What is Real? The Ethics of Digital Manipulation and What the Academic Community must do to Address the Problem

Swanson, Gary   University of Northern Colorado, USA

ABSTRACT

In 2006, the discovery that a Lebanese freelance photographer, Adnan Hajj, had manipulated pictures he took for Reuters raised questions about the standards of photojournalism at a time of widespread digital photography.

In March 2003, two photos involving Iraqi civilians by a Los Angeles Times photographer were "blended" in violation of the newspaper's policy, and the photographer was fired.
These incidents have increased pressure on news photo editors, who select and edit thousands of photographs on deadline each day, to detect digital alterations and it has put pressure on the academic community to teach higher standards of ethics: morality, honesty and integrity to name a few.

David Friend is an editor at Vanity Fair magazine and a former director of photography for Life magazine. He says: "Now all it takes is a swipe of a mouse, and the kid down the street can add smoke and mirrors to everything."

Like it or not, the reality is that fake images are everywhere and falsification has become a part of today's culture thanks to the popularity of digital cameras, the availability of desktop imaging software, and the immense popularity of web sites such as Facebook and Flickr.

Construction of Childhood in Children's Literature: Reflecting Change, Responding to Challenges

Rosario Torres-Yu, Ph. D

University of the Philippines

First Asian Conference on Education, October 24-25, 2009, Osaka, Japan

Abstract:

Impressive scholarly writing and research have been done on children in the last two decades according to Prout (2005). Debates that stem from varying conceptions of childhood permeate the discourse. The social construction of children or the process by which children learn specific behavioral and cultural codes is among the themes, which are attracting great interest in this new awareness of re-thinking childhood. The open attitude that comes with this new direction inspires this investigation on childhood construction in mainstream children's literature. It seeks to identify issues and challenges in the education of children in the context of changing social and economic conditions brought about by globalization. It limits its gaze to the discourse on concern for children, which is relevant to the discussions on development and education of children. It analyses the implications of representations of childhood in literature against the backdrop of changes in the family and the child's place in it in the midst of transnationalization of care giving and female migrant work. To concretize discussion, this paper focuses on the Philippines for the most part and draws from the literature on Asian children as well. Training the eye on Asian children is timely as it is a response to the growing discontent with the universalizing concept of childhood in western discourse, which dominates the present. Indeed, there is a need to produce multiple discourses on childhood because of the ideological and practical implications discourses have on policies and practices that affect children in general and children's education, in particular.

Keywords: Asian childhood, education, literature, ideology, construction

Introduction

Motherhood is a very powerful concept in Philippine socio-political and cultural landscape. Recently, the passing of former Philippine President Corazon C. Aquino, the first woman president of the republic and the response of the people to it enacted this power. Reminiscent of the 1986 People Power which brought down dictatorial rule, people lined the streets wearing symbols, flashing signs and using color yellow signifying the struggle for democracy, honored the former President who in death had become an icon, 'Ina ng demokrasya.' [Mother of Democracy] She is now perceived as a leader whose commitment to justice, democracy and peace was her legacy.

Mothers occupy key role in child-rearing practice in the Philippines as in many other societies. This is expressed in a saying " Ang ina ang ilaw ng tahanan." [The mother is the beacon of the home.] Traditionally, mother and children spend most of the time together at home, while father earns a living.

The child receives nurturance (literally through breastfeeding) and figuratively through caring. The family is where the child first learns the core values of obedience, filial piety, and duty, which the school, later on follows through and teaches more social and moral codes. Disciplining of children is the domain of the father who is expected to be firm and unwavering, an attribute of child rearing which is inscribed in a number of often quoted work of an 18th century poet Francisco Balagtas who is still being read in   public schools   today:

> "ang laki sa layaw karaniwa'y hubad
>
> sa bait at muni't sa hatol ay salat. (202)
>
>
> " di dapat palakhin ang bata sa saya,
>
> at sa katuwa'y kapag namihasa,
>
> kung lumaki'y walang hihinting ginhawa." (197)
>
>
> "sa taguring bunso't likong pagmamahal
>
> ang isinasama ng bata'y nunukal,
>
> ang iba'y marahil sa kapabayaan
>
> ng dapat magturong tamad na magulang." (203)
>
> Balagtas, 1838

The foregoing describes the traditional place of a child in the family. I shall return to this in relation to the concept of childhood. Connectedness and interdependence is highly valued in family relations as inscribed in another popular saying " *Ang sakit ng kalingkingan ay nararamdaman ng buong katawan."* [The whole body feels the pain of the little finger.] It means that if a member of the family is afflicted, the whole family suffers and it is expected that the rest of the family deal with it in the spirit of concern and care for the family.

The subject of motherhood, family and child care in the preceding, foregrounds discussions on children's literature and its representation of family and childhood in the context of changes in the family structure and composition of the family at present caused by labor migration and recently, female migrant work. The traditional family composition, which is described in the beginning, has mutated into different forms such as single-parent families, mother-headed, father-headed, child-headed, blended families and many others.   This paper explores this reality in relation to the problem

of social construction of childhood in literature and renders an analysis of its implications on the care and concern of children.

1.0 Childhood **Studies Discourse**

Impressive scholarly writing and research have been done on children in the last two decades according to Prout (2005).   Social scientists   were dissatisfied with the way their discipline dealt with childhood and this led to critiques of key notions found in conventional approaches.   Key assumptions were questioned with the critical eye trained on the individual focus of mainstream development studies and the idea of universal biological phenomena of child development.   Prout's discussion of the "new social studies of childhood" point to the use of a new perspective that sees childhood as a social construction and regard children as "social actors in their own right."   He welcomes this development but also cautions about the tendency to simply emphasize differences with conventional approaches because he believes that this too, is coming to an end.   He suggests that in order to push on the development of the field, it is necessary to integrate what is useful in earlier or different approaches with the present perspective that sees " childhood [then] like all phenomena is heterogeneous, complex and emergent and, because this is so, its understanding requires a broad set of intellectual resources, an interdisciplinary approach and an open-minded process of inquiry." (2005: p 2).

The open-mindedness that orients this re-thinking of childhood inspires this examination of childhood construction in children's literature.   It proceeds to identify issues in the education of children through literature by deploying critical approaches to reveal the ideological implications of childhood construction in literature.   It renders a reading of the representations of childhood in mainstream literature and contextualizes this reading by implicating the changing social and economic conditions that constitute the lived experience of child readers for whom these literatures are purportedly intended.   It seeks to know if the literature, as venue of children's education and construction enable children to understand or at least recognize the changes that have taken place around them.   Put another way, this paper seeks to know whether mainstream literature for children are able to reflect fundamental changes in its representations of family life and childhood and in the process, are able to respond to challenges these changes bring about.

The foregoing   will be rendered concrete by limiting the scope to the discourse on concern and care for children, which is an important theme in the discussions on development and education of children.   It draws from the Philippine experience for the most part and occasionally brings in other Asian experiences as sources allow.   Writing and research on non-western childhood is this researcher's own response to the growing discontent with the dominant conception of childhood which has been criticized for being centered on western childhood. One of the reasons for this dissatisfaction stems from an understanding that conception of childhood impact on policy and practical concerns on children from around the world. With respect to the specific subject of child concern, some scholars argue that discourses on heterogeneous childhood need to be produced in order to allow for a more critical examination of on-going international and local policies and programs on child concern and

protection that are put in place for the best interest of children in different circumstances in local and global contexts. This position argues that:

> At the global level there has been an increasing discontent with how children have been named, reified and measured. Prevailing Eurocentric and North-American notions of "childhood" and "development" held sway in how "childhood" and "development" is theorized. Benchmarks about progression are viewed as universal and little has been done to disrupt the colonization of families who have children who do not fit the Eurocentric milestone and who are asked to change their family practices in order to be "ready for learning."

> (World Yearbook of Education, 2009, p. 22)

This paper brings into the discussion what is happening to Filipino children in the present way globalization has been transforming family structure and family relations bringing in the process fundamental changes in their   social and cultural worlds and how mainstream Filipino children's literature is implicated in this process.

2.0 Social construction in literature, new perspective of childhood studies, and discourse on child concern and care

The function of children's literature in education is well established in theory and practice. It is widely accepted that children's literature is a fairly good venue for teaching children skills, moral, religious and social values, and aspirations, as well as for modeling social roles.   This thinking firmly rests on theories of growth taken from developmental psychology (Piaget, Vigotsky) from social learning in education (Bandura) and from theories of social and cultural construction in sociology (James, Prout).

In literary study and criticism, children's literature is attracting new interest as an interdisciplinary area for those whose work is in childhood studies, literature, education, development and culture.   Discourse in this area; show increasing interest in the criticism of ideology and Cultural Studies, as well as, in images of childhood. (Joosen and Vloeberghs 2006) In mapping out this development, Joosen and Vloeberghs observe that the tradition of criticism of ideology of the 1960s continue and so with the tension between pedagogy and aesthetics which influence our understanding of children's literature and its use through to the present. Of particular use to this paper is the observation that cultural studies framework, with its emphasis on critique of power, and the criticism of ideology   when employed in the criticism of literature for children infused criticism and also the production of children's books with new insights and energy. Cultural Studies gave way to a more serious consideration of marginalized forms of cultural expression such as children's literature, and within it, a largely ignored popular fiction or series of fiction for the young reader and brought back the political dimension of criticism of ideology. On the other hand, the ideology of criticism focused attention on the need to have a set of criteria to determine what is literary.

These theoretical insights on children's literature and its relation to childhood construction inform this project.

Literature's stable position in the social construction of childhood from the perspective of these literary and critical approaches is further strengthened by a new perspective of childhood studies enunciated by Prout, which is cited earlier in the discussion. Policy perspective is one of the three main areas (the other two being historical approaches and socio-cultural approaches) identified by Kehily by way of organizing the diversity of studies under the rubric of childhood studies. In this particular discourse, Kehily notes "identification of need followed by social action has been a feature of policy-based approaches." Discussions of need however, are commonly based on assumptions and value- laden judgments about children. (p.13) And here, an important observation, which points to an important shift in orientation, is relevant to this discussion:

> In a move to deconstruct western notions of childhood, the universalism of the 'needs' discourse has been critiqued and replaced by a discourse of 'children's rights.' The shift in orientation from needs to rights reflects an endeavor to understand and take into account the child's point of view. (p.13)

But the 'rights discourse' too comes under scrutiny by Stainton- Rogers, for instance when she points to the limitations of the needs discourse and the rights discourse and proposes the 'quality of life discourse.' This she claims is more open to developing sensitive approaches to children and families and to recognizing the strengths of individuals and families in ways that move beyond ways of individualizing and pathology. (Kehily, 2004, p. 14)

2.0 Transnational care giving and Filipino childhood

Filipino children, at present grow up or are brought up in highly differentiated family structures. The traditional nuclear family consisting of mother, father and children has been transformed into myriads of family types the most radical of which is the child-headed family where both parents are labor migrants and children are seen as "seasonal orphans." What this change apparently implies is that care giving has shifted from parents to relatives and even to older children in families of sending countries. Of the way family structures have changed, the absent-mother seems to be the emerging common form as increasing number of women joins the international labor market. , According to Yinger, recent assessment shows that men no longer constitute the vast majority of international migrants. In some countries, more than half of migrants are female. In the Philippines, 70% of all Filipino labor migrants are women. With this large percentage of migrant women, it is estimated that about ten million children are growing up without a mother. (Carandang and Lee-Chua 2008: 109) Migrant women labor became in demand when developments in rich countries, particularly the need for household work and care giving opened new opportunities for work for women from poor countries. Feminization of migrant labor thus went hand in hand with transnationalization of care giving. This trend is seen most evident in Asia where hundreds of thousands of women from main

sending countries include Indonesia, the Philippines, Sri Lanka and Thailand, while the main destinations are Hongkong (China), Malaysia, Singapore and the Middle East (Yinger)

How are children in sending countries and their care figure in this new context? Studies have been done on globalization and the phenomenon of transnational care giving (cite some of these) and one that examines the experiences of children in transnational families from the lens of gender is by Parrenas. (2006) The study reveals that "gender paradox defines transnational family in the Philippines, and that gender norms are being reified and transgressed " (p. 7) Put plainly, gender role switching is not taking place in Filipino families with migrant parents. The role of a breadwinner belongs to men as head of family while the role of family care belongs to women in the traditional division of labor in the family.   Disciplining is the father's domain while caring is that of the mother indicating clear gender boundaries. With a "father away family' or a 'mother away family,' one would expect that gender roles would change, however, Parrenas study reveals that gender norms were perpetrated by the care practices in these families. Looking at the work of fathers, migrant mothers, eldest daughters and extended kin, the study shows that "each group reinforces gender boundaries in the caring work that they do for the family." (p. 11) Of particular relevance to this discussion is the study's examination of the discourse of abandonment among the children of migrant mothers.   Children in these families, whether care is provided by substitutes, feel that they have been abandoned by their mothers and this strong emotion against the absence of mothers increases as families deviate from conventional practice, i.e. father doing care giving role, mother doing income earning role.

An in- depth study of Overseas Filipino Worker's families by Carandang et al   (2007) describes children in families where both parents are labor migrants and who are sometimes seen as "seasonal orphans." Drawing from several case studies of these families, the study reveals that although there is a pervasive sense of powerlessness and hopelessness among fathers and some of the children, resilience is present especially among children. Hope becomes the wellspring of resilience among children as they try to look beyond the present and imagine a happier complete family in the future.

Other studies cited by Parreπas qualify the generally assumed negative effect of migration to family as social institution.   She brings in the study of Asis who acknowledges the risks that migration may have on the family because of the chances of higher rates of infidelity, strained kin relations, and "wayward" children but adds that this is not as extensive as media and other scholars claim. In another study of more than 700 school children, Batistella and Conaco confirm that " severe cases of emotional disturbance" and "disruptive behavior" do   not necessarily   occur in transnational households but emphasize, " The single most important finding in the survey is that absence of the mother has the most disruptive effect on the life of the children." (Parrenas, 2005, p. 94)

Television has increasingly taken   over the role of parenting. This is a concern, which is commonly acknowledged. The intimacy in Filipino family relation between parent and children that is lacking in parent-away families is being replaced by this medium with no parental control on program viewing.   Value formation is therefore mostly left to television, which is viewed with great suspicion

because of the 'undesirable contents and images' that children are exposed to daily. (Cite studies on violence etc.)

[Discuss briefly the changes in family structures and the children's place in it, focusing on changes in social and cultural world of Filipino migrant families, include studies in other Asian countries]

3.0 The Child and Family in Children's Literature

Theoretically, readership (demand for) of Filipino children's literature is rather big considering that nearly 40% of the population of more than 90 million are children aged 17 and below. This puts children's literature in a good position to contribute to Filipino children's education. However, in reality, this potentially great influence is diminished by certain realities obtaining at present.   Until the 1970s, books for children were dominated by foreign language (mostly in English) books. Trade books or informational books mainly come from the United States and dominated the market until the 1990s.   American colonial education during colonial times fostered the use of the English language and the " American dream" [the aspiration to migrate to the United States as the land of opportunities], which provided the cultural impetus for the importation of English language books. [i] After political independence in 1946, this situation continued with few attempts to produce children's literature, written in English by Filipino authors in the 1960s.   It was in the 1970s onwards that storybooks and novels for children in Filipino language with a new format began to see print. Virgilio S. Almario, National Artist, who at that time   began publishing Filipino language children's story books as part of the mental feeding program of the government's National Nutrition Center gets credit for this development. He later on established his own publishing company and now enjoys a stable position in mainstream publishing.   It was also his company which began the practice of bilingual story book (Filipino and English in one book) while other publishers are testing the market for story books in Filipino and regional languages, especially in the retelling of epics and folk literature. Notwithstanding these developments, the market shares of original Filipino children's literature remains small the full discussion of which belongs to another occasion.   This brief background should help explain in part, the paucity of children's books with certain themes, including the representation of childhood and family, which is the subject of this paper.

What follows is a reading of these texts that reveal the ideological assumptions about childhood and relations in the family, which these texts encode. This section analyses the implications of these representations   on children's social construction given their lived experience.

The child in transnational family

Two storybooks and a novel for children treat the subject of a mother who works abroad as a domestic helper and or caregiver and leaves the care of her children to the father and or grandparents. The story book *Uuwi na ang Nanay Kong si Darna* (2002) [My Mother Darna is Coming Home] by Edgar Samar, illustrated by Russel Molina is about the happy arrival   of a mother from leave from

domestic work in Hongkong, whom the child –narrator vaguely remembers from photos.   Too young to remember how his mother looks, Popoy (boy-child) is amazed that she looks even more beautiful in person than in pictures she sends. The story shows the father as nurturing and creative as he instills a positive image of the absent mother by describing her as Darna personified, a super heroine in popular media. Thus, the child grows believing in his mother's magical power and taking pride in her work as domestic help. The story ends with a scene typical of Filipino overseas worker's coming home. Popoy's mother does not waste time opening the box of gifts or *pasalubong* and giving each item to each member of her extended   family. At last, she hands her gift of crayons and books to Popoy. Popoy thinks his mother could really read his mind because those are really what he likes and not being able to contain his curiosity asked his mother, to the surprise of everyone, if indeed, she is Darna. His mother does not reply but gives him a good tight embrace instead.

The picture book, Ang *Lihim ni Lea"* [The Secret of Lea], written by Augie Rivera and illustrated by Ghani Madueπo is a story of a girl-child who survives sexual abuse by her own father. Her teacher discovers something is wrong with her when she behaves unusually in school banging her head against closed doors. Teacher gets the help of a psychologist and learns that Lea believes that she has magical power to get through closed doors. This she experiences whenever her father abuses her. She receives help and re-unites with her mother who comes home and spends time with her until she is healed.   The story ends with mother and daughter   seen together in a setting that suggests London where the mother works as a nurse.

A young boy, Tonyo, eldest of three children embarks on a journey to find his mother in Hongkong. In this novel in English by Carla Pacis (O.C.W. *A Young boy's Search for his Mother, 1999*, 2001) mother works in Hongkong as domestic helper, leaves her three children (youngest is three years and second is five years) in the care of her husband and father. Tonyo whom his mother expects to stay in school later drops out because of home chores and 'work" in backyard hog raising which helps supplement family income. Tonyo's father who drives a pedicab for a living is unable to cope with his wife's absence. In less than four months, he spends most of his time in the cockpit, comes home very late and drunk and later starts to beat Tonyo in feats of anger over his wife's having to leave for work abroad.   Unable to accept this situation, Tonyo decides to look for his mother to bring her home. In his journey, he meets street children in Manila, and experiences street life, gets help from a Catholic priest Father Randy who gets him employed in a bakeshop. As a stowaway, Tonyo is able to reach the shores of Hongkong, gets help from well meaning Filipinos and later finds his mother. The novel ends with Tonyo and mother coming home and setting score with her husband. Tonyo who harbors so much anger at his father learns to forgive   upon seeing him outside the house as limped as a *petchay* (green leafy vegetable) and gives him a tight hug. The moment he hugs him, his father's bawl frightens him no end but he holds on tighter until his father's cries subside.

It's all right for mother to work abroad

One easily sees that the use of the   plot in Samar's storybook, though original and amusing in the way it depicts wonderment of   a child romanticizes the experience and relations in the family of a

migrant parent.   Although mother is absent, father takes over her role and the child stays happy. How much of the sad reality that millions of Filipino children of migrant mothers are concealed is a real problem in representation. Intended for children aged three to eight years old, stories like this that blend realism with fantasy are considered to be threading a difficult line because of the underlying assumption that children are innocent and must be shielded. Thus, stories for children must always bring hope even for a child in this story.

On the ideological plane, the image of a happy Filipino family who depends on overseas work for economic survival says so much about the position of the text vis a vis the reality that many families in this situation experience. In the story, the mother's coming home with electronic appliances (hair dryer, juicer, coffee maker) seems to exemplify the idea that overseas work brings progress and modernity especially in the more backward countryside. The very reason why Popoy's mother had to leave her very young child, too young to remember how she looks, in fact, is to be able to provide a better life for her family. This and the idea that the essence of motherhood is to be able to make supreme sacrifice for love of family, especially of children is clearly confirmed and reinforced by the story. In fact, the peritext in a message to parents, teachers, daycare workers and storytellers talks about using this story to " *ipaliwanag* ang *makabagong* kabayanihan *ng mga overseas Filipino worker. Ang mga OFW ay bayani dahil sa ipinakikita nilang tapat sa serbisyo at dakilang pagmamahal sa kanilang pamilya."* (*Uuwi na ang Nanay kong si Darna* 2002) [Explain the modern day heroism of overseas Filipino worker. OFWs are heroes because they exemplify dedication to work and love for their family.]

It is, however, silent on the dominant plot of real-life stories of children of migrant mothers wherein children experience various socio-psychological problems cited in previous section.   The explicit ideological position of this text resonates with the government's promotion of overseas work for economic support. Unable to provide gainful employment in the country for the majority of the labor force, it tries to ward off blame by popularizing the myth of heroism. This myth is further reinforced by messages from media that describe and ascribe OFWs as " major force in the economy," "central leg of the economy," and "modern heroes that must be honored."

It 's not always alright for mother to work abroad but…

Rivera's text presents a slice of truth and avoids wholesale idealization found in the previous story.   In this instance, the storybook becomes a venue for raising awareness on the problem of sexual abuse of children. The book's blurb in fact, encourages children to come out and in the words of Madrid, Executive Director of Child Protection Unit Network, Inc.: " There are just so many children out there who are afraid to seek help. This book can reach out to them." (back cover, *Ang Lihim ni Lea*) According to its publisher, Soroptomist International of Hope, part of proceeds from the sale will go into the construction of the Hub of Hope, the first day care center and breast bank for children with working mothers, in Baguio City found in Northern Philippines. It is necessary to mention that this book was published by a non-governmental organization, and is part of its advocacy and did not get printed in the usual way that mainstream children's stories get published.   On the front cover, one

reads the message " *Nangangailangan ng gabay ng magulang"* [needs parental guidance] which suggests that the subject and theme of the book is sensitive. The eight-year-old Lea's problem is revealed as her so-called " secret" unfolds.   She and her father just moved in a condominium unit, the 12th house actually. Her mother works as a nurse in London and supports her and her father who is implied as jobless since there is no mention that he has one. Her secret is two layered: first, she thinks she has magical power to pass through closed doors of the rooms of their neighbors and enjoys what she sees: snoring Mrs. Domingo, Paula playing the violin, Linda, the housekeeper watching Korean telenovela; second, she is being sexually abused by her own father. The real secret is revealed when she tries to do in school what she does in their condo. Teacher Cynthia is bothered by Lea's behavior change and seeks the help of a psychologist. At first, Lea is excited to tell that she could go through closed doors. But when asked what she likes best doing in their condo, Lea is able to say that she does not like staying there and her story in bits and pieces reveals that she is being abused by her own father and that her magical power works best whenever her father does those things to her. The explicit messages of the story, which is for children who are similarly situated, is that they should not be afraid or feel shame to come forward. They are "encouraged" to do so by depicting that there are people around who could give help; in this story, a teacher, a psychologist, a social worker, the police and the court and most importantly, the mother. Lea is taken temporarily by a social worker, her father was arrested and taken to prison through the UP-PGH Child Protection Unit, and her mother was contacted. Lea's mother comes home feeling guilty about what happened. She blames herself for leaving her daughter for work abroad but Teacher Cynthia comforts her by saying there are times when these happen even when mothers are not absent. When Lea is deemed healed, her mother takes her along with her to London, which suggests that children are best, secured and loved under the care of their mothers.

This story stands opposed to the idea of the other two texts, which reinforce the dominant thinking that mothers who work abroad are modern day heroes and it is all right to leave the care of children to the rest of the family. This idea of a heroic act and sacrifice is at the core of the government's conscious effort to extol the heroism and sacrifice of millions of   overseas Filipino workers whose remittances that run in billions of pesos help keep the economy from falling apart. In Samar's story and in Pacis' novel, mothers who work as domestic help will continue to work and leave the care of their children to relatives or to the father, because, unlike the mother who works as a nurse in London, these mothers' work conditions, pay and immigration policies of receiving countries do not give them other options to deal with prolonged separation. In the hierarchy of needs of an average overseas family, food, shelter, and education are highest of their priorities. Mothers choose separation from children and family in order to provide for these needs. Children's care that includes the presence of mothers for nurturance and intimacy may take a back seat.

Studies on the impact of overseas work and more recently, the phenomenon of transnational care giving discussed here point to a different   narrative of lived experiences of these families. Children of absent parents experience pervasive sadness and feelings of abandonment, and disruption. Others also manifest resilience especially in instances when absent mothers continue to perform

mothering despite physical distance.   Seen against this context, representations being done in contemporary Filipino children's literature remain limited in not reflecting the variegated lives that children in these families have.

Images   of childhood and motherhood in these texts, however, do   call attention to   deeply rooted problems that impact on children's needs and care which are   engendered by the state of the economic and political landscape of the Philippines for several decades now.   Chronic poverty, increasing population, unemployment and underemployment endemic corruption in government, dismal social and public health services, armed conflict; altogether reproduce a hostile environment that put children in harmful position. These very same conditions push millions of Filipinos to seek overseas work of which female migrant workers constitute the majority. Composed mainly of mothers and unmarried women with children, these women become absent mothers whose performance of nurture and care roles undergo major changes and challenges, as the studies cited reveal.   This phenomenon invariably impacts the lives of millions of children, the forms and extent of which remain to be fully examined. At the same time, these   conditions push millions of Filipino children from poor families in situations that breed street children, children in conflict with law, children who drop out of school at grade four, children laborer, child soldiers, and children in the flesh trade. Tonyo's journey in search of his migrant mother, in Pacis' novel reveals some of these realities. He experiences both street life and child labor. The novel is open- ended and therefore leaves a number of possibilities. Will his life change for the better when mother returns to Hongkong to work? Will his father who showed some remorse in the end be able to adjust and play the nurture role of his wife? Tonyo who dutifully does his domestic chores and later decides to look for his mother   to bring her back home I order to deal with problems spawned by the mother's absence shows a child capable of thinking and making decisions and in this sense shows some kind of agency.   This attribute of child characters present in a number of other stories is indicative of a different perception of the capability of a Filipino child that sees childhood as an active participant rather than passive and innocent. Perhaps the consciousness that organizes these portrayals is drawn from everyday reality that shows children of poor families in urban or country settings actively participating in day to day living and survival.

Children in non-migrant families, deprived but happy nevertheless

Other images of childhood and family in mainstream children's   literature reveal traditional assumptions and ideological ideas about the child's place in the family that raise many questions regarding social construction of Filipino children. Children in these stories receive love and nurturance from stay at home mothers as well as working mothers who exemplify the dominant domestic ideology. Working mothers in poor families are shown as super moms very much like the supermom of the migrant type. This is particularly strong in stories that extoll mothers of poor families in their heroic performance of care of children, household management and even income earning. [ii] Gender stereotyping remains strong in these texts. Since overseas work remains a stable feature of Philippine economy, I believe that it is necessary to provide a new constructs of childhood and family that not only reflect their reality. Even more important is that this kind of literature would enable them to come to terms with reality because I believe that Filipino children are capable of discernment and action.

Contemporary children's literature to be relevant to changing realities of children today need to become a venue for gender formation of children that will liberate them from existing domestic ideology and traditional gender role in the family   to better prepare them to deal with the reality of transnational households.

The child in non- migrant family

This section discusses representations of Filipino children in non-migrant family. In a random reading of these stories one sees that the dominant representation of the Filipino child who belongs to a middle class nuclear family, attends private school, has a nanny, worships as a Catholic, and resides in the city in Tagalog areas of the country is now being challenged by stories that deviate from this canon.[iii]   There are now stories on the child in different and sometimes difficult circumstances and stations. These are children   in working class families, in single-parent families because of separation (divorce is not legally accepted) or unmarried single parent family, in families whose members suffer from difficult problems (alcoholic father, father who is a chain-smoker, son who is addicted to drug), in the streets and living outside the family, in war affected areas of the south, in orphanages, and in poor indigenous families.

The working class family is the extended type, which include father, mother, three children and grandparents. Although deprived of material wealth (house, modern appliances), the family and children are always happy and much loved. Children share in doing some chores on weekends (helping mother baby sit younger sibling, wash dishes, tidy bed, sweep the grounds) and have one single most important aspiration, which is to finish school. The pervasive atmosphere in working class families is one of cooperation, love and happiness with attentive parents. In fact, a child narrator in one story describes his family as *masayang pamilya* (happy family) and repeats what his father says is important, which is a simple happy life because they live together. [iv] Clearly, the story projects an ideal family with each member as a role model. Atypical though is the eldest son's dream to become a poet, which is the reason why he studies well. In this way, this text challenges the typical aspiration among Filipinos to seek work overseas in a nation of transnational families.   In this instance, children see other options to explore.

The care of children

The Filipino child as represented in these stories must be nurtured and cared for in and out of family context. Living with the family and enjoying intimacy so important in child–rearing culture, caregivers are primarily the parents, especially the mother, helped by grandparents who normally live with the family. The normalized sexual division of labor (father earns a living and disciplines, mother manages household and nurtures) is amply represented, hence reproducing   the ideology of domesticity of women and mothers, as well as patriarchal values, [v] but does not remain unchallenged. Children are socialized into valuing the family wherein they receive care and attention, learn to be Christian and   good members of the family and community.   Other more explicit expression of purpose include raising a generation of young people with rich imagination, and who are critical and

creative, proud and confident in the future of the Filipino nation. [vi] Outside the family context, children who are orphans and who are found in the streets receive care in children's homes where they find a home and family just the same.

Social construction of Filipino Children: Resilience, Agency, and Challenging Gender Norms

What emerges from this reading of selected Filipino children's literature, which focused on the subject of care, is a concept of childhood that shows the Filipino child who is resilient, capable of understanding changes in her/his world and ready to act.

Stories on children in families with migrant mothers [transnational families] show the child-protagonist capable of action. Whether a much younger child (Lea) who imagines she has magical power or a much older child (Tonyo) who leaves home to search for his mother and succeeds in bringing her home, albeit temporarily, these children- characters model to child readers of these stories children capable of dealing with problems.   These stories exemplify their resilience, too. In other stories, [vii] agency is exemplified in different situations. A son and a younger daughter takes over selling 'taho' in the neighborhood when their father gets sick; a young girl from a poor family understands what her parents always say about being content with what they have while resources are limited and shares her blanket with them in the end; a boy born without legs is able to explore his world around him as he imagines a magical chair takes him around; a boy who rarely see his father as he grows up, and suffers doubts and peer judgment believes in the power of a charm that comes from a banana blossom to make him invisible so that he can become one whenever he needs to, and later learns that he was born out of wedlock, appreciates his mother's and grandmother's love for him and resolves to become a good father someday; children in middle class family growing up in separate household because their parents live separate lives are able to comprehend the reasonableness of living apart and are aware of different ways   their parents care and nurture them; and a girl who lives in war-torn Mindanao (southern part of the country with a long history of armed conflicts) shares her experiences in fleeing armed confrontations and staying in evacuation centers, expresses her feelings of insecurity, anxiety and fear and not being able to understand why there is war, prays to God to end it.

These attributes of characterization is further helped by the use of the first person child narrator which projects the child's voice and wisdom in no unclear terms. I believe these narrative strategies   are effective to children because in the act of reading, an atmosphere of children speaking to each other is easily established thereby avoiding   didacticism, which is characteristic of traditional practice in storytelling. Authorial power is diminished and rapport is created between text and reader. Uncanny links to harsh realities of present childhood in the Philippines serve to inform children of the real world they are in, but at the same time empowers them through the use of magic and fantasy.

It is interesting to note that in contemporary representation of Filipino childhood, none of the stories show child characters aspire to seek work overseas.   This is in great contrast to the fact that transnational families have become dominant in the Philippines.[viii] Other aspirations include becoming a doctor to serve the poor, a poet, a pilot or traveler, a good father. Other stories show children dream and pray to God for war to end and for a peaceful world to commence.

Filipino children's literature socializes children to conform to dominant gender roles, but at the same time show some evidence of counter-cultural voice in this regard.   Many stories on motherhood   teach children the codes of domesticity by glorifying the work of mothers at home, domestic work of migrant mothers included. Mothers are almost always vested with traits such as compassionate, self-sacrificing, and sensitive to children's needs.

 Surprisingly interesting is a different portrayal of a mother taking on the role of breadwinner when   her husband passed away. In the context of a poor family struggling to survive to be able to send the child to school, the stay at home mother in a reversal of role, decides to drive the pedicab her husband used to earn income in order not pay for its amortization and earn for her child's schooling. This brought about some changes in the way she used to raise her young daughter where before she does everything at home. This time, daughter has to help in some chores because she leaves early as most Pedi cabdrivers do, and she has to wear clothes like that of a male driver. All of these changes are initially resented by the child who is not proud of what has become her mother's "ugly" look, but later on realizes that other mothers in the neighborhood and even her teacher admire her mother, liken her to a heroine and describe her as "may trabahong lalaki at may pusong babae"[with a man's job and a heart of a woman]. (Chong, 22) As the peritext says, the story will make children love their mothers more. From a feminist perspective, the story socializes children to the idea that women are strong, capable and responsible.   It also puts in question the common concept of beauty which is physical when the story shows that the child finally understood that her mother who does not wear make-up and whose hands are not soft, possess inner beauty, a concept her teacher taught her. In another sense, this text challenges the prevalent attitude that does not conform to "crossing gender boundaries," that scholars of transnational families reveal. (Parrenas 2005)

Other new images of women, which are presented to children, include single professional mothers, mothers in separated households, and women bonding with women, which reflect changing conditions of women.   Unconventional images of fathers who are equally nurturing as mothers are being presented, too on the other end of the spectrum fathers who works as shoemaker makes her daughter who was born without legs one dozen shoes as an expression of his love;(Gatmaitan 2002) a grandfather and a grandson's special bonding made strong with grandpa's stories and the child's genuine love (Gatmaitan 2000); a man who finds inner peace when he discovers that his life can be made more meaningful when shared with others particularly children living in the streets who need his love and attention. (Villanueva 2005)

These images provide children with new windows with which to understand changing gender roles, which is clearly evident in their lived experience.

Conclusion

This discussion hopes to contribute to ongoing production of discourse on Asian childhood. In exploring images of childhood and family, representations in children's literature seem to suggest that a notion of Filipino childhood as an active social agent is present. The child in migrant and non-migrant families is vested with qualities of resiliency, intelligence, courage, and will to act on personal and family problems. Canonical representation is now being challenged by multiple images of family structures that reflect changing times. Children are now seen in different family structures such as transnational families with migrant mothers, single-mother families, and separated families. In this literature, uncanny links to social realities call attention to deeply- rooted problems in the socio-economic and cultural world that impact on children's care and social construction, the full extent of which needs to be continually studied.

Interestingly, children in these stories do not aspire to seek overseas work. This seems to suggest that a disapproving view on separation of children and parents, which is a feature of migrant families, may be discerned especially because intimacy between child and mother in child rearing is still dominant according to scholars. This is probably the reason too, why migrant mothers exert extra effort to continue their " mothering" during long years of separation   through the use of modern communication technology as studies on social cost of migration reveal.

Some revisions of traditional gender roles and boundaries are present, too. These are done through the use of images of women as single mothers who work either as professionals or ordinary workers, mothers in separated households, women bonding with women. On the other hand, some images of fathers are shown to be nurturing, and   able to smoothly cross gender boundary in the traditional sexual division of labor with implicit acceptance on the part of other family members.

Filipino children are living in an increasingly complex world brought about by changes in the socio-cultural and economic conditions at the national and global levels. Their social construction through literature is equally undergoing changes that reflect the complexity of this world. It puts into question assumptions of childhood   underlying traditional notion of care and child-rearing practice and gender construction.   In this way, contemporary children's literature   serves as a venue for re-educating Filipino children to better prepare them to discern and deal with future challenges, a function, however, that has yet to be fully realized.

Endnotes:

---

[i] In the public school system that the Americans instituted, this is explicitly stated in children's textbook on literature in the *Philippine Readers*, a six volume series prescribed for elementary school.
[ii] Two story books which are both award winners illustrate this: *Papel de Liha* [Sandpaper], written by Remigio and illustrated by Doctolero and *Ang Kyutiks ni Mama* [Mom's Nail polish] by Rene Villanueva.
[iii] Evasco, in his unpublished dissertation, " Mga Saranggola sa Tag-ulan, Ang Poetika at Estetika ng Pag-akda para sa Bata [Kites in Rainy Season, Poetics and Aesthetics of Writing for Children], University of the Philippines Diliman, 2007, reviewed children's literature in textbooks for children and identified this kind of stereotyping of Filipino child and family.
[iv] The story *Ang Aking Pamilya* [My family], written by Genaro Cruz and illustrated by Lyra Garcellano (Quezon City: LG&M Corporation, 2006), is a story of a boy in a working class family whose homework in school is to introduce his family in class. He does this by writing poems about each of the members of the family including his deceased grandparents. When he was done, his father reads his poems aloud over dinner which turned out as a happy occasion for all of them.
[v] There are, however, some departure from this kind of representation where working mothers in non-migrant families are portrayed. These are mothers who are office workers, pedicab driver, or who work in beauty parlors.
[vi] One major publisher of children's literature states this purpose in its new series dubbed " Chikiting Books."
[vii] I base these observations from my reading of the following stories: *Ang Madjik Silya ni Titoy,*[Titoy's Magic Chair], *War Makes Me Sad, Imbisibol Man ang Tatay,* [Father is Invisible Man] *Mama's House, Papa's House, Tahoooiey,* [Sound of Taho or soft bean curd, that taho vendor shouts as he goes around the neighborhood] *Ang Kumot ni Dora*. [Dora's Blanket] Please see bibliographical entries in the list of works cited.
[viii] It is relatively easy to understand that in a country where transnational families have become dominant, children of these families would "naturally" aspire to seek jobs overseas just like their parents. This is evident in, for example, " Coping with Life with OFW Parents," by Melanie Malano, published online by abs-cbn News.com, 7-27-09, from the book *Migrant Stories, Migrant Voices,* published by Philippine Migrant Rights Watch with support from Cortaid, an international development organization based in Netherlands.

The Professional Status of Taiwanese Primary School Teachers: A Historical Analysis

Ph.D. Tien-Hui Chiang[1]

Abstract

Considering socio-cultural influences, this essay focuses on the historical development of education in Taiwan as it relates to the professional status of primary teachers. The historical movement of Taiwanese education shows that unlike western societies, the influence of Confucianism in Taiwanese education has ensured that teachers are seen as a key element in protecting social morality and social solidarity. This has influenced their rewards in Taiwanese society, resulting in them being viewed as professionals and given high levels of social status, prestige and salary. The interplay of these factors has led to the construction of a very protected context for teachers, and deeply formed their professional ideology.

1. Introduction

Following the notion of the division of labour argued by Durkheim (1933), Structural-Functionalists contend that professionals fulfill irreplaceable and crucial functions for maintaining social equilibrium and civilization. As a result, they have devoted a great deal of effort to searching for one set of traits that will serve as criteria for judging whether a specific occupation is qualified to claim the status of professional or not (e.g. Carr-Saunders & Wilson, 1933; Davis and Moore, 1966; Lieberman, 1964). In contrast, Marxists argue that the development of capitalism significantly enlarges the size of the bureaucratic system, significantly merging most individual practitioners. Alongside this trend, most employees suffer from the impact of proletarianization (Apple, 1990; Braverman, 1974; Connell, 1985; Johnson, 1972; Ozga and Lawn, 1981).

Although these two sociological schools have uncovered different influences of industrial society on practitioners, their predetermined positions may underestimate the influence of social cultures on shaping the professional status of primary school teachers in a given society (Chiang, 1996, 2008a). Some scholars, for example, argue that it is important for comparative researchers to recognize the important position of cultural differentiation among individual societies, which generate a profound influence on shaping their own social contexts, and, then, educational systems and contents (Schriewer, 2003). Furthermore, individual cultures are developed within a specific social context so that unique meanings are always embodied within those cultures. Therefore, without awareness of such contexts, it is hard to discover such unique meanings and their interactive relations with the development of educational systems (Hall, 1973; Holmes, 1981).

The history of the industrial movement of Western teachers' associations shows that 'bread and butter' has traditionally been the central concern of teachers. Such a linkage further indicates that when a society bestows high rewards upon teachers, they will develop a strong professional image. If it does not, they will tend to reject the notion of professionalism and employ industrial action to fight for

Professor & Chairperson, Department of Education, University of Tainan, Taiwan; Director, Chinese Comparative Education Society --Taipei

their own interests, as witnessed by the cases of the American Federation of Teachers (AFT) (Myers and Myers 1995; Sadker and Sadker 1997; Spring 1994) and the National Union of Teachers (NUT) (Barber 1992; Gosden 1972; Tropp 1957). Those associations have conducted long-term direct actions, including strikes and protests against employers, in order to improve the material rewards of their members. Both cases suggest that the degree of broadly defined 'reward' affects the degree of professionalism attached to teachers' status and their reactions towards their collective actions.

In contrast, the influence of Confucianism in Taiwanese education has ensured that teachers are seen as a key element in protecting social morality and social solidarity (Tsurumi, 1977). This has influenced their rewards in Taiwanese society, resulting in them being viewed as professionals and given high levels of social status, prestige and salary (Chiang, 1996; Kuo, 1988). The interplay of these factors has led to the construction of a very protected context for teachers, and deeply formed their professional ideology. Considering socio-cultural influences, this essay focuses on the historical development of education in Taiwan as it relates to the professional status of primary teachers. Four key phases can be identified. The period from 1624 to 1894 can be seen as the first phase, when the Taiwan educational system assumed its early form. The second phase (1895-1945) occurred when Taiwan was a colony of Japan. The third phase ran from 1945 to 1987, which was broadly the period when the KMT (Kuo Ming Tang Party) government exerted strong centralized control over education. The final phase commenced in 1987 when Martial Law was abolished, and has been marked by a series of education reforms that have devolved some powers to educational institutions.

2. The First Phase: 1624 to 1895

Before 1661, no national system of education existed. Successive European colonial governments were only concerned with their political and economic interests and not with establishing an education system. Education as it then existed assumed its form and control from colonial religious teaching in all-age schools, particularly for adults, though many children attended. Teaching focused on introducing the Bible. When there were insufficient priests, soldiers were engaged to teach (Chiang, 2000).

After 1661, when Taiwan was dominated by Cheng-Gong Jeng who, having failed to defend against Manchuria's invasion which eventually established the Ching Dynasty, moved his troops to Taiwan, education as it then existed had as its primary purpose the creation of a national identity in opposition to the Ching Dynasty (Chiang, 2001a). Various types of primary school were set up, such as state primary schools (Confucianist schools), private primary schools (Shu-Farng institutes) and state Taiwanese aboriginal primary schools (Tunn-Fan schools). Except for Taiwanese aboriginal primary schools, schools were mainly concerned with the preparation of students for national examinations in order to enable them to become officers or qualify for the rank of literati (Lei, 1980; Wu, 1983). The school curriculum was thus designed to enable students to meet the requirements for selection. Teaching content focused on classic books based on Confucianism which functioned indirectly to reinforce the emperor's power. School textbooks included the Four Books (the Great Learning, the Doctrine of the Mean, the Analects and the Books of Mencius) and the Five Classics (the Confucian canon comprising the Books of Changes, the Books of Odes, the Books of History, the Book of Rites

and the Spring and Autumn Annals). Because no institutions devoted to teacher education existed before the second phase, the period of Japanese colonisation, well known scholars from Mainland China were recruited as primary school teachers (Chiang, 2000).

In order to meet the demands of these examinations, school lessons were divided into reading, repetition, calligraphy and composition, and their contents focused on the Four Books and the Five Classics. Teachers thus exercised very little control over what was taught. They were like skilled technicians, implementing someone else's policy. Teaching was little more than exercises in drill (Tsurumi, 1977). While primary schools existed throughout this period, very few children had the chance to attend them, particularly, after the war of 1683 when Taiwan returned to the control of the Ching Dynasty, who treated the island as a source of criminals (Wang, 1978). Schooling was confined to those who had wealth and power (Tsurumi, 1977). Although this situation was slightly improved later, the connection between schooling and elite status was not changed until the period of Japanese colonisation.

3. The Second Phase: 1895 to 1945

After the Sino-Japan Jia-Wu War in 1894, Taiwan became a Japanese Colony in 1895. In general, its early educational policy followed the 1890 Education Order issued by the Emperor of Japan, Mutsuhito (1867-1912), the purposes of which were to enlighten, discipline and indoctrinate Taiwanese people. Alongside the creation of subjects loyal to the Emperor, Japan intended to inculcate Japanese ways of life and thought into Taiwanese society (Jang, 1979). In other words, education was intended to serve the government's political interests. All state primary school teachers had to be appointed by the Taiwan Viceroy government in order to achieve this intention (Tsurumi, 1977).

However, a formal primary school policy was not introduced until 1898, because the Japanese Colonial Government had first concentrated on gaining an understanding of Taiwanese culture and language (Wu, 1983). During that period, the first Taiwan Viceroy, Akashi Motojiro, was primarily engaged in suppressing the Taiwanese people's opposition to Japanese authority. In response to this situation, the head of education bureau, Izawa, introduced an assimilation policy in which education came to be seen as a weapon in this struggle. In July 1898, the Taiwan Viceroy issued the State Primary School (Gong Shyue schools) Order which established a system of state primary schools. The new system was funded by the local government. However, the order required that all primary school heads be Japanese (Wu, 1983).

Izawa saw the teaching of Japanese language and ethics as a key means to transform Taiwanese people into Japanese subjects. Thus, the 1898 State Primary School Order introduced ethics, Japanese language, classical Chinese (composition, reading and calligraphy), arithmetic, music and gymnastics as the elements in a six-year state primary school curriculum (Tsurumi, 1977; Wu, 1983). In response to the assimilation policy, spoken and written Japanese were seen as a top priority in the school curriculum. The Taiwan Viceroy's textbooks, teachers' manuals and instruction manuals and other classroom materials were published and supplied to Taiwanese state primary schools, paralleling the use of school textbooks published in Japan in Japanese state primary schools (Chiang, 2001b; Wu, 1983). The introduction of such a national textbook policy can be seen as a hallmark of centralized

control over education in terms of determining what was taught in classrooms and how. Education became part of the state's mechanism to achieve its political interests. Teachers were required to carry out the assimilation and other policies stipulated by the Taiwanese Viceroy.

The 1898 State Primary School Order, however, increased the demand for Taiwanese teachers, with the result that the establishment of Teachers' Schools was announced in July 1898. Besides meeting the objectives of the 1898 Order, it was also argued that the introduction of teacher education was needed because it was difficult to recruit Japanese teachers to Taiwan, given the severe shortage of primary school teachers in Japan, and the fact that their salaries were too high (Wu, 1983). These schools offered three-year teacher training courses to primary school graduates. Subjects included ethics, Japanese language, composition, reading, arithmetic, bookkeeping, geography, history, science, calligraphy, music, gymnastics and pedagogy. With this introduction of teacher education, the Taiwan Viceroy explicitly exerted its centralized control over teacher supply by requiring that it appointed all state primary school teachers, so as to ensure implementation of the assimilation policy for transforming Taiwanese to Japanese.

To consolidate further the Taiwan Viceroy's centralized policy, private primary schools were to be terminated as soon as possible. Accompanying the 1898 State Primary School Order, the Taiwan Viceroy regularly sent detailed guidelines to local authorities against which to check private primary schools. Private primary school textbooks also had to be approved. In this repressive political climate, private primary schools constantly faced a threat of closure if they did not obey the local authority's instructions, so it was also hard for private primary teachers to exercise real control over the selection of teaching materials. Similarly, their control over classroom teaching was also vulnerable to close supervision from the local authority (Tsurumi, 1977).

In July 1902, Teachers' Schools were divided into two sections: Section A for Japanese students and Section B for Taiwanese students (Chiang, 1996, 2001b). The duration of courses in Section A was shortened to one year and three months, and one year in February 1905 and December 1907 respectively in order to reduce expenditure and to cultivate more Japanese teachers. On the other hand, the duration of Section B courses was extended to four years because Taiwanese students needed more time to master the Japanese language.

In March 1910, sections A and B in Teachers' Schools were reformed as Taiwanese Primary School Teachers' Sections A and B in response to the rapid growth in the numbers of Taiwanese primary school students, from 157 in 1897 to 5,412 in 1907 (Wu, 1983). Subjects included ethics, Japanese language, composition, reading, arithmetic, bookkeeping, geography, history, science, calligraphy, music, gymnastics and pedagogy. Later, a new Japanese Primary School Teachers' Section was created expressly for Japanese student teachers. The course was extended from four years to six years.

In 1914, the Taiwan Viceroy issued the Taiwanese Aboriginal Primary School Order, which decreed the establishment of State Aboriginal Primary Schools (Tuu-Fan schools) to extend the influence of the assimilation policy to Taiwanese aborigines. Thus, a three-tier-primary-school system was created, each catering to a different kind of student: Japanese students, Taiwanese students and Taiwanese aboriginal students. In 1919, the 7th Taiwan Viceroy, Den Kenjiro, insisted that education

was a vital way to transform Taiwanese people into pure Japanese people (Tsurumi, 1977). He demanded the opening of more primary schools for Taiwanese students, issuing a Taiwanese Education Order that led to the creation of a more comprehensive system of primary education. In response to this more comprehensive system of primary schooling and Taiwanese people's increasing concern with improving teacher quality, teachers' schools were divided into two sections, preparatory and main. The one-year preparatory section took Taiwanese state primary school graduates. The subjects that they took were moral culture, Japanese language, Chinese, Mathematics, fine art, music, vocation and gymnastics. The main four-year course took Taiwanese students who possessed the preparatory section qualification. Additionally, subjects taught were education, history, geography, science and business. In order to meet the immediate need for more primary school teachers through this more extensive system of primary schooling, Taiwanese State Primary School Teacher Training Sections were established both in Taipei and Tainan, in Teachers' Schools which offered one year courses (Wu, 1983). These were later extended to two years in 1933, the same duration as Teachers' Schools in Japan (Tsurumi, 1977). Subjects were moral culture, education, Japanese language, Chinese, geography, mathematics, science, housekeeping, handicraft, fine art, music and athletics.

In 1937, classical Chinese was banished from the state primary school curriculum (Tsurumi, 1977; Wu, 1983), and students were prohibited from speaking the Taiwanese language (Wang, 1978). Den Kenjiro also believed that compulsory education had to be brought in as soon as possible. However, it was not introduced until 1941 because of financial considerations (Wang, 1978). The introduction of compulsory education through the 1941 Primary School Order made all private primary schools (e.g. Shu-Farng institutes) illegal. It also unified Japanese state primary schools and Taiwanese state primary schools into state primary schools. Following unification, differences between Taiwanese Teacher Education and Japanese Teacher Education were extinguished.

In 1943 when Teachers' Schools in Japan became the equivalent of a three-year specialized college, the Taiwan Viceroy upgraded them all to the level of junior college, from which students normally graduated at the age of twenty (Tsurumi, 1977). The two-year preparatory section took advanced primary school graduates normally at the age of fifteen, making it equivalent to junior high school. The three-year main section took preparatory section graduates or high school graduates, normally at the age of eighteen. The Taiwan Viceroy also issued the Woman Teacher Education Order to allow Teachers' Schools to educate female teachers. This change arose because of the shortage of male teachers in the period of the Pacific War (Tsurumi, 1977).

Subjects for male students in the preparatory section were civics, science, mathematics, physical exercise, skills and foreign language. Beside these subjects, female students also took housekeeping. In the main section, education and vocational studies were added for male students and education for female students. By 1945, there were six Teachers' Junior Colleges (Central Daily News, 1995).

4. The Third Phase: 1945 to 1987

After the Pacific War in 1945, Taiwan was governed by the KMT (Chinese) government. The KMT government continued the centralized control over education experienced during the period of

Japanese colonization. In 1949, when the Chinese civil war ended, the KMT government moved to Taiwan and this control became even tighter. Education was now viewed as a key means to construct Taiwanese people's national identity in opposition to the Chinese communist party. Primary schooling, the primary school curriculum, teacher education and teacher supply were all dominated by the KMT government.

The development of primary education after 1945 led to fundamental changes. A unification of the primary school system meant that there was only one kind of state primary school. State Taiwanese aboriginal primary schools were integrated into state primary schools. Compulsory primary schooling was abandoned by the KMT government as it was not yet established in Mainland China. The National Curriculum Policy was introduced in 1945 to replace the different kinds of primary school curriculum developed in the colonial period. The 1945 National Curriculum Policy also contained the National Curriculum Standard Regulations that embodied the details of the National Curriculum Policy. Primary school subjects were group training, music, athletics, civics, history, geography, arithmetic, Chinese, social studies, general knowledge, natural science, organized group play, and painting and crafts. This curriculum was designed to end the influence of Japanese culture and to develop national identity in Taiwan. The KMT government also extended legislation dating from 1932, by which all state primary school teachers had to be appointed by the government. The 1932 legislation also allowed the KMT government to control the development of teacher education and teacher supply and introduced free (no-fee) teacher education to Taiwan. Because the 1932 Act defined Teachers' Schools as being at the level of high schools, all existing Teachers' Junior Colleges were down-graded from the level of junior college to the level of high school (Her, 1980; Yang, 1981) and now took junior high school graduates. The curriculum for teachers in training included Chinese, Mandarin, mathematics, geography, history, natural history, chemistry, physics, athletics, hygienic, civics, fine art, music, introduction to education, the management of education, teaching methods, teaching materials, and general psychological testing and statistics. In order to overcome the extreme shortage of teachers caused by the expulsion of Japanese teachers, two more Teachers' Schools were set up in Shing Jwu City and Ping Tong City, located in the north and south of Taiwan respectively. The Taiwan Provincial Taipei Female Teachers' School was also established in order to improve and extend female teacher education.

In 1946, the Taiwan Provincial Council re-introduced the National Textbook Policy because in the minds of Councilors no difference existed between Mainland China and Taiwan (Department of Taiwan Provincial Education, 1984; Her, 1980). The Taiwan Textbook Shop was also established to supply primary school textbooks, a list of which was issued for supply only by central government or KMT owned book stores, such as Jeng Jang and Kai Ming (Her, 1980). In 1947, the Chinese Constitution was passed by the main legislature, the People's Representative Congress. The Taiwan provincial government, then, issued the Compulsory Primary Education Act (Ministry of Education, 1985). In response to the introduction of compulsory primary education, the Textbook Supply Committee of Primary Schools was then established to supply national textbooks (Lii, 1984). This Committee was later reformed as the Edition and Translation Committee in July 1947, and was charged with the revision of the primary school curriculum. A new primary school curriculum was then

introduced in 1948, which defined nine school subjects: civics, music, athletics, Mandarin, arithmetic, social studies, natural science, fine art and handicraft.

In 1949, the KMT government moved to Taiwan following its defeat in the civil war against the Chinese communist party. This led to tighter control over the primary school curriculum. In 1953, primary school textbooks began to be supplied by the National Edition and Translation Institution controlled by the Ministry of Education (Yu, 1987). In 1960, Teachers' Schools were elevated to three-year Junior Teachers' Colleges (equal to the age group of twenty one) in response to rapid economic growth in Taiwan, and to improve teacher quality (Chiang, 1996, 2001b). Later in 1963, they were reformed as five-year Junior Teachers' Colleges, taking junior high school graduates (Lii, 1984). Three years had come to be thought too short to offer proper training, and three-year junior colleges were unable to recruit academically excellent high school students, whose first choice was university. Moreover, they produced about 3,000 graduates more than the estimated need of about 1,000 teachers per year (Lii, 1984). The five-year teacher college curriculum was composed of General, Professional and Optional subjects. General subjects were the Three Principles, Chinese, Mandarin, mathematics, civics, history, geography, natural science, chemistry, physics, English, music, fine art, handicraft, athletics and military training. Professional subjects were logic, introduction to education, child development and guidance, educational psychology, educational sociology, the introduction of curriculum, teaching materials and methods, psychological and educational measurement and testing, primary school administration, the history of education, comparative elementary education, educational philosophy, audio-visual education, health education, research of language and literature teaching, research of arts and crafts teaching, research of music teaching, research of natural science teaching and practice in teaching. All students had to finish a total of between 260 and 280 credits in five years.

Nine years of compulsory education was instituted as a minimum requirement for all students, commencing in September 1968. In response to this, the National Curriculum Standard Regulation was revised and re-addressed the importance of national identity in opposition to the Chinese communist party. The overt political purpose of education was later intensified, for example, when in the following year primary school textbooks were published and supplied only by the National Edition and Translation Institution in order to unify them (You, 1993).

The Teacher Education Act introduced in 1987 raised all Teachers' Junior Colleges to the level of college or university in response to increasing pressure to improve teacher quality and global trends in teacher education (Chen, 1995; Lin, 1981; Yu, 1979). The curriculum was divided into three sections: general, profession, and special subjects. Every student was required to complete 148 credits in four years, 74 (50%) for general subjects, 44 (29.7%) for professional subjects and 30 (20.3%) for special subjects.

5. The Fourth Phase: from 1987

It was a milestone for Taiwan in history when Martial Law was abolished in 1987. This new situation forced Taiwan to move into a new era, a democratic society in which people demanded more voice and called on the central government to conduct a series of educational reforms. In September 1988, because of increasing pressure from legislators, the Ministry of Education announced a reduction in the school textbook monopoly by the National Edition and Translation Institution (Bulletin of the

Ministry of Education, 1982/165). In February 1989, the Ministry of Education further permitted primary school teachers to use different editions of school textbooks (Bulletin of the Minister of Education, 1989/170).

On 2 May 1989, the Minister of Education set up the Primary School Curriculum Reform Committee (Kuo, 1994). In September 1993, based on its suggestions, the Ministry of Education introduced a New National Curriculum Policy, which went into operation in 1996. This policy modified the existing primary school curriculum and reduced the range of materials covered by primary school textbooks. It also introduced some teaching periods over which primary teachers were able to have full control and for which they were permitted to devise their own teaching materials and their own assessments.

Although the New Right started to become a dominant influence in western countries such as the USA and the UK in the 1980s (Chiang, 1997, 2008b), its influence in Taiwan didn't emerge until the 1990s, because of the constraints imposed by Martial Law, which was abolished in 1987, as noted previously. However, the extension of the New Right's influence to Taiwanese teacher education in the 1990s is manifest in the 1994 Teachers' Education Act.

In February 1994, because of dissatisfaction with the monopoly of primary school teacher supply by teacher colleges, the Teachers' Education Act was passed in the Legislative Yuan, destroying this monopoly. Although, the Act maintains the Government's right to appoint state primary school teachers, other higher education institutions are now allowed to provide teacher education. The policy of non-fee paying teacher education was also abolished. In December 1999, the Ministry of Education introduced the Post Graduate Certificate Program for higher educational institutes to provide teacher education for university graduates who would like to gain a teacher certificate. Those changes have produced a profound impact on teacher supply, shifting from a slight shortage to oversupply. This oversupply has intensified since the early 2000s as witnessed by the fact that very few graduates with teacher certificates are currently able to become primary school teachers. This phenomenon has brought in a new form of political pressure that has left the central government with no choice but to introduce new policies from the middle of 2000s directed at lessening the size of the teacher education market. As noted previously, the acceptance by the central government of the ideology of the New Right in the 1990s, has resulted in considerable political pressure, driving the state to implement a new ideology that is not free-market but planned under its direction. This new ideology has generated a series of new policies. The Ministry of Education, for example, initiated a new policy in 2004, cutting the capacity of Centers for Teacher Education in all higher educational institutes by 50%. In 2005, the Ministry of Education announced a counter-market policy – that if teachers' colleges agreed to cut their intake of student teachers by 50%, they could upgrade to the level of teachers' university. Without substantial resistance, the existing teachers' colleges accepted this political arrangement and renewed their titles as teachers' universities in August 2005. Although these actions have greatly reduced the scale of teacher education, the problem of teacher oversupply hasn't been alleviated significantly. In other words, it has now become extremely difficulty to become a primary school teacher. Although this competitive selection mechanism has ensured the professional quality of primary school teachers, the employment rate of graduates as primary school teachers is very low – less than 3% from 2005 to

2008. This phenomenon indicates that primary schools have become professional, in the public's eyes. Generally speaking, Taiwanese primary school teachers have traditionally enjoyed a much higher degree of social status than their Western counterparts. This phenomenon is due to the influence of Confucianism, which bestows higher levels of psychical and material rewards upon them.

The influence of Chinese traditional culture has ensured that teachers have enjoyed a high level of social status in Chinese society (Lee, 1972; Liou, 1973, Lin 1992). In ancient Chinese society, there was a close relationship between the Emperor and the teacher. As a national leader, the Emperor had to behave as a model for his people, to whom he was also a teacher. This symbolic meaning gradually extended to both senior officials and teachers and their relationships. A very high level of social status thus adhered to teachers who were defined as one of the five superior-social-status groups (God, the Earth, the Emperor, the Family and the Teacher). They had an important symbolic position to sustain as guardians of social morality. They had to possess a high level of academic knowledge, as well as sound social attributes, in order to influence other people.

This high social status was reinforced by Confucius's life and example. In the Chinese tradition, it has been generally agreed that he was the most remarkable scholar of the past two thousand years or more, as exemplified by the Four Books (Lee, 1977; Liou, 1973). Confucianism achieved an intense and extensive influence on Chinese culture. Furthermore, because of his long-term contribution to schooling, particularly as an inspiration for the movement for public education, he has been regarded as an icon of social equality and social morality. People tend to extend this symbolic meaning to school teachers. Teachers are thus expected, like Confucius, to have an important influence on maintaining or improving social morality. The declaration of the 28th of September, his birthday, as Teachers' Day in Taiwan indicates the length of his symbolic shadow on our school teachers.

During the colonial period, from 1894 to 1945, Taiwanese teachers continued to have a very high level of social status. This was mainly because the Taiwan Viceroy provided only two routes for academically excellent students: medicine or primary school teaching (Tsurumi, 1977; Wu, 1983). To become a teacher was extremely difficult (Her, 1980). J.T. Wu also argued that Teachers' Schools not only developed professionals but also leaders for Taiwanese society (see Wu, 1983). They thus constituted a social elite. Although the selection has been not quite so restrictive since 1945, passing the entrance examination was still very difficult. For example, only 6.3% of male and 3% of female examination candidates passed in 1966 (Lin, 1980). This academic selection further contributed to the high social standing of primary school teachers (Chen, 1992; Her and Liou, 1969; Lin, 1971; Lin, 1992; Win and Chan, 1979; Taiwan Normal University, 1980).

The Taiwanese economy grew more rapidly from the 1960s, while still embodying much traditional Chinese and Japanese culture. Teachers no longer serve as the only knowledge suppliers. People are able to acquire knowledge in other ways, and an open society encourages people to develop multiple and pluralistic values, concepts and thoughts. In such a society, teachers' social status is likely to decline, and Taiwan has not been an exception to this trend. Nevertheless, Taiwanese teachers still have a higher social standing than their Western counterparts (Lin, 1980) and are perceived to exert a significant influence upon social morality. This is recognized, for example, by the annual presidential speech in appreciation of teachers' contribution to national development on Teachers' Day (Bulletin of

the Ministry of Education, 1979/57; Bulletin of the Ministry of Education, 1980/70; Bulletin of the Ministry of Education, 1981/81).

Another piece of solid evidence to document the professional status of Taiwanese primary school teachers is their salary, which is much higher than that of civil servants. Teachers' salaries are determined by central government policy. Each year a central government budget plan specifies levels of the teachers' salaries. It is worth recording that primary school teachers' salaries are tax free. As well as receiving a twelve-month salary, at the end of the lunar year they have bonus of one and half months salary, which is standard within Taiwanese society. Promotion is partly determined on an appraisal process conducted each academic year. Most teachers are rated as 'excellent'. Once they have achieved this 'excellent' rating, their salaries jump to a higher level of the scale and the holders are given an extra bonus equivalent to one or two month's salary. Two months of extra salary are given only to senior teachers, on top of their ordinary teachers' salary scale

Salaries are based on a scale which takes into account post, school location, qualification and the length of teaching experience. This gives rise to a wide range of salaries. At present, the top levels of these scales offer some senior teachers other than school administrative staff, including the head teacher, department heads and assistants, about two thousand pounds per month, which is more than double a new teacher's salary of about nine hundred pounds per month.

In order to encourage teachers' professional development, teachers' salaries jump to higher scale levels when they achieve further qualifications, based on years of course duration. In relation to the bottom level, junior college graduates, Ph.D., masters' and first degree holders advance two, four or two extra levels on these scales, respectively.

6. Conclusion

The historical development of education in Taiwan suggests that education has been seen as an essential part of the ideological weaponry of central government. By and large, central government has determined who and what is taught, as well as how, as witnessed by the introduction of the National Curriculum Policy and the National Textbook Policy. Within this general framework, then, Taiwanese primary school teachers have been positioned traditionally as implementers of policy, and deliverers of curriculum content through classroom practices largely determined at the centre. The state also extended its control over teacher education and teacher supply. Nevertheless, when social changes occur, such as in 1987 when Martial Law was abolished, new beliefs may develop and drive the state to change its means of domination, as witnessed by the adoption of the ideology of the New Right to initiate a free market for teacher education. Although this free market policy pushed teacher education institutes into a competitive arena, the problem of teacher oversupply became critical after 2000. This led to a considerable degree of political pressure on the state to reverse its direction back to a planned mode, the results of which are seen in the introduction of a series of policies to shrink the size of the teacher education market. These changes indicate that there is an interactive relation between the state and the social situation. Perhaps, the state has legitimate authority to initiate educational reforms, the effects of which are able to create new social/political situations which leave the state with no choice but to amend its way of domination. Such an interactive relation also suggests that the state cannot be

viewed as an independent dominator with full power, but rather as a flexible initiator to meet social needs.

Overall, although, unlike like traditional professionals – medical practitioners, lawyers or engineers – Taiwanese primary school teachers do not possess a great degree of latitude in the conduct of their profession, they have long enjoyed a much higher level of professional status than their Western counterparts. Such a phenomenon is deeply connected with the influence of Chinese culture, which positions teachers as social guardians, protecting social morality and solidarity. Such a powerful social value, then, bestows on Taiwanese primary school teachers a high level of social status, prestige and salary. Despite a series of changes in teacher education and the impact of industrialization, their professional status hasn't significantly declined. The above analysis proves that socio-cultural influences need to be taken into account if researchers wish to gain a complete picture of teaching professionalism.

The Psychological Effects of Digressional Speeches

Misa Suzuki and Kawan Soetanto

School of International Liberal Studies, SILS. Waseda University, Tokyo, Japan 169-8050

e-mail: ksoetanto@gmail.com

Abstract---This study provides the results of the fact-finding survey on the psychological effects of digressional speeches which university lecturers give to students. By analyzing them, the study propose that the digressional speeches lead to the positive psychological effects especially when including frequent reference to senses of values, such as ways of living.

Keywords: Higher education; Digressional speeches; Class of Soetanto; Psychological effects; Mental Education

1. Introduction

The purpose of the study is to elucidate the factors of digressional speeches of lecturers which have an impact on mental growth of university students. The study compares the contents and psychological effects of digressional speeches in the classes of Soetanto with those in the other classes in the same university, Waseda University.

Plurality of thoughts, the freedom of different people having different opinions, has become one of the most notable values in societies with the worldwide democratization. With respect to education in such societies, Radford (2007) points out "The problem, from an educational point of view, is that these tensions in human thought and experience, and the ways in which we seek to address them, whether through religious belief or otherwise, are often very personal, potentially fragile and highly sensitive" (p. 24).   In the field of public education, especially, biases of thoughts are sensitively avoided, and the

attention on neutrality is encouraged[1]. Due to this social background, teachers do not seem to keen on teaching individual ideas, mental attitudes, and senses of values.

However, it is also important to remember that everyone cannot equally enjoy the chances to learn the way of life and values to overcome difficulties in life and internal struggles. It would be a significant part of preventive care for mental illness that public education will take a more active approach to hone the psychological ability of students to cope with such hardships. In this light, it is worthwhile to explore a possible way of mental enlightenment which is acceptable in the present pluralistic society.

The starting point for the study is the hypothesis that digressional speeches would be an effective modality of mental education. Digressional speeches of lecturers here mean anecdotes and stories of personal experiences which are supplementarily added though they are off the main subjects of lectures. Because of its *casualness,* meaning informality, honesty and spontaneity, digressional speech is thought to be an answer to the dilemma between the necessity of mental cultivation and the neutrality of education which is inevitably required in the society.

Furthermore, the reason this study focuses particularly on university education rather than any other public education is that university is the last safety net for most of the young people before entering the workforce[2]. In addition, higher education is more flexible than lower education which has to pay considerable attention to entrance examinations. Due to these reasons, university education was considered as the best object to study.

The purpose of the study and its background ideas have been provided in this chapter. The rest of this paper is organized in the following manner. In Chapter 2, related discourses will be reviewed. Chapter 3 contains the explanation of the setting of the case study and the methods to conduct the research. Chapter 4 presents the results and analyses of the study. Finally, Chapter 5 offers a summary of the findings and the suggestions for future research.

---

[1] In Japan, for instance, correction orders are sent from the Ministry of Education, Culture, Sports, Science and Technology to schools which are judged to be conducting education lacking political or religious neutrality (though private religious schools are the exception).

[2] The percentage of students pursuing higher education was 55.4% in Japan in 2008 (MEXT, 2008).

2. Review of the Discourses on Digressional Speeches

Some teachers have reported the importance of digressional speeches in lecturers.   Kawan Soetanto, a professor of Waseda University in Japan, suggested that digressional speeches can have an impact on mental growth of students. His education is one of the successful examples of motivating university students (Soetanto, 1994, 1996, 1998[a], 1998[b] and 2002). Though he regards his own pedagogy as the motivational education, it can be recognized as mental nurturing. This is because he put emphasis on the reform in the mental attitude of students in his education. He asserts that sound mental attitudes are the readiness for university education.

> *First, students should be raised to the one having a dream and self-awareness. And a sense of purpose*
> *and responsibility are also to be inculcated. Only after this, students would be ready to receive*
> *professional education. (Soetanto, 2003, p.10)*

In fact, a lot of students at his classes appeared to have gained (or retrieved) confidence, dreams, and enthusiasm through the observed sessions of his classes. This fact is simply reflected on the following answer of one of the interviewees.

> *Prof. Soetanto' invincible mind that had met many hardships sticks out in my mind. Through his*
> *class, I think I could gain such mental toughness. (T.T. (initial), interview, 2008)*

The Soetanto's method also has achieved recognition from many people besides his students such as parent, business person, employees and government officers etc.   in terms of mental enlightenment as well as motivational strategies[3].

One of the special features of the Soetanto's teaching method is the passionate digressional speeches during lectures in which he mentions his own belief about mental attitude and ideas on social problems. Soetanto pointed out that it is one of the important factors which motivate university students. In his thesis, he gave the clinical evidence that ways of living of students can be positively influenced by his digressional speeches (Soetanto, 2003, p. 56).

However, no attempt has been made to elucidate the factors of the digressional speeches of Soetanto contributing to positive psychological effects on the students. If the factors which make his digressional speeches effective are clarified, it will shed a light on a new possibility of mental enlightenment. As such,

---

[3] Refer to his works, especially the book, "Why did 'failures' succeed?: Nine methods of waking up motivation" and the article on the online magazine of "Nikkei Business Online", "Earnest makes 'motivated person'[Honki ga tsukuru 'yaruki-ninghen']" (see Bibliography).

it is worthwhile to examine the effectiveness of his digressional speeches from the perspective of mental growth of students in comparison with that of other lecturers.

An educationist, Takashi Saito, reported that digressional speeches are of significance. He asserts from his experience that students are waiting for digressional speeches in class "as if they were searching for an oasis in desert". In such times, the teachers who cannot make digressional speeches appear boring (Saito 2007: p.127). In the experience of the author during the undergraduate study, students also seem to actively listen to digressional speeches; conversely, they feel that a class without digressional speeches leaves something to be desired. Thus, it is feasible to speculate that digressional speeches let students listen willingly. However, obviously, more research is needed to objectively verify the perceptions of Saito and the author which are based on only empirical impressions.

3. Methods

3.1. The Setting of the Research

In order to investigate the psychological effects of digressional speeches, a case study was conducted in the Kawan Soetanto's classes in the spring and fall semesters 2008 at the School of International Liberal Studies of Waseda University. The classes studied include eight different ones. The details of each class are shown in the table 1.

Table 1

Summary of the Soetanto's classes which are studied

Semester	Class category	Class title	Target grade
Spring	First Year Seminar 2B	Digital and Globalization	Freshman
	Intermediate Seminar	Motivation and Education	Sophomore
	Advanced Seminar	Education, Motivation and EQ: Human Potential Development and Management	Senior

Fall	First Year Seminar 1B	Comparative Study of Asian Education Systems	Freshman
	First Year Seminar 2B	Introduction to Information and Medical Technology	Freshman
	Intermediate Seminar	Motivation and Education	Sophomore
	Intermediate Subject	Basic Digital Technology	All grades
	Advanced Seminar	Education, Motivation and EQ: Human Potential Development and Management	Senior

There are three reasons why Soetanto's classes were chosen as the object of the study. First, his classes tend to entail a plenty of digressional speeches. Although a lot of other classes also include digressional speeches, Soetanto offers not only abundant but also diverse stories when he digresses. As such, his classes are thought to be quite suitable to study in. Second, the education of Soetanto is already recognized as successful in terms of students' motivation. This implies that it is likely to be also successful in terms of mental enlightenment because his way of raising motivation contains the process in which students notice new aspects of spiritual values and the importance of them. Third, Soetanto is responsible for different types of classes for different years of students as seen in Table 1. Thus, it was expected to be able to enjoy the extensive results in various situation and conditions of classes with the fixed condition of the same lecturer. This is an important parameter of the object because it is of necessity to ascertain the validity of the effects of digressional speeches in differing patterns of classes.

3.2. Surveys

Questionnaires were given out in person to the students of Soetanto's classes and to the comparison group, or those who are unrelated to Soetanto's classes from a variety of faculties at Waseda University. This is because comparison with the results of the other classes was necessary in order to clarify the characteristic of the results of Soetanto's classes. Additionally, the wide spectrum of opinion was useful to examine generality of the case study. The 32 students of Soetanto's classes and the 118 undergraduate students of the other classes responded.

In the study, the purpose of the survey was to grasp a big picture of emotional effects caused by digressional speeches in university lectures and a multitude of opinions on them. All parts of the questionnaire were created by the author from scratch. This study is original in that a new questionnaire is presented.

4. Findings

4.1. Digressional speeches have a positive impact on mind of students.

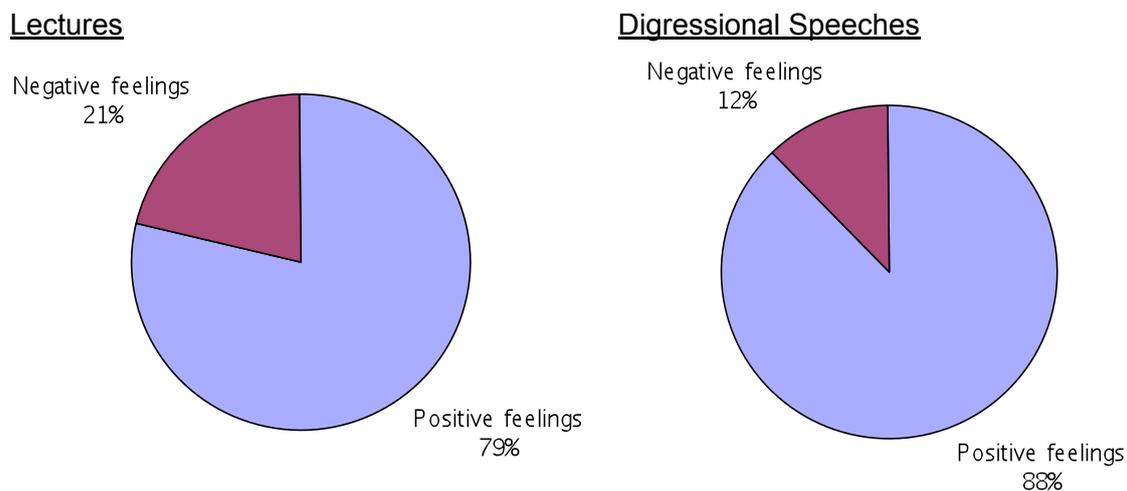
The study has shown that digressional speeches make students motivate to willingly listen to lecturers. The results of the surveys in both Soetanto's classes and the other classes showed that positive feelings increased when students listen to digressional speeches as illustrated in Figure 1 and 2 below.


Figure 1. **Pie Chart Presentation of the Comparison of the Feelings Evoked by Whole Lectures and Digressional Speeches (Soetanto's Classes).**

Lectures

Digressional Speeches

Negative feelings
46%

Positive feelings
54%

Negative feelings
24%

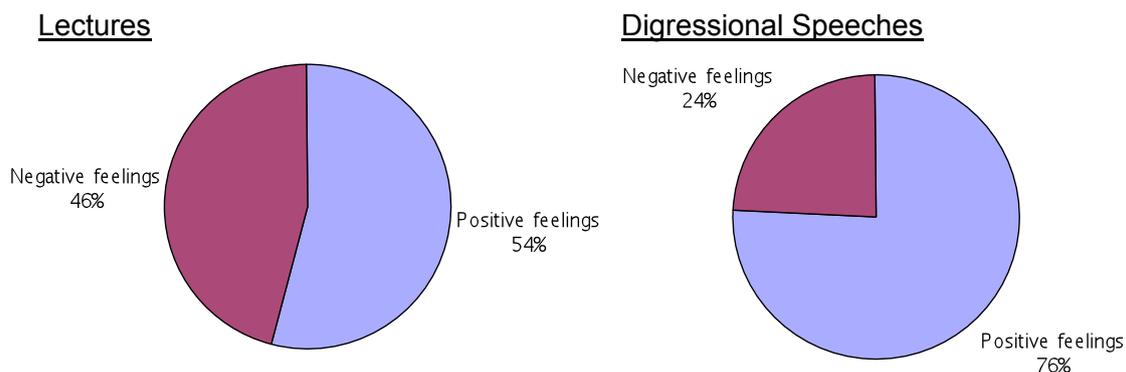
Positive feelings
76%


Figure **2. Pie Chart Presentation of the Comparison of the Feelings Evoked by a Whole Lecture and Digressional Speeches (Comparison Group).**

The result indicates that the more students of Soetanto's classes feel positive about a whole lecture (79%) than the students of the other classes do (54%). On the other hand, digressional speeches reduced the rate of negative feelings roughly in half in *both* Soetanto's classes and the other classes. It means that digressional speeches render positive emotional change to both types of students who are relatively content during a lecture and those who are not.

Furthermore, the difference between the result of Soetanto's classes and that of the comparison group regarding the effects of digressional speeches was that the students of Soetanto's classes felt more positive feelings (88%) than those of other classes during a lecture (76%). Although several reasons can be considered, through the observational research, quality of digressional speeches seemed make difference. The following section elaborates the difference in contents of digressional speeches.

4.2. Unlike other lecturers, Soetanto makes frequent allusions to senses of values.

The study found that Soetanto refers to senses of values more often than others though they are more or less mentioned in digressional speeches by both Soetanto and the other lecturers. The survey of the 118 undergraduate students clarified that most lecturers make digressional speeches. 91% (106 out of 118) of respondents know some professors who digress from the main topic in lectures (Figure 3).

The answer to the question if there is any lecturers who make digressional speeches

9%

91%

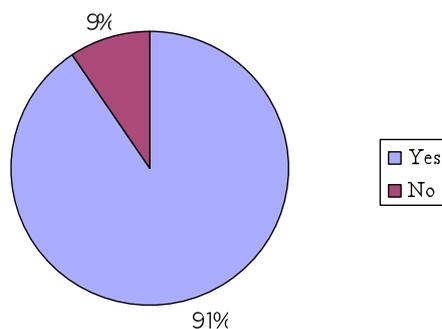
Yes
No


Figure 3. Pie Chart Presentation of the Answer to the Question if There Is Any Lecturers Who Make Digressional Speeches.

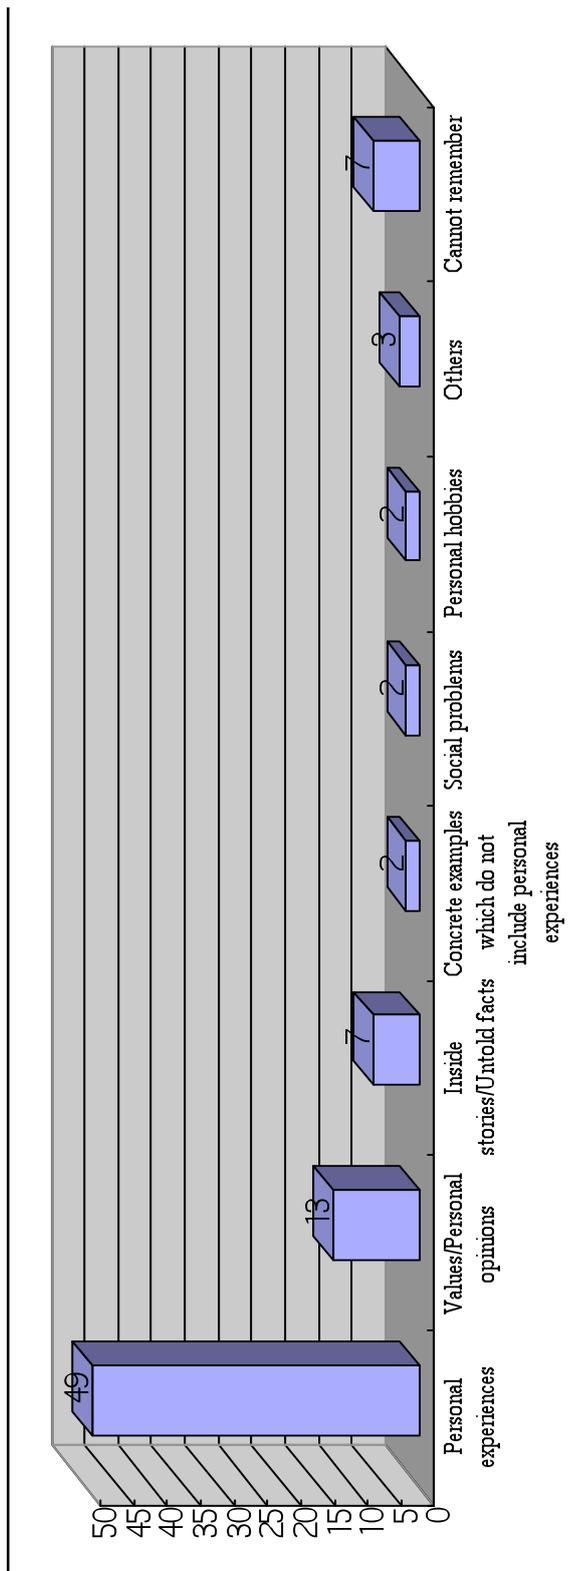
73 out of the 118 respondents answered to the open-ended question asking about contents of digressional speeches which respondents can recall. The types of the answers can be divided into eight which include 'personal experiences', 'values/ personal opinions', 'inside stories/ untold facts', 'concrete examples which do not include personal experiences', 'social problems', 'personal hobbies', 'others', 'cannot remember'. The break down is given in the Figure 4. 49 out of the 73 respondents (67%) wrote that they have heard the stories of personal experiences of lecturers in digressional speeches. The second most popular response was the stories about senses of values and personal opinions of lecturers, rating only 19% (13 out of 73) which was less than one-third of personal experiences. This result shows that stories of personal experiences are generally the most predominant content of digressional speeches in university classes.


Figure **4. Vertical Bar Chart Presentation of the Contents of Digressional Speeches (Comparison Classes)**
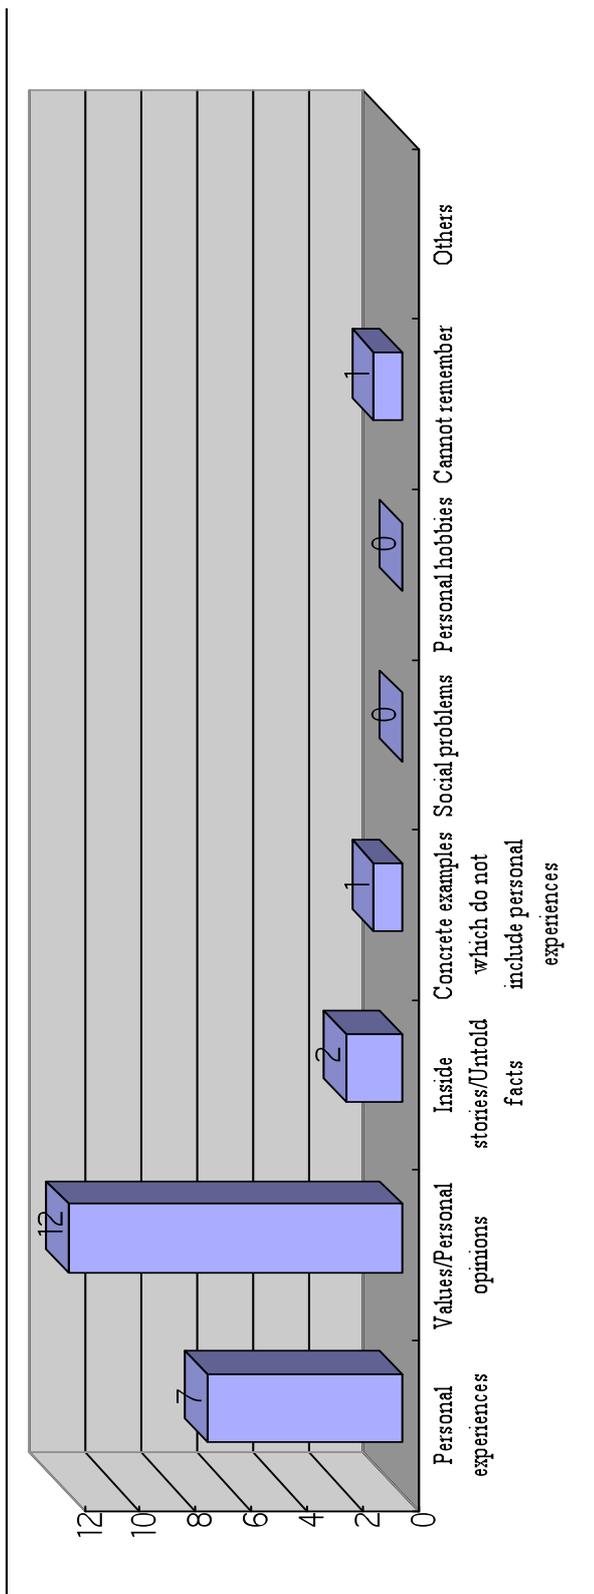

Figure **5. Vertical Bar Chart Presentation of the Contents of Digressional Speeches (Soetanto's Classes)**

The survey of the students taking Soetanto's classes also revealed that digressional speeches tend to include the stories about senses of values and personal experiences. 26 out of the 31 respondents have given the answer asking about the contents of digressional speeches. 12 out of the 26 respondents (46%) explained the speeches regarding values and personal opinions whereas 7 out of the 26 respondents (27%) wrote about the speeches of Soetanto's personal experiences (Figure 5). Compared with the comparison group, the students of Soetanto's classes remember more stories about senses of values than those about personal experiences. This difference is due to the educational philosophy which Soetanto possesses. He put an emphasis on raising mentality of students to motivate them to keep challenging. Considering that stories regarding values are repeatedly conveyed at class, the result was hardly surprising.

What is special about the responses was that all the 12 respondents of the survey who mentioned the digressional speeches about senses of values could describe details of what had been told. For example, S.T. (initial) who took the class of Basis Digital Technology in the fall semester 2008 wrote:

> *I have heard him saying, 'people start to have radiance even when they TRY to do something. In doing so, people can change'.*

N.S. (initial) who took the class of Advanced Seminar from 2007 to 2009 wrote:

> *The story about the person who has impressionable nature was impressive. He talked about the aspirational person, the person who has room in his/her heart, and other concrete examples. Because I came to want to become such a person who is emotionally sensitive, I remember it clearly.*

These detail comments imply the fact that senses of values are substantially conveyed to the mind of the students through digressional speeches.

Hence, it can be declared that university lecturers refer to personal experiences much more frequently than senses of values whilst Soetanto is the other way around. It is feasible to speculate that mentions on senses of values is the important factor contributing to the higher rate of positive feelings which the students of Soetanto's classes have when listening to digressional speeches.

5. Conclusion

The study elucidated the psychological effects of digressional speeches through a case study. The discoveries are following: (a) digressional speeches encourage positive feelings of students; (b) the rate of positive feelings evoked by digressional speeches was higher in Soetanto's lectures than in the other classes; (c) the feature of the digressional speeches of Soetanto is that he refers to senses of values more frequently than the other lecturers. On the whole, digressional speeches have the positive psychological effects. Moreover, referring to senses of values in digressional speeches facilitates the effect even more.

In order to verify the hypothesis that digressional speech is a way of acceptable and effective mental education, the author currently continue the analysis of the results. If space permitted, the more findings and analyses could be given. They would include the verifications of the arguments by the information based on observation, interviews and other documents. In addition, there would also be the discussions about more details of the psychological effects, the casualness of digressional speeches, the structured process of the enlightenment through digressional speeches, and the difference in the effectiveness according to gender. Hopefully, these parts of the study which could not be shown this time will be presented in another opportunity.

Since this study is a case study which offers empirical and descriptive validity of the proposal, it is clear that more extensive research is necessary to establish the statistical validity. In addition, the study

not from educational approach but from psychological one would be also valuable in reexamining the changes in mental state led by digressional speeches.

In conclusion, the merits of digressional speeches can be used in the field of positive psychology, or alleviating various kinds of anxieties in life and enhancing well-being. It is hoped that this study will contribute to interdisciplinary fields besides educational ones.

Critical practice and projective identification

Dr Michael Pronko

Meiji Gakuin University

pronko@ltr.meijigakuin.ac.jp

keywords = critical thinking, psychodynamics, cultural awareness, pedagogy, theory

Abstract

The concept of critical thinking has been an important one in higher education, defining a set of classroom practices as well as pedagogical goals and curricular structures. However, the inclusion of critical thinking inside the Japanese university classroom is more often than not met with initial acceptance followed by long-range rejection. To understand the dynamics of this external acceptance/internal rejection of critical thinking, the psychodynamics of the Japanese classroom must be considered. In particular, the psychoanalytic concept of projective identification together with the Japanese concept of 'amae' can help to chart courses for critical thinking to become more central in the university classroom. The paper will argue that projective identification has two poles, one in which the classroom is dominated by the instructor's instilling a belief system and the other in which processes such as empathy and intuition inform all activities. By better understanding the processes of projection and identification, a more substantial psychological framework for critical thinking can be established. This theoretical paper will seek to illuminate ways towards a more substantial classroom practice of critical thinking within such a framework and explain how that combination of critical practice and psychological analysis can lead towards greater autonomy for learners within their own frameworks. What has been missing from most of the theory, pedagogy and materials related to critical thinking is the crucial component of local classroom dynamics. The global concept of critical thought, which remains a western-initiated set of concepts, does not begin to solve local problems, in this case Japanese university education, without a more thorough psychological grounding and cultural awareness. This is especially important for students undergoing identity formation, and reformation, within the context of foreign language study and
 international education. This paper will bring together particular practices of critical thinking, an analysis of the resistance to such critical activities, and partial solutions to the issues. Thus, the issue resolves itself slightly differently from the theme of the conference, as it is more of a local solution, cultural awareness of the psychodynamics of the Japanese classroom, to a global problem, critical thinking in education.

The use of self-assessment to foster students' learning in teaching practice

Rebecca Hun Ping CHEUNG

Hong Kong Institute of Education

e-mail: rcheung@ied.edu.hk

Abstract

This study aimed to use self-assessment to facilitate students' learning. Participants comprised 57 students which were engaged in a self-assessment process by setting goals, recording evidence and evaluating their performance. Questionnaire and focus group interviews were employed to examine the usefulness of self-assessment and possible changes in students' learning. Results indicated that students found self-assessment enhanced their learning, especially in the area of reflective thinking. Students also reported evidence of positive changes of their learning.

Introduction

This study involves an investigation into the use of self-assessment as formative assessment in teaching practice. The purpose of the study was to explore whether there were any changes in students' learning after they used self-assessment to evaluate their teaching performance.

In the field of teacher education, preparing students to be reflective is a major focus of training programmes. Teaching practice is a core activity in any teacher training programme with the purpose of providing opportunity for meaningful reflection where theory can be challenged and practice improved. According to Hopkins (1995), if teaching practice is regarded as an assessment in which students only receive external feedback with a grade assigned by the supervisor, this assessment does little to promote reflective thinking. Various researchers have explored ways to encourage students to reflect on their teaching and make necessary adjustments to enhance student learning (National Council for Accreditation of Teacher Education, 2002). Self-assessment is now being used more and more in higher education for that purpose.

Shepard (2000) suggested that assessment could play a more useful role if it was used as part of the learning process. Assessment should not only be used to give a grade for judging the competence of

the students with reference to a set of standards and criteria, but should also be used to provide a learning context that promotes students' understanding of teaching and learning and improves their practice. Many researchers (e.g. Gipps, 1999; Klenowski, 1995) have developed self-assessment as a form of formative assessment and have achieved some success in promoting students' learning. The use of self-assessment as a tool for learning to learn and helping students to take responsibility for their own learning is well documented (Reynolds & Trehan, 2000; Boud, 1995).

Boud (1995) identified two essential components of self-assessment, namely the identification of standards and criteria for judging the quality of the work and the judgment on the extent to which the standards and criteria have been reached. According to Boud, in the process of identifying standards and criteria, the learner develops a deeper understanding of the demands of the learning task and clarifies the learning goals. Costa and Kallick (2004) conceptualised a feedback spiral which includes goals clarifying, planning, action taking, assessing and gathering evidence, reflecting and evaluating, modifying actions based on new knowledge and moving on to redefine the goals again. The spiral serves as a tool for enhancing the knowledge of the student about the effectiveness of the learning strategies, the extent of their learning, and the learning strategies to be used in the next stage of learning. This feedback spiral in turn promotes students' learning.

This study was informed by the Learning-oriented Assessment Project, a teaching development project of the Hong Kong Institute of Education (HKIEd). The project stresses a shift in thinking about assessment practices in teacher education away from performance-based methods toward those that may facilitate students' learning. A self-assessment tool was developed that could be incorporated into teaching practice to enhance students' learning. This tool served two primary functions: 1) to encourage students to analyse their own work, using the assessment criteria printed in the handbook for judging their own performance; 2) to aid students in understanding the gap between what they aimed to achieve and their actual practice, and requiring them to take responsibility for the improvement in the quality of teaching and learning. This study aims to examine the effectiveness of self-assessment in teaching practice and to explore whether the students, after engaging in a self-assessment process, exhibited changes in their teaching and learning practice.

Two research questions were formulated:

1.   Does self-assessment aid in teaching practice?
2.   Does the self-assessment process bring about changes in students' teaching and learning practices?

Self-assessment in teaching practice

Self-assessment has been highlighted as an essential component in the professional preparation of teachers in order to produce confident, independent and autonomous learners (Bailey, 1981). With reference to Boud's self-assessment schedule (Boud, 1995) and the feedback spiral suggested by Costa and Kallick (2004), self-assessment is conceptualized here as the process in which students engage in analyzing their own work and make judgments about what they do and do not know and what they can and cannot do. Consequently, self-assessment develops students' competence for self-monitoring, self-evaluation and self-correction. This in turns fosters active and independent learning.

In this study, the process of self-assessment included four aspects to connect planning, teaching and reflection. This four-step process proposed a systematic approach for the students to collect, interpret and refine their teaching practices.

1.   Goal setting: students set their goals in relation to the assessed items of teaching practice. This aspect engaged students to make explicit what they wanted to achieve, thus enhancing their motivation to learn.
2.   Evidence recording: students recorded evidence of what they had achieved with reference to the goals they had set earlier. This aspect engaged students to clarify and make sense of the standards and criteria.
3.   Self-evaluation: students evaluated the extent to which they had achieved their goals. This aspect engaged students to judge the quality of their work.
4.   Further action for improvement: students identified areas for improvement. This aspect engaged students to make decisions for self-improvement.

Figure 1 shows the conceptual framework of the self-assessment process illustrating the different aspects that engaged learning.

Figure 1:   The conceptual framework of the self-assessment process

Goal setting

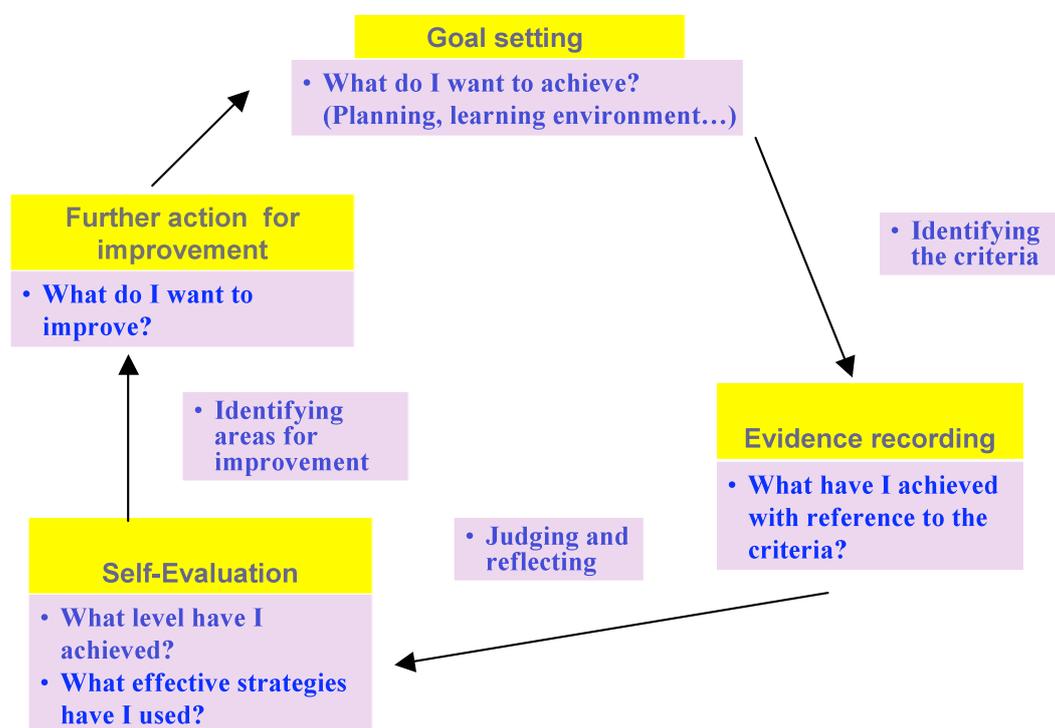
Further action for improvement
• What do I want to improve?

• Identifying areas for improvement

Evidence recording
• What have I achieved with reference to the criteria?

• Judging and reflecting

Self-Evaluation
• What level have I achieved?
• What effective strategies have I used?


Method

Participants

Forty-seven in-service students enrolled in the Early Childhood Education Programme at HKIEd were willing to take part in this study. The sample contained two groups of students, 27 of whom were in their first year of the Certificate of Education two-year programme while 20 were in the second year of the programme. As part of programme requirements, these students needed to complete a 4-week

block teaching practice. The second year students had prior experiences of teaching practice whereas the first year students had no previous experience.

Procedures

The study started two weeks before the block teaching practice. At the first meeting, the students were informed about the objectives and the procedure of self-assessment. A demonstration of goal setting and evidence recording was given. Then the students were engaged in practising goal setting, using the self-assessment sheet according to the assessment criteria printed in the handbook of teaching practice.

A self-assessment sheet was distributed to each student and used at three stages on the teaching practice. The students were asked to:

1. set their goals according to the assessment criteria before the block teaching practice;
2. record evidence of what they had achieved with reference to the goals they had set during the block teaching practice; and
3. evaluate their own performance and identify areas for improvement.

During the supervised field visits conducted by the researcher, students were asked to highlight selected episodes for discussion from the strengths and weaknesses recorded on their self-assessment sheets. The process of involving students in discussion and reflection based on their self-assessment allowed participants to take some control of their learning, thus building the confidence and independence of students in self-directed learning. It also provided useful information to the researcher for understanding the needs of the students and guiding the students to analyze their teaching and to identify areas for improvement.

Data collection

The use of quantitative and qualitative data collection methods provided multiple data sources for triangulation to address the research questions as well as to enhance the validity of the study. Quantitative data was collected by questionnaire and qualitative data from focus group interviews and the self-assessment sheet.

Questionnaire A questionnaire was designed and administered to all participants at the end of the teaching practice to collect descriptive data on participants' perceptions of the usefulness of self-assessment on teaching practice.

Part One asked students to indicate on a 4-point scale how useful they found self-assessment for their teaching practice. Part Two required students to indicate the usefulness of self-assessment in the areas of lesson planning, teaching skills and reflection on a 4-point scale and to state their views in the open-ended section. Part Three of the questionnaire asked students to circle the adjectives that best described their feelings about the teaching practice before and after the self-assessment process.

Interview A semi-structured focus group interview was conducted for each group to gain an in-depth understanding of the impact of self-assessment. Six students from each of the two groups were randomly selected to participate at the end of their block teaching practice. The interview was designed with a topic-centered approach where several initial questions were formulated to ensure that the following aspects of interest were addressed:

1. experiences of selecting the goals, finding the evidence and identifying the areas for improvement to explore students' understanding of the self-assessment process;
2. views of the usefulness of self-assessment on teaching practice, the most useful areas and the influences on teaching to obtain information about the effectiveness of self-assessment;
3. difficulties of using self-assessment to collect information for improving the use of self-assessment.

Results and Discussion

With regard to Research Question One on the usefulness of self-assessment in teaching practice, data collected from the questionnaires was scored and analysed for descriptive statistics to capture a preliminary picture.

.

The usefulness of self-assessment in teaching practice

79% of the students indicated that self-assessment was useful and the mean score (M=2.98, SD=0.64) also revealed a generally favorable response towards self-assessment. While 100% of 2nd year students found self-assessment useful, only 64.2% of 1st year students responded positively. To check for possible differences between 1st and 2nd year students, an independent-sample *t-test* was used. Analysis indicated a statistically significant difference (t=3.927; p<0.01) between 1st year students (M=2.71, SD=0.11) and 2nd year students (M=2.71, SD=0.11), with the 2nd students having more favorable responses.

When looking at students' perceptions of the usefulness of self-assessment in relation to the three areas identified as important in students' learning, again significant differences (p<0.05) were revealed between 1st and 2nd year students in all areas, with mean scores decreasing significantly for 1st year students (see Table 1).

Table 1: One-way analysis of variance of the four areas

Area	Source	SS	df	F
Lesson Planning	Between Groups	1.584	1	6.447*
	Within Groups	0.246	45	
Teaching Skills	Between Groups	1.883	1	8.669**
	Within Groups	0.217	45	
Reflection	Between Groups	1.414	1	4.361*
	Within Groups	14.586	45	

*p<0.05 **p<0.01

In an attempt to ascertain areas that were most endorsed by the students, the mean scores and rank orders for each of the areas were calculated and compared. The mean scores for all areas were above 2.5 which showed that students generally had positive responses towards each of the areas. Students rated reflection as the most valuable aspect in self-assessment, followed by teaching skills and, lesson planning was rated the lowest. An examination of the mean values between 1st year and 2nd year students revealed that the 2nd year students consistently rated higher than the 1st year students across all areas. Irrespective of their prior teaching practice experience, both student groups considered reflection as the most useful aspect in self-assessment.

The results showed that 2nd year students placed a higher value on having self-assessment on teaching practice. This more positive response expressed by the 2nd year students might be due to the fact that a comparison could be made by the 2nd year students. Reflection received the strongest agreement and was ranked the highest. This result supports Reiman's (1999) claim that reflection does not come naturally and needs to be guided. The self-assessment process in this study helped the students extract meaning from their work and aided them in understanding the effectiveness of their teaching and the gap between what they aimed to achieve and the actual outcomes. Consequently, self-assessment as a useful reflective tool was valued. This is also the belief of many researchers (e.g Reiman, 1999; Boud et al., 1985) that reflective skills often need some sort of guidance and support.

Changes in students' teaching and learning practices after using self-assessment

With regard to Research Question Two on whether self-assessment in teaching practice brings about changes in students' teaching and learning practices, both the quantitative data and the qualitative data gave affirmative answers to the question.

Students' change of perception toward teaching practice

Students were asked to express their feelings about teaching practice before and after the self-assessment. A positive change was found. There was an increase in positive feelings and a decrease in negative feelings and the results indicate that students had a positive view of the experiences gained from the self-assessment process.

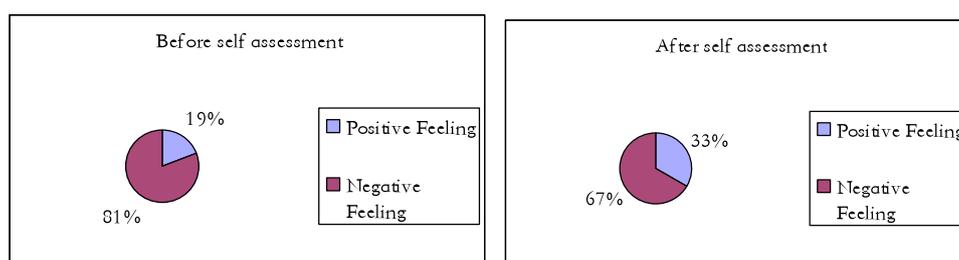
Figure 2: Perception change toward teaching practice


Figure 3:   A comparison of changes before and after using self-assessment
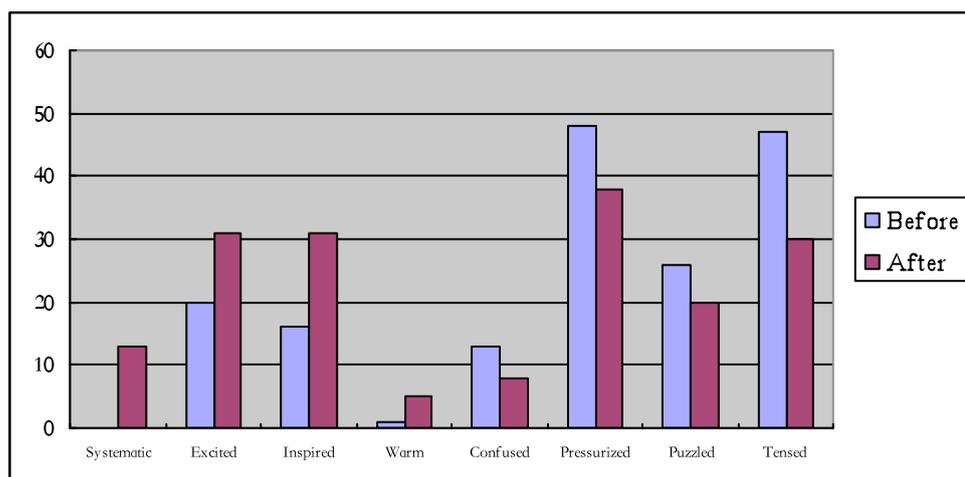

Analysis of the interview data was carried out in the form of thematic analysis. All interviews were audio-recorded, transcribed and coded. Instances and excerpts were grouped according to the following themes: lesson planning, teaching skills and reflective thinking. The main points and issues within each theme were then summarized to reveal the enhancement of students' learning.

Changes of practice in lesson planning

Students in both focus groups expressed the opinion that the self-assessment process enabled them to be more systematic in planning their lessons. Goal setting helped them to identify specific areas to work on and directed them on what to plan for the children. After using self-assessment in teaching practice, they were clearer about underlying teaching principles and understood better the children's needs and interests. The following excerpts illustrated their change of thinking:

	Before using self-assessment	After using self-assessment
Tam (2nd year students)	• *When I planned the lesson, I didn't refer to the teaching principles*.	• *I set my goals according to the teaching principles I have chosen. I wrote down the teaching principle, then the lesson plan. It seemed to help*

Chan (2nd year students)	• *I focused on what I want to teach and I didn't know where the children's interests and needs were in the previous lesson.*	• *After I've set my goals, I could refer to them when I evaluated. I could check if I had achieved my goal. If I haven't, I would consider children's needs and interests and revise the plan tomorrow accordingly.*
Fung (1st year students)		• *It helped me to focus. When I wrote down the goal, I dealt with one first if I found more than one problem in previous lesson plan. After I've achieved that, I would set another one. This made the way clearer.*

Changes of practice in teaching skills

Both 1st and 2nd Year students commented that the self-assessment process helped them to shift their focus from what the teacher does to how the children respond. They pointed out that they are often more conscious of their own performance in terms of a smooth implementation of activities rather than on children's learning. By collecting evidence during the lesson, it helped them to look for children's performance and identify what counts as evidence in relation to the goals. It provided critical information for students to reveal how well their specific goals were met and to identify their own strengths and weaknesses. It helped to made decisions about what could be done next time to make their teaching more successful, which in turn improved their teaching skills. Some reported:

	Before using self-assessment	After using self-assessment
Cheung (2nd year students)	• *I usually focused on my teaching only.*	• *I am now clearer with good teaching. I needed to observe children, to help children to learn, with reference to the goals set.*
Lam (2nd year students)	• *If I saw the children following my instruction to do the activity, I thought I had achieved the objectives.*	• *I knew clearer what I should do to help children. I know specifically which aspect I should scaffold children. I knew how to guide children by referring to the goals I set.*
Lai (1st year students)		• *I felt that I have improved in responding to children in class. I've got more to talk to them and know more ways to enhance their language development.*

Changes of practice in reflective thinking

During the interview, students kept repeating that they were made to think more when they were required to set goals, to search for evidence and to judge their own performance. This thinking also enabled them to have a clearer understanding of their goals and of the standards and criteria against which their teaching performance was judged. Loughran (2002) indicated that reflection emerges as a way of helping learners better understand what they know and do because they develop their knowledge through reconsidering what they learn in practice. With engaging in self-assessment, students could see the problems in their teaching by judging the gap between what they aimed to achieve and the actual outcomes, then making decisions to improve teaching. Some students reported that before adopting self- assessment, their day-to-day evaluation mostly were descriptions of teaching episodes rather than attempting to thinking critically about the episodes. The self-assessment process enabled students to see the link between the different aspects, thus develop their skills in critical thinking. Statements from the students include:

	Before using self-assessment	After using self-assessment
Chan (2nd year students)	• *The day-to-day evaluation was done to fulfill the requirement of teaching practice rather than reflecting my teaching.*	• *I would make use of photos, children's works as evidence to reflect on my teaching.*
Leung (2nd year students)	• *I did evaluation everyday and just described what children could do and couldn't do.*	• *I would think about what I did well or didn't do well seriously, then tried to find ways to improve.*
Cheung (2nd year students)	• *The daily evaluation is just a record of what I did that day. I didn't see the need to follow up. I didn't change my planning the next day according to the reflection. This is what we mean by feeling very vague of what to plan.*	• *The self-assessment stimulated me to think and evaluate systematically. Now, I would refer to the goals and evidence when I reflect. I now think more when I plan because I need to meet my goals. I would try my ideas for improvement in next lesson to see if it really worked.*
Ng (1st year students)		• *Through collecting evidence, I developed my analytic skills. I felt more confident when I found that I could gather evidence for my improvement. This means I can do better. And I've got a clearer idea of what and how to do next.*
Wong (1st year students)		• *Now, when I collect evidence for my teaching, I can see the progress of the children. I am glad that my effort has not been wasted. I have clear goals and steps to guide my teaching. I could feel my own progress as well.*
Lai (1st year students)		• *I learnt how to be selective in setting the right goals for my teaching. I now know I should not set too many goals, but to set goals which match my teaching principles.*

Conclusion and Implications

This study investigated the extent to which self-assessment facilitated students' learning among in-service student teachers in the Department of Early Childhood education at HKIEd. Findings from this study demonstrate that self-assessment can be a useful tool for facilitating students' learning on teaching practice in the areas of lesson planning, teaching skills and reflective thinking. Data from the questionnaire and interviews show that the process assisted students to clarify the learning goals; to gather evidence and use it to inform their own practice; to think about what happened and why it happened; and to make decision on what could be done to improve teaching. Through this process, students showed better understanding of the standards and criteria and became increasingly skillful in reflecting on their teaching.

The experience of self-assessment on teaching practice also enabled students to recognize the learning that had taken place and how their thinking had changed. Students started to feel that teaching practice was not only an assessment vehicle but a very valuable learning process. Students could gain control of their own learning and built up confidence which then generated more positive feelings towards teaching practice. Although the exercise involved an extra workload, it was still highly valued and well received by the students, especially the students with prior experience in teaching practice. Students reported that they did the self-assessment in teaching practice not only for the supervisor, but also for their own improvement in teaching. They felt that their focus had shifted from a narrow concern with grades to a more holistic view involving how to plan, teach and evaluate.

This study has made preliminary exploration into the use of self-assessment in teaching practice to facilitate students' learning and yielded positive answers to the research questions. Given the learning-oriented assessment project in HKIEd continues to espouse assessment innovation in higher education, developing self-assessment in teaching practice provides the idea and practice to meet the challenge and also brings a valuable focus for future research.

Concurrent Assessment of Subject Competency and Dimensioned Self-Efficacy: A Tool for Designing Learner-Centered Interventional Curriculum and Instruction

Lyn J. Dimaano

College of Education, University of the Philippines Diliman

lyndimaano@gmail.com

keywords = motivation studies, self-efficacy, assessment, intervention programs, learner-centered curriculum

Abstract

Test scores are a traditional source of learning needs information. However, self-efficacy beliefs, those that deal with a person's perceived ability to get something done or to reach a level of attainment, are also essential contextual inputs on how such learning needs should be addressed. Even better, if such beliefs are so dimensioned as to identify their causes, then they become actionable. Combined with test scores, dimensioned self-efficacy beliefs can be used to design more effective and efficient learner-centered intervention programs.

A framework for development and use of concurrent assessment of subject competency and dimensioned self-efficacy is presented here by example. We developed and tested the new concept, dimensioning self-efficacy into configurations of previous learning experience and self-assessed state of knowledge. We then designed a 5-point self-efficacy belief scale and used it with a 50-item criterion-referenced problem-solving diagnostic test in a unified test instrument. The unified test was then administered to high ability Filipino students of high school Mathematics, first in a pilot run, and then in full scale testing.

We found that concurrent assessment of subject competency and dimensioned self-efficacy beliefs provides value-added information on actionable aspects of an individual learner's motivation that cannot be deduced from subject testing results alone. In addition, the clustering of self-efficacy information around dimensions of previous learning experience and self-assessed level state of knowledge indicated the intervention needs of each group, both among low and high performers.

As synthesis, we present a model for identifying learning needs, based on combinations of subject competency levels and dimensioned self-efficacy beliefs. With the model, we also present interventional strategies in curriculum and instruction to improve motivation and performance, and hence, arrest or prevent underachievement in individuals or homogeneous groups.

Though not necessarily a stand-alone tool, concurrent assessment of subject competency and dimensioned self-efficacy presents a unique way to measure learning needs not only in terms of performance and attitude, but also in terms of the causes of such performance and attitude. This allows the teacher to target the causes, rather than the symptoms, of underachievement, while also providing clues to needs for enrichment or acceleration, depending on the range of difficulty in test content.

Because actionable dimensions of self-efficacy can differ from one discipline to another, and from one culture to another, we recommend that our dimensioned self-efficacy scale be concept-tested first and changed or refined as necessary before being used in a different disciplinary or cultural context.

Learner Stories: Impact of Second Language Identity on Motivation

Jason Man-bo Ho

Community College of City University

Hong Kong

Abstract

Based on a study conducted with four Chinese secondary school students in Hong Kong in 1996, the researcher investigates L2 identities and their effects on L2 motivation using their learner stories, drawing insights from Dörnyei's L2 Motivational Self System and Vygotskian Sociocultural Theory (SCT). He would also suggest a model for bridging the two research fields and proposing ideas on priming L2 identities for language education.

Introduction

"The kid's English person is still very small," a former colleague once said. And this comment has become the cornerstone for me to build up this study. It made me ask: "What do L2 learners think about themselves in the learning process? What can make the 'inner English person' grow?" Questions like these stayed in my mind and formed the base for me to start my study on L2 identity in 2006, when I was a secondary teacher.

In the research tradition of second language acquisition (SLA), Dörnyei's L2 Motivational Self System and Vygotskian Sociocultural Theory (SCT) are two relatively new theories. Not many researchers have tried to combine to two in theory and L2 pedagogy. Also, not long before my study, Murphey, Chen and Chen (2004) published an article on life history of tertiary-level ESL learners in Taiwan and Japan. So, I would like to try to conduct mine with my secondary students in Hong Kong.

Before looking into to my study, let us briefly review several concepts we would use as our frameworks for reference.

Sociocultural Theory and L2 Motivation

Sociocultural Theory (SCT), inspired by Vygotsky about 80 years ago, is a theory of mind about the role social relationships and culturally constructed artefacts play in the organizing human mental thinking (Lantolf, 2004: 30-31). These artefacts are tools – either physical or psychological (the latter of which include language, numbers, arithmetic systems, music, etc) – that humans use to mediate and regulate their mind and the world around them (Lantolf, 2000; Penuel and Wertsch, 1995). In short, language is one of the tools that mediate the mind.

Activity Theory (AT) is the second generation of SCT, crystallized by A. N. Leontiev, another Russian psychologist. Activity Theory refers to the theory about 'doing something that is motivated either by a need – biological, or culturally constructed' (like the need to be able to read and write). The need then becomes a motive, which is only realized in goal-directed action (Lantolf, 2000; see also Block, 2003: 101-102). The sequence of the operationalization of an activity system is:

Figure 1

Sequence from mental functioning to operationalization

(Block, 2003, p.102; and Lantolf, 2000, p.8)

$$\textbf{need} \rightarrow \textbf{motive} \rightarrow \textbf{goal} \rightarrow \textbf{action}$$

We will come back to this sequence of operationalization in the analysis of the learner stories in the study.

L2 Motivation

Since the 1970s, Gardner and his associates' research on L2 motivation has been the 'most extensive research' related to the role of attitudes and motivation (Ellis, 1985: 117). Up to the mid-1990s, L2 motivation was defined as 'the combination of effort plus desire to achieve the goal of learning the language plus favourite attitudes toward learning the language' (Gardner, 1985: 10).

The 1990s, however, saw the so-called 'motivational renaissance' (Gardner and Tremblay, 1994) when some researchers revisit the construct (Crookes and Schmidt, 1991; Oxford and Shearin, 1994, 1996; Williams and Burden, 1997; Dörnyei 1990, 2000, 2001a, 2001b, 2001c, 2002, 2003, 2005).

One of the recent developments in the field is Dörnyei's (2005, 2009) L2 Motivational Self System. It is a rather new framework (with only one large-scale research ever conducted by Csizér and Dörnyei in Hungary (2005a)), comprising three dimensions: a. Ideal L2 Self (L2-specific facet of one's ideal self); b. Ought-to L2 Self (attributes that one believes one ought to possess); c. L2 Learning Experience (situation-specific motives related to the immediate learning environment and experience).

Csizér and Dörnyei (2005b) also called for future research on the 'self' concept. In this study, we would ask several questions related to this self concept: 1. how the effects of the ideal and ought selves differ; 2. how the desire to reduce the discrepancy between the actual and idea self is translated into action; 3. how can we promote or "prime" the ideal L2 self.

L2 Identity and Personal Narratives

'Identity' is the sense of who a person is with reference to 'how the person understands his or her relationship to the world, how that relationship is constructed across time and space, and how the person understands possibilities for the future' in the person's sociocultural context (adapted from Norton, 2000: 5). L2 identity, then, in this study, refers to that person in his/her second language.

Murphey et al (2004) and Pavlenko and Lantolf (2000) used personal narrative in their researches on investigating L2 identities. The rationale for using self narrative was to bring the learners' past events into the present and projects present to future (Pavlenko and Lantolf, 2000: 171), and to let participants reflect on their self-identity as a language learner in terms of their biography (Giddens, 1991: 244). This research will follow the same tradition of using personal narratives for investigation, just as what other researchers did (Block, 2003: 131-133).

Murphey et al. (2004) used the learners' L2 learning stories as a mediational means to allow their learners in Taiwan and Japan to clarify and construct their L2 identities. The participants constructed their learning stories with events, desires, decisions, strategies, beliefs, actions, perceptions, involving trajectories and patterns of investment and de-investment. The function of using L2 learning stories is to raise metacognitive awareness so that learners can reflect on the above forces and become aware of their part in making their histories. They suggested that the class, as an activity system, would become more student-centred by putting the participants (that is, the students), their stories, their identities and their development, as their subject matter (p.83). They conducted their research by asking undergraduates in Taiwan and Japan to write about their L2 learning experiences. Besides their discovery concerning imagined communities (not the topic this research focuses on), these first-person narratives of language learners revealed the 'roller coaster' kind of development of the participants' L2 motivation, the impact of friends and near peer role modelling, and L2 learners' identities as successful L2 users.

Pavlenko and Lantolf (2000) also used first-person narratives -- the autobiographies of late/adult bilingual writers -- to investigate the participation issue and identity construction. They showed that L2 learners' participation in language learning implies struggling in the reconstruction of selves, or what they termed 'self-translation', entailing the phase of loss of one's L1 identity and the phase of recovery and (re)construction (pp.162-163).

The Study

Research Questions

In this study, I would like to find out:

1. What self identities did/does the ESL learners form in their L2 learning process?

2. What effects do self identities have on L2 motivation?

3. What is the impact of this L2 'identities' research on connecting motivation research with Sociocultural Theory (SCT) /Activity Theory (AT)?

Methodology

This is a qualitative research since it aims at exploring the dynamic nature of motivation and concerns about how learners think about themselves (identity) in their L2 learning process and how their thinking affect their L2 motivation (Ushioda, 1998; Dörnyei 2001c).

This study combines both life story and life history techniques (Miller, 2005; Nunan, 2004; Benson and Nunan, 2004; Richards, 2003). Basically, the participants first told the story of their own life. Then, the researcher used interviews – individually and in group – to help construct their life history in second language learning. The data were triangulated (Block, 2000; Richards, 2003: 22), using a variety of sources -- including participants' memoirs of their life stories, individual and group interviews, supplemented by phone conversation when necessary – for data collection.

The use of autobiographical source has also been used by sociocultural theorists for understanding research subjects in their historico-sociocultural contexts (Pavlenko, 1999; Cameron, 2000; Pavlenko and Lantolf, 2000; Lantolf and Genung, 2002; Lim, 2002; Murphey et al, 2004)

Participants

Susan, Cherry, Jane and David (names changed for privacy reasons) – were chosen from a F.6 class I taught in 2006 because their stories were interesting for discussion for this research and the students displayed a working knowledge in spoken English for interviews.

Learner Stories

The Story of Cherry

Cherry is a Hong Kong-born girl who entered kindergarten at the age of 3 and, like every most local children, started her first English lessons by learning ABC. There are two major experiences in Cherry's learning history. In Primary 5, she once got the highest score in the final, year-end English examination. This proved to be of great encouragement to Cherry.

Another thing that affected Cherry in her learning is her falling love with the pop song, "Lemon Tree" in Form 4. Cherry started listening to English songs since then.

In Form 6, she once joined a school-organized study tour to Singapore. Cherry also likes eavesdropping on English-speaking foreigners on MTR (the underground transit system in Hong Kong). Although she may not understand what is being said, she finds their accent interesting. She also looks for chances to speak English with her aunt since she thinks her aunt's English is really good.

Cherry's goal is to become a news anchor. She admires people with good linguistic skills, especially reporters. She thinks speaking English is a global trend.

However, Cherry was experiencing frustration at the moment of the study. She felt that she and her classmates were all learning English just to pass public examination. She was eager to re-gain the enjoyment of learning English. 'I really love English…It's my interest, my interest,' she said.

The Story of Jane

Jane had a background similar to Cherry at primary and secondary education. There are three special occasions in Jane's life in which she could have close contact with English speakers. The first of them occurred in Form 3 summer. She joined a programme called Summerbridge. It was the same event in which another participant in this research, Susan, also took part in. Summerbridge created an English-speaking environment for local students to speak English all day.

The following summer – Form 4 summer – Jane and Susan, encouraged by their Religious Studies teacher, joined a week-long multinational camp organized by a church group. Jane had a lot of chances to speak English with fellow worshippers from different countries who came to Hong Kong that summer.

Another special period to Jane took place in 2005 summer, after she finished her Form 5 study and taking the HKCEE. She joined a study trip organized to the UK. She thought her English was not good. So, she was afraid the host family would laugh at her. However, it turned out that the family were very patient to her. After the trip, her self-confidence in speaking English improved.

In summer, Jane would cousins come to Hong Kong. She would take this chance to talk to them in English and listen to her cousins' conversation.

The Story of Susan

Susan started to learn English at around 4 years old when she entered the kindergarten. She was educated in Chinese-medium primary and secondary schools, in which all school subjects other than English were taught in her mother tongue, Chinese.

She remembers that she learnt English through games and contests. In her primary years, she basically followed the teacher's instructions in the English lesson: reading storybooks.

There are two memorable experiences in which she had a lot of chances to use English with other people. The first one took place in her Form 2 and Form 3 summer holidays. Susan, like Jane – her schoolmate in Form 1-5 and then her Form 6 classmate – joined a weeks-long English-speaking summer programme, Summerbridge. She had a lot of chances to be involved in English activities organized by local and foreign English speakers from different countries.

Another critical experience took place in Susan's Form 4 summer. Her teacher encouraged her to join a camp organized by a church group that lasted several days. In the camp, she could talk to people in English.

In Form 6, Susan volunteered to join the English Club. She thought English was important as a school subject and for her career development in the future. She also claimed English was crucial for meeting foreigners and learning about foreign countries. Susan likes to learn from the newspaper. She believes that the newspaper can help her with grammar vocabulary. She read less newspaper in Form 6 now, so she felt she was not as motivated as before.

The Story of David

David is an ethnic Chinese born in Venezuela. His family returned to Hong Kong when he was about nine (in about mid-1990s).

David's mother tongue is Spanish. A speaker of Spanish with only a year of exposure to English (the second language he encountered in his life), David faced a lot of difficulties when he first arrived in Hong Kong when he was about 8 years old.

David, like other participants in this study, claimed following teachers' instructions in English lessons was his main way to learn English in primary and junior secondary periods. However, after a Form 6 schoolmate told the then Form 2 David that he should read more storybooks, he made up his mind and started reading one storybook per week and his reading habit last for about a year or more.

At the moment of the study, David enjoyed learning from the TIME magazine. He found the magazine, which was accompanied by an audio CD with English conversations based on the magazine articles, helpful to him for picking up vocabulary. David's sisters speak English and Spanish at home. He thought such a language environment at home would lead to success in language learning. He enjoyed learning, for he thought he did it for himself, not anybody else.

Group interview: language and transformation of identity

I tried to address three main questions in the group interview. **(Q1) "What kind of person you think you have to be or need to be, in order to become a good English speaker?"** Both Jane and Susan wanted to attain the 'native speaker' level. They explained later in the interview that they both like western culture. Susan said she likes the western lifestyle. Jane likes the French people because they were laid back and different from Hong Kong people. Interestingly, both Jane and Susan said they wanted to marry a foreigner. Susan got this idea since she was in Form 2, when she began looking for male friends on the Internet.

Cherry and David's dreams were, however, more career-oriented. Cherry wished she could be an English news anchor/reporter since a news reporter is good in language; David wanted to be a translator or a multilingual businessman -- able to speak Spanish, English and Chinese.

The next question was: **(Q2) "What helps you to achieve your goal?"** David said he would work hard in study; Cherry, watching English TV programmes; Susan, setting personal goals for herself in her study plans and school tests and speaking with her sister; Jane also mentioned watching English TV programmes and talking to herself in mirror.

The last question was: **(Q3) "When you speak English, do you feel different?"** All participants agreed. David found it unnatural to speak English. Cherry claimed she was a more serious person because she had to think hard to choose the right words and she could not make jokes in English. Susan said she could not express herself well in English.

Probably the more interesting answer was from Jane. She pointed out that speaking English could make her a different person, a more confident and mature person. David remarked that in Hong Kong, if one speaks English, it shows that he is a more intelligent person. Both Jane and David said at the

end of the interview that English could make them proud of themselves.

The learner stories and histories in the participants' life are represented in Figure 2. There are moments in the participants' life that critical experiences (abbreviated at CriEx for analysis, as seen in Figure 2) took place in their L2 learning history. These experiences, it is found in this research, have effects on the past, present and future L2 identities ("L2 Id").

Figure 2 Timeline of the participants' life histories and L2 identities (extracted from data of the life histories based on Appendices 1 to 3)

Participants / Stage	**Cherry**	**Jane**	**Susan**	**David**
Primary Stage (about 6-11 years old)	P.1-4 ---------------- - L2 Id: not obvious P.5 - CriEx -- highest mark ------------- **- L2 Id: successful English learner**	P.1-6 ---------------- **- L2 Id: not obvious**	P.1-6 ---------------- **- L2 Id: not obvious**	Before 9 years old ------------------ **- L2 Id: not obvious [since he spoken Spanish as his 1st language]** 9 years old - CriEx -- immigrated to Hong Kong -------------------- **- L2 Id: struggler /survivor**
Secondary Stage (About 12-17 years old)	F.4 - CriEx: Listening to "Lemon Tree", the first English pop song she loves ---------------- **- L2 Id: a popular culture consumer**	F.2-3 - CriEx: Summerbridge F.4 - CriEx: Church activity; F.5 summer - CriEx: UK trip ------------------ **- L2 Id: a brave L2 speaker**	F.2-3 - CriEx: Summerbridge F.4 - CriEx: Church activity ----------------- **- L2 Id: a brave L2 speaker**	F.2-3 - CriEx: Storybooks ------------------ **- L2 Id: an English story explorer**
Present (17-19 years old)	F.6 Frustrated at learning English at the moment is to pass AL exam. ------------------	F.6 ------------------ **- L2 Id: a 'larva' eager to assume to a different identity by using**	F.6 ------------------ **- L2 Id: Incompetent L2 learners**	F.6 feeling that it is hard to see his improvement in English ------------------

	- L2 Id: A 'serious' identity; Unnatural L2 speaker	L2		- L2 Id: Unnatural L2 self
Future	After AL*/ university: **- L2 Id: News reporter/anchor**	After AL/ university: **- L2 Id: Native-level speaker; an English speaking wife**	After AL/ university: **- L2 Id: Native-level speaker; an English speaking wife**	After AL/ university: **- L2 Id: translator/ multilingual businessman**

*Advanced Level (AL) examination is a public exam for secondary students; AL results are important for university entrance.

The life stories of all participants showed no obvious trait of an L2 identity formed at the start of their early primary stage. However, for Cherry and David, new identities were formed later in their primary stage. **Cherry** once got the highest mark in her final P.5 English examination. This experience significantly boosted her self-confidence in English. Her self image as a successful L2 learner has since been a strong motivational force to keep up in English.

David had a very different story. Spanish was his first language. He had only one year of English exposure in Venezuela before coming to Hong Kong at the age of 9. In Hong Kong, he had to learn English and Chinese in order to survive in the school and the society. Chronologically speaking, the second language he learnt is English. However, after immersed in this Chinese-dominant environment after about a year or so, he managed to speak English and Chinese, the latter of which has now become the language he feels more comfortable with. Looking back on his arrival in Hong Kong, David feels the most difficult thing he endured was the isolation caused by his inability to speak English and Chinese when he first came to Hong Kong. The struggler/survivor identity, as the researcher interpreted the 'self' David had when he came to the territory, motivated him to learn English and Chinese.

As for **Jane** and **Susan**, their individual L2 identity was not developed until they took part in the Summerbridge programme in F.2 and F.3 and the church gathering in F.5. The programme created a 'safe' English-speaking environment. The programme and the church gathering allowed Jane and Susan to interact with local English learners and foreign English speakers in real-life settings. They were the critical experiences that helped the two secondary schoolgirls to become brave English speakers, a new L2 identity they could not have assumed elsewhere. Jane's UK trip made her even a bolder speaker. After the trip, she started to like to communicate with foreigners in real-life situations.

Despite the frustration some of the participants had, all of them had their goals as to what ideal selves they would like to have in the future. These goals motivated the participants to take actions.

Cherry, who wanted to become a news reporter/anchor, enjoys exploring foreign cultures. She joined the study tour organized by the school to Singapore and she also joined her family to Thailand. She also liked reading English newspaper (Appendix 2.3, Line 132) and eavesdropping on MTR, a trait that a reporter would have.

Jane and Susan, who wanted to become native-level speakers, like foreign cultures. Jane made use of the chances she has for speaking English with her cousins from USA during summer holidays. Susan read newspapers, worked hard in exam preparation and engaged in English activities in school.

David, wishing to become a translator or multilingual businessman, cherished his family environment in which he can talk to his sisters in three languages: Spanish, English and Chinese.

From their non-obvious L2 self identity to their ideal selves that ranged from an English news reporter to a multilingual businessman, the participants have displayed transformation of their identity in their life history. From the time they did not know what/why they studied to the late second stage when they found their ways to learn English, we can see their shift from teacher-dependence to learner-centredness, from relying on what the teachers assigned in class to choosing their favorite pop songs, movies, newspaper, magazines, etc. A similar direction has also been documented by Lim in her autobiography: from learning in a formal learning environment; to an informal/self-instructional one, and finally to natural one (Lim, 2002; Benson, Chik & Lim, 2003).

Discussion

Shifting identity

Research Question 1: "What the self identities did/does the ESL learners form in their L2 learning process?"

Identities are most obviously seen being (re)constructed when critical experiences take place in one's life. For example, Cherry saw herself as a Form 4 student but also a popular culture consumer. She did not discover her interest in English pop songs until she first listened to "Lemon Tree". Her existing identity as a successful English learner since Primary 5 was destabilized by this critical 'Lemon Tree' experience. To reach an equilibrium, she constructed a new L2 identity – the popular culture consumer identity. This L2 identity continues in her life and motivates her to keep learning English from this aspect of cultural life.

As seen from last section (Figure 2), in terms of identity development, we can see the gradual tendency from a non-existent L2 identity from the participants' early primary stage to a goal-oriented identity they project into their future. In short, we may say they change from a teacher-centred learners (who had no autonomy to determine what, when and how to learn) to a self-centred person who decides what kind of person they would like to be.

Dynamic motivation

Research Question 2 "What effects do self identities have on L2 motivation?"

The learners' critical experiences shaped and transformed their goals and their identities. Goals become the driving force of what a person would become. For example, David's goal to become a multilingual speaker motivated him to communicate with his sisters in three languages at home. Cherry's goal to become a news reporter motivated her to read newspapers and eavesdrop on foreigners on MTR.

However, some goals are demotivating. For example, both Cherry and Susan lamented in individual and group interviews that they are not very happy with themselves because, for the moment, passing the AL exam has become their goal of learning English, which they regard as shallow.

Such dynamic conflicting motivation in L2 learning echoes Dörnyei's (2000) claim that motivation should not be merely viewed as a *stable* construct, rather it is a *dynamic* construct that evolves gradually in the course of time.

Impact of this Study on connecting Motivation Research with SCT/AT

Research Question 3: "What is the impact of this L2 identities research on connecting motivation research with Sociocultural Theory (SCT) /Activity Theory (AT)?"

The life stories here show that when the learners see their **needs** to become their future self/identity (e.g. Cherry wants to become a news reporter/anchor). So, they set their short-term/long-term **goals**, i.e. to pass the AL English exam and get into university. As a result, they have a **motive** to study hard in Forms 6 and 7 despite the pressure and difficulty they face at present. They take **action** by making study plans (for example, Susan set targets for doing past exam papers), practise speaking with relatives, reading newspapers, etc.

Combining Dörnyei's L2 Motivational Self System and the Vygotskian Sociocultural Theory, I would propose a new model for understanding the role L2 identity plays in activity system regarding L2 learning as below:

Figure 4 New model combining Dörnyei's L2 Motivational Self System and the operationalisation of activity system

need → motive → goal → action   *Activity Theory*

Actual Self

L2 Identity: Ideal L2 Self
/Ought-to L2 Self

Actu

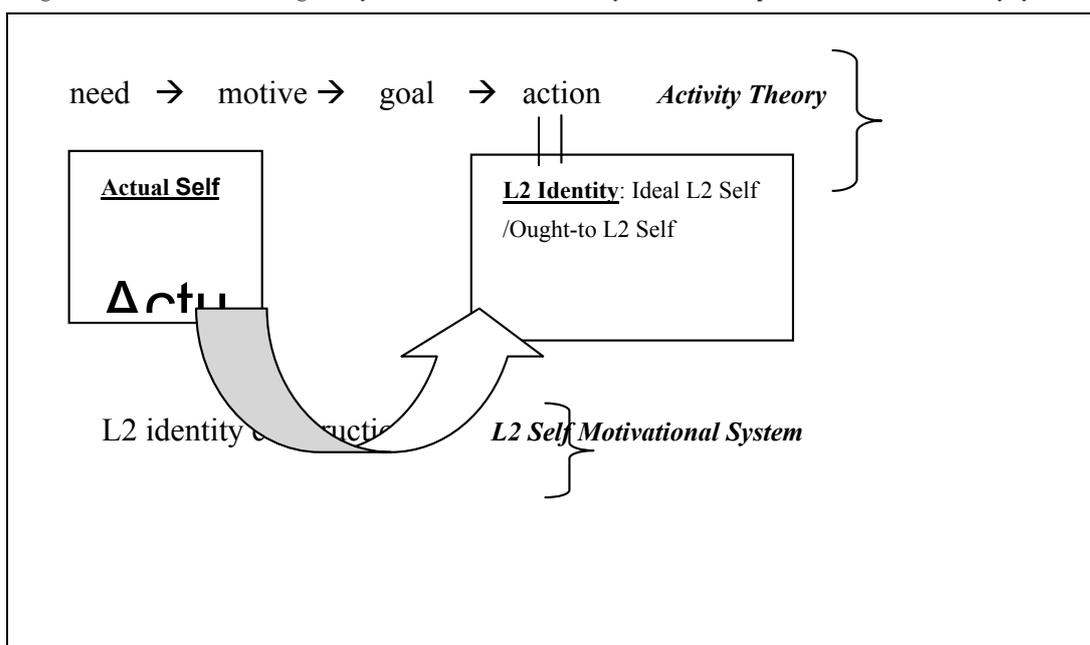
L2 identity c…uctio…   *L2 Self Motivational System*


Figure 3   Relationship between identity construction and activity system

* 'Ideal L2 Self' represents the L2 self identity with attributes that the person would like to possess, such as hopes, aspirations and desires; 'Ought-to Self', the L2 self identity with attributes that the person believes they ought to possess, such as sense of duty, obligations, responsibilities, etc. (Dörnyei, 2005)

When a learner sees that there is a need to attain his/her goal. To reduce the discrepancies between his/her actual self to his ideal L2 self, the person generates the motive necessary for attaining the goal (i.e. to become the ideal L2 self). The motive is then operationalized through the action.

Implications and further research

Cultivating positive L2 identities:

Teachers may include designing tasks that introduce these identities to the students, encouraging L2 learners to develop these positive identities (some teachers may hesitate using pop songs in language classroom) and explaining there is nothing wrong with being 'smart and bright' in L2 (some students may fear that their peers regard them as showing off their English in the class). However, in terms of pedagogy, how would we present an ideal 'English-speaking' future identity to the learners? Would a local successful L2 learner be a role model for learners to follow? Or, would a multilingual, multicultural World Citizen image be more appropriate? How much international posture, as Yashima has recently in her study (2009), should be introduced into a language classroom?

Creating critical experiences:

The stories of the participants show that participation in L2 community -- be it specifically formed (made up by gathering local L2 speakers together, like the Summerbridge programme) or created by putting the learners in the L2 community (like the situation the Spanish-speaking David was in when he moved to Hong Kong with his family, or the home stay experience Jane had in the UK in a summer) – could bring about a 'profound struggle to reconstruct a self' (Pavlenko and Lantolf, 2000: 174). Given a conducive environment or learning context, the learner may be triggered -- see the need to become the Future Self, and be motivated to set goals, and finally taking action. Would a local learning context be enough for providing rich learning experiences to the learners? Or would a taste in global English-speaking culture – through a song, a movie, a study tour, or a camp – be good stimulus for triggering a learner's interest?

Setting goals

As goal setting is important for concrete action to take place, questions arise. Are educational institutions like schools setting collective goals (like what some tutorial schools are doing by claiming they can help their 'customers' to get an A in public exams – presenting them the "'A's harvester" image as their L2 identity)? Should goals be set individually? Are the present education system and institutions putting passing public examination as the goal for all learners, regardless of their personal preferences and goals (if the learners are aware of them)? Are we allowing learner autonomy in goal setting? A recently published research by T.-Y. Kim (2009) used a complex model of AT in his analysis of two Korean student's goals and their L2 motivation. Perhaps the goal factor discovered in this study could be incorporated with Kim's for expanding Engeström's (1999) AT framework.

Conclusion

This study has attempted to apply insights from Dörnyei's L2 Motivational Self System and Vygotskian Sociocultural Theory (SCT). The researcher has found from the learner stories that when learners perceive a need to reduce the discrepancy between their Actual Self and their Future Self, the learner forms the motive to learn by setting goals, with would materialise in the learning action. Since individual sociocultural factors differ in different learning environments, the L2 identities the learners form differ, whic may imply differences in their L2 motivation and their actual investments in L2 learning.

It is hoped that in this attempt to answer the questions on L2 identity and motivation can trigger more intensive research efforts and contribute to the building of a unified second language learning theory.

Appendix   **Guiding questions for language learning story**

1. How did you learn English in primary, secondary, and/or post-secondary schools?
2. What positive and negative experiences did you have and what did you learn from them?
3. What were/are you expecting in the last/present English course/programme?
4. Have you changed your ways of language learning in the course of time?
5. What are the things that you found especially helpful in learning English?
6. What are the areas that you still want to improve in?
7. How do you think your next three years will be in terms of course/program/learning tools you may take or use?
8. What are your language learning plans and goals after taking/using the present/next course/program/study tools?
9. What advice would you give to those interested in taking the course/program or in using the study tools?

A Study on the Relationships between EFL College Students' Perceptions of British/American Culture Learning and the Changes of English Learning Motivation

Chang, Weiyu

Graduate Student

Department of Applied English

I-Shou University, Taiwan

s933952@ocu.edu.tw

ABSTRACT

The purpose of this study was to investigate the relationships between EFL college students' British/American culture learning and English learning motivation. The findings in the present study echoed some of the results in the earlier research and refuted some others'.

For the quantitative results, the subjects' negative attitudes toward learning English increased in the experimental group, and the participants' positive attitudes toward learning English had a correlation between the British/American culture learning and English learning motivation in the control group. Nevertheless, the qualitative outcomes interestingly evidenced positive effects between British/American culture learning and English learning motivation in EFL classrooms.

Keywords: EFL, British/American culture teaching, British/American culture learning, British/American culture perceptions, learning motivation

1. INTRODUCTION

Many researchers have proposed that language and culture are indivisible (Brown, 2000; Cortazzi & Jin, 1999; Masuduzzaman, 2007; Schulz, 2007; Wang, 2006), so we are unlikely to discuss the effects of language instruction without taking cultural backgrounds and knowledge into consideration.

In addition, Brown (2000) indicated that misunderstanding may occur when interlocutors are from different cultural backgrounds. In Tsai's (2002) study, it also revealed that miscommunication may take place not only because different languages are spoken but also different cultures are involved. Thus, even an advanced second language (L2) speaker may misunderstand or misconstrue the messages because of the lack of others' culture knowledge (Yo, 2007). Moreover, lots of English products such as movies, pop music, and TV/radio programs are released in Taiwan due to the prevalence of mass media, so there are more and more opportunities for people to be exposed to foreign cultures (Chuang, 2002).

Consequently, L2 learning cannot be isolated; however, as language instructors, we need to pay more attentions to look after every L2 learners, especially when there is a new language student starting to learn a L2. In other words, we have to not only put our instructional emphases on how to improve students' language skills such as listening, speaking, reading, and writing but also instruct them in the background knowledge and culture of that language.

1.1 Research Questions

1. Do EFL college students have a significant change on the British/American culture understanding before and after the treatments?

2. Do EFL college students have a significant change on the English learning motivation before and after the treatments?

3. What are the correlations between EFL college students' British/American culture learning and English learning motivation?

4. What are EFL college students' perceptions toward the British/American culture learning as well as their English learning motivation?

2. LITERATURE REVIEW

2.1 What is Culture?

"Culture is a way of life" (Brown, 2000, p.176), so everyone is cultivated and influenced by one's own culture. Li (1989) mentioned "culture may mean different things to different people" (p. 7) so that everyone has his/her own interpretation about the term of culture.

Brown (2000) explained that culture can be defined as ideas, customs, skills, arts, and tools that belong to a particular group of people in a particular period of time; as a result, it reveals how people communicate and contact others in their daily life. Chou (1997) also proposed that each group of people has its own cultural characteristics. The foundations of a culture include ancestors' wisdoms, ethical thoughts, religious beliefs, political systems, historical mythos and so forth.

Therefore, the notion of culture does not only refer to the past experiences, properties or thoughts in one's society but also comprise lots of tangible and intangible assets as well as the objects and concepts in the present period of time.

2.2 The Relationships between Language and Culture in EFL Classrooms

Thanasoulas (2008) presented that "language does not exist apart from culture" (para. 5), so learning a new language, to some extent, also refers to learning new worldviews (Klein & Cohen, n.d.).

Brown (2000) explained that culture learning is a process of learning a language and of perceiving the other's thinking, feeling and acting. Learning a L2 is also a creation of second identity and this newborn identity is a pivot in cultural learning. He further mentioned that language and culture cannot be divided into two parts because they are closely related to each other; in other words, a language is one part of a culture, and a culture is one part of a language. In light of Brown's interpretation, a L2 acquisition is also a second culture acquisition which is supported by Wang's (2006) points of view. Wang stated that foreign language learning is a kind of foreign culture learning. Thus, Masuduzzaman (2007) indicated that "language teaching is culture teaching" (para. 7).

As what have been discussed so far, language, obviously, is an important component in a culture (Chou, 1997; Jiang, 2000). Leveridge (2008) described a language as one of the branches of a culture in terms of their relationships. Language is a vehicle to deliver cultural knowledge and property generation by generation.

Besides, Cortazzi and Jin (1999) mentioned that the objectives of foreign language learning are for the purposes of academic expectation as well as for the intention of communication which are strongly agreed by many experts and scholars. However, real communication does not implement without contextual involvements, but culture is one part of the contexts; in short, communication implicates culture understanding, and the knowledge of a language can be enriched via cultural realization (Leveridge, 2008). All in all, language learning and culture learning are inseparable and important in EFL classrooms.

2.3 The Relationships between Culture and Motivation in EFL Classrooms

Dörnyei and Csizér (2005) presented that culture learning is also an important issue in L2 classrooms because one of the purposes of L2 learning is to interact with others, and the L2 skills are vehicles to contact people in a community. By learning the target culture, individual's language skills can be developed, and one's L2 learning motivation and behaviors can be shaped and upgraded as well. In addition, Wang (2006) illustrated that teachers have to deliver the knowledge of customs, thoughts, and styles of the target language in classrooms in order to raise and strengthen students' L2 learning motivation. Contrarily, learners' negative attitudes toward the target culture or the value of L2 learning may reduce their L2 learning motivation and behaviors (Oxford & Ehrman, 1993). Therefore, the relationships between culture and motivation are intricately interwoven in L2 education.

2.4 What is Motivation?

"Motivation is a complex concept" (Gardner, 2001, p. 8); similarly, Oxford and Ehrman (1993) defined that "motivation is a complex, multifaceted phenomenon that is integral to L2 success" (p.192). Dörnyei (2001) also mentioned that motivation involves one's learning desires, efforts, and attitudes. In short, one's motivation is related to goals one sets, efforts one devotes, desires one has toward objectives, and attitudes one has toward objectives (Gardner, 1985).

2.5 The Role of Motivation in EFL Classrooms

Motivation is an important determinant in L2 classrooms (Hernández, 2006), which is one of the key elements to determine one's success on L2 learning (Brown, 2000; Cheng & Dörnyei, 2007). Learners who have higher motivation may have higher L2 achievements, no matter what their language aptitude is (Cheng & Dörnyei; Chen, Warden, & Chang, 2005). As a result, Cheng and Dörnyei reported that without sufficient learning motivation, even an intelligent student may not insist on a long journey in L2 learning. On the other hand, one's deficiencies in language learning aptitude and condition can be compensated by one's high learning motivation (Dörnyei, 1998).

Considered as one of the most important elements in EFL classrooms, motivation determines one's success or failure in L2 accomplishments, since it supplies stimuli and supports during learners' long and tedious learning process (Dörnyei & Csizér, 1998). Similarly, due to the differences of learning methods and personal traits, motivation can influence one's success or failure in L2 learning (Huang, 2007). Consequently, learning motivation plays a crucial role during students' language learning process.

