words of theorists like Paulo Freire (1972). Freirean pedagogy has a reputation for empowering students (Paulo Freire, 1987, 2005; Roberts, 2008; Shor & Pari, 1999).

For three face-to-face hours a week, worlds and words mingled as we tried to better understand the low decile school environment and our agency within those places. Many students continued the discourse outside class; meeting physically and through email and telephone conversations. While I discussed the course and my understandings with various colleagues, my inner dialogue and reflection was captured through regular journal entries (from which the words in italics are directly taken).

This chapter analyses the course, its progress and achievements during its first year of teaching. I argue that, for empowerment-focused courses such as LDE to be effective, all participants – lecturers included - must live the words (theory) and make them shared worlds. It is important, I believe, that participants' worlds are shared, so they evolve into shared words. In essence, together, these describe a Freirean pedagogy. This chapter critically examines my attempts to walk Freire's talk, to cast aside selected academic formalities and the more common university pedagogical banking practices, and to teach in a non-oppressive, empowering and more inclusive way.

The course

I teach a range of courses at University, from undergraduate through to Doctoral programmes. Sociology of Education underpins my teaching and my research, and I place importance on the critical understanding of policy and context and the value of social justice (see for example Carpenter, 2005) I am a registered teacher and I see little relevance in students of education reading theory and research if they are unable or unwilling to make significant links with their teaching practice and contexts.

Reflection and scholarly dialogue, informed by literature, have the potential to bring participants' words and worlds together.

> If it is in speaking their word that men [sic] transform the world by naming it, dialogue imposes itself as the way in which men achieve significance as men. … dialogue is the encounter in which the united reflection and action of the dialoguers are addressed to the world which is to be transformed and humanized, this dialogue cannot be reduced to the act of one person's 'depositing' ideas in another, nor can it become a simple exchange of ideas to be 'consumed' by the participants in the discussion. Nor yet is it hostile, polemical argument between men who are committed neither to the naming of the world, nor to the search for truth, but rather to the imposition of their own truth. Because dialogue is an encounter among men who name the world, it must not be a situation where some men name on behalf of others. It is an act of creation; it must not serve as a crafty instrument for the domination of one man by another. The domination implicit in dialogue is that of the world by those who enter into dialogue, it is the conquest of the world for the liberation of men' (Paulo Freire, 1972 p.61-62).

Freire's words and philosophies have inspired many people (see for example Fassett & Warren, 2007; hooks, 1994; Shor & Pari, 1999) and they permeated the course. Using Freire's frame, I as the lecturer do not have a right to 'deposit' ideas in others. Individual students also should not impose their individual truths; combined dialogue or acts of creation are the key to learning.

> ...one's desire to engage critical communication pedagogy is inherently Freirean: It is about fulfilling a call to do the work of social justice, it is about learning to listen and see in self-reflexive ways, it is about speaking carefully and humbly and recognizing that it is the job of the critical scholar to open rather than shut doors of possibility, it is about engendering hope in the world rather than dwelling in stubborn immobility (Fassett & Warren, 2007 p.108-109).

The traditional university model often achieves positive change in the world; undoubtedly academia opens doors. However, as Bourdieu and Passeron (1977) note, those open doors usually enable entry and consequent success for those whose habitus is white and middle/upper class. The LDE course included such people, and also attracted students from a wide range of ethnicities - Maori, Pakeha, Samoan, Tongan, Niuean, Fiji-Indian, and German. Ages ranged from the early twenties to mid sixties, 16 were female, and 4 male.

Each student brought a particular history, social construction, knowledge and range of experiences to our dialogical encounters. Those who as children learned English as a second language had experienced particular educational challenges. Such awareness was relevant for our learning. Students who had felt the sting of racism could make others more aware. The more mature class members had first-hand knowledge of different political regimes, having lived through and experienced the contrasting impacts of the Keynesian welfare state, neo-liberalism and the third way. Maori students, as indigenous New Zealanders, provided the wisdom and guidance to inform protocols and our class kaupapa. To cap this, there was much all students could learn through educational cross-sector (primary, secondary, tertiary, bureaucracy) dialogue.

The common thread was that students' professional lives were focused on those who the system usually fails, and like me they cared about that injustice. All course members had chosen what could perhaps be described as an 'alternative' course; there was therefore something unique about each person. Who the students were and what they brought to the table, and who I was and what I brought, were integral to what and how all would learn. We, the students and me, potentially harboured the most valuable knowledge; it was contained in our worlds.

<div align="center">

ka ora ai te iwi
With your food basket and my food basket
The people will thrive

</div>

Setting the tone

> The educator who dares to teach has to stimulate learners to live in a critically conscious presence in the pedagogical and historical process (Macedo, 1995).

The allocated face-to-face contact time was short, a total of 10 x three hour sessions, with additional time set aside for one-to-one consultations. Establishing a warm, safe environment and getting to know each other as quickly as possible was crucial; much hinged on the tone of the first session. After a very short mihi (welcome), the first half hour of the class involved us mingling, meeting and greeting each other, generally with handshakes and short discussions. What could be described as a relaxed and informal opening of a university course in reality reflects widespread and customary practice for many Maori and Pacific Island communities. Following this we sat in a circle and took it in turn to introduce

ourselves, our places of work, study intentions and why LDE was chosen (by students) and developed (by me).

During my 'turn' I spoke of the Freirean process/dialogic discussion, and the importance which was to be placed on our shared knowledge. My key point was that, as experienced educators, the students brought considerable wisdom and expertise to the class. Whilst theory, visiting speakers, assessment tasks and my input were also integral, it was the juncture of all aspects that would result in worthwhile learning for each of us. All voices in the room mattered, without each of them our worlds would not be enriched as they could be. My own voice needed to be measured from the start; if I talked too much during the first session then a banking model could become the norm. In brief I started as I hoped to continue, quietly, but being 'upfront' about the Freirean process - and its significance - was of the essence.

Later in the first session, group discussions of a reading (Carpenter, 2008) gave students an introduction to some theory, permission to critique my writing, and a space to build peer relationships. Food was vital. It was provided in some form from week one and its provision said many things to the class: you are important, you must be tired after a day's teaching and this will provide sustenance, we can break bread and eat together as a community, and the university cares about you and is prepared to feed both your body and your mind.

For all classes it was necessary to be prepared in practical and pedagogical terms. This meant going to the classroom early and arranging circular seating, ensuring good ventilation and learning conditions, providing food and drinks *(Chocolates give energy! Provide food each time),* planning the sessions (reflection based methodologies, inclusive strategies, accepting silences as thinking time) and reflection on philosophical underpinnings (am I sure of where I stand in all of this? is my input appropriate? is everyone involved in ways which are comfortable for them?). The recording of my impressions after each class was the starting point for planning the subsequent class; reflection always preceded, underpinned and followed action.

'Knowledge' and readings

Unlike other postgraduate courses, I did not prepare a book of readings for LDE. This strategy does not indicate a dearth of relevant theory and research. It was because predicting particular directions the class would take seemed presumptuous. Shor (1992:35) addresses this issue and maintains that providing some readings is acceptable, provided all so called 'knowledge' is represented as someone's truth, but not necessarily as the truth. All readings, including those written by me, were therefore open to critique. Topical chapters or journal articles were made available through computer links, and they were updated on a weekly basis,

Classroom practices and dialogue

Freire observed that it is not easy to be a dialogical teacher - it entails a lot of work. In contrast he saw being a 'pure descriptivist' as easy (Macedo, 1995). Many University lecturers, including me at times, could be described as 'pure descriptivists'.

While many aspects of my pedagogy needed to change during the teaching of the course, becoming a dialogical teacher was the aspect which required my most conscious thought and reflection. I did not want a classroom where students just shared their feelings and perceptions, in a psychological manner, with little learning, intellectual engagement and empowerment. There had to be strong, pertinent and reflective links to theory and knowledge. Some people are quieter than others, some are more or less articulate, more or less widely read, for some English – the classroom language – was their first language, while for others it was their second or third. My challenge was to establish an atmosphere that did not suffocate or patronize students, and where dialogue characterized our epistemological relationship. Circle seating was a deliberate structural arrangement; we each had no choice but to be with each other.

Aside from challenging thinking with exigent but relevant material, and small but focused lectures, waiting and particular kinds of questioning were necessary. Primarily waiting, and waiting… and ensuring that the sound of my voice did not dominate the air space. A colleague suggested the slow count to five technique in which I used my fingers under the desk to slowly count to five before

speaking. At times I had to let the silence happen until someone else in the class chose to pick up the theme and address it. In Freire's words:

> Those who speak democratically need to silence themselves so that the voice of those who must be listened to is allowed to emerge (P Freire, Fraser, Macedo, McKinnon, & Stokes, 1997:306).

How did I do this? Sometimes avoiding eye contact worked; I discovered that it is possible to listen actively while gazing out the window. This technique meant that a speaker was more likely to make eye contact with peers, and in turn this meant that other students were more likely to contribute.

Shor writes of the 'patiently impatient' teacher:

> …the critical teacher has to balance restraint and intervention. She or he must lead the class energetically while patiently enabling students to develop their thoughts, agendas, and abilities for leading. The teacher has to offer questions, comments, structure, and academic knowledge while patiently listening to students' criticisms and initiatives as they co develop the syllabus. The patient critical teacher is also impatient to propel students' development so that they take more responsibility for their learning (Shor, 1992 p.25).

Rhetorical and open ended questions were useful, but I wanted these to come from the students as much as from me. A further challenge was to ensure that conversations did not filter through me. My goal was for a zigzag journey of conversation, radiating in all directions around and across the seated circle, rather than a student/lecturer didactic situation with observers. For me, the most successful sessions were when I said least, emotions ran high, and passions were tempered with world and word based reality, immersed in objectivity. How was this achieved? Primarily by my silence, students' comfort levels within the class, allowing space for the process to happen, and believing that positive outcomes would justify the means.

Problem posing had huge potential in our classroom. Shor advocates this form of dialogue:

> ...problem-posing focuses on power relations in the classroom, in the institution, in the formation of standard cannons of knowledge, and in society at large. It considers the social and cultural context of education, asking how student subjectivity and economic conditions affect the learning process. Student culture as well as inequality and democracy are central issues to problem-posing educators (Shor, 1992 p.31).

The third class

The following paragraphs describe our third class, which had the theme "Capital – families, communities and schooling". Outside of class, students had read and critically discussed a range of readings. While I could have commenced the session with a lecture (in a banking manner) on various forms of capital and their effects on low decile schools, or with problem-posing as indicated above, I knew from my reflections that my challenge was to ensure that "*ample time (was) given to their processes*". In particular I was unsure about the quieter students, or in Shor's (1992) words, the 'silent ones'. Were they engaged? Or were they struggling in the dialogic encounter? Were they linking their worlds with the words?

The class therefore commenced with student interactions, and without my participation as an 'expert'. In three groups (each based on one pre-read article/chapter) students shared their understandings of the readings, asked each other questions, and made links to their practice – the 'so what?' question. Following this, in the second stage, students moved into self selected groups of three (on the basis of each reading) and, in turns, each shared her/his understandings, questions and perceived relevance of a reading, plus led a tripartite discussion. The first stage of the exercise scaffolded students into the second stage; after the first group discussion, each had greater expertise regarding their particular reading and its links to practice.

The final stage was for the class to move back into a circle, and for us together to revisit the 'so what' question. My planned lecture was interspersed during this time, as and when appropriate; some material was hastily omitted while other theory/research/understandings/writers were added. What

was exciting for me during the dialogue was a Tongan student articulating links between theory and the historical and contemporary situation in Tonga. She used her insider knowledge of Tonga and its politics as an example of agency and power amongst class based groups. *Riveting stuff ... an emphasis on there being no one answer, that politics is central to any response and therefore can't be ignored.*

Our time ran out that evening well before we had completed my planned schedule. But that didn't matter. I seemingly had done and said very little, yet I was fully engaged the whole evening, and very tired at the conclusion. We all learned and all were challenged.

> <u>They</u> shared <u>their</u> knowledge.

> *Last night was kind of loose and joyful. At appropriate times students talked about their readings and their practice, and that of others.*

> *Delpit's messages resonated with Samoan students in particular. White privileges and attitudes were discussed.*

Visiting speakers

Visiting speakers were invited to share their worlds and enrich ours, and they all achieved this to some extent. A school principal, an education researcher, and a left wing education activist articulated their passions, politics and energy; all were grounded in the real world, had read widely, and appeared to relish their passionate engagement and dialogue with students.

In contrast, invited government officials had a less salubrious effect. They declined to be part of a panel, then 'hid behind' a power point presentation - one student later described their actions as 'death by power point'. Despite the most pointed of questions, the officials refused to address any issue which deviated from their planned address or was even slightly controversial. The bureaucrats' refusal to engage in dialogue meant that, in a practical sense, we learned little that we didn't already know or could glean from a website. Their actions did, however, teach us a great deal about a particular form of decidedly uncritical pedagogy, education politics and power, and the role of state officials and the state apparatus.

Assessment with its tensions

In his conversation with Macedo, Freire noted that teachers grade and they have "certain control over the curriculum … to deny these facts is to be disingenuous" (Macedo, 1995:377). Undoubtedly assessment and its consequent tensions represent contradictions for many users of Freirean pedagogy.

Grade point averages (GPAs) are tools of trade for universities. On the basis of GPAs students gain entry to further and higher level courses. Despite my feelings regarding the competitive nature of such systems, and my own social justice focus, it is obligatory to assess and rank the students. Any concerns I had regarding GPAs needed to be represented in a different university forum, not in this class.

That said, there is flexibility within the system for autonomous decision making. The course had three major assessment tasks. The first spanned the initial seven weeks, and each of three consecutive sub-tasks involved reading two articles, comparing them with each other, and making links to practice. My feedback on each sub-task was detailed, pedantic and explicit because I was intent on teaching students the 'game' (Delpit, 1997) of post graduate study. Readings were carefully chosen and 'paired', and in a sense they became de facto core readings. All were critiqued in some way during class, using various techniques such as the jigsaw cooperative learning process. While students were encouraged to meet outside class and/or use electronic media to continue their discussions, the assessment emphasised submissions were the work of individuals. Students needed to understand plagiarism risks. For the first time in my post graduate teaching no one in the class submitted a sub-task late, or requested an extension.

The second task was a group activity. Self chosen groups selected a film or documentary which portrayed, in some way, education in a low SES community. Groups then presented a theory based critique which included class discussion. This task differed from Task One in that students established

assessment criteria, and the marks awarded (out of a possible 15%, all group members to receive the same mark) were based on peer review. Time was set aside for the class to make decisions regarding assessment criteria. Such power and autonomy was obviously a foreign experience for most of the students and some appeared confused and embarrassed. Because of this, at one stage I left the room to enable more open discussion. It appeared that one student argued a strong case for all to receive 15% provided everyone contributed (*I don't mind if the 15 argument succeeds, it's their decision to make. I just hope that learning happens!*). Ultimately this was the class decision, with criteria developed by a volunteer. While I had some misgivings about the decision, it did demonstrate solidarity, class efficacy and courage. Despite some variance in the content and quality of the group presentations the class resolution was respected and all received an A grade (15%).

The third task (40%) required students to choose an aspect of their own schooling or teaching, or a political issue related to New Zealand's low decile schools, and appropriately theorise it. Topics included: a low decile school teacher revisiting the philosophy he wrote at the beginning of his teaching career; a Maori teacher reflecting on self-efficacy she and others gained from their schooling in a low decile intermediate school; and a Samoan secondary teacher examining injustices he perceived regarding Pasifika students and streaming practices in his secondary school. Theory enabled a deeper understanding of writers' potential agency.

Reflections and Conclusion

LDE was evaluated by students in 2008 and, according to university criteria, it was a successful course. Numbers interested in the course for 2009 provide an indication of the course's popularity; I decided to 'cap' the numbers at 25 so that Freirean processes have a better chance of working. This situation is reminiscent of one that bell hooks (1994) describes. As she became more and more committed to "liberatory pedagogical practices' her classes became too large. She warns that "overcrowded classes are like overcrowded buildings – the structure can collapse" (p.160). bell hooks also suggests that colleagues can be suspicious of popular teachers, and that "there is a tendency to undermine the professorial commitment of engaged pedagogues by suggesting that what we do is not as rigorously academic as it should be" (hooks, 1994 p.204).

While LDE contextual issues were central to class discussions, assessment tasks, and curriculum, I am not convinced that we engaged fully enough in actual problem solving as part of our classroom learning. This is an aspect I will change in the future; preliminary thoughts are to centre each classroom session on a particular problem, plus make problem solving central to group assessment tasks. I acknowledge that problem solving does not just happen when I, the lecturer, am present and have set the scene. It is possible that my personal insecurities masked what may well have ensued in groups, at home, in schools, and generally in students' professional lives. I live in hope, but with reservations - a state of reserved hope?

As a critical educator it is essential that I reflect on **all** that the course entailed, so that my pedagogy improves in future classes. I have already indicated a need for a stronger focus on problem solving. Secondly, while Freire's ideas underpinned the course I feel that his words and works were not given the credence they deserved – rather than share others' thoughts on Freire, in the future I intend to share more of Freire's words. In general there needs to be a stronger incorporation of theory (words) into classroom dialogue. Thirdly, our visiting speakers need to be better screened. It is unlikely I will again invite state representatives to talk with the class, our time is too precious to risk another death by power point or a 'this is the power we have over you' situation. The hegemony of the state already pervades the lived experiences of teachers; any LDE guest speakers need to bring alternative, radical or transformative perspectives.

How innovative is LDE? And what did it achieve? If I compare my pedagogy with best practice in New Zealand's primary or secondary schools, mine is far from unique. However the 'higher' one goes in the education system the more likely it is that a banking model predominates. This chapter suggests that encompassing words and worlds, and a particular way of working where the lecturer is not central and on stage, is meaningful, relevant and challenging at the university post graduate level. Two students, so far, have signalled an interest in course related thesis studies. Much needed research is therefore pending. At the end of the course my interactions with some class members continued and many still interact with each other. My hope is that, as a result of our shared dialogue, aspects of the low SES school context changed for the better, and continue to improve.

Bridging the Gap: An Alternative Solution to an Alternative Framework

Dr. Lourdes M. Ferrer
University of Guam, USA
UOG Station Mangilao 96923
lourdesferrer@yahoo.com

Abstract

This paper discusses the alternative frameworks of elementary school students from four ethnic groups. Their conceptions indicate a need to make students aware that the way they think is quite different from the framework used by scientists. The teachers in this study developed instructional strategies to assist students in building the appropriate conceptual links between what they already know and what they ought to know. The effectiveness of their instructional strategies is the focus of this study.

Introduction

When a student is faced with a new encounter he/she constructs the meaning of it by connecting the new information received with prior knowledge. When the existing idea that is called upon to explain the new encounter proves its usefulness, the linked idea is confirmed.

It may be that there are some perceived similarities between the new experience and a prior one. In this case, an incomplete fit may occur because there are only some similarities that exist between the current and prior experiences. The linked idea will have a complete fit only if it is slightly modified. Otherwise, prior knowledge is retained and the new knowledge is not accommodated.

However, in the construction of a modified knowledge a misunderstanding or a misconception might take place. A good example is the students' construction of meaning of the word energy. Young students always associate energy with strength (Ferrer, 2008). When asked about the food that gives them the most energy, rice was a consistent response. To them eating rice would make them *stronger* compared with eating sweets or drinking high-energy drinks with high percentage of sugar.

When the new encounter does not fit at all with any prior learning experience, the information from the new encounter is abandoned. There are, however, possibilities that the knowledge gained from the new encounter may be accommodated falsely. If the student perceives that the information before him/her is important for examination purposes, then this information is accommodated in the short-term memory. After the need for it is satisfied, it is removed from memory as if that information is never encountered at all.

Students' Conceptions: The Driving Force for Teaching

The afore-mentioned discussions suggest that students' conceptions can override the knowledge being presented in class, distort new information, or co-exist with new information. These conceptions need to be addressed in instruction so that students will understand the lesson presented to them. Before any attempt to address it, the teacher should assess first the kind of conceptions students bring to class.

In this study, the students' conceptions of food were assessed using the *interview-about-instances*. This type of interview is a conversation between the interviewer and a student about situations represented in diagrams or pictures to probe the student's construction of meanings. In this interview the student is presented with a specific set of examples and non examples of the concept. The student is asked to identify which cases are examples of the concept and then to explain that decision (Southerland, Smith and Cummins, 2005),

Each teacher candidate from the following ethnic groups – Chamorro/Filipino (N=12), Pohnpeian (N=15) and Yapese (N= 9) was tasked to interview five elementary school students following the *interview-about-instances* procedure discussed in class.

The results of the *interview-about-instances* are shown in the summary table below.

Table 1: Students' Conceptions of Food by Ethnicity

Categories of Responses	Frequency of Responses by Ethnicity			
	Chamorro	Filipino	Phonpeian	Yapese
	N=60	N=40	N=75	N=45
1. Solids eaten at mealtime are food (rice, chicken, fish, meat)	87%	88%	93%	89%
2. Liquids are not food (juice, milk, choco drink, lemonade, coconut water, soup)	92%	95%	95%	93%
3. Snacks are not food (e.g. cake, sandwich, nuts, ice cream, chips)	80%	75%	93%	93%
4. Those grown at home are food (fruits and root crops).	25%	13%	96%	95%
5. Fruits are not food				
6. Sweets are food.	67%	75%	13%	16%
7. Cooked things are food.	17%	20%	91%	95%
	37%	63%	80%	84%

The results of the interview revealed partial understanding and misunderstanding of the concept of food. Most of the misunderstandings came from the lower elementary students. More than 90% of the respondents believed that liquids are not food. The students' responses show a dichotomy between foods and drinks. The two separate labels are posted everywhere in restaurants and supermarkets and they are used to interpret drinks as not foods.

The same holds true with another label - snacks. They are not considered food because they are not eaten at meal times. More than 75% of the respondents held this conception. Food was regarded as solids eaten at meal times (87% - 93%) and did not include drinks or snacks eaten between meals.

Mixed responses were noted about fruits. For Chamorros and Filipinos (67% and 75% respectively), fruits were not regarded as food. They were considered as a separate category just like in supermarkets where 'fruit section' and 'food section' are found. However, Yapese and Pohnpeian respondents asserted that fruits are food because they grow them, cook some of them (e.g banana, papaya, bread fruit) and are served during meal times. To them all root crops are also food because they are always cooked and served at meal times. On the contrary, the Filipino respondents alleged that they are not food because they do not eat them. Only 25% of the Chamorros held on to the belief that they are food because they grow them at home and they eat them,

An interesting revelation about ice cream came from the Yapese respondents. To them ice cream is not food; it is a drink. They wait for it to melt and they drink it. Also, they do not have the term for 'eat the ice cream' but they have a term for 'drink the ice cream' in their language. Parents use the 'drink the ice cream' term with their children.

Both Yapese and Pohnpeian respondents considered sweets as food (91% and 93% respectively). Chamorros and Filipinos believed otherwise. Sweets give them tooth decay and diabetes, and they make them hyper. The negative connotation associated with sugar is very common among younger students.

From the afore-mentioned discussion of results, the students' framework clearly shows that it is part of the everyday culture and cannot be eliminated. It is, therefore, important to teach students the difference between the two ways of looking at food and where it is appropriate to use the science framework. Furthermore, the students' alternative conceptions of food need to be addressed by bridging the gap between what students know and what they ought to know.

Bridging the Gap

From a constructivist perspective, science teachers have to acknowledge the fact that children's minds are full of ideas. Some of these ideas are misconceptions. Others show limited understanding of concepts. Misconceptions are resistant to change. Since they are tenaciously held in mind, they cannot be eliminated easily. What is needed is teaching for conceptual change. It requires a constructivist approach in which learners take an active role in 'testing out' their ideas, reorganizing their knowledge, and proving the correct concepts to themselves (Ferrer, 2008).

Following were the various techniques used by the teacher candidates in this study to help students change their conceptual framework. There were 20 teacher candidates from Guam (comprising Chamorros and Filipinos), 9 from Yap and 17 from Pohnpei who developed these techniques.

Use of the Food Pyramid (Technique 1 by the Guam Teacher Candidates)

The food pyramid showed examples of food including those that were not considered food by the students, such as milk, juice, ice cream, cake, candies, carrot, lemon, banana, papaya. bread fruit, and yam.

The students in groups discussed the foods in each food group and the nutrients derived from them. They were asked to challenge each other's ideas and be explicit about their meanings. They were required to negotiate conflicts in their beliefs and then synthesize their knowledge that they would report to the whole class.

After each group presentation the students were given a handout on food nutrients for each food group to reinforce their newly acquired knowledge. They were also given food samples in picture cards. They were asked to group them according to the categories in the food pyramid.

Study of Food Labels (Technique 2 by the Pohnpeian Teacher Candidates)

The students were shown food labels for drinks – milk, chocolate, fruit juice. They analyzed the nutrients mentioned in the labels. Then they classified the drinks according to food groups in their textbook. In this way the students were able to see that drinks are also food.

Finally, the students were asked to define what food is following a series of leading questions. Their definition was substantiated by what food does to the body. Then they were shown the pictures of foods that they did not consider as food during the interview. They were asked questions to challenge their initial beliefs about those foods. The idea was to make the students see the faults in their misconceptions and change them on their own.

As reinforcement, the students were asked to classify those foods in question according to food groups and discuss the nutrients they give the body.

Cooperative Learning Stations (Technique 3 by the Yapese Teacher Candidates)

Students were divided into three groups according to the food groups they follow in their curriculum – energy-giving foods, protective foods, and body-building foods. Handouts for these food groups with accompanying pictures of food were placed in the three stations. The students went from one station to another and discussed the contents of the handouts.

Then they were given worksheets that required them to classify foods according to food groups. Those that they identified as non-foods in the survey were included in the worksheet. They were asked to discuss their answers with their group mates.

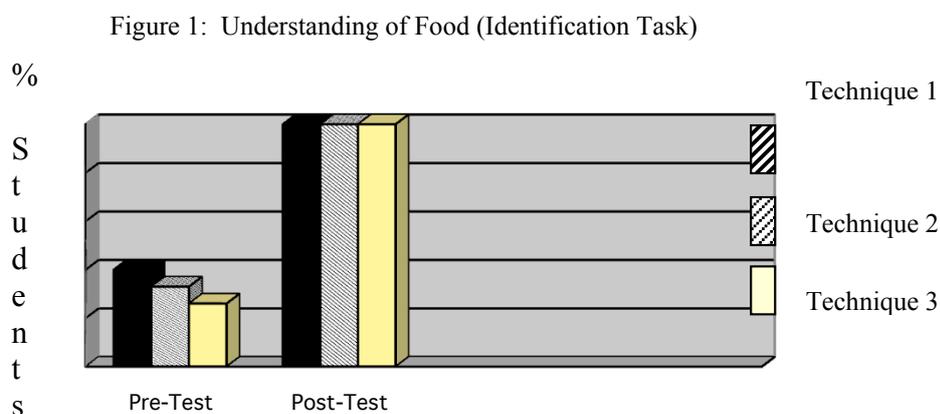
Impact on Student Learning

Teaching for conceptual change involved the following steps that the teacher candidates carried out.

1. Uncovering students' pre-conceptions. The students were given a checklist that required them to identify food and non-food.

2. Using various techniques to assist students modify or change their conceptual framework. The students were actively engaged in cooperative learning, compare and contrast activities (students' ideas presented against those in the food pyramid, food labels, handouts), and classification tasks.

3. Assessing student outcomes. The students were given the same checklist and a test on classifying foods according to food groups. The results of these assessments are shown in the graphs that follow.

Figure 1: Understanding of Food (Identification Task)


The pre-test was a simple *identification* of food using a checklist. The pre-test results show that only 40% of the student participants on Guam composed of grades 3, 4 and 5 (N_{total} = 30) had acceptable understanding of food. Thirty-five percent (33%) of the Pohnpeian student participants (multi-grade with N = 18) displayed adequate conceptions of food. The Yapese student participants (multi-grade with N = 15) had the most cases of misconceptions. They only had 26 % demonstrating satisfactory performance in the food identification task.

The post-test consisted of two tasks – *identification* of foods and *classification* of foods into food groups. The post-test results reveal 100% understanding of what food is by identifying correctly foods and non-foods. Only a handful of them (2 or 7% of the Guam student participants; 1 or 6% of the Pohnpeian participants; and 2 or 13% of the Yapese participants) were not able to meet the standard for the *classification* task. (Refer to Post-Test 1 in Figure 2).   Since classification is a higher order thinking skill, it was difficult for some students to carry out this task without the pre-requisite skills to classifying.

To address the classification difficulty of the students an application exercise was developed. It was the creation of a menu for lunch representing a balanced diet. This exercise which was suggested to be carried out through a cooperative learning activity would enable the students to discuss in detail the food nutrients present in the foods they want included in the menu. This application exercise which was considered a reinforcement activity was tried out with the participants the following day. The test results yielded 100% full understanding of foods and the nutrients they provide the body.

According to Harlow (2009), students learn new information in two ways; they can either assimilate the new information, when the learning fits within current knowledge structures, or accommodate the new information. When the existing information must change to accommodate the new, the process of knowledge reconstruction or modification can take longer.   As in the afore-mentioned scenarios, reinforcement – an added stage - was needed.

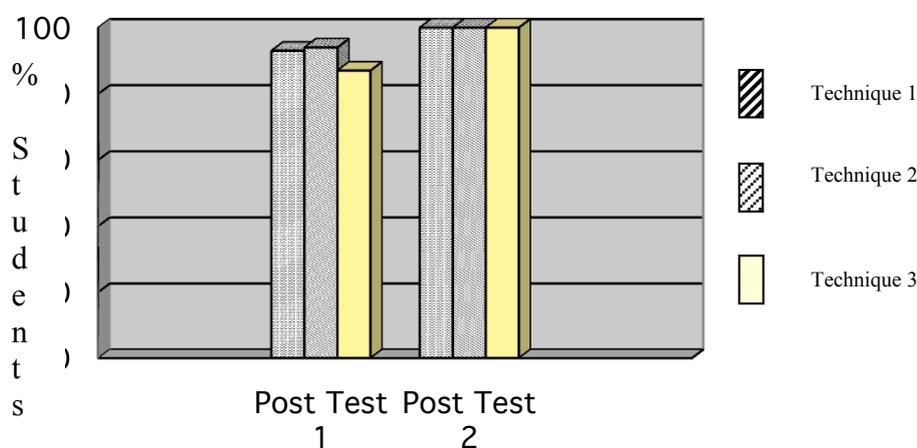
The next graph shows the performance of the students in this added stage of lesson development. (Refer to Post-Test 2 in Figure 2).   The reinforcement strategy proved effective at improving the performance of the students in the classification task.


Figure 2: Classification Task

Concluding Statements

The findings of this study show that students from different cultures share many similar ideas about food. They have deeply imbedded misconceptions that are rooted in their daily experiences. Until these misconceptions are corrected, they will effectively disable the students from moving on to scientifically accepted models (Harlow, 2009)

There are instructional strategies which teachers can utilize to encourage conceptual change. Bransford (2000) suggests a bridging strategy by guiding students with leading questions. The reasoning behind these questions is to have the students come to their own conclusions about their misconceptions. If the students are able to see the faults in their misconceptions and change them on their own, then these new connections will be stronger.

Equally important in the learning process is the use of continuous feedback with students. Continuous feedback helps students know where they are in their learning and where they are going (Brophy, 2004). Feedback from both teacher and students are needed. It is specially beneficial in science learning because of the natural process of science through inquiry. Science discourse gives way to challenging misconceptions because comparing ideas can shed light on personal misunderstandings (Harlow, 2009).

If students are to advance their knowledge of the world around them, they have to develop ideas that are more acceptable from the scientific point of view. Ferrer (2008) urges teachers to assist students in building the appropriate conceptual links between what they already know and what they ought to know to ensure that no misunderstanding could set in during the process of knowledge construction. Teachers have to provide a wider range of experiences that challenge students' conceptions that are contrary to scientific ideas. Some examples of these experiences include further investigation that would test the workability of the students' ideas in a different but related contexts, scaffolding new ideas provided to students through the use of technology, and organizing whole-class discussions so that different ideas about the same concept can be brought together and discussed.

A review of early literacy practices at home

Ren Li
Nanyang Technological University, renli816@gmail.com
Hu GuangWei
Nanyang Technological University, guangwei.hu@nie.edu.sg

Abstract

In this article, we review previous research on parental literacy practices at home. Based on the degree of parental involvement in literacy activities with the child, existing studies are grouped into and reviewed according to three categories: those on parental modeling, those on material provision by parents, and those on direct engagement between parent and child. Based on the review, we draw implications for early literacy development at home and school in Asian contexts.

1. Importance of Examining Parental Literacy Practices

In the field of educational research, the last three decades have witnessed an emergence of theoretical and empirical research into the origins of literacy in the preschool years (Dickinson & McCabe, 2001). Much of literacy acquisition is currently believed to occur at an early age, long before formal instruction in reading and writing begins at school entry and long before children can exhibit any manifest reading and writing skills (Bus & van IJzendoorn, 1995; Dickinson & DeTemple, 1998; Leseman & de Jong, 1998; Mason & Allen, 1986; Snow et al., 1991).

Although effective formal reading instruction in school can enhance success in literacy development for children, home serves as a setting in which language and literacy are typically first encountered (Purcell-Gates, 1996; Weigel, Martin, & Bennett, 2005). From an emergent literacy perspective, a literacy-rich home environment contributes crucially to the development of emergent literacy in preschoolers and greatly increases their subsequent chances of success at school (Bus, van IJzendoorn, & Pellegrini, 1995; Jordan, Snow, & Porche, 2000; Scarborough & Dobrich, 1994; Share, Jorm, Maclean, & Matthews, 1984). Early instruction and active engagement with parents in literacy related activities at home are seen as most important in preparing children for instruction in reading and writing at school (Leseman & de Jong, 1998; Li, 2002), so much so that a large portion of the difference between children in school achievement at the end of the primary years is believed to be already determined by differences in what they have experienced before school entry (Wells, 1987).

Though early research on literacy environment in homes primarily focused on shared book reading activities (e.g., Bus, van IJzendoorn, & Pellegrini, 1995; Scaborough, Dobrich, & Hager, 1991), more recent work has approached the home environment as multifaceted (e.g., Burgess, Hecht, & Lonigan, 2002; Leseman & de Jong, 1998). It is found that the social-economic status (i.e., parents' educational level, parents' occupation, and family income) of the family (Baker, Mackler, Sonnenschein, & Serpell, 2001; Burgess, Hecht, & Lonigan, 2002; Leseman & de Jong, 1998; Li, 2006; Laosa, 1978; Ninio, 1980; Snow et al., 1991; Weigel, Martin, & Bennett, 2005; Wong, 1998), the active interaction between parents and children (e.g., shared reading, family library visits, family talk) at home (Burgess, Hecht, & Lonigan, 2002; de Jong & Leseman, 2001; Scarborough, Dobrich, & Hager, 1991; Weigel, Martin, & Bennett, 2005; Wong, 1998), and parent-child relationship embedded in family activities (Baker, Mackler, Sonnenschein, & Serpell, 2001; Bus & van IJzendoorn, 1988, 1995, 2001; de Jong & Leseman, 2001; Leseman & de Jong, 1998; Snow et al., 1991) are all related to children's early literacy development and subsequent school success.

Empirical evidence suggests that although parental demographics are correlated with children's development, the correlations often disappear after controlling for other facets of the home literacy environment (Leseman & de Jong, 1998; Hoff, 2006). Furthermore, the social demographic characteristics of the family are relatively static. In addition, the emotional bound between parents and children are often embedded in parent-child interaction. We are thus more interested in the more active facet of the home literacy environment— parental literacy activities. These parental practices are most

subject to external influence such as family literacy programs and instructional efforts from school teachers.

2. Existing Research on Parental Literacy Practices

Parental literacy activities is an umbrella term covering what parents do at home to engage their children in literacy-related activities. These activities provide the vast majority of opportunities for pre-school children to develop their understanding of, and acquire knowledge of, literacy. In terms of the degree of parental conscious involvement in literacy activities with the child, parental literacy activities can be further divided into three categories: those on parental modeling, those on material provision by parents, and those on direct engagement between parent and child. In the rest of this paper, we will organize our review of previous research according to these three categories.

Parental modeling is defined as parental activities that *expose* children to models of literacy or literacy-related usage (Burgess, Hecht, & Lonigan, 2002), for example, parents reading newspapers in the presence of the child or taking the child to the library. During these activities, parents' literacy-related behaviors as *models* may raise the child's interest in literacy and as a result the child is more apt to be engaged in literacy activities (Sénéchal, LeFevre, Hudson, & Lawson, 1996).

Material provision refers to the provision by parents of literacy or literacy-related materials and equipment in homes. The materials can be of a wide variety, ranging from print (such as children's books or other reading materials, maps on the wall or other environment print) to toys (e.g., construction materials) and media (e.g., radios, computers) available at home for children's use. Parents do not merely provide materials for their child. They may also set rules concerning some literacy resources, for instance, which TV programs to watch or avoid.

Direct engagement is a term borrowed from Weiger, Martin, and Brennett (2005), referring to parents' efforts that *directly* engage a child in literacy and language activities designed to foster literacy or language development (Burgess, Hecht, & Lonigan, 2002; Weigel, Martin, & Brennett, 2005). Activities like parent-child joint book reading and parents' direct teaching during these activities belong to this sub-category. This sub-category emphasizes the intentionality of the parents and the personal experiencing of the child.

2.1. Research on parental modeling

Studies to be reviewed in this section target mainly home activities exposing children to literacy, namely parental reading habits and family outings.

2.1.1 Parental reading habits

Burgess, Hecht, and Lonigan (2002) found statistically insignificant correlations between parental modeling of literacy activities (termed Passive HLE [home literacy environment] in the study and based on parents' self-report) and two outcome measures (letter knowledge and word decoding ability) of emergent literacy, when children's earlier language and literacy abilities were controlled for.

Another study on 56 children from middle-class American families by Scarborough, Dobrich, and Hager (1991) that took children's reading achievement in Grade 2 as outcome measure also produced little evidence that differences in children's literacy outcomes were related to their parents' reading habits, defined as self-reported frequency of adult reading.

Although Weigel, Martin, and Bennett (2005) found in their study of 85 three- to four-year-old preschoolers that correlations between parental literacy habits and children's print knowledge as well as receptive language were all positive and statistically significant), they did not partial out the effects of other developmental predictors such as previous language development of the children. If multiple regression analysis had been conducted, the statistically significant relationships could have disappeared.

In summary, there seems to be little solid evidence that parents' reading habits have an effect on their children's language and literacy achievement. As Burgess, Hecht, and Lonigan (2002) have pointed out, compared with parental modeling activities, the active elements of the home literacy environment

(e.g., parent-child shared book reading) are more likely to be significant predictors of children's language and literacy learning when the effects of previous development of the child are controlled for. Put in another way, home literacy activities that directly engage children may have a much greater impact upon children's acquisition of language and literacy skills than merely exposing children to literacy does. This view is supported by Levy, Gong, Hessels, Evans, and Jared (2006). An alternative explanation for the lack of correlations could be that the role of parental reading habits in children's literacy development is an indirect one, as the results of Leseman and van Tuijl's (2006) study seem to suggest. Clearly, no definite conclusion can be made in this regard at the moment.

2.1.2. Family outing activities

As in the case with studies of parents' reading habits, research into the effects of family outings has also suggested an indirect role of modeling. Family outing activities expose children to external sources of literacy. Library visits are the most typical and the most literacy-related outings for many families. With a sample of 61 pre-kindergarten children from low and middle income families in Maryland, Baker, Mackler, Sonnenschein, and Serpell (2001) found no direct effects of the frequency of library visits on children's reading achievement. However, it could indirectly influence their literacy learning because of its relation to the affective climate at home.

In Sénéchal and his associates' (1998) study with a sample of 110 kindergarteners and 41 primary one students from English-speaking families in Canada, library visits were included in the category of storybook exposure and the overall category of storybook exposure was found to be related to children's development of language skills.

Griswold (1986) examined a much wider range of family outing activities (i.e., beach outings, picnics, visits of public library, museum trips, Disneyland and Marineland activities) of a large sample of fourth-grade children (N=1,715) from Black, Hispanic and White families in urban Los Angeles. Self-reported participation in those activities was compared across the three racial groups and used to predict reading and math achievement. The following results were obtained: (a) achievement was greater for participants of family outing activities than for non-participants; (b) visiting a public library was the best predictor of achievement regardless of race; and (c) a good predictor of achievement was frequency of picnics for Hispanics and visiting Disneyland for Whites, but there was no unique predictor of achievement for Blacks.

Like Griswold (1986), Snow et al. (1991) also examined the relationships of various family outing activities to children's language and literacy learning and development. Trips to museums, parks and libraries were collected in self-report. Frequency of family outings explained the largest portion of variance on word production (.22), reading comprehension (.24), vocabulary (.35) and word recognition (.24).

To sum up, most studies support a positive correlation between family outing activities and children's literacy development. However, the correlational nature of the studies reviewed makes it inappropriate to infer that encouraging children to participate in family outings will improve their literacy or academic achievement. It may very well be that family outings such as library visits result from children's good literacy development rather than constitute a causal variable for such development. A rival hypothesis is that frequent family activities of this type tend to result in greater parental involvement in school, which is a true causal variable for achievement. Furthermore, as Griswold (1986) has shown, the types of outing activities as well as their effects vary between families of different cultures, and library visits may be more common and beneficial for certain cultural groups but not for others. In any case, it is too hasty to claim a causal relationship based on the available evidence. For the same reason, Griswold (1986) called for follow-up studies to include verification of the relationships reported by attending to the quality of family outing activities.

2.2 Research on material provision

Print (e.g., children's storybooks, maps, tapes and computer programs), together with play materials (e.g., toys), is the medium through which children learn to master the surroundings (D. Taylor, 1983, cited in Li, 2002). As is shown in the studies to be reviewed below, a home literacy environment that is rich in literacy-related materials can facilitate children's positive attitude towards reading and writing. Parents are material providers, and at the same time they also set rules on access to these materials. In

this section, we will first review studies on the mere act of material provision and then those on the behavior of setting rules on access to the materials.

2.2.1. Material provision

Notably, the studies to be reviewed on parents' providing of literacy-related materials all employed inventories designed to assess the quality of home literacy environment in stimulating literacy development in children. An early study by Ware and Garber (1972) utilized the Home Environment Review (HER) to examine the relationships between measures of home literacy environment and a measure of school success. Among the nine dimensions of HER, the variable "materials in the home" concerning availability of materials in the home for children to learn was the most important predictor of future school success for the 4-year-old sample.

Three other studies employed a more widely used environmental measure—the Home Observation for Measurement of the Environment (HOME) inventory. With four versions targeting at families with children of different age ranges, HOME can cater for the needs of investigating samples of a wide range of ages. The definition of "materials" in HOME is also broader than that in HER: Materials at home in HER refer only to learning materials, while the concept of materials in HOME is extended to include play materials like toys and games.

Bradley and Caldwell (1981) investigated the validity of the preschool (or early childhood) version of HOME on a group of 60 Black children. Results showed a moderate correlation between preschool HOME scores and primary school achievement. The subscale showing the highest correlation with the composite achievement test score for both boys and girls was "toys, games and reading materials" at home. In a later investigation, Bradley and Caldwell (1984) investigated the home literacy environment on a younger sample with an infant version of HOME. Of all the HOME subscales gained when children were 12 and 24 months old, it was again the subscale of "play materials" that had the strongest correlation with first-grade achievement. The same result was also obtained by Elardo, Bradley, and Caldwell (1977) with a sample of 74 Black and White children. Thus, it seems that availability of developmentally stimulating materials and experiences is associated with children's good performance in achievement test.

With the development of information technology, computers, now widely available in families, provide additional access to literacy, although activities like computer games and Internet surfing are not literacy-related activities in the same sense as reading books is. The need to define literacy more widely by incorporating multi-modal ways of meaning making has been recognized in that the term *techno-literacy* is used to refer to those literacy practices and events which are mediated by new technologies (Lankshear et al., 1997; Marsh, 2004).

Marsh's (2004) study of 44 "toddler netizens" in England found through questionnaire and interview data that these children's multi-media literacy world was mainly composed of TV, computer games and mobile phones. Many children in this study were scaffolded carefully by parents and siblings, and they were developing skills to navigate the narratives in their multi-media literacy world in a meaningful way and developing the competences needed to become successful players. In addition, the texts in computer games that were connected with the wider popular culture interested the children and motivated them to read more widely in daily life.