3. METHODOLOGY

3.1 Subjects

There were 58 students whose majors were Applied English in a university in Kaohsiung County, Taiwan participated in the present study. They took English Listening and Communication Skills as the required course in spring of 2009 academic year. For the control group, a total of 29 subjects including 11 males and 18 females, aged 18 to 25, participated in the present study. As for the experimental group, a total of 29 subjects including 5 males and 24 females, aged 18 to 21, took part in the current study. All of the participants have learned English for at least 7 years.

3.2 Materials

Way Ahead: A listening and speaking course written by Nicholas Sampson and issued by Macmillan Publishers in 1999 was mostly adopted as the teaching and learning material in the courses. However, for the control group, traditional teaching methods were used during the process. The British/American culture inputs were given and some extra related multimedia video clips collected from the YouTube website were utilized in the experimental group as well.

3.3 Instruments

The research instruments used in the present study included the test for EFL college students' British/American culture understanding, the questionnaire for EFL college students' English learning motivation, and the technique of the interview.

The test for EFL college students' British/American culture understanding was developed based on the adopted materials to evaluate the subjects' British/American culture understanding. Furthermore, in order for assessing EFL college students' English learning motivation, the questionnaire for EFL college students' English learning motivation, including 63 4-point Likert-scale questions and 1 open-ended question, was devised based on Gardner's Attitude/Motivation Test Battery (AMTB) (Gardner, 1985).

Additionally, 10 interviewees were randomly selected from the two groups in the present study, which means 5 interviewees were respectively recruited from the two classes. The questions of the interview were yielded according to the adopted questionnaire and related literature.

3.4 Procedures

All the participants in both two groups were asked to complete the test for EFL college students' British/American culture understanding and the questionnaire for EFL college students' English learning motivation in the pre-test. They also received the 6-week program during the treatment phase and filled out the two documents which were the same as the instruments used in the pre-test in the post-test phase. After conducting the post test, the researcher randomly selected 10 students as the interviewees to participate in the semi-structured interviews in order to collect in-depth information. In order to gather genuine ideas and opinions, the interviewees' native language, Chinese, was implemented during the process.

3.5 Data Analysis

SPSS for windows 12.0, a well-known statistical tool, was used to compute the data to yield a set of quantitative results. In order to examine the intra-group differences before and after the treatments between the two groups, the Paired-sample t-test was conducted to analyze the data collected from the test for EFL college students' British/American culture understanding and the questionnaire for EFL college students' English learning motivation. According to McMillan and Schumacher (2006), Paired-sample t-test is usually employed in the research of the same group of participants tested in a pre-test and post-test; thus, it was appropriate to apply in the research of this kind.

The Pearson Correlation was also used to analyze the relationships between EFL college students' British/American culture learning and English learning motivation. According to Dörnyei (2007), the purposes of correlation are to investigate the differences and relationships between variables and to measure the strength and direction of the relationships between variables. Similarly, Huang (2006) noted that when a research aims at looking into the relationships between variables, the Pearson Correlation is appropriate to be utilized.

In addition, those responses collected from the interviews were translated and analyzed by the researcher and were used to explain the quantitative results in depth.

4. RESULTS

4.1 Results of Research Question 1

Table 1.

Paired-sample t-test of British/American Culture Understanding

	Control	Experimental
t	-2.85	-8.84
df	28	28
Sig. (2-tailed)	.008*	.000*

*Note: * p < .05*

As demonstrated in Table 1, the result indicates that there were statistically significant differences between the two groups in terms of the subjects' British/American culture understanding. For the control group, the statistic shows that $p = .008 < \alpha = .05$ which means there was a significant difference between the pre-test and post-test. Also, the result presents that $p = .000 < \alpha = .05$ which signifies there was a significant difference between the pre-test and the post-test in the experimental group as well.

4.2 Results of Research Question 2

Table 2.

Paired-sample t-test of English Learning Motivation

	df	28	28	28	28	28	28	28	28	28	28	28	28
	Sig. (2-tailed)	.839	.707	.009*	.281	.887	.058	.428	.551	.896	.959	.576	1.000

*Note: * p < .05*

I. = Interest in foreign languages, II. = Positive attitudes toward learning English, III. = Negative attitudes toward learning English, IV. = Integrative orientation, V. = Instrumental orientation, VI. = English class anxiety, VII. = Parental encouragement, VIII. = Motivational intensity, IX. = Desire to learn English, X. = Instructions (English teacher evaluation), XI. = Instructions (English course evaluation), XII. = Orientation index

As shown in Table 2, the result reports that there was no statistically significant difference in the control group in terms of the subjects' English learning motivation between the pre-test and post-test.

As for the outcomes in the experimental group, no statistically significant difference was found between the pre-test and the post-test in terms of the subjects' English learning motivation except for the category III ($p = .009 < \alpha = .05$).

4.3 Results of Research Question 3
Table 3.
Pearson Correlation of British/American Culture Learning and English Learning Motivation in the Control Group

English Learning Motivation	Pearson Correlation	Sig. (2-tailed)	N.
I.	-.003	.863	29
II.	.376	.045*	29
III.	-.075	.701	29
IV.	.003	.987	29
V.	-.265	.164	29
VI.	-.166	.390	29
VII.	.191	.321	29
VIII.	.277	.146	29
IX.	-.034	.861	29
X.	.083	.667	29
XI.	.157	.416	29
XII.	.025	.899	29

*Note: * p < .05*

I. = Interest in foreign languages, II. = Positive attitudes toward learning English, III. = Negative attitudes toward learning English, IV. = Integrative orientation, V. = Instrumental orientation, VI. = English class anxiety, VII. = Parental encouragement, VIII. = Motivational intensity, IX. = Desire to learn English, X. = Instructions (English teacher evaluation), XI. = Instructions (English course evaluation), XII. = Orientation index

As can be seen in Table 3, it explains the relationships between EFL college students' British/American culture learning and English learning motivation in the control group. As shown in Table 3, the result points out that only the category II has a statistically significant difference ($p = .045 < \alpha = .05$) in terms of its correlation with the British/American culture learning among the subjects after the 6-week experiment.

Table 4.
Pearson Correlation of British/American Culture Learning and English Learning Motivation in the Experimental Group

English Learning Motivation	Pearson Correlation	Sig. (2-tailed)	N.
I.	-.110	.570	29
II.	-.239	.211	29
III.	.043	.824	29

IV.	-.093	.633	29

VII.	.000	1.000	29
VIII.	-.114	.555	29
IX.	.025	.898	29
X.	-.355	.059	29
XI.	-.273	.152	29
XII.	-.121	.533	29

*Note: * $p < .05$*

I. = Interest in foreign languages, II. = Positive attitudes toward learning English, III. = Negative attitudes toward learning English, IV. = Integrative orientation, V. = Instrumental orientation, VI. = English class anxiety, VII. = Parental encouragement, VIII. = Motivational intensity, IX. = Desire to learn English, X. = Instructions (English teacher evaluation), XI. = Instructions (English course evaluation), XII. = Orientation index

As presented in Table 4, the result demonstrates the relationships between EFL college students' British/American culture learning and English learning motivation in the experimental group. The result of the Pearson Correlation reveals that no statistically significant difference was found in terms of the correlations between EFL college students' British/American culture learning and English learning motivation after the 6-week program.

4.4 Results of Research Question 4

In light of the data collected from the open-ended question and interviews, the researcher found out that most of the participants had high expectations of English learning, especially for the British/English culture learning. The reasons included: (a) they have had little experience in learning the British/American culture in EFL classrooms because most instructors focused on teaching the four skills; and (b) learning native speakers' cultures was also important to them since the target culture knowledge could widen their perspectives of the target language.

Moreover, according to their responses, EFL college students' English learning motivation could be enhanced via learning the British/American culture as curiosity toward different cultures could bring about their learning interests.

5. DISCUSSIONS

5.1 Discussions of Research Question 1

According to the results collected from the control group, the researcher discovered that since the participants' majors were English, they were actively interested in English learning. They often learned English outside of the classrooms, namely in informal learning contexts such as watching English movies or listening to English songs. As mentioned earlier, lots of English products such as movies, pop music, and TV/radio programs are released in Taiwan due to the prevalence of mass media, so there are more and more opportunities for people to be exposed to foreign cultures (Chuang, 2002). Moreover, the subjects expressed that learning the British/American culture was attractive and knowing native speakers' lifestyles and cultures was important to them, so they might also learn the British/American culture knowledge in informal learning contexts.

As for the consequences gathered from the experimental group, the result proved that teaching and

learning the British/American culture could improve college students' target culture understanding. Thus, it was witnessed that the more British/American culture knowledge is taught in EFL classrooms, the more target culture knowledge students have.

5.2 Discussions of Research Question 2
The results in the Paired-sample *t*-test collected from the control and experimental groups showed that only the category III (Negative attitudes toward learning English) had a significant difference in the experimental group. The possible reason was that teaching the British/American culture in class might make students feel like compulsory learning. In order to avoid the increase of students' negative attitudes toward learning English, the encouragements of leaning the target culture in informal learning contexts are recommended since learners may feel more comfortable and enjoyable when they are doing so. From their autonomous learning, both students' target culture awareness and English learning motivation are supposed to be developed simultaneously as their learning materials can be chosen based on their preferences and interests. As a result, EFL instructors are suggested to encourage students to learn native speakers' cultures outside of classrooms, not just learning in classrooms.

5.3 Discussions of Research Question 3
The Pearson Correlation dealt with the relationships between the subjects' British/American culture learning and English learning motivation. The results displayed that a significant difference was found in the category II (Positive attitudes toward learning English) in the control group. It was thought that the participants gained the British/American culture knowledge from their self-learning, namely informal learning contexts, so the consequences revealed an increase of positive attitudes toward English learning after the 6-week instruction. Thus, it, again, certified the arguments and explanations in the previous discussions (see 5.1 and 5.2).

Although the earlier studies reported that one's language learning motivation can be shaped and upgraded via learning the target culture in EFL learning contexts (Dörnyei & Csizér, 2005; Wang, 2006), the statistical results in the present study refuted their points of view. From the quantitative outcomes, most of the results did not correlate with each other in terms of the relationships between the British/American culture learning and English learning motivation. However, the qualitative results noted that students' English learning motivation could be enriched via learning the British/American culture because curiosity and interest inspired learners to explore different cultures.

After the data analysis, the quantitative and qualitative consequences formed a discrepancy between the British/American culture learning and English learning motivation. The reason is that one's English learning motivation involved complex elements (Gardner, 2001; Oxford & Ehrman, 1993); therefore, one's increase or decrease of English learning motivation could not be summarized simply based on the British/American culture learning. However, teaching and learning the British/American culture were not useless on facilitating students' English learning motivation; conversely, it has a certain effect to promote students' English learning motivation, but not the major determinant.

5.4 Discussions of Research Question 4
Various reasons were provided by the interviewees to explain their eagerness toward learning the target languages and cultures. One of the declarations was that the students wanted to make friends or communicate with native speakers and those tendencies revealed their real attitudes and interests toward learning foreign languages and cultures.

Moreover, Cortazzi and Jin (1999) noted that one of the objectives of language education is to cultivate students' communication skills with native speakers, so real communication can be carried out via the British/American culture learning. It is because communication implicates culture understanding, and the knowledge of a language can be enriched through cultural realization (Leveridge, 2008). More importantly, most of the interviewees mentioned that learning native speakers' lifestyles or cultures was important since some problems of miscommunication and misunderstanding could be avoided if a L2 speaker had adequate target culture knowledge. Such result echoed Brown (2000) and Tsai's (2002) findings; thus, it was evidenced that the target culture learning is important in EFL classrooms.

Although the positive effects and correlations were rare in terms of the British/American culture

learning and English learning motivation in the quantitative results, the qualitative consequences overthrew those consequences. Based on the responses collected from the interviews, most of the interviewees declared that it was interesting to learn the British/American culture which might stir up their English learning motivation because curiosity toward different cultures encouraged them to learn.

6. CONCLUSION

As mentioned by many researchers, the notion of language learning motivation is complex (Gardner, 2001; Oxford & Ehrman, 1993), so it is hard to motivate students merely based on an interesting learning topic. Learning the British/American culture does enhance EFL college students' English learning motivation; however, it is suggested to be learned via learners' self-learning. Through their autonomous learning, students have the rights to select attractive topics according to their own opinions or interests, and they can learn with less-pressure which is more helpful to develop their English learning motivation. One of the reasons is that everyone is educated by varied ways and grows up from various backgrounds (Brown, 2000), so learning methods and personal traits are different (Huang, 2007). As an English instructor, he/she is recommended to inspire students to learn the British/American culture knowledge in informal learning contexts since it is very hard to meet everyone's requirements for having an adequate learning topic and material in classrooms.

To sum up, the British/American culture teaching and learning cannot be ignored in EFL classrooms because individual's language competence can be developed and L2 learning motivation can be upgraded spontaneously and simultaneously through learning the target culture (Dörnyei & Csizér, 2005).

Effects of Achievement and Gender on Students' Foreign Language Anxiety

Ching-ya Chiu, Feng-cheng Chiang, Sheng-Tai Fan

Department of Applied English, Leader University; Institute of Education, National Cheng-Kung University; Department of Applied English, Leader University

Abstract

This study set out to investigate the effects of achievement and gender on junior high school students' foreign language anxiety. A modified "Foreign Language Classroom Anxiety Scale" questionnaire and an interview were employed, sampling 372 participants.

The major findings were as follows:

1. Low-achievers felt the most anxious and high-achievers the least.
2. Female students were more afraid of negative evaluation.
3. Various factors inducing anxiety and strategies for overcome them were found.

Key words: foreign language anxiety, English achievement, gender

Introduction

Since English is an inevitable communicative medium in modern society, people in Taiwan perceive English as an important and necessary tool in several aspects, including academic research, trading, traveling, and carrier promotion (Lin, 2005). Therefore, English proficiency is highly emphasized for students in Taiwan.

Of the factors that influence the success of English learning, affective factors, including self-esteem, motivation, learning style, and anxiety need to be considered (Brown, 2001; Oxford, 1990). Anxiety is related to painful preoccupations and concerns about obstructing events (Sarason, 1984). According to Krashen's Affective Filter Hypothesis (1982), the "affective filter" is an obstacle that influences learners' language acquisition. When the "affective filter" is reduced, learners cannot only lower their foreign language anxiety but also receive more input and have better language acquisition. When it comes to foreign language learning, learners may feel anxious in a communicative context. Horwitz, Horwitz, and Cope (1986) suggested that communicative competence may be the most threatening aspect of foreign language learning, and may pose great difficulties for the anxious student. They also classified foreign language anxiety into three perspectives, communication apprehension, test anxiety and fear of negative evaluation.

Communication apprehension has been described as an individual level of fear or anxiety associated with oral communication with others (McCroskey, 1984). Horwitz et al. (1986) also indicated that the first component of foreign language anxiety was communication apprehension. They thought it was a type of shyness, fear and anxiety abouto communicating with people. However, communication apprehension plays an important role in their conceptualization of foreign language anxiety because of its emphasis on interpersonal interactions. In a foreign language classroom, the abilities of listening and speaking are required, but anxious learners are unwilling to communicate with others and lack social interaction. Due to lack of oral communication, communication apprehension intensifies. Students who feel anxious about communication rarely communicate with others. With much avoidance, communication apprehension becomes an impediment to students mastery of a foreign language. This vicious cycle indicates that students with communication apprehension probably continue to be apprehensive (Daly, 1991; McCroskey, 1984).

In addition, test anxiety is another component of the foreign language anxiety. It could be part of social anxiety, particularly in an evaluative situation. Sarason (1984) defined text anxiety as "the tendency to view with alarm the consequences of inadequate performance in an evaluative situation"

(p. 214). Young (1992) contended that test anxiety seemed to more likely to affect foreign language learners with low levels of oral proficiency than those with high levels of proficiency. That was to say, language learners may experience more anxiety in a highly evaluative situation, because of lack of proficiency.

Horwitz et al. (1986) considered test anxiety as a type of performance anxiety stemming from fear of failure. Test-anxious students often put unrealistic demands on themselves and regarde imperfect test performance as failure, and sometimes even the brightest and most prepared students make mistakes on tests. MacIntyre and Gardner (1991) indicated that oral tests were complicated in a foreign language context because they may cause test anxiety and communication apprehension. Therefore, it was not easy for instructors to differentiate whether a student had test anxiety or communication apprehension or both.

The other component related to foreign language anxiety is fear of negative evaluation. Language learners may have a fear of others' evaluation, become distressed over their negative evaluation, and tried to avoid evaluative situations, and the expectation that others would evaluate themselves negatively (Watson and Friend, 1969. According to Horwitz et al. (1986), fear of negative evaluation is broader in scope because it is not restricted to test-taking situations, although it is similar to test anxiety. However, it may happen in any social, evaluative situation such as interviewing for a job or speaking in a foreign language class more than test-taking situation. In addition, MacIntyre and Gardner (1991) proposed that fear of negative evaluation is closely related to communication apprehension. The reason is that fear of negative evaluation may cause communication apprehension. Students may be unsure of themselves and what they were saying. Therefore, when fear of negative evaluation occurs, they fail to produce a proper expression.

In a foreign language context, students perceive negative evaluations mainly from both their teacher and peers. The negative evaluation that students feared most was the real or imagined ridicule of their peers (Horwitz et al., 1986). Aida (1994) pointed out that students with fear of negative evaluation may sit passively in the classroom, withdrawing from classroom activities that could help them to improve their language skills. Sometimes they would think of cutting class to avoid anxiety situations, causing them to be left behind. There is no doubt that the effects of fear of negative evaluation on foreign language learning are very clear.

In terms of practical research on language anxiety, a growing importance has been placed on research in anxiety related to foreign language achievement in the last few decades (Cheng, Horwitz, & Schallert, 1999; Horwitz, et al., 1986; Phillips, 1992). A number of research projects have examined foreign language anxiety in relation to foreign language achievement and showed a negative correlation (Bailey, 1983; Horwitz, et al., 1986; Phillips, 1992). However, some researches had different findings in gender and foreign language anxiety (Aida, 1994; Abu-Rabia, 2004). The research results of gender differences are still in controversy.

When it comes to the relation of foreign language anxiety and foreign language achievement in Taiwan, a number of studies have also been done at several levels, such as in elementary school (Wu, 2002), senior high school (Ying, 1993), vocational senior high school (Lin, 2005), and college (Cheng, 2005). Among these studies, a negative correlation related to achievement was found in foreign language anxiety. However, there has been insufficient research on foreign language anxiety of junior high school students.

As a result, it is worth examining the relationship between English achievement, gender, and foreign language anxiety in the context of junior high schools in Taiwan to see whether foreign language anxiety is different when students are at different levels of English achievement with different genders. To be specific, the main purpose of this study was to investigate the effects of English achievement and gender on foreign language anxiety of junior high school students, and it aimed to find out answers to the following questions:

1. Do students' English achievement and gender difference affect foreign language anxiety level in communication apprehension?
2. Do students' English achievement and gender difference affect foreign language anxiety level in test anxiety?
3. Do students' English achievement and gender difference affect foreign language anxiety level in fear of negative evaluation?
4. Do male and female students have any ideas about the reasons why they feel anxious in language classrooms in terms of communication apprehension, test and fear of negative evaluation?
5. How do male and female students deal with foreign language anxiety in terms of communication apprehension, test and fear of negative evaluation?

Methodology

Participants

The participants of this study were sophomore students (eighth grade) in junior high schools. Six schools were randomly selected from six administrative areas in Tainan city where English has been designated as a regular subject in the 2nd grade. Two classes were selected from each school, respectively. Three hundred and seventy-two participants, including 218 males and 154 females enrolled in this study.

According to the students' semester grades, the English achievement could be divided into three categories: high-achiever, intermediate-achiever, and low-achiever. Students whose grades ranged above 33.3% of the participants in that grade were the high-achievers. Students whose grades of English achievement ranged between 33.4% and 66.6% of the participants in that grade were the intermediate-achievers, and the rest (under 66.7%) were the low-achievers.

Instruments

(a) a Modified Foreign Language Classroom Anxiety Scale (FLCAS)

The FLCAS (See Appendix A) developed by Horwitz et al. (1986) was designed to assess the degree to which students felt anxious during foreign language classroom instruction. The FLCAS was divided into three parts: communication apprehension, test anxiety, and fear of negative evaluation. The scale demonstrated the internal reliability achieving an alpha coefficient .93. Its test-retest reliability yielded an r = .83(p＜.001) (Horwitz, Horwitz, and Cope, 1991). In this study, some parts of the sentences were modified so that the participants could understand better. A pilot study was implemented and the internal consistency reliability, Cronbach's α of the questionnaire was .88. In the formal study, the Cronbach's α of the questionnaire was .94 for internal consistency reliability which showed high reliability in this study.

(b) Interviews

Based on the different levels of achievement and genders, 36 participants from the six groups were involved in the interview to answer questions derived from FLCAS (See Appendix B). In each school, six participants, including 3 males and 3 females, were chosen and they were high-achievers, intermediate-achievers, and low-achievers, respectively.

Results & Discussion

Communication Apprehension

To evaluate the extent to which English achievement and gender would affect foreign language anxiety level in communication apprehension, two-way ANOVA was employed. Table 1 showed that there was no significant interaction effect between achievement and gender (p = .738), nor was the main effect on gender (p = .060). However, the main effect was found significantly different on achievement (p = .000). Table 2, the result of Scheffe's post hoc test, indicates that the low-achiever

group was the most anxious.

Table 1

Two-way ANOVA Results for Communication Apprehension

Source	df	MS	F	p
Achievement	2	10.514	20.852	.000*
Gender	1	1.792	3.553	.060
Gender*Achievement	2	.160	.318	.738
Error	349	.504		

*Note. *p<.05

Table 2

The Results of Scheffe Post-Hoc Test for Achievement in Communication Apprehension

	High achievers		Intermediate achievers		Low achievers	
	I-J	p	I-J	p	I-J	p
Low achievers	.63	.00*	.40	.00*	—	—
Intermediate achievers	.23	.03*	—	—	-.40	.00*
High achievers	—	—	-.23	.03*	-.63	.00*

Note. Low achievers > Intermediate achievers > High achievers.

*p <. 05

On the other hand, the main effect was found to be significant for differences in students' English achievement. The low-achiever group felt more anxious in terms of communication apprehension than the intermediate-achiever group or the high-achiever group. These findings are consistent with the results reported by Wu (2002) and Horwitz (1991), whose studies showed significant negative correlations between English learning achievement and foreign language anxiety. In the present study, a possible reason that low achievers were the most anxious in terms of communication apprehension may have been their lack of speaking and listening ability. A lack of social interaction ability and unwillingness to communicative with others may impede students in learning English. Students may discourage themselves or avoid communicating with others. What's more, the intermediate-achiever group was more anxious than the high-achiever group. A possible explanation is that the intermediate-achiever group was worse than the high-achiever group at speaking and listening and therefore the lower achievement students had higher anxiety. The low-achiever group was the most anxious group in terms of communication apprehension.

Test Anxiety

The results of the two-way ANOVA on text anxiety for gender and achievement are presented in Table 3, indicating there was no significant interaction effect (p = .663) and no main effect on gender (p = .410). The only significant main effect was found on achievement (p = .000). Also, based on the Scheffe's post hoc test in Table 4, the low-achiever group was the most anxious in test anxiety.

Table 3

Two-way ANOVA Results for Test Anxiety

Source	df	MS	F	p
Achievement	2	17.001	40.027	.000*
Gender	1	.290	.682	.410
Gender*Achievement	2	.175	.412	.663
Error	349	.425		

Table 4

The Results of Scheffe Post-Hoc Test for Achievement in Test Anxiety

	High achievers		Intermediate achievers		Low achievers	
	I-J	p	I-J	p	I-J	p
Low achievers	.81	.00*	.46	.00*	—	—
Intermediate achievers	.34	.00*	—	—	-.46	.00*
High achievers	—	—	-.34	.03*	-.81	.00*

Note. Low achievers > Intermediate achievers > High achievers.

*p <. 05

Gender was not found to be a significant factor in test anxiety. It is likely that students in junior high school may be used to tests and examinations and both male and female students may be equally anxious about tests; therefore, a gender difference was not found to affect test anxiety.

On the other hand, the low-achiever group felt more anxious in terms of test anxiety than the intermediate-achiever group and the high-achiever group. These findings seemed to contradict the study by Onwuegbuzie, Bailey and Daley (1999), who found that high academic achievers tended to have higher levels of foreign language anxiety than low achievers. They explained that many high academic achievers were able to attain high levels of performance in foreign language classes, while they still experienced high levels of foreign language anxiety. However, these were different to the findings in the present study with the low-achiever group being more anxious than the intermediate-achiever group and the high-achiever group. The intermediate-achiever group was more anxious than

high-achiever group as well. It is likely that low achievers may not employ high-level of learning strategies for the tests which teachers usually give to evaluate students' performance in Taiwan. Therefore, they may become more and more anxious and stressed if they cannot perform well in tests. From time to time, they will lack confidence in learning English. Over a long period of time, students' motivation may decrease in learning English. Thus, they may become poor language learners because of test anxiety.

Fear of negative evaluation

As illustrated in Table 5, the results of the two-way ANOVA on fear of negative evaluation for gender and achievement displayed that the *P* value of the interaction effect between achievement and gender did not reach a significant level ($p = .343$) whereas significant differences were found in the main effects on the factors of achievement ($p = .000$) and gender ($p = .017$) regarding fear of negative evaluation. The results of Scheffe's post hoc test are presented in Table 6, showing the low-achiever group was more anxious than the intermediate-achiever group and the high-achiever group. Also, the intermediate-achiever group was more anxious than high-achiever group in terms of fear of negative evaluation.

	I-J	p	I-J	p	I-J	p
Low achievers	.66	.00*	.40	.00*	—	—
Intermediate achievers	.26	.00*	—	—	-.40	.00*

seemed to have a fear of negative evaluation in public in Taiwanese society. In light of the similar results to Huang's study, there are two possible reasons for the findings in the present study. One is that female students are more anxious than male students in terms of communication apprehension and test anxiety; thus, female students may be afraid of receiving a bad evaluation from their teachers and classmates. The other possibility is that female students are still in their adolescence and feel shy in class. They may feel sensitive to others' opinions, especially those of their peers. Therefore, a significant difference was found, with female students feeling more anxious than male students.

In addition, the low-achiever group felt more anxious in terms of fear of negative evaluation than the intermediate-achiever group and the high-achiever group. These findings are in line with Lin's (2005) study. Lin indicated that students with high language anxiety tended to earn low final grades

while those with low language anxiety tended to get high grades. These were similar findings in the present study, with the low-achiever group more anxious than the intermediate-achiever group and the high-achiever group. The intermediate-achiever group was more anxious than the high-achiever group as well. It is likely that students who are lower achievers may be afraid of making mistakes in class and having their errors corrected by their teachers. They also may be afraid of being laughed at by their classmates or receiving negative evaluation from their teachers. They may dread losing face in front of others; consequently, the lower achievement students are likely to have higher anxiety in terms of fear of negative evaluation.

Reasons of feeling anxious

A major source of anxiety for students in communication was speaking to native speakers. Students experienced test anxiety because of incomplete preparation for tests. Moreover, students would feel anxious about the possibility of negative evaluation when they were communicating with classmates and teachers in class (See Appendix C).

In terms of communication apprehension, high proportions of both male and female students reported that speaking to foreigners was the situation which made them feel the most anxious. This may be due to the fact that students seldom or ever have a chance to speak to foreigners in their daily life. All students in junior high school are taught by Chinese teachers. They were only used to speaking English to their teachers or classmates in class. Once they had chance to talk with foreigners, they were likely to feel more anxious than when talking to their teachers or classmates. They may be afraid of making mistakes when communicating. If students could have more opportunities to communicate with foreigners, their anxiety may decrease.

As for the test anxiety, both male and female students responded that the major cause of this was not being well prepared for tests. A possible reason was that students in junior high school need to take tests for different subjects from time to time. They would be too busy to prepare several tests in a day. They may not have enough time to prepare for English tests; therefore, they might feel anxious when taking tests.

On the other hand, in terms of fear of negative evaluation, speaking or having conversations with teachers or classmates in class were reported as the most common source of this by male and female students. The tendency for the personalities of students in Taiwan is to be shy and conservative, and so they may be afraid of losing face when making mistakes in speaking English in public. Thus, it was likely that having conversations with teachers or classmates in class may cause their anxiety through fear of negative evaluation. In addition, more male students (33.3%) reported that they did not feel fear of negative evaluation than female students (27.7%). This is consistent with the findings from the quantitative data in Research Question Three in which there was a significant difference between male and female students. Female students were more afraid of negative evaluation than males.

Strategies for dealing with anxiety

According to the interview results (See Appendix C), students would keep calm and speak out their answers when they felt anxious in communication. When students felt anxious during tests, they would skip questions they did not know. Students would also ignore the laughing when they perceived negative evaluation from others (See Appendix C).

Firstly, both male and female students would keep calm and try to speak out answers to deal with their communication apprehension. This matches Daly's (1991) findings that providing adequate opportunities for communication for learners could reduce their apprehension in communicating. It was helpful for students to encourage themselves to have communication with others. As time passed, they could overcome their anxiety by talking in English frequently. Also, these students showed more self-confidence than those who asked for help from their classmates and teachers.

More self-confidence may not only facilitate students' learning but also reduce their anxiety. Once students have more confidence, their "affective filter" may be lowered. When the "affective filter" is reduced, learners not only feel less foreign language anxiety but also receive more comprehensible input and have better language acquisition (Krashen, 1982). Students may become more motivated by increasing their self-confidence. In this way, they become better language learners.

On the other hand, to deal with test anxiety, both male and female students reported that they would skip the questions they did not understand first. After that, they finished those questions if there was still time later. In previous studies, researchers indicated that students with test anxiety often experienced cognitive interference (Sarason, 1984) and had a difficult time focusing on the task at hand (Aida, 1994). By using the strategy that students reported most in this study, they could decrease their anxiety. They would gain confidence by answering all the questions they understood first. Then, for those questions they did not know, they may have time to think, or they could look for some clues from the context. They may even take a guess at the questions they did not understand. By doing this, students may not only save time but also become more efficient when taking tests.

Besides that, the strategy which both male and female students used the most with regard to fear of negative evaluation was ignoring the laughter of others. By doing this, they could concentrate more on speaking English. They may also gain more self-confidence in speaking by ignoring others' ridicule. Some students said they would study harder after they had been laughed at by classmates. Although most students reported that they would ignore other's laughing, they still had feelings of fear of negative evaluation. The results of Research Question Three showed that both male ($M =$ 2.85) and female ($M = 3.04$) students received higher mean values in terms of fear of negative evaluation. Therefore, it is important for teachers to teach their students some strategies to cope with the negative feelings from others' ridicule. More female students (27.7%) than male students (22.2%) feared negative evaluation. This finding was in accord with the results of Research Question Three in the present study. Female students were more anxious than male students in terms of fear of negative evaluation.

Conclusions

Summary

The factor of achievement was found to have a significant influence on foreign language anxiety, including communication apprehension, test anxiety, and fear of negative evaluation. As for gender difference, it was only significant with regard to fear of negative evaluation. Overall, low achievers felt more anxious than intermediate achievers and high achievers, and the intermediate achievers were more anxious than the high achievers.

Pedagogical Implications

On the basis of the findings derived from the present study, some pedagogical implications are offered.

First of all, in the present study, a significant effect was found for differences in students' English achievement; therefore, providing a non-threatening learning environment for students can help to reduce their language learning anxiety. Since students regard speaking to foreigners as a source of anxiety in communication, it may be helpful to reduce students' anxiety by providing authentic English villages in schools. Schools can hire native-speaking foreign teachers to teach students once a week. Alternatively, schools can hold summer camps and invite foreign teachers to teach students. By offering various English activities from foreign teachers, students can become completely immersed in an authentic English learning environment. Students can also learn about cultural differences when they enjoy classroom activities. Having more opportunities to contact foreigners may decrease students' anxiety to a certain extent. When students meet foreigners, they have more chance to practice their English. What is more, schools can also set up a day as an "English Day" once a week. Students would need to speak English all day wherever they go and whoever they meet. For example, students would have to speak English to clerks when they go to the bookstore on campus. Students would need to greet each other speaking English. With more practice in English,

students could lower their anxiety as well.

Secondly, due to the fact that students with different English achievement levels have different levels of anxiety, teachers can use cooperative learning to facilitate students' English learning in class. Cooperative learning is beneficial in learning a foreign language because it can provide opportunities for increasing language production and allow students to negotiate meaning with peers in a low anxiety environment (Bailey, Daley, & Onwuegbuzie, 1999). Teachers can use heterogeneous groupings combining high, intermediate and low achievers into the same group. By doing this, students who are lower achievers can receive assistance from students who are higher achievers and vice versa. Students can work together to accomplish tasks assigned by their teacher. In the process of their cooperation, they have opportunities for naturalistic language acquisition through the use of interactive group activities. Also, students working in a group can have positive interdependence and individual accountability to achieve a common goal. This will not only enhance their motivation but also create a positive affective classroom climate. Students may devote themselves more to the English context rather than be distracted by anxieties or fears.

Finally, since a main effect was found for significant differences in gender, in that female students felt more anxious than male students in terms of fear of negative evaluation, it is important for teachers to reduce female students' feelings of receiving negative evaluation and to provide a psychologically secure environment in English class. From the viewpoint of sociolinguistics, females tend to be polite, quiet and passive in the processes of socialization (Meunier, 1994). Female students may also be more conservative and timid than male students when learning English (Huang, 2005). Therefore, teachers can give more compliments to increase self-confidence when female students perform well in an English class. In addition, teachers can facilitate students' learning by dividing male and female students into different groups since students regard having communication with those students who are opposite gender as a source of anxiety in communication. Through working with the same gender students in groups, female students may encourage themselves to participate more in class activities and speak English more in class. By doing this, their anxiety about fear of negative evaluation will decrease. Moreover, it may be helpful if teachers can help female students recognize their fears and symptoms in terms of fear of negative evaluation. Teachers can discuss and share experiences about foreign language anxiety with students. Through such discussions, students can understand how to treat each other when they experience anxiety in learning English. By doing this, they may be less likely to panic when they experience anxiety-provoking situations.

Appendix A

Foreign Language Classroom Anxiety Scale

Directions: This scale contains items that may reflect your feelings about your English class. Please read each item and indicate whether you are (1) strongly agree, (2) agree, (3) neutral, (4) disagree, (5) strongly disagree.

Strong Disagree	Disagree	Neutral	Agree	Strong Agree
1	2	3	4	5

1. I never feel quite sure of myself when I am speaking in my foreign language class.

2. I don't worry about making mistakes in languages class.

3. I tremble when I know that I'm going to be called on in language class.

4. It frightens me when I don't understand what the teacher is saying in the foreign language.

5. It wouldn't bother me at all to take more foreign language classes.

6. During language class, I find myself thinking about things that have nothing to do with the course.

7. I keep thinking that the other students are better at languages than I am.

8. I am usually at ease during tests in my language class.

9. I start to panic when I have to speak without preparation in language class.

10. I worry about the consequences of failing my foreign language class.

11. I don't understand why some people get so upset over foreign language classes.

12. In language class, I can get so nervous I forget things I know.

13. It embarrasses me to volunteer answers in my language class.

14. I would not be nervous speaking the foreign language with native speakers.

15. I get upset when I don't understand what the teacher is correcting.

16. Even if I am well prepared for language class, I feel anxious about it.

17. I often feel like not going to my language class.

18. I feel confident when I speak in foreign language class.

19. I am afraid that my language teacher is ready correct every mistake I make.

20. I can feel my heart pounding when I'm going to be called on in language class.

21. The more I study for a language test, the more confused I get.

22. I don't fell pressure to prepare very well for language class.

23. I always feel that the other students speak the foreign language better than I do.

24. I feel very self-conscious about speaking the foreign language in front of other students.

25. Language class moves so quickly I worry about getting left behind.

26. I feel more tense and nervous in my language class than in my other classes.

27. I get nervous and confused when I am speaking in my language class.

28. When I am on my way to language class, I feel very sure and relaxed.

29. I get nervous when I don't understand every word the language teacher says.

30. I feel overwhelmed by the number of rules you have to learn to speak a foreign language.

31. I am afraid that the other students will laugh at me when I speak the foreign language.

32. I would probably feel comfortable around native speakers of the foreign language.

33. I get nervous when the language teacher asks questions which I haven't prepared in advance.

Appendix B

Interview Questions

1. In what situation will you feel the most anxious toward communication apprehension?
2. In what situation will you feel the most anxious toward test anxiety?
3. In what situation will you feel the most anxious toward fear of negative evaluation?
4. If you need to speak or answer questions in English, but you feel anxious in the class, what will you do?
5. If you are taking tests but you don't understand some of questions and feel anxious, what will you do?
6. If other students laugh at you when you speak English in the class, what will you do?

Appendix C

Result from the Interview Questions

Responses from the Interview Question One

	Male (*n* =18)	Female (*n* =18)
Speaking to foreigners	61.1%	66.6%
Speaking to teachers	5.5%	11.1%
Speaking in public	5.5%	11.1%
Have difficulties in speaking or cannot comprehend others' speaking	22.2%	11.1%
Do not feel anxious	5.5%	0%

Note. The percentage has been rounded to the nearest whole number. Consequently, sum of the total percentages may be slightly below or above 100%.

Responses from the Interview Question Two

	Male (*n* =18)	Female (*n* =18)
Taking formal tests, such as Basic Competence Test, or GEPT	16.6%	11.1%
Taking tests in school	16.6%	5.5%
Not being well prepared for tests	55.5%	44.4%
Facing specific questions such as listening or reading comprehension or grammar questions	5.5%	16.6%
Do not feel anxious	5.5%	22.2%

Note. The percentage has been rounded to the nearest whole number. Consequently, sum of the total percentages may be slightly below or above 100%.

Responses from the Interview Question Three

	Male (*n* =18)	Female (*n* =18)
Speaking or having conversation with teachers or classmates in class	55.5%	44.4%
Regarding others as better than I	11.1%	5.5%
Speaking to foreigners	0%	22.2%
Do not feel anxious	33.3%	27.7%

Note. The percentage has been rounded to the nearest whole number. Consequently, sum of the total percentages may be slightly below or above 100%.

Responses from the Interview Question Four

	Male (*n* =18)	Female (*n* =18)
Ask for help from teachers	22.2%	5.5%
Ask for help from classmates	33.3%	38.8%
Keep calm and try to speak out answers	44.4%	50%
Keep silent	0%	5.5%

Note. The percentage has been rounded to the nearest whole number. Consequently, sum of the total percentages may be slightly below or above 100%.

Responses from the Interview Question Five

	Male (*n* =18)	Female (*n* =18)
Skip questions first, then finish them if time available	72.2%	33.3%
Find clues from context	11.1%	22.2%
Take a guess	11.1%	16.6%
Leave the question blank	5.5%	22.2%
Do not feel anxious	0%	5.5%

Note. The percentage has been rounded to the nearest whole number. Consequently, sum of the total percentages may be slightly below or above 100%.

Responses from the Interview Question Six

	Male (*n* =18)	Female (*n* =18)
Ignore the laughing by others	77.7%	72.2%
Study harder after being laughed at by others	22.2%	27.7%

Note. The percentage has been rounded to the nearest whole number. Consequently, sum of the total percentages may be slightly below or above 100%.

Gender Differences affected by SSS and SSR in Extensive Reading

Dr. Atsuko Takase

Kinki University

Abstract

Extensive reading (ER) has been rapidly gaining popularity in Japan for the last decade, as ER is the most effective way to motivate learners to read and improve their reading fluency. It is said that the effectiveness of ER applies to learners of all ages and levels. However, there exist an abundance of studies that claim that female students read better than male students. This study examined the differences of reading performance and improvement in reading proficiency through ER between male and female students in an EFL context in Japan. A total of 120 university EFL students from two groups participated in extensive reading (ER) for one academic year: Group A: 72 freshmen (M = 53, F = 19), Group B: 48 sophomores (M = 48, F = 20). Students from Group A were provided with 15-20 minutes of Sustained Silent Reading (SSR) in class and also required to read outside of the classroom. Students from Group B had no SSR, and required to read only outside of the classroom. Both gro

 ups of students were instructed to start reading with simple stories (SSS) using easy materials and gradually increase the level of books. After 10 months of the ER program, a great gap was observed between the two groups in regard to the amount of their reading and the improvement of English proficiency. When analyzed and compared the data between male and female students in each group, the results showed that the female students read more than the male students in both groups. The reading proficiency of the both male and female students in Group A (AM, AF) and female students in Group B (BF) showed a significant improvement in the post Edinburgh Project on Extensive Reading (EPER) test, whereas the male students in Group B (BM) showed statistically insignificant gains. This difference was mainly due to the different levels of books they read and their reading attitudes. The BM students, who chose more difficult books than students from the other three groups, showed the l

 east gain in the post test, whereas the AF students, who read the biggest number of easy books, scored the highest gain. With some SSS and SSR, BM students might have improved their reading proficiency and attitudes toward reading. (375 words)

Abstract

In this paper, we develop a framework for accumulating student's confidence to learn English. We apply a machine translation which provides Thai translated output for students. Students have to verify English from the system and change the results into correct Thai. Based on this repetition, the system helps them to increase their confidence in reading. This will lead to the motivation on acquiring knowledge from various sources in English. We implemented this framework with a high school, Thammasart Klongluang Wittayakom School.

1 Introduction

English is recognized as an important language for communication in cross culture. Based on the statistics of ETS TOEFL score [2], the average of paper-based test score for Thai is 500. It is inadequate for studying in English program curricula, which requires score at least 550.

Thais are proficient in technologies such as electronic applications and, biological products. However, English language skills for Thai are deficient. This poses difficulty in knowledge sharing of specific resources with other countries [9]. IT valley in Maehongson province project that emerged under Thai government aimed to develop an IT community in rural area. While IT skills can be improved, it is difficult to apply the same approach to improve English language skills. This obstructs IT workers to acquire more knowledge and apply it in advance level.

After we surveyed the behavior of students in a high school by interviewing teachers, we classify students to three groups: talented, normal, and weak group. Considering the normal group, most students are lack of confidence to study English. When we assign documents for reading, students tend to be frightened, panic and finally de-motivated in learning English. There are a lot of reasons, such as lack of vocabularies, syntax and semantics gap between languages, lacking of experienced Thai teachers and so on. Based on the lack of vocabularies, we did an experiment on applying dictionary into e-learning system [4], we found that system helps them to learn English more easily and faster.

In this paper, we aimed to increase student's motivation on reading English by applying English to Thai automatic machine translation, called ParSit, into reading step. The paper is organized as follows. Section 2 states background of our work and scenario of student's process. Section 3 illustrates our Parsit. Section 4 explains the system architecture. Finally we summarize the conclusion and future work in section 5.

2 Background

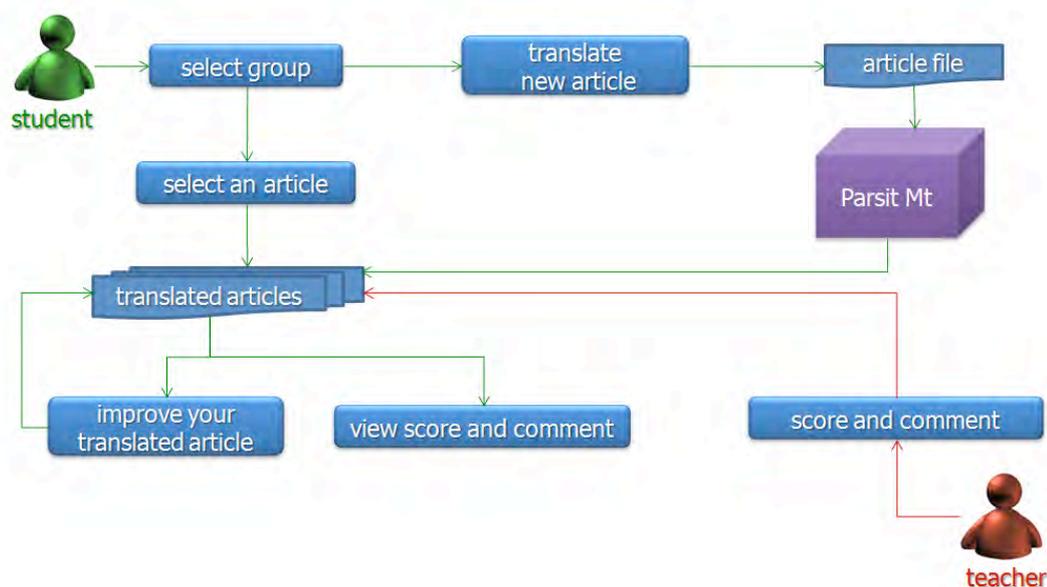
Motivation is the most important issue for improving language skill in Thailand. In Thai education system, students in public school start to learn English from grade 5. After we did a preliminary test on reading English in grade 9, we found that over 80% of students do not have a good skill on reading. We interviewed some students and found that they do not have a confidence on reading English. Self-regulation is an important skill which has been researched for a long period [10]. Self-regulated learners are cognizant of their academic strengths and weaknesses, and they have a repertoire of strategies they appropriately apply to tackle the day-to-day challenges of academic tasks. These learners hold incremental beliefs about intelligence and attribute their successes or


Figure 1. Self-regulation process for increasing language learning motivation

failures to factors (e.g., effort expended on a task, effective use of strategies) within their control [1]. Finally, students who are self-regulated learners believe that opportunities to take on challenging tasks, practice their learning, develop a deep understanding of subject matter, and exert effort will give rise to academic success [5]. It enables learners to acquire cognitive skill; moreover it is suitable for un-confidence students [6]. Our assumption is that if students get the results from machine translation, it will help them to roughly understand the content. Since the machine translation can not translate perfectly, we add correction process by assigning them to correct the Thai output. The repetition of this process will enable them to increase their motivation. As shown in figure 1, it illustrates the learning process. Students start from selecting group, article and then translating articles by using machine translation. After that, students will be assigned to correct the results from machine translation and submit to teacher. Teacher will comment and give a score to students and the process will finish.

3 An overview of automatic machine translation

Parsit [8] is English to Thai rule-based machine translation system (MT system). It composes of five main modules: English morphological analysis, English syntactic analysis, English semantics analysis, Thai semantics generation, and Thai syntactic generation. When Parsit receives a sentence, it will be sent to morphological module to stem and retrieve lexicon information. Next, English syntactic analysis, together with semantic analysis will be processed in order to construct an Interlingua representation. Word ambiguity will be resolved in semantic level. Thai semantics generation and syntactic analysis will finally be processed to generate an appropriate Thai sentence. Ordering will be treated in the syntactic generation level. The result of Parsit evaluation by applying BLEU score method is 0.0260 [3]. Parsit is now available at http://www.suparsit.com with more than 1,500 IP users per day.

3.1 Translation Memory

Automatic machine translation cannot fulfill the needs of users because of the unsatisfied accuracy. It is necessary to provide a tool for users to edit their own results. Translation memory (TM) is an environment for assisting translation by allowing the reuse of previously translated phrases and terms. We combine translation memory to Parsit which enables each user to keep his selected translation. Normally, translation memory database have to be prepared in order to collect sentence pair and update time for tracing the time sequence. Since our system has been designed for supporting cooperative work, we collect additional information, such as sentence owner, sentence original user.

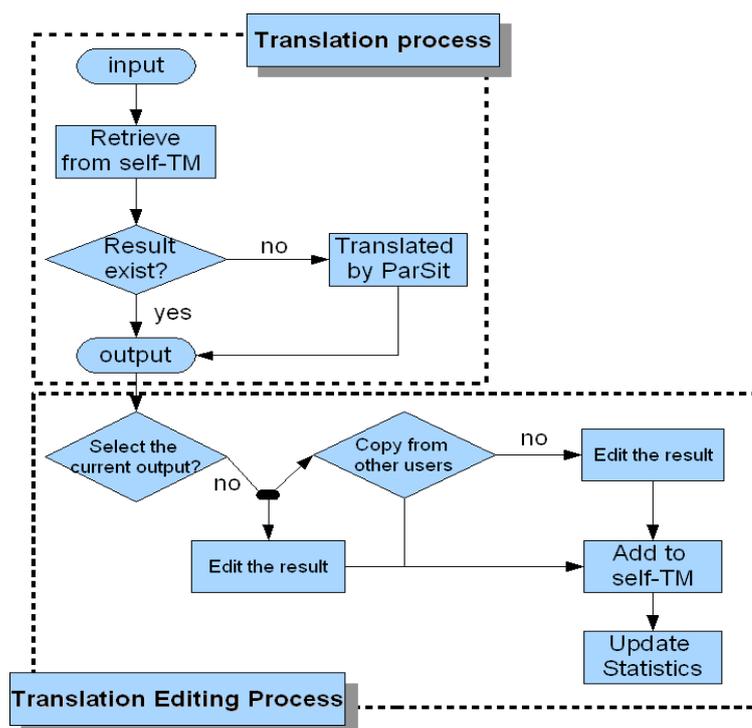
3.2 Process in cooperative work environment


Figure 2. Process on cooperative translation work environment

Figure 2 shows two main processes in this system, translation process and translation editing process.

Translation process: When a user starts sending any sentences, it will be checked whether the sentence is previously translated or not by referring to individual TM database. If the sentence exists in TM database, the translation results will be directly retrieved as an output. Otherwise, Parsit will be applied for automatic translation and return it as an output.

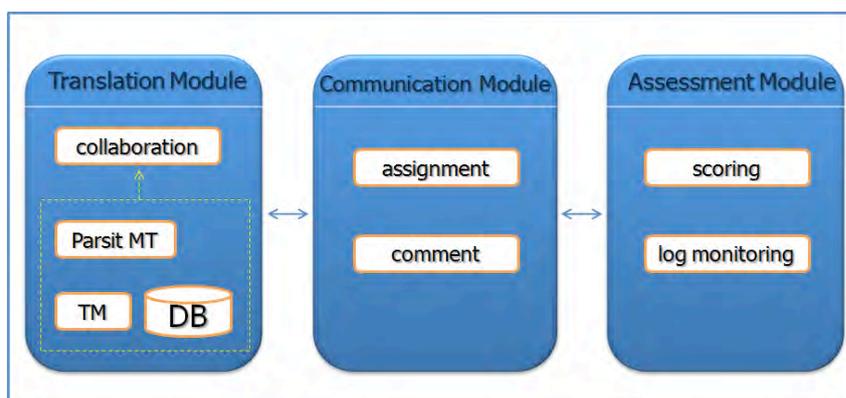
Translation Editing Process: After a user receives the translation result, it is possible to customize based on his/her own desire. If the user is satisfied with the result, the process will be stopped. If a user does not satisfied with the results, it is possible to edit the translation result. However, we cannot guarantee the automatic result because of the uncertainty of input. There are some cases that difficult to get a good reference from machine translation. Our system provides a collaborating environment for applying other translation results within a community. Based on the collaborative tool, it is possible for user to edit the results from others by using a good reference.


Figure 3. The overview of system in TUKL project.

The information in detail can be reached at [7]. After students apply machine translation and edit the results, teachers and teaching assistants will access in the cooperative environment to correct the output. Students acquire the correct output from teacher and learn the difference understanding between student and teacher. Moreover, it is possible to share knowledge among students based on each own translating documents.

4 TKL School Language assisted learning Project

We implement this framework with Thammasart Klongluang Wittayakom School under TKL Project. The main objective of this project is to motivate students learn how to apply technology to improve reading English skill, at the same time, increase their confidence on reading by assigning them to correct any mistakes from machine translation. Figure 3 shows the overview of the system. There are three main modules; translation module for automatic translation, communication module for teacher who want to communicate with students. Teachers can give assignment or comment to them, and assessment module for giving score and monitoring students' activity.

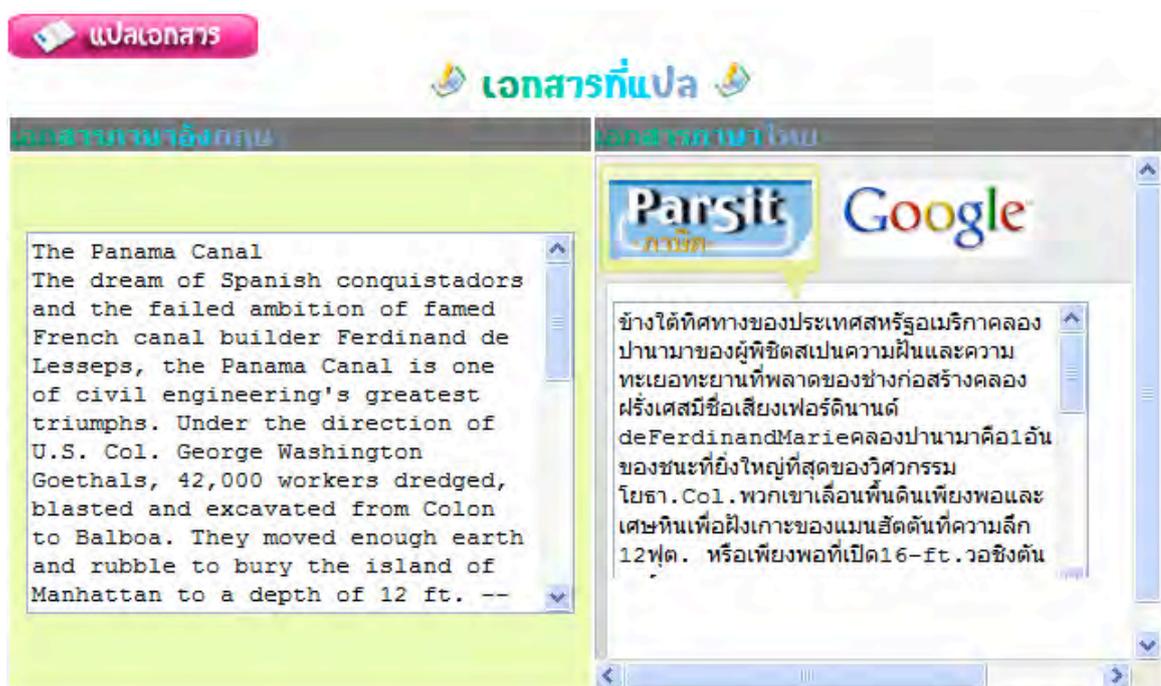
Figure 4 shows the snapshot of students' activity. Students are assigned to input English documents and then translate by using machine translation. After that, they have to correct the translated results.


Figure 4. The snapshot on example of student activity : translation activity

Figure 5 shows the snapshot of teachers' activity. Teacher is required to give a score and comment to each student. Currently, there are seven groups who join this project. Each group has three members. Four reading documents are assigned into each group individually. Figure 6 illustrates the top ten activity score of student.

5. Conclusion and Future work

We implemented the web based machine translation for helping students to increase their confidence in learning English. This framework is a joint collaboration with Thammasart Klongluang Wittayakom School under TKL Project. It helped to motivate students learn improve reading English skill, at the same time, increase their confidence on reading by assigning them to edit any mistakes from machine translation. Students and teachers can communicate through web board, intranet mail. Teachers can view the translating results and monitor student's attendance. We found that students are interested in this system, and enjoy working on assignment from teachers. In the future, we plan to develop a systematic evaluation process for detecting the motivation for learning English and measure qualitative reading English skill. Moreover, we plan to add more features, such as a Thai to English machine translation, dictionary, and parser.

Use of Think-Aloud Protocol in Investigating the Dictionary Use Process

Dr Wai-on Law, Hong Kong Community College, Hong Kong Polytechnic University,

cckurt@hkcc-polyu.edu.hk

Abstract

A study was conducted with 107 translation students in Hong Kong in 2007 to portray their dictionary use profile for Chinese to English translation. One of the triangulation methods used was the think-aloud protocol. The use of the think-aloud protocol can contribute to the teaching and learning of dictionary skills in relation to translation or language training, and to the research on dictionary use for specific purposes in terms of the language(s) concerned.

1.   Introduction

The dictionary is regarded as a tool that everyone uses since childhood. Its use is supposed to be familiar to all, the process of its use commonly understood. Its skills are so elementary that, in many people's mind, the training of them only belongs in the primary education curriculum. It is not worth occupying any place in the secondary school curriculum, let alone the tertiary. This concept is widely held until the present. However, if asked to explain the use process in detail, even language teachers may not be able to answer satisfactorily.

The dictionary use process is actually very complex, involving different levels of physical and mental operations, which also vary depending on the kinds of dictionary, and the purpose of its use. Many studies reach the same conclusion that a very low percentage of tertiary students were instructed to use the dictionary, no matter in which language under study; and that there is a serious gap in learners' need in this aspect (e.g., Atkins and Varantola, 1997; Cowie, 1999; Thumb, 2004). This situation is also found in Hong Kong (e.g., Li, 1998; Fan, 2000; Li, 2003).

Hong Kong is a city flourishing with translation studies. Over half of its nine universities offer translation programmes from the certificate to postgraduate levels. Considering the significance of the dictionary to translation, one would imagine that it would have a place in the translation curriculum. Nevertheless, universities regard dictionary use as basic skills which should have been treated in the secondary school curriculum. Unfortunately, this is not the case in Hong Kong. The use of the English to Chinese dictionary never finds a proper position in the secondary school curriculum, not to mention the Chinese to English dictionary. There is little formal training in the secondary school classroom, or in the university. Yet students use it regularly. This leaves a training vacuum in the continuum of learning for translation students. They have to pick up the skills by trial and error. Without a grip on the skills of dictionary use, their efficiency in translating is at stake.

From such backdrop comes this study, which hopes to draw the attention of teachers, students and curriculum designers to clarify the issue. They could understand more of students' process in using dictionaries in Chinese to English translation, their needs thereof, and find out what could be done to improve the situation (Atkins and Varantola, 1997: 36). **In relation to the theme of this conference, the purpose of this paper is to highlight the possible use of one of the instruments employed in the study, the think-aloud protocol, for exploring the dictionary use process in other language combinations and educational contexts.**

2. Methodology of the Study

By triangulation, including questionnaire survey, interview, think-aloud exercise and performance exercise, the study explored directly and indirectly Hong Kong translation students' patterns in

dictionary use, how they actually used the dictionary for Chinese to English translation, and the pedagogical implications. Over 100 students from 5 local undergraduate translation programmes participated. They were contacted through e-mail, in-class administration of the questionnaire, and individual meetings over a span of four months from December 2006 to March 2007. Substantial amounts of data were garnered consequently. While the first two methods have been widely used in dictionary research, and the fourth popular with studies on language acquisition for many years, the third just began to emerge as a useful instrument in disclosing the mind of the subject in the recent two to three decades. The following sections shall introduce its use in investigating the learner's thinking process.

2.1. Think-aloud Protocol as Research Instrument

The use of the think-aloud protocol is supported by the theory that information acquired by being attended to in the execution of a task is held in short-term memory and, while there, remains accessible to the subject, and, hence, to the researcher. Such an approach adds a new perspective to experiments in human behaviour, because the subject becomes a co-observer (Kiraly, 1995: 39 - 40). The data available for analysis is by its nature indirect, for it is to be used to investigate unobservable mental processes. All accounts have these features: (1) they give access to the processes actively and consciously involved in carrying out a particular task; but (2) they do not give access to automatized processes (Fraser, 1996: 67). Many highly over-learned processes operate automatically, thereby wholly unconscious, and thus no account can be given.

Think-aloud protocol manuals require that prior training be provided for research subjects. Such training not only gives the subjects an opportunity to practise and familiarize themselves with the method, but also gives the investigator an opportunity to train the subjects to verbalize but not interpret their thoughts (Li, 2004: 308). Before the subjects start with their translation, the task which they are to perform must be explicated (Lörscher, 1991: 39). The subjects produce their translations in situations in which generally they have neither any linguistic nor any non-linguistic contact with the only possible communication partner, the test leader. Nevertheless, it can be assumed that implicitly, in the minds of the subjects, the test leader is the addressee of the utterances produced (Lörscher, 1991: 57).

Thinking aloud makes demands on the subject's short-term memory capacity. It involves asking a translator to translate a text and, at the same time, to verbalize as much of his or her thoughts as possible. The performance is generally recorded on audio- or videotape (Fraser, 1996: 66). In order to make the observed phenomena accessible to further investigation, they have to be transcribed. The transcripts are segmented into "sense"-units, i.e., stretches of language, which suggest more or less discrete mental processes. After segmentation, the researcher labels those "sense"-units, which appear to represent comparable thought processes with the same description (Olk, 2002: 124).

There is nonetheless some difficulty in obtaining introspective data (Mann, 1982: 89). Subject training may bias the data towards the experimenter's desires and expectations, whereas no training may result in the loss of potentially relevant information through the subject's ignorance. The demands made on retrieval from short-term memory by the subject are likely to result in the loss, or addition, or change of information to the processes or strategies under investigation. Introspection demands that the subject observe the contents of their own mind, and infer from this observation the processes in operation. This suggests that the subject has a meta-cognitive awareness which is sensitive and developed enough to be able to do this. When subjects are asked to use any of these techniques, they are being asked to do something which they are not accustomed to doing. This is likely to make them stressful.

Kiraly (1995) points out that some researchers do not agree on the reliability and validity of subject verbalizations. The use of introspective data for the investigation of mental processes has been severely criticized by a few language researchers, notably Nisbett and Wilson (1977), and Seliger (1983). Nisbett and Wilson argued that conscious awareness is limited to the products of mental processes, and cannot reflect the processes themselves. But the problem is that no satisfactory definitions of product and process in terms of mental events exist (White, 1980: 105; quoted in

Kiraly, 1995: 40). Seliger (1983; quoted in Kiraly, 1995: 40 - 41) questioned the reliability of introspective data. His claim is that we cannot know to what extent such data reflect processing, or simply result from subjects guessing or inferring after the fact. This criticism may be valid for delayed or even immediate introspection, but true introspection, or thinking aloud, occurs simultaneously with the observed behaviour, so there should be no room for guessing or inferring. Sin (2002: 42) criticized that switching our focal awareness to our thinking process will disrupt the whole translation task, and as a result, distort our thinking process. Nonetheless, even if verbal reports are necessarily incomplete or possibly distorted, and do not reveal everything, what they do reveal is important.

3. The Think-aloud Protocol could Help Reveal Translation Students' Actually Use of the Dictionary

From the questionnaire survey and interviews, a general profile of how translation students use the dictionary for translation can be sketched. The actual process of how they use the dictionary for Chinese to English translation can be revealed from students' verbalizations, and their translations. But a system to analyze the think-aloud protocols produced in verbalization must first be established.

3.1. The Coding Method

Thumb (2004) studied the English-Chinese dictionary look-up strategies of 18 university students, who were asked to use the bilingualized (English-Chinese) dictionary that they habitually used during the think-aloud session. Thinking aloud was employed as the major method for collecting verbal data. Stimulated recall interview was carried out to achieve the goal of data triangulation, with "follow-up" questionnaires and observations to collect additional data. Hers is a systematic think-aloud coding scheme especially related to dictionary look-up. To the knowledge of the writer, there is no other coding scheme of bilingual dictionary "look-up operation codes" with think-aloud data. Its strength lies in the fact that it not only allows the researcher to interpret the think-aloud data by making qualitative statements about dictionary look-up behaviour, but also to make judgments about trends or inclinations that different users exhibit through quantification (Thumb, 2004: 108). Its weaknesses are twofold: (1) some codes only apply to Romanized languages, but not to ideographic languages like Chinese; (2) they are more for reception than production, the process of which involves different considerations and operations.

To Thumb (2004: 58), there are three types of mental operations in dictionary look-up: (1) **executive operations**, which refer to the physical and verbal actions in the look-up task; (2) **cognitive operations**, which focus on thinking about the word in the reading text, or about the headword in the dictionary text or both; (3) **meta-cognitive operations**, which concentrate on thinking about the look-up itself.

The coding scheme, based on Thumb's (2004: 62 – 65), has been modified for this research purpose. As her subjects used the English-Chinese dictionary for deciphering the meaning of an English passage, those codes related to the English features of the target words from the comprehension passage are sifted. Those related to Language Two to Language One equivalents in the English-Chinese dictionary are reworded to Language One to Language Two in the Chinese-English dictionary. Since the purpose for dictionary look-up is for translating the original text in the present study, but not just comprehending, the words "reading text" in some codes are changed to "original text". A few new codes pertaining to the translation process, but not particularly to any translation strategies, the use of the Chinese-English dictionary, as well as dictionaries of other language directions, are created.

The newly introduced codes to Thumb's system for this research purpose, the reasons, as well as examples of think-aloud protocols with these codes, are listed in the Appendix. The present coding system has adopted about half of Thumb's codes, with about one fourth newly created for the productive purpose of dictionary look-ups.

Having established the codes, the next stage is to analyze the protocols. There are generally four

main steps: (1) segmentation of the protocols; (2) coding of the segments; (3) search for patterns in the coded segments; and (4) revising the coding scheme, if necessary, and examining it for new patterns. Researchers usually segment their protocols into various units: lines, phrases, clauses, basic processes, and episodes (Thumb, 2004: 38).

To illustrate how the segments are analyzed and coded, two examples are taken from Subject One's think-aloud protocols:

Think-aloud protocol segment	Executive operations	Cognitive operations	Meta-cognitive operations
8. "Bi4jing4qian4que1"… "Gong1li4huo3hou2" is an abstract concept. I have to change it to a common English expression.	RT		PLT
42. "Zhao1shu4" can be rendered as "movement", I think. "Movement and posture" is better. "The movement and posture he learnt were of high standard."		CD, T	

Table 3.1: An Extract of Think-aloud Protocols from Subject One

In segment 8, Subject One referred to the text (RT: Referring to Text)   when she read aloud the sentence under consideration, "Bi4jing4qian4que1"… "gong1li4huo3hou2". She then planned on how to tackle the translation task there (PLT: Planning for Translation). In segment 42, she was translating (T: Translating) the original text, and chose the suitable definition from what she had found from the dictionary (CD: Choosing Definition). In order not to press them into verbalization, the subjects were allowed to pause at their own discretion, indicated by ellipsis (…), because frequent intervention on the part of the experimenter might distort the cognitive processes of the subjects (Krings, 1987: 162).

The think-aloud protocols are rendered into English, broken into segments, and the operations that they employed before or during their look-up tasks are analyzed. The dictionary use patterns are constructed by the coded segments.

3.2. How the Think-aloud Protocol Helps Reveal the Dictionary Use Process--A Portrait of One Hong Kong Student in a Chinese to English Translation Exercise

Subject Two made the most look-ups, and was also the most dependent on the dictionary among all subjects. He relied on the dictionary as authority, and expected to find equivalents from the Chinese-English dictionary for ready use in his translation, not only semantically, but also in usage. He made several look-ups for one search. He did not consider himself efficient in the use of Chinese-English dictionary, for "*I spend some time on the look-ups, but the results aren't satisfactory*" (Interview question). His process of using the dictionaries for translating a Chinese item into English is depicted in Figure 3.1, with 12 possible steps altogether. He did not use the English-Chinese dictionary. Instead of using *Pinyin*, the stroke and radical systems to access the entries in the printed Chinese-English dictionary, he simply input the Chinese characters to the web-based dictionary, which he made frequent use throughout the process, thus saving much time in search.

Figure 3.1: The Typical Dictionary Consultation Process of Subject Two for Translating a Chinese Item into English (The dotted lines indicate alternative routes.)

```
┌─────────────────────────────────────┐
│   The Dictionary User (Subject 2)    │

└─────────────────────────────────────┘
```

The Dictionary User (Subject 2)

Identified a problem word for search. (Step 1)

Found a word(s) from mental lexicon. (Step 2a)

Selected a web-based C-E dictionary (Step

Searched for the *Pinyin* of the problem word by direct input into a web-based C-E dictionary. (Step 3)

Selected a C-E dictionary. (Step

Searched for the headword in the macro-structure of the C-E dictionary by *Pinyin*. (Step 5)

Located the sought data in the micro-structure of the entry in the C-E dictionary. (Step 6)

Selected a monolingual English dictionary. (Step

Searched for the headword in the macro-structure of the monolingual English dictionary. (Step 8)

Located the sought data in the micro-structure of the entry in the monolingual English dictionary. (Step 9)

Not satisfied with the "equivalent" word(s). Tried and found another "equivalent" word(s). (Step 10a)

Chose a suitable option, taking the context of the original into consideration. End of search (Step 10b)

Step	Example segment
1: Identified a problem word for search.	24: Then I start with "e4dou4".
2a: Found a word(s) from mental lexicon.	33: I am thinking whether to use "meet" or "encounter" for "ou3yu4".
2b: Selected a web-based C-E dictionary.	29: Now I input "Hu2 Fei1" into Yahoo on-line dictionary.
3: Searched for the *Pinyin* of the problem word by direct input into a web-based C-E dictionary.	29: Now I input "Hu2 Fei1" into Yahoo on-line dictionary.
4: Selected a C-English dictionary.	43: Now I start to search in the *NACED*.
5: Searched for the headword in the macro-structure of the C-E dictionary by *Pinyin*.	43: I am now searching [w], the third tone.
6: Located the sought data in the micro-structure of the entry in the C-E dictionary.	45: In the entry there is a definition: "military feats".
7: Selected a monolingual English dictionary.	66: I am searching on Cambridge on-line E-E dictionary.
8: Searched for the headword in the macro-structure of the monolingual English dictionary.	65: I don't know the meaning of "posthumous" in "posthumous papers". I have to check it up from the dictionary.
9: Located the sought data in the micro-structure of the entry in the monolingual English dictionary.	67: One of the definitions says that it is an adjective, meaning "happened after a person's death".
10a: Not satisfied with the "equivalent" word(s). Tried and found another "equivalent" word(s).	73: Apart from "left", others like "hand down, pass, summon" aren't suitable.
10b: Chose a suitable option, taking the context of the original into consideration. End of search.	68: It seems right.

Table 3.2: Example Segments of the Steps in Subject Two's Dictionary Consultation Process in Figure 3.1

Subject Two's performance in the use of dictionaries showed his dependence on the dictionary, which may be due to his lack of confidence in his own language competence, but not laziness (Horsfall, 1997: 7), as he was willing to make more look-ups for a search than Subjects One and Three. In addition to taking fewer steps for each word search, the latter pair's more successful performance may be connected to their self-confidence and trust in their own abilities (Laukkanen, 1996: 263). At the same time, all four of them tended to look for English equivalents from the dictionary for the Chinese original. This is especially noticeable in Subjects Two and Four, which treated the bilingual dictionary as the authority for translation equivalence.

3.3. How the Think-aloud Protocol Reveals the Dictionary Use Efficiency of Individual Students in Terms of Dictionary Consultation Operations

Table 3.3 summarizes the numbers of segments in the think-aloud protocols of the subjects, the numbers and kinds of operations that they used with their dictionaries in the first 15 minutes for their translation task, and the average number of time of each operation used per segment.

Subject code	Number of think-aloud protocol segments	Executive operations	Cognitive operations	Meta-cognitive operations
1	58			
Total number of times used		25	29	28
Average number of times per segment		0.43	0.5	0.48
Total number of the kinds of operations used		7	10	6
2	86			
Total number of times used		50	22	50
Average number of times per segment		0.58	0.26	0.57
Total number of the kinds of operations used		9	10	8
3	38			
Total number of times used		23	22	12
Average number of times per segment		0.6	0.59	0.32
Total number of the kinds of operations used		5	7	6
4	41			
Total number of times used		26	13	33
Average per segment		0.6	0.3	0.75
Total number of the kinds of operations used		7	5	5

Table 3.3: A Summary of Figures Concerning the Think-aloud Segments of the Four Subjects

Subject Two produced the most think-aloud protocol segments, with 86. Subject One comes next, with 58, while Subjects Three and Four are close in number, with 38 and 41 respectively. Each segment of all subjects varies in the number of words. Subject One employed the operations quite evenly. Subjects Two and Four were the least involved in cognitive operations. This means that the

latter pair did not focus enough on thinking about the word in the original text for translation, or about the headword in the dictionary text, or both. They relied too much on the dictionary to solve their problems; once again demonstrating their lack of confidence in their own language competence.

Subject Three had the lowest number of meta-cognitive operation per segment, while Subject Four the highest. The latter concentrated on thinking about her look-ups very much; the former was not very aware of them. That she produced the least think-aloud segments in the first 15 minutes of the exercise is further proof that her meta-cognitive awareness was not sensitive and developed enough for introspection (Mann, 1982: 89). This is also in agreement with her attitude to the use of the dictionary for translation, that "*the most important of it* [the dictionary] *is to remind you how a word is used; otherwise it is not of much use*" (Interview question). This contrasts with Subject Four, who regarded it "*indispensable*" (Interview question). Out of the 30 kinds of operations, Subject Two was engaged in 27 kinds, followed by Subject One with 23, Subject Three with 18, and Subject Four with 17, the least. Although Subject Two is considered the most reliant on the dictionary, he was at the same time the most sophisticated in dictionary skills in terms of the total kinds of operations employed. Subject Four could be judged the least skilled in dictionary use.

The analysis from the data sheds light on the specific areas where dictionary use training is called for. The data also verify the interview results of informants. It has been shown that students with training in dictionary use (Subjects One and Two) seem to have been more sophisticated in dictionary use operations than those without. Another verifying instance is that, as Subject Four viewed efficiency in dictionary use as the pace in accessing the headword, but not finding the desired result of the word search, the analysis contradicts with her own claim that she was efficient in dictionary use.

In addition, the data demonstrate that the coding system for think-aloud protocols is very useful in analyzing the operations that the subject has undertaken in the dictionary use process for Chinese to English translation. It can also allow quantification of operations, so that the performance of specific aspects of dictionary skills of the subject can be evaluated, allowing diagnosis of strengths and weaknesses, as well as comparison with other subjects. It is a system that can be applied to other studies employing verbalization of the dictionary use process, thus building up the external reliability of such research method. At the same time, it powerfully addresses Bernardini's (2001: 251) concern about the lack of an established research paradigm of the think-aloud protocol.

4. Conclusion

The think-aloud protocols prove effective in exploring the thinking process of subjects in using the dictionary for translation. The coding system adopted from Thumb (2004) for Chinese-English dictionary use is useful for segmentation and analysis of the verbalized data from subjects. The methods can be duplicated to reap similar results. Many former studies (Hausmann, Reichmann, Wiegand, et al, 1989; Atkins and Varantola, 1997; Li, 1998; Cowie, 1999; Fan, 2000; Li, 2001; Chi, 2003; Li, 2003; Nesi, 2003) agree with the present study results. When process research advances, its aim will be to formulate theories which explain and predict, and not only describe (Tirkkonen-Condit, 1997: 70). For the dictionary use process, when dictionary look-up strategies for different purposes by different user groups in different languages are formulated, patterns of these uses can be formed, and user performance can thus be easier and more accurately explained and predicted. This can be the objective for further study.

Kiraly (1995: 113) suggests that think-aloud activities could be used in translation practice classes to enhance students' awareness of their own mental processes while translating. Students could translate a passage individually or in small groups, and record their thoughts on audio-tape. The quality of the translation product could be assessed by the instructor (or the other students), and the group as a whole could then analyze the results, including the relative effectiveness of various strategies used. Such activities would encourage students to think of translation in terms of process as well as result. This method is also recommended for use in the process of dictionary use for improving students' skills. The effectiveness of this method in enhancing students' skills in dictionary use and in translation should be further investigated for pedagogical reasons.

6. Appendix

Coding 1: executive operations before/during dictionary look-up	
(RAEN)	Referring to Absence of Entry: referring to the absence of an entry of target headword in dictionary text.
	Reason: It is not unusual that a headword under search is not found

	in a Chinese to English dictionary.
	Example: Subject Four, Segment 22: "There is no such character on page 142. It's strange. The simplified form should be like this, but it is not found."

Coding 2: cognitive operations before/during dictionary look-up

(SSR)	Searching by Strokes: searching by strokes and/or radical of the target Chinese headword
	Reason: It is an access method particular to the Chinese-English dictionary
	Example: Subject Four, Segment 20: "I use the index to search for "e4dou4", for I don't know the simplified version of the character "e4". I am now searching the radical table. I turn to page 142 for a likely radical, but I am not sure if I can find the word."
(RED)	Rejecting Definitions: rejecting L2 translation equivalent and/or L2 definition in dictionary text which is/are considered not fitting the original text
	Reason: In the Chinese-English dictionary, L2 (English) equivalents or definitions are available. They are usually looked for ready use by translators; rejected when considered not suitable for translation.
	Example: Subject One, Segment 30: "'Kungfu' suggests strongly to foreigners that it is like that of Bruce Lee's, like '*Wing Chun* fists'. It doesn't suit the context here. I won't use 'kungfu'…."
(T)	Translating.
	Reason: The activity for which the dictionary look-up is made.
	Example: Subject Three, Segment 26: "His feats"… I think of… "His feats were not refined".

Coding 3: meta-cognitive operations before/during dictionary look-up

(PLT)	Planning for translating
	Reason: It is especially for the translation purpose.
	Example: Subject Three, Segment 10: "'Zhuan2xia4yi2shu1xiu1xi2er2cheng2, zhao1shu4….' [Babbling] I will start to translate."
(SLD)	Switching Language Dictionary: switching/using another language dictionary for the search for the target word
	Reason: The translator may use dictionaries of other language

	combinations for Chinese to English translation.
	Example: Subject Two, Segment 47: "I have to check up with the E-E dictionary, with Cambridge on-line E-E dictionary."
(SED)	Switching Electronic Dictionary: switching/using electronic or web-based dictionary for the search for the target word
	Reason: The translator may use both the printed dictionary and electronic or web-based ones for Chinese to English translation.
	Example: Subject Two, Segment 47: "I have to check up with the E-E dictionary, with Cambridge on-line E-E dictionary."

Look-up for Chinese to English Translation

What kind of feedback affects slow learners in EFL writing?

Chiaki Baba

Meisei University

chiaki@ge.meisei-u.ac.jp

Abstract:

In this study, 25 sophomores are given English composition tasks for 14 weeks. The writer provides some hints, models, and appropriate feedback to them during the semester. Then, she analyzes their composition tasks and questionnaires statistically. There is no significant difference between the data, but the students' compositions have slightly improved qualitatively. Then the students' opinions toward writing English compositions have changed and they have become comfortable with doing it little by little.

1. Introduction

Recently university students' English proficiency has been deteriorating. The writer's students are all in the same situation; they do not like English, and do not have enough ability and motivation to study English at the college level. They spend 90-minute lessons, sitting down in their seats and waiting for the lessons to end. In these kinds of environments, teachers have to motivate the students by making appropriate lesson plans, and give their students attractive materials and tasks. Among them, it is better for their students to tackle the tasks which they have to do on their own. One of the good approaches is English compositions. The writer thinks that English composition tasks make her students consider their ideas earnestly. Many of her students have no confidence in their own English proficiency. Most of them think that they had been ignored by their teachers in their high school days because of insufficient English ability and motivation. Some of them think that they cannot do any tasks in English. They are not comfortable with writing both Japanese and English compositions and they do not have enough ideas to write compositions. They cannot write good, long English sentences, and some of them can only write two or three short sentences with errors. If they can write some more basic English sentences correctly, they will be confident in themselves. The writer tries to give English compositions with some hints, models, and appropriate feedback to her students and observes the changes of their proficiency and thoughts.

2. Review

Robb, Ross and Shortreed (1986) gives four kinds of feedback – correction, coded, uncoded, marginal – to Japanese college students' compositions, and the results show that the differences are not found in the students' performance among these kinds of feedback. EFL teachers spend a lot of time responding to grammatical errors of students' compositions, but this study does not support the practice of direct correction of surface error. Then, it suggests that "less time-consuming methods of directing student attention to surface error may suffice. While well-intentioned teachers may provide elaborate forms of corrective feedback, time might be more profitably spent in responding to more important aspects of student writing (Robb, Ross and Shortreed (1986: 91))." Similar research was done by Hatori, et al. (1990) involving high school students and Kanatani et al. (1993) involving junior and senior high school students. In these studies subjects are given three kinds of feedback – direct correction, underlining, stamping – and the results show no difference among the feedback effects. Hatori, et al. (1990) suggests that direct correction makes students lose their desire to write compositions.

Oi, et.al (2000) analyzes the effectiveness of two types of teacher feedback, grammar-based and content-based, on argumentative essays which were written by Japanese college students. The result shows that students who were given content-based feedback only improve the qualities and organizations of their compositions. Duppenthaler (2004) also investigates the effectiveness of three types of feedback – meaning-focused feedback, positive comments, and error-focused feedback on EFL journal writing written by Japanese senior high school students. The study finds that meaning-focused feedback is the most effective of all, which shows the same result as Oi, et.al (2000).

Shizuka (1993) gives four kinds of feedback, direct correction, uncoded feedback, peer feedback, and self-editing, to senior high school students, and analyzes the immediate effectiveness and the retention of feedback. As for immediate effectiveness, direct correction is the most effective, then, uncoded feedback, peer feedback, and the last is self-editing. Looking at retention, the order of the effectiveness is peer feedback, uncoded feedback, self-editing, and direct correction. Among the students with higher proficiency, direct correction and uncoded feedback are effective. As for the lower level students, only direct correction is effective. The results also show that students who have direct correction revise their compositions as their teacher corrects them and make the quality of their compositions better. Without the teacher's help, it is difficult for students to improve their English writing abilities – to edit and revise good compositions by themselves.

Oikawa and Takayama (2000) examine the effectiveness in four groups' improvement of EFL writing toward senior high school students: students in Group A are given error feedback and revise their composition, students in Group B are not given error feedback and revise their composition, students in Group C are given error feedback and write different composition tasks every time, and students in Group D are not given error feedback and write different composition tasks every time. The results show that the difference among the four groups is not statistically significant. Then the study suggests that students in Group A and B write more accurate English sentences than students in Group C and D, while students in Group C and D write more fluent English sentences than students in Group A and B. These researchers attempt to replicate their experiment for a longer period in Takayama and Oikawa (2001), and the study shows that a longer period of instruction leads students to improve accuracy in their compositions.

Baba (2002) gives grammar-based feedback in the spring semester and content-based feedback in the fall semester to Japanese college students, and then analyzes the quantities of their compositions, and the result shows that there is a statistically significant difference between the pre-test and post-test. Then the questionnaires are given to the students at the end of the year suggest that the students want both grammar-based feedback and content-based feedback. Furthermore, students given content-based feedback can write more fluent English sentences than students given grammar-based feedback.

Baba (2009b) provides different composition tasks to slow learners for 13 weeks, and then analyzes the total number of words written, the total number of T-units written, the number of words per T-unit, the total number of error-free T-units and the ratio of error-free T-units to total T-units in order to see the effectiveness of feedback on slow learners. The results show that students' compositions do not improve in quality and quantity. This study shows that the students can write better and use more sentences according to the themes of the compositions and that they need not only their teacher's feedback but also their teacher's direct and individual instruction during the lessons.

Then, Sumida (2005) and Aoki (2006) suggest that explicit feedback from teachers leads students to write better English sentences and revise their drafts appropriately.

As we see from the previous studies, explicit feedback affects students' English compositions. The question is how slow learners can improve their English writing ability after receiving teachers' feedback through revised compositions. In this study, the writer examines the effects of feedback on slow learners' EFL compositions.

3. Research Questions

The research questions in this study are as follows:

(1) How do the slow learners' compositions change through their teacher's feedback and their revising drafts?

(2) How do the slow learners' thoughts toward English compositions change?

4. Methods of this study

4.1 Subjects

The subjects of this study are 25 sophomores at a university in the Tama area in Tokyo. They belong to the School of Science and Engineering.

4.2 Procedures

(1) At the beginning of the semester, the subjects were asked to write a composition task as a pre-test and answer questionnaires about English compositions.

(2) The writer gave them an English composition task for 15 minutes once a week for 12 weeks. During the term, they were asked to write 6 kinds of composition tasks. The themes of the compositions were their hobbies, people they want to meet, their ideal room, their hometown, their university, and their treasure. One task was completed in 2 lessons. Before they started to write their tasks every lesson, the teacher provided mini-lessons about grammar points and sometimes some model sentences which are useful for the students' compositions were shown. During the lessons, she also walked around the classroom and gave some comments and feedback to the students. After they wrote their first draft, the writer gave some comments about grammar and contents. Then they revised their draft and completed it. They were allowed to use dictionaries.

(3) At the end of the term, they were given a composition task as a post-test and questionnaires about English compositions.

(4) The writer analyzed the total number of words written, the total number of T-units written and the number of words per T-unit in order to see the fluency of the compositions, and the total number of error-free T-units and the ratio of error-free T-units to total T-units in order to see the accuracy of the compositions. Then she analyzed the results between the pre-tests and post-tests.

(5) She analyzed the results of questionnaires to see the change of the students' thought toward writing English compositions.

5. Results

5.1 Quantity of Compositions

5.1.1 The total number of words written

Table 1 shows the average total number of words written.

	Pre-test	1	2	3	4	5	6	Post-test
words	17.56	23.96	24.72	22.36	29.84	22.64	28.16	21.12

Table 1: The average total number of words written

In order to see the improvement of the total number of words, the T-test was done, and there is no statistically significant difference between the pre-test and post-test, but the total number of words has slightly increased ($t(24)= 0.06$, $p>.05$). During the semester, each 2 week composition was followed by grammatical feedback and occasionally content-based feedback, which the students were able to understand and use in the subsequent compositions, leading to an increase in the number of words in each assignment.

5.1.2 The total number of T-units written

Table 2 tells us the average total number of T-units written.

	Pre-test	1	2	3	4	5	6	Post-test
T-units	2.76	3.56	3.48	2.96	4.40	2.80	3.88	2.44

Table 2: The average of total number of T-units written

According to the T-test, a significant difference between the pre-test and post-test is not found statistically (t(24)= 0.30, p>.05). The results show that teacher's feedback does not affect the number of T-unit in the compositions.

5.1.3 The number of words per T-unit

Table 3 indicates the average total number of words per T-unit.

No.	Pre-test	1	2	3	4	5	6	Post-test
words	6.41	7.11	7.30	7.25	6.54	6.94	7.19	9.98

Table 3: The number of words per T-unit

There is no statistically significant difference between the pre-test and post-test by the result of the T-test (t(24) = 4.35, p>.05). Looking at the students' compositions, the more words they were able to write, the longer the sentences became. Also the total number of words per T-units increased. Gradual growth can be seen from the data.

5.2 Quality of Compositions

5.2.1 The total number of error-free T-units

Table 4 shows the average total number of error-free T-units.

No.	Pre-test	1	2	3	4	5	6	Post-test
T-unit	0.44	1.32	1.76	1.88	3.04	1.32	1.60	0.92

Table 4: The total number of error-free T-unit

A significant difference between the pre-test and post-test is not shown statistically (t(24) = 0.14, p>.05). While some students can revise their errors in response to the teacher, others cannot notice their errors and revise them correctly. This kind of situation leads to the results in table 4.

5.2.2 The ratio of error-free T-units to total T-units

The average ratio of error-free T-units to total T-units is indicated in table 5.

No.	Pre-test	1	2	3	4	5	6	Post-test

T-unit	14.00	38.92	41.53	69.29	67.39	45.47	40.59	27.40

Table 5: The ratio of error-free T-unit to total T-units (%)

Although there is no statistically significant difference between the pre-test and post-test ($t(24) = 0.18$, $p>.05$), the ratio of error-free T-units to total T-units has increased little by little. Instructions for a longer period will lead the students' compositions to improve.

5.3 Questionnaires

The results of the questionnaires about English compositions are as follows:

4: Absolutely 3: Somewhat 2: Not particularly 1: Not at all

Questions								
Q1: Do you like writing compositions in Japanese?								
Pre-test	4	0%	3	52%	2	32%	1	16%
Post-test	4	12%	3	40%	2	44%	1	4%
Q2: Do you like writing compositions in English?								
Pre-test	4	0%	3	20%	2	24%	1	56%
Post-test	4	12%	3	12%	2	60%	1	16%
Q3: Are you good at writing compositions in Japanese?								
Pre-test	4	0%	3	8%	2	60%	1	32%
Post-test	4	4%	3	16%	2	48%	1	32%
Q4: Are you good at writing compositions in English?								
Pre-test	4	0%	3	4%	2	24%	1	72%
Post-test	4	0%	3	0%	2	44%	1	56%
Q5: Do you want to be able to write good compositions in Japanese?								
Pre-test	4	56%	3	40%	2	4%	1	0%
Post-test	4	44%	3	52%	2	4%	1	0%
Q6: Do you want to be able to write good compositions in English?								
Pre-test	4	32%	3	32%	2	28%	1	8%
Post-test	4	32%	3	48%	2	16%	1	4%
Q7: Do you want your friends to give you some comments about your compositions?								
Pre-test	4	4%	3	44%	2	36%	1	16%
Post-test	4	0%	3	48%	2	40%	1	12%
Q14: Are you comfortable with writing English compositions after practicing for 14 weeks?								
Post-test	4	0%	3	76%	2	24%	1	0%

Table 6: The results of the questionnaires about English compositions

The results show that there is no statistical significance between the pre-test and post-test, but students gradually began to like writing compositions in both Japanese and English. Then many of them feel that writing compositions in English is very difficult, and 14 weeks of guidance leads them to strengthen such beliefs. Seventy-six percent of them think that they have gradually become comfortable with writing English compositions after 14 weeks.

At this point, we will look at the comments which appear on open-ended questions no. 8 to no.13, and no.15.

Question 8: If you could write good compositions, what would be the benefit for you?

In April, some students answered that they could improve their ability to express something in English, that they could communicate with other people and that it would be useful for them to write compositions in society. The answers below are provided by only one student: to write a good report, to improve one's English writing ability, to get a lot of information, to be smart, and to be praised. In July, the answers provided by the students – the ability to communicate with others, being useful in society, expressing themselves, and improving one's English writing ability – had become more popular. One student answered that everybody had a favorable image of them.

Question 9: What do you have to do to write good compositions?

In April, one-third of the students answered that they should write as many sentences as possible, and some students thought that they need to study languages, and read many books. In July, after taking writing lessons, more students felt that they need to practice writing as much as possible. Some thought that they had to read more books than they had read, memorize English words and phrases, study English grammar, and learn how to organize sentences. They could understand what they needed in order to write good English compositions.

Question 10: What are your problems or difficulties while you write compositions in Japanese or in English?

In April, one-third of the students answered how and what to write are difficult for them, and some answered English words and grammar, organization, combining sentences, and *kanji* in Japanese. In July, some of them also felt it difficult to express their ideas in English. About half of all the students worried about a lack of their English proficiency and found that English words, phrases, and grammar are troublesome after they experienced writing English compositions.

Question 11: What is the worst thing while you write compositions?

In April and July, the students answered the same kinds of responses: organization, grammar, words, lack of ideas, and not having enough time. Many of them like writing about themselves, while some hate expressing themselves. An additional answer was that the themes given were not appropriate for the students or were not their favorite, they cannot write longer and better sentences.

Question 12: Please write down the titles you want to write compositions of in Japanese.

Students could imagine what they would write in Japanese in April. Only a few students gave answers such as recent events, *Kendo*, their lives, the things they think now, about biology, environment, war, and culture. However, in July, more of them could imagine what they wanted to write. They thought that topics about them such as self-introductions, their hobbies, their thoughts, and their favorite things were easy to write. Very few answers were about magic worlds, nature, history, and politics in Japan.

13. Please write down the titles you want to write compositions of in English.

Students could not imagine what to write in English in April. Some of them gave answers such as any simple topic, *samurai*, baseball, their lives, music, biology, liberty, and the WBC. However, in July, they became comfortable with writing compositions and some of them could imagine what they wanted to write, especially topics about themselves such as their hobbies, their future, their lives,

their favorite things, and how to spend holidays or summer vacations. One of them gave a unique answer: gradual changes of his English ability through lessons. Some of them wanted to write about machining techniques, magic worlds, history, baseball, and sportsmanship.

15. During the spring semester, what did you find or feel about writing English compositions?

The positive answers were as follows: "I can freely use words and grammar I already acquired." "English compositions are unexpectedly enjoyable tasks for me." "I can write sentences more easily than before." "First, I hated writing English sentences, but gradually I began to like it little by little." Every week's tackling of the tasks led them to be confident of their English writing. However, some students struggled with the tasks, and found difficulties with writing English compositions. Such students answered that they could not organize paragraphs, understand English grammar and how to use words. They are struggling in a long tunnel, so some more practice will lead them to reach the exit of the tunnel and find English compositions enjoyable.

6. Discussion

6.1 Quantity of Compositions

The results tell us that the instructions in only one semester do not lead to a higher quality of English compositions such as the total number of words, of T-units, of words per T-unit, by slow learners. Before improving their abilities, the writer had to lighten the students' worries. They struggled with how and what to write in their compositions at the beginning, and some told the writer that they worried about their composition tasks because of their insufficient English proficiency and the small number of words they could write. Thus, the writer informed that she watched their gradual growth during the year, and encouraged them to increase only a few words or sentences from the beginning. They felt relieved and tried hard to write their compositions. Some students who could understand how and what to write during the semester write more and better compositions. The examples are shown in 6.4.

6.2 Quality of Compositions

As for the quality of compositions, the number of error-free T-units has slightly increased, and the ratio of error-free T-units to total T-units has improved. When the students could find and use the appropriate sentences in the models which the teacher provided in her mini-lessons or could revise their compositions according to her feedback, they could write better sentences and did not make a lot of errors. On the other hand, they got confused when they are given the themes which were less desirable. They could not write their ideas smoothly nor choose the proper expressions, and became scatterbrained. Their compositions were completed by rambling sentences including a lot of errors.

On the whole, the students could revise their compositions as the teacher corrected them, and the quality of their compositions got better. In order to improve their composition accurately, they needed their teacher's help, and it supports the results in Shizuka (1993) and Takayama and Oikawa (2001).

6.3 Questionnaires

At the beginning of the semester, the students had no confidence in their English proficiency and they thought that they could not write English sentences. They also hated writing English compositions. Most of them lack experience in writing not only English but also Japanese compositions, and they did not know how and what to express about themselves in their compositions. During the 14-week instructions, their opinion had changed. They became comfortable with writing English compositions little by little, and did not feel anxious about working on the tasks. In the writer's class, she does not give Japanese compositions to her students, but writing English compositions leads them to think about writing good Japanese compositions, and their preferences in writing tasks changed. Although they have thought that they are poor at writing English and Japanese compositions, their wish to write good compositions in English and Japanese have strengthened.

As for peer feedback, more than half of them do not want their classmates to provide responses to their own compositions, because of a lack of their knowledge. In order to give good comments, students have to study English grammar, words, and organization in depth, so time is needed to perform peer feedback.

6.4 The tendency of the students who have improved their English writing abilities

In this section, the writer qualitatively watches some cases of students who made rapid progress in their compositions

Student A only wrote 8 words in his pre-test, and he struggled with writing tasks every week. He always told me that he did not have any idea about what to write, and how to express his feelings. Consulting a dictionary and receiving the teacher's mini-lessons and responses, he began to understand how to write, and then the total number of words in his compositions had increased. In his post-test, he wrote 20 words, and during the semester he could write a 43-word composition once. He always thinks that he is not good at English and is not comfortable with writing English compositions, but he tried hard, and unconsciously his proficiency has improved little by little.

Student B did not like writing English compositions, and could write only 19 words in his pre-test. He seriously tried to write his compositions every week, consulting a dictionary and asking me for some expressions. Then he revised errors in his compositions correctly. After that, he could use some words and phrases that he learned, and the quality of his compositions improved. In the questionnaires, he answered that he became able to use expressions and wanted to write more and better sentences.

Student C did not like writing in English and did not want to write English sentences better. He wrote only 26 words at the beginning. In the early period, he got the knack of writing English compositions, and the number of words he wrote had increased. He sometimes wrote over 60 words in his final draft, and reduced errors. The average total amount of words of his is 40.75, which is the best of all the students in the writer's class. The quality of his compositions also improved and the ratio of error-free T-units to total number of T-units is 66.1%, which is also the best result in the writer's class. Now he thinks that he is poor at writing English sentences, but unconsciously his English writing ability has improved.

Student D was interested in writing English compositions at the beginning of the semester, but he was not confident with his ability. Being different from other students, he has always had an idea about what to write. Although the average total number of words he wrote was 28 and it did not change for 14 weeks, the contents of his compositions became better, and he had reduced the number of errors he made.

Student E was a very serious student and he tackled all the tasks earnestly. He always wanted to write a lot, but he always made errors because of his insufficient knowledge of English grammar. After the teacher's feedback, he revised the part to which a response was provided. In the second draft, he added more and more sentences, and he made more errors. He is full of motivation, so he needs more practice and English grammar instructions.

7. Conclusion

In this study, the writer analyzes how the slow learners' compositions change through teacher's feedback and their revision. The results do not show a statistically significant difference between the pre-test and post-test, but the learners' compositions have improved little by little. Continuing instructions will affect their compositions more and more. The teacher requires providing not only their teacher's feedback but also their teacher's direct and individual instruction during the lessons in order to check their situations and to encourage them to write good compositions.

Then, she analyzes how the slow learners' thoughts change toward English compositions. The answers of the questionnaires tell us that they have become comfortable with writing English compositions and they hope to be a good writer of English in the near future. Through the lessons, they observe themselves and understand what their good points and bad points are in their compositions. In order to bring up good English learners, this kind of instruction the writer does is appropriate.

8. Pedagogical Implications

Nowadays, a lot of university students do not like English and lose motivation to study English. In this situation, teachers require giving good instructions and tasks and encourage them to learn English. Providing English composition tasks gives teachers and students good opportunities to communicate with each other. Teachers can give them responses and instructions individually in the classroom and on their compositions, which strengthens the relationship between teachers and students, especially slow learners. It is very important for teachers to develop a good rapport with students. Teachers need to watch students' gradual progresses, leading them to understand their students' situations, as well as give appropriate feedback, and manage good classrooms.

The Role of Translation on The Improvement of EFL Learners' Reading Comprehension at The Intermediate Level of Language Proficiency

Giti Mousapour Negari
mousapour@hamoon.usb.ac.ir
University of Sistan & Baluchestan

Abstract
The present paper attempts to investigate the role of translation on improving EFL learners' reading comprehension skill. To that end, 120 learners who were studying English at different Language Institutes were selected. The Michigan Test of English Language Proficiency (Corrigan, 1979) was administered to determine their level of English proficiency. The subjects were then randomly assigned to two control and two experimental groups. At the end of the instructional period a final achievement test was taken. It consisted of several unfamiliar reading passages. The results demonstrated that translation technique affects the learners' reading improvement at the intermediate level of language proficiency. The findings of the study will be applicable in teaching language skills, translation studies and lesson planning.
Keywords: translation, reading comprehension, teaching language skills, EFL learners

1. Introduction and background
Reading is the most important skill of all skills for language learners in general and for EFL learners in particular and it is one of the most useful and necessary skills for people (Farhady, 2005). On the other hand, one of the major problems of the EFL learners in learning a foreign language is their low comprehension in reading texts. It seems that teaching variables may play an important role in learners' reading comprehension.

The study will try to look at the results of two teaching experiences. In one group, reading passages will be translated for the students by the teacher and in the other group reading passages will not be translated. The ultimate goal of this study is to find out whether translation has any positive effect on EFL learners' reading comprehension.

According to Chastain (1988, p.217), "The reading goal is to read for meaning or to recreate the writer's meaning. Reading to improve pronunciation, practice grammatical forms, and study vocabulary does not constitute reading at all because by definition, reading involves comprehension. When readers are not comprehending, they are not reading."

Farhady (2005, p.1), stated that, "from a technical perspective, reading comprehension is a dynamic mental activity which interacts with the text to extract meaning."Barnett (1988) pointed out that a reading model provides an imagined representation of the reading process. Models of the reading process can generally be placed across a continuum of two opposing approaches in understanding the reading process, namely, bottom-up approaches and top-down approaches.

However, as Hudson (1998, p.46) noted; "most current researchers adhere to what has been termed as interactive approaches." These approaches are based on the reading activity that necessarily involves two elements: the text and the reader. In a way, reading strategies reveal the readers' resources for comprehension and indicate how readers conceive a task, what textual cues they attend to, how they make sense of what they read, and what they do when they do not understand (Block, 1986).

Translation, by dictionary definition, consists of changing from one state or form to another, to turn into one's own or another's language (The Merriam-Webster Dictionary 1974). Translation is basically a change of form. When we speak of the form of a language, we are referring to the actual words, phrases, clauses, sentences, paragraphs, etc., which are spoken or written. These forms are referred to as the surface structure of a language. It is the structural part of the language which is actually seen in print or heard in speech. In translation the form of the source language is replaced by the form of the receptor (target) language. (Larson, 1998, p. 3).

"The term translation itself has several meanings: it can refer to the general subject field, the product (the text has been translated) or the process (the act of producing the translation, otherwise known as translating). The process of translation between two different written languages involves the translator changing an original written text (the source text or ST) in the original verbal language (the source language or SL) into a written text (the target text TT) in a different verbal language (the target language or TL)" (Munday, 2001, p. 4-5) .

The term "Communicative translation" according to Newmark (1981, p.30) is an attempt "to produce on his readers an effect as close as possible to that obtained by the readers of the original. Semantic translation attempts to render as close as the semantic and syntactic structures of the second language allow, the exact contextual meaning of the original."

Cook (1992) argues further that all second language learners access their L1 while processing the L2. She suggests, " The L2 user does not effectively switch off the L1 while processing the L2, but has it constantly available" (p.571). Cook (1992) also maintains that when working with second language learners, teachers must not treat the L2 in isolation from the L1. In fact, according to Cook, one cannot do so, "The L1 is presented in the L2 learners' minds, whether the teacher wants it to be there or not. The L2 knowledge that is being created in them is connected in all sorts of ways with their L1 knowledge" (p.584).

Despite the observations that L2 learners make of their native language, at least in the early stages of language acquisition, Cohen (1992) stated, "There has been little research on the extent to which non-natives' thoughts are in the TL (target language) and the effectiveness of thinking in the TL as opposed to thinking in the L1"(p. 100). Kern (1994) specifically points out that, "At present it remains unclear precisely what role the native language plays in L2 reading comprehension" (p. 441). Cohen (1995) used a survey given to bilingual and multilingual university students to explore factors influencing language of thought. He found that not only do people with access to two or more language shift frequently between them, these shifts can be either unintentional (e.g., it is easier to think in one language than another and so the brain automatically shifts language) or intentional (e.g., using another language to help understand the grammar or vocabulary of the target language).

"Meaning is a communicative and therefore a social phenomenon. Nothing bears meaning and makes sense unless it occurs in communication, which by nature is a social activity. Yet, meaning is encoded in and by language. The construction of meaning is therefore both social and linguistic at the same time. This is to say that meaning, although signaled by language, does not totally reside in it, but is created in part between people in every instance of language use" (Farahzad 2004, p. 79).

She also added that all target language texts have a static part of meaning to some extent, but differ in their interpretations of the source text and have more interpretations in the target language (p. 82). Chellapan (1982) believes that learners can develop their reading comprehension ability by translating target language text into their native language.

It is quite obvious that text carefully, is trying to make sense of its features like sentence structures, context and register. In other words, there should be a kind of textual analysis, which is very important in reading comprehension (Chellapan, 1982). Indeed the difference between translation and reading is the degree of attention paid by the reader or translator, that is; in translation attention weighs far more heavily than in mere reading.

2. Methodology
2.1. Participants
The participants for the research were selected from EFL learners studying at English Language Institute in Zahedan. 120 learners were selected out of 200 by taking Michigan Test of English Language proficiency (Corrigan, 1979). They divided according to their scores. It means, the obtained scores were converted to Z-Scores to indicate how many standard deviations an observation is above or below the mean. The participants then assigned to three groups; beginners (low), intermediates (mid), and advanced (high) learners according to their level of proficiency (two or three standard deviations below the mean was known as, beginner; one standard deviation below or above the mean was known as intermediate; and two or three standard deviations above the mean was known as advanced).

Beginners and intermediate learners were randomly assigned into four groups, two experimental and two control groups, each including 30 students. One experimental and one control group consist of

beginners and the other two groups consist of intermediate learners. Their ages ranged from 18 to 25 both males and females.

2.2. Instruments

To fulfill the aim of this study, two testing implements were applied. The "Michigan Test of English Language Proficiency" was administered to distinguish the students' level of proficiency. The test included 100 items, including three parts: part one was a grammar test; part two was a vocabulary test; and part three was a test of reading comprehension. The participants had 75 minutes to finish the entire test. The second test was an achievement test which was taken at the end of the term from all participants. The other materials for the study consisted of reading comprehension passages extracted from the book "Active Skills for Reading" by Anderson, N. J. (2008).

The final achievement tests were some unfamiliar texts which the students did not practice them in the classroom. The learners had to answer totally 40 comprehension questions following the texts.

2.3. Procedure

The participants who were selected by Michigan Proficiency Test were randomly assigned to four groups, two experimental and two control groups. In the experimental groups the teacher translated reading passages while in the control groups the teacher did not translate the passages. The teacher was the researcher herself for all groups. She has taught English at different high schools and institutes for 8 years. The classes were conducted for 18 sessions, three times a week. Each session takes one and half hour. The term lasted 45 days.

In the experimental groups, for both beginner and intermediate learners, the teacher asked the students one by one to read the sentences of the passage and translate them. If they had any questions, they were asked in L1 which was Persian and the teacher answered in L1, too. This process went on until the passage comes to the end. Since the students had no more questions, the teacher asked them to write the answers to comprehension questions which appeared at the end of the passage. The questions were in English and the students wrote the answers in English as well.

The teacher speaking Persian, asked the students to stop and check their works. Each student read a question and then read his / her response. If he/she was correct, the teacher called another student to read the next question. If he/she was incorrect, the teacher selected a different student to supply the correct answer or the teacher himself gave the right answer.

The control groups, both beginner and intermediate groups, were taught without using translation. The teacher speaking English asked the students to read a sentence from the reading passage one by one. After the students finished reading the passage, they were asked in English whether they had any questions. If they had any questions about the vocabulary of the passage, the teacher tried to make clear the meaning of it using pictures, drawing on the board, using examples, and other realia.

After all of the questions were answered, the teacher asked some questions of his own about the passage. The question and answer practice continued for a few minutes. Finally the teacher invited students to ask questions.
All of the questions and answers were in English language. The students practiced vocabulary by using words in complete sentences.

To investigate the effect of the combination of the two independent variables of the teaching technique and the level of proficiency (beginner and intermediate) on reading comprehension a Two-way ANOVA was applied.

3. Data Analysis

At the end of the term a final achievement test was taken. It consisted of some unfamiliar reading passages which were suitable for the students with different level of language proficiency. After the administration of the test, the collected data were scored. The test included 40 reading comprehension questions from four unfamiliar reading comprehension texts.

To investigate whether there was any meaningful difference between the four groups a Two-way
ANOVA was run to estimate the effect of combination of translation and level of proficiency on the
students' reading comprehension.

4. Results and Discussion

In order to study the hypotheses, the first step was to specify four distinct groups as:
G1: No translation, Beginner (cont. group1)
G2: No translation, Intermediate (cont. group2)
G3: Using translation, Beginner (exp. group1)
G4: Using translation, intermediate (exp. group2)
As it was mentioned previously, at the end of the term all of the learners participated at a final
achievement test according to their level of proficiency.
The initial step to the analysis of the collected data was to investigate the significant differences among
the groups. For this reason means and standard deviations of groups are presented in the Table 1.

TABLE1. Means and Standard Deviation of two Independent Variables

ID1 ID2	M	SD	N
G1 beg. G2 inter. Total	28.93 29.53 29.24	2.567 2.501 2.529	30 30 60
G3 beg. G4 inter. Total	30.10 28.80 29.45	3.144 2.797 3.022	30 30 60
Total beg. inter. Total	29.55 29.17 29.36	2.890 2.656 2.771	60 60 120

To determine whether or not there is a relationship between the method of
teaching and the level of proficiency on the reading comprehension of the
participants a two-way ANOVA (Analysis of Variance) was implied. Table 2
displays the results.

TABLE 2. Two-way ANOVA for ID1 and ID2

Source	DF	MS	F	Sig.

ID1	2	.932	.122	.886
ID2	1	3.562	.465	.497
ID1*ID2	1	26.734	3.490	.041
Error	115	7.659		
Total	120			

The findings indicated that the interaction of the two independent variables is significant at .05 ($P<.05$). Therefore, the interaction of teaching methods and the level of proficiency affects learners' reading comprehension.

The present study confirms Rivers and Temperly's (1978) finding that Translation of passages from literature in their first language (L1) offers students of English as a foreign language (EFL) a unique opportunity to explore the dimensions of both languages and to develop their skills and style of written expression in English. In an EFL setting, translation instruction can be an informative and instructive chance for students as well as serve as tools for language learning. As EFL students are deeply engaged with the meaning of the literary text and its meaning through the translation process, they increase their awareness and understanding of their own society and culture. Moreover, they learn to extend their knowledge and understanding of other peoples, cultures, and issues.

5. Conclusion and Implications

As this study indicates, there is evidence that translation has positive effects on reading comprehension of EFL learners at intermediate level of language proficiency. The results of a Two-way Analysis of Variance proposed that the combination of the method of teaching and the level of proficiency did have positive effect on learners' reading comprehension.

This study has undoubtedly pedagogical implications both from the stand point of theory and practice. This research has shed some light, to a certain extent, on the factors involved in teaching a second or foreign language. Teachers can use translation for comprehending the reading part of the book that they teach.

The results will also alert teachers to consider translation as an important device for promoting reading comprehension. Teachers have to consider this point that learners translate the reading text unintentionally in order to comprehend them because it is easy for them to think in one language than another and so the brain automatically shifts languages.

As using translation is inevitable, it is suggested that teachers teach the learners some basic elements of translation before starting the reading comprehension passages. Teachers are also responsible for observing different traits in their classrooms and make learners aware of their own problems on translation, while encouraging them to work more on their problems. As learners may translate some sentences in classes, the teachers should create such an atmosphere in the classroom to make learners feel self-confident and secure to express themselves freely. Therefore, teachers have very important role in reading comprehension of passages by learners. They have a positive and influential effect on the emotional state of the students.

The results of this research are also beneficial to teachers in their selection, presentation and gradation of reading materials. The fact that learners in each level of proficiency use translation for comprehending the reading passages would be of prime importance for material developers. The materials should not be beyond the learners' ability. In this case the learners would recognize their talents to handle the new materials.

As far as the learners' comprehending of the new texts may affect their learning a second or foreign language, the presentation of the materials would be of prime importance developers. The presentation should be in a way to enhance the learners' self-concept while they go further in the path of language

learning. Material developers can provide different techniques for presenting materials in the textbooks regarding the skill of reading comprehension and other related skills. An analysis of affective and personality factors will determine how the individual will probably respond to emotional, cognitive and interpersonal demands of language learning.

One goal of instruction would be to help learners identify and assess their individual learning. At one stream, the students would be able to justify their progress in language learning by themselves. This is partly due to the concept that they have about themselves. They should know themselves in order to assess their improvement, or to find out the change created in them by the process of education. At another stream no formal education would be possible without some form of testing. The fact that the learners' feelings and assumptions about themselves affect their response to language tests should not be overlooked by language testing authorities. The length of the tests, the time required for completing the tests and the level of difficulty of the tests are the factors which influence how successful the learners will be in the process of testing. A learner with a positive self-concept would be more aware of his or her capabilities and would feel more confident while language testing. On the other hand, a student with low self-concept though knowledgeable may not feel confident enough to complete the test easily. Therefore, in the process of the learners' assessment many factors namely personal factors are involved. The tests have to make the students enhance their self-concept. Teachers or testing authorities are responsible to create such an atmosphere for learners to feel secure and confident while language testing.

**Pre-service EFL Teachers' Awareness of Their Own Classroom Actions
during Teaching Practice**

Ozgur YILDIRIM

Anadolu University, Turkey

1. Introduction

An effective foreign language teacher education program should provide teacher candidates with the knowledge of essential language teaching skills, methods and techniques as well as the subject matter knowledge and good command on communication and decision making skills (Richards, 1998). However, having the theoretical knowledge alone may not be enough for language teacher candidates for being effective teachers. Internalization and reconceptualization of the theoretical knowledge is also essential for a teacher candidate (Richards & Lockhart, 1994; Richards, 1998). This internalization and reconceptualization is generally affected by teacher candidates' self-perceptions, beliefs and perspectives about language teaching and learning. Johnson (1992, p.509) states that "unlike experienced teachers, pre-service teachers have not developed a schema for interpreting and coping with what goes on during instruction, nor do they possess a repertoire of instructional routines upon which they can rely". Therefore, it is important to investigate whether pre-service teachers are aware of what they are doing during teaching practice and whether they have solidly grounded methodological knowledge about the rationale of their classroom actions. Johnson (1992, p. 510) addresses this issue as follows:

> "More often, the practicum reflects the notion that once pre-service teachers have mastered the required subject-matter content, they will be able to use that knowledge to lead their students to successful second language learning. Calls continue to be made for explorations into what takes place during the practicum in order to better understand the ways in which pre-service teachers conceptualize their initial teaching experiences, to recognize the unique instructional considerations of second language teaching, and, finally, to determine the contribution that such field experiences have on the professional development of second language teachers."

Thus, the purpose of this study was to examine whether Turkish pre-service EFL teachers reflect a solidly grounded methodological knowledge on their classroom actions when they teach as a requirement of their teaching practice courses. In other words, the main aim of the study was to identify whether Turkish pre-service EFL teachers were aware of the rationale of their own classroom actions or not.

2. Procedure

The participants of the study were 10 pre-service EFL teachers studying their last semester at Anadolu University, ELT Department. The data of the study were collected through non-judgmental classroom observations, and interviews made based on these observations. Each participant's at least two (some participants' three) classroom practices were randomly chosen to be observed. The researcher observed each pre-service teacher's teaching practice and noted down what s/he did and what happened in the class step by step without adding any evaluative comments. The interview sessions were conducted separately with each pre-service teacher within two or three days after the classroom observations. During the interviews the participants were first reminded of their classroom actions with the help of the observation notes, and then they were asked the rationale of each action. All the interviews were tape-recorded and transcribed. The transcriptions were analyzed in order to identify categories.

3. Findings

The analyses of the data yielded to two main categories. Category one consists of classroom actions for which most of the participants could express a solidly grounded methodological reason (rationale). More specifically, (a) eliciting; (b) using error-correction techniques; (c) putting the activities used in the lesson in a logical order (from simple to complex; from controlled to freer; pre-during-post); and (d) making meaningful transitions between the activities were the classroom actions for which most of the pre-service teachers could express a rationale.

On the other hand, the second category consists of classroom actions for which most of the participants of the study could not express a solidly grounded methodological reason (rationale). For the following classroom actions, most of the pre-service teachers who participated in this study could not bring a methodological explanation: (a) using beginning / warm-up activities; (b) using ending activities (e.g. reviewing the lesson) / giving homework; (c) using pictures / images / audio in the classroom; (d) encouraging students to use dictionaries / supplementary materials; (e) choosing different activity types (matching, fill in the blanks, role-play, pair work, group work, etc.); and (f) using L1 during the lesson.

4. Discussion and Suggestions

Results of this study indicate that there are some areas of teaching for which pre-service teachers could not always bring a solidly grounded methodological explanation, although they were provided with the necessary theoretical knowledge. One of the reasons for this might be the effect of their belief systems on teaching. In other words, pre-service teachers' belief systems (beliefs about English, beliefs about learning, and beliefs about teaching) might be affecting their perceptions of the rationale of classroom actions. In addition, their own experience as a language learner might be another factor which affects their belief systems and their understanding of what is going on in the classroom. Also, being inexperienced in teaching might be an important factor, too.

Golombek (1998) brings three suggestions to teacher educators for training better-developed and more effective teacher candidates. The first suggestion is to connect personal practical knowledge to empirical knowledge. Teacher educators should provide their students with the opportunity of filtering theoretical knowledge through experiential knowledge. This may be accomplished by giving pre-service teachers more opportunities of practicing their theoretical knowledge in classroom demonstrations, and by making them discuss their actions in these demos.

The second suggestion Golombek (1998) makes is to foster reflection to contextualize theoretical knowledge. Putting more emphasis on reflection might help pre-service teachers become more aware of their classroom actions. These reflection sessions might be better in a dialogical form, in which the mentor teachers (teacher educators) make comments to help the pre-service teachers think about the rationales of what they are doing in the classroom.

Golombek's (1998) third suggestion is to explore the role of emotions and beliefs. Teacher educators should be aware of the strong effect of pre-service teachers' belief systems on their classroom actions, and they should try to explore their students' underlying beliefs which might affect their perceptions of classroom actions.

Consequently, any teacher education program that wants to train teacher candidates who are aware of the rationales of all the classroom actions they employ should go beyond only providing the teacher candidates with the necessary methodological knowledge. Pre-service teachers' belief systems and past learning experiences as language learners should always be taken into consideration while designing language teacher education programs.

Pre-Service Teacher Anxiety Throughout Teacher Practicum

Mr. Ali Merc

Anadolu University

Abstract

This study aims to investigate the level of student teacher anxiety that student teachers from different majors of study experience and whether the level of student teacher anxiety that student teachers from different majors of study experience change throughout the practicum. A revised version of Student Teacher Anxiety Scale (STAS) was administered to 403 student teachers completing their teaching practicum in different departments at Anadolu University Faculty of Education. The reliability analyses showed that the new version of the scale has a high reliability ($\alpha=,916$).

The results of the first administration of the scale which was before the teaching practicum showed that student teachers were moderately anxious about the items in the scale. When each department is taken into consideration, it is seen that student teachers from the Department of Mathematics Teacher Training for Primary School form the less anxious group among all groups. On the other hand, student teachers from the Department of Social Sciences Teacher Training were the most anxious group. The results of the one-way ANOVA analysis conducted to see whether there were any significant differences among the departments showed that there was a significant difference among the level of anxiety of student teachers from different departments. Moreover, Scheffe's multiple comparison test was run to see the specific differences among the departments. The analyses revealed that the difference between English Language Teacher Training and Mathematics Teacher Training for Primary School was significant. The second administration of the scale was through the end of the practicum process while students were delivering their lessons as practice teachers. 348 student teachers from seven departments participated in the study by answering the STAS. Once again, student teachers were moderately anxious about the items in the scale. When each department is taken into consideration, it is seen that student teachers from the Department of English Language teacher Training form the less anxious group among all groups. On the other hand, student teachers from the Department of French Language Teacher Training were the most anxious group. . The results of the ANOVA analysis

showed that there was a significant difference among the level of anxiety of student teachers from different departments. Moreover, Tamhane's multiple comparison test was run to see the specific differences among the departments. The analyses revealed that the differences between English Language Teacher Training and German Language teacher Training, French Language Teacher Training, and Social Sciences Teacher Training were significant. In order to find out whether there is a significant change between the two administrations of the STAS, a paired samples t-test was run. The result showed that there was a significant difference between the two administrations, that is to say, the student teachers, regardless of department, were less anxious in the second administration. Furthermore, in order to find out the departmental changes between the two administrations, a 7X2 Mixed-design ANOVA was conducted. It was found that there was a significant difference when time X department relationship is considered although time itself did not yield any significance.

PRE-SERVICE TEACHERS' BELIEFS ABOUT CONDUCTING READING CLASSES

Dr. Aysel Bahce

Ms. Ozlem Kaya

Anadolu University

Abstract

Beliefs of pre-service teachers play an important role in education programs as their belief systems have an effect on how they view the content of the program they study and the instructional materials, tasks, and teaching techniques they are exposed to. Any new information has to compete with the existing beliefs of pre-service teachers; therefore, teacher trainers should take these beliefs into account. Emphasizing the importance of knowing "where they (the pre-service teachers) are 'at' now" Wallace (2001) adds that "no training and supervisory procedures can function with maximum effectiveness without this information" (p.51).

However, identification of pre-service teachers' beliefs prior to their education is not enough. The changes in their beliefs, if there is any, should also be identified. If learning is "as a process of change" (Taggart and Wilson, 1998, p. 6), there should be changes in these would-be teachers' beliefs as they learn their profession by receiving two types of information: received knowledge and experiential knowledge. Received knowledge means "facts, data, theories, etc. which are either by necessity or by convention associated by the study of a particular profession (ibid., p.52); and, "the experiential knowledge" is "professional action (practical experience)" (ibid.). "Through simultaneous processes of assimilation and accommodation, new information is added to an existing repertoire of knowledge" (ibid.). If the mission of the program is to train good teachers, by the end of their education, these future teachers should develop a better understanding

of learning a language and the processes involved in all four skills and their teaching. Therefore, this is expected to have an effect on would-be teachers' beliefs.

Therefore, this cross-sectional study aimed at finding out ELT students' beliefs about teaching reading skill in a language classroom. An additional aim was to find out if the education students go through in the program caused any change in their beliefs about teaching reading. In total, 400 ELT students (100 students from 1st, 2nd, 3rd, and 4th years) participated in the study. For data collection, a four-part questionnaire was used. This questionnaire included Likert scale items, ranking items, and open-ended questions.

In the presentations the findings related with pre-service English language teachers' beliefs about conducting reading classes and the changes in their beliefs throughout their education in the program will be shared. Besides the implications of these findings for pre-service teacher trainers and curriculum developers will be discussed.

Keywords: pre-service teachers' belifs,teaching reading, teacher cognition, L1 use, reading aloud

Discovering Pre-Service Teachers' Beliefs About Teaching Reading

Ms. Ozlem Kaya, Anadolu University

Dr. Aysel Bahce, Anadolu University

Abstract

Teachers hold some beliefs about teaching and learning, and bring these beliefs into the classroom with them. Different beliefs lead to different types of classroom practices such as activities, tasks, materials, and teaching techniques. The effect of beliefs on teachers' classroom practices also put pre-service teachers' beliefs on the agenda because their belief systems have an effect on how they view the content of the program they study and the instructional materials, tasks, and teaching techniques they are exposed to. Any new information has to compete with the existing beliefs of pre-service teachers, so teacher trainers should take these beliefs into account. Up to now, there have been several research studies on beliefs of pre-service teachers with regard to general issues such as teaching in general or classroom management specifically; however, the number of studies focusing on teaching language skills is limited. Therefore, the present study focuses on ELT students' beliefs about materials used in EFL reading classes.

The aim of this study was to find out pre-service teachers' beliefs about materials used in EFL reading classes and the effect of training they receive in the program on their beliefs. It was conducted at Anadolu University, ELT Department and 100 students from each year (1st, 2nd, 3rd and 4th year) participated in the study. For data collection, a three-part questionnaire including both Likert scale items and open-ended questions was administered. The items in the questionnaire focused on content and language—vocabulary and structure—of both intensive and extensive reading materials. For the analysis of quantitative data descriptive statistics was used and qualitative data was categorized according to their themes by two different raters independently. In the presentation the findings and their implications will be shared and discussed.

Keywords: TEACHING READING, MATERIAL SELECTION, TEACHERS' BELIEFS, PRE-SERVICE TEACHERS' BELIEFS

Student Teachers' Views Regarding Primary Education Curriculum

Res.Assist. Tuba Cengelci
Faculty of Education, Anadolu University
Eskisehir, Turkey

Abstract

2004 primary education curriculum was prepared in light of constructivist approach in Turkey. The main purpose of the present study is to determine student teachers' views regarding primary education curriculum. Consequently, it was found that student teachers thought that new primary education curriculum disapproves memorizing, requires using more resources and investigations. Student teachers expressed that they have sufficient theoretical knowledge about the curriculum, but they need more practical experience to develop their competencies.

Key Words: Student teacher, primary education curriculum

INTRODUCTION

The Ministry of Education redesigned primary education curriculum in Turkey. The newly designed curriculum was applied in 9 cities in 2004- 2005 academic year; and it was conducted all over the country in 2005-2006. The justifications of this curriculum are defined as reflecting the developments in science and technology to education studies, enhancing the quality and equivalence in education, providing sensibility to economics and democracy, development of individual and national values within global values; keeping the integrity of program for 8-year basic education and lastly adapting the teaching programs according to European Union norms. There are considerable changes in the new primary school curriculum. For instance, attainments include knowledge, skills, attitudes, and values besides observable behaviors in the new primary school curriculum. Curriculum was designed with flexibility to adapt changes dynamically. Alternative assessment approaches are considered in consistent with constructivist approach (MEB, 2005, p.18). Yasar et al., (2005) stated that themes are given more importance instead of units in the new curriculum. Eight main skills which are critical thinking, problem solving, being able to do scientific research, creative thinking, entrepreneurship, communication, using information technology, and using Turkish language accurately are placed into the curriculum. Moreover, sub disciplines as spor culture and olympic education, health, environment, counseling, natural disaster education, and earthquake are determined and related with courses. Gozutok et. al. (2005) indicated that new curriculum helps students be much more active in learning-teaching process, and expressing themselves.

2004 primary education curriculum was prepared in light of constructivist approach. Constructivism is a learning theory that identifies how structures and deeper conceptual understanding occur instead of only representing isolating learned behaviors through reinforcement (Fosnot, 1996, p.30). Roots of the constructivism can be seen in Vico's expositions. He expressed that "to know" refers to know how to make. In other words, one knows a thing only when one can tell its components (Von Glaserfeld, 1989, p.123). In today's educational understanding, Jean Piaget raised the basic idea that composes constructivism differ from other theories of cognition. The idea is based on the fact that knowledge cannot have the goal of producing representations of a distinct reality, but instead it has an adaptive function (Von Glaserfeld, 1996, p.3).
Constructivism explains learning process with questioning, interpreting, and analyzing information; using this information and thinking process to form, improve and change our meaning and understandings belong to concepts and ideas; and integrating current experiences with our past experiences regarding a subject (Marlow and Page, 1998, p.10). Constructivist learning settings require learners to take responsibility of learning and be more active. Therefore, constructivist learning settings are designed for the purpose of providing interaction between learners and their environment (Yasar, 1998, p.70).

Becoming a constructivist teacher is required to consider some principles as follows (Brooks and Brooks, 1999, pp. 103-117):
• support student autonomy and initiative,
• use cognitive terminology such as classify, analyze, predict, and create,

- allow student responses to drive lessons,
- examine students' perception of concepts before sharing their own understandings of those concepts,
- encourage students to participate in dialogue, both with the teacher and with other students,
- encourage student to ask thoughtful, open-ended questions
- investigate basis of students' initial responses,
- include students in experiences that might engender contradictions to their initial hypotheses and then encourage discussion,
- wait some time after posing questions,
- provide time for students to construct relationships and create metaphors,
- nurture students' natural curiosity.

Richardson (1997, p.10) pointed out that constructivist teacher education can be seen in two different forms today. In the first one, instructors try to teach student teachers how to teach appropriately within the framework of constructivist approach. Generally, teaching of a particular subject is applied in this type including direct instruction in theory and practice. In the second form, it is important to encourage student teachers to do investigations of hypothesis and perspectives which may be used by them when they begin to teach. Both forms of constructivist teacher education have some advantages and disadvantages. Therefore, Richardson (1997, p.11) underlined the fact that constructivist teacher educators may develop an approach that is coherent with the content of the course and recognizes differences in the nature of constructivist teaching according to the subject matter that is being taught.

In our time, student teachers are expected to learn how to encourage students participate in teaching learning process and then use students' existing knowledge and ideas as a basis to help them construct new, more reasoned, more accurate or more disciplined understandings. Therefore, to learn how to engage students actively is the key principle for successful teaching (Holt-Reynolds, 2000, p.22). Selley (1999, p.3) pointed out that constructivism can be integrated with any curriculum. In this regard, student teachers can manage to do successful teaching with adoption of constructivist principles which give priority to children's own learning. Student teachers who will apply curriculum in primary schools are expected to know primary education curriculum very well. Also, they have to integrate their field knowledge with constructivist principles to realize student based active learning in the classroom.

The main purpose of the present study is to determine student teachers' views regarding primary education curriculum. The following research questions were addressed in the study:
- What do student teachers think about primary education curriculum?
- What do student teachers think about constructivist approach?
- What do student teachers think about difference between previous and current primary education curriculum?
- What do student teachers think about their competencies to apply primary education curriculum?

METHODOLOGY

This study aims to determine student teachers' views regarding primary education curriculum through semi-structured interviews using of a qualitative research approach. The participants of the study were 21 fourth grade student teachers enrolled in the Primary School Teacher Training Program at Anadolu University, Faculty of Education, in Turkey. Ten of the student teachers were male and eleven were female. The interview form was examined by field experts for content validity and one student teacher was interviewed for the pilot study. The final form was completed after student teachers' full range of perceptions regarding the questions in the interview form was determined. The interviews were conducted by using an audio-record instrument.

The data were analyzed descriptively. The data obtained from descriptive analysis were summarized and interpreted related to determined themes. For the purpose of calculating the reliability, the data were examined by two experts. Miles and Huberman's (1994) formula was used to calculate the reliability. As a result of this calculation, the reliability of the study was found as 89.2%.

FINDINGS

This section includes findings of the study. Frequencies of student teachers' were shown in the tables. Opinions were listed from the most repeated opinions to the least repeated ones and opinions were cited directly under the tables. Table 1 shows student teachers' opinions concerning primary education curriculum.

Table 1. Frequencies of Student Teachers' Opinions Related to Primary Education Curriculum

	f
Lack of equipment and background information make applying curriculum difficult.	12
Curriculum is student centered.	7
Entertaining learning via activities and enriched materials take place in the curriculum.	7
There are positive changes compared to the previous curriculum.	5
Curriculum is proper to constructivism and characteristics of primary school children.	4
Activities take too much time.	2

As seen in Table 1 most of the student teachers thought that lack of equipment and background information are the main obstacles which create difficulty in applying the curriculum. Regarding primary education curriculum, one student teacher said *"When I reviewed new primary education curriculum for the first time, I thought that it is very nice. But I think physical conditions of schools and background information of primary school teachers regarding constructivism are not appropriate to apply new curriculum. I think application of curriculum will be better over time."* Additionally, student teachers thought that curriculum is student centered, and entertaining learning via activities and enriched materials take place in the curriculum. Regarding this point one student teacher said *"I think this curriculum prevents students from memorizing knowledge. Students are active learners and focus on primary resources. Curriculum provides an investigative and active process for students in enriched learning settings with various resources."* Moreover, student teachers emphasized that there are positive changes compared to the previous curriculum. They said that curriculum is proper to constructivism and characteristics of primary school children. However student teachers said that activities might take too much time.

Table 2. Frequencies of Student Teachers' Opinions Related to Constructivist Approach

	f
Supervisory role of teacher	17
Student centered approach	16
Process and objective assessment with multi assessment tools and techniques	13
Entertaining and enriched learning settings	10
Active learning	8
Construction of knowledge by learners in their mind by themselves	5
Supporting multidimensional development of children	5
Learning by investigating	5
Requiring equipment and material	5
Proper to individual differences and necessities	2
Cooperative and interactive learning	2

Table 2 shows frequencies of student teachers' opinions related to constructivist approach which is the main theory the curriculum based on. Student teachers stated that supervisory role of teacher, student centered approach, and process and objective assessment with multi assessment tools and techniques are the most important point regarding constructivist approach. One of the student teacher said *"Constructivist approach is really an effective approach. It helps students learn and construct knowledge in their mind on their own. Teachers are supervisor in that approach. Interaction is very*

important. Teachers do not always give students instructions what to do. Students are telling their ideas, too. They answer questions, and participate in activities. They have many alternative activities." Another one said *"I can say that constructivist theory is perfect theory for me. Because it is completely student centered. I think it increases active participation time of students in the course. It makes students eager to do the activities."* According to student teachers entertaining - enriched learning settings and active learning are the other key descriptors of constructivism. Furthermore, construction of knowledge by learners in their mind by themselves, supporting multidimensional development of children, learning by investigating, and requiring equipment and material are the other themes regarding constructivist approach. Lastly, student teachers indicated that constructivism is proper to individual differences and necessities, and it provides cooperative and interactive learning for students.

Table 3. Frequencies of Student Teachers' Opinions Related to Differences between the Previous and Current Primary Education Curriculum

The previous primary education curriculum	f
Teacher centered approach	9
Lecturing and questioning method based on teaching-learning process	5
Result oriented assessment	4
Rote learning	4
Detailed and redundant knowledge	3
Intensive homework	2
Nonrecognition of students adequately	1
Current primary education curriculum	**f**
Process based assessment	13
Student centered approach	12
Learning by doing and living via activities	10
Courses and content changes	9
Instruction for individual differences and development	9
Supervisory role of teacher	7
Long terms studies and research assignments	5
Flexible program	4
Various teaching methods, techniques and materials	4
Entertaining and effective learning	4
Creativity and high level thinking skills	4
Interactive and cooperative studies	3
Association between courses and sub disciplines	3

Frequencies of student teachers' opinions related to differences between the previous and current primary education curriculum are shown in Table 3. Student teachers emphasized that the previous curriculum was teacher centered, and generally lecturing and questioning methods were used in teaching-learning process. For instances, one of them stated that *"When new curriculum is compared with the previous one, teacher was active in the previous curriculum applications, and generally lecturing and questioning methods were preferred for transferring knowledge to students. They did not find using various teaching methods and materials necessary. But now it is changed. Self impression of student is placed to forefront. Furthermore, assessment is different. Previously, student was given an exam, if s/he could manage to pass the exam, s/he was accepted successful. New curriculum requires doing assessment during the course process with multiple assessment tools and techniques."* Another one said *"Content of the courses was changed. For example in Life Science course it is aimed at relating real life with content of the course. Also subjects are tried to be connected with sub disciplines. Teachers are supervisors and students learn actively."* Student teachers believed that the previous curriculum focused on result oriented assessment, rote learning, detailed and redundant knowledge, and intensive homework. On the contrary, according to student teachers current primary education curriculum requires process based assessment, students centered structure, and learning by doing and living via activities. Current primary education curriculum brings courses and content changes. It provides instruction for individual differences. Student teachers pointed out that supervision of teacher, long terms studies and research assignments, flexibility, various teaching methods, techniques and materials, entertaining and effective learning, creativity and high level thinking skills, interaction and cooperative studies, association between courses and sub disciplines are important points about current primary education curriculum.

Table 4. Frequencies of Student Teachers' Opinions Related to Their Competencies to Apply Primary Education Curriculum

Needed **c**ompetencies	f
Teaching profession knowledge	15
Self-improvement and creativity	13
Professional satisfaction	6
Field knowledge	5
Being aware of individual characteristics and differences of children	5
Curriculum knowledge	4
Self-confidence and patience	4
General culture	4
Using technology effectively	4
Being aware of current events and environment	3
Student teachers' own competencies	f
I acquired required competencies	
Our education is adequate	14
Micro teaching studies are beneficial	3
Our program is consistent with constructivism	2
Instructors are efficient	2
I could not acquire required competencies	
I do not believe that our education is adequate	4
I am good at theoretical knowledge but I am not good at practice	4

As seen in Table 4, student teachers thought that teaching profession knowledge is the most important needed competency for applying primary education curriculum. One of them stated that *"Student teachers should have teaching profession knowledge and know how to put this knowledge into practice. How will they apply activities in the classroom? Which materials will they use? How will they use their creativity if they cannot find these materials in their schools? How will they assess students? Students teachers need to answer these questions."* Another one indicated that *"Initially, student teachers should primary school curriculum very well. Apart from this, they should know how to use educational materials. They should develop themselves for the purpose of being a good teacher."* According to student teachers, self-improvement and creativity, professional satisfaction, field knowledge, being aware of individual characteristics and differences of children, curriculum knowledge, self-confidence and patience, general culture, using technology effectively, and being aware of current events and environment are other needed competencies for applying primary education curriculum. When student teachers' own competencies examined, most of them stated that they acquired needed competencies. One of the student teachers indicated that *"I think I can apply constructivist approach in the classroom. Because all our education was constructivism oriented including micro teaching activities."* They emphasized that their education is adequate, micro teaching studies are beneficial, their program is consistent with constructivism, and instructors are efficient. But few of student teachers think that they could not acquire needed competencies. One of them said *"I think program does not prepare us for the real life. We have all necessary equipment and materials for teaching here. But we cannot apply our plans in primary schools. Absence of proper learning settings and teaching materials has an adverse effect on our teaching."* Student teachers pointed out that they do not believe their education is adequate. Also, they thought that they are good at theoretical knowledge but they are not in practice.

Table 5. Frequencies of Student Teachers' Suggestions

	f
Students teachers should be trained as individuals who investigate, produce, think, and develops themselves	3
Primary School Teacher Training Program should have much more practice	11
Students teachers should be educated regarding classroom administration adequately	2
In-service training should be organized for primary school teachers	4
Instructors should be model for constructivist applications	1
Numbers of teaching courses should be increased	3

Frequencies of student teachers' suggestions related to difference between previous and current primary education curriculum are shown in Table 5. In general, student teachers offered that Primary School Teacher Training Program should have much more practice. One of them said that *"Education of our university is very good. Also, our instructors are qualified. My only problem is lack of practice. I feel myself incompetent arising from lack of practice. I think it would be better teaching practice studies were conducted during the last two years in Primary School Teacher Training Program. There should be much more real practice opportunities in Primary Schools instead of observation activities."* Similarly, another student teacher said that *"Our instruction is good but not related to real life sufficiently. I wish we had much more chance to practice. I think we will have difficulties because of lack of practice."* Additionally, student teachers recommended that in-service training should be organized for primary school teachers. It can be said that student teachers focus on teaching methodology courses, classroom administration, qualities of student teachers, and instructors' constructivist applications.

DISCUSSION, CONCLUSION AND RECOMMENDATIONS

Consequently, it was found that student teachers have positive views on current primary education curriculum. They thought that curriculum requires student centered understanding and entertaining learning with activities and enriched materials. On the other hand, the findings of the study underlined the fact that there are some obstacles for applying the curriculum in the primary schools perfectly. For instance, lack of equipment and background information make applying curriculum difficult. Besides, student teachers emphasized that activities take too much time which will make planning harder. Similar problems were found out by other researchers. For instance, Yaman (2009) investigated relationships between classroom overcrowding and the Turkish language education curriculum in terms of the applicability in overcrowded classes. Moreover, the study focused on the problems encountered in the teaching process and the sufficiency of time for the program. Results of the study showed that according to teachers, activities do not meet the objectives due to pressure of time resulting from overcrowding. In light of the findings, suggestions were offered such as doing group work to lower the effects of overcrowding. Birgin, Tutak and Turkdogan (2009) examined the primary school teachers' views about the new Turkish primary education mathematics curriculum. The results of this study showed that teachers have been aware of distinguishing the new and old mathematics curriculum sufficiently but, teachers have needed knowledge and skills for developing teaching material and implementing student-centered instruction and using alternative assessment methods. It can be said that although primary education curriculum has contemporary and student centered understanding, some factors as crowded classrooms, insufficient physical conditions of schools, and in-service training needs make applying curriculum difficult.

Student teachers' opinions regarding constructivist approach can be concluded that constructivism is a learning approach which requires supervisory role of teacher, student centered understanding, process and objective assessment with multi assessment tools and techniques, entertaining and enriched learning settings, and active learning. It can be said that student teachers are aware of structure and implications of constructivism. Dharmadasa's (2000) study titled "Pre-service Teachers' Perspectives on Constructivist Teaching and Learning" focused on how pre-service teachers perceived constructivist teaching and how they perceived students' learning. Findings of the study showed that pre-service teachers were more concerned about aspects of students' learning than aspects of teaching. Most of them appeared to integrate the theoretical knowledge they learnt from coursework in college with practice but not project their thinking to actual classroom teaching. Pre-service teachers believe that they should develop appropriate knowledge and skills to realize constructivist teaching with confidence. Karadag et al. (2008) found out that primary school teachers did not think that they are adequate to apply constructivist learning approach in the classroom. Researchers recommended that in-service training programs which are not only consist of theoretical knowledge but also have effective application cases should be organized for teachers. Moreover they suggested that student teachers should be educated with constructivist approach. In the scope of related literature it can be said that teachers and student teachers need to see much more example practices, and resources about constructivist approach.

When student teachers were asked to compare the previous curriculum with the current curriculum they stated that current one is better in terms of student activity, enriched teaching-learning process, and performance based assessment during the process. Changes are beneficial and important according to the student teachers. This finding of the study supports the finding regarding student teachers' views on current primary education curriculum which clarified that student teachers have positive views about curriculum and changes. Yangin (2005) examined primary education Turkish course curriculum and the guidebook by comparing it with the previous Turkish course curriculum. Findings of the study revealed that both curricula include similarities as well as differences. The current curriculum is more explanatory than the previous one. Although the current curriculum offers many positive suggestions in theory, problems of insufficiently qualified teaching staff and inadequate equipment might be encountered in practice. Lastly, revising the current curriculum is recommended in the study in accordance with the outcomes of the curriculum in practice. Generally, it can be said that the new curriculum aimed at bringing positive changes. But this positive understanding should be supported with sufficient equipment and in-service training for teachers and student teachers.

Generally, student teachers believe that they acquired needed competencies to apply primary education curriculum which was prepared in light of the constructivist approach. However, they suggested much more practice should be taken place in primary school teacher training program. The study revealed that student teachers have positive views about their pre-service education. This finding is consistent with the findings of other studies. For example, Ozturk, Deveci and Karaduman (2007) examined primary school student teachers' self-efficacy perceptions regarding social studies curriculum. Findings of the study showed that primary school student teachers have high level of self-efficacy in terms of applying primary school social studies curriculum. Gurol and Serhatlioğlu (2007) determined self-efficacy levels of the 4th grade students enrolled in primary school teacher training program about applying new primary school curriculum. Results of the study showed that student teachers have information about new primary school curriculum, and they feel competent to apply curriculum. Arslan and Ozpınar (2008) found out that in education faculties, student teachers acquire necessary qualities and competencies which are expected from the Ministry of National Education. It can be said that although teacher training programs meet student teachers' needs, programs can be developed with more practice opportunities.

To conclude, it might be stated that student teachers have positive views about primary education curriculum, but they prefer to do much more teaching practice to apply curriculum better in their professional life. Additionally, they would like to learn how to manage real life professional problems in their pre-service teacher training process.

Following suggestions can be made based on the findings of this study:
• The close partnership between universities and primary schools can be developed for the purpose of practicing curriculum better.
• Lecturers from university can give courses for in-service training programs for primary school teachers regarding Primary Education Curriculum.
• Number of teaching methodology and practice courses can be increased in Primary School Teacher Training Program.
• Student teachers can be given opportunities to go and teach at different primary schools in different socio- economic regions.

AN ACTION RESEARCH IN PRIMARY SCHOOL TURKISH COURSE RELATED TO HELPING CHILDREN GAIN CRITICAL LITERACY THROUGH ADVERTISEMENTS

Ms Dal Sibel
Anadolu University and Research Assistant
sdal@anadolu.edu.tr
Mr. Mehmet Gultekin
Associate Professor
and Anadolu University

1. INTRODUCTION

Since democracy has a common and long standing place as a life style, it pushes people to behave actively in the search of the most suitable one among the choices. In this respect, individuals should be able to make the most accurate decision by thinking critically while buying a product, signing a contract, watching an advertisement and reading newspaper articles. This equipment needs critical literacy. Thus, one of the most important duties of our education system is to educate individuals who are critical readers.

With the help of critical literacy that is possible to teach starting from the first years of primary school, it is aimed to help children to see hidden meanings other than the ones provided to them by questioning written, oral or visual messages. Critical literacy teaching would provide students with the opportunity to question the conditions, events and people that they face during their life. Thus, students would have a chance to recognize incorrect information provided to them when they come across in books, written and visual media, and their social life, or social and global subjects.

Critical literacy activities are kinds of activities that could be held in many courses from social sciences to science and technology. However, having reading, writing, and visual reading and visual presentation skills among language skills which are aimed to be taught in language art course would help teach critical literacy primarily in this course and then to be transferred to other courses.

In Turkey, language art is held with the name of Turkish. How to teach critical literacy in Turkish Courses was seen as a problem in this study. In this respect, during the application process, discussions-debates depending on questioning are held through advertisements having the theme of "Production-Consumption and Effectiveness" were shown, and structured teaching activities like social action projects were conducted. With the help of this, students were able to question the visual images and their messages.

1.2. The Purpose of the Study
In this study, it is aimed to investigate how advertisements could be used in order to help students gain critical literacy in Primary School 5th grade students.

2. Methodology
2.1. Research Model
This study will be designed as an action research because of the features of the stuation to be investigated.

Participants-Atmosphere
The participants of the study are class 5/A students attending to Ticaret Odası İlköğretim Okulu (Chamber of Commerce Primary School)in Eskişehir in 2008-2009 spring term. The class consists of 22 students who are sitting in U design in the classroom.

2.2. Data Collection Tools
In big part of the study, which aims to help students gain critical literacy skills in Turkish courses in fifth grade students in primary school, the application process of the activities which are used to help students gain critical literacy skills through advertisements were video recorded. Students were also asked about their opinions related to the process. During the study, students were asked to write about what they experienced that day, what they learned, and their feelings and thoughts about the activities in the last five minutes of the lessons. On the other hand, homework, notebooks, rubrics and self-evaluation forms of the students were accepted as documents and investigated by the researcher. In this

way, the reliability and validity of the study were tried to be provided using more than one data sources and types. During the presentation or interpretation of the results some excerpts will be taken from these data to emphasize some part of statistical data.

2.3. Data Analysis
The analysis of the data in this study will be held in two phases as analysis during data collection and analysis after data collection together with descriptive analysis of the qualitative data. In the descriptive analysis of the data, first, the inventory will be formed, and then a framework for the descriptive analysis will be prepared, analysis of the data according to the prepared framework will be held, findings will be defined, and lastly, the findings will be interpreted.

RURAL EDUCATION APPLICATIONS IN PRIMARY EDUCATION IN TURKEY

Assoc. Prof. Dr. Mehmet GULTEKIN

Anadolu University
Education Faculty, Department of Primary Education
Eskisehir, Turkey

mgulteki@anadolu.edu.tr

Abstract

The aim of this study is to describe the applications of multi-grade classroom, transported education and areas based boarding schools and analyze the reseach findings obtained under this topic in Turkey. As a result of the study carried out, it is found out that the application of multi-grade classroom application in the primary education system should be decreased and the number and effectiveness of transported education and area based boarding schools should be increased.

Key Words: Rural education, primary education

INTRODUCTION

The National Education System in Turkey, determined by National Education Basic Act (No: 1739), consists of two main parts, namely "formal education" and "non-formal education". Formal education includes pre-primary education, primary education, secondary education and higher education institutions. Primary education involves the education and training of children in the age group of 6 to 14. Primary education is compulsory for all citizens, boys or girls, and is given free of charge in public schools. Primary education institutions are schools that provide eight years of uninterrupted education, at the end of which graduates receive a primary education diploma. The purpose of primary education is to ensure that every Turkish child acquires the basic knowledge, skills, behaviors, and habits to become a good citizen, is raised in line with the national moral concepts and is prepared for life and for the next education level parallel to his/her interests and skills (MEB, 2002). According to 2008-2009 acdemic year data of Ministry of National Education, in Turkey, primary education consists of 33.769 schools, 10.709.920 students and 453.318 teachers.

THE WAYS USED IN ORDER TO MEET THE NECESSITIES OF PRIMARY EDUCATION OF THE STUDENTS IN RURAL AREAS IN TURKEY

Since there are a lot of small and scattered allocation units in Turkey, it is very difficult to provide eight-year primary education opportunity in all units because providing eight-year compulsory education in 79.319 units would cause education costs to increase to a level that cannot be afforded, and a decline in quality of education. In this respect, some ways are utilized in order to provide better education possibilities to pupils living in small allocation units, spread primary school education sufficiently throughout the country, provide opportunity and possibility equation in education, and increase quality. These are; transporting primary children in rural areas to school, Regional Boarding Primary Schools, or YIBOs, Primary Schools with Hostels, or PIOs, and Multigrade Classrooms.

Transported Education: Transported Education or transported primary education is an application for students in scattered or with less populated areas having no school or doing teaching in multigrade classes to help them benefit from equal opportunities and to provide more quality in education by transporting them to central primary schools on a daily basis (MEB, 2002). In Turkey, transported education is an application which was started in order to help children who are at an age to start education and students who are at schools, where multigrade classes applied in areas having no school, low population and being scattered, to help them have high quality education, to provide equal opportunities in education and to help them benefit equally from eight-year compulsory and continous education possibilities.

Transported education is regulated according to "Transported Primary Education Regulations". Following criteria is considered according to regulation (MEB, 2005a) in choosing allocation units whose children will be taken into transported education:

- Having no school in the allocation unit,
- Having a school building which is made unavailable by natural disasters or other reasons,
- Having less than 10 students in total in 1st, 2nd, and 3rd grades,
- Having insufficient number of classes, and less than 60 students in 4th, 5th, 6th, 7th, and 8th grades in the primary school at the allocation unit,
- It is necessary for the allocation unit to have at least 2 kilometers distance with the transport centre primary school according to weather conditions and road safety regulations. If needed lowering this distance to 1.5 kilometers is due to the decision taken by Planning Commision.

The transporting costs and lunch costs of the students are covered by government.

Regional Boarding Primary Schools (YIBO) ve Primary Schools with Hostels (PIO): According to Ministry of National Education Primary Institutions Regulation, students in compulsory education age, who reside in units with no schools or complete first five grades in schools with multigrade classes, are accepted in regional boarding primary schools (YIBO) and primary schools with hostels (PIO) (MEB, 2002).

Regional boarding primary schools are the ones which are established to provide eight-year compulsory education needs of the students who are at compulsory education age and reside in low populated and scattered places. These schools provide opportunities for students, such as accommodation and food during their education. *Primary Schools with Hostels*, on the other hand, is a school in central residential areas without schools, having scattered and low population, or where primary education services cannot be provided. Children at compulsory education age are boarded there free of charge and others living around the school attend daily.

In order to provide primary education services for poor families' children living in villages and towns with no school in rural areas, food, clothing, school books, notebooks, allowences, classroom tools and every needs of the students attending YIBOs and PIOs are paid by the government. Students, who are aged between 6 to 14, and attend YIBOs, benefit from equal opportunities in education under the supervision of the government, this way; it is aimed to develop the area, at which students stay, economically. Covering all the services provided by YIBOs under one centre is an important application to use facilities and human resources effectively and to improve the quality of educational services. PIO's were converted into YIBO's in 2006-2007 academic year.

Education in Multigrade Classrooms: In the Turkish educational system, the term "multigrade classrooms" is used for the case in which one teacher teaches more than one class of different grades at the same time in the same classroom (Aksoy, 2008). Teaching in Multigrade Classrooms is implemented in order to provide primary education to all the students in the society in Turkey.

The reasons for the existence of multigrade classes in Turkey are mostly related to the insufficient number of students, school buildings and teachers (Koksal, 2005). Because in low populated villages having only 45-50 students, it is not possible to build up a school building with five classrooms and nominate five teachers; however, because of the need a building with one or two classrooms is built and one or two teachers are nominatead. On the other hand, in some places, although the number of the students and classrooms are sufficient, the number of the teachers to nominate is insufficient, thus, it becomes an obligation to combine the classes. Moreover, in some other areas, although the number of the students and teachers is sufficient, insufficiency of classrooms makes it an obligation to combine the classess.

2005-2006 academic year in Turkey, a total number of 561.795 students were educated in multigrade classrooms as 214.398 students in 2 grades, 167.053 students in three grades, 16.035 in four grades and 164.309 in five grades together (MEB, 2006).

Numerical data related to education in transported education, regional boarding primary schools and multigrade classes are shown in Table 1.

Table 1. Numerical data related to the applications of multigrade classrooms in primary education, transported education and regional boarding primary schools in turkey in 2004-2005 academic year

Applications	Number of Schools	Number of Students
Transported Education	6337	698.061
Regional Boarding Primary School	299	142.788
Multigrade Classrooms	16.379	587.379
Total	23.015	1.428.228

As seen in Table 1. 587.379 student were educated in multigrade classrooms in 2004-2005 academic year in Turkey. The total number for regional boarding primary schools was 299, and number of students attending these was 142.788. 698.061 students from 29.145 schools were transported to 6.337 schools and continue their education via the transported education. According to this data, 1.428.228 students in 23.015 schools attended to multigrade, transported or regional boarding primary schools in Turkey.

According to data related to 2008-2009 academic year, on the other hand, total number of YIBOs is 593 and number of students attending these schools is 262.838. The number of transported schools is 5851 and student number is 683.415 (MEB, 2009a; MEB, 2009b). According to this, the number of YIBOs and students attending to these schools is increased.

In Turkey, Ministry of National Education aims to increase the quality of education in primary schools (Transported, YIBO, PIO) which educate students who live in small allocation units, increase the number of YIBO and PIOs by improving them, and decrease the number of multigrade schools at the lowest number possible (MEB, 2005b).

RESEARCH RESULTS ACCORDING TO TEACHING APPLICATIONS IN TRANSPORTED EDUCATION, REGIONAL BOARDING PRIMARY SCHOOLS/ SCHOOLS WITH HOSTELS AND MULTIGRADE CLASSES IN PRIMARY EDUCATION IN TURKEY

Transported education, regional boarding schools, schools with hostels and multi-grade classes which are among the models developed and applied in order to create equal opportunities for education in Turkey, promote quality and contribute to the development of individuals and different regions are still valid. These applications have a crucial function to provide primary education to students in places where allocation units are scattered and the number of students is scarce. Especially with the passing to continuous eight year education, these applications have been accelerated and there have been many studies conducted. These studies give important information about the effectiveness and problems of the applications mentioned above. The studies in the literature about the transported primary education have put forward these results:

Studies related to transported Education, reveal results that transported education is, in fact, beneficial. It is also observed that with the help of "Transported Education", which affects schooling rates positively and provide effective participation in education, increased the success level of the students continuing their education through it (Kaya and Aksu, 2009, s.177). Principals, teachers and

parents are satisfied with transported education and expects it to be continued (Koc, 2000; Buyukboyaci, 1998; Ozkan, 1997; Karakutuk, 1996; Altunsaray, 1996). Studies related to transported education shows that it assumes an important role in eliminating opportunity and possibility unequality (Kaya ve Aksu, 2009, s.186), and that students who are transported are affected by it positively, have more qualified education, and showed significant increase in their school success (Bulut, 2003; Koc, 2000; Yilmaz, 1998; Buyukboyaci, 1998; Ozkan, 1997; Karakutuk, 1996; Altunsaray, 1996). Related to these, with the help of transported education, students have the opportunity to speak and write better in Turkish. Moreoever, transported education helps eight-year compulsory education to spread, and multigrade classrooms to be decreased (Bulut, 2003; Koc, 2000; Buyukboyaci, 1998;Yilmaz, 1998). Furthermore, it is also indicated that, opportunity and possibility equality was mostly formed, students had their schools where they would continue their education with better opportunities, they attended social and cultural activities more, and they benefited from health services sufficiently (Buyukboyaci, 1998; Yilmaz, 1998; Ozkan, 1997; Karakutuk, 1996). In addition to all these, it is stated that mostly, girls and poor-family children obtained education opportunities, they were provided with more qualified teachers, sufficient number of classrooms, laboratories and education areas, also, student numbers increased, multigrade classroom numbers decreased and the cost of education was lowered with transported education (Karakutuk, 1996).

Although there are findings suggesting that transported education is beneficial, there are also other findings that it is not beneficial. As a matter of fact, it was found out that most of the parents do not want the transported education and states that discontinuing the transported education and opening the schools back would be more beneficial (Isik ve Maya, 2003). Moreover, another finding claims that sense of efficiency of staff working at primary schools carrying out transported education is less than the ones working at primary schools doing normal education (Bastepe, 2002). The other negative finding claims that students in a central school are better than the transported students in reaching the goals of Primary School Mathematics Program for 4th and 5th Grades (Cereno, 1998).

Studies also reveal that transported education has a lot of problems. Most of the students in transported education suffer from headaches. Teachers have difficulty in motivating students to the lesson, especially in the first hour in the morning. Most frequently experienced problem is that students come to classes unprepared. Similarly, the attendance level of parents to meetings at school is very low and parents do not pay much attention to their children's education (Ari, 2003). It is also observed that transported students have problems such as, clothing and allowance (Yilmaz, 1998). Students who benefit from transported education also have problems with nutrition, especially related with lunch. Needed support, related to this issue, cannot be provided by Management of National Education and Governorship (Kucukoglu 2001; Buyukboyaci, 1998; Yilmaz, 1998; Ozkan, 1997; Altunsaray, 1996). Physical facilities, tools and supplies of the schools which are central to transported education are not sufficient. Especially, the lack of classrooms put school management in difficulty (Ari, 2003; Bas, 2001; Yilmaz, 1998; Ozkan 1997 and Altunsaray, 1996). The teachers' and personnels' who work at transported education centre schools' being inexperienced, supervision staffs' not being educated about transported education, and not having a policy concerning transported education causes problems, as well (Kucukoglu, 2001). Moreover, it is also claimed that along with having inappropriate transportation vehicles and uneducated transportation staff increase the risk of accidents (Bas, 2001; Buyukboyaci, 1998; Ozkan, 1997; Recepoglu, 2009, s.427). Furthermore, together with leaving school buildings dormant because of transported education (Koc, 2000), high cost of transportation is seen as an important issue (Pusmaz, 2000). Not asking for the opinions of the parents related to transported education (Bas, 2001; Koc, 2000) is mentioned as another issue.

When the results of the studies concerning Regional Boarding Primary Schools and Schools with Hostels are concerned, it is stated that the physical facilities, educational tools and thechnology used in YIBOs are insufficient (Ari, 2002; Yetim, 2001; Erkul, 1997). Staff working in YIBOs is also inefficient both qualitatively and quantitatively (Aras, 2002; Erkul, 1997). As a matter of fact, there is a need for health care personnel, technical staff and cooks along with education staff (Yetim, 2001). Because of these inadequacies, it is revealed that teachers do not want to work at these schools (Ari, 2002). It is also found out that directors of education do not pay much attention to these schools and most of the principals who face problems are not happy with working in those schools (Aras, 2002). According to the findings of the studies, YIBO principals are not educated for management skills, they have low seniority, they are not experienced enough and change places very often, do not have under graduate and graduate leve education in management science and educational management fields, inspectors do not have seniority in inspection, did not work as inspectors or principals in YIBOs, and

did not attend conferences and seminars related to productivity (Erkul, 1997). As a matter of fact, parallel to these findings, it is also revealed that the realization level of social functions for YIBOs is lower than normal primary schools (Kilic, 2001). In another study, on the other hand, the realization of services provided to students in YIBOs was found high (Yetim, 2001).

Recents studies also claim that family support for students educated in YIBOs is dramatically low (Senol ve Yildiz, 2009, s.375). Psychological uneasinesses like homesickness, reluctance and anger in YIBO students are observed very frequently (Ari, 2002). Likewise, depression and despair level of YIBO II level (6th., 7th., and 8th grade) students is found out to be higher than normal primary school II level (6th., 7th., and 8th grade) students (Cetinturk, 2001). Moreover, aggressiveness to self and antisocial aggressiveness level of YIBO II level (6th., 7th., and 8th grade) students appear to be higher than normal primary school II level (6th., 7th., and 8th grade) students (Ay, 2004). Furthermore, it is also observed that writing skills of YIBO 6th. grade students is lower than normal primary schools students (Yesil, 2003). According to another study, there is no significant difference in concept of self of students who study at YIBOs and students who study at normal primary schools. Likewise, it also found out that writing skills of YIBO 6th. grade students is lower than students of normal primary schools (Guven, 1996).

In one of the studies concerning regional boarding primary schools, parents stated that since there is no regional boarding primary school in their village, all the needs of students is being paid by the government, YIBOs having more facilities, doing more qualified teaching and students' being more successful so that they could continue higher education, they send their children to regional boarding primary schools (Sonmez, 2000).

According to studies held in multigrade classes, teachers stated that this application is beneficial in terms of increasing the students sense of helping each other and sharing, and socializing them (Dursun, 2006, s.53). However, success level of students in multigrade classes is lower than the ones studying in normal primary schools. Findings suggest that 4th and 5th grade students in normal primary schools are more successful in Turkish and Mathematics courses than the ones in multigrade classes (Kilinc, 2005). Similarly, there are a lot of problems in first reading and writing in multigrade classes, thus, success level do not come to the desired level (Cinar, 2004). As a matter of fact, the problems faced in first reading and writing teaching are; teachers are not educated enough in pre-service training, parents are careless, methods and techniques which are used in first reading and writing teaching is not known sufficiently and not applied by the teachers, there is lack of time in first reading and writing teaching, and all the students cannot be dealt with individually, first reading and writing teaching is not supported by inspection and guidance system (Kaya, 2005). There are findings concerning problems related to social sciences course (Bugday, 2003). The realization level of environment-related aims of the social sciences course is found to be lower than the other aims (Aydin, 1997).

In a study which aims to reveal school and student factors affecting student success and to find out what should be done to increase success in science courses in multigrade classes, it is observed that 5th grade students are more successful than 4th grade students, and doing research about the course in science classes, using workbooks, doing experiments, bringing tools to do experiments, writing down the results of the experiments done, repeating the instructed topics, relating them to the real life, using tools, forming level and interest groups, doing self-study, using projects, discussion, show and drama techniques increase success (Ucar, 1997). According to another study which determined the effects of mastery-learning application on learning products in multigrade and normal primary schools in villages, mastery-learning is effective both in multigrade classes and normal classes in village schools (Sonmez, 1998).

There are very important problems that teaching in multigrade classes has. Some of the most common problems are that teacher candidates are not prepared well for this kind of teaching; families are uninterested; the methods and techniques of first reading-writing are not known sufficiently and not used appropriately; students cannot get individual care; and they cannot get used to their classes (Kaya ve Tasdemirci, 2005, s. 1). At schools where multigrade classes are, the teachers cannot spare enough time for each grade (Cinar, 2004; Dursun, 2006, s.53). Multigrade classes application has negative effects on teachers' professional enthusiasm and motivation, thus, they do not want to teach in multigrade classes (Sahin, 2003; Ari, 2002). Schools do not have enough teaching tools (Cinar, 2004).

Teachers who are nominated to multigrade classes do not have enough knowledge and skills related to teaching and managing these classes, and they are not given enough knowledge and skills about multigrade classes teaching at educational institutions they graduate from (Ozben, 1997). Similarly, Teaching candidates do not have enough knowledge and skills related to teaching in multigradae classes. Moreover, existing format of teaching in multigrade classes course that teacher candidates take during their university life do not make any contribution to their level of knowledge and skills about teaching in multigrade classes, thus, they do not know how to behave in classes when they start their teaching career (Izci, 2008, s.111; Sag, 2009, s.20). Moreoever, parents do not provide any contribution and support expected from them (Kaya, 2005; Cinar, 2004). In addition to the application process and results, there are some difficulties in providing sheltering, social life, and basic needs (Sahin, 2003). Other than these, teachers who are appointed as principals need professional counseling. Moreover, while teachers who are appointed as principals see the communication process as a problem, others who are experienced and accept themselves as qualified enough in their career see the evaluation process more problematic (Kaykanaci, 1993).

Research results are summarized according to advantages and disadvantages of transported education, regional boarding primary schools and multigrade classes.

Table 2. Research results according to advantages and disadvantages of transported education, regional boarding primary schools and multigrade classes

	Transported Education	**Regional Boarding Primary Schools**	**Multigrade Classes**
Advantages	• affects schooling rates positively. • provides effective participation in education. • increased the success level of the students.	• all the needs of students is being paid by the government. • YIBOs having more facilities • Teaching is more qualified	• increases the students sense of helping each other and sharing and socializes them.
Disadvantages	• parents do not want the transported education. • efficiency of staff working is less than the primary schools doing normal education. • has high cost of transportation.	• physical facilities, educational tools and technology are insufficient. • psychological uneasiness like homesickness, reluctance and anger are observed very frequently.	• all the students cannot be dealt with individually. • has negative effects on teachers' professional enthusiasm and motivation.

Conclusion

As a conclusion, transported Education, YIBO, PIO and Multigrade Classes which are applied commonly in primary school teaching have separate and common problems. When limited number of studies is concerned, transported education is more beneficial than YIBO, PIO or multigrade classes. Considering this finding, students who do not have a chance to get education in normal primary schools should be registered to Transported education, if this is not possible, then they should be registered to YIBOs; and teaching in multigrade classes should be ended gradually in time. However, it should also be taken into consideration that studies about multigrade classes, which is the oldest application in the country, are very rare. On the other hand, for transported education, YIBO and PIOs to be successful, basic facilities should be strengthened, physical facilities, tools and equipment of these schools should be restored, precautions to solve students' problems like clothing, allowance, health and nutrition should be taken, and transporting vehicles should be made appropriate and drivers should be educated.

ICT @ AN EARLY AGE (A NEW CHALLENGE FOR NIGERIA)

PROVIDING E-LEARNING CAPACITY TRAINING COURSES TO TEACHERS WORKING IN EARLY CHILD CARE CENTRES (A CASE STUDY)

MISS ANUSI DORIS

SENIOR PROGRAMME OFFICER (LAGOS OFFICE) PROGRAMMING

SOCIETY FOR PROMOTION OF EDUCATION AND DEVELOPMENT (SPED)

NATIONAL SECRETARIAT: 2 CASSANDRA STREET, MAITAMA ABUJA.

3RD AVENUE, A CLOSE, HOUSE 10, FESTAC TOWN, LAGOS

sped.lagos@gmail.com, dorisanusi@yahoo.com

www.spedng.org

A primary focus of this paper is to highlight why the problem of Teachers ICT skills needs to be addressed and what experiences exist in using ICT for this purpose and the impact on children.

ICT can be effectively used in the area of Early child care Education in Nigeria.

The paper concludes by identifying strategies and planning elements that need to be taken into consideration when ICTs are used for Teachers Literacy programmes.

PURPOSE

No real attention is given to Early Childcare Education (ECE)

Nigeria's Universal Basic Education (UBE) targets, 2004, stipulate that 50% of the teachers should be trained in computer skills. The national government regards ECE more as a primary responsibility of parents and other care givers. Its responsibilities are limited, rare in practice and often non-existence. Moreover, the skills and experiences of many teachers are in doubt as many of them are not professionally qualified.

SUMMARY

The project contributes to improve the teaching knowledge and skills of teaching staff in order to help them develop appropriate educational tools and methodologies to deliver better quality education to children aged between 2 and 6 years in the targeted communities.

The advantage of E-Learning is that the trainees can access as much information as possible according to their own needs at their own pace. It also offers them a large range of opportunities to access other source of information as well as invites them to network with different kind of professional sectors all

over the world who have the same aspiration. They will be able to share experiences and expertise to improve their professional skills.

Making ECCC environment more child friendly

The project will work towards improving the learning environment of the two communities of Surulere and Amuwo-Odofin making it more child-friendly. 10 Early Child Care Centres (ECCC) will be selected in each community benefiting in total 20 ECCC. Two teachers will be trained per ECCC, one senior and one junior teacher, who in a second stage will have to train each 3 new teachers in the same ECCC. The teachers will be inclined in using more developmental and interactional teaching methodologies such as participatory approach to children, adjusting to the individual need of the child according to his / her personality and developmental stage and needs.

By the end of the project 160 ECCC teachers will be trained, it is expected that about 2400 children will directly benefit from an improved learning environment within 20 ECCC. The final outcome of this first year is to set up an E-Learning Child Care Network in Lagos (ECCNL) which will allow the consortium to keep track and monitor the evolution of the trained teachers and provide them with refreshing training to enhance their performance in class rooms online.

Actions

1. A Baseline Survey
2. Community Sensitization
3. Selection of qualified ECCC
4. Running e-learning training workshops

OBJECTIVES

1. Promote a healthy hygienic working environment
2. Provide new pedagogical approach
3. Facilitate interactive and participatory communication
4. Introduce time and activity management methodology

GOAL

The training will enable the participants apply and evaluate their attitudes and skills in relation to the professional requirements of an early Childhood educator

Feedback as dialogue: exploring formative assessment practices in distance learning

Dr Stylianos Hatzipanagos

King's Learning Institute

King's College London

Abstract

Feedback is a significant attribute of formative assesment. The view of feedback as an active, participative process, contrasts with the notion of feedback as a transmissive process that involves 'telling' or passing on information. This understanding of feedback as dialogue is fundamental to the process of "closing the loop' (Sadler, 1989). Communication forms part of the mechanism by which the learner monitors, identifies and then is able to 'bridge' the gap in the learning process. The outcome of this dialogue can be disconcerting for the students as there is no 'pre-determined' handed-down set of judgements but a mutually constructed set of targets that they need to act upon. In other words, communication becomes a vital part of the feedback cycle that enables students to actively construct their own understanding of what can be, complex and difficult messages to decipher (Higgins et al. 2001). This notion of feedback can also empower the student and 'disempower' the tutor by redressing the balance of power.

In addition, the above considerations on feedback as dialogue and student empowerment dictate putting the emphasis on assessment strategies that involve the learner at various stages of empowerment. Open and Distance Learning (ODL) environments despite lacking usually in face-to-face communication allow the development of this dialogue by the use of e-assessment.

The paper draws from two projects that explored the significance of formative assessment in higher education by establishing and comparing attitudes to assessment amongst tutors and students within three ODL environments: King's College London (ODL programmes); University of London (external programmes) and the Open University. The paper will put forward a conceptual model of formative assessment based on the literature and will examine how formative assessment can be made to work purposefully within the specific constraints of ODL environments.

MALAYSIAN WORKFORCE AND OPEN & DISTANCE EDUCATION: DETERRENTS AFFECTING NEEDS TO PARTICIPATE

Santhi Raghavan, PhD

Associate Professor

Faculty of Business & Management

Open University Malaysia,

Jalan Tun Ismail,

50480 Kuala Lumpur,

Malaysia

ABSTRACT

With the advancement of information and communication technologies, learning among workforce is more flexible and accessible, and at any time as well as at a reasonable cost. This paper discusses the current practices on workforce learning and assesses the deterrents faced by Malaysian human resource enrolled in open and distance education. Deterrents have potential for influencing workforce learners' participation in continuous education. These deterrents have to be identified and be provided for to ensure the achievement of their learning goals.

Keywords:

Workforce Learning, Open and Distance Education, Knowledge-based Manpower, Deterrents, Participation

Introduction

Malaysia's national education policy was formulated in the context of the country's aim to attain fully developed nation status by the year 2020 by implementing knowledge-tailored planning documents such as the Third Outline Perspective Plan or OPP3 (2001-2010), the Ninth Malaysia Plan or 9MP (2006 to 2010), the Second Industrial Master Plan (1996 to 2005), Multimedia Super Corridor Project and Malaysia's Vision 2020. The education system has been reformed to ensure the development of a highly educated, highly skilled professional workforce to transform Malaysia from the production-based economy to the knowledge-based economy. The government has facilitated changes and sought innovative approaches to expand the educational base, covering not only schoolchildren but also adults who are working by promoting higher education at all levels to improve their academic background and competencies.

Trained, skilled and well-educated workforce is critical in enhancing work and economic performance and sustaining competitiveness as Malaysia transforms into an ICT-driven and knowledge-based society (Zainol, 1999). As Proenza (2001) aptly says "… In today's k-based economy, human capital is business capital. And staying close to the source of knowledge creation is not just a good idea; it is a business necessity." Needless to say, many adult learners face a number of problems such as domestic responsibilities, absence from employment, time management and financial liabilities when participating in full-time higher education. Fortunately, accessibility to education programmes through public and private universities and colleges offering part-time higher education are being provided so that Malaysian workforce has the opportunity to acquire new skills and qualifications. One such avenue is Open University Malaysia (OUM), which is offering degrees and diplomas right upto PhDs to adult students via open and distance education (ODL). ODL appeals to many Malaysian workforce because of the weekend day-time classes, flexible lecture time, low programme fee, convenient location of learning centres, wide choice of university learning centres, the proximity to home and familiar surrounding of people and neighbourhood. In addition, courses offered by OUM are carefully designed for the Malaysian workforce in mind. With the knowledge that this ODL provider has the support from the government and private sector, the enrolment among working adults is overwhelming. In just 9 years, due to its flexibility, the number of courses in OUM rose from 5 programmes with 753 students, to 71 programmes offered, with about 89,000 students enrolment (OUM Statistics, September 2009). Because the global economy requires a better-educated worker (Keegan, 1998), and due to the increase in the use of technology in the workplace, many adults seek more schooling (Burns 2001). According to Kachar (2003), adult learners are now the new majority in Malaysian higher education.

Learning via ODL has its own sets of problems: cost and affordability, lack of confidence, support services, inaccessibility to online learning, lack of time, domestic responsibilities, etc. Conditions in most workplaces are also not conducive either, due to unreasonable employers who often do not grant released time-offs, uncooperative peers, as well long working hours and stressful pace. The main investigation carried out here is to explore the deterrents affecting ODL for workforce, which is the underlying structure of the many reasons the working adults give for not being able to participate effectively in ODL.

The research carried out indicates that all respondents (100%) experience somewhat situational, institutional, dispositional and informational deterrent towards participation in ODL. Fortunately, the finding indicates that overall, the workforce learners in this study do not perceive the deterrents listed

to be of major concern. Nevertheless, in response to the need of accelerating the development of future knowledge-based Malaysian workers, recommendations to overcome the deterrents faced are also given for the workforce learners, educators, policy makers, and all those concerned in the formulation of educational policies for workforce learning.

Literature Review

The concept of ODL is becoming more popular nowadays in the traditional university setting as universities reform to face local and global changes in human resource (Santhi et al, 2005). The term 'traditional' is used to describe full-time courses offered in higher education (Lawton & Barnes, 1998) where lectures are held behind closed doors, where face-to-face lectures and tutorial sessions are delivered on a frequent basis with extensive use of teacher-directed teaching. ODL, whereas, consists of the learner being in charge of his/her own learning and self-development where courses are flexibly designed to meet individual requirements, and it also suggests a learner-centred philosophy. The major differences between traditional on-campus programmes and ODL programmes are the instructional models being used to instruct students, the degree of maturation of the two learner groups, the physical location of the students, and the degree of responsibility placed on the two student groups.

Houle (1961) published the first significant study on motivational orientations by adults toward education (Merriam & Caffaralla, 1999). Numerous studies have been conducted that supports the continued use of Houle's typology and Boshier's (1971) Education Participation Scale (EPS) which can be used to determine the needs of adult students who participate in an educational setting (Dirkx, 2000; Merriam & Caffarella, 1999; Truell & Turner, 1997; and Fujita-Starck, 1996 and Boshier, 1982). Cervero (1995) also argues that educational programmes are intended to benefit the individual learner as much as their employers and thus, it is essential that the needs of individual learners be high on the priority list.

The Deterrents to Participation Scale (DPS), developed by Scanlan & Darkenwald (1984) has been used for researches by Hubble (2000), Rezabeck (1999), Nahdi (1999), Hansen (1999), Galusha (1998), Murphy & Terry (1998), Quigley (1998), Belzer (1998), Miller (1997), and others, who have developed almost similar typologies or classification to identify what factors deter the participants from participating in adult education. The deterrents classifications are situational, dispositional, institutional and informational.

Situational and institutional are structural barriers, those that exist external to the learner and beyond his or her control. Situational barriers are such as lack of day care centres for the learners' children, lack of transportation, lack of family support for learning, health problems, financial or legal difficulties, and personal or family problems, which may not be under their control (Belzer, 1998). Institutional barriers are matters such as scheduling of classes, locations of programmes, and institutional red tape that may discourage participation or retention. Institutional barrier had the widespread support of researchers through their use of this categorization (Rezabeck, 1999; Garland, 1993; Brindley, 1988; Brookfield, 1986; Charner & Frazer, 1986; Darkenwald & Valentine, 1985; Scanlan & Darkenwald, 1984; and Thiel, 1984).

Dispositional deterrents describe barriers that are within the learner, such as fear of failure, unwillingness to try something new (Cross, 1981), lack of self confidence (Rezabeck, 1999), self-esteem and prior educational experience (Hubble, 2000). Quigley (1997) notes that dispositional barriers are the most significant for determining participation and retention in any adult learning programmes. He adds that early identification of at-risk learners in a programme, with appropriate interventions, can significantly reduce drop-out rates and increase retention. "At-risk" learners here

means, those learners who probably have the highest chance of dropping out in the first few critical weeks (Latifah & Mansor, 2007) by virtue of the dispositional barriers than others (Quigley & Kuhne, 1997). In Darkenwald & Merriam's (1982) study, the fourth deterrent was used: informational deterrent, arising from lack of information from faculty among learners regarding educational opportunities in the faculty and difficulty to accessing information from faculty staff.

Thus, there are many deterrents to successful ODL – some are new and many have plagued ODL since it was first conceived.

Methodology

This study applies an exploratory survey which integrates Boshier's (1982) EPS and Scanland & Darkenwald's (1984) DPS as the basis for the research framework. These established scales are applicable in a university setting, and its test-retest reliability and construct validity has been previously certified in countless other studies.

This research utilizes the quantitative research methodology involving a sample of working adults participating in undergraduate programmes in OUM. In addition to examining who participates and why, the objective of this study is to address what deters them from participating effectively. The dependent variable adopted in this study is the participation need and the independent variable is the deterrents. Participation needs variables consist of Boshier's EPS seven factors: communication improvement, social contact/social relationship, educational preparation, professional advancement, family togetherness, escapism/social stimulation and cognitive interest. The questions were formulated to be answered using a seven-point scale, 1 = 'It is not a need at all', 4 = 'Average need', and 7 = 'It is a very strong need'. The deterrents variables four: situational, institutional, dispositional and informational deterrents. Respondents answer each item based on the seven-point scale, namely, 1 = 'I don't agree at all', 4 = 'Average', to 7 = 'I very strongly agree'. Higher scores indicate greater needs and greater deterrents.

Total population of open and distance learners studying in the OUM University Learning Centres at time of study was 24,000. A stratified sampling design was used. The survey sample covered all states in Malaysia and the Krejcie & Morgan (1970) formula was used to determine the minimum sample size, at 95% level of confidence. A pilot study to validate and improve the instrument was conducted in Science University Malaysia (USM) and International Islamic University (UIA). Cronbach alpha more than 0.7 was shown in all the components tested in this study. This was followed by a survey using the validated and improved instrument via direct administration. A total of 454 valid responses (83% of return rate) were used from 550 questionnaires sent. Exploratory Data Analysis (EDA) was first used to explore the data, followed by a reliability test. Descriptive and inferential statistics were then employed using the SPSS.

Findings and Discussions

Firstly the socio-demographic profile of the Malaysian workforce participating in ODL is identified. Secondly, the levels of participation needs are determined. Lastly, the strength of the relationship between the four deterrents and seven participation needs are identified. The frequencies, percentages and Pearson Moment Correlation were applied to the entire data. All tests of significance were conducted at alpha = 0.05.

Socio-demographic Profile

Majority (78%) of the respondents are younger adults aged below 39. The average age of the respondents is 33 years. This finding supports Valentine's (1997), MacBrayne's (1995) and Johnstone and Rivera's (1965) studies that students who choose to enrol in distance education are aged in between of 18 to 40 years old. Older workforces are less likely to participate primarily because they are less likely to be promoted in their employment even though new qualifications obtained from ODL. In accordance with human capital theory, these older adults gain less from investments in education.

69.4% of Malays, 13.2% of Chinese and 9.3% of Indians had participated as respondents. Respondents from other races are represented by the percentage of 8.1%. This is not in accordance to the proportion of Malaysian population documented in Census 2000, where Malays comprised 65.1%, Chinese 26.0%, Indians 7.7% and others 1.2% (Population and Housing Census, 2000). Both Malays and Indians have a slight increase in participation rate as compared to the proportion of population. The Chinese demonstrated lower participation rate. What is interesting to note here is the higher participation rate demonstrated mainly by the indigenous people of Sabah and Sarawak. Their participation rate is 8.1% even though they constitute only about 1.2% of the total Malaysian population. This could be due to the availability of ODL in the many parts of rural and remote Sabah and Sarawak. Direct higher education is not easily available for the working adults there.

Married learners constituted the majority workforce learners in ODL. About 78.6% of the respondents were married, 19.8% were single, 0.2% was widowed and 1.3% was divorced. Majority of the respondents (86.6%) had dependents to care for. Earlier studies have found that adult students were more likely to having families (Merriam and Caffarella, 1999; MacBrayne, 1995; and Ross & Powell, 1990). About half of the respondents (49.8%) belong to the lower level of education (SPM and STPM which is equivalent to O-level and A-level) and had not completed tertiary education. A common need may underlie these findings; those who do not have basic higher education such as diploma or degree are more likely to pursue to the formal tertiary education. Findings in previous studies by Valentine (1997), Kim et al. (1995), Courtney (1992), Merriam and Caffarella (1991) and Darkenwald and Merriam (1982) have indicated positive relationship between education level and participation in adult education. In their findings, adults with higher levels of education participated in adult education at a higher rate than those with lower levels of education.

Majority of the respondents (94.8%) earn less than RM3000 per month. It was also found that more than half of the respondents (56.8%) have less than 10 years working experience. Majority (87.0%) have less than 20 years working experience. The distribution of the respondents by monthly income indicated that the sample was relatively not affluent since a high percentage (94.8%) had monthly income of less than RM 3000. Majority of the respondents (93.0%) are made up of permanent workforce where 64.5% respondents are from the government sector. These findings reinforce the important role that employment plays in motivating participation in adult education. A majority of them (89.2%) also travelled less than 100 km to their University Learning Centre.

The Level of Participation Needs

Respondents were asked to indicate the level of need on a seven point scales, ranging from (1) 'It is not a need at all' to (7) 'It is a very strong need' and was recoded to 'Low = 1.0 - 3.0, Moderate = 3.1 - 5.0 and High = 5.1 - 7.0'. The findings showed that younger adults (ages < 39) have higher needs than those in any other age group. Older adults (ages >40) participate with a moderate need. This moderate need towards participation does not appear to be due to education level, income differences, or labour status. It is rather linked to the interests of older adults or the programme offerings.

It is interesting though to know that mid-aged and older adults (ages 40-49, 50-59 and >60) have moderate needs (5.01, 4.83 and 3.98 respectively) towards participation that seem to decline as they get older. The findings also show that all races have almost similar need for participation, ie Malays (mean=5.15), Indians (mean=5.06), Chinese (mean=5.02) and others (mean=5.01). Both married and single respondents have high participation needs (mean=5.12 and mean=5.12). It was also found that both widowed and divorced had moderate participation needs (mean=4.91and mean=4.80). Participants with or without dependents have high level of needs. Interestingly, the level of needs seem to decline as the dependents get lesser.

The findings also showed that SPM, certificate and diploma holder have high participation needs (mean= 5.30, 5.06 and 5.29 respectively), whereas STPM and 'Others' have moderate participation needs (mean 5.03 and 4.87 respectively). The fact that underlies these findings may be that those who do not have basic higher education such as diploma or degree may be more likely to continue their formal tertiary education. This is again in contrast with findings in previous studies by Kim et al. (1995) and Valentine (1997), where positive relationship between education level and participation in adult education was evident.

Table 1: Characteristics of Individual Participation Needs (n = 454)

Variables	Level	f	%	$\bar{x}$	SD	Level
Communication Improvement	Low	8	1.8	5.30	1.02	High
	Moderate	170	37.4			
	High	276	60.8			
Social Contact	Low	52	11.5	4.61	1.23	Moderate
	Moderate	236	52.0			
	High	166	36.6			
Educational Preparation	Low	13	2.9	5.10	0.96	High
	Moderate	193	42.5			
	High	248	54.6			
Professional Advancement	Low	11	2.4	5.36	1.05	High
	Moderate	171	37.7			
	High	272	59.9			
Family Togetherness	Low	15	3.3	4.57	1.34	Moderate

	Moderate	181	39.9			
	High	258	56.8			
Escapism/Social Stimulation	Low	117	25.8	3.99	1.36	Moderate
	Moderate	237	52.2			
	High	100	22.0			
Cognitive Interest	Low	9	2.0	5.31	0.92	High
	Moderate	159	35.0			
	High	286	63.0			
Total Participation Needs	Low	6	1.3	5.11	0.90	High
	Moderate	190	41.9			
	High	258	56.8			

Note: $\bar{x}$ = Low = 1.0 - 3.0   Moderate = 3.1 - 5.0   High = 5.1 - 7.0

Table 1 reveals the means and standard deviations for the seven factors of participation needs. The highest reported need was the professional advancement (mean=5.36). Obviously, workforces participating in this study are motivated to participate in ODL when that involvement will result in professional advancement. This is followed closely by cognitive interest (mean=5.31) and communication improvement (mean=5.30). The lowest reported needs was moderate need for the factors social contact (mean=4.61) and escapism/social stimulation (mean=3.99) respectively. About 98% of the respondents fall in the category of moderate to high level of participation needs. The result achieved is similar to the findings by Truell & Turner (1997). Previous research based on surveys also showed that job-related reasons have often been cited by adults as their main reason for participation in adult education (Merriam and Cafferella 1999; Valentine, 1997; Kim et al. 1995).

The lowest reported needs were the moderate needs for social contact and escapism/social stimulation factors. These results are similar to the findings by Truell & Turner (1997). Social interaction of any kind was of little interest to the participants in this study. Hence, ODL programme planners and administrators, should be aware of this fact when they plan for the professional and cognitive advancement programmes for the workforce learning.

The Level of Deterrents towards Participation Needs

Table 2 indicates that all respondents (100%) experience some form of deterrent in their quest for education through ODL. This means that the workforce experience moderate level of situational, institutional, dispositional and informational deterrents (mean=3.61, mean = 3.68, mean = 3.38, and mean = 3.58 respectively). Specifically when looked into each type of deterrent, more than 90% of respondent experience low to moderate level of deterrent. About 10-12% of respondents face high level

of situational, institutional and informational deterrents and 7.7% respondents face high dispositional deterrent.

Table 2: Characteristics of Deterrents (n = 454)

Variables	Level	f	%	$\bar{x}$	SD	Level
Situational	Low	146	32.2	3.61	1.22	Moderate
	Moderate	263	57.9			
	High	45	9.9			
Institutional	Low	136	30.0	3.68	1.22	Moderate
	Moderate	263	57.9			
	High	55	12.1			
Dispositional	Low	187	41.2	3.38	1.17	Moderate
	Moderate	232	51.1			
	High	35	7.7			
Informational	Low	166	36.6	3.58	1.39	Moderate
	Moderate	237	52.2			
	High	51	11.2			
Total Deterrents	Low	148	32.6	3.56	1.14	Moderate
	Moderate	265	58.4			
	High	41	9.0			

Note: $\bar{x}$ = Low = 1.0 - 3.0   Moderate = 3.1 - 5.0   High = 5.1 - 7.0

Supported by the total deterrent mean of 3.56, most of the respondents were found to be "Average Agree" with almost all items of the scale. Participants seem to perceive moderate deterrence to participation. The mean score of deterrent level is able to indicate the ranks of the deterrents for descriptive purposes. Institutional deterrent is higher than situational and informational. Dispositional has the least mean score.

Relationship between Deterrents and Total Participation Needs

Table 3 below shows the relationship between the four deterrents and total needs to participate. Situational deterrent has weak and negative relationship with participation needs. This shows that the lesser the situational deterrent, the more need the respondents have towards participating in open and distance education. Institutional deterrent has weak but positive relationship with needs to participation. This data means that when the institutional deterrent increases, the need towards participation also increases.

Table 3: Relationships between Deterrent Variables and Total Participation Needs

Variables	r	p
Situational Deterrent	-0.010	0.832
Institutional Deterrent	0.038	0.416
Dispositional Deterrent	0.003	0.955
Informational Deterrent	-0.119	0.011*

Dispositional deterrent has weak but positive relationship with needs to participation. This data means that when the dispositional deterrent increases, the need towards participation also increases. Informational deterrent has weak and negative relationship with participation needs. This shows that the lesser the informational deterrent, the more need the respondents have towards participating in ODL.

Since the p value is not below alpha=0.05 for situational, institutional and dispositional deterrent, there is no significant relationship between these three deterrents and participation needs. However, only informational deterrent is significantly correlated with participation needs.

Relationship between Deterrents and Individual Participation Needs

The seven components of participation needs employed in this study were communication improvement, social contact, educational preparation, professional advancement, family togetherness, escapism and cognitive interest. Table 4 below reveals the relationship between the deterrents and individual participation needs. Pearson Product Moment Correlations were employed in determining the strength of the relationships.

As the p value is not below alpha=0.05, there is no significant relationship between situational deterrent and needs, as well as between institutional deterrent and needs. The p value is below alpha=0.05 for "educational preparation" (r=0.119). Therefore, there is weak, positive and significant relationship between dispositional deterrent and educational preparation need. This means the higher the dispositional deterrent is, the more inclined the respondent is for educational preparation need.

Table 4: Relationship between Deterrent Variables and Individual Participation Needs (n=454)

Variable	Communication Improvement		Social Contact		Educational Preparation		Professional Advancement		Family Togetherness		Escapism		Cognitive Interest	
	r	p	r	p	r	p	r	p	r	p	r	p	r	p
Situational Deterrent	0.090	0.055	0.198	0.000	0.125	0.008	0.069	0.144	0.208	0.000	0.370	0.000	0.039	0.405
Institutional Deterrent	0.032	0.501	0.162	0.001	0.091	0.052	0.022	0.642	0.145	0.002	0.340	0.000	-0.007	0.877
Dispositional Deterrent	0.128	0.006	0.196	0.000	0.119*	0.011	0.012	0.792	0.159	0.001	0.387	0.000	-0.016	0.732
Informational Deterrent	0.083	0.076	0.173	0.000	0.109*	0.020	-0.007	0.878	0.583	0.008	0.314	0.000	-0.035	0.454

The p value is also below alpha=0.05 for "educational preparation" (r=0.109). There is significant relationship between informational deterrent and educational preparation needs. This relationship is both weak and positive. The more informational deterrents the respondents experience, the more inclined they are towards educational preparation need.

Recommendations

Recommendations for the Workforce Learners

The self-perceived learning needs and suitability of learning styles of the learning workforce are very often confined by their own experience and knowledge of the current courses. Without recognizing their real learning needs and style, intention to participate in organized learning activities is bound to be low. Learners should therefore understand better their learning needs and style through a more

systematic planning for their needs. They also need to expose themselves to innovative possibilities in terms of course content, learning environments and instructional methods.

Recommendations for the Programme Planners

One important ingredient in needs assessments and programme design is to involve the learners and would-be learners in the process. Such exercises can serve two purposes: Firstly, is to help the programme planner better grasp and interpret the needs and make the programme more relevant to the clients. This would very well remove any particular institutional and information deterrents the workforce learners might encounter. Secondly, is to help the learners themselves better understand their own needs and relate it to the relevance of the programme. This can be done by involving the workforce learners to recruit would-be learners. These workforce learners, who are living and convincing examples of the fact that "the older working adults can learn", could establish rapport and share experiences, whereby for some of the non-learners who have doubts about adult learning, such peer influence could possibly be enough to help break their belief in the myth about ageing and learning.

Recommendations for the Education Providers

To overcome situational deterrents, some deterrents to participation such as cost, financial assistance for courses, transportation problems, and child care, may be beyond the control of education providers to intervene. What could be adopted are for example, child care facilities could be made available at the University Learning Centres, transportation problems could be solved by car-pooling or bus/taxi vouchers, and part-time work could be provided to learners who may want to find extra money to cover cost.

To overcome institutional barrier, the availability of effective learner support services to the ODL students is essential (Birnbaum, 2001; Rezabek, 1999; Galusha, 1998 and Berge & Mrozowski, 1999). A lack of feedback and instructors contacts have been identified as deterrents (Zirkle, 2003; Flowers, 2001; Grace, 2001; Dooley, Patil, & Lineberger, 2000). Hillesheim (1998) has found that the quality of ODL depends on two-way communication between students and faculty. Some suggestions to improve institutional barriers are to provide:

1. toll-free telephone support to all areas of the campus.
2. online provision of learner services such as advice and counseling, library services, admissions, and financial aid which is a critical aspect of any ODL programme.
3. online office hours by faculty.
4. a database system for two-way communication use.
5. continuous monitoring on technical support to determine if deterrents exist that may keep students from accessing courses and programmes.

Interaction among students and between students and the instructor, and a high quality of content and instruction, are desired features of all courses (Mowen and Parks, 1997; Schrum and Berge, 1998). In order to maximize learners' interaction during an ODL course, the workforce learner, instructor, and the instructional designer needs to be very familiar with the characteristics of the delivery system being used. Based on the thorough understanding and competence with these tools, they can plan high quality, stand-alone, interactive learning experiences. Nevertheless, record-keeping of learners' interaction in ODL settings is an essential source for evaluating workforce learners' achievement and participation in a course, as well as evaluating their reaction to the course itself.

Concerning informational barrier, it is difficult for workforce learners as well as education provider to keep pace with technological change. Many adult students lack the knowledge and skills to learn through ODL courses. Flowers (2001) describes the need for institutions to better advertise their courses to facilitate awareness. The educational providers too may lack support staff to assist with

technical problems, to develop distance learning course materials (Dhanarajan, 2003), or to provide distance learning training to students. The technology-enhanced classrooms or laboratories and the infrastructure required to use them may also not be available in most University Learning Centres. Many workforce learners lack access to necessary hardware, software, or the internet. There are concerns over equal access to courses offered via newer technologies such as web-based instruction. Instructors also may lack access to the necessary equipment and courses. High costs to obtain these could also be a deterrent. Among ways to overcome lack of access to information are:

1. Negotiate with the local telephone company to reduce telephone charges could be one way to have easier access to information via internet or telephone.
2. Provide constant and similar messages via multiple channels, such as SMS, email alerts, management and team briefings, high quality catalogues, or on-demand videos of site information and resources.
3. Distribution of organisational, programme and course newsletters, flyers and wall posters.
4. If special infrastructure is built, it is necessary to have planned maintenance and resources to sustain the network over its lifetime.
5. Host an 'open day' for the programme, or course.
6. Reducing users' technical problems regarding access to courses by selecting the simplest courseware to meet the course goals
7. Provide easier access both with internet connection to the server and via direct dial to the server
8. A web page providing information regarding registration, admission, study skills, credit transfers, help-lines, etc.

In dispositional deterrent, adult participants in ODL can feel isolated and alienated due to lack of person-to-person contact, lack of feedback (Galusha, 1998) or may be uneasy about their own sense of competence, strength and weakness to continue learning. As the sense of isolation persists, the students may perceive themselves as unimportant when compared with the full-time, on-campus students (Zirkle, 2002). They may also experience fear in the increase use of technologies and may be lost or intimidated in the learning process.

Some learners are uncomfortable with the use of student-centered, group learning and collaborative online learning activities because they change the traditional social structure of the classroom. They may have adopted external locus of control that could lead to experiencing psychological factors that may impede learning. Solutions are to:

1. encourage participation and elicit feedback among workforce learners in their educational and social interaction so as to increase interactions with each other to establish a community of learners , either web-based or face-to-face.
2. identify workforce learners with external locus of control during the programme orientation, and stream them into small groups to be instructed in skills that would help in changing their external behaviours and attitudes.
3. provide counseling session on continuous basis to workforce learners to elicit and share information from the university and faculty. This will also humanize the information flow to and from the organisation, faculty and the workforce learners. This too can be done either web-based or otherwise. It may be possible to counsel workforce learners with external locus of control in increasing their feelings of self-efficacy, thereby raising their chances to complete the programme of study.
4. offer courses for workforce learners which are interaction-based, either web-based or face-to-face to encourage lack of interest among learners.
5. develop train-the-workforce learner sessions specifically for learning how to use e-tools.
6. improve workforce learners' self-image by conducting seminars on leadership, self-grooming, study skills, time management, etc.

Conclusion

The mean level of deterrents indicates that all respondents (100%) experience *moderate* level of situational, institutional, dispositional and informational deterrent towards participation in ODL. This finding indicates that overall, the workforce learners in this study do not perceive the deterrents listed as major concern. The mean score of deterrent level is able to indicate the ranks of the deterrents for descriptive purposes. Institutional deterrent is higher than situational and informational, which is similar to Rubenson's (2001) research. Dispositional has the least mean score. Partnerships among different units within an organisation or among different organisations require agreements on many fiscal issues. Consideration of these variables help leaders of other open and distance education providers find solutions to reduce or to minimize obstacles in their own organization when they use ODL.

An idea has been proposed that different business organizations are at different stages or levels of maturity regarding the capabilities that they have to conduct distance education (Berge, 2001; Schreiber, 1998). A hypothesis that was tested by Berge and Muilenburg (2001) states that when an organization is in the earlier stages, like OUM, it will face many deterrents. As the organization's competency in ODL as a whole matures, the overall number or intensity of perceived barriers to ODL will be reduced.

A STUDY OF PROFESSIONAL DEVELOPMENT OF TEACHING PERSONNEL OF DISTANCE LEARNING SYSTEM IN INDIA

By

Pradeep Kumar Hota

Principal

Dadhibaman College, Bhatli

Bargarh, Orissa 768030

Email: pkh37@rediffmail.com

INTRODUCTION

The clarion call of the current century culminates the cult of universalisation of higher education to reach all residing in every nook and corner of the country, interested in attaining higher education with a reasonable cost that necessitates a drastic change in the system of higher education. Since formal and conventional system of higher education is costly and meant for a chosen few, there is urgent necessity of revitalizing and rejuvenating the alternative mode of higher education i.e. through distance mode to democratize higher education with low cost to make available a big slice of our total population including those residing in quite remote inaccessible and far-flung areas.

Democratization of higher education and making higher education easily accessible to the growing population in India is the need of the hour. Alternative system and modality of instruction, learning and training are considered essentially inevitable which is employed all the possible and available means, materials and media to bridge the gulf of differences between teacher and learner beautifully is termed as distance learning. Communication, mediated through a host of media, is non-contiguous and carried out at both proactive and interactive stages through pre-produced self-learning packages and other media. For dissemination of academic

inputs effectively in distance teaching institutions (DTI), teachers, who come from the conventional system of education (with probably and unconscious culturally induced bias) or those who join a distance teaching institution afresh (without any background on the area of distance teaching or teacher training): need to learn the knowledge, skills and attitude involved in this novel system of multi-media teaching. To operationalise functioning of teacher effectively the new system requires knowledge of and skills in preparation of self -instructional materials (SIM), curriculum design and development, media selection and media-mix, development of multi-media packages, printing and production, adult-learning and student support, counselling, tele-conferencing, assessment and evaluation, project management and programme evaluation, R&D, planning and management, quality assurance and the like. Development of these complex skills demands rigorous and continuous training, exposure, roundtable and interaction, collaboration and network, and continuing professional development (including development in one's field of disciplinary specialization). This is necessitated further in a situation (like that of distance education) in which educational technology /development methodologies and process as well as the multi media development are in a constant state of flux and innovation.

For academics entangled with higher education in India, two short-term programmes (orientation and refresher) are being organized by the UGC through a large number of university academic staff colleges meant for higher education pedagogy and subject up gradation respectively. The school of education of IGNOU also offers a Postgraduate diploma in higher education for professional development of college and university teachers. For distance teaching institutions, the refresher programmes earlier offered by the UGC through the distance education Academic staff college at university of Poona and Central Institutes of English and Foreign Languages, (CIEFL). Hyderabad are now being offered by Distance Education Council (DEC) at the Staff Training and Research Institute of Distance Education (STRIDE) at Indira Gandhi National Open University (IGNOU), New Delhi.

Further, STRIDE also offers Postgraduate Diploma in Distance Education (PGDDE) and M.A. in Distance Education (MADE). Along with, it organize refresher and advanced level workshops for varieties of functionaries including teachers in the system. The Yashntrao Chouhan Maharastara Open University (YCMOU) also offers a master programme for training distance teacher and some Open Universities (OUs) and Correspondence Course Institutes (CCIs) also organize orientation and training programmes for distance education functionaries including teachers.

It is high time now to have glance seriously and comprehensively on the staff and professional development needs of distance teachers, the activities and programmes organized by few institutions and those who are involved in multimedia teaching, learning and training.

OBJECTIVES

The main objectives of the study are to trace out the continuing professional development needs and perceptions of teachers and academics of OUs and CCIs, analyzing the present staff development programmes to meet these needs; and to develop a framework for continuing and lifelong professional development of distance teachers in India.

Sample of the Study

Sample for the present study was determined at various stages and it comprises the following.

All the teaching and supporting members in teaching process of all OUs and CCIs for studying their perceptions, needs, expectations, contents and strategies of staff development.

All the teachers working in distance learning programmes of OUs and CCIs who have completed any certificate/diploma/degree programmes or orientation and training activities, research training like M.Phil and Ph.D in distance education and to find out the adequacies and efficacies of these programmes in meeting the professional development needs of teachers.

On the basis of mentioned population, sample was chosen at random in order to collect data needed for the present study.

Tools employed and Techniques of data collection.

For collection of data two Faculty questionnaires and one interview schedule was developed which are described below.

Questionnaire for faculty members

This questionnaire was developed with the objective of gathering data from the teachers of open universities and correspondence course institutes on the characteristics of teachers, their training and professional development needs, perceptions of Distance Education and training in Distance Education, their views on contents and methodologies of training, continuing professional development including the feedback and reward system.

Collection of data

The researchers visited five open universities like Indira Gandhi National Open University, New Delhi, Vardhaman Mahavir Open University (formerly known as Kota Open University) Kota, Dr. B.R.Ambedkar Open University, Hyderabad, Karnataka State Open University, Mysore, Netaji Subash Open University, Kolkata and seven correspondence course institute at Shimla, Hyderabad, Delhi, Annamalai, Kurukshetra, Bhubaneswar and Sambalpur. Interview was conducted simultaneous by the investigator during collection of data.

Findings of the Study

Three hundred distance educators both from open universities and correspondence institutes attached with conventional universities were taken as sample for the present study, out of which 20 institutional heads and distance educators were interviewed by the investigator for the study which are critically analysed later on. The details of sample are described in table 1.

Table 1

Academic Staff taken for the Studies

Category of Staff	Open Universities	Correspondence Course Institutes
Professor	29	25
Associate Professor/ Reader	68	32
Asstt. Professor/ Lecturer	81	45
Total	N= 178	N= 102
Institutional Heads and Distance Educators	20	

$$\sum N = 300$$

The number 2 item of questionnaire for faculty was about the distribution of faculty by age. All the faculty member were divided in 4 categories like less then 56 years, 46-55 years, 36-45 years and more then 35 years. All the samples for the study were distributed accordingly which are mentioned in table 2.

Table 2

Distribution of Faculty by Age

Age Range	Open Universities	Correspondence Course Institutes	Total
56 >	20 (11.23%)	15 (14.70%)	35 (12.5%)
46-55	60 (33.70%)	34 (33.33%)	94 (33.57%)
36.45	79 (44.38%)	41(40.19%)	120 (42.85%)
< 35	19(10.67%)	12(11.76%)	31(11.07%)
	N = 178	N = 102	$\sum N = 280$

It is evident from the table 2 that only 35 staff (12.5%) are above 56 years and 245 staff are between the age group of 36 to 55 which comprises 87.5% and they have come to the field of distance education very recently. Thus, necessity arises of providing training   to them.

The next item is regarding to qualification of teaching personnel obtained through conventional system and distance mode and their responses have been presented in the table 3

Table 3

Qualifications acquired through Conventional System and Distance Mode

Types of System	Open Universities	Correspondence Course Institutes	Total
Conventional System	178 (100%)	102 (100%)	280 (100%)
Distance Mode	27 (16.29)	16 (15.68)	43 (15.35%)

It is evinced from the table 3 that only 43 staff (i.e. 15.35%) both from OUs and CCIs have acquired certain qualifications through distance mode and a majority number of staff (86.64%) were new to the system. So, in this circumstance the importance of staff training cannot be ignored.

In the next item, the respondents were requested to state their experience in the teaching profession. The types of experience and numbers of years of the respondents have been presented in table 4.

E-learning Systems and HCI: Issues in replicating the classroom online

ABSTRACT

Due to an increasing use of the Internet as a delivery mode in education, training and business, Human-computer interaction (HCI) is an important consideration when developing curriculum or professional development programs for the online environment. Human-computer interaction is a branch of science concerned with studying the interaction that occurs between human users and computers, as well as the users and the system, the network and the virtual spaces/environment delivered via the computer screen. When studying online human-computer interaction is much more than how the user interacts with the information on the screen. In many cases the virtual environment and how users interact in and with this environment, presents barriers to student engagement. This is particularly true in technical subjects where teaching and learning in an online environment is even more challenging. This paper considers human-computer interaction in the teaching and learning of online Computer Science programs and the barriers and enablers presented by the technology and the online environment.

Keywords: Human Computer Interaction, HCI, Computer Programming, Elearning, Computer Science, Online Learning

1. Introduction

Due to an increasing use of the Internet as a delivery mode in education, training and business; human-computer interaction (HCI) is an important consideration when developing curriculum or professional development programs for the online environment. HCI is a branch of science concerned with studying the interaction that occurs between human users and computers. However, HCI is much more – it is also about the interaction that occurs between human users and the system, the network and the virtual spaces/environment delivered via the computer screen (DePaula, 2003). When studying online, the virtual environment and how students interact in and with this environment, presents barriers to student engagement. This is particularly true in technical subjects such as programming languages, where teaching and learning in an online environment has proved to be very challenging (Gulatee & Combes, 2006).

In the US 'in the academic year 2001-2, five million people took at least one course online, and three million were enrolled in online degree programs' (Kazmer & Haythornthwaite, 2005, p.7). These figures indicate that online distance education has become a popular alternative to face-to-face instruction. However, recent findings indicate that many of these initiatives have had mixed success (Zemsky & Massey, 2004). While research about elearning is still an emerging field, current studies indicate that there is still much work to be done. Other issues include 'the achievement and maintenance of quality in online learning delivery; ensuring access and equity in the delivery of programs; and establishing practices which can enable online learning to be sustained and to grow as a mainstream activity in university teaching and learning' (Oliver, 2001). In order to ensure that quality assurance goals are met, universities need to look carefully at the programs, the technology and how students respond to this new learning environment. HCI and students' emotional response to using technology and a virtual environment for study is therefore, an important component of successful elearning programs and an aspect that is often ignored. How students interact with the technology and the learning environment created are an important factor in student achievement and retention.

In highly technical subjects such as computer programming courses, students find elearning programs more difficult and time consuming. The technical nature of programming in Computer Science and how this type of content is presented via the online delivery mode may impede students' ability to learn independently. This paper examines some of the HCI issues when developing effective teaching and elearning programs in Computer Science topics, particularly in technical subjects such as programming languages.

2. Definitions of e-learning

E-learning can be defined as learning how to use technology, where content is provided by information communications technologies (ICTs), and teaching is carried out over the Internet. Sharifabadi explains e-learning as "the term used to describe teaching and learning resources or experiences that are, in some way, delivered electronically" (2006, p.391). Peltier, Schibrowsky & Dargo, (2007, p.140) propose that a major "characteristic of online education is that it allows students access to learning without the constraints of time and location". However, e-learning is meant to be more than just websites that contain educational content or linear drill and practice computer software. It includes all aspects of electronic delivery. So watching an educational video; using a digital camera or a computer to edit pictures, text or sounds for a presentation or project; or using an interactive whiteboard in a lesson, can all be considered implementations of e-learning. Therefore, e-learning has been variously described as learning using a range of different delivery technologies and methods such as Computer Based Training (CBT), Web Based Training (WBT), electronic performance support systems, webcasts, listservs and learning management systems (LMS). Learning management systems manage the learning environment and use the technology to "register the learner, schedule learning resources, control and guide learning processes, and analyze and report on the performance of the learner" (Brown, 2006). According to these definitions, e-learning then, is much more than just the delivery of content online via a computer screen. It attempts to emulate the learning environment found in the face-to-face traditional classroom. How students interact with the technology is an important consideration in the development of effective e-learning programs, particularly if students fail to engage with the programs because the delivery mode is an issue.

E-learning is becoming an integral part of the educational scene, with students being offered a range of delivery modes and options for study, particularly blended study where all students have access to learning programs online. Research by the International Data Corporation (IDC) and *Online Learning Magazine* (OLM) found that eighty percent of respondent institutions used online learning courses and planned to expand these by more than forty percent over the next two years (Asgarkhani, 2003). Over ninety percent of US public colleges offer at least one course online and enrollment in these courses is increasing (Litecky,et al, 2006, p.362). However, research by Werry (2002) and Zemsky and Massey (2004) found that there are major issues with e-learning and the success of e-universities and online courses in the US has been mixed. While current emerging research indicates that there are issues with the online delivery of tertiary subjects, e-learning as a delivery mode does appear to be an increasingly popular alternative to traditional face-to-face classrooms. Davis and Wong (2007, p.97) maintain that "while numerous studies have focused on the effectiveness and benefits of e-learning, few have focused on understanding and measuring the user experience and relating this to the actual student usage of the e-learning system". The user experience in online learning is closely related to HCI and the issues that using technology as a vehicle for learning brings to the educational experience.

3. Issues: teaching programming languages in computer science

Computer Science courses such as programming, database development and artificial intelligence (AI), are more difficult to teach and learn than other courses in a wholly online environment (Linschner, 2002), because students are required to develop a range of technical and practical skills, and conceptual understandings, in order to be able to apply this knowledge to different applications and workplace challenges. During their study students communicate with their lecturers and peers via the computer which provides access to a range of information, exemplars and activities to develop the programming language skills. The computer is also a vehicle for communicating directly with lecturers and other students for feedback and sharing, both synchronous and asynchronous, via email, discussion forums (bulletin boards), chat and social networking programs such as wikis and blogs. Online learning programs use the computer interface to present learning materials as well as a communication channel in an effort to emulate the face-to-face educational experience.

Research shows that students in face-to-face programming courses have difficulty visualising abstract concepts (McSporran & King,2005). Computer Science is recognized as an area of instruction that requires complex conceptual knowledge and understandings, and is potentially both highly technical and practical in nature. The understanding of essential abstract concepts that underpin the development of a 'programming mindset' present more challenges to teaching and learning than in other courses (Jehng & Chan, 1998). Students need to develop strategies and utilise their problem-solving skills to creatively solve programming problems or to create new programs (Bayman & Mayer, 1998). Even in a face-to-face teaching-learning environment, students find these units extremely challenging. Therefore, Computer Science students, particularly those working

in programming subjects, are at significant risk when attempting an online course compared to traditional classroom students. In the online environment where the student is physically isolated and where none of the body language and ready/immediate access to the lecturer's knowledge at the point of need is available, teaching and learning becomes even more difficult. Thus, teaching and learning via the computer in these subjects is particularly problematic (Gulatee & Combes, 2008; Gulatee & Combes, 2007).

4. Traditional classrooms versus online learning

The traditional classroom or face-to-face teaching provides students with opportunities to work with experts in their field of study. In a traditional classroom setting conceptual understandings may be immediate and personal through students' interactions with both their lecturers and other students. These traditional interactions contribute social and emotional focus that gives students a chance to compare themselves in terms of performance, problems and priorities with other students. Traditional classes also give students a chance to benefit from other students' questions, mistakes and insights. In the broadest definition, face-to-face tutorials tend to have two main parts:

1. a diagnostic component, in which instructors clarify students' progress with respect to coursework, answering questions, and reflecting on a previous assignment;
2. a lecture or problem-solving component, in which instructors elicit discussion on examples and issues, or in which students solve and discuss problems (Petre & Price, 1997, p.126).

In the wholly online environment the student is physically isolated. None of the body language and ready/immediate access to the lecturer's knowledge at the point of need is available. A major problem with teaching Computer Science topics on the Web is the lack of direct interaction in teaching and learning activities and immediate access to the lecturer. Matzen and Alrifai found that forty-five percent of the students in their research agree that it is more difficult to teach Computer Science on the Web than most other disciplines, especially introductory programming (Matzen & Alrifai, 2006). Another factor affecting the delivery of online teaching and learning includes slow Web-based e-learning systems, which lead to student frustration and course abandonment (Weippl, 2005). Klienman and Entin suggest that the most critical factor in the distant learner's success or failure is the technology setup. They refer to this as the technology hurdle at the start of the semester. If software has not been properly installed and the hardware not functioning smoothly, this tends to affect whether the students remain in the course. Their research also found that some students were overwhelmed with the amount of material to download before even getting started on course content. Therefore, the presentation and release of content in an online course is also a factor affecting success and student completion.

It is clear that an online course's viability is dependent not only on strong teaching-learning support from the university, but also technical support. The university must provide timely and consistent technical assistance throughout the online study period if students are to feel adequately supported (Kleinman & Entin, 2002). Research by Flowers (2001) also found that appropriate technology resources were available for only a percentage of the potential student body and not for the majority of students studying online. While current predictions that " high performance computing will gradually enable virtual communities to make use full of actual face-to-face interactions" (Deek & Espinosa, 2005, p.427), this reality may still be a long way into the future. The National Science Board's *Science and Engineering Indicators* (2006) reporting on science, mathematics and engineering education at all levels, found that many institutions also have low Internet connection speeds (71%), which limits the types of resources that can be provided online. Low bandwidth connections mean that students cannot easily access resources such as streaming video, seamless chat, multimedia simulations and specialist development environments which may be an integral part of the on campus classroom learning environment. Use of specialist resources and development environments is often required in programming for Computer Science. Thus, how students respond and interact with the technology being used for learning and the environment created, is an important component of the learning equation. Successful e-learning programs depend heavily on the technology available and the learning environment created. Students who are hampered by lack of access, issues with infrastructure and equipment and bandwidth, are more likely to have negative experiences and abandon their studies (Hara & Kling, 1999, 2000).

In his research Santally (2005) also focused on the barriers of online education for staff and students. Barriers included technology support, the cost for access to the Internet especially in a developing country, different teaching and learning cultures, and professional and social commitments. An example of technology support problems identified in this research include computer breakdowns and system crashes which affect the students' learning experience (Santally,2005). This research is supported by Combes and Anderson (2006) who found that one third of students studying wholly online experienced technology problems outside the control of the university. The cost of Internet access is also an issue for some students who

cannot afford these costs easily. Differences in learning cultures, especially where students are studying online courses at universities in other countries, cause difficulties for some students who may have serious communication problems (English as a second language), resulting in some students who do not communicate online at all. These issues affect students' learning progress in online courses. Professional and social commitments for both staff and students are also an issue. E-learning research indicates that it is difficult to adjust to and fit in the exigencies of an online study program into already heavily loaded lifestyles (Santally, 2005). Gibson et. al. (2001) found that most students were interested in studying online due to the flexible class timetable, the convenience of attending classes from anywhere and at any time, and the time and cost savings to be gained by not having to travel to university.

For online classes, the most influential negative aspect is instructor and student interaction and hands-on studying. Eom (2006, p.985), suggests that "…instructors' individual attention to students and responsiveness to students concern is the most influential factor to significantly increase the satisfaction of students talking online classes". Just how do students view online learning versus the on-campus experience? Kleinman and Entin (2002) found that learning outcomes between the students in traditional classrooms and online classrooms showed no significant difference. Moreover, the online students were more positive about the value of the course (Kleinman & Entin, 2002). However, these results may have been affected by the students' reasons for taking the course and the age of the students, since older students returning to study are often more committed (Honigsfeld and Dunn, 2006). This research also found that the online environment was preferred for this particular sample group of online students, because they had to study and work at the same time. Therefore, flexibility in scheduling was the most important deciding factor when choosing a course. This result indicates that the students in this online class appreciated the flexibility that allowed them to study, rather than the notion that the traditional classroom is better than the online classroom. In addition, most of the online students in the sample group were older than the on-campus students and had skills and experience in Computer Science before they began the course. They had clear career objectives closely related to the workplace and were, therefore, highly motivated. In this research, the results appear to be closely related to the particular set of students in the sample group and their reasons for studying online, rather than their preferred learning environment.

Honigsfeld and Dunn (2006) also found that the age of the students affects their learning. Older students who return to complete degrees after considerable life experiences, have more self-motivation to complete the course and be successful than traditional classroom students who may be younger. As a result, these older students may be more satisfied with courses than students in traditional classrooms. Students who enter courses with workplace skills and life experiences may also find courses easier. This research also found that the instructors teaching online felt the online environment introduced a greater workload that needed more support from administration, collection and the returning of student work, especially where assessments were not being uploaded online. Santally (2005) found that a major advantage of the Web-based delivery of education materials is that content can be delivered to a number of students and accessed with no restrictions on time and place (2005). Santally also found that "there is a wide belief that using the Web as the only delivery medium for educational materials, does not add significant value to the teaching and learning process" (2005, p1). Spallek et al. (2001) identified the most significant reasons for students choosing to study online are because they can study at home and work to flexible schedules. This research confirms findings by Kleinman and Entin (2002). The research by Lin and Overbaugh (2007) found that most students chose this mode of study due to personal time management issues. Thus, the successful transition from the traditional classroom to online is also influenced by other factors, such as convenience and flexibility, rather than the content or on-campus learning experience.

While first year experience (FYE) studies have identified isolation, anxiety and lack of identity as major impediments to success at university in the first year (McInnes et. al., 1995; McInnes et. al., 2000, Oliver, 2003), the literature does not consider lack of confidence as an issue for first time students. The findings from research into the first year experiences of online students (Combes and Anderson, 2006), suggest that lack of confidence, feelings of isolation and anxiety are closely related. In this study the lecturer is a central figure in the online learning environment. The presence of a pro-active lecturer who gives prompt feedback and maintains early and consistent contact with students, appears to counter-balance the students' need and preference for face-to-face instruction. While factors identified in the FYE on campus studies are evident in the emotional response of online students, lack of confidence and self-efficacy also appear to be key factors. Are HCI and the online learning environment factors for successful student learning and integration into university life? This question is particularly important as more and more universities turn to blended learning programs and the online delivery mode to provide an environmentally friendly and easily accessible alternative to the provision of curriculum and resources. Certainly, the findings in this study suggest that first experiences online do create difficulties for some students and leave lasting impressions of feelings of isolation, lack of confidence and anxiety. In this study the students' HCI and emotional response to online study and their feelings of anxiety and confidence are closely related to feelings of isolation and their ability to connect with the university and the online/on campus community. For online learning to be a satisfying and successful experience for students, information about courses and expectations need to be transparent, the technology easy to use and accessible, two-

way communication between the lecturer and the student consistent, and the development of lecturer-to-student and peer-to-peer asynchronous and synchronous discussions and feedback encouraged. Only when additional support structures, embedded into the online learning experience are provided, will the anonymous and isolationist aspects of working with technology as a vehicle for learning cease to be major impediments to success when studying online at university.

5. E-learning, something new or the same as face-to face?

Most online systems include the delivery of lecture materials, workshops, links to other learning materials and readings, discussion forums, and email. Synchronous and asynchronous methods of communication are used to deliver online materials and tools. Asynchronous methods use collaborative tools that enable students to communicate with their lecturer and their peers at any time. This communication method allows lecturers to put content, course materials and feedback into the online learning system at any time that is convenient or timely for the teaching and learning program. Students can access the materials anywhere and at any time. Instructors and students can also communicate with each other at their own convenience. Gibson, Blackwell, & Hodgetts (2001) found that synchronous communication is an effective online communication tool, in that it allows students to ask questions and get feedback in real time, just like students in the on-campus classroom. The benefit of a synchronous learning environment is that it provides immediate interaction and can mimic the timely feedback loop that is provided in a face-to-face classroom. According to Goldsmith (2001), students tend to have different attitudes toward asynchronous communication. Most students point to positive aspects such as time management and feedback which enhances their ability to learn, as well as convenience for the learner who can study either at home or at work. However, negative reports from students highlight the lack of interaction, with many learners believing that they can better express themselves directly with face-to-face communication (Goldsmith, 2001). Thus, the online delivery model should include a range of student resources, facilitator resources and facilitator support such as online course materials, discussion groups, real-time lectures, learning guidelines, textbooks and access to facilitators. Curriculum designed for the online environment should be holistic and contain a range of learning materials using different formats. While learning management systems such as BlackBoard and WebCT provide the facility for instructors to upload a variety of learning materials with a range of interactivity, instructors not only need to develop and include these types of materials, but they also need to have the skill to moderate and work as online tutors to enhance interaction with students and the online learning experience as a whole.

Results of Leung's (2003) research into online and on-campus versions of the same unit show that students attending traditional classroom lectures have a higher pass rate, even though the satisfaction ratings from both the online and the on-campus class were quite similar. The methods and tools for delivering the online course included both asynchronous and synchronous communication techniques between students and lecturers, and students and their peers (Leung, 2003). However, since most of the students in the sample group for this research had very strong backgrounds and experience in information technology, what might be considered easy for these experienced users may be very hard for beginners attempting to study programming courses online. Gibson et. al. (2001) found that another negative aspect of online learning is the length of time required by the student to complete activities and tasks and learn. He found that students took longer to complete readings and learning tasks online than in a traditional classroom. Other research has found that to successfully design online educational programs, the instructor must ensure that there is a balance between guidelines provided by the system and the human facilitator; learning materials need to include a visual process of inquiry; learners are motivated with the right questions, they should be engaged with a variety of learning activities, and need to be provided with clear guidance (Lim, 2001). Smith and Taveras (2005) also identified interaction with the instructor as the most important factor for students in an e-learning environment, with eighty-five percent of students reporting that they felt insecure, isolated or confused because of the absence of an instructor in online study. In this research project ninety-five percent of instructors said they spent a lot of time replying to online student queries. Since synchronous methods emphasize/simulate a one-to-one style of communication, researchers found that this delivery mode created a lot of intensive work for the instructors, far more than the oral exchange in a face-to-face class. Research by Gibson et al. (2001) also found that in many cases assessments and workshop activities have not really translated well from face-to-face classes into the online learning environment. These researchers and others (Zemsky & Massey, 2004) also found that many e-learning environments have fallen short of student expectations.

Current research findings such as those mentioned above, suggest that we need to consider e-learning as a new paradigm rather than as a substitute for the traditional, face-to-face classroom experience. Certainly online learners are faced with challenges when operating in the virtual environment which requires a range of different skills to engage with and interrogate e-learning materials. Clearly, students and lecturers also need to approach this learning experience differently. Interacting and engaging with learning presented in this medium is very different to face-to-face instruction and curriculum should be designed so that learning materials are rich, varied and provide students with support structures to ensure successful and deep learning takes place (Duderstadt, 2005). Rich online curriculum should contain synchronous and asynchronous facilities, a range of document

formats, links to other online resources, a variety of activities and assessment items based in real world, problem-solving contexts.

6. Is structure enough? The role of audio/visual content and feedback

The delivery mode and the differences between face-to-face and wholly online classrooms affect all learners, not just those studying Computer Science topics. Research by Combes and Anderson (2006) found that most online students felt extremely frustrated by using technology for group discussions, and felt they were missing the sense of rich opportunities often experienced in face-to-face groups. The issues of communicating in a virtual environment where there is no body language or immediate feedback loop so students can evaluate the sense and context of the discussion, are very real for online students. Students also reported that online discussions were time consuming, while lecturers felt that learning activities using virtual, text-based interaction required more effort from the instructor to push students to communicate with their peers. Students were sometimes confused by email IDs and found it difficult to relate to their peers in a wholly online environment. Research about students' reactions to online learning has been criticised as anecdotal rather than systematic or critical by Hara and Kling (1999, 2000). They also suggest that "the researchers who study distance education may be biased toward technology. The field has not critically addressed negative implications, especially from students' perspectives in distance education" (Hara and Kling, 1999, 2000). Tu and Corry identify a number of weaknesses in the research including the following: 'differences between online and traditional communities are not clearly addressed; the focus is usually directed at end products, not the level of self; and most of the data has been derived from short-term studies' (2001).

Even e-learning programs which try to mimic the face-to-face experience that occurs in traditional classrooms fail to address students' needs when they have problems completing workshop activities or an assignment. Frustration plus isolation from the learning experience and a sense of 'not belonging' to a community of learners is a major problem for online students (Combes & Anderson, 2006). E-learning programs where most of the learning materials are text-based and do not contain other formats types such as graphics, multimedia simulations, audio (podcasts) and visual representations, do not provide rich learning experiences for students, who might as well be studying only from a text book. Certainly as technology improves, lecturers have opportunities to provide a wealth of resources to all students, not just those studying wholly online, to augment their teaching-learning programs. Providing audio instructions to students alongside multimedia resources emulates the classroom experience while catering for audiovisual learners. This extra component of the learning experience may assist in making communication clear and enhance understandings for all learners. In this way the technology can be used to develop curriculum that pre-empts problems and provides support for learners at the point of need. This is especially useful in Computer Science programs such as programming languages where students often need immediate feedback to solve problems, create new programs or understand difficult language syntax. Since the audiovisual feedback is provided at the point of need and is available 24/7, students don't have to wait for the lecturer to log in and provide a response. Lecturer workload can be significantly reduced, an important consideration when teaching large classes. Using the technology available in this way provides students with a similar feedback loop as experienced in the face-to-face classroom. Online curriculum that is rich, multi-format and engaging is also available to students throughout the course and provides opportunities for review and revision, to consolidate understandings and conceptual development.

7. Conclusion

E-learning programs are currently in a state of transformation as curriculum designers and lecturers try to emulate the classroom experience. Perhaps it is now time to recognize the importance of HCI and the impact working with technology as a vehicle for learning has on student achievement. HCI is more than just the interaction that occurs between human users and computers. It is also about the whole e-learning experience and how students interact with and their emotional response to the technology and the virtual spaces/environment delivered via the computer screen. Barriers to successful student engagement include their feelings of isolation, anxiety and confidence, often engendered by the technology and technical issues they often have with access and bandwidth. Other barriers to successful student engagement in e-learning programs include feedback and consistent interaction with lecturers and their peers. To encourage deep learning e-learning programs must contain a range of different learning materials and formats, use audiovisuals as well as multimedia and text, include real world assessments designed for the online environment and provide learning support documents/ software. This is particularly the case when teaching technical subjects such as programming languages online, where students need to acquire a range of technical and practical skills, and conceptual understandings, in order to be able to apply this knowledge to different applications and workplace challenges. Due to the rapidly changing nature of technology, technical Computer Science subjects present greater challenges in the e-learning environment. Programming students must acquire practical skills and understandings of essential abstract concepts that underpin the development of a 'programming mindset if they are going to be adequately prepared for the workplace.

Perhaps it is now time to separate e-learning and consider it as a new learning paradigm rather than as a substitute for the traditional, face-to-face classroom experience. Current research into e-learning and virtual learning communities certainly indicates that we need to consider the whole environment, HCI and how students respond to the e-learning experience if we are to create successful curriculum programs. Online students require a different level of support and access to a wide range of rich learning materials. With the current move towards the provision of blended programs, e-learning is no longer just about off campus students either. More and more on campus students are also taking part in the e-learning experience. Since technology is such an integral part of online learning, e-learning programs need to be designed which approach learning as an holistic experience.

A COMPARISON OF STRING INSTRUCTION BETWEEN AMERICAN AND TURKISH UNIVERSITIES

Dr. Dilek Göktürk (Ph.D.)

Karabük University, Fethi Toker School of Fine Arts and Design in Safranbolu, Music Department

Abstract

In this study, the researcher's concern was determining main common problems in string education at the collegiate level both in the United States and the Republic of Turkey. At the end of the study, the results showed that although these countries had such different historical backgrounds and different systems regarding string instruction, professors at universities in both states faced with similar problems, and they offered solutions that would be used globally in such area.

Introduction

The origins of string instruction in the United States (particularly at public schools) date back to the 1800s. A flourishing interest in string pedagogy during the second half of the nineteenth century motivated American music educators to adopt and develop methods originating in Europe. Lewis Benjamin, Charles H. Farnsworth, and Albert Mitchell were among the first educators who systematically introduced string instruction methods to American students. Later, pedagogues such as Joseph Maddy and Paul Rolland made significant contributions to the improvement of string education nationwide. Organizations such as the Music Educators National Conference (MENC), the National School Orchestra Association (NSOA) and the American String Teachers Association (ASTA) were instrumental in coordinating the implementation of string methodologies.

On the other hand, string education in the Republic of Turkey has a short history; however, its development has been rapid. Although the interest in western music began during the eighteenth century in Ottoman Empire period (the so called "westernization" or "modernization" movement) these efforts became broader after the foundation of the Republic of Turkey in October 29, 1923. Music education and string education (as a part of music education) has been influenced and developed by these efforts. Another big influence on string education in the Republic of Turkey is the politics. Often-changing Turkish politics has affected such area.

History of String Education in the United States

During 1850s (until 1900s) Lewis Benjamin was one of the first influential figures in string education. He began teaching private lessons in 1847 and published his own method book *The Music Academy* in 1851. He also operated a free violin school in New York in 1877. Benjamin and other string educators were operating free violin schools in New York, Philadelphia, Camden, Pittsburgh, Cincinnati, and Chicago during the late nineteenth century, and during this time Benjamin decided to hold annual *Children's Carnivals* in Brooklyn and other cities. Increasing public interest led to the establishment of conservatories. These were in New England, Peabody, Oberlin, Boston, Chicago, and Cincinnati at first and were all in European type. At this time, Theodore Thomas was an important figure because he founded the Chicago Symphony Orchestra.

After-school orchestras at high schools existed as early as 1878 in the midwestern and northeastern sections of the country. The first elementary school orchestra was founded at Nathan Hale School in New London, Connecticut, in 1896. By 1898, schools in Richmond, Indiana began to offer high school orchestras as part of the regular school curriculum.

Between 1900 and 1918, Charles H. Farnsworth, a professor of music education at Columbia University, introduced the Maidstone Movement to American music teachers after his observation of the string classes in London while he was on a sabbatical leave in 1908. As another development during this period, Albert Mitchell established the first public school violin class at the Thomas K. Hart School in South Boston in 1911. Therefore, The Boston Public schools became the first school district in America to offer group violin classes as part of the regular curriculum by 1911. Beginning of 1918, schools in several parts of the United States offered string instruction as part of the regular school curriculum.

String instruction was offered in school districts throughout the United States between 1918 and 1929. Approximately 60 string class methods were published during the 1920s (Sollinger 1970: 165). Joseph Maddy organized the first National High School Orchestra and arranged for it to perform at the Music Supervisors National Conference in Detroit, Michigan in 1926. After two

years, and Maddy founded the National High School Orchestra and Band Camp at Interlochen, Michigan with Thaddeus P. Giddings and provided a permanent home for this ensemble.

During the 1930s, two important events occurred in the United States that made negative effect on the development of string education: the great economic depression and the development of talking motion pictures. String programs continued to grow during the early 1930s and orchestras were dominant in most schools. In 1939, The Music Educators National Conference identified two possible reasons for the decrease of public school string programs as follows (Grover 1960: 98):

1. There was a critical shortage of public school string teachers, and
2. Bands were associated with school athletic programs.

The number of school orchestras continued to decline during World War II (1939-1945) because bands were building a national spirit. The most important event about string education that occurred during this time period was the foundation of the American String Teachers Association (ASTA) in 1946. This organization became active in the 1950s, and it created a positive effect on public school string programs.
Between 1950 and 1960, string programs were added in school districts throughout the United States, and many colleges and universities added string teacher education courses. This act resulted in a dramatic increase in the number of trained string teachers. As another development, string instrument manufacturers developed smaller size instruments for school use. The National School Orchestra Association (NSOA) was formed in 1958 and contributed to the growth of school orchestras during this time period.

Many drastic social changes occurred in the United States during the 1960s. For example, the middle class continued to move to the suburbs, and, as a result, increasing economic disparity developed among the socio-economic classes. This movement led to a dramatic decline in funding for urban schools. ASTA sponsored two projects in the 1960s: the establishment of an Orchestra Day at the Midwest International Band and Orchestra Clinic, and the sponsorship of the Suzuki tour group to perform at the ASTA Conference in Philadelphia, Pennsylvania, in 1964. ASTA also sponsored a series of Suzuki workshops in different parts of the United States arranging a Talent Education tour to Japan to observe Shinichi Suzuki's teaching.

String programs began to decline in the mid 1970s due to the economic recession that occurred in 1974. Many school districts were forced to eliminate their string programs because of budget cuts; however private Suzuki string programs continued to grow throughout the United States. Most of the students in private Suzuki programs were from upper-income families.

The economic situation continued to deteriorate in the 1980s because of high inflation, high unemployment, and high property taxes. Taxpayers refused to pass bond issues to support the schools; therefore, more string programs disappeared from the public schools.

The 1990s were marked by a rebirth of string programs in many school districts as a result of the rising economic prosperity among the middle and upper classes. ASTA was involved in several projects during this time period, and it created a major impact on the future of public school string education.

In the new millennium, there are two main problems in American public school string education: the critical shortage of qualified string teachers, and economics. It is expected that 2500 future string teachers will graduate from these programs in the next ten years. By the year 2030, it is predicted that the minority student population in the public schools will be at least fifty percent of the total school population (United States Department of Commerce. *Population Projections of the United States by Age, Race, and Hispanic Origins* 1993: xvi-xviii).

History of String Education in the Republic of Turkey

The beloved leader in the Republic of Turkey, who is the "Father of Turks," Mustafa Kemal Atatürk (1881-1938) was enthusiastic about gathering role models (mostly Western) for the new educational system in Turkey after he founded the Republic on October 29, 1923. He invited renowned educators from other countries to visit Turkey and offer their suggestions for educational reform. Among these notable scholars who visited Turkey were John Dewey from the United States in 1924, Alfred Kühne from Germany in 1926, Omar Buyse from Belgium in 1927, and a team led by Walter Kemmerer from the United States in 1933. Another important educational reform initiated by Atatürk was the changing the alphabet in Turkey from

Arabic to Latin. His new government strongly supported this transformation. The Turkish adaptation of the Latin alphabet became mandated by law on November 1, 1928.

Although official music teacher education began in the Republic period in 1924, the need for music teachers had also been noted during the Ottoman Empire period. The need for music teacher education became apparent after the establishment of higher education institutions for teacher training. Music was included in the curriculum of the Girls' Teacher Training School in 1875. Other teacher training schools added music to their curricula in 1910. In 1917, the first music school *Darül Elhan* (Music School) was opened in İstanbul. The school was closed in 1926 (after the Republic), and reopened later as a conservatory in the Republic period.

Today, there are two types of music instruction in Turkish schools as follows:

1. General Music Instruction, which is compulsory at the primary level and optional at the secondary level, and
2. Instrumental/Vocal Music Instruction, which is taught at the Anatolian high schools of fine arts, conservatories, and university music schools.

Since the foundation of the Republic, three types of educational institutions have served string instruction: Anatolian high schools of fine arts at public school level, conservatories (to train professional performers), and university music teacher training schools (to train music teachers for public schools).

Public school string instruction is currently offered only at the Anatolian high schools of fine arts in Turkey. There is no string instruction at elementary and middle school levels and no group-class instruction at secondary level. All instruction at the Anatolian high schools of fine arts is provided in studio settings similar to the instruction that can be found at the conservatories. After students graduate from these schools they continue their education either at conservatories or university music teacher training schools. Those who attend conservatories usually play in professional orchestras and who graduate from university music schools usually become music teachers.

The first university music school was founded in Ankara in 1924, under the name of *Musıkî Muallim Mektebi* (Music Teacher School). The purpose of this school was to prepare music teachers to teach at secondary schools. One of the founders of the Music Teacher School was Professor Eduard Zuckmayer (1890-1972), who was a German composer, pianist and music educator. He was invited to organize the foundation of the institution along with the famous German composer Paul Hindemith (1895-1963). Zuckmayer stayed in Turkey to teach at the Music Teacher School in Ankara until his death in 1972, and Hindemith lived in Turkey for total five months between 1935 and 1937. In 1938, the name of *Musıkî Muallim Mektebi* was changed into *Gazi Terbiye/Eğitim Enstitüsü ve Müzik Şubesi* (Gazi Education Institute and Music Branch). This school provided music teacher training until 1978. After 1978, all music teacher training took place at *Gazi Yükseköğretmen Okulu Müzik Şubesi* (Gazi Higher Teacher Education School – Music Branch) whose curriculum was similar to that of *Gazi Eğitim Fakültesi Müzik Eğitimi Bölümü* (Gazi Faculty of Education Music Department), which was a four-year institution reestablished after 1982. There are currently twenty-three university music teacher training schools in Turkey that prepare students to teach music at the secondary school level. Some of these schools also offer master and doctoral degrees in music.

Purpose of the Study

The purpose of this descriptive study was to find out whether common problems in string instruction at the collegiate level would exist in the United States and the Republic of Turkey even though their cultural heritages and histories did not match. Contemporary scholars in Turkey (such as Süer, 1980; Uçan, 1982; Yayla, 2003; Özeke, 2003; Uslu, 2000; Tebiş, 2004; Özen, 2005; Kasap, 2005; Söker, 2006; Göktürk, 2008) have identified several weaknesses in undergraduate string teacher education at the collegiate level. These researchers indicated that insufficient facilities, the lack of well-trained instructors, outdated teaching methods, and student's lack of spirit to become string teachers were among these problems.

Methodology and Procedures

The research took in place in spring 2007 in Turkey and in spring 2009 in the United States. All the string professors taught at university music teacher training schools in Turkey (*N*= 71) and four string education professors (from different states and regions) in the United States have participated to the study. The reason that four American string educators were selected was because of the high number of American universities that offer such education. These professors were chosen as the

representatives of the American educational system regarding string instruction at the collegiate level based on their reputations in the area.

The questionnaire was developed after a preliminary study, which was also developed through an extensive review of the literature related to music education and string teacher education in Turkey. For the preliminary study, five open-ended questions were sent to eighteen randomly-selected string professors in Turkish universities. Based on the responses of this survey, the questionnaire, which was divided into six sections, was developed. Each section covered a different topic as follows:

- *Section 1* (String Skills/Techniques Courses)
- *Section 2* (String Methods/Pedagogy Courses
- *Section 3* (Private Lesson Instruction
- *Section 4* (String Laboratory Courses)
- *Section 5* (Strengths and Weaknesses of the Current Undergraduate String Education Degree Program)
- *Section 6* (Suggestions for Improving the Undergraduate String Education Degree Program)

The obtained data was presented in two different categories. The closed-format questions were presented as quantitative data, and the open-ended questions were presented as qualitative data. The findings regarding the responses by the participants from both countries were compared. Based on the comparison, the similarities and the differences in string teacher education between the United States and the Republic of Turkey were drawn, and possible global solutions for the existing problems in both countries were stated at the end of the study.

Results

Four American and a total of sixty-one out of seventy-one Turkish string professors (from twenty-two universities) responded to the study. The first part in this section includes the quantitative findings (#1 through #18 the questionnaire). The second part contains the qualitative findings for the open-ended questions (#19 through #26 the questionnaire).

Quantitative Results

Section 1: String Skills/Techniques Courses

This section of the survey consisted of the first five questions. According to the results, all four respondents from the United States indicated that their schools offered String Skills/Techniques courses while only ten Turkish universities offered such instruction.

Both American and Turkish participants indicated that one String Skills/Techniques course was given at their schools, and this course was offered two to five hours per week and mostly taught by string education specialists. According to the professors from both countries, the following skills are taught in such courses: (a) correct playing posture for each of the four string instruments, (b) correct instrument hold for each of the four string instruments, (c) correct bow holds for each of the four string instruments, (d) correct method of tone production for each of the four string instruments, (e) basic bowing patterns and articulations, (f) fingering patterns in first position for each of the four string instruments, (g) correct tuning procedures for each of the four string instruments. American professors further indicated that (a) full range of all instruments in 1st position (b) method book reviews, ensemble experience, repertoire review, (c) finger patterns for each of the four instruments through 5th position, (d) techniques of volume manipulation, (e) introductory experience in shifting and vibrato, and (f) introductory coverage of Suzuki and Rolland were taught in such courses. The method books used in these courses at American universities were listed as (a) *Essential Elements for Strings 2000*, and (b) Dillon, Kjelland, & O'Reilly *Strictly Strings*, Books 1 and 2. They also stated that students were required to prepare their own arrangements to teach this class, and a lab component also existed once a week, where Grade-1 and Grade-2 orchestral literature was rehearsed. On the other hand, for violin, *Kreutzer*, *Sevcik*, *Hans Sitt*, *Rodionov*, Fortunatov's *Young Violinist, Mazas, Fiorillo, Rode, Wohlfahrt*, *Keman Eğitimi* by Ömer Can, *Yaylı Çalgılar (Keman)* I, II, III [String Instruments (Violin) I, II, III] by Edip Günay and Ali Uçan, *Keman Eğitimi İçin Özgün Parçalar* [Original Pieces for Violin] by Ali Uçan, *Anadolu Güzel Sanatlar Liseleri İçin Keman Ders Kitapları Sınıf 1, 2, 3, 4* [Violin Instruction Books for Anatolian Fine Arts High Schools 1, 2, 3, 4] by Ali Uçan, and *Crickboom*; for viola, *Viyola Metodu I-II-III* [Viola Method I-II-III] by Ayfer Tanrıverdi; and for cello, *Sebastian Lee*, *J. Werner Violoncello School*, and *Dotzauer Exercises* are used in Turkey.

Section 2: String Methods/Pedagogy Courses

Questions #6 through #10 in the questionnaire requested information about String Methods/Pedagogy courses. According to the results, three respondents from the States and four schools in Turkey offered such instruction.

Both American and Turkish professors indicated that only one String Methods/Pedagogy course was given at their schools, and this course was offered one to three hours per week, and mostly taught by string education specialists. According to the respondents from both countries, the following skills are taught in such courses: (a) identifying fingerings in all positions for each of the four orchestral string instruments, (b) selecting appropriate bowings, care and maintenance of string instruments and accessories, (c) how to make minor adjustments and repairs of string instruments, identifying intonation problems and prescribing corrective procedures, (d) selecting instructional method books, and (e) selecting repertoire for solo instruments. In addition, American professors indicated that (a) Students prepared three orchestral scores from the *Teaching Music Through Performance In Orchestra Series* and rehearsed this music during class; (b) *Bob Culver Master Teacher Profile* was used; (c) Two secondary instrument solo recitals were mandatory; (d) Students designed a curriculum to teach either vibrato, spiccato, or shifting based on five or more sources; (e) 15-hour field experience in the public schools was mandatory; and (f) Paul Rolland's *The Teaching of Action in String Playing* was used as a source in such courses. The method books used in String Methods/Pedagogy courses in American schools were listed as (a) *Essential Techniques for Strings* Book 3, (b) Suzuki Books 1-3 for each of the instruments, (c) the Textbook, (d) *Teaching Music Through Performance in Orchestra,* (e) Paul Rolland's *The Teaching of Action in String Playing*, and (f) *Essential Elements for Strings 2000*. Turkish respondents listed *Keman Eğitimi* by Ömer Can, *Çevreden Evrene Keman Eğitimi – I: Birinci Konum/Birinci Kitap* by Edip Günay, *Sebastian Lee, Fevillard, Dotzauer, Popper, Grutzmacher, Duport, Keman Eğitimi İçin Özgün Parçalar* [Original Pieces for Violin] by Ali Uçan, *Yaylı Çalgılar (Keman) Sınıf I, II, III* [Strings (Violin) Grade I, II, III] by Edip Günay and Ali Uçan, and *Anadolu Güzel Sanatlar Liseleri İçin Keman Ders Kitapları Sınıf 1, 2, 3, 4* [Violin Teaching Books for the Anatolian Fine Arts High Schools Grades 1, 2, 3, 4] by Ali Uçan as the sources used in such courses.

Section 3: Private Lesson Instruction

Questions #11 through #15 dealt with private lesson instruction. All respondents from both countries answered the questions in this section. Two of the American respondents indicated that three years were required for such instruction at their universities whereas the other two American and all Turkish professors stated that four-year private lesson instruction was the requirement. According to the responses, students meet once a week for these courses in the United States, while the weekly meetings range from one to two hours at Turkish universities. Neither American nor Turkish students learn how to play all string instruments in private lesson instruction. Regarding the skills, (a) correct playing posture, (b) correct instrument hold, (c) correct bow hold, (d) basic bowing patterns and articulations, (e) fingering patterns for all the positions, and (f) correct tuning procedures are taught in such courses in both countries. American teachers listed *Mazas*, *Kreutzer*, *Dont*, *Wohlfahrt*, *Sevcik*, *Rode Caprices*, *Schradieck*, *Korgouff*, *Ysaye* while Turkish professors included some additional sources to the previous list of method books used in these courses such as *Keman Eğitimi* by Ömer Can, *Mazas*, *Fiorillo*, *Anadolu Güzel Sanatlar Liseleri İçin Keman Ders Kitapları Sınıf 1, 2, 3, 4* [Violin Instruction for Anatolian High Schools of Fine Arts 1, 2, 3, 4] by Ali Uçan, *Komarovsky, Hoffmaister, Compagnoly, Palashko, Leopold Auer, Ivan Galamian,* for violin; *Viyola Metodu I-II-III* [Viola Method I-II-III] by Ayfer Tanrıverdi, and *Viyola İçin Dizi ve Yay Çeşitleri* [Scales and Bow Techniques for Viola] by Oktay Dalaysel & Fatih Yayla for viola; and *Feuillard, Werner, Dupport, Grutzmacher, Popper, Schroder Technique Exercises, Werner, Dotzauer I-II-III, J. Stutuchewsky, H. Becker, Feuillard, Mainardi,* and *J. Merkb-Cossmann* for cello.

Section 4: String Laboratory Courses

Questions #16 through #18 in the questionnaire requested information about string laboratory courses that were offered at the respondents' universities. Based on the responses, such instruction was given at two Turkish and two American universities. The American participants stated that four String Laboratory courses were given at their schools (offered two to five hours per week), while the amount of such courses was one to two in Turkish universities (offered three hours per week). The materials that both American and Turkish string professors use in String Laboratory courses were listed as standard orchestral literature, and public school arrangements of orchestral literature. The participants from the United States further indicated that their students received a minimum of six semesters of these courses, and the skills included (a) knowledge of repertoire, (b) lesson planning, (c) rehearsal skills, (d) score study, (e) teaching conceptually, (f) teaching effectively, (g) assessment and grading procedures, and (h) classroom management. They also stated that they used a substantial amount of original music composed

for public school string orchestra, and a bulk of this literature had been pulled from the *Teaching Music through Performance in Orchestra Series*. Arrangements and original pieces by Turkish composers were also listed by Turkish respondents as sources used in such courses.

Qualitative Results

Section 5: Strengths and Weaknesses of the Current Undergraduate String Education Degree Program

Participants were asked in questions #19 and #20 about the strengths and weaknesses in string teacher education in their countries. Professors from the United States listed following strengths in string teacher education area: (a) the use of more contemporary instructional materials such as alternative styles material, which is best taught by ear so that students should regularly find and create their own arrangements, (b) the increased use of string teaching methods such as Rolland and Suzuki, and (c) changes in the curricular structure such as increased contact in laboratory classes.

The respondents from Turkey listed the following strengths: (a) increased use of string teaching methods from other countries such as *Popper* and *Grutzmacher*, (b) increased motivation of string education students to become better performers, (c) the establishment of Anatolian high schools of fine arts, (d) improved university teaching facilities, (e) the inclusion of more Turkish music in string method books, (f) increased number of string education specialists, (g) a rejuvenated interest in curriculum development, (h) a marked improvement in evaluation tools, and (i) increased number of high quality string faculty at universities.

American professors mentioned about following weaknesses in string teacher education programs: (a) too much theory and lack of practice in the area, (b) the need for additional semester of advanced string methods for the string majors to develop additional secondary instrument skills, (c) a better understanding of appropriate solo and etude material for high school and middle school students, (d) need for more conducting opportunities and more chamber music, and (e) the balance between the performance and pedagogy course requirements.

The respondents from Turkey indicated that (a) the general level of the applied string instruction, (b) the quality of the teaching methods and materials, (c) the balance between the performance and pedagogy course requirements, and (d) the length of the degree program late beginning age of string instruction, (e) the lack of a musical environment to demonstrate musical abilities (for students) and the lack of inclusion of musical knowledge into their daily lives, (f) poor physical conditions at some schools, (g) the heavy course load of instructors and professors, (h) the lack of quality in standardization in measurement-evaluation tools for auditions, (i) motivational problems of college music students, (j) the limited length of the program at university music teacher training schools, and (k) lack of research in the area were stated were main weaknesses in string teacher training area (Göktürk, 2008).

Section 6: Suggestions for Improving the Undergraduate String Education Degree Program

Participants were asked in questions #21 through #26 of the questionnaire whether they had suggestions to improve the string teacher education degree program in their countries. These suggestions are discussed in detail in the "Conclusion" and "Recommendations" sections in the article.

Conclusion

Several problems were identified in this study that university string professors and researchers in the string teacher education area in both the United States and Turkey should address. These issues in the United States are as follows:

1. lack of pedagogy instruction/guidance in the context of real, authentic string playing and teaching
2. lack of string pedagogy courses
3. lack of use of Paul Rolland's method
4. the need for more string workshops
5. More world music and folk music should be included in books.
6. More research studies should be conducted.
7. String faculty, who are specifically dedicated to train young string teachers, should be hired.
8. More string specialists with public school teaching experience teaching string education classes are needed.
9. It is very important to differentiate between teaching orchestra and band. Often in the United States, these two ensembles are treated as if they are the same when future teachers are being trained. The skills needed to be a successful orchestra teacher are somewhat different than the skills needed to be a successful band teacher.

In Turkey, the issues about the topic are as follows (Göktürk, 2008):

1. the lack of pedagogical courses in the string curricula at the collegiate level, such as String Skills/Techniques, String Methods/Pedagogy and String Laboratory Courses
2. technical problems and poor playing habits of students
3. the late beginning age of string instruction
4. the lack of research in the string teacher education area
5. the need for more string teacher workshops
6. the need for the inclusion of more Turkish music in string methods and the curriculum
7. the need for the adaptation of contemporary string method books and approaches from other countries
8. insufficient class time for private studio instruction
9. the questionable quality of string teachers at university music teacher training schools in the eastern region (particularly, string professors who do not know about recent developments in the area and pedagogical approaches to teach strings; string professors who are attached to their outdated approaches in string teaching)
10. substandard facilities in eastern university music teacher training schools
11. an insufficient number of string professors at eastern universities
12. the need for an organization for string teachers at the national level (to exchange ideas and knowledge)
13. the need for more Turkish string method books (particularly for lower string instruments)

Based on the issues in both countries as stated above, the following section of the article will present global solutions that can also be used by other countries which struggle with similar problems.

Recommendations

Based on the results, while they have different challenges, both the United States and Turkey have also similar problems in string teacher training area, although they have completely different historical backgrounds. As the similar problems, it is believed that the following recommendations can be global solutions for these common challenges in string teacher training area not only in both countries but also in others which struggle with similar inconveniences:

1. More weekly hours for string area courses (especially, string pedagogy courses) are needed.
2. More string faculty should be hired at the universities.
3. The methods by Paul Rolland and Shinichi Suzuki are not used as widespread as they could be. Both methods should be used more in both public school and university levels.
4. More folk music and world music should take place in method books, and new sources for string teaching should be developed by experts in the area.
5. More string workshops need to be offered to raise the quality level of string faculty.
6. More research studies need to be conducted in the string teacher education area to offer solutions for the existing problems.

7. Financial sources should be searched for the improvement of string teacher education. Grants need to be pursued by researchers in the area to upgrade the facilities and the quality of string education.
8. String education majors should be encouraged to perform more and to attend more concerts by professional symphony orchestras.
9. Exchange student/scholar programs should be established between the United States and Turkey so that both countries can learn about each other and develop better solutions for the existing challenges in the area via more interaction.

The future of string teacher education in the United States and in Turkey is predicated upon continual reforms in the area. By presenting the findings of the present study, new educational policies can be created and new solutions can be offered in the area through the collaborations among researchers in both countries. The United States has a long history in string teaching, and Turkey has strong musical traditions and a distinctive national identity. One of the ways to strengthen string teacher education globally is to develop effective practices in the educational system with the support of sources and teaching methods from both countries. In general, a combination of both national and international sources will be the most effective path to achieve excellence in music education in the world.

CORREPETITION AS THE PROBLEM AT TURKISH MUSIC TEACHER TRAINING SCHOOLS

Şirin Akbulut, D.M.A.

Uludağ University, College of Education School of Fine Arts Education, Music Education Department

ABSTRACT

Correpetition is an important problem at music teacher training schools in Turkey. Correpetition is not included as a course in the curriculum. Piano teachers at these schools accompany others because they are asked or asssigned, and this situation creates several problems. Therefore, students either play with no accompaniment or limited rehearsals before concerts or exams. In this study, the correpetition problem at Turkish universities was identified and possible solutions for the existing problems were stated.

Key Words: Piano, accompaniment, correpetition, piano instruction in Turkey.

1. INTRODUCTION

As in many countries, music education is also divided into three types in Turkey: (a) general music education, (b) amateur music education, and (c) professional music education. General music education begins in preschool, and the first eight years of schooling (in elemantary school and middle school levels) it is a mandatory subject of the curriculum. The purpose is to earn or to develop musical behavior through music. Amateur music education is usually used for out-side-of-school activities at private organizations, private music schools, libraries, public education houses or for local festivals.

Professional music education is given to individuals who want be to be trained as professional musicians. At the university level, professional music education is provided in the following main areas: to train composers or performers at conservatories; to train same types of musicians as in conservatories and music scholars (e. g. musicologists) at schools of fine arts; to train musical instrument makers at conservatories and at music teacher training schools; and to train military band musicians at Ankara State Conservatory and at Military Music School in Ankara. There are currently twenty-four conservatories, twenty-three colleges of fine arts (at the university level), and twenty-three music teacher training schools in Turkey. Music teacher training schools train music teachers for public schools. Music teachers are individuals who are the musician-educators teaching students general music and musical knowledge at public schools.

During the early years of the Republic of Turkey[1], the first school to train professional musicians was opened in Ankara in 1924 with the name *Musiki Muallim Mektebi* [Music Teacher School]. *Musiki Muallim Mektebi* became *Gazi Terbiye Enstitüsü* [*Gazi* Education Institute] in 1937. After this first music teacher training institution was opened in Ankara, several others have followed in time. Today, twenty-three music education departments exist as parts of colleges of education at universities in Turkey. In these departments, centralized curriculum that *Yükseköğretim Kurulu* (YÖK)[2] (Higher Education Council) prepares is used. The latest curriculum currently used at these music teacher training institutions was developed in 2006. This recent curriculum consists of 165 credit hours and total of 208 hours of course load (124 credit-hours are theoretical and 84 credit-hours are practical

---

[1] This period begins on October 29, 1923 and still continues on present day. Since the foundation of the Republic, Western Classical Music has been given more importance in Turkey, and many "firsts" in musical area was achieved during the early years of this period. Meantime, the five-hundred-year musical tradition in the West was modeled, and a modern perception in musical life was created in only thirty to forty years.

[2] Higher education has been reestablished academically, instiutionaly, and administrative-wise with the 2547 Higher Education Act that became effective in 1981. With this legislation, all higher education institutions were assembled under the roof of *Yükseköğretim Kurulu* (YÖK) [Higher Education Council]; academies became universities; education institues became colleges of education; and conservatories and vocational two-year schools became parts of universities. Therefore, YÖK is the only institution that is responsible for all higher education institutions with the authorization of the acts #130 ve #131 in the Constitution (http://www.yok.gov.tr/content/blogcategory/204/40/lang,tr_TR/)

courses), and it spreads into eight academic semesters (four years). These courses are in musical, educational and general cultural areas[3] (See the curriculum as the appendix).

2. PURPOSE of the STUDY

The purpose of the present study was to examine the place of correpetition in the curriculum used at music teacher training schools. Existing problems in correpetition were identified through the interviews with randomly-selected piano professors from seven different universities. At the end of the study, possible solutions were offered for the challenges in such area.

3. METHODOLOGY and PROCEDURES

As a qualitative type of study, descriptive anaysis method was used in the current research. Qualitative research is in-depth analysis of the data (Yıldırım and Şimşek, 2000). In the present study, data was collected via individual interviews, and a mixture of semi-stuctured and unstructured interview techniques were used. Interview technique is the shortest way used to learn individuals' knowledge, ideas, attitude and behavior and the reasons behind these actions (Karasar,1995).

The interview questions were prepared based on the literature survey even though the lierature is very limited in the area. Indeed, only two studies about the role of correpetition at music teacher training schools were reached during this search. This study is called as *Yeniden Yapılanma Sürecinde Müzik Öğretmenliği Programlarındaki Korrepetisyon Dersi Eksikliği* [The Absence of Correpetition Course in the Music Teacher Training Curriculum in the Process of Constructivism], and it was presented at the symposium named "Türkiye'de Müzik Eğitiminin Sorunları ve Çözüm Önerileri" [The Problems in Music Education in Turkey and Recommended Solutions] on the dates of September 23-25, 2009. The paper was prepared by Professor Cemal Yurga and Research Assistant Zeynep Kaya. Both authors were reached through the phone and were asked general information about the paper before they presented it at the conference. As another source, the paper that was presented by Professor Selmin Tufan and Associate Professor Enver Tufan, Ph. D. was titled as *Yaylı Çalgılar ve Piyanoya Ait Eşliklerin Bilgisayar Yardımıyla Stüdyo Ortamında Çalışılmasının Stüdyo Öğrenci Performansına Etkisi* [Preparing Accompaniments for String Instruments with Piano in Studio with the Help of Computer and the Effects of these Types of Accompaniments on Student Performances]. This paper was presented at 18th National Educational Sceinces Convention on October 1, 2009. The authors of this paper were also contacted, and necessary information about the relationship between correpetition and the computer technology was obtained.

For the data collection, as a total of seven piano professors from all different regions in Turkey were randomly selected and each represented a different region. The piano professors who were also serving in administrative level were prioritized as the interviewees because of their both pianist/pedagogue sides and administrative skills. These selected participants were contacted to be informed about the topic and to determine the date of the meetings. Four of the professors requested having face-to-face interview while two of them preferred using phone for the interview. Only one of the respondents chose Internet option and answered interview questions via e-mail, and afterwards, the researcher contacted with him/her through the phone to talk more about the responses.

The interview questions consisted of five main sections: (a) the importance of accompanying with piano (correpetition), (b) the place/role of correpetition in music teacher education curriculum, (c) the applicaton of correpetition at music teacher training schools, (d) the problems/challenges in correpetition, and (e) possible solutions for existing problems in correpetition.

Two of the participants allowed their answers to be recorded on a tape-recorder while others asked the researcher to take notes. Only one professor responded via e-mail. All recorded answers were transcribed carefully, written down and analyzed through content analysis. During this process, QSR Nvivo 8.0 computer program was used.

4. RESULTS

---

[3] http://www.muzikegitimcileri.net/

After an exhausting research on the topic, the researcher realized that there was almost no sources about the subject in Turkey. The first study found in the area was a conference paper titled as *Yeniden Yapılanma Sürecinde Müzik Öğretmenliği Programlarındaki Korrepetisyon Dersi Eksikliği* [The Absence of Correpetition Course in the Music Teacher Training Curriculum in the Process of Constructivism], which was presented at the symposium named "Türkiye'de Müzik Eğitiminin Sorunları ve Çözüm Önerileri" [The Problems in Music Education in Turkey and Recommended Solutions] on the dates of September 23-25, 2009 by Professor Cemal Yurga and Research Assistant Zeynep Kaya. Both authors were reached through the phone and were asked general information about the paper before they presented it. The authors of this paper indicated that their study was about correpetition and the problems that its absence in music teacher training curriculum creates. The authors pointed out (a) the problematic situation of the lack of correpetition course in the curriculum, (b) the necessity of such course, and (c) the need for the addition of correpetition course to music teacher training curriculum.

The other source found during literature review process was another conference paper titled as *Yaylı Çalgılar ve Piyanoya Ait Eşliklerin Bilgisayar Yardımıyla Stüdyo Ortamında Çalışılmasının Stüdyo Öğrenci Performansına Etkisi* [Preparing Accompaniments for String Instruments with Piano in Studio with the Help of Computer and the Effects of these Types of Accompaniments on Student Performances] written by Professor Selmin Tufan and Associate Professor Enver Tufan. Ph. D., who presented at 18th National Educational Sceinces Convention on October 1, 2009. Both authors were contacted by the researcher, and they indicated that they developed a project on the computer in studio settings. They indicated that this computer program consisted of recorded-accompaniments for string students and pointed out that this project made good effect on the performances by string students.

The data that was drawn from interviews with seven randomly-selected piano professors were divided into five sections, and each section was examined with content analysis.

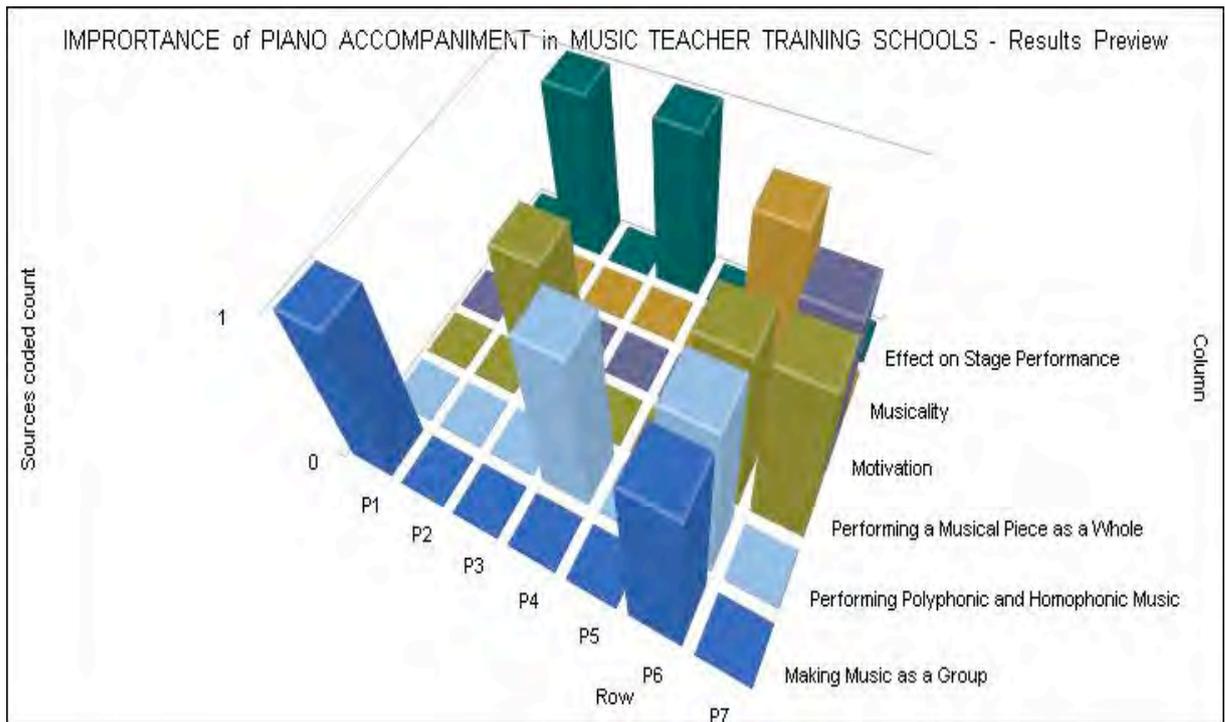
4.1. Findings Related to the Importance of Playing with Piano Accompaniment


Table 4.1.-1 Importance of Piano Accompaniment in Music Teacher Training Schools.

According to Table 4.1.-1, the following results were found:

4.1.1. *Performing Musical Piece as a Whole:* According to the participants, solo player and the accompanimist complete each other. "For example, [accompanist] gives the entrance to the soloist and helps him/her to continue..." (P6). "Without accompaniment, [solo piece] sounds incomplete and meaningless." (P3).

4.1.2. *Making Music As a Group:* For this column in the table, the following statement makes it clear: "While the student plays his/her instrument, s/he learns many things such as hearing complete harmony through playing with accompaniment; and the accompanist learns how not to perform as a soloist but to perform together completing each other in a musical ensemble.

4.1.3. *Performing Polyphonic and Homophonic Music:* The analyzed-data in this column of the table shows that a solo piece performed with its accompaniment is an action that occurs with a complete harmonic structure that a solo work never has, and it is important to understand the concept of harmony in music."

4.1.4. *The Effect on Stage Performance:* Based on the findings here, concerts are the most important parts of performing together because performers who practice with piano accompaniment regularly are usually more successful at concerts.

4.1.5. *Motivation:* Data indicated that playing with accompaniment motivates the solo player better. Accompanists, regardless of teachers or friends, make performers to play their instruments more. Also, piano students who are successful but having motivational problems can have the opportunity to practice and make music with their friends.

4.1.6. *Musicality:* Performing with accompaniment strengthens musicality because when two people make music together they work together to phrase musical sentences and ups and downs in music; even more, they start breathing together, which helped their musicality to grow.

The frequency chart is as follows:

Results	Frequency
Performing Musical Piece as a Whole	3
Making Music As a Group	2
Performing Polyphonic and Homophonic Music	2
Effect on Stage Performance	2
Motivation	1
Musicality	1

Table 4.1.- 2. Importance of Piano Accompaniment in Music Teacher Training Schools Frequency Chart

4.2. Findings Related to the Place of Accompaniment Course in the Curriculum Used at Music Teacher Training Schools

In last two curricula used at music teacher training schools were examined and found that correpetition was included as a course in 1997-curriculum, in which it was one-hour theoretical course with one credit hour in the fifth semester. In the last music teacher training curriculum developed in 2006, "Playing with Accompaniment" is a course in fifth semester, and it is two-hours per week with one-hour credit.[4] The same curriculum has two courses under "Accompaniment" title:

Harmony–Counterpoint–Accompaniment I; Harmony–Counterpoint–Accompaniment II; Harmony–Counterpoint–Accompaniment III; Harmony–Counterpoint–Accompaniment IV (offered in third, fourth, fifth and sixth semester) These courses have two-hours for theoretical work and two credit-hours. The contents of these courses are as follows: "Musical forms; harmonic and contrapuntal analyses in Turkish and Western music; examples of school songs, their analyses and rhythmic structure."

[4] http://www.muzikegitimcileri.net/

The contents of the course titled "Playing Accompaniment" that is offered only in fifth semester are as follows: "Knowledge and performance of school-music accompaniments and basic chamber musical works."[5]

Through the examination of the contents of the courses and the data in the sudy, indeed, correpetition is seen as a course with the same name in the music teacher training curriculum; however, the definition of the course does not have the actual meaning that is expected from this particular course. Such course in the curriculum requires the skills (a) to write, (b) to create, and (c) to play accompaniments for school-songs or children's songs. At this point, this course is not related to correpetition; that is, although it is named as "Correpetition" the content of such course is simple accompaniments, not performance-based correpetition.

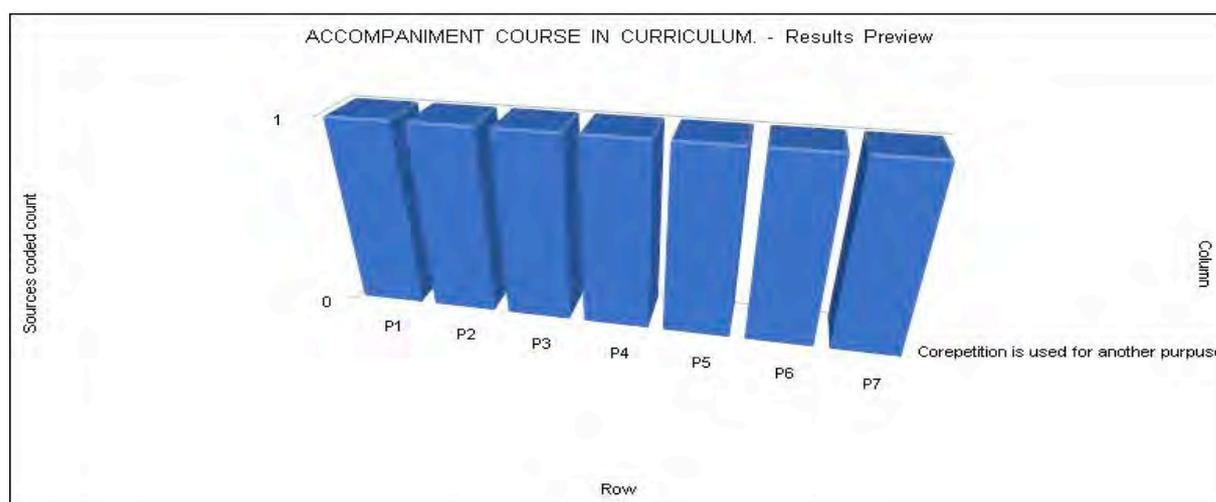
Today, correpetition is not a term used widely; instead; accompaniment is preferred. The course titled as "Correpetition" is far from the idea of performing. The main idea of such course is writing or creating accompaniments for school songs so that music education students can learn how to accompany their students in classroom settings in the future. The results related to this secton are seen in Table 4.2.-1. below:


Table 4.2.-1. Accompaniment Course in Curriculum.

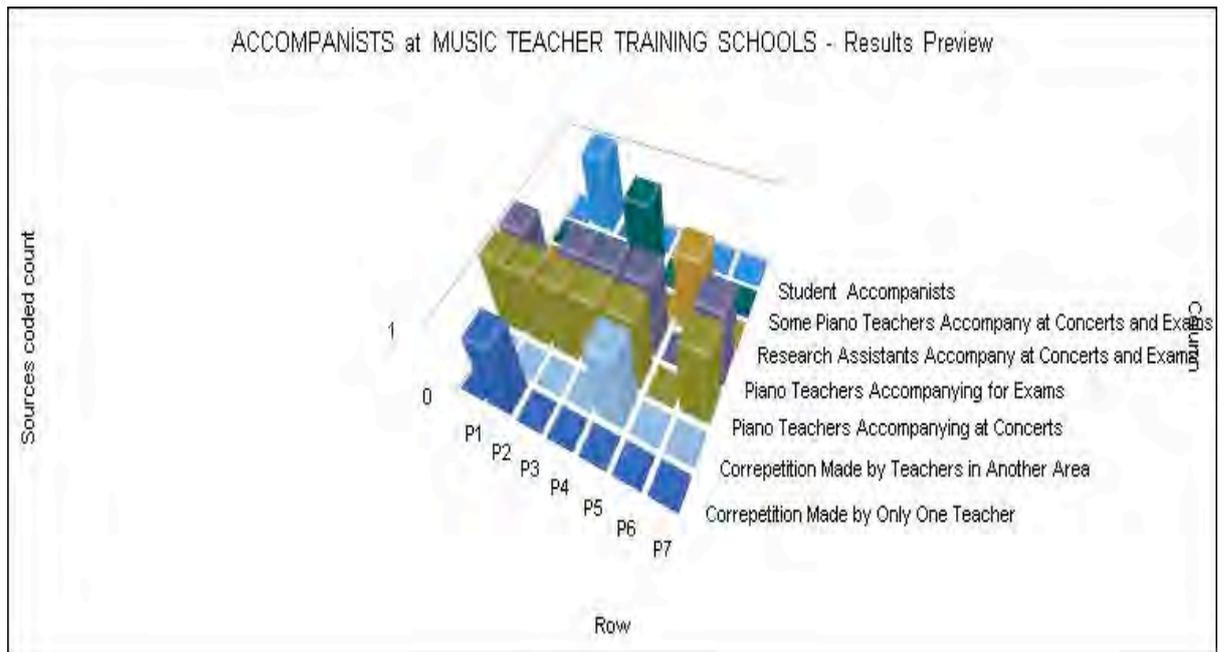
4.3. Findings Related to the Accompanists Working at Music Teacher Training Schools


Table 4.3.-1. Accompanists at Music Teacher Training Schools.

Based on the data in Table 4.3.-1., the following results were found:

4.3.1. *Piano Teachers Accompanying for Concerts:* The content analysis showed that piano teachers accompanied at concerts but they were not officially responsible for being accompanists and were asked/requested to do so. Piano teachers were usually asked/requested to do accompaniments by the solo-playing students or by the teachers of these students.

4.3.2. *Piano Teachers Accompanying for Exams*: This data shows the most-insisted situation in correpetition that piano teachers experience at music teacher training institutions.The data showed that this task was not standardized in all shools. For instance, in one school, piano professors organize a meeting and distribute assignments to accompany students for exams equally among all teachers. These piano professors determine the rehearsal hours before exam week and play for the exams. On the other hand, all piano teachers are assinged by the department head in another institution, they are scheduled with at least two rehearsals before the exams. Then, they accompany students during exam week. In another music teacher training institution, instrumental teachers ask piano instructors to accompany their students. As another example, piano teachers take the scores in advance, and they plan only one rehearsal because of the heavy course load. At this school, rehearsing with the accompanist piano teacher makes an effect up to 20% of the final grade.

4.3.3. *Some Piano Teachers Accompanying at Concerts and Exams:* Here, the data indicated that not all piano professors accompanied but they were selective.

4.3.4. *Correpetition Made by Only One Teacher:* According to the data shown here, only one piano teacher takes the whole responsibility to accompany everybody at school for all concerts and exams.

4.3.5. *Research Assistants Accompany at Concerts and Exams*: Based on the data, the research assistants are assigned to accompany for concerts and exams. (These research assistants come to this particular institution with the 35th Act[6] from another university and those of whom will have to go back to the schools where they come from.) All students whom they will accompany are determined at the beginning of the semester, they are expected to study with them every week, and to accompany for concerts and exams all semester long.

4.3.6. *Correpetition Made by Teachers in Another Area:* When there is not enough piano professors at an institution, teachers in other areas who have enough piano skills also accompany based on requirements by their colleagues.

4.3.7. *Student Accompanists:* When students have good piano skills, they may be asked to accompany their friends, or their teachers encourage them to take accompaniments as extra work. Therefore, these students pay more time and effort to accomplish this task.

4.4. Findings Related to the Problems of Correpetition at Music Teacher Training Schools

As shown in Table 4.4.-1., ten basic problems were identified in accompanying with piano at music teacher training institutions. Some of these challenges do not allow correpetition task to work properly in some schools while some accompanists were affected negatively by these problems in their universities.

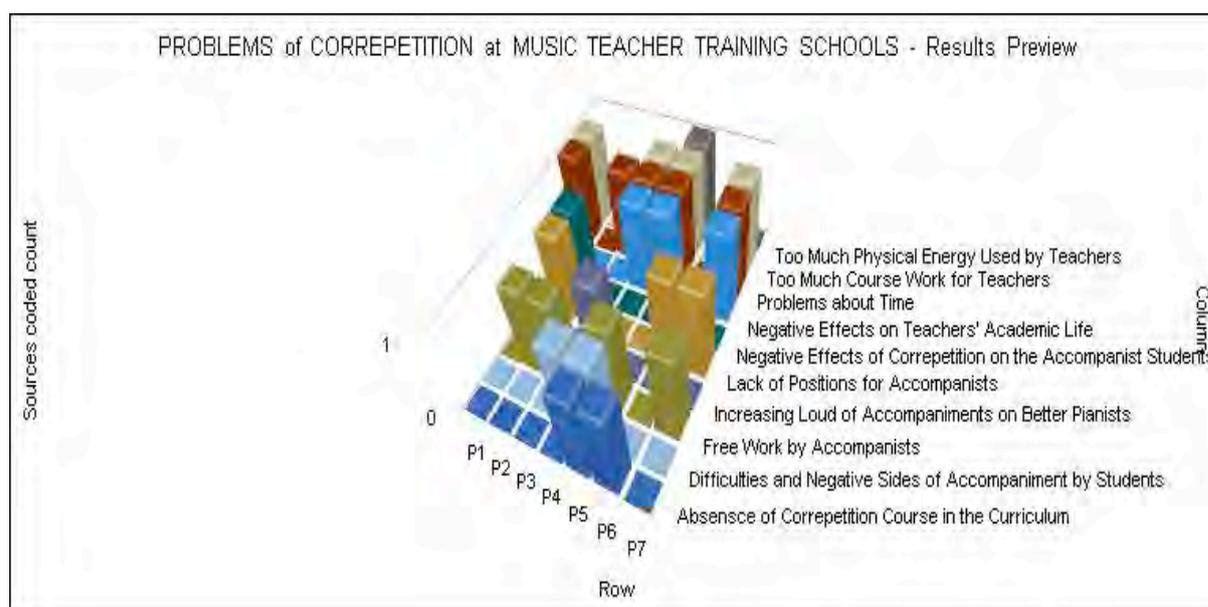
Table 4.4.-1. Problems of Correpetition at Music Teacher Training Schools (Matrix Coding)


Table 4.4.-2. Problems of Correpetition at Music Teacher Training Schools .

4.4.1. *Problems About Time:* This has the highest frequency. Respondents indicated that they had to find extra time to accompany. As the biggest problem, this also is the most important reason for pianists not to be able to accompany.

4.4.2. *Too Much Course Work for Teachers:* Participants who chose this stated that they had approximately thirty-hour course work. Therefore, finding time to accompany is diffucult fo them.

4.4.3. *Free Work by Accompanists:* With no compensation, all accompanists are requested or assigned by the administration to accompany.

4.4.4. *Lack of Positions for Accompaniments:* In Turkey, there is no correpetitor is hired only to work as the accompanist.

4.4.5. *Negative Effects on Academic Life of Teachers:* Pianists are expected to do academic works such as earning their Master's and doctoral degrees. To be able to achieve these goals, they have

to have high scores on standardized tests such as ALES[7] , ÜDS[8] and KPDS[9]. They are also expected to present papers at conferences, to do publications (articles and/or books), and to concertize. When they accompany, this will take their time away these academic works.

4.4.6. *The Absensce of Correpetition Course in the Curriculum:* The main reason that correpetition cannot be performed is because such course does not exist in the curriculum used at music teacher training schools. Therefore, piano teachers are either asked to accompany or assigned to do such task by the department head. On the other hand, "Correpetition" course is included in the curricula used at conservatories and colleges of fine arts with the following contents: "This is a course that strengthens the musical union through the use of piano accompaniment for other instruments. For the final exams, students practice their pieces in this course and perform in the final exam."[10]

4.4.7. *Difficulties and Negative Sides of Accompaniment by Students:* Students must have necessary piano skills to be able to accompany. Participants in the present study indicated that there were indeed very few students who were capable of doing accompaniments. They further stated that majority of students were not equipped to do such task, and under these circumstances, expecting students to act correpetitors would create problems.

4.4.8. *Too Much Physical Energy Used by Teachers:* Accompanists always pay extra effort and time to help their friends/colleagues/professors.

4.4.9. *Negative Effects of Correpetition on the Accompanist Students:* Most students have aproximately twenty hours[11] of clourse load forcing them to pay extra effort and create additional time to be able to accompany.

4.4.10. *Increasing Load of Accompaniments on Better Pianists:* The respondents indicated that "The better the piano teacher, the more the accompany load." This situation shows that better pianists are required to do more correpetition work than others.

4.5. Findings Related to the Possible Solutions for Existing Problems in Correpetition at Music Teacher Training Schools

[11] http://www.muzikegitimcileri.net/

Table 4.5.-1. Possible Solutions for Existing Problems

Possible solutions for the existing problems in correpetition are as follows:

       4.5.1. *Solution for Hiring Accompanists*: Most of the respondents suggested this solution. They stated that one or two pianists should be hired only to accompany at each institution. For this solution, "Specialist" position, which does not give the specialists the responsibility to teach[12] would be suitable for correpetitors. As another important point which participants also indicated that these accompanists should be trained as professional correpetitors.

       4.5.2. *Adding Correpetition Course into the Curriculum:* According to the professors: (a) Correpetition course should be included in the curriculum at music teacher training schools; (b) A systematic work to improve the current situation should begin in such area; and (c) As a course, correpetition should not be a burden on pianists but it should become a course with expert teachers in the area.

       4.5.3. *Using Technology for Correpetition:* Respondents indicated that if there was no accompanist the technology could be used for the same purpose. The positive sides of the technology use for the correpetition are as follows: (a) recorded accompaniment can be used anytime and anywhere, and (b) orchestral parts can be reduced and be recorded for the use to accompany. On the other hand, it limits musicality and togetherness in making music. Two of the participants indicated that they used such technology for accompaniment purpose but they experienced problems because of the lack of facilities and students who could not catch the rhythm in recordings. A project was developed and a software was created for such purpose at one of these institutions. This project was successful because every musical details such as fermata and nuances were included. A concert was also organized with the use of this program.

       4.5.4. *Providing Permanent Solutions*: The necessity of finding permanent and general solutions rather than offering solutions for individuals is necessary in the area. Also, schools should identify their problems in such area and search for possible solutions. Offered solutions should be practical and they should be reported.

       4.5.5. *Adding Correpetition and Stage Performance Courses to the Curriculum:* In many music teacher training programs, not only a course about performing with accompaniment but also a

---

[12] Higher Education Law and Higher Education Personnel Law #657 Instruction Assistants Act 33 b- Specialists are assistant instructors who are directly or indirectly related to instruction, knowledgeable in particular areas, working at laboratories, libraries, studios, and other practical fields.

course offering skills to perform in fornt of the audience should be included. The reason for this suggestion is that because many music students do not have the opportunity to perform enough while others have such opportunity several times. With the addition of correpetition course in the curriculum, students who do not have opportunities to perform enough will be able to play for audience via this course. This experience will make them more confident, and also they will be able to learn how to act on the stage.

4.5.6. *Training Students to Accompany:* With this recommendation, it was suggested that accompaniment skills of students should be strengthened so that (with the encouragement) they could accompany others. Therefore, students can understand the idea of "musical work" conceptually and practically. To achieve this goal, the importance of the existing accompaniment course in the curriculum should be strengthened. During the first semester, students can develop their skills and the folowing semester they can start accompanying. They can be encouraged to play either their own works or pieces by other composers. However, the overall level of piano students at several music teacher training schools make such solution to be put in practice impossible.

4.5.7. *Understanding the Importance of Correpetition:* The necessary background related to correpetition is more important than anything. The necessity of correpetition and understanding the importance of such skill are essential for finding possible solutions for the existing problems in the area.

6. CONCLUSIONS AND RECOMMENDATIONS

In instrumental education, solo and the accompaniment are two parts in a whole. Performing with correpetition increases motivation, makes the music heard as harmonic/polyphonic, develops musicality and improves the quality of stage performance.

The types of accompanists vary in different schools. There is no standardization in practice, and every piano teacher organizes his/her own accompany schedule. Through the examination of the practices in accompanying at different schools, three important points rise:

1. No correpetition course is included in music teacher education curriculum.
2. The accompanists at these schools are not trained as correpetitors.
3. There is no standardization in the area.

The points stated above create problems at music teacher training schools as follows:

1. Because the correpetition course is not included in the music teacher training curriculum, accompanists at these institutions make sacrifices (such as finding extra time and effort) to play for soloists. This situation creates negative effect on these piano professors (e.g. taking their time away of doing academic works).
2. There is no standardization in correpetition because of the lack of such course.
3. Accompanists at these institutions are not specialists in the area. Particularly, students accompanying students is a bigger problem because they are still students and are not trained to do accompaniments professionally.

The participants suggested following solutions for the challenges about the correpetition at music teacher training schools:

1. *Understanding the Importance of Correpetition:* Although few respondents suggested this solution, it is essential to understand the importance of such course.
2. *Training Students to Accompany:* This solution seems yo have a positive side to encourage students to be better pianists and to have better friendships but the positive effects of such training is still questionable. First, students who are not trained professionally to do such task might be problematic. Second, having the responsibility to accompany to other friends make the student to try to find extra time to practice in addition to the course load. Therefore, these circumstances might effect the piano student negatively regarding his/her academic achievement.
3. *Using Technology for Correpetition:* Many respondents indicated that technology could be used for correpetition. It is important to analyze advantages and disadvantages of the technology use. Teachers should be trained well to use technology in such area. Playing with a recording may not give the same affect to the solo player as playing with a real accompanist. Slowing down/accelerating together, the eye-contact during the performance, and feeling the music together are the important characterisitics of playing as an ensemble. Recorded-accompaniments may not give the same affect. In this case, technology can be used as subordinate help.

The following problems can be solved with the addition of correpetition course in the curriculum:

1. Correpetition course will be standardized.
2. Students will be able to study and perform with piano accompaniments during the semester, and in final exams they will be evaluated.
3. Piano professors will not have to find extra time to do accompaniments but they will be able to put correpetition in their weekly schedule and will be compensated for their effort.
4. Although it has positive sides, the lack of faculty members in the area may create challenges in practicality.
5. Faculty who will only do correpetition should be hired so that they have enough time to accompany everybody without having time problems.

The common solution for such problem by the respondents was hiring correpetition faculty (or specialists) or assigning one or two piano professors (depending on the number of students at the school) who will only acccompany. They also indicated that even research assistants might do such task. At the beginning, conservatories may provide correpetitors for music teacher training schools because some conservatories have the programs to educate pianists as correpetitors. Among these conservatories are at Haccetepe University in Ankara (in master's program), İstanbul University State Conservatory (Master's and D.M.A programs), and Mimar Sinan Fine Arts University State Conservatory in İstanbul (undergraduate degree).

Based on the presented data above, the following solutions are offered:

1. It is important to understand the importance of the correpetition at music teacher training schools.
2. The use of technology can be solution at some schools.

3. Adding correpetition course in the curriculum is necessary.
4. Hiring accompanists can solve such challenge easily.
5. It is also important to determine existing problems, searching possible solutions for these problems at each institution and preparing reports (including these efforts) should be considered by the administrators at music teacher training schools

An Analysis of Music Materials Taught at the Primary School between Macau and Taiwan

Dr. Dennis Ping Cheng Wang
Assistant Professor in Music Education,
Faculty of Education
University of Macau

The purpose of this study is to investigate the current status of music class and music materials used at the primary school in Macau and Taiwan in order to promote music education efficiently in the both mentioned Chinese societies. By analyzing the primary school music classes, the researcher revealed the weaknesses of the current music class taught in Macau. By analyzing the music materials which are currently used in the both cities, the researcher suggested a systematic music contents and music methods which the author believes will motivate students' interest in music and make music classes become enjoyable and efficient in both mentioned Chinese cities.

Despite the government of Macau has been promoting music education and art education in the past years, the research is aware the initial problems and challenges in music education in Macau is that the music class at primary school doesn't have a systematic contents and methods for the students. Although the government has provided different forms of professional development and many other music training workshops for the current teachers, the government neglects the most important issue which is the absence of the music textbooks at the primary school. Instead of publishing its own music textbooks, the local schools have been using the music textbooks from the neighborhood regions, such as Hong Kong, Taiwan and mainland China. However, due to the limited learning spaces and efficient teaching methods at most of the schools in Macau, the teachers can't apply others neighborhood successful teaching methods. These facts cause that not only do the local Macau students can't enjoy the efficient music learning like neighborhood regions, but the students also lack of the opportunities to learn their own musical and cultural heritage from their own belonging music textbooks.

The textbooks reflect the values, cultures and educational levels. The absence of the region's own textbooks would causes students neglect their own culture and heritage. (Chang, 1994) As well, not only do the students misses the chances to communicate with the world; but the students also the missing chance to adapt the most update knowledge in time.

On contrast, not only has Taiwan government has several governmental and non-governmental textbook publications; but the textbooks publications all include the world most update and current knowledge in the textbooks so that students can learn the first hand information and increase the worldwide competitiveness imperceptibly. Moreover, the contents of music textbooks are organized systematically without much confusion. The music concepts are introduced step by step at each grade in the textbooks so that the students' learning potential can be motivated and developed under the best circumstance

The textbooks at primary schools used in Macau are all from the neighborhood regions, such as: Hong Kong , Taiwan and mainland China and Macau does not have its own textbooks or any curriculum related publication. According to the survey, "Long Man Music", "New Primary School Do Re Mi", and "Today Music" are the most used top three primary school music textbooks in Macau. The "Long Man Music" textbooks package which were published in Hong Kong, included student music textbooks (12 volumes), teachers guide books (12 volumes), creative flash cards, computer software, recorder music textbooks (8 volumes), Children's Musical textbooks (8 volumes). (Long Man Music http://music.ilongman.com/index.php). However, according to the survey, the music teachers from more than 40% surveyed primary schools in Macau used their own teaching materials in their music classes rather than followed the curriculum guidelines which were designed by the Department of Education in Macau.

The current music textbooks used in Macau stressed on the international folk songs, such as, African, Japanese, Korean children nursery songs and folk songs. The folk songs from different provinces of mainland China are also included in the textbooks. (Figure 1) It is important to provide the global point of view for children and let children appreciate the different cultures and arts in the music class.

Moreover, introducing different small percussions, having enough percussion exercises for children to practice and designing various musical creative activities in the music textbooks can not only attract elementary school students' interest but also motivate their music learning and stimulate children's improvisational skills (Wang 2003). However, the whole set of the textbooks lack of systematic arrangement on music theory, such as, key signatures, rhythmic progression, and basic musical notation. For example, the music used in the 1st grade music class is supposed to be inspired, introductory and progressive in order to attract students' interest and motivation rather than introducing complicated rhythmic patterns and key signatures (Yao, 1993). The non-progressive introduction of musical rhythms and music notations twist perception of the 1st grade students learning progression. Furthermore, repeating the same music concepts and music theory at different levels music classes cause the confusion of music concepts for children and redundant of music learning.

On contrast, the textbooks at all school levels in Taiwan; Republic of China has been all edited, compiled and published by the National Institute for Compilation and Translation. Since 1988, nongovernmental publishers were allowed to publish and compile school textbooks as the selection textbooks by the local schools but the textbooks must be examined and verified by the National Institute for Compilation and Translation in Taiwan. (Chen, 1986)

The current selection of songs from the elementary school music textbooks stress on local Taiwanese and Chinese folk songs and the three major music teaching approaches, such as "Orff Music Approach", "Kodaly Music Approach" and "Dalcroze Music Approach". Among all of the governmental and nongovernmental textbook publishers, "Han Lin publisher" and "Nan-I publisher" are the two most popular and common used music textbooks used at the elementary school in Taiwan. Not only do the textbooks included the concepts of the global most successful and popular three music teaching approaches, but the recorder training is also requested as one of the fundamental music training at the elementary school. Before graduating from the elementary school after 6 years training, not only do students have concrete and systematic music knowledge, but they are also able to play the recorder fluently. Moreover, the students are acquainted with western and eastern music knowledge and composers. (Fan, 1998) The most importantly, the textbook compile officers adapt the "Orff Music Approach", "Kodaly Music Approach" and "Dalcroze Music Approach" and let students learn music under a fun and interesting environment and have connection with the follow the most popular trended in music learning.

1

Fish Bowl Model

1. Reliance on Others
   The water must be changed
   The fish must be fed
2. Preservation of an Ideal Environment
   The water temperature kept constant
   Bowl cleaned—fungi & molds cleaned away
   Best feed used
3. Isolated—Artificially Limited Environment
   Isolated from other fish
   Artificial/limited living space

1. Reliance on Others
   Teacher-centered, passive learning
2. Preservation of Ideal Environment
   Intolerance of errors
   Use of 'other' models (native speaker)
3. Isolation—Artificially Limited Environment
   Communication with outside not required
   Applicable only to given environment

Open Seas Model

1. Reliance on Self
   Choosing own water to live in
   Finding own food to eat
2. Adaptation to existing environment
   Constant change in quality of water
   Existence of fungi and other alien substances
   Food provided naturally by the environment
3. Co-existence—naturally selected habitat
   Co-existence with different kinds of fish, etc.
   Natural, shared living environment

1. Reliance on Self
   Learner-centered, active learning
2. Adaptation to existing environment
   Tolerance of mistakes & non-native forms
   Acceptability & Diversity of values as norm
3. Co-existence—naturally selected habitat
   Importance of cross-cultural understanding
   Communicability in international setting

Need for 'Language' Ability

Language ability: ability to use language to deepen one's capacity for thinking and communicating with others, on the basis of knowledge and experience, reasoning ability, and sensitivity and affection towards others.

With Japanese Language at the core, through the use of language in all subjects, teaching plans should be made to enhance the development of the ability to think rationally, etc.

Committee to Discuss Development of Language Ability 言語力育成協力者会議

7

Foreign Language Activities (Elementary School)

I. OVERALL OBJECTIVES
To form the foundation of pupils' communication abilities through foreign languages while developing the understanding of languages and cultures through various experiences, fostering a positive attitude toward communication, and familiarizing pupils with the sounds and basic expressions of foreign languages.

II. CONTENT
1. Instructions should be given on the following items in order to help pupils actively engage in communication in a foreign language:
   (1) To experience the joy of communication in the foreign language.
   (2) To actively listen to and speak in the foreign language.
   (3) To learn the importance of verbal communication.
2. Instructions should be given on the following items in order to deepen the experiential understanding of the languages and cultures of Japan and foreign countries:
   (1) To become familiar with the sounds and rhythms of the foreign language, to learn its differences from the Japanese language, and to be aware of the interesting aspects of language and its richness.
   (2) To learn the differences in ways of living, customs and events between Japan and foreign countries and to be aware of various points of view and ways of thinking.
   (3) To experience communication with people of different cultures and to deepen the understanding of culture.

8

Junior High School

I. OVERALL OBJECTIVE
To develop students' basic communication abilities such as listening, speaking, reading and writing, deepening their understanding of language and culture and Fostering a positive attitude toward communication through foreign languages.

II. OBJECTIVES AND CONTENTS FOR EACH LANGUAGE
1. Objectives
   (1) To enable students to understand the speaker's intentions when listening to English.
   (2) To enable students to talk about their own thoughts using English.
   (3) To accustom and familiarize students with reading English and to enable them to understand the writer's intentions when reading English.
   (4) To accustom and familiarize students with writing in English and to enable them to write about their own thoughts using English.

Other details:
1. treatment of grammar: consideration should be given so that instruction does not center on issues like explaining grammatical terms or differentiating between usages, but on actual use of grammatical items. At the same time, instruction should be provided in the awareness of the differences between English and Japanese in terms of word order, modification relation and other aspects.

9

---

2. Teaching Materials :
   a. should be useful in enhancing the understanding of various ways of viewing and thinking, fostering the ability to make impartial judgments and cultivating a rich sensibility.
   b. should be useful in deepening the understanding of the ways of life and cultures of foreign countries and Japan, raising interest in language and culture and developing respectful attitudes toward these.
   c. should be useful in deepening the international understanding from a broad perspective, *heightening students' awareness of being Japanese citizens living in a global community and cultivating a spirit of international cooperation.*

3. Connection with Elementary School:
   a. Language activities in Grade 1
   A certain extent of the foundation of communication abilities, such as a positive attitude toward communication focusing on speech sounds, is formed through foreign language activities in elementary schools. In light of this, language activities should be carried out with familiar language-use situations and functions of language taken into account.

   b. The syllabus should be designed in an appropriate manner with due heed paid to the connection with Foreign Language Activities at elementary schools.

10

Senior High School English

On the basis of what one hears and reads, speaking and writing activities will be appropriately introduced, thereby teaching English holistically by integrating the language activities in all fours skill areas systematically

Communication English I
   a. listen to introduction of objects and dialogues, comprehend information and ideas, and grasp general ideas and main points
   b. read descriptions and narratives, comprehend information and ideas, and grasp general ideas and main points
   c. discuss and exchange opinions about information and ideas gained through what one has heard, read, learned or experienced
   d. write succinctly about information and ideas gained through what one has heard, read, learned or experienced

Communication English II
   a. listen to dialogues and debates, about information and ideas gained through what one has heard, read, learned or experienced
   b. read descriptions, *critiques*, narratives, *essays*, etc. extensively or intensively, according to objectives of reading
   c. discuss and reach conclusions about information and ideas gained through what one has heard, read, learned or experienced
   d. write coherently about information and ideas gained through what one has heard, read, learned or experienced

11

English Expression I
   a. Speak spontaneously on given topics. Speak concisely according to given objectives and needs of the listener
   b. Write concisely according to given objectives and needs of the reader
   c. give presentations about information and ideas gained through what one has heard, read, learned or experienced
   d. Actually use what one has learned about methods and language used in presentations
   e. Based on what one has heard and read, sort and arrange similarities and differences from other opinions, and put together own idea

   English Expression II
   a. Speak spontaneously, given certain conditions. Sort and arrange content and speak rationally
   b. Decide on theme and write in various genres
   c. Listen to presentations , ask questions, and give own opinion
   d. On topics with various possible interpretations, take a stand and exchange arguments to persuade the other person to your side
   e. Giving clear arguments and evidence, write with organization, graphs and other materials and appropriate expressions
   f. Actually use what one has learned about methods and language used in presentations and debates
   g. Respecting other's points of view and ideas, and by considering both positions, expand own way of thinking and utilize the ideas in resolving issues

12

Global 30 (Creating Centers of Internationalization)

[Purpose]
Strengthening Japanese university education for international competition, and preparing attractive levels of education to foreign students

Preparing systematic basis for teaching courses in English
・ Taking courses in English and obtaining degrees through English
・ Accepting international applications in hiring faculty

Preparations for accepting foreign students (300,000)
・ Counselors, tutors, creation of programs in JSL, etc.
・ Accepting incoming students in both April and September

13

All Japan High School English Debating Championships

Motions

2006   Japan should make English an Official Language.

2007   All elementary and secondary schools in Japan should have classes on Saturdays.

2008   Japan should lower the age of adulthood to 18.

World Championships Motions

2007 Seoul
Final: This House would abolish the Nuclear Non-Proliferation Treaty

2008 Washington
Final: This House would Expand the number of permanent members of the UN Security Council

2009 Athens
Grand Final Motion:
This House believes that governments should grant amnesties to all illegal Immigrants

15

Met's Continuum: Content-driven to Language-driven

CONTENT-BASED LANGUAGE TEACHING: A CONTINUUM OF CONTENT AND LANGUAGE INTEGRATION					
Total Immersion	Partial Immersion	Sheltered Courses	Adjunct Model	Theme-Based Courses	Language classes With Frequent Use of content For Language practice
Content-Driven			Language-Driven

Marketisation of Education: Appealing or Appalling?

Derek O' Reilly

Dundalk Institute of Technology

Abstract

As marketisation is likely to play an increasingly important role in future education policy, it is important that any decisions that lead to marketisation are evidence based. This paper examines the complex relationships between the various stakeholders in the debate about the marketisation of education. Based on an objective analysis of the literature, the author attempts to determine whether or not marketisation of education is a good policy to pursue.