Bakar's (2007) half-year-long ethnographic study identified an influence of popular culture through computer games at home in the literacy life of two young Malay kindergarteners in multilingual Singapore. Popular culture at home provided children with access to literacy texts and it was one of the ways that the families supported their children's literacy acquisition. When playing computer games, the children not only gained some conceptual knowledge of geography but also acquired appropriate forms of oral expressions. Another case study by Morgan (2005) on three three-year-old children also revealed the role of the computer in helping the children with reading and knowledge of letters.

Based on the findings from the above studies, it seems that provision of appropriate literacy-related materials for preschool children can contribute to their future success at school.

2.2.2. Rule setting

Parents do not merely provide materials for their children. They also set rules regarding some literacy-related resources, for instance, TV programs and computer games. Unlike children's books that are universally assumed to play a positive role in children's literacy development, media like TV, videos and computers can affect children's development either negatively or positively, depending on how children are engaged with them. Important factors in children's engagement with media are: the amount of time and control, and the amount of social interaction involved (GreenField, 1984). Too much time spent on watching TV may reflect children's lack of access to, or deprive them of access to, more interesting activities.

Early studies on family rules concerned access to TV programs only. Appropriate rules on TV watching have been found to have positive effects on children's word production (Snow et al., 1991) as well as children's knowledge of letters and words (Mason, 1980).

In a more recent investigation, Li (2002) expanded the notion of rules on TV viewing to family regulations on multi-media, including TV, videos and computers. Her ethnographic methodology enabled her to depict in fine detail the lives of four Chinese immigrant families in which media were handled differently and served different functions. For those immigrant families in which parents set rules on media and engaged their children in activities around the media, the media became a window on to the mainstream culture and literacy practices as well as a means of entertainment, and played the important role of bridging the Chinese immigrant families with Western (in this case Canadian) society. For those families in which parents let children free on TV watching and made no attempts to interact with children in media-mediated activities, the media were an instrument of resistance against and escapism from the mainstream culture. At the same time, this kind of media use occupied much of the children's leisure time and deprived them of opportunities to come into contact with mainstream literacy activities.

The studies reviewed in this section suggest that providing literacy-related materials and setting appropriate rules on access to these resources are facilitative of children's language and literacy development as well as school success. Nevertheless, the correlational nature of the reviewed studies renders it impossible and inappropriate to make any firm causal claim about the relationship between material prevision/rule setting and literacy learning. This limitation further renders it desirable to conduct longitudinal studies that are designed to uncover a cause-and-effect relationship.

2. 3. Research on direct engagement

Studies reviewed in this section cover such activities as joint book reading and direct teaching that directly engage children in literacy activities. These are probably the most easily recognized literacy activities and have attracted the most attention from researchers.

2.3.1 Shared book reading

Although ethnographic and diary studies have shown that parents engage their preschool children with literacy in a multitude of ways and through various household activities (e.g., Heath, 1983; Snow & Ninio, 1986), parental-child bookreading has been the primary focus of most empirical studies (Scarborough & Dobrich, 1994). As Bus et al. (1995) have asserted, book reading is not a minor part of a literate environment at home but rather a central condition for developing knowledge necessary for eventual success in reading acquisition. Even in families with few other incentives to become literate, the frequency of book reading makes a difference.

Frequency of shared reading is a most studied facet of home literacy experiences, and this kind of information is collected by different means: parental reports, checklists, and naturalistic observation. The first two are the basis for estimating the amount or frequency of shared book reading interactions at home, and the third one is more often conducted in studies that focus on the qualitative features of parent-child book reading. Due to the potential social desirability biases in parental report, checklist measures have been favored by some researchers (e.g., Sénéchal & LeFevre, 2002 Sénéchal et al., 1996). These checklists are usually completed by parents to indicate, in a list of names containing foils, titles and authors of children's books they have at home for their children. Sénéchal et al.'s (1996) investigation into the reliability of self-report and checklist methods in estimating book reading

frequencies suggested that checklists as indirect measures of storybook exposure had criterion validity because they predicted children's language development better than did the traditional self-report measures of storybook reading.

With the different nature of individual studies in mind, we review quantitative studies on the frequency of book reading first and then qualitative ones on the qualitative features of joint book reading interactions.

Working with different ethnic groups in Netherlands, Leseman and de Jong (1998) and Leseman and van Tuijl (2006) both found correlations between frequency of bedtime stories and children's literacy achievement. Similar results were obtained in research with middle-class English-speaking samples. Dickinson and McCabe's (2001) study revealed that after controlling for demographic factors such as income, parental education and family size, book reading had a significant effect on children's receptive vocabulary, early literacy, and phonological awareness. Scarborough, Dobrich, and Hager (1991) found that the frequency of book reading at home was related to children's receptive vocabulary. Long-term effects of book reading were also reported by Sénéchal, Thomas, and Monker's (1995) longitudinal study: Preschoolers' book reading experience with their parents was related to their scores on a reading achievement test in Grade 2.

The studies reviewed above all elicited parental self-reports to measure the quantity of shared bookreading. As was pointed out earlier, a self-report is likely to suffer from social desirability biases. It is thus worth exploring whether a more objective measure of shared bookreading such as a checklist would still replicate correlations between joint reading and literacy development. The study conducted by Sénéchal et al. (1996) was such an effort, and significant positive correlations were found between shared bookreading as measured by children's book-exposure checklists and children's vocabulary scores.

Sénéchal et al. (1998) gathered information from parents about children's storybook exposure by means of both parental questionnaire and checklists. They also compared the effects of storybook exposure with those of parent teaching. Regression analyses indicated that storybook reading predicted oral language only and that parent teaching predicted emergent literacy skills only. This finding was replicated in Sénéchal and LeFevre (2002). The latter found that storybook exposure explained a significant 9% of unique variance in children's receptive language, whereas parents' report of teaching explained a statistically significant 4% of unique variance in children's emergent literacy skills. These results are consistent with what Bus et al. (1995) had found in their meta-analysis of research on parent-preschooler reading frequency: Although related to outcome measures such as language growth, emergent literacy, and reading achievement, the effects of book reading tend to be strongest for language skills. In other words, different kinds of home literacy experiences can be related to different kinds of skills.

Maturation is another matter that is worth noticing in the effects of storybook reading. Bus et al. (1995) suggested in their meta-analysis that although the effects of book reading are not restricted to the preschool period, they gradually weaken, as children become conventional readers. This conclusion is supported by results from de Jong and Leseman's (2001) longitudinal research, which found that the effect sizes of parent-child book reading on children's reading achievement were greater for younger samples. The declining influence of home storybook exposure may mean that schooling or independent reading by the child at later stages may, to some extent, compensate for a lack of family reading experiences in the preschool years (Cunningham & Stanovich, 1991). However, shared book reading can still give children a head start when formal schooling begins, and this may be particularly important for children from low-SES families (Bus et al., 1995).

To recap, empirical studies of shared reading experiences at home found generally positive correlations between the frequency of storybook reading at home and children' language and literacy development, regardless of whether checklists or self-report measures were used for the joint reading variable. Although some studies found that the effects of storybook reading tended to be stronger for oral language skills than for written language or literacy skills, these findings were obtained from a restricted sample of middle to upper-middle class English-speaking families in only one national context, namely Canada in both Sénéchal et al. (1998) and Sénéchal and LeFevre (2002). There is a need for more studies on a wider variety of samples from a wider range of SES levels in different contexts to corroborate the findings. Besides, a clear causal relationship has not been established by

those studies reviewed in this section, as the quantity of storybook exposure was often measured only once and then correlated with outcome measures collected at a later stage, and potential extraneous variables were not adequately controlled to eliminate alternative explanations.

Despite the accumulated evidence of a positive role for joint book reading that has been yielded by studies based on frequency data, some researchers insist that the empirical evidence should be treated with caution and that storybook reading should not be encouraged unconditionally (Bus et al., 1995). As Evans, Shaw and Bell's (2000) investigation revealed, young children's early literacy and oral language skills were not enhanced or developed via general reading activities at home. Hence, Bus et al. (1995) called for more and better research to determine the conditions under which storybook reading is most beneficial. In response to this call, there has been growing research attention to the qualitative aspect of shared reading.

Perhaps the most influential study on the qualitative aspect of book reading was Heath's (1982, 1983) ethnography of patterns of language use in three literate communities in Southeastern United States. It was through this pioneering work that the mismatch between language use at school and at home was found to account for the school failure of children from low-SES families. The three communities differed strikingly in their patterns of language use via storybook reading, in the paths of language socialization for children, and in the extent to which they prepared their children for schooling.

Since Heath's pioneering study, researchers have paid more attention to qualitative aspects of book reading, usually by observing natural parent-child reading interactions at home. Reading conditions and interaction strategies during bookreading are their major concerns. Sénéchal's (1997) research into the effects of different storybook reading conditions—namely, repeated reading, single reading, and asking questions—on vocabulary acquisition revealed the superior effects of asking questions to mere reading, and the superior effects of repeated reading to single reading. Sénéchal, Thomas, and Monker (1995) further clarified the role of active responding from children during shared reading. The results of their study showed that both verbal responding through labelling and nonverbal responding through pointing enhanced vocabulary acquisition.

In addition to reading conditions, considerable attention has also been given to parental, especially maternal interaction strategies during shared book reading. Distancing theory (McGilliguddy-DeLisi, 1982; Sigel, 1982; Wang, Bernas, & Eberhard, 2005) offers a model that relates parental interaction styles/strategies to the demands put on presumed constructive cognitive-verbal processes on the part of the child. Based on this notion of psychological distancing, parents' utterances of higher distancing levels in book reading such as explanation, evaluation and extension are assumed to be especially beneficial for children's language and literacy development than utterances of lower distancing levels (e.g., directives, reproduction, labeling, and demonstration) are. Besides, the use of metalinguistic verbs (i.e., words denoting verbal processes, e.g., *tell*, *say*, *read*) and cognitive state verbs (i.e., words referring to knowledge states in affirmative, negative, and interrogative forms, mental activity and beliefs, and a variety of mental activity forms, e.g., *think*, *know*, *remember*, *expect*, *believe*, *remember*) in parents' language during storybook interaction is suggested to contribute to children's cognitive development (Adrian, Clemente, & Vallanueva, 2007; Pellegrini, Permutter, Galda, & Brody, 1990).

Leseman and de Jong (1998) measured the instructional quality of book reading by counting the proportion of higher distancing level utterances in interactions. The effects of instructional quality on children's vocabulary scores remained statistically significant even after statistical controlling of existing individual differences in oral language skills. This suggests that the quality of shared book reading has a direct influence on children's literacy development.

Evidence for longer-term effects of higher distancing level utterances was provided by de Jong and Leseman (2001). Instructional quality in storybook reading and problem solving situations was significantly correlated with word decoding at the end of Grade 1. However, by the end of Grade 3, the strength of this correlation declined. In contrast to word decoding, the correlation of instructional quality with reading comprehension increased from Grade 1 to Grade 3 from non-significant to significant.

In addition to utterances of high mental demands, the usage of metalinguistic verbs and cognitive state verbs are also important elements of parental interaction strategies. Pellegrini, Perlmutter, Galda and Brody's (1990) study indicated that maternal use of metalinguistic verbs was positively related to

children's vocabulary acquisition. A significant correlation between maternal use of cognitive state verbs and children's cognitive development (as measured by subsequent understanding of mental states) were reported by Adrian, Clemente, and Villanueva (2007) as well.

It is worth mentioning that parents may not be able to use those beneficial strategies all the time in joint reading interaction. With a sample of 13 mother-child dyads from Black low-SES families, Pellegrini et al. (1990) examined mothers' teaching strategies in joint reading with their four-year-old children and found that mothers tended to use more low-demand strategies around traditional texts (i.e., traditional children's books) and more high-demand strategies and metalinguistic verbs around familiar expository texts (e.g., comics, newspapers, and toy advertisements). Furthermore, mothers also tended to be more flexible in adjusting their strategies to children's vocabulary level only in the context of familiar texts.

All the findings above are from correlational studies, which means that a cause-and-effect relationship has not been established beyond doubt. As a result, intervention studies that could provide causality information are valuable. One such study was conducted by Jordan, Snow, and Porche (2000). In their one-year-long intervention project with 218 kindergarteners, the parents in the experimental group received instruction to increase the frequency and quality of parent-child language interaction. The findings revealed that children of the parents from the experimental group made significantly greater gains in language scores than those from the comparison group did. Similar findings were also found in Whitehurst et al.'s (1988) intervention study with a group of middle-class parents in the U.S.

To recap, where interaction strategies in storybook reading are concerned, parents' utterances of higher distancing levels and their use of metalinguistic verbs are generally facilitative of children's developing language and literacy skills and, in some cases, cognitive abilities. Still some issues need to be investigated. As most studies focused on interactions around storybooks, those around other sorts of reading materials should be explored. Besides, it is not clear whether or how the effects on children's language and cognitive development of parents' strategies in storybook reading will change as they grow up and enter primary schools. These limitations call for further longitudinal studies that investigate a wider range of literacy interactions.

2.3.2. Direct teaching

Apart from exposing their children to environmental print and engaging them in storybook reading, parents who value their children's school success may also choose to teach them skills perceived to facilitate school achievement, as well as skills that children are not learning adequately at school (Snow et al., 1991). Although parents play a central role in this type of instruction, in families with more than one child, especially immigrant families in which the parents are not literate in the language of the host society, older siblings can serve as mediators of literacy (Gregory, 1998). Compared with research on parent-child joint book reading, only scarce research attention has been paid to direct instruction by parents. This lack of attention might be explained by the fact that once formal schooling starts, children receive most instruction at school.

Parents' help with children's homework is probably the most common form of direct teaching. However, in Snow et al.'s (1991) study, the frequency with which parents helped with homework was not found to be statistically correlated with any of the outcome variables, including word decoding, reading comprehension, vocabulary and writing production.

In fact, to our best knowledge, only one specific instruction behavior of the parents – teaching about words to children – was found to be significantly correlated with children's literacy achievements, and the beneficial effects of such direct instruction were quite different from those of storybook reading. Two studies by Sénéchal et al. (1998) and by Sénéchal and LeFevre's (2002) support this point: Parent teaching was related to emergent literacy skills (i.e., print concepts, alphabet knowledge, invented spelling, and decoding), whereas storybook reading was related to oral language skills (i.e., vocabulary, listening comprehension, and phonological awareness).

With regard to literacy interaction, the out-of-school network of children may extend beyond their parents and include relatives and non-relatives, adults and children, siblings and peers. Many studies reported that older siblings helped young children with their homework (Bayley & Schecter, 2007; Volk & de Acosta, 2001). Especially in the case of immigrant families, the role of older siblings is

unique in that they mediate the lives of their younger siblings between home and school in a new linguistic and cultural environment (Gregory, 1998).

Gregory (1998) was among the first to explore the notion of siblings as mediators of literacy in immigrant families. His in-depth ethnographic study of seven five-year-old children from Bangladeshi in London showed that older siblings provided fine-tuned scaffolding closely adjusted to the reading ability of the individual children. Volk and de Acosta's (2001) ethnographic study also depicted the role of older siblings in the literacy lives of three Spanish-dominant Puerto Rican families in the U.S. The bilingual siblings, drawing on their experiences in school, made use of Spanish or English to scaffold literacy learning in the other language, translating and providing helpful cues.

Older siblings' contribution is unique partly because of the uniqueness of sibling relationships. Azmitia and Hesser (1993) found that young children were found to be more likely to observe, imitate, and consult their older siblings than their older peers. In addition, older siblings who are successful readers are likely to enhance the young children' language and reading development as well (Norman-Jackson, 1982).

To summarize the afore-reviewed research on the effects of direct instruction, the limited number of studies conducted so far prevents any definite conclusions regarding which types of direct instruction by parents are especially effective for which aspects of children's language and literacy development. While existing research evidence points to the central role of parents, there is also good reason to recognize the important role of older siblings as mediators of literacy.

3. Implications for Literacy Instruction in Early Schooling

From the studies reviewed above, we can see that parental literacy practices cover multiple aspects of home literacy environment, which includes, for instance, parental reading habits, family literacy outing activities, provision of literacy-related materials and setting rules concerning access to those materials, parent-child shared book reading, and direct teaching from parents and other family members, especially older siblings. Based on the findings concerning these aspects, several important implications can be derived for early literacy development in home and school.

First of all, although no definitive conclusion about the beneficial aspects of parental literacy practices can be made based on empirical evidence documented in the existing literature, one thing is for certain: Home literacy environments are multi-faceted. Consequently, any family literacy program should address multiple literacy practices at home instead of focusing only on a single type of interaction or activity, for example, shared book reading. Directions on family literacy activities like parental reading newspapers in front of the child, family visits to the library, parental provision of multi-media literacy-related materials, and teaching-like interactions between the older sibling and the child should also be considered as part of the program. This implication is especially beneficial to those children who are from deprived families and lack exposure to such activities.

Second, as suggested by the previous studies, many children have already been exposed to various literacy-related activities at home. Therefore, teachers should be sensitive to the ways of literacy knowing that children bring with them into the classroom and build on their pre-school literacy experience. As an illustration, teachers can introduce into the classroom literacy materials that are familiar to children in the home, for instance, maps, popular culture, and toy or game instructions, especially those multimedia resources like episodes of cartoons and computer games. Teachers can also include into classroom activities discussion about the books that parents read to children and about family outing activities. These familiar materials and activities can activate children's interests and motivation in the classroom and take advantage of their knowledge of literacy developed outside of school. This helps the teacher respect the ways in which children learn literacy in real life and legitimize the children's abilities to develop their own literacy skills.

Third, schools can provide training programs for parents to increase the frequency and quality of parent-child interaction, especially high quality interaction in joint bookreading, a central condition for reading acquisition. Strategies like using utterances of higher distance levels and metalinguistic verbs and cognitive state verbs should be encouraged when parents read storybooks to their child. This could help maximize children's literacy gains as well as their development of cognitive abilities.

Fourth, considering the mediating role played by older siblings in younger children's literacy development, family literacy programs should also manage to involve family members other than parents, especially older siblings. As mediators of literacy, they can be better teachers than some parents and peers. Due to the complexity of the out-of-school network of many children, it is necessary to make a concerted effort in fostering children's literacy development that involve *significant others* in their life, namely school teachers, parents, siblings, community members and beyond.

4. Research Directions

As revealed in the literature, a correlation between home literacy environment and children's achievement is well established, and the multiple facets of home literacy environment seem to play different roles in children's language and literacy development. Although the findings reviewed in this paper are encouraging, there are some limitations that are common to the existing studies. These gaps should be addressed by further research in the field of early literacy development.

First of all, the correlational nature of most studies in the literature prevents firm claims about causality. Secondly, a great majority of the studies focused on English-speaking communities, with little research attention given to bilingual or multilingual families, especially those non-English speaking families in Asian contexts. Even in those studies involving bilingual and immigrant children, the outcomes were always measured in the majority language of the host society, and the value of minority children's mother tongue and literacy was not recognized (e.g., de Jong & Leseman, 2001; Leseman & de Jong, 1998). Thus, there is a deplorable lack of research on home literacy practices of bilingual children's biliteracy acquisition in Asia. Thirdly, as socioculturally situated practices that have different meanings to different cultural groups in different contexts, literacy practices that are successful in some contexts for some groups may not be generalizable to other settings and other ethnic/cultural groups. That is why the conclusions gained from studies in such countries like the U.S., Canada, and the Netherlands may not be generalizable to Asian families. Thus more studies in Asian contexts are in need.

To address these gaps, future studies should adopt longitudinal qualitative designs to investigate the complex interplay of multiple factors in literacy development and explore the effects of parent-child literacy-related activities on children's literacy development in multiple Asian countries, especially such multilingual societies as Singapore, Hong Kong, India, and Malaysia.

How Do School Characteristics Relate to Demand for Private Tutoring in the Asian Context?

Kyoung-oh Song
Assistant Professor in Chosun University
Republic of Korea

Private tutoring has become a worldwide phenomenon, yet there is little empirical evidence upon main factors leading the demand for private tutors across nations. Using data from the Third International Mathematics and Science Study (TIMSS) of 2003, this study firstly explored proportion of students' participation in private tutoring across nations and examined school-level factors that influence participation in private tutoring in selected Asian countries. From the HGLM analysis, the results revealed that in Korea, Taiwan, Japan, and Singapore which have a higher participation rate in private tutoring and a high mean achievement score, private tutoring has been mostly affected by the background characteristics of students and students' motivation. Meanwhile, in the Philippine indicating a high portion of private tutoring and a low math achievement, the results identified that participation in private tutoring varies widely between schools and that most of the variation can be explained by differences in the school process variables (e.g., use of remedial class, amount of school homework, frequency of tests, and use of grouping by ability).

Introduction

Private tutoring outside of school has long been a major phenomenon in Korea. The Korean government announced that 87.9% of elementary school students, 72.5% of middle school students, and 53.4% of high school students had participated in private tutoring as of 2008 and that the total amount of money spent in private tutoring by parents was estimated to be about 20.9 trillion Korean won (Korean National Statistics Office, 2009). When comparing this amount of money to the GDP of Korea in 2008, it amounts approximately 8.4% of the GDP. Considering that fact that the Korean government spent 3.4% of the GDP on primary and secondary educational institutions in 2005 (OECD, 2008), one can imagine the size of the private tutoring market in Korea.

Recent studies on private tutoring have also revealed that private tutoring is not a phenomenon prevalent exclusively in parts of East Asia, but more likely to be a worldwide phenomenon involving countries in Africa, America, and Europe (Bray, 1999; Baker, Akiba, LeTendre, & Wiseman, 2001; Lee, Park, & Lee, 2009). In addition, Baker et al. (2001) introduced the idea that private tutoring around the world might not be the same – the use and the function of private tutoring may differ across countries. If their argument is true, the policy responses to the private tutoring phenomenon should also be altered based on the accurate diagnosis on the private tutoring mechanism of each country.

The current Korean government is trying to curb the private tutoring expenditure with a focus on strengthening public education and alleviating the educational expenses to reduce the burden on the middle class. The main point of the new policy plan is to introduce "private-tutoring-free schools," which refers to schools that sufficiently absorb students' educational demands within school boundaries, both at regular and after-school hours. As a start, in 2009, the government will designate 300 private-tutoring-free schools and provide them with 200 million Korean won each in subsidy (Ministry of Education, Science and Technology, 2009).

However, there is a lack of theoretical or empirical evidence supporting the relationship between the demands for private tutoring and school quality enhancement. In response, this paper will examine whether the causes and features of private tutoring differ across countries and to explore the school characteristics that influence the demands for private tutoring. In particular, focus will be placed on the school factors which represent school quality enhancement strategies.

Literature Review

Overview of the Private Tutoring

Private tutoring can be defined as the education outside the formal schooling system where the tutor teaches academic subject(s) in exchange for financial gain (Silova & Bray, 2006; Tansel & Bircan,

2006). Silova and Bray (2006) indicate three aspects of private tutoring; private tutoring is only concerned with 1) academic subjects taught in formal schools, 2) learning activities offered by tutors for financial gain, and 3) activities outside of school hours. In recent years, private tutoring has often been used as a term of "shadow education" (e.g., Stevenson & Baker, 1992; Bray, 1999; Baker & LeTendre, 2005) in order to convey the image of outside-school learning activities as parallel to mainstream schooling in the form of non-formal schooling. The forms of private tutoring vary, including from one-to-one education between a tutor and a student to larger classes provided by individual instructors and private institutes.

Private tutoring has become a universal phenomenon in many of the East Asia. According to the research by Baker et al. (2001), over 70 percent of students in Japan, South Korea, and Taiwan reported that they had received a form of private tutoring during their school experience. Recent studies indicate that the growth in private tutoring has been worldwide trend (Baker, Akiba, LeTendre, & Wiseman, 2001; Lee, Park, & Lee, 2009). For example, Baker and his colleagues (2001) show that the participation in private tutoring by eighth graders studying mathematics is extensive throughout the 1995 TIMSS sample of 41 countries. More than a third of all seventh-and eighth-graders participate in weekly tutoring sessions, cram schools, or other forms of shadow education activities. The study by Lee, Park, and Lee (2009) has also produced similar results. Using the 2006 Programme for International Student Assessment (PISA), Lee et al.(2009) found that among 57 participating countries and regions, 37 countries have more than a 40% participation rate in private tutoring for science and 42 countries have more than a 40% participation rate in math private tutoring for math. Silova and Bray (2006) point out that private tutoring is now growing not only East Asia but also in other parts of the world, such as Africa, North America, South America, and Western Europe. Since the breakdown of socialism and the introduction of market economics, private tutoring is even more prevalent in Eastern European countries. For example, in Czech Republic, Latvia, and Slovak Republic, the proportions of private tutoring exceeded 50% (Silova & Bray, 2006).

Consequently, it is evident that prevalence of private tutoring is becoming a global educational phenomenon not only in Asia countries but also in Europe, America, and Africa.

Three Arguments Explaining the Demands for Private Tutoring

What attributes drive the demands for private tutoring and for what purposes? At least, three arguments are feasible in explaining the causes of the demand for private tutoring.

The first argument on the demand for private tutoring is that intense competition for higher education and labor market results in the prevalence of private tutoring (Baker & LeTendre, 2005; Slova & Bray, 2006; Lee, Park, & Lee, 2009). That is, the demand for private tutoring is brought on by intense competition for future educational opportunities accompanied by a "tight linkage" between academic performance and later-life opportunities in the labor market (Baker & LeTendre, 2005). In this sense, private tutoring will be regarded as "an enrichment strategy" when there are clear, high-stakes decision points within the system that are based on examination performance (Silova & Bray, 2006). For example, it is often observed that the tight linkage between elite universities and excellent labor market opportunities in Taiwan, highly competitive university entrance examinations in Korea, the examination-based connection between secondary schools and the best universities in Greece, and the use of secondary school certificate examinations in the labor market in Hong-Kong generate a strong logic for the growing demand for private tutoring (Bray & Kwok, 2003; Stevenson & Baker, 1992; Tansel & Bircan, 2006; Baker & LeTendre, 2005). Under these circumstances, high-stakes examinations function as "a gate-keeper to education and labor market opportunities" (Baker & LeTendre, 2005, p. 62).

The first argument has been continuously verified through further research studies. For example, Baker et al. (2001) empirically explore whether the use of high-stakes tests in national educational systems results in the prevalence of private tutoring as an enrichment strategy among students. Using the 1995 TIMSS grade 8 students' data, Baker's (2001) study shows that students in Korea, Romania, and Taiwan participated in private tutoring for competition-oriented enhancement motivation. However, the main driving factor related to private tutoring was as a remedial strategy to complement academic achievement. Almost 10 years later, Lee et al. (2009) have presented the meaningful results from the 2006 PISA cross-national data of 15-year-olds; this study represents the relationship between the number and characteristics of 15-year-olds receiving private tutoring whereby countries such as Korea, Turkey, and Hong Kong (for science), Taiwan (for mathematics), Greece, and Tunisia can be described as countries with high intensity of private tutoring and enrichment motivation. Meanwhile, countries such as Austria, Germany, Luxembourg, Belgium, and Finland can be described as countries with low intensity of private tutoring and with remedial motivation.

Yet, some studies question the link between high-stakes examinations and private tutoring. For example, Baker and LeTendre (2005) argued that the size, prevalence, and role of private tutoring are unrelated to national high-stakes tests. Given that the TIMSS study focused only on the seventh grade students and taking into consideration that students usually start preparing for high-stakes examinations in the upper grades of secondary school (i.e., 10th-12th grades), it is not surprising that a link between private tutoring and high-stakes examinations remain undetected. Aurini and Davis (2004) observe that tutoring businesses are growing substantially in Canada despite the fact that Canadian universities lack entrance exams and are not arrayed on a steep hierarchical prestige as are universities in other countries such as the United States and Japan. It is evident that there is a need for further research on the relationship between high-stakes examinations and private tutoring.

The second argument on the demand for private tutoring is that private tutoring is a product of an institutionalized remedial strategy used in some countries which provide lower levels of funding and enrollment. According to Baker et al. (2001), the 1995 TIMSS sample shows that in nations with underdeveloped and low cost strategies, private tutoring is more prevalent. In other words, there is lower public expenditure on education and low educational enrollment in grades seven and eight which leads to greater use of private tutoring, and more reliance on remedial strategies as well as use by high achieving students. In addition, Baker et al. (2001) indicate that low performing math students turn to private tutoring at much greater rates than high performing students. These findings imply that the primary role that private tutoring plays in the average national system represented in the TIMSS sample is that of remedial training rather than enrichment uses in most nations.

In the sequent research, Baker and LeTendre (2005) suggest that lower levels of funding and enrollment may indicate lower confidence in available school quality and as a result, in some nations, private tutoring develops as a kind of market reaction. That is, since education is commonly accepted as the main route to success, underfunding and limited access to education lead students to use private tutoring as an extension to mainstream schooling. In this context, private tutoring is used as a "remedial strategy" to help meet the requirements of what is being taught in mainstream schools

The third argument is that some nations have produced cultural and national motivations for students to make an effort towards educational success. As a result, greater emphases on student achievement have led to a high demand for private tutoring (Stevenson, Lummis, Lee, & Stigler, 1990; Lee et al., 2009; Kim, 2003). Many Asian cultures, particularly those influenced by Confucian traditions, are more broadly influenced by *credentialism*. Such countries tend to regard educational credentials as an important social value and an absolute standard in judging one's abilities (T. Kim, 2003). For example, Korean society has a tendency to impose excessive value and importance on entering a prominent university and equate this achievement with greater success in life (Choi et al., 2003; Hyun, Lee, & Lee, 2003). This understanding translates into the strong desire to attend a prestigious university, increasing the competitiveness among students (H. Kim, 2004). In turn, the desire for a good educational background leads to an increasing demand for private tutoring. (S-J. Lee, 2006). Furthermore, income disparities produced by educational background fortifies the existence of a tight linkage between educational background and the distribution of social values (Lee et al.,,2009). Through private tutoring, parents believe that their children will ultimately profit by gaining entrance into prestigious universities. Consequently, the tight linkage between educational background and the achievement of social value influence demands for private tutoring.

In some countries, the growing use of private tutoring is a result of a national strategy to encourage national achievement. Some nations have developed a system-wide initiative for national achievement in subjects like mathematics and science in order to equip the country to engage competitively and successfully on a global level. As the development of human capital takes on qualities and responsibilities of a unilateral national mission for successful global competition, educational policies aimed at achievement can be formed from a specific nationalist perspective that is promoted by the state (Bakers et al., 2001). These perspectives can motivate students to enhance national achievement and consequently, leading to an increase of private tutoring.

School Characteristics related to Private Tutoring

An increasing body of literature claims that the characteristics of school education are closely related to the level of participation in private tutoring. The main assumption behind these studies is that the deficiency of school education is the main factor which is stimulating the demand for private tutoring. For instance, Lee et al. (2009) point out that the low quality of public schools and teacher-centered education might result in an increased demand for private tutoring.

Some studies point out the lower parents' satisfaction with public education and the level of trust given to it, the higher participation rate in private tutoring (Chubb & Moe 1990; Jeon, Kang, & Kim,

2003) Chubb and Moe (1990) argue that parents' decision to participate in private tutoring are influenced by the degree of satisfaction with public schools and the degree of preference for private tutoring rather than demographic conditions. As the dissatisfaction with public schools increases, the rate of participation in private tutoring also increases. Thus, parents' dissatisfaction is a direct outgrowth of seeking various forms of private tutoring. Jeon, Kang, & Kim's (2003) study also reveal that Korean parents' dissatisfaction with public education is closely related to the attitude towards private education. Through the investigation of the factors affecting parents' satisfaction of public education services, they found that Korean parents living in *Gangnam* significantly prefer private tutoring to public education service and the trust in private tutoring and dissatisfaction with public education are significantly high compared with the parents living in *Gangbuk.* In addition, the proportion of expenses spent on private tutoring is higher for the parents living in *Gangnam.*

However, Davies and his colleagues (2002) point out that the increase of private tutoring in Canada is not caused by parents' dissatisfaction with public schools rather by educational policies stimulating competition. On a scale ranging from 4 to 16, with higher values representing greater dissatisfaction, parents who do and those who do not employ tutors offer mainly positive ratings of their provincial school systems. Thus, although parents who employ tutors certainly show some dissatisfaction, these results imply that they are not necessarily dissatisfied with public education rather they seek more personalized instruction or a competitive edge for their child or children through private tutoring. The growth of the private institute industry in Canada was caused by the local government's intensified comparison of students' achievement scores and the reduction of the public school budget. Particularly in Ontario, increased private tutoring was caused by education reforms, such as fortifying the competition for the college entrance examination, intensifying the math curriculum, standardized testing, writing, report cards of students' grades, and the abolishment of grade 13. All of these factors led to an increased demand for private tutoring.

A few studies indicate that the quality of school education is related to the demand for private tutoring. For example, Kim and Lee (2002) argue that the prevalence of private tutoring in Korea has been caused by the lack of high-quality school education. Teacher-centered instruction and deficient teaching in poor school education leads to a reliance on private tutoring as a way to supplement low-quality instruction in the public education system. Under the low cost approach to school education, where the demand for educational services is not supported by the school, private tutoring can increase through competitive strategies (Lee et al., 2009). There is a greater likelihood that the demand for private tutoring will increase when the educational system follows a low cost approach, when achievement is assessed only by test grades, and when college applicants are selected by a college entrance examination. Even in well-funded school systems, private tutoring increases with high-stake testing or standardized tests (Bray, 1999).

Meanwhile, the effort made by public schools to improve educational quality is evident through the attempt to decrease for the demand for private tutoring. For example, Davies et al. (2002) found that in a school that provides remedial classes for slow learners and low achievers or advanced academic programs for fast learners, the parents tend to spend less time and money on informal educational activities. One of the Korean educational policy strategies involves the creation of after-school programs which is expected to decrease the demand for private tutoring. Yet, the effectiveness of this policy to save on private tutoring cost is still controversial and inconclusive.

In a Korean context, the high school equalization policy is often debated with regards to its relation with the demands for private tutoring. For example, Kim & Paik's (2002) study reveal that the demand for private tutoring from students at general high schools is greater than the students at high schools with special purposes. Based on these findings, they suggest the acceptance of a school choice system as the appropriate policy. In contrast, Chae (2006) argues that the criticism of the high school equalization policy has not been fully supported by evidence. Through the KEEP (Korean Education & Employment Panel) data analysis of the effects of the high school equalization policy on private tutoring expenditure in Korea, Chae(2006) found that the high school equalization policy was not proven to have a significant positive effect on private tutoring expenditure.

Consequently, despite several meaningful findings on the characteristics of school education in relation to private tutoring, further research is still necessary to explore in further detail the complex relationships between the characteristics of school education and private tutoring.

Methods

Data

   We used the data from TIMSS 2003. TIMSS is an international assessment of the mathematics and science knowledge at fourth and eighth-grade students. And it also collects extensive background information on students, families, teachers, and schools related to the learning and teaching of mathematics and science. Here we used mathematics data of the eighth-graders from 5 countries that show distinguishing features in two aspects. One is the proportion of the students participating in private tutoring, and the other is the mean mathematics achievement score. The six countries are Korea, Taiwan, Japan, Philippines, and Singapore.

Variables

Dependent Variable: Dependant variable is the student's participation in extra lessons or tutoring in mathematics. It is measured with the following question: "during this school year, how often have you had extra lessons or tutoring in mathematics that is not part of your regular class?" The original response options ranging from 1 (almost every day) to 4 (never or almost never) were recoded into a dummy variable: 0 (never or almost never) or 1 (more than 'sometimes').

Explanatory Variables: To find out the variables that influence the student's participation in extra lessons or tutoring in each country, we set school level factors as explanatory variables. School-level factors are consisted of school contextual variables (community size, poverty rate) and school process variables (curriculum by ability, grouping by, remedial class, enrichment class, frequency of assessment, frequency of homework). For student background, his/her demographic variables (gender, father's education), motivation (educational expectation, instrumental motivation, self-confidence in math), and mathematics achievement are included.

Table 1 *Variable Descriptions*

Variable	Variable Description	
Student level (level 1) Variables		
Female	Is the student a female?	0 = no , 1 = yes
Father's education	Did one's father finish tertiary education?	0 = no , 1 = yes
Educational expectation	Does student expect himself/herself to go university?	0 = no, 1 = yes
Achievement	Plausible values (or estimates) of each student's achievement in mathematics.	
School level (level 2) variables		
Community size	Size of the community in which the school is located	1 = fewer than 3,000 person, 6 = more than 500,000 people
Poverty rate	percentage of students who come from economically disadvantaged homes	1 = 0~10 %, 4 = more than 50%
Curriculum by ability	How does the school organize mathematics instruction for students with different levels of ability?	1 = study the same curriculum, 2= study same curriculum but at different levels of difficulty, 3 = study different curricular
Grouping by Ability	Are students grouped by ability within their mathematics classes?	0 = no, 1 = yes
Remedial class	Does the school offer remedial mathematics?	0 = no, 1 = yes
Enrichment class	Does the school offer enrichment mathematics classes?	0 = no, 1 = yes
Frequency of assessment	How often does the teacher give a mathematics test or examination?	1 = never, 5 = every day
Frequency of	How often does the teacher assign mathematics	1 = never, 5 = every day

homework   homework?

Dependent variable

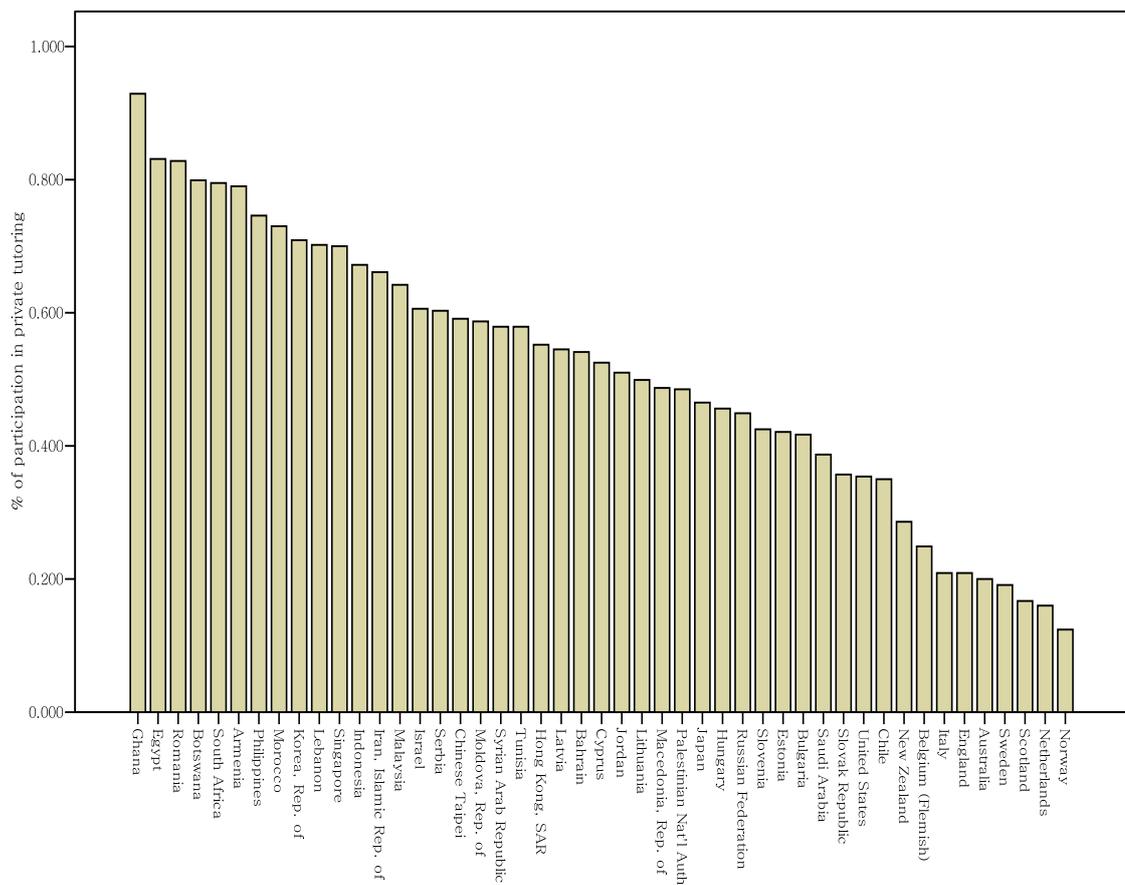
| Participation in private tutoring | Has the student participated in extra lessons or tutoring during this school year? | 0 = no, 1 = Yes |

Analysis Model

Two-level Hierarchical Generalized Linear Models (HGLM) was used to estimate the effects of various student and school level variables on student's participation in extra lessons or tutoring in each country. HGLM was used since the dependent variable is a dummy variable indicating whether or not the student participates in math private tutoring.

Results

Use of Private Tutoring across the Nations

Using the TIMSS 2003 mathematics data of the eighth-graders, we looked at how many students were participating in private tutoring for mathematics. Among 47 countries with available data, 34 countries reported that more than 40% of their eighth-graders participated in math private tutoring outside of school. The average participation rate in math private tutoring was 49%. Using the TIMSS 1995 data which was conducted 8 years before TIMSS 2003, Baker et al. (2001) reported that 16 out of 41 countries had more than 40% of their eighth-graders participating in math private tutoring. These results from the cross-national data confirm that the private tutoring is not a local phenomenon which only occurs in some Asian countries but a worldwide phenomenon whereby private tutoring has become more and more prevalent with time.


<Figure 1> Percentage of participation in private tutoring across nations

Table 2 shows the descriptive statistics for the selected Asian countries. While 67% of Korean schools have students grouped by ability within mathematics classes, only about 10% of schools in Taiwan and Japan do. Enrichment classes are offered by more than 70% of schools in Singapore, Taiwan and Japan. In general, more schools offer remedial classes than enrichment classes. Amongst all of these countries, the schools in Taiwan and Philippines conduct math assessment most often.

At the student level, we can also see that about 30% of students in Korea have a father with tertiary education while only 10-20% of students in other countries do. The percentage of students expecting to go to university is the highest in Korea (84%). In terms of psychological factors, students in the Korea and Taiwan show the highest degree of educational expectation.

School Characteristics Related to the Demands for Private Tutoring

Table 3 represents the results from the two-level HGLM analysis. The dependent variable is whether or not a student has participated in math private tutoring outside of school. Let us examine the effect of student-level factors on the demands for private tutoring first. In general, there seems to be no gender difference in the likelihood of participating in math private tutoring except for the case of Japan. In Japan, we can expect being a girl is associated with higher relative odds of participating in private tutoring. In Korea, which have a higher percentage of students whose father had tertiary education, we can expect the odds of participating in private tutoring for those whose father had tertiary education to be about 1.7 times (i.e. exp(0.565)=1.759 and exp(0.523)=1.686) the odds of participating in private tutoring for those whose father had lower levels of education. Generally, students who want to get into the university have higher relative odds of participating in math tutoring and students who consider that doing well in math is more necessary to get into university also have

higher relative odds of participating in math tutoring in most countries, even after controlled for other variables.

Table 3 also indicates the effects of the school-level factors on the demands for private tutoring after controlled for the student-level variables included in the model. In Korea, Japan, and Singapore students whose school reported to have lower percentage of students with economical disadvantages have higher relative odds of participating in private tutoring. Among the school process variables, it seems that organizing math instruction for students with different levels of ability has a positive effect in Korea and grouping students by ability within mathematics classes also seems to be effective to reduce private tutoring in Singapore. Meanwhile, providing the enrichment classes in schools seem to have no significant influence on the participation in private tutoring while providing the remedial classes in schools seem to have different influences across countries. In Taiwan whose students with low achievement score have lower relative odds of participating in private tutoring, the odds of participating in private tutoring of students whose school offers remedial classes are still expected to be 0.689 times (i.e. exp(-0.372)= 0.689) the odds of participating in math private tutoring. In Philippines, which have a high participation rate in private tutoring but a low mean achievement score, we can expect that being a student whose school offers remedial classes to be associated with a higher relative odds of participating in private tutoring, with an odds ratio of 2 to 3 (i.e. exp(1.201)=3.322 and exp(0.714)=2.043).

Discussions

From the analysis of 2003 TIMSS data, we found that in some Asian countries which show high level of participation in private tutoring, students' participation in private tutoring varies widely between

students rather than schools. The background characteristics of students (e.g., father's education) and students' motivation (e.g., educational expectation) significantly affect students' use of private tutoring. In addition, private tutoring has been influenced by school-level contextual factors (such as community size or poverty rate) rather than school process factors among school characteristics. These findings can be explained by Baker and LeTendre 's (2005) contention that extensive private tutoring exists in countries with intense competition for future educational opportunities, which are usually accompanied by a tight linkage between academic performance and later opportunities in higher education and the labor market. That is, in some countries which employ a modal strategy for enrichment purposes, many families fully devote private tutoring to guarantee that their children successfully enter high-status universities and have access to better paying jobs in the future. Thus, the logic of "rate of return to education" rather than the quality of school education can be the main factor which drives the demand for private tutoring.

The results from our analysis have also shown that in the Philippines, the primary role that private tutoring plays is that of remedial training. In these countries, a considerable variation of participation in private tutoring lies among schools and several school-level factors significantly affect students' use of private tutoring. Different from other countries, the data from the Philippines indicate that school process factors rather than contextual factors are the main factors stimulating the participation of private tutoring. Specifically, increased participation in private tutoring is associated with 1) use of remedial class, 2) increasing school homework, 3) frequent tests, and 4) use of grouping by ability. In these nations, education is recognized as the main route to success and private tutoring is getting prevalent in order to supplement formal schooling (Baker et al., 2001). In particular, the nations (such as Philippines) that invest lower public expenditure on public education, students widely use private tutoring as an augmentation of mainstream schooling. In this sense, a low cost approach to public education can drive the prevalence of private tutoring.

The findings from the current study hold major implications for education policymakers. First implication is that in some nations including Korea and Taiwan, private tutoring was chosen due to its enrichment capabilities of private tutoring by parents who react to intensified competition for further educational and labor market opportunities. Thus, policy strategies for private tutoring need to be investigated in the structure of labor market or the competitive mechanism of educational systems rather than the quality of public schools.

Consequently, although private tutoring has become a worldwide phenomenon, there is considerable cross-national variation in the modal strategies of private tutoring from country to country. Hence, policy responses to private tutoring should be differential across countries. When policy makers implement policy actions following their own modal strategy of private tutoring, the feasibility of these policies can be guaranteed.

Characteristics of policy alternatives against the challenges faced by domestic private education since the 1980s and analysis of the corresponding changes in private education expenses[1]

Han, Shin-il
Kim, Min-jeong
Kim, Hyunchul
Lee, Yong-min
Sungkyunkwan University

Abstract

This research sought to find out the educational realities and problems of Korea and provide the fundamental information required for establishing reasonable policy alternatives by examining private education-related theories and actual private education policies of Korea based on the term of Korea's central government. Toward this end, this research analyzed the approaches of the private education policies that have been implemented by previous Korean governments since the 1980s based on the theory suggested by Bray (1999). Based on the analysis, the household income and expenditure survey data (1982~2007) of the National Statistical Office (NSO) were leveraged to examine the time series transition of private education expenses and its relationship with education policies. To analyze the approaches of private education policies, various government records (policy planning data, promotional materials and handouts, government periodicals, etc.), research reports on education policies and private education policies of research institutes and professors, and press releases were collected, and theoretical analysis was conducted. Based on the research analysis, 30 years of private education policies in Korea were classified into three parts: prohibition, partial permission, and full permission. Meanwhile, private education expenditure against GDP has continued to increase since 1982, proving that the various education policies of previous Korean governments have not had direct positive effects on decreasing private education.

I. Introduction

The private education policies of previous Korean governments were torn between social quality and individual right to education. The regulation on private education focused on social equality until the 1980s; since the 1990s, however, the regulation on private education has been eased pursuant to the individual right to education.

Even though the government has made its best efforts to solve the private education problems and normalize public education, few research results comprehensively summarize and analyze all the private education policies of previous Korean governments.

Therefore, this research sought to analyze the time series transition and its relationship with education policies by using the household income and expenditure survey data (1982 ~ 2007) of the National Statistical Office (NSO). Toward this end, the background, development, and proposal related to the establishment policies were reviewed as suggested by previous Korean governments to address the private education problems that have persisted for 30 years. In particular, the theory of Bray (1999, 2003) -- who suggested the approaches of private education policies and strategies -- was organized to analyze private education policies. For this purpose, various government records (policy planning materials, promotional materials and handouts, government periodicals, etc.), research reports on education policies and private education policies of research institutes and professors, and press releases were collected, and theoretical analysis of such was conducted.

This research identified the realities and problems in domestic education and provided the basic materials required to establish reasonable policy alternatives by examining private education-related theories and actual private education policies in Korea. It also sought to find out the relationship between the private education expenses borne by each household and education policies of the

Korea Private Education Research Center.

government and to examine if the various education policies implemented during the terms of each government have positive effects on reducing private education expenses.

II. Understanding Private Education Policies and Private Education Expenses of Korea

1. Approaches of private education policies

Except Bray's research (1999), there are few studies that suggest the approaches of private education policies. Therefore, this section seeks to examine more specifically the theory of private education policy approach as proposed by Bray. In particular, Bray suggested six types of approaches of private education policy:

1) Laissez-faire approach
Many countries have overlooked private education in planning education policies. The reason for adopting a laissez-faire approach is that a market adjusts the quality and cost of private education to achieve the best balance. In other words, a balance of power can be achieved when a market guarantees variety and a supplier is in harmony with a consumer. More than anything else, however, the government implements this approach because private education is regarded as a complex challenge that incurs huge financial loss and creates a political trap. That is why many countries are reluctant to get involved directly in private education.

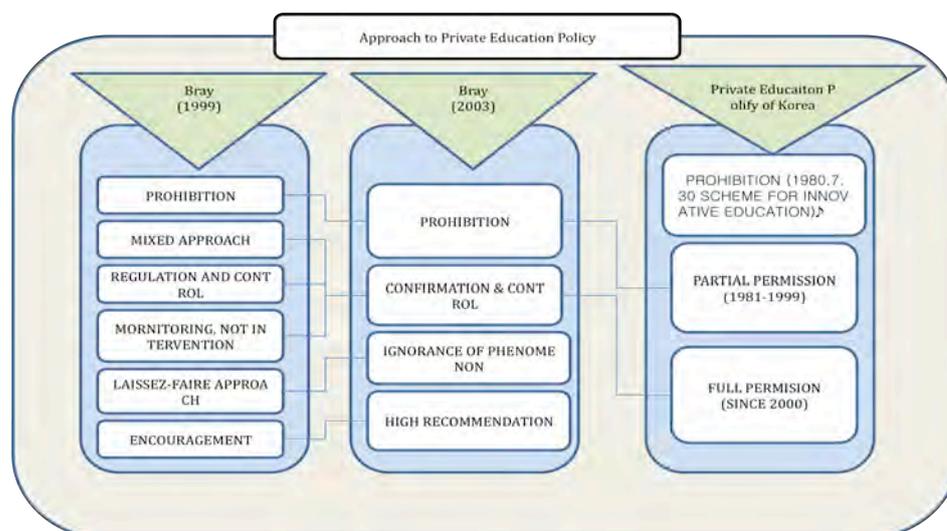
2) Monitoring, not intervention
The more aggressive method than the laissez-faire approach is to collect and monitor data related to size, type, and influence of private education. Such data is helpful in establishing education policies for schools and other social policies and is used to impose tax on private education providers and decide the schoolteachers' salary. Note, however, that there are few countries that actually collect data regarding private education even as investigation into a specific area is required to acquire the data.

3) Regulation and Control
Regulation & Control is a more aggressive approach to private education with various possibilities. For example, this approach includes regulations on non-educational fields such as fire evacuation facilities and ventilation facilities of private education organizations. Moreover, this approach monitors and regulates the tuition fee, class size, and curriculum, forcing education organizations to be registered and controlled by the government.

4) Promotion
This approach promotes private education aggressively from the perspective that private education is necessary to meet students' requirements and is deemed to contribute to creating human capital individually and socially.

5) Mixed approach
The government blocks some forms of private education more aggressively. For example, the government prevents schoolteachers from providing extracurricular lessons and acquiring additional income while allowing educational institutions except schools to provide private education. In other words, private education is permitted in general except the form that is legally restricted by the government regulation.

6) Prohibition
The most extreme approach is to prohibit all forms of private education based on the premise that private education causes social inequality. In other words, all forms of private education for commercial purposes are prohibited except complementary extracurricular lessons provided voluntarily or publicly and only for students with learning disabilities.

[Figure 1] shows an approach diagram of the Korean government's private education policies based on the approach to private education as suggested by Bray (1999, 2003).


2. Private education expenses

1) Concept of private education expenses

According to the early research on private education conducted by Kim, et al (1982), private education refers to "the part of educational expense borne by each individual wishing to receive school education." On the other hand, Kim (1998) classifies the concept of private education into two: (1) general private education that is inevitably required to receive school education, and; (2) special private education required to receive extracurricular lessons.

In the research conducted by Choi (2003), private education expense is defined as 'the expenditure for private education institutes, private tutoring expenses, expenses for arts & physical education, and specialization & talent fostering expenses for career preparation and related material costs." Most of the research studies conducted after Choi 's research referred to private education expense as 'the expenditure for extracurricular education other than school education"; this means that private education expenditure is the cost required for complementary education rather than the additional cost required for school education. For surveys related to educational expenses and private education expenses conducted by the government, research studies carried out before 2003 proposed a comprehensive definition for private education expense, i.e., private education expenditure as the cost paid for education without public accounting. Note, however, that research studies conducted after 2003 are limited to private education other than school education. Similarly, this paper restricts private education to 'the extracurricular education provided outside schools to meet individual supply and demand."

2) Method of estimating the entire size of private education expenses and configuration of household income and expenditure survey data of the National Statistical Office (NSO)

The household income and expenditure survey data of NSO (1982~2007) ensures data continuity and reliability since daily income and consumption are examined through housekeeping accounting books. While nationwide surveys have been conducted since 2003, however, the survey was restricted to urban households with more than two members in a family before 2003. Therefore, this research was based on survey data (1982~2007) targeting urban household with families with more than two members to ensure time series. The general method of estimating educational expenses and private education expenses is as follows: "Average monthly educational expense x 12 x Number of households nationwide."

The "expenditure for educational institutes and private education ("institution fee")" out of the educational expenses in NSO data was used in this research. This item covers expenses charged by entrance examination preparation institutes and tutoring institutes (complementary educational expenses), expenses required to learn piano/arts/Taekwondo/computers, and other fees.

III. Analysis of Private Education Policy Type and Transition

1. Analysis of private education policies in Korea

1) Prohibition on private education

This approach regulates private education as a target to be removed and prohibits private education by implementing strict legal sanctions. The 7.30 Scheme for Educational Innovation of domestic private education policy announced in 1980 is a representative example of this approach.

(1) 7.30 Scheme for Educational Innovation (1980)

The open enrollment of middle schools adopted on July 15, 1968, innovation in the high school entrance examination system, and equalization policy for high school (February 28, 1973) have all contributed to the increase in the number of high school students. As of 1980, about 1.5 million students or 15.35% of a total of 9.8 million students received extracurricular lessons.

The government and the Ministry of Education were requested to take major actions against social cynicism across the nation caused by the excessive boom of private education by recovering school stability and realizing innovation in the educational environment. Accordingly, the National Security Committee enforced the "7.30 Scheme for Educational Innovation: Normalizing School Education and Subsiding Overheated Private Education" on July 30, 1980 to normalize school education, create an ideal educational environment, and address the problem of disharmony between the poor and the rich caused by overheated private education.

This innovative plan was classified into two parts: normalization of school education and solving the problems of overheated private education. Specifically, the plan focused on abolishing the college entrance examination, enforcing the college graduation quota system, and strictly prohibiting all forms of private education.

The "7.30 Scheme for Educational Innovation" was the government's extensive and strict action, drawing considerable attention from parents and students suffering from overheated private education. Nonetheless, regulating all forms of private education legally drew flak for the coercive measures. Moreover, the plan is a representative example of how a strict legal regulation can neither solve the fierce competition in college entrance examinations completely nor root out excessive private education until the academic-oriented society is abolished.

2) Partial permission of private education

This approach recognizes that private education itself is definitely a social phenomenon and that there are many actual challenges in prohibiting all forms of private education using strict measures. Instead, this approach focuses on permitting private education gradually through innovative modification and compensation.

The legal regulation against private education caused those with financial and social capabilities to use private education illegally, with the number of people involved in illegal private education increasing over time. Moreover, in 1986, the Supreme Court ruled in favor of private education: "Delivering knowledge must not be restricted unless it is illegal in society and nation." (Government Policy Briefing, 2007). In other words, owing to opposition, i.e., prohibiting private education in a liberal democratic country is unreasonable, prohibition has been partly eased even before a year has passed.

The representative private education policy before 2000 when private education was fully permitted is the "5.12 Easing of Overheated Private Education and Reduction of Private Education Expenses (1997)."

(1) 5.12. Easing of overheated private education and reduction of private education expenses (1997)

The Ministry of Education made its best efforts to find efficient methods of easing overheated private education and reduce the burden of private education expenses. As part of such efforts, the Ministry of Education announced the "Plan to Ease Overheated Private Education and Reduce Private Education Expenses" on May 12, 1997. From a short-term perspective, the plan encouraged the government to provide cost-effective, quality private education and meet the actual requirements for private education by securing and operating satellite channels specializing in private education and activating after-school educational activities. From the mid- and long-term perspectives, the plan emphasized efforts to enhance the quality of school education, improve the college entrance examinations system, and change parents' awareness to decrease the high demand for private education.

Above all, the plan stressed that the government's approach to private education must be changed through considerable efforts to adopt various methods gradually so that not only the short-term but also the mid- and long-term goals are achieved instead of focusing on total prohibition and settlement of private education problems.

3) Full permission of private education

This approach acknowledges private education as part of education just like public education instead of viewing it as a target to be removed but tries to minimize the need for private education by strengthening public education and enabling private education to be absorbed into public education. In other words, this approach acknowledges a complementary relationship between private education and public education but attempts to minimize the effects of private education.

On April 27, 2000, the Constitutional Court declared the "Act on the Prohibition on the Establishment and Operation of Private Teaching Institutes and Extracurricular Lessons" unconstitutional. As a result, the private education market changed from a target to be regulated to a free market, paving the way for the creation of a special education zone. Private education targeting elementary school students emerged again after 40 years. In fact, the private education fever continues to intensify. Accordingly, recognizing that the 2000 plan for prohibiting private education was a failure, the government sought to establish a counter plan (2004.2.17 Scheme for the Reduction of Private Education Expenses, 2007.3.20 Scheme for Private Education) by improving public education and enabling private education to be absorbed into public education.

(1) 2.17 Scheme for the Reduction of Private Education Expenses (2004)

Recognizing that private tutoring costs -- which have continued to increase since 2000 -- have imposed a burden on many parents and caused a wide variety of educational, social, and national problems, the civilian government focused on reducing private education expenses instead of rooting out private education completely. As a short-term countermeasure, the government released the "2.17 Scheme for the Reduction of Private Education Expenses" to ease the parents' burden of excessive private tutoring costs and normalize public education.

Depending on the fields and characteristics, the top 10 initiatives of this plan are mainly divided into three parts: 1) enabling private education to be absorbed into the public education system; 2) strengthening school education, and; 3) improving the social and cultural environment. The plan is also classified into short-term, mid-term, and long-term initiatives based on the implementation period. For the initiative of enabling private education to be absorbed into the public education system, short-term tasks include the following: Establishing an e-learning system to replace private tuition for college entrance examinations;   Implementing after-school complementary instruction to replace private tuition for curriculum;   Activating education for fostering the talents and aptitudes of students to satisfy the demands for private tutoring for fostering talents and English proficiency, and;   Operating an "after-school education program" targeting elementary school students in the lower class to satisfy the demands for child care. On the other hand, mid-term tasks include the following: Securing excellent teachers by improving their expertise and responsibility for the increased reliability of school education;   Improving the quality of class evaluation to normalize school education;   Complementing the High School Entrance System Without Examination such as differentiated education and expansion of students' selection;   Normalizing school education by improving college entrance systems and strengthening career guidance;   Guaranteeing the people's basic educational level by implementing the responsible teaching system for developing primary scholastic abilities and expanding educational welfare. Finally, the long-term task of improving the social and cultural environment includes   reforming social systems and ways of thinking such as academic cliquism or distorted perspective of education.

The "2.17 Scheme for the Reduction of Private Education Expenses" eased the burden of private tutoring costs for the unprivileged classes and low-income brackets and paved the way for strengthening teachers' competence and overcoming academic cliquism. Note, however, that efforts to adopt the EBS lecture series for college entrance examinations and after-school educational programs did not have an actual remarkable effect on the lower and middle income earners; Neither did private education address the high-income earners' fierce competition in private tutoring for college entrance examinations even though this initiative enabled various countermeasures for public education to absorb the demands for private education.

(2) 3.20 Scheme for Private Education (2007)

The "3.20 Scheme for Private Education" is intended to complement policies according to target groups and category of the "2.17 Scheme for the Reduction of Private Education Expenses" based on the "Survey of Private Education" conducted by the Korea Educational Development Institute (KEDI) at the end of 2006.

The government released the "3.20 Scheme for Private Education" consisting of 7 main goals and 22 tasks: providing English broadcasting service through EBS beginning April 2007; providing financial assistance (KRW 156.8 billion) to implement after-school educational programs for all

agricultural and fishing communities until 2008; operating after-school child care programs for elementary schools (KRW 16.6 billion); establishing 1330 English Education Centers for elementary schools until 2009; conducting a statistical survey on private education twice a year, and; punishing illegal special-purpose high schools (Kim Young-cheol, et al, 2007).

Compared to the "2.17 Scheme for the Reduction of Private Education Expenses (2004)," the "3.20 Scheme for Private Education (2007)" led to the following outcomes: 1) Strengthened the management of private education providers to respond quickly to the changing demands for private education and ensured a unified, systematic system as well as conducted a statistical survey on private education twice a year to improve the scheme for establishing infrastructure in keeping with the private education policy; 2) Added to the category of "supply of alternatives to private education" new initiatives such as the existing after-school educational programs, EBS broadcasting service, and mentoring of 10,000 college students to strengthen alternatives to private education for unprivileged people and bridge the educational gap, and; 3) Included in the public education system private education for talent or aptitude fostering such as arts, physical education, and writing, occupying a considerable ratio of private education for elementary school students.

This plan is the latest comprehensive initiative for private education released by the previous government. Currently, many tasks of the plan have been implemented but have yet to satisfy fully the people's high demands and expectations. Above all, there is a need to establish systematic educational policies from a long-term perspective and to execute promotion and marketing to encourage people's aggressive participation so that the many countermeasures suggested by the government can ultimately succeed. <Table 1> shows the previous government's annual private education policies.

<Table 1> Private Education Policies of the Previous Korean Government

Type of private education policy	Government	Year	Major Education Policies & Private Education Policies
Prohibition of private education	5·6 Republican Government 1980-1993	1980	7.30 Scheme for Educational Innovation
Partial permission of private education	Civilian Government 1993-1998	1995	5.31 Scheme for Educational Innovation
		1997	5.12 Easing of overheated private education and reduction of private education expenses
Full permission of private education	National Government 1998-2003	2000	Constitutional Court's judgment, i.e., prohibition of private education is unconstitutional
			6.27 Scheme for preventing overheated private education and strengthening public education
		2002	Scheme for the diagnosis and improvement of public education
	Participatory Government 2003-2008	2004	2.17 Scheme for the reduction of private education expenses
		2007	3.20 Scheme for private education

2. Change in Private Education Expenses

<Table 2> shows the annual educational expenses, private education expenses, and private education expenses against GDP based on NSO data. [Figure 2] shows the related diagram.

<Table 2> Estimation of the Annual Educational Expenses and Complementary Educational Expenses

Year/Government	Educational Expense (unit: KRW1	Private Education Expense	Private Education Expense/GDP

		(unit: KRW1 billion)	(unit: KRW1 billion)	(unit: %)
1982	5th 6th Republican Government	1,510	163	0.29
1983		1,656	229	0.35
1984		1,988	305	0.41
1985		2,325	377	0.45
1986		2,699	446	0.45
1987		3,333	597	0.52
1988		3,743	891	0.65
1989		5,207	1,627	1.05
1990		6,555	1,819	0.97
1991		8,116	2,083	0.92
1992		10,356	2,584	1.00
1993	Civilian Government	11,616	2,486	0.86
1994		13,178	2,752	0.81
1995		16,138	4,831	1.21
1996		19,259	5,377	1.20
1997		21,264	5,706	1.16
1998	National Government	20,131	4,843	1.00
1999		22,169	5,101	0.96
2000		24,996	6,331	1.09
2001		27,755	6,727	1.08
2002		29,124	6,966	1.02
2003	Participatory Government	32,161	16,326	2.25
2004		34,389	17,994	2.31
2005		36,428	19,388	2.39
2006		38,756	20,869	2.46
2007		41,645	22,832	2.53

[Figure 2] Change in Private Education Expense Against GDP

For the ratio of private education expense against GDP since 1982, private education expenses (private tutoring fee) have increased rapidly (0.65%→1.05%, 0.81%→1.21%, and 1.02%→2.25% in 1989, 1995, and 2003, respectively). Meanwhile, private education expenditure decreased remarkably from KRW 5.71 trillion to KRW 4.84 trillion (1998) beginning 1998. Considering the fact that the economic crisis in Korea (IMF crisis) caused serious economic recession in Korea beginning 1998, private education expenses can be said to be highly vulnerable to the economic condition.

3. Comparative Analysis Between the Education Policies of Previous Governments and Change in Private Education Expenses

1) 5th ·6th Republican Government (1980-1992)
The 5th Republic of South Korea suggested a plan to prohibit strictly all forms of private education through the 7.30 Scheme for Educational Innovation to ease the overheated private tutoring fever

and deal with the expensive private tuition across the nation. According to the survey on complementary education costs conducted in 1982, the partial permission of private education in a gradual manner since the mid-1980s has caused a change in the private tutoring cost.

Compared to 1988 as the start of the 6th Republic of South Korea, private education expenses recorded a rapid increase (KRW 891 billion → KRW 1.63 trillion, 0.65%→1.05%) in 1989. The republican government permitted private education partially because suppressing the people's need for and right to education forcibly is unreasonable even as all forms of private education are illegal. Private education expenses have significantly increased since 1989 when college students' private tutoring and students' attendance to lectures at institutes started to be allowed. The economic boom after the 1988 Seoul Olympic Games also contributed to the increase in private education expenditure in 1989.

2) Civilian Government-National Government (1993-2002)

The civilian government focused on producing excellent students with various talents and skills through diversified free education while permitting private education partially like what the 6th Republic of South Korea did.

Private education expenditure recorded a remarkable year-on-year increase in 1995 when the civilian government -- whose term started in 1993 -- actively discussed education policies to introduce the 5.31 Scheme for Educational Innovation (1995). Moreover, since the College Scholastic Ability Test (CSAT) has been adopted as a new college entrance examination system, and the college entrance examination by university was revived, the high burden of new examination system more likely led to investment in private education particularly institutes specializing in college entrance examination or complementary lecture. The 5.31 Scheme for Educational Innovation including improvements in the 1997 college entrance examination system (prohibition of college entrance examination by university, adoption of cumulative records), establishment of independent private high schools, strengthened foreign language education, and permission of early school entrance also contributed to the increase in private education expenditure. The announcement made on August 4, 1995, i.e., allowing students to attend institutes, led to increasing private education cost as well.

Although household expenditure for private education has gradually increased since 1995 until the late 1990s, its ratio has decreased slightly. This is because after-school educational programs for extracurricular activities and complementary education have been implemented based on the 5.31 Scheme for Educational Innovation since 1996. In addition, short-term policies such as encouraging after-school educational activities and adopting EBS satellite broadcasting service for education in accordance with the Easing of Overheated Private Education and Reduction of Private Education Expenses announced by the government in 1997 had a positive effect on saving on private education expenditure.

In 1998, the national government started amid the economic depression brought about by IMF; as such, the decrease in private education expenditure was mainly caused by economic factors rather than the government's education policies.

There has not been any remarkable increase in private education expenditure since the mid-1990s; after the IMF crisis, however, private education expenditure has continued to rise since 2000 when the Constitutional Court declared that the prohibition of private education is unconstitutional. In other words, the Constitutional Court's judgment stimulated investment in private education, with each household's burden of high private education costs increasing further. Meanwhile, the 2000.6.27 Scheme for Preventing Overheated Private Education and Strengthening Public Education proposed by the government to establish step-by-step comprehensive countermeasures for minimizing the social byproducts of the Constitutional Court's judgment and preventing overheated private education helped check the increase in private education in 2002 compared to the previous year.

3) Participatory Government (2003-2007)

In February 2003, the participatory government started its term focusing on educational objectives such as strengthening autonomy and diversity and creating a capability-oriented society.

The ratio of private education expenditure against GDP increased by 2.25% for various reasons such as high demand for English education including continuous rise in overseas studying following the economic recovery since the early 2000s, expansion of foreign language high schools, and teaching of English as part of the curriculum at elementary schools. Moreover, the high demand for special-purpose high schools (called "magnet school" in the US) as a result of the national government's announcement on the expansion of foreign language high schools designated as special-purpose high schools (2001) and announcement on the expansion of independent high schools (called "charter school" in the US) and operation of schools for gifted-talented students (2003) contributed to the increase in private education expenditure.

Private education expenditure -- which recorded an increase of as much as 2.25% (2003) compared to 1.02% (2002) -- has not shown any remarkable increase since 2004. Note, however, that private tuition fee for arts and physical education constituted a larger portion of institution fees than the expenses for entrance examination and tutoring institutes from 1990 to 2002. Nonetheless, since 2003 & 2004, expenses for entrance examination and tutoring institutes have recorded higher increase than the private tuition fee for arts and physical education.

That is because the 2.17 Scheme for the Reduction of Private Education Expenses as announced by the participatory government in 2004 affected short-term education policies. For example, "after-school programs" and private education for talented students are run by schools, thereby enabling saving on private tuition fee for arts and physical education. Furthermore, policies such as the EBS broadcasting service for CSAT and normal operation of special-purpose high schools under the 2.17 Scheme for the Reduction of Private Education Expenses have contributed to the slowdown in the increase in private education expenditure. Unfortunately, however, each household's burden of private education has continued to increase as of 2007.

IV. Conclusions

As shown in the research results, private education policies have changed in close relation to the change in the college entrance examination system; various strategies to decrease the high demands for private education have been actively discussed in line with the change in education policies. Based on such research results, the following recommendations are made to improve the Korean education system:

First, the most fundamental measure for decreasing the high demand for private education and reducing private education expenditure is normalizing school education and ultimately strengthening its competence instead of compulsory policies forcing behavioral changes such as prohibition of private education. Therefore, for private education to be absorbed into school education, the government must diversify efficient alternatives to private education such as EBS educational broadcasting or after-school programs and develop them as effective systems to expand opportunities for education through a cooperative relationship.

Second, the previous governments implemented various policies to reduce demand for private education. As shown in this study, however, most of the education policies did not lead to satisfactory results. Instead, a new education policy may increase private education expenditure, proving that increasing private education costs cannot be solved only by education policies. That is because private education in Korea focuses more on satisfying the social and psychological requirements for higher social position and competitive advantage rather than on complementing studies on subjects where students get low grades. In other words, encouraging parents and students to strengthen their confidence in studying and creating a capacity-oriented society in the nation are absolutely required. Such efforts to ease the hierarchical structure in the labor market must have precedence over education policies.

Third, based on the analytical result of the relationship between the change in private education expenditure and policy, the size of private education expenditure continued to increase during economic growth. This means that the intended compulsory policies on private education do not have significant impacts on reducing private education expenditure. For example, in spite of the policy on prohibiting private education (1980), each household's burden of private education persisted in the 1980s. Because private education has been partially permitted since the late 1980s, and with the 1988 Seoul Olympic Games triggering an economic boom, however, private education has increased rapidly. Although private education expenditure decreased rapidly due to economic depression caused by IMF (1988), the full permission of private education since 2000 and revitalized economy in the early 2000s caused the rapid increase in private education costs despite various policies to control the overheated private education. In other words, each household's private education expenditure records a rapid increase during the economic boom but does not decrease even during an economic slowdown, although the growth pace is slow.

Fourth, the policy of reducing private education expenditure is related to almost all fields of domestic education. Like other education policies, policies involved in private education must be implemented in linkage with other policies systematically and comprehensively. Otherwise, they may not be effective, and other problems may occur as a result. Therefore, there is a need to conduct research on the fundamental causes of private education-related problems through systematic cooperation with various fields.

**The Ramification of Cultural Diversity and its Implications toward Assessment in International Universities:
A Case Study of International University in Vietnam**

Narumon Sriratanaviriyakul
Dominic Wong
RMIT International University Vietnam

ABSTRACT

International universities are growing rapidly. At a transnational university in Vietnam, the curriculum offered across all campuses is the same but students' results at Vietnamese campuses are not quite satisfactory.

Due to different learning styles and expectations from international students in Vietnam, should we adapt the assessments to fit the students? Would that affect the standards and quality of the program? This paper is going to examine the assessment issues faced by students.

KEYWORDS

International students, Cultural diversity, Assessment, International Curriculum

INTRODUCTION

Globalization makes education borderless. Due to neoliberalism, marketisation, economic rationalism, and corporate managerialism, the curricula in universities, especially in international universities, are standardized to be available to both local and international students (Bower et al., 2007). Education becomes one of the commodity services that universities provide. This argument is well supported by Alexander & Rizvi (1993), Dobson (1998), Starck (2000), Matthews (2002) and Marginson (2003) as cited in Feast (2005).

However, international students are from different cultural background, their expectations and learning styles are different. Western learners seem to be more independent while Asian learners are dependent on teachers and instructions based on the way they were taught in former education (Brown & Joughin, 2007; Vandermensbrugghe, 2003).   Majority of international students, who are away from their home countries are mostly non-native English speakers who travel to USA, UK, Australia, New Zealand, for instance, to receive their education in English. In the USA alone during 2007/2008, there were a total of 623, 805 international students, which is 7 percent more compared to the figures of the previous year (Open Doors, 2008). The trend of international students is moving up every year especially during the economic crisis.

Table I. Number of International students in USA in 2007/2008

Rank	Country	No. of International Students	Compared with Previous Year
1	India	94, 563	+13%
2	China	81,127	+20%
3	South Korea	69,124	+11%
4	Japan	33,974	-4%
5	Canada	29,051	+3%
6	Taiwan	29,001	- <1%
7	Mexico	14,837	+7%
8	Turkey	12,030	+5%
9	Saudi Arabia	9,873	+25%
10	Thailand	9,004	+1%
11	Nepal	8,936	+15%
12	Germany	8,907	+3%
13	Vietnam	8,769	+45%
14	United Kingdom	8,367	- <1%
15	Hong Kong	8,286	+7%
16	Indonesia	7,692	+5%
17	Brazil	7,578	+6%
18	France	7,050	+5%
19	Colombia	6,662	-1%
20	Nigeria	6,222	+5%

Highlighted rows show non-native English speaking countries.

Most international students expect to have an international degree as a gateway to upgrade their career paths. However, once they enroll in the program, international students usually find it hard to keep up with domestic students. As part of the standard curriculum that has been internationalized to use in different campuses around the world, the same assessment format and grading were also used. Internationalising or rather the effects of globalization affects the usage of English as lingua franca for communications (Altbach & Knight, 2007). Therefore, the entry requirements for undergraduate level in the international curriculum is using the same standard, which are English proficiency score of either 525 on paper-based or 197 on computer-based on TOEFL score or 6.5 on overall score on IELTS test while receiving minimum 6.0 on each individual band, and other scores on other subjects depending on the area of study field. However, during the learning process, cultural diversity seems to affect how well they perform on the assessment. This paper will discuss assessment issues faced by students in an international university in Vietnam due to cultural backgrounds as well as suggesting recommendations to educators in international institutions.

ASSESSMENT AND ITS IMPORTANCE

As part of the learning process, assessment is one of the most important components in a curriculum as it is always viewed as a way to test or measure student performance. Popham (2008, p.10) stated that 'assessment is a formal attempt to determine students' status with respect to educational variables of interest'.   Brown et al. (1997) also stated that 'assessment defines what students regard as important, how they spend their time and how they come to see themselves as students and then as graduates. Students take their cues from what is assessed rather than from what lecturers assert is important'. Earl, L.M. (2003) cited in McMillan (2007) suggests that assessment *as* learning helps students to learn as it can be used as a tool for students to foster self-monitoring.

While the assessment is important of the education, the cultural differences make it inhomogeneous in many countries, students came from Asia-Pacific region may have concerns about the way they are being assessed in International Universities.

As stated by Brown and Joughin (2007) again, assessor's expectations in the assessment tasks maybe incompatible with the students' perceptions towards the assessment requirements. While Brown and Joughin (2007) stated that assessor should not take cultural backgrounds as barriers but rather the assessment should suit the cultural differences of students.

Therefore, assessment can be an issue for international student.   Especially in the international universities, students are away from their home countries, students have to cope with anxiety and need to adapt to their surroundings, as well as the way they work on their assessments. For instance, the writing format they used to write in the assignment in their home countries is not valid any more in the foreign context, friends helping each other on assignments resulting in plagiarism issues in Asian cultures, etc. (Vandermensbrugghe, 2003).   In some culture, certain assessment is brand new and students have never had a chance to develop the skills to cope with. Perhaps, another essence in internationalising the assessment is incorporating the western way of thinking into education; Vandermensbrugghe (2003) suggested that Anglo-Saxon countries such as Canada, USA, England and Australia are leading in internationalising the curriculum. At the same time, they may incorporate critical thinking as essence in setting learning objectives and thus affect the curriculum and asessment (Vandermensbrugghe, 2003). As a result, the westernized-based curriculum is blatantly used in many courses to assess students. This often creates 'culture shocks' or 'surprises' to international students.

Asian students tend to be more conservative and quiet when western students tend to be proactive and independent. In addition, most of the time, it is claimed that international students do not have sufficient English proficiency (Alexander 2007 as cited in Ryan et al. 2009). They are always been viewed as deficient and do not participate in class if they are not forced to (Egege & Kutieleh, 2004; Brown & Joughin, 2007).   Although the international students have been screened by the English proficiency tests using entry requirements, and are assumed to have adequate English level, they may still not be prepared well enough to deal with local knowledge, pronunciation and terminology in the subjects (Ryan et al. 2009). If Asian students are asked to defend their work in viva voice (oral) exams, they will feel more intimidating, resulting in worse performance than other assessment format. *This issue can affect the reliability and validity of the assessment.*

Reliability in assessment means that students' score are free from errors of measurement. (Popham 2008) Popham mentions internal error, external error and background knowledge of the students, however, K.G. (2009) argues that culture and gender also varies the result in the assessment in certain subjects such as mathematics.
In international universities, campuses located outside the home countries usually use the same format and grading criteria as the head campuses, where most students are western students.

According to the course guidelines at RMIT, each course assesses students in 3-4 tasks to ensure reliability and validity of the scores; which are usually mid-term examination of 20%, 2 assignments of 15% and hurdle final examination of 50%.

> A student must pass all components designated as hurdles in order to pass the course. In the event that a student fails one or more hurdle component, the result is a Fail (NN) and their final percentage mark is the lowest of the failed hurdle components. If, however, the combined grade for all components is lower than that of lowest failed hurdle component, the student will receive the combined grade for all components.
> (RMIT 2009)

Hurdle assessments are designed to make sure that students completed previous assignments by themselves and did not ask somebody else to complete the assignments for them.

A CASE STUDY OF AN INTERNATIONAL UNIVERSITY IN VIETNAM
This international university delivers the same degrees and diploma programs that students acquire in Australia. Academic programs in Vietnam operate to quality standards which aim to ensure an equivalence of educational outcome with students undertaking the same programs at the University in Australia and the programs are monitored by a five-year audit cycle by the Australian Universities Quality Agency (AUQUA) (RMIT 2009). Approximately 90% of Vietnam Campus students are Vietnamese, other 10% comprises of Korean, Chinese, Russian, Canadian, and other nationalities (Student Life, 2009). These students are considered international students.

Research Programme

To identify specific student challenges at an international university in Vietnam a research project was implemented.

Scope

The research was designed to identify specific assessment issues from the perspective of Vietnamese students. The programme was not designed to isolate specific challenges or issues with regard to the overall learning objectives but rather focused on the assessment design & implementation. At the outset is an existing perception that there exist considerable differences between Australian university assessment & Vietnamese university assessment. The programme therefore attempted to identify specific student issues with regard to assessment design & implementation. It is understood that due to sample & time constraints the research is limited to both students of & assessment at one institution.

Research design

Sample – random. The sample was randomly selected from a group of 100 first semester students.

Sample size – 20 students

Quantitative – through the use of a structured questionnaire allowing for numerical scoring

Qualitative – at the conclusion of each question respondents were encouraged to expand on their personal experience & views.

Question design – a series of short questions were used to elicit structured responses. The questions were designed to be easily understandable & through the use of numerical scoring also allow empirical results. The design was formulated through consultation with several existing academics from several countries, including Vietnam.

Moderated Research implementation – the research samples were controlled over a period of 1 hour during which time –
• Each question was explained before the respondents' sample recorded their score on a numerical scale.
• After completing the survey the respondents were able to supply further comments.

Sample Demographics

• 20 students
• 12 male
• 8 female
• 18 – 19 years old
• Vietnamese (all)
• High school graduates (all)
• RMIT first semester students

Questionnaire Design

See Appendix section.

Research results

Question 1: Do you understand this international university's assessment system?

Result interpretation

Quantitative: The results are ambiguous. Via the numerical marking score it is not statistically demonstrated that the students have any clear understanding.

Qualitative: During the extended interview all students expressed the opinion that they clearly understood the assessment methods. Clearly there is a disconnection between the two, which will be discussed in the conclusion.

Question 2: Is the assessment criteria clearly explained to you in the course material or by course instructors?

Result interpretation

Quantitative: The results demonstrate that students are clear and satisfied with the explanations & details supplied regarding assessments

Qualitative: During the extended interview all students expressed the opinion that they were happy with the degree of clarification. Several students did express the view that the criteria for assessment varied from course to course & furthermore the assessment criteria were often overly complex.

Question 3: In your opinion, do you think this international university's assessment is fair?

Result interpretation

Quantitative: The results indicate that the respondents believe the assessments are fair & objective.

Qualitative: Individual respondent comments support the qualitative results further demonstrating general satisfaction. No negative comments were recorded regarding fairness & objectivity.

Question 4: Is this international university's assessment system different from Vietnamese high school system? How?

Result interpretation

Quantitative: Respondents clearly indicated that they understand there to be a very large difference in assessment systems used at this international university's and Vietnamese universities. A large degree of unanimity was observed on this question.

Qualitative: Recorded comments strongly support the quantitative results. Respondents indicated that there exists a very large difference between the two methods. Of particular note were the following issues;

• grading system (Vietnamese universities typically average the results of both mid term & final exams)
• Vietnamese universities allow for a re take of the final exam if students are awarded a fail
• For many course at this international university, a final 'hurdle' exam is used. Respondents found this to be both unexpected & in some instances unbalanced.
• Many exams at this international university place a high percentage of total marks on the application of theories, in many ways the opposite of the system typical at local institutions.

Specific recorded comments regarding Vietnamese educational institutes include;

' Vietnamese schools require you to memorise.'
'Teachers expect us to study by heart'
'We learn parrot fashion'
'Creativity counted for only 10%'
'Vietnamese schools test memory'

Question 5: Which is the most important to you?
Result interpretation

Quantitative: 80% of respondents indicated that high scores were most important; the remaining 20% choose obtaining knowledge.

Qualitative: It was significant that there was a clear focus on results, grades & scores. This was significant in terms of the assessment design as students will become excessively concerned with the exact nature, design & marking criteria.

Question 6: Do you think the assessments should be modified to meet local and language ability?
Result interpretation

Quantitative: The results are ambiguous. There was a spread of results across all possible scores.

Qualitative: There was a disconnection between qualitative & quantitative results as the majority of respondents indicate during free comments that the assessment should be modified for local language skills. These comments extended to include the design of the instruction periods as well as the exam. Several respondents commented negatively on the excessive use of 'long words' in assessments.

Question 7: Would you prefer exam-based assessment or assignment-based assessment? Why?

Result interpretation

Quantitative: The results were clear, all respondents favoured assignment based assessment.

Qualitative: During the discussion period it was clear that there was a strong bias towards assignments & many reasons were offered to support this preference. Respondents indicated that exams do not test a broad base of knowledge & may disadvantage certain students due to stress or nerves. Respondents also indicated that assignments allow them to more fully explore the background & research for any given subject whilst simultaneously reducing the emphasis on time limited language skills.

Specific recorded comments included;
'Exams cannot test knowledge'
'Assignments allow us to do research '
'Exams focus on certain topics only'

Question 8: Does the standard exam system identify the most able student?
Result interpretation

Quantitative: The results are ambiguous. Via the numerical marking score it is not statistically demonstrated that the students have any clear opinion regarding the effectiveness of exams at identifying the most able students.

Qualitative: During the extended interview several students expressed the opinion that the multiple-choice style was better designed at identifying able students.

Question 9: Do you think the marking of the exam is objective and fair?
Result interpretation

Quantitative: There is a clear agreement amongst respondents that the marking system is objective & fair.

Qualitative: Comments made during the session support the quantitative results. No respondents expressed any concerns regarding objectivity.

Question 10: What problems do you come across when you prepare for the assessment?
Result interpretation

Quantitative: All respondents choose option 1 – 'do not know how to answer the questions'.

Qualitative: Respondents indicated that during the majority of classes they were taught theories only. Consequently they experienced difficulty in applying these theories in an exam-based situation. Also clearly indicated that this style of exam was new to them, as it is not used in any standard Vietnamese exam system. Respondents strongly indicated that the teachers should include examples of how to apply theories during the class.

Specific recorded comments include;

'I do not have enough experience to answer the questions'
'We study theory only. I do no know how to apply it.'
'I need example template or guidelines to answer the questions.'

Question 11: Do you feel lack of language skills affect the final score?

Result interpretation

Quantitative: The results are ambiguous. Via the numerical marking score it is not statistically demonstrated that the students have any clear degree of agreement regarding this issue. Results were spread almost evenly across all possible scores.

Qualitative: During the extended interview many students stated that their lack of English languages skills would impact upon their final score. These general comments disagreed with the scores chosen. It is difficult therefore to reach a firm conclusion regarding the students view on how language ability impacts on overall score.

CONCLUSION

Globalization makes a number of international universities grow rapidly. Because the transnational programs are found common in many universities, assessment is becoming an issue.   Most international students perform poorer on the assessment comparing to domestic students.   Because most international students has background studying in different environment and background, when they attend international universities, they do not expect a total change in the assessment in the

curriculum.

Using questionnaires to explore Vietnamese students' point of view at an international university in Vietnam has shown that Vietnamese students have studied in the way that they need to memorise and repeat the same idea in the assignments and examinations. Therefore, they have a hard time applying the knowledge studied in classrooms. Furthermore, Vietnamese students expect to have guidelines and examples to follow in the written work because they are afraid to express their opinion or new ideas as it can be viewed as 'rude' or 'challenging the teachers'. (Brown & Joughin, 2007) Therefore, in the Asian culture, where teachers are highly respected, students see that as an unacceptable practice.

At an international university in Vietnam, where classes are divided into 1 hour and 30 minutes each section, twice a week, approximately twenty percent is allocated to lectures and the remaining time is spent on workshop. However, Vietnamese students seem to need more time on practicing and applying theories as a transition from Vietnamese high school education to international university education, where memorizing is just not enough. As the research results have shown that though assessment system and criteria is quite clear to them, if they do not know how to answer then it is pointless.

RECOMMENDATIONS

Since the assessment itself does not seem to be the problem in the international students' point of view, according to the research findings, the teaching and learning styles are recommended to be changed.

Teaching and learning strategies for international universities should:
• Seek to secure the participation of all students and encourage all students to know and listen to each other;
• Provide students with a range of learning opportunities including provision for independent learning;
• Include research assignments with local organisations working on international projects or national projects with an intercultural focus;
• Include analyses of international case studies;
• Include problem-solving exercises in international or intercultural contexts;
• Include self-reflective writing that focuses on students' autobiographies and other strategies that encourage students to use their own background in their learning;
• Include inquiry-based assignments involving contact and communication with people from different cultural backgrounds and/or located in other countries
• Include internships in international/intercultural agencies;
• Include simulations of international or intercultural interactions;
• Include assignments that students can use examples from their own experience;
• Use CCC in counter-arguments;
• Support language learning
• Encourage critical discussion in class
• Provide multi-level reading guides
• Discussing different points of views

    Compiled from: Arkoudis(2006), Deakin University (2004), Killick (2007)

International universities, although using international curriculum, should use case studies based on local companies, local products, and environment to give a clearer picture to students until they understand. Then, teachers can move on to examples of companies in different companies and make comparison of local companies and foreign companies in class.