Fundamentals Of The Debate

In recent decades, the marketisation of education has been a much-proclaimed political aim in many countries. Both ends of the political spectrum have put a lot of political capital into their attempts at persuading the public to adopt the marketisation of education (West 2002). Does the marketisation of education represent an area where both political ideologies agree on policy? More importantly, does the marketisation of education have the potential to simultaneously enrich the entire population or will it result in there being both winners and losers?

To participate in the debate on the marketisation of education, one must have a clear understanding of the meaning of the following two terms:

1)   Marketisation of education

2)   Basic educational rights

Marketisation Of Education

The marketisation of education operates within a quasi-market. A quasi-market has some resemblance to, but is not, a real market (Collins 1990). A quasi-market is a public sector institutional structure that is designed to reap the efficiency gains of free markets without losing the equity benefits of traditional systems of public administration and financing. Instead of operating as a completely free market, a quasi-market operates within a controlled government market. Quasi-markets operate within tight boundaries that are set by government.

Within the quasi-market of marketisation, the government still continues to be the primary funder of education. However, each school's funding becomes dependent on that school's ability to attract student numbers. In marketisation, funds follow students. Schools that are successful in attracting students receive more funding.

In education, the terms marketisation and privatisation are often mistakenly treated as meaning the same thing. However, marketisation and privatisation are not the same (EdInvest 2001). Marketisation refers to the adoption of market practices in education. Privatisation is the transfer of the ownership or administration of schools to private hands. Marketisation does not mean that all schools become privatised. Marketisation means that each school takes greater control of its own affairs, that each school competes for student intake and that each student gets to choose the school that they wish to attend.

Marketisation does not mean that the government ceases to play any role in determining education policy. The government continues to determine education policy and it continues to regulate schools to

ensure that national standards of education are maintained. Monitoring, assessment and curriculum are still controlled at the centralised level.

Basic Education Rights

In the current debate, there is general agreement among educationalists that certain ***educational rights*** must be catered for in any educational system (Lawson 1992). Educational rights consist of both the ***common needs*** of all students and the ***individual needs*** of specific students.

Common needs relate to commonalities in education that should be afforded to an entire population. They include:

1) There should be free and compulsory education for all between the ages of 5 and 16.

2) As well as being concerned with training for work, education should also be concerned with general social, moral and intellectual development.

3) A minimal level of education (in the form of the national curriculum) should be available to all. Additional choices can also be made available to some.

Individual needs relate to needs of specific members of the population. They include:

1) **Social needs:** These include the legitimate ethnic and religious traditions of minority groups (within the framework of an educational system that is concerned with general social, moral and intellectual development).

2) **Personal differences:** These include a child's tastes, aptitudes, abilities and styles of learning.

To have any credibility, all arguments either in favour of or against marketisation need to ensure that the basic educational rights of a population are maintained. Therefore, the debate on marketisation of education should focus on the twin pillars of whether or not marketisation ensures that the educational rights of citizens are met and whether or not marketisation has the potential to deliver a better education to all citizens. The debate should focus on evidence rather than on subjective, emotive, arguments.

Arguments In Favour Of And Against Marketisation

This paper examines the complexities of marketisation in education by considering the work of authors who have researched in this field. The arguments both in favour of and against marketisation in education are presented.

Arguments In Favour Of Marketisation

Marketisation is necessary so that parents and students are given real choices in education (Lauder 1991). Ball claims that the system of state education does not sufficiently satisfy the needs of parents or students (Ball 1994). Under marketisation, different schools will target different types of students. Marketisation will lead to a wide variety of educational alternatives being made available (Tooley 1998). To differentiate themselves from other schools in their local market, individual schools might decide to specialise in niche areas of education, such as in languages or sciences. Specialisation will be driven by demand from students. As a result, more students should be provided with an education that better suits their abilities and requirements.

Marketisation will not lead to a system where all schools are run for profit (Bartlett 1991). Instead, most schools will be run as charitable trusts. Any profits that these schools make, as a result of attracting sufficient numbers of students or by being run efficiently, will be put back into providing better school resources.

State education represents bad value for money. State education generates an inefficient bureaucracy, which encourages waste and inhibits responsiveness to the concerns expressed by students and parents. Under marketisation, schools have a strong incentive to be responsive to the needs of both students and parents. Unresponsive schools will be unpopular with both students and parents. Switching between schools will move students and resources from unpopular schools to more popular schools. As unpopular schools lose students, they will be forced to adapt to the market and become more responsive to students' needs. Otherwise, these schools will face closure. Therefore, marketisation should bring about an increase in responsiveness in all schools. Marketisation will force all schools to operate to the highest standard. It is only through the freedom of parental choice, in a market of competing schools, that good schools will flourish and badly performing schools will be forced to improve or be removed (Ball 1993). Marketisation forces all schools to up their standards in the same way that providers in other markets are forced to supply better products or services. With marketisation in education, there is a real incentive for schools to compete with each other in the excellence of their product and in the reduction of their costs (Tooley 1998). Tooley suggests that, under marketisation, the problem of deteriorating schools might not arise at all. Lauder agrees with this argument, stating that students being given a choice of school is sufficient to force a raise in standards for all schools (Lauder 1991). If a school does not provide a service that is relevant to its potential students, then it will lose those students to other, more pro-active schools, and will ultimately go out of business.

The competitive process of any market provides incentives and so evokes effort. Markets promote the replacement of less desirable with more desirable. Markets give choice to the individual. Ball states that the absence of profit or loss motives for school managers leads to conservative, self serving, minimalist, survival strategies (Ball 1994).

Marketisation will help meet countries' economic needs. Given a choice, students will pick courses and subjects where there is a demand for labour, therefore filling skills shortages (Streeck 1989; Deakin 1991). As long as the state ensures that all students receive an adequate education, it should not interfere with the running of individual schools.

The state education system will always be geared to suit the educational needs of the office holding section of society and of vested interests, such as teachers (Ball 1994). All other groups within society will be obliged to accept and help finance a system that does not provide them with the maximum benefit for their children. Marketisation will remove this minority grip on education. Marketisation results in an overall decline in socio-economic stratification between schools (Gorard 2001). In particular, marketisation allows poor families to attend schools in areas where they cannot afford to live (Gorard 2001).

Vast state intervention in education has never been able to achieve equality. State education cannot guarantee that all students receive the same quality of education, despite claims by those in favour of state education that it does. It is impossible to ensure that all students receive exactly the same education. Even if they have the same funding available, no two schools will use their resources in the same way. Each school will have different priorities for spending. In addition, no two students will have the same level of motivation. What is important, however, is that all schools provide an adequate standard of education, so that no student is given a sub-standard education. Rather than trying to achieve the unobtainable goal of absolute equality in education, governments should focus their effort on ensuring that all students receive an adequate education. By doing this, governments will allow schools and students to gain from the benefits of marketisation.

Even if governments attempt to force all schools to be the same, they will not correct the inequalities that exist in society. Forcing the same education on all students will simply cause the middle classes to focus on other, extracurricular, means as a way of providing their children with better life opportunities. There is a vast over-estimation of the impact that education has in relation to other areas that affect how young people succeed in later life (Levin 1994; Tooley 1998). Studies consistently find that variations in family circumstances, not variations in school quality, make the difference in children's educational achievement. This is hardly surprising. More than 90% of the waking hours of a

child from birth to the age of 18 are spent outside school, in an environment that is heavily conditioned, both directly and indirectly, by their family (Belfield 2003). Even if it were somehow possible to provide all students with the same education, these other factors would still have a significant impact on how successful individuals become in later life. If middle class people cannot buy into better schools, then they will buy into opportunities outside of school. Parents will always use any means they can to help their children to get ahead in life.

Irrespective of the outcome of the debate, marketisation is a fact of life for many state schools today. Falling student numbers are effectively providing a quasi-market, where schools must compete for the limited number of available students (Lawson 1992). A further effective quasi-market exists in the provision of elitist, private schooling. Private schools meet the demands of the middle and upper classes to be educated separately from the working classes (Levin 2001). This policy reflects the fact of life that wealth inequality exists in every aspect of society.

Tooley argues that there is too much state interference within marketisation (Tooley 1998). Government interference destroys the ability marketisation to work effectively. By rigorously controlling the distribution of education, governments are not allowing marketisation to reach its full potential. Tooley believes that, in the market of education, there is no incentive for schools to do well. Schools are restricted by regulation from recruiting the types of students that they want to recruit. Even the most successful schools are not allowed to expand. Staff in the worst schools are paid the same salaries as those in the best performing schools. Badly performing schools tend not to be closed down. Instead, these schools are given extra government money in the hope that they will be able to improve. In a proper educational market, successful schools would be allowed to expand and bad schools would be allowed to close.

State education has utterly failed very many students. For these students, there is nothing to be lost in trying a market system. It could not be worse than their current situation.

Arguments Against Marketisation

The role of education is more than teaching students how to read, write and calculate. It also provides the state with an opportunity to teach people how to behave as citizens and how to interact within society. Education is a powerful force for the nurture of moral, social and community values and responsibilities. The very principles of equality and democracy are embedded into education. Education is fundamental to the effective operation of a democratic society and for the enhancement of civic intelligence and participation. Education produces better citizens, more caring parents and more efficient workers (Lawton 1992). School is the one place where a state can guarantee that all its citizens are afforded at least some understanding of the importance of society and tolerance. To treat individuals as consumers of education rather than as citizens in the education process causes fundamental changes in the nature of education (Grace 1994). Consumers are concerned to maximise the individual return in their transactions. The concept of citizen implies a set of wider social and political responsibilities. A danger for education in the marketplace is how to deal with issues to do with social values, democracy and tolerance. The benefits that individuals get from education affect others in society (Lawton 1992; Tooley 1994). There are likely to be benefits to the community or society at large if there are educational opportunities available, in terms of equality of opportunity, social cohesion, democratic benefits, law and order and economic growth. Ball believes that it is wrong to assume that these educational values will remain unblemished by the demands of the market (Ball 1994). As a result of competitive pressure brought on by marketisation, schools are focusing primarily on the measurable output of academic achievement (Woods 1998). As a result of this focus, other outputs, such as the personal, social and pastoral aspects of schooling might be progressively weakened over time. In their attempts to increase student intake, schools operating under a marketisation regime will be more likely to provide subjects that are seen as relevant to the market. Browne states that market lead education tends to produce non-rounded individuals (Brown 1996).

What individual parents want for their children is not always in the best interest of the community as a whole (Lawson 1992). Marketisation aims to place the individual's needs and wants above all else. Marketisation does not recognise the importance of society (Ball 1994). Therefore marketisation is at odds with the functioning of a civil society and is at odds with a fundamental aim of education in building such a society. Marketisation can lead to a loss of social cohesion (Lawson 1992). If there is a demand from within a population for a particular type of schooling, then the market will be eager to provide this schooling. This schooling may be provided, even if it is at odds with the functioning of a civil society. For example, there is much contention within the UK at present regarding the role of Islamic religious schools. Secularists argue that religious schools increase ethnic segregation. A report commissioned by the local authority in Bradford pinpointed separation in schools as one cause of the riots by Asian youths in that city in 2001 (Economist Sept. 7th, 2006). Trevor Phillips, chairman of the UK Commission for Racial Equality, fanned the flames when he said that religious schools were 'schooling people to be strangers to each other'. Those in favour of such schools argue that parental satisfaction and social justice outweigh the loss of social cohesion.

Marketisation discriminates against the poor and further advantages those families who are already financially or culturally privileged. Ball claims that the marketisation of education is essentially a class strategy, which has, as one of its major effects, the reproduction of relative social class advantages and disadvantages (Ball 1994). The appeal of self-interest and free enterprise mask the political interests of the most privileged sections of society (Brown 1996). Marketisation is meant to enable free and fair competition between individuals. However, individuals have very different starting points on their journey through life. Whereas a state system of education attempts to treat all students equally, parents with a higher cultural capital will be better placed to maximise advantages for their children in a market system (Barr 1993). Marketisation will lead to a wider gap being formed between the learning opportunities that are afforded to the well off and to the poor (Fitz May 2000). Allowing parents to choose schools will additionally privilege those who are already privileged, since making a good choice, perhaps making any choice at all, requires families to have resources such as literacy, confidence, taste, knowledge of legislation, leisure time, and private transport. Poor families will not be able to 'play' the market successfully. Poor parents are more likely to keep their children at badly performing schools (Lawson 1992). A major assumption in support of marketisation is that, when given a choice, parents will move their children from bad schools to better schools. However, this is not necessarily the case. Even when schools do not provide ideal learning environments for their students, many parents tend to keep their children at these schools anyway. Lawson says that parental

apathy, lack of access to informed data and lack of confidence to act are reasons why parents keep their children in bad schools. In addition, Lawson says that the potential emotional effects that changing school can have on their children often stops parents from pursuing a change.

One of the main arguments in support of marketisation is that it provides choice by allowing parents to choose the school that they wish their children to attend. However, irrespective of social class, proximity to a school is cited as the most common reason for picking a particular school (Lawson 1992). Lawson states that 90% of parents choose their local school. Bagley confirms this finding, stating that distance from a school is the most common reason that parents give for not selecting a particular school (Bagley 2001). As parents become better informed, the percentage of parents opting to exercise choice increases only slightly. In general, parents who do chose to send their children to non-local schools do so for reasons of safety and access or because of the perceived quality of an area, rather than for better academic standards. Lawson states that there is no evidence that choosing non-local schools is confined to middle class parents. There is no reason to believe that marketisation will dramatically alter these patterns.

Within marketisation, students might find themselves excluded from their local school, as popular schools will have a much greater say in which students they admit (Lawson 1992). Parents might find themselves having to make long journeys to school every morning. Under marketisation, primary school children will not necessarily go to their local school. Primary schools, in particular, play a crucial role in community building. Primary school children tend to make friends with other children who attend their own class and who live in their own locality. They engage in the various childhood interactions, such as play and parties with these friends. In a school where students do not live close to each other, many of these childhood interactions will not exist or will be highly restricted. This could have a significant negative impact on the mental and social development of the nation's children.

In normal markets, it does not matter who the customer is. However, in education, it does matter who the customer is (Ball 1994). A principle of marketisation of education is that the best schools will attract more students. To become the best, a school must maximise the impact of resources on outcomes. Under such a system, it is not in a school's self interest to cater for special needs or disruptive students. The needs and preferences of special education needs students are being increasingly marginalised and devalued (Bagley 1998). Even those in favour of marketisation concede that educational markets can only ever be quasi-markets (Tooley 1994). A safety net to guarantee an adequate education for all students needs to be incorporated into marketisation. Tooley does not attempt to suggest how the affects of marketisation would impact on this loss making section of education or how the unfortunates, who are adversely affected by the market, would be catered for in an inclusive way.

Good markets only exist where there is sufficient competition in the marketplace (Lawson 1992). This is not the case in education, where parents and students face various barriers to choice. Chief amongst these barriers is geography and transport links (Bagley 2001). Although markets might work in the major population centres, it is difficult to see how they could function in rural areas. In small communities and rural areas, the number of children may be too small to justify more than one school of reasonable size. In such cases, competition cannot be relied on to protect the interests of parents and children (Friedman 1955). Clearly, these small rural schools operate outside of any market forces. In a free market, many small local schools might well be forced to close, as they are highly inefficient. If several small rural schools are closed, then the remaining school is likely not to face any competition for student enrolment. It will therefore operate as a monopoly service provider within its own geographic area. Monopoly service operators have a history of abusing their position (Whitty 2000; Whitfield 2006). They tend to exploit contract niceties, ignore service failures and – within education – avoid involvement with, or get rid of, difficult or resource-intensive students.

Conclusion

It is clear that marketisation of education is a complex and emotive issue. Each side of the debate has its strengths and weaknesses. Many people on both sides of the argument take a blinkered view of the debate. Marketisation is too important an issue to be decided by emotive, subjective, opinions. Education is a once-and-for-all experience, which cannot be repeated (Lawson 1992). Whereas the

effects of a bad hamburger or an uncomfortable jumper are quickly remedied, the effects of a bad educational experience remain with a person for life. Both sides of the debate agree that providing individuals with a good education benefits both the individual and the country. Providing individuals with a bad education adversely affects both the individual and the country.

There are several contradictions in the arguments that are presented by the opposing sides of the debate in marketisation. For example, Brown states that schools specialising in subjects as a result of market forces will lead to less rounded students (Brown 1996). Tooley argues that schools specialising in subjects as a result of market forces will lead to students being provided with an education that better suits their abilities and requirements (Tooley 1998). Those on both sides of the debate need to acknowledge the positive contributions that the other side might have to offer.

It is clear that state education has not provided for the needs of all students (Tooley 1998). Perhaps marketisation will provide better education opportunities? Perhaps it will not? However, based on the evidence in support of marketisation, it is certainly worth trying marketisation out on a pilot section of the community. However, marketisation needs to be introduced in a way that is not threatening to any stakeholders in education. People need to be made aware of both sides of the argument in a transparent and civilised debate.

The only argument presented by either side of the debate that infringes upon the educational rights of any student is the one made by anti-marketisation secularists who oppose religious schools (Lawson 1992). So long as marketisation can ensure that the educational rights of all students are met, then there is no compelling reason to oppose the marketisation of education. The fact that marketisation might offer the potential of a better education for children only adds to the argument in favour of marketisation. A properly regulated market in education will not only ensure that the educational rights of all students are respected. It might also offer the potential to deliver a better education to all students.

The evidence suggests that marketisation has the potential to provide people with choice and provide efficient services (Lauder 1991; Tooley 1998). Therefore, it should be considered as a viable option in education policy. In order for marketisation to work, the following two conditions must be met.

- The state must continue to regulate education. Marketisation needs to happen within the context of the basic educational rights of the population. The state must maintain a strong, central level of regulation to ensure that all students receive an adequate education. Many other markets, from cars to banking, are regulated to ensure adequate standards are adhered to. Indeed, in many markets, competition forces the actual standards that being achieved to be far higher than the adequate standards regulated by the state. There is no reason to believe that the educational market should be any different.

- The state must continue to fund education to ensure that all students are provided with an adequate level of education.

Like so much else in life, education policy in affected by the environment that it exists in. The version of marketisation adapted in each country will be different to the marketisation policy implemented in other countries. Over time, marketisation in any country will evolve to take on its own characteristics that respond to satisfy the requirements of that country's population.

Abstract

Education helps to develop a Scientific outlook of the world resumed us and discover the laws of development of Nature and society.

Our World is ever changing; therefore, the system of education and training must also change to meet the needs of the globalized systems of production, exchange and distribution.

The on-going revolution in Science and technology outdates some of the crafts and trades, and in their place new ones come up demanding new labour skills. Hence, education must be geared up to meet new challenges.

The direction of change in the present system of education has to be discussed in retrospect and prospect of globalization.

Globalization is understood as a cross border flow of goods and capital. This phenomenon is not new, but began in the wake of the Industrial Revolution in England. This revolution ushered in capitalist mode of production whose defining feature was wage labour based on division of labour.

In course of time, division of labour, when combined with mechanization of production, led to mass production. Because of small populations in England and the Continent, and less purchasing power with the workers, the size of the home markets remained small, as a result of which the whole

output was not sold. To solve the problem the industrializing countries sought overseas markets and secured them by colonial conquests.

During the periods of two World Wars and rehabilitation, and the Cold War in the second half of the 20th century globalization was on low key. However, the emergence of a unipolar World with the fall of the USSR, globalization renued with an accelerated pace. Disinvestment, privatization and liberalization has led to neo – laissez – faire.

The compulsions of globalization – increased competitiveness in the World market – have forced industry to adopt labour saving methods, which led to cutback in regular employment and to resort to casualisation of labour in the developing countries. Further, it is observed that as automation takes possession of labour process, 'de-skilling' of labour takes place, as automation does not require any special skills.

Against this background, education should be reoriented towards vocational training for self – employment in order to reduce poverty. Once the self – employed gain entrepreneurial experience and accumulate capital with state assistance, they can enter small and medium scale enterprises, and able to provide employment for others. Such a system of education is not only inclusive but also generative of employment opportunities. This also bestows a human face to globalization.

EDUCATION IN A GLOBALIZED ECONOMY

The importance of education need not be over emphasized. Education helps to extend our Scientific outlook of the World, and sharpens our mental faculties to cognize and understand the laws of Nature and Social development. Our society and the world are not static; they are ever changing. Therefore, education system should also change in time and space to accommodate the changing needs of society, specially production and its diversification in a globalizing world.

Section – 1

Globalization in Retrospect

Any change in the present system of education has to be discussed in retrospect of globalization – its history and nature. Globalization is generally understood as an ever increasing cross – border flow of Commodities and capital and thereby the emergence of an interdependent and integrated world economy. This is not a new development. It began way back in the wake of Industrial Revolution of the 18th Century in England and the Western Europe. The Industrial Revolution ushered in a new mode of production, namely capitalism.

The defining feature of the capitalist mode of production is commodity production, with division of labour based on wage – labour. Adam Smith, the founder of the classical school of political economy, stated that division of labour improves the dexterity of the workers, and thereby increases the productivity of labour. Further, he highlighted the relation between the division of labour and the market by saying that division of labour depends on the extent of the market, and the expansion of the market, in its turn, extends division of labour[1].

As the market expanded to meet the demand, division of laour was combined with machine production, leading to mass production. But due to the relatively small population and the subsistence wages of the workers, the size of the home markets remained small. As a result, a sizable portion of the output used to remain unsold i.e., market gluts (such a situation was anticipated by T.R. Malthus in 1822, and the first glut was experienced by England in 1825. Since then, market gluts became a recurring feature). A solution to the problem was sought in the overseas markets. Consequently, trading companies were floated, e.g., The East India Company, the Dutch East Indies Company, etc. These companies exported manufactured commodities and imported raw materials to feed the expanding home industries. This two – way traffic of merchandise had contributed greatly to expand international trade, and thereby the formation of a world market.

The formation of a world market is of a historical significance. The goods produced in one country are being consumed by other countries, and the raw materials of a country are consumed by others, thus production and consumption have become globalized. This new development has greatly eroded narrow nationalism, ethinic isolation and religious predijuces, with the result that a secular and cosmopolitan culture began to develop[2].

The cross – border flow of commodities was followed by the inter – state flow of capital. Compared to the export of commodities, export of capital has an advantage. When commodities are exported, the trader gets profits at once, while the export of capital enables the exporter to earn not only profits, but also interest and royalties over a long period. Moreover, export of capital by way of loans to the local governments and investment in production will help the capital exporter to get a foothold in the economy of the capital – importing country.

Once a foothold was established, the capital – exporting countries, for the safety of their investments and for secured markets, made colonial conquests of Asia and Africa. This phase of globalization was characterized by the complete domination of world market by the Metropolitan Countries. So, the inter-state capital market began to expand.

According to Sir George Paish, British investments abroad in 1914 amounted to $ 20,000 million, or 23 per cent of the total investments at home. In the same year British investments in India reached to $ 1845 millions, and in the USA close to $ 3674 million. In 1912 France was estimated to have loaned abroad over $ 8000 million, mainly in the Far East and Russia. Germany did not lag behind, its overseas investments totaled $ 6500 million. Foreign capital was mostly invested in mining,

mineral oils, railways, plantations and public utilities. Sir Paish called these investments as financial imperialism[3].

By the export of capital European powers acquired vast overseas territories as their colonies or spheres of influence. Between 1870 and 1900 Britain's spheres of influence was extended to 5 million square miles, with a population of 88 million, that of France to 3.5 Million square miles with a population of 37 million, and of Germany one million square miles with a population of 14 million[4].

The USA had not lagged behind the European metropolitan powers in respect of capital exports. Until 1870 capital was an inward flow, but by 1898 US capital exports amounted to $ 1210 million, which increased to $ 3 billion by 1914. In this process it acquired spheres of influence in Portirico and Cuba. After defeating Spain, the USA had reduced the whole Latin America as its backyard[5]. In this context we recall the observation of Maurice Dobb.

"Imperialism requires creating such conditions as to ensure profitable investments abroad. The first among these conditions is the availability of plentiful and cheap labour, and where this requisite does not exist, pre-capitalist relations need to be modified but destroy them not completely in order to ensure the supply of wage labour by dispossessing the tribals as in Africa or the running of the handicraftsmen as in India. The fulfillment of these conditions required effective political control over the protectrates' by annexation by military conquest[6]". Long before in , 1902, J.A. Hobson wrote.

"Colonial economy must be regarded as one of the necessary conditions for capitalist expansion. Its trade, enforced by the use of armed force, was in a large measure little other than robbery, and in no sense an equal exchange of commodities[7]". Hobson's view was endorsed by the sociologist, Sombart by saying: "The great trading companies of Europe may be described as semi-war like conquering undertakings to which sovereign rights, backed by the forces of the state, had been granted[8]".

The above observations were true in the case of East India company in india. During 1757-1815 the company shipped home an amount of about £ 1000 million. A measure of this amount can be gauged if we note that the native capital amounted to only a mere £ 36 million during the second half of the 18th century[9]. According to an estimate during the first decades of the 20th century Britain appropriated under one title or another about 10 percent of the national income of India[10]. The same

was true of other British colonies. That is why Andre Gunder Frank said that capitalism was associated with both development and underdevelopment through the exploitation of the overseas territories[11].

Present phase of Globalization

With the collapse of the colonial system during the first decade of the World War-II and the emergence of the USSR as a super power, things have radically changed. The former colonies and semi-colonies (e.g. India, Egypt, Indonesia, China etc.) have taken independent path of development aimed at economic self-reliance. Unreconciled with the change, the former metropolitan countries devised a subtle method of exploitation of the developing countries, namely neocolonialism. One of the chief methods of neocolonialism was economic and military aid with conditionalities. During the 1960s and 1970s foreign aid to the developing countries amounted to an annual average of $ 20 billion, but during the same outflow amounted to $ 100 billion on account of repayments, interest and royalties. Commenting on such a kind of aid Jan Timbergen exclaimed: 'who in fact aids whome[12]'. As we see below, the situation has not changed due to the free flow of foreign direct investments (FDI) under the present phase of gobalisation.

With the fall of the USSR (1990), globalisation has gained an accelerated pace, the WTO acting as the cart-pusher. The developing countries are forced to privatize their economies by disinvestment of public sector and adopt an open-door policy to FDI, and the entry of MNCs into key sectors, industry, banking and insurance. Special economic zones (SEZs) are created to FDI, where labour laws are relaxed and tax concessions granted. There is apprehension in India that these SEZs may sooner or later become foreign enclaves, resembling of the East India company's creating a dual economy.

Expectations of employment growth are belied. While output in India is growing at 7-8 percent during 2002-2007, the growth of employment in organized sector has decreased from 2.4 to 1.04 percent during the same period[13]. What is worse, is the increasing casualisation of labour to save in the wage bill, and thereby to increase the competitiveness in the world market. This type of employment has increased in Africa from 44 to 48 percent, in Latin America from 29 to 44 percent and in Asia from 26 to 32 percent (ILO 2002). This situation was aptly commented upon by a participant in the dialogue organized by the World Commission on the Social Dimension of Globalisation (WCSDG) in the Philiphines, 2004: "There is no point in a globalization that reduces the price of the child's shoes but costs the father his job"[14].

An Assessment

The present phase of globalization is variously interpreted. The World Bank welcomed it as a powerful instrument of economic growth and reduction in poverty. The WTO see in it a vehicle to level up development by an increased cooperation between nations. But facts are otherwise. As to poverty, Harve Kempf, editor of Le Monde, writes:

"Switzerland by any standard is one of the wealthiest countries in the world, but the percentage of its poor, in relative terms, was at 14 percent in 2005. In Germany, it was as much in 2003, and in UK 22 percent in 2002. In the US, the richest country on the earth, 23 percent of its population earns less than half of the median income. In Japan the number of households with no savings doubled in five years to reach a quarter of the population and in France one in every four is in a precarious position[15].

Two decades of globalized Indian economy could not mitigate poverty. As of today, about 30 percent of the population, or 300 million, a number equal to the population of Europe (excluding the states of the former USSR), are living below the poverty – line. The prospects of lifting them above the poverty – line seems to be bleak in the near future because of the decreasing rate of employment opportunities.

By way of concluding this section, we cite the openions of three writers.

Prof. F.R. Pizzati defined the present phase of globalization. "It is a movement of goods and capital across national boundaries under a new paradigm of neo-liberalism". Therefore, he called it as neo-globalisation[16]. Douglas Doud says that "Globalization is an ideological and economic tendency of global expansion of capitalist mode of production ... in order to shift the periodical burden of overproduction on to the developing countries[17]. Prof. V.V. Reddy Characterises the present phase of globalization as "a new version of neo-colonialism in a unipolar world[18]."

Therefore, commenting on the present phase of globalization, Joseph Stiglitz a noble laurate in Economics, says that "Globalization is neither good nor bad. It has a power of immense good. The countries of East Asia have embraced it on their own terms and at their own pace. But, to much of world it has not brought comparable benefits. For many, it seems closer to unmitigated disaster[19].

Section – II

<u>Education and skill Formation</u>

Academics say that education is a continuous process of learning and unlearning. This is because of the fact that some of the things we have learnt in the school and college may become outdated due to the 'explosion' of knowledge on account of latest scientific discoveries and inventions. Every new invention and discovery are a stepping spring for the growth of further knowledge. That is why **<u>Bhagavadgeeta,</u>** the holy script of Hindus, likeness knowledge to an occasion with no bank.

In the process of changing techniques of production, specially its diversification, some of the acquired labour skills become obsolete, and demand grows for new skills to meet the development needs. This is the experience of the West as well as of India,   of late.

Commodity production, the characteristic feature of capitalism, with simple division of labour in which each worker or group of workers, without any specialized skills, are employed in single operation. The repeated performance of a single operation (e.g. Adam Smith's example of Pin-making) would improve the dexterity of the workers, and thereby raised labour productivity. Therefore, the early phase of commodity production did not require any special training through formal education.

However, when division of labour was combined with machine production, education became necessarily specialized for the training of those skills in demand. Later, when the whole production process was mechanized, and production became more diversified, the demand for higher technical personnel, e.g., engineers and managerial cadre arose. Here, comes the importance of specialized higher education.

Capitalism by its very nature is innovative, and never content with the achievements already made. It continuously modernizes productive forces, with the result of the old industries are destroyed, and in their place new industries come up. This is described as 'creative destruction'. At a higher stage of development, the whole production process is automised with remote control, so much so that labour-output ratio declines. For, automation and conveyer – belt require relatively small number skilled workers, and the new recruits if any, can be trained on the work – spot. This stage is marked with a general 'de-skilling' of the labour force[20]. This also co-insides with a fall in the demand for white – collar jobs in banking and insurance as book-keeping and documentation is increasingly computerized and memory 'stored' for instant reference. This leads to 'jobless growth', which is a contradiction in the capitalist mode of production. Such growth is reflected in the recurring crises of overproduction[21].

Today, India is a full-fledged capitalist economy; therefore, experiences of all the ills of capitalist development – concentration of private wealth on the one hand, and poverty on the other. (See Annexure-I) During the last one decade, growth of G.D.P. amounted to 6 – 8 per cent, it is a 'jobless growth', for the backlog of unemployed has steeply increased (See Annexure-II) accompanied by casualisation of wage labour, whose continued employment is uncertain. Given the present trends of growth, secured employment is likely to fall on the one hand, and a rise in the casualisation of labour, on the other. Moreover, in India and other developing countries higher technical education is beyond the reach of most of the youth because of its high cost. For example, in India a four year engineering course costs a minimum of $ 2000 per annum, while the per capita income (in current prices) is only $ 600 (2008). Even then because of, the general de-skilling many of the highly skilled may not get a placement for the highly educated.

Against this background, education needs to be revamped in such a way that it is more and more oriented towards self-employment i.e., post-school vocational training in the emerging crafts and trades. Once the self-employed gain experience in entrepreneurship and accumulate capital, they can enter into small and medium scale industries, using local resources and talents. Self employment may take the form of self-help groups, specially of women, to make edibles and other articles of common use in the households. Such self-help groups are already successfully experimented in some states of India, with state assistance in the form of low interest bearing loans.

To encourage self-employment state funding of vocational education should form the budgetary policy of the developing countries. This seems to us, in the given conditions, the only possible solution to the negative effects of globalization on employment in organised sector and the casualisation of wage labour.

ANNEXURE-I

UNEMPLOYMENT IN INDIA (in Millions)

1. Backlog in 1990	28
2. New entrants into labour force	37
3. Total unemployed (1991-95) (1+2)	65
4. New entrants into labour foce (200-006)	49
5. Total unemployed (3 + 4)	114

A Cartoon was published in the 1970s in a Soviet Weekly, New Times, Moscow, to the effect that the owner of textile mill summons his scientist, and orders him to solve labour problem in the mill. After some time the scientist presents the owner a robot, and tells the owner, now the labour problem is solved, for which the owner shouts, 'you fool, who will by my cloth'. That is the contradiction of capitalist production.

Economic Research at the Czech universities: A Decade of Wasted Hope?

Martin Machacek, Department of Economics, Technical University of Ostrava

Eva Kolcunova, Department of Economics, Technical University of Ostrava

Introduction

The Czech Republic became a member of the Organization for Economic Cooperation and Development (OECD) on the day 1995-12-21 as the first of post-socialist   countries of Central and Eastern Europe (CEECs). A year later Poland and Hungary joined OECD and then Slovakia in 2000. These four countries along with Lithuania, Latvia, Estonia and Slovenia joined European Union in 2004 as well. The mentioned events suggest that the process of overall economic and institutional transformation was not only in the Czech Republic in principle completed and therefore it is not necessary to talk about transition economies in these cases.

But as Ciaian et al. (2008) mentions, some sectors in former socialist CEECs have not passed fundamental reforms yet. Besides health services it concerns especially the university sector.

The causes can be sought in the fact that there are strongly represented public goods and an asymmetrical access to information in this sector. This leads to a natural dependence on the administrative regulation, simplifying operation of pressure groups.

In the era of socialist centrally planned economy the universities played particularly the role of educational institutions whilst basic research has been concentrated in the institutes of the Academy of Sciences and applied research in institutes at various branch ministries (Moore, 1994; Balasz et al., 1995; Kamenicek, 2005). University teachers had to concentrate on education and promotion of the ideology of Marxism-Leninism. The situation was significant especially in social sciences. In this context Turnovec (2002, p. 7) states that in Czechoslovakia in seventies and eighties of the last century the mandatory part of dissertations in economics was a chapter called "Criticism of bourgeois economic theories". After the fall of communism and acceleration of reform processes the pressure groups interested in the conservation of "old order" succeeded in a penetration into the administration regulating university sector and successfully settled in these regulatory bodies. These groups of people were not interested in exposing universities to the competition and adopting principles of research realized at universities. That is their human and social capital, built in the environment of politicized education and marginal research with soft criteria of valuation, would suffer by this. If the economic research at universities, about which we speak in our paper, at least managed to partially develop and gradually expose to an international confrontation, it was often due to an inflow of "new blood" from the rank of fresh graduates of top foreign schools and due to a help of economists living abroad. It means it was rather despite of ruling academic elites and the institutional arrangement pursued by them than due to their significant merit.

Although in there is a long time discussion in the Czech Republic about the need of fundamental change in the system of tertiary education, and despite the impulse of the Ministry of Education from 2008 when the material "White book" containing reform concepts and strategies for next 15 - 20 years was prepared, an approval of this material is obviously not awaited. The reason is a strong resistance of the academic lobby. Czech universities disagree with the way it was treated with the conclusions of "Thematic Review of Tertiary Education: Czech Republic" of OECD expert group from November

2006 (File et al., 2006), containing among others a criticism of the management system of human resources and research. But looking at the results of economic research at Czech universities since the beginning of transformation, the view is gloomy. On the one hand, it is clear that the globalization and revitalization process of economic research has been started in the Czech Republic. If in the year 1993 Czech government database registered only 7 papers of domestic economists in foreign journals included in the Journal of Economic Literature (JEL) database and the number of these papers was never higher till the year 1997 (a year earlier it was even zero), in the year 1998 the number of papers jumped to 53 and the following year even to 67 (Turnovec, 2002). Presented numbers of course include also the outcomes of economists working out of academia. Unfortunately the growth trend has not continued and the stagnation both in the quantity and the quality of publications has occurred in recent years. This fact is now perceived as a problem even officially.

For instance, in 2008 the Research and Development Council, an advisory body to the Czech government, warned that the Czech Republic's long-run relative citation index (RCIO) value for economics amounted to only around 10 percent of the Thomson Reuters ISI National Science Indicators database average. Our own previous research showed that high-ranking positions in Czech economic departments, government advisory boards, and public agencies providing research grants are mainly occupied by professionals without any publications in journals with an impact factor (Machacek and Kolcunova, 2008). According to Turnovec (2005) an average number of publications in journals from databases JEL and Web of Science (WoS) per an academic economist in Czech Republic had been only 0.85 in the period 1994 to 2003. According the database WoS it had not been even 0.75 (Ciaian et al., 2005) in Slovakia in the period 1990 to 2004.The report produced by Accreditation Committee of Czech university sector appointed by the government acknowledges that "in a significant measure still some problems come out in the quality of scientific research and publication activities at habilitations and professorships. So far there are only a few publications in journals with an impact factor and numbers of foreign publications are low. This responds also in low citation responses (In addition they are not followed in many economic branches at all)" (see the report produced by Accreditation Committee about evaluation of habilitations and procedures to professor appointments in the area of economics, 2005).

Machacek and Kolcunova (2005) revealed that of the economics professors tenured in the Czech Republic from January 1999 to June 2005, almost 54 percent had not published a journal paper with an impact factor before their appointment. At the same time, some 85 percent had not published a paper in a foreign academic journal with an impact factor. Similar results held for those who were made associate professors in the same period. We conclude that due to continuing debates about "White book of tertiary education" the date is mature for coming back to the earlier realised research and either actualising either upgrading this research using the grant of Czech Science Foundation (GA402/07/0342). Specifically, this paper expands on Machacek and Kolcunova (2005) by significantly updating the existing Social Sciences Citation Index (SSCI) dataset, analyzing the SCOPUS dataset, and focusing on the publication patterns of full and associate professors before and after their appointments. In doing so, we gain a better understanding of the evolution of research activity at Czech universities, as well as contributing to the international literature on the academic life – cycle (i.e. Baser and Pema, 2004). As for the data, our sample now consists of all the 100 full professors and 207 associate professors of economics who were appointed in the Czech Republic between January 1999 and June 2009. From our data analysis we conclude that the R&E activities at Czech universities still remain underdeveloped and sector competitiveness has not improved, even with reform efforts from the Czech government. This conclusion provides some additional support to the existing literature reviewed above.

Methods

Data on 100 professors and 207 associate professors appointed between January 1999 and June 2009 in the Czech Republic were obtained from web pages of Ministry of Education, Youth and Sports (http://www.msmt.cz/vzdelavani/habilitacni-a-jmenovaci-rizeni). As the report is oriented to the economic research, the focus is on appointments in branches as follows: Economics, Finance, Public Economics Economic Policy, Econometrics and Operational Research, National Economy, International Trade, Business Economics and Management, Management, Sector Economy and Management, World Economy, Accounting and Financial Management (incl. Business), Economic and Social History.

At individual academics we search for the number of their publications using international databases Web of Science (WoS) – Social Sciences Citation Index and Conference Proceedings Citation Index - Social Sciences & Humanities, and Scopus. The publications are found to the date of professor or associate professor's personal appointment and within two years after the year of appointment and also to the date of the research completion (June 2009). Publications are further split in "papers" and "foreign papers". While the first category does not comprise reviews, information, lead articles, etc., the second one moreover excludes papers published in the Czech Republic and Slovakia. The reason for excluding publications published in Slovakia from the sample of foreign papers is a matter of fact that the Czech Republic and Slovakia formed one state entity until 1993 and Czech and Slovak are very closely related languages. In assigning of found publications to the persons a shared responsibility is taken into account. In these cases we proceed in a strictly egalitarian way. It means if a certain publication is a collective work of n authors, the author's share of each person is expressed as a fraction of 1/n.

Unlike the earlier research (Machacek and Kolcunova, 2005) we do not present results of specific Czech universities where professor and associate professor appointments in the period under review was carried out. We conclude that these results are not interesting for an international scientific community, but they are available upon request. In contrast with the earlier research we compare results from the two "competitive" publication databases (WoS and Scopus). This step, among others, responds to complaints of some Czech scholars of the previous analysis for narrowing it to journals with the impact factor. Newly we also observe the rate of "feminization" in individual branches of professor or associate professor appointments. Compared to the earlier research the next innovation is watching publication activities of professors and associate professors within a period of two years after their appointment.

Results and discussion

The following two charts show how the total numbers of successfully topped professorial appointment procedures, respectively habilitations (i.e., procedures for the appointment of associate professors), are involved in various economic fields.

It is evident that in the past decade has been by far the most popular branch of professorship and habilitation the branch of Business Economics and Management (26 %, resp. 36 % share). Other favourite branches are Economics, Finance and Sector Economy and Management. Altogether these branches' share in professorships is 66% and in habilitations even 73%. On the contrary there are branches where the appointment procedure takes place only seldom (World Economy, National Economy, Economic and Social History**,** etc). The comparison with the earlier study (Machacek a Kolcunova, 2005) shows that presented differences among branches remain stable in time and are

obviously caused by natural needs of academic sphere that are derived from the demand of university clients (students, business sector, public sector).

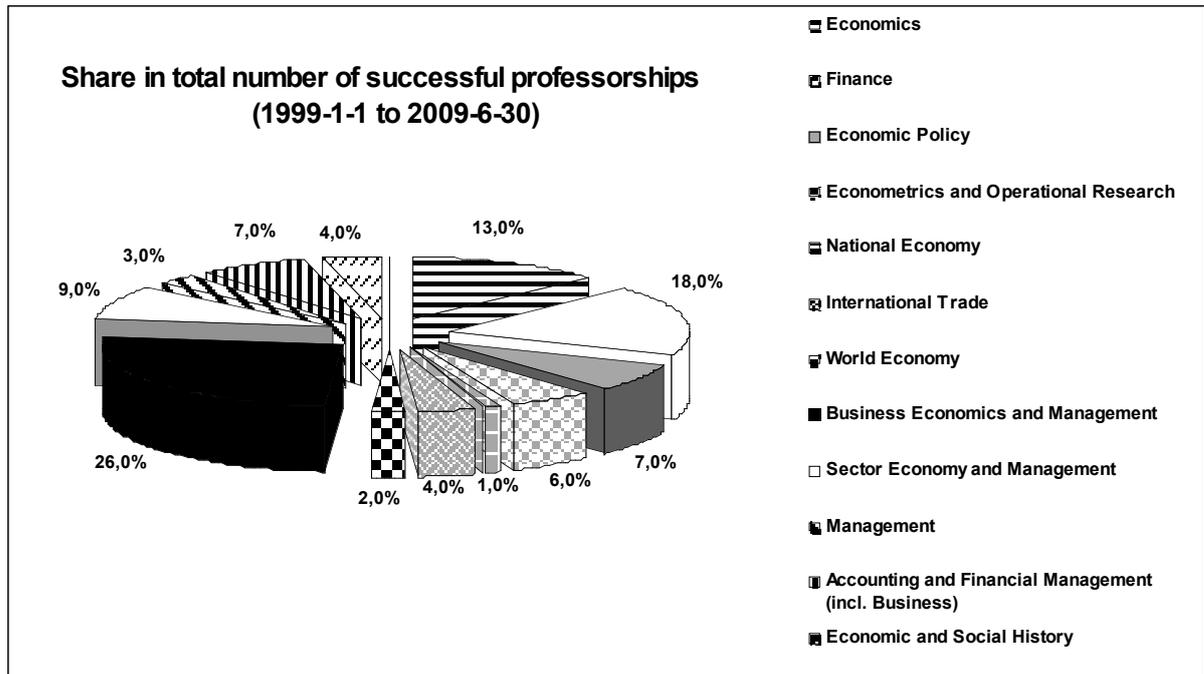
Chart No.1


Chart No. 2
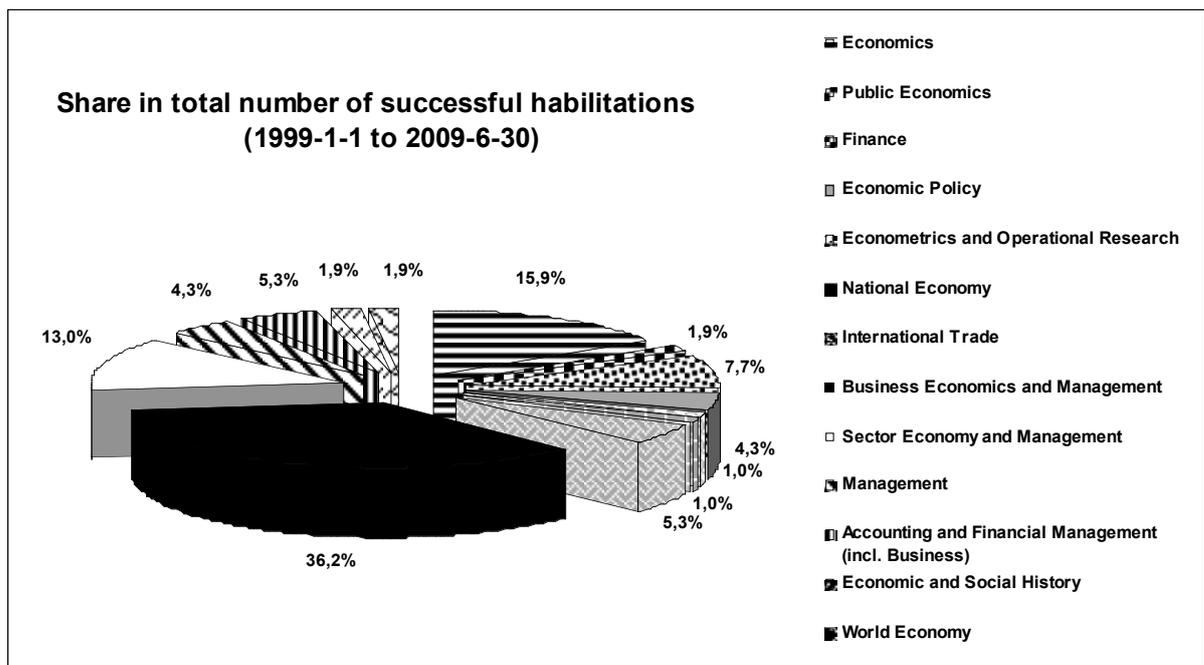


In connection with differences in popularity of individual branches of professorship and habilitation question arises whether there does not come into play a factor in inter-disciplinary perspective of requirements for candidates' publishing activity. In other words, whether candidates in popular branches are not subject to fewer requirements than in the less popular branches. The Charts No. 1 and No. 2 describe this problem. In these charts it is possible to observe the shares of habilitations and

professorships according to branches that were successfully completed without any publication listed in international databases WoS and Scopus. Although the results are according to databases insignificantly different, in both cases it is evident that in some branches really exists an above-average share of successful procedures without publications and in the other branches it is just vice versa. If we focus only on the popular branches Business Economics and Management, Economics, Finance and Sector Economy and Management we can see that according to both databases the branches Business Economics and Management and Sector Economy and Management rank among branches with "soft" publication criteria whereas Economics and Finance are branches with under average share of procedures without publications. Again we see no change comparing the findings in the year 2005. Though in past there were objections in Czech Republic against the findings that successful habilitations and professor procedures without publications are concentrated in the branch of Business Economics and Management, these objections were focused on the use of database containing only journals with the impact factor, the use of an alternative database (Scopus) puts these objections aside. The hypothesis that some tolerance of application reviewers contributes to the popularity of some branches between aspirants, with lack of publication performance, for professorship or habilitation, cannot be categorically rejected.

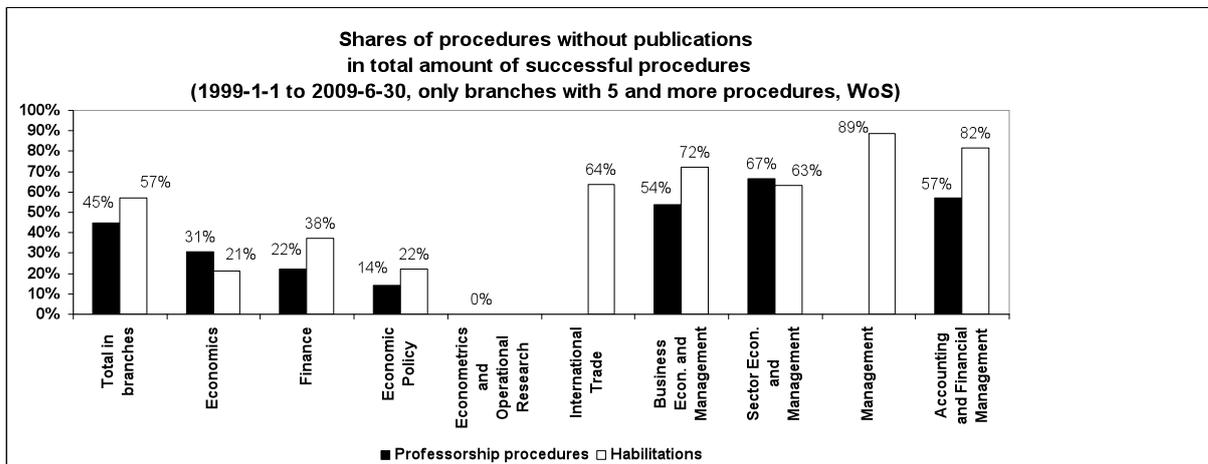
Chart No. 3


Chart No. 4
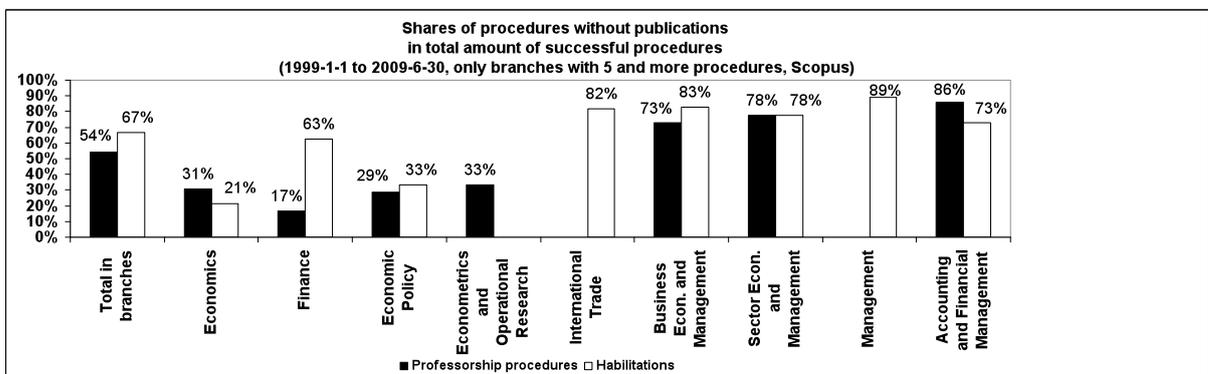

Table No. 1 provides interesting information about the research results. This table summarizes data for individual subjects of habilitations and professorships procedures according to database and type of publications. E.g. this table implies that only 26% of newly appointed professors in economic disciplines were women in the Czech Republic during the past ten years. In case of newly appointed associate professors this share was only a little higher and gave 29%. When compared with data from earlier research (Machacek and Kolcunova, 2005) it shows that the proportion of women among those

appointed professors decreased by 5.5% and the one in appointed associate professors decreased by even significant 26%. This does not expose the Czech university sector too flattering card, especially when there is domestic "Humboldtian" (File et al., 2006) career system under which the rank of associate professor is a precursor to obtain the standard professorship.

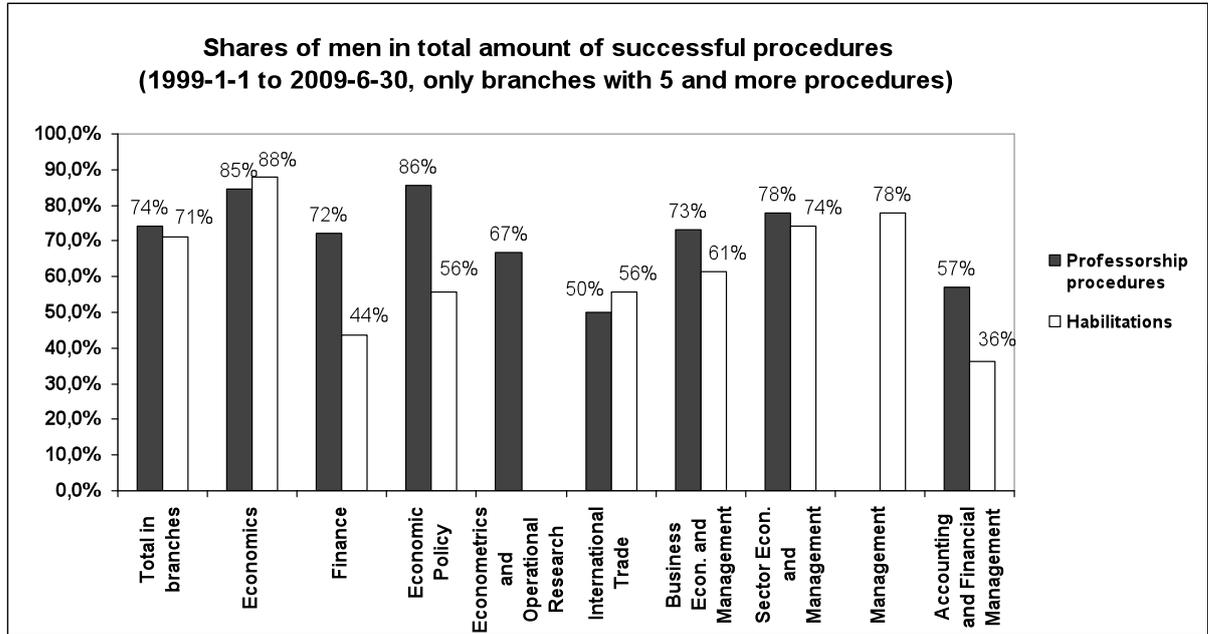
Table No. 1: Aggregate results of research

	Professors	**Associate professors**
Internal procedure	83	164
External procedure	17	43
Women	26	60
Men	74	147
Total	100	207
Without publications to 2009-6-30 (WoS)	30 %	46 %
Without papers to 2009-6-30 (WoS)	37 %	57 %
Without foreign papers to 2009-6-30 (WoS)	83 %	89 %
Without publications to the appointment date (WoS)	45 %	57 %
Without papers to the appointment date (WoS)	50 %	65 %
Without foreign papers to the appointment date (WoS)	84 %	91 %
Without publications to 2009-6-30 (Scopus)	40 %	57 %
Without papers to 2009-6-30 (Scopus)	42 %	58 %
Without foreign papers to 2009-6-30 (Scopus)	75 %	83 %
Without publications to the appointment date (Scopus)	54 %	67 %
Without papers to the appointment date (Scopus)	55 %	68 %
Without foreign papers to the appointment date (Scopus)	81 %	88 %

Chart No.5 follows information on the share of women in new professors. This chart features the data on masculinisation in individual branches of procedures. It is evident that the only two branches with at least five habilitations and majority of women are branches Finance (56% women) and Accounting and Financial Management (incl. business, 64% women). An equivalent share of men and women is in the branch International Trade concerning professorships. All other significant branches show a majority of men although some of them are above average masculinised (e.g. Economics or Sector Economy and Management) and the others vice versa (Business Economics and Management, etc.). Next interesting finding, in the Table No.1, is that full 83% of professor procedures and 79% of habilitations took place at the home university of aspirant (category "internal procedure") and only small amount of procedures took place at the university where the aspirant was not employed (category "external procedure"). Likewise in this respect the differences have become deeper since the year 2005. It

confirms well known reality that Czech university sector is rather impenetrable and shows a low mobility of academic workers.

Chart No. 5

Shares of men in total amount of successful procedures
(1999-1-1 to 2009-6-30, only branches with 5 and more procedures)


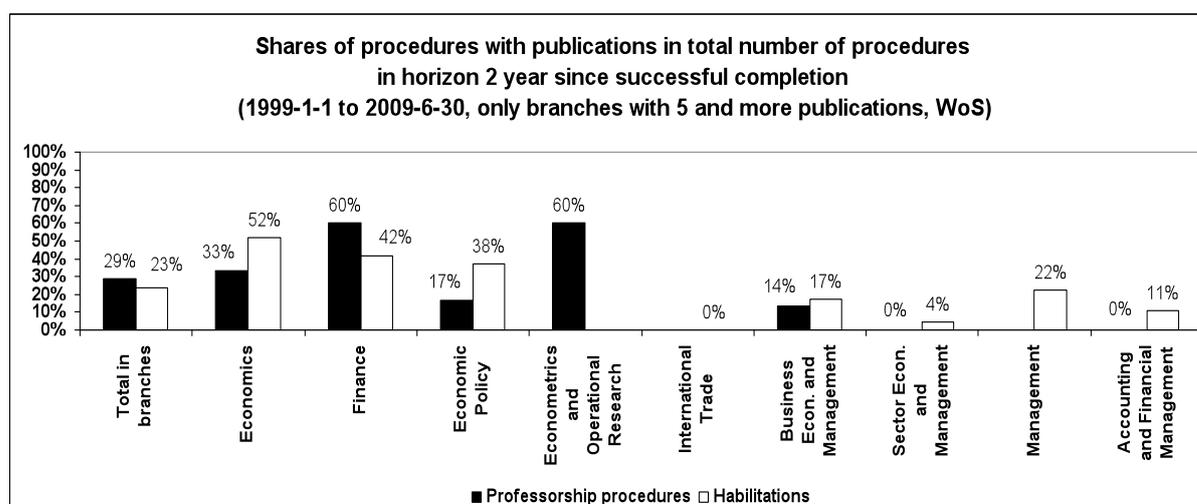
As far as the publication activity of newly appointed professors and associate professors is concerned the aggregate results of the investigation is possible to read also in the Table No.1. By the end of June 2009 30% professors and 46% associate professors appointed in years 1999 to 2099 (according WoS), resp. 40% professors and 57% associate professors (according Scopus) has not had a single publication record in international databases. In the case of foreign, i.e. aside the Czech Republic and Slovakia published papers the shares are 75 to 83% (professors) and 83 to 89% (associate professors). If we focus on publication records to the year of professorship or habilitation capping the stated numbers are even higher and amount 45 to 54% (professors) resp. 57 to 67% (associate professors). More than 80% professors and about 90% associate professors obtained their degree without any foreign publication filed in reputable international databases. In the case of data obtained from WoS some improvement occurred comparing the study from year 2005. But this improvement does not exceed 5% of procedures and does not change a negative impression owing to findings fundamentally anyway.

It was said, this report also follows a time profile of publication activities of professors and associate professors appointed in the analysed decade. We specifically focus on what happens with these activities within two years after the appointment. It is logical that in this research we must be satisfied with a smaller sample of procedures as the selected two years term still does not invoke the procedures completed in the years 2008 - 2009. In the case of professor procedures we work with 84 procedures from 100 in total. In case of habilitations we work with 173 procedures from 207 in total.

Results of analysis of publication activity time profile based on data from WoS are presented in the Chart No.6. This chart shows that only 29% professors and 23% associate professors have been publishing in journal or proceedings with the impact factor within two years after their appointment. Above average it was in the branches Economy and Finance, in case of professor procedures also in the branch Econometrics and Operational Research, in case of habilitations in the branch Economic Policy. Other significant branches show vice versa very second rate results. In case of branches Sector

Economy and Management and Accounting and Financial Management (incl. Business) for example any of professors has not been publishing within two years after his appointment. The same can be said about associate professors in the branch International Trade. The more precise view would for example show that professors who published papers listed in WoS within two years period after their appointment in 83% cases had already published before. And on the contrary 48% professors, who have not published papers within two years period after his appointment, had not published before. Also there is a difference among braches. While in the branch Economics all professors publishing after their appointment had already publication in WoS in past, in the branch Business Economics and Management 58% professors without publication had not published even before this appointment. As far as associate professors are concerned those who published papers listed in WoS within two years period after their appointment in 83% cases already had published before. And on contrary 68% associate professors, who did not published papers within two years period after their appointment, had not published before. It seems so that as professors and associate professors make a progress in the professional career and reach desirable degree then they significantly limit their publication activities. This can be of course caused also by the fact that their administrative duties increase (sessions in evaluation committees for doctoral and habilitation theses, examination of inceptors, preparation of opponent reviews, other expert activities, etc.).

Chart No. 6

Shares of procedures with publications in total number of procedures in horizon 2 year since successful completion (1999-1-1 to 2009-6-30, only branches with 5 and more publications, WoS)


Conclusions

Within days from 2009-5-22 to 2009-6-18 the Ministry of Education of Czech Republic realised a vast survey amongst academics. The aim of this survey was to find out their expectations in connection with the reform of tertiary education and to identify better the problems in the sector of university education. 24% of all Czech academics (6099 persons) of which 11% were professors and 19% were associate professors actively participated in this survey. This survey also revealed that according to 72% of academic workers Czech university education needs an in-depth reform. It emerged though that the support of reform decreases with a qualification classification of respondents and their position in the school management (www.msmt.cz). This seems to confirm the thesis – presented in the introduction - about a prevailing distrust to more radical changes among influential academic officials.

This report withal confirms for the area of economic research that recent domestic development is unfavourable and deserves a stronger action. Since nineties the situation has still existed that more than 80% professors and associate professors have no publication in a prestigious foreign periodical and one third to a half of them has not any internationally listed publication. Since the outbreak of the so-called Velvet Revolution, while this year expires just 20 years. The more alarming is the fact that the situation has not gradually improved but at least stagnated or got even worse. It is clear from the comparison of the results of the performed research with the ones of our original study (Machacek and Kolcunova 2005).

It is obvious that the academics, who know that they can obtain professorships and habilitations without more publication efforts, are not motivated to the standard scientific work. This attitude, once appointed, professors or associate professors subsequently transfer to the doctoral students, which reproduces the problem in time. As many of Czech professors and associate professors are not used to publish in recognized international journals and proceedings, as it is a reputable practice in economic branches, and they are not therefore forced to watch current development trends and to use them in their students' education. So there is a blending of the lack or the low quality of economic research with teaching outdated and useless knowledge. Through the lack of education and poor economic education the efficiency of the economy is decreasing and its growth potential and international competitiveness is reducing. The problem of university economic education in the Czech Republic is also a low mobility of professors and associate professors from the perspective of their qualification growth.

Described difficulties are not inherent only to Czech Republic but also to Slovakia (Ciaian et al., 2008) and probably to other post-socialist CEECs. Just as the area of health service the sector of tertiary education in these countries waits for penetrative completion of reforms started during the transformation period. Without stronger reform effort in the observed area the post-socialist CEECs will barely be able to face the challenges of global knowledge economy of 21st century and to resist the pressure of "more aggressive competitors" in international markets.

Abstract

This paper expands on Machacek and Kolcunova (2005) by updating the existing SSCI dataset, analyzing the SCOPUS dataset, and focusing on the publication patterns of full and associate professors after their appointments. Our sample consists of 100 full professors and 207 associate professors of economics appointed in the Czech Republic between January 1999 and June 2009. We conclude that the R&E activities at Czech universities still remain underdeveloped and sector competitiveness has not improved.

The Interference of Filipino in the Use of English Prepositions in Written Compositions of Students of the University of the Philippines

Maria Corazon Saturnina A. Castro,Ph.D.
Department of English and Comparative Literature
College of Arts and Letters
University of the Philippines-Diliman

ABSTRACT
This paper analyzes the extent of the interference of Filipino in the use of English prepositions in compositions written by college freshmen of the University of the Philippines. Using Error Analysis and Contrastive Analysis, it describes and categorizes the errors in preposition committed by the students and explains the difficulties and the causes of these errors. This study concludes that most of the errors are not interlingual but intralingual.

A preposition expresses a relation between two entities, one being represented by the prepositional complement of the various types of relational meaning (Quirk and Greenbaum, 1990).   These relationships include those of time, position, direction, and various degrees of mental and emotional states. Studies have shown that the preposition is one of the most problematic categories that students encounter in learning English (Richards, 1974)

In the Philippines, one major grammar error observed in both students' speech and writing is the prepositional error. Corder (cited in James, 1998) defines **errors** as the result of some failure of performance. Dulay, Burt, and Krashen (1982) state that **errors** are the flawed side of a learner's speech or writing. An **error** is any deviation from a selected norm of language performance, no matter what the characteristics or causes might be. The problems of the Filipinos with the preposition may be grouped into three: 1) using incorrect (unidiomatic) preposition; 2) non-use of a preposition when one is needed; 3) using a preposition when none is needed (Guzman and Arcellana, 2004).

It is not uncommon to find the use of English preposition reflecting Filipino structures—that is to say, literal translations from Filipino to English. The differences between the prepositional systems of English and Filipino are believed to constitute the difficulty of the Filipino learner in learning and using the English prepositions. While English has numerous prepositions denoting various kinds of relationships, Filipino generally uses only three—*sa, ng, kay.* Overwhelmed by the numerous prepositions to choose from, the Filipino learner is said to base his understanding of English on his first language (L1) resulting in grammar errors.

Statement of the Problem

It is within this context that this paper poses the major problem: ***To what extent does Filipino (L1) affect the use of English prepositions in written compositions of students of the University of the Philippines?***

To answer this query, some sub-problems must be addressed:

1.   How does the prepositional system of Filipino differ from the prepositional system of English?
2.   What are the prepositional errors found in the data?
3.   How much of the errors can be attributed to the students' L1(Filipino)?

Hypotheses

This paper hypothesizes that the prepositional system of Filipino has minimal effect on the use of English prepositions in the students' compositions. Many of the errors are not due to L1 interference (interlingual errors) but due mainly to intralingual transfer, i.e., generalizations made within the target language English.

Objectives of the Study

This paper evaluates the extent of Filipino's interference in the use of English prepositions as reflected in written compositions of students of the University of the Philippines. Using Contrastive Analysis as a method of describing the prepositional systems of English and Filipino and Error Analysis as a method of diagnosing the errors in the compositions, this paper undertakes the identification, description, and categorization of the errors and the determination of the sources of errors.

Conceptual Framework

As mentioned earlier, this paper uses the Contrastive Analysis Hypothesis (CAH) as a means of describing the differences in the prepositional systems of English and Filipino. Proponents of the strong version of CAH claim that by comparing systematically the native language and the language to be learned, one can predict and describe the patterns that will cause difficulty in learning, and those that will not cause difficulty. A more moderate version of CAH which this paper adopts does not imply a prediction of degrees of difficulty. Instead it recognizes the significance of interference across languages and the fact that these interferences can explain the linguistic difficulties of the learners (Brown, 1994).

This paper also uses Error Analysis to identify, describe, classify errors and to determine their causes. There have been a number of error taxonomies presented in second language (L2) literature. Corder (1973) classified errors into four categories: omission of some required elements; addition of some unnecessary elements; selection of incorrect element; misordering of elements. James (1998) noted that errors may be **interlingual**, i.e., mother-tongued influenced. These are errors resulting from the learner indulging in a literal translation from L1 to L2. The target language may also cause **intralingual** errors. The learner may also resort to some **communication strategies-based errors** such as approximation and circumlocution errors. Lastly, **induced errors** are errors that result from the language situation rather than the learner's incomplete competence of the target language or the interference of the mother language.

For the purpose of diagnosing the errors found in the data, this paper adopts an eclectic framework culled from the frameworks of Corder and James (see table 1).

Table 1.

Categories of Errors

1. Interlingual
  - Literal translation
  - Features of L1 are transferred to the target language
	3. Communication strategy-based
	  - filling the gap
	  - incorrect use of an L2 expression that involves a preposition
	  - coinage

2. Intralingual
   - omissions
   - additons
   - misselection of L2 preposition
   - redundancy
   - cooccurrence restrictions
   - overgeneralization
	4. Induced
	   - teacher-talk induced
	   - material-induced

Methodology

Two hundred seventy eight (278) compositions were collected from ten (10) sections English General Education (GE) courses. The data were guided compositions, meaning to say, the teacher provided the topic for the writing session. The teachers confirmed that all the students speak Filipino as the first language. Of the 278 compositions, 163 or 58% contained errors in prepositions. These 163 compositions comprised the corpus of the study. Sentences with prepositional errors were isolated and the errors were described and categorized using the frameworks of Richards (1974) and James (1998).

Results and Discussion

Descriptions of the Prepositional Systems of Filipino and English

FILIPINO

Guzman and Arcellana (2004) describe the prepositional system of Filipino as having only three prepositions—sa, ng , and kay. These three are multifunctional in the sense that one preposition may convey locative, directional, or even spatial relations. The determination of the distinct sense of a Filipino preposition depends on preceding phrases in addition to the preposition itself as illustrated in the box below:

FILIPINO	ENGLISH
SA ilagay SA kahon ipatong SA mesa nagpunta SA palengke galing SA palengke patak NG ulan kinain NG pusa basa NG pawis ibigay KAY Anna kunin KAY Anna tungkol KAY Anna para KAY Anna	 put (it) **in** the box put (it) **on** the table went **to** the market came **from** the market drops **of** rain eaten **by** the cat wet **with** sweat give **to** Anna get **from** Anna **about** Anna **for** Anna

According to EnglishClub.com, (http://www.englishclub.com/grammar/prepositions-list.htm) there are about 150 English prepositions. The English prepositions can be grouped in categories such as:

1.　　　Those indicating direction (to, towards, into)
2.　　　Location (in, at, on, by)
3.　　　Spatial relationship (above, across, around)
4.　　　Time, place, and object (on, in, within, about, for, etc.)

The nine most frequent prepositions in English are at, by, for, from, in, of, on, to, with. However, this grouping is misleading as each form has multiple meanings (may denote time, space, location, etc.) and functions (agentive, dative, benefactive, etc.). Thus, each of these frequent prepositions must be studied in detail to isolate a small but optional number of meanings that it performs in English. There are also variations in the use of prepositions. More than one preposition may be acceptable in certain contexts. For instance , *a quarter to/of ten, from 9 to/till 5 pm,* etc (Celce-Murcia and Larsen Freeman, 1983, 1998). All these contribute to learners' difficulty in learning and "mastering" the English prepositions.

Following the comparison between the English and Filipino prepositional systems is a description of errors found in the data. According to James (1998), it is necessary to include a description of errors for the following reasons:

1.　　　To make explicit what would otherwise be tacit and on the level of intuition;
2.　　　To provide a basis for counting errors;
3.　　　To create categories.

This study adopted Lennon's categories (cited in Brown, 1994) to describe the learners' errors.

These categories are substitution, addition, omission, and misordering.

The data yielded the following results:

Description of Errors	Frequency	Percentage
Substitution	139	62%
addition	53	23%
Omission	35	15%
Misordering	0	0
TOTAL	227	100%

Substitution ranks highest with 62% while misordering is last with no incidence at all. It is evident that the large number   of English prepositions compared with the number of prepositions in Filipino contributed to contributed to the learners' difficulty   in processing relationships   between the grammatical elements and choosing the appropriate English prepositions.

At this point, it can be hypothesized that L1 interference caused the errors but it is also possible that the internal make-up of English caused much of the learners' difficulty. These possibilities necessitate what James calls error diagnosis.

Error diagnosis tries to ascertain the factors that cause learners to commit errors. Primary diagnosis simply explain why errors occur while secondary diagnosis discusses the forms that these errors assume. This paper attempts to do both.

There is a general agreement over the main diagnosis-based categories of error (James, 1998). The four major categories are 1. Interlingual errors; 2. Intralingual errors; 3. Communication strategy-based errors; and 4. Induced errors.

Interlingual errors are errors caused by the interference of the learner's mother tongue. Learners engage in over-literal or word-for-word translation. The origins of the intralingual errors are found within the structure of the target language itself and through reference to strategies by which a second language is acquired or learned. These are errors that reflect the general characteristics of rule learning. Under this category of errors, Richards talks of faulty generalization, incomplete application of rule restrictions, incomplete application of rules, false concepts hypothesized. James (1998)) , on the other hand, has false analogy, misanalysis, incomplete rule application, exploiting redundancy, overlooking cooccurrence restrictions, hypercorrection, overgeneralization. Lacking the required form, the learner resorts to using another near-equivalent L2 item resulting in communication strategy-based errors. Induced errors are the result of being misled by the ways in which teachers give definitions, explanations, examples, and arrange practice opportunities (James, 1998).

Using Richard's and James' taxonomies, the following categories are derived:

Category	Frequency	Percentage
Interlingual		
-direct translation	22	10%
Intralingual		
-misselection of prep	107	
-inc. application of rules	42	
-simple addition	26	
-redundancy	12	
Overlooking cooccurrence rest.	4	
Total		84%
Commmunication strategy- based		
-misuse of L2 expression	14	6%
Induced	0	
TOTAL	227	100%

Interlingual Errors

The interlingual errors comprised 10% of the total errors. These errors are the result of prepositions directly translated from L1 to L2. The learners made use of L1 repertoire to process meanings and structures in L2.

Example:

1.   I was usually forced to write essays and articles OF English journalism teacher.

        This sentence is the direct translation of : *Ako ay madalas mapilit magsulat ng mga sanaysay at artikulo NG aking guro sa English Journalism.*

        NG can be both *of* and *by* depending on the preceding word. NG after a verb signals a passive voice and denoted by BY in English.

        Example:

        Kinain NG bata   (eaten BY the child)
        NG after noun is usually denoted by OF in English. It signals possession or the fact that the object of the preposition has reference to the noun.

        Example:

        Kamay NG bata (hand of the child)

        Pagmamahal NG ina (love of a mother)

        What happened in the preceding example was that the proximity of the noun ARTICLE to the position of the preposition prompted the learner , who was thinking in Filipino, to write OF instead of BY.

2.   I have to share the learnings TO others, directly or indirectly.

        This sentence is the direct translation of: *Ako ay nakakapamahagi ng aking mga nalalaman SA iba.*

        SA is always associated with something locative and directional. Its equivalent English prepositions are IN, ON (locative) TO, FROM (directional). The use of TO instead of WITH must have stemmed from the idea that sharing is directional, that is to say, someone gives something TO someone else.

Intralingual

Misselection of Preposition. These are errors that do not conform to TL norms but cannot be traced to the L1. The high frequency of misselected prepositions gives credence to Brown's observation that intralingual transfer is a major factor in second language learning. Researchers have found that that the early stages of language learning are characterized by interlingual transfers but once the learners have begun to achieve parts of the new system, more and more intralingual transfers are manifested (Brown, 1994). The learners in this study have studied English for at least 10 years and the occurrence of many intralingual errors only reaffirms the findings of earlier studies.

Examples:

1.   It takes me a whole lot of time to finish a text on something that I don't have a clear idea WITH.
2.   I tend to be hesitant WITH the ideas I wrote.
3.   It is usually comprised WITH at least two or more characters.
4.   I don't entertain problems and I never get affected WITH them.
5.   People are talking WITH me because they realized that I have that characteristics.

One error that surfaced many times is the use of WITH instead of by, of, to. This misselection often results in unidiomatic expressions like *talk with.* One can also hypothesize that the learners associated TALK with SPEAK (both of which are oral language productions) and generalized that if speak is used with WITH; talk (which is also oral production) could also be used with WITH.

Conversely, different prepositions are used when WITH is needed as seen in the following examples:

1.   I 'm really disappointed OF what I have done.
2.   …the wind blowing through my hair is what I am most likely to associate TO dried leaves.
3.   I'm drawing a tiger but I have nothing to color it ON.

There also a number of instances involving the locative prepositions ON and IN. Although the learners were not able to make distinctions between the two related prepositions, the sense/intention of the learners was, nonetheless, comprehensible. These errors are what Burt and Kiparsky call "local errors." Local errors do not prevent the message from being understood. Usually these are minor violations of one segment of a sentence still allowing the reader to make an accurate guess about the meaning of the writer.

Examples:

1.   The hero will triumph ON the end.
2.   Some poems may look ridiculous when written IN paper.
3.   Sumptuous food and sweet desserts awaits IN the table to be eaten.
4.   On days when I put peppermint candy ON my mouth….
5.   I hum a tune a heard IN the car's radio.

Incomplete Application of Rules

These errors occur when learners fail to perform certain operations. This error category is evident in the omission of prepositions in the phrasal verbs/idiomatic expressions requiring the use of prepositions and must be learned as one unit.

Examples:

1.   I am really open with what going _____in my life….
2.   …and I don't have a hard time relating _____the topic.
3.   If a person feels extreme anger and has no one to share it____ he can "dispose"___ almost all his anger though writing a poem.

Simple Additions

Addition errors are characterized by the presence of a preposition which must not appear in a well-formed sentence.

Examples:

1.   You can feel my knuckles swelling but I won't let you feel for you may end up being the reason OF why it is swollen.
2.   In fact, I also consider this as a reason ON why I have lots of friends.
3.   The problem is WITH me.

The sentence, *The problem is WITH me*, is a little ambiguous. Without looking at the context, one can say that the sentence is correct in the sense that 'the problem" may refer to someone or something that

is WITH the speaker. An examination of the text , however, showed that the writer meant "the problem is ME." In such case, WITH is not needed.

Redundancy

Redundancy manifests the learners tendency to overelaborate the target language which often results in verbosity.

Example: 1. A smile forms on my face and my eyes can't help but wandering AROUND.

> The term *wandering* already implies 'moving or going around." The learners probably wanted to highlight 'circular movement" of the eyes as they examine the area; hence, the addition of *around.*

Example 2: …and all that boosted up the company sales.

> In the second example, the learner attempted to foreground the increase or the "rise" in sales; hence, the addition of UP.

Overlooking Cooccurrence restriction

This error refers to the failure to observe the restrictions of existing structures, that is, the application of rules to contexts where they do not apply.

Example 1: Taking it seriously will just end up to let them do it again.

Example 2: I embraced myself, a useless attempt at protection from the cold…

In both examples, the learners failed to recognize the fact that the phrasal verbs *end up* and *attempt at* select the –ing complement rather than the infinitive nor a noun form.

Communication strategy-based errors

Misuse of L2 expression

This error results from the learners attempt to use the English idioms but not able to realize the correct form.

Example 1: I put everything I know and discuss about it.

The addition of ABOUT must have come from the learner's association of expression TALK ABOUT with DISCUSS. The learner generalizes and assumes that like TALK ABOUT, *discuss* would also require the preposition 'about."

Example 2: No, not the kind of novel that one can read in one sitting, over the night.

The use of *over the night* instead of the expression "overnight" reflects the learners "over attempt" at approximating the L2 expression. Not wanting to miss out on any words, he over monitors his L2 output adding the article THE , presumably because the next structure is NIGHT which is a noun. This over monitoring of L2 output is what James called "hypercorrection."

Example 3: If I were a literary piece, I would be a poem because I already took up English 11 and I found poetry really interesting.

In contrast to the previous examples where the addition of prepositions resulted in the misuse of the L2 expression, example 3 deletes an entire noun phrase (the expression took *a course in*) and replaces it with UP.

Conclusion and Implications to Language Learning and Teaching

The results of the study showed there are a number of differences between the English and Filipino prepositional systems in terms of number and sense. Despite the common notion that Filipino affects the use of English prepositions, this study revealed that most of the errors are intralingual—errors that originate from the target language, English.

This research debunked the common notion that L2 learning is primarily affected by the L1. The difficulty in learning the English prepositions necessitates classroom strategies and techniques (early on, as early as the basic education level) that will distinguish the various senses of the prepositions. These strategies and techniques call for using the preposition in context; giving semantic explanations for various uses of prepositions instead of simply asking students to memorize verb+ preposition or adjective+preposition constructions; and engaging learners in authentic communication to promote their learning. It is hoped that this early exposure to the forms and functions of the English prepositions will result in their imbibing the target forms without much reference to the L1.

There is a need to re-evaluate the teachers' command of the English language and this evaluation must be done in all levels. Although there was no way that this study could establish the teacher-induced errors, there is the possibility that some of the errors originated from the teacher talk. For the non-native speaker teacher, the command of English is always a serious concern. There is a constant need for the Filipino teachers of English to undergo methodological and language proficiency trainings to meet the language demands of the ESL classroom. This is a tall order considering the limited resources given to education in our country. Inevitably, this reevaluation will have to be aided by the NGOs and the private sectors and supplemented by the institution and proper implementation of educational policies and reforms.

Recommendations of the Study

Considering the premium given to English learning and teaching, there should be more action research done in the area of *errors*. These future studies must consider more accurate and more varied data elicitation techniques, increased number of data and more precise categorization of errors for more generalizability and refinement of the findings. It was observed that some errors can be diagnosed with two or more causes requiring not just the evaluation of the linguistic context but also the pragmatic context of the errors.

This study is synchronic focusing on the learners' language at a given time. A diachronic, longitudinal study can be considered to further illuminate on other important aspects of second language learning.

For now, let this study be the seed of more classroom research that will take up the challenge of venturing into the analysis of the different levels of errors.

Constructing a Reading Comprehension Test for General Education ESL Courses

Lalaine F. Yanilla Aquino

University of the Philippines

Who dares to teach must never cease to learn.

--John Cotton Dana

One of the things that make teaching general education (G.E.) English courses challenging is the difficulty of choosing appropriate materials for each class—the kind of materials that are **a little above** the students' current reading comprehension ability (to provide room for learning and to make reading more challenging) and likewise deal with topics which are within the students' interest and experience (to make learning more enjoyable and meaningful). Because the materials are also for a G.E. class, these should lend themselves to helping students develop not only their critical thinking abilities but also their reading and writing skills, so as to prepare them for more academic challenges, particularly in taking their major courses.

Choosing such reading materials becomes somewhat easier when an instructor knows the students' present level of reading ability. One way of determining this ability is to give the students a diagnostic reading comprehension test. Yet, such a test is not readily available. This is the reason why the present study has been done—to provide instructors of G.E. English classes with a validated diagnostic reading comprehension test which they can use to gauge their students' reading comprehension abilities.

Theoretical and applied research for the past few decades have recognized reading comprehension as a cognitive and *constructive* activity in which three factors—text, reader, task—act and interact during comprehension. Thus, it has to be emphasized that a diagnostic reading comprehension test is not the only measure that can gauge reading comprehension; it is just one of several. There are four major types of measures that can assess reading comprehension: **product** (recognition tasks, recall tasks), **process** (miscue analysis, cloze procedures, eye movement analysis), **metacognitive** (think-alouds, intruded text or scrambled text, error-detection), and **interview/observation**. The multiple-choice items constructed for this study are examples of product measure, specifically of recognition tasks. In recognition comprehension task, a reader must examine several answer choices and then select the one believed to be the best response. Such a recognition test requires memory, but a student need not generate a response.

Test Construction and Validation: Process and Challenges

Constructing and validating the test has been one long (and sometimes tedious) process consisting of the following stages:

1. Formulating objectives
2. Choosing the reading materials
3. Writing the test items
4. Encoding and editing the reading materials and test items
5. Field-testing
6. Doing the item analysis
7. Revising the test based on the item analysis
8. Field testing the revised test
9. Doing the item analysis of the revised test
10. Preparing the "final" copy of the diagnostic reading comprehension test

Formulating Objectives

The test construction process started with formulating objectives—answering *why* and *how* the study had to be done and *for whom*. Initially the main objective was to construct and validate a diagnostic reading comprehension test which instructors of G.E. English courses at the University of the

Philippines can use to gauge their students' reading abilities—this is the *why* part of the study. Since the results of the study are to be used in the context of the Revitalized General Education Program (RGEP) of the University of the Philippines (UP), the test has to be one that can be taken by **any** G.E. English student—regardless of year level. This answered the question *for whom* and partly answered the question *how*. Because there are no more prerequisites in the RGEP and because students can take their G.E. English courses even if they are already in their sophomore, junior, or even senior years, the field testing had to be given across the different year levels and not to be limited to the freshmen. Since the test was meant to help *any* G.E. English instructor—one who could be teaching English 1 (Basic College English), English 10 (College English), English 11 (Literature and Society), English 12 (World Literatures), English 30 (English for the Professions), or even Creative Writing 10 (Creative Writing for Beginners)—the test had to include both literary and expository texts and had to cover different levels of reading comprehension—literal, inferential, interpretative.

Choosing the Materials

The objectives that were formulated in the beginning of the study became the basis for choosing the reading materials to be used in constructing the test. Since the test is meant for students of different year levels who are taking any of the various G.E. English courses, the materials have to include both literary and expository texts and have to be of different levels of readability. This is to ensure that the test would be within the decoding ability range of both "good" readers and "poor" readers.

To determine the readability of the chosen texts, the Fry Readability Formula was used. This readability formula is computed based on the average number of syllables and the average number of sentences per 100 words. It has to be emphasized that the readability formula is useful in determining the appropriateness of a text for a particular grade or year level and the level of language sophistication it exemplifies in terms of word length and sentence length. The readability formula does **not** determine how complex the ideas are or whether or not the vocabulary is appropriate for the target readers.

In addition to the genre (literary or expository) and the readability considerations, the materials were also chosen based on variability of subject matter and familiarity of the topic. Variability of subject matter was considered because the students to be tested would come from different fields and would therefore have different academic backgrounds. To ensure that the test would not be biased against students from a particular field, the texts chosen cater to different areas: philosophy, linguistics, statistics, ecology, humanities, general interest, etc. Likewise, some of the passages provide more familiar contexts (i.e. Philippine) while others do not (e.g. stories by a Thai writer, an American writer). To further ensure that the passages were neither too long nor too short, they were limited to around 400 to 460 words per passage. An exception to this range is the poem, which only had 147 words.

After taking into consideration the characteristics of the passages given above, a final list of passages was prepared. A total of twelve passages were chosen—one taken from a Philippine short story, one taken from a novel by a Thai writer, one taken from a novel by an American writer, eight expository texts taken from different fields of study, and a complete lyric poem. The passages have different levels of readability but have more or less the same number of words. In the test, these passages were arranged according to their readability level, so that the students would start with the most readable text. These passages are described in Table 1.

Table 1

Characteristics of selections used for the diagnostic reading comprehension test

Passage	Genre	Readability	Number of Words
A (Philippine, story)	Literary, fiction	Grade 5	455
B (Thai, story)	Literary, fiction	Grade 6	451
C (American, story)	Literary, fiction	Grade 6	456

D (Philippine)	Expository, essay	Grade 7	432
E (Philippine)	Expository, essay	Grade 8	416
F (Philosophy)	Expository, essay	Grade 9	457
G (humanities)	Expository, essay	Grade 10	428
H (ecology)	Expository, essay	Grade 12	412
I (linguistics)	Expository, essay	College	408
J (general interest)	Expository, essay	College	436
K (statistics)	Expository, essay	College	455
L (lyric poetry)	Literary, poetry		147

Writing the Test Items

Before the test items were written, a list of skills and concepts to be tested was prepared. The list included literal comprehension, inferential comprehension, interpretative comprehension, vocabulary knowledge, and knowledge of writing as a craft. The twelve items (with the exception of one passage which had thirteen items) written for each passage tried to cover all these skills and concepts. A total of 145 multiple-choice items were written for the twelve passages. Each question was provided with five choices.

Encoding and Editing the Passages and the Test Items

After the test items were written, decisions had to be made as to the format and layout of the test. Arial Narrow 11 points was used for each passage while Palatino Linotype 9 points was used for the test items. Different fonts were used for the passage and the test items to help the reader visually distinguish the two parts of the test. Each passage was labeled with a capital letter. The passages and the test items were found in the same set of papers—with the passage printed before the continuously numbered test items. A separate answer sheet was also provided.

Field-Testing

Field-testing took one and a half weeks. The test was given in the middle of the first semester of school year 2007-2008 to the five classes handled by the researcher: two sections of English 1 (one of which was the "bridge" section) and one section each of English 12, English 197, and Comparative Literature 172. The test, which had 12 passages and 145 items, was rather long and the students could not finish it given the less than one and a half hours allotted for each class meeting. Thus, the students were told on the first day of the test that the test was only diagnostic and not graded and that the students are to try to answer as many items as they could. During the second day of the test (the next class meeting), the students were allowed to finish answering the test. A total of 127 students took the test. From these students, the scores of those who were not able to finish the test (because they were absent on the first or second day of the test) (n=5) and the scores of the exchange students (two Koreans, one Japanese) (n=3) were not included in the scores that were ranked for the item analysis, so as not to invalidate the results. Thus, only the scores of 119 students were ranked and considered for item analysis.

Item Analysis

Item analysis, simply put, is a kind of relatively simple statistical computation that is made of each test item to determine if it has an optimum level of difficulty and if it discriminates well enough between the "high" group and the "low" group.

The answers of the 127 students were checked, totaled, and encoded in Excel—this serves as the master list. The scores of those who did not finish the test and those of the foreign exchange students were removed from the data. The remaining total scores (n=119) were then ranked—this served as the highest to lowest list. From this list, the scores of the highest 27% (n=32) and the lowest 27% (n=32) were taken and their individual answers for each item encoded and considered for item analysis. Using Anastasi and Urbina's (1997) definition of **index of difficulty (p)** and **discrimination index (D),** the test was subjected to item analysis. Thus two indices were computed for each item—the index of difficulty (p) and the index of discrimination (D)—using the following formula.

$p = \dfrac{H + L}{N_H + N_L}$

$D = \dfrac{H - L}{N - (.5)N}$

where   H = the number of students from the HIGHEST group who correctly answered the item

L = the number of students from the LOWEST group who correctly answered the item

N = the combined number of students in the HIGHEST and the LOWEST groups

N_H = the total number of students in the HIGHEST group

N_L = the total number of students in the LOWEST group

The following table of values was used in distinguishing the good items from the bad items:

Table 2

Values for the index of difficulty and the discrimination index

Index of Difficulty		Discrimination Index	
.29 and below	very hard	.19 and below	poor
.30 to .45	hard	.20 to .29	marginal
.46 to .75	**optimum**	.30 to .39	reasonably good
.76 to .90	easy	**.40 and above**	**very good**
.91 and above	very easy		

Based on the values found in Table 2, an ideal item should have an **optimum** level of difficulty (neither too easy nor too difficult) and a **very good** discriminator between the highest scorers and lowest scorers; such an item will definitely be included in the revised test. The discrimination index is the crucial measure here. For instance, even if an item has an optimum level of difficulty but scores .19 or below in the discrimination index, such item has to be either rejected or considerably improved; it cannot be readily considered for inclusion in the revised test.

After subjecting each of the 145 test items to item analysis, the following results were obtained:

Table 3

Results of the item analysis of the original test

Index of Difficulty			Discrimination Index		
Description	Number of Items	Percentage	Description	Number of Items	Percentage
Optimum	69	47.6 %	Very good	21	14.5 %
Hard	27	18.6 %	Reasonably good	13	8.9 %
Very hard	29	20 %	Marginal	22	15.2 %
Easy	17	11.7 %	Poor	89	61.4 %
Very easy	3	2.1 %			

Table 3 shows that though there were many items (47.6%) that had optimum level of difficulty, only a few (14.5%) had very good index of discrimination. Only 56 items (total of very good, reasonably

good, and marginal) could be clearly included in the "final" test, with some revisions. The poor items needed major revisions for these to be considered for the "final" test.

Revising the Test

Some major decisions had to be made in revising the test. Aside from the information provided in Table 3 as to the level of difficulty and ability to discriminate of the 145 items, the average scores of the students were also considered in revising the test. The mean percentage for the 119 students was only 50%, meaning they had an average of only 72.5 correct answers out of the total 145 items. For the highest group (n=32), the mean percentage was 61%--only 11% higher than the total mean percentage; for the lowest group (n=32), the mean percentage was 41%. Considering the mean percentage scores of the highest and the lowest groups, it can be inferred that the original test was rather difficult. Thus, in the revision, the difficulty level had to be adjusted. One major revision that was done to do this was to reduce the number of choices from 5 to 4. This was easy enough to do—the distractor items that yielded the lowest score (none or very few of the students chose them as the answers) were deleted.

The other revisions made can be classified into the following:

- Deletion of items with **negative discrimination index**—such items discriminate against the high scorers, i.e. the "poor" readers tend to answer these items correctly while the "good" readers do not.

- Deletion of items that were **very hard** or **very easy**—such items also tend to have poor discrimination index because either very few (including the highest scorers) or most of the students (more than 90%) answer such items correctly.

- Rewording or rephrasing of ambiguous items—such items tend to have distractors with very high scores, i.e. students think that the wrong answers are the best answers.

Aside from the revisions done on individual items, the format of the test was also changed. While the original test had only one set of papers with the test items found right after the passage, the revised test consisted of two sets of papers—the passages, with each passage printed on one page, and the test items, with each set of ten items for each passage printed on one page. With this format, the students no longer wasted time turning the pages just to read parts of the passages again. Because the passages and the test items are found in two different sets of paper, there is no need to use different fonts. Times New Roman 12 points was used for both the passages and the test items.

Aside from the change in format, another major revision is the reduction of the number of passages to ten (from twelve) and number of items per passage to ten (from twelve). Instead of the original twelve passages, only ten passages where included in the revised test. Two passages—the one on linguistics and the poem—were discarded because the students really found these very difficult. The passage on linguistics yielded only two items with good discrimination index while the poem yielded only one.

Field-Testing the Revised Test

As indicated earlier, the revised test item consisted of ten passages with ten items for each passage. Thus, the 145 items were reduced to only 100 in the revised test. This revised test was again field-tested and given in the beginning of the second semester of academic year 2007-2008 to the researcher's five classes: English 11, English 12, English 30, English 120, and English 191. Field-testing was done for a week. Because the test was much shorter than the original, it took the students only one class meeting to finish it. A total of 117 students took the revised test.

Doing the Item Analysis of the Revised Test

Though a total of 117 students took the revised test, only 106 of these were considered for item analysis. Like in the first item analysis, the scores of the foreign exchange students and those who did not finish answering the test were discarded. Moreover, the scores of the graduate students (n=2) who were enrolled in English 120 (Stylistics) were also not included. All these steps were taken so as not to invalidate the test. The answers of the 106 students were checked, scored, and ranked. The answers of the highest 27% (n=28) and the lowest 27% (n=28) were analyzed using the same formula in the first item analysis. Each of the 100 items in the revised test was analyzed to determine its index of difficulty and discrimination index.

Table 4 shows the results of the item analysis. Comparing these with the results of the item analysis of the original test as shown in Table 3, it can be inferred that the revised test is better than the original test. The revised test has yielded 31% of combined very good and reasonably good items compared to only 23% of the same in the original test. Likewise, the revised test has only 45% of poor items compared to the 61% of poor items in the original test. Another indication is the performance of the students. The mean percentage score for the 106 students who took the revised test was 55% compared to 50% in the original test. The mean percentage score for the highest group was 65% while for that of the lowest group was 45%. This result is also higher than the original in which the highest group had a mean percentage score of 60% while the lowest group had 41%.

Table 4

Results of the item analysis of the revised test

Index of Difficulty				Discrimination Index		
Description	**Number of Items**	**Percentage**		**Description**	**Number of Items**	**Percentage**
Optimum	53	53 %		Very good	13	13 %
Hard	19	19 %		Reasonably good	18	18 %
Very hard	4	4 %		Marginal	24	24 %
Easy	9	9 %		Poor	45	45 %
Very easy	15	15 %				

Preparing the "Final" Copy of the Test

When this research was presented in a national conference in April 2008, one of the feedbacks obtained was that it was too "culture-based" because it was tested only on the students of UP and UP has a "culture" all its own. It was suggested that it be field tested and given also to students of other universities, so that the validated test can also be used by these universities. This suggestion was taken into consideration and the 100-item test was given to three other private universities in the National Capital Region (NCR). True enough, that UP has a culture all its own, was shown by the results of the item analysis. It can be inferred from the comparison of the two sets of data that the UP students was a more homogenous group and giving the test to three other universities has made the group more heterogeneous. Table 5 shows the comparison of the results based on the UP-only data and the UP-plus-three-universities data.

Table 5

	UP only Mean=55%	UP & 3 Universities Mean=48%
Difficulty Index		
Optimum	53%	56%
Hard	19%	28%
Easy	9%	4%

Very Hard	4%	12%
Very Easy	15%	0%
Discrimination Index		
Very Good	13%	25%
Reasonably Good	18%	12%
Marginal	24%	31%
Poor	45%	32%

Giving the 100-item revised reading comprehension test to three other universities yielded more optimum and very good items. The test was once again revised based on these results. The same things were done in revising the test: deletion of items with negative discrimination index, deletion of very hard or very easy items, rewording or rephrasing of ambiguous items, etc.

After the revision, the present form of the reading comprehension test consists of 10 varied passages and 68 test items. This is now being used in gauging the reading comprehension level of the students at the beginning of the semester.

Lessons Learned, Insights Gained

Constructing and validating the diagnostic reading comprehension test for G.E. ESL courses afforded the researcher the opportunity to learn some lessons, to gain some insights. Some of these lessons and insights concern the nature of reading comprehension, the factors that affect it, and the things that distinguish the "good" readers from the "poor" readers. These lessons and insights are not definite, neither are they conclusive. They are simply things that can be inferred from the results of the three item analyses—that of the original test, the revised test based on UP-only data, and the revised test based on UP-and-other-universities data.

Reading is a skill. Reading is an ability that can be developed and like other forms of knowledge, the more an individual practices it, the more that this skill is enhanced. The nature of reading as skill (something that is well established in many theoretical and empirical studies) can be inferred from the comparison of the mean percentage scores of the upperclassmen (55%; n=48) and the freshmen (48%; n=71) in the original test. The assumption, of course, was that compared to the freshmen, the upperclassmen (sophomores, juniors, seniors) have already done more reading, particularly of the academic kind, and this partly explains their higher percentage score. Moreover, if one were to look into the details of the high scorers (the highest 27%), most of them were language and literature majors and a few were World Literatures students—presumably, individuals who have done a lot of reading either because they are required to do so or they like doing so (based on experience, students who usually enroll in World Literatures are those who like to read a lot). Another interesting finding was that between the two English 1 sections, the regular class (mean=49%) did better than the "bridge" class (mean=43%); this somehow confirms the results of the UP College Admission Test (UPCAT) because the "bridge" class consists of students who got the lowest scores in the English language proficiency and reading comprehension tests.

Vocabulary knowledge and awareness of the craft of writing are two indicators of good readers. Most of the items that have **optimum** level of difficulty and are **very good** in discriminating between good

and poor readers have to do with vocabulary knowledge (e.g. what the words *teetered* and *telepathy* suggest; what the word *neologism* refers to) and knowledge of the craft of writing (e.g. How does the writer develop the main idea of the first paragraph?, What does the use of repetition in paragraph 1 achieve?) From the result of the item analysis, one can infer that good readers tend to have a wider knowledge of vocabulary, so that they are able to tell the nuances of word choice and the emotive meanings that some words suggest. Moreover, good readers are able to infer the purpose of the writer in rendering certain parts of a passage in a particular way, readily identify the main idea of a passage, and identify the usefulness of certain writing techniques.

Language register affects reading comprehension. Generally, the students did better in the expository texts (mean=54.88%) than they did in the literary texts (mean=41.25%). For instance, they found poetry (mean= 41.2%) particularly hard. Ironically, their worst score was in Passage A (mean=38.7%), which was taken from a Philippine short story and had a readability level of grade 5. These results show that readability level does <u>not</u> indicate comprehensibility level. Likewise, it can be inferred that the language register also affects comprehension because though the words and sentences in the literary pieces are shorter than those in the expository texts, students generally found the former more difficult to understand (perhaps because they are not quite familiar with the techniques of the narrative). Moreover, among the expository texts with formal register Passage I (linguistics) proved to me most difficult for the students presumably because of its high level of abstraction and use of too much jargon (e.g. *interorganismic, prokaryotes, eukaryotes, biosemioses*).

Implications for Teaching General Education ESL Courses

The results of the item analysis of the original test and the revised tests have some implications for the teaching of G.E. ESL courses. One is that for the reading and writing classes like English 1(Basic College English) and English 10 (College English), it would be better to start the semester with "easier" expository texts that are not simply readable but also have "less intimidating" language register. This can help the students gradually understand and appreciate the academic register and become more aware of writing as a craft.

Another implication is that teachers cannot assume that students already know "the basics" whether it be in a reading and writing class like English 1 and English 10 or in a literature class like English 11 (Literature and Society) and English 12 (World Literatures). Some opportunities to learn the basic things (e.g. identifying the topic sentence in a paragraph, the difference between a simile and a metaphor) have to be given to the students to help them acquire the concepts and skills necessary for understanding the more difficult lessons.

Because some of the items that most of the students found very difficult had to do with vocabulary knowledge and the knowledge of the craft of writing, it would also be good for teachers of G.E. ESL courses to provide students with opportunities to expand their vocabulary, to discover the nuances of diction, to explore how the same words are used in different contexts, to infer the purpose of writers for rendering passages in particular ways, to identify linguistic markers that indicate relationships between and among ideas in a text, etc.

Despite its difficulty, constructing and validating the diagnostic reading comprehension test has been an interesting, exciting, and meaningful experience. As the "final" version of the test is given to students, more insights are gained as to the nature of reading and the process of learning. Definitely, more challenges are yet to come, more lessons are yet to be learned, more insights are yet to be gained as this reading comprehension test is used to gauge students' reading comprehension abilities every semester.

The Feelings of EFL Students Towards Novel Analysis Courses in the English Language Teaching Department

Mr. Murat Ismail Golgeli

Anadolu University

Turkey

Abstract

This study attempts to investigate the feelings of EFL students towards novel analysis courses and whether the teaching techniques used during the novel analysis class have an effect on their feelings. A total number of 168 students, who were 3rd and 4th year ELT students at Anadolu University, participated in the present study. The data for the study were collected through two different instruments: a literature feeling survey and semi-structured interview sessions. The views of the students towards novel analysis courses were analyzed and the statistical analysis of the data revealed that the majority of the students employ positive views towards novel analysis courses. As for the teaching techniques, the data showed that the students prefer instructor-based classes rather than their own presentations during the class. In addition, the relationship between the students' grades from the novel analysis course and their scores from the survey were investigate

 d. The results of this analysis indicated that the students with higher grades also had higher scores from the survey, which supports the finding that the students generally have positive feelings towards the novel analysis course and the instructor-based teaching technique. Also, the semi-structure interview results corroborate the finding from the quantitative data analysis as most of the interviewed participants reported positive feelings towards the novel analysis courses and the instructor-based teaching technique. The findings of this study may yield to further insights for implementing novel analysis teaching techniques in the curriculum of educational institutions where literature and language education are combined. Furthermore, the outcomes of this study may yield to further insights for reviewing the curriculum of the literature classes in EFL context.

Cohesive Devices Used in Writing by Iranian Undergraduate EFL Students

Sara Nowrouzi

Universiti Sains Malaysia

saranoroozi@gmail.com

This study was on the type, frequency, and accuracy of cohesive devices used by Iranian undergraduate EFL students in their expository writing. The results showed that references were used most frequently followed by lexical cohesion, and conjunctions, while the least frequently used ones were ellipsis and substitution. It was also found that references were sometimes overused without any referent or misused. Conjunctions and lexical devices were used properly and effectively in conveying the meaning.

Key Terms: cohesive devices, rhetorical problems, expository writing

1. Introduction

Writing is a socio-cognitive, problem-solving process affected by cultural and rhetorical norms that should be considered by EFL (English as a Foreign Language) learners in their writing process (Johnson & Johnson, 1999). Rhetorical norms refer to the rules of expressing oneself correctly and effectively in writing or speaking (Richards, Platt, & Platt, 1992). According to Atkinson (2003), EFL students' writing in a language classroom context is a way to determine their ability to solve a rhetoric problem and their awareness of their own communicative goals, of the reader, and of the writing context.

However, in spite of numerous approaches to the teaching of writing (communicative language teaching (CLT), process-based approach, product-based approach, genre-based approach, etc....) having evolved from different teaching methods, tackling EFL writing is still one of the challenging areas for teachers and students (Shokrpour & Falahzadeh, 2007).

Iranian EFL students have problems in writing clearly because of lack of attention to writing skill in high schools (Ostovar, 1997). At universities, students have only two writing courses under the titles of "Paragraph Writing" and "Essay Writing" that are not enough to prepare students to write well in English (Curriculum Planning Council, 1996). An investigation done by Jafarpour (1994) indicated that most compositions written by Iranian EFL students majoring in English lack unity and coherence. This deficiency seemed to arise from students' restricted knowledge and the right application of cohesive devices in their writings.

Moreover, in a report on the 3rd Biennial Conference of the European Association for the Teaching of Academic Writing (EATAW) by Futasz and Timar (2006), one of the problems in EFL writing is the cross-national and cross-cultural issues regarding non-English rhetorical forms that should be identified by the teachers and used in designing courses for their own students.

The objectives in this study were to identify the type, frequency, and accuracy of cohesive devices, as classified by Halliday and Hasan (1976), used by Iranian undergraduate students who have passed the two writing courses and are supposed to use cohesive devices effectively in their writing.

If cohesive devices are used appropriately by the writer, the readers can understand a piece of witing better and faster because of the flowing succession of words, structures, and ideas which connect together in a meaningful unit of expository or argumentative piece of writing (Halliday & Hassan, 1976). According to them, a text without cohesive devices is ill-formed and difficult for the reader to interpret appropriately. This descriptive research will shed light on the weaknesses or strengths of Iranian undergraduate EFL students in using cohesive devices. In general, examining the features of EFL writing tasks and the students' problems in performing the task would certainly be pedagogically beneficial.

1.1 The Theoretical Framework

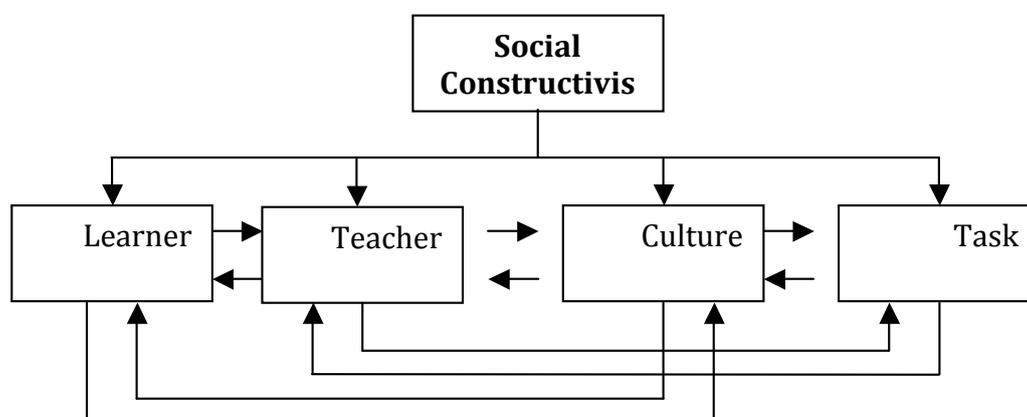
According to what Futasz and Timar (2006) report about the cross-national and cross-cultural problems because of non-English rhetorical forms that has to be identified and taught by the EFL teachers, this study is based on the theory of social constructivism (Figure 1) in which the learner interacts with the teacher, the task, and the culture (Vygotsky, 1978). Therefore, cohesive devices used in writing (task) are different in different languages (culture) and should be presented by the teacher in EFL classes.


Figure 1: The Theoretical Framework

1.2 Research Questions

On the basis of the objectives stated above, there are three research questions in this study:

1. What type of cohesive devices do Iranian undergraduate EFL students use in their expository writing?
2. How frequently do they use them?
3. How accurately do they use them?

2. The Writing Process

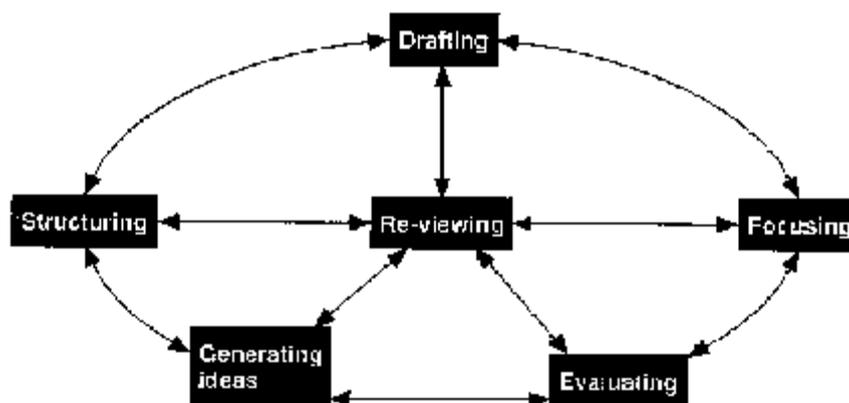
Since 1960s, there has been a paradigm shift from writing as a product to writing as a process and from concern with questions such as " what have you written?" or " what grade is it worth?" to how will you write it?" and "how can it be improved?" In line with this change of emphasis, many process approaches to writing have been presented such as the framework (figure 2) developed by White and Arndt (1991) who consider writing as a recursive (not linear) process.


Figure 2: White and Arndt's (1991) diagram of process writing (adopted from Johnson & Johnson, 1999).

According to this framework, brainstorming helps writers activate their long term memory and start writing about the topic; focusing is related to determining the purpose of writing; structuring deals with organizing the text to make it cohesively and rhetorically acceptable to the reader; drafting involves revising on the basis of feedback received on content and organization from others; reviewing is referring back to the text to find out any problems in content, language, and organization; and evaluating is concerned with developing checklists for possible reformulations (Johnson & Johnson, 1999)

3. Cohesion

Cohesion is part of language system and a way of organizing text on its surface. It is 'a semantic relation between an element in the text and some other element that is crucial to the interpretation of it' (Halliday & Hasan, 1976). One element 'presupposes' the other and points back or forward to it. Cohesion exists within a phrase, clause, sentence, and also between sentences. Halliday and Hasan in their book "*Cohesion in English*" (1976) identify five types of cohesion: reference, substitution, ellipsis, conjunction, and lexical cohesion. All these types will be explained below:

3.1 Reference

Reference is a semantic relation which, according to Halliday and Hassan (1976: 31), embodies an instruction for the reader or addressee to retrieve information from elsewhere. Such information is the referential meaning i.e. the identity of the particular thing or object that is being referred to. Halliday and Hassan (1976) generally classify references into Exophoric (situational) and Endophoric (textual). Exophoric reference refers to a situation where the meaning is not shown in the text itself but obvious to those in a particular situation. In the following example, only the people involved in the situation know who "he" is:

> For he's a jolly good fellow and so say all of us.

Endophoric reference is either anaphoric (referring to the preceding text) or cataphoric (referring to the following text). The following examples show this distinction:

1. My parents are going to visit me. They will arrive next Friday.
2. Just as he was about to enter the room, Jones was stopped by a noise on the other side of the door.

In the first example, "they" is an anaphoric reference to "my parents" and in the second one, "he" refers cataphorically to "Jones".

More specifically, Halliday and Hasan (1976) categorize reference into three types: personals, demonstratives, and comparatives. A brief illustration of each type is given below.

3.1.1 Personal Reference

Personal reference, unlike what the term might suggest, includes reference to persons as well as objects. In simple terms, personal reference consists of three classes: personal pronouns, possessive determiners, and possessive pronouns. It enters into the structure of language in one of two forms: 'participant in some process' or 'possessor of some entity'. The former falls into the class "noun", subclass "pronoun", and functions as "head" in the noun phrase. If the noun phrase is subject, the 'participant' has one form (I, you, we, he, she, it, they, one) and it has another form if it is anything other than subject (me, you, us, him, her, it, them, one). The latter falls into the class "determiner" and functions either as "head" (mine, yours, ours, his, hers, its, theirs) or as "modifier" (my, your, our, his, her, its, their, one's).

Consider the following example based on similar five examples given by Halliday and Hasan (1976: 45-46):

I do not know what happened to him. He is always mistaking my things for his.

> I: participant, subject pronoun, head
>
> him: participant, non-subject pronoun, head
>
> my: possessor, determiner, modifier
>
> his: possessor, determiner, head

3.1.2 Demonstrative Reference

Demonstrative reference is a form of verbal pointing which involves identifying the referent by locating it on a scale of proximity. Halliday and Hasan (1976) classify demonstratives into Neutral (the) and Selective.

3.1.3 Comparative Reference

According to Halliday and Hasan (1976), comparison is a form of reference because simply a 'thing cannot just be "like"; it must be "like something".' It contributes to textual cohesion by setting up a relation of likeness or contrast between two items or elements and is expressed by adjectives like same, identical, equal, adjectives in the comparative degree, and adverbs like identically, likewise, so, such, etc. For example:

> Most workers here wear the same clothes everyday.

Here the same means 'the same as every other day', though with the possible ambiguity of 'the same as each other'.

3.2 Substitution

Substitution is somewhat different from reference in that another word takes the place of the thing that is being discussed. Where reference is a relation between meanings, substitution is a grammatical relationship. There are three general way to substitute in a sentence: nominal, verbal, and clausal. The pronoun *one* is often used in nominal references, as it is in the following example:

> My computer is out-of-date. I need to buy a new one.

3.3 Ellipsis

Ellipsis means leaving something unsaid but it is still understood. The following examples are adapted from Halliday and Hassan (1976: 143) for illustration:

1. Here are thirteen cards. Take any. Now give me any three.
2. Joan brought some carnations and Catherine some sweet peas.

In the first example, the omitted items are card after any in second clause and cards after any three in third one. And in the second one, there is only one possible interpretation: Catherine *brought* some sweet peas.

3.4 Conjunction

Conjunction, functions somewhat differently than the other three because it is not strictly semantic or anaphoric, rather, it is related to the entire environment of a text. The conjunctive elements "presuppose the presence of other components in the discourse" (Halliday and Hassan, 1976: 226). Instead of giving cohesion to a text, it actually coheres two sentences together. In the following example, although there is a distinct shift from one sentence to the next, the sentences are still very much a part of a coherent text:

1. It rained, but I went for a walk anyway.
2. 'While you're refreshing yourself,' said the Queen, 'I'll just take the measurements.' And she took a ribbon out of her pocket, marked in inches.

3.5 Lexical Cohesion

Lexical cohesion is the result of semantic relationships between words. Halliday and Hasan (1976) classify lexical cohesion into two types: reiteration and collocation. Reiteration can be done through the repetition of a lexical item, the use of a synonym, or the use of a superordinate word:

1. Mary bit into the peach. The peach wasn't ripe. (Repetition with the identity of reference)
2. Mary ate some peaches. She likes peaches very much. (Repetition without the identity of reference)
3. There is a boy climbing that tree. The lad is going to fall if he doesn't take care. (synonym)
4. Mary ate a peach. She likes fruits. (Superordinate heading)

Collocation refers to the 'association of lexical items that regularly co-occur" (Halliday & Hasan, 1976). They claim that there is cohesion between any pair of lexical items that stand to each other in some recognizable lexico-semantic relation. Therefore, in addition to synonyms and superordinates mentioned above, this kind of cohesion includes the following categories:

1. Antonyms: like ……… hate, wet …….. dry
2. Complementaries (ungradable antonyms): boy ……. girl, stand up …… sit down
3. Converses: order …….. obey
4. Words related to the same ordered series: Tuesday …… Thursday, dollar ….. cent, and colonel ……. Soldier
5. Words related to unordered lexical sets: road ….. rail, student ….. book

4. Cohesion and Expository Writing

Expository writing involves explanation and discussion of ideas, theses, or hypotheses and is very important in communicating facts, or evidence in formal education, in job related contexts, and to further an argument (Just, Carpenter, & Wooley, 1987). This type of writing involves using structures and cues to insure a smooth processing of the text so that the knowledge and application of cohesive devices is necessary for this purpose.

According to Alonso and McCabe (2003), cohesion has traditionally been neglected in language teaching and only from the mid 1970s onwards, in particular with the publication of Halliday and Hasan's *Cohesion in English* (1976), did it become progressively assumed in L2 writing teaching that a coherent text is more that a series of grammatical sentences lined up one after another. They further state that all general ESL course books and most reading and writing courses incorporate work designed to help learners grasp the cohesive devices of written English: discourse connectors, ellipsis, conjunctions, and so forth. However, L2 writing instructors still come across ESL student compositions in which sentences, assessed in isolation, are grammatically correct and yet the overall effect is one of incoherence.

Meisuo (2000) investigated the use of cohesive features in the expository compositions of Chinese undergraduates and found that students employed in their writing a variety of cohesive devices with some categories more frequently than others. Lexical devices were the most frequently used, followed by conjunctions and reference devices. In terms of tie distances, the majority of the cohesive ties were either immediate or remote. There was no statistically significant relationship between the number of cohesive ties used and the quality of writing. Certain cohesive features were identified in the expository writing of Chinese undergraduates which included ambiguity in reference, overuse and misuse of conjunctions, and restricted use of lexical cohesion.

5. Method

5.1 Data Collection Procedure

About 10 writing samples of the students were analyzed to identify the type and frequency of using each cohesive device in their writing. The topic was "Reasons to Attend College" and the students were required to write at most 500 words about it. The writing task was done in class during 90 minutes and the students were free to use dictionaries and ask the teacher any questions about the instructions.

5.2 Design of the Study

Since there was no treatment done by the researcher, the design of the study is an ex-post facto one and the writings of the learners after the end of the two writing courses were analyzed.

5.3 Data Analysis Procedure

Based on what is defined as descriptive statistics by Babbie (2007), the data was analyzed descriptively in order to show a summary of the Iranian EFL university students' writing sample characteristics First of all, a coding scheme (as shown in table 3.1) was used for labeling each device. Then, the writings were carefully examined by two raters, the researcher and an experienced EFL lecturer, for identifying the cohesive devices used by the learners. The raters agreed on about 200 codes and the disagreements in labeling were solved through discussion. And finally, the descriptive statistics as employed by Sim (1994), was used to show the results through tabular representation of the percentages of each cohesive device used by the students.

Table 3.1: The Coding Scheme Used for Analyzing the Use of Cohesive Devices

No.	Cohesive Device	Code
1	References	REF

2	Ellipsis	EL
3	Substitution	SUB
4	Conjunction	CON
5	Lexical Cohesion	LEX

6. Results and Discussion

After careful examination of the writing samples, the results were summarized in table 4.1 as follows:

Table 4.1: Students' Use of Cohesive Devices

Cohesive Devices	S1	S2	S3	S4	S5	S6	S7	S8	S9	S10	Total	**Percentage**
References	7	8	13	7	1	5	7	10	8	11	77	**33.5%**
Ellipsis	1	-	-	1	-	-	-	2	1	-	5	**2.5%**
Substitution	-	2	1	3	-	1	2	-	2	1	12	**5.5%**
Conjunction	6	7	4	7	7	8	6	5	6	8	64	**28.5%**
Lexical Cohesion	6	7	4	9	5	8	5	8	9	6	67	**30%**
Total	20	24	22	27	13	22	20	25	26	26	225	**100**

As shown above, the most frequently used cohesive devices by Iranian university EFL learners are references (**33.5%**) followed by lexical cohesion (**30%**), and conjunctions (**28.5%**), while the least frequently used ones are ellipsis (**2.5%**) and substitution (**5.5%**). It should be also noted that most of the references were of personal or demonstrative types and no comparative reference was used. The frequent use references and conjunctions can be attributed to their background in pre-requisite grammar courses in which compound and complex sentences are presented and practiced. However, the accuracy of their use is important too and will be discussed later. As to the frequency of the lexical cohesion devices, mostly the same words or phrases were repeated without using synonyms or superordinates.

With regard to the accuracy of cohesive device use, some students' writing samples in italics and without any change (not corrected by the researcher in form) are provided below. For example, the references are sometimes overused (without any referent):

> *"In our today world, more educated and more understanding persons are the main powers. A perfect, hardworking university graduated student is more knowledgeable than most of the ordinary people who have not passed **those** courses. So such a person with more intellectual ability and new practical information can occupy the job opportunities."*

> *"Many people go to college because they love knowledge."*

Sometimes the references were misused (used incorrectly):

> "My friend's father wants her to be a doctor but **he** has a different idea."

Conjunctions were mostly used properly and effectively in conveying the meaning but were mainly limited to "but", "so", and "and":

> *"You may be like or hate to study **but** for improving, you have no choice."*

> *"Education is very important in Iran. **So** many people go to college."*

> *"Military service is very difficult. **And** it is very dangerous too."*

Lexical devices were mostly limited to the "repetition" device and the most noticeable example was the repletion of the word "college" throughout the essay by most students. More examples are given below:

> *"Some people come to **university** for prestige but some others continue their education to **university level** for finding a good job."*

> *"Many **girls** go to college for finding a good husband because people nowadays prefer educated **girls**."*

As a corollary to the predominance of "repetition", substitution and ellipsis were rarely used:

> *"People go to college for different reasons: First, **some** want to find a good job."*

> *"Many boys and girls go to college because their parents want them **to**."*

In sum, the frequent but incomplete use of references and conjunctions as well as the limited use of ellipsis and substitution can be attributed to the students' insufficient background knowledge in grammar, and the frequent use of only repetition as a lexical device reveals these learners limited vocabulary repertoire. This study revealed that if the students were sufficiently knowledgeable in the proper use of ellipsis and substitution, they could use these devices in compensating (to some extent) for their restricted vocabulary knowledge.

7. Conclusion

Due to the importance of cohesive devices in reasonable flow of ideas in expository writing and based on the results of this study, a number of suggestions are made regarding teachers, learners, textbooks, academic syllabus, and further research: Teachers should emphasize more on the rules and limitations in using the references in English and encourage the learners to use ellipsis and substitution in their writings where necessary; learners should read more expository writing samples written by native speakers to get more familiar with the correct use of cohesive devices; the textbooks chosen as student resources for expository writing should include a detailed presentation of cohesive devices with enough examples for the learners; more time should be dedicated to practice in writing skill at universities or more writing courses should be added to the present ones to provide learners with more practice opportunities and teacher feedback in applying all the necessary cohesive devices; more writing courses should be added to the present ones to provide learners with more practice opportunities and teacher feedback in applying all the necessary cohesive devices; and more research, specially experimental, can be done to investigate the ways of improving the use of cohesive devices in writing.

Design and Development of Constructivist Web-Based Learning Environment Model to Enhance Creative Thinking for Higher Education Students

Charuni Samat[1] and Sumalee Chaijaroen[2]

Educational Technology Faculty of Education Khon Kaen University Thailand

Abstract

The purpose of this research was to design and develop the constructivist web-based learning environment model to enhance creative thinking for higher education students. Research methodology is developmental research in phase I: statistic methods are document analysis, survey and case study. The procedures were as following: 1) to examine the principles and theories. 2) to explore the context concerning creative thinking. 3) to synthesize designing framework of the constructivist web-based learning environment model to enhance creative thinking. 4) to design and develop the constructivist web-based learning environment model to enhance creative thinking according to above mentioned designing framework, and 5) to evaluate the efficiency of the constructivist web-based learning environment model to enhance creative thinking.

The result revealed that:

1) The constructivist web-based learning environment model to enhance creative thinking for higher education students comprise of 8 components as following: 1) Problem base 2) Resource 3) Related case 4) Mind tool 5) Creative thinking lab   6) Collaboration 7) Scaffolding , and 8) Coaching

2) The efficiency of the constructivist web-based learning environment model to enhance creative thinking illustration as following: 1) The Experts review 2) The learners' opinions 3) The learners' creative thinking: fluency, flexibility, originality and elaboration, and 4) learning achievement

Key words**: Design and develop learning environment model, Constructivism, Creative thinking**

INTRODUCTION

In recent time, the society entering to Knowledge-based society with higher educational and knowledge level. Moreover, people with thinking skills were needed in applying knowledge for usefulness. The guideline of National Educational Management based on National Educational Act stated that the students had to construct their own body of knowledge by themselves which was learning process for developing different experience and things to be meaningful for themselves by interacting with environment from the application in thinking process and searching for knowledge and practice. The students could be able to discover knowledge and experience by themselves. The teachers acted as facilitators. They should provide environmental climate and instructional resources facilitating motivation for learning (The Office of National Educational Commission, 2002). It was supported by learning management based on Constructivist theories including the assumption that learning was a process occurring inside the students. The learners constructed their own body of knowledge from relationship between the founded things and prior knowledge by trying to understand with the founded incidents and phenomenon and constructing them as Cognitive structure or schema. Besides, the Constructivist also believed that learning was construction rather than perception. The instructional goal would support construction rather than trying to transfer knowledge. Therefore, the

Constructivist would focus on each person's construction of new knowledge appropriately (Sumalee Chaijaroen, 2008).

According to the studies of creativity in higher education level, found that there were various weak points. Specifically, the instructional problems in which the students' studying techniques. The students had to get knowledge from their instructors and follow the others rather than think by themselves in creating performance or body of knowledge for creating new things for society which wasn't very clear (Sumalee Chaijaroen et.al., 2003). Moreover, according to the quality assessment of higher education institutes, found that the percentage of students working in one year showed the quality standard of academic creativity performance in lower level than good level   (The Office of Accreditation and Educational Quality Assessment, 2007). Furthermore, it was also found that the educators graduating in higher education showed their creativity in work practice lower than 50 percentile for 65% (Noi and Prayuth Thaithani, 2008). Most of students owned lower level of capability in creative thinking process (Premier's Office, 2003). It showed that for the instructional management in higher education, it wasn't succeed enough as it should be. It was also necessary to find the instructional management technique for enhancing creative thinking (The Office of National Educational Commission, 2003).

Specifically, for the studying in analytic courses and system design from scope and content of the course focused on rational in designing relational data base in different models. Besides, the design of data base should be relevant to authentic context situation and serve to those who used it. So, it was necessary to encourage the students to be able to gain creative thinking which would cause the design of new data base. The design of data base had to be based on Fluency in selecting symbols and associating relationship in designing data base meaningfully during the limited time. Moreover, the students could have Flexibility in discriminating and grouping for organizing data base as Normalization. It would cause Originality in designing data base for new styles. Furthermore, they had to gain Elaboration in selecting, improving, and adjusting former data base for developing new data base in different contexts appropriately. They should also be encouraged their characteristics to be relevant to desirable characteristics of the Bachelors in Computer Education focusing on the students with creativity. They should be able to create the cause, effect, imagination. They should know how to solve problems with steps and should be able to create innovation (The Manual of Bachelor in Computer Education, 2004).

According to the rational of National educational Act in 1999, it focused on students' practice and ability to learn in every place and time. It was supported by Web-based learning which was an innovation with characteristics of constructing knowledge and enhancing creative thinking. It could be seen that Web-based learning had characteristic of Media attribution and Media symbol system as being Hypermedia which could present both animation, graphic, letter, sound. Specifically, if the illustration was relevant to the students' studied content and constructed imagination, it would cause Originality for designing and applying for new things as well as Hypertext which was a model of a technique to access data associating Node of knowledge from various places existing unlimited together. It was foundation of knowledge for supporting the students to construct knowledge efficiently and expanding their thinking style, and Elaboration. Moreover, their Flexibility would occur by organizing pre-concept and ordering or grouping the information technology or content as well as media attribution facilitating the collaboration process for solving problems, sharing viewpoints which would enhance in expanding knowledge structure and creativity. Furthermore, the students could also construct knowledge by themselves from the practice through their own thinking process, and ability in searching for various answers for solving problems during studying with clear objective (Salomon, 1977; Hannanfin, 1999; Jonassen & Henning, 1999; Jordan, 2003; Sumalee Chaijaroen, 2003; 2008).

According to the above reasons, the researchers were aware of the importance and necessity in studying the creative thinking of students studying through Constructivist Web-based Learning Environment Model to enhance creative thinking for higher education students by using instructional management paradigm as student centered. It was the environmental management for students' creativity development with Media attribution and Media symbol system to serve the need in constructing the students' knowledge and enhancing their creative thinking by focusing on the students' learning the course content simultaneously with creative thinking development and technology use. Therefore, this research would focus on the study of creative thinking of students studying from Constructivist Web-Based Learning Environment Model to enhance creative thinking

for higher education students so that the research findings would be major foundation in developing the Learning Environment Model to enhance creative thinking in the future.

OBJECTIVE

To design and develop the constructivist web-based learning environment model to enhance creative thinking for higher education students.

RESEARCH METHODOLOGY

The research and development was employed in this study. Research methodology is developmental research Type II (Richey, RC and Klein JD, 2007) including 3 phase, these are; phase 1: model development, phase 2: model validation, and phase 3: model use. This report is in phase I: statistic methods are document analysis, survey and case study. The procedures were as following: 1) to examine the principles and theories. 2) to explore the context concerning creative thinking. 3) to synthesize designing framework of the constructivist web-based learning environment model to enhance creative thinking. 4) to design and develop the constructivist web-based learning environment model to enhance creative thinking according to above mentioned designing framework, and 5) to evaluate the efficiency of the constructivist web-based learning environment model to enhance creative thinking.

Target group

1) Fifteen expert review for assessment the validation of model as follows: content, instructional technology design, web-based learning design and Evaluation.

2) Twenty of Second Year Bachelor's degree students in Computer education major, the faculty of Education, Khonkaen University.

Research Instrument

1) The instrument for experiment included the constructivist web-based learning environment model to enhance creative thinking for higher education students with design and development process as follows: (1) to examine the principles and theories, (2) to explore the context concerning creative thinking, (3) to synthesize designing framework of the constructivist web-based learning environment model to enhance creative thinking, (4) to design and develop the constructivist web-based learning environment model to enhance creative thinking according to above mentioned designing framework, and (5) to evaluate the efficiency of the constructivist web-based learning environment model to enhance creative thinking.

2) The instrument for collecting Data including: (1) The Record Form of Documentary Investigation and Analysis for constructing theoretical framework,   (2) The Analysis Record Form for constructing the design framework, (3) The Evaluation Form of Learning Environmental Model for the experts, (4) The Creative Thinking Form, (5) The Learning Achievement Test, and 6) The Students' Opinion Survey of Learning Environmental Model.

Data Collection

1) Document analysis and Literature review

According to studying and analysis principles, theories, and related literature with design and development of constructivist web-based learning environment model to enhance creative thinking for higher education students including Psychological base, Pedagogies base, Technologies base, Contextual

base, Media base, and important variables that enhance the learners to encourage creative thinking base for basic of research.

2) Contextual study of learners

According to studying student's creative thinking, found that from The Creative Thinking Test was used for studying the students' creative thinking based on Guilford's (1967) approach: (1) Fluency, (2) Flexibility, (3) Originality, and (4) Elaboration. Next step was to design and development model from the results of contextual study.

3) Synthesis of designing framework

According to studying synthesis of the designing framework based on theoretical framework including results from principles, theories, and related literature and contextual study of students' creative thinking. Researcher would offer to the advisors and expert review for comment then edited based on feedback.

4) Develop the learning environment model

Development the constructivist web-based learning environment model to enhance creative thinking for higher education students based on foundation of creating designing framework was adopted.

5) Evaluate validation of the learning environment model with experts

According to studying evaluates the output for checking the quality of the model as following details: (1) To evaluate validation of the content It was to examine the accuracy of the content of necessary on the industrial with tools; open-end question assessments of content then it was evaluated by 3 experts in content. After finishing evaluation, researcher edited the content based on feedback, (2) To evaluate the constructivist web-based learning environment model to enhance creative thinking for higher education students. It was evaluated with open-end question assessments of design by 5 experts in instructional technology design then edited based on feedback, and (3) To evaluate media and web-based learning design and presentation for checking the media quality on the network. It was evaluated with open-end question assessments of media and presentation by 5 experts in educational technology then edited based on feedback.

RESEARCH RESULTS

Design and develop the constructivist web-based learning environment model to enhance creative thinking for higher education students in this study would be presented into two parts as following details.

1. The constructivist web-based learning environment model to enhance creative thinking for higher education students,

The learning environment model with conceptual framework in designing as follows:

I: The stimulation of cognitive structure and creativity (1) Problem base to enhancing creative thinking.

II: The support for balance adjustment and creativity (2) Resource and

Relate case.

III: The enhancement in constructing knowledge and creative thinking

(4) Collaboration, (5) Mind tool and (6) Creative thinking lab.

IIII: The support and enhancement for constructing knowledge and creative thinking, (7) Scaffolding and (8) Coaching.

According to the basic components, they were constructed and developed as constructivist web-based learning environment model to enhance creative thinking for higher education students as shown in the following figure: 1

| The stimulation of cognitive structure and creativity | Cognitive constructivist | Authentic context | Problem base to enhancing creative thinking |

Figure 1 (flowchart):

The stimulation of cognitive structure and creativity
- Cognitive constructivist → Authentic context → Problem base to enhancing creative thinking
- Situated learning(Brown, Collins,andDuguid,1989) → Enabling Context
- OLEs (Hannafin, 1999) → 4 ability of creative thinking: - fluency, - flexibility, -originality,
- Creative Thinking Guilford (1967)

The support for balance adjustment and creativity
- Information → Conceptual → Resource
- Mental model
- SOI
- Constructivist → Discovery
- Social constructivism → CLEs (Jonasen, 1999) → Relate case

The enhancement in constructing knowledge and creative thinking
- Cognitive tool → OLEs (Hannafin, 1999) → Mind tool
- Creative Thinking Guilford (1967) → 4 ability of creative thinking: - fluency, → Creative thinking lab
- Social constructivism → Collaboration → Collaboration

The support and enhancement for constructing knowledge and creative thinking
- Social constructivism → OLEs (Hannafin, 1999) → Scaffolding
  - Conceptual
  - Metacognition
  - Procedural
  - Strategic
  - Creative thinking
- Creative Thinking Guilford (1967) → 4 abilityof creative thinking: - fluency, - flexibility, -originality, -
- Cognitive apprentiship → Coaching → Coaching

Figure 1: Designing framework of constructivist web-based learning environment model to enhance creative thinking for higher education students

According to designing framework of constructivist web-based learning environment model to enhance creative thinking for higher education students , found that there were major components as follows: 1) Problem base, 2) Resource, 3) Related case, 4) Mind tool, 5)Collaboration, 6) Coaching, 7) Creative thinking lab, and 8) Scaffolding obtaining from major theories in various aspects: Psychological base, Pedagogies base, Technologies base, Contextual base, Media base, and important variables that enhance the learners to encourage creative thinking base as shown in the following figure: 2-10

Figure 2: It was shown major page entering to Constructivist Web-Based Learning Environment Model to enhance creative thinking. There were 6 problem bases for students: (1) Context diagram, (2) Data flow diagram, (3) Basic E-R diagram, (4) Advance E-R diagram, (5) E-R diagram to relation, and (6) Normalization.

Figure 3: It was shown Problem base for enhancing the students to construct knowledge and enhance creative thinking from real situation in designing data base.

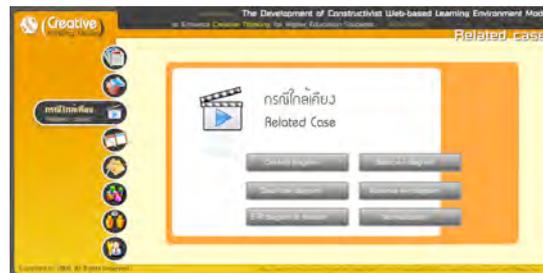
Figure 4: It was shown Resource for collecting information, content, technology which the students used in Problem base while they were facing it. It was major component supporting in constructing knowledge and enhancing creative thinking of students.


Figure 5: It was shown Related case which the students didn't have adequate experience in solving problems. The Related case would help them gaining experience in solving problems and being able to transfer the rationales as knowledge for solving new problems.

Figure 6: It was shown Mind tool for constructing knowledge and enhancing creative thinking. The students had to be supported in practice their learning task.

Figure 7: It was shown Creative thinking lab for enhancing creative thinking based on Guilford's (1967) approach for all 4 aspects including Fluency lab, Flexibility lab, Originality lab, and Elaboration lab.

Figure 8: It was shown Collaboration for supporting the students to share their experience with experts in designing data base through CoPs as Web-blog. Besides, there were Web-board and Chat room for expanding thinking viewpoint, enhancing Flexibility, and Elaboration. Moreover, it was major component in adjusting and preventing Misconception that would occur in learning.

Figure 9: It was shown Coaching center by teachers and experts in designing data base with Best practice. They could be able to explain the students throughout the learning duration without the teachers to coach all the time. Furthermore, the successful techniques and methods from being role model for students to solve their learning problems.

Figure 10: It was shown Scaffolding for enhancing students to solve problems or learning in case that they couldn't be able to practice their own task by themselves. The Scaffolding might be the suggestions as well as different strategies for solving problems or providing opportunity to find alternatives in solving various problems or Divergent thinking to successfully practice one's task.

2. The model efficiency assessment

The efficiency assessment of learning environment on network, adopted from the concept of Sumalee Chaijarean (2003), was found that

(1) Evaluation of productivity, which was divided into content, the learning environment model design, and assessment, was appropriate. (2) Evaluation of using context was found that using group of three was suitable (3) Assessment of learners' opinions effected learning environment model, which was found that supporting and development of students' creative thinking, (4) Evaluation of students' creative thinking, which was found that there were 70% of qualified students, and (5) Evaluation of learning achievement of learners, which was found that there were 70% of qualified students.

SUMMARY AND DISCUSSION OF RESEARCH RESULTS

According to the above findings, found that it was supported by the findings of Neo (2005); Kwon (2006); Tezci (2008); Ransarit Wechsuwan (2005); Jakarin Silarat (2006); and Sumalee Chaijaroen et.al., (2007), found that the students showed their creative thinking including: Fluency, Flexibility, Originality, and Elaboration. They obtained higher level of learning achievement and various problem solving skills. For the findings of this study, it would be because of Web-Based Learning Environment Model with the design and development of Guilford's approach of creative thinking enhancement for 4 aspects including Key Word of Fluency, Flexibility, Originality, and Elaboration (Guilford, 1967; Mumford, 2006), in this study, different key words were used as basic information technology leading to design by determining learning task that the students had to show their ability in finding answers quickly, fast, with a large amount of number or alternatives for solving problems in limited time, Fluency. The students were encouraged to show their Fluency in various aspects: Fluency in finding words, thinking, connection, and tasks that made them think of many kinds of answers by classifying the types and meanings as well as predicting answers and steps of problem solving in order to achieve goal for doing responsibility, Flexibility. Moreover, the students' responsibility for finding new things by transforming and applying or creating new improved patterns or things, Originality as well as determining task facilitating students to select problem solving technique by evaluating answers and testing based on specified criterion or rational in order to construct or design as the determined more perfect goal or as thinking in details for elaborating more perfect thinking, Elaboration. It was the enhancement for students to apply and develop creative thinking ability based on Guilford's approach. It was supported by Salomon's (1977) approach with explanation that learning could be able to create enhancement for skills which would be meaningful as the needs in learning task.

Furthermore, Constructivist Web-Based Learning Environment Model was designed facilitating creative thinking. It could be seen from the components of creative thinking lab. Inside the lab, there would be 4 more rooms for facilitating Fluency in matching for telling name and meaning of symbol using for designing data base as the empirical evidence from the students' interview that *"I like Fluency lab because it is fun and relax. When I can match the symbol and meaning, it could help in solving problem during labeling different figures and connecting with problem solving in problem base for E-R Diagram writing."* According to the empirical evidence and research findings of this study, found that the design of Web-Based Learning Environment could facilitate the students in applying and developing the students' creative thinking regarding: Word Fluency, Thinking and Connecting relationship. Besides, Flexibility lab focused on enhancing creative thinking as Flexibility by designing for students to be able to study and obtain Flexibility in classifying and showing steps of Table formation as Normalization. The students would be able to use Normalization rule in transforming E-R Diagram. Moreover, in the lab room consisted of instrument facilitating the design of E-R Diagram, demonstration and testing of techniques before practice. As the empirical evidence from students' interview that *Flexibility lab was used for analyzing problems by trying out Normalization from assigned task. There were demonstration of techniques and trying to perform Normalization flow chart. As a result, I could classify the complex information."* According to the empirical evidence and research findings of this study, found that the design of Web-Based Learning Environment Model could enhance the students in applying and developing their creative thinking as Flexibility for classifying and describing the meaning as well as showing steps of problem solving in order to achieve goal in performing task. Moreover, Originality lab focused on creative thinking as initiating to design or transform E-R Diagram to be more perfect. In the lab, there were instruments supporting the design of E-R Diagram, demonstration of techniques, and testing of techniques before practice. As the empirical evidence from the students' interview that *"When I enter Original lab to analyze flow chart from problem base, it could help us labeling the chart correctly which would cause the correct problem solving and transforming in designing new things by ourselves."* According to the empirical evidence and research findings of this study, found that the design of Web-Based Learning Environment Model could support the students in applying and developing the students creative thinking in originality which could be able to design and create new things by applying prior knowledge in transforming and applying for new things, or adjusting and developing as new patterns or things with more perfect. Besides, Elaboration lab focused on enhancing creative thinking in selecting and making decision for using Normalization rule in transforming E-R Diagram as Relation so that the data base would be moiré perfect. In the lab, there were the instrument facilitating the design of E-R Diagram, demonstration of techniques, and testing techniques before practice. As the empirical evidence from the students' interview that *"I enter Elaboration lab to learn and test in transforming*

information from E-R Diagram into Relation and helping in tallying data as group. There would be explanation of steps in detail which would be easier during solving problems." According to the empirical evidence and research findings of this study, found that the design of Web-Based Learning Environment Model could be able to support the students in applying and developing the students' creative thinking as Elaboration which was the ability in thinking to create by selecting former thinking which was more clearly developed by testing in addition to decision making. It was supported by Osborn's (1953); Terry 92005); and Kwon (2006) approaches with explanation that the technique development relating to creative thinking for applying in constructing instruments of problem solving. The learning task would lead to knowledge construction and enhancement of students' creative thinking. It was also supported by the research findings of Neo (2005) and Suchat Wattanachai (2007) in designing the learning environment for enhancing the students' creative thinking.

According to all of the above findings, it could be confirmed of efficiency of the constructivist web-based learning environment model to enhance creative thinking for higher education students that it could very well support the students' knowledge construction and creative thinking, more ever for The application of Constructivist Web-Based Learning Environment Model to enhance creative thinking of higher education students in instructional management, the congruence with the students' context, school, course content, and appropriate media attribute.

Scientific Thinking of the Learners Learned with The Knowledge

Construction Model enhancing Scientific Thinking

Thitima Gamlunglert* Sumalee Chaijaroen**

Abstract

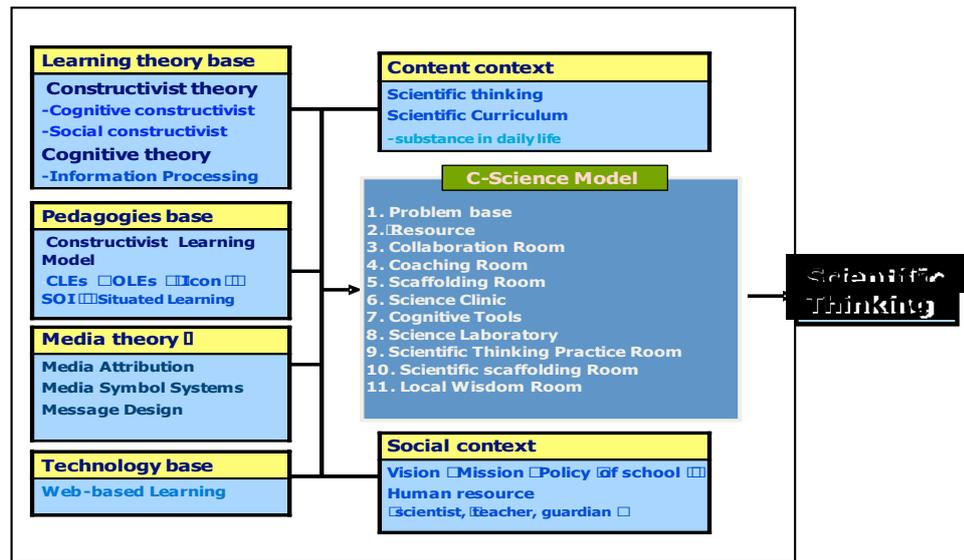
The purpose of this research was to examine scientific thinking of the learners learned with the knowledge construction model enhancing scientific thinking of the learners**.** The result revealed that scientific thinking of the learners consist of inquiry, analysis, inference and argument.

Keywords: scientific thinking, web-based learning environment, constructivist theory

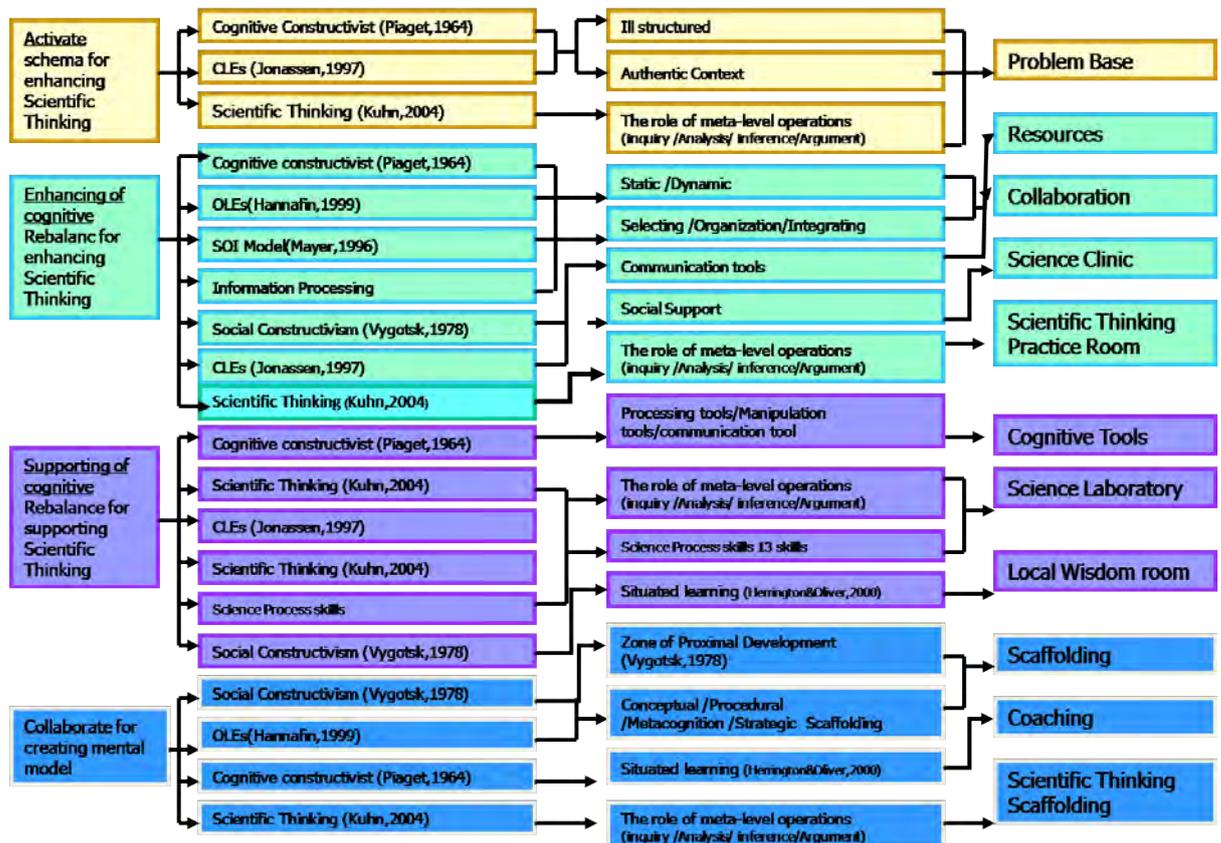
Introduction

According to changing of the world and promulgation of national educational, the learners to be trained thinking skill, management, problem solving, love reading, and desire to learn continuously, be able to utilize information technology in searching for information in order to obtain and search for knowledge for their lifelong learning. Constructivist theory was appropriate learning theory in managing education for serving those things. This theory focused on learners' knowledge construction based on their experience, interpretation the meaning of the world as well as constructing body of knowledge. Especially, the content on this study, substance daily life, the learners should have ability to find out the evidence to explain phenomena by using inquiry, analysis, inference and argument, which we called scientific thinking. In order to encourage scientific thinking of the learners by using the knowledge construction model enhancing scientific thinking of learners. And utilization of media attribution of web-base, hypertext, hyperlink, hypermedia for increasing efficiency of the learners' knowledge construction and scientific thinking. According to above mentioned reasoning, this study aim to examine the scientific thinking of the learners who learned with the knowledge construction model enhancing scientific thinking of the learners.

Conceptual Framework

The knowledge construction model enhancing


Conceptual framework of this study consists of independent variable (Learning with the knowledge construction model enhancing scientific thinking of the learners which integrated from theory and context) and dependent variable (scientific thinking of the learners).

Designing Framework


Designing framework illustrates how to design the knowledge construction model

enhancing scientific thinking of the learners both theory and practice. According to related

theoretical approaches, there were 11 components of the knowledge construction model enhancing
scientific thinking of the learners through the web-based learning as following :

(1) Problem Base (2) Resources (3) Collaboration (4) Coaching (5) Scaffolding (6) Science Clinic (7) Cognitive Tools (8) Local Wisdom Room (9) Scientific Thinking Room (10) Science Laboratory and (11) Scientific Thinking Practice Room.

Methodology

 1.The target group included 51 sixth-grade learners, Demonstration School of Khon Kaen

University, Thailand, in 2008 school year.

 2.The variable was scientific thinking of the learners learned with the knowledge construction model enhancing scientific thinking of the learners.

 3.The research design of this study was pre-experimental as one shot case study.

$$X \qquad o$$

    X = learning with the knowledge construction model enhancing scientific thinking of

      the learners

    O = scientific thinking of the learners who learned with the knowledge construction

      model enhancing scientific thinking of the learners

Research Instruments

  The research instruments consisted of the knowledge construction model enhancing scientific thinking of the learners, constructed by the researcher and interview form of learners' Scientific thinking based on Kuhn's (2004) : the role of meta-level operators in scientific thinking including: 1) inquiry, 2) analysis, 3) inference, and 4) argument.

Figure : Web-based learning environments of the knowledge construction model enhancing scientific thinking of the learners

Data collecting and analyzing

In-depth interview was employed for collecting the learners' scientific thinking data.

Protocol analysis was used in order to analyze scientific thinking data.

The research findings

The result of this study was found the scientific thinking of the learners who learned with the knowledge construction model enhancing scientific thinking of the learners in 4 aspects :

1) inquiry, 2) analysis, 3) inference, and 4) argument. The details are as following: During performing their learning task through problem based situation relating to their real life and other aspects of the knowledge construction model enhancing scientific thinking of the learners. When they had an experience with an incident or situation, they would set the goal for inquiry and to do achieve the goal which access data, recognize its relevance to theory and formulate questions to ask of data (inquiry). Then, they analyzed it (analysis) by means of represent evidence (distinct from theory), make comparisons and seek and detect patterns. After that they show something they know and how do they know it with draw justified claims, reject unjustified claims and acknowledge indeterminate claims (inference). Later on, they would present their information or reasons for sharing with the others to confirm their own findings (argument), Besides, they might modify their own information which didn't have sufficient reasons or evidence for confirmation.

Abstract

This research was aimed to develop the knowledge construction model based on the constructivist theories to support ill-structured problem solving process of industrial education and technology students. The target group was 40 third-year undergraduate students within the first semester of the academic year 2009 in the Department of Educational Communications and Technology, faculty of Industrial Education and Technology, King Mongkut's University of Technology Thonburi. Research methodology is developmental research in phase I conducted as the following stages: 1) study the principles and theories, 2) exploring the context concerning, 3) synthesizing framework of theories, 4) design and development the model, and 5) evaluation of model efficiency.

The results of this research in phase I found that the knowledge construction model based on the constructivist theories to support ill-structured problem solving process of industrial education and technology students consisted of following essentials: 1) ill-structured problems, 2) data bank for problem solving, 3) the support center of excellence for ill-structured problem solving, 4) cognitive tools for ill-structured problem solving, 5) ill-structured problem solving process transfer center by related cases,　　6) sharing and social collaboration for problem solving, 7) consulting and knowledge center by experts,　8) scaffolding and cognitive strategies for ill-structured problem solving, and 9) coaching. The results from the study of model efficiency showed that the model was effective on production, using context, learners' opinions, intelligence quotient of learners, and learning achievement aspects.

Keywords: Ill-Structured Problem Solving Process / Constructivist Theories / Knowledge Construction.

INTRODUCTION

Nowadays, the context of global education in learning management has changed from the traditional teacher centered methods of teaching, and only emphasized on transferring of information from teachers to learners into the constructivist learning environmental management. In order to learner is a knowledge construction, they could encounter with the resource of knowledge from many existing environment (rich environment) by emphasis on their roles , and lead the real world or their work places to use in learning condition. As a result, learners can transfer contents into authentic context. (Jonassen, 1997; Scott Grabinger, 1998)

As considering to Thai contextual educational management, knowledge construction based on the constructivist theories conform to educational management which is legislated Thai National Education Act, especially educational management process. This process will focus on enhancing teachers to accommodate learning environment of media and facilitate the learners to initiate learning style, knowledge, skills, thinking process, management of situational encounter, and transferring of knowledge to prevent and solve problems.

Faculty of Industrial Education and Technology, King Mongkut's University of Technology Thonburi has one of important missions is to produce the bachelors for working and training in the industries focusing on solving problems in the industrial sector of the country , especially training which is aimed at developing knowledge, skills , and attitudes of industrial personnel. Characteristics desired of graduates in this filed must have abilities to analyze the problems and needs toward trainings. Moreover, they must be able to analyze the problem conditions, causes, and solutions of training. (Verapan Sitthipong, 1996)

For the authentic context in industrial training operations, these were often happened the problems, especially the undefined- exact causes problems or multiple-causes problems. These problems have to use several problem-solving methods such as low-quality production problem that may consist of these reasons such as lacking of skills of employees, persecution of employees , damaged equipments and incorrect maintenance of machineries, lacking of working morals of employees ,and unfavorable working system All the problems are the ill-structured problems. (Jonassen, 1997)

As all above reasons about the context of global education in teaching and learning management which emphasize on the learners' knowledge construction roles, and the mission of Faculty of Industrial Education and Technology that focus on teaching and learning for enhancing abilities in solving ill-structured problems, the researcher developed knowledge construction model based on constructivist theories to support ill-structured problem solving process. The researcher designed problem situations according with contexts of industrial trainings to activate the intellectual disequilibrium based on constructivist theories, and support the intellectual balancing of learners by organizing different essentials advancing knowledge construction and solving ill-structured problems.

The findings from this research would be the way to do research on knowledge construction and solving ill-structured problems. Besides, this developed model can be applied to the management of teaching and learning, training in closer context emphasizing on knowledge construction and solving ill-structured problems both in the institutions and personnel training in organizations.

OBJECTIVE

To design and develop knowledge construction model based on constructivist theories to support ill-structured problem solving process of industrial education and technology students.

RESEARCH METHODOLOGY

This research is developmental research Type II (Richey, RC and Klein JD, 2007) including 3 phase, these are; phase 1: model development, phase 2: model validation, and phase 3: model use. This report is in phase 1 was aimed to design and develop models with document analysis and contextual conditions as following steps

Research in phase 1: Model development includes the following steps

Step 1: Literature review

This step was to study and analysis principles, theories, and research related with creation of knowledge based on constructivist theories. Then, it was studying the contextual basic of model development, important variables that encourage the learners to create ill-structured problem solving process, media theories, and pedagogy for basic of research.

Step 2: Development of theoretical framework

For this step, development of theoretical framework by the theory, principles, research, and related context which became the basis of theoretical framework synthesis were used. After researcher offered this framework to the advisor together with tools; the record of review and analysis document, editing based on feedback was the next step to be done.

Step 3: Contextual study of learners

This was the step of studying how to solve problems of students. Solving multiple cases was to study the original basic of learners' former problems. Next step was to design model from the results of contextual study.

Step 4: Contextual study of industrial problem

For this step, researcher studied about the authentic problem or work place by studying the information in the factory, and interviewed people involved in manufacturing wooden toys to use for creating the problem situations.

Step 5: Synthesis the designing framework

This was the step of synthesis of the designing framework based on theoretical framework including results from contextual study of learners and industrial problem. Saving the synthesis designing framework in design the record was the next step. Researcher would offer to the advisors for comment then edited based on feedback.

Step 6: Creating the learning environment on network

Creating the learning environment through the network based on foundation of creating designing framework was adopted.

Step 7: Submitting learning environment on web to the advisors

It was the step of submitting learning environment on web to the advisors to check validation of the model, media attributions, media symbol system, and the design of learning environment. After that, researcher had to edit this learning environment based on feedback.

Step 8: Presenting the learning environment on web to the experts

Researcher presented the learning environment on web to the experts for assessment the validation of model. This step evaluates the output for checking the quality of the model as following details

- *To evaluate validation of the content*
  It was to examine the accuracy of the content of necessary on the industrial with tools; open-end question assessments of content then it was evaluated by 3 experts in content**.** After finishing evaluation, researcher edited the content based on feedback**.**

- *To evaluate the design of the model based on constructivist theories to support   ill-structured problem solving process*
  It was evaluated with open-end question assessments of design by 3 experts in instructional design then edited based on feedback.

- *To evaluate media and presentation for checking the media quality on the network*
   It was evaluated with open-end question assessments of media and presentation by 3 experts in educational technology then edited based on feedback.

Step 9: Testing of learning environment on web to try out the context

The final step was testing of learning environment on web to try out the context to evaluate and improve model completely. Next, researcher divided the 40 students and provided learning environment on web for them. Moreover, the students were assigned to study on web into 3 times for 4 hours per each time during 6 - July 20, 2552.Next step was summarizing lessons between researchers and students in the end of every hour. In this step try out can be evaluated as follows

- *To evaluate the ill-structured problem solving*
  It was an evaluation from the answers of tasks, students' learning, depth interview with talking about the issues of ill-structured problem solving process according to the concept of Jonassen (1997). Besides, researcher analyzed information by summarizing, and interpretation from the answers of tasks, students' learning, information from depth interview.

- *To evaluate learning achievement*
  It was to evaluate the scores from learning achievement test with the statistic average, percentage, and deviation values. Then, considering the criteria of percentage of students' scores after studying which is 70 percent of full score has done.

- *To evaluate learners' opinions through model*
  This step was the evaluation of learners' opinions through model from answering of 3 topics; content, learning on web, and design, which support ill-structured problem solving including the writing of comment or other suggestion. After that it was the analysis information by summarizing, and interpretation from the answers of students' opinion assessment and information from interview.

All information will be improved and planed for the operations in the next step

RESEARCH RESULTS

Design and development of knowledge construction model based on constructivist theories in this study would be presented into two parts as following details.

1. Element of knowledge construction model based on constructivist theories, which there are 9 elements as followings.

Element 1: Ill-Structured Problems

Knowledge construction based on constructivist uses problem situations that occur in the context of the industrial training to encourage the students to reach the intellectual disequilibrium and intellectual equilibrium by assimilation or accommodation. In the industrial production units, ill-structured problems were found in every day of working. The production processes have involved many factors such as employee, machineries, materials, money, and management. Those factors are all interrelated. Therefore, industrial problems are the multiple problems which have many constraints for resolution, or requirements that must be accommodated.

For this result, it must use a variety of problem solving processes. Learners need to build multiple problem spaces in the ill-structured problems, so in this design was provided the context of the problems which is real world problems or work place in the industry. Cognitive flexibility theory (Spiro et al., 1987; Spiro et al., 1988) will be used in presentation of contextual problems as multiple cases using hyper text and hyper media to synchronize various contexts that learners must understand and interpret of those contexts. In the presentation of multiple cases learners need to compare and contrast the similarities and differences between cases. (Jacobson, 1990).

Element 2: Data bank for problem solving

Data bank for problem solving provides a variety of learning resources to associated problems toward troubleshooting from the learners. Therefore, preparing of learning resources help learners to connect the knowledge to information from memory. This method supports the intellectual equilibrium, constructing arguments, and articulating personal beliefs to selecting the best solution in the process for ill-structured problem solving (Jonassen, 1997).

Providing information is necessary for problem solving because the students will use the information to decision-making and justify the chosen solution. There are various methods in the ill-structured problem solving. Each learner may decide different problem solving. Thus, taking the best of reliable evidence to confirm claims by their own assumptions, beliefs, thoughts, or constructing arguments. Inconsonant thoughts of them will cease disputes and lead to selecting the best solution (Jonassen, 1997).

Design can be available in both print media such as photos, text books, journal and electronic media such as CD-ROM, multimedia. Related links provide relevant information and the search engine to search the internet.

Element 3: The support center of excellence for ill-structured problem solving.

It is a center focused on providing excellence in the ill-structured problem solving process for learners. It was designed by presenting problems as multiple cases which let the learners to practice into the small cases with the best practice from the experience of experts as a model, and cognitive apprenticeship theory (Collins, Brown and Newman, 1989). From the result of design, it will activate the characteristics of tasks as follows.

- *Supporting unit task for learners' excellence in articulate problem space, and the task of monitoring and evaluation this process.*

    For this task, the learners will be encouraged to find out the actual problems by creating multiple representations or understandings of the problems. Then, giving experiences of experts in the articulate problem space and monitoring and evaluation process to synthesize conceptual models and let the learners study these strategies including train them use the strategies of monitor and evaluation this process by giving the multiple cases and assigned the mission of articulate problem space. Learners practice into small cases which there are questions for stimulation the learners to create metacognitive strategy toward creating multiple problem space.

- *Supporting unit task for learners' excellence in the identifying and clarifying, organize problems and task of monitoring and evaluation this process.*

    For this task, the learners will be encouraged to identify and clarify, organize problems by giving the experiences of the experts and key concept of identifying and clarifying alternative opinions, positions and perspectives of Stakeholders to synthesize as conceptual models, and let the learners

to use those strategies including train them to use the cognitive tools to identify and clarify, organize the problems by giving the multiple cases and assigned the mission of identifying and clarifying, organize problems. Learners practice in multiple cases that there are questions for stimulation the learners to create monitoring and evaluation in this process.

- *Supporting unit task for learners' excellence in searching for the cause of the problems and the task of monitoring and evaluation this process.*

For this task, learners will be encouraged to search the cause of problems and they can associate relationships and compare the differences of each reason to create multiple representations to solve the problems by giving the experiences of experts to synthesize as conceptual models , and let the learners to use those strategies including train them to use cognitive tools to search the cause of problems by giving the multiple cases and assigned the mission of alternative solutions with constructing arguments and articulating personal beliefs. Learners practice in multiple cases that there are questions for stimulation the learners to create monitoring and evaluation this process.

- *Supporting unit task for learners' excellence in generating possible problem solutions and the task of monitoring and evaluation this process.*

For this task, learners will be encouraged to generate possible problem solutions. Learners have to create multiple representations and choose the way to solve problems in any case to alternative solutions by giving the experiences of experts to synthesize as conceptual models and let the learners to use those strategies including train them to use cognitive tools in monitoring and evaluation this process by giving the multiple cases and assigned the mission of articulate problem space. Learners practice in multiple cases that there are questions for stimulation the learners to create monitoring and evaluation this process.

- *Supporting unit task for learners' excellence in constructing arguments and the task of monitoring and evaluation process.*

In the process of ill-structured problem solving, each learner may decide different methods of problem solving. Therefore, showing the best evidence to confirm claims the assumptions following their beliefs, thoughts, or constructing arguments will terminate the argument and lead to selecting the best solution (Jonassen, 1997). For this task, learners will be encouraged to create constructing arguments by giving the experiences of experts to synthesize as conceptual models and let the learners to use those strategies including train them to use argumentation tools in constructing arguments by giving the multiple cases and assigned the mission of alternative solutions by constructing arguments and articulating personal beliefs. Learners practice in multiple cases that there are questions for stimulation the learners to create monitoring and evaluation this process.

Element 4: Cognitive tools for ill-structured problem solving

It is an important element to support the process of ill-structured problem solving which consists of

- *Tools for supporting problem representation*

  Semantic network is cognitive tool used to create a mental representation can learn through problem space. Semantic network will be used to create the mental representation through problem space. Moreover, semantic network will be applied to create problem mapping by connecting internal representation and external representation (Jonassen, 2003). Semantic network will be used to identify and clarify, organize programs such as Mind Manager program.

- *Tools for supporting argumentation*

  There are many processes of ill-structured problem solving. Sometimes, learners may have different ideas to solve problems. Good problem solving was presented by debating, and giving reasons from learners more than giving agreement with any alternative options using the best evidence to confirm claims supporting their ideas (Voss, 1988). From the principles, they can use argument mapping table, and argumentation schemes as supporting tools for argumentation.

- *Communication Tools*

  Communication tools from OLEs model of Hannafin (1994**)** will encourage learners to exchange knowledge between students, teachers, and experts who live in different locations or at different times. In the other ways, it may be the cooperation between people who do activities together in groups. They require decisions and interacting with friends for learning sharing. Electronic mail, web-board, chat are the selected tools.

- *Supporting tools for social supports from CLEs model of Jonassen (1997)*

  These tools support communities of learners and support collaborative problem solving within the group of learners in the same place or are in remote locations. The researcher has led this principle to design by providing social support from experts, and relevant knowledgeable people. If learners need more consulting, researcher has put an E-mail for learners to be able to contact the specialists and supported communities of learners by providing Weblog to share learning together.

Element 5: Ill-structured problem solving process transfer center by related cases

This element was adopted from the basic of constructivist learning environments (CLEs) design. Jonassen (1999) has suggested that comprehension of each problem can activate experiences of those problems, and conduce to creating mental model of problem solving.   If learners have little experience, it is difficult to resolve this problem. Therefore, this model is designed by providing access

to experience related with problems. The adoption of experience and process, which experts use to solve real problems in the industry filed to be the related cases. In this case, learners can store information as declarative knowledge and procedural knowledge in cognitive schema.

Transferring procedural knowledge of ill-structured problem solving process use similar in the process of related cases, which are the procedural knowledge .It transfers to the new problem situation. There must be procedural overlap between procedural transferring. If the past experience of the related cases, which are procedural knowledge of learners, are similar to processes in the new task.

Transferring of declarative knowledge will be very useful if learners search and utilize from schemata by comparing the relationship between the new problem situation and cognitive schemata which is similar to the new problem situation. Learners must retrieve integration by taking out of existing knowledge such as content, rules, and theories. Then, they must map that knowledge with the problem situation, which is similar to the existing knowledge, to develop other skills in solving problems.

Element 6: Sharing and social collaboration for problem solving

This is elements that support the exchange of multiple ideas in problem solving and the development of conceptual understanding of learning, which derive from sharing of multiple ideas within groups, while learners' exchange of learning by discussion, or dissertation, and exchange various ideas of individual. In the process of ill-structured problem solving is a required process for providing collaborative solution. All communications cause multiple representations (Jonassen, 1997). The design will adopt from features of computer networks to support social collaboration, which allow chatting via computer networks such as E-mail, web board, chat, and weblog.

Element 7: Consulting and knowledge center by experts

Some problems in the industry are the ill-structured problems. Learners must try to understand the nature and constraints of the problems, the decision, and generate possible problem solutions. If learners have little experience, it is difficult to resolve. Thus, this model is designed to be reachable to relevant experience of problems. Being the sharing of knowledge and experience of the experts transferring to learners, the design provides information from viewpoint. Principles in problem solving of industrial experts such as senior engineers, manager of production department, and general manager by offering principles and perspectives as conceptual model. If learners need some more advice, researcher has already put an e-mail, web board, chat for learner communication with experts.

Element 8: Scaffolding and cognitive strategies for ill-structured problem solving

This element based on Vygotsky's Social Constructivism, which believes that if the students are in the lower Zone of proximal development, they could not learn by themselves. Therefore, they need to be helped by scaffolding supporting their problem solving, or learning when they are unable to do the tasks. Learning was designed to be the way to self-success. In this study, scaffolding was established from the principles of Hanafin (1999) as following details.

- *Conceptual scaffolding*

    Conceptual scaffolding   is an assistance base, designed to support learners in creating concept for searching the actual problem, generating possible problem solutions, constructing argument, and monitoring and evaluation.

- *Metacognition scaffolding*

    Metacognition scaffolding is an assistance base that supports the students to plan problem solving, evaluate options for problem solving, and identify chosen problem solving.

- *Procedural scaffolding*

    Procedural scaffolding is assistance base that recommend processes of using resources and tools in the developed learning environment.

- *Strategic scaffolding*

    Strategic scaffolding is the assistance base that focuses on the useful optional questions. This scaffolding will support critical thinking, strategic planning, strategic decision making during learning to find out the actual problem, generating possible problem solutions, constructing arguments, and monitoring and evaluation.

Element 9: Coaching

From ill-structured problem solving, learners possibly get misconceptions or are in the lower Zone of proximal development. As a result, they could not do their own tasks. They need to be guided including observation of practice and provide supports, guidance, and reflect of learners' tasks. If they cannot always be fulfilled by scaffolding, teachers' roles are important by changing from knowledge transferring to be coaching. In addition, a good coach will encourage and motivate learners to analyze the process of self-reflective thinking. Also, coach was able to guide students to use the scaffolding and other elements in this model.

2. The model efficiency assessment

The efficiency assessment of learning environment on network, adopted from the concept of Sumalee Chaijarean (2003), was found that

(1) Evaluation of productivity, which was divided into content, the model design of the learning environment on network, and assessment, was appropriate. (2) Evaluation of using context was found that using group of three was suitable (3) Assessment of learners' opinions effected learning environment, which was found that supporting and development of learners to create the ill-structured problem solving process, and giving opportunities to create their own knowledge (4) Evaluation of learning achievement of learners, which was found that there were 70% of qualified students.

SUMMARY AND DISCUSSION OF RESEARCH RESULTS

Findings from this research are the learning environment model consists of 9 important elements. From the opinion assessment of students on the learning environment model on network, found that it encourage and develop the learners to create the ill-structured problem solving process and give opportunities to create their own knowledge. The result of this study is probably caused by design learning environment model since the design of problem situations using cognitive flexibility theory (Spiro et al., 1987; Spiro et al., 1988) That lead the students to realize the multiple problem spaces, which learners need to compare and contrast the similarities and differences between cases, and make multiple solutions on the information.

The resource of knowledge was designed to support information, which learners can find the answers from given problem situation. From student' opinion, she said *"From the resource of knowledge, information was organized in order for making understanding. There are related links to connect the information, so it is easy to decide the way to solve problems. According to search engine, it helps me to search information conveniently"*

In addition, design of the support center of excellence led students to practice in multiple cases by using best practice from experts. Therefore, learners can link to problem solving following learning tasks. From the learner' opinion, he said *"When I do the task of making understanding with actual problem, I can identify related and different problem. Before I choose they way to solve problem, I can understand the cause of various problem. Beside, constructing arguments can lead the strategies that experts use as the role model then I can apply these strategies to problem solving."*

Moreover, the model also encourages students to share experiences with others by adding sharing and social collaboration for problem solving in the design. Collaborative learning supporting and group work with chat room or web board, learner though that *"Chatting with others get many different perspectives in find out problems, who are the stakeholders in the problem situation?, what constraints in the problem situation are?, the cause of the problem, and problem solving. Sometimes, good ideas can be applied to problem solving."*

Including, consulting and knowledge center by experts can advise students. Experts will suggest and answer questions to the learners. It is knowledge sharing, experience of experts such as senior engineers, manager of department of production, and general manager. Thus, the empirical evidence was identified from learners' opinion, who said that *"This is a good center. There is an expert to answer and give suggestion. I get more understanding and problem solving process, especially solving the problem about people and industrial management"*

Scaffolding and cognitive strategies were recommended to suggest how to solve problems (If learners cannot do their tasks successfully). As the empirical evidence from student' opinion that *"in the first step, I am not sure how to use tools ,but after coach introduced into the procedural scaffolding to study the <u>varied</u> elements in the learning environment and illustrate the functions of each center. This allows access to resources well. I have ever entered to assistance base to study more with complicated content. I like the strategies of decision making for problem solving."*

There is coaching for giving suggestion, observation and implementation, and guides for learners' task as the empirical evidence from the student *"sometimes, problems occur while I am doing tasks. I don't know how to continue. However, coach can help and suggest what to do such as telling me to visit procedural scaffolding to study the elements in the learning environment. There are extra questions to find more answers; for example, how do you know which one is the suitable decision? or why did you choose this problem solving process."*.

From all empirical evidences and findings in this study, researcher can summary that learning by learning environmental model on network encourage the students to create ill-structured problem solving process , and learning achievement of students through learning achievement assessment which value 70% of qualified scores.

Management of learning should be considered about consistencies and contextual conditions of the learners, academy, and appropriate subject. The study of mechanisms in ill structured problem solving process of learners including other affected factors such as society, economy, education, etc., should be studied in the future to design and develop the model of learning environment on network related with the Thai contextual conditions.

The Development of Problem Solving Ability among High School Students

Assoc.Prof. Jariya Neanchaleay, Assoc.Prof. Sangduan Taweesin and Miss Wannakarn   Chaichuang

Abstract

The purposes of the study were to investigate students' problems solving abilities on Element and Compound Properties by comparing and investigate students' learning achievement before and after learning procedures through problem- based learning which complied with real or normal instruction environment. A sampling group consisted of 42 high school students in central part of Thailand. Tools in this study were pretest and posttest, learning activities   by using problem – based learning management plan provided the efficiency in terms of knowledge, procedure skills, learning behaviors ,learning with media with observation and problem solving ability together with evaluation form and interviewing. For analyzing qualitative data with sharing idea, the students expressed their positive attitudes that the knowledge and the experiences from problem- based learning with solving abilities and the science procedural skills could be used in daily life. Also, it could be used for self- study in various subjects especially on science subjects. Team working and learning were measured through interviewing and observation form which all data were analyzed and criticized about the situations in order to determine whether there were problems and obstacles or not. For quantitative data came from evaluation form on problem solving abilities and learning achievement test analyzed by using SPSS with mean, standard deviation and t-test. In conclusion, the problem- based learning could help students to know the procedures, steps and understand how to learn, they developed themselves in terms of knowledge, solving abilities, team learning and critical thinking with the desired characteristics along with the scientific strategies for having effective learning capabilities at a high level.

Keywords; Problem Solving Abilities, Problem- based Learning

1. INTRODUCTION

The instruction in science education at the present moment has been the main responsibility of IPST (The Institute for the Promotion of Teaching Science and Technology) which design the courses, objectives, learning materials as well as instructional approach in order that learners could learn and achieve the desired goal. As the main organization responsible for education in science and technology, IPST has always been emphasizing the development of instruction in science and technology and develop the courses so as to keep up with the recent advances in science and technology. Learners are now encouraged to think, observe, research, experiment and solve the problems by themselves. This is the properties of a highly efficient researcher in a learner. The important thing is "Learners think, do, and solve the problem by themselves", in other words, learners think in a scientific manner. In many circumstances, however, instruction in science and technology still fails due to various factors like passive learners, unsuitable learning materials and inexperienced instructors. There are only a few research works on the development of practical instruction so that it could be used in a normal circumstance [1]. Although many institutes support instruction in science and technology and have developed the courses so many times, the standards of basic education and key point indicators for learners are still at the low level. ONESQA (The office for National Education Standards and Quality Assessment) wrote an evaluation report on the standards of National Education Quality in A.C 2005 and found that in all basic education schools, the 4th standard which reads "Learners have capabilities to think, analyze, synthesize, criticize, create new ideas, reflect and envision" yielded 9.7%. The 5th standard which reads "Learners have knowledge and skills essential to the curriculum" yielded 11.4% [2]. Sriboonyanon School located at Amphur Muang, Nonthaburi, which was under the control of OBEC (Office of the Basic Education Commission) Region 1 in the academic year of A.C2006, focused on the development of learners in accordance with the 4th and the 5th standards. The things which could be developed were various instructions or learning approach and teaching style which comply with education reform. The heart of education was to teach students to think with reasons and use the ideas to analyze the data in the future.

If the development of a country is considered as serious, the first priority is the development of human resources. The quality must be based on education. The desired education must bring knowledge, idea,

skill and attitude to life. Learners should know themselves, know their lives, know the environment in which they live, and apply what they know to solve the problem as well as improve their lives in accordance with the nature. In organizing the basic education to comply with the National Education Act B.E. 2542, Section 24 states that the objective of Problem-Based Learning are to provide learners with problem solving process, authentic experience and practical work so that learners have basic skills to practice analysis skill, management and various situation. Problem-solving skill plays an important role in the development of life. This is in accord with Basic Education Curriculum B.E. 2544 with the aim that learners learn scientific process to form bodies of knowledge. Learners have many activities in group and individually. Instructors have a role to plan and manage learning, encourage and help learners to learn all their life. This way, learners will become complete in their body and mind in emotional and societal contexts and they can live happily, independently and creatively with others. In order to make the best use of science and technology, science is the background of other disciplines and plays an important role from kindergarten to graduate level in the worldwide scale.

The changes in education in the globalization era take place under the dramatic changes in economics, politics, technology and culture. This era is also referred to as "Knowledge-based Society" where the education is the most recognized factor. Learning by rote focusing on the contents given by the teachers could not develop the learners in all aspects. Hence, the man could not keep up with the speed of society changes. The people responsible for the instruction, therefore, should ask themselves: To what extent does their instruction comply with the desired quality and the environment of Thai society? The education reform, which is learner-based learning and focuses on the development of a learner in every aspect—namely, good in virtue, good at learning, and good at living—is now called and known as PBL or Problem-based Learning. This is an instruction which depends on Student-centered Learning as an approach in the development of education quality. It is widely known and used in many institutes worldwide [3].

Problem-based Learning (PBL) focuses on the following basics: 1) A problem is raised to stimulate learning; 2) There is active participation; 3) Learners play the main part in activities to develop thinking skills and solve real problems; 4) Learners use their abilities to collect data and conceptualize; 5) Learning atmosphere is meaningful and yields good interaction; 6) Learners have opportunities to broaden their knowledge and solve problems step by step (problem definition, hypothesis, experiment and result summary). In real life, people think to solve problems all the time. Problem-solving thinkers could encounter the changes in society [4].

Chemistry is a branch of science education. The objectives are the same as other branches of science. Instruction in chemistry focuses on experiments and thinking process because knowledge comes from science basics and knowledge acquisition by scientific approach in order to understand the principles in chemistry. Chemistry also introduces scientific method through experiment, discussion and conceptualization. Therefore, the instructor should provide learning activities which show the relationship between the contents so that learners could integrate the knowledge. In this way, learners not only know the contents but also understand how the knowledge is formed.

There are many factors affecting learning achievement, both direct and indirect. One factor which could be solved is the factor in terms of instruction management. Therefore, the instruction management should be varied to develop the instruction approach. The instructors could and should do this so that the instruction in chemistry is more effective. According to the above-mentioned rationale, the researchers were interested in studying and developing Problem-based Learning on chemistry subject entitled "Element and Compound Properties" in accordance with Basic Education Curriculum B.E. 2544 so that it yields the most benefit to students.

2. RESEARCH OBJECTIVES

2.1 To create the problem-based learning management plan entitled "Element and Compound Properties"

2.2 To study students' solving ability by using the evaluation form on "Element and Compound Properties"

2.3 To compare the students' learning achievement before and after studying the problem-based learning lesson on "Element and Compound Properties"

3. RESEARCH HYPOTHESES

3.1 In the problem-based learning on Element and Compound Properties, the learning management plan is suitable and beneficial for the development of learners' learning.

3.2 The students who are taught with the problem-based learning on Element and Compound Properties have abilities to solve problems at the high level and their learning achievement after studying is higher than the one before studying.

4. POPULATION AND SAMPLING GROUP

4.1.1 The population for this research consisted of all 135 high school students at Sriboonyanon School located at Amphur Muang, Nonthaburi, under the control of OBEC Region 1.

4.1.2 Sampling group was composed of 42 high school students in 1 classroom in the second semester of the academic year at Sriboonyanon School located at Amphur Muang, Nonthaburi, under the control of OBEC Region 1. They were chosen by using purposive sampling method.

5. EXPECTED OUTCOMES

The expected outcomes for this research are as follows:

5.1 There will be an approach in organizing lessons on chemistry by using problem-based learning which complies with real or normal instruction environment. Instructors could use PBL to organize learning so as to develop high-level thinking process for high school students in the future.

5.2 There will be an understanding of students' problem solving ability and a way to develop a scientific problem solving thinking process.

5.3 There will be a way to develop the efficiency in organizing students' learning process in the subjects related to science. This could be applied in other science classes like biology, physics, physical science, high school science and classes other than science.

6. RESEARCH TOOLS

6.1 Learning management plan entitled "Element and Compound Properties"

6.2 Interview form on problem-based learning

6.3 Evaluation form on problem solving ability

6.4 Learning achievement test on "Element and Compound Properties"

6.5 Observation during activities

7. TOOL QUALITY VERIFICATION

*LEARNING MANAGEMENT PLAN ON PROBLEM SOLVING

1) Learning management plan was checked the accuracy of the contents, expected learning outcomes, activities and evaluation.

2) Learning management plan was revised along with the guidance given by experts.

3) Learning plan was reviewed by experts in learning activities and contents on Element and Compound Properties.

4) Learning management plan which was reviewed by experts in learning activities and content was corrected and tested with the sampling group.

*INTERVIEW FORM ON PROBLEM-BASED LEARNING

1) The developed interview form was proposed to experts to check, consider and give suggestions.

2) The interview form was corrected and revised along with the guidance given by experts and then was used in the field.

*EVALUATION FORM ON PROBLEM SOLVING ABILITY

1) The developed evaluation form on problem solving ability was proposed to experts to verify the appropriateness.

2) The developed evaluation on problem solving ability which was verified by the experts was used with the sampling group. The criteria for the score were as follow:

The highest	yields	5	points
High	yields	4	points
Moderate	yields	3	points
Low	yields	2	points
The lowest	yields	1	point

The scores were given during the activities in each learning management plan and all scores were summed up to find out the average score to evaluate the problem solving ability as follow:

The highest	ranges between	4.50-5.00	points
High	ranges between	3.50-4.49	points
Moderate	ranges between	2.50-3.49	points
Low	ranges between	1.50-2.49	points
The lowest	ranges between	1.00-1.49	points

*LEARNING ACHIEVEMENT TEST

1) The developed learning achievement test was proposed to experts to examine whether the test complies with the learning standards and it covers all the contents or not. The test was then revised in accord with the suggestions.

2) The developed learning achievement and the evaluation form were proposed to experts to evaluate IOC (Index of Item-Objective Congruence) and test validity as follow:

        1   point for any item with validity

        0   point for any item with no certainty that it is valid

        -1   point for any item with certainty that it is not valid

3) The test with 40 items which was approved by the experts and yielded the value between 0.80-1.00 was used with the sampling group.

8. DATA COLLECTION

8.1 Orientation was held for 42 high school students in class 2 in the second semester of the academic year B.E. 2549 at Sriboonyanon School located at Amphur Muang, Nonthaburi, under the control of OBEC Region 1. Directions and agreements were discussed about Problem-based Learning on Element and Compound Properties.

8.2 Before the treatment, the researchers had the sampling group take pre-test with the learning achievement test which the researchers developed. Duration was 50 minutes for 40 questions.

8.3 Learning activities were held using Problem-based Learning on Element and Compound Properties. Duration was 27 hours for 9 learning management plans as follow:

A. Preparation: The students were given guidance and equipment 1 day before the real treatment in order that they were ready for the activities.

B. Instruction: Learning management plans about PBL on Element and Compound Properties were used so that the students could create their project under the agreements by the group.

8.4 Learning behaviors were evaluated during each learning management plan. The tool used was evaluation form on problem solving ability.

8.5 Post-test was given after the activities for PBL on Chemistry. The tool used was the learning achievement test which was used during the pre-test with 40 questions.

8.5 Observation through the process.

9. DATA ANALYSIS

9.1 Qualitative data came from learning management plans and interview form and also with observation. The data were analyzed, criticized and discussed about the situations in order to determine whether there were problems and obstacles or not. The results were used as a way to develop the next learning management plan.

9.2 Quantitative data came from evaluation form on problem solving ability and learning achievement test. The differences of the mean score were analyzed using SPSS (Statistic Package for Social Sciences) application. The procedure was as follow [5]:

9.2.1 The average score ($\bar{x}$) and the standard deviation (S.D.) were derived from the evaluation on problem solving ability and the learning achievement test.

9.2.2 The validity of the learning achievement test was found using the index of Item-Objective Congruence (IOC).

9.2.3 The reliability of the whole learning achievement test was found using KR-20 (Kuder Richardson-20).

9.2.4 The statistics used to test the hypothesis was t-test (Dependent Samples).

10. RESEARCH SUMMARY

10.1 The results from using learning management plan on Element and Compound Properties were explained using learning management plan 1 and learning management plan 9 as examples.

Learning management plan 1 for Element and Compound Properties (Period 2-3):

> 1) Before the instruction, most students did not know what metal chloride is and could not identify the different properties of metal and non-metal chlorides.

> 2) Students lacked scientific process skills such as defining problems or problems were unclear. Most students were not familiar with this approach; they did not dare to express their opinion and discuss in front of their class. Their presentation was out of order. Some students were absent-minded and talked whereas others were enthusiastic to solve the problems by themselves.

> 3) Students expressed their opinions in classroom and solved the problems in group. They discussed and shared leadership-follower roles. They also summarized together.

> 4) Instructors used media such as video or CAI to help students build up their bodies of knowledge.

Learning management plan 9 for Element and Compound Properties

1) Before the instruction, students could tell the properties of some elements in the Periodic Table. When faced with various elements, students got confused.

2) These activities were aimed to give prediction skill as a scientific method which was essential and widely used in their daily life to students.

3) Students paid attention and showed enthusiasm during the activities. They could tell the position of elements in the Periodic Table, for example, valence electron of element, reaction of elements, metal, spectrum. Some elements needed no experiment.

4) According to observation, students could have unity due to the fact that they could work together in groups and their reasoning and thinking skills were enhanced.

It could be concluded that before using learning management plan about Problem-based Learning, the students did not understand PBL. When they practiced more activities, they knew the procedure, the steps and understood how to learn. The data survey before the PBL showed the information on students concerning their basic knowledge and this was used as a way to develop such instruction approaches like learning in group and self simulation.

After using learning management plan about PBL, the students could develop themselves in terms of knowledge, ability, opinion and principle. They could discuss, give a presentation and do activities like comparing the pro and con of a situation. As for the process skill, they could work in group step by step. They could search for information from other resources. As for the desired characteristics, they

showed interest and worked together. They could express their opinion, listen attentively, finish their work in time and show responsibility.

The benefits from Problem-based Learning after the 9 learning management plans after we used interview form with students showed that the students could solve the real problems. They could think by themselves. They analyzed and understood the origin of the problems as well as how to solve the problem. They could work in group to think and solve the problems. They planned their work and did activities by themselves. This means that Problem-based Learning could develop students in learning, knowledge, process skills and desired characteristics along with 13 scientific strategies for problem solving to be used in daily life.

10.2 The results from evaluation on problem solving ability according to evaluation form for PBL on Element and Compound Properties were that the average score ($\bar{x}$) was 4.48 and the Standard Deviation (S.D.) was 0.27. This means it was at the high level.

10.3 The learning achievement of the students before and after the Problem-based Learning on Element and Compound Properties were different in that the learning achievement after the treatment was higher with a statistical significance at.05 level.

11. DISCUSSIONS

The research results could be discussed as follow:

11.1 Methods for Problem-based Learning on Element and Compound Properties comply with the concept given by Wattanaporn Ra-ngabtook [6] as follow:

1) Basic Education Curriculum B.E. 2544, its objectives, its structure, learning contents and standards for the sciences were reviewed.

2) Instructional approaches and activities for sciences, expected outcomes after learning, content scopes and supplementary lessons on chemistry for high school students were reviewed.

3) Theories, principles and concepts concerning instructional approach called Problem-based Learning were reviewed.

4) Literature was reviewed to analyze the learning essence for Element and Compound Properties.

5) Procedure to write learning management plan was reviewed and equipment for 9 learning management plans was developed.

6) Learning management plans for Element and Compound Properties were developed. Each plan consisted of the following topics: main contents, expected outcomes after learning, learning contents, learning procedure, media/resources, evaluation method and learning log.

7) Instructional approach is an important part to help students learn and the steps are given below:

7.1) Introduction to the lesson: this is aimed to build an interesting atmosphere for students so that they are eager to learn. The media is widely used like images, real materials, videos, questions, discussions and games.

7.2) Instruction: the instructor let the students learn how to solve problems. In each problem there are titles, activities to do and group of activities. The instructor will guide, encourage and help the students learn.

7.3) Practice and Experiment (Some learning management plans do not have this step): It consists of discussion before the experiment which is to define problem, hypothesize, plan how to solve or do experiment, collect data and summarize.

7.4) Summarization: The instructor and the students discuss together to reach a conclusion which complies with the learning contents in that lesson.

7.5) Evaluation and Assessment: The evaluation was used to evaluate problem solving ability, Problem-based Learning, group activities, procedure, conceptualization, scientific methods and creativity. This idea complies with Preeya Chantrasittiwet [7].

11.2 The results concerning problem solving ability according to the evaluation form for PBL on Element and Compound Properties were at the high level. The average score ($\bar{x}$) was 4.48 and the standard deviation (S.D.) was 0.27. This is because Problem-based Learning on chemistry complies with the scientific methods suggested by Department of Curriculum and Instruction Development [1] B.C2544. This is one important thing which could help learners learn in accord with their body, intellect, emotion, spirit and socialization. The learners could learn step by step and participate in real practice. The learners also find and build up their bodies of knowledge from various resources under the guidance of the instructors. If students learn from their experience, participate in real practice and have chance to solve problems by numerous methods, they will certainly use their previous experience as well as scientific methods to solve the problems they face. The knowledge from various resources will make learners able to think and remember for a long time. It could be seen that students know more and understand more dimensions of problem solving. Interaction with others will also help learners build up bodies of knowledge together by sharing opinions. The students could learn and broaden their viewpoints, thus.

11.3 The learning achievements of students before and after the treatment showed statistically significant difference at.05 level. The learning achievement after the treatment is higher than the one before the treatment. This is because Problem-Based Learning on Element and Compound Properties is developed step by step. The lesson begins from easy contents to difficult ones. It could then be seen that the development of PBL on chemistry helps students gain more learning achievement after the treatment.

12. SUGGESTIONS

12.1 SUGGESTIONS FOR MAKING USE OF RESEARCH RESULTS

1) The contents to be used in Problem-Based Learning should be related to the daily life of students so that the students could express their opinions in a wide and various ways.

2) The instructor should encourage students to express their opinion and suggest presentation techniques to reach a conclusion step by step.

3) There should be more learning resources for learners so that they could learn by themselves, especially animated media.

4) Problem-based Learning is intended to help students think and decide by themselves. Therefore, the instructor should not tell answers immediately until the students write their experiment results or finish their experiment. The instructor should give suggestions and additional knowledge only after the experiment.

5) Problem-based Learning is suitable for science project because each step in each lesson focuses on scientific skills essential for science project.

12.2 SUGGESTIONS FOR FURTHER STUDY

1) The Problem-based Learning management plan on Element and Compound Properties should be developed from time to time.

2) The Problem-based Learning management plan should be used with students at higher level in order to compare the research results.

3) Computer-assisted Instruction lesson should be developed in accord with Problem-based Learning on chemistry and other science subjects like general sciences, biology, physical sciences and physics.

4) Problem-based Learning could be used with other subjects besides sciences in order that the research results cover wider areas and could be used to integrate many learning lessons.

5) More participants are required for the research like chemistry instructors in high school to help plan learning management plan, observe student's behaviors and express their opinions during the lesson.

Quality of Teaching in Indian Schools: An analysis

Dr. C. P. S. Chauhan

Professor of Education &

Dean, Faculty of Social Sciences

Aligarh Muslim University, Aligarh (India)

Email: cps.chauhan1949gmail.com

Abstract

India has one of the largest education systems of the world, but it has proved to be inadequate to meet the demands of the people. Since school system is a feeder mechanism for higher education, its quality is important. There has been impressive progress of school system, but, its quality remains questionable. Major objective of this paper is to make an analytical assessment of the quality of teaching in terms of student learning and teacher performance in schools.

Introduction

Education system in India is one of the largest in the world, both in terms of number of institutions and student enrollment. At present, there are about 1.2 million elementary schools, over 169 thousand secondary and senior secondary schools (Government of India, 2009), more than 430 universities and equivalent institutions and nearly 21000 colleges. However, this system has proved to be inadequate to cater to the educational demands of millions of people, especially those belonging to weaker sections of the society, who have developed high level of aspirations for higher and professional education. The Government has been pursuing the goal of providing free and compulsory elementary education of eight years for all children in the age-group 6-14 years. The secondary education for the age-group 14-18 years is supposed to be the weakest link in the system. At the higher education level also only about 12% of the youth in the age-group 18-25 years are enrolled.

Since school system is a feeder mechanism for colleges and universities, the quality of higher education can not be better than that of school education. The quality of education imparted in educational institutions is largely dependent on the quality of teachers engaged and pedagogical practices that go on. While there has been remarkable quantitative progress at school stage in India, the quality of education imparted has remained questionable The major objective of this paper is to make a data-based analytical assessment of the quality of teaching in Indian schools with special reference to quality and commitment of teachers and academic performance of students.

Post-Independence Policy Perspective

At the time of independence, India inherited an educational system that served only a small minority of privileged sections of the society including kings, big landlords and rich merchants/businessmen who

were close to the rulers. The Constitution of free India, which commenced in the beginning of 1950, incorporated an important provision under Article 45 stating that the state would provide by 1960 for free and compulsory education for all children until they completed the age of fourteen years. The purpose was to universalize school education of eight years for all children in the age-group 6-14 years. This goal of 'universal free and compulsory education' should have been achieved in India by 1960. But, despite strenuous efforts, the goal has been illusive and the target dates have had to be shifted ahead repeatedly.

However, the Government has reiterated its commitment to achieve the goal of UEE with social justice by passing the '86th Constitutional Amendment Act 2002' thereby making free and compulsory elementary education a 'fundamental right' of every child in the age-group 6-14 years. Under the provisions of this amendment (Article 21A) the Government 'shall provide free and compulsory education to all children of the age of six to fourteen years in such a manner as the State may, by law, determine'. Further, by re-writing the earlier Article 45 the Government promises to 'endeavor to provide early childhood care and education for all children until they complete the age of six years'. Along with this, the Government has also introduced a new 'Fundamental Duty' through Article 51A (k) for every citizen 'who is a parent or guardian, to provide opportunities for education to his child or, as the case may be, ward between the age of six and fourteen years'. This constitutional amendment is an important milestone in the history of Indian education and would be followed by the Central Legislature to operationalise the Fundamental Right (Chauhan, 2009). From now onwards, the provision of free and compulsory education will become legally enforceable. It is believed that it will help the Government achieve the goal of UEE within a reasonable time in the years to come. Recently in 2009, the detailed Right to Education Bill was introduced in Parliament and passed without much debate.

Being a union of states, India has created a uniform structure of school and college education, popularly known as '10+2+3' system (Chauhan, 2009). The first 12 years constitute school education, which visualizes 10 years of general education for all children with a uniform curriculum framework followed by 2 years of further schooling in specialized alternative streams. Each of these two stages is further divided into sub-stages. The first 10 years of general education include 8 years of *elementary* education - 5 years of *primary* stage consisting of classes/grades 1-5 (for children aged 6-11 years) and 3 years of *upper primary* stage of classes *6-8* (for children aged 11-14 years), followed by 2 years of *lower secondary* (also sometimes known as high school) education. Thereafter, a child must pursue 2 years of *senior secondary* school education which provides for diversification of curricula in academic and vocational streams. Generally, a child is admitted to class 1 at the age of 6 years and is supposed to complete primary school education of 5 years at the age of 11 years. The full elementary education up to class 8 should be completed at the age of 14 years. The secondary school stage (classes 9-12) is meant for children aged 14 -18 years. This pattern is being followed uniformly in most of the states.

At the time of independence in 1947, India had a small system of school education. According to available data, total number of elementary schools was 150.000 which enrolled 12.10 million children – only about 25% of the relevant age-group 6-14 years. The enrollment of girls was about 3 million – only 25% of the total enrollment (Chauhan, 1990). There was one teacher for every group of 35 students. Secondary and Higher Education systems were still smaller and accessible only to affluent social groups.

Quantitative expansion

Immediately after independence, the native government took up the task of educational development on a priority basis and by the year 1950-51 total number of elementary and secondary schools increased to 230,400 with 23.8 million students and 751,000 teachers. This quantitative growth of education system continued with accelerated growth-rate during the last 10 Five-Year Plans (1950-2007), and at present (2006-07), there are about 1.2 million elementary and 169,000 secondary schools having enrolled 231 million children of which 46% are girls. These schools have engaged over 6.1 million teachers of which 39% are women (Govt. of India, 2009). The pupil-teacher ratio varies from

45 in primary schools to 31 in secondary schools. The gross enrollment ratio (GER) is 111 at primary stage, 74 at upper primary stage, 53 at secondary stage and 28 at senior secondary stage. The figures for girls are 3-4 points lower at all stages. The poor quality of instruction causes heavy dropout rates both at primary and upper primary stages. Of every 100 children enrolled in class 1 more than 25 leave school after class 5, the other 24 leave after class 8 and still other 13 leave after class 10. This means that only 38% of those enrolled in class 1 reach class 10 to appear in the first public examination. In the case of girls the corresponding figure is 36. The dropout rates are still higher among children belonging to scheduled castes (over 70%) and scheduled tribes (over 78%). The highest dropout rate is among the Scheduled tribe girls (about 79%). Since the total estimated population in the age-group 6–18 years is about 291 million (2008), about 60 million children are still out of school.

Students' Learning and Academic Performance

In the process of rapid quantitative expansion of school education the quality component could not receive adequate attention. Questions are being raised in all academic platforms regarding poor quality of education being offered, especially in the schools established and maintained by the government. While there have been great advances in access, there is a realization that challenges persist and many children actually leave primary school without learning the basic skills of reading and writing. Although, it is difficult to define the concept of 'quality' in the context of a complex process like education, yet it is felt that quality of teaching has significant bearing on all aspects of schooling including enrollment, motivation, level of students' readiness to learn, participation rate and learning outcomes. A glance over the examination results shows that there is about 84% transition rate from primary to upper primary stage. While pass percentage of children is 95 and 88 in classes 7 and 8, only about 50% students score 60% and above marks. But, these marks give no information about what children at various stages *can* do and what they *cannot* in terms of skills and competencies. The Baseline Achievement Survey (BAS) conducted by the NCERT in the year 2002 showed that average level of mathematics achievement receded from 58.25% in class 3 to 38.47% in class 8 (Table 1) and that of language from 63.12% to 52.45%. In science also, the achievement level came down from 50.30% for class 5 children to 40.54% for class 8 children (Govt. of India XI Plan Document, 2008).

Table 1

Students' level of achievement by subjects and classes/grades (Percent)

Classes/Grades	Mathematics	Language	Science*	Social Studies
III	58.25	63.12	---	---
V	46.51	58.57	50.30	---
VII	29.87	53.00	35.98	32.96
VIII	38.47	52.45	40.54	45.00

* Science is taught as Environmental Studies

Source: XI Five-year Plan Vol. II, MHRD, New Delhi

Another stringent national survey of learning abilities of class V students conducted by the National Council of Educational Research and Training (NCERT) covering about 7000 schools, 15,000 teachers and 84,000 children selected from rural and urban areas exhibited only a marginal overall improvement in students' performance in language, mathematics and environmental science over the baseline survey

conducted in 2002. It has been shown that on the average over 30% children have not developed simple vocabulary, 50% do not know the fundamental mathematical concepts and operations. In some states these figures are still higher. Mathematics, science and language (specifically English) are the three major subject areas in which school children do not perform satisfactorily in examinations. The incidence failure is largest in these subjects. This deficiency in language and mathematics learning, which are the basic tools for acquiring higher knowledge in all fields, is a matter of grave concern.

A World Bank survey (2006) conducted on secondary school students in the Indian states of Rajasthan and Orissa, with permission of the Indian Ministry of Human Resource Development showed that international mean achievement in mathematics test was 52 percent for grade 8 students, but the average scores of children in Rajasthan and Orissa on the same test were 34 and 37 percent respectively. Similarly, the international mean of achievement was 57 percent for Grade 12 students, but the corresponding scores for Indian students were 44 and 38 percent in Rajasthan and Orissa respectively (Kingdon, 2007). Pratham, a Bombay-based NGO, has been conducting achievement surveys since 2005 on regular basis and publishing the Annual State of Education Report (ASER). So far, this NGO has brought out four annual reports in the years 2005, 2006, 2007 and 2008. These reports provide very useful information not only to the children and their parents but also to decision makers. Some of the results of ASERs are summarized in Table 2 showing the general pattern school performance. The results show a comparative picture of performance of school children on various academic tasks. It is a thorough diagnosis of strengths and weaknesses in children's learning in terms of skills and competencies expected to develop at elementary school stage.

Table 2*

School Performance on selected Academic Tasks (Percentage of children failing to do the given tasks)

Task	ASER 2005	ASER 2006	ASER 2007	ASER 2008
Percentage of children (classes 1-2) failing to read letters words or more	Not reported	26.7	21.70	24.40
Percentage of children (classes 1-2) failing to recognize numbers 1-9	Not reported	38.40	31.90	24.30
Percentage of children (classes 3-5) failing to read level 1 text or more	35.00	47.00	41.70	33.40
Percentage of children (classes 3-5) failing to do subtraction	41.00	55.00	58.0	45.10

*Compiled from Annual Survey of Education Report (ASER) – 2005, 2006, 2007, 2008

It is clear from the figures that the percentage of children of classes 1-2 who cannot read letters or words has declined marginally form 27% in 2006 to 24.4 % % in 2008. Similarly, the percentage of children in these classes who cannot recognize numbers 1-9 has decreased from 38% to 24%. The progress in reading ability and arithmetic operations is also equally disheartening. However, in some states like Bihar, Madhya Pradesh, and Chhattisgarh there has been some improvement in the situation during the last two years.

During the last one decade, the privatization of school education has been very fast in India. Parents who can afford are more inclined to enroll their children in high fee-charging private schools as compared to government managed schools. In a sample survey conducted in 2003 (Muralidharan K and Kremer M, 2006), it was found that 28% of the population of rural India has access to high fee-charging private schools in the same village. Most of these schools have been established within the last five years and are located in financially weak areas where government schools have shown poor performance. Over a few years in the recent past, the number of privately managed schools, which are now about 17% of all elementary schools, has increased faster than government run schools mainly because of the preference of parents to educate their children through English as a medium of instruction. Some of these private schools – about 2% of all elementary schools in the country, are residential in character. Private residential English medium schools are much in demand, especially among wealthy and prosperous families. ASER 2008 notes that the proportion of children going to private schools has gone up from 16.4% in 2005 to 22.5% in 2008. The overall growth of private schools in short period of three years from 2005 to 2008 has been more than 37%. The growth of private schools has been highest in the states of UP, Rajasthan and Karnataka. In some states the percentage of children going to private unaided schools is as high as 40%. In the states of Kerala and Goa about 50% of the total enrollment is in private schools which are mostly aided by the state governments.

Goyal (2007) conducted a study on 6000 students of grades IV and V selected from 200 government, private aided and private unaided schools in the state of Orissa and found that overall learning levels were lower, absolutely and relatively, in government schools than in private schools. The average percentage correct scores in government schools ranged from 30 to 40 percentage points, half or a third below the average scores in private school. A similar study conducted in the state of Rajasthan by the same author showed that the average percentage correct scores in government schools ranged from 40-50 percentage points, a quarter to a fifth, below the average scores in private schools. The results showed that private schools, whether aided or unaided, outperformed public schools. Such findings provide directions for policy interventions for raising quality of schools in the public sector through increased funds and effective utilization of facilities. The studies also pointed out that teachers in private schools get much lower salaries than teachers in government schools and private schools are 3-4 times more cost-effective than government schools in terms of learning gains per rupee, showing that there is much room for improving the cost-effectiveness of government schools.

Teachers' Quality and performance

Teacher is central to the system of education. His very presence in the classroom has a great impact on the overall personality and social behavior of children while his absence tarnishes the image of the school and teaching profession. Improvement in the quality, efficiency, and equity of education, to a considerable extent, depends on the nexus of teaching and learning, which is in turn influenced by the quality of teachers. The teacher has been identified as the single most important factor influencing the quality of education by the Indian Education Commission and the National Policy on Education. Consequently, the government of India, like that of many other developing countries, has been trying to meet the challenge of improving the quality of education by improving teacher quality on several fronts—by raising pre-service education requirements, improving teacher training, increasing the diversity of the teaching force and promoting stronger participation by local government and community organizations.

The World Bank celebrated the Global EFA Week in 2006 from April 24 to April 30 whose focus was 'Every Child Needs a Teacher''. It was emphasized that achieving EFA depended on having enough professionally trained, adequately paid and well-motivated teachers. A high dropout rate of school children is largely due to lack of adequate facilities, large-scale absenteeism of teachers and inadequate administrative control and supervision. According to recent reports of the government of India, about 12 % of all elementary schools in India are single teacher schools catering to nearly 5% of the total enrolment (Mehta, 2008). While Kerala has an average of 9 teachers in elementary schools, the states of Uttarakhand, Madhya Pradesh, Meghalaya and Chhattisgarh have less than 3. The average Pupil Teacher Ratio for All India is 1:36. Bihar has the worst teacher pupil ratio at 1:64, Uttar Pradesh has 53

and Jharkhand has 49. It has been found that about 50% of elementary school teachers in India have themselves not studied beyond the higher secondary level (Class XII). Just about 35% are graduates and another 17% are postgraduates and above. But, that leaves 45% who have never been beyond school level.

Teacher absenteeism is a serious problem in India. A team of economists from Harvard and the World Bank made three surprise visits to 3,700 randomly-selected schools in 20 Indian states and found that at any point of time 25% of the teachers are absent from school. The head teachers were, on average, truant 5% more often than ordinary teachers. Salaries do not make any significant difference to truancy except in private schools. There was state-wise variation in this respect also. The state of Maharashtra has the best record with a truancy rate of 14.6%, followed by Gujarat (17%) and Madhya Pradesh (17.6%). The worst offender is Jharkhand (41.9%), followed by Bihar (37.8%) and Punjab (34.4%). Absence rates were generally higher in low-income states.

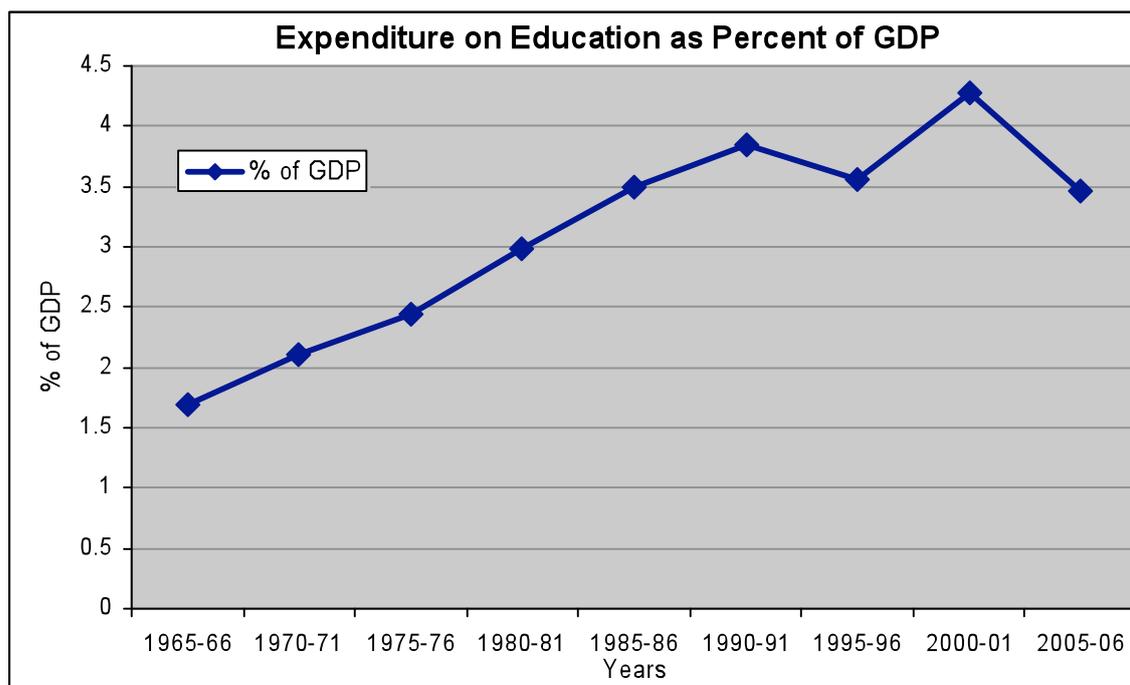
Teachers' absenteeism has been an acute problem within the school education system all across the globe. Comparable studies done in other countries, show India as one of the worst cases. Bangladesh, for instance, has a teacher absenteeism or truancy rate of 16%, Zambia 17%, Papua and New Guinea 15%. Among the known studies, only Uganda does worse than India, with 27%. In the USA, the teacher truancy rate in 1993-94 was between 5 and 6 percent. The existing literature on this issue shows that the teachers' absentee rates in developing countries tend to be as high as 27 per cent.

The Government of India has recently tried to deal with the problem of teacher absenteeism by hiring teachers, called para-teachers' on contact basis in the primary education sector at a mass level. This practice has raised serious question regarding the quality of education at primary level, as the academic and professional qualifications of these teachers are relaxed and lowered as compared to those of regular teachers. They are also paid less. Therefore, a peculiar situation is prevailing in India's primary schools where we have two sets of teachers appointed as 'regular' and 'para-teachers' working in the same school and performing the same duties. But they are governed by different set of service conditions.

Other Factors affecting quality

The author feels that these learning deficiencies may be attributed to certain systemic factors such as lack of adequate infrastructural facilities, large-scale absenteeism of teachers, overcrowded classrooms, and traditional teaching methods based on rote learning. There is a common complaint that schools are under-equipped, understaffed, and overcrowded. More than 4% schools have no building, 9.5% have a single classroom, 1.3% schools have no teachers, over 16% are single teacher schools, 50% schools have no regular headmaster, and over 7% have no blackboard. The average class size is 40 (91 in the state of Bihar). Quality, in all kinds of human endeavors, depends on the quantity and quality of human and material resources put in. Education Commission (1964-66) recommended that at least 6% of the GDP should be spent on education. The Commission agreed that it would be costly for a poor country like India, but warned that not spending would be costlier. The recommendation was accepted by the government and concrete proposals were incorporated in National Policy on Education -1968. But unfortunately, even after more than four decades since the Commission's recommendations, the government has not been able to raise the financial resources for education to the desired level.

In 1965-66, public expenditure on education was 1.69% of the GDP which increased to steadily to 2.44% by 1975-76 and to 3.49% by 1985-86. Through the National Policy on Education-1986, the government reiterated its commitment to increase public expenditure on education to 6% of the GDP as early as possible. During 1990s, some progress was made in this direction and the figures rose to 3.56% in 1995-96 and to 4.28% in 2000-01. The figure of 4.28% achieved in 2000-01 is the highest so far (Figure 1). But after this, the figure started declining and by 2005-06 it came down to 3.46%. Even now the figure the figure is hovering around 3.50%. It appears that the Commission's dream will remain unfulfilled.

Figure 1


Studies have reported that private schooling is more cost-effective than the Government managed schooling. As reported by Kingdon (2005), the recurrent per pupil expenditure in private schools is only 41% of that in government schools and 55% of that in aided schools. The relative lowness of per pupil expenditure in private schools is due to the fact that teacher salary levels are drastically lower in private than in government schools. The average teacher salary in private junior schools is only 42% of that in government schools and 43% of that in aided schools. In other words, there are large economic rents in the salaries of teachers in government funded schools as compared to private schools. The same author (Kingdon & Teal, 2002), in another study, found that enhancement of teacher salaries in private schools resulted in the improvement of academic achievement of their students, while in the case of government school teachers, this strategy had no impact.

The use of information technology in the classroom in order to make teaching-learning process more effective appears to be a distance dream because only 13 % schools have computers which are mostly used for official purposes. However, under XI Five Year Plan the government of India proposes to improve ICT facilities in schools because it has been found that students who often do not perform well in conventional subject examinations demonstrate high success levels in the use of ICT and IT-enabled learning (XI Plan document Vol. II, 2008). It is believed that IT could provide new directions in pedagogical practices and students' achievement.

Covering the course in time and preparing students for examination is the major concern of school systems in India. The entire teaching-learning process is dominated by examination system which determines how teacher would teach and how students would learn. Teaching has virtually reduced to one-way transmission of information from the teacher to his students. The nature of evaluation of educational outcomes forces children to memorize huge textual material to be reproduced in the answer books in the examination hall. There is hardly any place of for development of understanding, reasoning, creativity and higher abilities.

Future policy prospects

Education is one of the most important aspects of human resource development. Poor school performance not only results in the child having a low self-esteem, but also causes significant stress to the parents. Parents are indifferent to school-attendance of their children and children lack proper motivation to learn due to unfavorable environment and poor quality of teaching in schools. Large-scale absenteeism and truancy as also high dropout rates and low scholastic achievement are some of the unpleasant and adverse consequences of poor quality of education imparted in schools. The issues of quality need to be addressed urgently by way of identifying the factors that impact it and bringing about required improvement in them.

Due to socioeconomic considerations, the major emphasis in educational policy-decisions has been on expansion of schooling facilities during the past six decades so as to ensure that minimum educational opportunities are made available to all sections of the society, especially to weaker and marginalized groups. While good progress has been made towards providing universal access to elementary education, secondary education is still awaiting due attention. The process of creation of basic infrastructure for elementary education has almost been completed under the schemes like *Sarva Shiksha Abhiyan,* though much is still left to be done. The focus has now shifted to issues related to quality of education imparted in elementary and secondary schools. The quality of education has suffered because of a variety of reasons including inadequate planning, poor instructional strategies, inadequate training of teachers, and poor infrastructure in rural schools, outdated pedagogy, teacher absenteeism and inefficient supervisory and administrative mechanism. The Human Resource Development ministry has asked the state governments to appoint more teachers for mathematics and sciences to improve quality of school education in India. According to the National University of Educational Planning and Administration annual survey, released in January, about 57 per cent schools in India have less than three teachers and about 11 per cent have only one teacher (Hindustan Times, 6th Feb 2008).

Poor leaning may also be caused by poor health. According to a recent report of the World Bank, about 47% children in India are underweight. About 26% of the people in India live below the poverty line. One half of India's poor is located the three states of Uttar Pradesh, Bihar, and Madhya Pradesh, Maharashtra, West Bengal and Orissa account for 22.5% of poverty. Although, during the last three decades the school curriculum at national level has been revised and updated at least four or five times, yet, the quality of education remains dismal. The main reasons for this state of affairs are: non-conducive learning environment; non-availability of essential instructional material; dearth of properly qualified teachers; inadequate training/orientation of teachers in the modern methods of teaching; low salaries of school teachers; lack of dedication on the part of teachers; and inadequate public funding for education. In the XI Plan period, increased funds have been allocated for education sector to ensure that along with expansion of educational opportunities at all stages, quality education is also provided.

Conclusion

It is evident from the aforesaid analysis that India has reached very close to providing for access to free and compulsory elementary education for all eligible children, especially in terms of number of schools and enrollment. But, quality of teaching needs improvement. Greater emphasis needs to be placed on teaching at primary school level where linguistic and numerical skills are developed. These skills are fundamental for further learning. It is desirable that highly qualified and trained teachers are recruited for primary stage and made to work. A result-oriented system needs to be put in place with improved infrastructure, upgraded pedagogical practices and sound monitoring and evaluation mechanism. The Sarva Shiksha Abhiyan (SSA) is an ambitious program but aims at achieving quantitative targets only.

It is difficult to understand why public expenditure on education should go down from 4% to 3.5% during the period 2004-2008 when 3% education-cess is being levied on all tax-payers. In fact, allocation for education should have improved. The schemes like 'Mid-day Meal' for children may give desired results in terms of increased enrollment and retention of children, but in-built corruption which is reported in the news papers needs to be checked.

Social Constructivism in Teaching of Political Science in Indian Class Room

Assistant professor Sandeep Kumar

Assistant Professors

Department of Education

University of Delhi

ABSTRACT

This paper aims to provide an understanding of effectiveness of teaching of political science with reference to social constructivism. Paper include the theoretical framework of history and teaching leaning processes of political science and process of knowledge construction in social constructivism along with the lesson plan framework. Finding has been presented after the analysis of the data on some identified components, based on social constructivist approach.

Nature of instruction depends on the nature of the subject. In other words how we perceive knowledge and the process of coming to know provides the basis for educational practices. Each discipline and subject is different from the other in terms of subject matter and practices, which in turn are based on different epistemological assumptions. So what makes a discipline different from others is the manner or way in which they formulates their questions, how they defines the content to their domains and organizes that content conceptually and the principles of discovery and verifications that constitute the ground rule for creating and testing knowledge in their fields. Thus, it becomes important to study the nature of a subject, to ensure that instruction is informed by the theory of learning which is consistent with the nature of the subject being taught. So in the first section of this paper presents the theoretical framework of the research and will briefly understanding the history and teaching of political science followed by the knowledge construction process in social constructivism

Theoretical frame work of research

The following section is divided into two subsections: Political Science-Historical review and teaching learning process; and Social constructivism- process of knowledge construction.

<u>Political Science- Historical review and teaching learning process</u>

Political science as a systematic subject first developed in the times of the ancient Greeks with reference to the city-state. For the traditional political thinkers, knowledge was "a supreme means for improving the quality of human life in political association" (Johari, 1996). They studied the subject not as specialists but generally as seekers of wisdom and knowledge. Thus, what they studied constituted a part of general philosophy and this older mode of systematic inquiry represented a concern to search for, build and maintain a good regime in which human beings can live their lives in a manner consistent with their nature. Traditionally, the primary objective of political science was building theory about the ideal state based on speculation. It means building a value theory which is based on speculation about the ideal, and has a moral and ethical touch.

If we try to understand the scope of traditional political science we find that it was more concerned with normative issues such as 'what ought to be' and less with the empirical 'what is'. It tried to solve the problems within a ideal framework. In doing so, the traditional political thinkers did not reason in a vacuum and rather, sought knowledge within a context. In other words, the traditional political thinkers attended to both empirical facts as well as normative values in an interrelated manner. Thus, traditional

political science is an application of human reasoning, abstraction, or ideology, to political issues with a sense of the context to time and place.

In the initial phase, starting form the ancient Greeks to the first half of 19th century, a kind of universalism prevailed. During this period, the concept of state was identified with the society itself and thus the subject mater of political science was fully integrated with the general study of society. The political philosophers studied everything that interested them and there was no subdivision of specialization in the study of political matter. The subject remained a part of general philosophy and was studied as political thought. In the latter half of the 19th century, political science emerged as an independent discipline and as the state was also distinguished from society.

In 20th century political science as a discipline shifted paradigms from traditionalism, to behaviouralism and then to post behaviouralism. These days it is concerned with the applicability or praxis and its nature is moving towards action research. Easton (1997) says that the concern of political science is to solve the social and political problems in relation to their applicability. Primary objective of political science these days seems to be application of knowledge in the solution of societal problems. It is also important to know that in 21st century political science seek to integrate the study of normative premises of political theory with empirical dimensions of research i.e. they focus both on norms as well as on facts. Thus they broaden the scope to include both types of issues and questions. So the scope of political science is not confined to mere understanding of theoretical and practical aspects a of the state and government. Rather, it also brings into its folds the various socio- political problems and decision making process i.e. today political science is not a kind of subject which is suppose to teach the theoretical aspects but it deals more with the application and becomes an applied science. In this relation Barth, R.S (1991) said that nature of teaching of political science should be context specific so that students can make use of it in their real life situation.

These days we need a political scientist community which deal with the concept of political science with emotions and logic, whose purpose is to analyze the current situation and political system instead of just accepting them as they are and for this student's participation is important. According to Sharma, B.L. (2007) students' participation makes a class more live and authentic, because students individually or in groups play an active role in the process of knowledge construction. It is important to understand that the utility and importance of the subjects like political science is depends on to what extent we make its relation with practices of daily life.. Mishra,K.K. (1997) says that the highest achievement of a political science teacher is to relate the classroom teaching to the daily life of the students. In this concern William, Albert's (1989) develop a deep understanding, according to him the best method of teaching is that which is based on students' previous knowledge, beliefs, attitudes because on this basis students create a kind of bridge between what they know and what they will know. Bening & Bening (1996) says that teaching learning processes are purely based on the situation and context and there is no any universally good or bad method of teaching. Selection of method depends on the content, context and the students. But this is also true the teaching learning which is based on students understanding is good. We also need to understand that social, cultural and political contexts also play a major role in the process of knowledge construction. So it is the duty of a teacher to take care of all these aspects.

Thus, the above discussion deals with the development of political science and its teaching learning understanding in brief, which says the nature of teaching methods depends on the nature of the subject. If we do not consider these nature based relationship in teaching learning processes, it is difficult to make this process successful. It becomes more important for a subject like political science which receives its content from socio- cultural and political contexts. In next session we will understand the process of knowledge construction from the social constructivist point of view.

Social Constructivism- Process of knowledge construction

The constructivists view learning as an active process in which the learners actively construct knowledge as they try to comprehend their world. Each of us generates our own mental models or schemas through which we make sense of our experiences. These mental modals are constructed by our prior knowledge, current mental structures and existing beliefs. Constructivism includes the work of Piget, Bruner, Vygotsky, Dewy, Glaserfeld etc. constructivism basically based on these two principles 1) Learners are active constructor of knowledge and not passive recipients and 2) The function of cognition is adaptation to the world and not accurate representation of the reality.

There are three types of constructivism. Trivial Constructivism, Radical Constructivism and Social Constructivism. Trivial Constructivism believes that learners are active participants in the construction of knowledge and knowledge does not exist independently of the knower. It does not dismiss the concept of objective reality and believe that the purpose of cognition is to construct mental structure that accurately represents the objective reality. Radical Constructivism does not dismiss the existence of an objective reality but considers it unimportant. All knowledge is coloured by one's subjective experiences and the function of cognition is adaptation and construction of viable explanations of experiences. Social Constructivism believes that subjectivity plays a major role in the process of knowledge construction. It emphasises the social context of learner where knowledge and learning embedded. Thus knowledge is socially generated. Knowledge is social not individual construct. Social aspects like language, symbols, cultural tools, social practices etc play an important role in learning process. Here we will try to understanding more about social constructivism.

Social constructivism is an approach about how people learn. It implies that we can not take information as if it were a liquid and pour it into someone's head as if the head were a receptacle. So social constructivist approach is about facilitating the learner to go beyond simple recall and move towards understanding, application and competence. It believes that knowledge or reality does not have an objective and absolute value or at the least, we have no way of knowing reality. Von Glasserfeld (1995) indicates in relation to the concept of reality: "It is made up of the network of things and relationships that we rely on in our living, and on which, we believe, others rely on too." The learner interprets and constructs a reality based on his/her experiences and interaction with the surroundings. Diriscoll (2000) says that every knowledge can be understood in its own context and lived practices have an important role in this process. To emphasis the role of context in knowledge construction Steffie and Gale (1995) clarified that meaning of words whether individual or social takes place in social context. He said meaning in linguistics develop through social interaction. Here we need to understand that each individual has their own different socio-economic and historical context and background that is why they have different kind of leaning processes and so they need different kind opportunities to explore their environment.

Social constructivism places the emphasis on the interaction with others; knowledge is seen entirely as a negotiated human construct. Jonassen (1994) said to create the teaching learning environment effective; create real world environments that employ the context in which learning is relevant; focus on realistic approaches to solving real world problem; provide multiple representation of reality; present authentic tasks; support collaborative construction of knowledge through social negotiation etc.

So it is important to provide authentic environment to the learner to develop their understanding and knowledge. In this concern Ernest (1995) said that sensitivity towards and attentiveness to the learner's previous constructions and the use of multiple representations of concepts is very important in learning process.

Situated Cognition is one of the important concepts related to Social constructivism which we need to understand which assumes knowledge to be social construction as opposed to knowledge being seen as personal constructions. The terms situated cognition, situated learning, situated action or situativity denote an array of related perspectives falls under the broad umbrella of Socio-cultural constructivism. This theory claims that every human thought is adapted to the environment, which is situated, because what people perceive, how they conceive to their activity, and what they physically do develop together.

Social Constructivism emphasis cooperative learning. According to Griffin (1995) cooperative leaning offers many benefits for students, it improves both academic learning and social skill, for teachers, it is an aid to classroom management and instruction. So cooperative learning teaches social as well as academic skill because through this process student learn to honor and respect one another's differences , to support one another through learning processes, to communicate effectively with one another and to come to a consensus or understanding. So Social constructivism believes that every one is an active constructor of knowledge, knowledge is context specific which is embedded in context, and teaching leaning processes are purely based on the nature of content and context.

Frame work of lesson plan based on Social constructivist approach

Social Constructivism as an approach deals with how we learn and make meaning of our surrounding. It believes that people construct knowledge and understanding of the world by them selves. And the basis of this knowledge and understanding is their experiences and reflection over them. J.S. Chall (2000) says when we learn new knowledge; we try to relate it with our previously constructed knowledge and experiences. In this process we can accept that new knowledge or we can reject as well, but in any situation we are the active constructors of our knowledge.

Social constructivist learning approach raises the importance of different activities and practices in class room. Generally it means providing different and specific opportunities to the students to construct their knowledge based on reflection before, on and after the action. A constructivist teacher always motivates students to know about the knowledge and importance of the activities they are doing in the class, not only this even how and why these activities are helping them to understand the concept. Raising questions about the thinking processes of one self and learning methods student of constructivist class become an expert learner. According to Freeman (1998) we can understand this process like a spiral where student do continuous reflection on their experiences and face new complexity. This complexity leads them to new knowledge. That is why an important role of the teacher is to promote reflective practices.

Lave & Wenger (1998) said that the social constructivist teacher provides problem solving and discovery based opportunities in the group to the students to construct their thinking, understanding and knowledge.

Before we discuss about the format of lesson plan, it is important to understand some of the characteristics of social constructivist teacher.

- Become one of many resources that the student may learn from, not the primary sources of information

- Engage students in experiences that challenge previous conception of their existing knowledge.

- Allow students to develop and drive lesson and seek elaboration of student's initial responses. Provide some time to think after posing question.

- Encourage the spirit of questioning by asking thoughtful, open ended questions. Encourage thoughtful discussion among students.

- Use cognitive terminology like classify, analyse, and create when giving task.

- Do not separate knowing from the process of finding out..

- Encourage students to challenge each other's conceptualization and ideas.

- Encourage self analysis, collection of real evidence to support ideas and reformulation of ideas in light of new knowledge.

The above discussions provide a kind of basic understanding to understand the class room processes of a social constructivist classroom. With this understanding let's discuss the format of a social constructivist lesson plan. Social constructivist approach believes that we need to provide such opportunities to the students so that they become active participants in the teaching learning process. On the basis of the above understanding now we will talk about the basis of format of lesson plan

Engagement of the students—

This process engages the students in the class with the help of question or any kind of appropriate event. Activities take place during the engagement maintain the interest of the students in the class and provide chance to them to know what they know and what they need to do to know more. We can start

this process with instruction or with less instruction but the complexity of this process depends upon the context or the background of the students. Engagement develops the interest of the students in the teaching learning process. D. Sheridan (1993) says successful engagement leads to the successful lesson. Engagement is preliminary task which create a relation of students with the class room practices. This platform provide opportunities to analyse their past experiences and knowledge. So successful engagement is the first step to ensure the participation of the students in the class.

Exploration—

After engagement student should get a chance to explore the content with sharing their more experiences. The purpose of this process is to help the students to understand the concept with sharing their experiences with each other. Student should be given enough and appropriate time for exploration. Teacher can also raise some important questions and incident to help students' thinking process. The role of the teacher is that of a facilitator. Teacher may also ask some extra questions to develop the deep understanding of the students.

Explanation—

After the exploration, scientific explanation of the concepts being studied should be done. Teacher can make available concepts to the student with any method (lecture, demonstration, reading etc) but students' participation is important during the entire process. Students should also be given chances to share their experiences, what they have experienced regarding given concept and how can they accommodate this new knowledge with previously constructed knowledge with changes or as it is. This is the right time to provide the content systematically to the students and use different learning theories. This is the time when students moves from concrete to abstract regarding the concept and also moves from already existing knowledge to the new knowledge. Role of the teacher is to provide the feedback and direct the discussion and learning process.

Elaboration—

Next step is to help students to elaborate the concepts. Elaboration helps students to know how to apply the learned concepts in different situations and also help them to develop new conceptual understanding. Interaction among the students is very essential for elaboration and the development of reflective understanding. During this process teacher participation also become important for the discussion, so that discussion can take the right direction.

Now let us understand how to use all above terms (Engagement, Exploration, Explanation and Elaboration) in the lesson plan format. So on the basis of above understanding developed lesson plan is given below

Lesson Plan No.

Subject:	Name :
Topic :	Class :
Date :	Period:

Objectives related to content: Should be written in the form of process and opportunities will be provided.
Objectives related to political science : broad objective of the class

Methods, Technique and Teaching Aids : What so ever method, technique and teaching aids want to use. Preferably collaborative and cooperative learning techniques should be used.

Engagement : To draw the attention of the student, Motivate thinking process and

recalling previous knowledge and experiences.

Exploration : To provide time to the student to think, plan, organize, systematise and

analyse the collected information and knowledge.

Explanation: To involve students in the process of analyzing the explored information or knowledge and to help them to develop their understanding reflectively.

Elaboration : To provide them opportunities to the students to develop broad and concrete understanding of the concepts and their applicability in real life situations.

Role of the teacher : What role the teacher is suppose to play during the class such as facilitator, guide, helper, mentor etc.

Home work : it is not necessary to give home work after every lesson. Home work must be analytical, reflective and application based in real life situations.

Data collection and analysis

On the bases of the developed lesson plan format twenty lesson plans were made and executed with eleventh class to teach political science. Concept on which lesson plan were made were given by the school teacher. Some of the concept or lessons given by school teacher were Political Theory, Rights, Liberty, Equality, Social Justice, Citizenship etc. As concepts were given by the school teacher it became a challenge because now it can be effectively find out to what extend social constructivist approach is effective to teach any concept of political science.

To collect the qualitative data researcher did participatory observation while teaching the class and noted down all processes immediately after the class. After all the lesson plans were executed a qualitative analysis was done on the basis of some components. Components for analysis were also develop from the theoretical framework discussed in the first part of this paper. Analyses were done on six components those are given below.

Component 1: evidence of conceptual understanding based on appropriate methods, basic concepts, knowledge construction and conceptual communication.

Component 2 : engagement of students to develop the understanding and meaning construction through reflection which may include appropriate learning techniques, self evaluation, respect of alternative views, analysis, feedback from teacher etc.

Component 3: Application of knowledge in real life situations.

Component 4: Active participation of students in exploration and explanation with cooperative and collaborative work, their own thoughts and questions.

Component 5: Use of students' experiences for effective teaching-learning process which includes students' past knowledge. How this knowledge help to build new understanding of different concepts

Component 6: Use of challenging curriculum and situation to develop depth understanding.

Findings

In this section findings of the research is being presented which is based on the analysis done on the six components mention above. As it has been mentioned earlier that the effectiveness of the social constructivism in teaching of political science being observed and analyzed from first to last class and find the results. These findings are being presented here as general trends.

Critical Thinking-

Critical thinking involves the process of discrimination, evaluation, and analysis. It also provides space to reconstruct of the process of synthesis and thinking on the basis of analysis. During the last classes researcher found that students collected information from best possible sources such as oral, verbal, reflection, observation, experience, reason etc which shows the evidence of critical thinking of students. It is also important to mention that during last classes student gave more focus to develop the thinking process about the concepts instead of just knowing the truth. It was also observed that in relation to what to believe and what to do, critical thinking takes place in the process of problem solving and decision making. Except all above there are many other observed incident or dimensions those shows the evidence of critical thinking. Such as—

- Students raised many meaningful questions with deep clarity.
- They collect relevant and appropriate information and interpret with abstract thought.
- They tired to achieve reasoned results and conclusion through appropriate criteria and standards.
- Fee thinking on alternative view of different ways of thinking.
- Effective communication to solve the complex problems.
- Make the difference between the ideas and conclusion on the basis of logical or illogical.
- Raising question to their own thinking and ideas to develop systematic understanding.

Analytical thinking and understanding –

It was also observed that they tried to understand the hidden principles and strategies behind the concept instead of just understand it descriptively. Students not only provide meaning to different concept even set the limitations of the meanings. They show evidence to find out logical conclusion through the analysis, identify the issues, interactions and diagnostic understanding on available information and knowledge. There are some other points which show the evidence of analytical thinking and understanding in students' thinking.

- Students' evaluation of the appropriateness of the available content to develop the conceptual understanding.
- They also evaluate the importance and appropriateness examples and experiences of the teacher and students.
- They tried to understand the different ideas, debates and solutions from different perspective.
- They also tried to understand relevance based conclusions.

Reflective thinking—

Reflective thinking also being showed during the process of critical and analytical thinking processes by the students. In this process they understand reflection as an active, awareness based and careful thinking which leads them to generate the knowledge. Here it is important to mention that during the reflective thinking processes students think about their own knowledge and after analysis they develop

their understanding regarding concepts. Following points also shows the evidence of reflective thinking done by students.

- To determine, what kind of information is required to understand the available issues and concepts.
- To collect available information and analyzing or synthesizing.
- To develop understanding about different reliable ideas for related concepts.
- To understand analysis or synthesis from every possible perspective.
- To provide space for analysis of own thinking in relation to other perspectives and ideas.

Except these, skillful use of information, organized an systematic understanding of the ideas, open ended analysis also shows the evidence of reflective thinking.

Metacognition abilities—

Metacognition abilities means to think about once own cognitive abilities. It also means to think how to think. There are several incidents being observed in the class where students ask question about their thinking process and ask why they think, the way they think. In this process students were very attentive to about two things, first the development of their learning and second if development of learning is not in proper direction, changing the strategies to achieve that proper development. Evidence of such abilities show the characteristics of metacognitive abilities. When student become able to control their thinking processes, they become more capable learners. In brief, being aware about reason behind their thinking, to be aware about on self, to control their leaning process are the clear evidence of metacognitive abilities..

Everyday cognition—

It is directly related to every day practices. Students develop the process of understanding about the given concepts of political science through daily life examples and experiences. To relate all the concepts to their daily life, helped them to develop their understanding deeply about the given concepts. These kinds of evidences become clearer in further classes. Relevance of examples, importance of context, source of knowledge etc also become clearer in late classes. So it was being observed that relating of daily life experiences with the concept helped students to understand and develop the thinking process more efficiently.

Understanding of multiple perspectives—

Students tried to develop the acceptable understanding of different perspectives. They also learned how to respect others perspectives and ideas as well as how to give importance to them to facilitate the conceptual understanding for concepts. Learning processes start with the analysis of multiple perspectives. It is also very important to understand the leaning processes of political science with the interpretation of multiple perspectives. More ever political science is the subject which gets its content from social contexts so in this regard understanding of multiple perspectives become more important. Observed classes shows evidence of such examples.

Relevance of past experiences—

Past experiences and past knowledge is very important in the construction of new knowledge. Research finding shows that student used their past knowledge to construct new knowledge and with this develop their reflective thinking processes. Teacher provides them opportunities to share their life experiences and students also make use of it for their learning. Student learned that experiences are the bases of learning. So awareness about their experiences and using them in learning facilitate them to develop new understanding of different concepts.

Collaboration—

Opportunities to work in collaboration provide chance to students to analysis different concepts with different perspectives and with multiple ideas. Through group work (collaboratively) student could able to understand such concept, those they can not understand alone. In group work student become

familiar with the understanding of other students and develop their understanding collaboratively. That is how working collaboratively provide a good platform for the students to develop their thinking.

Self responsibility for knowledge construction—

Social constructivist approach provides opportunities to the student to understanding that they are active constructor of knowledge and so they are responsible for their learning, that is why student become more aware and attentive in the class about their learning and tried to understand concepts with relation to their own experiences. They also understand that it is very much possible that student may have different understanding about the same concept because everyone constructs their own knowledge and that process is context specific.

Sensitivity towards the political science concepts—

Students show the sensitivity towards the concepts (liberty, equality, social justice, secularism, rights etc) and related important issues discussed in the classes. Students also show their sensitivity and concern with untouchablity, social injustice, religious deadlocks, and inequality in equality during the classroom processes. All this become possible only of social constructivist approach where student get chance to learn from their own and other experiences. Student showed and develop their concern regarding sensitive issues, what else can be expected from an effective political science class.

Higher order thinking skills—

Students develop the skills to use higher order thinking skills regarding several topics from the social constructivist environment, such as types of liberty, types of rights, why not social justice, gender equality etc and learn classification of examples according to the concepts, directed thinking and knowledge construction. So we can say social constructivist teaching learning environment provide better opportunities to learn.

Student-student and teacher-students negotiation—

It is important to provide challenges to the students in learning processes. For this teacher should create an environment which provide chance for negotiations about the concepts. Same environment was provided to the student in this research. This environment leads them to the right track of thinking and understanding the political concepts. Negotiations helped them to develop balanced view about between their own ideas and others ideas. Negotiation with teacher provides them space for critical reflection because they were getting challenges from teacher in terms of questions or situation or incidents etc.

Conclusion

Above findings of the research show that social constructivist approach facilitates teaching of political science in positive direction. One of the strong basis behind this facilitation is similar nature of political science and social constructivism. Students showed the evidences of engaging them self in the processes of reflection, critical and analytical thinking, self evaluation, metacognitive abilities, higher order thinking skills, collaborative work, respect of multiple perspectives, sensitivity etc which helped them to provide opportunities to develop conceptual understanding about different political science concepts. It was also found problems and hurdles related to the implementation of social constructivist approach was for very short time and gradually they removed from the situation automatically. So finally we can conclude that social constructivist approach is very effect in teaching political science, it is to understand the nature of both and create teaching learning environment and such environment will provide scope for the students to construct their own knowledge.

Trends and Reforms in Higher Education in India

Dr Herkan Neadan Toppo
Lecturer,
Department of International Relations,
Jadavpur University, Kolkata 700032
West Bengal (INDIA)
hntoppo@rediffmail.com, hntoppo2007@gmail.com

Introduction:

Since the ancient of ages India has seen the glorious tradition of higher education which is being percolated for a long period of time through generation after generation in different disciplines and areas of knowledge through existing institutional system. The simulation of knowledge gave way to the great civilization, which became the centers of advance learning. Although the knowledge was exclusively theoretical and academics, and it was related to the basics as a part of liberal education which was an imitation for the common people. For example Buddhism promoted institutionalized higher learning in this country through nationwide network of *Viharas* in its attempt to enlighten and to emancipate the masses through learning of the Buddhist philosophy. Whereas the new dimensions of higher education now clearly envisages development of knowledge and skills for a sustainable future as requisite changes taking place in human lifestyle and values. So this is an age in the aegis of development in science and technology and a strong belief of building capacity with such features and specialties which offer a cutting edge in competitive competence in global demands in its economic role. The mode of education changed with the change of time. The new waves of liberalization and globalization have redefined the transnational provision of higher education through the mobility of the programmes or educational institutions form one country to another. Consequently, with the liberalization of economy and globalization, Indian economy has acquired buoyancy and has already decided to launch 'operation knowledge' as a part of the continuous expansion and improvement of the facilities of modern equipment but also a gigantic task to redesign teaching - learning in any discipline. Hence, the issue of accessibility of quality higher education arises in the context of the transition from the elite to the mass education. Many trends are putting new pressures on the conventional system, forcing many institutions to review and amend their existing policies and procedures.

The aim of the study on this topic is to focus on mainly Three points: First on the challenges and prospects of the internationalization of higher education, Secondly on social equality and justice in Indian context and Thirdly, prospects of the new developments in the higher education system.

Historical Development:

During the last 150 years, India has widened access to higher education quite extensively. But the basic thrust of development planning during the first two decades in independent India was essentially on growth and development (Raza, Monis, (ed.), 1991, 22, 58). The philosophies of education veered round a general "all round development" approach covering language, cognitive or intellectual, motor, physical, creative, emotional, aesthetic, spiritual, social and moral (Pardian, Cynthia, 2006, 1). The encouragement to the mass education came through largely by the involvement of British in Indian education system, particularly from the late nineteenth century, which brought a rapid growth of colleges - established both by the government as well as private agencies, for spreading Western education (Hasim, S R, 2006, 17). At the same time, Christian missionaries had found western education most efficacious for Indian society. It was found that the rise of a popular education policy of missionaries at the beginning of the twentieth century was from below (Bara, Joseph, 2000, 301). So, Christian missionaries in India were the catalysts for the rebirth of learning and intellectual aspiration (Kabir, Humayun, 1956/1961, 26, 98-99, and 126-27).

The English higher education in India can be said to have begun with the establishment of Hindu College in Calcutta in 1817, the first Europeanized institution of higher learning. The educational policy was articulated in a 1854 dispatch from Sir Charles Wood to the Governors of the East India Company. It laid down guidelines for founding a University system, modeled on the University of London, that would affiliate the existing colleges, examine students, set standards of courses, prescribe texts and confer degrees. Subsequently the first three Universities (Calcutta, Bombay and Madras), established in 1857 were developed on this model with the aim of the cultivation of the European literature and science. In 1882, Hunter Commission and 1902 Raleigh Commission was set up for readjusting the system education to the changing context was felt even in the pre-independence. Only in 1904, the Indian Universities Act was the first step towards reform and in 1917, the Calcutta university commission headed by Sir Michael Sadler; recommended setting up of the Intermediate colleges also emphasized the need for 'Residential University'. The Association of Indian Universities was established at the initiative of Government of India as the Inter-University Board of India and Ceylon in 1925.

In post-independence India, the Radhakrishnan Commission came to be set in 1948, immediately after independence and recommended a three year integrated courses at the BA and BSc level. Few years later,

on the recommendations of AIU, the University Grants Commission was established in 1956 which regulates monitors and also a funding agency for higher education.

A very thorough study of all aspects of Indian education system was undertaken in 1964-65 under the Chairmanship of Prof. D S Kothari, Consequently, the First National Policy on Education (NPE) was formulated in 1968 and the New NPE in 1986.Revised slightly in 1992. Acharya Ramamurthy committee of 1990 revived the proposal of NAAC which was endorsed in 1992 by the Central Advisory Board of Education (CABE).

In 1987, All India Council of Technical Education (AICTE) was established with Human Resource Development (HRD) Minister was its chairman. And AICTE has set a committee in 1993 to recommend appropriate measures for streamlining higher technical education. Committee favoured for establishment of an Education Development Bank of India' with working capital of Rs 3,000 Crore created out of donations by the Center, State Government, and National and International financial institutions. In 1993, a development was the appointment of a full time chairman to the AICTE on the expiry of first Five years when the Union Minister of HRD also doubled up as Chairman of this body. This was illegal after 1987 when P V Narasimha Rao moved over to external affairs. AICTE is now as central to professional education as the UGC is to mainstream education. AICTE controls engineering, professional and pharmaceutical education.

Meanwhile the Gajendragadkar Committee, 1994, recommended for Autonomy of University as an academic necessity. Later on The Punnayya Committee (evaluate the function of UGC): finds that it is not doing its functions (co-ordinate and determining the standard of higher education and disburse grant) properly. It submitted its report in January 1994 to UGC. It gave adverse verdict. Wheras the Gnanam Committee (submitted its report on higher education in 1990), set up by UGC under the Chairmanship of Prof. A Gnanam, made a strong case for making University / College teacher , Head and Vice chancellors more accountable through a well –laid out system of performance appraisal:

   i)   Prescription of Code of ethics for teachers, principals, officers including V Cs

   ii)   Code of Conduct etiquette for other staffs

   iii)   Code of Discipline for the students

Still the present approach towards higher education is governed by the National Policy on Education-1986 and Program of Action -1992. It translated this vision of Radhakrishnan and Kothari Commission in Five principle goals for higher education which includes: 1. Greater Access 2. Equal Access (or equity) 3. Quality and Excellence 4. Relevance 5. Promotion of social values.

India is home to approximately 17% of the world's population (India Census 2001) and total estimate of literate: 1,080,264, 388, and 65.35%. Meanwhile in terms of enrollment of close to 12 million students, India is the third largest in the world in the sphere of higher education, next to China (21 Million) and the United States (17 Million). But India tops the world in terms of its 18,500 institutions. India is the largest education system in the world. Nevertheless, the Growth of enrollment and institutions has been phenomenal since independence, the former from One million in 1947 to 12 million in 2005, and the latter form 2,000 to 18,500.during the same period. The system consists (as of 2007) of 252 State universities

Recently, the National Knowledge Commission, a high-level advisory body to the Prime Minister of India, with the objective of transforming India into a knowledge society and in its endeavour to transform the knowledge landscape of the country has submitted around 300 recommendations on 27 focus areas during its three and a half year term. While the term of the NKC has come to an end, the implementation of NKC's recommendations is currently underway at the Central and State levels. (http://www.knowledgecommission.gov.in/) For reforming higher education the NKC recommends establishment of 1500 universities by 2015 to attain a gross enrollment ration of 15%. The XI Five Year Plan envisaging an unprecedented expansion of higher education in India has proposed 30 New Central Universities, * New IITs, 7 New IIMs 10 National Institutes of Technology and 20 Indian Institutes of Information Technology among others. The expansion of education with excellence and equity are imperative for a democratic society to sustain itself in long run.

Existing Higher Education System:

Education being in 'Concurrent List' of Indian Constitution, universities can be established by the Central as well as State Governments. Traditionally universities have been extending the privilege of the mechanism of affiliation. This still remains the basic structure of providing higher education in India. These Universities have a large number of degree colleges affiliated to them for imparting undergraduate education. Some colleges also have post graduate and teaching and research. One of the

main tasks of such universities is to oversee the academic standards of the affiliated colleges. Some of the Universities have over 100 Colleges affiliated to them and over 1, 00,000 student's enrollment. Indian Education Scenario in the existing policy framework of higher education, only universities are authorized to award degrees.

A second type of comprises the Unitary Universities like Aligarh, Banaras, Lucknow, Baroda, Annamalai and Jadavpur. These Universities do not have major responsibilities in respect of affiliated colleges. In most of them, there is undergraduate and post-graduate teaching as well as research.

There are also some Universities which are in some sense a mixture of two types. Their territorial jurisdiction is usually confined to the city in which the university is located. The colleges located within the city are affiliated to the University. Some of the colleges are, however, managed by the University and are known as its constituent colleges. Delhi University is a typical example of the mixture of the two types.

A New type institution in higher education is provided by the agricultural Universities, established on the American pattern of Land Grant Universities with stress on research and extension work. The first of its type to be established was Govind Ballabh Pant University of Agriculture and Technology in Pantnagar, Uttar Pradesh in 1961. Initially it was thought that every State would have One agricultural University. Exceptions were latter made due to different agricultural and climatic regions within some states. Agricultural Universities are largely funded by the Indian Council of Agricultural Research (ICAR).

Another new category are the Institutions of excellence such as IITs, IIMs, IISc, and IIITs etc were created through special acts of Central Government, Governments –Central and States continue to control higher education. Existing system of awarding degrees through the Universities has evolved over the time and it has acquired many nomenclatures, viz.

1.   Central Universities
2.   State Universities
3.   Deemed Universities – Conferred on outstanding institutions
4.   De-Novo Universities – Conferred on some newly established institutions in specialized subjects with promise of their being developed as universities.
5.   Private Universities – setup under the State Legislative Acts.

Prospects and Challenges of Internationalization of Higher Education:

The increasing commercialization has led market – driven motives to govern higher education, which has created imbalances. Privatization and commercialization attracts provisions of general agreement on trade services (GATS). Due to increased mobility across the borders, opening up of higher education sector to foreign participation under GATS thus becomes hotly debated.

This definition includes internationalization as a process that has both international and local elements. It can be said that in the present knowledge age internationalization of higher education is now a fact of life that cannot be neglected (Powar, K B, 2001, 74). In India, as in many Asian countries, a new wave of globalization is building up a new socio-economic system. GATS, a comprehensive legal framework of rules and disciplines covering 161 service activities across 12 classified sectors - e.g.: telecommunications, financial, energy, distribution, environmental, health, education, construction services, has given birth to the Foreign Education Providers (FEPs). Consequently, the contemporary vibes of the internationalization and commercialization of higher education under GATS has made education a lucrative commodity.

As opined by Jane Knight, "Internationalization of higher education is the process of integrating an international /intercultural dimension into the teaching, research and service functions of the

institutions" (Knight, Jane, 1997, 8).

There are four modes under which services can be traded under GATS such as cross border supply of service covers distance education, BPO, etc. Consumption abroad takes place with physical movement of persons as students , tourists, patients etc. going abroad to avail themselves of the services; commercial presence; service providers move to another country to offer services (Offshore Campuses); persons moving abroad to work (Teaching faculty, researcher working abroad). Students from Asia and Africa come to study in India, where the committee on Promotion of Indian Education Abroad (COPIEA), was established in 2002 to tap global market. Altbach (1989) points out those foreign students, who are the principal manifestation of internationalization, are an embodiment of cosmopolitan culture and provide valuable cross cultural perspectives.

This can be looked within a broad concept of internationalism embracing a wide variety of intellectual, cultural and economic relations among nations. The principal functions of higher education requiring further analysis are:

1.   Teaching
2.   Research and its application through technology, specific development programmes, and relationship with commerce and industry and the community more generally.
3.   Learning from the student perspective
4.   Institutional management and , planning and administration
5.   Agencies, instruments and procedures for policy making

For each of these functions we need to consider the following international activities:

1.   Academic mobility: The worldwide expansion of higher education can be reflected in the light of academic mobility (it includes students, faculties and universities/ institutes going transnational seeking for better opportunities) and increasing enrolment rates in tertiary education, which is an indicator of human development index. International mobility of students has grown rapidly in the past two decades. About 2.7 million students's world-wide study in a country other than their country of origin. It is not a new phenomenon that Indian students study abroad. What is a recent phenomenon is the rapid growth of student mobility. One of the distinct trends of the present day international politics is the shift in focus from Europe to Asia. The increasing role of Asia particularly India is becoming evident.

One of the very important features of academic mobility is the presence of the international students in Indian Universities:

2.   Foreign Education providers: The internationalization and commercialization of higher education under General Agreement on Trade Services (GATS) has given birth to the Foreign Education Providers (FEPs), which are broadly categorized into three types: i) Operating in their respective home campuses ii) Offshore campus iii) Collaborative partnership – twinning programmes or to establishment of franchisees. In India, as in many other developing countries, inflows of FEPs are increasing rapidly.

The numbers of FEPs are rapidly increasing in the Indian subcontinent and the upcoming transnational circumstances India might gain regional hub status in the South Asia region. It can easily attract students' from Nepal, Sri Lanka, Bhutan, Bangladesh, Far East Asia, South East Asia, West Asia and Sub Saharan Africa. Whereas Singapore, Malaysia and China have already emerged as major global players in the cross-border higher education, thereby they are attracting many reputed Universities, colleges and institutes in their countries to establish built environment campuses on partnership basis. They have the strict controlling mechanism of FEPs in their country. Consequently hosting a large pool of globally mobile students. At the same time desire among the young generation to earn a foreign degree for lucrative job opportunities in business and hotel industry sector is very high.

Source:http://unesdoc.unesco.org/images/0014/001465/146541e.pdf

Nevertheless, the transnational higher education tends to be concentrated in the following cities and have their campuses therein: Mumbai – Nasik – Pune Zone, Chennai, Hyderabad, Delhi and National Capital Region (NCR), Bangalore, Chandigarh and Kolkata. These regions are cosmopolitan in nature. So it attracts the FEPs and foreign students' more easily. Maharastra has emerged as a leading player in getting attention from foreign varsities especially the Mumbai – Pune – Nasik Zone

Table 8. Classification of FEPs Advertising in India – 2006

So the internationalization of higher education has given a new dimension to academic mobility. There is an emergence of different modes of supplying education facilities to fulfill the students' requirements for enhancing better career opportunities. The internationalization and commercialization of higher education under General Agreement on Trade Services (GATS) has given birth to the Foreign Education Providers (FEPs), which are broadly categorized into three types: i) Operating in their respective home campuses ii) Offshore campus iii) Collaborative partnership – twinning programmes or to establishment of franchisees. Globalization refers to higher education which involves teaching research and service functions of university or university level-institutions- a subset of the totality of post secondary education. These have undergone considerable change over the last two decades. The numbers of students seeking to enroll themselves for higher education in universities or institutions are increasing rapidly. This change has profound implications for society and for the institutions themselves. Higher education institutions are now responding to demands for rethinking their offerings in the light of the consequent greater diversity in the student body, in such respects as age range, interests, prior experience and domicile. The activities that

contribute to achieving these objectives include joint research projects, student exchange programs, staff mobility projects, specially designed programs aimed at foreign students, joint curriculum development initiatives, specific initiatives in the context of university development aid policies etc.

In India, as in many other developing countries, inflows of FEPs are increasing rapidly. The FEPs are advertising in Indian newspapers (National and Regional) to attract the students' who desire to earn a foreign degree. So far there are no regulatory measures to control the entry of the FEPs. Amidst all uncertainties, our country is working out its regulatory policies to invite the FEPs to be incorporated in the higher education system. A noteworthy feature of the finding is that around 563 universities, Colleges and Institutes from 30 different countries are advertising in India through their consultancies or agencies. In terms of advertisements received, the leading countries are UK, Australia, Canada, and USA. There are also unexpected countries that have representation in India – like Nepal, Mauritius and Kyrgyzstan. The legal status of these FEPs and Indian partners remain a challenge in the absence of regulatory measures and guidelines. Therefore FEPs are mushrooming in some specific regions – Mumbai – Nasik – Pune zone, Chennai, Hyderabad, Kolkata, Chandigarh and Delhi (National Capital Region (NCR)). There are many issues that need to be reflected upon. They include – equity and access, relevance of these FEPs-offered courses, equivalence of degrees, governance and management and potentials. Meanwhile the courses offered are in attractive packages (some with scholarship) which might make India a future hub of higher education in the South Asia region. But according to the study conducted, it has been found that there are some apprehension concerning the legal status, recognition and accreditations of FEPs. Concerns have also been raised over the comprehensive range of study programme, of promoting entrepreneurship, and of a complete education amongst students'. Also of concerns are their cooperation with the government and the business sector in developing learning and research. The issues of socio-economic realities and social justice also raise certain questions. Are FEPs committed to the establishments of a community where equality of opportunity will be a reality for all?

Social Equity and Justice:

Education in the Indian subcontinent is virtuoso and is foremost a source of liberation. Liberation form illiteracy which had led to subjugation and exploitation of the long oppressed sections of the society. So the issue of access and equity to higher education is being addressed in the light of vast economic disparities, cultural and linguistic diversities and extremely uneven opportunities of learning and aspirations of the

potential students. Article 46 of the Constitution states that, "The State shall promote, with special care, the education and economic interests of the weaker sections of the people, and, in particular of the Scheduled Castes and Scheduled Tribes, and shall protect them from social injustice and all forms of social exploitation". Articles 330, 332, 335, 338 to 342 and the entire Fifth and Sixth Schedules of the Constitution deal with special provisions for implementation of the objectives set forth in Article 46. These provisions are being fully utilised for the benefit of these weaker sections in our society. Social Justice through university education. The studies in educational reforms gives birth to many questions like equal opportunity for higher education though the finance Minister in his budget speech on the Union Budget 2005-06 made the following announcements- 'The key to empowering the Scheduled Castes and Scheduled Tribes is to provide top class education opportunities to meritorious students.'

There are disparities in Gross Enrolment Rate (GER) hs been seen between male and female, Muslims, Hindus and others, poor and non poor from rural and urban areas, scheduled castes (SC), Scheduled Tribe (ST) Other Backward Classes (OBC) and others are evident.. The enrollment of women has seen a consistent upward trend from less than 10 percent of the enrollment in 1950-51 to about 40 percent now. A similar growth trend is observed fro students from the disadvantaged sections of the society. (Agarwal, Pawan, 2009).

The achievements made in the literacy rates of Scheduled Castes and Scheduled Tribes are also significant compared to those in the 1991 Census, i.e. 37.41 per cent and 29.41 per cent respectively. Besides, the growth in female literacy amongst the Scheduled Castes and Scheduled Tribes is also at a faster rate as compared to male literacy figures. In India the female literacy increased at a faster pace (10 per cent) than male literacy (8 per cent) over the period 1981-91. Overall, the literacy rate recorded an increase from about 19 per cent of the population aged 5 and above in 1951 to 52 per cent of the population aged 7 and above in 1991. The rate of female literacy also rose noticeably from 9 per cent of the population aged 5 and above in 1954 to 40 per cent aged 7 and above in 1991. The enrolment of SCs/STs in secondary and senior secondary levels was 18.6%, their enrolment in higher education came down to 17.4%. Enrolment in professional, technical and vocational education stood at 14.7%.

The literacy rate among SCs has increased from 25 per cent in 1981 to 38 per cent in 1991.

Correspondingly, the literacy rate among STs has increased from 17 per cent in 1981 to 30 per cent in 1991. In spite of these increases, the levels of literacy among SCs and STs are distinctly lower than that of the population as a whole (52 per cent). Gender disparity is conspicuous among SCs and STs. The ratio of female literates to total number of literates improved from 69 in 1981 to 76 in 1991. The rural-urban differential in male literacy declined from 27 per cent in 1981 to 26 per cent in 1991. However, the rural-urban difference in female literacy increased. Female literacy varies from 8 per cent in Barmer district of Rajasthan to 94 per cent in the Kottayam district of Kerala.

Source: Selected Educational Statistics (2004-05), MHRD, Govt. of India, 2007 (As published in Agarwal, Pawan (2009) 55)

Expansion of higher education over the years has democratized higher education. Despite this, there are significant inequities in participation. To varying degrees, gender disparity, inter-religious group disparity, disparity across income groups, inter-caste disparity and rural urban disparity all exist.

It is seen that though participation of women students and students form SCs and STs has raised significantly, participation of girls, SCs and STs in professional, science and commerce programmes is proportnately less.

In higher education, affirmative action has been the most and controversial policy of correction to achieve the equity objective. So the importance of caste identity in the Indian polity has been the basis of preferential treatment for admission in institutions of higher education since independence. Numerical quotas have been vogue for the SCs (15%) and STs(7.5%) at the national level. Later some states also introduced quota-based reservations for the OBCs-a 27 % quota. The Central government had made it clear that all these would be addressed and the rollout would be done in a phased manner. The Eleventh Plan outlay made financial provisions to accommodate this expansion. (*Agarwal, Pawan (2009) 59*)

Prospects and Development:

1.   Since then higher education had always been vibrant. In the wings of time the form of education developed was a moreover teacher-centric system and initial years of independence it was considered relevant to the industrial society. (Takwale, Ram, 1998, 10).

2.   The issue of accessibility of quality higher education arises in the context of the transition from the elite to the mass education and has significant implications in the sense that it demands redefinition of the aims of higher education (Gautam, Satya P, 2005, 2).

3.   The movement for change has arisen from a wide spread sense of inadequacy of the traditional paradigm. This sense of inadequacy cannot be understood unless we look beyond the historians' craft at the changes in the wider world.

4.   The emerging new trends in the higher education focus on multi-disciplinary programmes that allow students to tailor their study to match their interest, helping them gain edge in specialized industries or broaden their career options. In this context, considering the ongoing internationalization, this has developed as a concept, originated from globalization. This has occupied the attention of the international agencies and institutions of higher education.

5.   As a result, this new phase in higher education relates the universities and multiversity's (multi-campuses and even single universities) to internationalization. It is identified in this study that they are often co-existing, interlocking, or contradictory in nature. "Internationalization involves the co-existing multiple missions of the university. Thus, the postmodern university will likely internationalize its mission of teaching, research, and public service in the global information age" (Scott, John C., 2006, 3, 4).

6.   The major trends which are to addressed are by the University higher education system:

a.   Student Mobility (student studying outside their home country has raised).

b.   Staff mobility (the notion of brain drain circulation is gaining currency, with a recognition that scientists working overseas very often return to their home countries in due course)

c.   Trans-national education (universities setting shop in overseas locations; countries active in this provision include the USA, the UK and Australia)

d.   Increase in international teaching activities (concentrated in professional subjects such as business and IT)

e.   International collaboration in research

Conclusion:

In Conclusion, I can say that the strategies to shape our Universities to meet the local and global needs, the restructuring of the Universities to suit the present day requirements in a changing scenario and to meet the visions for the future. Functionality of Modern Indian Universities during the last 150 years is a phenomenal shift in their prime role from conferment of degrees to commitment for development and values of University education. The new paradigms of education which is in need of Multi – disciplinary Universities and quality assurance in higher education

GLOBALIZATION: EMERGING TRENDS IN

HIGHER EDUCATION

(A Study of India)

Professor. Gattu Satyanarayana

Osmania University

India

ABSTRACT: In the era of globalization Indian state and society has been facing a serious crisis in adopting global policies and programmes on the one side and to meet the needs and aspirations of the people with in the frame work of constitutional obligations on the other. This study mainly aims at to explain the implications of globalization on higher education in terms of policies and programmes within the frame work of problems and prospects.

Higher education has been gaining lot of importance all over the world more so in India due to the impact of Globalization and global policies on the one side and also changing needs and aspirations of the people of respective countries on the other. It is well known fact that the concept and purpose of education though the same for all categories of people and nationals allover the world but its process, system, curriculum development may vary depending on the unique socio-economic and cultural conditions of given nation and its various sections. Sometimes the system of education may vary depending on the socio-economic cultural patterns of the various sections of the population within the nation. As such there are variety of educational systems and process at a given time allover the world at various stages of education. Though the western education systems and models have been highly appreciated for its scientific, practical orientation and utility but eastern educational systems particularly Indian education has been theoretical and integrated personality development oriented despite being its very high achievements in various fields of knowledge since ancient times. However, there are changes taking place in all systems of education such as general, technical and professional education of India at every stage in response to global policies of contemporary times. As such Indian education has been experiencing lot of crisis in adopting the trends of world over and its consequent effects are very serious on the not only structure and function of education but also various sections of population specially the weaker and deprived sections. Every nation has been orienting and revamping educational systems for its human resource development and marketing inline with global policies and perspectives.

In view of the above there are radical changes taking place in India in the structure, functions and curriculum of all courses of higher learning in line with globalized policies.

This paper aims at to understand the globalization and its impact on higher education in India in terms of policy pursuits and structural changes. Further, it also deals with the problems and prospects of the emerging trends in higher education and its positive and negative impact on the various sections of the people specially the marginalized.

However, it is generally viewed that the education system in India specially higher education has been acquiring and adapting a system of western model which is commercial in nature and it is accessible to those who can afford and interested which is against the indigenous model of Indian educational system which inclusive of various sections of the population who can not afford specially such as schedule castes, schedule tribes and backward castes and women. In the post globalization era those who are marginalized sections would be further marginalized and difficult for them to cope-up with new system which is resulting in lot of disparity and inequality in opportunities.

Evolution of Higher Education in India

The ancient history of India reveals that there are only two centers of higher learning namely Taxila and Nalanda. Western education introduced during the British Raj. The modern education system in India falls under concurrent list i.e, in the control of central and state government. Besides there are institutions which are autonomous in nature. There are articles in Indian constitution provides for education as a fundamental right and universities in India are run by state and central government besides there are some private universities and deemed universities. Historically private educational institutions have been contributing a lot. It is interesting to note that despite increasing investment in education, still 40 percent of the population is illiterate and only 15 percent of the students go to high school. It is estimated that "as of 2008, India's post secondary high schools offer only enough seats for 7 percent of India's college age population, 25 percent of teaching positions nation wide are vacant and 57 percent of college professors lack either a master's or Ph.D degree-----. Further, by 2007, there are 1522 degree granting engineering colleges in India with an annual students intake of 5,82,000, plus 1,244 polytechnics with an annual intake of 2,65,000. However, these institutions face shortage of faculty and concerns have been rank over the quality of education".[1]

In the context of achievement of institutional excellence in higher learning of various fields of knowledge in comparison to world universities the following discussion reveals status of higher education in India.

"Although, no Indian University made to the top 300 of the Chinese conducted Academic Ranking of World Universities in 2006, three Indian Universities were listed in the Times Higher Education list of the world top 200 universities.

Indian Institute of Technology, Indian Insititutes of Management and Jawaharlal Nehru University in 2005 and 2006. Six Indian Institutes of Technology and the Birla Institute of Technology and Science-Pilani were listed among the top 20 science and technology schools in Asia by Asia week. While the National Institute of Information Technologies has been renowned as the largest providers of Information Technology training and education company in Asia and among the top 15 global head of education. The Indian school of Business situated in Hyderabad was ranked number 15 in global MBA rankings by the Financial Times of London in 2009, while the All India Institute of Medical Sciences has been recognized as a global leader in medical research and treatment"[2]

G. Satyanarayana[3] in his preface to 'Globalization :Indian State and Educational Pursuits' states that the "contemporary Indian society has been facing lot of crisis in the filed of education.The problems and issues of educational pursuits, in terms of curriculum development, syllabus preparation, selection of students and teachers, teaching problems of the teachers and the overall environment of teaching and learning, problems relating to examinations, evaluations, medium of instruction, teaching aids and lastly the philosophy of education and its aims and objectives have all been raising anxious debates and large scale experiments-----   The trends of changes which are taking place are as follows:

1. Ownership of education (state ownership is declining, private ownership in increasing).
2. Increasing disparities in educational pursuits among various communities and sections with in the communities such as tribal, rural and urban and also due to socio-economic and political background.
3. The problems of medium of instruction, curriculum development and syallabus framing is increasing.
4. To make the relevance of education in the changing socio-economic conditions of the students and the society needs serious attention.
5. The inaccessible trends of education for poorer and rural students, which is against the spirit of the nature of state and its declared policies such as universalisation of education, uniform education and compulsory education are to be examined.

He further opines that 'the emerging trends of educational pursuits are not in line with Indian constitution of universalisation and uniform policy of education and Indian philosophy of education such as Gandhiji's concept of education 'earning while learning'. Rabindranath Tagore's aesthetic, creative and elitist education, Vivekananda's concept of education that 'it is a process of manifestation of internal capacity of a person which already exists in one self,' and Mother Mirra Alpha's concept of education is that it is not gaining something or concurring somebody but it is a process of learning by which one should reach to the outmost perfectibility in life'.

The contemporary trends in educational pursuits reflects the increasing expenditure on education and declining interest of the state, growing unemployment, declining importance to conventional courses, including the conventional engineering courses; capitalist kind of commercialization of education and as a consequence inability of the majority students to bear the expenditure. Further Government is also increasingly withdrawing its role and responsibility from the management of education.

As a result there are various changes taking place in the educational system and consequent implications are multidimensional. One may curious to know the changes in terms of--- 'What are the emerging trends in education? And what are the implications? And what is the present status of education among the various sections of the societies? What will happen to the earth bound societies who are still out of the framework of educational process who are in the dark and ignorance and struggling to exist? What are the constitutional obligations of the state? Who have to own the educational responsibility of the poorer sections? What will be the implications of globalization, liberalization, and privatization of higher education in India. He while quoting Jawaharlal Nehru's concept of capitalism, in Glimpses of World History states that ,'Capitalism is like a rock, however the long you may cook it, it would not yield you the food, only thing you can do with it is that you have to remove it altogether'

Further, the dominant discourse of the contemporary times revealed that declining importance to social sciences and increasing importance to computer sciences. This will certainly and adversely affect the majority students in India who normally come from rural and deprived sections who prefer to study non-technical and non-engineering courses which is affordable and understandable without much external aid and without much guidance from their families".

G.Satyanarayana[4] while discussing the responses of academic community on globalization and its implications states that "In response to the above policy trends there are seminars, symposiums, debates and discussions initiated all over the world by the intelligentsia concerned for the cause of marginalized nations and societies. One such international conference was organized by the World /Asian social forum from 2nd to 7th January 2003 at Hyderabad .It is a historical event .The chief guest of valedictory function was none other than the former President of India Sri K.R.Narayanan who is one of the intellectual giants of contemporary India. He has cautioned in his valedictory address that most of the nations of the world and more so the Indian nation and its states are going to be adversely affected by the process of globalization to the extent of uprooting identities. This affect will be more in the context of underdeveloped and developing societies and more so the indigenous earthbound poorer sections of the developing world. He concluded that 'unipolar systems are unnatural while multipolar systems are natural'. Hence, there is a need for unity of the developing societies to resist the developed world and their policy impositions. This is the only way to help the helpless people of developing world and their majority people not to further marginalize".

The following statement by the prime minister of India reflects the alarming situation of Indain higher education in the era of globalization:

" Our university system is, in many parts, in a state of disrepair…In almost half the districts in the country, higher education enrollments are abysmally low, almost two-third of our universities and 90 per cent of our colleges are rated as below average on quality parameters… I am concerned that in many states university appointments, including that of vice-chancellors, have been politicised and have become subject to caste and communal considerations, there are complaints of favouritism and corruption" .

– Prime Minister Manmohan Singh[5]

Globalization would further complicate the Indian education system in terms of its accessibility, affordability, nature, content, loosing control of the state and its accountability. The following discussion reflects the existing status of Indian higher education.:

"India's higher education system is the third largest in the world, after China and the United States. The main governing body at the tertiary level is the University Grants Commission (India), which enforces its standards, advises the government, and helps coordinate between the centre and the state. Accreditation for higher learning is overseen by 12 autonomous institutions established by the University Grants Commission.

As of 2009, India has 20 central universities, 215 state universities, 100 deemed universities, 5 institutions established and functioning under the State Act, and 13 institutes which are of national importance. Other institutions include 16,000 colleges, including 1800 exclusive women's colleges, functioning under these universities and institutions. The emphasis in the tertiary level of education lies on science and technology. Indian educational institutions by 2004 consisted of a large number of technology institutes. Distance learning is also a feature of the Indian higher education system.

Some institutions of India, such as the Indian Institutes of Technology (IITs), have been globally acclaimed for their standard of education.The IITs enroll about 4000 students annually and the alumni have contributed to both the growth of the private sector and the public sectors of India.

Besides top rated universities which are providing highly competitive world class education to their pupil. India is also home to many universities which have been founded with sole objective of making easy money. Regulatory authorities like UGC, AICTE have been trying very hard to extirpate the menace of private universities which are running courses without any affiliation or recognition. Students from rural and semi urban background often fall prey to these institutes and colleges .

The following discussion reveals the picture of the technical education of contemporary India.From the first Five Year Plan onwards India's emphasis was to develop a pool of scientifically inclined manpower. India's National Policy on Education (NPE) provisioned for an apex body for regulation and development of higher technical education, which came into being as the All India Council for Technical Education (AICTE) in 1987 through an act of the Indian parliament. At the level of the centre the Indian Institutes of Technology are deemed of national importance. The Indian Institutes of Management are also among the nation's premier education facilities Several Regional Engineering Colleges (REC) have been converted into National Institutes of Technology. The UGC has inter-university centers at a number of locations throughout India to promote common research, eg. the Nuclear Science Centre at the Jawaharlal Nehru University, New Delhi"[6]

Madhuri N.V[7] While explaining the importance and challenges of higher education in 21st century elucidate the various issues of higher education in India with reference to changing requirements of higher education such as the significance of higher education, the skills required in the management of higher education, the requirement of sound regulatory mechanism to assess and accord accreditation by taking into account all the aspects of higher education ,   the need for evaluation and assessment of academic excellence , curriculum development with a balance between regional and national development , the need for the UGC to be empowered to provide an environment of teaching ,training ,development and participation, colleges to empower in all respects and provide moral and material support .She also emphasis the need for autonomous colleges with an objective of 'greater willingness on their part to accept the responsibility and accountability'. Interestingly it is pointed out that there is no much enrollment in the under graduate science educational courses .Further it is also emphasized on the technical education system should promote industry institutional interaction through apprenticeship opportunities, consultancies and sponsored research. There should be university industry interface to raise resources from non traditional sources such as industries and other commercial concerns and to make use of highly qualified trained manpower produced by the institutions of higher education. It is also pointed out that open university system in the country is on lines parallel to the general university system without initiated any innovative courses-----it should be ensured that course material should be easily accessible to the common man .Library facilities and the cost of the books have been declining in proportion to the increase of demand and the requirement the idea of networking libraries providing shared access to journal and books needs to be encouraged by providing necessary infrastructural support. Further, there is lot of hue and cry of increasing fees of higher education which cannot be

affordable to weaker sections of the society and there should be rational in the fees structure. The meritorious students of the weaker sections should be encouraged through the various systems of financial support such as scholarship. In the era of globalization it is natural that the foreign students are to be attracted for the higher education. The fees they pay will be a vital source of foreign exchange for the country. The examination reforms be initiated with appropriate mode of testing student ability, aptitude, and performance without favor and corruption on the objective lines but not issuing mere diplomas and degrees .As such India can enormously emerge as manpower resource center and as an asset in the 21st century if properly trained and encouraged. Further research and development at university level should be in tune with the long term goals of national development. The higher education institutions should be accessible to the people regardless of their class or caste—life oriented, job oriented need based opportunities should be made available to all the people. She while concluding states that, "the old dogmas of higher education cannot face new challenges. Our national education has to get out of conventional degree –oriented education and get to grips with national demands of developments and global market needs. A synthesis material and spiritual values instilled through our higher learning as our Salvationist instrumentalities and tools of collective progress".

Pankaj Das[8] while explaining democratization of education issues of exculsion and inclusion in policy depicts the actual picture in the context of Schedule castes and schedule tribe education. He while quoting (K.Sujatha, 2002) states that :

> "In India, the Scheduled Castes and Scheduled Tribes have been socially underprivileged, economically backward and economically deprived for centuries. Historically both the groups were denied social access to education. Scheduled Caste were systematically segregated from the village and were denied access to education. The exclusion of the Scheduled Tribes on the other hand was based on a different set of social and cultural factors. In one of the studies they were defined as the "double disadvantaged group" owing to their socio-economic and spatial marginalisation.- ------- Further he states while quoting Jaffrelot (2003) that "India is a case of political democracy without social democracy. The whole policy environment for inclusion in India reflects the fulfillment of political interest rather than the social interests; where equity is not a major agenda".

Anil G.Mudbidri[9] While explaining the "implication of globalization and privatization on reservation provisions of Indian constitution states that "Article 14 of the Indian constitution states that education will be free and compulsory till the age of 14 years. Education is considered a fundamental right .Hence, it confers equal opportunity to all in the field of education. Privatization of education, it is feared, goes against the sprit of this article. Today there is no application of "Reservation Policy" in privately managed Business Houses and Industries and the same way come true in the field of education. The number of students enrolling for university education will come down drastically. Today due to the encouragement given by the government, India has one of the highest number of students obtaining Post graduate education, but this may change with privatization."

Mallesh Sankasala[10] While discussing the impact of economic reforms and dalit population of India states that "the constitution framers under the chairmanship of Dr.Ambedkar who envisaged that state would play important role in the planning and socio-economic development of its citizens to establish egalitarian society .As such they provided certain safeguards such as social ,educational, cultural, religious ,economic .political and employment in the Indian constitution for dalits and other weaker sections. But "the free market ethos unleashed by the reforms, conceptually can neither confirm to the democratic sprit of the Indian constitution of 'one vote, one value', nor can it coexist with the system of positive discrimination embodied in these safeguards". He while discussing the impact of new economic policy states that it has very adversely affected the reservation policy of India in the public

sector and also private sector. The new economic policy which envisages privatization with increased high technology and its optimum use has adversely effected the job market of all the sections particularly vulnerable sections such as the dalits who mostly at the lower rung of organizational jobs without technical skills .As such they lost not only their jobs but also their livelihoods which they cannot find in other fields because of demand of technical skill and intensive competition for the less number of jobs as compared to the past."

National Policies and the Neoliberal Agenda

HariHar Mishra[11] in his unpublished article on "Globalization and Education: National Policies and the Neoliberal Agenda" critically examines the globalization and its implications on the national policies of education in India. He states that "the review report had made recommendations for significant changes in the National Policy on Education 1986 in consonance with the terms of reference which had directed the Committee to:

(a) make education an effective instrument for securing a status of equality for

women, and persons belonging to the backward classes and minorities;

(b) give a work and employment orientation to education;

(c) exclude from (education) the elitist aberrations which have become the glaring

characteristic of the education scene;

(d) lay special emphasis on struggle against (the) phenomenon of 'educational

institutions …. Increasingly being influenced by casteism, communalism and

obscurantism; and

(e) move towards genuinely egalitarian and secular social order.

(Expected from the Government of India's Resolution dated 7 May 1990 constituting the NPE 1986 Review Committee)

He further argues that: The political and economic framework for subjugation by global forces in the education sector emerged soon after the announcement of the New Economic Policy, when the Indian government was 'persuaded' by the IMF and the World Bank to accept the twin concepts of structural adjustment and a social safety net in planning and budgeting for social sectors. There was no choice, the government told the people, justifying its apparent 'helplessness', since these were the preconditions set by the Bretton woods institutions for extending further loans. Plainly speaking, these twin concepts implied that the government would, as part of the structural adjustment programme, incrementally reduced public spending on social sectors such as health, education and social welfare. Recognizing that such a reduction could lead to severe socio-political tensions, the IMF and World Bank 'offered' to create a social safety net by extending loans for the social sector on certain terms and conditions.

ASSAULT ON THE CHARACTER KNOWLEDGE: As was the case with the Macaulayian approach to education, globalization also aims at using education as a tool for building up various skills and capacities that are useful to the global economy (recall the competency-based approach of MLL). The post-Jomtien framework in which educational aims are being trivialized and curricular knowledge is either being reduced to mere literacy skills (for reading product labels and prices), or fragmented into bits of information or competencies (for reading factory instructions, punching keys at the computer keyboard or accepting the dictates of the market uncritically). This amounts to rejection of a holistic approach to building up an enlightened and humane society. In this paradigm, knowledge in the sciences, social sciences and humanities would need to be divested of its philosophical, historical, ethical, socio-cultural and aesthetic roots. Given the predominance market force in the globalized world, it can be predicted that only those courses, research programmes or training activities would receive financial support which have saleable value in the global market--------- . In this sense, there is a fundamental conflict of an epistemological nature between globalization and social development.

Alienation of knowledge from the social ethos is a logical out come of globalization. Increasing preference for the internet as a source of 'knowledge' and its screening or filtration by corporate forces on the basis of marketability, will lead to uprooting of a substantial population of knowledge from its social ethos. Those communities, sections of society or nations denied equitable access to digital technology or English, the dominant language of information technology, will neither share the digitalized knowledge nor be able to contribute their knowledge for human progress .Geo-cultural diversity will come to be largely ignored and eventually have little role to play in defining or qualifying knowledge. This trend will, over a period of time, establish the hegemony of only globally acceptable parameters of what is worth knowing in the age of globalization.

FRAGMENTATION OF KNOWLEDGE : There is no place in the post-jomtien view of curriculum for the world of work being pedagogically integrated with the world of knowledge. Similarly while defining child centeredness joyful learning or multi grade teaching in DPEP literature no attempt is made to envisage knowledge in the content of the social ethos".

NATIONAL KNOWLEDGE COMMISSION

GOVERNMENT OF INDIA

Prime minister of India, Dr. Manmohan Singh constituted Knowledge Commission on 13/6/05. "The commission was to advise the prime minister's office on policy related issues with regard to education, research institutions and reforms needed to make India competitive in the knowledge economy.

The terms of reference of knowledge Commission are:

1. To build excellence into education of system to meet the knowledge challenges of the 21st century and increase India competitive advantage in fields of education of knowledge.
2. To promote creation of knowledge in science and technology laboratories.
3. To improve the management of institutions engaged in intellectual property rights.

4. To promote Knowledge applications in agriculture and industry.
5. To promote the use of knowledge capabilities in making government an effective ,transparency and accountable service provides to citizen and promote wide spread sharing of knowledge to maximize public benefit.

Many of the recommendations of the NKC are already in the implementation stage .There are number of controversies erupted since its inception, the commission with regard to its recommendation of and their consequences on structure and functions of higher education and their implications on various sections of Indian society specially deprived. The commission spoke ….against the human resource development ministry's   plans to increase quotas for backward castes in institutions such as I I T's. Majority of the vice-chancellors respected the policy direction given in KNC on the higher education. However, some of the vice-chancellors of various leading universities accept major directions like structural reform, augmentation of university number, freeing appointment of vice-chancellors from direct or indirect interventions on the part of the government etc.

As back drop of KNC the Yashpal committee, 2009 has been constituted to advise renovation of rejuvenation of higher education. It has recommended several things of which major are the setting up of a constitutional body-"The national commission for higher education and research" [12].

Uttam B.Bhaite [13] in his exhaustive presentation of higher education in India in its historical perspective aptly highlights the impact of globalization and its implications not only on various sections of Indian society but also on the emerging structural and functional orientation of higher education in India. He also explains " its pervasive impact on national policies, cultural systems, institutional structure, interpersonal relations etc".

He further states that,it is prudent to examine the wider implications of globalization on a unique society like India .Since "higher education is now being treated at the policy level as more for the individual good than public good. So, it does not deserve any special support from the government. Since it is more further the individual good., its beneficiaries have to bear its cost….. The principle of cost recovery is a core part of this educational neo-liberalization. However, it would be prudent to examine carefully as to how far it would be wise to adopt it in a society like India which continues to be characterized by traditionally inherited acute inequalities based on class, caste, gender, ethnicity and religious affiliations and having larger sections of disadvantaged population awaken and to the notion of equality and aspiring for upward social mobility". While concluding He states that ,"It can also be reasonably predicted that unless India articulates a comprehensive policy with regard to higher education and unless the supervisory and monitoring agencies exercise their authority diligently and with reasonable strictness, the Indian higher education system is likely to plunge into deep chaos".

CONCLUSION

In view of the above discussion the following conclusions are drawn. The higher education is going to be steadily privatized and commercialized for which the state will readily provide policy, legislative, financial and technical support. Knowledge will be gradually trivialized, fragmented and alienated from its social ethos as well as its aim of social development. All deprived sections of society such as dalits, tribals, the majority of other backward classes, cultural and linguistic minorities and the physically and mentally disabled, two thirds of each section being girls, will suffer from further discrimination and exclusion in the education system.

The national economy will not be reprioritized for the purpose allocating adequate resources for education and social development. Instead, there will be increasing dependence on external aid to fulfill constitutional obligations by compromising under pressure from global market forces.

The constitution and laws will be marginalized, amended and even tampered with in order to fulfill the combined dictates of globalization .

Thus, it may be concluded within the above limited spectrum of globalization and its impact on higher education has wider implications of privatization, commercialization and consequent structural and functional changes experiencing the field of education obviously enables the rich and enlighten sections enjoy the educational facilities and consequent grabbing the socio-economic and political power and other advantages more than the existing pattern on the cost of those who have not yet benefited even after 62 years of independent India's policies of uniform education for all, universal education, accessible and affordable education system would be a distant dream . For my imagination it will never come true and so far deprived sections get prepared to loose their roots of origin and hopes of better future and get prepared to lead a shelter less scattered life of unknown destiny.

As consequence of this trend the marginalized sections will be further marginalized and State has no role to play which will be the divine justice that is survival of the fittest and the sufferer will suffer due to their fate.

Repositioning local knowledge: Developing strategies for critical education research

Professor Fors Nils Olov

Indiana University of Pennsylvania, Ph.D. Candidate; People's Education Press (Beijing), Teacher Trainer

olafpep2008@gmail.com

Abstract

Problematized accounts of research and representation (e.g. Lyotard, 1984; Feyerabend, 1993; Atkinson & Coffey, 2003; Angrosino & Mays de Perez, 2003) force us to reexamine how we write and read research; by recognizing that research assigns power to certain representations, we can explore how our community discourses and praxes interact. The "objectivity cloak" of positivist research conceals the fact that research paradigms and questions, even the forms in which research is reported, reflect the agenda of privileged members of the community that the research supposedly serves. As Freeman (2007) notes, research privileges certain activities by validating and providing "meaning;" Georgakopoulou (2006) argues that research privileges certain "canonical narratives" and marginalizes others. So-called "global" narratives too often tend to represent the agendas and interests of a select few and, when imposed on local contexts, marginalize local settings, identities, narratives, and knowledge. Unless all participants in the global community are given access to the construction of knowledge, valuable resources are left unused. One way to counter the is to revise the goal of research and teacher education so that it is no longer limited to the construction and dissemination of a knowledge base, but rather the construction and validation of multiple communities that facilitate and support legitimate participation. Studies are needed that not only "capture" local knowledge but also enable participants to shape and validate the local context without being led by a master context.

This paper argues that researchers, teachers, and other knowledge constructors need to reduce and resist the marginalizing forces at work in the narratives and constructs we employ. The paper provides a brief description of how contexts interact and what the consequences are for contextualized research and practice, and argues that critical research and community building can be used to legitimize a greater variety of identities, positions, and activities. Critical recognizes that all research is ideological and subjective, and that research is a social act intended to bring about change. The objective is not primarily to "prove" or "discover," but rather to (re)position and empower all participants (researchers as well as subjects) and their knowledge. Shohamy (2001), discussing assessment, argues that use of such tools must be monitored and limited, that participation and access must be universal, that "those who develop tools of power to assume responsibility for their consequences," and that citizen's rights are protected (p. 376). These principles can be used to yield a set of strategies to inform practice and praxis. Critical research establishes discourse and knowledge at the local level, thus validating and strengthening the position of that knowledge. The goal is not to create a unified, single description or definition of knowledge, but rather to bring forward the multiple and diverse identities, roles, and narratives as they are perceived from the different participants. By doing so, it is possible to reveal and validate the many potential identities and positions that are available to—and that can be created by and for—the participants in the activity.

Women leaders in Malaysian Research University

Zaharah Hassan
University Kebangsaan Malaysia
zabha@ukm.my

Abu Daud Silong
Universiti Putra Malaysia
adsz@ace.upm.edu.my

Ismi Arif Ismail
Universiti Putra Malaysia

Abstract

Malaysia wishes to establish world class universities among the public and private universities in the country. As such, concepts like Research Universities and APEX University were introduced, emphasizing on rankings of their university in the world. Research universities are institutions with high priority on the discovery of new knowledge and the production of graduate students especially PhDs in a wide range of disciplines. The emphasis of these institutions is on the international nature that represents the leading edge of higher education's embracing the forces of globalization

Studies indicated that the success of many organizations is due to the leadership factor. In order for the Malaysian University to compete world wide it needs a new kind of leader that is considered effective and relevant in a fast changing world. What kind of leader can provide an effective leadership in this changing nature of higher education system?.

The purpose of this study is to identify the role and the competencies needed by these global or world class leaders to lead their organization in the new environment. Focus group interviews and semi structured interviews were held with different group of participants. This paper will describe the preliminary finding from interviews with five women leaders holding various posts in the university administration. Most participants feels that they have to assume new roles since they are leading a workforce that are shifting from traditional independent pattern of inquiry to becoming members of team oriented, cross disciplinary, and international partnership with research directed more often than before toward real world problems. To complement the new roles they have to acquire new competencies ranging from understanding diversity and multiculturalism, to recruitment of staffs and students at international level. Leading Research University effectively is crucial issue for policy makers, leaders, staff and the community at large.

Investigating the Performances of Government PR Practitioners: Contribution from Academe to Professionals for Work Efficiency Improvement

Dr. Komolsevin Rosechongporn

Chair of Doctoral Program in Communication

Bangkok University

Abstract

While business public relations practitioners work primarily to support marketing efforts and thereby generate sales and profits for their firm, Government PR people usually perform various tasks to promote understanding among the public regarding the government issues. The Government Public Relations Department (PRD) is the government PR tool to disseminate information deemed necessary by the government to the public, especially those in rural areas. The government issues are various, covering politics, economy, agriculture, and cultural aspects. The goal of these efforts is particularly to improve their life quality and encourage them to develop desirable understanding and behavior.

The Government PR practitioners have employed various media channels to accomplish their missions. Those channels include broadcast media (TV, radio, newspaper), print media (brochure, leaflet), and new media (internet). However, PRD has successively been accused of work inefficiency and inability to satisfactorily achieve its objectives. A provincial governor, for example, stated in one interview with the press that PRD has been promoting knowledge about democracy among the rural people for ages, yet vote buying among these people is still prevalent and becoming more devastating.

As a result, PRD has regularly requested PR educators to conduct a thorough investigation of their work, and provide training and workshop to their PR staff so as to improve their efficiency. This research, therefore, aims to investigate the current performances of the PR practitioners of PRD, as well as any hindrances to their efforts in achieving work efficiency. The research findings will be used as inputs for conducting further workshops to improve their work performances. Since PRD has eight regional offices around the country, eight focus-group interviews were conducted with 10 key informants in each group. Those key informants include the regional office director and deputy directors, the heads of radio and TV stations, operators, and reporters.

The findings reveal that PRD regional offices have faced both physical and functional problems. Physically, they lack adequate budget and staff to perform their jobs effectively. Thus, one person has to perform many tasks (producer, scriptwriter, program announcer) and has no time to improve their work efficiency. Inadequate budgets and under staff have deprived them of any attempt to conduct proper pre- and post- work evaluation. Without valid research to investigate the public's need, interest and satisfaction, their work eventually becomes unfocused, uncreative, and unproductive.

Functionally, they confessed that, despite their recognition of the significance of research in improving their work efficiency, they have very little knowledge in doing proper research and evaluation which are two most important phases in PR work (Research-Action-Communication-Evaluation or RACE). So far, they have been trying to evaluate their work by talking around with the public, but those efforts are neither scientifically valid nor reliable.

After the research is completed, a workshop on PR research and evaluation will be drafted and launched to the Government PR practitioners in the PRD regional offices. The focus of workshop will be on the small-scale research which can be conducted with minimal budget and staff.

The Study of interaction between different interactive learning type and different learning styles throughcomputer network, in learning problem solving

Dr, Sorakrich   Maneewan
King Mongkut's University of Technology Thonburi , Bangkok , Thailand

Abstract

This research has three purposes which are 1) to study interaction between different learning styles and interactive styles in learning through computer network, in order to learn problem solving by using a case study, 2) to study problem solving capabilities in students that learned through computer network with different learning interaction styles, and 3) to study problem solving capabilities in student that learned through computer network with different learning styles. Research method was to develop two styles of interactive lesson through computer network in order to learn problem solving in photography fundamental. First style is interactive between students and contents and the second style is interactive between students and students. These two lessons were evaluated by experts, and were developed through the good quality computer network. The sampling group was 80 undergraduate students of the School of Industrial Education who enrolled in EDT334 subject (Education Technology in Photography Fundamental Technique) and included four different learning styles: 1) Divergent Type 2) Assimilative Type3) Convergent Type and 4) Accommodative Type The simple random was used to define sample group and used Two-way-ANOVA statistic to analyze data.

The research result is following
1. There was interaction between interactive learning through computer network and different learning style at the 0.05 significance level. (sig = .003 < 0.05)
2. Students who learned from different learning interactive through computer network had the same capabilities in problem solving after learning at the 0.05 significance level. (sig = .910 > 0.05)
3. Students who learned with different learning styles had different capabilities in problem solving after learning at the 0.05 significance level. (sig = .000 <0.05)

Keywords : Problemsolving Capabilities, Learning Interactives, Learning Styles, Computer Network

1.Background and Significance of the Problem

To develop effective human resources, it requires education to facilitate and technology as well as computer network, available worldwide, to change the approach and the learning process into a new way. Furthermore, introduction should be paved in such a way that corresponds to the naturalistic approach in order to develop the potential of the learners to the maximum. The application of learning process where students can use computers as tools to acquire knowledge will lead to a new way of learning or self-directed learning. This kind of learning is better in that students are responsible for their own plan, practice and evaluation of their progress (Chai-Anan Samudavanija, 1997: 2). Self-directed learning is a process where learners analyze their own demand in their learning and set their learning goal to acquire knowledge, supporters and sources. Moreover, learners evaluate themselves (Dixon. 1992:2) Zhao (Zhao. 1988:3) supports this idea and says that the role of an instructor in a WWW classroom will change from knowledge distributor and the learning center into a new form in that learners will be the center of the instruction. Learners are the ones who acquire knowledge individually and they get support so as to develop their own potential to learn on their own. The learners can choose the lesson in the form of hypermedia which is a technique where main contents and related contents are linked together. The texts can be linked to related passages or images and sounds to allow learners to gain their own control. The sequence of the contents can be arranged and the appropriate schedule can be done according to the learners (Spiro Feltorich and Jaobson. 1991 : 30). Web-based Instruction is a form of learning where learners can control their lesson by acquiring knowledge in the learner center manner. There can be learner interaction as well (Gillani and Relan. 1996 : 135).

The advantages of the web-based instruction where instruction make the best use of world wide web technology (Budd, 1997) are as follows. 1) Instruction will be done according to the pace of learners (Self-pacing).The instruction need not be in the same schedule between learners and instructors. Learners can choose their learning time according to their suitability. 2) Media in this system are normally repetitive in multiple modes of delivery, namely, the instructors provide learners with many media with the same contents or similar contents so that learners gain various experiences, resulting in clarity and retention. This idea complies with McManus (Mcmanus.1996) in that web is a center which contains many benefits of other kinds of media, for example, media can be linked in various forms to present at the same time (we can link and organize presentation system from various sources). 3) Although learners, instructors and their peers in this course system do not need to meet face-to-face, there are other kinds of interaction in this communication technology and many programs to facilitate such interaction like e-mail programs. The quality of interaction through computer network and world wide web is better

than other kinds in that such interaction takes place in a more thoughtful way than immediate response (which is found in face-to-face classroom interaction). That is to say, learners in this interaction have many chances to think, reflect and find reasons before they answer (Unlike classroom, they do not have to answer immediately). This is beneficial for students, especially those who are shy to speak in classroom. In this system, they can share and discuss very well through computer network.(Owaton.1997)

Driscoll (Driscoll. 2002 : 5-9) emphasizes the importance of the interaction found through website as follows:
1. Learners can control their own learning. Control in this context means that learners can control what to be learned, the duration for learning, the depth of the contents to be studied as well as the contents or opinions that they would like to share.
2. Learners have opportunities to express their opinions equally. This is hard to be done in normal classroom.
3. Learners have interactions with instructors and their own peers. This will result in more interesting instruction and encouragement to support self-centered learning.

4. Viewpoints and attitudes towards the contents and lessons are broadened. This is one element found on web-based instruction. Learners have opportunities to explore their additional contents from websites and various sources of information, resulting in broader learning perspective. Therefore, if learners have opportunities to express or share their viewpoints, they will gain and broaden their own viewpoints as well as attitudes towards such contents and lessons by themselves.

Cooperative learning depends on the properties of computer network where learners can interact in terms of ideas and with instructors and their peers under the scope of the computer network.

Besides such above-mentioned instruction activities, David Kolb (David Kolb,1991) proposes the suggestions about the learning that the students or adults will gain learning experiences according to their own identity. The students have their own different Learning Styles. Some might be better in listening to lecture and report but others are better in various activities with many learning devices. Some might prefer reading alone but others might prefer discussing the topics with others. Learning styles are, therefore, important for selecting instruction approach.

E.G. Bogue (E.G.Bogue.1974 : 149-153) explains that the learners themselves know their own learning styles better than instructors. Therefore, instructors who study students' learning styles and students' learning styles preference will understand the students better. They will be able to develop strategies for instruction in such a way to corresponds to the demand of learners. This is beneficial and enhances the performance of the students. This is different from old instruction approach in which instructors decide by themselves which learning styles their students like. Paitoon Sinlarat (1981) also shares similar viewpoints as follows:

Gagné (Gagné. 1980) believes that the center of education is to teach persons to think, use their thinking power to achieve reasons to become a good problem solver. Educationists and psychologists all agree with Gagné in that problem solving is the most important learning result in life. Basically, in everybody's daily life there are problems to be solved all the time.

Problem solving is the goal of the Buddhist wisdom (Anderson ,1980). During practice, there are 2 things to be considered as follows:
1.   Problem solving must present ideas of world situations, that is to say, problem solvers propose ideas to solve problems (or mental model) to know the holes in such problems (Newell & Simon, 1972). Although only few agree with the definition of the holes in problems and mental models, such holes in mental models usually presents various models to explain the construction of knowledge structure, knowledge acquisition, knowledge reflection, mental image as metaphor to the system, along with the practice or the success of knowledge building (Jonassen &

Henning, 1999). Even though holes in internal problems might be outside and many tools must be used to present such ideas (Jonassen, 2000c), the structure of the ideas to fill up the holes is the highest end of the problem analysis.

2.   Problem solving must be based on the activities to fill up the holes in such problems. Thinking is an internal process (Jonassen, 2000b). Making sense with attention must be related to activities. Therefore, feedbacks can be found and directed with the role of knowledge and activities (Fishbein, Eckart, Lauver, van Leeuven & Langemeyer, 1990). Problem solving must deal with the holes in such problems or internal process.

Gick (Gick, 1986 : 99-120) proposes an approach to solve problems through 2 steps as follows:

1.   Construct Problem Representation: In this step, learners try to understand the problems and link such problems to previous knowledge and construct problem representation.

2.   Search for Solution: Learners search for ways to solve problems. Understanding need to be used to analyze the relationship between the things specified in such problem. Ways to solve problems are constructed and then followed in order to achieve the results to be evaluated later.