Universities might wish to set up a learning unit where senior students can volunteer to take shifts to help junior students and obtain a small fee or recognition, as senior students can also review their knowledge before they set off to work while junior students get to learn from their seniors. However, the language conducted must be in English language. In addition, students will get to network and learn to be good trainers in the future.

Group and individual projects, writing research paper, working on case studies will encourage individual learning as well as improving critical thinking skills, where international students seem to need it most. Discussion questions might be given as guidelines to help students to initiate thinking process. In international universities, plagiarism case can also be an issue when students are helping

each other work and end up having similar result. Therefore, developing critical thinking skills will promote students to learn how to apply the theory and perform better in assessments.

Provide reading guides such as sets of questions to accompany difficult articles will allow students processing time that second language learners need (Arcoudis 2006). Therefore, by providing multi-level reading guides, students may find reading easier and access the main ideas faster. Teachers may wish to assign students to perform a short role-play to allow students to take part in the story. As a result, they may have a better understanding of the case studies or articles.

Small group discussions in class may be important, as it will allow students to argue and exchanging different points of views. Teachers should be walking around the classroom and facilitating the discussion. After sometimes, the groups may present their idea to the class and receive feedbacks from fellow students or teachers may wish to rotate the members of the groups to allow further discussion. This will allow students to learn to accept different points of view, as well as, encouraging students to think critically as well.

However, each university is different, at an international university in Vietnam, in particular, where two classes per week used to be taught in one lecture and one tutorial per week are transformed into 30-student per classroom with two classes a week. It is a challenge to the teachers where there are a lot of materials to be transferred to students, and there need to be time to allow students to learn how to apply them into their real life. Teachers might wish to pre-assess students before learning to understand students' background and expectations. The key is to balance lecturing time, interaction time, questioning time, and feedback time. Once the class is balanced, international students should have fewer problems in adapting their learning styles and performing better in the coming assessments.

APPENDIX

Questionnaire Design

- Do you understand this international university's assessment system?
- Is the assessment criteria clearly explained to you in the course material or by course instructors?
- In your opinion, do you think this international university's assessment is fair?
- Is this international university's assessment system different from Vietnamese high school system? How?
- Which is the most important to you?
-      High scores on assessment
-      Obtaining relevant knowledge
-      Socialization
-      Getting a degree
-      Preparing for employment
-      Other _____
- Do you think the assessments should be modified to meet local and language ability?
- Would you prefer exam-based assessment or assignment-based assessment? Why?
- Does the standard exam system identify the most able student?
- Do you think the marking of the exam is objective and fair?
- What problems do you come across when you prepare for the assessment?
-      Do not know which area to concentrate on
-      Do not know how to get high score
-      Do not understand the marking criteria in some exams, i.e. accounting
-      Do not know how to answer the questions
-      Other _____
- Do you feel lack of language skills affect the final score?

Curriculum Development for Practicing Ability Formation through Field Survey 2008-2009:
Mainly on a Social Skill Theory

Professor KAMEI AKANE
TOHOKU INSTITUTE OF TECHNOLOGY
akane@tohtech.ac.jp

ABSTRACT

The present study aims to improve the study model of student's memory type, and to produce the curriculum that develops the field survey ability. It is incontrovertible that many of past university educations in Japan tend to give priority to the transmission of one-way knowledge by the lecture form too much. It did not come to support student's problem discovery and problem solving ability. Therefore, the field survey of the student's (1) discovering the investigation object, (2) trying communications, and (3) discovering and presenting the problem is made a curriculum in this educational improvement plan. The difference with the social investigation practice of the past is to put the following social skill theories this plan on the mind, and to make a detailed educational curriculum.

Communications: It is related, speaks, and it appeals.
Object grasp: It sees and it catches.
Problem solution: It thinks and it compares it.

The curriculum in this educational improvement plan has been offering as the regular curriculum of Department of Management and Communication, Faculty of Life Design; it newly established in 2008, the Tohoku Institute of Technology. The subject composition is as follows.

Logical idea method
Social investigation method
Social science itemized discussion
Primary statistics
Intermediate statistics
Data analysis
Information science training for social research

The educational improvement plan has been begun from April 2008, and receives the Japan Universities Association for Computer Education (JUCE) subsidy, is adopted as a support of the upgrade and making to individuality plan of the undergraduate education in fiscal year 2008, and is continuing now.

Comparison of the 2004 SSEP with NCSS Themes

Prof.Dr. Sefik YASAR
Anadolu University, Faculty of Education
Department of Primary Education
Eskisehir, Turkey

Abstract

The Social Studies Education Program (SSEP) for the 4th and 5th grades was redesigned by the Ministry of Education in 2004. In this study, the 2004 SSEP was examined in relations with the themes determined within the context of NCSS criteria. The NCSS themes were compared with the learning areas of the 2004 SSEP in terms of highlighted points, questions, and emphasized topics.

Key Words: Social Studies Education Program, learning areas, NCSS themes

INTRODUCTION

In Turkey, the Ministry of Education redesigned primary education programs in 2004. As a result, the Social Studies Education Program (SSEP) for the 4th and 5th grades has changed remarkably. It is inevitable for primary education programs to have some global qualities and standards since they aim at training the work force that could meet the needs of era and keep up with the developing and changing world. Examining the 2004 primary education programs in terms of standards of international institutions at certain disciplines will give opinions about using their criteria as information sources and appropriateness of the programs with the standards in the world. The National Council for the Social Studies (NCSS) in the USA aims at making Social Studies course more effective with some criteria and themes; besides, NCSS argues for the necessity of designing the education programs on the basis of the skills such as critical thinking, problem solving, decision making (Rice and Wilson, 1999)**.** This study aimed at examining the 2004 SSEP according to the themes determined within the context of NCSS criteria and the learning areas.

When the SSEP for the 4th and 5th grades is examined, it could be seen that the vision of this program is to train citizens of Turkish Republic who adopt Ataturk's principles and reforms, comprehend Turkish history and culture; also who are equipped with democratic values; respectful to human rights, and environmentally- conscious; besides who could interpret information with their experiences and hence could form, use and arrange it within social and cultural context. Additionally, it aims at preparing individuals who develop social participation skills and learn the methods that social scientists use for information production, also who know their rights and responsibilities and who are active and productive in social life (MEB, 2005, p. 43).

The 2004 SSEP differs from the previous program in terms of its objectives, content, teaching-learning process and evaluation. For example, the 2004 SSEP has teaching units designed within the framework of the learning areas while the content of the previous program consists of subjects and sub-subjects. A learning area is defined as "the structure which classifies learning and which contains related skill, theme and concepts as a whole" (MEB, 2005, p. 102). Thanks to the learning areas, the 2004 SSEP realizes a kind of thematic learning (Yasar, 2005, p. 334). The learning areas and units of the 2004 SSEP are indicated in Table 1.

Table 1. The Learning Areas and Units of the 2004 SSEP

Learning Areas	Units for the 4th grade	Units for the 5th grade
Individual and Society	I am learning about myself	I am learning my rights
Culture and Heritage	I am learning the past	Step by step Turkey
People, Places and Environments	The place we live	We are learning about our

		region
Production, Distribution and Consumption	From production to consumption	Our products
Science, Technology and Society	Fortunately we have them	Realized dreams
Groups, Institutions and Social Organizations	All together	People working for society
Power, Management and Society	People and management	A country and a flag
Global Connections	My friends away	Our World

While determining the learning areas, different social studies disciplines were included; and it was attempted to release the social studies education course from the dominance of History and Geography disciplines in contrast to the previous social studies education program. Thus, in this course it is tried to have students gain social identity through social studies disciplines starting from their near surroundings. In this study, ten themes determined by the NCSS for the Social Studies have been examined in detail.

Purpose

The purpose of this study is to examine the 2004 Social Studies Education Program in Turkey in terms of the themes established by NCSS. Specifically, the following two questions guided this study:
- What are the themes identified by NCSS and what are the learning areas in the 2004 SSEP in Turkey?
- To what extent are the 2004 SSEP learning areas consistent with the themes identified by NCSS?

METHODOLOGY

Document analysis, a qualitative research method, was used in the study. This method involves analyzing the printed materials containing information related to the phenomenon under investigation. Which documents are significant and can be used as data sources is determined in accordance with the research problem. As far as educational research is concerned, documents such as programs, student books and teacher guide books, course books, student records, school letters, student assignments and exams, lesson and unit plans can be used as data sources (Yildirim and Simsek, 2005).

The data sources used in the study include the "Curriculum Standards for Social Studies: Expectations of Excellence" by NCSS (2002) and the 2004 Social Studies Education Program (MEB, 2005) in Turkey. First step in the study was establishing the themes identified by NCSS and the learning areas in the 2004 SSEP. Then, the NCSS themes and the learning areas in the SSEP were analyzed comparatively to determine to what extent the 2004 SSEP learning areas are consistent with the themes identified by NCSS. In this regard, the features of the themes identified by NCSS were presented first and then how a specific theme was included in the 2004 SSEP was examined so that the similarities and differences could be determined.

FINDINGS

The findings obtained in parallel with the research objectives are presented below.

The Themes Identified by NCSS and the Learning Areas in the 2004 SSEP

Table 2 shows the NCSS themes and the learning areas of the 2004 SSEP together.

Table 2. The NCSS Themes and Learning Areas of the 2004 SSEP

2004 SSEP Learning Areas	NCSS Themes
Individual and Society	Individual Development and Identity
Culture and Heritage	Culture
People, Places and Environments	People, Places, and Environments
Production, Distribution and Consumption	Production, Distribution, and Consumption
Science, Technology and Society	Science, Technology, and Society
Groups, Institutions and Social Organizations	Individuals, Groups, and Institutions
Power, Management and Society	Power, Authority, and Governance
Global Connections	Global Connections
Time, continuity and change	Time, Continuity, and Change
No overlapping	Civic Ideals and Practices

As seen in table 2, the learning areas in the 2004 SSEP are similar to the themes determined by NCSS. While some of the NCSS themes such as "People, Places and Environment", "Production, Distribution and Consumption", "Science, Technology and Society", "Global Connections" take place by the same token in the 2004 SSEP, the other themes like "Individual Development and Identity", "Culture", "Individuals, Groups, and Institutions", are all included in the 2004 SSEP with similar names.

On the other hand, the theme of "Civil Ideals and Practices" does not take place in the 2004 SSEP. Furthermore, there are not any teaching units or attainments related to the learning area of "Time Continuity and Change" in the 2004 SSEP. Teaching this learning area in association with the other learning areas is suggested.

Comparison of the NCSS Themes with the Learning Areas of the 2004 SSEP

With regard to the second research question, the NCSS themes and the SSEP learning areas were compared to determine to what extent the 2004 SSEP learning areas are consistent with the themes identified by NCSS. The similarities and differences for each theme then were presented.

Culture

According to NCSS (2002, p. 21), the Social Studies Education program should provide experience to students about the studies on culture and cultural variations. In a democratic and multi-cultural society, students are required to understand multi-perspectives derived from different cultural features. Such an approach helps them to develop new understandings about the people in their society and the world (NCSS, 2002, p. 21). Sunal and Haas (2002, p. 9) emphasize that the main aim of Social Studies course is to help students develop their skills of decision making and obtaining information as citizens who embrace the cultural differences as richness in a society of democracy.

In the 2004 SSEP, this theme takes place as the "Culture and Heritage" learning area, which aims to introduce the fundamental components of Turkish culture, and adopt the necessity of development and protection of the culture to develop the national awareness. While students comprehend the fact that cultural components are the features separating a society from the others, they meanwhile realize that they could contribute to develop and enrich global world cultural heritage which occurs from local to national and from national to universal (MEB, 2005, p.103).

Comparing the theme of "Culture" determined by NCSS with the "Culture and Heritage" learning area of the 2004 SSEP yields some differences between them. In the 2004 SSEP, it is emphasized that students should firstly learn about their own culture. Thus, in the 4th grade, the unit entitled as "I am

learning the past" asks students to investigate the cultural past for their near surroundings. However, the learning area called "Culture and Heritage" is mostly associated with History discipline, so Geography, Anthropology and Sociology have been ignored and the effect of language on culture has been undervalued. Therefore, it could be claimed that some of the questions that NCSS (2002, p. 21) asks (such as "How do belief systems, religion or political ideas in a culture influence other components of the culture?", "How does a culture adapt to changing ideas and beliefs?", or "What does language inform about culture?") could not be answered in the activities and attainments of the 2004 SSEP.

Time, Continuity, and Change

According to the NCSS (2002, p. 22), the SSEP should inform students about the ways through which they could see themselves within the time. Knowing how to read the past and restructure it enable students to develop historical viewpoints and answer these questions: Who am I? What happened in the past? How does the past concern me? How did the world change and will it also change in the future? Why do our own personal ideas that we are not related with the past change? How possible to see our viewpoints about our life experience as the parts of human being history within time? (NCSS, 2002, p. 22).

In the 2004 SSEP, this learning area is defined as the requirement to understand students' own ancestors and their positions at the present time. Furthermore, this program could help students connect past-present and future. Thus, students could learn about their identity, past events and connect them with past and they could understand the changes of the world and its future circumstance. Besides, they could try to explain people's emotional ties with past, their positions through humankind history in terms of chronology, change and continuity perspective (MEB, 2005, p. 104).

The 2004 SSEP and the NCSS resemble with one another in terms of their viewpoints and target attainments for "Time, continuity and change". Both of them are based on the students' comprehension of change by locating themselves within the past, present and future process, also on their interpretation and understanding of the past. However, when the 2004 SSEP is examined on the basis of teaching units, it could be seen that there is no direct unit related to "Time, continuity and change" whereas it is pointed out that this learning area is associated with all other areas.

People, Places, and Environments

The studies on people, places and instruction between human and environment help learners develop spatial ideas and geographical viewpoints. The contemporary social, cultural, economic and civic requirements necessitate individuals to ask some questions and be able to answer them. These questions are "Where are the objects positioned? Why are they positioned there? What does "region" mean? How do the forms of lands change? What are the results of these changes for people?" Thus, this field study enables learners to make critical decisions as well as learning about the relation between humankind and environment. In schools, this theme is usually covered through the teaching units and lessons related to Geography (NCSS, 2002, p. 22).

In the 2004 SSEP, by means of this theme, it is aimed at letting students recognize the people's interaction with environment, and understand the results and reasons of this interaction by applying various skills and values; also gain personal or social viewpoints of future. In that sense, the students could know their environment. What is more, they would comprehend the significance of their environment and its protection not only for themselves but also for the society and future life while criticizing the role of humans for their habitation and being environmentally-conscious (MEB, 2005, p. 103).

It could be claimed that the 2004 SSEP has a parallel understanding with the NCSS for the learning area of "People, Places and Environment", which is based on the discipline of Geography. As Turner

(1999, p. 68) pointed out Geography is a discipline that investigates the surface of the earth and its relation with human life. By means of this theme, it is aimed at helping students gain geographical viewpoints by assimilating the interaction of human, place and environment; furthermore, it is desired to help students develop environmental consciousness.

Individual Development and Identity

According to the NCSS (2002, p. 24), the SSEP must contain the experiences about individual development and identity. How do people learn? What are the reasons for their behaviors? How do people influence what they learn, perceive and develop? How do people meet their basic needs in such diversity? Such questions are at the heart of the studies related to individuals' development from their youth to adolescence. In schools, this theme is usually included in courses and teaching units related to Anthropology and Psychology (NCSS, 2002, p. 24).

In the 2004 SSEP, this theme takes place under the title of Individual and Society and it tries to examine the effects of individual's personal development and social environment on the development. Students will determine their places in different groups, and try to relate role, right and responsibility; at last, they will realize that they have rights as children. For this learning area, the fundamental concepts of the disciplines of Psychology, Sociology, Anthropology and Social Anthropology and Political Science are given (MEB, 2005, p. 102).

The theme of "Individual Development and Identity" determined by NCSS has some common points with the "Individual and Society" learning area of the 2004 SSEP. Both of them emphasize the significance of culture and social environment for the development of an individual's identity and shaping the behaviors. However, the effect of Sociology discipline is a bit more dominant in the 2004 SSEP. Although these two programs share the common philosophy, it could be claimed that the 2004 SSEP emphasizes rights and responsibilities for this learning area more than NCSS.

Individuals, Groups, and Institutions

It is important for students to know how the institutions emerge, what controls and influence these institutions, also how institutions control and affect individuals and culture and to know how these institutions survive and change. The studies about individuals, groups and institutions based on Sociology, Anthropology and other disciplines prepare students to ask and answer some certain questions such as; what are the roles of institutions in my society and other societies? How am I influenced by the institutions? How do the institutions change? What is my role in institutional change? Moreover, this theme is studied in Sociology, Anthropology, Psychology, Political Science and History courses and teaching units in schools (NCSS, 2002, p. 25).

In the 2004 SSEP, this learning area takes place under the title of "Groups, Institutions and Social Organizations". Thus, students could examine how the groups, institutions and social organizations around influence their lives via this learning area. Besides, due to social problems, events and requirements, students will be aware of the significance of being a responsible individual associating group, institutions and social organizations and the importance of organizing and social participation. For this learning area, students will encounter the concepts of Sociology, Law, Psychology, Political Science and Civil Rights (MEB, 2005, s. 104-105).

The NCSS theme of "Individuals, Groups and Institutions" shares some similar points with the learning area of "Groups, Institutions and Social Organizations" of the 2004 SSEP. Both of them emphasize the mutual interaction among individual-group-institution; also, the foundations of institutions and groups and their effects on an individual are highlighted. Additionally, the 2004 SSEP contains social organizations and the importance of social participation is mentioned. However, in the 2004 SSEP, the role of an individual in institutional change, which NCSS has emphasized for this theme, is neglected.

Power, Authority, and Governance

The Social Studies Program should provide experiences about the studies on how people establish the structures of authority, power and management and how they change them. Hence, students should answer these questions: What is power? How is power gained, used and justified? What is legal authority? How are the governments founded, structured and changed? How can we hold the government accountable for the civil requirements? How can individuals' rights be protected in the rules of the majority? (NCSS, 2002, p. 26).

This learning area is under the title of "Power, Management and Society" in the 2004 SSEP. Students notice their responsibilities and duties by examining the ways of full-participation in the society as conscious citizens, which is one of main goals of Social Studies course. Furthermore, by learning the ways to participate in social services and various official activities, they would recognize the democratic ways to influence the management (MEB, 2005, p. 105).

Both the NCSS theme of "Power, Authority, and Governance" and the learning area of "Power, Management and Society" of the 2004 SSEP aim at training effective citizens in a democratic society. According to Kaltsounis (1987, p. 4) the Social Studies course is quite important since it promotes training responsible citizens who could keep the continuity of society. Michaelis and Garcia (1996, p. 3) stated some functions of the social studies course as forming an understanding about democratic structure and values; developing decision making and participation skills related to thinking skills and social criticism competency; and providing information necessary to cope with social problems and comprehend human relations.

By means of this theme, students are proposed to learn how the government is formed as a management mechanism in a society, what their democratic rights are as citizens, and how to use these rights and how to participate in management. However, as being different from NCSS, the 2004 SSEP emphasizes local administrations more in the concepts of "Power and Authority using this power".

Production, Distribution, and Consumption

The Social Studies Programs should give information about the studies on how production, consumption and distribution are arranged by people. The human beings have requirements which necessitate more than restricted sources. Therefore, to answer four basic questions different ways are tried: What will be produced? How will the production be arranged? How will these goods and services be distributed? In that sense, this theme is generally taught through units and courses related to economics discipline in the form of concept, principle and subject (NCSS, 2002, p. 27).

In this learning area which takes place with the same name in the 2004 SSEP, it is expected that primary school students could distinguish their desires and needs and the differences among them. Moreover, they would comprehend the inadequacy of resources in the national economics and believe the protection of existing resources. Students could learn the basic concepts about production, distribution and consumption, and so by knowing more about professions they realize that the professions are for the ease of life (MEB, 2005, p. 104).

The theme of "Production, Distribution, and Consumption" is defined as a theme based on economics discipline in both the 2004 SSEP and NCSS source of "Program Standards for Social Studies". One of the important goals of Social Studies course is to have students acquire skills for economic life. It could be claimed that the learning area of "Production, Distribution and Consumption" overlaps with the same theme of NCSS in terms of structure and content.

Science, Technology, and Society

According to the NCSS (2002, p. 8), Social Studies Programs should promote the studies on the relations among Science, Technology and Society. As known, without technology and science that supports it, a modern life is impossible. However, some questions emerge along with technology: Is new technology better than the old one? What can we learn from the past about the unexpected big social changes caused by new technology? How could we cope with the past changes and the feeling that technology is out of control? How could we protect our basic values and beliefs in the world which has become a village connected with each other via technology? Furthermore, this theme is seen in teaching units and courses related to History, Geography, Economics, Civics and Management.

This theme takes place with the same name in the 2004 SSEP. The modern life is impossible without technology and science. In this learning area, students learn that creative, critical and scientific thinking underlie the developments of science and technology. Besides, they comprehend the processes of scientific and technological developments and their effects on social life. On the other hand, they discuss how some technological products destroy nature while learning to what extent technology is related to their daily lives. In this learning area, students are informed about the basic concepts related to History, Geography, Economics and Civics (MEB, 2005, p. 104).

Within the context of the theme of "Science, Technology and Society", both NCSS and the 2004 SSEP emphasize the same points and answers the same questions. In this theme, it is aimed at enabling the students to comprehend the effects of technology on the social life, evaluate the benefits and costs of new technology, and understand the necessity of using technology in accordance with ethical rules; and as a result, gain scientific thinking.

Global Connections

The Social Studies Program provides experiences about the studies on global connection and interdependence. Examining the relationships and patterns among cultures like economical competition, dependence, ancient envy, political or military cooperation would help students investigate alternative politics developed in national and global contexts. This theme is generally associated with Geography, Culture and Economics; however, Humanities containing Literature, Art and Language, Physical and Natural Sciences are also included (NCSS, 2002, p. 29).

In the 2004 SSEP, the aim of this learning area is to inform students about all kinds of interactions between societies through the themes of disciplines such as Geography, Anthropology, and Economics. While students learn about general characteristics of countries in different regions of the world through the subjects of Geography, students also have the opportunity to compare and contrast their countries with other countries (MEB, 2005, p. 105).

Within the context of the theme of "Global Connections", the framework of the 2004 SSEP generally overlaps NCSS, whereas it could be claimed that NCSS handles this theme from a larger perspective. In that sense, "Global Connections" is a vital topic for Social Studies course. The attempts of integration among countries in the world and universal movement in education cause education to become global (Sozer, 1998, p. 35). By means of this theme, it is aimed at enabling students to balance national and universal viewpoints in the case of facts and events of all aspects of lives, and develop sensitivity to the current global issues and also comprehend the fact that the nations are interdependent and they influence each other. However, the 2004 SSEP ignores global matters of tension, economic development, environmental quality, universal human rights and so forth which are caused by national and global priorities; yet it highlights the introduction of different cultures and economic cooperation.

Civic Ideals and Practices

Social Studies Programs should emphasize the studies about citizenship ideals in a democratic republic, their principles and applications. Comprehension of citizenship ideals and applications is essential for full participation in the society, and hence this is an aim at the heart of Social Studies. The learners ask such questions; what is citizenship participation and how could I join in this? How does the meaning of citizenship develop? What is the balance between rights and responsibilities? What are the roles of a citizen in a nation and society as the member of world community? How could I create a positive variety? Furthermore, this theme is included in teaching units and courses related to History, Political Studies, Cultural Anthropology, global studies and Law; also in the content of Humanities (NCSS, 2002, p. 29).

The Social Studies course is quite significant to gain students citizenship ideals. As known, the most important goal of social studies teaching is to lead students to gain "societal personality". When the 2004 SSEP is examined, it could be seen that there is not a direct learning area with a title of "Citizenship Ideals and Applications". However, in all learning areas, there is a great emphasis on the gain of citizenship consciousness. Especially in the learning areas of "Individual and Society", "Groups, Institutions and Social Organization" and "Power, Management and Society", it is planned to have students gain some expectations from active citizens such as citizenship rights and responsibilities and social participation.

CONCLUSION AND RECOMMENDATIONS

Within the context of program development studies, the SSEP was designed by the Ministry of Education in 2004 and put into practice as of the 2005-2006 academic year. It aims at enabling individuals to participate in life actively, decide accurately and solve problems (Gultekin, 2005, p. 519). Moreover, this program intends to train students as information producers and users and help them to develop needed skills and values through their own experiences. It could be claimed that this program is a quite important attempt to adopt learner-centered understanding and to put it into practice.

The evaluation of the 2004 SSEP in terms of the standards of international vocational institutions is crucial to adopt an understanding of a modern and universal program. The NCSS in the USA which has some guiding studies on Social Studies also makes some predictions on the Social Studies course in its source called "The Program Standards for Social Studies"; and thus its content was integrated with ten themes. In this context, when the learning areas of the 2004 SSEP are compared with NCSS themes, it could be seen that the themes determined by NCSS take place in the 2004 SSEP with the same or similar names. Of the ten themes determined by NCSS, except the theme of "Citizenship Ideals and Applications", nine themes are included in the 2004 SSEP. In this program, there are nine themes that were called as the learning areas and eight units related to eight themes, except for the theme of "Time, Continuity and Change".

Although the learning areas in the 2004 SSEP generally overlap with NCSS themes in terms of objectives and content, it is obvious that NCSS adopts a broad perspective for some themes. In the 2004 SSEP, nationality is emphasized, yet the balance of local-universal is neglected; furthermore "Global Connections" is perceived as the comparison of our nation with the others. It could be claimed that having a broad viewpoint would be more effective to prepare the future citizens.

The following recommendations can be put forward based on these conclusions:
- The Turkish 2004 SSEP and social studies education programs of developed countries could be studied comparatively.
- The 2004 SSEP could be improved in light of the comparative study.
- Some in-service training programs could be arranged concerning the consistency of the 2004 SSEP with international standards.
- Teacher candidates of Social Studies could be provided with informative training regarding the consistency of the 2004 SSEP with international standards.

AVIATION ENGLISH: THE PRACTICALITY IN AVIATION INDUSTRY

By:
Nurul Ain Binti Md. Zulkifly, Senior Lecturer
Safura Binti Abdul Rahman, Lecturer
Prof. Hj. Ahmad Zahir Bin Mokhtar, Dean
of
Universiti Kuala Lumpur Malaysian Institute of Aviation Technology (UniKL MIAT)

1.0 INTRODUCTION

1.1 Background of the Study

UniKL MIAT is geared to be the premier Aviation training institution specializing in Aircraft Maintenance Technology with a population of 1600 students. The comprehensive yet balanced mix of theoretical and practical training complying with global airworthiness authorities' standards and industry requirements will enable graduates to keep pace with the demands of aircraft maintenances at present and in the future. UniKL MIAT produces graduates with the knowledge on wide range of aircraft technology in servicing, overhaul and maintenance tailored to the industrial requirements. The training programmes are comply with the international Aviation regulatory bodies and closely monitored by the Department of Civil Aviation Malaysia (DCAM). Not only that, DCAM has set the high standard of English proficiency which is in contrast with UniKL MIAT students' entry requirement. As English is one of the main languages in Aviation, UniKL MIAT is using English as the medium of instruction for teaching purposes.

The English subject offered in UniKL MIAT for Diploma in Aircraft Maintenance Technology (DAMT) is a combination of English for Academic Purposes (EAP) and English for Specific Purposes (ESP). It focuses on theory, practical and complex grammar which the syllabus consists of Grammar, Writing, Presentation Skills, Communication Skills, Business Communication, Job Hunting Skills and Technical Report Writing.

1.2 Purpose of the Study

The purpose of this study is to examine the practicality of the Aviation English syllabus in the Aviation industry. There is a need to know whether the syllabus is effective for the graduates' communication skills in the real working world. The research statements are as below:
1. Improvement on the proficiency skills which includes speaking, reading, writing and listening.
2. Effectiveness class activities.
3. Sufficient class contact hours.
4. Necessity of the multimedia facilities

1.3 Limitations of the Study

This study investigates the practicality of Aviation English syllabus in industry for UniKL MIAT graduates from different trades including avionics, manufacturing and composite. Due to tight scheduling and majority of the graduates are pursuing their studies, it limits the number of respondents.
1.4 Aviation English

English is the standard language of Aviation set by the International Civil Aviation Organization (ICAO). This does not apply only to those directly involved in flying or air-traffic control, but virtually to all those employed in aviation sectors who are required to communicate with international passengers and customers, pilots, dispatchers, operations centre technicians and regulatory agencies. To facilitate the interchange of information among them, English has evolved to become the global language for all aviation needs, and solid command of both general as well as it specialized (ESP) varieties, has become an essential prerequisite for safety efficiency and effective communication (Bratanic).

2.0 METHODOLOGY

Data was gathered by distributing the questionnaires among 60 UniKL MIAT graduates from different trades including avionics, manufacturing and composite. The questionnaires focused on the factors of the effectiveness such as proficiency skills, group work based activities, class contact hours and media facilities.

3.0 RESULT

Proficiency skills are divided into four skills; Speaking, Reading, Writing and Listening. Referring to Figure 1, 54.1% of the respondents agreed that they are more confident in Speaking after learning Aviation English for 4 semesters in UniKL MIAT. However, 50.6% of them were uncertain whether they are able to speak clearer, louder and more fluent although 62.4% of the respondents agreed that they are more confident participating in discussion. Besides that, 49.4% of them agreed that they have more confidence communicating with people.

Figure 1: Speaking

Referring to Figure 2, 57.6% of the respondents agreed they differentiate better between general English and Technical terminologies in Reading. Besides that, 65.9% of them agreed that they are able to extract important points for job purposes such as in reading the Aviation manual, reports and many more.

Figure 2: Reading

Figure 3 shows that 56.5% of the respondents agreed that they are able to spell correctly and 45.9% of them agreed that they are able to choose suitable words when they write. Unfortunately, 55.3% of the respondents were uncertain on their ability to write grammatically correct sentences.

WRITING

Figure 3: Writing

Based on Figure 4, 67.1% of the respondents agreed that when they listen, they are able to understand better the meanings of many words. Besides that, 80% of them agreed that they are able to follow instructions given and 60% of the respondents agreed that they are able to recognise and interpret speaker's views, attitudes or intentions.

LISTENING

Figure 4: Listening

In relation with the Class Activities, 65.9% of the respondents agreed that the exercises given are helpful for their present job scope as shown in Figure 5. Besides that, 51.8% of the respondents agreed that the assignment topics given are relevant and 67.1% of them agreed that the assignment topics given are helpful. Moreover, 56.5% of the respondents agreed that the knowledge in presentation skills has helped them in their present jobs.

CLASS ACTIVITIES (1)

Figure 5: Class Activities

In their present job, 67.1% of the respondents agreed the experience working in groups has helped them to become good team players, 58.8% agreed it has helped them to be active team players and 47.1% agreed they have become creative team player as shown in Figure 6. Besides that, 40% of the respondents agreed that individual assessment has helped them to become good staff, 58.8% agreed they have become independent staff and 48.3% agreed they have become creative staff.

CLASS ACTIVITIES (2)

Figure 6: Group Work

Figure 7 shows that 66.5% of the respondents felt that the 2-hour class for Aviation English is enough.

CONTACT HOURS

Figure 7: Class Contact Hours

For the Multimedia Facilities, 82.4% of the respondents felt that language lab should be provided and 91.8% felt that computer lab should be used as part of class activities as shown Figure 8. 98.8% of the respondents preferred LCD projector, and 71.8% of them preferred OHP as part of teaching aids.

Figure 8: Multimedia Facilities

4.0 DISCUSSION

After 4 semesters of learning Aviation English, most of the graduates are more confident participating in discussion and communicating with others in their present job. Furthermore, they understand better when they read both in general and Aviation English as this is important in understanding the Aviation Manuals. Unfortunately, graduates were uncertain on their ability to write grammatically correct sentences. If given more class contact hours, without doubt more concentration would be made on grammar. Besides that, graduates are able to listen better where they are capable to follow instructions given. Since they have improved their confidence in Speaking, their presentation skills have also improved. Not only that, graduates benefit from all class activities. Graduates felt that the 2-hour class for Aviation English is enough due to the packed schedule of Technical and other subjects. Graduates also felt that language lab should be provided as part of class activities.

5.0 CONCLUSION

As a conclusion, the Aviation English syllabus is effective for UniKL MIAT as graduates have improved in most of the skills. However, there are more rooms for improvement to prepare future graduates for the working world and to achieve the standard set by ICAO.

HIGHER EDUCATION

UNIKL MIAT STUDENTS ATTITUDE TOWARDS THE USE OF CODE SWITCHING BY THE TECHNICAL INSTRUCTORS IN CLASSROOM

By:
Safura Binti Abdul Rahman, Lecturer
Nurul Ain Binti Md. Zulkifly, Senior Lecturer
Prof. Hj. Ahmad Zahir Bin Mokhtar, Dean
of
Universiti Kuala Lumpur Malaysian Institute of Aviation Technology (UniKL MIAT)

1.0 INTRODUCTION

1.5 Background of the Study

UniKL MIAT is geared to be the premier Aviation training institution specializing in Aircraft Maintenance Technology with a population of 1600 students and 50 students are International students. Figure 1 shows the number of students for semester 5 Diploma in Aircraft Maintenance Technology with 346 Malaysian students and only 2 International students.

Figure 1: Number of students for Semester 5 Diploma in UniKL MIAT

The comprehensive yet balanced mix of theoretical and practical training complying with global airworthiness authorities' standards and industry requirements will enable graduates to keep pace with the demands of aircraft maintenances at present and in the future. UniKL MIAT produces graduates with the knowledge on wide range of aircraft technology in servicing, overhaul and maintenance tailored to the industrial requirements. The training programmes are comply with the international Aviation regulatory bodies and closely monitored by the Department of Civil Aviation Malaysia (DCAM). Not only that, DCAM has set the high standard of English proficiency which is in contrast with UniKL MIAT students' entry requirement.

As English is one of the main languages in Aviation, UniKL MIAT is using English as a medium of instruction for teaching purposes. The fact is after eleven years of learning English in primary and secondary schools, most of Malaysian students are still not proficient in this language. For this reason, the Technical instructors in UniKL MIAT have to code switch in order to teach technical subjects in English. Furthermore, they think that the use of code switching in class is a tool in teaching. Hence, this research is based on UniKL MIAT students' perception towards the use of code switching in the classroom.

1.6 Purpose of the Study

The purpose of this study is to look at several aspects relating to the UniKL MIAT students' attitude towards the use of code switching by the Technical Instructors in classroom by responding to the research statements below:
5. Frequency of code switching in the classroom.
6. Reasons of using code switching in the classroom.
7. Attitude towards the use of code switching.
8. The implications of using code switching in teaching the Technical subjects.

1.7 Limitations of the Study

This study investigates semester 5 UniKL MIAT students' attitude and opinions towards the use of code switching by their Technical Instructors as a language tool. Due to time limitation, code switching which is naturally occurs in the classroom is not observed in the study.

1.8 Code Switching

Code switching refers to the change from one language to another in verbal communication context in a particular situation. Code switching is used in a classroom to help the instructors to teach their subject. In this context, the instructors will start the lesson in the second language (English), and then moving into the first language (Bahasa Malaysia) based on the certain circumstances. According to Willis (1981), the use of code switching in a classroom is preferable and economical when the instructors wanted to explain the meaning of new words in order to make the students to understand better.

2.0 METHODOLOGY

Data was gathered by distributing 70 questionnaires using convenient sampling among semester 5 Diploma students. The questionnaires were divided into three parts using Likert Scale. The first part was the frequency of using code switching in the classrooms, the second part was the attitude towards the use of code switching by Technical instructors, and the third part was the implications of using code switching in teaching the Technical subjects.

3.0 RESULT

3.1 Frequency of Code Switching in the Classroom

From the study, the students responded that the Technical Instructors sometimes use code switching as part of their teaching method. Figure 2 below shows that 50% of the students responded that the Technical Instructors sometimes code switch from English to Bahasa Malaysia. The reasons are discussed in Figure 3 below.

Figure 2: Frequency of Code Switching in the Classroom

3.2 Reasons of Using Code Switching in the Classroom

Referring to Figure 3 below, 44.3% of the respondents agreed that English is used in teaching technical terms and 42.9% of them agreed that English is used when the Technical Instructors introducing technical terms. Meanwhile 45.7% agreed that the Technical Instructors code switch whenever students are confused.

Figure 3: Reasons of using code switching in the classroom

3.3 Attitude towards the Use of Code Switching

Even though the Technical Instructors use English in teaching, majority of the respondents felt that code switching is important in learning any subject including technical subjects. Figure 4 below shows that 45% of the respondents agreed it is important for the Technical Instructors to code switch in teaching any subject and 35% agreed that code switching is important to be implemented in teaching technical subject. On top of that, 50% of the respondents also felt that code switching is necessary in Malaysian context. However, 41.4% of the respondents disagreed that the use of code switching is seen as a waste time in learning the Technical subjects. 45.7% of the respondents agreed that using code switching in the classroom eases up their learning process especially in learning Technical subject. Meanwhile, 27.1% of them disagreed and another 27.1% were uncertain that code switching are interference while learning technical subjects. Surprisingly, 38.6% of the respondents disagreed that code switching should be avoided.

Figure 4: My Attitude towards the Use of Code Switching

3.4 The Implications of Using Code Switching in Teaching the Technical Subjects

Based on Figure 5 below, 61.4% of the respondents agreed that they understand better when the Technical Instructors code switch. 44.3% of them agreed that using code switching saves time in teaching and 64.3% of the respondents agreed that by using code switching it simplifies their understanding. Besides that, 54.3% of the respondents agreed that they give positive feedback for class participation, better examination results and others when the Technical Instructors code switch. However, 41.4% of the respondents disagreed that they still get confused when the Technical Instructors code switch. Meanwhile, 34.3% of the respondents disagreed that code switching demotivates them in classroom. 37.1% of the respondents agreed that the Technical Instructors code switch when they are being asked by students.

Figure 5: The Implications of Using Code Switching in Teaching the Technical Subjects

4.0 CONCLUSION

As a conclusion, Technical Instructors use code switching in classroom whenever the students are confused as it will ease up classroom learning process. Besides that, by using code switching it simplifies students' understanding towards the subject taught by the Technical Instructors. The students also agreed that the use of code switching by the Technical Instructors should not be avoided since majority of them understand better, able to give positive feedback in participation and they are still motivated to learn the Technical subjects.

Contemplations on Didactics of College English Reading Course Assisted by Internet

Sun Ruichao

(College of Foreign Languages, Nanjing University of Aeronautics and Astronautics, Nanjing Jiangsu 210016)

Email Address: sunruichao@hotmail.com
Phone: +86-15996302762
Topic of the submission: Language Learning and Acquisition

Abstract

Problems in English Reading course is that the English majors read little out of class and traditional teaching models limit their capacity development. According to Constructivism, English teaching should be constructed around students under their teacher's guidance, and both sides should interact and cooperate with each other. The internet acts as a bridge to apply Constructivism into English teaching and offers sound conditions for English Reading course reforms.
Key words: English reading course; the Internet; Constructivism

I.   Present Situation of English Reading Course for English Majors in China

 Firstly, English majors have a small vocabulary. English reading course is an integrated part in the Curriculum for English majors, which aims to train the students' reading competence. As a matter of fact, reading course requires the students to read extensively. The related curriculum issued by China's Ministry of Education regulates that a student in English major at level 2 should read textbooks up to 250000 words, non-text materials up to 500000 words. At level 4, they should read textbooks up to 375000 words, non-text materials up to 620000 words. But, for a long time, this course has been designed for only 2 course hours per week, and English teachers in charge of this course follow the traditional teaching method: carefully analyzing the text in classroom without strict requirement for extensive reading. The students can never reach reading quantity required by the Curriculum. Secondly, traditional English teaching schema limits the development of the students' reading competence. The teachers prefer to make students do all kinds of English grammar patterns or drills in class, or explain the different shades of meanings of new words appearing in the text, or tell the students some reading skills so as to train their reading speed and accuracy of catching desired information. These drills help a lot in the students' examinations, but do little in their genuine communication in English. Accuracy rate , hence, falls into the sole norm upon judging the students' reading competence. And TEM 4 and TEM 8 further consolidate such notion. Chinese students, more or less, learn English in order to pass TEM 4 and TEM 8 because that stuff decides their BA degree. They are busy accepting the knowledge poured down by eager teachers and have little time to think, judge critically or even bring forth new ideas. Such teaching does not involve any genuine language training or practice, which cannot improve the students' competence of language application, nevertheless, deprives them of their independent learning choices. Such teaching patterns waste time and energy of the students and the teachers as well.

  What is concerning the circle of English teachers is how to make Extensive Reading Course function energetically in developing their students'reading competence. Recently, many English professors and teachers have studied a lot about the teaching methods, patterns, text materials and effects of this course. The fruit of their studies inspire me in my teaching this course. According to my experience of teaching for ten years, we should start from didactics so as to walk out of the predicament of this course: to change the traditional didactics into task-targeted didactics, teacher-centred classroom into student-centred and teacher-assisted forum.

Ⅱ. Didactics of English Reading Course for English Majors Assisted by the Internet

  The 21th century is the era of information, which witnesses the popularity of internet across the world. Advanced multimedia technology brings opportunities and challenges to the traditional English teaching in China. In 2004, China's Ministry of Education issued *Regulations for College English Teaching* which put forward that new teaching schema should not be limited by time or place, on the contrary, should develop into the students' autonomous learning based on modern information technology, especially internet technology. This regulation points out that internet-assisted teaching will become a new means of college English teaching. Profile information on the Internet offers college

students profile choices, at the same time, offers the teachers unprecedented information advantages and a ladder for improvement.

The following is my teaching plan which is based on Constructivist Learning Theory and guided by task-oriented didactics.

A. Classroom Teaching

What does constructivism mean? The term refers to the notion that learners construct knowledge for themselves ---- each learner constructs meaning individually and socially as he learns. Learning is an active process in which the learner uses sensory input and constructs meaning out of it. It consists both of constructing meaning and systems of meaning. Besides, learning is intimately associated with our connection with other human beings, our teachers, our peers, our family as well as casual acquaintances. We are more likely to be successful through our efforts to educate if we realize this principle instead of tring to avoid it. *Much of traditional education, as Dewey pointed out, is directed towards isolating the learner from all social interaction, and towards seeing education as a one-on-one relationship between the learner and the objective material to be learned. In contrast, progressive education recognizes the social aspect of learning and uses conversation, interaction with others, and the application of knowledge as an integral aspect of learning. Learning is contextual: we do not learn isolated facts and theories in some abstract ethereal land of the mind separate from the rest of our lives: we learn in relationship to what else we know, what we believe, our prejudices and our fears. On reflection, it becomes clear that this point is actually a corollary of the idea that learning is active and social. We cannot divorce our learning from our lives.* Hence, I transfer the teaching points into tasks for my students to fulfill so as to challenge their interest. The students are required to preview the text before they come into the classroom, which is important. Otherwise, they cannot follow the teaching speed and even hinder it. The students are divided into different groups (pair or panel, up to the context) to discuss the comprehension points and language points and make conclusions. If there are some controversial topics, a debate can be arranged between the students and they will understand deeper. When a fictional text appears, role play is no less than a good taste. This practice not only makes them understand more about the text, but also practises their oral English.

However, textbook is far from enough. More reading materials are always prepared closely related to the topics in the textbook. And the students are required to read instantly as fast as possible and then answer questions. This part is actually a practice of fast reading skills aiming to improve the students' reading competence. Reading strategies are explained previously , their reading speed is inspected and their bad reading habits will be corrected such as vocalizing, moving lips when reading, regressing out of habit and so on.

B. Extracurricular Activities

As is known, reading competence depends mainly on extensive reading. Reading skills do some help, but not final. Strangely, more and more Chinese teachers put the first concern on reading skills and pay less and less attention to reading quantity. They are attending to trifles and neglecting the essentials. Extensive reading greatly broadens the students' vocabulary which is the key to reading competence. Is reading in a foreign language a reading problem or a language problem? Charles Alderson put forward that practicing EFL reading strategies may have the possible effects in students with an initial low verbal ability in the language. Today, the extensive reading course in any university in China is designed as two hours per week, this is far from enough. Therefore, the students have to read a lot after class. Fortunately, Internet is aside us, which extends teaching to any place at any time. So, I have homework for my students. The background of the text waits for the students to explore and discuss. This task is closely connected with the topics in the textbook. And the students are required to read at least one piece of English news per day and write a summary, which keeps them familiar with live English. Thirdly, they need to finish reading a book in English within two weeks. The readability of the books should be considered for the students. Every one is unique in the world. Choices of the books might be given to the students so long as the books are healthy and sound. Great educator *Johann Amos Comenius* thought students' interest in learning was a guarantee to successful education. Teachers should have strict and explicit requirement of reading quantity about which the students must be clear so as to guarantee the effect. Afterwards, a forum of reading reports may be organized for the students to communicate with each other.