Julian et al. (Julian et.al, 2000 : 38-54) asserts that case study-based instruction can enhance learners in solving problems. The properties needed to be used for problem solving can be as follows:

1. Focus on the big picture
2. Work forward from what they know
3. Simultaneously consider multiple factors
4. Generate tentative solutions
5. Consider potential consequences and implications

According to such theories and research works as cited above, the researchers realized the needs to study web-based instruction as a learning innovation which grows rapidly due to the advances in internet system depending on telecommunication technology. There are many learning interactive forms between learners and contents as well as learners and peers. The results from one research work show that students are more satisfied with the interaction between learners and contents. However, they lack skills in learning in groups and discussion skills. That is to say, learners just answer the questions from the instructors; they do not answer the discussion topic. The topics raised are normally unrelated to the main topic. Gagné (Gagne'. 1980) believes that the center of education is to teach persons to think, use their thinking power to achieve reasons to become a good problem solver. Educationists and psychologists all agree with Gagné in that problem solving is the most important learning result in life. Basically, in everybody's daily life there are problems to be solved all the time. If web-based instruction through computer network is used to develop problem learning, it will be probable that both instruction approaches become successful. Learners can solve problems in such a good way. Moreover, it is useful for answering the question whether learners with different learning styles who interact through computer network between learners and contents as well as between learners and peers have different problem solving skills or not. This research results will be used to develop cooperation in school and workplace to define desire traits in Thai society. It is also beneficial for other computer network instructions in the future.

2. Research Objectives

1.   To study the interaction between different learning styles and interactive styles in learning through computer network in order to learn problem solving by a case study.

2.   To study problem solving capabilities in students that learned through computer network with different learning interaction styles.

3.   To study problem solving capabilities in students that learned through computer network with different learning styles.

3.Population and Sampling Group

Population consisted of all 259 undergraduate students at the Faculty of Industrial Education and Technology who enrolled in EDT334 subject (Education Technology in Photography Fundamental Technique) in the first semester of the academic year 2006.

Sampling Group consisted of 80 undergraduate students at the Faculty of Industrial Education and Technology who enrolled in EDT334 subject (Education Technology in Photography Fundamental Technique) in the first semester of the academic year 2006. They were from 2 classes.

Variables
  Independent variables are
1. Learning styles as specified by Kolb (Kolb,1991). There are 4 types as follows:
1.1 Divergers
1.2 Assimilators

1.3 Convergers
1.4 Accommodators
2. Learning interaction styles through computer network which consist of 2 types as follows:
2.1 Learning interaction through computer network between learners and contents
2.2 Learning interaction through computer network between learners and peers
3.Dependent variables are Problem solving capabilities in EDT334 subject (Education Technology in Photography Fundamental Technique).

Research Hypotheses

1.There is interaction between learning interaction styles through computer network and different learning styles

2. Students who learned with different learning interaction styles through computer network by using a case study have different problem solving capabilities.

3. Learners with different learning styles through computer network have different problem solving capabilities.

4. Tools used in this research

Tools used in this research were as follows:

4.1.The lesson through computer network about Education Technology Fundamental Technique was designed and based on 5 case studies. There were 2 kinds as follows:

4.1.1 The learning interaction through computer network between learners and Contents.

4.1.2 The learning interaction through computer network between learners and their peers.

4.2 Evaluation form for the web-based instruction in terms of the media structure and web design.

4.3 Evaluation form for the lesson through computer network in terms of problem solving capabilities.

4.4 Survey test on Learning styles by Kolb (Kolb, Rubin and McIntyre 1971; Kolb, 1991; Wolfe and Kolb,1984)

4.5 Test of problem solving capabilities in the course on Education Technology Fundamental Technique.

5. Treatment and Data Analysis

The treatment and data analysis were as follows:

5.1 The survey test on learning styles by David Kolb (Kolb, 1991) was used with students.

5.2 The results were used to classify students into 4 following groups

Group 1 Divergent Type
Group 2 Assimilative Type
Group 3 Convergent Type
Group 4 Executive Type

5.3 All students of 4 groups were chosen through simple random sampling method in order to have 2 groups of 40 as shown in Table 1.

Table 1 shows the form of the experiment

Learning styles	The learning interaction		
	Learners/contents	Learners/peers	Total
Divergers	10	10	20
Assimilators	10	10	20
Convergers	10	10	20
Accommodators	10	10	20
Total	**40**	**40**	**80**

The statistical tools used for the experiment analysis and evaluation were as follows:

1. The students' attitude towards the web-based instruction lesson through computer network which used problem solving approach by experts. The mean ($\overline{X}$) and the standard deviation (S.D.) were used for analysis.

2. The problem solving capabilities test was used to find out the difficulty, the distributive power, the reliability according to KR-20 formula by Kuder Richardson.

3. The efficiency of the web-based instruction lesson through computer network based on case study was measured by using E_1 / E_2 (Saowanee Sikhapundit.1985)

4. The problem solving capabilities were measured as well as the learning by learners who learned such web-based instruction lesson through computer network based on case study. The mean ($\overline{X}$) and the standard deviation (S.D.) were measured.

5. The study was done for 2 independent variables: the learning interaction through computer network and 4 types of learning styles. The dependent variable is problem solving. The results were analyzed using.

           1) basic statistics which were mean and standard deviation
           2) Two way ANOVA

6.Results from Data Analysis

Results from Two-way ANOVA for problem solving capabilities of learners with different learning styles who learned with different learning interactions were different. The researcher used the scores to analyze and show the results in Table 2.

Table 2 Results from Two Way ANOVA for different learning styles and different learning interaction which affected the problem solving capabilities after learning through computer network (Before the treatment)

Variance Source	SS	df	MS	F	Sig
Sum of variables	1156.487	7	165.212	6.783	.000
Learning styles	789.138	3	263.046	10.800	.000
Learning interaction	.313	1	.313	.013	.910
Through computer network Interaction	367.037	3	122.346	5.023	.003
S.D.	1753.700	72	24.357		
Total	42293.000	80			

$p < 0.05$

According to Table 2, it was found that learners with different learning styles showed different problem solving capabilities after the treatment with significance at the 0.05 level (sig = .000 > 0.05). Learners with different learning interaction did not show significance at the 0.05 level (sig = .910 < 0.05). There was interaction between learning interaction through computer network and different learning styles with significance at the 0.05 level (sig = .003 < 0.05).

       The researchers tested problem solving capabilities before and after the treatment for learners with learning interaction through computer network. They were divergers, assimilators, convergers and accommodators who learned with different interactions through computer network. The scores were analyzed as shown in Table 3.

Table 3 shows the average scores for the learners who learned through computer network with different learning interaction through computer network before the treatment

Learning styles	Learning interaction through computer network					
	Learners and contents		Learners and peers		Total	
	$\overline{X}$	SD	$\overline{X}$	SD	$\overline{X}$	SD
Divergers	11.50	4.67	10.10	3.76	10.80	4.19
Assimilators	8.00	3.46	9.90	2.92	8.95	3.27
Convergers	10.00	1.89	10.20	5.61	10.10	4.08
Accomodators	13.70	5.14	10.70	3.83	12.20	4.67
Total	10.80	4.38	10.23	4.00	10.51	4.18

According to Table 3, it was found that learners with different styles did not have different average score for problem solving capabilities ($\overline{X}$ for divergers = 10.80, for assimilators = 8.95, for convergers = 10.10, and for accomodators = 12.20). When the average scores for problem solving capabilities form learners with different learning styles and different learning interaction through computer network, it was found that the learning style with the highest average score was accomodators ($\overline{X}$ = 12.20). The learning style with the lowest average score was assimilators ($\overline{X}$ = 8.95).

Table 4 shows the average score for the problem solving capabilities of learners who learned through computer network with different learning interaction through computer network after the treatment

| Learning styles | Learning interaction through computer network | | | | | |
| | Learners and contents | | Learners and peers | | Total | |
	$\overline{X}$	SD	$\overline{X}$	SD	$\overline{X}$	SD
Divergers	25.10	5.59	23.10	4.95	24.10	5.24
Assimilators	19.50	6.36	14.00	2.05	16.75	5.40
Convergers	21.10	6.28	27.00	2.45	24.05	5.54
Accomodators	22.80	6.07	24.90	3.48	23.85	4.93
Total	22.13	6.21	22.25	6.00	22.19	6.07

According to Table 4, it was found that the highest average score for problem solving capabilities was from divergers ($\overline{X}$ = 24.10) and the lowest average score for problem solving capabilities was from assimilators ($\overline{X}$ = 16.75). When the average scores for problem solving capabilities from different learning styles and different learning interaction through computer network, it was found that the highest the highest average score for learners with the interaction between learners and peers was from ($\overline{X}$ = 27.00) and the lowest average score for learners with interaction between learners and peers was from assimilators ($\overline{X}$ = 14.00).

7.Summary and Discussions
Two Way ANOVA of variance for problem solving capabilities form learners with different learning styles and different learning interaction yielded the following results.
1.   Learners with different learning styles for problem solving after the treatment were different at the 0.05 significance level (sig = .000 > 0.05). Learners who learned from different learning interaction through computer network had the same problem solving capabilities at the 0.05 significance level (sig = .910 < 0.05). There was interaction between learning interaction through computer network and different learning styles at the 0.05 significance level (sig = .003 < 0.05).
2.   Divergent learners were different from assimilators at the 0.05 significance level. Assimilators were different from the convergers at the 0.05 significance level. Assimilators also were different from accommodators at the 0.05 significance level.

The problem solving capabilities before and after the treatment for learners who learned through computer network with different learning interaction were as follows:
1.   Divergers showed the highest average score for problem solving capabilities ($\overline{X}$ = 24.10) and assimilators showed the lowest average score for problem solving capabilities ($\overline{X}$ = 16.75). When the average scores for problem solving capabilities from learners with different learning styles and different learning interaction, it was found that convergers who had interaction between learners and peers showed the highest average ($\overline{X}$ = 27.00). Assimilators with interaction between learners and peers showed the lowest average score ($\overline{X}$ = 14.00). The results for each pair were as follows:

Divergers were better at problem solving than assimilators.
Convergers were better at problem solving than assimilators.
Accomodators were better at problem solving than assimilators.
Learners with divergent type and assimilative type who learned with learning interaction between learners and contents were better at problem solving than learners with accommodative type with learning interaction through computer network between learners and peers.
Learners with convergent type and executive type who learned with learning interaction between learners and peers were better at problem solving than learners with learning interaction through computer network between learners and contents.

Discussions

According to the study of interaction between different interactive learning type and different learning styles through computer network, the research could discuss the following aspects along with the findings from related research documents and papers.

1. There was interaction between learning interaction through computer network and different learning styles at the 0.05 significance level.

Two Way ANOVA of variance and covariance for the problem solving capabilities of students with different learning styles after the treatment showed that there was interaction between learning interaction through computer network and different learning style at the 0.05 significance level. This was in accordance with the specified hypothesis.

The researcher formed the hypothesis that there is interaction between learning interaction through computer network and different learning styles because the researcher believes that in order to have problem solving capabilities, the students had to have problem solving process according to the experts in case study based learning (Julian et al, 2000). Here are brief and clear process: 1) general picture of the problem must be made under appropriate principle, 2) begin with solving problems from what is already known, 3) think many elements at the same time, 4) many possible and temporary answers must be made, 5) consider answers which show potential and meaning as well as great benefit and small risk. The activities in cooperative instruction will develop the understanding of learners better than working alone and it increase relationship in groups by sharing opinions among themselves. Learners will also learn to listen to others to find out the best solution. The researcher designed the lesson with 2 learning interactions through computer network: learning interaction between learners and contents (one individual learner learns contents) and between learners and peers. The researcher believes that the problem solving capabilities of students with different learning styles in different learning interaction through computer network are likely to have interaction.

According to the data analysis, it was found that the interaction between different learning interaction through computer network and different learning style was different. The score from learners with different learning styles in 2 learning interactions through computer network showed different problem solving capabilities. This was possibly because the design of web-based instruction by using case study was to be used through computer network with different instruction process. The learners would know additional information and searched for more details from recommended sources. Moreover, learners would share opinions, discuss the problems and solutions to such problems. There were experts (instructors) to answer the questions, join the discussion group and give advice on solutions. Therefore, the problem solving capabilities form learners who learned with learning interaction between learners and contents would learn by themselves. They would send e-mail and participate in web boards. This is in accordance with Kahney (Kahney, 1993) in that problem capabilities are essential in the perspective of education. If we believe that learning results can be different, then we will have different instruction. This complies with Yunfei (Yunfei, 2002) who conducted the study on impact of web-based instruction on undergraduate students based on learning styles as described by Kolb. The research results revealed that the learning style affected how they learned on web site. There was interaction between learning style and capabilities of learners. The students who are convergers are happier and more satisfied on web site than assimilators with the significance level.

2. Learners who learned from learning interaction through computer network about case study had no different problem solving capabilities at the 0.05 significance level. This was not in accordance with Hypothesis 2. The research work by Prachanan Nilsuk (2001) who conducted a study on effects of link and web page in web-based instruction on learning achievement, problem solving and knowledge transfer of learners with different learning styles explains that the problem solving capabilities and knowledge transfer were not different. Udom Rattana-ampornsophon (2001) studied the effects of synchronous and asynchronous communication on web-based instruction for problem-based learning. The results showed that learning achievement was not different. This means that web-based instruction and communication on web pages are not related to problem solving capabilities and learning achievement.

According to the table showing the results about problem solving capabilities of learners in 2 learning interactions before the treatment were quite the same with 10.80 as an average for the interaction between learners and contents and 10.23 as an average for the interaction between learners and peers. As for the results after the treatment, they were quite the same with 22.13 as average for the interaction between learners and contents and 22.25 as average for the interaction between learners and peers. This means that both interactions have the same efficiency no matter which interaction learners applied.

3. Learners with different learning styles through computer network had different problem solving capabilities at the 0.05 significance level. This was in accordance with Hypothesis 3. It was found that divergers could get the highest average score for problem solving capabilities whereas assimilators showed the lowest average score for problem solving capabilities. When the average score for problem solving capabilities was compared according to different learning interaction, it was found that convergers could get the highest average score for the interaction between learners and peers. Assimilators showed the lowest average score. This is because convergers can think in abstract manner and do experiment whereas assimilators focus on thought and conclusion as abstract so they are less interested in real experience. Moreover, assimilators do not like to do experiment. They do not apply theories either. People in this group are normally in the area of basic sciences like mathematics and in organization where there is research. Yunfei (Yunfei, 2002) conducted the study on impact of web-based instruction on undergraduate students based on learning styles as described by Kolb. The research results revealed that learning styles affected the way students learned on web site, their interaction and their learning capabilities. Convergers were happier and more satisfied with the web-based instruction than assimilators with the significance level. Sein and Robey (Sein and Robey, 1991 cited in Wentling T.L. and Others, 2000 : 16) conducted a study based on Kolb's learning styles to see the interaction between learning styles and learning achievement. It was found that Convergent Type is a mix of active experimentation and abstract conceptualization (AC), so they are better at learning. Sein and Robey suggest that learning achievement of students is likely to be related to the learning style of students.

Developing eLearning Content Considering Various Video Scenarios

Nael Hirzallah
College of Computing, Fahed Bin Sultan University, Tabuk,
nhirzallah@fbsc.edu.sa

ABSTRACT

Most educational institutes are moving towards implementing eLearning platforms. Content development for eLearning is considered the heart of any eLearning platform. Without such, these platforms are considered passive systems. Unfortunately many institutes are lagging behind in this issue, or simply they are satisfied by having their instructors uploading PowerPoints and Word versions of their lectures. This paper will first present few forms of electronic lectures (eLecture) such as Multimedia, Power-points, As-In-Class eLectures, or just simple html files. It will then propose a simple authoring tool that takes as input, the instructor video, in either scenario: a close up view or a wide view, as well as not only the electronic material but also how it was presented. Thus, the notes that were inserted during the presentation through the presentation application, as well as the animation and slide transitioning used, will be part of the content development. The presented tool selects significant screen shots, rather than periodical ones, and links them with the video/Audio input within a simple file written in SMIL.

Keyword: eLearning, Multimedia, Content Development, Authoring Tool.

1. Introduction

eLearning is becoming an essential approach that most educational institutes are adopting. The dependency of these institutes on their eLearning platform such as Moodle [1], Blackboard [2], WebCT [3] and many others, has dramatically increased once sufficient training has been received by the staff. Almost all eLearning platforms offer a way to create, or at least upload, electronic lecture notes (eLectures in short). eLectures are considered the heart of any eLearning platform. However, an institute may not realize earlier how heavy the load of activating such feature is. There exist many challenges in activating such feature within the eLearning platform. One of these challenges is to select which eLecture format to adopt. This may be specific to the platform used; thus, migrating to a different system in the future would be costly when a good number of eLectures have been developed. Another challenge is the resistance the instructors may show after realizing how time consuming is to learn how to compose a short lecture in the required format. Yet another challenge is when the students find themselves obligated to download some players to be able to view online eLectures. Finally, content development is a costly process especially for courses that their contents change frequently, such as in the field of computer science.

For these reasons, one may find many institutes who are using an eLearning platform are lagging behind if content development is considered. Yet, having the top eLearning platform without the necessary content is like having a state of the art computer screen without a computer.

This paper will present an automated lecture capturing system that creates an eLecture through an intelligent screen capturing algorithm, namely Smart Screen Capturing (SSC) algorithm. The system packages the lecture presented to the students in the lecture room as is; with video, audio and animations in a standard format that may be viewed by popular and publicly available applications; thus, producing an As-in-Class (AiC) eLectures. The paper will also give the reader some flavor on the two video scenarios that can be considered by the proposed authoring tool.

The paper is organized as follows: Section 2 will discuss briefly three most common simple formats for eLectures that can be adopted by lagging institutes on the issue of electronic content development. Section 3 will discuss two scenarios of capturing video that can be included in eLectures, and in Section 4, a simple authoring tool that is built on top of a Smart Screen Capturing algorithm to generate eLectures will be detailed. Finally in Section 5, we will conclude the paper highlighting its contribution.

2. eLectures Formats

eLectures can take various formats, such as Multimedia, Power-point, As-In-Class eLectures, or just simple html files. Multimedia eLectures, although require a lot of time to compose, but they are by far much more attractive to students to watch and learn from than simple html or PowerPoint documents, especially when being interactive. However, they not only require a lot of time to compose, but also they require a lot of skills and much training to be received by instructors and/or authors. Such Multimedia content which are usually rich with animations may be developed by Macromedia Flash MX, Adobe Director or other similar tools.

Authoring on the fly (AOF), such as Ref. [4], is a content production by presentation recording approach. It was used by many applications to create eLectures during normal lectures. The major advantage of these applications is

the reduced costs for the creation of eLectures. Its main objective is to automatically capture live lectures and presentations in classrooms and lecture halls, and make them available as eLectures in a variety of output formats for access over the internet. These eLectures are often of As-In-Class (AiC) type eLectures. AiC lectures are useful in blended learning where students may re-attend the lectures they did not full understand at their own space and convenience. They are also useful for distant learning, where students feel as if they are in class. Lectures and training sessions in companies or universities are in many cases based on some kind of electronic material, such as PowerPoint-slides, digital images, video clips, etc. The slides used in these lectures are graphically annotated and verbally explained by the presenter. Hence, it was natural to exploit this effort already invested in live-events for the automatic production of instructional content for later off-line use. The proposed tool in this paper follows this approach, thus, more details will be discussed later.

Another format for eLectures is a simple html files with some scripts. Most editing applications, such as Microsoft Word or even PowerPoint, are offering a "Save as Web page" option that converts documents to html files which could be uploaded and viewed through most internet browsers.

In the following section, we will discuss the value of adding video to such eLectures, whether in the form of Multimedia, AiC, or simple html files.

3. Video in eLectures

This section talks about the video content scenarios to include in eLectures. The format of the eLectures, whether Multimedia, AiC, or simple html files, would not differ much; however, the examples used in this section are all of AiC type. Figure 1 shows a screenshot of an AiC eLecture which composes of two active regions: one for the slides, and another for the video.

Figure 1 Sample two

The argument in this section is about the video included in such eLectures. When AOF concept is used, the video camera may capture the front of the class (wide view), where the instructor is standing before his class next to the screen or the white board. If the instructor is writing additional notes on the white board, then the resolution of the camera taken must be large enough to capture the notes being put on the board. In that case the size of the video will be extremely large even if compression is used. While if it is kept small, the notes then may not be readable. A major disadvantage of using such video recording to extract or view the notes being written on the board is a tradeoff between keeping the video file small and the readability of the notes. Thus, to keep the file size acceptable by an average user, who may be using slow speed internet connection to view the eLecture, the AOF systems must be supplemented by the output of electronic boards (eBoards) representing the notes being written by the instructor. In Classroom 2000, [6], a project that began July 1995, the entire lecture experience is turned into a multimedia authoring session. It requires the instructor to use an upright electronic whiteboard system which is connected to their Zen* system along with the presentation application. Its first experiment was in January 1996 in Georgia Tech. The output of Zen* includes multiple active regions including: wide-view video shots, notes from the eBorad, and the slides being presented. Therefore, assuming that the notes are made available through sources other than video, the question now becomes: "Why do we need a video (which may be considered the largest size) in our eLecture after all?"

We performed a simple survey in which a total number of ten students from different faculties were asked to sit for an experiment where each was provided with three samples of eLectures. The eLectures talk about general subjects, yet all eLectures contain almost the same level of animation and the same instructor voice. The subjects were made sure that they were not in the field of the students' study. The first eLecture was a simple PowerPoint-show with an audio track. The second, as seen in Figure 1, was an eLecture sample showing a wide-view video shot where the

instructor can be seen moving before the class. While the third one was an eLecture sample showing the face of the instructor in the video region, as shown Figure 2.

Figure 2 Sample three

The main difference between the second and the third was the content of the video region. The former shows the instructor moving before the class, while the latter shows the face of the instructor. Since none of the three eLectures involved notes by the instructor, the main difference between the first and the other two is the existence of a video region next to the slides.

The students then were asked to rate their interest to continue viewing the full eLecture. All the students were almost split equally between the second and third samples, with an edge towards the third, showing the face of the instructor. In the questionnaire given to the students, they were asked to justify their first choice. Most answers that voted for the third, claims that seeing the face expression and the movements of the instructors lips, helped them understand the topic more, while others claimed that the virtual eye contact, which happened once in a while, helped them stay focus. On the other hand, those who voted for the second sample claimed that the existence of the video helped them feel as if they were in class. We call sample two and sample three, if taken during the real lecture time, as AiC eLecture samples. Thus, although the existence of a video within an eLecture may not contain a lot of useful content, as far as the subject itself is concerned, but they help much the students to stay focus during the whole eLecture, and understand the subject better.

In the following section, we will present an AOF system that involves a Screen Capturing algorithm, and takes into consideration animations, notations, and *soft* notes being inserted by the instructor during a lecture through the presentation application, such as PowerPoint. Furthermore, *hard* notes, that are written by the instructor on the side white board are also extracted and added to the eLecture.

4. The Authoring Tool

Almost every live presentation in these days is based on electronic material containing dynamic contents such as animations. A common format that is widely-spread for slides is PowerPoint. Yet, authors may use dedicated standard tools for their lectures. For that, the proposed system captures the screen shots and intelligently chooses the appropriate key frames. These frames are supposed to have captured significant animations, slide transitioning and inserted soft notes. The tool then combines these key frames with the Video and audio representing the instructor into a SMIL file format.

In what follows, we first explain the first part of the system, namely the Smart Screen Capturing SSC algorithm, and then we present how to capture possible notes written by the instructor on a side white board. Finally, we explain how to compose the eLecture in the suggested output format, namely the SMIL format.

4.1 Smart Screen Capturing Algorithm

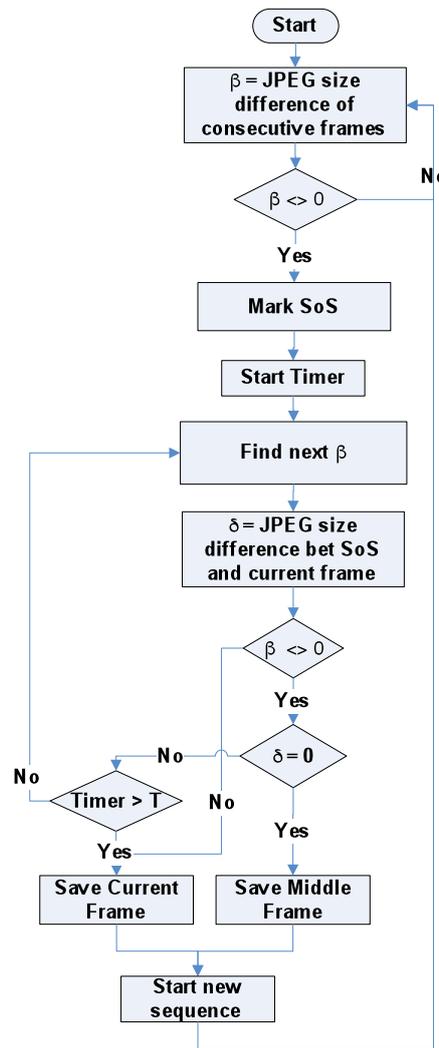
The SSC algorithm represents a modified version of the idea that was presented in our previous work [5] as far as the selection of the key frames is concerned. The previous work suffered from not capturing soft notes that have been added through the presentation application and are characterized to be small and lasted for a short duration. Thus, unless the notes added to a slide made a significant difference, if compared to the original slide, and lasted for a good duration, then they will be missed. The modified algorithm, as depicted in Figure 3, periodically grabs screen shots (or frames for simplicity) then compares the most recent frame, named by *current frame*, with the immediate previous frame.


Figure. 3 Smart Screen Capturing Algorithm

A basic approach to compare frames is by comparing the intensity values of corresponding pixels in the two frames. In simple words, if the number of pixels whose intensity values have changed from one frame to the other exceeds a certain threshold then a change is detected. However, since the type of frames considered here is different from that of normal video frames, because the frames of the screen shots are identical when there is no change, as there is no need to worry about brightness variations, then a much faster comparison method could be performed through noting the JPEG file sizes of the frames. In comparing computer screen shots, a change in the JPEG file size would indicate a change in the frame. This way, the comparison process is much faster.

If a change is detected in the current frame, then the algorithm marks the frame as a start of a change sequence frame (or simply, Start of Sequence, SoS), which may represent some animation, slide transitioning, instructor notes being inserted, or simply a new slide. Starting from this frame, marked as SoS, two kinds of comparisons will then be performed per each current frame.

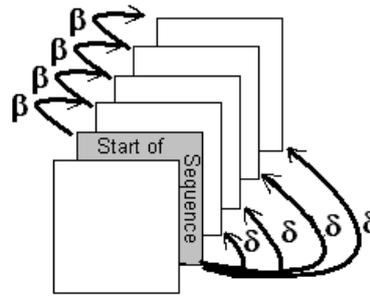
As illustrated by Figure 4, the first comparison is performed with the immediate previous frame (resulting in β values), and another with the SoS frame of the current sequence (resulting in δ values). Furthermore, a timer starts counting the elapsed time till a decision is being taken, as shown in Figure 3.


Figure 4 Sequence of Slides

The algorithm chooses not to save each frame upon any change detection for two folds. The first reason is to reduce the number of frames being saved per lecture. The second reason is due to the fact that frames during Slide Transitioning and notes insertion are usually insignificant for a lecture. Once the frames become stable with β equals to 0, that is, no more changes, the current frame will be saved. Otherwise, if the sequence duration becomes too long hitting a preset threshold equals to T seconds, the current frame will also be saved. This may indicate a significant change including animation and notes insertion, since slide transitioning and insignificant animations usually take short periods. Finally, when the sequence of changes ends up by going back to the first frame or slide in the sequence, that is, the current frame becomes identical to the SoS frame; this may indicate some kind of animation that is usually of a cyclic type. Thus, the frame positioned in the middle of the sequence is being saved instead.

In summary, the algorithm takes the extra steps and performs multiple comparisons to eliminate insignificant changes, such as those caused by flying from left paragraphs, yet attempts to detect easy to miss significant changes such as gradual ones caused by animations or inserted notes.

4.2 Adding the Hard Notes

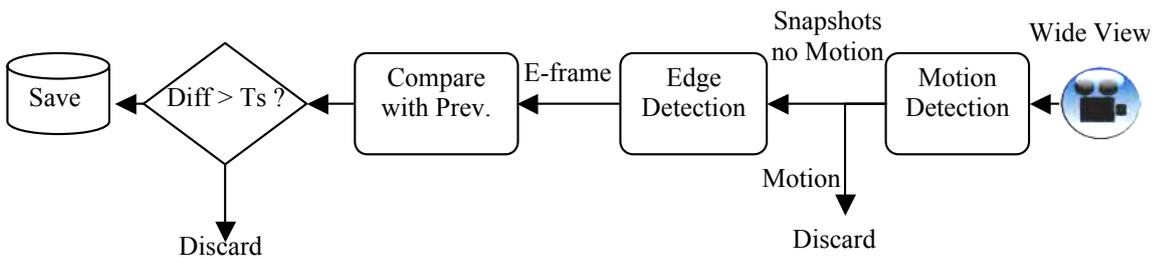
Furthermore, we propose a simple method to introduce the notes that have been written on a side white board, if any, by the instructor into the eLecture, without the need for eboards, like that in Classroom 2000 [6]. Moreover, rather than including a high resolution video component into the eLecture which may dramatically increase the size of the eLecture, a feed of the high resolution camera capturing the whole white board undergoes three steps, as shown in Figure 5.


Figure 5 Capturing Hard Notes

The first is motion detection. When no motion is detected, indicating that the instructor is outside the frame being captured, snapshots are taken. The second step, which is fed by these snapshots, is edge detection to detect edges in these snapshots and to generate E-frames. One may use any of the available edge detection algorithms in the literature. The final step is to compare the current E-frame with the previous one, using a basic comparison approach as discussed earlier. If the difference found exceeds a preset threshold, then either the original snapshot is saved or just the E-frame along with its timestamp. Thus, by doing this, rather than adding the high resolution video component into the eLecture, only filtered images are added.

4.3 The eLectures format

As mentioned earlier, some work has been done in the literature to generate electures that can be put and viewed online, such as AOF [4], but the difficulty was having popular players be able to play back their outcomes. Initially, this presented two challenges. The first was to have an authoring tool that does not need special training, and the second was having the outcome format be able to be played back by popular applications.

The proposed system adopts the SSC algorithm along with the simple hard notes capturing and works to generate eLectures in a common format that can be put and viewed online. This format is called SMIL. SMIL, Synchronized

Multimedia Integration Language [7], a W3C Recommendation, allows integrating a set of independent multimedia objects into a synchronized multimedia presentation using defined regions.

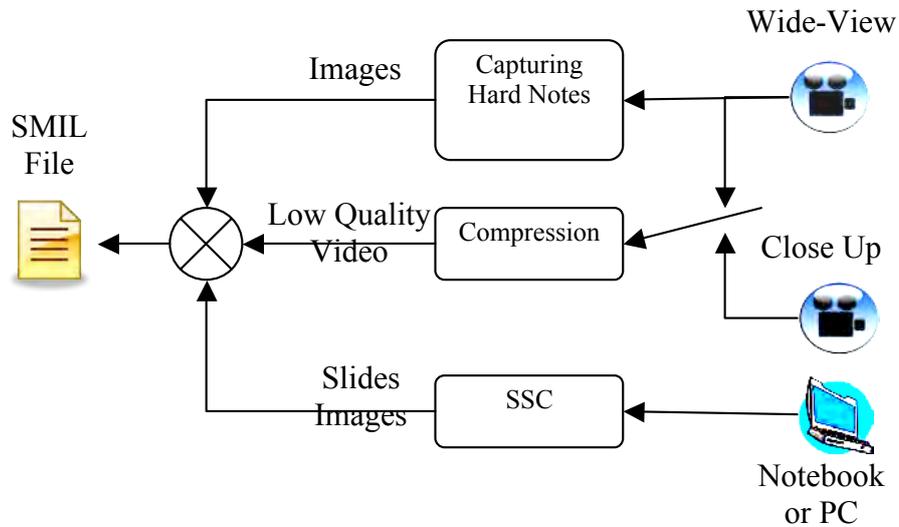
Thus, by describing the regions that will compose the layout, and filling those with images, hyperlinks or video as needed, and finally defining a sequence of changes in one or more of these regions, the outcome would be a complete lecture. The suggested components of the eLectures will be as shown in Figure 6.


Figure 6 Composing eLecture

The layout sample illustrated in Figure. 7 is composed of four active regions specified as follows:

1. Video showing the instructor in a wide view (including Audio) that runs through a compression process. (a close up view could be used instead)

2. Images showing the slides, animations, and instructor on-the-fly soft notes

3. E-frames images that represent hard notes.

4. Hyperlink texts to jump into marked positions within the eLecture

Figure. 7. An eLecture sample

Figure. 7 shows an eLecture being played by RealPlayer application (also available as a plug-in), a RealNetworks™ application. The students are offered to stream and view eLectures through their normal browsers within Add-on components publicly available.

5. Conclusion

This paper discussed common formats used for online lectures or eLectures. It questioned the need for a video region within an eLecture and concluded through an experiment performed by a number of students that the existence of video within any eLecture helps the students stay focus and understand better the subject being presented. Furthermore, the paper presents Smart Screen Capturing algorithm that is featured by the ability to generate slides from screen shots representing animations, on-the-fly notes, and significant slide transitions; giving some kind of live presentation feeling or As-in-Class eLectures. The algorithm is being implemented in an authoring on the fly tool to create eLectures without the need for training or much knowledge in eLearning tools and applications. Moreover, the paper presented a simple technique to capture notes being written on a side white board by the instructor.

It also presents an authoring system built on top of the proposed algorithms that may be applied during a traditional lecture. Thus, both notes being added through the presentation application as well as those that are written on the board are considered in the authoring tool. Finally, students would be able to get lectures while sitting at home through their web browsers without the need to install special applications, but their common ones.

The Development of Online Learning Media on Sufficiency Economy by Using Learning Management System

Pornpapatsorn Princhankol , Jariya Neanchaleay , Siripen Larpwongmetee

Faculty of Industrial Education and Technology

King Mongkut's University of Technology Thonburi,

Bangkok , Thailand

1.Background and Significance

At present, the development of human resources is very important for organizations. If there are human resources of good quality and efficiency in an organization, such organization will become successful and make a lot of progress. The training courses are one important tool for the organization development due to the belief that an organization will become better only when its personnel are developed in terms of knowledge and skills so that they can work effectively with fewer mistakes [1]. One way of the development of personnel or human resources is to provide them with training. Training is a process where trainees will get knowledge, gain understanding, build their skills and expertise, have good attitudes and manners in work. Moreover, they can change their own behaviors according to their roles and responsibilities. Nowadays, there are many forms of training—both inside the training classroom and outside the training classroom [2].

Surfing the internet for training is technology intended for training in the future when compared to other traditional media like videotapes and computer-assisted instruction. There are many advantages from internet system for more effective training because education through internet system is considered as one form of distance learning [3]. Internet technology has shown that it is a powerful media which will be used in effective training. This can be done inside and outside the classroom, in other words, wherever you can connect to the internet. Training can be done because it can be accessed, especially the places where this system is installed. Internet is also user-friendly because it is easily accessible 24 hours. Learners can learn anytime. It is also efficient when compared to the cost. Not only is it more popular, it is also widespread at home and work. This is a new dimension of training tool and process [4] where Learning Management System (LMS) can be used. This system gathers many tools related to online instruction with the aim to support 3 kinds of users, who are learners, instructors, and technical experts. Normally, there is no limit. Instructors can create contents and cover management, improvement, control, data backup, data support, data log for learners and scoring system [5].

According to Strategic Plan for the Development of Thai Governmental System (2546-2550 B.E.) Strategy 6: To make governmental system up-to-date, there are measures to encourage government sector and state enterprises to develop themselves so that they become modern organizations which apply information technology and modern communication in administration. Department of Agricultural Extension is one organization which followed the government's policies by defining the main strategy for the Department of Agricultural Extension (between 2549-2552 B.E.) Strategy 6 is aimed to promote learning and develop agricultural network, to support and develop farmers and communities to learn by themselves, and to build network to develop agriculture in every sector and every level. Knowledge management is also focused. The working process in the Department of Agricultural Extension is changed so that cooperation takes place in every part in the form of integration and link to network. This is mainly dependent on farmers, locations, and working environment.

"Sufficiency economy" was the philosophy proposed by King Bhumibol Adulyadej to give guidance on the survival for Thai citizen over 25 years ago, long before the economic crisis. Afterwards, the King emphasized the way to solve, to survive and to live in a stable state under the changes in the Globalization era [6]. Learning about sufficiency economy is to learn how to live and lead a life as a Thai in a self-sufficient manner in a middle road to serve the sufficiency in themselves, families and communities without depending on external factors. The important thing is that people must depend on themselves without making trouble to other people and make the best use of existing resources in daily life. To illustrate, the four requisites of life are obtained to lead a happy life in a comfortable manner and to meet the sufficiency in life. Promotion, distribution and practice in sufficiency economy

will help people. However, it was found that sufficiency economy was still not widely applied and this philosophy was only little used in daily life.

According to the above-mentioned reasons, the researchers intended to study and develop an online learning media which is a mixture of information technology and training as a way to develop training through learning management system on intranet network in order to achieve the main strategy of the Department of Agricultural Extension which is aimed to provide equity in learning and self-learning support. The learners can apply knowledge and understanding about sufficiency economy to do work, to lead life, to warn life in occupation, fighting and problem solving. The principles in sufficiency economy will offer modesty, reasonability, vaccines and bodies of knowledge along with ethics. When the King's sufficiency economy is applied in daily life of each individual according to each person's appropriateness, it not only is a guide to lead life ad solve problems with carefulness, but it also shows faith in King Bhumibol Adulyadej.

2. RESEARCH OBJECTIVES

1) To develop and find out the quality of online learning media by learning management system entitled "Sufficiency Economy"

2) To study the effectiveness of the online learning media by learning management system entitled "Sufficiency Economy"

3) To find out the learning achievement of learners after learning the online learning media by learning management system entitled "Sufficiency Economy"

4) To evaluate the learners' satisfaction towards the online learning media by learning management system entitled "Sufficiency Economy"

3. Research Hypotheses

1) The quality of the online learning media by learning management system entitled "Sufficiency Economy" is at least at good level.

2) The effectiveness of the online learning media by learning management system entitled "Sufficiency Economy" is not less than the criteria set at 80/80.

3) The learning achievement of learners who learn the online learning media by learning management system entitled "Sufficiency Economy" is higher with statistical significance at the 0.05 level.

4) The learners' satisfaction towards the online learning media by learning management system entitled "Sufficiency Economy" is at high level.

4. EXPECTED OUTCOMES

1) There will be an online learning media by learning management system which is of good quality and effectiveness in accordance with the criteria and helps learners understand and learn well.

2) Learners who finish learning the online learning media by learning management system entitled "Sufficiency Economy" will develop themselves, have knowledge, understand and apply such practical ways in their life.

3) This is to expand learning opportunities through new technology. This reduces the limitation of time, place, and travel expense.

4) There will be a practical way to develop other online learning media by learning management system which serve the strategy of the Department of Agricultural Extension.

5) RESEARCH SCOPE

The development of online learning media by using learning management system entitled "Sufficiency Economy" followed the experimental research to find out the quality and the effectiveness of the online learning media, learning achievement and learners' satisfaction towards the online learning media by using learning management system entitled "Sufficiency Economy"

1) THE SCOPE OF CONTENTS

The scope of contents for the development of online learning media by using learning management system entitled "Sufficiency Economy" was consisted of 5 following lessons:

Lesson **1** Philosophy of Sufficiency Economy

Lesson **2** Sufficiency Economy for Farmers
Lesson **3** New Theory—One Kind of Agriculture Based on Philosophy of Sufficiency Economy
Lesson **4** Making a Living in Sufficiency Economy Manner
Lesson **5** Exemplary Farmers Who Do Sufficiency Economy Agriculture

2) THE SCOPE OF POPULATION AND SAMPLING GROUP

THE POPULATION IN THIS RESEARCH WERE THE PERSONNEL FROM BUREAU OF TECHNOLOGY TRANSFER DEVELOPMENT, THE DEPARTMENT OF AGRICULTURAL EXTENSION, TOTALING 107 PERSONS (ON OCTOBER 1ST, 2007).

The sampling group consisted of 30 persons from Bureau of Technology Transfer Development, the Department of Agricultural Extension. They were chosen through simple random sampling method.

3) Experts
      1. There were 3 experts in the contents about sufficiency economy.
      2. There were 3 experts in the development of online learning media.

  4) VARIABLES

   1. Independent variable is the online learning media by using learning management system entitled "Sufficiency Economy".

     2. Dependent variables
       1) The quality of the online learning media by using learning management system entitled "Sufficiency Economy"
       2) The effectiveness of the online learning media by using learning management system entitled "Sufficiency Economy"
       3)The learning achievement of learners after learning the online learning media by using learning management system entitled "Sufficiency Economy"
       4) The learners' satisfaction towards the online learning media by using learning management system entitled "Sufficiency Economy"

6. Related Theories and Research
The development of the online learning media by using learning management system entitled "Sufficiency Economy" was based on the following related theories and research works:

     1) Learning Management System
     2) Training
     3) Instruction Media
     4) Process for the development of online learning media
     5) Principles to find out the quality and the effectiveness
     6) Learning achievement test
     7) Questionnaire about learners' satisfaction
     8) Philosophy of Sufficiency Economy
     9) Philosophy of Self-Dependence
     10) Concepts about Values
     11) Related research works

7. Research Methodology
The researchers conducted a research to find out the effectiveness, the learning achievement of the learners and the learners' satisfaction towards the developed online learning media by using learning management system entitled "Sufficiency Economy" by testing the online learning media with the sampling group, that is to say, the personnel from Bureau of Technology Transfer Development, the Department of Agricultural Extension. The process was as follows:

   1) **The quality of** the online learning media by using learning management system entitled "Sufficiency Economy"w was measured by 3 experts in contents and 3 experts in multimedia. The questionnaire was based on Likert's 5-rating scale.

   2) The effectiveness of the online learning media by using learning management system entitled "Sufficiency Economy" was measured by testing with the pilot group (which was not the sampling group) of 30 persons from Bureau of Technology Transfer Development, the Department of Agricultural Extension. They would do the pre-tests and post-tests for each lesson. The results were used to determine the value (E_1/ E_2).

   3) The test which passed the effectiveness would be used to find out the learning achievement of the developed online learning media. The researchers tested it with the sampling group of 30 persons from Bureau of Technology Transfer Development, the Department of Agricultural Extension. They would do the pre-test before learning and they would do the post-test after learning. There were 40 question items in the posttest. The results were used to determine the statistical significance level.

   4) After the sampling group had done the post-test, the researchers would give them the questionnaire about learners' satisfaction towards the online learning media. The data were used to find out the learners' satisfaction towards the online learning media by using learning management system entitled "Sufficiency Economy".

8) Research Results

   1) The development of the online learning media by using learning management system entitled "Sufficiency Economy" which was analyzed and designed by the researchers consisted of 5 learning units as follow: Philosophy of Sufficiency Economy, Sufficiency Economy for Farmers, New Theory—One Kind of Agriculture Based on Philosophy of Sufficiency Economy, Making a Living in Sufficiency Economy Manner, and Exemplary Farmers Who Do Sufficiency Economy Agriculture. Each lesson contained introduction to the lesson, the presentation of the contents, the summary of the contents, activities and posttest. After the sampling group had finished all posttests for each lesson, they would do the posttest after learning. The learners could learn everywhere and any time thanks to the learning management system which provided them with logging in for introduction to the lesson, various interactive activities such as bulletin boards, announcements, contacts for instructors, related links, downloads, test, learning log, and report on learning results.

2) As for the effectiveness of the developed online learning media by using learning management system entitled "Sufficiency Economy", the effectiveness during the learning (E_1) was 82.42 and the effectiveness after the learning process (E_2) was 82.33. Therefore, the effectiveness of the online learning media was 82.42/82.33, higher than the criteria set at 80/80.

3) The learning achievement of learners showed that the developed online learning media by using learning management system entitled "Sufficiency Economy" yielded higher learning achievement after learning than before learning at the level of statistical significance of 0.05.

4) The learners' satisfaction towards the developed online learning media by using learning management system entitled "Sufficiency Economy" showed that the average score was 4.19. This means the learners were highly satisfied with the developed online learning media.

9) Research Discussions

Here are the discussions for the development of the online learning media by using learning management system entitled "Sufficiency Economy":

   1) The effectiveness of the developed online learning media was higher than the criteria set at 80/80, in other words 82.42/82.33 because the researchers developed this online learning media based on the lesson development by Priroj Teeranatanakul, Paiboon Kiattikomol, Saksun Yampinij [7] which has 5 steps: Analysis, Design, Development, Implementation and Evaluation. The design of the lesson also followed guidance given by experts in contents, resulting in the lesson having effectiveness higher than the criteria. This complies with the research work by Chanjira Tabrit [8] who developed lesson through computer network about Balanced Scorecard for the personnel in public health center in Pathum Thani. The researcher developed the lesson along with pretests and posttests and conducted questionnaire about their opinions towards the lesson through computer network with the sampling group of 30 persons. The effectiveness of such lesson was 80.22/80.66. So, it could be used in real life. This developed online learning media by using learning management system entitled "Sufficiency Economy" could show its effectiveness and it helped learners gain more learning achievements.

As for Learning Management System (LMS), it is a tool which provides convenience for instructors, learners and system administrators right from the start—registration. The system prepares the entire lesson so that the lesson was available for learners all the time. After the learners have started the lesson, the system will record the progress and

show the report on the activities and the learning results of each learner in every learning unit in details until the end of the course. The learning management system is usually consisted of various functions such as the display of personal information, tests, attendance records, learning records, bulletin, related links, announcements, downloads and contacts for instructors. Therefore, learners are more interested in this kind of instruction than in traditional classroom. This might the reason why learners are interested and pay more attention. The developed online learning media by using learning management system entitled "Sufficiency Economy" shows its effectiveness. This is in accordance with Piyapol Jupitak [9] who developed the online learning media by using learning management system entitled "Design and Construction 2-D Animation" in that learners could learn in a fast and comfortable manner. The learners showed eagerness during learning. They paid more attention to the contents because learning management system offers channel for communication between learners and peers as well as between learners and instructors. There are also activities, exercises, tests and result report available to be printed at any time.

2) As for the learning achievement of the learners who learned the developed online learning media by using learning management system entitled "Sufficiency Economy", it was found that the learning achievement after learning was higher than the one before learning at the level of statistical significance of 0.05 because the developed online learning media by using learning management system entitled "Sufficiency Economy" passed the quality evaluation done by experts in contents and experts in multimedia. The developed online learning media, therefore, had effectiveness and helped learners gain more learning achievements. This complies with the research work by Patchareeya Chiaocharn [1] who developed the lesson through computer network on the operation about passport examination for immigration officials. The sampling group consisted of 30 immigration officials who just began their work in 2548 B.E. The lesson through computer network had showed higher learning achievement after learning, so the learners had progress in learning at the level of statistical significance of 0.05.

3) As for the learners' satisfaction towards the online learning media by using learning management system entitled "Sufficiency Economy", it was 4.19 on average, i.e. at high level. When the details about the satisfaction towards the online learning media by using learning management system entitled "Sufficiency Economy" were considered, it was found that the majority of learners were satisfied with the learning management system with the score of 4.53 on average. This is because the researchers used the learning management system which provided more convenience than other media. Moreover, there are interactions between learners, system administrators and instructors. This is a new kind of training for the Department of Agricultural Extension because it encourages the learners to learn. Therefore, the item about learning management system was the most satisfactory. As for the items about satisfaction towards images, sounds, characters and language, contents and presentation, and test, they were at high level. The researchers considered and found out that the images were colorful and related to the contents. The number of images was appropriate in each lesson. The sound was clear. The volume for narration was appropriate. Besides, there was also music to gain interest from learners. As for the texts and language, this lesson was checked in terms of grammar and the color as well as the size of the text corresponded to the screen. The contents and the presentation of the contents met the learning objectives. They were clear and arranged from simple to difficult orders. Therefore, learners understood in orders. As for images, sounds and language, the researchers designed the screen to be appropriate in terms of beauty and main menu with easy-to-understand descriptions. Images which were used corresponded to the narration. The sound was clear for the contents in each lesson. The language was easy to understand. The test in each lesson also met the objectives. The contents were checked by experts in contents. The test was suitable for the contents. The number of the test was suitable. So, learners did not get bored with the test. This complies with Supattra Sisuwan [11] who developed the distance vocational training for 2 ways. There were 2 sampling groups that were experts in training, distance learning for 2 ways and educational technology. The research results show that the learners were highly satisfied.

10. Suggestions
The suggestions derived from the development of the online learning media by using learning management system entitled "Sufficiency Economy" were as follow:

1) Suggestions from Research Results

1.1) According to the research results, the effectiveness of the online learning media by using learning management system entitled "Sufficiency Economy" was higher than the criteria set at 80/80 and showed higher learning achievement after learning at the level of statistical significance of 0.05. The satisfaction towards the online learning media by using learning management system entitled "Sufficiency Economy" was also at good level. This is because the contents from the books were put into online learning media where there were animations along with narration,

music, interaction between learners and peers. This gains attention and encourages learners to learn more. Learners can learn according to their preference at any time and any place without boredom. The learners know, understand and can apply their knowledge in their work. This can be used as a way to study and develop online learning media on other topics in the future.

1.2) The level of learners should correspond to the contents and the course by considering whether it is suitable for the trainees.

1.3) The tools for presentation in an appropriate, interesting manner should be studied as well as problems raised by learners. This could be used to improve and correct the mistakes in the lesson so that the online learning media yield the highest effectiveness, the highest learning achievement and the highest satisfaction.

2) Suggestions for other research
    2.1) The contents can be presented in the form of game to entertain learners as well as give knowledge at the same time without boredom.
    2.2) There should be the lesson on sufficiency economy for various levels of learners.
    2.3) This could be used to develop e-Learning on sufficiency economy and the sustainability of farmers as an approach to apply sufficiency economy with farmers in various fields.

ABSTRACT

This research was aimed to study and to examine the quality of the online interactive lesson entitled "Knowledge Seeking and Knowledge Management", to study the learning achievement from the online interactive lesson entitled "Knowledge Seeking and Knowledge Management", and to evaluate the students' satisfaction towards the online interactive lesson. The tools in this study were 1) online interactive lesson entitled "Knowledge Seeking and Knowledge Management", 2) the form to evaluate the quality of the online interactive lesson entitled "Knowledge Seeking and Knowledge Management", 3) the test to find out the learning achievement, 4) the form to evaluate the students' satisfaction towards the online interactive lesson. The sampling group in this study was composed of 40 fourth-year undergraduate students at the Department of Educational Communications and Technology, Faculty of Industrial Education and Technology, King Mongkut's University of Technology Thonburi in the first academic year of 2007. They were chosen through simple random method out of the population. The experiment follows One-Group Pretest-Posttest Design. The learning achievement of the students was analyzed using t-Dependent statistics. The results were given below.

The developed online interactive lesson presented the topics about knowledge seeking and knowledge management in form of texts, still images, animations, and learning activities where in learners could interact with the lessons online. The quality of the lesson as evaluated by the experts in media development was 4.18 on average with the standard deviation of 0.60. This was at good level. The quality of the lesson as evaluated by the experts in content was 3.84 on average with the standard deviation of 0.55. This was at good level. The students had showed higher learning achievement after learning than the one before learning with statistical significance at the .01 level. The students' satisfaction towards the lesson was 4.22 with the standard deviation of 0.68. This means they were highly satisfied. Therefore, the developed online interactive lesson was suitable for instruction with undergraduate students about knowledge seeking and knowledge management.

1. INTRODUCTION

Browsing the internet makes users catch up with the latest information and news because the news and information on the internet are updated and up-to-date. The users will be able to learn through various channels of internet to meet their demands and their interests. Internet, therefore, is the major source of information, especially for studies on media which affects the education, in other words, online interactive lesson. National Science and Technology Development Agency discusses the online interactive lesson and says that the online interactive lesson is an educational technology which organizes the instruction based on computer technology and computer network to support the instruction. Thai government has recognized the importance of the development of educational technology and has defined the policy in Thailand's National Education Act B.E. 2542, Chapter 9 Technologies for Education, Section 66 as follows: "Learners shall have the right to develop their capabilities for utilization of technologies for education as soon as feasible so that they shall have sufficient knowledge and skills in using these technologies for acquiring knowledge for themselves on a continual lifelong basis."

According to the above-mentioned background, the Department of Educational Communications and Technology, Faculty of Industrial Education and Technology, King Mongkut's University of Technology Thonburi has developed information system for education. The system has been developed as a network which can connect to various educational institutes to provide service and share data about education. The data, therefore, is linked without boundaries and in an unlimited manner. This information will broaden the viewpoints of learners so that they can see the changes in the world, resulting in an ability to adapt themselves to the world's changes.

However, an important process which helps people get to the information is called knowledge seeking which let people seek more information and knowledge. To seek knowledge, an important thing to make the best use of the information is called Knowledge Management or KM which collect, build, organize, share and applies various information and knowledge to give benefits to learning with quality. Knowledge Management, therefore, is an important tool for learning.

According to the required properties of the online interactive lesson, knowledge seeking and knowledge management, the researchers recognized the importance of a study on the development of the online interactive lesson entitled "Knowledge Seeking and Knowledge Management" so that learners could learn by themselves through an internet network. This was to expand an opportunity for education and to give an option for seeking knowledge through online interactive lesson. The learners can learn and use this online interactive lesson all the time and everywhere if there is an internet network. This study would be useful for students and to the general public who are interested. Moreover, it could be considered as a model in the development of a better online interactive lesson in the future.

2. Research Objectives

1. To develop and examine the quality of the online interactive lesson entitled "Knowledge Seeking and Knowledge Management"

2. To study the learning achievement of the students who studied from the online interactive lesson entitled "Knowledge Seeking and Knowledge Management"

3. To evaluate the students' satisfaction towards the online interactive lesson entitled "Knowledge Seeking and Knowledge Management"

3. Expected Outcomes

1. The developed online interactive lesson could be used for instruction in undergraduate level and the general public who are interested in knowledge seeking and knowledge management.

2. To provide an additional option for learners to seek more knowledge through online interactive lesson. The learners can learn the lesson by themselves anytime and everywhere if there is an internet network.

3. To be the model in developing online interactive lesson in another subject.

4. Hypotheses

1. The quality of the developed online interactive lesson entitled "Knowledge Seeking and Knowledge Management" was good.

2. The students who studied the online interactive lesson showed higher post-test scores than pre-test scores with the statistical significance at the .01 level.

3. The students showed satisfaction towards the online interactive lesson at high level.

5. Population, Sampling Group and Experts

5.1 Population

The population in this study consisted of fourth-year undergraduate students at the Department of Educational Communications and Technology, Faculty of Industrial Education and Technology, King Mongkut's University of Technology Thonburi.

5.2 Sampling Group

The sampling group in this study was composed of 40 chosen students out of the population through simple random sampling method, namely lotto.

5.3. Experts

The experts to evaluate the quality of the lesson were as follows:

1. The experts in media development were qualified with at least Master's degree in educational technology and have worked for at least 5 years in the relevant fields. There were 3 experts chosen out of the people who had experiences in media development through purposive sampling method.

2. The experts in contents were qualified with at least Master's degree in fields related to knowledge seeking and knowledge management and have worked in the related fields for at least 5 years. There were 3 experts chosen who were qualified through purposive sampling method.

6. Tools used in this study consisted of

1. The online interactive lesson entitled "Knowledge Seeking and Knowledge Management"

2. The form to evaluate the quality of the online interactive lesson entitled "Knowledge Seeking and Knowledge Management". This form had 5 opinion levels according to Likert scale.

3. The test to find out the learning achievement. This test had 4 choices for each item.

4. The form to evaluate the students' satisfaction towards the online interactive lesson

7. Procedure for the Development of the Online Interactive Lesson

The procedure for the development of the online interactive lesson followed the steps below:

1. Analysis

Analysis of the contents followed these steps:

1.1 Brain Storm Chart was created.

Brain storm chart was a technique for brainstorming to select the topic of the contents which should be in the lesson.

1.2 Concept chart was created.

The topics from the Brain Storm Chart were considered and grouped. Then some more topics were added to make the contents complete. In some cases, the topics which overlapped were removed.

1.3 Content Network Chart was created.

After the Concept chart had been created, the order or the sequence of the contents to show the continuity of the topics was considered to create Content Network Chart

2. Design

The lesson was designed in terms of learning units and instruction process. It followed these steps:

2.1 Ways to present the data were defined and the behavioral objectives were written down. In this step, the researchers placed great emphasis on the learners.

2.2 The contents were divided into teaching units to be suitable for each time of learning.

2.3 Learning Unit Chart was created to set the order of each learning unit. The numbers were written down. The learning units should be related in terms of the contents.

2.4 The behavioral objectives were written for each learning unit.

2.5 Each learning unit was designed in a way that learners could interact with the online interactive lesson.

3. Development

The lesson was developed to make the contents complete before programming. There were 4 sub-steps as follows:

3.1 The contents were written in instruction scope or script. The contents were written in order of the scope and the instruction method was designed to make learners interact with the online lesson.

3.2 The instruction scope was arranged to check the order of the presentation so that all contents were linked to one another.

3.3 The accuracy of the contents was verified by the experts in contents. This was to certify that the contents were accurate before developing the lesson.

3.4 The test was developed and the quality of the test was examined by piloting the tests with 40 students who had already studied this subject to find out the difficulty, discrimination and reliability of the test.

4. Development of Online Interactive Lesson

In this step, the contents in each scope were developed and transformed into online interactive lesson. It followed these steps:

4.1 The program to present the lesson was selected. In this case, it was Dream weaver.

4.2 Tools were developed and prepared. The resources required for the development of the online interactive lesson were prepared, which were still images, animations, graphic images, etc.

5. Evaluation of Online Interactive Lesson

The lesson was evaluated to check whether the developed online interactive lesson could be used to meet the desired objectives. The experts in contents and the experts in multimedia evaluated the quality of the online interactive lesson before testing the lesson with the sampling group.

8. Methodology

The experiment with the sampling group followed One–Group Pretest–Posttest Design. It could be concluded in the following table.

Table shows One-Group Pretest-Posttest Design.

Pretest	Treatment	Posttest
T_1	X	T_2

The definitions

X	represents	Treatment or learning from the online interactive lesson
T_1	represents	Pretest
T_2	represents	Posttest and satisfaction evaluation

9. Study Results

9.1 The developed online interactive lesson presented the contents through texts, still images, animations, and activities where the learners could interact online. The contents for knowledge management consisted of:

1. Knowledge Identification to make use of existing knowledge

2. Knowledge Creation and Acquisition by creating sources both inside and outside to make the contents meet the demands

3. Knowledge Organization by organizing the types and kinds of knowledge's to make it accessible and retrievable for easy use.

4. Knowledge Codification and Refinement by formatting the design and "language" into the same standards and making adaptation of the contents to make them up-to-date and meet the demands

5. Knowledge Access so that access to knowledge can be done in a short time.

6. Knowledge sharing by creating documents, database, community of practice, mentoring system and job relation.

7. Learning by applying knowledge in decision making, problem solving and work improvement

9.2 Results from the Evaluation of the Online Interactive Lesson

This table shows the average score of the online interactive lesson as evaluated by the experts in media development.

Times	Mean	S.D.	Meaning
The quality of the online interactive lesson and interaction	4.26	0.19	
The quality of the letters	4.20	0.83	Good
The quality of the images	4.08	0.79	Good
Total Mean	**4.18**	**0.60**	**Good**

This table shows the average scores of the online interactive lesson as evaluated by the experts in contents.

Items	Mean	S.D.	Meaning
The quality of the contents and presentation	3.67	0.19	Good
Images and letters were suitable for the contents	3.78	0.77	Good
Test	4.08	0.68	Good
Total Mean	**3.84**	**0.55**	Good

9.3 Results from the Test to Find Out the Learning Achievement of the Learners

The comparison Table of the learning achievement scores of the learners who studied from the online interactive lesson

Learning Achievement		n	$\overline{X}$	Σ D	Σ D^2	t
Mean	**Pre-test**	40	10.68	424	5160	16.23 **
	Post-test	40	26.69			

According to the Table, the learners showed higher learning achievement for their posttest than their pretest with the statistical significance at the .01 level.

9.4 **Results from the Analysis of the Data on the Learners' Satisfaction**

The table shows the mean score of the learners' satisfaction towards the online interactive lesson.

Items	Mean	S.D.	Meaning
The form of the online interactive lesson	4.32	0.67	HIGH
The texts	4.17	0.68	High
The images	4.17	0.70	High
Total Mean	**4.22**	**0.68**	*High*

10. Discussion

According to the learning achievement of the students who studied from the online interactive lesson, the average score of the learners for their posttest was higher than the pretest with the statistical significance at the .01 level. This was because the learners learned from the lesson which had images to present the contents and let the learners interact with the lesson in thinking, analyzing, and considering. This helped the learners had higher learning achievement. According to the students' satisfaction towards the lesson, the students showed great satisfaction towards it because it was interesting and allowed students to interact with it. The students could learn independently so they were highly satisfied with the lesson. Therefore, the developed online interactive lesson was suitable for the instruction with undergraduate students to learn about knowledge seeking and knowledge management.

Abstract: This article introduces Participatory Management (PM) as a multidimensional approach. The data were obtained from 903 female teachers who work in high schools in Mashhad, Iran. The results indicate there are directly and statically significant relations among all components of PM. The result of ANOVA and MANOVA show there were significant differences of PM and according to different educational level and age level. Hence PM could be the best method for enhancing high schools performance.
Key word: Participatory Management, Trust, Decision making, Team work, Share power

INTRODUCTION

Today, most of these innovations are being introduced in the field of educational management to encourage decentralization and implementation of collaborative school governance (Walker and Dimmock, 2000; Anderson, 1998; Chan and Chui, 1997). Thus, increased participation in the workplace and school will better align us with an enlightened vision of freedom and democracy, helping to create a genuine democracy that nurtures human progress (Simmons, 1999; Wood et al., 2004).The shift to participative management in the workplace is both inevitable and necessary (Wood et al., 2004). Participatory Management is a process in which subordinates share a significant degree of decision-making power with their immediate superiors (Gono, 2001; Riesgraf, 2002).Participatory group is something more than putting individuals in groups (Glosser, 2001).The improvement of the individuals' skills is also taken into consideration in addition to getting them involved in the group activities (Hirst, 2000).When manager manages to form groups with people of different potentials, the result will be much more profitable (Hirst, 2000). Participatory management encompasses various teachers' involvement schemes in co-determination of working conditions, problem solving, and decision-making (Kim 2002).The participatory group is something more than putting individuals in groups. Other than to get them involved in group activities, the individuals' skills improvement should be taken into consideration.

The followings are advantages of participatory management:
●Through a wise use of participatory management, leaders may possibly make sound decisions by drawing upon collective expertise, experience, and wisdom of their employees (Lichtenstein, 2000);
●In individual members of a group, participation create a sense of belonging resulting in more cooperation and endeavour to attain the group objectives;
●Individuals who have sense of belonging to a group are more willing to co-operate to accomplish common decisions. However, participation is not dependent on individual physical appearance but rather on her/his mental involvements (Muhs, 1982);
●Influential in gaining people's trust and group decision-makings;

The manager will also be able to form groups of people with different potentials if she/he did not divide her/his employees into groups based on their abilities - the stronger are separated from the weak.

Theoretical background

The pioneer in participatory management was Frederick Taylor (1856-1915). His management philosophy is based on four principles, namely: 1) Develop efficient jobs;   2) Decrease soldering - a term used to describe horse play; 3) Good mental attitude toward work; and 4) Worker management cooperation. Frank Bunker Gillberth (1868-1924) and his wife, Lillian Evelyn Moller (1878-1972), Henry Gantt (1861-1919), and Harrington Emerson (1864-1945) become the key contributors to the scientific management development. Fayol (1841-1925) gave us the classic five functions of management: planning, organizing, supervising, coordinating, and controlling. In the US, the first formal study of participatory management dates back to Mary Parker Follett's (1868–1933) management ideas. Three individuals who played major roles in the success of the behavioural school were Elton Mayo (1880-1949), Chester Barnard (1886–1961) and Douglas McGregor (1906-1964). Researchers Elton Mayo and their associates manipulated lighting levels in an electric relay production plant, and found that productivity improved independent of the level of illumination. The Hawthorne studies concluded that the workers were more responsive to social situations than to management controls. Since the Hawthorne study, participatory management researchers have focused their research on human motivation. Abraham Maslow (1998) has helped managers understand participatory management by explaining that employees have different levels of needs that drive their behaviours at different times. In line with Maslow's work, McGregor showed this distinction by suggesting theory X and theory Y. McGregor's theory Y matches participatory management assumptions. Chris Argyris suggests that employees should be treated as mature adults. Argyris points out that participative leadership can decrease the degree of incongruence between the formal organization and the healthy (Argyris, 1957). Rensis Likert (1967) was the first to conduct systematic survey research on participatory management. Likert identifies four types of management styles consist exploitive-authoritative, benevolent-authoritative, consultative system and participative system. William Ouchi (born 1943) studied participatory management from the point of trust and created the term Theory Z. He emphasizes that management must have a high degree of trust in its workers in order for participatory management to work. More recently, Drucker (2002) expects that future managers will face increased needs for employee participation. Hence managers will have to be able to understand when to command and when to partner, this is mainly because of rapid change in work environments. Drucker points out that the importance of knowledge workers will grow and the only comparative advantage of a developed country will be knowledge workers.

Research on Participatory Management

Researchers have found that Participative management may positively impact job satisfaction (Kim 2002; Robert et al 2000; Spence-Laschinger& Finegan 2004), perceived organizational support (Rhoades & Eisenberger 2002; Eisenberger et al 1990; VanYperen et al 1999; Lau and Lim 2002), extend stronger support to realize the goals(Gamage, 1996; Hargreaves & Hopkins, 1991; Lindelow et al., 1989), better decisions and greater efficiency(Gamage, 1996; Hargreaves & Hopkins,1991; Hoy & Tarter, 1993; Likert, 1967; Lindelow et al.,1989), organizational citizenship behaviour (VanYperen et al 1999; Eisenberger et al 1990), labour-management relations (Ospina & Yaroni 2003), job performance (Wilson,1990;Lau & Lim 2002; Ming 2004). Employee satisfaction, motivation, morale and self-esteem (Hargreaves & Hopkins, 1991; Lindelow et al., 1989) positive work outcomes (Wilson, 1990), identifying and solving problems (Blasé &Blasé, 2001), establishment of strong networks among the members (Hargreaves, 2001), open communication (Blase & Blase, 2001; Saunders & Thornhill, 2003); and supportive and collegial behaviour of the leader (Hoy & Tarter, 1993).

RATIONAL AND STUDY HYPOTHESES

This research attempts to define Participatory management as multidimensional approach contains fifteen components as follow:
1-Trust: PM enhancing the levels of trust (Blase & Blase, 2001; Tschannen-Moran, 2001) and high levels of trust hastens the establishment of strong   networks among the members (Hargreaves, 2001)
2-Decision making: PM is key decision-making processes (Saxton, 2004) and it is the practice of empowering employees to participate in organizational decision making (Marzano, 2003).

3-Team work: PM increase decision making that it is accomplished by group participation (Robert & Moran, 1998).

4-Share power: PM is a process in which influence is shared among individuals who are otherwise hierarchically unequal (Kim, 2002; Marzano, 2003).

5-Motivation: participative approaches to decision making mainly out of pragmatic motives to achieve valued organizational results (Somech, 2002)

6-Communication: PM causes Communication effectively with subordinates (Albanese, 1975).

7-Involvement: PM encompasses various employee involvement schemes in co-determination of working conditions (Kim, 2002; Marzano, 2003).

8-Collaboration: Through a judicious use of participatory management, leaders may make sound decisions by drawing upon the collective expertise, experience, and wisdom of their employees (Lichtenstein, 2000).

9-Democracy: Democracy is a benefit of participatory management (Bartle, 2007).

10-Transparency: Transparency is a benefit of participatory management (Bartle, 2007).

11-Innovation: PM encourage innovations (Walker & Dimmock, 2000).

12-Respect: PM prepare a situation for expressing appreciation when a subordinate does a good job (Albanese, 1975).

13-Problem solving: PM promotes the adoption of problem solving, flexibility and change (Marchant, 1982).

14-Identify common goal: PM is an co-operation between manager and subordinates in the setting up of objectives (Dutton, 1973).

15-Equalitarian: In PM power inequities are balanced (Harchar & Hyle, 1996).

      The reason for the study was to provide principals with greater understanding of the benefits of PM. Two research questions connected with the aim are developed and tested:

Research questions 1: What is the extent of participatory management with regard to female teachers in government high schools in Mashhad city?

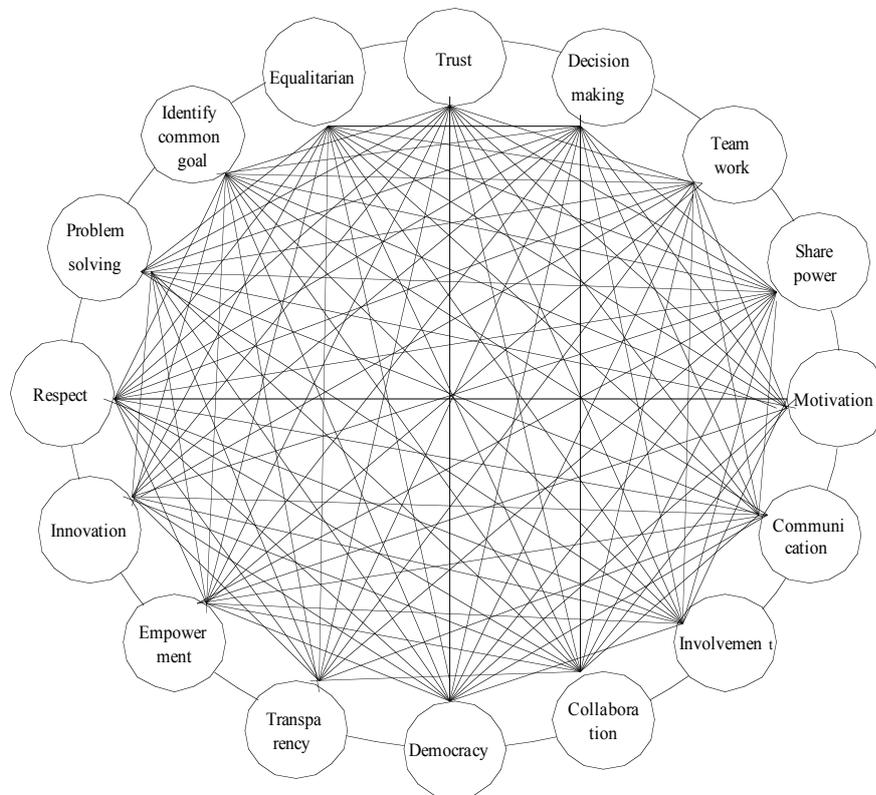
Research questions 2: What are the extents of relationships among 15 component of participatory management with regard to female teachers in government high schools in Mashhad city?


Figure 1: Possible correlated components in participatory management

METHODOLOGY

The main objective of the study is to determine the extent of participatory management in female government high schools in Mashhad, Iran. The data for this study was obtained from 903 female teachers and Random sampling method was used. The Questionnaire was containing 96 items for PM. Reliability of Questionnaire with Cronbach's coefficient alpha was 0.97.

Descriptive and correlation are utilized in this study. Accordingly, Pearson's product moment correlation is used in data analysis. A t-test for one statistic sample was made to examine the deviation of Participatory Management with respect to the desired situation. Additionally Analysis of variance (ANOVA) and MANOVA were used to compare the participatory managements in different educational levels and age groups.

RESEARCH RESULTS

For answering research question, data analysis yielded the overall results (as shown in the Table 1) for the overall mean score of Participatory Management component (from the maximum score 100) was 70.1, with the standard deviation value of 16.45. This means that there was a prominent level of Participatory Management in the educational organization in Mashhad, Iran. Hence female teachers were not denied from Participatory Management in Iranian educational environments. The finding indicates that Respect (PM12) component were strongly present in educational environments whereas Share power (PM4) component were weakly present in educational environments.

A t-test for one statistic sample was made to examine the deviation of Participatory Management with respect to the desired situation .Since the scores in the variable range between 0 and 100, the mean value of 60 has been selected as the desirable point statistically. If the obtained scores of Participatory Management have a mean value equal to 60 or larger than 60, it could be concluded that Participatory Management was at a desirable state in the educational organization in Mashhad. Based on the results, the overall t-test value was 18.563 at the significant level of .000. As the results in Table 1 show, the highest mean value is 78.1 for the Respect (PM12) component whereas the lowest mean value is 58.6 for the Share power (PM4) component. The t-test value was at significant level for all the 15 components, the highest being 29.363 and the lowest being -2.472. Overall, the mean value was more than 60 except for the Share power (PM4) component, the standard deviation of which was 16.0 and the t-test value was 18.563 at the significant level of 0.00. These findings show that the level of Participatory Management for 14 components was prominent or favourable (i.e. more than 60 mean values) except for the Share power (PM4) for the female government high schools in Mashhad districts, Iran.

Table 1: Overall results of mean value and t-test value regarding PM

Components	Mean	SD	t-test	df	sig
Participatory Management (PM)	70.1	16.4	18.563	902	.000*
Trust(PM1)	72.9	17.5	22.034	901	.000*
Decision making (PM2)	67.5	20.3	11.134	901	.000*
Team working (PM3)	68.8	19.7	13.376	901	.000*
Share power (PM4)	58.6	16.0	-2.472	902	.014

Equalitarian (PM15)	70.3	19.6	15.716	900	.000*

Note: * means statistically significant

The teachers express the educational environment head try to protect teachers, present confidence in teachers, sharing their opinions and find solutions cooperatively with the teachers, encourages the teachers to initiate new changes and innovations in the curriculum. Also the manager based on opportunity of free Communication and mutual respect, tries to keep the Teachers' Council, providing genuinely high-quality education by the teachers, provides for the teachers, being regularly informed about the goals of this educational environment, informs the teachers about new circulars and policy directives. As the results in Table 2 there were strong and significant correlations (high correlation with 99% coefficient level) among the 15 components of participatory management. The results show that the highest correlation was 0.913 for the Involvement component whereas the lowest correlation was 0.767 for the Trust component.

Table 2: Correlation results of participatory management components

	PM 0	PM 1	PM 2	PM 3	PM 4	PM 5	PM 6	PM 7	PM 8	PM 9	PM 10	PM 11	PM 12	PM 13	PM 14	PM 15

Note: All correlation is significant at the 0.01 level

CONCLUSION

Considerably the essential task of management in today's organizations as demands grow on educational organization for improved quality and They must involve and motivate employee , create a positive culture, build a group vision, provide a positive instructional environment, encourage high performance and maximize human resources. Hence managers tended to involve employee more in technical domain than in managerial domain mostly by using consultative participation approaches, and they preferred to include employee based on their motivation rather than their expertise (Somech, 2002).

Additionally, findings of the study can be used to make some changes to the management process and improve organizational performance of educational environment in Iran. In addition, findings can be used to obtain a more comprehensive view on the applicability of participatory management in enhancing performance. Dialogues on participative organization can be seen as a way for an organization to build key capabilities essential for success in the complex and dynamic contemporary organizational environment.

This finding of this study can assist the managers to obtain the suitable styles for guiding and developing the human resource. In addition, this finding helps to recognize the current educational organization and judgments about the organization, managements, and other function (within the sample society) and prepare more comprehensive view on the applicability of participatory management in enhancing organizational performance and

better achievement goal of high schools. Finally, it is recommended that managers see participatory management style as a positive trend and not a threat to their authority.

**A PROPOSED FRAMEWORK FOR THE
EFFECTIVE MANAGEMENT OF PRESCHOOLS**

By
DR. LILIA DINO BAUTISTA
Faculty, Educational Leadership and Management Department
De la Salle University-Manila, Philippines

ABSTRACT

This study was aimed at the development of a framework for the effective management of preschools based on the Revised Head Start Performance Standards (RHSPS) and actual management practices in selected top performing preschools in Metro Manila. Descriptive multi-site case study approach was employed in the study. Results showed that the participant schools observed most of the practices in all the management areas covered by RHSPS. Replication of the study in other preschools is recommended.

Introduction

A good preschool is important in today's world for it lays the foundation of good education (Stratos, 2003).The significance of good management for the effective operation of preschools has been increasingly acknowledged during the 1980's and 1990's (Bush,2003).This paper would like to give you an idea about the development of a framework for the effective management of preschool which was primarily anchored on the Revised Head Start Performance Standards (Federal Register, 1996), and on concepts on preschool management propounded by organizations and individuals who are concerned with promoting effective preschool management (e.g. Alberta Teachers' Association, 2003; Australian Curriculum Studies Association, 1995; Boyer, 2001; Swanson, 2001; and, Vonta, 2003).

Conceptual Framework

The present study was based on the premise that the intended framework could be developed from two sources of benchmarks: (a) standards identified from the conceptual literature (conceptual benchmarks); and (b) actual management practices in selected top performing local preschools (empirical benchmarks).

Problem Statement

This study addressed specifically the participant schools': a) standards/ideal practices of effective management based on the conceptual literature; b) profile as regards structure, enrolment, clientele, years of experience; c) feedback of administrators, teachers, and parents about schools' observance of actual practices which conform and non-conform with the ideal practices in the literature; d) particular characteristics that could probably explain the performance such as structure, enrolment, clientele, years of experience; e) and practices that may be proposed under the areas presented in the conceptual benchmarks.

Method and Procedures

Descriptive multi-site case study approach was employed to come up with a framework of effective management for preschools.

Six top performing preschools in Manila were selected upon the recommendations of three preschool consultants. Bases were learning- centered educational philosophy, active parents' involvement in school activities, pupils from middle and high socio- economic families, qualified administrators and teachers, teacher-student ratio of at most 1:20, presence of teacher aides, at least six years of existence and comfortable facilities

The researcher used interviews and checklist developed by herself based on the standards identified from the related literature.
The same instruments were utilized during the on-site observations in determining management practices in the participating preschools in Metro Manila.

The framework developed in the study consists of benchmarks and the procedural paradigm followed in coming up with a benchmarks was adopted from the *benchmarking continuous improvement cycle* developed by the Educational Benchmarking Incorporated (1995).

The results of the analysis provided the inputs to the proposed framework. The propose framework consists of proposition grouped by management area.   .

Results and Discussion

Based on the percentage of practices per area, which are common across schools, the management areas were ranked from 1 (i.e. 6 out of 8 or 75% of the listed criteria are commonly practiced across the six schools) to 12 (where none of the criteria is commonly practiced across schools). Rank 1 is the area on philosophy, while rank 12 is the area on school budget/capital.   Results revealed that majority of the participant schools are part of the basic education department, administered by the department principals, but the preschool units are under the leadership of the preschool coordinator. These findings may be explained by the presence of the next higher curriculum level that can possibly prepare the preschool graduates to the grade school.. Another finding is that 4 of the 6 participant schools have existed for at least 30 years, indicative that families are likely to enrol their children in such preschools. That all the participant schools cater to children of the middle-class families, where parents who are financially capable are willing to pay the tuition fees of preschools that offer quality programs and services. That three areas: school philosophy, parents - school   relationship, and physical facilities were found common across the six schools. Findings indicate that the schools' educational philosophy are clear, the central role played by the parents in the education of their children is recognized, and provision of a learning environment that gives physical safety and emotional security. However, the three areas practiced by fewer participant schools are: school capital/budget, teacher profile, and staff training and development. Findings imply the need on the part of these schools to review their practices on budget which are mostly not observed; only a minority of the participant schools is able to adhere to the educational requirements for preschool teachers; and the inadequate provision for faculty development which could be an effect of inadequate information dissemination or lack of communication about school practices.

Generally, the standards in the RHSPS are being practiced in the participant schools. This finding indicates that these participant schools can match foreign schools in terms of effective preschool management. However, this inference is tentative, and needs to be verified with the use of outcome variables (e.g. children-related outcomes), which were not included in the study.

From the data presented, a framework for the effective management of preschools in Metro Manila was developed. The framework presents two sets of management practices: 1) practices common across the participant schools based on the modal responses, and as verified by on-site observations and interviews made by the researcher and, 2) management practices which are observed by some, but not by all of the participant schools based on the same data source. These are referred to in the proposed model as additional practices.

Conclusions and Recommendations

The framework proposed in the study consists of practices that are found in foreign standards, the RHSPS. It may therefore be inferred that the RHSPS is comprehensive enough to cover all the management practices in the participating top performing schools. It may also be concluded, based on these findings, that the RHSPS standard is applicable to the local setting. For this reason, it is recommended that preschool owners, managers, and consultants use the framework proposed in the study as a reference in evaluating and improving their current school management practices. Prospective preschool owners may also refer to this framework before establishing their own preschools.

Particular characteristics of the majority of the preschools covered in the study are suggestive of school performance. Differences in performance may be explained by teacher-pupil ratio, length of existence of the school, structure (independent or attached to the basic education department), and socio-economic status of the school clientele. However, due to the limited sample size of the study, replications in other settings, with bigger sample sizes are called for. More important, future researchers may conduct similar investigations among other local preschools to validate the framework proposed in the study.

The Perceived Effectiveness of Bureaucratic Human Resources Development Interventions among Community Colleges in Thailand

Asst. Prof. Dr. Krisda Tanchaisak
Martin De Tour School of Management
Assumption University, Thailand
Krisda2009@gmail.com

Abstract

Human factor is considered one of the most important resources for organizations because all sorts of operations need people to implement. For this reason, Human Resources Development (HRD) is receiving increasing attention in both private and public sectors. This research study aims to investigate the bureaucratic governmental Human Resources Development practices extended to public community colleges in the northeastern part of Thailand. Community colleges were established to provide formal education and vocational trainings to adults that did not have a chance to attend colleges and universities during their childhood, due to poverty or lack of access and several other reasons. One of the distinct objective of community colleges was to help people to start own businesses through the teaching of vocational skills and practices. The colleges' personnel had to keep updated with academic and practical knowledge so they could teach more effectively in the fast changing globalised world. However, these colleges were set up as governmental units operated under a strong centralized bureaucratic system. While the Thai government tried to promote personnel development, there were many mandated protocols and procedures in the bureaucracy. The governmental Human Resources Development practices were mostly centralized and emphasized training related to procedural information for administrative control. Hence, this research study was designed as an exploratory study to gain better understanding about the Human Resources Development interventions and practices that the Thai government used, specifically regarding the effectiveness as perceived by the personnel.

Four focus group and individual in-depth interviews were performed with selected personnel in four community colleges in the northeastern region of Thailand. Results revealed that personnel in different positions and localities had different focus on needs for development. The majority of the development programs were planned by the central office. Some Human Resources Development interventions and practices corresponded with personnel's need while some did not. Most personnel described their need for the central office to allow for more autonomy and supports especially in pursuing further study. College leaders had major roles and influences on the developmental direction of personnel. The central office should restructure the Human Resources Development practices to be more decentralized and respond to each locality's requirements. Collaborations and networking among colleges should be promoted.

Introduction

Human factor is one of the most important resources for organizations. Human are involved in all sorts of operations hence they are the key to the success of organizations (Kruger, 1998). It was found that human resource can create sustainable advantage for organizations (George & Hegde, 2004). Rucci, Kirn, & Quinn (1998) reported a causal relationship between workers' satisfaction and customers' satisfaction. This is because satisfied workers, who are capable and willing, are more equipped to satisfy customers. Service quality can be enhanced by employees (Sureshchandar, Rajendran, & Anantharaman, 2002). They are contact points between organizations and customers. A well made organizational plan can be ruined by low quality people. It is imperative that organizations should train and develop human resources regarding skill, knowledge and attitude so they can deliver excellent results. For this reason, Human Resources Development (HRD) is receiving increasing attention in both private and public sectors (Chermack, Lynham & Ruona, 2003). Inferiority in HRD is likely to result in negative performance.

This research study aimed to investigate the HRD interventions and practices among public community colleges in the northeastern part of Thailand. The operations of these colleges were under the supervision of a central authority, the Bureau of Community College Administration (BCCA). Starting from 2002 to 2009, the Bureau has established altogether 19 community colleges to serve the needs for formal degree programs and vocational training courses to people in communities that universities did not cover. Because of the young age of these colleges, there is a strong need to train and develop personnel to set the future pace. These colleges operate as a governmental unit under a strong centralized bureaucratic system. While the Thai government tries to promote personnel development, there are many mandated protocols and procedures to follow. It is interesting to examine the pattern of HRD interventions used by such governmental unit. Hence, this research study was designed as an exploratory study to gain better understanding about the HRD interventions and practices that community colleges used, specifically regarding the effectiveness as perceived by the personnel. Hence, the research question was posed as:

RQ: What are the HRD interventions that community colleges in the northeast of Thailand used in order to develop personnel?

Literature

In the Thai educational context, educational institutions are supervised by the Ministry of Education. The Ministry administered the operations of several units including the Office of the Higher Education Commission (OHEC) and the Office of National Education Standards and Quality Assessment (ONESQA) to make sure that the operations of public and private higher education institutions maintain the same standard level. Public universities were parts of the government system. Operations were performed as a bureaucratic governmental unit. Usually, decisions were centralized at the Ministry. The Ministry controls budgets of all public educational institutions. However, the government decided that from 1998 onward, public universities would be decentralized but OHEC and ONESQA shall maintained the control of quality in education (Office of the Higher Education Commission, 2009). This process took more than a decade to transform universities on a one-by-one basis. Until 2009 some public universities are still undergoing the transformation process. The transformation brings about tremendous needs for HRD interventions especially for the transforming of fundamental attitude toward servicing stakeholders.

Human Resource Management (HRM)

In the past, the management of personnel, or Personnel Management, was limited to a few tasks such as recruitment and selection, welfare and compensation, training, and the handling of personnel and other relevant legal matters (Davis, 2006) such as social security, withholding tax, and etc. The changes of management paradigm from scientific management to humanistic approach (Argyris, 1957, Argyris & Schon, 1978) instigated the worldview that realized socio-cultural contributions that employees offer to organizations. It was found that human did not only work for organizations but also influence and shape the way the organization operated (Looise & Drucker, 2002). This approach suggested that human was not just a passive object. Operationally, they are an important factor and should be utilized to create values to the firms (Reisinger, 2000; Struemer, van der Klink, & van de Brink, 1999). Hence, it was more appropriate to look at employees as one of the important resources that company should invest in. Financially, this resource could provide both present and future returns on the investment. The worldview of personnel management was evolved into the Human Resource Management (HRM) approach. In the HRM approach, most functions of personnel management were maintained, but with a different perspective. HRM encompassed a more strategic aim (Davis, 2006) and a concern for the development of personnel in tasks, career and personal lives.

Human Resources Development (HRD)

Training refers to the delivering of skill, knowledge, and attitude to workers to perform their present job while development refers to the improvement of skill, knowledge, and attitude for future, foreseeable and unforeseeable, jobs (Delahaye, 2009). Nowadays, the Training and Development (T&D) function of HRM was changed fundamentally from their origin under the umbrella of personnel management. In the past, T&D was limited to training people for skills necessary to perform their current jobs well. Later, development was added as a reflection of the perspective that human could create future benefits for the firms. Swanson (1992) suggested that training and development can increase the effectiveness and efficiency of workers. Development helps to prepare personnel for their future jobs. A more recent perspective view that "future job" should include not only jobs in the organization who offered development for personnel but also for jobs outside the organization. O'Connell (1999) reported that employees who were individualistic preferred training for skills that could apply to other workplaces.

The concept and practices of T&D was evolved into Human Resources Development (HRD) with the infusion of T&D, organizational behavior (OB), and organizational development (OD) (Hill, 2002). Training and development should aim, not only at improvement performance but also, to change workers' behaviors and result in the organization-wide improvement. Dilworth (2003) suggested that HRD consisted of strategic change management, knowledge and learning, career planning, and employees' well being. Employees should be developed not only as a company's asset but also as an individual with free will. Stakeholders are expanded from only an organization to include the personnel him/herself (Ruona, Lynham, and Chermack, 2003). It is extended beyond T&D simply for works into training and development for personal life such as work and life balance (Kirkman, 1981).

For the above process, the management of knowledge and learning are necessary (Delahaye, 2005). HRD goes beyond training people to do jobs for the efficiency of organizations into training people to change their mindsets and to be responsible for their own career and life. The focus has shifted from organizational objectives into mutual objectives. Training and Development process is shifted to become sociological informal learning in the workplace (Mankin, 2009). HRD interventions occur at the individual, group, and organizational levels.

In this regards, workers are adults who have different learning process from children. Knowles (1980) suggested a self-directed learning process. HRD practitioners should play the role of facilitators rather than teachers (Knowles, 1990). Birzer (2003) supports that this teaching approach is more effective than other behavioral teaching and learning methods. In general, the T&D intervention includes training need investigation, designing the transfer of learning process, implementation and evaluation of results (Delahaye, 2005). While the aim of HRD has shifted to enable personnel to think out of the box and created changes in the organization, one of a bureaucracy's notable characteristics is to keep everything in order under strict rules and regulations. Hence, it is interesting to investigate the bureaucracy's HRD intervention process.

Bureaucracy Perspective

Traditionally, public organizations monopolized markets to a more or less extent. There were few, if not no, competitors for customers to turn to if they were dissatisfied with the products or services. Customer satisfaction was comparatively less emphasized. The house of representative draws laws and regulations for the government to conform to. Hence, it is important that all governmental units should operate in the manner that requires personnel to focus more on the established rules and regulations. The right protocol is valued more than good services. Personnel have to make sure that they follow the right protocols even though the process might create complication or difficulty for customers. As long as the personnel follow rules and procedures, they would be fine. Pleasing customers is not an agenda. This becomes the traditional dominant worldview among civil servants in Thailand. The bureaucracy procedures are prioritized over individual treatment (Robbins & Coulter, 2009). The bureaucratic system results in rigidity and is less efficient in responding to changes in the environment (Child & McGrath, 2001). In the attempt to be more responsive with changes in the environment, modern bureaucracy maintains control but allow some personnel participation (Josserand, Teo, & Clegg, 2006).

In the modern era, stakeholders' voices are attended to more than before (Alsbury & Whitaker, 2007; van de Ven, 2005). There are calls for equality and better treatment for people as well as good governance practices in the public sector. The modern environment requires civil servants to develop themselves both in attending to the bureaucratic system and offering satisfying services to the civilians. Hence, civil servants have to develop their skills, knowledge and, especially, attitude accordingly. The Thai government realizes the disadvantages of bureaucratic system and the importance of flexibility. She is trying to release higher governmental agencies from bureaucracy by appointing several independent agencies including CHE and ONESQA.

Methodology

The researcher applied for approval from the Bureau of Community College Administration (BCCA), the governing authority of community colleges in Thailand, to conduct a research study and collect information from personnel in the local community colleges. Northeastern region of Thailand was selected as the location of the study because the colleges in this area are comparatively more successful than colleges in other parts of Thailand as suggested by the Bureau. The researcher sent letters of introduction together with the approval letter from the Bureau to director in each of the four community colleges in the northeast of Thailand. Telephone calls were made to make appointments with directors and personnel who were selected by the directors to participate as informants. In-depth semi-structure interviews were performed with the directors and three personnel in each college during March 2009. Focus group interviews, consisted of 4-6 personnel, were also performed at each college with personnel. Questions were related to the HRD interventions and practices of each college. The interviews were audio recorded and transcribed by the researcher.

Results and Discussion

There were three categories of personnel in community colleges, civil servant, government-employed personnel, and annual contract workers. The government is changing the HR system from hiring civil servant to hiring government-employed personnel with new sets of compensation and promotion plans. The government wants to end the civil servant system gradually by not recruiting any more of them but recruiting government-employed personnel instead as one of the steps to break bureaucracy.

Positions in each college are determined by the Bureau. When there is an opening, the college would make a human resource requisition to the Bureau. The Bureau, then, organizes the recruitment process and assigns personnel to the college. However, as to the time of interview, several positions in some colleges were left unfulfilled for years due to some procedural problems. The application processes are performed twice a year throughout the country. In some years, there were no applicants with the required major or field of study as requested by the college. In some years, applicants could not pass the exam. There was no further action by either the Bureau or the colleges. A director said that *"we had two job openings for 3-4 years since I became the director in this college but so far there is no replacement yet."* They passively kept waiting for the Bureau to recruit people. The director seemed to have no worry about this issue. The burden was pushed to personnel who had to struggle and share the amount of jobs. One of the personnel said *"I have to do everything on my own, use my own car to visit*

communities. Those who are not dedicated enough cannot stand for long." Hence, the quality of works might not be as good as it could have been. This contributed to the problem of limited time for personnel development because they had full-hand of jobs.

An important issue many people raised was about condition of work. Several people mentioned that their jobs were suppressing *"I came here in the hope for a better condition in a higher education institution but it turned out opposite to my expectation."* Some personnel worked for vocational school before. They worked under the governance of the Vocational Education Act with less benefits and privileges than community colleges which belong to the CHE. They thought they could proceed with academic career but it turned out they had to deal with all work routines and teaching classes seven days a week with no time for academic advancement.

Each college included HRD plans in the annual budgets subjected to approval from the Bureau. These HRD plans ranged from educational trips to training classes for various operational tasks. Most of the trainings aimed at delivering knowledge necessary to perform current jobs. The Planning Committee of each college together with the director would investigate the needs for training, design and implement the method for training, usually in the form of training courses. The evaluation of the results was performed through personal observations of job improvement. A few colleges offer training programs regarding the well-being of the personnel, such as meditation course and a course to inspire working spirit, but that were limited to only a fraction of overall training courses. Another channel was on-the-job training since some jobs needed hand-on experience such as going out to visit community members. This approach was easy and popular among colleges.

Personnel could request to attend training courses organized by other institutions. Directors would make the approval based on personal judgment. The expenses would be allocated to the traveling budgets rather than HRD budget. There is no budget for tuition fees or other fees to take courses in other places. Personnel had to seek and request for this on a case-by-case basis. Most of the time, they would go for practical knowledge training related to their jobs such as education assessment, handicraft, or computer courses. There was no attempt to promote or systematic assistant to personnel to seek appropriate courses to take.

Budgets of colleges must be approved by the Bureau. All periodic training courses organized by the central units were about procedural practices. The bureaucracy system requires a lot of rules and procedures, personnel must know all the rules such as memorandum writing, governmental document filing, etc. Personnel, especially in the administrative functions, were satisfied to learn such knowledge. However, most training budgets were allocated to personnel in the central unit rather than the development of personnel in the local colleges. As one personnel mentioned that *"those at the central office went to visit many institutions but knowledge learned could not be applied at the Bureau. They should rather send us because we could bring the knowledge back to improve our local colleges."* The result was that the personnel in the central unit collected necessary knowledge but those in the local colleges did not and sometimes they did not need the knowledge. This could be referred to as expert power base (French & Raven, 1960). It is likely that personnel in the central uses this strategy by learning more about the tasks and procedures hence they could influence the personnel in the rural areas. Those in the local colleges lacked sufficient knowledge for their works and had to rely on the center.

Many personnel, especially those in teaching function, wanted to pursue further study. However, this was hardly satisfied by the college. Due to the task structure of the college, degree classes were conducted during weekend while training courses were conducted during the week days. Personnel were scheduled to work seven days a week and took turn for weekly leave. They could hardly find continuous time for further study. They had to go on their own and managed their teaching schedules. Some directors assisted by rescheduled classes among personnel while some did not. Study leave was not applicable and scholarship was also not available. Those who wanted to further their study had to struggle on their own both regarding funds and time. It was very likely that they endured the condition because they wanted to keep their job while studying. Once they earned the degree, they might seek for a better job with their better qualifications. They are planning their own career rather than planned by the organization. The rules and regulations did not permit further study but the director had an important role in allowing for flexibility in the scheduling to allow personnel to arrange their time for further study.

It seems that the Bureau does not encompass modern HRD perspective to develop personnel. Most training offered by the Bureau was limited to basic skills training. This might be due to the fact that colleges were relatively new. The Bureau was opened in 2002 and the system might not be in place yet. Personnel, especially newcomers, had to learn the system in order to function correctly. The bureaucratic system was strongly evidenced. Trainings were offered to keep people under the rules and procedures rather than to promote development and changes. Actions for development were not supported. Directors had an important role in promoting learning among personnel. However, these directors were selected by the Bureau. The Bureau keeps close control over these directors as one of the directors said *"last year, I was called to the Bureau altogether 120 days."* The Bureau itself was governed by the CHE which operates under strong bureaucratic control. This was carried over to the

supervision of community colleges. The objective of the government to release colleges from bureaucracy seems remote. The policy of the government seems preferable but people in the administrative positions still hold strong bureaucratic worldview. They were civil servants for decades before they came up the ladder to assume higher positions in CHE, ONESQA, and BCCA. It would be difficult to change these long-time veterans' bureaucratic perspectives. The aim to introduce flexibility into the government system is difficult to achieve. The HRD interventions were centralized either through budgetary control or centrally organized courses in spite of the aforementioned privatization of higher education institution attempt. Personnel who wanted to develop themselves were dissatisfied but those who were passive seemed to prefer the situation because they could learn the right procedures as against ambiguity found in the change process. Again, conforming to the right protocol would yield them peaceful lives in the bureaucracy.

The central authority should restructure the HRD practices to be more decentralized and respond to each locality's requirements. The need investigation or the first stage in the HRD process (Delahaye, 2005) should be performed carefully to realize true needs of personnel in the local colleges. Without this process, the directions for the development of personnel and the colleges are unaligned. Personnel in different college and localities have different needs for knowledge. Participations from personnel in the operation levels should be allowed when the Bureau plans for T&D rather than planned from the center that lacks information regarding the local conditions of each college.

It was found from the interview that the leaders, i.e. directors, have an important influence and role in creating flexibility and facilitating HRD of personnel. Leaders, with their authorities, can motivate personnel to learn and organize proper conditions that stimulate learning. They are able to devise budgets for necessary development and allow flexibility in timing for further study and other supporting structures. Leaders with visions realize the importance of development and stimulate the development process. They also can function as a liaison between the college and the Bureau and other institutions. Collaboration and networking with local business communities and other universities can create better opportunities for personnel's development.

Currently, some personnel in the colleges came to know personnel in other colleges through central training programs. These personnel created personal relationships and shared knowledge and information among themselves. This resulted in informal group support system among personnel who felt suppressed. Although the centralized training focused only in skills, the by-product of the process is the creation of networks among personnel that support sharing and learning.

Conclusion

In conclusion, the HRD process among bureaucracy in Thailand is still governed by strong bureaucratic perspective of the administrators. This research provides a proof of leaders' power both in positive and negative directions to the management of organizations. The bureaucratic viewpoint is still very strong and hinders the human development process toward organizational development. Before any development could be performed, the transformation of the administrators' perspective should be attempted first. The inclusion of other perspectives, either in the form of bottom-up communication or bringing in private sectors administration might introduce some changes in this perspective. It is strongly recommended that HRD intervention is needed at the central authority, the Bureau of Community College Administration. Future research should investigate a priori factors contributing to the bureaucratic perspective of the Bureau. Another interesting research project is an experiment for an implementation of a more appropriate HRD intervention according to the HRD stages: need assessment, designing of the transfer of learning, implementation, and evaluation of results (Delahaye, 2005).

Analysis of the Higher Education Resources Distribution Affected by the Taiwan College Students

Po-Lin Chen
Doctoral Student
Department of Education, National Chengchi University,
E-mail: 97152516@nccu.edu.tw

Abstract

This study applies the time series analysis to forecast the future student number of higher education students in Taiwan. The predicted values might be used in the educational planning. The main purpose of this study is to forecast the number of college students for the next six years, and present timely strategies and amendments for future tertiary education policies. The autoregressive integrated moving average (ARIMA) model shows that the number of tertiary will step up every year. The forecasting procedure used in the study are as following: (a) differencing, (b) identifying the orders of autoregressive process and moving average process according to the significant lags in "pacf" and "acf" of differenced time series respectively, (c) accepting the model whose "acf" of residuals are not all significant and which has least residual mean squares, (d) constant component was added to the selected model to build an alternative model. The reliability of each alternative model was discussed according to their residual mean squares and trend of educational policies. The analysis method for time series analysis is chiefly based on the Box and Jenkins(1976) employed by the SAS statistical package. Hopefully, the forecast error would not exceed the 5% threshold ((real value- predicted value)/ real value). The forecast of students number will found its meaning.

The Evolving Teacher, Leader and Action Researcher
Dr. Ryan Thomas
Nipissing University

Abstract

Overview
The purpose of this action research effort was to train pre-service teachers to create written accounts of their leadership actions. Secondly, this act, reflect, and revise mode (action research) enabled and enhanced pre-service teacher's capacity to articulate their practice and improve teaching and leadership. In doing so, identity formation, growth and the expansion of self-understanding was nurtured.

Research Questions
The following questions served as a guide.
1.   Using an act, reflect, revise mode (action research) what evidence of leadership can be realized?
2.   What leadership/teaching actions and reflections will cause revisions and guide growth?
Sample
A purposeful cross-sectional sample (N=320) was selected due to accessibility and convenience. All participants were pre-service teachers (students) who attended Faculty of Education classes. All were enrolled in the Bachelor of Education (BEd) program, a one-year full-time professional program that meets the requirements of the Ontario College of Teachers for teacher certification. All participants had an approved undergraduate degree from an accredited university before enrollment. Participants were enrolled in one of two divisions in the Bachelor of Education program. Participants Included 120 students who were training to become J/I (Junior/Intermediate - Grades 4 to 10) teachers and 200 pre-service students in the I/S (Intermediate/Senior - Grades 7 to 12) levels. Pre-service students completed recursive rounds of action research during practicum while completing courses in curriculum studies, curriculum methods, and foundations in education. Each year there were three practice teaching sessions for a total of 13 weeks of placement in elementary and secondary schools throughout the province of Ontario, Canada. Throughout the year age ranged from 22 to 57 and there were 217 females and 103 males respectively.
Research Design
This qualitative endeavor required us to supply images of action research that were studied in class and exemplars of written action research accounts from previous year students were used to layout a framework. Our intent was to facilitate the development of leadership skills through reflective practicum tasks on three separate occasions. We collected over 1000 reflective accounts which were read, sorted into themes, and checked for the act, reflect, and revise elements. The themes, as noted earlier, involved five elements which included: Moral purpose, understanding change, relationship building, knowledge creation/sharing, and coherence making. These beacons of leadership guided and informed this study as we read accounts and looked for evidence line by line.

Each participant enacted an action research effort by noting their actions (ACT), documenting their thoughts and feelings concerning their leadership actions (REFECT) and detailing what they planned to do to next (REVISE). This task (ACT-REFLECT-REVISE) was but one means of collecting evidence and documenting the beginning of a long journey in education.

Meaningful Learning in Higher Education
A longitudinal follow-up study during Bachelor education at the University of Oulu in Finland.

Mr. Miki Kallio
Mr. Tuomo Glumoff
University of Oulu

Abstract

Background: The main goal of higher education is to produce experts for working life as well as for research. The study orientation of students should be directed towards insightful learning and enhancement of the depth of knowledge and understanding through-out the studies. Despite of that, our hypothesis is that many students try to learn by rote (only the minimum required) to pass the exams. They also have difficulties recognizing the relevant from irrelevant and that directs their learning towards memorizing irrelevant details in order to pass the courses.
Goals
We want to find out if that is a prevalent problem. Also the development of education should be based on contextual research data about the processes of learning. Therefore follow-up surveys should be conducted every term of academic year to obtain true overview of learning. To accomplish all that, relevant tools are needed.
Research problems
What kind of a study orientation do students have at different stages of Bachelor education? How does knowledge become organized into wholes during the education? How does the thinking of students develop? How can the learning follow-up data be used for continuous quality assessment in higher education?
Work plan
The study sample consist of students who began their education in the fall 2008 at the Department of Biochemistry in the University of Oulu, Finland. The same group of students is followed up over the period of Bachelor studies and the progress is tracked by conducting annual evaluations.
Methods
The Inventory of General Study Orientations -measurement is used to investigate the study orientation of students. A concept map is used to investigate the students' ability to organize knowledge into wholes at different stages of education. A case assessment is used to investigate the student's ability to build organized knowledge.
Implications
This study provides longitudinal scientific knowledge about the development of students' learning outcomes, that is relevant to all educators. It serves also as an example of research based evaluation process and it gives globally applicable tools for researchers of higher education. The study has also relevance when developing learning-based quality assessment methods.

Developing and Growing a Sustainable Online Graduate Business Program

Dr Somnath Basu
California Lutheran University

basu@clunet.edu

keywords = Advanced Technology, Unique Marketing, Program Quality, Pedagogic issues, MBA

Abstract

The creation of a successful global graduate education program requires two key strategic decisions: the development of a program whose quality is without par and the usage of a vigorous and robust marketing strategy that ensures enough participants attend to lead to the "word of mouth" campaign regarding the program. Thus the two fold strategy begins with building a program of a quality that is far superior than any other in the market (using all creative resources) and then NOT resting on the idea that "If you build it, they will come" but instead aggressively marketing the program where a threshold number of students enroll, experience the program quality and then serve as future ambassadors to the program. Thus marketing value is upfront and continuous while downstream, product quality becomes an important differentiation. Finally, the maintenance and upgrading of the program needs to be continuous in order to maintain the pre-eminence of the program which in turn leads to a sustainable educational model. This presentation will delve into the various quality building and marketing efforts leading to the development of a program as described above.

Professor Sue Jackson

Birkbeck Institute for Lifelong Learning
Birkbeck, University of London

This paper raises issues and questions about lifelong learning and community for older women, drawing on empirical work undertaken in the UK and Australia. Drawing in particular on policy developments in the UK and Japan it argues that lifelong learning has been seen as a solution to both global and local problems, and shows how older women learners can make an active and positive contribution towards such solutions through their participation in community actions.

Introduction

Many nations – including the UK and other European countries, Japan, North America and Australia - have seen a focus on lifelong learning which concentrates on supposedly economically valuable skills tied to the labour market and the development of a knowledge economy. A concentration on employment and training excludes those whose contribution to the labour market is unrecognised or whose skills remain unvalued, including women in the home, unemployed people or older people. Such a learning agenda can only continue to replicate the structural inequalities of gender, class and other differences, where only certain types of knowledge, skills and work are valued. This is likely to devalue much of the learning that women do, and even more likely to devalue the learning and work of older women, working-class women or those from minority ethnic groups.   There is little or no recognition of the contribution that such lifelong learners can make to their local, national or global communities.

This paper will raise issues and questions about lifelong learning for older women. In doing so it will draw on empirical work (including interviews, focus groups and questionnaires) undertaken with the National Federation of Women's Institutes in England and Wales in the UK; and the Sydney Older Women's Network and Queensland Rural Women's Network in Australia. Framing the discussion by drawing on policy developments in the UK and Japan it will argue that lifelong learning has been seen as a solution both to global and local problems, and will show how older women learners can make an active and positive contribution towards such solutions through their participation in community actions.

The research

The fieldwork for this research was primarily located in three groups of networks for older women[i], the National Federation of Women's Institutes in England and Wales[ii], and the Older Women's Network and Queensland Rural Women's Network in Australia[iii].

The National Federation of Women's Institutes

The National Federation of Women's Institutes (NFWI) is an international organisation. It began in Britain in 1915 and is the largest organisation for women in the UK. It currently has around 215,000 members, most of whom are over the age of 50.   Although Women's Institutes were originally located exclusively in rural areas, this is no longer the case. Both lifelong learning and community are central to the mission of the NFWI, which is to educate women to enable them to provide an effective role in the community; to expand their horizons; and to develop and pass on important skills: key elements of lifelong learning and active citizenship (see http://www.womens-institute.co.uk/)..

THE RESEARCH WITH THE NFWI TOOK PLACE IN 6 SITES. THE ORGANISATION OF THE NFWI IN ENGLAND AND WALES CONSISTS OF 70 REGIONAL FEDERATIONS, EACH OF WHICH MAY INCLUDE UP TO ONE HUNDRED OR SO LOCAL INSTITUTES. 5 SITES WERE SELECTED FROM THE REGIONAL FEDERATIONS. THESE WERE:

- o   The largest Federation, with 248 institutes and 9500 members. It covers a large geographical area from the industrial south east to the rural villages of the region. The Federation receives an annual education grant from regional County Council.
- o   The second Federation also covers a large geographical area. However, the region is sparsely populated and mainly consists of rural farmlands and market towns, although it includes an affluent spa town. It has a total of 101 institutes.

- o   The third Federation is one of the smallest, with 33 institutes. It covers a largely urban area, including institutes in socially and ethnically diverse communities in on the outskirts of a large city.
- o   With its headquarters in a city centre, and also including socially and ethnically diverse communities, the fourth Federation has 45 institutes in industrial towns as well as in a range of villages.
- o   The fifth Federation has 95 institutes with almost 4000 members. It covers a diverse geographical area, from a major city to the Welsh valleys.

Interviews and focus groups were conducted with members of institutes from within the five selected Federations, and questionnaires were distributed.
The sixth site for the research with the NFWI was Denman College, the residential college of the NFWI, which opened in 1948. I was a participant observer in some of the classes, ran a focus group, interviewed staff, and invited participants to complete questionnaires (36 out of 78 completed and returned).

The Older Women's Network and Queensland Rural Women's Network

The Older Women's Network (OWN) first formed in New South Wales, Australia in 1987 when a group of older women and workers in the Combined Pensioners Association decided to establish a network which would focus solely on older women and issues that specifically concern them.   There are currently 14 OWN groups in New South Wales. A national body, OWN Australia, was established in 1993 to act as a lobby group for older women and to liaise with other national women's organisations. OWN Sydney runs from project funding and with the aid of volunteers, in premises funded by the City of Sydney. It is a self-help organisation committed to promoting the rights, dignity and wellbeing of older women and keeps its members in touch through a monthly newsletter, OWN Matters. OWN's website states:

> OWN's Guiding Principles provide older women with a blueprint for growing old with dignity and wellbeing, consistent with the concepts of positive and healthy ageing. They were developed through an on-going consultative process involving all NSW groups. The Guiding Principles are used by members as a guide when representing the Older Women's Network at public meetings and forums (see http://www.own.org.au).

One of its key guiding principles is about education. Older women learn and develop a wide range of skills throughout their lives and should have access to learning activities that enable them to keep pace with change, to enhance self-fulfilment, and to continue their contribution to community life.

OWN Sydney run a range of interest groups and activities designed by and for older women, including:

- o   Workshops, seminars and training
- o   Interest groups
- o   Discussion groups
- o   Social events
- o   Physical activities

The research with the Older Women's Network in Sydney consisted of focus groups, questionnaires and analysis of *OWN Matters*.

The Queensland Rural Women's Network (QRWN), formed in 1993 to meet the needs of women in rural communities, does not have an explicit agenda for adult education and learning, nor does it focus solely on older women. However, one of its aims is to encourage personal development and education for women in rural communities (see http://www.qrwn.org.au/index.htm). QRWN is spread across vast and often remote areas of Queensland, Australia. The research therefore consisted of questionnaires, telephone interviews and email correspondence.

Names are coded throughout and ethnicities and sexualities (where stated) are self-identified.

Lifelong learning: a solution to global and local problems?

Lifelong learning policies have risen to prominence in recent years, and are high on the educational, economic and social agendas of many governments (including in Europe, Japan, North America and Australia) as well as of international organisations such as the OECD, UNESCO and the World Bank. 'Lifelong learning' is a comparatively new concept, although it has existed in different guises and been differently named across a century and more, including as recurrent, popular, continuing, liberal and lifelong education (Jackson, 2010 forthcoming). For

example, what is often referred to as adult education in England is known more commonly as social education in Japan (Narushima, 2002; Yamaguchi, 1997), with Japan's Social Education Law, being passed in 1949.

Towards the end of the twentieth century, lifelong learning became a catchphrase for many governments across the developed world. In Japan, a law to promote lifelong learning ("The law concerning the development of mechanisms and measures for promoting lifelong learning") was passed in 1990, providing the systematic encouragement of active participation of all people in lifelong learning (Fuwa, 2009). In Europe 1996 was declared as a year of lifelong learning and in 2000 a 10 year Mission was set for Europe to develop lifelong learning to become the most competitive and dynamic knowledge-based economy in the world (European Council). In Britain, the first Minister for Lifelong Learning was appointed in 1997. Although the UK Government's early policy papers (se eg DfEE 1998) argued that learning has a wide contribution, including enabling people to engage in community participation, one of its prime benefits was seen as economic, with an emphasis on the links between education, employment and economic prosperity.

Lifelong learning has been seen as a solution to a host of local and global problems. It has been argued that 'lifelong learning' has been open to multiple translations, including discursively, ideologically and through policy developments (Okumoto, 2008), although this has been seen both as promise and as threat (Thomas et al, 1997). It is claimed that lifelong learning enhances social capital and promotes active citizenship and social cohesion (see eg Schuller, 2001), thus increasing community participation and developing opportunities for disadvantaged groups and individuals. However, such individuals are also expected to make the most of the policy developments which have led to a growth in vocational education and training, to benefit themselves, their nation states and the global economy.

In the UK, Japan and elsewhere discourses of lifelong learning are framed within the globalisation of the knowledge economy (Archer et al, 2003), although current discourses and policies show major and sometimes conflicting messages. Lifelong learning is seen as a key to self-improvement (including economic improvement), as a means for national prosperity, *and* as contributing to societal good. Yet, like most countries in the developed world, the lifelong learning and widening participation agenda in the UK is one that has been primarily concerned with skills-based vocational learning. There is an assumption that the more training, skills and qualifications people have, the more likely they are to be in work. Although *lifelong* learning should impact on all individuals throughout their lives, in reality it increasingly focuses on younger adults and vocational education and training. As Tony Blair (then Prime Minister of the UK) demonstrated, a key reason for promoting lifelong learning is that "Education is the best economic policy that we have" (DfEE, 1998).

There have been similar global interests in the development of lifelong learning. Lifelong learning is seen as a key to self-improvement (including economic improvement), as a means for national prosperity in a global economy, *and* as contributing to societal good and social responsibility. In Japan, for example, one of the principles of social education is "to promote participatory democracy by enlightening people through learning in their own communities" (Narushima, 2002, 201). As David Blunkett (then Secretary of State for Education and Employment in the UK) stated, lifelong learning:

> helps make ours a civilized society … and promotes active citizenship. Learning enables people to play a full part in their community. It strengthens the family, the neighbourhood and consequently the nation (DfEE, 1998).

In Japan, a key policy move involved the setting up of free or reduced-cost learning activities through *kominkan,* or citizen's public halls throughout the country, seen as a vital course of community involvement which enabled people to develop their participation in democratic life (Thomas 1985). Nevertheless, ever-increasing moves to marketisation and neo-liberalism has meant that the sense of community learning of *kominkan* at the heart of social education has faded (Narushima, 2002: 204), although a large number of Japanese elderly belong to *Roijin* or old people's clubs located in local neighbourhoods, with women forming the majority of members, some of whom are very active in community and voluntary work (Repass, 1999).

It could be argued that learners in adult education have been disproportionately drawn from particular gender, class and age groups (Fuwa, 2009). In Japan, as in the UK and elsewhere:

> the majority of learners who participate in educational programmes held at facilities for adult education are middle-aged women with no jobs, and the elderly; a majority of learners are from a middle-class background and the numbers of learners from the working-class is quite small; the learning interests of adults are predominantly hobby; recreational and sports activities, rather than contemporary issues in political, economic and social affairs (Fuwa, 2009, 640).

Nevertheless, opportunities to engage in lifelong learning are important for older women. Women are a significant proportion of the older population in the developed world (Etienne and Jackson, 2010a forthcoming) and this is particularly significant in Japan, whose populating is ageing faster than any other country. By 2025 over 1 in 4 (27%) of its population will be over 65 (Makino, 1997).   In Japan, as elsewhere, learning opportunities take place "in the context of neo-liberalism with an emphasis on the unbridled workings of market forces" (Fuwa, 2009: 459). Courses which were once free or low cost have become privatised, and these changes affect learners who now often need to pay for expensive programmes (Narushima, 2002, 204).

Financial matters clearly impact substantially on learners' ability to continue to participate in lifelong learning and adult education, and (older) women are likely to have less access to resources, including pensions . Even in retirement, choices that exist for older women are largely influenced by family responsibilities, money and networks of support as well as the expectations of the wider community (Etienne and Jackson, 2010a forthcoming). Older women are likely to have missed out on educational opportunities when young, and are likely to be amongst the poorest groups in society (Jackson, 2005).

Despite the European Union's pursuit and subsequent adoption from 1993 of 'gender mainstreaming', within the policies of lifelong learning there is little consideration of the relationship between gender and the knowledge-economy and even less concern regarding social class, race and ethnicity (Webb et al, 2006). Although rarely explicit "policies and practices of lifelong learning, in very different contexts and with different groups of learners, are gendered in their construction and effects" (Leathwood and Francis, 2006: 2).

Participation in and benefits of lifelong learning and community participation for older women

The three main reasons normally given for participating in learning are work-related; education and progression; and personal development (Sargent, 1997), but for older learners, this is predominantly personal development. The number of older women learners far outweighs the number of men (Aldridge and Tuckett; 2002), with women less likely than men to hold higher educational qualifications. There is a rural/urban divide in access to learning (Tuckett and McCauley, 2005). In rural areas, where the majority of the women in this research are located, a severe lack of public transport prevents older women from attending education centres, and the older women are the more likely they are to be dependent on public transport (Jackson, 2005). This is compounded for women in extreme remote areas, such as those who are members of the QRWN and for whom travel across vast distances is not an option. This research confirmed that organisations such as those represented in this paper are central for learning opportunities for older women, opportunities which would otherwise be almost non-existent.

Although 'older women' in many ways defies definition, in this paper I am defining 'older women' as those aged over 50, as do many of the women in the research:

> FGP[iv]1: Well the definition that I like is anyone who is willing to call themselves an older woman. And it's basically over 50 isn't it?
> FGP2: Yes, well, 50 and onwards
> FGP1: Yes but there are people who object to calling themselves older women but I think older women have definitions
> FGP2: Also I feel that too that it's good keep 'older women', 'older' because … everyone gets old and why should it be regarded as something like a disease? You are an untouchable.
> FGP1: The transparency of older people in society, you know you walk down the street and nobody looks at you. I think that's an issue for me that I'd like to impact.
> FGP2: The invisibility
> FGP1: Lost ladies.

For many women aged over 50, educational opportunities will have been denied when younger. In the UK, for example, women in this age group are more likely to have left compulsory education aged 15 – for older women, this reduces to aged 14. An officer at Denman College explored the changing role of education, and the impact on older women. Until the mid-1990s there were very few accredited courses at Denman College.   The NFWI had developed its own certificates, which were very popular amongst its members, particularly with regard to developing confidence. She stated that Denman is often the 'first step back into learning'. She expressed concern that accredited assessed courses would disadvantage older women. A lack of funding for non-assessed and therefore non-accredited courses means that older women are denied opportunities that were also denied to them when younger (Jackson, 2004).   As one respondent explained, 'Some of us missed out on education when we were young, there weren't the opportunities', and there were real concerns at Denman that the opportunities may be continuing to be denied. The less likely people are to have continued education whilst young, the less likely they are to participate when they are older (Sargent, 1997; Schuller, 2002), leaving older women doubly disadvantaged.

One woman, now doing an accredited course in parchment craft, felt she was being given a new opportunity that she had not had in the past. She told me that she had left school at fifteen, and that she had no 'paper qualifications'. It was really important to her that the course is accredited, and the hope of a certificate at the end was one of the reasons she was undertaking the course. A member of staff said that Denman enables women to:

> take their education forward, I mean so many of them … it's perhaps they are from an era when they didn't work or they gave up work to have a family, brought their family up, and then suddenly now that they have got, you know, perhaps their children have gone, they have got grandchildren or whatever… through their grandchildren very often they'll go back to education, they feel that they want to be part of their learning.

Women indicated the importance of being able to have time in older age to develop their learning through adult education:

> While I was working there was just no time … then five years ago I wanted to do this … craft course and I just thought 'go'.

> I hadn't really looked at Shakespeare since I left school at sixteen and I hadn't ever thought about it as the first priority, but I am really enjoying doing it.

As one of the women from OWN Sydney stated:

> I didn't have a vast education so I am not in the league of a lot of the ladies here that have gone to University. I haven't done that but I have been working most of all my life.

This led to her particularly valuing the Older Women's Network, where she can learn from other women:

> That is what makes it very, very interesting because people bring their life experience with them and it's absolutely fascinating. We all have so much to share with each other.

One of the skills that is shared is engagement with new technology. These skills were lifelines for members of QRWN because of their isolation in rural communities. QWRN has a major project, 'Taming Technology', which aims to coach rural women in contemporary telecommunications technology, including what they call 'applications for life – telecommunications which add value to family on-line interactions' (http://www.qrwn.org.au/). Such skills are very important for older women. For one woman – an active lone traveller in the past – learning computing skills enabled her to keep in touch with friends all over the world. She had learned to do 'all sorts of things on the computer', and had passed those skills on to others. Although learning 'stretches your mind …', and 'opens your mind and it gives you a broader interest', it 'has to have a clear purpose to it: there is no sense to learning without purpose'.

However, classes with no apparent purpose *can* lead to new opportunities. One of the staff members of the NFWI stated

> The average age of WI members is in the late 50s and many of them are a lot older than that. So, there is an issue about what they want in the training and who is involved in taking up training and learning opportunities, but opportunities for learning do lead to new things for some of the women. So for example, there was a session or a series of sessions on reading [historical handwriting] that I thought wouldn't be successful at all but in fact was very successful for the women who took it; and those that completed the course went on to do a whole project around local history and community activities at the time.

An officer at Denman College stated that far from women having less need for learning as they grow older:

> I think (lifelong learning) is actually more important …. The speed of changes in community, society, technology, these are all having an impact on individuals and families and I think it's crucial that people keep up to date because if they don't they would be out of step with society. Also I think … to keep people engaged in society, to keep people engaged with other people, learning brings people together … I think that it's absolutely crucial.

Some respondents extended their learning through the roles required within the local institutes and the Federations of the NFWI, such as president, treasurer, skills co-ordinator, press and publicity officer etc. This learning was most effective in the development of active citizenship and community engagement, especially through the development of confidence, including confidence to speak in public. Public speaking and engagement was also identified as an important aspect of learning for women in OWN:

> FGP1: (It is important) to have an input into government policy, there was a workshop this week, I forget the date, and it is to tell to the department what you think we need for help.
> FGP2: That is an opportunity to lobby the government. I think that is terribly important.

In the main, discussions of learning new skills and building confidence were about taking a place in the public world. For some of the women, these skills were developed through listening to invited speakers in their local Institutes (see Etienne and Jackson, 2010b), as this member of the NFWI stated:

> There are key speakers in perhaps issues like healthy eating or children and exercise and sometimes it is just an excellent and amusing speaker which will inspire. And I think inspiration is important as well.

The talks give the women opportunities to develop their critical thinking and explore their values and attitudes as a result of engaging in discussion and critique:

> And the other thing about learning is that we always choose really good speakers, powerful speakers, who are able to speak. It's usually balanced so that you have got to have speakers who speak for and against the resolution, so everybody is learning and learning how to weigh up information and of course some of them may want to change their minds and vote in a different way from the information they have been given.

For some of the women, issues raised in these talks are extremely challenging, for example the sex trafficking of women and children, child prostitution or domestic violence. The opportunities for debate and discussion about such issues can lead to active community participation and political engagement. As one member stated:

> They came and spoke to us about the issue and they asked us to sign petitions and a couple … went down to the County Hall when the planning permission was given, to march against it.

Major resolutions which begin in local institutes are taken up by the national federation, normally with an aim to influence policy. An officer of the NFWI said:

> One of the campaigns that we are working on … at the moment … is the closure of rural schools …. But the reasoning for closing them doesn't make sense because they perhaps instead of looking at the wide benefits to the community they say: "They have to go and that's it". If you lose the school you lose the heart of the community. This campaign has really grabbed the members' attention. I have never known them to respond as they have to anything … We issued a petition calling on the minister for education to really look at the criteria. Because nobody will admit to it … nobody will admit who has written this policy, whose responsibility it is. So there is this huge battle. (We) issued a petition among (the) membership and so far we have had 4,500 signatures and more than that, and they are coming in daily.

A member of staff at Denman confirmed that many members use the learning with which they engage to move out into their local communities:

> I mean every WI does something for the community even if it's just a few people going in to help in a primary school – they get involved in all sort of things. They are great volunteers which is great – the community keeps them young and their minds active and there is also – I think there is a big emphasis now on health as well and I think that a lot of our members would be very pro - what's the thing going on at the moment – 'walking your way to health'? - I think you will find a lot of women getting involved in that within their WI.

Several of the women across the groups identified the importance of engaging with local and national politics, especially in relation to women's lives, although there was a recognition that women's voices are often not heard.

Conclusions

In this paper I have argued that lifelong learning is currently viewed as a potential solution to a variety of local and global economic and social problems. However, it is mainly those who are currently in the labour market, and especially younger people, at whom policy developments to address these issues are aimed. Older women learners are not seen as part of the solution, and continue to remain marginalised and invisible. Whilst nation states continue to define meaningful lifelong learning as vocational education primarily aimed at younger people, older women will continue to be forced to follow a pattern of loss of opportunities that have disadvantaged them when younger. This replicates structural inequalities of gender, but also of social class and economic deprivation.

Lifelong learning and community participation is particularly important for older women who are likely to find themselves marginalised in a society that only recognises vocational skills, that prioritises skills development for

younger people, and that places very little value on skills traditionally developed in the home. The women in all three organisations in this research project have shown the wider benefits of participating in informal (as well as formal) learning, including for public as well as private recognitions of the skills and knowledge that older women have, demonstrating how lifelong learning can contribute towards solutions for local and global problems. The research has shown how older women learners can make an active and positive contribution towards such solutions.

Global issues are acted out in local communities through the political engagement of individuals, groups and networks and, as the women in this research have shown, lifelong learning can enable older women to (continue to) play an active part in community politics. However, without recognition of this by governments, discursively, ideologically and through policy developments, not only will older women continue to be one of the more disadvantaged groups in society but local and national communities will be the poorer for the loss of active participation that older women can bring. There will be less likelihood of local solutions being sought and found for global issues and problems, and less potential for diverse voices to be added to find global solutions to local difficulties.

Local Problems and Global Solutions: Cross-Cultural Distance Learning In Asia

Michiko Nakano

Director, Distance Learning Center,

Waseda University

nakanom@waseda.jp

0.0   Introduction to local problems and global solutions

It has become our mission in the 21ˢᵗ century to educate our university students as Global Citizens so that they can say their opinions in English about not only global issues but also the more immediate issue of Coexistence in Asia.   It is also important for young generations to build human network in the world.   How can we help our students to be able to solve real problems in the world?   The easiest way is to provide discussion opportunities in their daily life by making use of Information, Communication Technology (ICT) and Multi-Point Distance Communication System. These technological advancement enabled our students to discuss contemporary issues with oversea partners, every day, day and night, beyond the borders of space and time.

Since English began to be used as a common tool of communication in accordance with globalization, the most common local problem in Japan is a student's lack of English oral proficiency required to discuss the current problems in the world, such as climate change which inherently contains such irrevocable dilemmas about national interests as opposed to lengthy process of idealistic consensus-building towards global solutions.   In addressing other current problems in the world without resorting to the military powers, we need to realize that global solutions can be reached at with our firm recognition that this is the age of dialog.   In this sense, English Education has been highlighted as a means of promoting dialog more urgently now than before. In order to overcome the local problem mentioned above, Waseda University adopted the three stages of English Education: tutorial English to promote communicative competence, cross-cultural distance learning to promote inter-cultural competence and cyber seminars among Asian students to promote discussion ability on complex issues.

In this paper, it is argued that our goals in English education arising from local

problems linked to global solutions are attainable by looking at educational concepts in terms of communicative competence, intercultural competence and cross-cultural competence. According to Nagasawa (personal communication), Communicative competence Ministry of Education, Sports and Sciences proposed to teachers in Japan originates from Canale(1983), and Canale & Swain(1980a, b). Communicative Competence is summarized by Kramsch (2005) as Melting Pot View; i.e., you are accepted once you conform to the main stream of American or British Culture and Societal norms embedded in Native Speaker (NS) English. Without being melted into the mainstream NS norms nor blindly following their norms, communicative competence can be introduced in Asia; we need to know NS values and how NS speakers behave, but we do not need to mimic them. Once Asians are accustomed to detach ourselves from the authority and social norms, and to test ourselves as individuals, we would begin to trust our instincts and feelings and could think outside the box. For this reason, our programs at the first stage of Educational goal are based on communicative competence. In the second stage, we conduct one-to-one cyber seminars in which Intercultural Competence is introduced. Intercultural competence is metaphorically summarized by Kramsch as Salad Bowl View in which differences are respected as diversity, but the sense of unity may be difficult to achieve. English Language Education at this stage is called CCDL (Cross-Cultural Distance Learning) programs at Waseda Uiversity. We use videoconferencing system (Polycom) and/or the PC chat system (LiveOn) and conducts exchanges with students from partner overseas universities in English. CCDL promotes understanding of different cultures and provides opportunities to gain practical communication abilities in English, which leads to links with Asia and steps to the world. This is the age of Dialog. Conflict resolutions had better be reached at by dialog rather than military powers. At the tertiary level of Education it is better for us to give Dialog training to our students. The role of English in Global Literacy should transform itself and the nature of English Language Education should be shifted from NS-oriented to Englishes-oriented.

   At the final stage, cross-cultural competence is focused in our education; Cross-Cultural Competence represents a set of social and emotional intelligence to cope with incommensurable world views. Multi-point Distance Learning System is utilized and the students need to cope with multiple points of views such as historical perspective, socio-economic perspective, political perspective involving not only the point of view of a global citizen but also that of an expert in a given area. In the final section of this paper, our educational outcomes are briefly described in terms of

motivation, and social skills.   The present paper summarizes our educational efforts in Asia.

1.0 English tutorials and communicative competence

First-year University students who have been studying English for the sake of entrance examinations for prestigious universities in Japan tend to have the following features (for comprehensive survey, see Nakano (2002)):

> 1. Fairly good passive knowledge of grammar and vocabulary as the result of Grammar-Translation teaching they had received
>
> 2. They tend to overuse some adjectives and formulaic expressions, since they are not taught alternative expressions to convey different shades of meaning.
>
> 3. They are good at reading and writing, but they have strong speech anxiety, since high school teachers tend to correct grammar mistakes.
>
> 4. In their oral speech, they tend to echo high frequency expressions learned in their high school textbooks.

In order for them to use English as an appropriate tool of communication, university students need to stabilize their passive knowledge of vocabulary and grammar to the extent of automaticity so that they should be able to respond effortlessly in English and appropriately in a specific context of situation.   To be able to express their opinions and negotiate meaning in English, they need to go beyond phatic communication – more than being just nice to each other in English 一 and get used to using English in any topic they like without any speech anxiety.   For this purpose, we decided to take a radical reformulation of English Language Education called 'English Tutorial Programs'.   One tutor instructs four students to minimize their speech anxiety and to give relevant feedback by observing learner language directly at first hand: recasting, focus-on-form instruction and how to monitor a learner language by learners themselves.   After each lesson, students submit their reflection report and their tutors give feedback on the same day.   At the same time, tutors assess their mastery of two can-do statements per lesson. These activities for the sake of assessment and feedback are done all online.   The teaching materials are based on Common European Framework (CEFR). We needed six levels for our students, since some of them did not take English as an entrance examination item; some are beginners or basic users in their Spoken English.   According to CEFR, the main objectives for speech interaction and speech production can be outlined as follows:

> **A1 (Beginners)**
>
> Can produce simple mainly isolated phrases about people and places.

Can interact in a simple way but communication is totally dependent on repetition at a slower rate of speech, rephrasing and repair. Can ask and answer simple questions, initiate and respond to simple statements in areas of immediate need or on very familiar topics.

A2 (Basic)

Can give a simple description or presentation of people, living or working conditions, daily routines, likes/dislikes, etc. as a short series of simple phrases and sentences linked into a list.

Can interact with reasonable ease in structured situations and short conversations, provided the other person helps if necessary. Can manage simple, routine exchanges without undue effort; can ask and answer questions and exchange ideas and information on familiar topics in predictable everyday situations.

Can communicate in simple and routine tasks requiring a simple and direct exchange of information on familiar and routine matters to do with work and free time. Can handle very short social exchanges but is rarely able to understand enough to keep conversation going of his/her own accord.

B1 (pre-Intermediate)

Can reasonably fluently sustain a straightforward description of one of a variety of subjects within his/her field of interest, presenting it as a linear sequence of points.

Can communicate with some confidence on familiar routine and non-routine matters related to his/her interests and professional field. Can exchange, check and confirm information, deal with less routine situations and explain why something is a problem. Can express thoughts on more abstract, cultural topics such as films, books, music etc.

Can exploit a wide range of simple language to deal with most situations likely to arise whilst travelling. Can enter unprepared into conversation on familiar topics, express personal opinions and exchange information on topics that are familiar, of personal interest or pertinent to everyday life (e.g. family, hobbies, work, travel and current events).

B2 (Intermediate)

Can give clear, systematically developed descriptions and presentations, with appropriate highlighting of significant points, and relevant supporting detail.

Can give clear, detailed descriptions and presentations on a wide range of subjects related to his/her field of interest, expanding and supporting ideas with

subsidiary points and relevant examples.

Can use the language fluently, accurately and effectively on a wide range of general, academic, vocational or leisure topics, marking clearly the relationships between ideas. Can communicate spontaneously with good grammatical control without much sign of having to restrict what he/she wants to say, adopting a level of formality appropriate to the circumstances.

Can interact with a degree of fluency and spontaneity that makes regular interaction, and sustained relationships with native speakers quite possible without imposing strain on either party. Can highlight the personal significance of events and experiences, account for and sustain views clearly by providing relevant explanations and arguments.

C1 (Pre-advanced)

Can give clear, detailed descriptions and presentations on complex subjects, integrating sub-themes, developing particular points and rounding off with an appropriate conclusion.

Can express him/herself fluently and spontaneously, almost effortlessly. Has a good command of a broad lexical repertoire allowing gaps to be readily overcome with circumlocutions. There is little obvious searching for expressions or avoidance strategies; only a conceptually difficult subject can hinder a natural, smooth flow of language.

C2 (Advanced)

Can produce clear, smoothly flowing well-structured speech with an effective logical structure which helps the recipient to notice and remember significant points.

Has a good command of idiomatic expressions and colloquialisms with awareness of connotative levels of meaning. Can convey finer shades of meaning precisely by using, with reasonable accuracy, a wide range of modification devices. Can backtrack and restructure around a difficulty so smoothly the interlocutor is hardly aware of it.

<div align="right">Modern Languages Division, Education Committee

Council for Cultural Co-operation (2001, p.58, p.74)</div>

Since these descriptors are constructed in terms of Task-performance, context-conditions and quality-criteria (Green: 2009), we could easily think of what speech situations or tasks we need to present to our students.

1.1   Validation Experiment

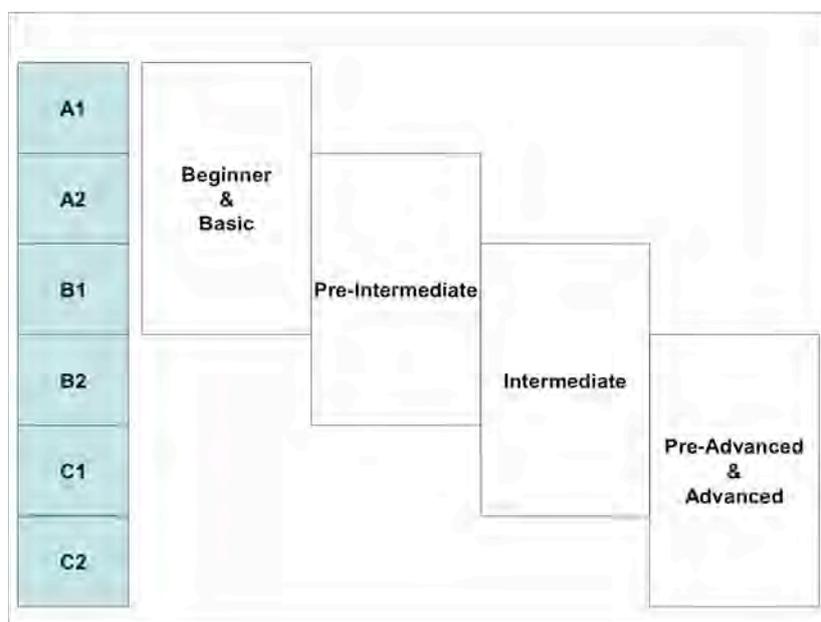
This experiment was conducted in 2007 and reported in Tsutsui, Nakano and Kondo

(2007).   In this section, the major findings are briefly outlined.   Our immediate goal of the present experiment is to show statistically significant correspondence between the outcome of learning CEFR-based textbooks by Waseda students and the tutors' assessment of individual learner performance.   We have adopted the questionnaire proposed by North & Schneider (1998).   They developed the questionnaire format to elicit a learner's subjective assessment of their ability in English as well as to elicit a tutor's assessment of his or student's ability. We have used 99 items out of 221 originally in North & Schneider (1998) and more recently Schneider and North (2000). The 99 items relate to Spoken Production, Spoken Interaction, Strategies and Language Quality.   2619 students and 982 tutors took part in the experiment.   Table 1 shows the breakdown of participants.

Table 1 Participants

Levels	Participants
Beginner	0032 (013)
Basic	0417 (153)
Pre-Intermediate	0591 (225)
Intermediate	0601 (229)
Pre-Advanced	0704 (266)
Advanced	0274 (096)
計	2619 (982)

Number in the brackets indicates the number of participants who are assessed by their tutors.

We asked the students at each level to respond to the items belonging to the three levels.   The following diagram shows the self-assessment items the students at each level responded to.


Firstly we have equated learners' judgments as well as tutors' assessments separately and estimated Item Difficulties as well as Item Discriminations according to

2-parameter logistic model:

2PL logistic Model

$$p_j(\theta) = \frac{1}{1 + \exp\left(- Da_j(\theta - b_j)\right)}$$

a_j stands for Item Discrimination and b_j, Item Difficulty.

1.2   Results

Table 2 shows the correlations of Item Difficulties between those by students and by tutors.

Table 2 Correlation of Item Difficulties between the students and the tutors

	r
Spoken Interaction	.849
Spoken Production	.969
Language Strategies	.899
Language Quality	.831

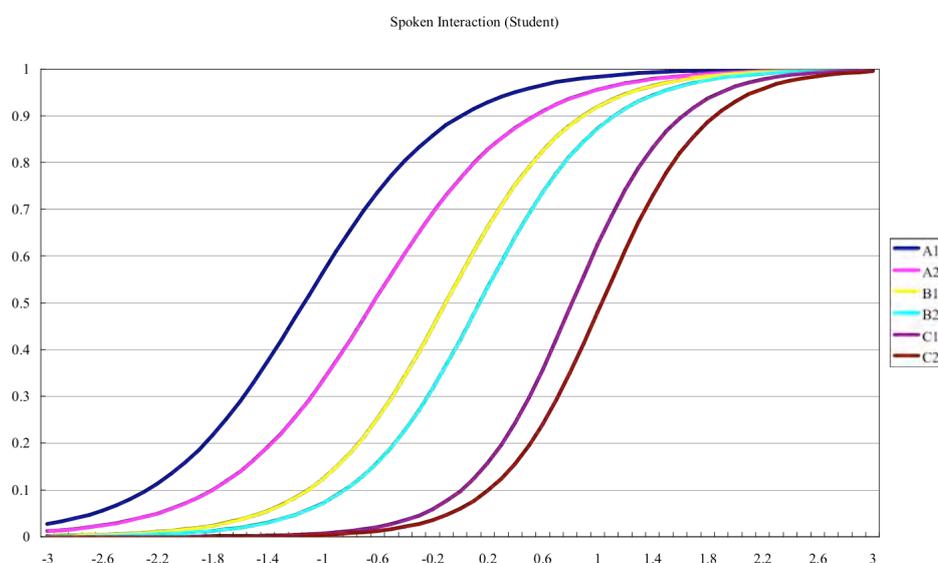
Fig 1 represents students' assessment of Item Difficulties for Spoken Interactions; Fig 2, for Spoken Productions; Fig 3, for Strategies; Fig 4, for Language Quality. Apart from B1 in Strategies and C1 in Language Quality, Item Characteristic Curves are not crossed.   This indicates that teaching materials correspond to the levels of descriptors in CEFR on the whole.


Fig. 1 Item Difficulties of Spoken Interaction (student)

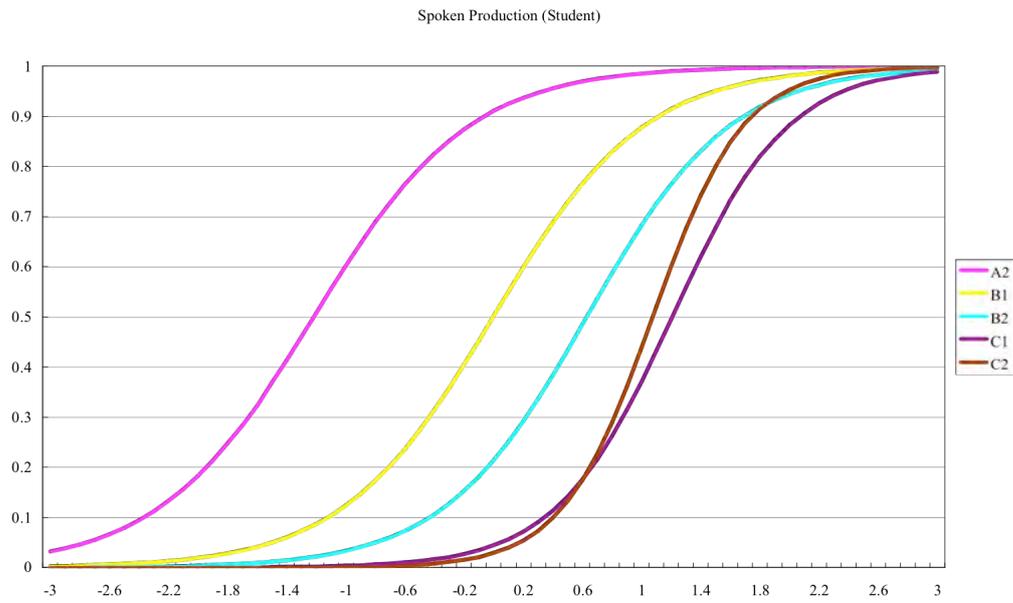
Spoken Production (Student)


Fig. 2 Spoken Production (student)

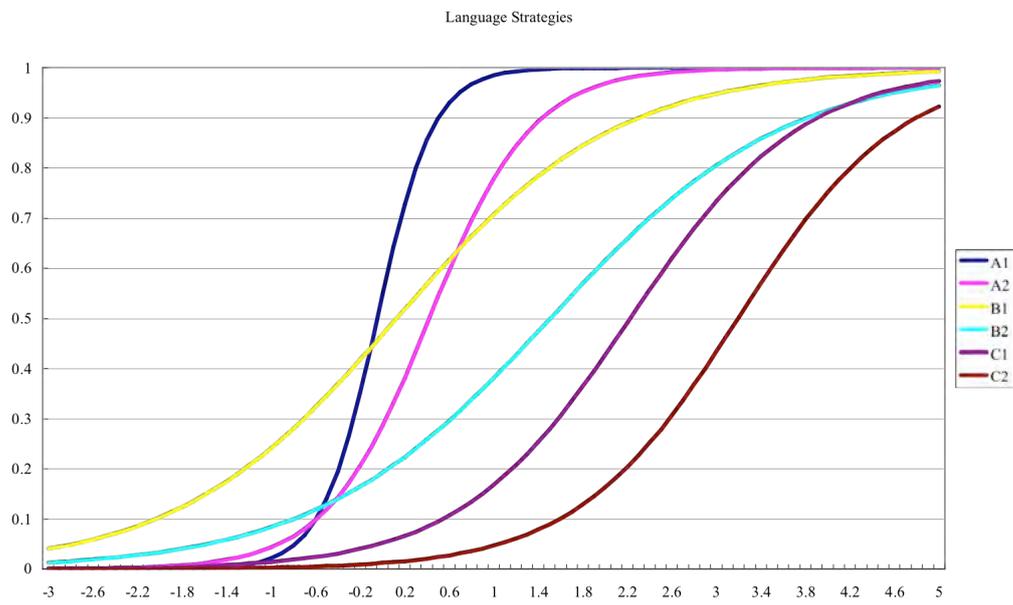
Language Strategies


Fig. 3 Item Difficulties for Language Strategies (Student)
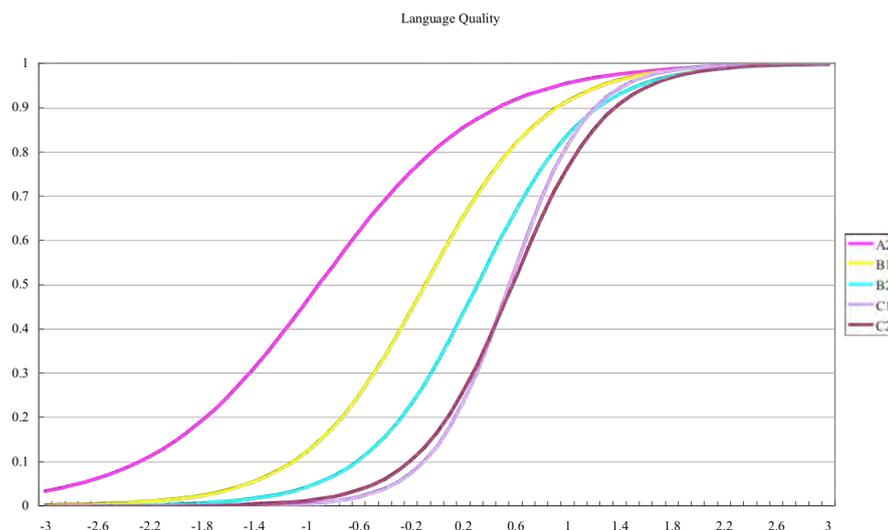


Language Quality

Fig. 4 Item Difficulties for Language Quality (Student)

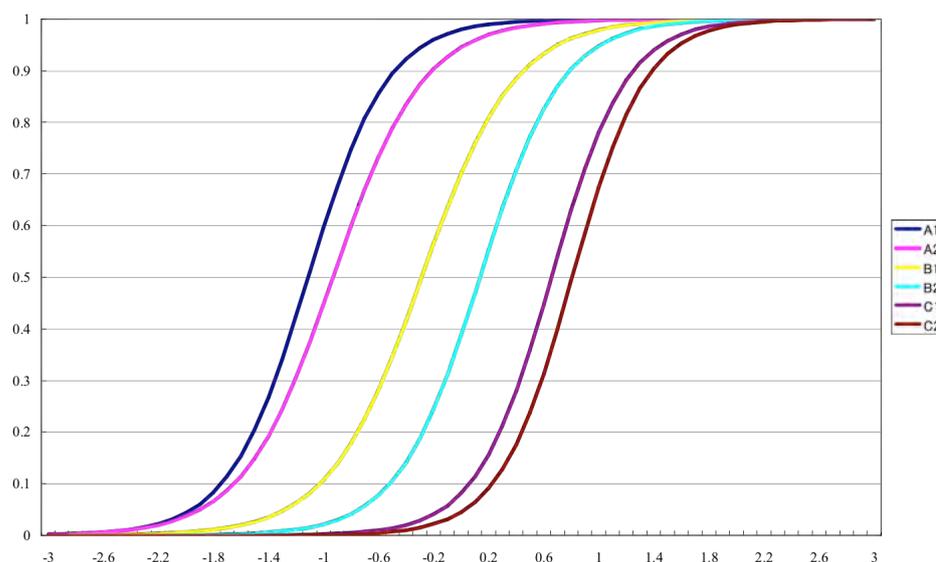
Fig 5 shows Tutors' assessment of Item Difficulties. Although the Item Discriminations are sharper and more distinct than those by the students, none of the curves are crossed. This indicates that tutors regards teaching materials as following the descriptor levels specified by CEFR.


Fig. 5 Item Difficulties for Spoken Interaction (Tutors)

2.0 Inter-cultural competence and one-to-one CCDL as emerging cross-cultural competence

CCDL programs are given to Intermediate learners of English (B1+ and B2), but the content itself and guiding principles explained below can stretch their ability in

English.   As mentioned in 0.0, exchange tools between Waseda students and oversea partner students are either TV conferencing system and/or oral chatting system, shown in Fig 6.

Fig. 6 Exchange Tools

There are three courses: Global and social issues, Media and International Career Path. The topics in Global and Social Issues are Happiness Factors, Family Roles in the Changing World, Climate Change, etc.   Media course deals with Successful Advertisement in East Asia, Gender Images portrayed in media, Country Images portrayed in media, etc.   International Career Path addresses the issues of People vs Task Focus, Work Life Balance, Entrepreneurs, Distribution of Reward and Recognition, Free Trade Agreement, etc.   We have CCDL concepts common to the three courses: see detail in Nakano (2009a and 2009b).

1 Intercultural Translation

If there is no translation equivalence in English for your native concept, paraphrase, summarize, and give the situational context of use.

Is your English good enough to convey native concepts in our own culture?