Ⅲ. Conclusion

The ultimate goal of education is to have the students study in great interest. English teaching reforms have marched for years, how to help Chinese college students to learn English effectively, with interest, calls for more teachers to explore. Extensive reading course is no exception.

Writing after reading: implementing reading response journals into the classroom
Lu Huayun
Nanjing University of Aeronautics and Astronautics, Nanjing, China, 210016

Abstract: The present study analyzes the problems existing in China's college English teaching, because less attention has been paid to writing practice, which resulted in students' poor writing ability. After doing a research on the function of reading response journals, basic methods and procedures are given. Two training templates are designed to teach students how to respond to what they have read. Classroom activities are conducted to implement reading response journals writing.
Key words: reading response journals; English writing; college English teaching; writing training

I. Introduction

The purpose of English teaching is to develop students' ability of communicating in English. Although listening and speaking are considered as important parts of English learning, reading and writing are no doubt the key base of that. On one hand, reading enables students to grasp vocabulary and grammar, and writing makes it possible for students to express their ideas. On the other hand, fostering reading comprehension and writing capability may directly promote listening comprehension and speaking ability. To certain extent, writing can be the most important index of learners' comprehensive language capability.

In China, College English Test – Band 4 (CET-4) and College English Test – Band 6 (CET-6) have been put into practice for more than 20 years, which has greatly influenced college English teaching and learning. Because these two tests have played a very important role in personnel training and the improvement in the quality of college students, they have won the good graces of the whole country. However, while CET-4 and CET-6 has been exerting so profound an impact, we also feel their disadvantage. First, questions of objectivity domain the tests, and questions of subjectivity have a low ratio. Such standard tests may make it difficult to verify students' state of mind, process of thinking and their weaknesses in creativity, such as lacking subjective initiative, ignoring divergent thinking and lacking the spirit of creative and innovative. Secondly, blindly pursuing passing ratio has affected the development of students' language application ability and communicative competence. As a consequence, colleges and teachers have not paid enough attention to their English integrated qualities. In English teaching, it is required that students should make balanced progress in listening, speaking, reading and writing. Yet the trend in recent years shows that greater significance is being attached to the first two abilities. One aspect of the reform in CET-4 and CET-6 is that, by revising syllabus, the focus now shifts towards listening and speaking, instead of reading and writing. Such a measure-shift is expected to improve students' comprehensive language ability (), to which the author can not absolutely agree. I think that writing practice should not be weakened; on the contrary, it should be highlighted. And how to achieve this goal is the purpose of this study. In the past, one major style of writing teaching has been assigning a subject for composition. This has not produced great effect on promoting students' writing ability. By investigating my students' compositions, composition part of CET-4, undergraduates' graduation project (thesis), thesis written by masters and doctors, I have noticed that in students' writing, problems like failing to express what the author meant, awkwardly putting sentences together, and talking frivolously have influenced their intention of expressing their thoughts in the right way. This means that in college writing teaching is not a success; and that is the reason why it needs attention.

Assigning a subject for composition provides learners sufficient space and freedom to give a picture of their thinking and reflects what integrated qualities they have. Therefore, writing in this way can really be used to measure the capability that learners have. On the other hand, the purpose of college teaching is not only to pass the tests, but also to explore how to improve their ability to apply the language. I think it is in this respect that reading response journal can play its proper role.

In my country, elementary and secondary education is doubtless the two most important stages which lay a solid foundation for writing in native language. As college teachers, we may think that a person's writing ability and aptitude has been greatly developed in these two stages. Practice has proven that the

development of writing ability is a success in the primary and secondary education, and there's much in their methods that can be made use of in college English teaching. Chinese writing in elementary and secondary schools receives considerable attention. In literature, it can be found that reading response journals are thought to be a breakthrough in argument writing. The essential prerequisite for writing a reading response is to read first, then digest and absorb the information, thoughts and sentiment that echo in these works. Based on this is that the author is able to form their own viewpoint by adopting the useful factors while doing the reading. Different from assigning a subject for composition, limits of reading response are plain to see – the subject of writing should be sticked to. Authors are required that, after gaining an adequate understanding and digesting of what they read, they must express their opinions, provide perspective, and show agreement or disagreement. They will have to reach higher standards in writing a reading response than writing a composition with an assigned topic. Additionally, it is a good practice for learners' later research. My students, most of whom will be engineers, in their future scientific work, will read related literature. They will firstly have an understanding of the basis of materials. By practicing reading response journals, they are able to investigate the materials thoroughly, grasp the useful score part fully, and conduct their own research.

II. Importance of reading response journal writing

1. Reading response journals are the optimum training method which guides the students to develop argumentation writing capability from narration.

During high school in China, the capability for narration and exposition writing are considered as the primary purpose for English teaching. On entering the college when the students begin writing argumentation, they feel strange and fear of difficulty to certain extent. Teaching the students to write reading response journals is a good way to decrease and eliminate their psychological obstacles. Reading response journal is a kind of writing in which the reflections are generated on the basis of reading the original work. The style that a narrative interspersed with comments is often adopted. In general, the content of reading materials is first described in brief, and then the reader's feeling is given in outline. After that, the facts are presented, the things are reasoned out and theory is related with practice. The points of view are clarified through summarization. Narration and argumentation are integrated organically and at last conclusions are given. Generally speaking, reflections can be always generated through attentive reading. Reading response journals are formed by writing down what you read, think about and feel. With unremitting efforts, the students feel free to write argumentation after mastering the principle and scientific training.

2. Reading response journal reflects the basic writing requirements of the argumentation

First, the writing requirements must be clarified. It is required to carefully read, understand the original work, and grasp the essentials. Only when the substance of the original work is thoroughly understood by careful reading can readers realize what it should be and their opinions be aroused. After reading the original work, readers' feelings can be many-sided. It is possible that reading, analyzing and understanding materials may have left readers with feelings in certain aspect; their task is to describe what has been inspired and touched deeply. In journals readers are encouraged to communicate their feelings, through which teachers will be able to look through what their students are thinking and what they know about the reading materials that have been selected. It is in this way that reading response journals have intense practical significance and moral influence in college teaching.

Second, the role and function of reading response journals in argumentation should be fulfilled. A journal is a type of writing which organically integrates "reading" and "response". Reading is the basis of response, and response is evoked by reading. Readers first gain a proper understanding of the material and then reflect in the journal what they have understood about the material. In other words, response should not be in separation from the original work, nor should it be replaced by reading. Therefore a journal is a narrative interspersed with comments, in which comments are the vital part. Readers may grasp just one point that touches them deeply and utilize reasonable examples to achieve organic integration of "reading" and "response". Also, a well-knit structure of writing must be established. Journals are composed of "citation", "comments", "connection" and "conclusion". "Citation" means a contextual quotation, or a very short summary or abstract of quoted references. Citation should be concise, precise, and pointed. "Comments" takes place after citation. Comments may refer to focus on what has been cited, or, seeing through the appearance to perceive the essence. By giving an in-depth analysis of the material, readers finally show their opinions. "Connection" is to generate new meanings by connecting reality with reading. And "conclusion" is to echo the beginning of the writing and advocate expectation and put forth calls. The argument is proposed in "citation" part and analyzed in depth in "comments" and "reflection". In "conclusion" the argument is highlighted. The structure is the same as that of argumentation, i.e. proposition-analysis-solution. It follows that reading response journal should possess argument point, argument foundation and argument proof, which is exactly the basic requirements for argumentation writing.

3. Reading response journals can arouse the students' interest of argumentation writing.

Interest is the best teacher. The writing enthusiasm of the students can be stimulated if they are given the freedom to the selection of reading materials. However, a piece of high-quality reading response journal can not be written only with interest and enthusiasm. When students write journals for the first time, the following problems often occur. First, "connection" is not made between reading and practice; the so-called reading response journal is almost a summary of the original text. Second, the conclusion is label type. At the beginning of writing, a general description of the original text is given, and at last, determination will be made about what they hope they will be. Third, the points of view are separated from the topic materials, i.e. there is lack of connection between them. Finally, there is no link between "reading" and "response" and a gap occurs in structure. All of the above problems should be given attention to in teaching activities.

III. Methods

A semester is selected to carry out reading response journal writing training during two-year college English teaching. First, reading materials are selected by students themselves. If any one dose not know what to read, the author（being the teacher）will assign materials for them. It is of importance to choose the materials suitable for their levels both in contents and meanings. Therefore, a standard is established and the teacher should make examination for the materials students choose. To make the process smooth, the author (as the teacher and training designer) recommends reading materials both in the library and on the website. The students are also encouraged to search materials by themselves. Internet supplies abundant reading resources, **e.g.** the following two websites. One is http://www.readbookonline.net, a classical literature website; and the other is http://www.theshortstory.org.uk, a contemporary English novel website. In consideration of reading response journal writing for the first time, all the materials are short stories in which students take an interest. It will take one month for students to conduct writing, from beginning reading materials to submitting writing paper.

After assigning the writing task, the author made a PowerPoint presentation to guide the students' writing on the following aspects. First, students should know what the introductory paragraph, the body, and the conclusion of the writing include. Second, they were provided model essays. The author recommends the students the websites for journal writing, such as http://teacher.scholastic.com/writewit/bookrev/tips.htm, and http://www.wisc.edu/writing/Handbook/CriReadingBook.html, etc.

In addition, two times of "pre-writing" training are carried out; at least 200 words are required respectively. The purpose is to let the students learn the demands for reading response journal writing. To research the effects of the reading materials on writing, different reading resources are determined. The students in one class are asked to choose one piece of article in the current textbook and those in the other class are required to choose one piece of article, or novel that they like from any kind of resources. The first pre-writing training template is designed according to the outline given in reference [12]. As shown in Appendix 1, the template includes the basic information of the reading (title, author, illustrator, publisher, and main characters, etc), further information (beginning, middle and ending), and the reader's thinking and opinions (main idea, what I like/dislike about the book, favorite characters and the ending the book should be like, etc). Following is the writing guidance. The students are demanded to write down the first impression on the reading, to relate it to themselves experiences and other books. During writing, the students should ask themselves questions about the reading, such as "I wonder why…?", "It puzzles me that….", etc. Furthermore, they were asked to "try to agree/argue with the author", and to write down the ideas that they were touched by figures of speech or detailed information. The students are free to choose some of the above contents to write. The second pre-writing training template is shown in Appendix 2. Students are especially encouraged to express their feelings in a freer way. In addition, to decrease writing resistance Character Helps for Writing is attached.

IV. Discussion

One month later, the time for submission of the formal reading response journal was coming. No outline and prompt were given. Under the guidance of the teacher (the author) students were expected to obtain inspiration from the two times of writing trainings and to express their real feelings freely. The results show that most of the students achieved the training goals and wrote a reading response journal which could meet the basic requirements for reading response journal writing.

Appendix 1

A Reading Response Journal: OUTLINE

The title of the book: _____

The author's name: _____

The illustrator's name:_____

The publisher:_____

The main characters:_____

About the story:

        The beginning:_____

        The middle:_____

        The ending:_____

The main idea of the book:_____

What I like about the book:_____

What I dislike about the book:_____

My favorite characters:_____

I'd like the ending like this:_____

        Your writing need not include every part in the following list:

1. Write the first impression.
2. Relate it to your own experience.
3. Relate it to other books.
4. Ask yourself questions about the book (such as "I wonder why…?", "I'm having trouble" or "It puzzles me that…").
5. Try to agree with the author.
6. Try to argue with the author.
7. Write down the ideas that you were touched by, figures of speech or detailed information.

Japanese Undergraduates' Reactions to American ITV Classes

By Keiko Inada Khoo
Loma Linda University, California, USA

ABSTRACT

This study examined how the media effects and intercultural communication between American instructor and Japanese undergraduates impacted the learning in an interactive television course in a U.S. health science distance-education program. The analyses of the survey and focus group discussions revealed that the students found learning goal attainable but communication unsatisfactory due to the technology-caused miscuing of nonverbal messages and due to the Japanese preference and reliance on contextual communication.

INTRODUCTION

Distance education is often the solution on the global scale to meet certain local needs with specific expertise from other parts of the world. Interactive television (ITV) or teleconferencing with full two-way audio and video capabilities has been touted to simulate intact classrooms. For this reason, it is the preferred choice of technology when synchronous delivery to create face-to-face interactions is desirable. Nevertheless not much is known how learning is affected by media effects or intercultural communication where participants bring conflicting beliefs about good teaching and learning as educators often assume what is effective in their own culture in face-to-face mode will also work for students of another culture in technology mediated classes.

Media Effect

Media effect was best delineated by Rao, Lim, and Ridge (2000) with the contributing factors:
- Situational characteristics that users can control e.g. display resolution or asynchrony
- Inherent characteristics or limitation such as impossibility of mutual eye gaze
- Voluntariness of the communication
- Role of involuntary cues
- Sender ability to encode signals which is influenced by culture and gender
- Receiver ability to decode signals which is influenced by culture and gender

Immediacy as American Teaching Style

American faculty typically considers student engagement as the core value of effective teaching. For many decades, the research in educational communication has advanced the understanding of immediate teaching style. Immediacy was a word coined by Meherabian (1971) to signify psychological and physical closeness seen during communication acts. In educational contexts, immediacy is not usually expressed physically but rather by nonverbal and verbal means such as eye contact, smile, vocal expressions, gestures, humor, calling students by their names, use of personal examples, discussions of student-raised topics, invitation to participate, solicitation of students' views and opinions, and providing feedback through comments on homework.

Immediacy's positive effects on learning, particularly in college classrooms, has been tested and proven on many American campuses including those with ethnically diverse student bodies as well as on foreign university campuses with their native faculty and students. Neuliep's study (1997), in a Tokyo university, hypothesized and proved that the effects of nonverbal immediacy was weaker for the Japanese students than for the American students because of the limited range of immediate behaviors that are culturally appropriate for Japanese instructors. Pribyl, Sakamoto, and Keaten (2004) replicated Neuliep's study in another university but hypothesized that Japanese students' learning motivation is more intrinsic due to the Confucian cultural influence, which places the responsibility on the learner, and therefore might be a mediating factor in the immediacy-learning relationship. The study established a robust relationship but without clarifying the effect of motivation.

Japanese Culture and Classroom Communication

This study recognized the mutually exclusive nature of immediacy and distance education as well as the formidable challenge intercultural communication adds to its thesis, however, fortunately captured a rare opportunity to study the reactions of physical therapy students in a technical school in Japan to an American ITV course. The cultures involved in this study are diametrically opposed in values in almost all parameters proposed by Hofstede (1980). Japanese culture was characterized with collectivism, a large power distance and high-context communication. These features are often observed in the deference to consensus rather than independent opinions, the reverence shown to older persons such as teachers with an unspoken rule that inhibits interrupting or questioning them, and the preference for implicit communication that encourages "reading into" each other. Khoo (2007) offered other Japanese practices that may potentially confound the type of intercultural communication under examination:

- Politeness and associated display rules to attenuate expressions of affects
- Controlled styles of expressions that minimize potentially negative effects
- Silence exercised for self preservation

None of these traditions are conducive to participatory learning that presumes or prepares the learner to be a confident and competent director of his/her inquiries. Japanese students may feel uncomfortable with the degree of autonomy, independence, self-expression the immediate style of instruction often promotes. Japanese may accept or even admire American ways of open communication. Paradoxically, a long-held custom of keeping thoughts to oneself may not readily allow them to emulate what they esteem. Sometimes the fear of being labeled as stupid or uncooperative by Americans motivates them to break the silence.

REVIEW OF LITERATURE

In a new field of study such as learning in distance education, qualitative method can be very helpful in uncovering what the issues are. The following U.S. studies described the problems and solutions in ITV classes. Stone and Saulino (1997) took a sociocultural approach to understanding instructor-student interactions. They found that the television did not always lead to a more collaborative learning since the students did not feel comfortable in making remarks but rather put in effort for their "televised" presentations. Comeaux (1995) also discussed:

- students' feeling of needing to say profound things on camera.

McHenry and Bozik (1995) used ethnographic observations and interviews to discover how the collaborative processes of knowledge construction might work in video conferencing. They concluded:

- technology affected students' perception of the class and communication, for example originating site students hated to use the microphone but it meant the receiving site students were cut out of communication;
- technology necessitated new adaptations, for example it became necessary to disable the monitor at the originating site because students were bothered by seeing themselves on the screen;
- technology required new teaching strategies, for example making classes personal by calling students by name, introducing everyone during the first session or beginning each session with phatic communication.

METHODOLOGY

This study chose a combined approach although greater reliance was placed on the qualitative method using two focus groups of ten and five students each. These students also completed the survey which provided small numerical data and the comments in an open-ended question, both of which were analyzed qualitatively. Descriptive and nonparametric Spearman's rho correlations were the only statistics applied to the numerical data.

Teaching Style Survey was compiled by this investigator for a larger study, employing all ten items from the Revised Nonverbal Immediacy Measures or RNIM (Thomas, Richmond, and McCroskey, 1994) and all 20 items from the Verbal Immediacy Measure (Gorham, 1988). Students were asked to report how frequently each immediate behavior was observed using a five-point scale. Students were also asked to rate their own learning with the real instructor as well as a potential learning with an ideal instructor, using a nine-point scale. The comparison of the potential and real learning allowed the computation of a measure known as Learning Loss which has been reported to be more sensitive to

varying effects of immediacy. The survey results from the ITV course were compared with those of five face-to-face courses the same students completed in the same year.

RESULTS
Quantitative Analyses

Quantitative data of the ITV course showed very similar responses with those of the face-to-face courses, as shown in the table of Course by Course Descriptive Statistics. Six behaviors of the ITV instructor were rated noticeably differently with more than .50 deviation from the group means of the other five courses in a five-point scale.

The ITV instructor received the lowest ratings on two nonverbal behaviors:
- Walks around (.9 compared to 2.8 mean of other courses)
- Looks at the board or notes* (2.0 compared to 2.7 mean of other courses)

The ITV instructor also received a much lower rating on three verbal behaviors:
- Initiates conversations outside of class (2.1 compared to 2.7)
- Uses words "our class" (1.8 compared to 2.4)
- Talks about things unrelated to the class (1.5 compared to 2.2)

The ITV instructor received a higher rating than the face-to- face courses on one behavior:
- Calls on non-volunteering students for questions* (2.6 compared to1.3)

The response values to the nonimmediate behaviors marked with *s had been inverted. The lower rating means that the instructor looked at the board or notes more frequently. The higher rating means that the instructor did not call on non-volunteering students for questions often.

These differences can be logically explained by the limitation of the technology. The podium camera could not accommodate the instructors' movements and emphasized the absence of her face when she looked down at the notes. The instructor obviously did not extend the online time to converse with the students before and after classes particularly about things unrelated to the course. The classroom cameras did not enable the instructor to pan the whole room easily which may have precluded the sense of group identity or notice who were ready or hesitant to speak up.

The students' self rated learning of 7.4 (in 9-point scale) was also similar to the mean rating 7.54 of other five courses indicating the viability of the ITV course for the students to achieve learning objectives.

Aggregate Nonverbal	3.1	3.2	3.0	3.2	3.1	3.0
Aggregate Verbal	2.8	2.5	2.2	2.5	2.6	2.6
Aggregate Overall	2.9	2.8	2.5	2.7	2.7	2.5
Ideal Learning	8.2	7.8	7.9	8.0	8.7	7.9
Real Learning	7.7	7.0	7.1	7.7	8.2	7.4
Learning Loss	.4	.8	.8	.3	.5	.5

Spearman's rho Correlations

	Face-to-face Courses	**ITV Course**
Learning & Aggregate Nonverbal Immediacy	.75**	Not Significant
Learning & Aggregate Verbal Immediacy	.64**	.73*
Learning & Aggregate Overall Immediacy	.72**	Not Significant

** Correlation is significant at the 0.01 level (2-tailed).   * Correlation is significant at the 0.05 level (2-tailed).

Association between immediacy and learning in the ITV course, as shown in the comparisons in the table of Spearman's rho Correlations is significant only for Aggregate Verbal Immediacy (p = .05) but not with nonverbal immediacy reflecting the media limitations on gaze, movements and facial expressions. In contrast, the face-to-face courses show a higher-level significance at .01 for the correlations between all three aggregate immediacy measures and learning. ITV results, however, must be viewed with a caution because of the small data size.

Qualitative Analysis

Qualitative data, students' statements, were transcribed in Japanese and translated into English which are quoted in this section as they were uttered in fragments and in incomplete sentences.

Uncompromised Learning

The data, first of all, indicated that the ITV classes were not substantially different from face-to-face classes in terms of reaching the learning objectives.
- "I don't think the content of lectures changed",
- "ultimately, there was nothing we could not learn", and
- "they [effects of instruction] came through. But I don't know if they were maximized".

Harder Work

Students felt they had to work harder in the ITV course.

- "compared to the style experienced this term, that was not easy" and
- "I think somehow responses were hard to understand".

Constraints on Receptive Communication

It was clear that ITV communication constrained both the reception and production.
 The receptive issues were that the students:
  understood less or less quickly what the instructor said.
  - "my understanding is less through ITV. In other words, what the teacher is saying does not come through and I found it hard to get things across", and
  - "understanding is quicker in direct exchanges".
  were impatient when the camera and the projector had to be switched.
  - "switching the screen to show papers resulted in a waste of time".
  could only see limited gestures.
  - "I could see the teacher partly" and
  - "I felt that gestures were limited by the visual field and the camera. So it was hard to read them".
  could not see the instructor's face all the time.
  - "Some times it was hard to read when the camera was focused on the Teacher F's face and she was writing things on the paper",
  - "teacher's face was not always shown because, for example, only the paper is shown. Then you cannot see the face at all", and
  - "it was a strange feeling not to be able to see the teacher's face when she was looking up something or writing on papers".
  missed the fact that the instructor could not walk around in the class.
  - "In direct lectures, teacher can come around and I like that".
  could not engage gaze.
  - "I was looking at the teacher's face but I didn't feel I engaged my gaze", and
  - "gaze is strange on TV".

Difficulty in Decoding Messages Due to Directional Miscues

Directional miscues made auditory and visual reception confusing: Hearing the instructor's voice from the speaker in one corner and seeing her face on the screen elsewhere was surreal to them.
- "for example, the teacher is here but the voice is there",
- "I am looking this way but the teacher's image is over there", and
- "when I saw myself alone, singled out on the screen while the teacher was talking, I felt like the question was directed to me. Not to the whole class".

A student reported a little auditory delay.
- "teacher's responses to questions come after a while" and
- "it is like a telephone call with time difference".

Students Preoccupation with Reading Instructor's Nonverbal Cues

Decoding instructors' nonverbal cues was students' preoccupation: One group revealed the importance of seeing and reading the instructor's face by describing their concerns when they could not see her.
- "you wonder what she is doing, that concerned me" and

- "I was concerned some of the time, unless I can judge the teacher [if she] has vocal tones".

The insecurity they felt was described.
- "very uneasy" and
- "it was hard to concentrate".

The anxiety came from the inability to engage gaze with the instructor.
- "[I] did not feel good",
- "[I] felt insecure",
- "[I experienced] a unique disjointed feeling" and
- "I think I can study better in the direct way because I can tell how teacher is thinking or her nature if I am face to face with her".

Unique Notions of Good Tension and Atmosphere

Good tension and atmosphere were two mysterious notions the students shared. The latter came up in the discussions in both focus groups. These concepts showed the extent of contextual communication the students were accustomed to. Perhaps because of that, no student could define them except to point out that these qualities were missing in ITV classes. One student complained that in ITV instruction "the positive tension is less [than what it should be]". This investigator questioned "ITV has less tension?" Her answer was "the good sense of tension [was lacking]". Another student brought up the topic of atmosphere by saying "between TV to TV there is no atmosphere, so it is not possible to liven up". Yet another lamented that he "could not judge the atmosphere [in ITV classes]" and his friend agreed "that's true". This investigator tried to guess the meaning by suggesting some definitions such as "Atmosphere… like guessing if teacher is upset?", "body position?" and "atmosphere you speak of is perhaps nonverbal communication?. Answers were "yes", "yes", and "yes, something like that".

Constraints on Productive Communication

Expressive communication issues students described were mostly about the difficulty in asking questions. They said they could not:

    ask questions because it takes time.
- "With ITV even one question takes several exchanges and causes inconvenience"
    show or point to things to explain.
- "It is easier to ask questions in a direct lecture because I can show things but it is hard with ITV, I can't show things"
    state the questions concisely and clearly.
- "When I ask questions I cannot make them clear, so I wished I can deal directly"
    ask questions right after the session.
- "Let me tell you my experience with ITV. I thought of a question as soon as the line was shut off. I thought if the teacher was still here getting ready to leave or in her office, I could ask my question…"
    overcome a preconceived notion that ITV communication is difficult.
- "I probably had a prejudice against ITV which discouraged me from asking questions",
- "I expected. ITV makes me feel the distance and the difficulty of communication",
- "It may be because I already think it is going to be hard to express them [questions]"

Difficulty in Encoding Messages Due to Directional Miscues

Directional miscues made encoding nonverbal cues complicated: The students' subconscious efforts to send positive nonverbal feedback to the instructor caused a dilemma. The students realized that if they wanted to read the instructor's face by looking at the screen, the instructor could not see their faces because they would be facing away from the camera.
- "I wanted to watch the teacher's face but then I was pretty sure she thought 'where is this student looking?'"

Students Preoccupation with Encoding Positive Feedback

Encoding nonverbal feedback was also students' preoccupation. The meaning of the dilemma described above became clearer as similar concerns were brought up in the second focus group. They

recalled the anxiety they felt about the impressions they were giving to the instructor. They talked about the screen that showed the students sitting in the ITV classroom.
- "I don't know how to say, but I become conscious of what conditions I was seen in",
- "you would think we were not that conscious … but…"
- "[I] wondered how the other person is seeing me..." and
- "when there are cameras, cameras do that".

They were bothered when they could not see themselves on the screen.
- "There were times we could not see ourselves. Then I didn't know what to do",
- "am I on the screen now? Or am I not now?"

They expressed how it made them feel.
- "I was uneasy…"
- "honestly, I had those feelings too".

The students said they did not want to be caught doing something wrong but most of all they did not want to appear sleepy. The male students were particularly concerned about sleeping.
- "I know this sounds strange, but if I got sleepy it will be bad to fall asleep",
- "[I] did not want to be caught on screen",
- "I didn't want to fall asleep".

DISCUSSION
ITV as Viable Option

This study verified that the classes can be conducted via ITV without compromising the learning objectives. Immediate style, at least of verbal type, showed positive effects in intercultural communication in spite of the technological mediation of communication via ITV.

Media Effects

Students' dissatisfaction was partly due to the technological limitations inherent in ITV systems even though the set up in this study was bundling of several international phone lines to deliver the best results. Students reported a slight delay in audio reception, impossibility of engaging gaze and for the instructor to walk around. Some of the difficulties could have been resolved by realigning the speaker and the screen or replacing them with multiple monitors. There were also logistically impractical instructional behaviors such as engaging students in out-of-class discussions especially for conversations unrelated to classes.

Culture-Specific Communication Needs of Japanese Students

What this study revealed is that the Japanese students are more likely to be stressed in ITV classes because of the two culture-specific communication needs. One of the foreseen characteristics of the Japanese culture was high-context communication which means greater reliance on shared knowledge and implied meanings often conveyed nonverbally.

Context-Dependent Communication

Focus group discussions revealed that the students were very context-dependent communicators and resistant to or unable to switch to more explicit style of verbal expressions. Because of this tradition, the students were more than ready to take in any messages the teachers were sending with nonverbal immediate behaviors but reluctant to participate in classes. For example, because they could not depend on the deictic means for referring to shared knowledge using such words as "this", "that", "here", "there" or pointing or showing objects, they felt they could not ask questions. They depended so much on instructors' nonverbal expressions that they had a strong need to constantly read the instructors' affects. When they could not receive the full input, they felt "anxious", "insecure", and "disjointed". Students implied that the cumulative effects of nonverbal communication needed to reach a critical level for the class morale to be "liven up" into a positive environment.

Constant Self-Monitoring of Own Nonverbal Cues

Another side to this high-context communication is how Japanese students constantly and subconsciously monitor their own nonverbal cues. This activity became a more conscious one due to the intervention or interference of ITV technology when it became obvious that they could use the monitor screen as a mirror. But the careless positioning of the screen, loud speaker, camera and microphone caused some confusion and frustration. The students' needs to read the instructor's affects

and their needs to present positive feedback to the instructor could not be met simultaneously. A concern about the monitor screen showing the students was reported by McHenry and Bozik (1995). In their American study, the students at the originating broadcasting site were so bothered by having to look at themselves that the monitor had to be disabled. This is quite a contrast to the needs of the Japanese students who were bothered when they could not see themselves.

Japanese students tended to overwork their surveillance which is an energy-consuming process and can divert their attention from lectures. It can be exhausting to look for cues when they are not accessible or to look for meanings when none is intended. It is understandable why the students concluded that the ITV classes were "hard." A future study on how Japanese students manage their own immediacy will be able to further increase the understanding of their learning experiences.

Home-Video Project: Efficacious EFL Approach to Teach Large Speaking Classes

Retno Hendryanti[1] and Ima Normalia Kusmayanti[2]
rth@stttelkom.ac.id, and ink@stttelkom.ac.id
[1&2] Institut Teknologi Telkom, Bandung

Abstract
Video making project has been suggested as a teaching strategy in foreign language classes. Our study showed that home-video strategy provided equivalent opportunity among 50 students to practice and perform the tasks and it increased students' ability in using proper expressions related to their life context. This strategy also provide critical and creative thinking as well as risk-taking, elements of successful language teaching and learning that are otherwise overlooked in large, overcrowded classrooms.

Keywords: heterogeneous language proficiency, crowded speaking classes, video making project, qualitative study, quantitative study

1. Introduction

Among a myriad of problems faced by English as a Foreign Language (EFL) classes in Indonesia are heterogeneous condition of students' language proficiency and crowded classes. This makes teachers difficult to create opportunities to practice the four language skills and accurately assess each student's skills individually. This will even worse when the emphasis of the class is speaking.

In Institut Teknologi Telkom (ITTelkom), we have 50-60 students in a class with varied language proficiency levels. This is applied to English 1 (focusing on reading skills), English 2 (focusing on writing skills, and English 3 (focusing on speaking skills). Consequently, it is difficult to have everyone equal chances to speak in class activities during the 100-minute class time in English 3 classes. Thus, more effective strategy to make everyone speak is urgently needed.

A solution to this problem is video project. Dufon cited in Hanson-Smith and Rilling (2006) argued that video project can be a means to investigate second language interaction. Hoelker, Nimmannit, and Namakmura (in Hanson-Smith and Rilling, 2006) supported Dufon's idea and they added that video project can be used to observe students' verbal expression and body language. Thus, video making project has been suggested as a teaching strategy in foreign language classes (Kondo, 2002; Ryan, 2003 in Hanson-Smith and Rilling, 2006).

Filming and editing are perceived as the most preferable project-based approaches to motivate students to utilize their prior knowledge and experience in English. Moreover, this project provides a conducive environment to gain and develop computer skills in a task-based, cognitively challenging setting (Hanson-Smith and Rilling, 2006) in which students are able to gain a learning experience that is influential for life.

For the reasons above, this study investigated (1) whether home-video strategy gave equal opportunity to both low and high achievers to perform the speaking tasks and (2) whether it improved students' ability to use proper expressions in the context of student's life in campus.

2. Theoretical Foundations
2.1 Speaking in EFL Context
Related to EFL context, ACTFL (Oclarith, 2008) provides seven general speaking levels description: (1) Low Beginners can't produce a sentence, but if guided by questions, they can produce common words, tell name or exchange greeting. (2) Mid Beginners takes time for them to produce a simple sentence and still commit grammatical errors and can't respond correctly to question. (3) High Beginners can talk about topics that are familiar to them. However, their sentences are short and erroneous. (4) Lower Intermediates can ask and answer questions about activities and family. They also know how to use languages in ordering foods and making purchases. (5) Mid Intermediates can talk about basic topics and could talk about topics beyond their basic needs. They can make longer sentences; however, their sentences are still erroneous. There is till long pauses between sentences and

pronunciation is still influenced by first language. (6) High Intermediates can initiate simple conversations. Their interlocutor could understand them better. But still, they have limited vocabulary. (7) Advanced can participate meaningfully in a conversation. They can make paragraph-length utterances. They can also narrate and describe events. Native speaker can understand them well.

It is essential that EFL language learners need to recognize that speaking involves three areas of knowledge: (1) mechanics (pronunciation, grammar, and vocabulary). This involves the use of the right words in the right order with the correct pronunciation; (2) functions (transaction and interaction). This covers knowing when clarity of message is essential (transaction/information exchange) and when precise understanding is not required (interaction/relationship building); (3) social and cultural rules and norms (turn-taking, rate of speech, length of pauses between speakers, relative roles of participants). This deals with understanding how to take into account who is speaking to whom, in what circumstances, about what, and for what reason.

Adapting from several resources, Brown (2001) set out eight characteristics of spoken language, which influence the process of EFL speaking production. The first characteristic is clustering: some learners can pick up a whole sentence, but there are also learners who can only pick up clauses or even only in form of phrases. The second one is redundancy through rephrasing, repetitions, elaborating and insertions. The third one is reduced forms, which can be phonological, morphological, syntactic, and pragmatic. The fourth characteristic is performance variables including hesitations, false starts, pauses, and corrections for grammar. The fifth one is colloquial language, such as idiom, slang, reduced forms, and shared cultural knowledge. The sixth one is the rate of delivery because second or foreign language learners think that native speakers always speak fast. The seventh one is stress, rhythm, and intonation. The eight one is the rule interaction including negotiation, clarification, attending signals, turn-taking, and topic nomination, maintenance, and termination that determine meaning negotiation.

Moreover, the goal of teaching speaking skills in EFL context is communicative efficiency. To help students develop communicative efficiency in speaking, instructors can use a balanced activities approach that combines language input, structured output, and communicative output. Language input comes in the form of teacher talk, listening activities, reading passages, and the language heard and read outside of class http://www.nclrc.org/essentials/speaking/goalsspeak.htm). Structured output focuses on correct form in which may have options for responses, but all of the options require them to use the specific form or structure that the teacher has just introduced. In communicative output, the learners' main purpose is to complete a task, such as obtaining information, developing a travel plan, or creating a video. Speaking evaluation should cover (1) pronunciation, (2) fluency, (3) vocabulary and circumlocution, (4) accuracy and comprehensibility, (5) content, and (6) comprehension and strategic competence (Montgomery, 2000).

For a communicative, learner-centered learning, there are ten useful guidelines for teachers: (1) provide appropriate input; (2) use language in authentic ways; (3) provide context; (4) design activities with a purpose; (5) use task-based activities; (6) encourage collaboration; (7) use an integrated approach; (8) address grammar consciously; (9) adjust feedback/error correction to the situation; and (10) include awareness of cultural aspects of language use.
(http://www.nclrc.org/essentials/goalsmethods/guidelines.htm)

2.2 Video-Making Projects to Promote Communicative, Learner-Centered Speaking Activities
As it is mentioned earlier, video making project has been suggested as a teaching strategy in foreign language classes. Actually, it is also a means to investigate second language interactions, including verbal expression and body language (Dufon 2002; Hoelker, Nimnannit, and Nakamura 1999 in Hanson-Smith and Rilling, 2006). To make a project which is communicative and learner-centered, Hanson-Smith and Rilling (2006) suggested some ways including film project suggestion, organizing and evaluating the project shown in Table 1, 2, and 3.

Table 1 Film project suggestion

Student level before the course	Teaching Strategy	Types of Projects	Further Reading
Intermediate: knowledge of equipment and software operation	1. Self-guided study of software potential and video recording	1. Select a genre (e.g. game show, documentary), and film with local	Sherman 2003

| | 2. Exposure to scriptwriting and film genre
3. School or Web presentation | color.
2. Create a mood to illustrate vocabulary using music and images.
3. Write and dramatize a story | |

		mostly accurate and researched.	researched.	and used to good effect.

3.   Research Method

This was a case study employing qualitative and quantitative method combining action research and quasi experimental procedure to discover whether home-video strategy is an effective EFL approach to teach large speaking classes. The cycle of action research was adapted from "Steps in the Action Research Cycle" designed by Nunan (1994). The quasi experimental was employed for the reason that the participants were not randomly selected.

3.1 Research Site and Participants

The site was at *Institut Teknologi Telkom* located in Bandung, Indonesia. The participants were 100 Informatics Engineering students taking English 3 class. These students were chosen as participants because Electrical-Communication Faculty and Industrial Engineering Faculty do not assign their students to take English 3. In addition, these students were grouped into classes based on semester registration, not based on their speaking level. Regarding to familiarity with multimedia tools, these students are able to operate video camera and computer software for editing movies. To assist the researchers, two lecturers were involved each was assigned to experimental and control group.

3.2 Research Procedure

The data was collected starting from August 2008 to January 2009 using students' home video, student's pre-test and post-test. In addition, questionnaire and interview were also used to reveal students' perception toward home-video project. A complete design of the study is presented in the following figure.

Table 4 Research Procedure

Stages	Description

1	Planning: a. problem identification: pre-test
	             b. observing and recording classroom interactions
	             c. setting a hypothesis

2	Acting and Observing: Conducting intervention: lecturer assigned students
	     a. to do home-video making project (experimental group).
	     b. to do role play as a project (control group)

3	Reflecting: a. presenting the projects
	             b. distributing questionnaires and conducting interviews.
	             c. post-test

4   Results and Discussion

4.1 Planning

In this stage, there were three main activities. The first activity was problem identification. There were 28 meetings for English 3 divided into two terms with mid-term and final exams. The first two meetings were used for classroom introduction and learning contract. 3rd and 4th meetings were used for conducting the pre-test through speaking test in interview format to check the use of expressions about opinion and suggestions to 50 students in the experimental group and other 50 students in the control group. The speaking evaluation score ranging from 1-4 was based on (1) pronunciation, (2) fluency, (3) vocabulary and circumlocution, (4) accuracy and comprehensibility, (5) content, and (6) comprehension and strategic competence (Montgomery, 2000).

Once the scores were listed, two tests were employed to determine normal distribution. Based on Kolmogorov-Smirnov's test, the result for the control group was 0.200 and the experimental group was 0.200. Meanwhile, using Shapiro-Wilk's test, the result for the control group was 0.269 and the experimental group was 0.624. They were above the probability of 0.05; therefore, the distribution in both the control and the experimental group was normal.

Further, T-Test was employed to compare the results of pre-test of the experimental and control groups. The critical value of t with df of 18 was 2.101. The t value of the pre-test score was .152, which was below the critical value of t. Therefore, the null hypothesis was accepted meaning that there was no significant difference between the mean of the control group's pre-test and the experimental group's

pre-test. This indicated that both groups have similar diversity in terms of speaking level, which was from High Beginner to High Intermediate.

Second, for preliminary observation, in the next four meetings, students in both groups were assigned to group works with discussions and impromptu speeches as main speaking activities in the classrooms. They were monitored to generate a hypothesis, which was the third activity in the planning. Based on the preliminary observations, it was revealed that through discussions and impromptu speeches, the High Intermediate students dominated the speaking activities, whist, the Mid Intermediate students only gave short responses, and the Low Intermediate and High Beginner students kept silent most of the time. Thus, it was discovered that discussion and impromptu speech did not provide equal talk time to all students and that more effective strategy to make everyone speak was urgently needed.

4.2 Acting and Observing

Based on the hypothesis generated in the planning stage, students in the experimental group were assigned to make 15-minute home-video project, while students in the control group were assigned to perform a role play for 15 minutes as their project. Students were grouped into seven with each consisting seven to eight people. In the next two meetings, students were introduced to expressions related to expressing and responding to opinions and suggestions. Then, in the 11th and 12th meetings, students got acquainted with script writing and story board.

In the next two meetings, students in both groups had mid-term exam to evaluate whether they are able to use the expressions learned in the previous meeting in the form dialogue. After the mid-term, students in the experimental group organized a film project using self-directed learning (Hanson-Smith and Rilling, 2006). This included writing script, making story board, recording and editing the movie. On the other hand, students in the control group wrote scripts and rehearsed for the role plays. All these occurred in seven weeks.

Based on weekly observations, it was found that throughout the seven weeks, students in the experimental group showed enthusiasm not only in the making of script and story board, and playing the roles in their movies, but also on the using of video camera and software to edit their movies. In the making script, each group ensured all members had equal talk-time in the movie. They showed eagerness throughout the seven weeks of movie making process. Meanwhile, students in the control groups were excited to do their projects in the first three meetings after the project was assigned. They lost interest for the next four weeks.

4.3 Reflecting

In this stage, there were three activities: project presentation, questionnaire distribution and post-testing conducted in three meetings. In the two meetings, students in the experimental group showed their movies, while students in the control group performed their plays. During these meetings, questionnaires were also distributed at the end of each session to discover students' perceptions toward their projects.

To answer the first research question, from the project presentations, it was discovered that students in the experimental group had equal talk-time. This was due to recording and editing process made them able to constantly change their scripts in order to have equal talk time. On the other case, most students in the control group showed the phenomena in which the High Intermediate students dominated the speaking activities, whist, the Mid Intermediate students only gave short responses, and the Low Intermediate and High Beginner students kept silent most of the time. This was similar to discussion and impromptu speech activities. Since they did not have repeated editing process, the equality of talk time was difficult to achieve.

In addition, it was found that students in the experimental group consider their home-movie project challenging because not only they could improve their speaking skills, but also were able to apply their prior knowledge on multimedia technology. In their movie, all members in each group. On the other hand, students in the control group viewed the role play as monotonous activity.

To answer the second research question, post-test were given in the form of interview to see the improvement of students' ability to use proper expressions in the context of student's life in campus, in this case expressions related to opinions and suggestions.

Once again to ensure the normal distribution, two test were employed. The result of Kolmogorov-Smirnov's test for the control group was 0.200 and the experimental group was 0.200. The result of Shapiro-Wilk's test for the control group was 0.450 and the experimental group was 0.181. They were above the probability of 0.05; therefore, the distribution in both the control and the experimental group was normal.

Then, T-Test was employed to compare the results of post-test of the experimental and control groups. The critical value of t with df of 18 was -2.101 and 2.101. The t value of the post-test score was -7.399, which was outside of the critical value of t. Therefore, there was a significant difference between the mean of the control group's post-test and the experimental group's post-test.

5   Conclusion

This study showed that home-movie project provided equal time talk for all students in the experimental group because they were given opportunity to constantly edit both their script and recorded movie. On the other hand, in the case students in control group, the fact that some students dominated and others lacked of time to talked was do to the inability to edit during their live performances.

Since the scores of the experimental group were higher, it can be concluded that home-movie is more effective than role play activity. In our context, video-making project is effective strategy for students to combine what they have learned in their real-life experience, and most importantly to make everyone speak in the context provided.

There are a multitude of benefits of using a task-based approach to teaching EFL. Our video project sought to solve the aforementioned problems by creating student produced videos, while at the same time increasing student motivation by giving them the opportunity to express their original ideas and creativity. Using scaffolding to support students during the creative process, the teacher can provide the language and writing support necessary to for students to create a coherent and entertaining video. This type of project also incorporates critical and creative thinking as well as risk-taking, elements of successful language teaching and learning that are otherwise overlooked in large, overcrowded classrooms.

Getting Feedback from the Unresponsives:
When Students Can't Tell If They Do (Not) Understand

Florita Diana Sari[1], Danang Mursita[2] and Jondri[3]

[1,2,3]Faculty of Science, Telkom Institute of Technology (ITTelkom), Indonesia
[1]flo@ittelkom.ac, [2]dma@itttelkom.ac.id, [3]jdn@ittelkom.ac.id

Abstract

Feedback is key factor in learning without which learning will be meaningless. Instead of asking student's feedback conventionally like "Do you understand?", one best practice offers three sub-methods to maximize feedback communication in large classes, i.e. seating adjustment, tardiness management, and traffic-light cards. This paper reports that students and lecturers responded positively toward F2M; students achieving A and B grades increased from 45% to 58%, while those achieving D and E decreased from 35% to 21%.