Be creative in English, as in the outer circle English users such as Singaporeans, Malaysians, and Filipinos, but avoid excessive use of

lexical borrowings.

2 Grice's maxims vs Politeness

See Grice (1975) and Brown and Levinson (1978).

Combine the two principles and control your language.

Ameliorate two conflicting speech principles.

3 Indirect (High/collectivist) culture vs Direct (Low/individualist) culture

Indirect / High Context Culture: People in these cultures tend to infer, suggest and imply rather than say things directly. At least that is how they appear to people from more direct/low-context cultures—though not, of course, to each other.

Direct/Low Context Culture: Direct cultures tend to be less collectivist, with less well-developed in-groups, and more individualist than indirect cultures. People lead more independent lives and have fewer shared experiences; hence, there is less empathic understanding of others. People need to spell things out and be more explicit; to say exactly what they mean rather than merely suggest or imply[No culture, of course will be exclusively direct or indirect—all cultures will have elements of both poles—but many cultures tend to be more one than the other. As always, personal differences will also come into play, along with circumstances.]

Indirect mode of speech vs Direct mode of speech: our learners need to intuit in utterances, "That is a very interesting viewpoint, or This proposal deserves further consideration" such implicatures as 'I don't completely agree. We need to talk more about this. I see things very differently.' These modes of speech are built-in in our culture.   Then, why not incorporate direct/ individualistic orientation into our society more than before.

Polychronic vs monochronic time orientation and risk orientation: see Hofstede (1980).

Be diverse.

Go beyond the East and West.

4 Agreement styles

Submission style allows another person or group to have authority to make decisions or being willing to hand over control

Compromise style: An agreement in which both sides make a concession by agreeing to accept less than they originally wanted

Evasive style: To intentionally avoid dealing directly with a difference for strategic reasons

Consensus building process

Increase flexibility.

5 Research method which helps students make sound judgments

We instruct our students how to evaluate sources of information in terms of the six factors:

Authority: Is the writer of the source an expert?

Purpose: Does the source want to inform you or persuade you?

Audience: Who is the audience? Is it written for experts? Children?

Currency: Is the information recent?

Quality: Is the language objective?

Accuracy: For factual information, can the same information be found in other sources?

6 ODIS (Observe, Describe and Interpret, but suspend your judgments.)

Don't be judgmental.

7 Emotional Intelligence and Social Intelligence combined: see Goleman (1995) and Salovey and Mayer (1990).

Emotional intelligence is believed to determine the potential for learning the fundamentals of self-mastery, whereas emotional competence shows how much of that potential has been mastered in ways that can be translated into on-the-job capabilities (Goleman, 1995: xv). Students are introduced to Goleman's framework of emotional competence from time to time during the business-related activities in the preparation lesson as a hint of how to become a better communicator or to develop leadership skills.

Social Awareness

Primal empathy: Feeling with others; sensing non-verbal emotional signals.

Attunement: Listening with full receptivity; attuning to a person.

Emphatic accuracy: Understanding another person's thoughts, feelings, and intentions.

Social cognition: Knowing how the social world works.

Social Facility

Synchrony: Interacting smoothly at the nonverbal level.

Self-presentation: Presenting ourselves effectively.

Influence: Shaping the outcome of social interactions.

Concern: Caring about others' needs and acting accordingly.

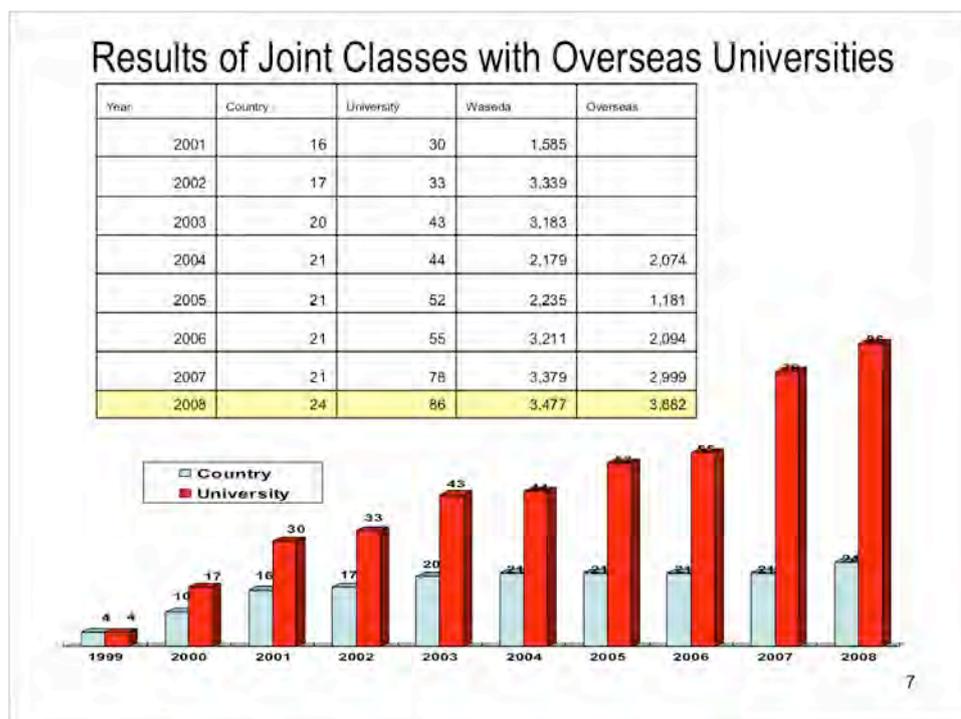
(Goleman, 2006: 84)


Fig. 7 CCDL Participant Data from 2001- 2008

In the expanding circle countries, English is not used in our daily life.   We need to offer students more opportunities to use English.   Asian interactions are authentic communication opportunities.   Text-book teaching confined within the classroom activities is communicatively vacuous to a large extent and NS-norm dependent. The more they use English, the better their proficiency becomes.   In fact their English improves as the result of NNS-NNS Interactions.   Strategic competence is fostered in the interactive dialog, since CCDL programs develops the ability to switch perspectives; by encountering views and opinions different from our own, we will begin to develop a deeper self-awareness and begin to see things in others' shoes. Gradually, we want to encourage our students to develop a more "ethnorelative" awareness. This means not just respecting others' opinions, but also being able to understand why others have different points of view and why their values and choices may be different from your own. It involves "suspending" our own values, to enable us to put ourselves in others' shoes. The ability to accommodate or assimilate diverse perspectives like this is what we call "Emerging Cross-cultural Competence."   It is

hoped that intercultural competence is inherently linked in the mind of a learner to the development of cross-cultural competence.

3.0 The Growth of Cross-Cultural Competence and multi-point distance learning CCDL

Our teaching at the third stage focuses on the development of cross-cultural competence so that our students should be able to discuss competently the current problems in the world with their overseas partners whose worldviews are incommensurable. We believe that multi-point distance learning offers opportunities for turning a learner's point of view into trans-cultural ones which may be termed as Global Literacy Education with Cross-Cultural Competence. According to Kramsch (2005), "neither intercultural nor multicultural education put into question the mainstream principles of the dominant Anglo American culture..." (2005:13). Since we embody different and incommensurable world views, both Kramsch and Cameron (2002) oppose the world view of 'unity and diversity.' Real world problems cannot be solved by native-like communication skills. Instead, they propose trans-cultural competence. By using ICT effectively, we can be confident that 'Cross-Cultural Competence' offers the necessary educational concepts of English Language Education particularly valid in Asia. Fig. 8 gives some examples of multi-point distance learning programs. These content courses involves scrutinizing multiple sources and perspectives: socio-cultural understanding of the concepts in Asian countries, historical perspectives in each of the countries involved, speculation about causes, consequences, and hypothetical futuristic situations. In order to take an active part in cyber discussion, the students need to evaluate alternative proposals and making and responding to hypotheses. At the same time, they need to initiate idealistic/humanistic and futuristic discourse, and give feedback on and follow-up statements and inferences by other participants. Furthermore, they are expected to relate their own contributions to the development of discourse to simulate a process of consensus-building among Asian users of English.

Since each set of circumstances we are in are bound to be different from generation to generation, we can not hand down our solutions to the younger generations. Each generation must find their own solutions for themselves. Furthermore, society may not always be right. The mind-set we wish to foster in the mind of our students, therefore, includes sympathy for the weak and the poor, courage to go into the

academic wilderness and the conceptual frontier in order to discover solutions for the real problems in the world, readiness to question the authority and social norms and the self-reliance to trust their experiential instincts and feelings. Younger generations must be able test themselves as precious individuals.

Fig. 8 Multi-point CCDL courses

3.1 Some outcomes of our education in terms of motivation and social skills

In order to test our educational methods, we ran two experiments.   The experimental findings are reported in Nakano et al. (2008i) and Nakano & Yoshida (2008j).   This final section briefly outlines these experiments.   Generally, Program Assessments can be done by looking at the following two points:

How much a program can promote a learner's motivation to learn

How much a program can improve a learner's social skills (communication skills + intercultural knowledge)

We compared and contrasted three Class Types:

Theme-based CCDL programs (+ textbooks about intercultural communication skills + oral-chatting: see Section 1.2)

Global Literacy course (learner-centered CCDL): participants choose topic of discussion and reading material + weekly TV conferencing followed by

individual oral chatting)

Regular English Lessons (oral or text chatting outside lesson hours)

234 Waseda university students took part in Motivation experiment and 388 students, in Social Skills experiment. We distributed online 35 Motivation Questionnaire items which are adapted from Noels et al. (2000) and DÖrnyei (2005) and modified in accordance with the CCDL environment. Motivation progresses from Amotivation via External Motivation to Intrinsic Motivation. Intrinsic motivation is triggered by quest for knowledge, the sense of Accomplishment or such physical Stimulation as English sounds and rhythm. It is assumed that Motivation accommodates self-regulation dynamics: Eternal/Extrinsic regulation, Projected regulation, Identified regulation and

Intrinsic regulation. We factor analyzed the data and extracted 5 Factors in Motivation data:

Factor 1 Intrinsic Motivation for Knowledge

Factor 2 Amotivation

Factor 3 transition from extrinsic regulation to introjected regulation

Factor 4 Intrinsic Motivation for Accomplishment

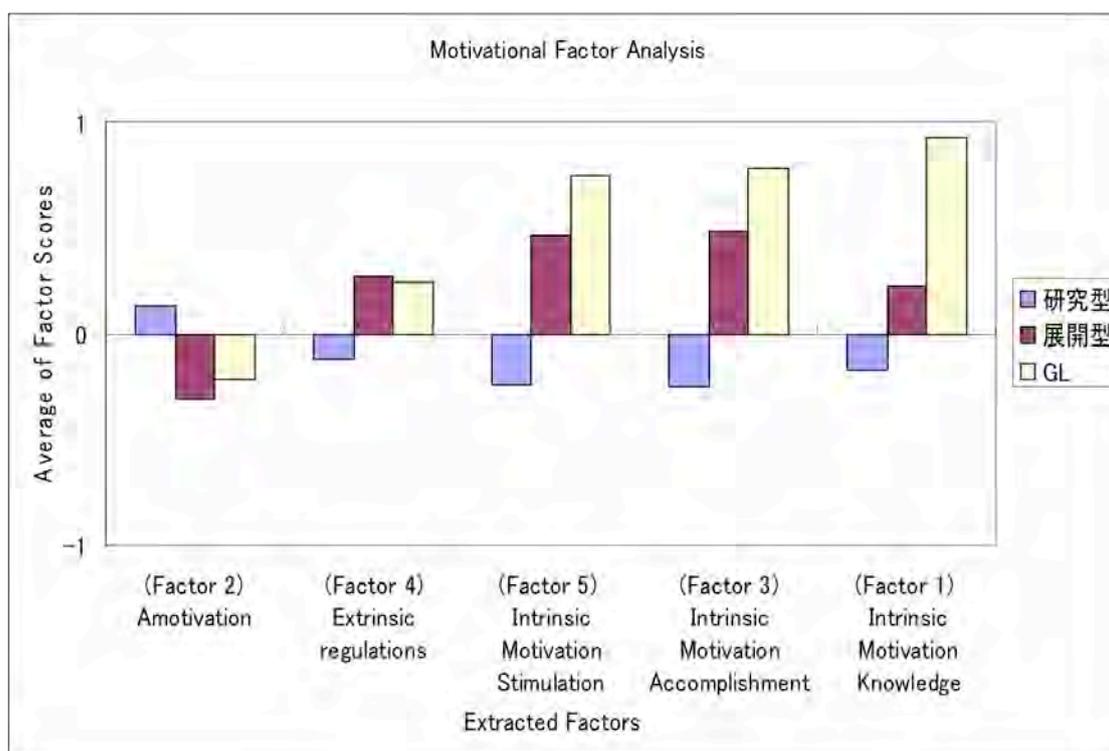
Factor 5 transition form extrinsic to intrinsic


Fig. 8 Mean Factor Scores

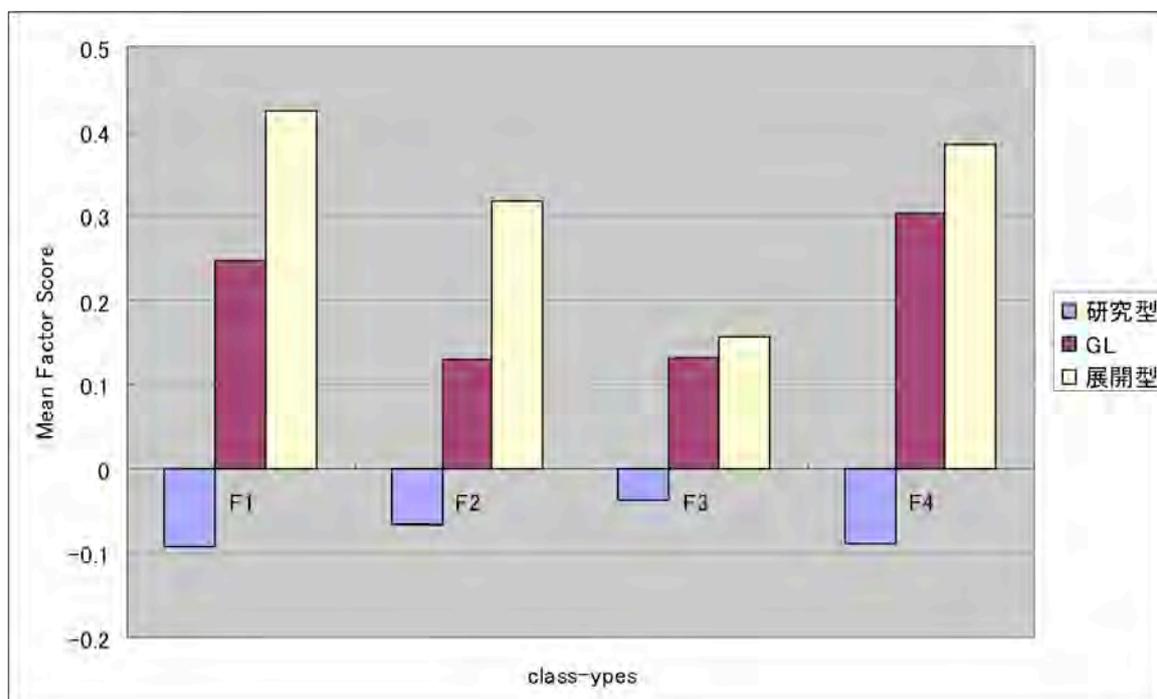
Blue bar stands for mean factor scores in regular English lessons.

Yellow bar stands for mean factor scores in Global Literacy class (a type of CCDL).

Wine-colored bar stands for mean factor scores in CCDL programs.

Note that Global Literacy class is a student-centered CCDL; the students choose the topics of discussion and presentation as well as reading materials.   On the other hand, theme-based CCDL programs have textbooks and the discussion topics are predetermined by the textbooks.   For this reason motivational mean scorer are better in CCDL Global Literacy Class than in the theme-based CCDL programs.   It should be noted that regular English lessons elicit negative values for all the positive motivation types and the only positive value is for Amotivation, i.e., the students are unwilling to study English.   The present experiment confirms that the CCDL approaches to English Language Learning suits the goal or purpose of learning among our students.

For Social Skills, We analyzed the data as in Kikuchi (1988, 2007); Firstly, Item-total correlation analysis was done, secondly, the highly correlated 3 items with the items belonging to the four categories are identified and finally we factor analyzed the 18 items.   Then we calculated mean factor scores for the three class types separately. Fig. 9 represents the mean factor scores.


Factor 1 Fundamental Skills for L2 Communication

Factor 2 Social skills with considerations for other people

Factor 3 Skills for dealing with distress

Factor 4 Planning skills

Blue bar stands for mean factor scores in regular English lessons.

Wine-colored bar stands for mean factor scores in CCDL Global Literacy class.

Yellow bar stands for mean factor scores in the theme-based CCDL programs.

As you can see, the theme-based CCDL courses are better suited in enhancing the acquisition of Social Skills. We have seen in Motivation Experiment that CCDL Global Literacy program is better than theme-based CCDL courses in raising a learner's motivation. CCDL programs all together are a way ahead of regular English lessons. The students who participate in the CCDL programs are trying to perform up to our expectations and to stretch their ability in English to cope with an increasing number of problems whose answers come along with a dialog with their contemporary peers in Asia.

Using the Communicative Orientation of Language Teaching Observation Scheme (COLT) for Classroom Observations

Jonathan Aliponga

Gerald Williams

Midori Sasaki

Kansai University of International Studies

Introduction

In our university, it is only our department that conducts classroom observation. This is done once a semester, usually a month after classes started. The question that any teacher might ask is: "Why are we doing classroom observation?" To many teachers outside Japan, this is an inappropriate question to ask because whether the purpose of classroom observation is to gather data for research, help a teacher solve a disciplinary problem, or sit in the classroom to make sure the objectives set for the course are achieved is pretty commonly practiced. However, teachers in Japanese colleges and universities and even in elementary and secondary schools will be surprised to hear that our department does classroom observation with the goal of assessing the curriculum.   Assessing the curriculum means to make sure the objectives for all courses offered for the semester are met. This can be checked through student evaluation usually using questionnaires, and through classroom observation. The latter entails talking to the teacher what is expected before the observation and giving feedback after the observation. These processes are not commonly done at Japanese colleges and universities for two reasons. One reason is that the curriculum is not defined. Out of more than a hundred colleges and universities in the country, may be only a few have a solid curriculum which they rigidly follow and assess regularly. I can attest to this based on my experience teaching at a high school for three years and at four different universities for five years, and many of the teachers would agree that a 'real curriculum' does not exist. We would come to a meeting wherein the chair or program coordinator would inform us about the course we would teach, and it was up to us to formulate our course objectives based on the course name and general goal of the course. The semester would start and end without any classroom observation. It is not the case in our department. We have established our curriculum which we have been using for two years now. And for two years, we have conducted

classroom observation because, after three decades of research, it has been proven to be effective as far as improving teaching is concerned. (Sheal, 1989)

The term classroom observation is not new in language teaching. Classroom observation 'arrived' in language teaching research as a research tool as early as 1960s in the U.S. (Allwright, 1988). In the early 1960s, Flanders (1960a) devised a system of Interaction Analysis, an instrument used to observe actual classroom behavior such as teacher talk and student talk. In the late 1960s, researchers like Jarvis, Politzer and Rothfarb utilized systematic classroom observation as the key procedure in their research work. Systematic classroom observation is a quantitative method of measuring behaviors from direct observations that specifies both the events or behaviors that are to be observed and how they are to be recorded (Medley, 1992). Research using systematic classroom observation has provided researchers and other people in the field of teaching with substantial knowledge base that has helped them understand effective teaching (Waxman et al., 2004).

Unlike Politzer's (1966) study which aimed at identifying 'bad' and 'good' teaching techniques, Rothfarb (1970) and Jarvis (1968) sought to determine how well teachers' actual behavior fitted the audiolingual ideal. With the shift from audiolingual approach to communicative language teaching which reached its peak in the early 1980s and still considered as the well-informed approach in language teaching (Brown, 2002), a number of researchers developed instruments to describe events in a communicative language setting. Allwright (1988) and Coulthard (1977) analyzed the discourse of teacher and learner speech. Van Lier (1988), on the other hand, utilized ethnographic approaches to classroom observations. None of these studies captured the complexity and variety of instructional events in L2 classroom settings. Thus, Spada and Frohlich (1995) designed COLT which was utilized in the present study. COLT, which stands for Communicative Orientation of Language Teaching Observation Scheme, was developed to describe classroom processes and examine these in relation to learning outcomes. It was designed in such a way that it will avoid subjective, judgmental and impressionistic nature of classroom observation which is the reason for the bad reputation of classroom observation (Wang and Seth, 1998).

Research Questions

Aside from the goal of making the classroom observation as objective as possible by utilizing COLT, it was also the aim of this present study to create a state of imbalance in our teachers' perception of their own

behaviors and to provide self-awareness among our teachers which could increase their control of their actions and the possibility to modify them to improve their teaching. Specifically, the following questions were addressed in this study:

(1)   What is the nature of the communicative orientation in the English language classrooms at the Department of English Education of Kansai University of International Studies?

(2)   What are the implications of the findings of classroom observation for teacher, curriculum and materials development?

Review of Related Literature

Akbari   et al. (2009), in their study, identified five necessities of teacher observation. One is it is a means of attending to the need teachers have for assistance in understanding their classroom behaviors, classroom dynamics and teaching techniques. Two is it is a way of engaging teachers and administrators in a dialogue about effective practice. Three is it is a mechanism for assessing areas requiring improvement. Four is it a vehicle for fostering understanding about unique issues teachers face as well as for expressing appreciation for work they do. Finally, it is a tool for evaluating the teacher's performance. All five necessities, which can be categorized into three, are evident in the present study. In present study, the first category has to do with providing teachers with feedback as to whether or not the course objectives are met. The second has the goal of promoting good relationship between the supervisors and the teachers. The last has to do with the rehiring process. One cannot argue the fact that these reasons are important not only for the teachers but also for the supervisors, administrators and students. No matter how important classroom observation is, it is undeniable that it is not an easy task. In fact it is a very challenging task for supervisors to do. The challenge lies in making the teachers who will be observed feel comfortable with the classroom observation process.

In the study conducted by Wang and Seth (1998) in China, they found out that teachers viewed classroom observation as 'bad' because of its subjective, judgmental and impressionistic nature. In order to change this negative image of classroom observation, they employed a collaborative approach in their conduct of classroom observation. They gave teachers the opportunity to decide what they would like to do throughout the

classroom observation process. Results showed that this approach created a drastic change in teachers' attitude towards observation.

Lam (2001) conducted similar study on teachers' attitude towards classroom observation in Hong Kong. The results revealed two main reasons for teachers' adversarial attitudes. One has to do with doing classroom observation with the primary goal to evaluate teachers. The second relates to the idea of the principal or supervisor sitting in the back of the classroom checking the evaluation checklist, and making the decision what is good and bad teaching afterwards. The findings also revealed that teachers preferred to include teacher development and peer observation in teacher observation practices.

The present study took into account all the purposes of classroom observation cited by Akbari et al. The next challenge was to employ classroom observation in such a way that our teachers would see the necessities more than the disadvantages. One way to realize this was to employ the Communicative Orientation of Language Teaching Observation (COLT) scheme as an instrument for systematic classroom observation.

Prior to the use of systematic observational methods, research on effective teaching typically consisted of subjective data based on personal and anecdotal accounts of effective teaching (Nuthall and Alton-Lee, 1990). In order to develop a scientific basis to teaching, researchers began to use the more objective and reliable measures of systematic classroom observation. In the past few decades, several hundred different observational systems have been developed and used in classrooms and research studies (Anderson and Burn, 1989). The paper on interaction analysis as a feedback system by Amidon and Flanders (1963) utilized an instrument that looked into the verbal behavior of teacher in the classroom which is classified as either indirect or direct. This classification gives central attention to the amount of freedom the teacher grants to the student. The teacher can be direct, that is, minimizing the freedom of the student to respond, or he can be indirect, maximizing the freedom of the student to respond. Hough (1965), on the other hand, developed an instrument that could analyze both teacher and student behavior. It is a 16-category system which is grouped into four major subdivisions: (1) teacher indirect verbal behavior, (2) teacher direct verbal behavior, (3) student verbal behavior, and (4) silence or nonfunctional verbal behavior. These are among the many instruments developed for systematic classroom observation. Among the newest instrument that can capture the complexities of L2 classroom, and can determine the nature of communicative orientation in the classroom is the Communicative Orientation of Language Teaching Observation (COLT) scheme of Spada and Frohlich (1995) which the present study utilized.

Methods

Participants

Table 1. Part-time teachers observed using COLT

Teacher	T1	T2	T3	T4	T5	T6	T7
Nationality	American	Japanese	American	Australian	Canadian	Japanese	Australian
Highest Degree	M.A. in Education	M.A. in Ling & Literature	M.A. in TESOL	M.A. Applied Ling	M.A. Eng Education	M.A. Medieval Studies	M.A. Applied Ling
# of Yrs of teaching experience	6 yrs	4 yrs	6 yrs	4 yrs	9 yrs	15 yrs	
Length of teaching at KUIS	Just started	Just started	Just started	Just started	Just started	9 yrs	2 yrs
Course taught during observation	Intro to Int'l Bus	English B	Community Planning	English B	Business Manner	Intermediate Listening I	Intro to Int'l Bus I
Major Skill Focus	Independent Writing	Integrated speaking	Reading	Integrated Speaking	Independent Writing	Listening	Integrated Speaking

As shown in Table 1, there were seven teachers involved in this study. All teachers observed, two Japanese and five foreigners, have Master's degree. Three have a graduate degree in education, three in applied linguistics or language teaching, and one in medieval studies. All of the participants have at least 4 years of teaching English either in a language institute, elementary, high school or university. Out of seven teachers, only two have been teaching with the Department of English Education for one year or so, and the rest just started teaching in the spring semester. All participants taught a course under the Department of English Education at the time of the observation.

Instrumentation

One instrument utilized in this study is Spada and Frohlich's Communicative Orientation Language Teaching (COLT) scheme (see Appendix). The scheme, was not modified for this study, is rooted within a theory of communicative language teaching and can capture the complexity and variety of instructional events in L2 classroom settings, such as the variety of activities and modalities used, the kind of language that learners produce in pair or group work, the kinds of questions teachers and students ask one another, the types of verbal interactions which take place within different activities or tasks, the content focus of the lesson, the control of content, and even the type of source materials used.

The COLT observation scheme has two parts, but only Part A is utilized in this study. As described by Yu (2006), Part A is referred to as the macrolevel analysis and is designed to conduct a real-time coding that describes classroom

activities at five major levels. The first, *activity type*, such as drill or roleplay, etc., is employed to help the observer identify the kinds of tasks and exercises that students need to do during the class. Compared to the other levels, it is not only qualitative (as opposed to quantitative) in nature, but is the only open-ended category within the context of which the information of classroom processes realized by the other levels are provided. The second level, *participant organization,* such as teacher-centered activities (like whole- class interaction) or student-centered activities (like group

work), records the amount of time spent on different types of class interaction. The third level, *content*, can be employed to determine whether an observed class is primarily code-based or meaning-based in its orientation. Code-based instruction is realized through a subcategory with an explicit focus on language (form, function, discourse, and sociolinguistic rules), whereas meaning-based orientation

is realized through the subcategory of *other topics*. The fourth level, *student modality*, i.e. listening, speaking, reading, or writing, measures how much time students spend practicing the four skills. The last level, *materials*, focuses on information regarding type, length, and source of texts being used. In short, the Part A analysis permits a description of classroom practices for different focuses of communicative competence within activities. For instance, if an activity is described as sociolinguistics-focused, the features of instruction are specified.

Besides using the COLT scheme and note taking, a video camera was utilized to record the lesson. Using video analysis to study teaching and learning resources and learning has special advantages (Stigler,

Gallimore, & Hiebert, 2000). One advantage is that it enables detailed examination of complex activities, such as the use of teaching and learning materials, from different points of view. The second advantage is that it preserves classroom use of teaching and learning materials by many people with different kinds of expertise, making possible detailed descriptions of many classroom lessons. The third benefit is it increases the opportunity to develop powerful theoretical observational systems to analyze the use of resources in the classroom and learning situations.

Procedure

The first step done in this study is the **explanation of the goals of classroom observation**. Before the start of the spring semester, teachers were informed that there would be classroom observation. Since classroom observation has been done for almost two years, this announcement was made especially for the newly hired part-time teachers. The eight goals of classroom observation (Borich, 2008) were made clear to all concerned teachers. The first is to achieve empathy, a willingness of teachers to see events from different and nonjudgmental points of view and to appreciate the observer's interpretations or reasons for acting they way they do. The second goal is to establish cooperative relationship. It was emphasized that there is a need for everybody to work with colleagues for ideas and support. The third goal has something to do with becoming realistic. Many teachers especially the new ones tend to have an idealistic view of higher education and teaching. Classroom observation can provide us with an opportunity for reflections which will make us more realistic in evaluating both what is desirable and what is possible in different classrooms. The fourth goal is to establish direction. This means to establish the professional goal toward which teachers want to work during their first year at our department. Through classroom observation, teachers will identify characteristics and practices they will want to emulate in their own teaching. The fifth goal has to do with attaining confidence which can be developed over time and with support from colleagues. Feedback from classroom observation can provide a venue for reflection of our teaching techniques, classroom management, what works best in the classroom and what need to improve to make teaching and learning successful. It is through this realization that we can build our confidence in teaching. The sixth goal is to express enthusiasm. If we see how we teach from classroom observation, we will learn how to calm our fears and attain our goals, perform activities, and produce results that we would like to accomplish. The seventh goal has something to do with becoming flexible. In order to achieve our course objectives, we have to take risks. Effective teachers most often achieve their goals in the context of

trials and errors. Feedback from classroom observation will provide an opportunity to see procedures and techniques which work and do not work in the classroom. The last goal is to become self-reliant. The greater our awareness is of our strengths and weaknesses and what is going on in our teaching environment, the greater our personal confidence, enthusiasm, and flexibility will be in achieving our goals.

The second step is the **introduction of the classroom observation instrument, the Communicative Orientation of Language Teaching (COLT) scheme**. For the first timers, it is not easy to understand the COLT scheme by just listening to the explanation. In order for the participants to fully understand the use of the instrument, they had a hands-on experience of using it. First, the COLT scheme was explained using a video of a classroom lesson. The participants were encouraged to ask questions during the demonstration of the COLT scheme. The demonstration was followed by using the COLT scheme by the participants. Another video of a classroom lesson was shown, and the participants played the role of an observer, filling out the COLT scheme form as they watched the video.

The third step is **sending the classroom observation schedule** (see Appendix) **to the concerned teachers**. The schedule was sent three weeks prior to the classroom observation. This was to give time to the teachers to carefully plan what they should do in three weeks so that come the observation week, they could present the full lesson, from activating prior knowledge to homework assignment. The schedule contains the name of the teacher to be observed, the name of the teacher who will observe, the date and class time/period of the observation, and the course name the teacher is teaching, and the classroom number.

The fourth step has to do with **reminding all the participants of what would be expected during the classroom observation**. This included focusing on the course objectives, designing learner-centered activities, and enforcing the Department policies such as use of computer, homework system and speak English only rule. All of our students at our Department are required to have a computer. Each of the courses for four years at our Department has a general goal, specific objectives, grading system and textbook. The general and specific objectives and learner-centered tasks are anchored in the following principles which are theoretically well informed global understanding of the process of learning and teaching: (1) Teaching techniques should focus on or account for the needs, styles, and goals of learners; (2) Teaching techniques should allow learners to interact with each other; (3) Language learning should focus on meaning and should use authentic and natural language; (4) Language teaching should integrate the learning of subject-matter content with the learning of the second language; (5) Language teaching curriculum should incorporate content or subject material and the four skills of

listening, speaking, reading, and writing into the classroom; (6) Learners should be exposed to concrete experiences through which they discover language principles; and (7) Language teaching materials should engage learners in doing some comparable real world tasks and they should be assessed in terms of outcomes.

These principles provide us with methodological options for tailoring classes to particular contexts. For example, decisions about focusing on business, tourism and education content and TOEFL iBT for our classes were made. With this goal, the next step for us to do is determining *how* we will teach. Our students come to our Department with their own knowledge, experiences and interests. We consider these elements in my planning and execution of classes. To do this we think about our classes in terms of "what will students do," rather than "what will we as a teacher do." In this situation we give our students materials, set guidelines and goals, and be prepared to let them tackle the work. At the same time, we are ready to teach them when they have trouble. At the basis of this are the two theories of *need* and *error*. In other words, a goal was set for them, a *need*, which they achieve by developing skills such as paraphrasing, vocabulary, or summarizing—skills which were set to help them achieve success on the TOEFL iBT. The second basis is *error*. Rather than presupposing what they do and do not know or can and cannot do, and leading them through steps to achieve the skills and practicing them, we organize activities for them to try and find out where they need help by observing the errors they commit. Once they have committed an error, our job is to assist them.

The Homework Ticket System can seem very teacher- centered. However, much like us deciding what materials and language skills they need to develop we are in a position to make this decision. The ticket system specifically targets their dislike of doing homework. We also believe that many of our students do not have a routine of doing homework. And we know that unless they are actively studying while outside the classroom they will not achieve the goal of TOEFL iBT. We also know that students may not view teachers as good resource for their own learning, and we are encouraging them to see teachers as helpers by forcing students who do not do homework to spend time with teachers in the hope of changing their context of spending time with teachers. So the homework ticket system is intended to get students into the habit of studying outside the classroom and to develop a view of teachers as good resources. Finally, the system we have required students to leave the classroom unless they have the homework completed or the ticket signed. There are two purposes to this. The first is to promote independent learning. Homework should be designed to be used in class as part of the learning. If a student fails to complete the homework then they are not doing their part in their own learning. Second, to emphasize to students who have completed their homework the importance of homework as part of the learning

process. If a student is permitted to stay and complete the homework in the classroom, then two things are being communicated to students: first, the classroom teacher is accepting responsibility for the student for doing the homework, and; second, class time is a place to complete the homework. Both of these messages undermine the promotion of independent learning and the role of the classroom teacher as someone who facilitates the learning process.

The Speak English Only policy is intended to address the fact that we are in a non-English environment and in a society where speaking English has often been viewed as showing off. First, unlike the U.S. and other Anglo countries, students do not experience English outside the classroom, so are limited to how much English they are exposed to in natural settings. Our policy is to maximize their exposure to English, and to enable them to use the language. Second, students with a higher ability often 'help' their friends by not speaking English or translating for them in the mistaken belief they are helping them. This can be effective and has its place. However, it is often taken so far that the lower ability student can avoid facing their own deficiencies by relying on students with a higher ability. This is called Learned Helplessness. Learned Helplessness is a major obstacle for why some learners never improve out of the beginner level of English. One final aspect of our Speak English Only policy is to provide students with positive role models in using English. All Japanese teachers of English are fluent in English, and their abilities should not be a surprise to students.

Finally, the use of computer is included in the curriculum, hence we require all teachers to design their class activities and tests which need computer use. The reason why computer use is required it is because we would like to provide our students with the computer skills which are necessary in their future job whether it is in the field of business, tourism, or education. Examples of computer use are the departmental tests and the course survey questionnaires which students had to take on-line.

The fifth step is **coming to the classroom and observing the class.** The observer, who is either the program coordinator or chair of the Department, came to class ahead of time to set up the video camera. The observations started as soon as the teacher to be observed entered the classroom. The observer used the COLT scheme to determine the activities that transpired during the 90-minute class. The observer sat anywhere in the classroom and coded the COLT features in as unobtrusive a manner as possible. During the observation period, activity/episode descriptions were recorded on the scheme, and check marks were placed in all the relevant categories . At the same time, the video recording was made of the classroom interaction for verifications

purposes. After the classroom observation, the observer provided the teacher-participants with the copy of the COLT scheme.

The final step is the post classroom observation conference. This happened only if the teacher-participant requested for the conference, after reviewing the COLT scheme. Also the post observation conference was not required because it was assumed that all participants understood how to interpret the results and what to do after seeing the results.

Discussion and Analysis

Table 2. Percentage (%) of the COLT features in EFL classrooms

As seen in Table 2, only three features, such as *Participant Organization*, *Content* and *Student Modality*, were included in the analysis because these are the major features believed to answer the questions in this study. Under *Participant Organization*, it is evident from the data that Class organization has the highest average percentage (53%) followed by Class and Individual combination (29%), Class and Group combination (13%), Group (5%), and Individual (0%). This means that 53% of the lesson time was spent involving the whole Class in a central activity, 29% on a combination of Class and Individual seat work, 13% on a combination of Class and Group work, 5% on Group work and none on Individual activity.

The data for each teacher interestingly reveal that teacher 4 spent 82% on the whole Class activity which was led either by the teacher himself, a student or students (e.g. a group of students had a role-play or PowerPoint presentation and the rest of the class was the audience), or the whole class or individual groups participated in choral work (e.g. giving a correct response to a question raised by the teacher). Only 4% was spent on Group activity while 14% on the combination of Class and Individual seat work. Another interesting result is that of Teacher 2 who spent 81% of the time on the whole Class task and did not employ any group work at all.

In the literature on communicative language teaching, group work is considered to be essential in the development of communicative competence (Spada and Frohlich, ibid). Group work encourages learners to negotiate meaning, to use a variety of linguistic forms and functions and to develop overall fluency skills. This is exactly what we encourage all our teacher to utilize in the classroom. However, based on the data, it is clear that all of our classrooms were not learner-centered or communicatively oriented. In all our classrooms students to spent more time responding to the teacher's questions and rarely initiated discourse.

As regards Content, the average percentage shows that, generally, more focus of instruction in all classrooms was placed on Discourse (67%) and only 24% on Form. Specifically, although teacher 2 heavily put emphasis on Discourse (94%), there was a slight focus on Form (4%). The rest of the teachers, specifically teachers 1, 3, 4, 5 and 7, although put stronger emphasis on Discourse in their classrooms, it is evident that focus on Form was also given high importance. Only teacher 7 did not focus on Form (0%) at all.

The traditional second language teaching of putting strong emphasis on grammar and correction was not proven to be very successful in the development of either linguistic or communicative competence (Spada and Frohlich, ibid). This is based on the theory that second language instruction should be exclusively meaning-oriented because this is the way children learn their first language. Recent research findings on second language classrooms have proven that a combination of meaning and form, which is evident in the classrooms in the present study, may be more useful since not all aspects of learning a second language are similar to first language acquisition. This explains the considerable growth of content-based, subject matter-based and meaning-oriented instruction, all of which are described as communicative.

With regard to Student Modality, the average scores were not computed because each class had a major skill focus which was expected to have the biggest emphasis in the classroom. Specifically, based on the data, various skills (listening, speaking, reading, writing, other which is vocabulary in this study) were not taught in isolation. All teachers integrated two or more skills into their activities. Another result that was expected to come out in this study was for one skill to dominate the other skills as far as skill focus emphasis was concerned. This is because each course had one major skill focus. For example, in teacher 1's classroom, the major skills focus of this class was independent writing, that is writing about one's opinion.   However, writing emphasis was only 12% which was less than listening (16%) and the combination of listening and speaking (29%). This true to the classrooms of teachers 3 and 6. The major skill focus of teacher 1's classroom was reading, but reading was only 21% as opposed to 45% for the combination of listening and speaking. On the other hand, teacher 6's major skills focus was listening which was 24% only while the combination of listening and speaking was 54%. The only classrooms which gave more emphasis on the major skill focus were that of teacher 5's and teacher 7's. Teacher 5's major skills focus in the classroom was writing (34%), specifically independent writing, which was more than the emphasis on the rest of the skills. Teacher 7, whose major skills focus was integrated speaking, utilized speaking (29%) the most in the activities than the rest of the skills of listening, reading and writing. What is striking is the biggest emphasis on vocabulary skill (40%). It was expected in this class that activities should

have utilized reading, speaking and listening skills more since this was an integrated speaking course. In fact there was no focus on reading (0%), listening was only 1%, the combination of listening and speaking was 7% and 8% for the combination of speaking and writing. The same is true for the class of teacher 2 whose major skill focus was speaking, specifically integrated speaking. It was expected that there was an equal emphasis on reading as listening and speaking. However, reading was 0% while listening and speaking skills were 48% and 37%, respectively. Although classroom of teacher 4, whose major skills focus was integrated speaking, gave strong emphasis on speaking and listening, none was given to reading. A combination of listening and speaking was 49% while reading (0%), which was expected to be given the same focus as speaking and listening, was not given emphasis at all.

One of the arguments made in the communicative language teaching literature is that students should be encouraged to integrate their skills practice to reflect a more authentic use of language (Spada and Frohlich, ibid). Generally, based on the data in this study, all teachers were able to integrate two or more skills into their activities. Although one skill was not integrated into those activities as evident in many classrooms, this does not mean the class was a failure. Based on the post conference with the teachers, the reason was the 90-minute class time was enough to cover all skills. For example, in an integrated speaking class, students were expected to learn the skills of reading and listening which were necessary for speaking. Students had to summarize what they read and listened, and integrate these two summaries as they spoke. The only skills which were covered in this one class period were listening, that is summarizing the listening passage, and speaking what was summarized. The rest of the skills were taken up in the next meetings.

Several implications for teacher development, materials development and curriculum development follow from the present study. The findings of all teachers controlling the activities in the class instead of groups or pairs of students all worked and interacting with each other on the given tasks, and some teachers not putting emphasis on the major skill focus of the course suggest that there is a need for the Department of English Education to conduct ongoing teacher development programs. Ongoing teacher development programs are crucial to the long-term development of teachers as well as for the long term-term success of the Department curriculum. To achieve these, teacher development programs should be carefully planned and focus on appropriate goals. Richards and Farrell (2005) suggest some goals for teacher development. These goals include understanding how the process of second language development occurs, how roles change according to the kind of learners we are teaching, and understanding the kinds of decision making that occur during lessons. Other

goals have to do with reviewing our own theories and principles of language teaching, developing an understanding of different styles of teaching, and determining learners' perception of classroom activities. Another goal which Richards and Farrell did not mention which should be included in the teacher development programs is developing an understanding of the curriculum of the place where the teacher works. In this present study, it is the Department of English Education. Understanding a curriculum means implementing it successfully. Successful implementation means achieving the desired goals of the course. One cannot fully grasp the entire curriculum by learning it alone. Even if there was an orientation at the beginning of the semester about the Department curriculum, based on the data in this present study, teachers failed to achieve what was expected from them in their classrooms. Therefore, there is a need for teacher development which should involve classroom observation which is believed to provide an opportunity for better understanding of pedagogy, curriculum and materials which might not be learned from self-observation and critical reflection alone.

Summary and Conclusion

Communicative Orientation of Language Teaching (COLT) scheme as a systematic classroom tool used in this study provided valuable data as to the nature of the communicative orientation in the English language classrooms at the Department of English Education of Kansai University of International Studies. Utilizing only the selected COLT features, namely: Participant Organization, Content and Student Modality, results show that all classrooms were teacher-centered. Teachers led all the activities, restricting students in doing the tasks themselves and using the language. As for Content, the primary focus of instruction in all classrooms was both on meaning and form, emphasizing more on discourse or meaning. Finally, as far as Student Modality was concerned, two or more skills were integrated into the activities. The only problem was some teachers did not give more emphasis on the major skills focus in their classroom activities. These results suggest the need for the Department of English Education to conduct ongoing teacher development. Conducting classroom observation using COLT scheme as a strategy for teacher development will provide realistic data which will be useful for evaluating not only our pedagogy but also our appropriate choice of materials and successful implementation of curriculum. As Borich (ibid) puts it, each of us sees what we expect to see most of the time. When someone points out another view, or when we look at the situation with a different perspective, we often gain new insights. This is true of classroom observation. And in order for classroom observation to take place successfully, an

appropriate tool should be used and post classroom observation should be held. COLT scheme served its purpose in this study.

The Strategy Orientation of Language Teaching (SOLT): Development of an observation instrument for Strategy-Supported Language Instruction

Professor Ryusuke Yamato, Kyoto Sangyo University

Professor Takashi Kimura, Sugiyama Jogakuen University

Associate Professor Tomohito Hiromori, Ritsumeikan University

Junko Matsuzaki Carreira, Assistant Professor, Tokyo Future University

Hiromi TSUDA, PhD candidate, Rikkyo University

Abstract

In this paper, we will propose a new observation instrument for foreign language classroom. To date, various classroom observation schemes have been developed in the field of language teaching. The COLT (the Communicative Orientation of Language Teaching) proposed by Spada and Frohlich (1995) is no doubt the most famous and most widely used one. This scheme is to describe classroom events at the level of activities and analyzes the communicative features of verbal exchanges between students and teachers within each activity. Drawing on the COLT, Guilloteaux and Dornyei (2008) invented a new classroom observation instrument, the MOLT (the Motivation Orientation of Language Teaching) to assess the teachers' use of motivational intervention.

  In addition to these two crucial elements of effective language teaching proposed by the COLT and the MOLT, another feature has attracted many researchers and language teachers: i.e., the teacher's strategies instruction to enhance learners' self-directed learning. In order to describe and analyze this aspect of effective language teaching, we developed a new observation instrument: the SOLT (the Strategies Orientation of Language Teaching), employing the real-time coding principle and a post hoc rating scale of the two previous observation schemes.

  The SOLT describes the teacher's strategies instruction at the level of verbal intervention, and analyzes the quantity and quality of such instruction. In this process, the class procedures are divided into three stages: Pre-Task stage, In-Task stage and Post-Task stage, in every one of which the teacher's strategy-related utterances are analyzed from both quantitative and qualitative perspectives. In order to examine quantitative aspect of strategies instruction, the number of all the teacher's utterances that may help students to understand and use learning strategies is counted. In this counting, the utterances are grouped into two types: one concerning meta-cognitive strategies that are considered useful for any type of tasks, and the other strategies that are considered useful for a specific task given in class. In order to clarify qualitative aspect of strategies instruction, the explicitness of utterances when the teacher refers to a strategy is tallied, because explicitness is claimed to be a crucial factor for effective strategy training (Chamot et.al., 1999; Macaro, 2001). This explicitness is scaled by three levels: Level 1, the lowest level, is given to an utterance that satisfies none of the four requirements of explicitness (what, why, when, how) but would induce strategic behavior in an indirect manner. Level 2, the middle level, is given to an utterance that satisfies at least one of the requirements. Level 3, the highest level, is given to an utterance that meets two or more of the requirements.

  Preliminary data analysis from initial use of the coding procedure reveals significant differences between the Strategy-Supported Instruction given by one of the authors and a common language class taught by a regular teacher.

Abstract

This presentation will report the key aspects of an experienced instructor's pedagogical transformation process. One-year case study was conducted in 2005, and discovered the key aspects in the instructor's transformation process. The case study examined the challenges an experienced English instructor faced pedagogical transformation through the new pedagogy using of Information and Communication Technology (ICT).

Introduction

Background

This presentation will discuss the key aspects of an experienced instructor's pedagogical transformation process. One-year case study was conducted in 2005. The existing data collected for the dissertation were used and reanalyzed to discover the key aspects of an experienced instructor's pedagogical transformation process. This was a qualitative case study collected multiple data sources. The subject was a veteran instructor with thirty-years' experience teaching English courses, including regular English courses as well as those designed for English for Speakers of Other Languages (ESOL) students. He was a tenured faculty member at a Mid-Atlantic state university in the United States. He had been interested in using technology in a classroom for several years. Although he was thinking about how he could best help international students develop communicative English skills, he had been skeptical about a new instruction using technology. This proceeding will provide in the instructor's transformation process showing his evolving perception and the key aspects of decision-making.

Purpose of This Study
The purpose of this study was to investigate the case of one experienced English professor's pedagogical transformation process and to determine the key aspects that affected his decisions of using a new teaching methods.

METHODOLOGY

Research Questions

This research investigated an experienced instructor's evolving perceptions of implementing a new instruction using technology, and the aspects affected his decisions of changing his traditional instruction method. There were two research questions as follows. (1) How do the instructor's perceptions of using a new instruction using technology evolve over time?

(2)What are the key aspects that affected his decisions of using a new teaching method?

Literature Review

Hall, Loucks, Rutherford, and Newlove (1975) suggest the LoU. They indicated the *LoU Chart.* It showed that the innovation is a process that an individual goes through for adoption (Hall et al. 1975). The LoU included eight different levels to measure innovation adoption, which is especially applicable in educational settings (Hall et al. 1975). The initial stage begins with ignorance or no interest in innovation and develops into active and effective adoption.

Rogers (1995) states, "An innovation is an idea, practice, or object that is perceived as new by an individual or other unit of adoption" (p. 11). Using a new teaching method is a new practice to the faculty. Some instructors may notice that innovation includes some advantages; however, those advantages are not always clear. They are often uncertain whether a new instruction can bring more effective than the current methods. If advantages are related to individual problems or needs, the potential users make efforts to know about the innovation (Rogers, 1995). Rogers (1995) describes that innovation does not occur instantly; rather, it includes several stages. Thus, it is a process including a sequence of attempting actions or decision-making. He suggests *a model of stages in the innovation-decision process,* which consists of five stages such as knowledge, persuasion, decision, implementation, and confirmation. Each stage is tightly connected with an individual's perspective and attitude based on his perceptions of innovation.

Participants

The subject of this study was an English professor. He taught at a Mid-Atlantic, mid-sized state university in the United States. The instructor is a tenured professor and a veteran of 30 years' teaching English. He had been interested in implementing a new instruction using technology for a couple of years. He finally decided to use a new instruction for the first time in his course in the spring 2005 semester while receiving an advice from a technology mentor.

Research Design

This research used a qualitative case study method. The existing multiple data were used. The existing data were as follows. (a) the researcher's logs about the instructor's technical training, (b) email correspondences, (c) transcripts of asynchronous discussion forums, (d) weekly interviews with the instructor, (e) interviews with selected representative students (n=5), (f) the students' course papers, and (g) student informal course feedback.

Data Analyses

The existing data sources were examined focusing on instructor's perceptions of using a new instruction evolve over time, and the key aspects that affected his decisions of using a new teaching method. The data were coded specifically focused on two points above.

Settings

The setting of this study was an ESOL section of an introductory English writing course. The course was required for all students at the beginning of the college program. This course was hybrid course, with face-to-face classroom sessions and supplemental online activities. In this course, fourteen international students were enrolled in the course in fall 2005.

The Role of the Researcher

The researcher gave advice to the instructor how he could try a new instruction as the instructor's technology mentor during this research. The researcher also provided on going assistance to the instructor whenever he needed.

Limitations

Since this case study examined only one participant using the existing data, the findings may not be applicable to other instructors. This study was also limited by the influence of the potentially biased perceptions of the researcher's perspectives as a technology mentor.

FINDINGS & DISCUSSION

In the beginning of the spring 2005 semester, the instructor did not have any specific concerns about using a new method using technology because he had no clue what types of problems he would face. His initial interest in employing a new instruction was maintained after he received advice of the possible instruction using the technology in the individualized training   He actively collected the necessary information and sought help from others without hesitation. However, when he faced the unexpected problems, he had a little frustration about them. Yet, he was willing to continue to shift a new instruction

Although he was willing to use a new instruction in the spring semester, the instructor became very skeptical about employing a new instruction. He noticed that it could provide him with more varied opportunities in his classes. His skepticism was expressed regularly until later in the semester   Because he had some knowledge, he was able to imagine possible bad results of using a new instruction. He also stated his uncertainties about whether he could teach efficiently by using it. Furthermore, he expressed concerns about time issues and influence of the ineffective course. However, he finally decided using a new instruction. Yet, he was discouraged with and frustrated about technical problems. Although he expected the better results, his dilemma of a new instruction was clearly recognized. The dilemma had continued for a while. However, once he discovered the students' better outcomes, he seemed to be comfortable using a new instruction.

It showed that including a new instruction may not be easy and not occur instantly as Rogers(1995) states. As a result, an instructor 's pedagogical transformation process may be tightly related to one's perceptions. He initially desires to know about the new instruction expecting possible benefit, and then to wants to see whether it works or not. Next, the dilemma occurs while suffering from the concerns. Finally, discovering the better outcomes or benefits makes him conformable using a new pedagogy. This approach was supported by Rogers (1995) *a model of stages in the innovation-decision process*. The major key aspects of the pedagogical transformation were concerns and advantages. The two aspects included information, examination, and discovery. It means that an instructor needs appropriate information: however, he has to examine how it works and need to discover the positive outcomes. Specifically discovering the better student outcomes can help him employ a new instruction.

Faculty mentoring in higher education:

The Bukidnon State University experience

Dr. Beulah Rose Torres
Bukidnon State University

Philippines

Abstract

The threefold purpose of this paper is 1) to describe how the mentoring program was developed at Bukidnon State University (Philippines); 2) to present the views about mentoring as experienced by the mentors and protégés, that is, after they went through mentoring process that aimed to improve their teaching styles, research capability and service learning strategies; and 3) to present insights and lessons learned.

The first section introduces the beginnings of the university's mentoring program. It also presents the synopsis of two studies that became the basis for initiating the mentoring program in this university. The second section of the paper explains the best practices that surfaced after the program was implemented. It features how mentoring takes place in set-ups such as one-on-one mentoring, peer mentoring, and group-mentoring. This section also presents the mentors' views as well as the faculty protégés' views about their experiences. For the purpose of identifying challenges and issues associated with mentoring, the third section presents emerging mentoring prototypes, lessons learned, challenges, issues and recommendations.

Introduction

Faculty mentoring in higher education as a tool for professional development is uncommon in Philippine higher education. In cases in which mentoring activities exist, the main objective is to guide and train student apprentices who are already in their senior year, e.g. 'critique teachers' mentoring student teachers or 'clinical instructors' mentor student nurses. Undue focus on this type of mentoring seems to explain why there

are no available empirical research reports on faculty-to-faculty mentoring in Philippine higher academic settings, except perhaps those conducted locally in our own university, the Bukidnon State University (BSU). Given the need for professional development that may result to professional or organizational development, this researcher believes that faculty to faculty mentoring is critical in higher education.

The threefold purpose of this paper is 1) to describe how the mentoring program was developed or designed at Bukidnon State University (Philippines); 2) to present views about mentoring as experienced by the mentors and protégés, that is, after they went through mentoring process that aimed to improve their teaching styles, research capability and service learning strategies; and 3) to present insights and lessons learned.

Bukidnon State University (BSU) is located in the Province of Bukidnon, Philippines. It is nestled at the heart of Malaybalay City, the capital of the province. First known as Bukidnon Provincial High School founded in 1924, it first offered a two-year high school diploma. After acquiring a 6.02-hectare land in 1927, this school attained a full-fledged status as a teacher institution offering a four-year normal course, and was thus renamed Bukidnon Normal School. It was only in 1976 that this institution was converted into Bukidnon State College. Thirty years after, this college became a university by virtue of R.A. No. 9456, and was inaugurated on June 15, 2007. An average of 130 regular faculty members, with approximately the same number of faculty guest lecturers teaches in this university. Likewise, an average of 8,500 students is enrolled in the graduate, undergraduate, secondary, elementary and pre-school levels.

The university has six colleges, one graduate school, as well two laboratory schools for both elementary and secondary students, respectively. The Social Sciences Department (SSD) is one of the 16 academic departments of the university, offering general courses to all students in the various programs in the university. These courses include history, philosophy, humanities, political science, economics and other general courses. The SSD also offers major courses for programs such as sociology, social science and economics. An average of 35 faculty members teach in this department every school year. Their teaching status may be regular or part-time.

The BSU mission statement requires its faculty and staff: "To develop competitive professionals who are committed to build a sustainable life for all through instruction, research, extension and production." This paper assumes that one way to accomplish this mission is to adopt and institutionalize a faculty mentoring program for each mission areas: instruction, research, extension and production. However, it was earlier observed that the scope of mentoring in BSU is not only along 'instruction' but is also limited to student-to-student (e.g. peer counseling) or faculty-to-student mentoring for instruction purposes (e.g. critique teachers guiding pre service teachers in the university's laboratory schools). Eventually, it was shown through informal undocumented interview that informal faculty-to-faculty mentoring has been in existence in isolated cases. For example, a certain faculty guide some novice teachers at the Department of Education. Likewise, another faculty was engaged in one-one-one research mentoring in the Natural Science Department. In both cases, mentoring relationships were formed simply because the mentor, out of concern and passion, merely wanted to assist less experienced faculty. Subsequently, meetings were irregular and voluntary.

For the faculty to help 'build a sustainable life through instruction, research, extension and production, they should be equipped to perform tasks not only in the instruction area but also in other aspects of the mission. It is on this vein that I initiated the design and development of faculty mentoring program for BSU. The program

however, was designed particularly for the university's Social Sciences Department that I was assigned to chair since 2006. I chose to design it by making use of the principles of 'rapid collaborative prototyping'. It was my aim to produce prototypes of mentoring over a short period of time for each of the four areas of the mission statement. The target users of the program are the BSU faculty, particularly the SSD faculty. They are considered the learners in the design process as facilitated by this researcher.

Trip and Bichelmeyer (1990) believe that design in the process of rapid prototyping should be coupled with 'research' in order to 'discover the complexities of the subject matter, prerequisite knowledge needed to understand the content, and the presentation modes that are most conducive to acquiring the material." (p. 7). This paper therefore presents the results of the research that simultaneously occurred during the design of the mentoring program. Research data are, however, limited to the mentoring experiences of the learners, as they themselves reported.

The research questions addressed in this paper are: How was the faculty mentoring prototypes of BSU designed and developed? What mentoring projects and mentoring models emerged? What are the mentoring perceptions of the mentors and the mentees? What are insights gained and the lessons learned?

Review of Literature

This section presents the mentoring literature, including my own studies that I used as bases for designing and facilitating mentoring activities at Bukidnon State University. In particular, this section presents the definition of mentoring; the mentoring models or the different structures of mentoring relationships; and the method for designing a mentoring scheme. Studies regarding mentoring and instructional design are also presented.

Definition of mentoring and mentoring practices

In higher education, faculty mentoring may be used to describe relationships between and among colleagues with the purpose of developing the career or profession of the more novice faculty. It may be formal or informal, structured or unstructured. Relevant to this study, mentoring in which the mentor is a teacher and the mentee or protégée is a novice or seasoned teacher may be defined as:

A nurturing process in which a more skilled or more experienced person, serving as

a role model, teaches, sponsors, encourages, counsels and befriends a less skilled or

less experienced person for the purpose of promoting the latter's professional and/or

personal development. (Anderson, 1987 cited by Bryson, 2001, p. 1)

Within the framework of a learning organization espoused by Argyris and Schon (1978), and contextualized by Parsloe and Wray (2000, p. 22), the mentoring activities are aimed to '. . . help and support people to manage their own learning in order that they may maximize their potential, develop their skills, improve their performance and enable them to become the person they want to be'.

In 2002, I conducted a survey for the purpose of exploring the current faculty-to-faculty mentoring practices at BSU, and of determining the mentoring preferences of its faculty (Torres, 2002). Results showed that informal faculty-to-faculty mentoring activities about developing teaching strategies were existent for the last 10 years. The mentoring occurred either within the classrooms or within a certain department's communal faculty rooms, e.g. Department of Professional Education in BSU or Department of Language and Letters . In this same survey, more than half of the senior teachers affirmatively answered when asked if they ever mentored anyone in BSU (then Bukidnon State College). They reported mentoring a fellow faculty for more than nine years, although some indicated mentoring a colleague for a period of three to five years. Their mentoring involvement was largely in the area of instruction, while research ranked closely behind. No extension-related mentoring was reported. Mentoring activities were taking place within an unstructured framework. On the other hand, when novice teachers were asked what they felt about their current mentors, the mentees revealed that they felt 'extremely inspired' and 'extremely attentive', although they also felt 'moderately scared' but 'not at all hostile'.

In the same study, perceptions about ideal mentors vary. For novice teachers (who do not have mentors yet), a mentor must be a friend but for those who already have mentors, a mentor must be a coach. The senior teachers, on the other hand, wanted a mentor to be both a sharer and a coach. The results indicate that faculty-to-faculty mentoring is not a novel idea in BSU, and that the practice has prevailed in an informal structure for close to 10 years already. The results of this study were not, however, enough to conceptualize a mentoring scheme for BSU.

Mentoring models

When I explored the literature for mentoring models, I found that there are three dominant mentoring models that may fit into a university set-up: the one-on-one peer mentoring (Woodd, 1997); the peer mentoring and group mentoring (Anderson, 2003), with Baird's model as a variant of group mentoring. Another variation of group mentoring is the 'alternative mentoring model' (Turk, 1999)

The literature reviewed by Woodd (1997) describes a one-on-one mentoring model within the context of higher and further education, which she calls 'peer mentoring' that exists for the purpose of 'instructional improvement' (Harnish and Wild, 1994, cited in Woodd, 1997). As a relationship between one experienced faculty mentor and one less experienced faculty (or a faculty new to the learning environment), she explained that the mentoring activities between each of the partners may be carried out in a 'non-hierarchical, non

judgemental way' that may transpire in a formalized scheme. The age difference between them does not affect their relationship that is supposed to be mutually supportive and collaborative in nature. In fact, the mentor in this structure views himself as a co learner hence freeing the mentee from any anxiety or fear involved in learning new things in a new environment.

On the other hand, there are two types of mentoring relationships cited by Anderson (2003): the peer mentoring and the group mentoring. Although he describes these models within the context of business companies, the same mentoring structures may apply to a higher education environment. In peer mentoring, 'self-directed learners' come together as one group of peers. They then take turns acting the group leader. 'One week, for example, one participant was responsible for researching a topic, presenting it at the next meeting, and initiating and facilitating the discussion. The next meeting another individual was responsible for reviewing the previous meeting, asking whether participants were able to implement the suggestion and ideas, and then leading discussion on the next topic.'

In group mentoring, one mentor or a team of mentors work with a team of protégées. The team of mentors have 'complimentary skills', while the latter have 'identical goals'. The mentors rely on each other as they deliver the goods together. They combine common tasks and reduce the overall workload. The mentees, on the other hand, depend on each other as they work towards their collective goals.

In Baird's (1993) model, which he calls 'helper-sharer-carer' model, the mentor acts as consultant or 'critical friend', performing collaborative tasks with a group of mentees. In Baird's own experience as research mentor at the University of Melbourne, he carried out duties he described as: 'organization/administration', 'conceptual guidance', 'sharing perspectives', and 'support' (pp. 49-50). Hence, as consultant, the mentor in this model carries out his task with less and less frequency and intensity as the mentoring progresses until such time when the team of mentees feels they could be on their own.

Another variation of the group mentoring is the 'alternative mentoring model' which Turk (1999) describes as a format in which a team of primarily experienced teachers work together to guide an individual teacher. "In a teaming environment, several members with various skills and expertise can assume mentoring roles, thereby broadening the support that they give to the beginning teacher," Turk wrote.

Design of mentoring program

The instructional systems design (ISD) models (e.g. Gordon & Zemski, 2000) suggest that the design and development of any program, project or activities may follow a linear instructional design process: analyze, design, develop, implement and evaluate. While it is possible that the mentoring program of any higher education institution can evolve this way, there is no available literature that confirms this, rather the literature shows that faculty mentoring programs have been designed by addressing issues related to faculty instruction or research. The two different lists suggested by Caruthers (1993) and Daresh (2001) were probably used.

In this paper, however, the design of the mentoring program uses the rapid prototyping method of instructional design. This design approach can result in the quick development of instructional materials or

activities (Reiser, 2001 cited in Knowlton, 2006). As the name suggests, the design is done 'rapidly' in a sense that design tasks are completed concurrently rather than sequentially through the project. Compare this to a traditional instructional design model in which the designer cannot move to the next step without completing the previous task.

Tripp and Bichelmeyer (1990) explain that in this method of instructional design, the development process begins with needs analysis, and content, and a statement of tentative objectives. The process continues with 'design and research, or construction and utilization' — done simultaneously with the learners who as potential users, utilize the prototype while it is being designed. The designer, on the other hand, determines the strengths and weaknesses of said prototypes by asking the users questions. Their answers are used to improve the prototype, to modify the objectives of the prototype, or to create new objectives. Then the process begins again. The design process ends with the creation of an appropriate 'artifact' customized for the intended users.

Available studies that explain the use of rapid prototyping as method for designing and developing instructional strategies include the design of a computer-mediated communication, e.g. electronic bulletin board, (Knowlton, 2006); *e*learning instructional design that incorporates action research (Cook & Crawford, 2008) ; software engineering (Tripp & Bichelmeyer, 1990); and design of courses for distance delivery (Johnson, n.d.). With regard to using rapid prototyping methods for designing projects similar to the nature of faculty mentoring activities, Jones and Richey (2000) cited studies related to the design of an electronic performance support system to support school teachers in the use of alternative assessments (Law, Okey & Carter, 1995); and a four-day instruction-led training school to give the pilot-course learners a sound learning experience, and to general feedback to be integrated in the next version of the course (Lange & Shanahan, 1996). Jones and Richey (2000) themselves conducted a development study using rapid prototyping methodology to design a one-day instructor-led training program for the learners.

Hence, this paper assumes that because rapid prototyping was used to design projects similar to a mentoring program, that is, in terms of improving the learning experiences of the product users who happen to be the designers themselves, then there is no reason why the mentoring program for BSU cannot be designed this way. Furthermore, drawing from the argument of Tripp and Bichelmeyer (1990), rapid prototyping as a design process for the BSU mentoring program is appropriate because the mentoring phenomenon in BSU can be categorized under the three types of situations in which rapid prototyping is applicable: "cases that involve complex factors which make prediction problematical, cases where we have experience but lack satisfaction with results derived from conventional methods, and new situation where there is not an abundance of experience from which to draw" (Tripp and Bichelmeyer, 1990, p. 9).

Methodology

The process of rapid prototyping involves, among others, the parallel processing of the various design and development tasks. The focus of this paper is the study of the perceptions of mentors and mentees involved in the design of the BSU mentoring program. This paper is therefore the 'research' component of the 'design' process— two concurrent activities needed for developing a faculty mentoring program.

Purposive sampling was utilized to gather qualitative data. Through interviews collected from the participants of the design process, mentoring experiences were drawn. Qualitative responses to interview questions were then analyzed to determine the mentoring models that emerged from mentoring participants' reported mentoring activities. The insights and lessons learned were further analyzed from the same qualitative data, in addition to the observations that I made as designer, mentoring facilitator, and researcher.

Within the Social Sciences Department that has an average of 35 faculty members every school year since 2006, the research participants coming from the department varied according to the mentoring project that the faculty are more inclined to join, or were assigned to participate. It should be noted that the faculty in the department is already divided into four groups corresponding to the four mission areas of the university: instruction, research extension and production. (As chair, I either retain or change the composition of each group every semester.) Thus, if a mentoring scheme is designed along a certain mission area, the participants are likely those who are members of that particular mission area. In some instances, however, I appoint participants in the design of a mentoring project if I see that certain faculty members are interested in the project, or have the potential to contribute ideas in evolving the project. In other occasions, however, participation is voluntary.

Interviews were conducted at different times within the span of school years 2006-2008, depending on the period at which the mentoring project was being designed.

Results and discussions

In this section, the prototypes of the mentoring projects that evolved along the mission areas of instruction, research and extension, are reported: how the each mentoring project was designed; the description of the mentoring model in which the mentoring relationships occurred; and the perceptions of the mentors and mentees of each mentoring activity. The 'production' as one of the four components of the BSU mission is not mentioned in this section.

Case 1: Mentoring project for 'instruction'

Two mentoring activities related to instruction are reported in this section: 1) faculty mentoring on teaching strategies in 2006; and 2) faculty mentoring on the use of electronic grading system in 2007. Both activities took place within a faculty group mentoring in which a single faculty member mentored a team of faculty members.

Faculty mentoring on the use of teaching strategies

As a teacher-training institution, it is assumed that the faculty members who are not teaching education subjects must also demonstrate teaching skills comparable to those teaching in the College of Education. To improve the SSD faculty's teaching skills, I organized a mentoring on the use of appropriate teaching strategies

during the first semester of 2006-2007. It did not only aim to improve teaching, but also to increase the repertoire of teaching strategies among new teachers in the department.

The mentor is a volunteer from the College of Education in the same university. As mentoring facilitator, I sent a letter addressed to all SSD faculty inviting each one to join. Four beginning teachers signed up. The mentor and the four mentees met and scheduled their sessions. Below are the perceptions of the mentor including one single mentee who claims that her experience is representative of the three other mentees:

Mentor: *Sometime in 2006, four teachers reported to me for sessions. We met three times, and after that they said they were busy, . . . (but) in my division, I am in touch constantly with young teachers . . . Most of them teach subjects that I teach and I discuss with them informally strategies in teaching. I (also) encourage them to put in writing what they do in their classes together with the materials (that they create) that they give to their students.*

C is coming up with cloze exercises she uses to end the major concepts of the course she teaches. B has shown her lecture notes which she has creatively constructed to enhance the lecture she gives to her classes.. D is another very open-minded teacher I love talking about strategies to/with her. V sits in my class anytime she wants. She claims she is my copycat. J freely talks about what she does with her classes. . . I would like to extend my expertise to more teachers. I hope more teachers would realize I can help them.

Mentee (from SSD)*: To be a mentee of Dr. A is like going back to school with a fervent interest to learn. Together with R, J, and P, it is but natural to feel the tension and pressure everytime we have our session for at least twice a week. Sometimes we sounded like our students complaining about teachers who seemed to talk fast. Luckily, we got along just fine with Dr. A. Well, that's how we'd like to believe.*

We have learned new things despite of several instances when we missed our class because of other responsibilities. What we actually learned so far were about the so-called 'teacher-centered instruction' which in particular deals with Exposition 1. Here, the teacher is expected to discuss for about 20 minutes and put in some important rhetorical questions. These questions may not necessarily draw a response from the students for these would only serve as something to think about by the students momentarily. These questions are designed to ask in the course of the discussion and the teacher provides the answer as she continues to discuss the topic. This teaching strategy is coupled with 'close procedure' to evaluate the students' learning.

The one-on-one impromptu conversation was such a relief. We did it! Dr. A gave us an assignment to come up with our topic to discuss in front of her. We thought it was the end of the session, however, it was only the beginning.

After the first semester of School Year 2006-2007, the teachers who went through the mentoring process were encouraged to informally mentor other beginning teachers. Likewise, all teachers in the department were encouraged to design lesson plans that may incorporate new teaching strategies learned either from the department's mentoring process or from any source. As an output, some of the faculty's lesson plans were published in the department's magazine.

Faculty mentoring on the use of electronic grading system

In 2007, instruction-related mentoring continues. This time, it was extended to computing grades—electronically. One of the faculty members voluntarily customized software for computing grades in our department. The purpose was to address the observation that our department's teachers cannot submit students' grades on time because of the bulk of grades that must be conventionally computed. Thus, an announcement was posted outside the department's computer room inviting any faculty member to go through mentoring. A total of eight (8) faculty members signed up. As in the mentoring on teaching strategies, the process took place in a group mentoring structure in which one faculty mentor worked with a team of protégées.

Below are the experiences of the mentor and the mentees:

Mentor . . . *mentoring sessions lasted for 30-45 minutes per session. Follow up sessions were conducted per request of the mentees. I explained the process of inputting scores and the generation of grades. Questions about the process were explained by demonstrating the actual use of the system . . . mentees difficulties were addressed right away.*

Mentee: *I was one of the mentees who eagerly signed up. Huddled in front of a computer, we watched and listened as Sir C demonstrated how to use the program while entertaining questions on the process. In a span of 20-30 minutes, we learned how to operate the program. Set flexibly, and conducted informally in a milieu of an eagerness to teach by a colleague who is always willing to address questions and points one that hasn't been raised or thought of during the session, the mentoring session provided an effective avenue for learning new things for people with hectic schedule.*

When more mentees were interviewed, they expressed other benefits: *'With this program, computing grades is no longer a hassle'; 'I can now beat the deadline for submission of grades'; and 'The computer can compute my grades for me in a few seconds!.* However, they also indicated some problems encountered, such as

542

the need to have more computers for teachers; accidental erasures of files; and suspected computer hacking that caused changes to grades of students.

Case 2. Mentoring project for 'research'

During the second semester, School Year 2007-2008, a group of faculty researchers in this university set off a research (Alberto, Casiple, Dales, Mirasol, Torres, *in press*). At some point, the paper proposed three years ago finally reached its data-gathering stage that required mentoring sessions with the faculty mentees. Hence, four faculty members from the Social Sciences Department volunteered to go through the mentoring process.

There were three mentors who took turns having sessions with these four mentees. The topics based on needs analysis conducted in 2005, range from descriptive to inferential statistics, including interpretation of results/printouts from statistical computations and identifying types of measurement scales. Each session in this group mentoring format ended with journal writing which every mentee was required to write.

The following were some of the views of the mentors:

Mentor 1*: Mentoring took place in the Math department's office with three mentees, who were so enthusiastic and interested to learn how to determine what statistical tool is used in comparing variables. However, after giving the handouts which included the importance, and how to use the t-test (independent and dependent t) and one way ANOVA, some doubts were clarified. After the discussions, questions were asked on how to use the softwares like Excel and SPSS to analyze data.*

During the hands-on activities, mentees were given the chance to encode data and to analyze using the appropriate/correct statistical tool. After the computation, output was printed and interpretation followed. The mentees were amazed how the computer did the complicated job. They were confused, however, when to reject and accept the null hypothesis . . .

Mentor 2*: . . . there was a natural conversation related to the previous topics the mentees had experienced without their knowing that it was already a review of the concepts which linked to the present topic to be taken. After giving them the objectives, (they) were excited upon knowing that there will be a hands-on activity.*

Mentee 1: *. . . This opportunity of being a research mentee is quite timely. I really need to be refreshed and updated. I learned four (4) scales of measurements today, namely: nominal, ordinal, interval and ratio.*

Familiarization of the aforementioned measurements is important to avoid incorrect usage during the conduct of the study. An incorrect use of a measurement will largely affect the outcome of a research.

Mentee 2: . . . *I like the journal writing in our statistics tutorial. Although I find it cumbersome and time-consuming, it does help a lot in making us understand the topics better. It somehow forces us to review what we have just learned in a session thereby allowing us to identify what we have so far understood and what needs further explanation. It provides immediate feedback to both the mentor and the mentee.*

Mentee 3: . . . *journal writing . . . helps me recall the topics discussed.*

Case 3. Mentoring project for 'extension'

Two mentoring activities are illustrated in this section: 1) mentoring pianists on piano accompaniment; and 2) mentoring school children who are left behind (not performing well academically). In both cases, the faculty mentors of the SSD facilitated a mentoring activity that requires an adult mentor or mentors. Both mentoring activities also operated within a group mentoring structure. In the 'mentoring on piano accompaniment', only one single SSD faculty member facilitated a mentoring activity of another single piano teacher teaching a group of children. While in the mentoring 'no child left behind project', a team of SSD faculty members facilitated a mentoring activity of a group of faculty members teaching a group of children. This format is slightly different from Anderson's group mentoring because the mentor is not involved in direct mentoring. Rather, this emerging mentoring model allows the mentor to initiate and facilitate the activities between a group (or individual) mentors and a team of mentees. Thus, the facilitating mentor's support is in the form of organizing, networking, managing, supervising and evaluating the mentoring activities of the two groups.

Mentoring on Piano Accompaniment

During the summer of 2006, the researcher organized a piano accompaniment workshop for all accompanists at Bethel Baptist Church, Malaybalay City The author did this by partnering with a person who could conduct the workshop. In this mentoring activity, the former served as the faculty mentor, while the latter served as the faculty mentee who was tasked to tutor 20 children, on piano accompaniment. Again, the mentoring format here is similar to the mentoring in 'no child left behind project', the only difference is that unlike in 'no child left behind project' in which there was a group of volunteer mentors, there is only one single mentor in piano accompaniment. As mentoring facilitator, I merely initiated, liaised, and facilitated this mentoring activity. I do not know how to teach piano accompaniment but the person I asked to mentor has the expertise to teach it. He was not, however, a faculty from the SSD.1

After a series of workshops (around three times a week for a period of 2 hours per session), the mentoring activity concluded with a recital, with each participant showing off their acquired skills to a hundred of church audience. After the workshop, the mentoring continued when four kids from the group showed unusual interest and skill in piano. Their ages range from 14 to 16. This time they practised classical music pieces with the same faculty mentee. After six months, I was encouraged to organize a chamber piano recital for the children for children to perform classical music, together with the faculty mentee. Apparently, this faculty mentee extended the kids' interest from sheer accompaniment of congregational singing to solo performance of classical music. Another six months passed, and the same kids performed more complicated classical music before a much larger crowd. Recently, an international pianist visited our place and invited the kids to participate in a month-long international piano festival that will take place this year. At this time of writing, these pianists are busy preparing for this rare opportunity.

Faculty Mentor: *My role was to organize and manage a mentoring program for the piano accompanists. Serendipity. That was how this project was organized. I met someone who plays the piano well. Right away, I invited him to conduct a workshop for budding accompanists in our church, and he immediately said yes. After this informal conversation, the faculty mentee did everything in his end, while I arranged for permits related to the venue, schedule, donors, equipment, communication, and other pertinent training needs. After a year, I was amazed at the progress of the four children.*

When the faculty mentee was asked what his role was during the workshop, he stated that he considered himself as the conceptualizer, researcher, instructor, motivator, role model, and expert.

Faculty Mentee: *(Conceptualizer) I helped Ms. T conceptualize the whole workshop since it was done for the first time. Before I began, I had objectives in mind – to teach new skills, to find individuals who have high music quotient so I could help them improve, to bring more creativity to local church musicians, and to develop more Filipino Baptist musicians and composers. (Researcher) Even though I already knew a lot about music, I had to study more and refresh myself on the history and many theories. (Instructor) I did my best to simplify everything I knew about music and composition and teach it to the participants with ages ranging from around 7 to 40+. I had to adjust my advanced knowledge and bring it down to everyone's level. I designed the workshop so it would be interesting, enjoyable, effective and informative. It was a mix of short lectures, workshops and master class. (Motivator/encourager) Many of them were shy and unsure what to do. I had to encourage them continually that no matter how young or old they were, they could still be very creative. (Role model/Inspiration) I had to show them that I was a good pianist in addition to being a doctor. (Expert) I had advanced knowledge, skill and experience on classical and church performances compared to the participants. I was competent.*

When this mentee was further asked about the personal benefits he obtained from the mentoring

activity, he answered: 'friends', 'connections', 'fun', 'performances', 'influence', 'satisfaction', 'multiplication', and 'self-esteem'. Thus, he found friends 'who think the way (he) think(s).'; he experienced

"indescribable fun and happy days!"; he also found his opinions to be "increasingly . . . more valuable in the field of arts, culture, education, and people development.". Furthermore, he also found the experience as a way to 'increase' himself and to ' spread . . .ideas and dreams'.

For this piano mentor, motivating exceptional kids is his way to give back: "Many people in the past also mentored me and supported me. That is why I am what I have become. Mentoring new artists is the best way to repay them." When asked what it was like to perform during those festivals, he said that the experience has given him "(U)nderstanding (of his) own capability in music and human resource development and . . . new hope that (he) can still be an active concert pianist in addition to being a doctor."

Faculty mentoring on a 'no child left behind' project

During the first semester of school year 2007-2008, a friend from the community, who started a short-term 'No child left behind' project in an elementary school, was returning to America. However, she wanted to sustain her project even in her absence. Thus, the SSD department volunteered to continue the project but the department proposed to do it in another setting. This was how the SSD's mentoring project named 'Sa karunungan walang iwanan' (literally translated 'In education, no child should be left behind' started. In this project, around fifteen (15) SSD faculty members served as faculty mentors, while ten (10) volunteer teachers from the community were the faculty mentees. The role of the SSD faculty members was to facilitate the operation of the entire project; while the faculty mentees' role was to teach first and second grade children at the Barangay San Jose elementary school, a school around 4 kilometers away from the university. In particular, the faculty mentors were tasked to supervise, monitor and evaluate the mentoring activity at San Jose. The volunteer mentees, on the other hand, who were all unemployed during this period, were tasked to teach reading, writing and arithmetic to children who were doing poorly academically, compared with the average student in the first and second grades classes at San Jose.

The mentoring process at Barangay San Jose took place within the framework of a group mentoring structure in which a team of faculty mentors worked with a team of faculty mentees who served as teachers of around 30 children. The SSD faculty mentors monitored and evaluated the project; they were assisted with their senior students who were also present in the field.

Faculty Mentor 1: *The project has given us a new learning experience, and has developed in us a sense of service.*

Faculty Mentor 2: . . . *it is fulfilling to think that in some ways, we have contributed to bringing children who have been academically left behind, closer to the mainstream of development.*

Faculty Mentor 3: . . . *(the project) allowed both students and teachers to have a peek on the current state of community children, e.g. how they cope with in school despite their lack . . .; how we could possibly help them achieve their hopes and dreams even in our own small way*

Faculty Mentee 1 *(Volunteer teacher): My role was to hep the children, especially the slow learners, improve their reading and writing skills.*

Faculty Mentee 2: *I love to help the children especially the slow learners. Parents can no longer supervise them because of other problems*

Lessons learned

The analysis of the perceptions of the mentors and mentees in the form of assertions is presented in this section. These assertions were therefore drawn out from the collective experiences of both parties.

Assertion 1: Overall, the mentees perceive the mentoring process in terms of how the mentoring activity transpired in specific set-ups. In the instruction area, mentoring is viewed in terms of "lecturing", informal discussion on teaching strategies, sitting-in classes, journal writing, designing lessons, and modelling. In research, mentoring takes the form of "hands-on exercise", 'question and answer', return demonstration, giving of handouts, natural conversation, and journal writing. While in extension, the mentoring is reported to include teaching children who are not performing well in a regular classroom; or coaching exceptional children.

Assertion 2: Mentoring is also perceived by mentees in terms of ambience: informal (e.g., natural conversation), classroom-like (a bit of tension), modelling (tacitly done, e.g. designing lesson plans for others to pattern with); eagerness to learn.

Assertion 3: Group mentoring models are a dominant format among mentoring relationships.

Assertion 4: The mentors were also asked how they benefited from the mentoring activities. Overall, the benefits are related particularly to their role: being able to address the difficulties (of the mentees); and being able to provide experiential learning to the mentees. One faculty mentioned substantial personal benefits.

Assertion 5: Overall, it is clear that mentees believe they learn very quickly from the mentoring process than undergoing a regular class or reading a lengthy how-to-do instruction. They likewise view it as a good way

to review past lessons that are not at all given practical application; and a way to serve the community, or a means to perform civic duty.

Assertion 6: It is likewise clear from the anecdotes from indirect mentoring activities that the mentors who directly trained the children, claim personal benefits way beyond the expectation of this author..

Insights

Some general lessons emerge which might provide guidelines for any university seeking to adopt mentoring as an approach to developing its organization.

- Mentoring may start to occur in the departmental level for various reasons, including: to increase the faculty's teaching repertoire; to build and improve the capacity of the faculty to conduct research review the concept of and application of statistical tools for research; to facilitate community activities, e.g. to lead actual community work or to partner with different individuals or agencies.

- There is no single formula for good mentoring for as long as an individual or a team wants to mentor or be mentored, or for as long as a mentor wants to facilitate/supervise another mentoring activity that is not directly related to his academic preparation, but nevertheless has a passion for such activity.

- Mentoring does not have to occur spontaneously. Structured mentoring works and its small successes put together may create an impact.

- Mentoring does not always require large amounts of time. An experienced, perceptive mentor can provide great help in just a few minutes by making the right suggestion or asking the right question

- Mentoring activities are not limited to newly arrived faculty but to every teacher who wishes to improve his university responsibility to teach, to research, and to serve the community.

- Indirect mentoring, as it emerged from the BSU experience, can occur when faculty mentors network or liaise with an individual or a group of adult mentors who are willing to share their talents and consequently guide and train a group of learners, both young and adult ones.

- Mentoring occurs when a faculty mentor connects or links with another mentor. In this case, the former establishes an environment in which another mentor makes students' accomplishment limited only by the extent of his or her talent.

- The mentoring roles of the faculty mentor in the indirect mentoring that emerged in the BSU experience include: organisation/administration, conceptual guidance, sharing perspectives, and support. These were Baird's (1993) experience as direct research mentor, but could also be take place in the indirect mentoring structure.

- It can be arranged that at a mentor from a department other than one's own can be requested to mentor the novice or seasoned faculty, as needed.

- A mentor as role model can guide mentees through either words or action.

- As an outcome of mentoring, a network of contacts may be built. Likewise, a network of mentors may be formed, of which their experience might be crucial in finding a regular or better job, for instance.

- There is a potential for mentoring to develop people skills which include abilities to listen, to share ideas and to express oneself; to develop leadership; and to develop teamwork

- Outcomes for mentors may include improved understanding of the curricula that the department offers, immediate and future opportunities for extended networking, a better appreciation of their extra curricular programs, and the development of personal skills.

- Outcomes for mentees may include professional development, a broader understanding of the mission of the university and how this can be accomplished, increased knowledge specific to their work, and less tangible benefits such as an opportunity to enrich their resumes, to practise their profession while awaiting/applying for a job, to extend their network.

- Team learning in peer mentoring was unreported, so it can be assumed that tacit learning may have occurred during group reflection, e.g. when they prepared their modules, and when they conducted group evaluation on the journal entries of faculty mentees.

- There are organizational benefits from the mentoring or coaching process because it can be used as what Dansin and Rolff (1993) refer to as a method by which a university is able 'to organize its own

improvement processes and mobilize internal knowledge and skills for such work (p. 146). Explaining further Dalin and Rolff describe this phenomenon as a manifestation of a learning organization in which 'structures and change capabilities make it possible to initiate changes when needed'. Bryson (2001) calls this mentoring approach as a 'process of organisational transformation harnessing the fruits of individual learning' (p. 157), or team learning (Tumapon, 2002)

- The formal and structured activities that were initiated at SSD and facilitated by its department head, were either sustained or completed through the effort of the same person, and through the cooperation of her faculty. After the department head organized the group of mentor/s and mentees, the succeeding activities did not follow any agreed format or schedule. The lead mentor with the cooperation of the team coordinated the succeeding activities.

- The mentoring participants spent time to carry out the activities even if there was no economic incentive at all.

- What emerged from the BSU experience is that a mentoring program that addresses the three dimensions (instruction, research and extension) of the role of a university faculty, has the potential to transform a university into a learning organization without too much emphasis on the pedagogy of teaching.

- Whether the university faculty is assigned to teach, research or render community service, mentoring provides an opportunity to enhance competences in their role that is closely aligned to institutional priorities.

- In general, it seems that structured mentoring helps a university develop from within, and demonstrates that the capabilities of its teachers are valued.

Challenges, issues and recommendations

The results of this study appear to reinforce Bryson's (2001) claim that mentoring can foster organizational learning in a university. There are, however, challenges that must be addressed.

In the 'faculty mentoring on the use of teaching strategies', there is a need for intense mentoring which should require more time and commitment on the part of the faculty mentees. However, due to work overload, the novice teachers who are still struggling to adjust to the new workplace will most likely attribute non-participation to busyness. On the other hand, seasoned teachers may not be interested to increase their teaching

strategy repertoire anymore because of the notion that this will no longer make a difference considering the fact that they will soon retire from work in the university. There is likewise a need to find out why natural mentoring seems to work in one department yet unsuccessful in another department. Moreover, there should be a widespread involvement in mentoring if it has to generate positive changes in the university.

Addressing these issues may require reduction of teaching load, generation of resources for an incentive scheme, an emphasis on the concept of lifelong learning and its benefits, and a stronger advocacy on the benefits of mentoring across departments.

With regard to mentoring on the use of electronic grading system, this activity must be supported with sufficient supply of computer units if it has to attain maximum benefits. With the scarce resources of the department, the challenge to obtain more computers is compounded with the seeming indifference of some faculty to make use of the new technology. Security of grades is also an issue that must be addressed not only to ensure that important documents are protected but also to encourage the apprehensive sector of the faculty to utilize computers and hence totally abandon the non-electronic grading system. For the moment, what the sceptical teachers do is that they keep a hardcopy of their grades and then transfer data into the computer. This makes their work doubly tedious, and therefore defeats the purpose of a computerized grading system. Hence, it is important to fortify computer defences against hackers and viruses. A computer specialist in the department must obtain training. It is likewise recommended to infuse into future workshops in the electronic grading system, the rationale and importance of electronically preparing students' grades.

The challenges that faculty mentoring in research face is that the subject matter of the current mentoring activity could not ensure research output on the part of the faculty mentees. The topics were purely about the concept and use of statistical tools. To be refreshed on their uses and to be presented with sample studies using such tools may not altogether motivate the faculty to start researching. Another thing that hinders actual research may be the existing heavy workload of the faculty. Moreover, economic incentives for research are minimal especially to SSD teachers doing qualitative research. What may be done is to reduce workload, increase university-level incentive for research, create department-level incentive for researches that are either published in the department's magazine, or presented in the regular SSD colloquium. It may even be helpful if funding agencies outside the university may be sought for possible funding or publication of qualitative researches.

With regard to mentoring on piano accompaniment, linking with an expert mentor outside the university may become the prime stimulus for developing a child's talent to the maximum level, yet this can be impeded by the inability of the children's parents to fund attendance to piano workshops, for instance. This problem may even be exponentially increased if the respective family of the talented children does not truly understand the intricacies of training requirements e.g. sustained (but expensive) formal lessons with a qualified teacher or constant correct practice. Another problem concerns the availability of more qualified piano teachers. As of this writing, there are only two licensed piano teachers in the area.

An impingement of the faculty mentoring on the 'Sa karunungan, walang iwanan' project, on the other hand, is the perceived lack of encouragement and support of the school administration and/or the barangay government in which the project is based. Moreover, bureaucracy may also delay in accomplishing things within

the time allotted for the completion of the project. As a result of an evaluation conducted, the project also needed more learning materials, e.g. books, children's writing materials, and volunteer teachers' instructional materials. The need to develop the faculty mentors' interpersonal skills may encourage more support for the project. Moreover, if the goals of the project may be marketed to potential benefactors, there is good reason to believe that enough resources may be generated to sustain the project.

Summary and Conclusion

The focus of this study is the perceptions of mentors and mentees who participated in the rapid prototyping process for designing mentoring prototypes for Bukidnon State University (BSU), Philippines.

I started this study with one goal in mind: to develop a faculty mentoring program for BSU in order to foster professional development along the four BSU mission areas: instruction, research, extension and production. It began with the normal stages of instructional design as found in the literature, e.g. needs analysis (e.g. Torres, 2003; Torres, 2004), then the design using the rapid prototyping method proceeded to address the four areas of the BSU mission statement. Out of these preliminary efforts, five (5) initial mentoring prototypes emerged at different periods between 2006 to 2008: faculty mentoring on the use of teaching strategies and faculty mentoring on the use of electronic grading system (for the 'instruction' BSU mission area); faculty mentoring on research (for the 'research' BSU mission area); mentoring on piano accompaniment (for the clientele based on the community) and faculty mentoring on a 'no child left behind' project (both for the 'extension' BSU mission area). Apparently, no mentoring prototype yet for the 'production' component of the BSU mission emerged.

The perceptions of the mentors and mentees can attest to the potential of the prototypes to foster professional development, not only among the faculty mentors and mentees but also to the professional clientele that the faculty serve, e.g. community partners. Moreover, the perceptions of the mentors and mentees who participated in the design of mentoring activities seem to manifest characteristics of a learning organization described by Dalin and Rolff,(1993); Parsloe and Wray, (2000); and Tumapon (2002).

The reported mentoring activities took place within the framework of 1) one-on-one mentoring model; 2) group mentoring model (e.g. an individual mentor guiding a team of mentees or a team of mentors guiding a team of mentees); and 3) 'indirect mentoring' model which later emerged when the faculty got involved in community work..

The present study is limited to the Social Sciences Department of BSU, who participated in the design of mentoring prototypes. The design process however may be replicated by other departments to customize their own mentoring activities. In contrast, the prototypes may be modified or enhanced in such a way that its final product would suit the mentoring needs of the entire university. Alternatively, the same emerging prototypes may

evolve into additional prototypes to include mentoring prototypes that may address the 'production' mission area of the university. In any case, the mentoring prototypes can be used as a complementary tool for staff development and support for newly recruited young instructors.

Intertwined with this study is the instructional design process using the rapid prototyping model, for the purpose of generating mentoring prototypes for the faculty of Bukidnon State University. There were no specific procedures for involving the mentoring participants, and for evolving the mentoring prototypes. There were also no general time allotments provided for designing each mentoring prototype. These observations are, however, consistent with the nature of the rapid prototyping process for designing instruction. What was further observed was that the mentoring prototypes were usable, for at least one school year. They were produced in a shorter period of time, and most of all received by satisfied mentors and mentees who had been involved throughout the development of mentoring prototypes. In other words, the rapid prototyping method for creating mentoring prototypes worked. The success of this model for prototyping projects similar to faculty mentoring activities for BSU, was confirmed by the study of Jones and Richey (2000).

As prototyping of mentoring activities progresses, more qualitative inquiries should be concurrently conducted in order to verify this paper's assertions; and to determine if mentoring difficulties are addressed and effectively hurdled. Studies may also be made about the effectiveness and impacts of mentoring activities as part of the rapid prototyping process. The use of formal surveys, focus groups and other opportunities for input may be useful to the eventual establishment, expansion and institutionalization of an appropriate 'artifact' (Tripp and Bichelmeyer, 1990), which in this case, a faculty mentoring program, not only for the Social Sciences Department of Bukidnon State University but for the entire faculty in the different departments of this university.

A Case Study of a Global Mentor-Mentee Relationship

Kumiko Shiga, Ph.D.

English Teacher at Hyogo Shogyo (Commercial) High School in Kobe, Japan

Felicia Lincoln, Ph.D.

Associate Professor of Curriculum and Instruction at the University of Arkansas, USA

Abstract

This is a case study of Dr. Lincoln and me. We first met at the University of Arkansas in fall, 2000. She served as my academic advisor through my study in the Master and doctoral programs for six years. In 2008, I came back to Japan. But our relationship as a mentor-mentee relationship lasted. In this paper, I share my thoughts of what a global mentor mean and how she helped me go through many difficulties/challenges from miles away from me.

Literature Review

Thorpe and Kalischuk (2003) define a mentor as a wise, experienced, and faithful advisor to an aspiring professional. Owens and Patton (2003) found benefits for both mentors and mentees through a mentoring program. Mentees receive support and encouragement which enables them to further develop their confidence and professional identity, increasing their satisfaction in their career. On the other hand, mentors attain personal satisfaction and fulfillment that arises from supporting and assisting another member of the profession in their development. They concluded that the mentoring process encourages the development of leadership skills and advancing the mentors vision not only for their individual success but also for the future of the field as a profession.

According to London Metropolitan University (2009), there are 21 components to be effective mentors.

An effective Mentor is someone who:

- defines the relationship;
- achieves mutual respect;
- balances professionalism and friendship;
- knows about the course;
- knows the school really well;
- is committed to the process of mentoring and identifies appropriate training needs;

555

- is action oriented;
- is non-threatening and approachable;
- offers time;
- has excellent interpersonal skills and communicates clearly;
- knows what good quality teaching is;
- empathizes, encourages and motivates;
- engenders respect and trust;
- can give negative feedback constructively;
- celebrates successes;
- genuinely wants to help others;
- represents the Trainee's interests;
- responds to individual circumstances;
- understands what teaching and learning are about;
- believes in a continuous learning environment;
- has a vision about helping the Trainee to develop.

In mentor-mentee relationship, friendship is not necessary. However, such relationships can have lifetime benefits for both parties, but a hierarchical arrangement still exists and problems may arise if boundaries are crossed (University of Wisconsin, 1998).

Meeting with Dr. Lincoln

In 2004, I went to study at the University of Arkansas as an exchanged student from a Japanese university. In the first semester, fall 2004, I took basic courses of Education, Sociology, and English as a Second Language (ESL) courses to improve my English. I was not fluent English yet, and I still had many difficulties in communicating in English.

In the middle of the fall semester, it was time to register for the coming spring semester. However, the academic advisor for exchanged students was not familiar with Education courses, and I was a little lost in not knowing which courses to take. Fortunately, one of my professors at the Education department told me about the ESL courses that I might be interested in and who to contact for more information. This is how I met Dr. Lincoln, the program coordinator of ESL education.

In the spring semester, I took two of her ESL education courses, and I learned so much from her. I was especially surprised to know how behind our researches on English education was in Japan compared to the ones in the US, and it made me feel like learning more about it from her. In addition, I could not improve my English as much as I expected, and it made me wish to continue studying abroad.

One day, I visited Dr. Lincoln and told her how I felt and what I wanted to do. She supported me to carry on the plan to come back to the University of Arkansas (U of A) to study after my completion of the bachelor degree in Japan in a year. I went back to Japan in May, 2001, and completed my bachelor degree in March, 2002. Dr. Lincoln helped me apply for the Master of Education (MEd) program at the U of A. During this period, our relationship was very formal student-professor relationship.

MEd at the U of A

In fall, 2002, I started my MEd program, and Dr. Lincoln became my academic advisor. So, our relationship was shifted from student-professor relationship to student-advisor relationship. During the two years in the program, she led me through the academic work and also helped me be more like a member of the society by offering me opportunities to learn about the culture there. For example, she took me for lunch sometimes and I started to eat at restaurants I had never been with my friends before. This simple act broadened the sphere of my activity to know more about the community. She also invited some international students during thanks-giving holidays to give us opportunities to experience how typical thanks-giving holidays are for American families. In this way, she not only supported me academically, but socially and morally. As a result, our relationship became less formal than before.

Ph.D. at the U of A

I never intended to move on to the Ph.D. program until the last semester of the MEd program. However, at the beginning of the last semester before completing the program, Dr. Lincoln asked me if I was interested in the Ph.D. program or not. At that time, my biggest concern was about the financial stability. However, there was an opening for a teaching assistant of Japanese, and fortunately, I got the position. So, I moved on to the Ph.D. program, and Dr. Lincoln continued serving as my academic advisor. Though I was a student as I had been and Dr. Lincoln was my academic advisor as she had been, this resulted in changing our relationship dramatically.

First, there was a significant change in my role. I was no longer just a student, but also a teacher for students in the Japanese program. However, by that time, I had very little classroom teaching experience. In addition, though I had experience in American university as a student, I was not familiar with the system as a teacher. I was not aware of a lot of academic culture of the U of A. As a result, I faced series of difficulties and challenges as an international teaching assistant (ITA). In addition, the change of my status changed the relationship with Dr. Lincoln from a student-professor relationship to a student/teacher-professor/mentor relationship.

In academic field, I started to work much more closely with her. We constantly did research together, submitted proposals to conferences, traveled together, and co-presented at conferences. We also started to go out for lunch or dinner more often than before just to enjoy ourselves. In addition, she was always there to help me go through every step to become a more successful ITA.

In the four years, our relationship was far much less formal. Dr. Lincoln became my academic advisor, a dissertation chair, a mentor, a colleague, a friend, and more than anything else, a great role model as a teacher and citizen of the society.

Professional Development & Meaning of Mentor

Before I became a teaching assistant at the Japanese program, the U of A, I had studied there for more than two years. So, I did have some opportunities how professors teaching at American universities. In addition, because I belonged to the education department, I had learned many things about common teaching pedagogy and education system in the US. However, I was still used to have very formal relationship with teachers as a part of Japanese custom even when I started to work as a teaching assistant and I was not familiar with American academic settings as a teacher. For example, I was not aware of the importance of syllabus, what to do when academic dishonesty happens, how to earn respect, and so on. As a result, I had several unpleasant and unexpected surprises and experiences with students in my new environment.

My supervisor at the Japanese program of course helped me go through all difficulties. However, he was also relatively new faculty member at the university and he was not a native professor. So, sometimes his perspective was based on a Japanese perspective which was not accepted in the American academic culture. However, fortunately, I had another place to go for help, and it was Dr. Lincoln. She was always patient to listen to me and gave me a lot of advice how to work in American academic settings, deal with its system and American students. Her support was not limited academically, but socially and culturally. She was always there to support me or give advice to me to be a more successful student, a more successful ITA, and a more successful resident of the community. She was much more than an academic advisor for me. She gave me academic, social, and moral support. She was my academic advisor, mentor, and role model.

Global Mentor

In May, 2008, I completed the Ph.D. program and came back to Japan. The first job I got was a part-time teacher at a junior high school in Kobe, Japan. I worked there from the end of August to the end of March, 2009, and faced many difficulties as a new teacher in Japan. Many difficulties and issues I faced were not just teaching itself, but more of issues with disruptive students and so on. And it made me lose so much confident in myself as a teacher. I often e-mailed Dr. Lincoln to share my feeling and experience. Her respond was always very sympathetic but positive to support me emotionally. To me, Dr. Lincoln is a friend, a colleague, a professor, and a mentor who

1. lives miles away from me,
2. knows how I performed in the US university both as a student and a teacher,
3. has unique/different perspective from my colleagues in Japan,
4. cheers me and believes in me,
5. is very enthusiastic about teaching,
6. is aware of multiculturalism,
7. is conscious of being my role model,
8. is surrounded by totally different environment and information from myself, and
9. reminds me to open my eyes to bigger world and broaden my perspectives.

And that's who I call a global mentor. Mentors don't always have to be with us physically. But one of the most important roles for mentors is to provide emotional support and provide opportunities to develop professionally. Mentors can fulfill their roles being miles away from mentees.

Exploring the Links between Personality Traits, Professional Stress, and Coping Strategies among Mentor Teachers in Taiwan

Dr. Ya-Fang Chiu

Taipei Municipal University of Education

Dr. Roger Shouse

The Pennsylvania State University

College of Education

Department of Education Policy Studies Program in Educational Leadership (EDLDR)

Abstract

One way schools have sought to raise teacher quality is through the establishment of mentor teacher programs, which emphasize collegial guidance and advice through the use of recollection, reflection, and consultation. Studies of such mentoring programs indicate that this scheme can be effective in preparing new teachers for daily professional demands, as well as for increasing involvement, commitment, and quality among senior teachers (Chang et al., 2005; American Federation of Teachers, 1998; Commission on Teacher Credentialing, 1993; Feiman-Nemser, 1992; Heller, 2004; Nolan & Hoover, 2004; Stanford et al., 1994).

Yet while a number of studies have examined the impact of mentoring on new teachers, few studies have examined its impact on the mentors themselves, in particular, the stresses and disturbances they may encounter while serving in this key organizational role (Chang, 2004). In some cases, such stresses may even threaten mentors' emotional and physical health to the point that their school's mentoring program is suspended entirely. It therefore seems important to examine whether suitable personality factors can be identified prior to senior teachers' participation in mentoring programs. In other words, at a time when senior teachers' expertise is highly valued, so too is greater knowledge in stress management. As Heller (2004) and Humphrey (2000) point out, many effective senior teachers do not necessarily become qualified, professional, and effective teaching counselors.

This study explores mentor teachers' reactions toward mentoring stresses and the application of related coping strategies. It likewise aims to reveal how mentor personality traits influence work stress and coping strategies with an aim to improve the selection of mentor teachers as well as the design of effective preparation courses. Base on data gathered from questionnaires and semi structured interviews, and examined using a variety of quantitative and qualitative techniques, this study traced connections between mentor personality traits, stress response, and coping strategies. Findings indicate that among the five main personality traits of mentor teachers, "Agreeableness" is the highest of them; the reaction on mentoring stresses is in the medium- low degrees; and coping strategies could deal with stresses actively. Among the five personality traits, "sensitivity" is the trait that can most accurately predict the reaction toward overall mentoring stresses, but it is negatively predictive. "Openness" and "Agreeableness" are the traits that can most accurately predict the coping strategies for the overall mentoring stresses. They have a positive, predictive effect. Finally, some suggestions are given to higher educationalists for reference.

Key words: Personality traits, coping strategies, mentor teacher, mentoring stresses

Directing The Collaborative ESL Classroom With Purposeful Seating Charts

Patrick Rates

Ritsumeikan University

Abstract

The arrangement of the classroom is an integral part of any teachers' classroom preparation. Many teachers regard seating charts as primarily for the purpose of getting to know student's names, taking role or grouping students. A seating chart can have an influence on classroom organization, seating students in a way that will give them the opportunity to promote positive learning environments in specific situations. A seating arrangement can be a great tool for the ESL teacher in accomplishing the goals of the lesson.

This paper explores options in classroom-seating plans; in addition it will explore random seating charts and the effects of the approaches on the ESL classroom. It is the aim of this paper presentation to demonstrate how seating chart, and how utilizing a random seating plan can be advantageous in an ESL setting. This paper will present data gathered from a student survey and teacher experiences with random seating charts.

Introduction

Seating arrangements play a major part of a teacher's classroom activities and classroom management plans. The teacher, in deciding the seating arrangement needs to think about not only the organization of the room, the aim of the activity, but also the make-up and nature of the students and the teacher's own involvement in the activity (Sommer, 1967; Zifferblatt 1972; Sommer 1977; Becker, et al., 1973). The consideration for the physical environment of the room is so that teaching and learning can occur as efficiently and effectively as possible. In an ESL classroom, to achieve the goal of encouraging, assisting, and supporting students in learning in a way that the classroom seating is structured to support both the teacher to student support and student to student interaction. Other factors a teacher may consider while making a seating arrangement is the make-up of his or her students including the personality of the class, the number of students, and age of the students. Teachers also want to consider the goal of the classroom activity and how the classroom seating can best support the activities goal (Johnson, 1970). For example, in an ESL class, the teacher may want pair work or group collaboration with much student interaction or the teacher may want the students to do an individualized reading exercise or the teacher may want the attention of the class directed toward the teacher. By altering the seating arrangements the teacher can contribute to the success of the ESL student in the classroom. The teacher must look at what outcomes from the class they are striving to achieve and arrange the students to best meet these goals. Another factor to consider by the teacher is the personality of the class. There are a number of variables in considering the personality of the class. For example, the various levels of English, different strengths and that some students are shyer than their peers.

Seating arrangements can also have an outcome on the effectiveness of communication of the students themselves. From the point of view of the teacher, a factor deciding different seating plans is matching a style of teaching that best suits the instructor, to the objective of the lesson.

Along with the classroom layout, I would like to suggest and offer feedback from an in class survey suggesting that randomizing the classroom seating, or changing of the student's assigned seat, the student's group or pair makeup, changing where in the classroom the students sit every class or every couple of classes can be beneficial for the students development. I found that first, the students are perhaps meeting new people with different personalities and being forced to leave their comfort zone, being exposed to other personalities and strengths and weaknesses which especially beneficial in an ESL classroom. Second, if the teacher changes the classroom seating chart regularly, the students will get the chance to hear more people talk, work, and study in the English language, students will have the challenge of working with different level and abilities of English.

Advantages of Having a Seating Chart

I feel that the class needs can be best handled with a seating chart. For example, students with special needs could be placed appropriately also student individual needs could be best addressed (Poulou 20006). Stronger students could be placed near weaker students. This also works well for students with positive or negative classroom behavior could be seated near others who could benefit from a good role model. (Sommer 1977) Also, students had the comfort of knowing where to sit. Shy students may be more comfortable if told where to sit instead of making that decision. So, the class is not inconvenienced by who wants to sit where and next to whom. Seating charts also provide a quick and convenient way for the teacher to take attendance and learn student names.

Disadvantages of Seating Charts

There are disadvantages to a seating chart. By creating a seating chart it puts the management of the class arrangement exclusively on the teacher, placing the teacher as an authority figure (Holtrop, 1997). This method is good for some teaching styles, but it is not as good for others who want to give students as much freedom in the class as possible. Students may feel empowered by the opportunity to choose their own seats. Also, if the teacher provides new shuffled seating chart each class it makes more work for the teacher. The teacher must rethink the make-up each class.

Seating Arrangements

I will describe some possible seating arrangement styles that teachers have at their disposal. When deciding a seating arrangement, teachers should consider what will give the class maximum effectiveness and control and give students the best chance to grasp the lesson. Depending on how the instruction is being delivered or goal for the class, it makes sense for the teacher to change the layout.

The organization of the class is a major element to the classroom. In an ESL classroom emphasizes is often placed on collaboration and interaction is often encouraged. Different arrangements give students different ways to participate in the class and it gives the teacher different ways to provide instruction. The following is few of the more common seating arrangements: collaborative groups, cluster groups, rows, circle, semi-circle, and pairs. The best arrangement for each class depends on the class and teacher.

Collaborative Groups

The characteristic of a genuine collaborative classroom includes the sharing of knowledge among students and teachers, shared authority between the two, using teachers as mediators, and finally, heterogeneous groupings of students (Kulieke et al, 1990). When students divide into groups, group work can be enhanced. Group members are able to work together on a common goal. Typical roles in a collaborative group may include: a team leader, and recorder or clerk. When students utilize these roles in their collaborative groups, they develop skills in making group decisions, leading, and managing a group. This constructivist approach to teaching "puts the student in the drivers seat" and stresses the importance of active student engagement (Perkins, 1992).   All of these skills are of value for students in the future. In collaborative groups each group member has a responsibility of contributing to the group, each member has a responsibility. Students should be active seekers and processors of information, not passive recipients (Schunk, 1986; Davis & Murrell, 1994).

When students divide assignment tasks among themselves, small group work has the tendency not to work well. Groups working together, sharing information, listening to each other promotes learning and collaborating (Erickson & Strommer, 1991, McKeachie, 1986). From my experience, when students discuss and work together they arrive at a better sense of understanding and understand what parts of the activity needs further discussion and reflection.

In the classroom, I find that collaborative groups need to regularly assess the effectiveness of its communication strategies and seek ways to improve its group communication. I find that groups become more failure and comfortable with the collaborative group learning process and become better at the process. Periodically, we reserve time at the end of class to assess group dynamics. What is working? What isn't? How can the groups

function more effectively? I also encourage groups to discuss the group dynamics within the group.

Clusters

Collaborative groups are often arranged into cluster groups. A good way to integrate collaborative learning with ESL students is in a cluster group (Emmer 1995). Cluster groups are often made up of three, four or five students working together on an activity task. Students arrange their desks so every desk is facing one another to encourage group interaction. The class is made up of scattered groups of clusters throughout the class. In the class, the teacher walks around the room and works with the groups and monitors group progress. The make-up of the group needs to be thought about before class by the teacher or the student. The goal of cluster discussions is that each group member shares information towards a group task, and a common goal. In order for cluster groups to be effective, the students need to be able to work together, helping each other learn.

There are quite a few considerations when deciding to place students in clusters. It is advantageous to have students of different levels at each group so that they can work with others helping each other learn. The potential problem is that they will be close to one another and can easily chitchat with friends in their native language. Clusters also have the potential disadvantage of students who approach the assigned tasks in individualistic ways, rather than focusing on including all of the members of the group. For example, rather than work together in the group discuss, each student works alone on a portion of the assignment and gives the answers to the group without discussion. For the teacher, clusters can also be a disadvantage when addressing the class because students may not be oriented toward the teacher. Students may have their back to the teacher and not be focused to the front of the room, being focused on the group.

Traditional Rows and Columns

Traditionally, the arrangement for many teachers is a row and column style of seating layout. Many teachers used to favor the traditional form of row seating because it offers the teacher the ability to move around the classroom easily and allows the students have a clear view of what is happening in front of them, although this style has fallen out of favor with many educators today

This arrangement still has its benefits for teacher-centered instruction. It is easy for the teacher to monitor all the students in the class. Rows and columns put students facing the teacher and the instructional area. In an ESL classroom this may be advantageous in listening and reading activities.

The problem with this arrangement is that some students sit in the corners and in the back of the room, making participation and interaction less or more difficult for those students. This arrangement is also not advantageous for group work, by not allowing students to interact as well as other arrangements.

Pair Work

By Separating the rows and columns so that the two sides are facing each other transforms the classroom into another learning environment. This arranges students so that they face each other, and can encourage student interaction with pair discussions. For teacher, the aisle is also a convenient to monitor and offer support to students during the lesson.

The problem with this setup like rows and columns is that there are students that are in the back of the room and in the corners. Also, it is hard for the teacher to see all the students and monitor. The students are not facing the front of the room when sitting in pairs. It is difficult to have class discussions or provide feedback to the class without moving and looking around to see who is talking. Pair work is good for classroom situations where there is little direct instruction from the teacher and student's work is encouraged.

Circle

By placing desks in one large circle students are able to support each other in learning. They can solve problems

through class discussion and shared explanations. A circle of desks has the advantage of putting every student in the front row. The teacher then is centered in the lessons acting as a collaborator or facilitator. Again, the problem with this arrangement is there are students who will be at a disadvantage during the class feedback or instruction time. Also, it is may be hard for the teacher to see all the students and monitor their activities.

Semicircle

In a semicircle seating arrangement all the desks touch each other facing the front of the room in a semicircle shape. The teacher can easily see each student and the students can see the teacher's instruction. The teacher can use this arrangement in direct instruction, or student collaboration. In this arrangement, all the students can see each other; they can have discussions amongst themselves in pairs. Also, because the students all have clear vision of the instruction area, instruction from the teacher could be done easily. The teacher would have full control over the students. In semi-circle formation students' social interaction can be improved, asking more questions than other arrangements (Marx, Fuhrer, and Hartig, 1999).

The disadvantage of semicircle seating arrangement is that the teacher would have a hard time meeting with the students individually, because the seats are very close to each other. The semicircle also takes up the entire classroom so there isn't much room for activities outside the activity area. Because students are sitting next to each other the students can work easily together without much movement around the class, making collaborative learning possible. The teacher can take a passive role and listen to the students and let them run the class. The teacher walks around the room and monitors student work.

No seats

In an ESL teaching situation where conversation and class interaction is emphasized, a teacher may wish to have an even more engaging arrangement for interaction. This arrangement would be ideal for role-play activities or activities emphasizing interact. If this is the goal of the instruction, it may be best to not use seats at all. In this arrangement, interactions become much more lifelike and enable the students to use the language in the context of an actual situation. This arrangement cannot be done for the entire lesson but is well suited for portion(s) of the lesson. In this arrangement it is very easily to move students quickly amongst various groups and swapping partners in role-plays.

Randomized or Shuffled Seats

In combination with the arrangement of the class, I would like to propose that randomized or shuffled seating can enhance the class and benefits the teacher and student in many ways. I find that by shuffling the classroom seating arrangement the class is refreshed. With randomized seating the teacher chooses a seating arrangement and shuffles the seating arrangement so that students are given the opportunity to work with different students each class and are seated in different location in the classroom. There are going to be expected issues that the students are going to have when changing from one seating arrangement to another. For example, students must check their new seat location before each class and students must get acquainted with new group member for each class. Some students will have gotten accustomed to their seat and the people around them and not be as willing to sit in their new seat. Most of the students will like the change and will get used to it very quickly, even though it might come to as an adjustment.

Methodology

I would like to present data from a survey was given to two hundred and fifty, first and second year students from the Science and Engineering Department at Ritsumeikan University on their opinion of randomized seating. The students were surveyed anonymously, in class on there opinion of the randomized seating charts, which was used every class for fifteen weeks. The survey was conducted after the fifteen-week semester was completed.

The standardized curriculum in the Science and Engineering department is designed to be collaborative in fashion, working through the in class exercises in groups, the acquisition lesson occurring in individuals as a

result of group interaction. The instructor is more like a facilitator than a teacher. In this class atmosphere, I feel that a seating chart and shuffling of seats is an important part of the makeup of the class.

The survey was given at the end of a fifteen-week semester utilizing a randomized seating system. The following are the list of survey questions, results and opinions students wrote for each question of the survey that was given in class.

1. *Do you like changing seats every class?*

- Yes: 63%

- No: 18%

- No opinion: 19%

Reasons given by students who responded, "Yes":

- Communicate with others
- Talk with many people
- Hear various ideas
- Keeps the class fresh, more fun
- Make new friends
- Makes the class friendlier

Reasons given by students who responded "No":

- Stress
- Not a long enough time to make friends
- It is difficult to change seats and a bother

2. Does changing seats help you work with other people?
- Yes 87%
- No 2%
- No Opinion 11%

Reasons given by students who responded, "Yes":

- Communication skill
- Get different ideas and opinions
- We can learn from each other
- It makes class fun
- I can make friends

Reasons given by students who responded "No":

- I want to improve my own English

3. Does changing seats help you work with different people who have different views than your own?

- Yes 87%
- No 2%
- No opinion 11%

Reasons given by students who responded, "Yes":

- Communication skill
- Communicate with different people
- Hear others ideas opinions
- Communicating with many people is needed in society

Reasons given by students who responded "No":

- I can't give my opinion to new members

4. Do you prefer working with the same group members every week?

- Yes 21%
- No 72%
- No Opinion 8%

Reasons given by students who responded, "Yes":

- I can't communicate with others
- Makes the class interesting
- I want to make friends
- I can get other students opinions

Reasons given by students who responded "No":

- I can get familiars with group members
- It is easier to talk to the same people

5. If you change seats, how often do you want to change seats?

- Every class 32%

- Every 2 weeks 28%

- Every 4 weeks 15%

- Every 5 weeks 21%

- No Opinion 4%

6. Why do you think changing seats is good or bad?

  - Communicate with many people

  - Make new friends

7. Would you prefer big groups (6-10 students), small groups (3-4 students) or pair work (2)?

   - Small group 68%

   - Big group 12%

   - Pair 20%

Survey Results - Discussion

The students of the survey were given a survey with the following questions and were encouraged to additional comments on their own opinion.

1. Do you like changing seats every class?

2. Does changing seats help you work with other people?

3. Does changing seats help you work with different people who have different views than your own?

4. Do you prefer working with the same group members every week?

5. If you change seats, how often do you want to change seats?

6. Why do you think changing seats is good or bad?

7. Would you prefer big groups (6-10 students), small groups (3-4 students) or pair work (2)?

The results of the survey show that students have an overall favorable opinion of randomized seats. Many students feel that randomized seating helps them communicate in small groups. Students also expressed that randomized seating helps them communicate with a greater variety of people. Many students have expressed to me that randomized seats livens up the class by giving the class a new atmosphere. Some students also expressed that they would prefer to have permanent seating throughout the semester. These students expressed that they were unable to feel comfortable with a new group every week. Some students also feel that it is a bother to have to check the seating chart before class and change seats every class.

Our classes in the Science and Engineering Department are largely collaborative, which is an excellent opportunity for randomized seating. Obviously each teacher has their own style and purpose for each class, but these are observations that I have made in my classes and the results that I have found in my class. By my own observations, students were hesitant at first, but most soon enjoy working with other students. I find that by changing the class layout and shuffling the student's seats that it keeps the class fresh. As new student groups are formed each class, students have the opportunity to take on new roles. Each group usually has a dominant student who will emerge and lead the group in the discussion. When groups are shuffled from class to class students have the opportunity to take on new roles. In my opinion classroom will be very successful where students are able to get instructions but they are allowed and able to explore learning by helping each other and

doing hands on activities.

Conclusions

There are many options available to the teacher when planning the classroom layout. In deciding the seating arrangement the teacher needs to think about not only the organization of the room, the aim of the activity, but also the make-up and nature of the students and the teacher's own involvement in the activity. The end goal for a teacher when considering the physical environment of the room is to provide an environment where teaching and learning can occur as efficiently and effectively as possible. I have proposed that seating charts and randomized seating can be a valuable tool in the classroom, beneficial for both students and teachers.

The idea of randomized seating and seating arrangements all have different functions and are best used for different classroom purposes. No single one should be considered as a classroom's primary arrangement, but rather as a toolbox that can all be used from time to time. The important thing is to understand that the arrangement of students in the classroom can be a highly useful tool in making lessons more effective.

Second-Language Oral Proficiency in Japan

Dr .Adam Serag
English Education Center, Ehime University

Abstract

This paper examines the difficulties associated with learning and speaking English as a second language (ESL) in Japan. A review of current work in this area is given, with a focus on public speaking anxiety of Japanese university students that has been tackled from a socio-psychological perspective. A combination of Exposure and Response Prevention (ERP) and Self-Disclosure methods was implemented in the form of a one-minute weekly public speech assignment given to 213 of first grade students at Ehime University. The English speaking course ran once a week for one 90-minute class over a fifteen-week semester. A therapeutic effect was achieved as students confronted their fears and discontinued their escape response. Students showed a dramatic improvement in both their English speaking and critical thinking abilities with overall enjoyment demonstrated in their response to course evaluation questionnaire. The gradual cognitive exposure techniques helped students establish a sincere belief that they are competent and that occasional imperfections or failures are the result of some other factor such as the lack of effort. The course ended with successful full oral presentations from all students who become more confident in their abilities and second language acquisition.   The paper discusses the role of sociolinguistic factors that impact second-language (L2) oral proficiency and how a combination of ERP and Self-Disclosure methods has worked effectively with the students to overcome a major obstacle to foreign language learning in Japan .The paper then reflects on the learners' motivation to ensure that the students would be properly prepared for their future academic challenges in Japan and overseas.

Keywords: ESL, Speaking, Exposure and response prevention (ERP), Self-Disclosure,

Public Speech, Sociolinguistic Factors, Second Language Acquisition

Introduction

Most of the difficulties that ESL learners face in the study of English are a consequence of the degree to which their native language and self-concept differ from English language and western concept of self. For example, native speakers of Japanese, may face many more difficulties than native speakers of German, because German language and self-concept are closely related to English language and western self-concept, whereas the Japanese are not.   Learning a second language involves much more than learning the words, and the sounds of a language. Communication breakdowns occur not only due to the more commonly understood syntax and pronunciation difficulties but because when we learn a language we also learn a culture. Research on Chinese ESL students and British teachers found that the Chinese learners did not see classroom discussion and interaction as important but placed a heavy emphasis on teacher-directed lectures (McKay, Sharon; Schaetzel, Kirsten, 2008, Jin and Cortazzi, 1998). Moreover, there is a number of obstacles to overcome before mastering the four macro skills in a non-English speaking environment such as Japan.

Culture and the Self-Concept

The Self-Concept is influenced by culture. National culture is the set of collective beliefs that distinguish people of one nationality from those of another (Hofstede 1980). The four main dimensions of national culture that were identified by Hofstede (1980) are (individualism/collectivism), power distance, (masculinity/femininity), and uncertainty avoidance. This paper argues that three of the four main dimensions of national culture are relevant to second language acquisition in Japan. The dimensions are (individualism/collectivism), power distance, and uncertainty avoidance.

Individualism and Collectivism
Hofstede (1980) defines Individualism as a cultural construct, measures the importance placed on the welfare of the individual as opposed to the group. The importance of the group is reflected in collectivism. In individualistic cultures, "people look after themselves and their immediate family members only," whereas in collectivistic cultures, "people look after the interests of larger groups and collectivities in exchange for loyalty" (Hofstede, 1980).

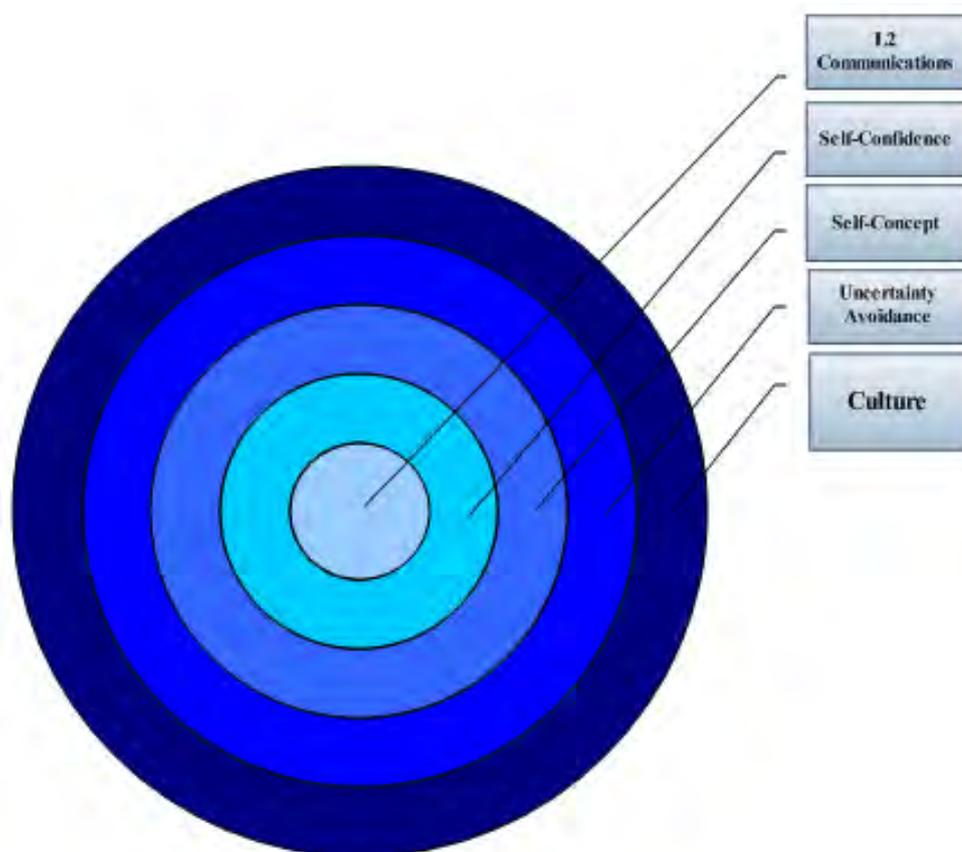
In individualistic societies, individuals "can pursue private interests irrespective of their bearing on the interests of others, whereas in collective societies, obligations toward collective well being supersede the pursuit of personal gains" (Parsons and Shils 1951). Wagner (1995) equated collectivism with "cohesiveness, commitment, or conformity" and where person-group relations are perceived as enduring and important. Individualism is based on the assumption that person-group relationships are fleeting in nature (Wagner, 1995). "Selfishness" for individualists means attending to personal objectives and ignoring group interests, whereas "selfishness" for collectivists implies catering to group interests even at the expense of personal desires (Wagner 1995). Individualists will value cooperation only when it leads to the attainment of personal benefits that cannot be achieved by working alone (Wagner 1995). Horney (1937) held that individualism carried the seeds of potential hostility that pervade all human relationships. The advantages of collectivism, in creating stable long-term relationships, have been studied in detail in the Japanese contexts by various authors (Gerlach 1992). The norms of reciprocity are more prevalent in collectivistic Japan than in the individualistic U.S. (Johnson, Cullen, Sakano and Takenouchi 1996). The 'Guanxi' or 'special relationship' in the context of China, another collectivistic country, always involves a reciprocal obligation (Leung, Wong and Wong 1996).

Power Distance
Power distance as a cultural variable, captures the acceptance of hierarchies of power in a society. "Power distance can be defined as the extent to which less powerful members of organizations within a country accept the unequal distribution of power" (Hofstede 1980). Japan is a country with high power distance, where people are allowed to express their opinions on improving efficiency conditions though a process known as kaizen, they are not encouraged to propose ideas that contradict the basic practices or disturb harmony (Taka and Foglia 1994). At the organizational level, high power distance would pose a barrier to effective communication, thus underutilizing the potential for interaction. This would occur because power distance has an inverse relationship to a society's openness to objective sources of new information (Dawar, Parker and Price, 1996).

Uncertainty Avoidance

Uncertainty avoidance is a cultural construct, measures the extent to which people in certain societies try to avoid uncertain, and risk taking situations by adopting strict codes of behavior. Hofstede (1980) defined uncertainty avoidance as "the extent to which the members of a culture feel threatened by uncertain or unknown situations." Societies with low uncertainty avoidance are more risk taking (Nakata and Sivakumar 1996) and exhibit greater acceptance of dissident behavior. Cultures with high uncertainty avoidance tend to be distrustful of new ideas or behaviors because of their low tolerance for ambiguity (Dawar, Parker and Price 1996). Societies with high uncertainty avoidance also place more importance on rules as a means to avoid risk (Dawar, Parker and Price 1996). Uncertainty avoidance is inversely related to the level of openness in a society (Dawar, Parker and Price 1996).

Figure 1

Culture and Communication


Speaking and the Self-Concept

Speaking is "the process of building and sharing meaning through the use of verbal and non-verbal symbols, in a variety of contexts" (Chaney,

1998,). People speak to convey information and ideas, and try to maintain social relationships. Speakers have to choose the suitable vocabulary, construct appropriate grammatical structures and

use a comprehendible accent, plus the concurrent tasks of thinking and organizing ideas and expressing them at the same time.

In order to be competent in speaking English, the ESL learner needs to deepen his understanding for the western identity and culture ,and even the political factors of English, that are needed to speak appropriately with a new 'voice', an Englishman (Hughes, 2002 in Fitriana 2004:1). Learners of English need to have a certain amount of confidence to use their English effectively when communicating in L2 with other people locally or internationally. Self confidence can determine one's success or failure in speaking L2. This paper argues for the correlation between self-concept and

English speaking ability. Self-concept is the product of culture and experience and the main factor that has an impact to one's self-confidence(figure 1).

People sometimes do not have enough courage to speak in front of other people even in L1. Anxiety, as perceived intuitively by many language learners, negatively   influences language learning and has been found to be one of the most highly examined variables in all of psychology and education (Horwitz, 2001).

As language learning poses a threat to learners' self-concept, in response learners may generate some particular beliefs about language learning and its use. Research on 'language anxiety' suggests that certain beliefs about language learning also contribute to the student's tension and frustration in the class (Horwitz ,1986). Such beliefs have been found to cast a considerable influence upon the ultimate achievement and performance in the target language. The researchers use terms such as 'erroneous' or 'irrational' to indicate certain widely held "beliefs about language learning which can be a source of anxiety" (Gynan, 1989 in Onwuegbuzie ,1999)

Speech anxiety

Speech anxiety "refers to those situations when an individual reports he or she is afraid to deliver a speech" (Ayres & Hopf, 1993, p. 4). Speech anxiety is also referred to as public speaking anxiety, stage fright, and fear of public speaking (Ayres & Hopf, 1993). Many researchers have pointed out that the skill producing most anxiety is speaking (MacIntyre and Gardner 1991). What distinguishes speaking is the public nature of the skill, the embarrassment suffered from exposing our language imperfections in front of others (Arnold, 2000).

Feelings of tension or nervousness centre on the two basic task requirements of foreign language learning: listening and speaking (Horwitz , 1986) because, in interaction, both the skills can not be separated.

About 14% of people in a basic public speaking course have high levels of speech anxiety (Ayres & Hopf, 1985). For some people their fear of public speaking is a phobia and they will refuse to even attempt a speech (Ayres & Hopf, 1993). However, the majority of individuals with speech anxiety "are afraid, feel their fear is excessive, but are able to deliver a speech if necessary" (Ayres & Hopf, 1993). Speech anxiety affects both how students prepare for their speeches and their performance (Daly, Vangelisti, & Weber, 1995). Students that are high in speech anxiety find if more difficult to choose a topic and find information for their speech, use less audience adaptation, are more uncertain when revising their speech, and are less likely to structure their speech in an organized fashion (Daly, 1995). Many learners express their inability and sometimes even acknowledge their failure in learning to speak a second/foreign language. These learners may be good at learning other skills but, when it comes to learning to speak another language, they claim to have a 'mental block' against it (Horwitz, 1986).

Learning a language itself is "a profoundly unsettling psychological proposition" because it directly threatens an individual's 'self-concept' and world-view (Guiora, 1983 in Horwitz, 1986). Language anxiety as a combination of other anxieties that create a separate form of anxiety intrinsic to language learning (Horwitz, 1986).

The Japanese Public Speaking Anxiety

 Japanese students tend to be self-critical, blaming themselves for their failures more than they admire themselves for their successes (Kurman, J., Yoshihara-Tanaka, C., & Elkoshi, T.2003). A self-effacing attributional style in turn is known to be negatively related to a number of personality traits, such as self-esteem, and positively related to others, including trait social anxiety (Leary &Kowalski, 1995). Anxiety in general is known to be detrimental to performance on tasks that require attention and deliberate effort (Roccas & Brewer, 2002) such as learning a foreign language or speaking in public. They do not seem to mind very much being negatively evaluated for other types of classroom performance such as poor attendance. Furthermore, some students will accept the certainty of negative evaluation in the form of bad grades for poor attendance or class participation rather than risk the possibility of being negatively evaluated or laughed at by their peers for making a mistake in public.

Students are also concerned about standing out and appearing to show off their abilities. One who displays one's knowledge is regarded in Japan as immodest, and immodesty is a negative behavior in Japan. Students' self-presentation is apparently internalized between the second and fifth years of primary school (Yoshida, Kojo, & Kaku, 1982, cited in Kurman, 2001). Students are caught in a double bind: if they make a mistake, they may face the embarrassment and if they answer correctly, they become intentionally prevented from taking part in the activities of their group. This also indicates a significant degree of discomfort at judging peers being common in the group as a whole in Japan. Such discomfort may be a result of lack of confidence or experience in rating peers, or the stress caused by fear of hurting, or being hurt by, classmates (Wen & Tsai, 2006; Nigel & Pope, 2005). Power relations are also a factor, as students often dislike having power over their classmates or peers exercising power over them (Liu & Carless, 2006). As a result, many students prefer to remain silent in the English classroom where oral productive communication is the central concern and learners are expected to participate actively in class. Teachers tend to reduce the performance pressure that many Japanese students experience simply by not asking them to "perform" English in front of the typically large classes.

McKay (2003) states that Communicative Language Teaching (CLT) may not fit in straightforwardly with Asian educational culture. A number of studies have compared the communicative behavior of Japanese with those of other cultures. Ishii (1984) pointed out that Japanese are relatively quiet and reserved, and expect listeners to read their minds. Japanese speak less compared with Americans (Geatz, Ishii, & Kropf, 1990), and show less self-disclosure (Barnlund, 1975, 1989). Niikura (1999) argues that the assertiveness of Japanese was the lowest when compared with Malaysians, Filipinos, and Americans. Iwawaki, Eysenck, and Eysenck (1977) also observed that Japanese are more introverted than British people. In classrooms, Japanese students are sometimes characterized as passive, introverted, unmotivated, inactive and unresponsive (Hadley and Evans, 2001; King, 2005).

A Brief Overview of the Institutional Context

Committed to teaching and the advancement of knowledge, national universities provide the highest standards of excellence in higher education, foster intellectual and personal development, and stimulate meaningful research and services to humankind. In general, national universities attract the best students, faculty, and staff. They prepare students to be scientists and decision makers, articulate and principled, innovative and confident, and able to think critically with sound reasoning ability. Furthermore, national universities in Japan are research-intensive institutions where the faculty discovery enhances learning and prepares students to compete in a knowledge-based society and encourage and assist graduate students in applying for nationally recognized scholarships and funded research opportunities. Thus, Japanese graduates of national universities can produce research results that can contribute to the international research literature in overseas.

Ehime University is a Japanese national university in Matsuyama which has the biggest number of students in Shikoku region. The university was established in May 1949 as one of the many national

universities which were established by the Japanese government in the reformation of the education system after the defeat of the World War II. The English Education Centre was inaugurated in April 2001 and provides a range of English language courses for students at Ehime University. Given the severe competition for admission to Ehime University, everyone who is accepted into a national university in Japan has a high level of scholastic ability, intelligence, perseverance, and capacity for effort, qualities much valued in leadership positions in both national and private sectors. The view that these and other relevant qualities also can be developed and identified in other ways, places, and stages of life is simply not part of the Japanese tradition, but there is something missing. How can students see more meaning in learning English and think beyond the tasks at hand? How can they become motivated? Even at university level in small group discussions, for instance, some learners might feel anxious for fear of negative evaluation from their peers, possibly resulting in being quiet and reticent, contrary to their initial intention to participate. Such psychological dilemma of ESL learners between willingness to speak up in the classroom and fear of losing their self-esteem in front of others seems to be a phenomenon in foreign language classroom settings in Japan.

Speaking Course Structure

The 213 first grade students were divided into nine classes and the course ran once a week for one 90-minute class for each class over a fifteen-week semester. The course aim is for students to express their ideas clearly and concisely, and to participate actively in conversations and discussions.

One of the requirements for passing the course was that students had to attend 80% of the classes, participate in class activities, and successfully complete the course with a final exam.

Diagnosing student needs

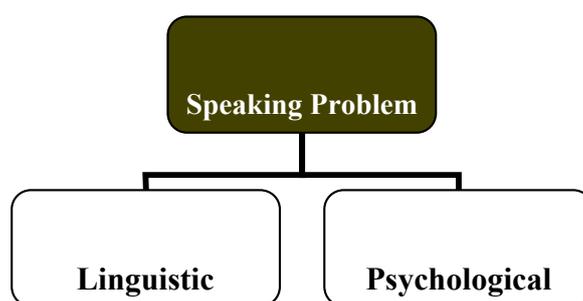
This research divides L2 speaking problem in Japan into two parts (figure 2).First part is linguistic and the second is psychological.


Figure 2

Breaking the problem into manageable parts

The speaking linguistic problem lies in the slowness of speech, which results from separating words as if they were syllables. English is approached as if it were a random collection of individual words, each word given the same stress, rather than an organized pattern of words grouped as phrases. Physical problems of pronunciation result from differences between the two languages in lip and tongue movement and breathing control. Most students who have not had good training on pronunciation justify their pronunciation by substituting close-sounding Japanese sounds that they are accustomed to using for new and discrete English sounds.

Although Japanese students may study English for many years, they often have a hard time with English articles. The articles, such as "a" and "the" not only do not exist in the Japanese language, but are also function words, which mean that they do not contain any meaning and are necessary for functional purposes. Therefore, Japanese students often cannot hear them while they are listening to English speech. This makes it hard for them to learn English articles. Besides, the rules on when to use the articles are so complicated that even the native English speaker cannot explain them exactly. In Japanese, the final verb in the sentence signals the tense in which that sentence takes place regardless of the verb tenses within the sentence. Therefore, it is hard for them to understand why they need to match all of the verb tenses in a sentence in English.

The students' anxiety symptoms were intense worry, blushing, rubbing the palms, perspiration, staggered voice, reluctance, poor performance in spoken activities, less enthusiasm or unwillingness to speak, less eye-contact, reading from the script while giving a speech. Moreover, some students stated that they try to avoid being exposed to the criticism from other classmates.

Strategies to Cope with Language Anxiety

• **Oral Presentation Methodology: One-minute Weekly Speech Assignment**
Students were required to do an additional 1-minute weekly public speech assignment throughout the semester designed from a combination of Exposure and Response Prevention (ERP) and Self-Disclosure methods once a week for one 90-minute class over a fifteen-week semester.

Exposure and response prevention (ERP) is a method available from behavioral psychologists for managing the anxiety. The one-minute weekly public speech assignment was based on the idea that a therapeutic effect can be achieved as students confront their fears and discontinue their escape response. There are several explanations for how exposure method has worked effectively with the students:

1. First, much of what we learn in life comes from things being paired together, such as public speaking and having people laugh at us. Much of what we unlearn, on the other hand, comes from un-pairing two things. With anxiety, this means un-pairing the fear trigger (public speaking) from the expected outcome (people laughing).
2. The second way that exposure works is through habituation. The more often we are exposed to something, be it good, bad, or otherwise, the less of an emotional reaction we will have.
3. Exposure works by giving the people new correct information about the things they thought were threatening.

Combined with ERP, Self-Disclosure plays an important role in the learning experience and producing positive learning outcomes. Morton (1978) classified self-disclosure in three dimensions: descriptive, evaluative, and topical. Evaluative intimacy pertains to disclosures that judge phenomena (Monsour, 1992) while topical intimacy refers to disclosures regarding sensitive topics (Canary & Cody, 1994; Siegman & Reynolds, 1983). For example, the ability to discuss topics such as animal experimentation, and human cloning signifies a significant bond with another individual. Similar to evaluative intimacy, the interact ant assumes more risk when engaging in communication over controversial topics.

• **Teaching conversational grammar**
The speaking course focused in part on essential concepts of grammar and methods of grammatical analysis. The goals of the course were to bring to the student's awareness the fact that many properties of languages can be described in terms of a limited set of basic concepts, to develop the student's skill in analyzing sentences, using English as an example and to sharpen critical thinking by practicing problem-solving. The course focused on methods of analysis, rather than on memorization of rules. An

additional goal of the course is to overcome any "grammar anxiety" students might have the feeling that grammar is something difficult and mysterious, and only useful for "correcting" writing or speech.

The psychological method implementation

Gradual physical exposure

Stage 1: Students Began classes with the speech by reading out loud what their prepared written speeches while sitting in their seats in the class room.

Stage 2: Students were asked to read out loud their written speeches while standing next to their seats in the class room.

Stage 3: Students were asked to read out loud their written speeches while standing in the teacher position in front of all students in the class room.

Stage 4: Students were asked to memorize their written speeches and deliver speeches while standing in the teacher position in front of all students in the class room using the eye contact and body language.

Feedback Loop inspired by Japanese karaoke

Japanese Karaoke is a form of popular entertainment, originally from Japan, in which recordings of the music but not the words of popular songs are played, so that people can sing the words themselves using a microphone and public address system.

At the start of the semester, students were asked to use microphones to amplify all speeches. Some students admitted to being nervous about using the microphones including students who confessed that they were shy about speaking in class in general. The microphones provided a feedback loop that helped students to monitor themselves and others as speakers and listeners, and behave (individually and together) in ways they felt focused and productive discussions possible. Students were unusually attentive, listening to each other with real care, making extremely thoughtful and increasingly articulate contributions, often building on what others had said, or referring to a previous point.

Assessing Speaking Skills
Ten assessment criteria were used to judge student performance included the following:

1.   Speech development and ideas
2.   Speech value
3.   Audience Response
4.   Answering questions
5.   Voice
6.   Manner
7.   Language
8.   Pronunciation
9.   Speed
10. Time (1 minute)

Speaking Anxiety Management

The combination of Exposure and Response Prevention (ERP) and Self-Disclosure methods was implemented to manage students speaking anxiety at all the three stages of language learning: input, processing and output.

Input

Krashen (1985), considering input as a basic stage of language learning, asserted in his 'Input Hypothesis' that "speech cannot be taught directly but emerges on its own as a result of building competence via comprehensible input".

What causes incomprehensibility is learners' 'affective filter', i.e. anxiety or lack of confidence and this prevents utilizing fully the comprehensible input. For successful language acquisition, a learner's affective filter needs to be lower, otherwise a tense, nervous or bored learner may 'filter out' input, making it unavailable for acquisition (Lightbown & Spada, 2006). 'Affective filter' at the input stage may reduce the effectiveness of input by restricting the anxious students' ability to pay full attention to what their instructors say and reduce their ability to represent input internally (Tobias, 1977 in Onwuegbuzie ., 2000). Input anxiety is more likely to cause miscomprehension of the message sent by the interlocutors, which may lead to the loss of successful communication and an increased level of anxiety.

The combination of ERP and Self-Disclosure methods provided an environment for bolstering the learner's self-confidence by being under the spotlight in the classroom for a minute every week where students have real-life communication, authentic activities, and meaningful tasks that promote oral language. In addition, interactive speaking activities were provided for students to express themselves and understand the social and cultural rules appropriate in each communicative circumstance. Communicative language teaching was based on real-life situations that require communication. Students were encouraged in class to collaborate and work in randomly-matched pairs in every class to achieve goals or to complete tasks included the following activities

1. Discussions
2. Role Play
3. Simulations
4. Information Gap
5. Brainstorming
6. Interviews
7. Story Completion
8. Picture Describing and find the Difference

Processing

Anxiety at the processing stage, called processing anxiety, refers to the "apprehension students experience when performing cognitive operations on new information" (Onwuegbuzie, 2000). The Feedback Loop provided as a result of using microphones to deliver speeches in addition to having a weekly critical thinking assignment with Gradual physical exposure helped divide the speaking complex task into more manageable components. Students were able to prepare their speeches choose words, practice pronouncing them, and stringing them together with the appropriate grammatical markers at home in a week time frame before delivering them in class.

Output

Anxiety while communicating in the target language is more likely to appear at the output stage, which entirely depends upon the successful completion of the previous stages: input, and processing. Anxiety at the output stage refers to learners' nervousness or fear experienced when required to demonstrate their ability to use previously learned material (Onwuegbuzie, 2000).

As a result of using the psychological methods, linguistic framework and grammatical support, students were able to express their thoughts in English in a positive manner and to speak English with natural pronunciation, intonation, and rhythm. In addition, they become able to express in English their thoughts regarding familiar topics and things of interest and give their opinions about topics of social significance

Class Evaluation

The Survey (available in the Appendix) was used for class evaluation. All participating students were asked to respond to the survey. The questionnaire contains 6 items measuring reaction to teaching and learning in class. Participants were asked to rate the extent from which they think with each item on a four point Likert-type scale ranging from "very useful" to "not useful". Study participants checked the place on the scale that best reflected their feelings about the item. Scores were then computed .The survey questionnaires were administered to all participant students during the tenth week of the speaking course   (figures 3,4,5,6,7,8).

Results
Results are reported under four categories: achieving goals, most valuable aspects, recommendations for improvement, and the overall effectiveness of the course(Collection rate: 87%).

Grading scale:

- Excellent: 4
- Good: 3
- Not good: 2
- Poor: 1

Survey Questions

1. How do you describe your study load out of the classroom

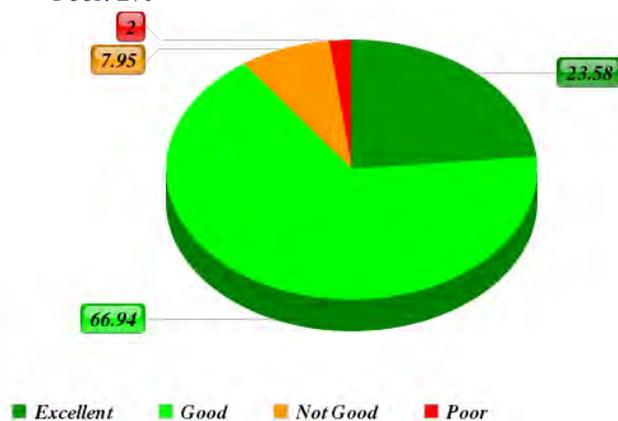
- Excellent:23.58%
- Good: 66.94%
- Not good: 7.95%
- Poor: 2%


Figure 3

Student feedback on the course

2.   How would you rate your overall understanding for teaching instructions?

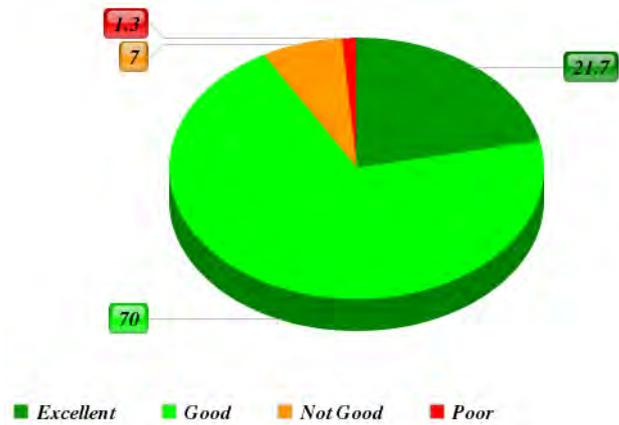
- Excellent:21.70%
- Good: 70%
- Not good: 7%
- Poor: 1.3%


Figure 4

Student feedback on the course

3.   The usage of materials and teaching effectiveness?

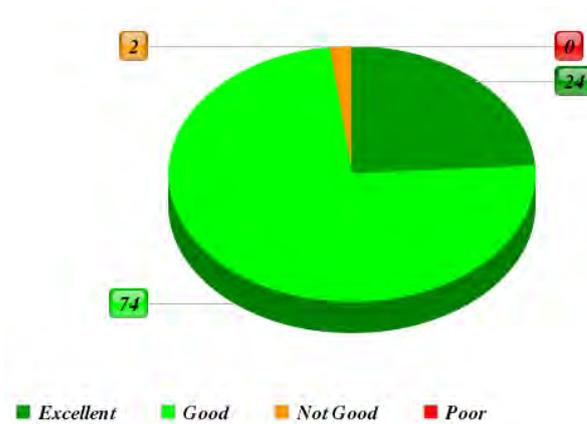
- Excellent: 24%
- Good: 74%
- Not good: 2%
- Poor: 0%


Figure 5

Student feedback on the course

5. Class structure and time management?
• Excellent: 44%
• Good: 53%
• Not good: 2%
• Poor: 1%

Figure 7

Student feedback on the course

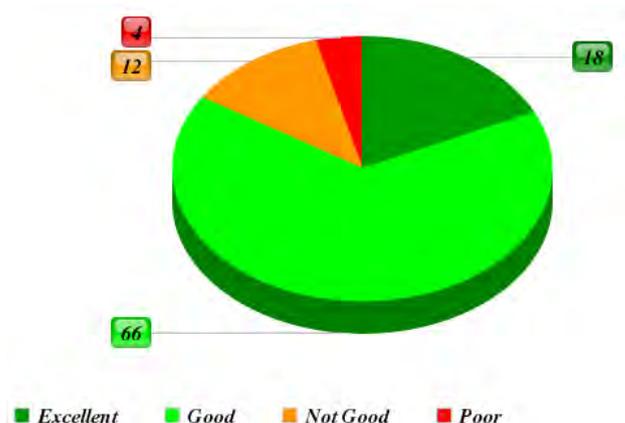
6. Were the content of this class and the level appropriate for you?
• Excellent: 18%
• Good: 66%
• Not good: 12%
• Poor: 4%


Figure8

Student feedback on the course

The comments on the lecture are as follows:

- I think my language capabilities have been increased.
- I listened to other students speaking better than me and that made me study English every day.
- If I study hard in this class my English will be better
- I think communication between students become better because of this class
- Now I have the courage to express my self in public because I can speak in front of people

The suggestions from the students are as follows:

- I would like to study reading and writing and listening along with speaking in the same class.
- No Japanese please
- I would like to talk to the teacher more

Conclusion

Western teachers have an important role in developing learners' self concept in Japan. This if students know they will be performing in front of an audience, there could be a marked improvement in motivation and classroom performance. Psychological support is necessary to stimulate Japanese students to communicate more actively along with a curriculum that can address the needs of Japanese students. The presence of a real audience with a built-in information gap would have an impact on Japanese students in terms of motivation and effort to communicate in English.