Keywords: feedback communication, material comprehension, student's achievement

A. Introduction

"Do you understand?" and "Any questions?" are possibly two of mostly asked questions that mostly remained unanswered when university teachers try to communicate with students in classroom. It seems that many of university teachers do not really realize that the two expressions may not quite the successful ways of obtaining proper feedback on material comprehension. If lecturers are lucky enough to teach high-achievers or highly curious students, they may respond well to "Any questions?". However, in all levels of education, the "Do you understand?" seems to be 'must-be-avoided' type of question due to its potential failure to engage students in responding to materials comprehension. Especially in large classes, students may have various responses in mind, none of which is likely to be communicated to the lecturer. Such responses may be well represented in the following excerpt, showing what comes to students' mind when lecturers ask whether students understand.

.

Do You Understand?

'Do you understand?' lecturer asks student.

 'Understand what?' thinks student.
 'What am I supposed to understand?'
 'What will my lecturer think of me if I say "no"?'
 'If I say "yes" will my lecturer ask me a difficult question to catch me out?'
 'Why am I being asked this anyway?'
 'Is it going to be important for me to understand this?'.
 'How will I know when I understand it?'.
 'What will I be able to do when I understand it?'.
 'How will I be able to demonstrate my understanding of it?'.
 'Do I actually have to understand it, or will it be enough simply to demonstrate my understanding of it, by doing something I can do, even when I don't understand it?'.
 'Does my lecturer understand it, anyway?'.

'Mmmm…' replies student (as soon as possible after all that thinking).
'So you don't understand it then?' alleges lecturer.
'Well, …' replies student.
'So you understand it well?' smiles lecturer.
'Just about' replies student.
'Ah, good' says lecturer. 'I made myself clear then?'
'Of course' replies student.

[Because of things like this, the word is best avoided in intended learning outcomes – and in life in general, except to get people thinking]

              (from Race, 2000; with minor editing)

Burning issues thus arise as how to help classroom communication successful and mutually useful? What is to be communicated, instead of asking "Do you understand", when university teachers want to know if their students really understand? What are possible ways of knowing students' comprehension without test, and even without asking?

To begin with all this issue, among matters and manners of communication that may take place in class, communicating feedback can be the most useful for learning. Feedback is said to be 'the most influential factor in learning' (Black and William in Harmer 2007), without which teaching/learning process will be meaningless (Taylor 2006, Mink et al 1993). Such important is constructive feedback that William and Black (1998) believe it as "at the heart of teaching" (Harmer 2007 p. 137).

Therefore, in attempts to respond the above three issues, we focus to design one method of obtaining student' feedback and manage it to be used right away as feedforward for lecturers. We call the method Feedback-Feedforward Mechanism (F2M). This way, after learning or doing some materials, students will give feedback on their material comprehension and lecturers will immediately use the information to adjust the teaching techniques for the same session. The expected outcome of this method is that not only communication will take place successfully but also it will be used to increase the quality and achievement of learning process.

Although F2M can potentially be applied in large classes in general, but as initial implementation we select two Calculus-I classes in one engineering institute in Indonesia. There are at least three reasons for the selection. First is that Calculus-I is one of the four compulsory subjects in the Preparatory Year that usually has low level of achievement. Data from three previous years shows that 51% Calculus-I students in average got C or lower. The three others subjects are Calculus-II, Physics-I, and Physics-II, with achievement of $\leq$ C are 58%, 69%, and 79% respectively (www.itttelkom.ac.id/intranet). These students whose grade C or less will very likely repeat the subjects in the following semesters, including in the 6-week 'Short Semester' inserted between academic years as remedial semester for 'repeaters'. Some of them even take it for the third or fourth time in order to escape the Drop-Out at the end of the 4th semester for those with GPA less than 2.0 (at the scale of 4).

The second is that Calculus-I, to be taken in first semester, trains mathematic-analytical skills that is crucial for most engineering and science subjects in the following semesters. Its load of 4 credit hours per week also adds importance to this Calculus subject, compared with Physics I and II which only worth 3 credit hours. Increasing students' achievement in Claculus will more significantly improve students' Grade Point Average (GPA).

The last reason is obtained from preliminary questionnaire about learning math. Students' response to the questionnaire shows that 32% students have anxiety when learning math. Some 28% students think that learning math is dull and boring. These findings help lecturers to introspectively examine the existing practices in math classes, motivating the lecturers to think of ways in improving achievement and learning satisfaction. Added with the perceived needs to obtain information on students' level of understanding before tests, a mechanism on how to get students feedback is needed. This mechanism is expected to get feedback from all students rather than just from the active ones, so that even the most unresponsive in class will participate and benefit from it.

B. The Existing Condition

Observation in three different Calculus-I classes provides information on the existing condition of typical Calculus class. Such information is necessary prior to any design of mechanism. Three main characteristics on classroom, leacturer, and students are observed and examined as follows.

The typical classroom in the campus site of study is 9m x 18m room equipped with white&blackboard at the center of the front walls, LCD-projector, OverHead Projector, and 100 seats. It usually provides room for 70-85 students. The seatings are 7-aisle-7, with all seats facing the front wall. This setting does not quite help students nor lecturers. Students sitting next to side walls will have less clear and comfortable views toward the whiteboard. Lecturers will also not be able to reach students sitting next to side walls, areas where students will easily find a 'refuge' to escape lecturers' attention. At the same time, the rear of the classroom is usually left empty.

Fig 1. Floor of typical class (7-A-7)

Lecturers mostly use conventional teaching method, resulting in 'board-to-projector oriented' lecturing. The flow of teaching is generally in 'one-size-fits-all' approach, thus lecturer will very likely aim to teach the 'middle students', i.e. those who are not very strong nor very weak in learning. This approach is taken since these lecturers think that normally middle students will constitute the greater number of students in the class. This way will very likely bore the stronger students while at the same time is less helpful for weaker ones. Combined with the seating explained above, this approach will increase the possibility of 'undetected failure of learning' during the process.

Students are less responsive in terms of voluntarily doing problems on board, asking questions, and responding to lecturer's prompts. The seating may also influence this condition since not only the lecturer find it difficult to reach all students, but also it is difficult for students to get themselves out of their seats to go to the board. Further, students rarely communicate their difficulty in understanding the material. As mentioned at the beginning of this report, students will unlikely respond well to questions like "do you understand?" or "any question. Lecturers may then come up with tests and quizzes to measure students' comprehension, ways which may adversely increase students' anxiety in learning math. Such anxiety may even be greater in classes with very discipline lecturers, resulting in lower attendance or even complete withdraw of weaker students.

Having observed the existing condition, four problems are identified and thus formulated as follow:
1. seating in the class is not optimal for mutual engangement and feedback communication.
2. conventional lecturing leads to monotonous and repetitive learning process, mostly without sufficient feedback.
3. ratio on lecturer-students does not help lecturer to respond to heterogenous level of understanding, particularly in the absence of students' feedback
4. anxieties hinders students from communicating difficulties or feedback to lecturers, decreases class attendance, and may lead to complete withdraw from class activities.

In attempts to solve these problems, F2M is designed and implemented on two classes of Calculus-I during one semester. Thus the F2M aims at general improvement of feedback communication take place in class, with particular goals to cope with classroom problems mentioned earlier. Thus, more specifically the aims of designing F2M are:
1. to condition classroom physical environment as to help students-lecturer to communicate better,
2. to offer inexpensive, quick-and-easy method to encourage feedback communication in classroom,
3. to respond to students with greater difficulty in understanding material without reducing the size of class,
4. to deal with students' anxiety in attending learning and in communicating difficulties.

The ultimate goal of this method is thus increasing students achievement as a result of better feedback communication happening in class.

C. The F2M

We design an alternative method to promote feedback communication which in turn is intended to increase overall students's achievement. This method, called Feedback-Feedforward Mechanism (F2M) consists of three sub-methods, i.e. seating adjustment, tardiness management, and traffic-light cards.

1. Seating adjustment (3-6-3 setting)

Seating adjustment is perhaps one of fundamental modifications in daily classroom practices in the site institution. For about seventeen years, the 7-aisle-7 (7A7) seat arrangement (see Fig. 1) has been used with no complains nor retrospective examination. One among reasons why seating arrangement deserves better attention is that the current arrangement does not provide equally clear views to whiteboard nor give sufficient room for lining up and exiting the room as two of main criterias of good classroom arrangement (Pitner, 2009). The 7-aisle-7 seat arrangement practically has given up the center space of classroom, that with best views, to the aisle. With only one aisle, lecturer may not find it inviting to come to reach all students up to those at the back of the class. This single aisle may in many cases even disappear due to students' moving their chairs to fill in all front row spaces available.

Therefore, F2M requires readjustment of seating first by dedicating the best center column for students. Secondly, adding more aisles will likely ease lecturer to move around the class to get 100% coverage on students. The last, the rear space of the class should be utilized to allow greater amount of movement and circulation within classroom. Thus the new arrangement will be best illustrated in the following figure.

Fig. 2. The floor of 3-6-3 arrangement

In this new setting, seats are arranged in 3 seats – aisle – 6 seats – aisle – 3 seats. Such setting dedicates the central column of the class, the area with best view toward board/screen, to 50% of total students. The remaining half of students seatings are divided into two on each sides, facing 45° toward board/screen. This way, all students will get the best available views with less muscular strain. Besides, if lecturer can only reach and distribute attention to 3 students at each sides of the aisle, this new setting with two aisles will naturaly provide 100% coverage to all students. Although having 70-85 students in one classroom may not the best practice for teaching math, this 3-6-3 setting allows better sirculation of people and air. Thus, within all the limitations at hand, this setting may help creating a better learning environment.

In short, compared with the previous 7A7 seating, there are at least three advantages of the proposed 3-6-3 setting, i.e. (a) providing better and more confortable view, (b) allowing 100% coverage of lecturer toward the students, and (c) allowing better air and people sisculation. This setting is not complicated and thus can be well prepared by the cleaning service and become the default setting in the site campus.

Pic 1. 100% lecturer-coverage on students

This 3-6-3 setting has also been implemented as pre-condition for the last sub-method of F2M, namely the traffic-light cards. Later the rear space of the class is used for grouping and regrouping students for different instruction based on the traffic-light card that students acknowledge. Further about traffic-light card will be explained later. At this point, below in Fig. 3 is the complete setting of 3-6-3 with view of the rear side of classroom.

Fig 3. Complete setting of 3-6-3 with rear space for on-carpet activities

2. Tardiness management (MMS rule)

Preliminary study and observation show that lower achievment in Calculus-I classes (very likely in other classes as well) is partly due to lower attendance. Most of lower attendances are caused by tardiness, in which lecturers decline students coming into class if they are late. It will be unlikely for such students to keep up their pace with other fellow students, at least for the days they come late. In the long run, it will disadvantage these students as they will become illegible to sit for exam when their atendance is less than 80%. If late students do not have access to learning in classroom then they will also have no access to any feedback taking place in classroom. The number of late students, however, tend to be increasing as students may become busier with all intra and extra academic activities including the process of adjusting to new life as university student.

Hence a mechanism to teach discipline to students with greater access for them to attend class is necessary. F2M comes up with a rule for students to wait outside for a while if they come late. This rule is dubbed MMS (in Indonesian/Malay: 'Mohon Menunggu Sebentar', which means 'please wait a while'). Applying MMS, lecturer in the course introduction will explicitly ask that late students should not knock on the door nor enter the classroom until the lecturer lets them in. Late students must wait outside in order, without distracting attention. This way, lecturer will be able to finish explaining parts of material and to find pause to open the door and allow late students to attend the rest of materials for the day.

Variations to this rule can be numerous. For lecturers who wish to promote discipline, the attendance of late students may not be taken despite the rights given to follow classrooms. For lecturers with greater interest to train students through exercise drills, they may give additional assignement for late students while suspending the attendance for the day until the assignement is turned in. Still some other variation may apply to this rule.

There are at least three advantages from applying this rule. First is that all students will maximally be exposed to classroom learning and feedback. This will help them keep up with learning materials and get direct assistance from lecturer when they find difficulties. Secondly, this MMS rule will allow lecturer to treat students' tardiness porpotionaly with the amount of their tardiness. The rigid regimen of discipline will not be able to respond differently to students' 1-minute or 1-hour lateness, that like on/off button the class is started and ended. MMS will naturally treat students who are 2-minute late differently from those who are 20-minute late, that they will likely have different waiting time. The last is that this rule cater all interests playing in classroom: teacher can still promote discipline and order, on-time students will not be much interrupted by the late-comers, and still late students will hve access to classroom learning and feedback.

3. Traffic-light cards (TLC)

One crucial part in obtaining feedback during the learning process is when materials have been delivered and there comes the time to know whether students understand it or not. As an alternative to replace the conventional way of "Do you understand?", F2M uses three colored-cards as a means of assessing students' comprehension (Pic 2). Although such cards can appear in any colors, they are usually in red-yelow-green similar to those of traffic light and therefore are conveniently called Traffic-Light Cards (TLC).

Pic 2. Trafic-Light Cards (TLC)

Traffic-light cards (TLC) are not new idea in learning method, especially in K-9 education. They are flexible and can be used in various subjects from English to Chemistry. Among ways of using it is when teachers ask questions with A-B-C of answers, students may respond by raising red card for A, yellow for B, and green for C (Traffic card as Starter, www.lancsngfl.ac.uk). Another example is using the cards for ordering class, i.e. teacher may lift red card to 'stop all activities', yellow card 'to prepare starting activities', and green card 'to start activities' (www.ehow.com). Also, TLC can be used similar to its purpose in soccer: as punishment and reward for students.

In university Calculus class, one application of TLC is to help students communicating their level of material comprehension. Each color represents certain percentage of comprehension, e.g. red card for up to 50%, yellow card for 50-75%, and green card for 75-100% comprehension. This way, after a portion of material delivery, lecturer will ask students to assess themselves as to measure how many percent they think they understand the material. It is important to notice that TLC will be useless if lecturer does not quantify the worth of each card. If each card simply represents 'understand', 'half understand', and 'not-understand', TLC will only confuse students. In turn the result will confuse the lecturer since students may have misunderstood their level of comprehension, or the way students interpret the level of 'understand', 'half understand', and 'not-understand' may be different from that of lecturer's.

TLC may appear in any dimension as long as they are easy to hold. In this, study we use 10 cm x 7,5 cm cards of green-yelow-red and blue-white-pink. We observed that both sets of colors worked well. Questionnaire from two classes show that none of the 109 students feel embarrassed in using the cards, either in sessions with green-yelow-red cards or those with blue-white-pink ones. However, further trial on this method show that TLC canot be replaced by raising hands. Most students find that raising hands when lecturer ask their level of comprehension is somewhat embarrassing. Therefore, TLC have helped students to eliminate embarrasement in communicating their level of understanding.

Mechanism in using TLC is easy and quick. The method is also highly flexible in terms of time allocation, allowing lecturer to adjust TLC to respond to students' need. As a model implemented for 100-minute session, the scenario and time allotment can be illustrated as follows.

Fig. 5. Scenario of using TLC

Time	Step
20 minutes	1. Lecturer delivers material in 20 minutes. This limited span of material delivery will hopefully encourage students to come on-time and learn the materials before attending class.
10 minutes	2. Lecturer distributes TLC and quantifies them (writing the value of each card on whiteboard: red card for up to 50%, yellow card for 50-75%, and green card for 75-100%) 3. Students all at once lift the card relevant to their comprehension level. Lecturer counts for the reds and the greens. 4. Lecturer extracts the reds from the population, and groups them at the rear space of classroom for on-carpet activity. In cases where reds do not appear, greens can be separated and grouped for on-carpet activity.

30 minutes	5. Students with yellow cards are grouped with the greens, with ratio of for example 5 yellows for 1 green. The ratio can be adjusted to class situation. These groups will independently (without much of lecturer's help) discuss and do calculus problem given by lecturer on tranparent mica, using whiteboard marker as the pen and tissue paper as the eraser. The solution on transparent mica will be presented by the greens in front of the class after the class resumes. 6. Students with reds will receive full assistance from the lecturer and do calculus problem more suitable with their capability. (In these pictures, the reds are none. Therefore the greens are grouped at the rear space of class, doing calculus problems independently with their peer-greens while the yellow groups are receiving lecturer's assistance. The calculus problems done by the greens are still those that may appear in Calculus exam. This way, when the solution is presented in front of the yellows, there will be not much gap between the greens and the yellows).
30 minutes	7. Class is resumed and the greens present the solution to their problems on the OHP. Lecturer gives feedback on their creativity and analysis.
10 minute	8. Lecturer distributes cek-out papers on which students can communicate additional difficulty found in the session. Written feedback will allow all students to communicate their ideas/problems at once in shorter span of time rather than allowing students to communicate it orally.

D. Conclusion

Implementing F2M, 109 students and their lecturers found it useful in communicating feedback about material comprehension. Students responses on Likert-scale classroom questionnaire revealed that 63% supported the tardiness management and 78% found traffic-light card helpful or very helpful. None of the 109 students in two classes think that F2M, especially the traffic-light cards, embarrassing. Assuming that calculus classes have typical students inputs and they learn same materials, comparison between year prior to F2M and that after F2M showed increase in student achievement: students achieving A and B grades increased from 45% to 58%, while those achieving D and E decreased from 35% to 21%.

We believe that due to its flexibility and effectivity in obtaining feedback for quality teaching and learning, F2M can be well responded in other classes especially those involving problem solving. Classes with full lecturing, such as Civics, may not be really benefitted from F2M. However, application on other science classes such as Calculus-II, Physics-I, and Physics-II can be considered. This way, overall achievement especially for students in their Preparatory Year (first year) is expected to increase and will help students to achieve greater success the following years.

THE RELATIONSHIP BETWEEN CULTURE OF LEARNING AND TURKISH UNIVERSITY PREPARATORY STUDENTS' READINESS FOR LEARNER AUTONOMY

Ms. Aslı Karabıyık
Anadolu University
Turkey

Abstract

The applicability of learner autonomy in different cultural contexts has been widely researched in the literature in recent years. However, the studies investigating the connection between culture and learner autonomy in Asian cultures have been inconclusive as they revealed contradictory findings about Asian students' reactions to autonomous learning. Taking this inconclusiveness as an impetus, this study aimed to investigate Turkish university learners' readiness for learner autonomy and its relationship with learners' culture of learning to explore whether learners' approaches to learner autonomy were based on their culturally predetermined learning behaviors or could be explained on the basis of differences in their educational backgrounds and experiences.

This study implied that national and ethnic definitions of culture may not sufficiently explain the differences in learners' autonomous behaviors. Therefore, learners' previous learning experiences - culture of learning- along with other individual factors should be taken into account in any attempts to promote learner autonomy.

This study gathered data from 408 students from the preparatory schools of seven universities in Turkey. The data were collected through questionnaires, and analyzed quantitatively by using descriptive statistics, a one-way ANOVA, cross tabulations and a Pearson product-moment correlation coefficient.

Analysis of the quantitative data revealed that there was a statistically significant relationship between the participants' culture of learning and their readiness for learner autonomy, which suggested that the extent of exposure to autonomous activities in the high schools in which the participants studied had an effect on their subsequent perceptions and behaviors related to learner autonomy.

TEACHER EVALUATION IN GHANAIAN POLYTECHNICS – SOME EXPERIENCES FROM TAKORADI POLYTECHNIC

Nkrumah, Maame Afua: maameafuankrumah@yahoo.com

Apori, Samuel Obeng (Dr.): nanaapori@yahoo.com

Takoradi Polytechnic

Abstract

Student's evaluation of teacher performance is one of the most controversial techniques used to identify teacher effectiveness. Many question and challenge the usefulness of students' ratings in providing feedback that can lead to improved instruction by teachers and learning by students.The concept of school self evaluation is quite new in most Ghanaian Polytechnics. In fact, ensuring the quality of Polytechnic education internally has had a checkered history in most Ghanaian Polytechnics and Takoradi Polytechnic is no exception. In recent times however, Takoradi Polytechnic has put in place several interventions meant to improve its educational quality. Among these interventions has been teacher assessment which is an important component of school self evaluation. Teacher assessment at the polytechnic is aimed at improving teaching and learning but, the exercise is faced with many challenges. Hence, the main objective of this research was to find how teachers and students of the Polytechnic perceive teacher assessment, the challenges associated with the exercise and how it can be improved.

To effectively investigate this, data was collected from the Rector of the Polytechnic, 4 staff members of the Academic Quality Assurance Unit, fifty lecturers and three hundred students. In all, three hundred and fifty-four respondents were involved in the research. The following aspects were investigated using structured questionnaire and an interview guide: the value of the assessment, the consequences of it on teachers and students, challenges associated with the exercise and areas for improvement. The Statistical Package for the Social Sciences (SPSS) was used for the analysis and the results were presented using descriptive statistics.

The results of the study revealed that assessment of lecturers is very much valued by most lecturers and is not seen as 'attacking'. In fact, many of the lecturers were willing to effect the needed changes revealed through the assessment. Unfortunately, few students entertained fear of being victimised, while others were not motivated to participate in the exercise because of the perception that the exercise had no punishing consequence. Some students were also not very cooperative during the exercise due to the fact that they lacked adequate education on the exercise. Interestingly, the majority of the concerns raised by the students had to do with facilities and the management of the polytechnic. Details and possible explanations to these, and their implications for Polytechnics and researchers are presented in this report.

INTERNAL COMMUNICATION IN GHANAIAN POLYTECHNICS -

CHALLENGES AND PROSPECTS

Apori, Samuel Obeng (Dr.): nanaapori@yahoo.com

Nkrumah, Maame Afua: maameafuankrumah@yahoo.com

Forson, Joseph Oscar: konforson03060@yahoo.co.uk

Takoradi Polytechnic, Ghana

ABSTRACT

Many of the problems that occur in organizations are the direct result of faulty communication. Hence, many agree that without good communication, organizations develop nasty grapevines and employees feel excluded and kept at an arm's length from work. In fact, for any effective work process aimed at achieving clearly set out goals, the important role of communication cannot be over emphasized. This is because work is first and foremost about communication/relationship with others - bosses, coworkers, clients etc. Communication problems at work can suck the energy of workers and affect the productivity of staff and the quality of students produced. Lack of communication problems however, results in the accumulation of energies toward the achievement of set goals and results in increased productivity. It was therefore for a good reason that, the purpose of the study was to explore the challenges associated with internal within Ghanaian polytechnics and how these can be improved in order to increase productivity.

The respondents of the study were in total 120; 66 males and 54 females. Administrative staff from all ten polytechnics in Ghana was used for the research. A semi-structured questionnaire was used to collect data collection, SPSS 12.0 computer programme was used to analyze the data and descriptive statistics was then used for the presentation of the results.

The results of the study showed that quite a significant number (40%) of Ghanaian polytechnic workers were not satisfied with internal communication within their polytechnics. Among the many challenges were: much use of the grapevine; perceived favoritism; inadequate communication gadgets and malfunctioning or absence of effective print media in communication. The causes of these challenges

and how they can be handled are also presented in this report. The research results further form a basis

for future research and many academic arguments.

WORK-FAMILY CONFLICT, JOB SATISFACTION AND LABOUR TURNOVER INTENTIONS AMONG TEACHERS

Oredein, afolakemi olasumbo (Ph.D)
e-mail:opyoredein@yahoo.com
Institute of Education
Olabisi Onabanjo University
Ago-Iwoye, Ogun State.

Ilisan, Ogun State
Nigeria

Abstract
Examining the extent at which work-family conflict and job satisfaction could predict the labour turnover intentions among Nigerian secondary school teachers is the purpose of this study. 229 (95%) respondents out of 240 returned their copies of the questionnaire for data analysis. The results reveal that there was a statistically significant ($p > 0.05$) influence of work-family conflict, and job satisfaction on labour turnover intentions among secondary school teachers in Ogun State, Nigeria, as perceived.

Key Words: Work-family conflict, job satisfaction, labour turnover, secondary school, Nigeria

Introduction

Work-family conflict is an inter-role conflict in which the role pressures from work and family domains are mutually incompatible in some respect (Carmeli, 2003). That is, the participation in the work -family role is affected by participation in the family -work role. Work-family conflict is a common problem among employees; it is an undesirable situation and it negatively affects quite a number of other areas within and outside the family, these include: an increase in prolong fatigue, high level of absenteeism at the work, and labour turnover intentions, among others (Nicole, 2003). The most common outcomes associated with work-family conflict are higher instances of job and family distress, poor health outcomes, and decreased job and life satisfaction (Warner, 2005). Sometimes, it leads to broken homes, and polygamy or an unexpected marriage. Nicole (2003) reveals that work-family conflict is caused by factors from both the work and home situations. The role of work time arrangement in the development of such a conflict is particularly striking; for example, working shifts, sudden transfer, frequent overtime, and change of working hours all increase the risk of conflict. Both the organization and the employee have the responsibilities of eliminating work-family conflict. Empirical evidence shows that individuals with high emotional intelligence are able to balance family interference with work and vice-versa (Brett & Stroh, 1995; Clarke, 2000; Carmeli, 2003; Nicole, 2003).

There is a growing body of research that reveals that work-family conflict is more prevalent than family-work conflict (Warner, 2005). This is not surprising given that these pressures continue; the experience of employees' work life interfering with their family is almost inevitable. Warner further says that the most significant determinant of work-family conflict is found in the work domain. Therefore, it is critical for employers to become aware of practices that can be implemented in order to reduce employees' work-family conflicts.

Clarke (2000) cites Minuchin proposed family systems theory, which suggests that families are cultural systems that go through developmental stages. This tries to maintain a sense of continuity and equilibrium and enhance each member's growth. The theory and the related concept of family equilibrium suggest that pressures both outside and within the family can disturb the equilibrium of the family (Brett & Stroh, 1995). Clarke reflects on the double ABCX Theory and suggests that three factors interact to produce a family's well-being: the stressor, the family's resources or characteristics to cope with the stressor, and the family's ability to cope with the stressor. Wiggins and Sheham (1994) proceed to identify family support, family adaptability and family communication as predominant among characteristics that facilitate coping, with family communication identified as the characteristic that enables the evolution of the other two attributes of family functioning.

Job satisfaction is a psychological concept and, therefore, giving it a precise and single scientific definition might be nearly impossible, since the nature and concept are somehow abstract. However, job satisfaction could be defined as a pleasurable emotional state resulting from the appraisal of one's job, an effective reaction or an attitude towards one's job. In other words, job satisfaction implies the extent to which people like their job and dislike it. Weiss (2002) argues that job satisfaction is an attitude; it refers to how content an individual is with his or her job. Job satisfaction is a relatively recent term in the Nigerian context since in previous centuries; the job available to a person was often predetermined by the parents' occupation. Job satisfaction is very crucial to the long-term growth of any organisation. Job satisfaction is closely related to efficacy, and, it has been identified that many teachers lose or fail to develop self-efficacy within educational settings (Dweck, 1999). Various researches have been carried out on factors that could influence teachers' job satisfaction (Evans, 1998; Mäenpää, 2005). Those factors include: school-specific factors like availability of material resources, teacher-students ratio, school environment, and school culture, prompt payment of salary, and feelings of successful teaching, among others. Interestingly, teachers have different factors that could influence their job satisfaction. For instance, prompt payment of salary might be an influencing factor to a teacher while school environment might be an influence factor to another. Job satisfaction has been demonstrated to be closely related to commitment, turnover, job performance, productivity and burnout (Khaleque, Hossain, & Hoque, 1992; Cooper & Kelly, 1993).

Labour turnover is the voluntary or involuntary termination of an individual's employment with a given organization. Labour turnover is the rotation of workers around the labour market, between firms, jobs and occupations, and between the states of employment and unemployment (Abassi & Hollman, 2000). Each time a position is voluntary or involuntary created, a new employee might be replaced, this replacement cycle is known as turnover (Woods, 1995). Labour turnover is a much studied phenomenon (Lam, Foong, & Moo, 1995; Shaw, John, Jerkins, & Nina, 1998; Booth & Hamer, 2007). Labour turnover or 'brain drain' as it is being referred to in tertiary institutions is one of the major challenges facing education in Nigeria today. Labour turnover intentions seem to be very prevalent in private secondary schools than in public schools, and this might be due to some physical or social influences. The physical influences include poor salary, school environment, and delay in payment of salary among others. Social influence on the other hand is the shared cognition by friends or organizational members that influence people's decision on job movement (Albeson, 1993). The social influence makes hopping from one job to another an acceptable behaviour (Naresh, Pawan & Chong 2003), thus, if an individual has not changed his/ her job for a long time, he/she feels an increasing pressure to do so because of social influence. In some countries in Asia, it has been observed that labour turnover intentions is giving sleepless nights to human resource managers, and employees have developed bad attitudes due to labour shortage (Naresh, Pawan & Chong 2003). But in Nigeria, the Guardian newspaper an editorial of noted that in the last 20 years, a sizeable number of Nigerian academics have migrated abroad in search of greener pastures.

Statement of the Problem
It is observed that there is a growing labour turnover intention among secondary school teachers especially in private secondary schools and this in turn results to frequent in change of teachers even within an academic session.
This study therefore examines the extent at which work-family conflict and job satisfaction could predict the labour turnover intentions among Nigerian secondary school teachers. Also, the study investigates the relationship between work-family conflict, job satisfaction and labour turnover intentions among Nigerian secondary school teachers. Gender influence on work-family conflict, job satisfaction and labour turnover intentions among secondary school teachers were examined as well.

Research Questions
To this end, the study focuses on answering the following research questions:
- What are the perceived causes of work-family conflicts?
- To what extent would composite influence of work-family conflict and job satisfaction predict secondary school teachers' labour turnover intentions?
- Is there any statistically significant relationship between work-family conflict, teachers' job satisfaction and labour turnover intentions?
- Is there any statistically significant gender influence on work-family conflict, teachers' job satisfaction and labour turnover intentions?
- Is there any statistically significant difference between private and public secondary schools on work-family conflict, teachers' job satisfaction and labour turnover intentions?

Method

Design

The research is to elicit information on work-family conflict and job satisfaction as predictors of labour turnover intentions among secondary school teachers. The study is purely a descriptive survey research where variables in this study had already occurred and are not subject to manipulations. Work-family conflict and teachers' job satisfaction are the independent variables while labour turnover intention is the dependent variable.

Participant

The participants in this study were drawn from the private and public secondary schools in all the 20 Local Governments in Ogun State, Nigeria. The Local Governments were clustered into four groups based on the geographical location. Schools Two secondary schools were randomly selected from private and public secondary schools from each of the four groups based on the year of establishment, making 8 private and 8 public selected secondary schools. From each selected secondary school, 15 teachers were randomly selected based on their work experience; making 120 private school teachers and 120 public secondary schools teachers, also, 238 (99%) of the participants returned their copies of the questionnaire for the study, 118 (99%) teachers from the private, and 120 (100%) teachers from the public secondary schools respectively.

Instrumentation

The development of the questionnaire was guided by a literature review. A structured Personal and Organizational Factors of Teachers' Turnover Intentions Questionnaire (POFTIQ) was adopted for the study. The instrument used has four sections: A, B, C & D. Section A aims at seeking information of a background nature, including age, gender, name of the school, location, year of establishment, work experience, and marital status, among others. Section B elicits responses on the teachers' job satisfaction, using a 4-point scale ranging from *strongly agree to strongly disagree*. The focus of sections C and D are on work-family conflict and labour turnover intentions. Section C and D comprises 10 structured items each with a 4-point scale ranging from *strongly agree to strongly disagree.* The instrument was first administered to 10 teachers (alpha = 0.85) as pilot survey.

Procedure

Participants responded anonymously to the questionnaire given to them. All data collected were grouped based on the various research questions formulated for testing in this study. The data was subjected to statistical test and analysis. Descriptive statistics, Correlation, Regression analysis and t-test were used to calculate the research data.

Results

Research Question 1: What are the perceived causes of work-family conflicts?

Table 1: Descriptive Statistics on the Perceived Causes of Work-Family Conflicts

Perceived Causes	N	Mean	SD	%
Stress from work	238	3.22	0.51	9.88
Lack of good parental care	238	3.35	0.70	10.26
Love of money	238	3.19	0.77	9.77
Nature of job	238	3.37	0.72	10.32
Poor remuneration	238	2.93	0.92	8.97
Job insecurity	238	3.58	0.61	10.96
Lack of understanding between couple and extended family	238	3.27	0.64	10.01
Extra marital affairs	238	3.41	0.59	10.44
Family background	238	2.93	0.90	8.97

Cultural belief	238	3.41	0.59	10.44

Table 1 above reveals that job insecurity is the perceived highest cause of work-family conflicts among secondary school teachers with the percentage of 10.96. Cultural belief and extra marital affairs are the next perceived causes of work-family conflicts among selected secondary school teachers with the same percentage of 10.44. Next to cultural belief and extra marital affairs is the nature of job (10.32%), like jobs that involve transfer, or shift. For instance, transfer as in the case of teachers, shift as in the case of nurses. Poor remuneration and family background are the least perceived causes of work-family conflicts among selected secondary school teachers with the same percentage of 8.97. This shows that poor remuneration and family background are not really the cause of work-family conflict among teachers compared with the teachers' job insecurity as it often take place in private secondary schools.

Research Question 2: To what extent would composite influence of work-family conflict and job satisfaction predict secondary school teachers' labour turnover intentions?

Table 2:   **Analysis of Variance**

Variables	Sums of Square	DF	Mean Squares	F-value	Prob>F
Regression	2201.583	2	1100.792		
	5039.413	235	21.444	51.33	.000*
Residual	7240.996	237			
Total					
R= 0 .551					
R^2= 0.304					
SE= 4.611					
R^2 (adj.)= 0.298					
DurbinWatson=1.543					

* Sig. at p<0.05

Table 2 above presents the regression analysis on the composite influence of work-family conflict and job satisfaction on secondary school teachers' labour turnover intentions. Since $\alpha = 0.05$ exceed the observed significance level, p = 0.000, the data provide strong evidence that at least one of the coefficients (independent variables) is non zero. The overall independent variables (work-family conflicts, and job satisfaction) appears to be statistically useful for predicting the dependent variable (teachers' turnover intentions) This implies that work-family conflict and job satisfaction have statistically significant composite influence on secondary school teachers' labour turnover intentions. The R^2=0.304, that is, the explanatory variables (work-family conflict and teachers' job satisfaction) capture about 30% variation in the endogenous variable (secondary school teachers' labour turnover intentions). Also, it implies that work-family conflict and teachers' job satisfaction exert a significant relationship with secondary school teachers' labour turnover intentions (table 3).

Research Question 3: Is there any statistically significant relationship between work family conflict, teachers' job satisfaction and labour turnover intentions?

Table 3:   **Descriptive Statistics and Correlation Matrix**

	Mean SD	1	2	3	4
1. LTOI	58.87 5.50	1.00			
2. TJS	41.55 3.48	0 .66*	1.00		
3. WFC	46.49 4.01	0.78*	0.60*	1.00	

*P<0.05   WFC= Work-family Conflict; TJS= Teachers' Job Satisfaction;
          LTOI= Labour Turnover Intentions.

Results in table 3 above show that work-family conflict has the highest mean of 46.49, while teachers' job satisfaction has the least mean of 41.55. Also, the table reveals there is positive relationship between the variables and it is discovered that the highest positive relationship is between work-family conflict and labour turnover intention (r=0.78). This implies that work-family conflict can easily influence the labour turnover intentions among secondary school teachers. Also, teachers' job satisfaction has a positive relationship (r=0.66) with labour turnover intentions. This implies that increase in work-family conflicts and teachers' job satisfaction could culminate in increase in labour turnover intentions among secondary school teachers. Furthermore, work-family conflicts have a positive significant relationship with teachers' job satisfaction, that is, work-family conflicts and teachers' job satisfaction are significantly related to labour turnover intentions among secondary school teachers.

Research Question 4: Is there any statistically significant gender influence on work-family conflict, teachers' job satisfaction and labour turnover intentions?

Table 4:   **T-Test on Gender Influence**

Variable	Gender	N	Mean	SD	SE	t-value	p-value
Work-Family Conflict	Male	149	46.52	4.04	0.33		
	Female	89	46.46	3.97	0.42	0.104	0.713
Teachers' Job Satisfaction	Male	149	41.45	3.57	0.29		
	Female	89	41.73	3.33	0.35	-0.612	0.615
Labour Turnover Intentions	Male	149	58.56	5.61	0.46		
	Female	89	59.40	5.29	0.56	-1.172	0.628

Not Sig. at p>0.05

Table 4 above reveals that there is no significant gender influence on work-family conflict, teachers' job satisfaction and labour turnover intentions. Since α = 0.05 does not exceed the observed significance level, p = 0.713, p = 0.615, and p = 0.628 respectively. This implies that both male and female teachers have the intentions of changing their jobs. Also, both female and male teachers have the same level of job satisfaction, and work-family conflicts affect both male and female teachers the same way.

Research Question 5:   Is there any statistically significant difference between private and public secondary schools on work-family conflict, teachers' job satisfaction and labour turnover intentions?

Table 5:   **T-Test on School Type Influence**

Variable	Gender	N	Mean	SD	SE	t-value	p-value
Work-Family Conflict	Private	118	46.43	4.04	0.37		
	Public	120	46.57	3.99	0.36	-0.273	0.955
Teachers' Job Satisfaction	Private	118	41.05	3.62	0.33		
	Public	120	41.66	3.35	0.31	4.463	0.017*
Labour Turnover Intentions	Private	118	58.93	5.71	0.52		
	Public	120	58.18	5.32	0.49	6.176	0.008*

Table 5 above reveals that there is no significant school type influence on work-family conflict, since α = 0.05 does not exceed the observed significance level, p = 0.955, while the teachers' job satisfaction and labour turnover intentions are significant, since α = 0.05 exceed the observed significance level, p = 0.008 respectively. This implies that both private and public secondary school teachers have experience of work-family conflict. Public secondary school teachers are more satisfied with their job

than their counterparts in the public secondary schools. This may be due to lack of prompt payment of salary, being made to teach many subjects, and employers undue desire to exploit their employees among others. Also, the rate of labour turnover intentions is higher in the private secondary schools than in the public secondary schools.

Discussion

The findings of this study show that stress from work, lack of good parental care, love of money, nature of job, poor remuneration, job insecurity, lack of understanding between couple and the extended family, extra marital affair, family background, and cultural belief are perceived causes of work-family conflicts among secondary school teachers. The stress from work could be the demands on the job. These may include: dealing with students' disciplines, large classes, teaching new courses, frequent changes of timetable or courses, increased workload, need to hit targets or deadlines, long working hours, and lack of regular breaks (Oredein, 2009). During the study, it was observed that stress from work is high in private secondary schools than their counterpart in public schools, though public secondary schools still have with large classes than private secondary schools.

Also, the results reveal that there is composite influence of work-family conflict and job satisfaction on secondary school teachers' labour turnover intentions. Both work-family conflict and teachers' job satisfaction have a positive relationship with labour turnover intentions. Although, this study is on permanent secondary school teachers, the result is not in consistent with Slattery & Rajan Selvarajan's (2005) work on temporary employees, that job satisfaction is negatively related to turnover intentions with temporary agency. But it is in tandem with Lindsey (2007), who identifies in his study that job satisfaction is one of the factors that could contribute to turnover rates in organizations. Slattery and Rajan Selvarajan's (2005) suggest that job satisfaction is a more distant cause than commitment when it comes to turnover intentions. But this study as well shows that work-family conflict is more related to labour turnover intentions than teachers' job satisfaction. Nevertheless, one strong message that could be relayed from this study is that teachers' job satisfaction may be a more distant cause of labour turnover intentions than work-family conflicts. Moreover, work-family conflicts have a positive significant relationship with teachers' labour turnover intentions. This is in consistency with Lindsey (2007) which avers that the relationship between conflicts and turnover intentions is linear and significant. Conflicts generally have been recognized as pervasive issues within organization, with effects that contribute to the strongest turnover predictors (Frone, 2000; Medina, Munduate, Dorado, Martinez, & Guerra, 2005).

Furthermore, the results reveal that gender has no significant influence on work-family conflict, teachers' job satisfaction and labour turnover intentions. That is, gender has nothing to do with turnover intentions of secondary school teachers. Male and female teachers have the same level of job satisfaction, and both experience work-family conflicts. This is in consistency with Onovoh (2000), who identifies in his study that male and female teachers experience the same level of job satisfaction. This study also shows that school type has no significant influence on work-family conflict, while the teachers' job satisfaction and labour turnover intentions are significant. Teachers in both private and public secondary schools experience work-family conflicts. Teachers in the public secondary schools are more satisfied with their jobs than their counterparts in the private secondary schools. Labour turnover intentions are higher in private secondary schools than in the public secondary schools.

Recommendations

Secondary school education serves as a bridge between primary and tertiary education, thus the need to reduce the rate of teachers' turnover intentions in secondary schools. Based on the outcomes of this study, it is therefore recommended that government, proprietors, and proprietresses, should take a look at what they can do to reduce work-family conflicts. For instances, they can give preference to married people when conducting any transfer, and they should hold the well-being of teachers paramount. In other words, government, proprietors, and proprietresses should treat teachers as an asset which needs a lot of attention. Teachers are nation builders; hence they need to be motivated and compensated adequately. Government, proprietors, and proprietress should examine the sources of labour turnover intentions among teachers and recommend the best approach to fill the gap of the sources so that teachers can be retained in the teaching profession. Besides, teachers should be paid regularly as and when due, in addition, incentives should be given to teachers. Academics should have regular breaks or annual leave. A good working environment should be provided. Government, proprietors, and proprietresses should consider the methods of allocating work and associated administrative

arrangements. Moreover, the rate of labour turnover intentions can be brought down by focusing on teachers' job satisfaction, and working on ways whereby work-family conflicts can be reduced.

Abstract

The radio as a vehicle of mass communication has undergone many changes over the years through the development of informatics and cybernetics. The process of digitization suffered by conventional broadcasters and the availability of its content on the Internet, produced the latest step in the recent history of media - the Web Radio In turn, the education has been used in the new technological resources to produce educational programs multidisciplinary in several areas of knowledge and in different parts of the world. Therefore, the present educational-communicative paradigm requires a new way of thought about the pedagogic models and new intervention strategies in society, which are able to respond to contemporary educational and intervenient processes. In this sense, the radio has been a great ally for Education for over one hundred and fifty years, taking the information and knowledge to the most inhospitable places. Nowadays, with a web format, the radio makes available, in virtual space, an ample group of technological interfaces with an alternative and complementary environment of teaching-learning. Appears, therefore, learning through the Internet radio - the Radio-learning, providing the virtual space and a set of interfaces for technology that teachers can disseminate their scientific work, suggest readings, stimulate debate on issues related to discipline (forums discussion), information notes, reviews, interviews with local experts and invited, promotion of academic events (congresses, seminars, lectures, conferences or meetings), lessons in podcast, beyond the possibility of synchronous communication with the network, through email, blog, messenger, chat, myspace, twiiter and others. In this communication, we will make a reflection about the web radio and the concept of radio-learning, showing its present panorama as an educational-communicative media and highlighting the case study of the Rádio Universitária do Minho.

Key-Words: Radio Web, E-Learning, Collaboration, Multimedia Sharing, Interactivity.

1. Introduction

The possibilities of information and communication with the evolution of the media on the Internet changed our way of thought, act, work, relate, teach, and learn, that is, our whole life in society (Sampaio, 2008). In other words, it is what Castells (2002) denominates "Network Society".

This new communicational and social order is presented through the cyber culture, which inter-relates information, communication and technology generated by the inter-connection of computers, on which a communication destitute of corporeal presence is consolidated (Roesler, 2007). Arises, then, the culture of networks, appearing contemporarily as a metaphor to translate the sense of the interaction, communicability and sociability experiences of people with the virtual word (Paiva, 2004).

To Lévy (1994), the World Wide Web universe favors a collective intelligence on the educative domain and cooperative learning, producing a cyberculture on the information society. Castells (2002:463-464) adds to that, asserting that "the web allowed interest groups and network projects to

---

[1]Text produced under the individual program Doctor Foundation for Science and Technology of Portugal (FCT), integrated in the Center for Research in Education (CIED) - Universidade do Minho. Project: Information Society, Innovation and educational processes.

overcome time-costs problems associated to the chaotic pre-www information, as, in this basis, groups, individuals and organizations could interact significantly with what has become, literally, a wide world web of interactive and individualized communication", reinforcing the formation of virtual learning communities in education.

The "Web" not only amplifies the formation of social communication fields as a "media", but is capable of creating new cultural and social constructions, acquiring its own life in cyberspace (Maccormack & Jones, 1998; Bochmann, 1995). Thence, a new social conscience is created, which will be used by an information society, at local and global levels, crossing both communication contexts, constituting a global network (Tapscott & Williams, 2008).

On the educational field, the cyberspace has enabled the development of virtual learning environments, focused on the utilization of interaction software and the Internet itself as a pedagogic interface potentially capable of decreasing geographical distances and increasing interaction between student and instructor pairs, above all those who act on the distance education modality (Palloff & Pratt, 2000; Lévy, 1997).

In this sense, the radio found on the Internet the possibility to acquire another temporality, when it makes available multimedia files, asynchronous transmission, flexibility, and then, straiten the relationship between listener/user. According to Alves (2003), within the new digital environment new patterns of communication and activities appear. According to the author, the cyberspace connects users and institutions, making available to both a great range of opportunities and services. Then, discussion lists, chats, video-conferences, audio-conferences, podcasts emerge, which now merge to the radio for the offer of content and participation of the audience on the web program.

In this communication, we will make a reflection on the web radio, presenting its present panorama as an educational-communicative media and highlighting the case study of the Rádio Universitária do Minho (RUM), and present the concept of radio-learning as the new tendency of web radio.

2. Methodology Adopted in the Investigation

The investigation from which this communication originated considered important to analyze the educational potentialities of the web radio, more specifically on the Portuguese Undergraduate courses, being described in more detail on the Rádio Universitária do Minho case study.

Investigations through case studies contemplate multiple sources of evidence and different techniques of field research, which could involve the observation of the phenomenon during its occurrence, studies and document analysis, interviews, measurements and qualitative and quantitative surveys inherent to the case (Yin, 2003; Stake, 1995; Bassey, 1999; Punch, 1998; Merriam, 1998; Fabrício, 2000).

In the present investigation, we used, as techniques and instruments for data collection: information survey on the web; document analysis (through the technique of content analysis – program grids); the observation of Portuguese university radio programs, and the analysis of the formative tendency of RUM (including semi-structured interviews to the radio's director).

We also used the classification of radio-phonic categories from Filho (2003), which could be categorized in: *Journalistic* (note, news, bulletin, reporting, interview, comment, editorial, chronicle, journalistic documentary, round-tables or debates, police program, sportive and techno-scientific programs); *Educative-Cultural* (autobiography, educative-cultural documentary, thematic program); *Entertainment* (musical program, fictional program and artistic event); *Publicity* (spot, jingle, testimonial, promotion piece); *Advertising* (public action radio-phonic piece, electoral and religious programs); *Service* (notes of public utility and service); *Special* (children's program, varieties program).

3. Results on the Web Radio

With regards to the mass media that develop social-cultural activities of formal and informal education, it almost always includes formal programs, being directly focused to the school curriculum (Trilla, 1998). It is the case of the various university radios on the web of informative character, but with a strong formative tendency, establishing mixed educational-communicative configurations. Perona & Veloso (2007:18) establish a typology for radios with cultural and educative tendency – community,

popular, formative, municipal, scholar and university – asserting, quoting Merayo (2000), that "Even though, all seem to share a common line: they attempt to reach non-commercial objectives and are guided especially and directly to a social character purpose".

According to Correia & Tomé (2007), the informal and non-formal contexts provide a great source of knowledge, always constituting an important source of innovation and stimulus to the search for knowledge, through methods and techniques that deviate from the traditional means of educational formation. As education and communication are indissoluble concepts, the institutions are intensively using the technological resources, aiming at the transformation of information in knowledge, now more than ever, in virtual educational environments (Lévy, 1990).

With the online emission, the radio developed another language, through the incorporation of new elements to its discursive structure, and through the way the listener/user takes a pro-active attitude of investigation and use of contents. In parallel, the scheme of emission and reception had to follow this evolution, favoring the fragmentation of audiences in function of their specific interests (Cordeiro, 2005; Leão, 2007). This way, the educational-communicative potentialities of the web radio started to be found by lecturers, school managers, educational institutions and university radios, based on successful experiences with the use of the interface in different parts of the world.

Contrary to traditional radio, the radio through the Internet is not restricted to audio, neither imposes limits to geographical reach (Lee, 2005). Its transmission could come followed by images, videos, texts, pictures, and links or through message boxes and chats (Priestman, 2002). This advance allows the listener to do much more than just listen, making communication much more dynamic. Today, it is possible to conduct an online formation, offering didactic material in PDF files or Word document, video, podcast, and have access to up-to-date information through the RSS feed, clear doubts with the instructor / educator through messenger, e-mail, chat, forums, besides the interactivity in real time, through audio-conference or video-conference.

Based on a cooperative work, with interactivity among the participants and sharing of ideas, the interface "web radio" is presented as a mean through which the students feel an important and active part of the educational-communicative process. "This takes us to a proposal of rupture from the traditional educational model based on a linear transmission of discipline content, in which emission and reception are separate" (Fernandes & Silva, 2004:379).

4. The concept of Radio-Learning

The concept of Radio-Learning or R-Learning follows from social, educative and formative characteristics of the radio on the Internet, as an object of learning. It is about the combination of various elements common to the web radio: the ubiquity (accessible everywhere) – the flexibility – the low cost of production and program broadcasting – the emission in real time (integral) – the synchronous communication (communication intermediated by computers in a simultaneous way) – the multi-directed connectivity – the multimedia sharing – the streaming (listen/see directly from the Internet) – the collaboration (exchange of information in cyberspace) – and the interactivity, integrated to e-learning (system of learning on the Internet).

According to Silva (2001:130): "The new technological supports brought the facility of access to information, namely by the increase of storage capacity, by the processing speed and by the compatibility between the systems".

The schools through a web radio can provide educational programs with different themes for different courses and disciplines, which will be available online and can be accessed at anytime and anywhere in the world. Through this technological resource, there is no possibility of losing the program if the person is busy, the programs are available online and can be accessed when necessary or possible (Suanno, 2003). This model of educational web radio is what we call **Radio-Learning**, actually expanding in many parts of the world.

Fig.2 – Elements of Radio-Learning

5. The Experiences of University Radios in Portugal

In Portugal, contrary to in other European countries, the university radios on the web appeared at the end of the 90's, and today, after almost two decades, few remain active in the national scenario.

The radio researcher Paula Cordeiro, says that, in Portugal, in 2005, there were four university radios with FM emission and few projects of university radios in the web (Cordeiro, 2005). Leão (2007) also shares the same information, identifying the *Rádio Universitária de Coimbra* (www.ruc.pt) – from Universidade de Coimbra; the *Rádio Universitária do Marão* (www.universidade.fm) – from the Trás-os-Montes and Alto Douro Region; the *Rádio Universitária do Algarve* (www.rua.pt) – from the Universidade do Algarve; and the *Rádio Universitária do Minho* (www.rum.pt) – from the Universidade do Minho, as the portuguese university web radios.

Besides these, from the research performed for this work, we have identified the presence of other two university radios – the *Rádio Universitária Beira do Interior* (www.rubi.ubi.pt) – from the Universidade Beira do Interior, and the *Radio Zero* – from the Instituto Superior Técnico (www.radiozero.pt). In global terms, it is possible to assert that they share similar objectives, but have different and heterogeneous structures and program typologies (Cordeiro, 2005). However, among the mentioned radios, the *Rádio Universitária do Minho* stands out presently for its diverse and segmented program on the web, dedicated to the promotion and divulgation of cultural, scientific and support activities to the lectures of the Universidade do Minho, representing, at the same time, some of its departments and academic unities, besides a strong cultural intervention in the local communities of the Braga and Porto Districts.

The Rádio Universitária de Coimbra (RUC) exists since 1986 and was one of the first university radios in Portugal with web emission. Nowadays, it develops its activities based on the following categories: the formative, the informative, the academic and the cultural-educative. The formative category is established through periodic courses of formation and recycling for speakers, editors/speakers and technicians, besides the realization of didactic programs in collaboration with public and private institutions. The informative category is a space focused on the debate of questions related to the Universidade de Coimbra and to up-to-date news. About the academic life at the Universidade de Coimbra, the RUC dedicates an ample space in its program grid, transmitting the main occurrences of the learning institution. Finally, the cultural category is responsible for the divulging of various cultural activities going on in Coimbra, at the North Region or in the rest of the country, with programs dedicated to music, theater, cinema, poetry, literature and the transmission of concerts, shows and popular festivals.

The Rádio Universidade do Marão (FM Universidade) gave its first steps in the virtual world in 2000 (Cordeiro 2005), and since then the objective of the broadcasting station was to become the first university radio totally digital in Portugal. However, for technical reasons, this evolution to the web was only firmed in posterior years (Leão, 2007). Presently, the Rádio Universidade do Marão is focused on the academic public of the Trás-os-Montes and Alto Douro Region, with a purely informative focus.

In 2003, the Rádio Universitária do Algarve (RUA) arouse in a partnership between the Academic Association and the Universidade do Algarve. In the web, it has as an objective to divulge and promote the academic activities and cultural and musical events of the South Region in Portugal. Different from "RUC" and "RUA", it is grounded in three pillars to develop its activities: the Academy, the Culture and Alternative Music. The objective of the programs directed to the Academy is to show to the national Portuguese community the contributions that the Universidade do Algarve offers to the region and to the country, related to teaching and research. The Culture is centered on the promotion and divulging of cultural events that take place in the Algarve Region (popular festivals, concerts, shows, cinema, literature, theater). The Alternative Music programs promote the work of artists and bands unknown to the public in general and to the communication means.

Still in 2003 the Rádio Universitária Beira do Interior (RUBI) was created as a laboratory of the discipline radio-phonic Journalism at the Universidade Beira do Interior, only with an internal character. In 2004, the RUBI starts to emit its radio-phonic program on the web, and started to be called "RUBIweb". But only in 2006 that the RUBI decided to bet on the diversity of categories in its program grid, aggregating multimedia interfaces to its web radio platform, such as the podcast and e-mail.

According to the Filho's (2003), radio-phonic classification of categories, Rádio Universitária Beira do Interior is exclusively generalist and informative, functioning as the "voice" of the Departments from the Universidade Beira do Interior, as well as of the local community, Covilhã.

The Radio Zero is part of the Association of the Instituto Superior Técnico (IST), with its headquarters in Lisbon (before 2006 it was called RIIST – Internal Radio of IST). Being originally a radio of university character, its objectives are centered in offering radio-phonic formation to the students interested in working in radio, as well as inform the "IST" academic community about the main events going on at the university, in a cultural, scientific and educative ambit (http://www.radiozero.pt/projecto/). It has more than 40 programs on its online program grid of journalistic, cultural-educative and entertainment character (in its majority).

The Rádio Universitária do Minho (RUM) exists since 1989, and since 2006 it started to transmit via web, with a clearly heterogeneous program offer, on which spaces of purely formative-instructive character are mixed with others that explore different categories and formats, closer to some ongoing experiences in Europe. According to Leão (2007), the RUM launched two crucial interfaces in the context of its strategy to conquer and gain the loyalty of new public: the website and the online emission. The consolidation of the online emission, particularly, revealed as an alternative to the "conventional receptors", emphasizing culture, debates on education, science, economy, politics, news, local informs, chronicles, interviews, and specialized reports.

In its relationship to the Universidade do Minho, the RUM makes available the virtual space and a group of technological interfaces for the lecturers to divulge their scientific works, suggest readings, stimulate the debate on themes related to their disciplines (discussion forums), to inform grades, tests, interviews, divulge local, national and international academic events (congresses, seminars, talks, colloquiums, meetings…), store lectures in podcast (in a way that the student can have access to the discipline contents in any part of the world), besides the possibilities of synchronous communication with the broadcasting station, through e-mail, *blog*, messenger or *myspace*.

Besides, it is on the program grid that the RUM is most different from the other portuguese university radios, for its thematic diversity of the programs dedicated to the educative-cultural and journalistic categories: *Magazine da Educação* (Education Magazine) and the *Livros com RUM* (Books with RUM) – information and reflection on the Portuguese and international literary situation, with interview from critics, authors and specialists in literature; *Ciência para Todos* (Science for All) and the *Universidade Sem-Muros;* (No boundaries University) at the *Democracia Viva* (Living Democracy) – promotion and divulging of the university's cultural and scientific activities; *Praça Município/Café com Blogs* (Municipal Square/Coffee with Blogs) – debate about the Portuguese political scenario; *Campus Verbal* (serves as a radio-phonic laboratory, where the students from the Institute of Literature and Science of the Universidade do Minho, of French and German areas, produce radio programs based on what they have learned in the lecture rooms, and store the contents at the university's website in a podcast format; *Olhar no Feminino* (Look on the Female) – discusses themes related to the female world; *Rumo Económico* (Economic Route) – interviews and reports on the national and international economic panorama; *ECO RUM* – program focused on the protection and conservation of the environment; *Cultura Impressa* (Printed Culture) – the main topics of printed media are debated on the program; *Caixa de Ferramentas* (Tool Box) and the *Diferença em 1° Plano* (Difference in 1st Level) – debates and interviews and the promotion of specialized support services to attend the peculiarities of people with special needs; *Cultura Crónica* (Chronic Culture) – program focused on stage arts, cinema, literature and shows; and the *Escola de Rádio* (Radio School), where courses on the radio-phonic universe are developed (the courses are given by communication experts from the Rádio Universitária do Minho and lecturers of the Universidade do Minho.

According to (Geller, 2007:5):"If you can create quality programming, and consistently stick a host, program, or format over the time it takes to find its audience, you will likely have your own sucess story".

This is the case of Rádio Universitária do Minho, with more than 60 specialized programs, divided by categories, and for all public.

Fig. 2 – Program Grid of the RUM

It is this way that the university radios work in Portugal, functioning as a social communication vehicle of local communities and as a valuable space for the divulgation, socialization and popularization of science and technology, produced by different departments at the teaching institutions.

To Cordeiro (2005:10): "The contribution and influence of university radios in the development of the future professionals' formation, allied to the importance in the context of radio-phonic communication in general are incontestable, and, in a context where the main concern is the profit-making of the station, university radios appear as elements that offer alternatives of program and formation".

6. Final Considerations

According to the preliminary results of this investigation, the university radios are not restricted to generalist or informative functions anymore, but figure as a complementary or alternative mean for people's formation.

Such tendency is present in the objectives of the Rádio Universitária do Minho, through its social, cultural, educative and formative activities, both on conventional and web formats.

However, the understanding of the web radio as an educational-communicative media has been followed by some difficulties related to the international academic community, in face of the still restricted investigation about the potentialities of online radio. Besides that, due to the similarity of its basic characteristics, it is common for the student public to confound podcast with web radio.

Another question to be considered is the need to create its own identity as a means of mass communication on the web, once it comes from a traditional media format. Even though it is still in need of a solid methodological-theoretical basis, the use of the web radio as a formative interface has been expanding significantly in the world.

Despite the abovementioned obstacles, any course or discipline in school or at university, made available in a virtual learning environment, could use the radio-phonic program, or produce, in a local radio station, contents to be shared by the students. It is only question of believing in the potential of the radio on the Internet and its potentialities, to make the dream of Roquete Pinto (considered the father of broadcasting in Brazil) worth, transforming it definitively in an educational mean (Souza & Souza, 2007).

Peace Begins With Me… and Continues to Exist Because of Me!

Bonnie Lee Rabe, Ph.D.

If we wish to create a lasting peace we must begin with the children.

Mahatma Gandhi

Peace programs and much of the Peace Education training focuses on theory, practice, and advocacy. In reality, we attempt to understand and prevent violence, resolve conflict between and among people, and become more knowledgeable of other cultures and peoples through these programs. To instill in children a natural and peaceful response to the challenges of life, we must begin early.

As defined by the United Nations, the culture of peace is a set of values, attitudes, modes of behavior, and ways of life that reject violence and prevent conflicts by tackling their root causes to solve problems through dialogue and negotiation among individuals, groups, and nations.[2]

The United Nations model promotes the *teacher as learner* as the theory of peace unfolds, and the *learner as teacher* in the development of a peace curriculum. The United Nations, in an effort to promote Peace Education[3], has identified themes that are appropriate for different developmental levels. If those basic themes are analyzed and early developmental strategies identified, we have the basis for early Peace Education dealing with more than multiculturalism and conflict resolution; but dealing with building the basis for a peaceful existence.

Can the elements of peacefulness, if they are incorporated into the education of a child and extended into the home, truly become a way of being?

The Academy of International Studies, a Connecticut interdistrict magnet school in Danbury, Connecticut, USA has implemented and is institutionalizing a Peace Curriculum as a way of life. An important development as implementation continues, is the logistics of the dual language component of the program.

We create wonderful frameworks based on quality thought and theory yet we encounter unexpected blocks to our efforts. Even in the most disappointing conditions, creative administrators find ways around these blocks and ultimately create wonderful learning environments focused on the development of a culture of peace and conscience.

WHAT IS PEACE EDUCATION?

Peace Education takes many forms: conflict resolution, building character, democratic education, and learning about war and peace. Often programs address the outcome of non-peaceful ways, i.e. resolving conflict, consensus building, bullying, and mediation.

At the core, the very essence of personality development, our children often do not have the information or skill sets to make informed decisions as they grow. They hear and observe violent actions at home, in the media, and among their peers.

In her book, *It Takes a Village to Raise a Child* (1996), Hilary Rodham Clinton states:
Children are not rugged individualists. They depend on the adults they know and on thousands more who make decisions every day that affect their well-being. All of us, whether we acknowledge it or not, are responsible for deciding whether our children are raised in a nation that just doesn't espouse family values, but values families and children. (p. 7).

Imagine a microcosm of encouragement where children make their own decisions based on the basic tenants of peaceful living; reinforced through the encouragement of teachers, custodians, secretaries, nurses, bus drivers , and parents who all do the same!

By constructing an environment of love and support which looks at the unique differences in children as opportunities to stimulate a range of interests, encouraging and rewarding rather than stifling and controlling could we make a better world?

---

[2] UN Resolution A/RES/53/243: Declaration and Programme of Action on a Culture of Peace.

[3] United Nations cyberschoolbus.org

Certainly the Montessori and Waldorf models addressed issues of peace, but how can being at peace with oneself and others be brought to the mainstream?

THE BASIS OF PEACE EDUCATION

The history of Peace Education has attempted to be all encompassing. Peace Education has broadly been referred to as theoretical, philosophical, multicultural, conflict resolving, and political. It deals with education, conflict resolution, and theory within multiple languages and cultures.

Because the frames of peace keep changing as we struggle to describe the illusive and ephemeral state, it becomes increasingly difficult to describe what it is to be at peace… both to ourselves and our students.

John Galtung

John Galtung, a Norwegian sociologist, is credited as being a principal founder of peace and conflict theory movement. He developed the first academic journal devoted to Peace Studies, *The Journal of Peace Research*. His theoretical works address four levels: conflicts internal to a person or between persons; conflicts between races, generations, sexes, or classes: conflicts between states; and conflicts between civilizations or multi- state regions. He originated the concept of peace in journalism, which has become influential in journalism and communications studies.

According to The Peace Education Center at Columbia University's Teachers' College:

> Violence in its multiple forms at all levels of the global social order is a major problem. For nearly five decades educators concerned with this problem have argued that education has a responsibility to address the related issues through instruction in the school system, in the education of teachers, and, theoretically in the carving out of appropriate knowledge and in the development of pedagogies which are both relevant to the substance in achieving the learning goals of the field.
>
> Peace Education is now the subject of UN policy, research and training by UNESCO, the Council of Europe and ministries of education, various universities throughout the world and a worldwide trans-nationally conceived and conducted NGO Global Campaign for Peace Education. [4]

To educate for peace means building the capacity for peace.http://www.gse.harvard.edu/~t656_web/peace/Articles_Spring_2004/ - _edn2 Building capacity for anything is a slow process, requiring dialogue, establishment of a common language, and commitment. "These skills and values are essential for survival in an increasingly interdependent world, where violence has become an instrument of policy, yet still breeds more violence."[5]

THE CONNECTION WITH MORAL DEVELOPMENT RESEARCH
Jean Piaget

Piaget studied moral judgment in children. His findings fit into a two-stage theory: 10 or 11 year old children think about moral dilemmas in the context that rules are absolute; older children take the dilemma in the context of relativity.

Lawrence Kohlberg conceived a theory of moral adequacy to explain the development of moral reasoning. Although it has been questioned as to whether it applied equally to different genders and different cultures, Kohlberg's (1973) stages of moral development goes. In his interviews of both children and adolescents about moral dilemmas, he discovered stages that went well beyond the stages of moral development identified by Piaget (Craine, 1985). In his model, moral reasoning which is the basis of ethical behavior, identifies six developmental stages where the individual becomes increasingly more adequate in responding to moral dilemmas. Piaget, in researching the development of logic and morality, focused on early child development. Kohberg expanded Piaget's initial work,

[4] Peace Education Center. Teachers College, Columbia University. Retrieved on March 12, 2008 from http://www.tc.columbia.edu/PeaceEd/philosophy.htm.

[5] *Educating for Peace, Global Education Network*. Retreived on March 12, 2008 from http://www.global-ed.org/e4p/index.htm.

determining the process of moral development continued over a lifetime and concerned itself with justice.

In Level I: *Pre-conventional Morality*, Kohberg notes that very young children are moral in a rather primitive way described in two stages: 1) the r*eward and punishment stage* (Does the action lead to punishment or reward?) and 2) the *exchange stage* is based simply on one's own pain and pleasure. There is, however, increased recognition that others have their own interests and should be taken into account.

Level II: *Conventional Morality*, kicks in by the time children enter elementary school. They are usually capable of conventional morality, although they may often slip back into This is also the level within which most adults function. In the two convention morality stages: 3) the *good boy/good girl stage* - the child tries to live up to the expectations of others, and to seek their approval and 4) the *law and order stage* where the point of view includes the social system as a whole where the rules of society are the bases for right and wrong. Doing one's duty and showing respect for authority are important.

Some adolescents and adults go a step further and rise above to moralities based on reason. Level III is therefore referred to as *Post-conventional Morality*. The two stages include 5) the social contract stage where the relative value of an act is determined by "the greatest good for the greatest number." At this level, morality is a matter of entering into a rational contract with one's fellow human beings to be kind to each other, respect authority, and follow laws to the extent that they respect and promote those universal values; 6) is referred to as the stage of *universal principles*. At this point, the person makes a personal commitment to universal principles of equal rights and respect, and social contract takes a clear back-seat: If there is a conflict between a social law or custom and universal principles, the universal principles take precedence

Lawrence Kohlberg

Kohberg, developed a moral system of development based on a study of lower and middle income boys in Chicago in the late 1950's ages 10, 13, and 16; and through the 1970's expanded the study to include girls, delinquent children, and children from other countries. In the interviews, Kohlberg asked the subjects to respond to a series of dilemmas. He analyzed the responses, specifically looking at the reasoning behind the answers given. He analyzed the responses into 6 categories. He then had other researchers score the protocols to establish interrater reliability.

    Level 1: Preconventional Morality
        Stage 1: Obedience and Punishment Orientation (avoid punishment)
        Stage 2: Individualism and Exchange (making deals)
    Level 2: Conventional Morality
        Stage 3: Good Interpersonal Relationships (being good)
        Stage 4: Maintaining Social Order (move from thinking of self to society)
    Level 3: Postconventional Morality
        Stage 5: Social Contract and Individual Rights (individual basic rights)
        Stage 6: Universal Principals (principals of justice)

According to Kohlberg, social experiences do promote development but emerge from thinking about moral problems. The 6 stages come into play as we find our views questioned and challenged. When our thinking and beliefs change we move into new stages that reflect our broader viewpoints. (Kohlberg, 1975).

Carol Gilligan

Carol Gilligan, a research assistant for Kohberg, disagreed with some elements of his moral system. Kohlberg's approach is based on Piaget's cognitive developmental model, whereas Gilligan's is based on a modified version of Freud's approach to ego development combined with the Kohlberg & Piaget models.

She criticized Kohlberg for studying only privileged white males and found, in some of Kohlberg's investigations, women turned out to score lower – and therefore were considered less developed - than men. Gilligan asserted that women, contrary to the beliefs of some theorists of the day, were not inferior in their personal or moral development, but that they were different. She is known as the founder of "difference feminism".

In 1982 Gilligan published her *Stages of the Ethic of Care*. Like Kohlberg, her model has three major divisions: *Preconventional*, *Conventional,* and *Post Conventiona*l. Gilligan, however, came to the realization that the transitions between the stages are fueled by changes in the sense of self rather than in changes in cognitive capability. In the *Preconventional* stage, the goal is individual survival. Transitioning from selfishness to responsibility to others, the individual then moves to the

Conventional stage where self sacrifice is goodness. As one transitions to the next stage from goodness to the truth that she is a person, too; one arrives at the *Postconventional* stage where the principle of nonviolence dominates - do not hurt others or self.

Paolo Freire

Most often Peace Education in schools encourages children to practice cooperation and collaboration in solving problems, make responsible decisions, clearly articulate feelings and communicate effectively. One of the most powerful figures in forming the foundation of Peace Education is Paolo Freire. Part political philosopher, part educational theorist - Freire merges theory with practical experience. Friere, a 1986 United Nations Education Science and Cultural Organization's Peace Prize awardee, suggests we explore a deeper reciprocity between teachers and students. He challenges us to think in terms of the teacher as a student and student as a teacher. Children and teachers learning together, building the basics of peace!

Friere's theories provide the basic assumption of The United Nations Peace Education Teacher as Learner (representing theory) and Learner as Teacher (representing curriculum). The United Nations Peace Education initiative has identified themes: ecological thinking and respect for life (ages 8-12), tolerance and respect for dignity and family (ages 11-16), critical thinking active non-violence (focusing on ages 12+), social justice and civic responsibility (ages 14+) and leadership and global community (ages 16+).

As exceptional as the philosophical underpinnings of this United Nations approach are, they do not address the early exposure to the concepts of Peace. Would the incorporation of the elements of peace earlier in a child's learning make a difference in their moral development? Would building foundations of a peaceful existence early in life reduce the frequency of problems and, in turn, the necessity of intervention?

AN INTEGRATED PEACE CURRICULUM

Danbury, Connecticut is located at the edge of the New York metropolitan area. According to the Danbury History Project files: Danbury, covering over 42 square miles, is the seventh largest city in Connecticut with a population of over 75,000 people. 58 different languages are spoken in Danbury, which is rich with immigrant history - 27% of the current population was born in other countries. Once a great hatting center, Danbury today makes electronic equipment, plastics, machinery, and furniture.

Dr. William Glass, Deputy Superintendent for Danbury Public Schools has long been an advocate for Peace Education. Recently, his efforts with Peace Education were honored by the U Thant Institute. A long-time advocate for the development of the language of peace in the educational experience, Dr. Glass consistently modeled for staff and students, reinforcing the presence of peace as elements emerge.

Our conversation began innocently enough, discussing curricular issues that improve the quality of education. Carefully probing each others' belief systems over the past several years, Bill broached an idea. Can the elements of peacefulness, if they are incorporated into the education of a child and extended into the home, truly become a way of being? Thus began a collaboration leading to the exploration of development of peacefulness in children.

Working together, beginning at the entry level to school, could children and teachers create an environment that promotes natural and peaceful responses to the challenges of life? Assuming that early exposure to a peaceful environment, language and expectations will make a difference in children's values and attitudes, a plan began to emerge. It begins with building a common language. Expanding from the basic United Nations themes, a unifying theme of Peace evolved, connected and supported transparently by the curricula taught within the school.

> A people's beliefs and values, and their ideas, about the qualities children have to
> develop in order to function effectively as adults in the society, influence the ways in
> which people raise their children and interact with them. The requirements of life in a
> particular society, the skills and abilities valued by that society also influence their
> child-rearing practices. All these factors constitute a most important set of influences

on the child's development. These factors make up the child's social environment, and they differ from one cultural group to another.[6]

Linking Danbury's well-established *The Learning Tree Curriculum,* with the international studies enhanced curriculum, and a Peace Education theme was a logical next step. Building on the roots of *The Learning Tree Curriculum,* the UN themes were identified: ecological thinking and respect for life, tolerance and respect for dignity and identity, critical thinking active nonviolence, social justice and civic responsibility, and leadership and global citizenship; were enhanced at appropriate developmental levels, and essential questions developed. The Peace Curriculum began to emerge.

The five curriculum themes link across grade levels from Kindergarten to Grade 5 and connect within subject areas in each grade. The themes are connected to state standards and sample activities, related books and web links provided. Each of the five themes are addressed and revisited periodically throughout the year at each grade level as appropriate linkages appear. (See Appendix A for the initial Peace Curriculum Map Overview for Grade 5.)

BEGIN WITH THE END IN MIND - The Moral Imperative
The first element of the curriculum is the Moral Imperative, the end result that is desirable in all children. Focusing on the essential question *How does one perpetuate peace?* Teachers and students work backwards from this goal to deconstruct and identify elements of peace to be analyzed.

Fifth graders will award an Academy Peace Award to a community member who has contributed to the community. They will develop the criteria for the award based on what they have learned about peace. The script for the Academy Peace Prize Ceremony is their statement of belief, the moral imperative.

KNOW ONESELF - The Why: Respect for Dignity & Identity
Turning inward, the student begins to study peace by asking, "*Why is peace important?"* The exploration of the child's belief systems and values in comparison to peers, and what is socially acceptable in their school society, neighborhood, and in other cultures occurs in a safe and supportive environment.

5th grade students begin to develop respect for dignity and identify as they begin to study historical periods, issues and trends affect our understanding of the past, present and future.

SHAPE ONSELF – The What: Ecological Thinking & Respect for Life
Students have developed a sense of who they are in relationship to others as well as a set of expectations. They now ask the bigger question, "What is peace?", a question that has perplexed philosophers throughout recorded history.

In the United Nations unit on ecological thinking and respect for life. The knowledge, skills, and attitudes stressed in peace education link together through a holistic appreciation for the value of life and the interdependence of living systems on the planet. The concept of one person making a difference in the world evolves.

This curriculum theme is addressed and revisited periodically throughout the year as appropriate linkages appear. Teaching about the environment and the notion of environmental responsibility is a crucial component of education for peace.

As the Academy Peace Prize develops, 5th grade students develop a press release announcing the acceptance of nominations and the criteria for which the nominees will be judged.

SHAPE ONSELF – The How: Critical Thinking & Active Non-Violence… and How does one live a peaceful life?

Originally peace education began as a response to violence and war. As stated in the "Since wars began in the minds of men, it is in the minds of men [and women] that the defenses of peace must

---

[6] Apanpa, Olasumbo S. *Linking theories of child development to child-rearing practices: A trans-cultural perspective on early education and culture.* World Forum on Early Childcare and Education.

be constructed."[7] The components that are essential in educating for peace include knowledge, skills and attitudes needed to prevent violence and promote the non-violent resolution of conflict.

> Peacemaking, peacekeeping, and peace-building are complex and important responses to the proliferation of violent conflict. The root of these approaches lies in the basic knowledge and commitment to the practice of non-violence and critical thinking. When we eliminate violence as an option for resolving conflicts, we make room for creative alternatives. Co-operation, critical thinking, communication and problem-solving become essential tools. Conflict itself can be viewed as an opportunity for growth and expanded communication rather than a precursor to violence and a threat to dignity, security and life. Peace educators are developing tools to help transform the current "culture of violence" in which hurt and harm are advocated and glorified to a "culture of peace" in which the preservation of life and human dignity are the central guiding principles for living together in a secure world.[8]

Adapted from this concept from the United Nations curriculum and linking with the award-winning Danbury Public Schools Learning Tree Curriculum, students begin to *Shape* themselves to lead a peaceful life.

Fifth graders demonstrate their skill in Spanish and understanding of the culture by promoting a celebration of Peace. They plan and create an invitation for the Academy Peace Award Celebration in Spanish and English.

SHARE ONESELF - The End Product/Result: Social Justice & Civic Responsibility How does one bring peace to others?

The seeds of Peace need to be sown "in every relationship and in all learning communities around the globe"[9]. Combining the root element of Share Oneself from the Learning Tree Curriculum, students extend beyond the self. They look at issues such as philanthropic giving and assisting others.

In a direct application of this concept, the 5th grade curriculum component, students in the arts integrate technology as they plan the logistics of videotaping the Academy Peace Prize Award Ceremony.

IMPLEMENTATION

The faculty and staff were acclimated to the philosophy behind this *way of being* from the interview process through the present. It has become a strong, integral part of the system.

As this curriculum and *way of being* continues to roll out, students are observed to be a little different. Anecdotal notations include comments from parents about their child's previous school isolation and how, in this school, they now have established friendships. In another observation an occasional energy-filled student makes the choice to run in the hallway. The adult response is not, "Don't run!" but is more morally-directed, "At AIS we walk in the hallways so everyone is safe!" This simple shift in approach is typical of the positive expectation of all school community members.

The principal, Helena Nitowski does a monthly Town Meeting by grade level in which students engage in an interactive discussion of a topic of importance to the children. Components of the peace curriculum continue to be discussed and reinforced by all: teachers, support staff, students, and parents.

The curriculum moves into its' fourth year and has continued to develop, a direct result of the dedication of the teachers. Each grade level focuses on a continent as an extension of the Learning

Tree curriculum. The curricular design was intended to be a seemless, curricular overlay that easily integrated with the daily expectations of the school. The Peace curriculum, Learning Tree curriculum, and an international thematic focus through continents have become intertwined, closely coupled, and institutionalized.

The most complex component remains the broadest sense of the term curriculum: all the experiences of a student. A group of dedicated and resourceful teachers have taken the lead in the further development and integration of curriculum.

THE SHAPE OF THINGS TO COME… A PRIMARY AREA OF FOCUS

The peace curriculum has been integrated into the daily school community experience at AIS.

As a complimentary component to this initiative, a unique dual-language strand has been introduced in this school. Initiated, because shaping oneself - by broadening skills and knowledge of other cultures and peoples - and reaching out to others (share oneself) are experiential priorities and research supporting early language acquisition. Cazabon, Lambert, & Heise-Baigorria, (2002) note that as students gain a second language they broaden their vocabulary as well as developing multiple views of the world.

(Connecticut Council of Language Teachers Position Paper, . A result of extensive research and discourse, including discussion about the 56 languages/dialects which are spoken in the Danbury Public Schools, English-Spanish were selected as the dual languages

Beginning in Kindergarten students and their parents could opt for a dual-language experience. Students would be grouped with half native speakers and half with no experience in a second language, continuing as a cohort through the elementary grades. The classes would be taught with the teacher speaking in both languages.

Initially, the Danbury teachers' union and district administrators collaborated and agreed upon a plan for posting the positions at the new school and interviewing candidates. It was determined that 60% of the staffing would come from current Danbury teachers, and the other positions would be open.

In the first three years, the school gradually increased staffing based on the grade roll-out (the school opened with K-2 and added a grade each year through grade 5). This model worked well for the first three years, until a budget reduction began.

As the 2008-2009 school year approached, reality hit AIS. Budget cuts and a resulting reduction in force prohibited the hiring of a bilingual teacher in grade 3, resulting in a reduction in force which caused a "bumping" process (based on seniority) to occur. This was of great concern, because the students currently in grade 2 who had received dual language instruction in Kindergarten, first, and second grade, would no longer have access to a dual language teacher. The end result is there were no bilingual teachers placed in grades 3, 4, (and ultimately 5).

Some initial questions surfaced during the 2008-2009 school year: *Does student participation in the partial immersion Spanish language program result in a different set of skills from those students receiving traditional Spanish lessons? If the partial immersion program is related to positive academic performance and attitudes, then will students enrolled in these programs have a higher level of academic performance and more positive attitudes? How do we best measure these changes? Will the daily exposure to Spanish as a second language, for those students performing at a high level of reading, narrow the second language acquisition gap between the fourth grade dual language group and the fifth grade group who will be receiving daily instruction?* If so, this model could change best practices in elementary second language acquisition.

Administrative decisions affecting the program design will continue to be analyzed.

Rosenbusch (1992) recommends that the minimum time recommended for an elementary foreign language class is 75 minutes per week with classes meeting at least every other day. According to Met and Rhodes (1990) "foreign language instruction should be scheduled daily for no less than 30 minutes" (p. 438). These strategies will provide periods that are long enough for activities to be motivational without teacher burnout (Rosenbusch, 1995).

In June 2009 the principal and staff met and discussed how to track the acquisition of a second language and student performance. Restricted to the collection of data and teacher logs in the form of action research in this initial year, when the health of a key Central Office administrator and staffing issues interfered, those data will be reviewed in the coming year.

Of the fourth grade classes, the dual language student group has been together from Kindergarten, through third grade. Because there is no bilingual teacher for the fourth or fifth grades, the resources have been reconfigured so that fourth and fifth grade classes have 30 minutes of Spanish instruction daily.

Surprisingly, a review of current best practices in elementary second language acquisition yielded information centering around the speed of language acquisition: it appears that the new model at AIS is out-pacing other models of elementary second language acquisition. Armed with this information, the principal and staff have re-focused their attention and concentrated their resources on grades four and five for the next two years. In the next year, the original dual language cohort will be divided among the three fourth grade classes, receiving daily Spanish instruction.

The three fifth grade classes will receive traditional Spanish instruction daily. All fourth and fifth grade students will be tracked for second language acquisition as well as reading performance.

Among data tracked with these students were reading performance and second language acquisition. 90% of the high performing, dual language students were also high scoring in state and district reading tests. A possible correlation will be explored.

.

SUMMARY

The peace curriculum has been integrated and institutionalized in three years at the Academy for International Studies in Danbury, Connecticut, USA. The success of this way of being is a direct tribute to the dedicated and talented teachers, staff, administrators, and parents who share these beliefs with the students who are fortunate to have been selected by lottery to attend this wonderful school!

Tracking the outcomes of this initiative in peace is a worthy task, but in the public setting with so many interfering variables is a challenge. As a more formalized study unfolds and, as more data are collected and analyzed over time, the successful growth of this initiative will be documented. The value is in whether this initiative may be replicated into other settings.

We need to teach the next generation of children from Day One that they are responsible for their lives. Mankind's greatest gift, also its greatest curse, is that we have free choice. We can make our choices built from love or from fear…
Dr. Elizabeth Kubler-Ross

Differentiated Instruction Program

Dr Zaha Alsuwailan,

University of Kuwait, Kuwait

The potential possibilities of any child are the most intriguing and stimulating in all Creation

Ray L. Wilber

One of the major problems confronting the teacher in the classroom is how to deal with students with different abilities. The teacher works so hard and divides his time and energy to recognize the students' interests and needs in order to be capable to work with them according to their readiness. For that reason, differentiated Instruction was designed to help the teacher gain better understanding of students' Individual differences. It provides the students with different abilities various options for taking the information, understanding the ideas, and expressing what they learn. The teacher interacts with different learners in the classroom to achieve their needs. He attempts to deal with the input of the content to understand what students learn; the learning process to examine how the students make sense of the ideas and information; and the output of the learning profile to measure how students use what they have acquired in the classroom (Tomlinson, 1995). Differentiated Instruction then was an answer to the problem of dealing with students with different abilities.

In this paper, I intend to redesign the Differentiated Instruction Program (DIP) for the preservice teachers in Kuwait. The main purpose behind this program is to help the teacher to deal with students as individuals. I will first provide a theoretical framework about differentiated Instruction. Then I will investigate the objectives of DIP. Accordingly, I will propose a method and evaluation for the redesigned program as well as a vision of the participant that I wish to involve.

The Differentiated Instruction's Theoretical Framework:

I believe that any program must be divided into two phases, which are theory and practice in order to offer an inclusive knowledge for the learners. In theory, the learners need to be provided with various concepts that help them increase their understandings about students' abilities. To do so, they need to be provided with a wide background of differentiated Instruction before they start their student teaching. In practice, they will be given the chance to examine what they have learned.

<u>Why Differentiated Instruction?</u>

Differentiated program refers to the conscious attempt by the instructor to meet student learning needs that fit with individual abilities (Sherman, 1978). It is a way of thinking that challenges how educators typically envision students, assessment teaching, learning, classroom roles, use of time, and curriculum (Tomlinson, 1999). It emphasizes the importance of organization in each curriculum area in a manner that allows each student to move at his own pace under the supervision and guidance of his teacher. In Differentiated Instruction, "teachers begin where students are, not the front of curriculum guide" (Tomlinson, 1999, p.2). They must provide techniques that accommodate with each individual to learn as deeply as impossible.

Differentiated Instruction requires focusing on students' learning characteristics' and strategies rather than pedagogical differences, in discovering how to support students with different abilities. It also requires that each teacher establish his goals that regard the individual differences (Porter, 2001) as well as develop an appropriate learning plan to help the student develop skills and knowledge which meets his needs (churton&Cranston et al, 1998).

Hull (1974) mentioned that educators like Search, Burk, and Skinner pursed what we call today Differentiated Instruction long time ago. Their studies have concluded that differentiated Instruction has to focus on several concepts. First, Instruction is individual when it gives the opportunity to the learner to proceed through content materials at the pace that is comfortable for them. Second, the learner should be free to work at times convenient to him. Third, the learner should start instruction based on his experiences. Fourth, the teacher is occupied by small numbers of skills and knowledge that are needed to be considered. Finally, the learner must be introduced to various activities according to his ability (Hull, 1974).

We should know that differentiated is not a method (Talbert&Frase, 1972). It is a way of dealing with students so that each student has his own turn and share of the teacher. The teacher needs to acknowledge the differences of his students and what make them special is their differences.

Tomlinson (2000) states, "Differentiated Instruction is not a strategy. It is a total way of thinking about learners, teaching, and learning. It is, in essence, growth toward professional expertise. There is no such thing as expert teacher who is insensitive to individual need and ineffective in adapting instruction in response to learner need" (Tomlinson,2000).

Furthermore, Tomlinson explained that when a student experiences a learning situation, the brain responds with the release of the chemical noradrenalin, causing the brain to be over stimulated.

Attention is diverted from learning and focused on self-protection, resulting misbehavior or withdrawal, with more time being spent on learning to cope rather than learning concepts. On the contrary, if student readiness is beyond what needed for a particular task, the brain is, quite literally, not engaged, releasing fewer neurochemicals. The advanced student often feels lethargic because his or her brain under-stimulated (Tomlinson, 1998). Teachers should realize this fact before they teach in the classroom. They must be prepared not only for the classroom but also for the students.

The Role of the Teacher in Differentiated Classroom

In differentiated classroom, the teachers have the ability to:

1- Asses student readiness through a variety of means.
2- "Read" and interpret student clues about learning needs and preferences.
3- Create a variety of ways students can gather information and ideas.
4- Develop varied ways students can explore and "own" ideas.
5- Press varied channels through which students can express and expand understandings (Tomlinson, 1999, p.19).

The teachers must understand before modifying the content to be clear on the key concepts and generalizations or principles that give meaning and structure to the topic, chapter, unit, or lesson. They are planning in order to help the students gain better understandings of the course. Another thing, the teacher should emphasize critical thinking. It encourages the students to reflect over things rather than memorize information. Moreover, the teacher must not forget to engage students in each activity and be careful that all students are learning.

In differentiated classroom, the teachers should accommodate their teaching strategies to students' selection. The students should have the right to choose the teaching profile that fit with his needs (Ibid).

Differentiated Instruction Programs

Differentiated programs are the tool that can assist the teacher to explore his students' abilities and to divide his time probably in order to meet their needs. They provide the teacher with different activities that enable him to work individually with each student. They also provide multiple approaches to content and learning process. Differentiated programs according to Tomlinson can make substantial differences in classrooms and teachers' relations with their students (Tomlinson, 1995). Davalos and Griffin (1999) pointed out the importance of differentiated programs to both teachers and students. They conducted a study to see whether differentiated instruction can meet the needs of gifted students. They spent more than 150 hours observing teachers while they were being trained to individualized instruction. They found out that it is fundamental in classroom and it can meet the gifted students needs as long as there are well prepared teachers who know how to use individualization as an instructional

technique and understand the academic, social, and emotional needs of gifted learners and be prepared to support these needs (Davalos&Griffin, 1999). Another study was conducted by Wertheim and Leyser (2002) to measure the efficacy of Differentiated Instruction in classrooms. The participant included 191 Israeli prospective teachers. They responded to a modified form of the Teacher Efficacy Scale and a 59 item instructional strategies scale. They responded positively toward communicating and interacting with students but they showed less willingness to use differentiated instruction. Wertheim and Leyser suggested the importance of making the teachers aware of the significant of differentiated strategies. They believed there should be more focus on the development of skills that are required for successful teaching of students with diverse learning and behavior needs. They also suggested an extensive training and practice in the areas of individualized and differentiated instructional techniques (Wertheim and Leyser, 2002).

On the other hand, Tomlinson believes that teacher-education programs in general fail to address adequately the necessity of differentiated instruction for the diverse classrooms and they are not preparing the preservice teachers probably to face this problem. She discovered that preservice rarely experience differentiated instruction in their teacher preparation programs. They only take a course about the exceptional children to help them understand the needs of academically diverse learners; nevertheless, the preservice teachers reported that it dealt exclusively with learner trait, not with methods of teaching. They also indicated that education professors, university supervisors, or master teachers hardly ever promote to actively differentiate instruction. During their training, they were actually advised by their master teacher to "keep every one together." In addition, they rarely had instructional strategies that interested them. Therefore, they did not have enough strategies for addressing students' diverse needs.

  Tomlinson discovered,

    Once in their classrooms, the undertow for new teachers to "teach to the middle"

    is profound both because of complexity of teaching and because of peer pressure

    to conform to "the way we do school here. The few novice teachers who had

    master teachers who differentiated instruction were far more likely to do so their

    first teaching placements than their classmates (Tomlinson,155,p.115).

  To manipulate these problems, Tomlinson (1999) recommends that teacher-education programs and school districts should:

- Set clear expectations for the novice's growth in student-centered, responsive instruction.
- Provide clear models of differentiated curriculum and differentiated instruction in action.
- Provide mentoring that helps teachers reflect on student needs and appropriate responses to those needs.

- Ensure teachers' comfort in implementing a growing range of instructional strategies that invite differentiation and facilitate its management.
- Provide early partnerships with teachers who practice differentiation.
- Provide time and structure for reflecting on and planning for student needs.
- Recognize growth toward responsive instruction in meaningful ways. (Tomlinson,1999, p.115)

Accordingly, differentiated instruction programs should set clear objectives to help the preservice teacher understand better how to work in diverse classrooms.

Objectives:

The differentiated Instruction program major purposes are to help the preservice teachers during their student teaching to plan for a diverse classroom; acquire classroom management skills; help students and parents prepare for differentiated classroom; and asses the students' progress (Tomlinson, 1995). The program must give the preservice teachers a clear vision to what differentiated instruction is. It is also should provide them with methods used in differentiated instruction. They must understand that these methods are suggested ones and they have either to choose or create the methods that suit their students' need. This will give the preservice teachers the freedom of creativity.

Methods & Techniques

Before the preservice teachers design a method, they should realize that differentiated instruction curriculum must adjust the students' capabilities and needs. It also should be based on the students' past performance in the content or subject; the students' special interest in topics within the content; and the students' abilities to deal with available instructional material (Hull, 1974). Furthermore, to enrich the curriculum, the teacher must add activities from the same subject-matter field or problem area where students can proceed according to their own pace (Thomas, 1965). It is desirable that the teacher creates his own materials and activities that cope with his students demands (Kelly,1975). Karlin and Berger (1974) have identified a method to individualize that curriculum. He suggested to the 'preparation of contracts', which is "a series of questions and problems that the student must solve by finding answers for himself." This can be accomplished by dividing the students into groups and by preparing a contract for each group. The benefit of this method is that the student looks for information on his own and by his own readiness as well as it enables him to think and learn and be able to participate actively (Karlin & Berger, 1974).

On the other hand, Tomlinson (1995) recently identified learning contract between teacher and students as a method allows the students some freedom in their use of class time in exchanging and in doing responsible and effective work. Contracts can contain both skills and content components, and help in managing the classrooms because their components vary with students needs (Tomlinson, 1995). It

reinforced students' knowledge and skills and enable students to see their peers as knowledgeable instructors and collaborators in the learning process (Fahey, 2000). For example, a student in contract put his plan of actions for the weak; decide which tasks will be done in school and which at home. Therefore, learning contract would save the students' time and teach them self-management. The teacher may give them more work if they don't follow their week plan properly (Tomlinson, 1995).

Tomlinson (1999) also proposed other methods such as content-based method. She thinks that it helps the student understands the information and not to memorizes them. She believes that in most today's classrooms, students are meant to memorize vocabulary, names, dates, and rules. As a result, they forget a large amount of what they've memorized. Consequently, she suggested content-based method that directs the students more toward thinking and predicting. This will enable students to understand rather than memorize; retain ideas and facts longer because they are more meaningful; make connections between subjects and facts of a single subject; relate ideas to their own lives; and build networks of meaning for effectively dealing with future knowledge. In this case, the students will focus on concepts and principles rather than memorizing the facts (p.46).

Another method is curriculum compacting. It is a process which contains of three phases. In the first phase, the teacher assigns students for compacting and helps evaluate their understanding about specific topic or chapter. There are formal evaluation as in a written post-test, and informal one as the teacher and student discussing the subject being studied. In the second phase, the teacher may give homework or ask the student to work with other classmates when he thinks that the student did not understand the lesson well. In the final phase, the teacher and student design a study for the student to engage in while others are working with the general lessons. The student decide under the teacher guidance the project goals, time, and procedures. For example, a student who compacts out of math may develop a plan for using advanced mathematics software available in the class (Tomlinson, 1999, p.48).

Moreover, Tomlinson (1999) provided multiple resources material methods by creating classroom library from discarded texts of different levels , and by gathering magazines, newspapers, and brochures. The students are asked to use multiple texts and combining them with a wide variety of other materials of their interests (p.50).

Suggested Method

Being a teacher for six years in government schools and a professor in the university has given me a chance to be closer to students with different abilities. I believe that differentiated Instruction programs

do not make a good and a talented teacher who knows how to deal with students, a teacher can only make himself. The importance of DIP program; however, relies on giving the tools for the teacher and teaches him how to use them probably. Tomlinson and other scholars have proposed different methods regarding how teacher can present the lesson as well as presenting different approaches to help student acquire the information according to their own pace. The suggested method; on the other hand, deals with the obstacles that student face in understanding the lesson. Before we deal with students with different abilities, we need to understand the reasons behind making them different. Psychologically, each student has his own way of grasping the information. Some students may understand the lesson by analyzing the facts; others by memorizing or using their imagination. Thus, understanding what goes in students' mind helps us deal with them more easily.

There are three ways that can help us understand our students. First, giving them quiz at the beginning of the year to test their abilities. Second, involve the students in a general discussion to understand their personalities. Finally, asking them to write their likes and dislikes of the subject. This can build a close bond between a student and a teacher and help the teacher deals with the students' subject problems.

However, there is an important fact that we should all know. Before we teach our students the subject, we need to teach them how to study the subject by proposing different methods of studying. As we have mentioned above, students differ in how they gain the information. We need to make use of their own abilities and help them learn how to deal with the information. If they are lean to imagination, we need to use that in our teaching methods and plans. In other words, we need to transform their abilities into our lesson plans to give the students equal opportunities to obtain and encompass the information according to their own capacity.

In DIP, the preservice teacher need to learn the different methods of differentiated instruction to choose what is best for his students. The teacher needs to be armed with different methods that can help him deal with different students in different classes he teaches.

The preservice teachers should know how to satisfy their students' individual needs. In order to help them achieve this concept, they must be prepared to identify students' individual interests, build an appropriate curriculum plan that fit with their level and design the activities that suit their abilities. While they design their activities, they should ask themselves what the students need to know, what the students like to know and what the students already know.

The Participant

The suggested differentiated program includes 20 preservice teachers during their student teaching. They will be divided into four groups. Each group consists of five students and each group teaches different grade. The group needs to design their own plans, methods and activities.

The participants should be as Tomlinson describes "hunters and gathers" who actively continue to find out all they can about students' current readiness, interest, and learning profile and look for suitable activities for their students. They must understand that learning activities are task to help the student develop the "knowledge, understanding, and skills specified in the content goals" (Tomlinson et al, 2002, p.56). At the end of each week, the students must meet with their group and write a report about effectiveness of their method on their students' development.

The participant should spend the first semester in school in order to have time to understand the students and be capable to identify their needs. The preservice teachers in school will be embedded in individualization problem. They have to understand how to deal with it and to be able to use adequately the methods in differentiated instruction. After they finish the first semester in school, each group should present a report about the strength and weakness of the plan, the method, and the activities that they have applied. They also should share their experiences with other groups in order to increase their knowledge.

The journey to differentiated instruction needs careful planning. The teacher educators must recommend the participants to follow the following steps before they start teaching in the classroom in order to comprehend what, who, and how they will teach.

Step 1. *Activities prior to the first session*. There are many activities to plan and many decisions in learning experiences to be made prior to the first meeting. Typically, instructors start by developing a rationale statement that describes why the participants should be interested in the learning experience, how it will help them professionally, and what instructional process will be. Additional activities include determining suggested leaning competencies and requirements, identifying necessary support material such as books, articles, and audiotapes, and security needed learning resources. Another useful thing is a preparation of a workbook or study guide of supplement materials that will include any necessary syllabus information (Hiemstra&Sisco,1990,p.45).

Step 2. *Creating Learning environment*. Once the beginning experience is under way, several activities will help in creating a good learning environment like caring for the tidiness of the classroom

by asking the students to arrange their stuff before they leave the classroom. This will create the sense of responsibility within the students (Ibid).

Step 3. *Developing the instructional plan*. This is an important step in differentiated instruction, which is the main concern in our program. The teachers need to spend more time in mapping his plan by specifying the topics, activities, and objectives that they intend to use in their lesson (Ibid).\

Step 4. *Learning activity identification*. The teachers must be familiar with various learning activities, techniques, and approaches so that they can choose the appropriate ones to their students. They must also be aware of the time of the activity that they wish to use in their classroom. They must also be aware of the time of the activity that they wish to use in their classroom. They must concentrate on the activities that meet with their students' needs which help them develop their individual abilities (Ibid).

Step5. *Mentoring students' progress*. The teachers can monitor the students' progress through engaging them in small or large groups. This way will enable the teachers to monitor their students' progress and to give them a feedback.

Step 6. *Evaluating individual learner outcomes*. The teacher must evaluate his students' development through observing and testing their abilities (Ibid).

Program Evaluation

The purpose of training program is to make the participant aware of the DIP requirements regarding participation and accommodation; give the participant the opportunity to study theories related to differentiated Instruction; increase awareness of DIP activities and methods; and enable the learner assess and document a students' participation in differentiated instruction environment (Shriner&Destefano, 2003).

In DIP, it is important to examine the goals, the methods, the activities, and the participants' progress. The participant must be examined pre and post training for measuring the quality of the program. The pre-tests are exams given to the participants to measure their knowledge about differentiated instruction. These exams are diagnostic ones that investigate the participants' willingness to teach in diverse classroom as well as to make sure of their understanding of differentiated instruction. Whereas, post-tests examine the participants mastery or at least comprehension of differentiated instruction after they finish their semester teaching. The pre and post tests are written exams that diagnose the quantity of knowledge that the participants gain.

Resources:

- A model for differentiated instruction program.
- A plan for teacher in DIP.
- Activities for teachers.

In conclusion, I've attempted to transform differentiated instruction into a program that can give the teacher the tools to deal with students with diverse abilities. The program is divided into two phases. In the first phase, the preservice teachers are introduced to the meaning of differentiated instruction, the importance of applying it in the classrooms, and their prospective roles in differentiated classrooms. In the second phase, the preservice teachers practice what they have learned about differentiate instruction. They need to understand how to plan, manage the classroom, and create activities.

Abstract

The education of today engineers is being challenged today to integrate technical and non-technical issues in order to serve the employment market.   Thailand is a developing country and the place where many industries invest their manufacturing. The engineering is the top study major for students in universities at all time.   Both government or private universities offer many different engineering education program all over country.   There are more than 51 institutes offer engineering programs.   The job market for engineers is appealing.   Engineering is essentially the use of scientific and mathematical tools in real life applications. Over the years, the profession of engineering has been separated itself into different fields based on society's needs and technological advances, and on how engineers apply science to solve technical problems.   In this paper, the case of integration of engineering and law is described, illustrating how to implement such integration in engineering education. These cases refer to graduate and continuing education in Thailand. A theoretical framework for a holistic approach to engineering education has been suggested. It is based on a comprehensive analysis undertaken.

1. INTRODUCTION

The education of today engineers is being challenged today to integrate technical and non-technical issues in order to serve the employment market.   Thailand is a developing country and the place where many industries invest their manufacturing. The engineering is the top study major for students in universities at all time.   Both government or private universities offer many different engineering education programs all over country.   There are more than 51 institutes offer engineering programs.   The job market for engineers is appealing.   Engineering is essentially the use of scientific and mathematical tools in real life applications. Over the years, the profession of engineering has been separated itself into different fields based on society's needs and technological advances, and on how engineers apply science to solve technical problems.   Each engineering discipline however has its own characteristics that distinguish it from other engineering fields. Nonetheless, different engineering fields overlap with each other in many and interesting ways. In addition, the engineering knowledge alone cannot be enough for worker to be sufficient and satisfy employers without other knowledge. Examples include the two sets of engineering fields: civil and environmental engineering , and business administration and law. Sometimes, the overlap involves more than two engineering fields. In this paper, the case of integration of engineering and law is described, illustrating how to implement such integration in engineering education. These cases refer to graduate and continuing education in Thailand. A theoretical framework for a holistic approach to engineering education has been suggested. It is based on a comprehensive analysis undertaken.

2. Law in engineering study

2.1 Engineering liability

Engineers are not aware of liability law when they receive their engineering degrees. the elements of engineering malpractice causes of action against engineers are obvious when law is becoming more familiar to people and going to court is more common in modern life. Therefore, the raises the awareness of our students to their legal responsibilities to their employers and to society is needed. The common form of legal issue for engineers is negligence.   The concept of negligence developed under common law and the meaning of legal liability for a failure to act. Originally liability for failing to act was imposed on those who undertook to perform some service and breached a promise to exercise care or skill in performing that service. Gradually the law began to imply a promise to exercise care or skill in the performance of certain services. This promise to exercise care, whether express or implied, formed the origins of the modern concept of "duty." For example, Civil engineers have a duty to responsible for the design of the building. In a negligence suit, the plaintiff has the burden of proving that the defendant did not act as a reasonable person would have acted under the circumstances. The court will consider the facts. The defense of the case by A defendant who is not liable in negligence, even if she did not act with reasonable care, if she did not owe a duty to the plaintiff. In general, a person is under a duty to all persons at all times to exercise reasonable care for their physical safety and the safety of their property. The application to engineering is engineering malpractice. Engineering malpractice liability is a subset of professional liability directed towards engineers. Engineering malpractice uses the same concepts of negligence to determine liability. Specifically, if an engineer is negligent, and this negligent conduct is the proximate cause of the injuries, then the engineer is liable for engineering malpractice. Malpractice Examples:

There are numerous examples of engineering malpractice in published court opinions. Many of these cases involve civil engineering practice as these engineering practitioners commonly are accused of malpractice.

2.2. INTERDISCIPLINARY ENGINEERING EDUCATION

Industry increasingly demands that an engineer have the ability to work outside the boundaries defined by a single field. The interdisciplinary engineering program is designed to achieve the breadth of education necessary for engineers to function in such assignments, while providing a high level of technical expertise and practice in modern design methodology. Team projects are an integral part of the program, and students should expect to become proficient at working and communicating with a design team. Engineers also need to know the relevant law such as criminal law, Patent law, liability law, and environmental law. This section describes the involvement of graduate engineering students in interdisciplinary education.   In order to deal with such broad issues in engineering education, the university has set up new department which is engineering law graduate study department.   It is unusual to involve engineers in organizational development. However, technology as developed by engineers is intended to be used within a complex organizational framework. Thus, it is essential for engineers to obtain direct knowledge and experience about such organizations. The best learning process to address this aim is to participate in a genuine project involving organizational development. Today such projects always comprise the implementation of new technology. In the project described here, however, the emphasis of innovation is on organization rather than on technology: redesigning the organization in a large hospital. Large hospitals are highly complex systems in terms of the dynamic interrelations between people, the organization they work in and the technology they work with. Such complex social systems must continuously develop and redesign themselves to meet all the requirements of their tasks.   A strong background in design techniques applicable to a wide variety of complex problems is in demand along with engineers who understand more than one discipline and are prepared to work at the intersection of two or more engineering disciplines.

3. The graduate study program in Engineering Law

        The need of integration of law knowledge for engineers initiates the curriculum of Master of Engineering in Engineering law and inspection. The program was designed and evaluated by the experience educators and supreme court judges.   The program was approved and accredited by The board of higher education, the ministry of Education.

The total credits of completed degree are 36 credits. The subjects are grouped as follow:

The general education:

RU600   Knowledge and Morality

RU603   Graduate Study

EL609   Research and Decision Making for Engineering Work

The engineering core courses

EL610   Conceptual Principal in Infrastructure Development Engineering

EL611   Management and Engineering Organizational Development

EL612   Maintenance and Inspection in Engineering

Law and Inspection core courses

EL620   Project Administration and Engineering Law

EL621   Law Concerning Building Inspection

EL622   Environmental Management and Energy Conservation Law

EL623   Industrial and Labor Law

EL624   Seminar in Inspection and Engineering Law

EL630   Environmental Impact Analysis

EL631   Land Development, Urban Plan and Law

EL632   Industrial Standard and Quality Assurance

EL633   Risk Administration and Safety

EL634   Inspection, Energy Management System Standard and Law

EL635   Intellectual Property and Information Technology Law

EL636   Professional Law and Engineer Ethics

EL637   Logistics Engineering Law

EL638   Commercial Law and International Industrial

EL639   Draft and Format Law in Engineering Work

EL640   Special Topics in Inspection and Engineering Law

EL636   Professional Law and Engineer Ethics

EL637   Logistics Engineering Law

Explaining variability in article production by Korean speakers of English

Gavin Austin

School of Behavioural, Cognitive and Social Sciences, University of New England, Australia

Andrew McDouall,

Dept of General Education, Halla University, Korea

Abstract:

The Syntactic Misanalysis Hypothesis (SMH) (Trenkic 2007) aims to explain article-drop in second-language English by speakers of article-less native languages. We tested the SMH by having ten intermediate Korean speakers take part in a story-recall task. The results not only support the SMH, but show that this hypothesis is applicable to 'the + Adj + N' contexts in which the adjective has a non-identifying function.

It has long been recognized that second-language speakers (L2ers) of English are especially likely to omit articles if their native languages (L1s) lack this type of item (e.g., Goad & White 2004, Snape 2007). One recent attempt to explain article-drop in L2 English by speakers of article-less L1s is the Syntactic Misanalysis Hypothesis (SMH) (Trenkic 2007), a theory of morphological variability which receives compelling validation from Serbian speakers in the study reported in Trenkic's own work. In the current paper, we present further evidence in support of the SMH, this time using data gathered from Korean speakers. We also show, however, that Trenkic's hypothesis needs to be formulated in slightly more precise terms if it is to provide us with a satisfactory account of this particular interlanguage phenomenon.

The SMH is predicated on two related assumptions. The first assumption is that L2ers of English whose L1s lack articles will misanalyze this item as an adjective.[1] For example, a noun phrase containing an article such as 'the chair' will be taken to mean something like 'identifiable chair'.[2] Second, under the cognitive demands of spoken-language production, information which is necessary for successful communication will be allocated more attentional resources than information which can be omitted without significant risk of a breakdown in communication. To clarify what she means by the relative importance of certain types of information, Trenkic uses the following sort of example. Suppose there are two chairs in front of you, one green and one blue, and you are required to sit in the blue chair, not the green chair. In this scenario, it would be felicitous for someone to say (1a) to you. It is also likely that, despite the obvious ungrammaticality of (1b), the desired outcome could still be achieved if this person said (1b) to you. This is because the adjective 'blue' tells you which chair you must sit in—a crucial detail. By comparison, the article is not essential to the outcome of the

---

[1] We follow Trenkic in limiting our analysis to definite articles.

[2] By extension, this principle applies to a noun phrase such as 'the blue chair' as well, so that this particular noun phrase will be taken to mean something like 'identifiable blue chair'.

interaction, and can therefore be omitted. However, if the person said (1c) to you, there would undoubtedly be a breakdown in communication, and you would be left standing as a result.

(1) (a)   Please sit in the *blue* chair.[3]

     (b)   Please sit in *blue* chair.

     (c)   Please sit in the chair.

Accordingly, when an L2er tries to produce a noun phrase such as 'the blue chair' in the situation described above, Trenkic hypothesizes that the L2er will attend to the adjective 'blue' more closely than to the article-as-adjective 'the'.

These two assumptions have key implications for the production of articles in the context 'the + Adj + N' versus in the context 'the + N'. Specifically, when the L2er is confronted with the task of producing 'the blue chair', the article will be supplied at a relatively low rate because the adjective 'blue' uses up more attentional resources than the article-as-adjective 'the'. In contrast, when the L2er has to produce the noun phrase 'the chair', the article is produced at a high rate because there is no competition for attentional resources here between a true adjective and an article-as-adjective. Rather, the article-as-adjective 'wins' by default.

Now compare (2) and (3).

(2) Sally has two cats, a *thin* cat and a *fat* cat. The *thin* cat is friendly, but the *fat* cat attacks people.

(3) I met a man yesterday. He helped me to carry a heavy box. Then I bought the kind man a drink.

As we saw in (1), the adjectives 'thin' and 'fat' in (2) enable us to identify which cat is being referred to. In (3), however, the adjective 'kind' does not have an identifying function: since there is only one man in the story, there is no need to distinguish him from another man. Rather, the adjective 'kind' is (optionally) included only because, in the course of the story, the man is shown to possess this trait. Hence, whereas identifying adjectives are necessary, non-identifying adjectives can be omitted without causing confusion. This can be verified by comparing (4) and (5).

??   (4) Sally bought two cats, a ~~thin~~ cat and a ~~fat~~ cat. The ~~thin~~ cat is very friendly, but the ~~fat~~ cat often attacks people.

(5) I met a man yesterday. He gave me $500. Then the ~~kind~~ man went away.

---

[3] In spoken language, this identifying function of an adjective is typically accompanied by increased word-stress, indicated here by italics.

This distinction between identifying and non-identifying adjectives is noteworthy because Trenkic does not draw an explicit dichotomy between these two types of adjective anywhere in her explanation of the SMH. Moreover, with one possible exception, the adjectives in her examples are all clearly of the identifying variety. Granted, it does not necessarily follow that the SMH can be applied *only* to noun phrases with the structure 'the + Adj + N' in which the adjective has an identifying function; after all, Trenkic's reliance on noun phrases containing identifying-type adjectives for illustrative purposes may simply be accidental. Even so, we suggest that it is worth determining whether the SMH can be applied to 'the + Adj + N' noun phrases containing identifying adjectives only, or is applicable to 'the + Adj + N' noun phrases containing *non*-identifying adjectives as well. This seems a reasonable position to adopt on the grounds that, despite the optionality of the adjective 'kind' in (5), the production of a non-identifying adjective (when it is included) must surely use up at least *some* of the attentional resources allocated to the noun phrase in which it occurs. Thus, we make the same prediction re article suppliance in noun phrases containing non-identifying adjectives as the one that Trenkic made re article suppliance in noun phrases containing identifying adjectives: articles will be dropped more often in the context 'the + Adj + N' than in the context 'the + N'.

In order to test this prediction, we had ten intermediate Korean speakers of English take part in a story-recall task loosely adapted from Snape (2007). The texts were seeded with noun phrases of the relevant types. It turned out that the rate of article suppliance in 'the + Adj + Adj + N' contexts was 32/69 (46.4%), while the rate was 52/61 (85.2%) in 'the + N' contexts.[4] Following Trenkic, we used the formula utilized by Woods *et al.* (1986) to verify that this difference is statistically significant, $z = 4.44$, $p < .001$. In short, our research suggests that the SMH is applicable to 'the + Adj + N' contexts in which the adjective has a non-identifying function.

To conclude, the findings of this investigation offer broad support for the SMH, but they also highlight the importance of specifying the types of noun phrase covered by the hypothesis. This outcome has implications for future research on the SMH. The most obvious of these implications is that we need a study to be conducted which directly compares the rates of article suppliance in 'the + Adj + N' contexts when the adjective is non-identifying versus identifying. In keeping with the argumentation presented in this paper, our prediction is that article suppliance will be higher when the adjective is non-identifying than when it is identifying. However, this prediction will of course remain only speculation on our part until it is tested empirically.

On a more general level, we take the view that the results of the present study also have some modest implications for English-language instruction, teaching-materials design and language-proficiency assessment. All too often, the results of a study such as ours remain confined to the domain of 'pure' science, and their practical relevance goes not merely unrecognized but unexplored. However, if we reach a better understanding of the factors which influence article production in L2 English, it surely follows that this especially subtle and complex feature of English can be taught to L2ers with article-less L1s more effectively, or evaluated in the speech of such L2ers more accurately. For instance, in light of the findings of the present study, it would clearly be advisable to eschew examples such as 'the red car' or 'the beautiful green house' when teaching this type of L2er how to use English articles in the appropriate manner. Likewise, if an L2er omits articles often in these contexts, it seems reasonable that such omissions should be penalized relatively lightly when this L2er's English is being assessed.

---

[4] The fact that we used 'the + Adj + Adj + N' contexts rather than 'the + Adj + N' contexts is not important.

The Zone of Proximal Development and Its Application to

Writing Instruction: Focusing on the Aspect of Affect

Toru Yamashita

Kumamoto University

yamasita@kumamoto-u.ac.jp

Abstract

While the cognitive and social aspects of Vygotsky's Zone of Proximal Development (ZPD) have been the focal point in language teaching and learning, the affective aspect of ZPD has not received much attention. According to recent research, however, Vygotsky refers to affect and its relation to thought in the consciousness of the learner. Thus, this article illuminates the role of affective aspect in the overall framework of Vygotskian sociocultural theory, and that the affective ZPD is important for writing instruction, in addition to cognitive and motivational factors. It also proposes an affective diary as a mediation tool to create the emotional ZPD in the writing process.

1. Introduction

ZPD is a concept which reflects the affect of humans, and that promoting social interaction in collaborative activities between the teacher and the learner, and among learners by focusing on the affective aspect of ZPD is needed to enhance the effect of ZPD. This also implies that there exist complementary relationship between affective aspect, and motivational, cognitive, and social aspects, and that these aspects contribute to the establishment of ZPD.

It is also necessary that affect, including anxiety in the writing process are reconsidered in terms of the affective ZPD. The concept of affective ZPD needs to be incorporated into collaborative learning from the outset of the writing process. Also, a diary is a useful tool for the learner to record real-time affective states, such as emotions and feelings. After learners in a group are involved in collaborative dialogue to exchange and share emotions with regard to writing activities, they need to record the emotions, using collaborative affective diaries.

2. Affective ZPD in Vygotsky's theory

Vygotsky defines ZPD as the distance between the actual developmental level as determined by independent problem solving and the level of potential development as determined through problem solving under adult guidance or in collaboration with more capable peers (Vygotsky, 1978, p.86).

In this definition, cognitive and social dimensions of ZPD as well as scaffolding are emphasized. These aspects of ZPD have already been dealt with in the research and practice of language learning.

The notion of ZPD is also described by Vygotsky as an essential feature of learning is that it creates the zone of proximal development; that is, learning awakens a variety of internal developmental process that are able to operate only when the child is interacting with people in his environment and in cooperation with his peers. Only these processes are internalized, they become part the child's independent developmental achievement (Vygotsky, 1978, p.90).

In this notion of ZPD, both interpsychological and intrapsychological (internal) processes of development are highlighted.

According to Kinginger (2002), the above concept of ZPD has been defined and interpreted in various ways in the context of US foreign language education. On the whole, however, there are three interpretations; the skills interpretation, the scaffolding interpretation, and metalinguistic interpretation. The skills interpretation tends to emphasize input processing (internalization of skills) in social interaction, and the task level (ZPD), which is a little over the learner's current ability. The scaffolding interpretation is that the teacher assists learners' performance as they move toward the level of ZPD in terms of cognition. The metalinguistic interpretation stresses the positive role of the learner in the production of language output in collaborative dialogue and the learner's reflection on his/her language production. Additionally, there are conservative and progressive trends in the interpretation of ZPD. The scaffolding and metalinguistic interpretations can be categorized into the progressive trend because they aim to transfer the locus of control to the learner. In these interpretations, however, cognitive and metalinguistic (language awareness) aspects of ZPD are underscored, and the affective aspect of ZPD is not included.

Mahn & John-Steiner (2000) argues that the concept of ZPD is expanded so that it involves the affective aspect by pointing out that the affective ZPD is constructed in affective interaction and scaffolding among the teacher and learners. Furthermore, Mahn & John-Steiner (2002) claim that affective factors, such as fear and anxiety influence the level of ZPD and propose that dialogue journals as written dialogues be used in the development of writing because caring support and emotional interaction through affective language in the process of writing the dialogue journals will help establish the foundation for the collective and affective ZPD of the learners as a whole. They further contend that the affective ZPD created through the dialogue journals will help the learners raise the metacognitive awareness of their own writing process as well. Thus, it can be suggested that the mutually reinforced relations between affect and cognition in social interaction are important for expanding the notion of ZPD, and that the affective ZPD can contribute to the remediation of emotions and the subsequent development of motivation and cognition in the writing process. It should also be noted that the learners can transform the writing process toward the affective ZPD by exchanging emotions and feelings through affective language in the dialogue journals, receiving affective scaffolding from the teacher.

On the other hand, Levykh (2008) argues that the conservative features of ZPD (social, cultural, and historical features) have already involved affective and cognitive aspects, and that the expanded concept of ZPD is not needed. This conceptualization of ZPD seems to be different from the extended concept of ZPD proposed by Mahn & John-Steiner (2002). because Levykh (2008) underscores the affective genesis of ZPD and the role of culturally and historically developed emotions in the effective establishment and maintenance of ZPD. Levykh (2008) also maintains that an emotionally positive collaboration between the teacher and the learner in a caring environment has to be created from the initial stage of the learning process. Thus, the teacher is expected to play a more substantial role in providing affective scaffolding for the learner. In this conceptualization, scaffolding from the teacher is considered to be more important than interpersonal scaffolding among learners to establish the holistic ZPD which encompasses affective, cognitive, social, cultural, and historical features. That is, the active role of the learner who can remediate emotions and transform the learning process and environment as an agency is less emphasized. Also, affect includes not only feelings exchanged among learners but also culturally developed emotions in art, which lead to the cultural development of the learner.

Therefore, we need to place greater emphasis on the emotions and feelings exchanged and shared among learners in addition to affective scaffolding from the teacher by further developing the concept of affective ZPD because the learner as an agency should be able to actively transform the learning process collaboratively in terms of affect, motivation, and cognition.

3. Affect, motivation, and cognition in Vygotsky's sociocultural approach

Cognition and motivation have been important constructs in mainstream educational psychology. According to Meyer & Turner (2002), in the prevalent cognitive conceptions of motivation, cognition

and motivation are only two components of learning, and affect has not been a central component of major motivation theories, such as goal theory, expectancy-value theory, and self-efficacy theory. That is, there is a tendency that affect has not been a major source of motivation. Instead, cognition is thought to be a more contributory factor to motivation. That is, the cognitive appraisal of the object and situation by the learner has been regarded as the main source of motivation and affect. However, as Linnenbrink (2006, p. 311) points out, some scholars claim that affect is an important factor to motivational processes, and that affect may influence how information is stored, retrieved, and processed and how one appraises a specific situation. Hence, affect can lead to motivation and cognition although this directionality is not dominant in educational psychology.

In the fields of second language acquisition (SLA) and language learning, there has not been a coherent and consistent theory of affect, compared with the construct of cognition although the role of affect is becoming more important in the field. Also, affect is regarded as a broad and vague concept which tends to encompass learner characteristics, such as attitude, personality, motivation, self-esteem, anxiety, tolerance for ambiguity, and so on, excluding cognition (Arnold, 1999). Therefore, it is significant to reconceptualize the construct of affect in relation to motivation and cognition.

It is postulated in Vygotskian sociocultural theory that affect, motivation, and cognition are thought to be developed as part of social interaction. This differs from the above conceptions of educational psychology, which have a tendency to place more emphasis on the individualized aspect of learning. Also, affect in addition to motivation and cognition plays an important role in social interaction. It can be suggested that affect has a significant effect on motivation and cognition although this directionality is not central in the current theories of educational psychology and SLA. Furthermore, there is a possibility that the establishment of the affective ZPD in collaborative learning will lead to the creation of affect to promote and develop the aspects of motivation and cognition as well.

Damasio (2000) claims that affect in the consciousness of humans is linked to brain structures and essential to the cognitive and reasoning processes of inference and decision-making, from the viewpoint of neuroscience and proposes the somatic marker hypothesis, which emphasizes embodied subjectivity formed by real-time bodily information and the somatic and physiological aspects of affect. His conception of affect is also implicated in Vygotsky's sociocultural theory. Although Vygotsky does not explain the role of affect in detail, he conceptualizes the relationship between affect and thought as follows:

> Thought has its origins in the motivational sphere of consciousness, a sphere that includes our inclinations and needs, our interests and impulses, and our affect and emotions. The affective and volitional tendency stands behind thought. Only here do we find the answer to the final 'why' in the analysis of thinking (Vygotsky, 1987, p.282).

In this conceptualization, affect is considered to influence thought. Cromby (2007, p. 107) argues that Vygotsky underline the close relation between feelings and inner speech, which is the unspoken comment on one's and others' activities. He further points out that inner feelings as embodied subjectivity through inner speech and outer socialized feelings through language (outer speech) create thought, which consists of affective tendencies that are completed and internalized by inner speech. Hence, Vygotsky's conceptualization of affect seems to be in contrast to the current dominant conception of cognitive appraisal in educational psychology. We need to focus more attention on complementary and reciprocal relations between affect and cognition (thought) in social interaction. It should be noted that inner speech and language have a function to mediate affect intrapsychologicaly and interpsychologicaly in relation to the affective ZPD. This also means that language plays an important role in the communicative exchange and sharing of emotions in collaborative learning to create the collective and affective ZPD.

4. Practical application of Vygotskian sociocultural approach

There is little practical and empirical research to apply the affective aspect of Vygotskian sociocultural approach to language learning.

As mentioned above, Mahn & John-Steiner (2002) propose the effective use of dialogue journals in collaborative learning to create the affective ZPD. In addition, Le (2003) focuses on the affective aspect of Vygotskian sociocultural theory and applies it to peer scaffolding in group interaction of EFL learners. In this study, qualitative research methods of journals, interviews, audio-recordings, and video recordings are used. In the journals in response to questions, emotions, such as enjoyment and stress are expressed with regard to peer scaffolding and assistance in group work. There is a possibility that the dialogue journals will contribute to the further development of the emotional aspect of collaborative learning, and the transformation of the learning process and environment if emotions and feelings expressed in the journals are shared and understood among the learners.

Dipardo & Schnack (2004) investigate learners' experiences in a reading and writing program in which eighth-grade language arts students are paired with elderly volunteers, using collaborative journals, interviews, and questionnaires This qualitative study, which is based on Vygotskian sociocultural approach, emphasizes the role of emotion in the co-construction of meaning and the establishment of trust and support among the participants. Also, they report that emotion is integrated with cognition in this study.

In these studies founded on Vygotskian theory, which underscores the collaborative and affective aspects of learning, dialogue and collaborative journals are utilized. It can be suggested that collaborative journals among learners will be effective for practicing and investigating the affective aspect of collaborative learning because emotions and feelings in the journals are exchanged and shared among the learners.

5. How to investigate affect in relation to motivation and cognition
Several types of studies have been conducted to investigate affect, motivation, and cognition in the fields of SLA and language learning. In addition to quantitative approaches, such as questionnaires, qualitative approaches, such as learning histories, autobiographies, learning diaries, journals, interviews, and verbal protocols have been mainly utilized as tools of the studies.

Oxford (1995) employs leaning histories to examine the cognitive, motivational, and affective aspects of language learning, including learning styles, learning strategies, motivation, self-esteem, and anxiety in a learning community, using learners' introspective narratives in specific contexts and their content analysis. In this study, however, the affective aspect is not clearly distinguished from the cognitive and motivational aspects. Also, the cognitive appraisal of one's language performance in relation to learning styles and strategies is considered to be a major contributing factor to motivation and affect, and the metacognitive awareness of the learner's past learning processes is emphasized. Furthermore, emotions, such as anxiety, anger, frustration, discomfort are not central in this study, which depends on the learner's memory. Also, the learning histories do not seem to be appropriate to measure emotions and feelings to be exchanged and shared in the on-going process of social interaction while it is suitable for investigating longitudinal changes in constructs, such as cognition and motivation qualitatively.

Tse (2000) analyzes learners' perceptions of foreign language study qualitatively, using foreign language autobiographies. Based on the autobiographical writings of the participants in response to open-ended questions, this study centers on the attribution of success and failure (e.g. effort, ability,

learning environment) in the participants' language learning. Thus, this study is founded on attribution theory, which is one of the major motivation theories, and cognitive appraisal. That is, effort and ability attributions are considered to have psychological effects on self-esteem, expectancy of success, and affect (e.g. gratitude, anger). Like the study using a learning history, the affective and social aspects of language learning are not the main focus of this study because affect is thought be the result of cognitive appraisal by the learner.

So & Dominguez (2004) also employ an interpretive biography written by a learner and analyzes the learner's emotional processes and episodes, including fear, anxiety, and stress. In this study, emotion regulatory strategies, such as situation selection, cognitive change, and response modulation are underscored. Cognitive change is to adjust the learner's interpretation of one's own proficiency, and response modulation is to encourage more positive emotional response of the learner. This study centers on the individual aspect of language learning in terms of emotion regulation. Thus, the social aspect of affect is less emphasized. Also, affect is thought to be caused by cognitive appraisal. Furthermore, the interpretive biography needs to be used cautiously in investigating emotions because emotions tend to be subject to reappraisal and retrospective selective memory.

Porto (2007) uses learning diaries to qualitatively investigate how EFL learners experience language learning and how learners' introspection and reflection in the diaries lead to the development of self-determination and learner autonomy over time. In this study, the learners' perceptions of the learning environment and the prevalent feelings of the learners are coded and categorized. The prevalent feelings include disenchantment, fear of failure, dissatisfaction, appreciation, interest, relevance, self-esteem, enthusiasm, self-confidence, and so on. with the result that the affective and motivational aspects of language learning are elicited and identified. Also, as the learning diaries are collected in the period of more than 3 years, they can be analyzed systematically from a long-term perspective in terms of affect and motivation. However, this study does not focus its attention on emotions and feelings exchanged and shared among learners.

Consequently, on the whole, the learning histories, autobiographies, and interpretive biography employed in the above-mentioned studies are basically founded on cognitive appraisal, which is dominant in the current theories of educational psychology and SLA. Also, they can be used for the investigation of changes in the cognitive and motivational aspects of language learning over time, from a longer range viewpoint. However, they are not suitable for measuring emotional changes in the learning process, and real-time emotions and feelings exchanged through language in social interaction.

In addition to the journal studies employed by Mahn & John-Steiner (2002), Le (2003), and Dipardo & Schnack (2004), a learning diary (affective diary), which focuses on the affective aspect of language learning, is thought to be an effective tool to record and examine the on-going emotions exchanged and shared among learners, toward the creation of the collective and affective ZPD. If affective diaries are collected for a longer period of time continuously, they could contribute to the improvement and transformation of the affective aspect of collaborative learning. Verbal protocols and interviews can also be utilized after video-recording emotional interactions. Moreover, learning histories and autobiographies could be used with affective diaries because the complementary relations between affect and cognition are important in the learning process.

6. Affective intersubjectivity and ZPD in writing instruction
Previous writing models have a tendency to center on the cognitive aspect of the writing process of the individual learner. Sasaki (2002) argues that future studies should examine how affective and emotional aspects are associated with the writing process in the reconceptualization of writing models, and that the sociocultural contexts of the writing process should be considered. Cumming (2001) also suggests that situated interactions and scaffolding toward ZPD can contribute to the improvement of the writing process and the promotion of learning to write in a second language. He also points out that

a few studies have adopted Vygotskian sociocultural approach in the research and practice of writing instruction.

In recent years, in writing instruction, affect and motivation have received increased attention in addition to cognition. Writing anxiety (apprehension), which is a negative affect toward writing, has been an object of recent research. The research of writing anxiety focuses on how to reduce the anxiety and improve writing skills by intervention, based on a questionnaire survey (self-report). Also, according to Cheng (2002), writing anxiety tends to be related to self-efficacy, which is influenced by the self-rating of one's proficiency. Cheng (2004) develops SLWAI (Second Language Writing Anxiety Inventory) as a questionnaire to survey the writing anxiety of the learner, making it distinct from factors, such as self-efficacy and self-confidence. The items of SLWAI are categorized into cognitive anxiety, somatic anxiety, and avoidance behavior. Cognitive anxiety is the mental aspect of anxiety experience (e.g. preoccupation with performance), and somatic anxiety is one's perception of physiological effects of anxiety experience. On the whole, however, SLWAI is developed, founded on the conception of cognitive appraisal, which is prevalent in the current theories of educational psychology and SLA. That is, cognitive appraisal is regarded as the underlying factor of writing anxiety. Besides, SLWAI, which is a self-report measure of writing anxiety, is not necessarily an appropriate tool to investigate on-going emotional experiences in the particular context of the writing process because it depends on the memory of the learner and tends to be subject to forgetting.

Affect consists of various kinds of emotions, such as enjoyment, pleasure, relief, contentment, comfort, hope, gratitude, discomfort, anger, boredom, tension, frustration, shame, and so forth. These emotions have not been dealt with as the main objects of research in SLA and language learning. Also, in recent writing research, emotions except for writing anxiety have not been fully investigated. In addition, cognitive appraisal, which focuses on the causal and unidirectional relationship between cognition and affect, has been mainly employed in the research. While it is necessary to examine cognitive appraisal in the mental aspect of the individual learner with respect to writing anxiety by using a certain scale, we also need to consider a diversity of real-time emotional experiences in the collaborative learning of writing as an alternative method of research. It should be noted that emotional experiences in the writing process can also influence motivation and cognition. Furthermore, we should pay more attention to the social aspect of affect, which is suggested in the concept of affective ZPD although ZPD has been primarily investigated from sociocognitive perspective in writing research (Guerrero & Villamil, 2000).

Imai (2009, p.3) introduces the concept of affective intersubjectivity proposed by Denzin (1984), which means the level of how learners interpret and understand the emotions expressed in social interaction (socialized emotions) with each other. This concept has been examined from several theoretical approaches, including phenomenology. In Vygotskian sociocultural theory, the concept has been discussed from social and cognitive aspects, such as co-construction of knowledge and shared problem-solving (Hausfather, 2001). It can be suggested, however, that affective intersubjectivity will reinforce cognitive intersubjectivity in the collaborative writing process. The affective ZPD should also be reconceptualized in light of affective intersubjectivity, in relation to the theory and practice of writing instruction.

Learners can exchange and share various kinds of emotions in a group through language toward the affective intersubjectivity and ZPD after collaborative and cognitive writing activities, such as planning, idea generation, concept mapping, and formulation. The learner records his/her emotional experiences, using an affective diary in each process of these activities. Based on the affective diaries, learners can be involved in collaborative dialogue to establish the affective intersubjectivity and ZPD. Also, learners in a group can record the results of the sharing of emotions and feelings, employing a collaborative affective diary. These kinds of diaries can record more real-time emotional experiences, as compared with other introspective tools, such as learning histories and autobiographies. They will be effective mediation tools, and appropriate for investigating emotions to be expressed through affective

language in the specific contexts of the writing process. Besides these affective diaries, collaborative journals can also be employed to exchange and share emotions.

Through these activities, the learner as an agency can participate in the improvement of the affective aspect of the collaborative writing process, which is expected to lead to changing and promoting the motivational and cognitive aspects of learning as well. Moreover, affective scaffolding as well as cognitive scaffolding from the teacher is important for the facilitation of the above activities. The teacher should provide support and encouragement for the learner from the outset of the writing process, directing the learner's attention to the affective intersubjectivity and ZPD. The teacher who is a researcher as well as a practitioner, will not distinguish between positive emotions and negative emotions in terms of emotion regulation, based on a predetermined measure of emotions. Instead, emotions expressed in the affective diaries as mediation tools will be examined in light of the affective intersubjectivity and ZPD. As Imai (2009) argues, besides the generalized affective concept of anxiety, the interpreted and shared meaning of emotions among learners in specific contexts of social interaction is significant for the research and practice of language learning. This can also be applied to the collaborative development of writing to create the affective ZPD.

7.   Conclusion
This article could make it clear that the affective intersubjectivity and ZPD suggested in Vygotsky's sociocultural theory have significant implications for the emotional aspect of writing development as an alternative to the current prevailing theories of educational psychology and language learning. It could also elucidate that it is important to focus more attention on the complementary relations among affect, motivation, and cognition in the collaborative process of writing. However, as mentioned above, there seems to be little empirical research, based on the conception of affective ZPD at this point. Although it is essential to synthesize psychological categories among affect, motivation, and cognition, it is also necessary to further illuminate the reciprocal categorical relations both theoretically and empirically in the framework of Vygotskian sociocultural approach, referring to other related theories in the fields of educational psychology and SLA.