Making public speech presentations in English highlighted both the importance of grammatical competence (syntax, pronunciation, vocabulary) and strategic competence (gesture, body language, appropriate expressions). Learners experienced less anxiety and had more confidence in talking to each other and the instructor in L2. The speeches also show that they developed their critical skills, vocabulary and sentence structure in order to make impressive speeches with content.

The Effect of Recast Timing on EFL Error Correction

Arezoo Farazandeh (English Lecturer)

Islamic Azad University of Iran,Karaj

Email:a.farazandeh@gmail.com

www.kiau.ac.ir

Abstract

The present study conducted the effect of recast timing on EFL error correction. The subjects are all Iranian female Persian-speaking of Kish Institute (Pasdaran Branch). They were all considered to be at the elementary level according to a homogeneity test given. The subjects are from 17 to 24. Sixty students were selected. There are experimental group and control group. All subjects' mother tongue is Farsi. The subjects are all female. The subjects are a number of Kish Institute students. The researcher is not the teacher of the classes but she observes the classes randomly each week.

Results supported the effect of recast timing in error correction on learners' speaking skill.

Instrumentation

In order to homogenize the participants in terms of their language proficiency, NELSON proficiency test was given to them before the treatment. The test is a NELSON elementary test. This test has been showed to many teachers in Kish Institute and has been found a reliable and valid test. After getting pre test and post test two means are achieved in order to compare these two means the researcher used a t-test.

Key words: recast, uptake, EFL

Introduction

Undoubtedly, feedback accounts for one of the important features in language teaching. According to Ur (1996), feedback is information given to the learner about his/her performance of a learning task, usually with the objective of improving this performance. Chastain (1988) believes that the type of feedback language authors and teachers provide students reflects their view of language and their objectives. If they view language as a perfectible grammatical system, they focus students' attention primarily on language, and they correct all the errors the students make when they speak it. If they view language as a functional communicative system, they focus the students' attention on meaning, and they respond to the content and the comprehensibility of what the student say.

Lyster & Ranta (1997) proposed six different types of feedback which   recast is one of them.

Feedback accounts for one of the important features in language teaching. There are various types of corrective feedback used by teachers in response to learners' errors. Here there are six of them which are presented by Lyster and Ranta(1997):

1. **Explicit correction**: teacher supplies the correct form and clearly indicates that what the student had said was incorrect.

S.I go to school yesterday.

T. No, You should say ,I went to school yesterday.

2. **Elicitation:** teacher directly elicits a reformulation from students by asking questions such as "How do we say that in English?" or by pausing to allow students to complete teacher's utterance, or by asking students to reformulate their utterance.

 S.I go to school yesterday.

T.I…..(pause) to school yesterday.

S.I went to school yesterday.

3. **Metalinguistic clues**: teacher provides comments, information or questions related to the well-formed ness of the student's utterance.

S. My father is sick, she is very kind.

T. Father is feminine?

S. Sorry, he is very kind.

4. **Clarification request**: teacher uses phrases such as "pardon?", "I don't understand".

S.I go to school yesterday.

T. Pardon? What do you mean I go to school yesterday?

S.I went to school yesterday.

5. **Repetition:** teacher repeats the student's ill-formed utterance adjusting intonation to highlight the error.

S.I go to school yesterday.

T.I go(emphasize) to school yesterday?

S.I went to school yesterday.

Definition of Recast

According to Lyster & Ranta (1997) recasts involve the teacher's   reformulation of all or part of a student's utterance minus the error. Among corrective feedback types, recasts have received the most attention from researchers. There are several reasons why recasts have received so much attention from researchers.

   Recast is a type of corrective feedback that is generally defined as "involving the teacher's reformulation of all or part of a student's utterance, minus the error" (Lyster & Ranta, 1997, p. 46).

   Examples (from Ellis & Sheen, 2006):

E_1 T: Where you were in school?

S: Yes, I stand in first row.

T: You stood in the first row? (Recast)

S: Yes, in the first row, and sit, ah, sat the first row.

E_2 S: Korean is more faster.

T: Is faster. (Recast)   S: Is faster than English.

Method

   The main objective of this study is to determine whether recast timing has an impact on EFL learners' speaking skill. Researches on the recast timing enable teachers to choose the proper time which help the students to correct their errors, and this study aims at showing the significant relationship between recast timing and error correction.

Subjects

   The subjects are all Iranian female Persian-speaking of Kish Institute (Pasdaran Branch). They were all considered to be at the elementary level according to a homogeneity test given. The subjects are from 17 to 24. Sixty students were selected. There are one experimental group and one control group.

Procedure

In order to have two homogenous groups, the homogeneity test was administered on the first session. The subjects were given thirty minutes to complete the test. The researcher explained that they would get one point for each correct answer, and they would not be penalized for the wrong answers. The sixty students were divided into two groups. There are one experimental group and one control group. Our procedure consists of three separate parts: pretest, treatment, and then post test. In order to meet the inter-rater reliability of scores, the rater judged the students speaking skill three times. The researcher in this study prepared a scale and according to this scale, the speaking skill is divided to four sections: fluency, accuracy   (structure, vocabulary, pronunciation). The rater gave the scores out of 20 and at the end the researcher took the average of these scores. In the experimental group, the teacher should give delayed recast to the learners' errors and in the control group; the teacher should give immediate recast to their errors as it was done traditionally.

Statements of Problem

There are two moments when teachers may choose to deal with correction:

  (1) Teachers may correct learners immediately after the error.
  (2) Teachers may decide to delay correction until after an activity is completed which is called delayed feedback.

There is a research question in this study:

Is there any significant difference between the error correction of learners after immediate recast and delayed recast?

The main objective of this study is to determine whether recast timing has an impact on EFL learners' errors correction. To that end, the following null hypothesis is presented.

HO: There is no statistically significant relationship between immediate recast timing and delayed recast timing.

Literature review:

Bexi Perdomo (2006) has published many articles on EFL in Venezuela since 2006; she has conducted the effectiveness of oral recast in EFL classroom. The study was held for thirty-eight college students and a female teacher. The students have to learn the right use of the auxiliary verb 'to have",

and result supported the claim of her study (The effectiveness of recast compared to explicit negative feedback).Therefore, she recommended the use of recast in college EFL classes.

Braidi(2002): A response was coded as a recast if it incorporated the content words of the immediately preceding incorrect NNS utterance and also change and corrected the utterance in some way.

Long (2006): A corrective recast may be defined as a reformulation of all or part of a learner's immediately preceding utterance in which one or more non-target like (lexical, grammatical, etc.) items are replaced by the corresponding target language form(s), and where throughout the exchange, the focus of the interlocutors is on meaning not language as an object.

Sheen (2006): A recast consists of the teacher's reformulation of all or part of a student's utterance that contains at least one error within the context of a communication activity in the classroom.

Results

Standardizing Nelson Proficiency Test

To have four homogenous groups participating in the study, Nelson test was used as proficiency test in this study. This test included 50 multiple choice questions. The test was given to 66 participants to assess their English proficiency. The following table shows the summary of the item analysis for standardizing Nelson Test. As it is known the items with Ifs that fall in range between 0.30 and 0.70 are usually considered acceptable and with the IDs upper than 0.30 are good items. As it is shown in table 4.1 no item was omitted.

Variable	Descriptive Statistics (FarazandehFinal.sta)							
	Valid N	Mean	Median	Minimum	Maximum	Variance	Std.Dev.	Standard Error
NELSON	66	31.95	33.00	15.00	44.00	55.92	7.48	0.92

As data shows in table 4.2 the mean of the final scores of 66 participants in Nelson Test was 31.95, the standard deviation was 7.48, and the standard error was 0.92. So, the participants were selected within one SD above and below the mean.

X±1SD=31.95±7.48=39.43,24.47

After achieving two homogeneous groups, the pretest was used in order to compare the results with the results of posttest to find out the degree of improvement in students' speaking skill.

The related descriptive data computed for the pre-test of the experimental and control group is presented in Table 2.

Descriptive Statistics of the Pre-test

Groups	Experimental	Control
X	14.75	14.14
S	3.47	3.27
S	1.86	1.81
N	30	30

In order to be sure that there is inter-rater reliability of scores in the pre-test, the researcher calculated the reliability of the three sets of scores which were given by the rater.

The inter-rater Reliability of Scores in Pre-test

Groups	Experimental	Control
$R_{1,2}$	0.85	0.87
$R_{1,3}$	0.91	0.84
$R_{2,3}$	0.89	0.86

As the result shows, there is a high degree of agreement between the scores of judges.

The related descriptive data computed from the posttest of two groups are presented in the following

table.

Descriptive Statistics of the Post-test

Groups	Experimental	Control
X	17	15.59
S	3.17	2.18
S	1.78	1.48
N	30	30

The statistics which was done for pre-test was again calculated for the posttest's inter-rater
reliability of scores.

The inter-rater Reliability of Scores in Post-test

Groups	Experimental	Control
$R_{1,2}$	0.92	0.93
$R_{1,3}$	0.89	0.87
$R_{2,3}$	0.91	0.87

To test the null hypothesis that there was no statistically significant difference between the average
performances of the subjects in two groups, a t-test was run. Since the researcher was concerned with
mere difference, a

Two- tailed test was used. The probability level chosen to reject the null hypothesis was 5 chances out
of 100 (0.05 probability level).

To arrive at the desired answer, the t-test formula was employed and the following result was
obtained:

t=3.36

Considering that a t value of 3.36 exceeded the t-critical value of 2.000 for 58 degree of freedom, the null hypothesis was rejected at the 0.05 level of significance.

As it was proved that there was a significant difference between the average performances of the subjects on the posttest, the researcher came up with a new hypothesis, i.e., the immediate recast does not improve speaking skill more than delayed recast.

Discussion

As the data analysis indicates, there is a significant difference between the average performance of the subjects in control group with immediate recast and experimental group with delayed recast.

The statistics shows the speaking skill of those learners who received delayed recast has been improved in contrast to those learners who received immediate recast.
Since it has proved that the immediate error correction of learners directly has influence on their feelings, so it is suggested by the researcher to avoid giving feedback on learners' errors immediately. This way of correction may cause debilitative anxiety to learners and it decreases their learning level.

Suggestions for Further Studies

In this research the researcher conducted her research only on elementary level with average age of 17 to 24 so it can be tested on other proficiency levels and different ages. The skill which was considered in this study was speaking so it can be conducted for other skills as well.

The subjects of this study were all female learners with their special feelings and characteristics, therefore; it is possible to conduct the same study on male subjects.

ABSTRACT

This paper describes the role of learning English as a second language (ESL) in schools in Jordan. The Results Based Management (RBM) approach was selected to describe the input, management model, and the expected results in terms of output, outcome, and impact within predetermined strategic directions and educational policies. A survey of student records in the last year of high school graduates from a school was carried out to form the input for this model.

Keywords: RBM, ESL , Classroom management, Schools.

INTRODUCTION

English is recognized as the dominating language in the world. The dominance of English is clearly indicated in popular culture, and has become the main language of popular music, advertising, satellite broadcasting, home computers, and video games, it is the language of international airtraffic communication. It is used so extensively and deemed to be so important in the academic scientific and technoligical sectors that over 80 percent of all information is stored in electronic retrieval systems in English. More over internet is offers over 90 percent of its information in English (Chang, 2006). In arenas devoted to multilingualism and to the preservation of the wealth and variety of language in the world, criticism is commonly made of the aggressive expansion of English at the cost of other language, which has prompted some scholars to use the labels killer language and tyrannosaurus rex to refer to it (Liurda, 2004).

English today has especial status in at least 70 or so countries and is the most widely taught foreign language in over 100 other countries. In many of these countries, English also serves as the vehicular language in the general curriculum, and at times in the primary school (Ghosen, 2004).

Advances in language teaching stem from the independent efforts of teachers in their own classroom. This independence is not brought about by imposing fixed ideas or promoting fashionable formulas. It can occur where teachers, individually or collectively explore principles and experiment with techniques (Freman, 2007). Leeser (2004) pointed out that one of the challenges in content-based instruction in second language classrooms is how to focus on form in a way that is both effective and appropriate. Most researchers have tended to focus on methods and techniques to use in the classroom or on the analysis of the linguistic demands of the content areas. Much less attention has been paid to researching the process of co planning and co-teaching and to supporting the evolution of the partnership between ESL and content teachers (Davison, 2006). Attempts to explore the attributions that learners make in relation to teachers' gestures, focusing thus on the non-verbal discourse of the

language classroom have lead to suggest that one of the crucial things that learners learn in a language classroom is how to interpret teachers' gestures in conjunction with their verbal input in order to learn successfully (Sime, 2006).

Current foreign and second language methodologies have shifted from traditional teacher – centered instruction, to learner- centered classroom, where learning, learner and purposes, and meaningful processes of communication are integrated (Lacorte, 2005). Teachers are primarily responsible for creating and maintaining classroom communication competence, which based on an understanding that opportunities for learning are jointly constructed but primarily determined by the teacher (Walsh, 2003). Research of the past 20 years strongly suggests that interaction is a key to successful second language learning, classroom interaction (Ghosen, 2004). It has been argued that knowledge is most effectively constructed through dialogue arising from jointly undertaken inquiry. The assumption is that active verbal engagement with a topic of interest will help students to transition from everyday's to scientific concepts and master the modes of language use associated with schooling (Haneda &Wells, 2008).

Therefore, this paper aims at discussing the effect of teacher's method in managing the English language (EL) class on students' acquisition at Jordanian schools where class management is considered one of the general fundamentals that a qualified teacher should possess and which in return desired educational goals can be achieved.

Consequently, class management concept is a mutual effort between teacher and students in order to achieve planned goals by focus on:

-The role of student differences such as attitudes and motivation, aptitude, personality, gender, age, etc., and the characteristics of the environment in second language acquisition (English). There are two primary individual difference variables involved in learning language, ability and motivation, the student with higher levels of ability will tend to be more successful at learning the language than students less endowed. Similarly, students with higher levels of motivation will do better than students with lower levels (Gardner, 2006).

-The role of teacher in understands, expect, and feel comfort with the natural responses of students through interaction. And creating class environment where students feel safe, secure, and sense of belonging which help in reduce fear and anxiety. In addition to structure classroom activities and use strategies to support language acquisition and comprehension of classroom activities (Curran, 2003), and use the multimedia application which provide teachers and learners with effective means of language acquisition in the classroom. (Tschirner, 2001).

The importance of this paper stems from the importance of class management in general regardless of the subject being taught, as teaching and learning process is of an interaction peculiarity which supposed to be positive in order to achieve goals. This process requires suitable conditions that class management has to offer. The importance stems also from that English language is taught all over Jordanian schools; public and private from grade 1 to grade 12 as a second language, and it is significant in the Jordanian society as well regarding job requirements which English language has become one of its basics. So, it is essential to study factors that affect EL acquisition such as classroom management.

RESULTS BASED MANAGEMENT (RBM)

It is said that if you do not know where you are going, any road will take you there. This lack of direction is what results-based management (RBM) is supposed to avoid. It is about choosing a direction and destination first, deciding on the route and intermediary stops required to get there, checking progress against a map and making course adjustments as required in order to realize the desired objectives.

Results-based management (RBM) is an approach that seeks to focus efforts and resources on the expected results of a project, program or organization. RBM builds on traditional management approaches such as management by objectives or activities, but shifts the emphasis from inputs and activities to results. Definition of the terms used in RBM approach is given in Table 1. This approach can be applied to almost any project (CIDA, 1999 ; Resheidat, 1997).

RBM can mean different things to different people. A simple explanation is that RBM is the way an organization [or sector institutions] is motivated and applies processes and resources to achieve targeted results. Results refer to outcomes and intermediate outcomes that convey benefits to the community. Results also encompass the service outputs that make those outcomes possible [such as trained students and trained teachers]. The term 'results' can also refer to internal outputs such as services provided by one part of the organization for use by another. The key issue is that results differ from 'activities' or 'functions'. Many people when asked what they produce [services] describe what they do [activities]. RBM became a central aspect within the UN system and a global trend among International Organizations such as the World Bank, United Nations Development Program (UNDP), and Canadian International Development Agency (CIDA).

RBM has been on UNESCO's agenda for several years and has been one of the main items of the Organization's reform process. This process is not a mere technical one as it involves a radical shift in the way we conceive interventions and in our approach to our work, with an increased emphasis on partnership, accountability and transparency for the achievement of well-identified expected results, implying changes in the very working culture of the organization. While from an institutional point of view, the basic purposes of RBM systems are to generate and use performance information for accountability reporting to external stakeholders and for decision-making, actually the first benefiting from the implementation of the RBM approach are the managers themselves. They will have much more control on the activities they are responsible for, be in a better position to take well-informed decisions, be able to learn from their successes or failures and to share this experience with their colleagues and stakeholders. The RBM approach is to be applied to all organizational units and programs, including extra budgetary projects. Each of them is expected to define anticipated results for their own work, contributing to achieving the overall expected result(s) defined for the organization. The integration of RBM in the implementation of large-scale organizational reforms can be seen as important as the application of RBM in small and definitive projects.

Considering classroom management as a target program or an educational project where the stakeholders of this project exchange the know-how, services, sustainability and maintaining the on-going momentum, requires the implementation of results-based management approach.

Table 1: Summary of RBM Terminology.

Input	The human, organizational and physical resources.
Activity	Action to be undertaken
Output	A short-term developmental results
Outcome	A medium-term developmental results
Impact	A long-term developmental results
Goal	Aim to be reached.
Purpose	The project objective to be achieved with the life of the project and which can be attributed to activities, outputs and outcomes.
Assumptions	Conditions that influence the achievement of or lack thereof result. Assumptions are issues over which the project planners and managers have generally little control. Yet, assumptions are necessary conditions for the project to perform. They represent the major risks and uncertainties.
Indicators	An indicator is "a pointer, measurement, a number, a fact, and opinion, or a perception that points at a specific condition or situation and measures changes in that condition or situation over time .Indicators may be either quantitative or qualitative in nature and seek to measure progress towards achieving results.
Risks	Risks indicate the probability that the assumptions will not hold true.

The following modules (Prince George's County Public Schools) may assist teachers in becoming proficient in the area of classroom management .

1. Establishing a Positive Climate**.**

"When students feel safe, secure, and are engaged, learning increases. Learning decreases when students feel threatened or unchallenged " :

-Promote and Maintain High Expectations

-Know Your Students.

-Engage All Students in the Learning Process

2. Organizing Your Classroom.

"In organizing your classroom, consider ways in which you can make students feel welcome, encourage involvement, and allows for learning experiences in a multitude of arrangements" :

-Ensure Furniture Arrangement Promotes Learning Opportunities

-Have a Seating Chart

-Maintain Plans for Materials and Assignment Management

-Create Bulletin Boards that Foster Learning

3. Developing Rules, Routines, and Procedures**.**

"It is critical for an effective teacher to have rules and procedures in place for students and who fully understand the working expectations. Class rules should be aligned with both the school's plan and the code of student conduct":

-Create and Communicate (Verbally and in Writing) Fair Expectations

-Develop Routines and Procedures for Tasks that Occur Regularly

-Set Up a System of Specific Consequences and Rewards

4. Assigning and Managing Work**.**

"Assignments should be based on instructional objectives and provide opportunities for students to extend, refine, or rehearse the skills or content of the lesson. The teacher must have a system for providing meaningful and relevant assignments and managing their work":

-Promote Student Responsibility and Accountability to Learning

-Develop and Implement a Fair and Consistent Grading Process

5. Preparing for Instruction.

"When students are actively engaged in learning, they are focused on the task and are involved with the material, so fewer behavior problems exist. Therefore, an effective teacher has prepared meaningful lessons that involve students for every minute of class time":

-Plan for Long-range Units and Daily Instruction

-Develop Plans that Include Best Practices for Instructional Delivery

6. Managing Behavior.

"To manage behavior in the classroom, effective teachers use anticipatory responses to reduce misbehaviors and are consistent in their delivery of consequences":

-Be Proactive

-Be Consistent

7. Maintaining Momentum**.**

"As the year progresses, stay focused on successes and maintain the momentum of continuous improvement **":**

-Build a Culture of Excellence

-Reflect and Seek Out Support

-Take Care of Yourself

CLASSROOM MANAGEMENT: CASE STUDY

We have selected one school for this study: Yarmouk Model School. This school is housed and run by Yarmouk University in Irbid, Jordan. We anticipated that this school is unintentionally applying classroom management and always hiring qualified and well trained teachers. Students enroll in the school from the first grade till grade 12. It is a mixed school for boys and girls. The student population is about 2100 students. Every year 120 -130 students graduate from the 12th grade and sit for the general examination that is the gate for being admitted to the university or college education.

About The School:

No. of highly qualified teachers = 134, Supporting staff = 21

Facilities**:** Modern Library, Modern Chemistry, Physics and Biology laboratories, Educational studio, modern video and lecture hall, indoor and outdoor gymnasiums, workshops, health clinic, etc.

Incentives: Annual Best student award, Student Conferences, Talent Competitions

Further information could be found in the web site at

http://portal.yu.edu.jo/index.php?option=com_content&view=article&id=134&Itemid=292

Because of the private act, we were not able to get the records of students from the school or from the Directorate of Education in Irbid. Accordingly, we have contacted the parents of the students who were enrolled in the school and completed their secondary education and enrolled in universities. A trace study for those graduates has been extended even beyond that to working careers or higher education in different fields.

Figure 1 shows the components of RBM approach and will be described as follows:

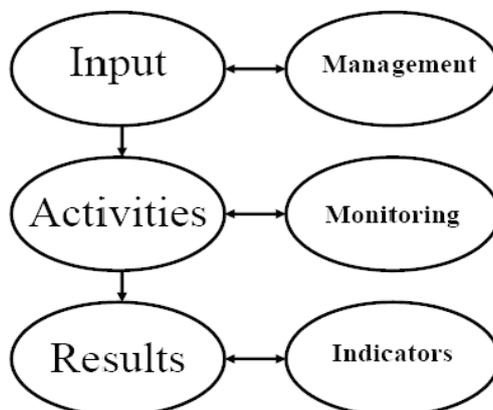
Input	Classrooms, Teaching aids, Teachers and Students
Activities	Teaching, self learning, motivation by teachers, competitive awards, etc.
Results	Output as shown in Table 2.
	Outcome will be shown later after the results
	Impact will be shown later after the results
Management	School management, Classroom management
Monitoring	The progress of students is monitored by teachers, principals and parents
Indicators	Smart Indicators: **S**pecific**,** Measurable, **A**ttainable**,** Relevant**,** and Trackable


Figure 1: RBM Components

Statistics for the school year 2007/2008 :

Total number of students = 2129 and distributed as follows:

Kindergarten   520

Primary   524

Secondary   959

12th Grade   126

Table 2: Distribution of grades in the general examination run by the Ministry of Education.

Range of grades	90.0 – 99.9	80.0 – 89.0	70.0 – 79.9	60.0 – 69.9	50.0 – 59.9	< 50.0
Grading	Excellent	Very Good	Good	Fair	Pass	Fail
Number of students	33	54	18	11	1	9
%	26.19	42.85	14.28	8.73	0.79	7.14
*English grade %	97	91	86	73	68	-
* Records are based on the average of the group						

TRACE STUDY

The authors have carried out a trace study for the graduates of the Model School by direct personal contacts with the graduates and/or with their parents. This limited study dealt with 45 students whom have graduated from Yarmouk Modern School since 15 years until now and acquired 85 and above in English language at the general exam .

The students were enrolled in the university education as shown in Table 3. Because the majority of this sample pursued higher studies beyond the Bachelor's Degree, they sat for the test of English as a foreign language TOEFL. They have gained excellent records.

Table 3: Distribution of College Enrollment and TOEFL Scores

College	Medicine	Engineering	Pharmacy	Sciences	Economy	Other
Number	12	8	7	10	1	7
TOEFL	80-99 out of 120					NA

Another indicator about the proficiency of students in English, they sat for English examination run by the university. Those who pass the examination are exempted from the first course in English language. Our study showed that all students in the sample had passed this Examination.

DISCUSSION OF RESULTS

We will start discussing the results considering the inputs, monitoring, how to measure the results, the level of risk. We have to focus on two objectives:

• School Management

• Classroom Management

Classroom management stems from the overall school management. These two objectives are interrelated. In other words, they are like twins. Good school management at the planning level highly influences the performance of the classroom management. However, the risk level may be considered as a medium one for the school management is of a low level.

For the short tem results is measured by the performance of students who sat for the general examination run by the ministry of education. The achievement of students as shown for example in Table 1 indicates the high level of both school and classroom management. The passing average is about 93 % as compared to about 65 % for all students in Jordan. For English performance is also reached an excellent level.

Similar results were also reached for the cohorts of students in previous school academic years. These results were not included in this paper because of space limitations. On the other hand, as far the trace study is concerned, the English proficiency was also reached an excellent level whether at the high school or at the university levels. The outcomes of the trace study on the medium term are very obvious.

For this school, the set of outcomes accumulated over the years lead to the "Impact" on the students, their career, and their families and in turn on the country. It is no wonder that this school was rated as number one in the whole country.

In order to maintain this highly recognized performance of the Model School, incentives for school administration and teachers must be considered. The school environment has always stimulated parents to encourage students to enroll in it.

The school non curricula activities such as annual conferences and students awards maybe considered as significant milestones for all stakeholders; namely, the university, the school, parents and students.

CONCLUSIONS

The following conclusions may be drawn from this study:

1. Classroom management plays a major role in the high school education.
2. School management must be the umbrella of classroom management.
3. Students participation and self learning is vital for motivating students towards learning
4. English language as a second language at the school level and as a language of instruction at the university level was an important indicator for the high scores achieved by students.

Abstract

This paper explores the collective voice of the key stakeholders directly, with a focus on the MEXT's 2003 Action Plan to Cultivate 'Japanese with English Abilities' (APCJEA). Analysis of the research interviews identified the key challenges, which can be divided into the following three categories; (1) discontinuity in EFL policy across diverse schooling levels, (2) gaps between SELHI and Non-SELHI schools and (3) APCJEA's unrealistic set-up goals. This paper constitutes a discussion of these issues.

Introduction

The Action Plan to Cultivate 'Japanese with English Abilities' (APCJEA) commenced in 2003 with the aim of enabling English learners in Japan to be confident with high-level English communication skills. This scheme, implemented by the Ministry of Education, Culture, Sports, Science and Technology-Japan (known as MEXT), appeared to have had a considerable impact on the contemporary field of English education in Japan at the very first stage of its five-year period, which ran from April 2003 to March 2008. It may be considered a turning point to break away from the traditional English teaching styles and methods used in schools. APCJEA is an official public innovation of MEXT to transform the educational system, and this can be seen as an exceptionally novel initiation for Japan as it involves explicit aims and objectives based on concrete statistical evidence (Yamada, 2005). In the highly rigid Japanese education system, in which the implementation of the EFL communicative language teaching reform has been a casualty in the past (O'Donnell, 2005, cited in Sage, 2007), this breakthrough might have resulted in reshaping the mindsets of EFL teachers. However, the outcomes of the APCJEA campaign, which officially came to an end on 31 March 2008, should be reviewed and re-examined carefully with regard to the insights and reflections of those parties involved in its operation.

The theory and philosophy underpinning this project were touched upon in *Rudiments of Component Oral Interaction: Corresponding to the Latest Innovations Proposed by Japan's Ministry of Education* (Hasegawa, 2005). The study reported here attempted to build upon this previous article, by discovering the characteristic elements which have emerged at the conclusion of APCJEA's five-year implementation period. Several current studies of the influence of APCJEA have identified both achievements and negative elements in its their theory and practice Kashihara, 2008; Okuno, 2007). This study explored the collective voice of the key stakeholders directly, with a particular focus on the challenges of APCJEA. Analysis of the research interviews identified the key challenges, which can be divided into the following three categories; (1) discontinuity in EFL policy across diverse schooling

levels, (2) gaps between SELHI and Non-SELHI schools and (3) APCJEA's unrealistic set-up goals. The following sections constitute a discussion of these issues. Abbreviations for commonly used phrases can be seen in Table 1 below.

Table 1: Abbreviations

APCJEA	The Action Plan to Cultivate 'Japanese with English Abilities'
EFL	English as a Foreign Language
GP	Good Practice
IP	Interview Participant
MEXT	Ministry of Education, Culture, Sports, Science and Technology-Japan
SELHI	Super English Language High Schools

Research Method

What sets this paper apart from others that have considered the merits of MEXT's reform of English education in Japan is its focus on the directly expressed negative responses of the organisers and other parties involved in APCJEA, from both theoretical and pragmatic perspectives. To best address these issues the interviews were conducted in Japan. Ten interview participants (IPs), including five Japanese EFL school teachers, four university professors, and one stakeholder from MEXT (refer to Table 2), were invited for a semi-structured interview. This was the maximum number of IPs available because of the researcher's limited time in Japan and the excessively orthodox and conservative top-down system characteristic of Japanese bureaucracy.

The interview sought participants' demographic information first and then moved to the main questions, shown in the appendix. The interviews were conducted in the participant's preferred venues. Each interview took approximately 45 minutes and was tape-recorded for the researcher's further investigation. In order to ensure that the interviewees understood the questions clearly, the interviews were conducted and analysed in Japanese and excerpts included in this paper have been translated into English by the researcher. All IPs were informed of their rights to withdraw at any stage from the interview without penalty.

Table 2: Interview Participants (IP)

IP8	MEXT Officer
IP9	High School English Teacher (Non-SELHI)
IP10	University Professor

Challenge 1: Discontinuity in EFL Policy across Diverse Schooling Levels

The first challenge to overcome in the future is the establishment of the sequential EFL study environment from the lower to higher level, especially in the assessment of communication ability. The lack of an oral skills component in the senior high school and university entrance examinations may lead junior high school and senior high-school EFL learners to underestimate their importance and possibly discontinue exercising these skills.

The Japanese education system, especially at high-school level, has traditionally made it very difficult to implement new schemes or trials. IP1 pinpointed that this is possibly due to the large amount of course content taught in high schools, which is dictated by the content covered by the university entrance examination. Comments from two high school teachers expand on this issue:

> There are some students who believe that grammar-focused study leads to successful outcomes on the university entrance examination. And of course there are some parents who do so, too. For example, there are four lessons called 'reading sessions'. But, in fact, three out of the four per week were reading … and a different teacher took over the other lesson as 'reading grammar' [targeting the university entrance examination]. (IP3)

> The university entrance examination does not allow for the assessment of a student with good communication ability in English [which APCJEA promotes] as a highly achieving student. (IP9)

When asked about the introduction of oral communication assessment in English, IP5 commented that this is possible at the level of the high school entrance examination. In fact, there were some high school entrance examinations which included an orally conducted component, following the structure of *Eiken* (one of the most well-known English Proficiency Tests in Japan)   the written part first, followed by the oral communication. However, IP1 pointed out the danger here, citing cases in several prefectures in which organisers are ordinary teachers who have neither experience in organising an oral test nor any criteria on which to base a valid and fair assessment, and that no training session was conducted. At tertiary level, there is very little chance of candidates' oral skills being tested during entrance examinations for the primary reason that there is an excessively high ratio of examinees to examiners.

IP5 and IP10 commented that APCJEA had a powerful effect in transforming the structure of Japan's National Centre Examination for University Admissions (*senta shiken*), which attracts over 500,000 examinees each year and can be taken as the vertex of the standardised education system in Japan (Guest, 2008). The English portion of *senta shiken* excludes direct translation and the type of questions

which tend to be a better measure of examinees' familiarity with their specific format than of their English ability itself; instead, a listening section, which costs approximately 10 million yen to administer each year (IP1), was introduced into the test in 2005 (Guest, 2008). On the other hand, some respondents believed that this was not an outcome of APCJEA, but rather of consistent pressure by The Japan Association of College English Teachers over the past decade (IP1), or perhaps a response to requests from business and industry, or simply introducing improvements to the educational environment as a survival strategy designed to attract students (IP6).

In reality, however, despite the fact that oral communicative competency skills were promoted up to high-school level as part of the APCJEA initiative, compulsory assessment of these skills has not been introduced as part of most university (and high-school) examinations. Although, Carter (2006, p. 29) argues that '… many students will fail to distinguish between examination success and individual learning, because they see them as one and the same thing', the absence of opportunities to have their skills assessed is certainly a de-motivating factor for high school EFL learners, especially those who intend to continue their EFL study at tertiary level. Even if an oral component were established in most entrance examinations in the future, difficulties in measuring oral interaction performance would persist, since these examinations are dominated by judgemental assessment, whereas oral skills are concerned with '… what language ability (knowledge) is and how it can be measured' (Shohamy, 1998, p. 156). Although the quality of the *senta shiken,* for example, has been improved by the inclusion of an increased variety of texts and multi directed tasks, a greater focus on higher-level cognitive skills (that is, knowledge acquired via the study process at school), explicitness of statements, more contextualised knowledge and skills, and a broad range of focused texts and tasks, its overall purpose is clearly not for examinees to be assessed on their capacity to utilise English skills in real-world communicative environments (Guest, 2008). Thus, prior to the introduction of supplemental EFL campaigns such as APCJEA, with its expectation of a drastic reform of EFL education, a re-structure of the current EFL system in Japan in terms of the examination systems should have been undertaken. The EFL system in Japan has never had concrete strategies in place to ensure that EFL learners remain motivated across the various stages of their graduated learning process, and this is something which is beyond the scope of APCJEA.

Challenge 2: Gaps between SELHI and Non-SELHI Schools

It should be highlighted that APCJEA itself does not appear to be cognisant of this lack of cohesion and long-term vision of how EFL programs transition from lower to higher levels in Japan's English language educational environment. This means that its programs are likely to generate only short-term impact and improvement in Japan's EFL environment, and that ongoing benefits cannot be expected. Prime example of the irrational nature of MEXT's strategic long-term planning in terms of APCJEA is SELHI (Super English Language High Schools); MEXT appointed 169 high schools to be SELHIs (refer to *Shingakushuushidouyouryou de motomerareru eigoshidou o yosousuru*). Special financial support was provided for each SELHI-appointed school over a three-year period with the aim of achieving rapid improvement and establishing the innovative EFL program. In return, those SELHI schools were obligated to design and implement their own action plans and publish reports on their outcomes.

The number of SELHI-appointed schools in Japan (total 169) might seem to be a positive step, yet it does not account for even 4% of the total of 5313 high schools in Japan (MEXTb). The salient issue considered in this section is whether only SELHI-appointed high schools were able to have the opportunity to make valuable improvements to their EFL programs while the others were left without any reconstruction.

> I think that in terms of English ability, the gap between SELHI and non-SELHI was certainly broadened. This is due not to subject guidance *(kyookashidoo)* but more daily-life guidance

(seikatsushidoo) [which is related to this issue]. … Some students are not ready to study in school. More evident and drastic innovative solutions are needed to bridge this gap. It is a fact that there are schools who would like to apply the teaching style conducted at SELHI, but cannot do so readily because of a range of difficulties which are unrelated to English study itself. In addition, there is no real connection between those elements required for university entrance examinations and actual communicative ability in English. (IP2)

Identical examples were demonstrated by IP4, who was teaching at a non-SELHI school. She explained about her school situation, where students' behavioural problems and unsatisfactory academic performance were key issues. In addition, she lamented that many of her students' family and socio-economic backgrounds made it difficult for them to even attend school regularly due to their part-time work obligations:

Before arguing about teaching methodologies, we must consider that there are always students who do not wish to study at all. It is not about English, but all subjects. They do not like studying so sitting on their chair is nothing but a torture to them. Considering this harsh reality, what officers at MEXT are talking about seems to be very superficial. The people who established this APCJEA, do not give much consideration to the voices from the educational environment in the school. … Thus, English education itself may be far beyond the argument [of the reform/improvement of Japanese people's English ability]. (IP4)

The ideas and concerns described above have influenced the allocation of SELHI schools. IP2, who teaches at a school where both general and international study streams exist, indicated that his school was unsuccessful in its initial application to be a SELHI, which was put forward by its international stream. On the recommendation of MEXT that it apply from its general study stream, since a large number of SELHI schools already had international streams, its subsequent application was successful.

Changes such as these in MEXT's selection processes eventually caused a reverse-problem and confused the teachers further. University professors IP5 and IP6 both judged MEXT's reconsideration and handling of this situation to be appropriate. However, this is a case in which there was no coherent MEXT policy based on sound research, no solid philosophy leading it, and more importantly, no overt explanation and direction towards a long-term scheme. As for the SELHI selection process, there were no selection criteria or benchmarks. In other words, MEXT itself was also in need of a solid and persuasive mainstream philosophy leading to the aims and actions required for APCJEA.

Regarding SELHI, in fact, some schools which focused on internationalisation or English education were appointed at the early stage. However, for the last few years, more schools consisting only of general study streams have been appointed as SELHI. At that [early] time, there was certainly some tendency for confident and highly achieving schools to be appointed. But it is not like that these days. (IP5)

In the early stage, high schools which originally had high levels of English were appointed as SELHI. Hence, schools which already considered themselves to be SELHIs applied for the program. … However, outsiders began to wonder what the point was for high schools which were already at a high level to become SELHIs. … Then the tendency began to change to the establishment of 'drastically' improved high schools. (IP6)

Despite this imbalance in the implementation of EFL programs in SELHI and non-SELHI schools, some participants in the program remain optimistic that APCJEA will have a significant influence upon a large number of schools in Japan over a long-term period. IP7 expressed his concern regarding APCJEA, saying that he had not even taken a close look at its information. Although disliking the concept of APCJEA for its entirely top-down scheme, he concedes that some elements in it, such as SELHI, should be encouraged more.

> Teachers at SELHI schools study teaching methodologies and styles a lot. When they move to other [non-SELHI] schools, they can demonstrate what they have gained and acquired to other teachers at the school and have an impact in this way. So concentrating on the promotion of a larger number of SELHI programs will be much more effective [than carrying out other various schemes]. (IP7)

The comments above were supported by IP8, who is an officer from MEXT. He explained that the SELHI scheme did not in fact finish at the end of the APCJEA period, on 30 March 2008, but will conclude when the review of the SELHI program and reflections on its outcomes have been disseminated to non-SELHI schools. Subsequent discussion, however, failed to yield concrete strategies for conducting such a dissemination; one can only presume that the implicit doubt about the likelihood of such reviews actually taking place prevails in the field of EFL education in Japan and is shared by its teachers.

> Using the knowledge of the examination committee of SELHI, which mostly consists of university lecturers, … we provide guidance to the schools/teachers and are considering conducting surveys which will identify the basis of future educational reform in terms of SELHI policy, and the outcomes of this data collection will be distributed to schools. (IP8)

What IP7 and IP8 suggest above, however, can be achieved only while the SELHI program is under operation, with schools motivated by the promise of financial support in return for continual monitoring on the part of MEXT. In the absence of the establishment by MEXT of any concrete strategic support plan, it is unrealistic to say that the number of SELHI schools or SELHI-influenced schools will increase automatically in the post SELHI-era. It would be inappropriate to rely on the EFL policies of individual schools, since this is the situation which has prevailed in the past and SELHI is one of the APCJEA projects whose express purpose is overcome through this chronic problem.

As symbolised by SELHI, APCJEA targeted mainly high schools, whilst the majority of universities did not consider the APCJEA scheme. IP5 bemoaned this situation, saying that students who have improved their English ability at a SELHI school regress when they enter a university which does not require them to use English much. This leads to their becoming disheartened. IP5 and IP6 consider that MEXT may disagree with this, citing the Distinctive University Education Support Program, which is commonly referred to as Good Practice (GP). However, they note that while GP can be considered as the university equivalent program to SELHI, it is still an isolated practice, unlike the more comprehensive EFL reform, and improvements which encompass the whole university rather than specific academic areas have taken place in only some of Japan's universities. Although APCJEA raised implications for EFL study at university level, it failed to follow through on these in a practical sense; as IP1, IP5 and IP6 suggest, APCJEA should focus more specific attention on improving EFL programs not only up to high school but also university level, particularly in the post-SELHI era. IP1 proposed the following: 'Compulsory classes at university level in academic areas/courses which require English ability should be conducted in English [so their entrance examination should include an English test]' (IP1).

Challenge 3: APCJEA's Unrealistic Set-Up Goals

It is urgent to reconsider the diverse conceptual dissonance between the various parties involved in APCJEA, especially between its organisers and school teachers, in the interpretation of its aims and achievements. Investigation of the interviewees' perceptions about APCJEA's stipulated timeline (from April 2003 to March 2008) revealed pessimistic perspectives in the post-APCJEA period. The title APCJEA itself sounds like an attempt to achieve targets which are too broad. (APCJEA demonstrates explicitly that its aim of EFL applies not the particularly concentrated category of people but the whole Japanese population. Refer to MEXTa.) While admitting the lack of an alternative, more appropriate, title, IP3 commented, ' … but the problem is what level and what stage are implied by the phrase *eigo ga tsukaeru* (to be able to use English)'. Moreover, all of the plan's aims appear unachievable within the limited five-year time span. The following are comments made by two teachers about SELHI-appointed schools. It is interesting that not only IP4, who was a teacher in a non-SELHI school, but also IP2, who was teaching at a SELHI school considered to be one of the most exceptional and successful cases of the program, expressed the identical pessimistic view.

> MEXT's ideas are fine. But … it is impossible for the students in my school to achieve *Eiken* Level 2 by the end of Year 3. (*Eiken* is one of the most well-known English Proficiency Tests in Japan, grading from Level 1 (highest) to Level 5 (lowest).) Not even Level 3. … Introducing assistant language teachers (one of the APCJEA activities) … does not result in an improvement in students' communication ability. (IP4)

> To be honest, [the aims] are too high. Only a small number of schools can achieve those aims. … English is not the only subject a school teaches. Therefore, successful SELHI schools are those which conduct their English program in the school's English and international streams. To have a successful SELHI program within a school's general study stream, the introduction of a totally new program is required. … It is not that easy in reality. (IP2)

Although IP1 emphasised that a radical improvement in the English language ability of the Japanese nation within five years was unrealistic and pointed out the confusing nature of the program's title, he also noted that the title, Action Plan to Cultivate 'Japanese with English Abilities', which was simultaneously recognised as its aim, was used as a slogan for this immense challenge taken on by MEXT, and could be interpreted in multiple ways, commenting:

> 'Plans to enable some particular groups of Japanese to use English', or 'Plans to enable all Japanese to use English'. I personally take the meaning of the title as 'Plans to increase the number of particular groups of Japanese people who will be able to use English'. (IP1)

The connotation of multiple meanings led to similar confusion for others. This lack of clarity engenders doubt in people's minds and makes them unlikely to commit to the APJCEA scheme and its aims; this should have been addressed in the initial stages.

A more comprehensive explanation is required urgently, regarding not only the issue of who constitutes APCJEA's target group, but also the teaching guidelines known as *gakushuu shidooyooryoo*, since some teachers, in tumult, do not draw a distinction between these and APCJEA. In order to respond to those who label the co-existence of APCJEA and the teaching guidelines problematic, one MEXT officer, IP8 offered this careful explanation:

> The only regulation is the teaching guideline *(gakushuu shidooyooryoo)*. Teaching guideline benchmarks are administered by school education law *(gakkoo kyooiku hoo),* which is equivalent to a legal system in the field of Japanese education. There should not be any difference between different areas in Japan as they all carry out education based on the same teaching guideline. Thus addressing the differences [in our education style in Japan] is one of our roles. … APCJEA is one of our policies. It does not aim to establish a criteria or standard. … We will not take any specific action if people do not aspire to the aims [of APCJEA]. … Rather there is an existing standard in the [Japanese] compulsory education system and each person concerned makes efforts/actions in order to achieve that standard. This [APCJEA] simply adds an additional, higher step to the existing guidelines. (IP8)

Comments such as this indicate that there is some doubt about the explicit purpose of APCJEA's goal setting. IP8 was asked whether the aims outlined in APCJEA are actually unrealistic for learners to achieve within a five-year period, and are, rather, aiming at the future reform of EFL in Japan, over a much longer timeframe. He clearly answered that they are strategies for achieving the aims. 'We believe that people in education need to act in consideration of these higher standards' (IP8). IP5 was in agreement with these ideas, saying '… people would not make extra efforts if the stated aim was not slightly higher than the actual expectation' (IP5). In this light, MEXT's choice of a title which implies such high expectations, and its stipulation of such unrealistic aims, becomes understandable. However, some teachers became extremely frustrated and/or became reluctant to participate in the program after taking the title's meaning and the aims of APCJEA literally. With regard to the issue that MEXT may be misleading some educators in its conduct of this pilot study, IP1 analysed the MEXT strategies which underpin APCJEA, linking them to political strategies within Japan.

> Policies which seem to be pragmatic and realistic are not accepted. Rather, with regard to the achievements of politicians and government officials, some degree of 'bluffing' is more readily accepted. There is nothing wrong with conducting steady and step-by-step tasks, but acute insight is required to assess their quality, and this does not attract attention. If there is no attention, financial support cannot be provided. (IP1)

APCJEA focuses on the EFL education system throughout the whole of Japan. Undertaking educational reform in each local community leads to the development of it in the larger scale. Only if there is sound reform in each broad area can there be reform at prefectural level. And only then can Japan-wide reform be targeted. Thus, logically speaking, the process of the practical implementation does not follow the top-down strategic APCJEA. The current process for EFL grant approvals, which is linked to the political nature of the underlying finances, impedes the implementation of a desirable bottom-up system in which teachers' opinions are sought and considered.

IP8 commented that there is a range of opinions, even within MEXT itself - for example that not only EFL education but also more Japanese-language or maths/science education should be improved to a higher level. In fact, financial assistance cannot generally be offered solely to EFL education as an isolated grant. In any political campaign, there are two distinct groups, in that there are those who set up the plans and those who carry them out. If the latter group identifies areas of dissonance or difficulty in the execution of those plans, then this feedback should be conveyed to the former group and adjustments and/or offers of alternative arrangements made. In terms of APCJEA, the International Education Division *(kokusai kyooikuka)* at MEXT is the central body for planning APCJEA, whereas the School Curriculum Division *(kyooiku kateika)* runs junior high schools and senior high schools, as explained by IP6:

> They are different departments. … The International Education Division is like shooting off fireworks without conducting any clean-up, while real-life guidance is run by the School Curriculum Division. The International Education Division needs to secure finance and attract public attention. In some ways, their relationship may be like that between dream and reality, and this quality can also be observed in the aims of APCJEA. (IP6)

It is important that not only the strategies and policy of the education system in Japan, but also the MEXT's decision process itself, should be examined and reshaped in order to successfully reform the EFL education system in Japan (IP9).

Conclusion

Each of the issues discussed above needs to be considered separately and on its own terms in order to ensure the advancement of APCJEA's aims. Setting aside the issue of the underlying politics, the success of APCJEA should be measured neither in terms of the smooth implementation of action plans nor an increase in English usage by the Japanese. Rather it should be based on improvements in the English ability of Japanese learners. (Of course, it is difficult to measure improvement as well as determine how much improvement can be considered a successful outcome.) Within the context of such an approach, a reassessment of APCJEA's successes, as well as of the dilemmas and/or negative effects which have emerged to date from statistical evidence and the voices of the various stakeholders, becomes necessary. Conducting such a reassessment as a basis for the formation of future strategies would enable MEXT to feel confident, for the first time, that their strategies are working to further the aims of APCJEA.

Appendix: Semi-structured interview questions

1.   How long have you been involved in APCJEA?

2.   Any changes before/after APCJEA? If so, what are they?

3.   What are the positive and negative elements of those tasks?

4.   Theory: What do you think about APCJEA's aims, concerning the following points;

        (1) improvement of the quality of a simple interaction: achievable/unachievable?

        (2) examples of conversation/discussion at a high level, which are demonstrated in textbooks in a natural manner (= very high level of language ability and communicative competence with flexibility): an achievable/unachievable under APCJEA?

5.   Practice: What is the impact on financial support and teaching conditions created by changes in teaching curriculum? How do you think communication/discussion (introduction, procedure, and conclusion) should be taught?

6.   Can you tell me whether or not you would like to follow the APCJEA's policy in the future?

Education Policy in California for English learners

Dr. Eric Lin
Claremont Graduate University

Introduction-This paper argues, with evidence, that there are several aspects of the schooling of English language learners where EL students receive an education that is demonstrably lesser to that of native English speakers. California is also by far the center to more limited English students than any other states. However, with such a large population of English learners, it is surprising how little attention is actually paid to the basic learning resources these students receive in California, and in the nation. English learners are distributed throughout the schools, from kindergarten to grade 12. For example, these students are assigned to less qualified teachers, are provided with mediocre curriculum and less time to cover it, are housed in inferior facilities where they are often separated from English speaking classmates, and are assessed by invalid instruments (The California High School Exit Exam (CAHSEE)-ELA, English-language arts) that provide little, if any, information as indicator about their real achievement.

There are very few California schools that report having no English learners among their student population. Today, the typical California school is composed of both English learners and English speakers. Although most English learners are found at the elementary school level, a larger percentage of English learners (hereafter also referred to as ELs or EL students or ESL, English as Second Language) is found secondary schools than commonly believed. I begin this article with an examination of the achievement data on English learners in California. I think it is first important to establish the degree to which these students' achievement represents a challenge to the overall productivity and welfare of the state's education system. In other words, I attempt to make the case that the achievement gaps are so wide that they threaten the well-being of the state and its economy, and therefore should be a concern to everyone. We then follow with a discussion of several of test indicators that we argue contribute significantly to this situation. Finally, there several some external factors of the problems faced by ESL students, nor can they be neatly compartmentalized.

Some, like the shortage of skilled teachers, represent both input shortcomings (e.g., insufficient numbers of qualified teaching personnel) as well as process problems (e.g., inadequate instruction in the classroom) simultaneously.   Therefore, I present these factors approximately in the order in which I think they affect the condition of schooling for English learners and are amenable to policy intervention. I end with a set of policy recommendations for addressing these issues. Therefore my recommendations provide directly to the kinds of actions that all stakeholders might undertake in the shorter term time frame

Now, let us look at CAHSEE.   First of all, according to its official website, the origin of CAHSEE is defined as "State law, enacted in 1999, authorized the development of the California High School Exit Examination (CAHSEE), which students in California public schools would have to pass to earn a high school diploma. For the 2008–09 school year, all California public school students were required to satisfy the CAHSEE requirement, as well as all other state and local requirements, to receive a high school diploma.

The CAHSEE requirement could be satisfied by passing the exam or, for students with disabilities who tested with modifications, receiving a local waiver pursuant to *Education Code* Section 60851(c)." Furthermore, "the purpose of the CAHSEE is to improve student achievement in high school and to help ensure that students who graduate from high school can demonstrate grade-level competency in reading, writing, and mathematics. " And, finally, "The CAHSEE consists of

two parts: English-language arts (ELA) and mathematics. Test questions address California State Board adopted content standards that a High School Exit Examination Standards Panel, appointed by the State Superintendent of Public Instruction, determined students should know to graduate from high school."

So what is English-language arts? And what are the testing measurements and indicators for the educators, the students, and the parents? The ELA part of the exam, which addresses state ELA content standards through grade ten, has a reading section and a writing section. The reading section covers vocabulary, informational reading, and literary reading. This section includes approximately 50 percent literary texts and 50 percent informational texts. The writing section covers writing strategies, applications, and conventions. The ELA part of the exam consists of 79 multiple-choice questions (seven of which are field test items and are not scored) as well as a writing task (essay) in which students are asked to respond to a specific topic or a literary or informational passage.(www.cde.ca.gov)

ELS and the English learners

Here, we want to know what is education department's policy for the English learners on the ELS exam. Were they given adequate resources and assistances prior to the examination? English learners were permitted to take the CAHSEE with certain test variations if used regularly in the classroom. For example, English learners were permitted to hear the test directions in their primary language or use a translation glossary if these test variations were used in the classroom. Students who are English learners were required to take the CAHSEE in grade ten with all other grade ten students. During their first 24 months in a California school, English learners were to receive six months of instruction in reading, writing, and comprehension in English (*Education Code* Section 60852). During this time, they were still required to take the CAHSEE.

California High School Exit Exam- The California High School Exit Exam is a major part of California's education accountability system. (http://cahsee.cde.ca.gov/)

California High School Exit Exam (CAHSEE) Results

Statewide:	Passing	ELA	*377,637 (79%)*	*30,977 (40%)*	*164,086 (70%)*	*176,212 (90%)*

The California High School Exit Exam (CAHSEE) is a major element of California's education accountability system. The need for improving the education provided by California's high school is undeniable. Although accountability measures may be necessary to this effort, there is early evidence that the CAHSEE presents exceptionally high stakes for EL students. EL students are much less likely to pass the CAHSEE than are English speakers. The rule does allow for districts to defer the requirement that students pass the exam until the pupil has completed six months of instruction in reading, writing, and comprehension in the English language. However, no student, including those who are still classified as English learner, will receive a high school diploma without passing the exit examination in English.

  It is possible that EL high school students do not receive the same instruction or have access to the same range of courses as their English-speaking native classmates puts in serious questions the curricular validity of these tests for English learners. In addition, the condition of these students as English learners, who do not have the same level of understanding of all English instruction as fluent English proficient students, brings serious concerns about the instructional validity of the exam. This also reflects on EL students in classrooms with teachers who do not have special certification or preparation in English learner teaching strategies.   According to its legal authorization, the CAHSEE is exam designed to meet the instructional and curricular validity. Curricular validity is defined as the exam is consisted with textbooks content, and instructional validity is the material expected to be taught.

  By definition, the quality of a test is traditionally considered in two statistics called validity and reliability, the first being more important. In short, validity consists of correlation between the test and the world outside it, while reliability of correlations within the test.

Validity is the answer to the question "what does the test measure or predict, and how good is it at doing so?'. This answer lies in two groups of correlations with concepts outside the test:

1. Correlation with other test;
2. Correlations with real-life measures like education level, job performance, social background, age, sex and so on.

From these one can infer what the test measures or predicts. Reliability is the answer to the question "if it were possible to take this test again, without any learning effect between the two test administrations, would I then get the same score?".   Reliability can also be understood as the correlation between two hypothetical very similar versions of a test. Test validity is requisite to test reliability. If a test has low validity result, then reliability is meaningless. In other words, if a test is not valid there is no point in discussing reliability because test validity is required before reliability can be considered in any significant way.

Conclusion

There is a difference between a condition and a problem. We as human being tolerate all manner of conditions everyday: bad weather, unavoidable and untreatable illnesses, poverty. Conditions become defined as problems when we come to believe that we should do something about them.   Problems are

not simply the conditions or external events themselves; there is also a perceptual, interpretive element. There are great political stakes in problem definition. Some are helped and others are hurt, depending on how problems get defined. Various mechanisms such as indicators, focusing events, and feedback-bring problems to their attention. We can all use indicators to assess both the magnitude of and the change in a problem. We, as educators, our interpretation of indicators (ex: High School Exit Exam, CAHSEE) can turn out to be a process more complicated than a straightforward assessment of the facts. (Stone, 1988; Stone, 1989; Jones, 1998)

While it has been notably difficult to establish a strong correlation between the quality and condition of school facilities and the educational outcomes for students, because the quality of school facilities is so highly related to wealth of students and communities that schools serve. There is considerable consensus that it is difficult to both teach and learn in inadequate facilities.
 Finally, parents are a resource that is too often overlooked for English learners. Even parents without high levels of education can make significant impacts to their children's schools. The involvement from the parents is known to be an important predictor of students' success in school; it is critically important that the schools find ways to involve them. Both parents and teachers should all work together as a team to provide supports for English learners. Administrators should focus less on the politics but more on retaining well-functioning principals at the same schools, and policy makers must design regulations that help to ensure consistency and stability. Administrators must assist teachers to create supportive communities, and break down the isolation that teachers often feel, especially in challenging schools.

While California is still the world's number eighth- largest economy, California ranks next to last in states where the adult population has at least a high school education, according to a report released by the California Faculty Association at Cal State Los Angeles(www.calfac.org). While other states have made greater gains in building educated workforce and moved past California, California is slipping toward educational and economic mediocrity among states on the measure of state competitiveness, prosperity, and success. The majority of English learners students are immigrants or the children of immigrants. There is a strong evidence that immigrant students, and the children of immigrants are more academically ambitious than native-born students. Here, the suggestion is that there is a critical window of opportunity in which to influence these children's academic futures.

Education Policy in California for English learners

Currently, California finds itself in the awkward position, resulting from its own failures to act when economic times were good. Even while the state provided billions of money in class reduction, it failed to make the one important improvement in the area of its English learners. Though it developed a comprehensive plan for leading the progress of its students with multiple assessment and tests for its English learners.

Given the state's high jobless rate at a fresh post-World War II high in July at 11.9%, the situation is a particularly difficult one. (www.edd.ca.gov). Moreover, with the state in virtual bankruptcy, it is unclear where the resources can be available for the increasing number of underperforming schools. Where can we find qualified teacher for every English learner when it lacks the resources to provide the teacher with any adequate support in the classroom?
Now, as they become a larger and larger percentage of the school population, and threaten any real academic gains for the state as a whole, the success of California's reform efforts depends on its ability to raise the achievement of its English learning student. The people of California are tired of the same old politics and failed policies. We want pragmatism. As my professor, Peter Drucker, wrote in his book in 1960s (Drucker, 1969) that the major changes in society would be brought by information, and that knowledge has become the central, key resource that knows no geography. The largest working group will become what he calls knowledge workers. The defining characteristic of these knowledge workers is the level of their formal education. Therefore, education and development, and specialized training, will be the central concern of a knowledge society. English learners in California, and in the nation, represent a potentially rich intellectual and economic resource if the state invests in them.

Abstract

That Japan aims to attract 300,000 international students by the year 2020 is fundamentally an exercise in student recruitment. Based on secondary literature and official documents, this paper takes the approach of the push-pull model to analyze and highlight the problems that Japan is likely to face during the implementation of the said plan.

Introduction

As is widely reported in the popular press, Japan's higher education sector has a problem. There is an over-supply of places in the universities on the one hand, but demand for those places on the other hand is slowly but surely diminishing. Japan has set her sights to tackle this problem with some help from outside. The solution is to take in 300,000 foreign students within the next decade. This basically infers that Japan is about to seriously get involved in international student recruitment along with the associated activities like marketing, promotion fairs, and information dissemination through the internet.

Student recruitment calls for intimate knowledge on what drives foreign students to select one country and/or institution over another. This 'decision making factors' is the focus of the paper. We pit these factors against what the 300,000 students plan is ostensibly offering. We posit that for the targets to be achieved, some critical issues need to be addressed. For the most part, the 'product' or rather 'service', must be perceived to be worthwhile for the potential consumer-students.

If all goes well as planned, Japanese universities and the Japanese higher education sector might turn 'robust' with foreign students mingling about in the campuses. However, Japan's reputation might somewhat suffer should the plan backfire due to mishandling of the issues that may surface along the way.

Some literature on factors

The 'push-pull' model is widely used in international student mobility literature to dissect the decision making process of potential foreign students. [See for example, McMahon (1992), Habu (2000), Nattavud (2005), Llewellyn-Smith and McCabe (2008), and Vo, Muntasira, and Jiang (2009)].

Mazzarol (1998), focusing on international students in major English speaking nations, proposed that potential foreign students undergo a three-stage decision making process. In stage one, a series of domestically-derived 'push' factors is important in the process. These factors normally are beyond the host countries' jurisdiction and they may touch on the political, economic, and social aspects from the viewpoint of the potential students.

In the second stage, 'pull' factors accruing to host nations like Japan come into the forefront. These include factors such as overall level of knowledge and awareness of the host nation, personal recommendations from parents, relatives, or friends, cost issues, environment with regards to climate and lifestyle, geographical proximity, and social links as in family and friends living in the host nation.

The third stage concerns factors that distinguish one particular institution from another. In terms of importance to the potential foreign student, these factors are 'quality and reputation of the institution, the recognition of the institution's qualification in their own country, the international strategic alliances the institutions had, the quality of the institution's staff, its alumni base, and its existing international student population' (Mazzarol and Soutar, 2002).

Bourke (1997) in her study on international students in Ireland listed the recognition of host institution's degree overseas as the most important factor when choosing an institution. This is followed by factors such as the host institution's quality of courses, the availability of courses, the status of the university in the home country, the cost of education at the host institution, its entry requirements, and its learning and teaching styles.

Looking at Asian students in Canada, Chen (2006) proposed that the key factors influencing the choice of an institution relates to what is called 'academic pulling' factors and 'administrative pulling' factors. Specifically, these factors touch on reputation, quality, and ranking of the university and the programs. This is followed by factors like the availability of financial aid and cost issues.

To summarize, while the above albeit limited literature listed out a variety of factors influencing prospective international students in their choice of country and institutions, the one constant and over-riding factor is 'quality' and 'reputation'. This point is consistent with IDP's research which revealed that the quality of education (and employment outcomes) is the most important driver of growth for the global international education community (IDP, 2002).

The problem

Amidst the rather bleak notwithstanding recovering economic situation, the Japanese higher education sector is facing the twin problems of declining enrolment and excess capacity. Compounding these problems particularly for the national and public universities is the issue of annual budget cuts amounting to 1% per annum scheduled until 2010.

The Japanese higher education sector is one of the largest in the world. OECD (2009) notes that there are about 716 universities; eighty-seven are national, seven three are public, and 556 are private universities which include two year colleges. About 80% of undergraduate students enroll at private universities.

The declining enrolments at universities are due to the shrinking population of the 18-year olds. This group peaked at over 2 million in 1992 and has since gone on a steady decline. By 2020, the 18 year old population is predicted to drop to 1.16 million (AEI, 2009).

This condition is made worse in that, an increasing number of Japanese youth are beginning to explore their options by choosing to enroll in degree programs at universities abroad, especially those in the U.S. and U.K. (Kuwamura, 2009; Ishikawa, 2009). This new trend has a significant bearing in that Japan universities have long been characterized by a high percentage (over 90%) of university enrolments coming from the 18 to 22 year-old cohorts.

While the 18 year old population is undergoing a decline, Japanese universities took the opposite path to expand their numbers and thereby, capacity. According to Goodman (2005), there were 98 national, 41 public, and 384 private four-year universities in 1992. In 2004, as national universities were merging while undergoing the corporatization process, the overall numbers ballooned to 88 national, 77 public, and 545 private universities.

One main cause of the expansion in capacity is that, many two-year colleges upgraded themselves to four-year universities in a bid to survive. However, this was untenable and it was only a matter of time before consolidation takes effect, beginning with the lesser known, regional, and private universities (Akabayashi, 2006). In January 2003, Risshikan University in Hiroshima Prefecture became the first of such universities to fail followed by Hagi International University of Yamaguchi Prefecture in 2005 (Terada, 2007). Most recently in August, Japan Times (2009) reported in a survey that 'nearly half of all colleges nationwide failed to meet their enrollment quotas for the academic year that began in April as the shrinking birthrate continued to deprive them of students'.

The consequent financial crunch has led universities to look for new ways in funding. Developing new markets such as professional schools (as in law and management), programs for adult students (such as evening and weekend classes) and non-degree courses in lifelong education are some examples (Goodman, 2005).

However, it is the international student market that is getting the most attention from Japan. Japanese universities are poised to tap into this expanding market. According to projections made by IDP Education Australia, the global international student market is predicted to swell from 2 million in

2003 to 7.6 million in 2025 (IDP, 2002). About 70% of total demand is expected to come from Asia, particularly from China and India.

The solution

Formulating her estimates on these figures, Japan under the Fukuda administration in 2008, embarked on the so-called 300,000 International Students Plan. This is 'part of the "global strategy" to open up Japan to the whole world and expand flows of people, goods, money and information between Japan and countries in Asia and other regions in the world… Japan will aim to accept up to 300,000 international students by the year 2020'. The plan pledged to make efforts 'to strategically acquire excellent international students, as well as to accept highly capable students' (MEXT, 2008).

In plain words, Japan hopes to take in a large number of international students to fill up the increasingly vacant seats in her universities. Mustering the resources of six ministries (Education, Culture, Sports, Science and Technology, Foreign Affairs, Land, Infrastructure, Transport and Tourism, Justice, Ministry of Economy, Trade and Industry, and Health, Labor and Welfare), this plan is presented in five measures as reproduced below from MEXT sources.

1. Inviting international students to study in Japan – Offering incentives to study in Japan and providing one-stop service –
2. Improving introduction of entrance examinations, enrollment, and entry into Japan – Facilitating procedures for studying in Japan –
3. Promoting globalization of universities and other educational institutions – Creating attractive universities –
4. Improving the environment for accepting international students – Efforts to create an environment under which students can concentrate on studying without anxiety –
5. Promoting acceptance of international students in society after their graduation or completion of courses –Globalization of society –

(MEXT, 2008: 3-4)

In brief terms, the first measure sets out to market Japan to potential international students. In doing so, Japan hopes to motivate potential students to come to Japan for studies. From within Japan, the various ministries, universities, and related institutions are to use the internet to transmit information. At the same time, in addition to holding student fairs abroad, Japanese embassies and consulates, overseas offices of independent administrative corporations, and overseas bases of universities and other educational institutions are to coordinate in disseminating information on Japanese universities. Plans are already underway to establish eight overseas promotion offices at Moscow, Tunis, Hyderabad, Tashkent, Hanoi, Cairo, Bonn and New Delhi (WENR, 2009).

The second measure pledges to allow potential students to take entrance examinations in their home countries instead of the costly and cumbersome requirement of having to come to Japan just to sit for the entrance examination. Under this measure, universities are encouraged to grant admission to potential students into the programs and approval for accommodation prior to arrival. Consequently, Japan pledges to ease immigration entry procedures for potential students.

The third measure promises to 'make universities attractive to international students' by developing a system to allow students to obtain academic degrees by studying only in English. Thirty 'global' universities are to be selected to spearhead this endeavor. Japan plans to hire a large number of foreign faculty members to assist in the development and provision of programs in English.

The fourth measure focuses on improving accommodation facilities and scholarships for foreign students. Japan is nudging the local municipalities and private companies to allot at least a portion of the municipal housings and company dormitories for foreign students to use. Finally, the fifth measure promises to provide potential foreign students with employment support after graduation. Japan expects to hire as much as 50% of the graduating foreign students as stipulated in the plan.

Some critical issues to ponder over

Considering that Japan has about eleven years to attract 180,000 plus students to add to the current numbers of around 120,000 students, the plan is without doubt a bold one. In the previous major plan to take in 100,000 international students, which is much smaller number, Japan needed about twenty years to achieve the target (MEXT, 2004).

If the current plan is successful, Japan can expect to fill up some of the gaps in her university classrooms with foreign students while at the same time, hoping that foreign students can act as a catalyst to induce more competition into her universities. Similarly, Japan can also look forward to employing the young, able bodies, and intelligent minds of the foreign students to help prop up the shrinking labor force.

However, Japan will probably face a string of rather formidable obstacles on top of the ambitious target number and narrow time span allotted for the plan. In this respect, it is crucial that Japan has a good hold on what potential foreign students are looking for.

Picking up from the previous section, quality and reputation is foremost in the minds of prospective students. As Chen (2006) noted, international students are on the lookout for a perceived high quality of education at competitive costs. Mazzarol and Soutar (2002) further stressed that 'quality of reputation is likely to remain the most important factor influencing study destination choice'.

In a 2009 report, OECD allocated considerable space to highlight this area. To quote: 'Many aspects of the Japanese tertiary system demonstrate very high levels of quality, including its world-class research universities and its excellent system of technical training in national colleges of technology. However, during its visits to higher education institutions the Review Team learned from faculty and students that the pedagogical approach used might not be up to best practices followed in many OECD tertiary education systems' (OECD, 2009). The OECD added that they 'are not alone in this observation.' [For similar observations, see for example Ishizuka (2004) and the several papers in Eades et al. (2005)].

As an example, the OECD (2009) highlighted the situation in the graduate programs, particularly those of the doctorate level in social sciences and humanities. Compared to other OECD countries like the U.K. and U.S., the programs in Japan are 'less extensively developed' and have 'no structure in place

at the institutional or national level to promote graduate student recruitment, retention and success.' (The OECD however admitted that recently, there has been a range of noteworthy initiatives aimed at sprucing up the graduate programs.)

The OECD made a recommendation for Japan to use her strong regional links through bodies such as UMAP (University Mobility in Asia and the Pacific) to strive for an EU-styled regional wide framework to integrate and rationalize the 'recognition of qualifications, the quality and status of higher education institutions, and the comparability of curricula' among participatory states. The OECD also suggested that the NAID (National Institution for Academic Degrees) along with other evaluation bodies take the lead to 'develop guidelines and a suitable methodology for the evaluation of educational services provided by Japanese universities operating in other countries' as a start (OECD, 2009).

In the same light, the OECD also called on top research universities of Japan to act as 'movers' to initiate improvement systems for quality assurance as well as to establish mission statements befitting their status as world class research institutions vis-à-vis their 'undergraduate-graduate student number balance, the nature and importance of the international dimension in their quality assurance and improvement strategy, their funding situation, and the further strengthening and enlarging of their graduate programs.' Such a step may encourage other 'lesser' institutions in Japan to follow suit.

In addition to the issue of quality and reputation, the availability of courses is also an area of importance to foreign students. As mentioned above, by the logic of Japan declaring that foreign students can graduate by studying in programs that use only English, Japan intends to attract English-speaking students. Considering that over 90% of foreign students studying in Japan are already from Asia, it is understandable that Japan wants to take in more students from areas outside of Asia.

In July 2009, the government selected thirteen top national and private universities to act as 'global universities'. They are expected to offer programs conducted in English. To do so, foreign professors are to be imported in large numbers to develop and teach courses in the English-based programs. Preliminary proposals indicated that up to 20% of all classes in the global universities are to be taught in English. In addition, up to 30% of the professors are to be hired from abroad to sit on the faculty specifically designed to enroll foreign students.

However, if past records are consulted, it seems that Japan may not have an easy task in hiring foreign professors. For a start, although Japanese laws have authorized in 1982 the employment of foreign professors at Japanese national and prefectural/municipal universities on similar terms with Japanese staff, the law left the period of service to the discretion of each university (OECD, 2009).

In addition to this, foreign professors found additional obstacles in the living environment for family members, the high price of goods, and language barriers both in daily life and in transactions within the university. Compared to other OECD countries, it is thus not surprising that the percentage of foreign professors even at top universities is very small. For example, in 2005, only about 1% of professors and 3% of associate professors at Tokyo University were foreign nationals. In 2007, the respective percentages of foreign professors in Japan, U.S., U.K., and France were 3.4%, 19.3%, 17.6%, and 5.4% (Huang, 2009). Considering these circumstances, a sudden leap in numbers of foreign professors within a short time span seems daunting (OECD, 2009).

A third issue this paper wishes to highlight concerns facilities such as housing and support systems for foreign students. OECD (2009) noted that these facilities are 'underdeveloped' when compared to the practice at other member countries. For decades, Japan has provided student housing to only 25% of international students. The rest, 75% of them, has no choice but to live in private facilities which are expensive and complicated to secure.

Closing remarks

The issues addressed above are not new for Japan as they are in fact, 'artifacts' from the previous era of the 100,000 students plan (MEXT, 2004). Japan has not been able to sufficiently address these issues then. Yet, it did not deter Japan from embarking on a successive plan to take on a bigger number of foreign students. It appears that Japan has to work doubly hard to overcome these issues this time around.

This little paper merely deals with a limited range of issues. These included quality and reputation issues, availability of courses in English, and student support services especially in accommodation. There are much more to these but space constraints dictate that they be addressed in a future paper. Besides the ones mentioned above, students these days seem to increasingly rely on university rankings in their decision making. Moreover, career prospects and the lure of immigration may have influence on some students who may wish to stay on in the host nation after graduation.

Note: The views of this paper belong to only the author and do not represent those of any institution whatsoever.

A Survey of Attitudes towards Critical Thinking among Hong Kong Secondary School Teachers: Implications for Policy Change Both Locally and Globally

Mr. Paul Stapleton

Hong Kong Institute of Education

paulstapleton@gmail.com

Abstract

"Critical thinking" is a common term used in educational circles as well as by the general public. The term is frequently found in educational policy documents in sections outlining curriculum goals. It is also a term heard in the media, often decrying the perceived deficiency of thinking skills being taught in schools and universities. Despite this high profile nature of critical thinking, however, precise definitions of what it really means for pedagogical purposes are lacking.

In keeping with the conference theme, this study set out to examine a local problem whose solution may have applications at a broader level. Specifically, in Hong Kong, although the term "critical thinking" appears prominently in education policy documents under the headings "Learning Goals" and "Generic Skills" (to be attained), there is no clear direction regarding the meaning of the term or how to engender it in students. Rather, it is assumed that critical thinking is a self-evident concept that needs no further elaboration.

In this study, 72 in-service high school teachers in Hong Kong were surveyed and interviewed on their beliefs about the meaning of critical thinking as well as their commitment to the concept as an educational goal. This mixed method approach employed a questionnaire yielding quantitative data, while interviews with five key informants produced supporting qualitative evidence. Results indicated the teachers had a sophisticated, yet narrow understanding of the term. For example, many believed that a good critical thinker is one who looks at issues from diverse viewpoints. However, many others claimed that a good critical thinker is one who supports opinions with sound reasoning and evidence. Further, the participants expressed strong support for the inclusion of critical thinking in the curriculum, while conveying a desire for training in how to teach it. The findings suggest a more precise definition of critical thinking is needed in educational documents in addition to training programs that help teachers make it a part of their practice.

The findings from this study may have relevance beyond the local context. Curriculum documents from several other countries were viewed as part of this research and it was apparent that the meaning of term "critical thinking" was often assumed. In this presentation, the researcher will suggest how the term "critical thinking" can be unpacked and given a more precise definition so that curriculum planners and teachers can better approach and apply teaching strategies that stimulate higher order thinking skills.

Keywords: critical thinking; secondary school curriculum; educational goals; thinking skills

ABSTRACT

As English has become a global language which is used all over the world, local cultures of different areas, has turned out to be a distinctive obstacle that affects the correct understanding to listeners. Such phenomenon protrudes in real life when two persons from two countries are talking, especially when one is from the west and one is from the east as their culture background are enormously apart. In our English classroom, cases of such are frequently found and most of them are caused by the linguistic differences while a certain amount of them appears owing to the lack of the counterpart culture. It is believed that such problems are not unique to students from any particular country; it should be a common problem for any students who take English as a foreign language. So in this presentation, we are going to analyze some examples to show the linguistic setbacks and misunderstanding results from cultural distinction. It will mainly cover:

1. Chinese Structures VS. English Structures

1) Chinese active voice vs English passive voice

2) Chinese verbs vs English preposition

3) Chinese "have" vs English "there be"

2. The Western Culture VS The Chinese Culture

1) Religion

2) Value

3) Traditional view and customs

4) Privacy

5) Idioms

These problems do not only exist in our students; it should be a global issue as well. Therefore, how to solve problems of these kinds is a thing that requires all teachers who teach English as a foreign language to give it a critical thinking. By doing the presentation, we not only expect to arouse our peers' intense attention to the issue, but also look forward to eliciting effective approaches for such issue.

An Analysis of the English Training Market in China

Yaru Zhang

yrzhang@stu.edu.cn

Shantou University

China

Abstract

The English training market is thriving nowadays in China. It has become an important supplement to the traditional English education system. Therefore, it is of great significance to carry out some research on this market. This paper has analyzed the results of some of that research. Great opportunities and serious problems both exit in this market. We should take advantage of the opportunities and find proper solutions to the problems.

1. Preface

With the development of economy and the increasingly rapid pace of internationalization, English has become a more and more important tool in China. A good command of English is a key factor in pursuing higher degrees, finding good jobs, learning advanced technologies, sharing ideas with people from other parts of the world and doing business around the world. Obviously, a good command of English cannot be achieved simply by taking exams or remembering vocabularies and grammars. We need to practice. We need a platform where we can get opportunities to fully practice this language. Therefore, English training institutions emerged.

Some media pointed out that China has been crazy for English. Meanwhile, global English training institutions have been crazy for China. As shown by the report "Chinese Citizen's Consumption Activities Survey", the market value of current English training market in China has reached 20 billion RMB and there are more than 50 thousand institutions doing business in this market. The English training market in China has become the world's largest one.

2．Analysis of the Demand for English Training Market

2．1 The Internationalization Calls for Talents with Good Command of English

After joining WTO, China has officially become a member of the international market. That is to say, China has to compete and cooperate with foreign countries in this market. This situation brings a need for talents with a global perspective and an ability to think globally. For example, as a manager, one has to draw up the company's development strategies and business plans based on the world economic environment; as a product designer, one should not only pay attention to the domestic demands, but also the requirements and favors of foreign consumers; as an investment expert, one needs to be familiar with the economic status and investment policies of different countries in order to seek best investment opportunities internationally. Doubtlessly, a good command of English, the international language, will help one form a global perspective.

Moreover, under the background of globalization, people need to possess certain internationally recognizable qualifications to prove their talents. Nowadays, these qualifications are key factors in evaluating candidates when companies recruit staff. There are different certificates for different industries, such as MCSE for IT, ACCA for accounting and MBA for management. Possessing these so called "international talent passport" means a better job and a brighter future. However, most of these qualifications should be obtained by taking courses and exams. Those courses and exams are often carried out in English, so one needs to master English to obtain those worldwide recognizable qualifications.

What's more, globalization requires people to communicate in English. With the development of internationalization, lots of foreign companies opened branches in China while many Chinese companies also began to do business in other countries. The staff of those companies may come from different countries and have different mother languages. In this situation, work is often carried out in English. Moreover, nowadays China takes part in or hosts many international

conferences and activities, such as the 2008 Olympics, the 2010 World EXPO, the APEC and the SCO. These international activities and conferences are all carried out in English.

In addition, internationalization also requires people to use English as a tool in learning about the most advanced ideas and the most sophisticated technologies. Nowadays, business competitions and science competitions are international. People need to master the world most advanced ideas and most sophisticated technologies to win competitions. Those ideas and technologies are often spread by internet, TV, magazines and books and, most of the time, in English. Therefore, one with good English listening and reading skills can learn about those ideas and technologies more quickly and more easily. That is an important way to enhance one's competitiveness.

2．2 The Study Overseas Rush Creates a Huge Demand

Lately, more and more Chinese people decide to study abroad. According to the survey conducted by the UNESCO, the number of Chinese students studying overseas has become the largest in the world. When study abroad, one can learn about more advanced ideas and more sophisticated technologies so as to enhance oneself and lay a solid foundation for one's future work. Meanwhile, one can also experience the exotic culture, broaden one's horizon and become more independent, strong and mature through studying overseas. Additionally, some people may already have good jobs, but work stress and competitions drive them to continue to study; some people may have reached certain positions but feel the difficulty in improving, so they choose to study abroad to enhance themselves; while others may not be satisfied with their current jobs, so they try to improve their skills and learn more by studying overseas in order to find better jobs. Above all, with the development of economy, more and more Chinese people can afford the tuition fee of foreign schools. As a result, a study overseas rush appears in China.

However, as a student from a non-English speaking country, one needs to prove his English proficiency when he applies for schools, so he has to take some internationally recognized exams, such as IELTS, TOFEL, GRE and GMAT. Take IELTS as an example, the number of candidates has exceeded 210 thousands in 2007, increased by 50% compared with 2006. China is now the number one source of IELTS candidates. Take TOFEL as another example, in 2008 there are more than 100 TOFEL exam halls in China, increased by 100% compared with 2007. They are located in 33 cities. One can conveniently choose an exam hall near his home. Nevertheless, the traditional exam-oriented education form makes Chinese students less independent in preparing for exams. They have been used to follow guidance. High schools and colleges don't provide specific guidance for international English exams, so students turn to English training institutions for help. That creates a huge demand for English training market.

2．3 The Drawbacks of Traditional English Education System Bring Great Opportunities

2.3.1 Exam-oriented Education Makes Students Incapable of Practical Application

The traditional English Education in China is exam-oriented, and those exams are normally focused on grammar and vocabulary instead of capability of practical application. The world famous English language expert Alexander, author of "New Concept English", once opened a troubleshooting column on a Chinese newspaper. Once he was asked by a Chinese student: what's the difference between an attributive clause and an appositive clause? Surprisingly, he answered: "Knowing this distinction does not improve your English. It just at most broadens your knowledge related to English." After giving a few examples and explanations, he even concluded "There is not so called attributive clauses. At least, I don't know any of them." Another typical example is that there are very few native English speakers who are good at grammar and syntax. They just know how to speak and write, but can't explain clearly why. If we make a wrong sentence, they will feel weird, but can't explain why it is wrong. Foreign teachers seldom talk about grammar and syntax at class. Instead, they lead students to read materials and discuss some topics.

As a result, almost every Chinese student can be called "English expert" in terms of grammar. They are even better at grammar and syntax than native speakers. However, it is hard to find a good interpreter in a bunch of bachelors, masters and doctors.

Many training institutions realized this drawback of traditional English education system in China, so they offered various kinds of application-oriented courses, such as Business English, Travel English and Oral English. Those courses are so welcomed that they do not only bring training

institutions great fortune, but also partially make up the drawbacks of traditional English education system.

2.3.2 A Lack of Education Resources Brings Down the Quality of English Education

China has a very large population, but education resources such as teachers and teaching halls are quite limited. Therefore, there are often dozens of students at one class. In this case, it is very hard for teachers to take into account the individual characteristics of each student. Students also don't have enough chance to practice speaking and listening.

Lots of training institutions realized this situation, so they opened many classes with a small number of students in each class. Each student then was allocated enough education resources. Thus, they can fully practice speaking and listening at class and receive specialized guidance according to their individual characteristics and English level, but of course, they have to pay a large amount of money for taking those education resources.

2.3.3 Inadequate English Education at Primary Schools Forces Parents to Turn to Training Institutions

In most regions of China, primary schools have not opened enough English classes. In some places of inland China, students even don't take English classes until they enter middle schools. However, receiving English education in early childhood is vitally important. According to a report conducted by Johnson and Newport in 1991, if a non-English speaker continuously studies English from 3 to 7, there is a chance that his English proficiency gets close to native English speakers when he grows up; if he starts studying English from 8, that chance turns smaller; if he starts after 11, there will be a marked gap between him and native speakers. Results of numerous psychology research on children and long-term education practice have proved that only children can quickly master a language, because "Broca's area", a place takes in charge of studying language in the brain, is most active in childhood. One's mother language is stored there. As people grow older, "Broca's area" gets less and less active, that is why it is much harder for an adult to learn foreign languages.

All of the conclusions above indicate that children have natural abilities to learn English easily and quickly. If adequate learning materials and a good study environment are provided, children can master English quite well.

Consequently, training institutions opened numerous kinds of English classes for children to make up the contradiction between vital importance of childhood English education and inadequate English classes at primary schools. In order to let their kids receive good English education in childhood, lots of parents spare no expense to put their kids in those classes. Once again, the English training market gains great fortune due to the deficiency of traditional English education system, but also to some extent makes up that deficiency.

3. The Status Quo

3.1 A Hot Pursuit of Venture Capital

According to "2007 investment report on education and training industry" released by China Venture, as of October 31st, 2007, there were 36 venture capital investment cases altogether in education and training industry in China. 25 enterprises benefited from a total of 356 million US dollars investment. This upsurge trend has continued to this year. As shown by the China Venture's first quarter report, the number of venture capital investment cases and the total amount of investment have grown by 150% compared with the same period of last year. Normally, bubbles emerge whenever some industry gets overheated. However, venture capital experts believe there are no bubbles in the education industry. The reason for venture capitalists to put large amounts of money into this industry is simple: like medical care, education sector is protected by the government. Meanwhile, huge demands exit in this industry, so it can make money. Many investors talk about clothing, food, housing, transportation, medical care and education in the same breath, because they are all indispensable elements in people's daily lives. Few people become millionaires in one day in this industry, but they seldom lose a lot of money in one day either. In recent years, New Orient, Global IELTS, Wall Street English, REITs children's English, New World Education Group and other institutions are favored by venture capital.

3.2 A New Era of Brand

July 14th, 2008 was the last day of New Orient summer camp commencement last year. It is said that on that day, a serious traffic jam happened in Beisihuan of Beijing where New Orient was located. Sweating parents and students with heavy luggage formed a long queue. The queue twisted under the burning sun, extending to the high way. According to Mr. Hu Min, headmaster of New Orient, the number of enrolled students last summer hit a record high.

Nevertheless, the manager of a small unknown training institution in Beijing was very upset about the enrollment last summer vacation. He complained:" Normally, the summer camp enrollment was three or four times as many as usual. I sometimes had to change offices into classrooms. However, the number of enrollment decreased by 30% this summer vacation compared with last one. Some classrooms were even vacant throughout the summer vacation.", though the tuition fee of this institution was almost only half of New Orient's.

That summer, every training institution which had established well-known brands was very popular. Dell English opened 20 more classes and the number of students increased by 35%; Universal IELTS rented numerous new classrooms and every classroom was run at full capacity. Classes started from 8 in the morning and did not end till 9 in the evening.

Some experts believe 2008 was a turning point in the history of English training market. Yu Minhong, chairman of New Orient, pointed out 10 years ago, when New Orient was just founded, there were hundreds of training institutions in Beijing and everyone was similar to each other, but now a few well-known brands such as New Orient, Dell, Web, Wall Street, Universal IELTS, etc have occupied the market. Small institutions are in difficulty. The English training market is coming to a new age marked by well-known brands.

3.3 Practical English Has Become the Main Role

A survey conducted by Sohu Education reveals that in China 47.34% of people enroll in English training classes for job requirements, 22.58% for business communication, only 20.39% for exam preparation. Coincidentally, China Social Survey Office also carried out a research on the aim of people taking English training classes. 1500 people from 8 major cities of China were interviewed. 80% of them claimed they had taken or was taking English training classes. 42.7% of those interviewees said they took English training classes to enhance their ability to use English at work, 26.4% to find better jobs, 28% to have fun or to prepare for travels, only 25.7% to prepare for academic exams. We can tell from those two surveys that English has become a practical social skill, instead of an academic course in China. People want to learn English because they need to use English, rather than because they want to shoot a high score in English exams. Practical-application-oriented training classes are more popular than exam-oriented ones.

3.4 English Training Classes for Studying Abroad Boomed

The number of people going to study abroad has sky-rocketed from 860 in 1977 to 144,500 in 2007. In 2008, this number had exceeded 200,000, reaching a record high. One can easily tell the heat of this study overseas rush from the bustling scenes of a series of large international education exhibitions in China.

As more and more people choose to study abroad, relevant English training classes become more and more popular. Official statistics shows that the number of people receiving IELTS trainings grows by more than 50% each year since 2006. In 2006, the growth rate is 52%; in 2007, it is 60%; in 2008, it is as high as 200%. It is estimated that this year the growth rate will remain to be as high as more than 50%. Accordingly, IELTS training has become one of those projects which have the highest growth rate in the English training market.

Two main factors contribute to the popularity of IELTS training classes. Firstly, IELTS has become more and more recognizable. As of this year, except the schools in UK, Ireland, Australia, New Zealand and other Commonwealth countries, there are more than 2000 schools in Europe and America accepting IELTS as the proof of English proficiency of international students. Secondly, more and more people choose to study abroad. This is partly due to the positive effect of financial crisis, and partly due to the more lenient visa policy. For example, the visa policy of USA has gradually become lenient since 2007. The current visa application pass rate has exceeded 80%.

This rate of UK, Australia, Canada and many other countries has also significantly grown. Besides, the downward trend of the exchange rates of US Dollar, British Pound, Euro and Canadian Dollar remarkably brings down the cost of studying abroad, enabling some working-class people to study abroad.

3.5 The Positive Effect of Financial Crisis

The current financial crisis makes it even harder for college graduates to find jobs. On one hand, more than 6,110,000 college students graduated this year. They need jobs. On the other hand, some companies cancelled the campus recruitment programs. This dual pressure for college graduates is very painful and difficult to ease.

In addition, an increasing number of enterprises are affected by the financial crisis. The declining profit margin forces them to strictly control cost, so layoffs and wage reductions become the most widely used method. As a result, the unemployment rate skyrockets. An old Chinese saying goes: "to collect wealth in bullish market, to acquire knowledge in bearish market". In face of the spreading unemployment crisis, many job seekers and white-collars go to enroll in training classes and hope that attending training classes can help increase their competitiveness in the job market. As a result, the winter of economy becomes the spring of training market. Moreover, though some people don't have to worry about being laid off at present, the declining business enables them to have time attending training classes. This factor also contributes to the prosperity of training market.

4. Problems and Solutions

4.1 Problems

The main problems of the current English training market in China are reflected in the following areas:

4.1.1 Some Institutions Are Not Qualified

On one hand, due to the relatively easy market access, all kinds of capital swarm into the English training market. Some operators are not professional in English education. They have no idea how to arrange classes, select teachers and pick up textbooks. Some operators, though, have some experience in English education, all they care about is how to make money. Improvidence and desire for quick success and instant benefit make them neglect the teaching quality.

On the other hand, most of the teachers serving in training institutions are teachers from traditional schools. Teaching in training institutions is just their part time job. Though most of these teachers are quite experienced and qualified in English education, some of them hardly take the training classes seriously. They just come to training institutions to earn more money, so they seldom carefully prepare for classes. They are not at all responsible and only concern about getting wages. Moreover, some institutions even hire college students to be teachers. These students lack of teaching experience and their own English may not be good enough either, so the teaching quality cannot be guaranteed. Additionally, many foreign teachers of training institutions are not professional in English teaching. They are hired just because they are native speakers, but in fact they don't know how to make their classes effective and helpful. Summarily, these problems are caused by a lack of efficient teaching quality evaluation mechanism and supervision system.

4.1.2 Fake Advertisings and Frauds

Most consumers don't know how to judge the teaching quality of an English training institution when choosing institutions. They only make their choices based on advertisings and promotions. However, there are many fake advertisings and frauds in this market. For example, an institution promises:" we can help you speak fluent English in three months" in its enrollment brochures. Those people who are eager for quick improvement are often easily cheated by such advertisements. However, any person who knows about the basic rules of learning a foreign language is aware that no one can remarkably improve his English proficiency in one day. Significant improvement can only be achieved by hours and days and weeks and years of constant work and practice.

In addition, some institutions promise a lot of things in their enrollment ads such as professional teaching staff, updated teaching method, sophisticated facilities and comfortable classrooms, but seldom fulfill those promises in reality. Students sometimes even encounter such problems as reduced teaching hours, increased student number in one class and dilapidated classrooms after enrollments. What's more, some institutions even disappear without a trace after collecting tuition fees, leaving a bunch of angry students.

4.1.3 Disordered Competition and Pricing

There are almost 300 new institutions establishing every year in Beijing and there are also about 300 institutions closing down at the same time. In face of this rat race, many institutions have to reduce prices at the expense of quality. A serious price war is going on. Take a three-month oral English training class as an example. Some institutions charge 3000RMB for it while some only charge 600RMB. In this brutal price war, many institutions close down. Every failure of institutions also causes great loss to students in terms of money and time.

4.2 Solutions

4.2.1 Set Strict Accrediting Criteria

Just as I mentioned above, the easy market access enabled many unqualified institutions to exist in the English training market and harm the interest of consumers, so it is very important to set strict accrediting criteria. In China, it is the educational administrations' responsibility to monitor the establishment of training institutions. They should carefully inspect the running conditions of each establishing institution, including teaching staff, facilities, finance and so on, set high accrediting criteria and never approve any unqualified institutions to establish.

4.2.2 Strengthen Supervision

At present, training institutions solely rely on internal supervision system to manage teaching quality. The whole market lacks of external regulators, so training institutions can act freely as they wish. In this situation, external regulators involving students and educational administrations should be established to protect the interest of consumers. Moreover, some monitoring methods should be taken, such as carry out questionnaire survey among students regularly and disclose the results through media; require each teacher to possess National Teaching Certificate and evaluate the teaching level of foreign teachers by experts to decide whether they are qualified to teach in training institutions.

4.2.3 Establish a Reasonable Rating System

Since most consumers are not professional in judging the teaching quality of training institutions, they normally make choices based on advertisements when choosing institutions, so they sometimes get cheated by fake advertisings. Therefore, it is of great importance to establish a reasonable rating system for training institutions just like the rating system for bonds. In that way, consumers can make choices based on the grade of institutions. Additionally, a reasonable rating system can also strengthen the self-discipline consciousness of training institutions and stimulate them to improve teaching quality.

4.2.4 Avoid Irrational Price War

Price war is a low-level competitive method. Reasonable pricing competitions can eliminate market bubbles and improve market order, but irrational price wars will do great harm to both training institutions and consumers. In order to survive in price wars, training institutions have to cut down costs and this is often done at the expense of teaching quality. Therefore, a market guidance price should be set based on the grade of training institutions and the services they provide to avoid irrational price wars.

5. Conclusions

The English training market is thriving nowadays in China. Great opportunities and serious problems both exit in this market. Opportunities lie in the facts that the internationalization calls for talents with good command of English and that the studying overseas rush and the drawbacks of traditional English education system create a huge demand. However, problems are reflected in the following areas: some institutions are not qualified; fake advertisings and frauds flood the market; disordered competitions

and irrational price wars frequently happen. We should take advantage of those opportunities and find proper solutions to those problems. Above all, it is important to make the English training market a good supplement to the traditional English education system.

Administrative Practices in Teaching English as a Second Language(TESL) in Chinese Tertiary Institutions.

Dr. Igor Smerdov, Russia (Xingjian College, Guangxi University, Nanning, China)

Keywords: Academic Practices, Administrative Practices, English as Second Language Teaching, Teacher's Motivations, Learning styles.

Situational Introduction of the Case Study

I've chosen the two colleges I've worked for as the basis for the case study: Jiaying University, Meizhou (Guangdong Province), and Xingjian College, Nanning (Guangxi-Zhuang Autonomous Region). The objectives and goals of Jiaying and Xingjian as social institutions are the same: the standardized educational project in China – training in the English language, communication in it, basic knowledge of English-speaking countries, American, British and other major countries' culture, preparing students for the national exams and, eventually, the Chinese job market. In case of Xingjian College, it's even potentially commercially viable in the future when (and if) it will gain reputation and prove itself to be an expensive alternative to a top provincial school and a cheap alternative to training in the West, but it is not the primary purpose at the moment.

The state-run Jiaying University is positioning itself in the educational market as a public school functioning in accordance with the state standards, with long traditions (has existed since 1913), with stables conditions and strong support from the regional government.[i] These factors are important for foreign teachers as well, also important are the facts that this is a public university with good living and working condition, guaranteed high salaries, lively local communities in the middle of the Hakka region in Northern Guangdong, with its own distinct lifestyle, history, subculture, dialect, cuisine etc[ii]. In case of the private Xingjian College, the commercial and English teaching quality factors come to the fore: most of subjects are taught by foreign teachers, its campus is in fact a part of the Guangxi university campus, its graduation certificates will include the name of Guangxi University (the key-school in the Guangxi-Zhuan Autonomous Region in the South of China) although not for the current freshmen.

In terms of quality of students, there is no big difference between Jiaying and Xingjian, but the basis of the comparison comprises academic practices of both colleges and administrative mechanisms behind them, so I assume that the students' level is the same.

Methodological Introduction of the Embedded Case Studies and the Paradigm Shift

The rapid modernization of China and Chinese educational institutions has caused an unprecedented situation when the country aiming at the superpower status in the world in the near future has a relatively obsolete and traditionally weak educational system in need of a quick overhaul. The urgent need of this rapid improvement and modernization is exacerbated by the sheer size of the Chinese education system and by the fact that it is expanding rapidly and involving bigger and bigger percentage of the young Chinese high-school graduates into the tertiary level education in practically all spheres of university curriculum. So the Chinese are solving the two big problems: expanding and modernizing their huge university system (probably already the biggest in the world) simultaneously. So when it comes to resolving too many issues within a lifespan of one generation there may be many irregularities and abnormalities as the Chinese are trying to complete an unprecedented task within the shortest time and the people who are leading these reforms at different levels are very often not up to the huge task and project they happen to manage and head.

It's very hard to answer the questions why there is so much frustration regarding the Chinese administrator's management practices in connection with foreign teachers they invite and value so much[iii]. Even in the very carefully tailored and conducted Ming Sheng Li' research *Perceptions of the Place of Expatriate English Teachers in China* she mentions that "Though many of the Chinese administrators at the departmental level had been educated in the English speaking countries, they often had difficulties making their recruitment decisions faced with the diversity of academic qualifications and professional training in the West. As a result, they unconsciously fall victims to their cultural exclusions while grappling with the intricacies and complexities of certifying procedures, and qualification status relativities and educational qualities." (Ming Sheng Li, 1999, p.p. 185-186) The complexity of language Ming Sheng Li employs in this description of the Chinese administrators' difficulties assessing the foreigner's credentials signals that she is really afraid to call a spade a spade.

Once, on page 123 of her extensive research she notices: "In addition, the lack of the screening procedures and the management practice on the part of the Chinese administration, might have contributed, to some extent, to the recruitment of irresponsible teacher" (Ming Sheng Li, 1999, p. 123). Even her word choice: "might have contributed, to some extent" etc. speaks for itself. The only thing I can say is – give me a break! Nobody pressures the Chinese administrators to hire any foreigner, they can screen, interview, assess, question anyone as long as they want. It's not a "lack of the screening procedures" – it is the inability to implement and apply the existing ones.The need for direct observation and for calling incompetence an incompetence has become obvious.

The paradigm shift in ESL teaching was well described and analyzed in George Jacobs and Thomas Farrell's *Paradigm Shift: Understanding and Implementing Change in Second Language Education* (Jacobs, G., Farrell T, 2001).[iv] It's time to say that the research paradigm should also move forward towards more field studies and anthropological research of what's happening at the grass root level of teaching and administrating. The new situation in education and mushrooming of new colleges like Xingjian make traditional sociological and pedagogical research methods based on qualitative and quantitative analysis of data obtained from carefully tailored questionnaires, if not obsolete, but at least much less reliable and effective than they used to be with regard to traditional opinion polls and analysis of the administrators and teachers' response. In case of poor, blurred and inertial motivation of the learners and teachers, there is no reliable database for any conclusion based on the non-motivated people's responses.

The only feasible point of view from which some conclusions can be made, especially on the particular case studies and in case of small scale research, is the point of view of an internal observer who really works on the ground and talks to the people at the grass-root level as the administrators, visiting researchers, external polls, questionnaires and very often students and learners themselves provide wrong or at least partially true information. So the most effective method for this sort in inquiry into the new academic paradigm of Asian colleges cannot be based on questionnaires and polls exclusively as most of proponents of this "bimethodological" sociological research in the sphere of ESL teaching and learning would claim, particularly Ming Sheng Li in her important work *Perceptions of the Place of Expatriate English Teachers in China* (Ming Sheng Li, p.p.57-58).

She claims after R.B. Burns that "both qualitative and quantitative methods are used collaboratively to develop lines of inquiry to provide multiple sources of more accurate and convincing evidence than a single source of information (Yin, 1989) and to ensure research credibility (Davis, 1995). The two research approaches, derived from different philosophies, can be legitimately used as a research tool proving alternative insight into human behavior (Burns, 1994, p.241). The qualitative mode enables the researcher to explore the complex nature of the research questions that might be unattainable through the quantitative approach while the latter can supplement the qualitative approach with statistical data" (Ming Sheng Li, 1999, p.p.57-58). This synthesis of the qualitative and quantitative approaches has a few deficiencies with regard to Ming Sheng Li's research. First, her research and polls were conducted in 1997 when the phenomenon of the new, edutaining, academic paradigm was not so visible in China, so she simply could not notice such a drastic change when edutainment became, if not prevalent in general, but at least dominating in many, particularly private, Chinese colleges.

The limits of my analysis are also obvious as I'm claiming that the quantitative methods based on questionnaires and opinion polls amongst students, administrators and teachers are mostly misleading and irrelevant in the new academic paradigm. So what's left? First, the qualitative analysis based on personal interviews, private conversations and personal experience of working in the particular new academic milieu that suits the definition of edutainment is the only solid ground for conclusions on the nature of this new teaching paradigm. Second, some qualitative methods and analysis of opinions can still be used as a supplement, particularly when it doesn't contradict common sense and the dominant mindset of the institution where the interviews were conducted. Finally, I'll repeat one of the Western researchers in the Asian context: "My subjectivity is pivotal in my own research since it ultimately defines the boundaries of any observation study I do" (McKinley J., p.139, 2005).

Raising the Academic Level

At Jiaying University, foreign teachers have been teaching Oral English, Writing, Survey UK/US, sometimes Newspaper Reading and British Literature, maximum 4-6 hours a week out of up to 30 periods. At Xingjian College, foreign teachers dominate in the time-table and they teach much more than 50 % of classes, up to 20-22 hours out of 30 on average. The Chinese teachers are bound to instruct in Translation, English Grammar and the Humanities. In fact, it is an entirely different education despite the fact that it stays within the same education standard. A kaleidoscopic rotation of

foreign teaching methods, accents, backgrounds and faces broaden the students' horizons and understanding no matter if sometimes the teachers' qualification is relatively low. At least, the students can compare their teaching methods and attitudes.

It is hard to judge what happen in the Chinese teachers' classes in details, but at Xingjian College they are openly assigned by the administration to prepare students for the national exams that traditionally takes a lot of students efforts as the Chinese employers actually pay big attention to graduates' certificates and how many of the national certificates of honour a graduate obtained such as Test for English Majors-4 and -8, College English Test-4, 6 and 8, The College English Test-spoken English Test (CET-SET) etc. (Jingyang Jian, 2006, p.p. 30-34)[v] So in those still pretty much exam oriented classes taught by Chinese teachers something valuable is learned there and some knowledge acquired. In this regard, not much can be done, a 3000 years of Chinese educational exam-oriented tradition cannot be scrapped quickly, but the purpose of reducing this exam-orientation influence is clearly visible.

When it comes to foreign teachers' schedules, there is big number of subjects that repeat themselves. Some subjects taught by foreigners have some content related to English culture and the Humanities, such as British Literature, American Literature, American Culture, English Speaking Countries where history, social systems, culture of English speaking countries are studied. At the same time, there are many disciplines based exclusively on communication and students' use of the language: Communication, Listening, Writing, Comprehensive English, Extensive Reading, Integrated English Skills and special language courses such as Interchange, Passages. Such abundance of communicative subjects is understandable as outside those classes with foreigners Xingjian students have very few chances to speak and use the learned language (English speech contest, English corners, some relatively rare seminars, lectures and classes, otherwise what is left are just self-study, phone calls to friends in other countries, TV and video, karaoke bars, written communication with schools and companies students want to continue their studies or work for).

Each class has at least three courses based on communication in English such as Communication, Interchange, Comprehensive English, Integrated English Skills in addition to more traditional Creative Writing, Extensive Reading, Listening. As a result, the students practice similar communicative skills in different situations under the guidance of different foreign teachers in accordance with the principle "the more English communication, the better". Perhaps, the administration and the students' parents who pay three times more for the same standard course of English do not mind. The curriculum development is a professionals' business and the experts can always explain and back up their choice of courses. Plus, the preparation for the national exams TEM-4 and TEM-8 still continues to dominate in the students' (as well as their parents') minds, so the foreign teachers help the students pass the Chinese exams many teachers even have no idea of.[vi] Needless to say, the TEM-4 and TEM-8 pass rate at the college is very low as the majority of the foreign instructors do not know about the Chinese national exams for English majors. It makes it one of the most obvious contradictions within the Chinese education system in English.

There is a doubt whether this big amount of teaching hours spent on studies of the oral English language under various rubrics of Interchange and Passages raise quality of education. First, oral English studies in big groups of students of different levels are not very productive by definition, although the size of classes at Xingjian College is 30 students only. At Jiaying University's Foreign Languages Department, this number is much bigger, 40 or even 45 on average while it can be up to 60-70 people in a class of non-English majors. Second, normally, ESL foreign teachers hired as ESL teachers cannot offer anything else as their professional competence varies significantly from college teachers and engineers to landscapers and truck-drivers. Their professional competence is often superfluous as, even if they may be able to teach some subjects related to their professions in the past, the Chinese students have came to this college not for studies of Mechanics or Electronics, but for courses on English language, culture, elementary managerial and business practices. So a foreign ESL teacher at Xingjian (as well as at thousands other colleges in China) has to teach ESL and English speaking countries culture related subjects and courses exclusively, so very often it turns into just teaching the students basic English, some personal experience and, sometimes, elementary business practises. As the teaching is mostly based on personal experience, edutainment prevails. It certainly has some value and teaching function, but hardly can be called an education in proper sense of the word as the students' logical and interpretational skills, generalization abilities and cultural horizons are not developing alongside the language speaking skills, but very often stagnating as there are not enough professional teachers to help develop these skills.

This is the main problem of educational projects in the English language in Chinese colleges like Xingjian: from the sociological standpoint, the educational process is based on repetition of similar or even the same educational situations under the guidance of different non-professional teachers. The

student has to repeat the same phrases in different situations, but eventually it is the same ESL i.e. grammar, syntax, communication in English, reading of texts aimed at just understanding and reading comprehension but not acquisition of various interpretation skills and strategies what a proper education in the learned language should be based upon. So the Chinese college of very expensive and even, to a certain extent, elitist education in English function as a karaoke-bar where faces, music and lyrics change, but the communication and performance standard is the same – repeating, following or lip-synching the teletext. In this case, the students certainly learn something valuable, but not as much as they could and pay for. Their talents, basic logical and generalization skills stagnate. As it's impossible to sing better than a singer in a karaoke sample, so the students can never do better than in the original. Ideally, students should have such a chance of doing better than the karaoke-original, but the college doesn't provide it.

Academic Stability, Normalcy and Predictability

Another big problem of Chinese colleges like Xingjian is their instability, not in terms of finance, but in terms of academic curricula and teaching practices. In well-established western universities, very often it doesn't matter who teaches the course, conducts seminars and tutoring as the level of teaching, standardized procedures, syllabi, teaching practices have been stabilized for a long time, if not for centuries. Plus the students' orientation to gain knowledge independently and the teacher's role as a facilitator in this process help motivate the student audience. In China, the role of personality of the teacher is still very important as the foreign teachers' academic level, backgrounds, motivations, experiences are vastly different even within one college and often vary from a retired truck driver or church minister to a retired or acting university professor. In the situation of low motivation and lack of real perspectives to use the English language in everyday life in China, the teacher's level and personality type really matter

In such an unstable academic situation when the contingent of foreign teachers is hired randomly on the basis of not their teaching and research credentials (many people Xingjian college hired within the last 3 years, for example, just did not have them at all, and most of 100.000 English teachers hired in China annually do not have teaching experience, let alone teaching experience in China) and academic achievements how it always happens in western colleges and many Asian universities now, but, in fact, on the first come/first hired basis, the secondary elements of the traditional academia should be emphasized: stability of curricula and syllabi, predictability of courses and textbooks, clarity of contracts and their extensions, predictable policies and micromanagement practices. The system "Chinese college-foreign teacher" needs stability and predictability of teaching plans and syllabi to give teachers more time to prepare for courses as it happens in the best Western universities. If a teacher knows what s/he will teach next term, next year, in 2 years, s/he will prepare better and it will look like a serious job with serious attitude rather than a search of tourism opportunities. With the college high salaries, by Chinese standards, the teacher doesn't need to change places in China often, s/he can travel around China in holiday. And it the administration adds some opportunities from research and supervising students dissertations helping them with their research, then it will eventually look like a solid western university.

When the number of foreign teachers exceeds 25 like at Xingjian College, the everyday micromanagement tasks should be assigned to an authoritative group-leader, a professional with big teaching experience but not a Chinese administrator with minimal international experience or foreign dilettante-teacher. This teacher can be paid a full salary just for administrative job and setting up exams and syllabi which will result in a unification of the teaching processes. There will be no need in co-ordinators, all other intermediary leaders and administrators as the process will be similar to the normal practices of traditional western universities, so the academic situation and paradigms will be close to normalcy.

The factor of stability and predictability of courses and teaching loads is becoming crucial as the number of poorly motivated students in Chinese college classrooms exceeds the limits teachers in Western countries have got used to, so the teaching and communicative skills, variety of teaching techniques, various classroom student centred activities and extra teaching materials are vitally important to keep the students interested in the process. All these things require the teacher's time, experience (that should be acquired within a few months, if not weeks), desire to change and learn in the completely new teaching environment when the teacher and just a few good students in classroom are really interested in learning, and they both have to make efforts to keep the class silent majority at least partially involved. The situations like the one I described are very common at Xingjian College. A foreign teacher with minimal or zero experience (they keep hiring this sort of people despite the clear tendency that these newly converted English teachers don't stay at Xingjian longer than a year) will in

100 % cases prefer to establish friendly relationship with students first and very often at any cost, but he majority of the students want an easygoing and relaxed teaching approach, minimum or no home assignments and just a pleasant classroom atmosphere.

So the teacher, particularly a newcomer to China, faces a dilemma. S/he inevitably has to cater for the interests of the two (sometimes 3) clearly cut groups, the minority who seriously want to learn, to use time productively in classroom, participate and the majority who just want to have a good time, to entertain themselves, to relax and, maybe, to learn some easy things. The 3rd group can be just those ballast students who can join both groups depending on their mood or the teachers' policy. For an experienced teacher with a strong will and communicative skills, a lot of teaching techniques and prepared material, normally, this is not a big challenge as the situation may be similar to the one in a problematic public school in the US or Britain, and after 3 or 4 years of teaching in this environment people can handle the arising problems with motivation and discipline relatively well.

The newly arrived teachers are very often completely lost facing such a problematic Chinese class, so the struggle to find a way of balancing between the two competing groups without giving too much preference to any. Here is the crucial moment when the Chinese administration can really help. They have to abandon their attitude based on the native-speaker-ideal fallacy[vii] and recognize that even if they hire native-speakers on the basis that they are considered better teachers, these NS teachers are not automatically competent in any aspect of English teaching and many of them actually need elementary help in class-management and everyday communication with students. The most important help from the college administration that a freshman English teacher can rely on is, apart from the expected (but not often provided at all) detailed job induction and thorough introduction of the strong and weak sides of the particular college's students community.

The crucial moment in this fragile process of establishing the right work ethic among the poorly motivated college students is when the college administration has to unquestionably support hard working and motivated students. These class leaders and the best students should be instructed on how to establish the good working relationship with a new teacher and how to help a new foreign teacher with minimum or no experience to teach in the most effective way.

The next big problem is what to do about the (unfortunately, dominant in many Chinese private colleges) vast majority of mediocre, inept students who are generally not good at academic studies and they just happen to be at this college due their family financial support and pressure to learn English. Their academic difficulties can be also attributed to the different learning styles they prefer from visual, analytic to tactile and kinaesthetic. These students can be even called the victims of this recent frenzy and common fashion of English learning in China as they naively anticipate that they will learn the target language quickly and easily, but in still very big Chinese classes of 30 students, achieving a high level of oral and written English proficiency is rather an exception than a rule. As soon as those mediocre students realize that learning English at the highest level is not a cake walk, they lose interest and become a burden for the teachers and classmates.

Rao Zhenhui, the Chinese ESL expert, suggested "that teachers employ instruments to identify students' learning styles and provide instructional alternatives to address their differences, and that teachers plan lessons to match students' learning styles while at the same time encouraging students to diversify their learning style preferences. By doing this we can assist our students in becoming more effective language learners."[viii]

The obvious rational objection to Rao Zhenhui's suggestion is that similar mismatches between learning and teaching styles happen in every classroom all around the world regardless of the students' dominant learning style which is, in all probability, visual as the recent influence of TV, movies, video, etc. So the ESL (and other) teachers all around the world normally cater to this new shift in their students' preferences of learning styles, and the use of visual teaching materials, PowerPoint presentations is on the rise in classrooms everywhere. But there is one big difference between the western universities' classroom and the one in Chinese private colleges that reinforces the need for teachers to cater to all students' exclusive and individual learning styles and intelligences whatever exotic they may be: in western universities students (with such exotic and rare learning styles like musical or spatial as they described in Phyllis Ghim-Lian Chew's *Globalization, Multiple Intelligences, and ELT in Singapore*) have to adapt to the dominant visual, verbal and analytical teaching styles, because if they will not do that, they will fail the particular course and eventually be expelled from the college. At Chinese private colleges and many 2nd or even 1st tier colleges, Chinese students do not have to adapt and do not feel forced to adapt as they will not be expelled from school on such an insignificant reason as failing one or two courses, even if they fail a foreign teacher's course many times. The student's chance of failure and eventual expulsion from school makes a big difference, and many foreign teachers at Chinese colleges would certainly like to see a much bigger number of lazy and unmotivated students to be just expelled.

At western universities, nobody will care about switching the university class to a dancing or singing or drawing contest, as most of the time, the students have to adapt to social dominant rules. In Chinese classrooms, the financial reasons, face-gaining and preserving issues, guangxi-based relationship between college administrators and students' parents happen a way too often, and this loophole allows many apparently lazy and undisciplined students hamper the others' progress.

Conclusions and Suggestions

The principle "the more English communication, the better" for the system "Chinese college-foreign teacher" is questionable. Eventually, it has to be converted into "The more quality communication in English, the better". The administration should find out what other strong sides foreign teachers have apart from being native speakers of English, to find out where their best professional competence is, and try to distribute courses in accordance with the competence. Similar communicative courses like Interchange, Integrated English Skills, Comprehensive English, Communication where students do the same things should be diversified and supplemented where possible by other courses foreigners can deliver such as business practices, internet technologies, computer technologies, practices of multinational businesses, western culture, philosophy, sociology, history of some countries (let it be Australia or New Zealand, countries the course of English Speaking Countries is normally not focused on).

It should be their real history with real problems (not the teacher's personal adventures there), the syllabi can be productively borrowed from Australian and New Zealand universities and schools, so level of the course and teaching will be higher and the teacher's task will be just to adapt the course to the low motivated Chinese students. In any case, the raising of the teaching level will keep away people who come to China for a change, to relax, to find a girlfriend, to raise the low status in their home country, to spend some time before retirement etc., but it will eventually improve the college reputation. Those strangers in teaching profession and second youth seekers will have to go to less demanding places or just start working better.

The amount of plagiarism in writing students dissertation should be drastically cut down. This is the crucial moment when the Chinese administrators should act quickly and decisively, even if their understanding of what academic plagiarism is still may be blurred.

The administrators should stabilize the academic environment at private colleges, provide a semi-western or at least westernized teaching and academic situation with priorities given to those students who are actively participating in real plagiarism-free research projects an eventually get a high retention ratios. They should rely more on foreign teachers' expertise and utilize it fully in terms of courses people are given to teach and research projects they conduct with students instead of so common, but boring dinners the beginning and the end of semesters and team-building meetings that help to report about "cultural synergy and collaborative culture where foreign expertise could be fully utilize to serve the Chinese ELT purposes" (Li Ming-sheng, p.225), but in reality they just waste people's time.

Finally, Chinese education in English should be presented not as a commercial project only with all its shortcomings such as the reluctance to expel students for bad examination results and plagiarised dissertations, i.e. the education should be transformed from a cake walk edutainment under the guidance of not-demanding dilettante-teachers into the traditional academic paradigm as the hard work endeavour with a risk of failure.

Paradigm Shift in Second Language Education: In second language education, the principal paradigm shift over the past 40 years flowed from the positivism to post-positivism shift and involved a move away from the tenets of behaviorist psychology and structural linguistics and toward cognitive, and later, socio-cognitive psychology and more contextualized, meaning-based views of language. Key components on this shift concerned:

1. Focusing greater attention on the role of learners rather than the external stimuli learners are receiving from their environment. Thus, the center of attention shifted from the teacher to the student. This shift is generally known as the move from teacher-centered instruction to learner-centered or learning-centered instruction.
2. Focusing greater attention on the learning process rather than on the products that learners produce. This shift is known as a move from product-oriented instruction to process-oriented instruction.
3. Focusing greater attention on the social nature of learning rather than on students as separate, decontextualized individuals.
4. Focusing greater attention on diversity among learners and viewing these differences not as impediments to learning but as resources to be recognized, catered to and appreciated. This shift is known as the study of individual differences.
5. Focusing greater attention on the views of those internal to the classroom rather than solely valuing the views of those who come from outside to study classrooms, evaluate what goes on there and engage in theorizing about it. This shift led to such innovations as qualitative research - with its valuing of the subjective and affective, of the participants' insider views and of the uniqueness of each context.
6. Along with this emphasis on context came the idea of connecting the school with the world beyond as a means of promoting holistic learning.

7. Helping students to understand the purpose of learning and develop their own purposes.
8. A whole-to-part orientation instead of a part-to-whole approach. This involves such approaches as beginning with meaningful whole texts and then helping students understand the various features that enable to texts to function, e.g., the choice of words and the text's organizational structure.
9. An emphasis on the importance of meaning rather than drills and other forms of rote learning.
10. A view of learning as a lifelong process rather than something done to prepare for an exam.

[v] Jingyang Jian, *Communicative Activities in EFL Classrooms*, Zhejiang University Press, 2006. p.173: "Some college and universities have included the oral test as a course requirement. Students feel more motivated to practise oral English, even though it is an extrinsic motivation, but it is better than none at all" (p.34).

[vi] Chinese students and administrators are still preoccupied the national exams. There are many examples of the negative influence of the exam-oriented system on the students' achievements such as: "However, Nobel Prize has never been issued to any scholar from the Chinese mainland, as examination-oriented education here pushes students to become interested only in the result of examinations, rather than the mastery of knowledge." // http://www.7139.com/ennews/edu/200808/64909.html

[vii] "The native-speaker-teacher ideal has remained as a central part of the conventional wisdom of the ELT profession. As with many hegemonic practices, there has been a tendency to accept it without question" - Phillipson R. *ELT: The Native Speaker's Burden?*// Hedge T., Whitney N.(Eds.) *Power, Pedagogy & Practice,* Oxford, Oxford University Press, 1996.p.p. 27.

[viii] In all academic classrooms, no matter what the subject matter, there will be students with multiple learning styles and students with a variety of major, minor and negative learning styles. An effective means of accommodating these learning styles is for teachers to change their own styles and strategies and provide a variety of activities to meet the needs of different learning styles. Then all students will have at least some activities that appeal to them based on their learning styles, and they are more likely to be successful in these activities. Hinkelman and Pysock (1992), for example, have demonstrated the effectiveness of a multimedia methodology for vocabulary building with Japanese students. This approach is effective in tapping a variety of learning modalities. By consciously accommodating a range of learning styles in the classroom in this way, it is possible to encourage most students to become successful language learners. (Zhenhui Rao, *Matching Teaching Styles with Learning Styles in East Asian Contexts* // The Internet TESL Journal, Vol. VII, No. 7, July 2001 (http://iteslj.org/Techniques/Zhenhui-TeachingStyles.html)).

Overcoming obstacles to integrate of Media Education in school curricula

Abstract

The production of media messages contributes to the development of critical skills on the analyses of media messages. However, teachers and students do not have opportunities to work in the production of media messages at school. This paper presents the preliminary results of a research project whose aim is to help teachers and students in the production of on-line and/or printed school newspapers in order to develop Media Education in the Region of Castelo Branco, Portugal.

1 - Media Education: overcoming obstacles

Media Education has never been so present in the agenda of educators and the researchers as nowadays. Following the efforts of Unesco that started in the 60s and Grünwald Declaration in 1982 the development of Media Education was not equal in every country. Nowadays countries like Canada, Australia and New Zealand overcome the expectations when implementing this area in the curricula so important for the long life learning of the citizens of the 21st Century.

Most of education comes through media that do not show reality but represents it (Potter, 2005). Citizens must therefore be able to interpret critically media content besides producing media messages. Production is a key skill to develop critical analyses of media messages (Carlsson e von Felitzen, 2006).

Media Education will be the pedagogical activities developed in order to increase Media Literacy of citizens being the later result of the first. (Buckingham, 2003). We identify with the following definition: "Media literacy is the ability to access, understand, analyze, evaluate, create and communicate information in a variety of contexts and formats, including print and non print, in order to empower citizens to control their relationship with the media" (Comrie, Vacarino, Fountaine e Watson, 2007, p. 14).

So we can understand the effort of other countries and organizations to follow the most developed countries in this area. This year the United Nations through the Alliance of Civilisations and Grupo Comunicar (Frau-Meigs and Torrent, 2009) published a book on the situation of Media Education in several countries of the five continents. In the book it is clear that in spite of existing good practices, the true is that many obstacles still exist in the development of Media Education. Another good example arose this year in the United States of America with the creation and the realization of the first conference of National Association for a Media Literate America (Namle), in August 2009. In this conference it was clear that Media Education should be integrated in the curricula of all teaching levels, especially in the initial and in-service teacher training of all scientific subjects. This feeling is similar in the European Union, especially in the beginning of this century with the realization of the first European Congress on Media Education and the creation of the Media-educ (2004) network on-line. Two years after this network evoluted to Euro Media Literacy network, that produced and published the European Charter for Media Literacy (2006), signed by hundreds of people of several countries. In 2007 the Universitat Autònoma de Barcelona was asked to produce the state of the art of Media Education in the European Union. The results showed that there is a great work to be done in relation to four fundamental aspects: i) designation and consensual definition of Media Education; ii) teacher training; iii) integration of Media Education in the curricula; iv) the development of research projects on Media Education in schools (UAB, 2007).

As a consequence of the state of the art, the European Commission (2007) published a Declaration that defends the urgent integration of Media Education in all curricula of all teaching levels. This proposal was reinforced in a document approved by the European Parliament (2008), as a consequence of an Austrian proposal. This one was also one of the twelve proposals published by Unesco in a conference held in Paris to commemorate the 25th anniversary of the Grünwald Declaration.

As a consequence of these documents and having in mind the work developed by several European researchers (Buckingham, 2007, 2008; Frau-Meigs, 2006, 2008; Rivoltella, 2007), we identified several obstacles that the development of Media Education face, as follows:

a) The digital divide between: rich and poor countries; generations; students;
b) The conservative character of the educational systems;
c) The indefinition about the best way to insert Media Education in the curricula;
d) The low support politicians dedicate to Media Education;
e) Copyright questions (*i.e.* non-acceptance of fair use);
f) The low interest media demonstrate about the media messages produced by children and young people;
g) The lack of educational resources both in human and in technological terms;
h) The lack of cooperation between different knowledge areas, educative, social and political actors;
i) The lack of evaluation of the projects developed, which is fundamental to give visibility to these projects and also to good practices could emerge.

These obstacles are common to other countries in the World as well as the proposal to overcome them. Out of those proposals we summed up 20 organized in five groups:

Education and training

a) Media Education must be inserted in the curricula of every teaching level (including teacher training) that may be adaptable to local contexts.
b) Initiatives in the field must be on production of media messages, creativity and interactivity within and outside the school;
c) Media Education must be faced within cultural logics and not within a functionalist one;
d) Media Education must be included in life long education;
e) It is necessary to pay attention to copyright;
f) It is necessary to mobilize all the actors of the schooling system to integrate Media Education in the curriculum.

Academic research

g) Develop research in the field;
h) The research must: *i*) be interdisciplinary ; *ii*) include literature review; *iii*) assess practices; *iv*) define quality criteria; *v*) define skills to acquire each school level; *vi*) help field projects; *vii*) analyse the contribute of other actors (parents…); *viii*) include dialogue with teachers that work in direct relation with students;
i) Define evaluation criteria on citizens literacy as well as criteria for evaluating initiatives and projects;
j) Develop pedagogical resources (in traditional and/or digital support) validated with students, teachers, researchers and media professionals;
k) Create dissemination networks of research outcomes at local and international level, increasing international cooperation;
l) Define methodologies that foresee an evolution of the role of the teacher and the higher participation of students and connection with the community;
m) Create ethical recommendations for researchers.

ICT and media

n) Promote the access to media in a ecological perspective so that everyone can accede all traditional and digital media;
o) Discuss educational licenses so that schools have access to the most recent technologies and contents;

Institutions

p) Involve regulators in order to promote co- and auto-regulation with;
q) Organize seminars, meetings, international conferences to exchange experiences;
r) Sensitize and mobilize the policy makers to the importance of Media Education showing them outcomes of the developed initiatives;

Civil Society

s) Alert public in general to the importance of Media Education of citizens of the 21st Century;

t)   Mobilize all the actors, parents, teachers, media professionals and youth associations.

2 – Media Education in Castelo Branco (Portugal): 2005-2010

A research project to overcome the situation in Portugal started in 2007. We had in mind the obstacles and the proposals to overcome them and the research steps were based on the following:

a)   Develop pedagogical multimedia tools to support students and teachers in the production of media messages;
b)   Validate material with experts, teachers and students;
c)   Develop research in schools with students and teachers;
d)   Associate university research, teachers and media companies;
e)   Involve the Ministry of Education;
f)   Disseminate the Project and his outcomes in a Internet site as well as in national and international conferences;
g)   Organize two conferences (one national and one international) to present the final outcomes.

First we decided to work with printed school newspapers because new media did not replace the old media (Lievrouw and Livingstone, 2006). Besides school newspapers are among the media most present in schools. The great majority of Portuguese schools publish regularly a printed school newspaper (Gonçalves, 2007).
In Portugal since 1991 there is the National Contest of School Newspapers promoted by the daily newspaper Público (2005) and the Ministry of Education. Every year around four hundred contestants participate either in paper or on-line. The National Curriculum of Basic Education also points out actions to be developed by each teacher in order to help students to develop skills like: i) bring together school and current life, with particular emphasis on important issues; ii) help youngsters to decode media language; iii) develop a critical approach; iv) encourage the school population to read newspapers; v) guarantee a more active learning of the Portuguese language. Among those actions there is one that foresees the need to establish a narrow link between school, media and ICT (Ministério da Educação, 2001).
Our interest is in newspapers mainly school newspapers because we think that they can have an important role introducing Media Literacy in the curricula. School newspapers are nowadays published either in paper or on-line, being a link between traditional and digital media. The school newspaper is to Pinto (1991) an easy and cheap media, an important resource to develop critic sense, reflexive styles and habits and creativity, respect for diversity of opinions and the interest in up to date news. He also states that the newspaper can be used in the classroom as a meaningful pedagogical and didactic help in several subjects.
School newspapers production can increase citizens Media Literacy level but there are several obstacles to that production. According the research developed by several authors (Abrantes, 1998; Beach, 2007, Breda, 2005; Carlsson e von Felitzen, 2006; Chenevez, 2007; Costa, 2006; Gonçalves, 2007; Gonnet, 1999, 2006; Lescaille, Correy and Famery, 2004; Mediappro, 2006; Pinto, 2003) we identified the following obstacles to school newspapers production:

a)   Lack of teacher training;
b)   Lack of students training;
c)   News not following journalistic rules;
d)   Students do not participate at every stage of school newspaper production;
e)   Inexistence of a deontological code for youth;
f)   Topics of news for the school newspapers are imposed to the students;
g)   Copyright issues;
h)   Inexistence of school newspaper data bases;
i)   Poor printing quality and limited editions;
j)   Limitations to circulation;

2.1 – Production and validation of the CD-Rom "Let's produce school newspapers"

We have decided to develop and validate the CD-Rom "Vamos fazer jornais escolares" ("Let's produce school newspapers"), whose aim is to help 11-16 years old students and their teachers in the production of school newspapers either printed or online.

At a specific level the CD-Rom aims to: *i*) training and motivation of students and teachers to the pedagogical use of newspapers; *ii*) develop skills in students in order they become critical readers; *iii*) develop skills in students that allow them to produce critical and reflexive media messages; *iv*) citizenship education. As far as the contents the CD-Rom is organized in seven units: newspaper organization, writing to the newspaper, newspaper production, newspaper analysis, from paper to the www, resources and FAQs. In these units written text, audio, photos and videos are available. It also includes a navigation map, a glossary, help and a section about the CD-Rom, where the contents, objectives and types of activities are explained.

DVD main entrance

The CD-Rom was validated by multimedia and newspaper experts, and was tested by 104 students and four teachers in two Portuguese schools along a school year. Classes were video and audio recorded and field notes were also taken. The results from this PhD thesis showed that:

a) 102 in 104 students referred they liked working with the DVD;
b) 99 in 104 students referred that the DVD helped them in the production of contents for the school newspaper;
c) According to the teachers involved the texts written by the students came close journalistic texts;
d) The number of collaborators to make the school newspaper overcome, for the first time, 50 people in each school;
e) Students wrote texts specifically aimed to be published in the school newspaper;
f) Texts that motivated the students more were those whose topics were chosen by them or negotiated with the teachers;
g) Teachers referred that the DVD was innovative, underlined more motivation, autonomy and responsibility by the students.
h) Before using the DVD students wrote mainly about: *i*) major issues; *ii*) other school issues (i.e. study visits); *iii*) important dates like the Father's Day, Mother's Day, St. Valentine´s Day, and so on. When the DVD was used, students wrote about: *i*) animal protection; *ii*) sports (i.e. World Cup); *iii*) history of the ice-cream; *iv*) music (the hip-hop culture; MTV Music Awards); *v*) The replacement classes; *vi*) The school bar schedule; *vii*) The bad quality of the food of the school bar.

The students have also interviewed ex-school colleagues that were already working, the Spanish teacher and the new school principal. One of the issues that seemed important was the fact that students worried about writing articles about matters that interest them but in their opinion also interested their school mates. They worried to write for an audience at the same time they were part of that audience, because they were readers of the school newspaper (Tomé, 2008).

2.2. – From the PhD thesis to the research project

The results were quite good. So we decided to present a research project having the PhD thesis and the improvement of the CD-Rom as the starting point. The Project was funded by Fundação para a Ciência e a Tecnologia and European Social Fund. It was called Media Education in Castelo Branco region and

aims to: *i*) allow students and teachers a better knowledge in relation to the several steps in the production of a printed or online newspaper; *ii*) improve newspaper reading; *iii*) contribute to students become critical decoders and reflexive producers of media messages; *iv*) increase the use of digital media (DVD, Internet, ...); *v*) improve contents and graphics of existing school newspapers in the region of Castelo Branco; *vi*) approach schools to the educational community.

The Project also developed a handbook to help teachers with pedagogical activities, a website (www.literaciamedia.com) and a template to help teachers and students producing online newspaper.

The website of the Project underlines mostly the essential news to be developed during the three years of the Project. It is a mean to get in touch with the newspapers produced in schools by students and teachers, having also a fundamental role – to enlarge the relationships among the researchers, and the teachers of the participating schools. Besides the support of members of the project in schools whenever necessary the objective is to take advantage of new technologies. All the doubts and problems that may arise may be solved through the creation of a forum in the project website that may prevent travelling around the region and a waste of time.

Project Website

Although authors as Breda (2005) and Gonçalves (2007) considering that it is too soon to what they call "cybernetic derive" of the school newspapers as they estimate that the number of schools that edit a school newspaper does not reach more than 10 per cent, we decided to create tools so that students and teachers could produce on-line school newspapers on a regular basis, even without expertise in the field.

 Template for on-line newspapers production

We created a platform, to be available to all participating schools during the first semester of this school year, with the following characteristics:
   a)   Each school can produce one or more newspaper, with different editions of each one;
   b)   Titles, subtitles and contents are personalized, so sections and subsections are defined by the newspaper editor;
   c)   News can be in various formats such as text, images, audio, video, as well as files with more than one format, i.e. multimedia;

d) Image, audio, video or multimedia content can be inserted no matter the format or the file of the file because the platform has a system that adapts the file to be visualized on-line;

e) Contents can be edited by school administrators, newspaper administrators, teachers and students, however the contents produced by the students must be allowed by the editor before being shown on-line;

f) Content insertion can only be done by registered users. The registration is done by the editor of the newspaper and so users can only introduce news for the newspaper they are registered in;

g) The newspapers produced by the schools can be printed as the platform creates a PDF version automatically;

h) The platform has a system that allows news to be visualised in PDA cell phones with Internet.

The handbook frames Media Education in Europe and in Portugal, explains the Project as well as the DVD "Vamos fazer jornais escolares" contents and some pedagogical worksheets that teachers can use with their students. In the second part 14 technical worksheets are included in order to help teachers interacting with newspaper production online platform.

3 – Preliminary results

The DVD, the handbook and the access to the online platform were given to the 24 schools in November and December 2008. 50 teachers and 623 students are working in the Project. Besides the material the research team was always available to support teachers and students going two schools whenever asked.

The research team is made up by researchers of five Portuguese universities and two foreign universities (Italy, France), and has the support of media a company Netsigma and the biggest newspaper in Castelo Branco, Reconquista, that prints the school newspapers produced freely.

After the data analysis of the interviews made to the teachers we concluded:

a) Schools published more editions with more copies: 23 out of 24 schools published a printed newspaper (15 schools published three editions and the others only two) with one thousand copies per edition.

b) Only five schools published an online newspaper and only two used the online platform. Those who did not published an online newspaper justified it with lack of time, the existence of a school Moodle platform, hardware problems and the existence of a PDF edition of the printed newspaper.

c) The DVD was used by the students of the 12 schools that had a journalism club. In three schools a DVD was used by the students only once or during the first week of classes (3) being locked up afterwards. In the other schools it was used only by the teachers (4 schools) or it was not even used. Teachers who did not used the DVD said they had no time or had no instructions to use.

d) The DVD was mainly used in the computer room, in the journalism club or in regular classrooms with laptops. It was also used in Portuguese and ICT but mainly in non-disciplinary areas (Project, Citizenship Education and Accompanied Study).

e) Teachers considered the DVD accessible (E8, E24), helped to structure the news (E1, E14), and to produce news according to the different journalistic genres (E9, E 10, E12, E24), besides facilitating the contact with newspaper lay out (E2). It was also used as a guide (E11, E17, E19, E20), explained where to search images with no copyright (E9, E14), followed the concept of hypertext (E12) and it was used to teach the units on journalistic text in the 3rd Cycle (E14, E22). "11th Grade students looked up for chronics and wrote some. I think we gave them wings to do and to publish their work" (Teachers from school E14r).

f) Teachers did not point out difficulties in the use of the DVD but referred obstacles in the implementation of the Project. Students copied text from Internet and used them as their own (E4), besides hardware problems (E5, E8, E14). "The Computer Room was not free in the schedule of the journalism club. The room given to the club had computers that did not work properly. The laptops available had lots of virus" (Teacher from school E8).

g) Only 12 out of 24 teachers admitted that the DVD had a positive impact in the production of the school newspaper mainly concerning to the news structure (E1, E15), the quantity of news and improvement for the next edition (E2, E4, E9), in terms of enthusiasm, discovery and novelty (E12) and the students autonomy in the production (E15). It was also important because the newspaper contained more news written by the students (E14, E17, E22, E23). "Before the newspaper only had news written by the teachers. The importance is that it becomes a newspaper written by students and that is what a school newspaper should be. And

had section as Books, Films, Games, sections the students wrote" (Teacher from school E14). In the other schools nothing changed in the production of the school newspaper.

h) The handbook given to schools printed and in PDF format was only used by five teachers but not really explored. In the majority of the cases it was kept and the pedagogical worksheets related to the use of the DVD were not used. In the schools it was used it supported the interaction with the online platform.

i) This school year only 16 out of the 24 teachers coordinating the project in the schools are available to work in the project. Three teachers were assigned to other school, five teachers that stay in the same school said they were tired, had no support and no time to go on developing the Project.

j) In four schools were the project is going on with the same teachers important improvements were verified: *i*) in the E19 school they proposed the school board a specific Project on the production of media messages; *ii*) in the E16 school the teacher asked for the school board more hours to develop the project; *iii*) in the E21 school the teacher is going to work with a class, before he was in charge of the library; *iv*) in the E2 school the Pedagogical Board approved the creation of a journalism club.

4. Conclusion

The DVD "Vamos produzir jornais escolares" can have an important role in the support of teachers and students as far as the production of school newspapers either printed or online. Its use depends, however, on the availability of the teachers as well as the functionality of hardware. Teachers that used it before consider that it had meaningful impact in the process of school newspaper production namely in what concerns the respect of the journalistic text rules, the quantity of texts produced, autonomy of students and inclusion of text written by students in the newspaper. In the schools the DVD was not used the school newspaper went on being produced as usual with texts written not for the school newspaper exclusively and with no concern with the rules of journalistic texts.

In spite of an online platform being created its impact could not be verified because only two schools used it. The rest of the school said they had no time and experienced difficulties with the platform. Our intent is therefore the inclusion of a template of a newspaper that each school can use to create its own online newspaper. Besides these two schools only three others published an online newspaper which is according to the literature that refers that is too soon to the cybernetic derive as far as school newspapers.

The handbook was only used in five schools so the pedagogical worksheet had no effect as they were not used. We intend to present and disseminate the handbook to the teachers now we have the final printed version.

From the data analysis we could verify that the schools that used the DVD more often were those with a journalism club. But the biggest issue seems to be the lack of time. Teachers only have one to three week hours to produce news with the students and the newspaper, what makes many to work extra hours to complete the task. Lack of time is also referred by students has one of the teachers stated: "The project is very interesting. It is a pity that teachers and students can not afford time. Students have examinations, homework. Our teaching is this way. Their schedule is fuller and fuller with more activities" (Teacher from school E14). It is important therefore that all educational teachers but manly policy makers concern with this area so that Media Education can be a reality in the curricula in Portugal.

Teaching about media: a borrowed solution in education for worsening media environment in Taiwan

Lin, Tzu-Bin

tzubin.lin@nie.edu.sg

ABSTRACT

Following the expansion of Taiwan's mass media after the end of military rule in 1987, there has been growing concern about the worsening media environment. The worsening media environment has been a long-lasting social phenomena in Taiwan since the early 1990s after the lift of martial law and the open of media market. This phenomena brings various debates and causes moral panic among parents. Advocates from difference sectors of Taiwanese society successfully lobbied the Ministry of Education (MOE) in 2002 to initiate media literacy education which is viewed as one solution to the worsening media environment in Taiwan. As the first country in the East Asian region to promote media education in both formal and informal education systems, Taiwan's media education policy occupies a significant place in the development of media education in the region. This policy initiative aims at preparing students for a complicated media environment through borrowing the idea of media literacy from other countries like the UK, US and Canada.

This paper is going to explore the following issues:

1. How and where did the Taiwanese look for a solution to a local problem globally?
2. To what extent did the borrowed idea practice in a local context?

Empirical data are from interviews with policy-makers and stakeholders as well as the policy text. Drawing on theoretical and methodological approaches from policy sociology and critical discourse analysis, this paper focuses on how the discourse of media literacy which is borrowed form other countries is constructed to suit the local context and provide a potentially workable solution to the social problem locally. The importance of the paper is to provide a case study of policy borrowing and transferring in the East Asian context.

The Need to Teach Ungrammatical English

Kenichi Namai

Waseda University

Educators in the world need to be totally objective about the usefulness and linguistic status of English as a Lingua Franca (ELF) and incorporate it in their curriculums if they genuinely wish to achieve their aim of English Language Teaching (ELT), namely helping students to develop (verbal) communicative skills in English. From a pedagogical point of view too, ELF is systematically accommodated for nonnative speakers and thus more learner-friendly than native speakers' English.

1. Introduction

Ministries of Education in many countries where English is being taught as a foreign language look to countries where English is a native language for appropriate methods, and they have adopted Communicative Language Teaching (CLT), which is indeed used widely by native English-speaking teachers in their own countries (McKay 2003). As Bax (2003) points out, however, this is rather unfortunate, since CLT has always neglected one key aspect of language teaching – namely, the context in which it takes place. As a result, CLT has never worked in countries like Japan, where main focus of education is still on heavy-duty examination preparation.

In today's globalized world, it is often the case that nonnative speakers of English communicate in English with other nonnative speakers, and what becomes crucial in this context is modification of native speakers' English for easier comprehension between nonnative speakers. This is English as a Lingua Franca (ELF), and it even works in communicating with native speakers. After all, the aim of CLT is to help students develop communicative skills, and therefore the concept of ELF is fully compatible with CLT, the actual practice of which also emphasizes fluency rather than accuracy, in order to instill self-confidence by fostering a positive learning environment. Then why not adopt ELF from the beginning?

In what follows, I will argue, with special reference to the context of Japan, that if CLT is to be adopted in English teaching, the target should be ELF, not so called standard British or American English, and that written exams should all be replaced by oral proficiency tests based on ELF. I will also argue that educators should be totally objective about the status of ELF, since there is nothing illegitimate about these varieties of English from a purely scientific point of view. It will also be explained in passing how ELF might be more approachable for students who are culturally inhibited from speaking up, such as most students in Japan.

2. Background

Bax (2003) quotes a young teacher describing his arrival in Japan:

> In the manner of H.G. Wells' Time Traveler, I stumbled on a school that had remained oblivious to developments in language teaching, where teachers looked at me strangely when I questioned their obsession with Grammar-Translation and suggested that speaking was the most important skill involved in learning a language. (Diploma essay)

Bax then writes that this teacher immediately criticized far more experienced teachers as failing "without any reference to the culture, the learning context, student needs and wishes, and other contextual factors" (ibid.), only because he was a native speaker of English and he was armed with CLT. Bax calls this the "CLT attitude," which has been shared by the majority of native English-speaking teachers for many years.

Is CLT effective even in countries like Japan, where English is not necessary for building a successful career? The answer must be no, since we are still hearing things like "We need to do something about our ineffective English education system. Most Japanese still can't speak English at all," the same remarks that we heard 30 years ago, despite the fact that in 1987, the Ministry of Education started the JET (Japan Exchange and Teaching) Program, through which native English-speaking assistant teachers have been sent to virtually all secondary schools in Japan to implement CLT. According to *2008 TOEFL Test and Score Data Summary* by the ETS (Educational Testing Service), Japan's TOEFL iBT average score (66) is still among the lowest of all the participating countries in Asia, followed only by Cambodia (65) and Laos (59). It is true that in Japan, very many people, including rather poor

learners of English, take TOEFL yearly, whereas in most other Asian countries, only selected elites can afford to take it, which results in their relatively good average scores. But the number of Korean examinees (128,445 in the 2005/2006 academic year) now surpasses that of Japan (78,635 in 2005/2006), although their population is only 48 million, as opposed to more than 127 million of Japan. Likewise, more Taiwanese than Japanese take TOEFL every year in terms of number of examinees per population; 33,327 Taiwanese out of the total of 23 million ($\approx$ 0.14%) took TOEFL in 2005/2006, whereas only about 0.06% of Japanese (78,635 out of 127 million) did in the same year. And yet, both Koreans and Taiwanese constantly score higher than Japanese, as the following table indicates.

	TOEFL CBT			TOEFL iBT	
	2003/2004	2004/2005	2005/2006	2007	2008
Korea	213	215	218	77	78
Taiwan	203	205	206	72	73
Japan	190	191	192	65	66

CBT (Computer-Based Test): 300 max; iBT (Internet-Based Test): 120 max

Hence, the fact that many ordinary Japanese take TOEFL cannot be a good excuse for their unimpressive performance. As White (1995) points out, educational reforms will be resisted, or modified to fit within established norms if they are perceived as incompatible with or disruptive to the context into which they are introduced. It seems that this is exactly what has happened to the JET Program in Japan.

Nevertheless, the Ministry of Education still holds the CLT attitude and has recently revised its Course of Study (or Teaching Guidelines) for Foreign Languages to further push CLT to high schools. (In reality, "foreign language" is synonymous with English in most Japanese high schools.) Education is compulsory up to junior high in Japan, so every junior high student is thus urged to do communicative English once again. As for senior high English, the new Course of Study specifically states that English classes ought to be conducted in English, in order to ensure that CLT will be adopted without fail. Since more than 96% of junior high graduates now go to senior high school, this means that virtually every Japanese student is expected to practice communicative English for at least six years.

3. Culture

Since English words and phrases are everywhere in Japan, many Japanese youngsters answer yes when asked if they wish to be English speakers, blindly believing that English is a must for success in any career, even though they haven't the slightest idea what it takes to achieve that goal. Moreover, they don't seem to realize that Japanese culture, with which they are totally saturated, is there, for the most part, to hinder their acquisition of practical English skills.

First of all, Japanese culture forces one to ask of oneself questions like *Will I look silly?* or *Will people laugh at me?* whenever they try to do something in public; this is the (in)famous "Japanese sense of shame" that most people come to develop as they grow up in Japan. Students in general thus avoid taking risks of feeling shame at all costs by not voluntarily speaking up in class. So it is only natural that Japanese students "rarely initiate discussion, avoid bringing up new topics, don't challenge the instructor, seldom ask questions for clarification, and don't volunteer answers" (Anderson 1993) even in English speaking classes. This aspect of Japanese culture is so deeply ingrained in Japanese mind that no matter what English teachers do (e.g. Doyon's (2000) suggested strategies to create a more relaxed and intimate atmosphere in the classroom, such as removing the "teacher's" mask, moving away from the evaluational paradigm, etc.), their efforts will simply be wasted unless the whole of Japanese culture changes and starts embracing outspokenness, and classes of all other subjects are conducted in communicative ways as well. Although CLT has been adopted in Japan for the last 20 years or so, the reality is that not much progress has been made. Needless to say, classes of other subjects still remain traditionally Japanese. Thus, failure of CLT in Japan has always been predicted, and it will stay ineffective, even with the new teaching guidelines issued by the Ministry of Education.

4. TENOR

Abbot (1981) coined the term TENOR (teaching English for no obvious reason) to refer to English programs like EGP (English for general purposes) offered widely at Japanese colleges and universities

to non-English majors. "TENOR learners are generally classified as school students whose motivation levels are low and unclear and who have few if any specific needs" (Langham 2003). Thus, these students, "(l)acking any clear extrinsic motivation beyond getting a passing grade" (Cogan 1995), usually do not improve their English much in their English classes, which generally have forty or more students and meet only once or twice a week for 90 minutes. The table below indicates the average TOEFL ITP scores of Japanese university students between 2003 and 2006; many universities participate in this testing program (more than 60,000 examinees each year) and use the paper-based version of TOEFL as achievement test, pretest and posttest of English programs, part of an entrance examination to graduate school, etc. Notice year-to-year progress is negligible and that the average scores remain very low compared with the average scores of university students in Taiwan (506.73), Korea (527.97), and China (561.18) in 1998/1999 (data from CIEE).

TOEFL ITP	2003	2004	2005	2006
University Students	448.4	448.07	450.59	449.86

ITP (Institutional Testing Program): 677 max
(data, courtesy of CIEE)

Therefore, "(v)ery often, such courses lack a clear rationale for their existence" (Cogan ibid.). Surprisingly, however, most of these seemingly ineffective EGP courses are nonetheless required courses, regardless of students' majors.

In contrast to university students, junior and senior high school students have a clear reason for studying English, namely, passing entrance examinations to senior high school and university, respectively. But the English part of entrance examinations is largely a set of multiple-choice questions that mainly require skills of reading and translating, along with knowledge of prescriptive grammar, and not much else. Therefore, it is understandable that main focus of English teaching in high school is still placed on heavy-duty exam preparation, which is most effectively done in the Japanese language. Thus, CLT is viewed as TENOR by many Japanese teachers of English and their students alike. This is one of the reasons why JET Program has failed to achieve its stated goal of implementing CLT in Japanese high schools (Kushida 2006). If the Ministry of Education genuinely wishes to produce, through education, creative individuals who are fluent in spoken English, it needs to guide universities and senior high schools to develop entrance examinations that require much more listening and speaking ability. Unfortunately, however, this is not happening.[i]

5. Teachers
Traditionally, Japanese high school teachers of English have been trained to meet student needs of exam preparation. Most teachers are thus not prepared to do CLT, so if they have to do it, they are going to have to practice spoken English themselves first. *Asahi Shimbun* (December 23, 2008) reported a case of a high school English teacher in Yokohama who did just this at a private English conversation school for three years. In the classes he conducted at his high school, his students gradually noticed improvement in his pronunciation and complimented him on it. And yet, he admits that no matter how hard he tries, 30 minutes is the longest he can carry out his lessons in English.

Preparing for CLT-based English classes is time-consuming. In elementary schools too, English is going to be officially added to the existing subjects in 2011, and many teachers are currently busy preparing themselves for it. Since elementary school English will be nothing but communicative English, teachers must do CLT. However, according to the evening edition of *Asahi Simbun* on February 23, 2009, teachers are now complaining that preparation is taking too much of their time; one teacher was reported as saying, "If you want to conduct an interesting 45-minute lesson, you need to spend four days preparing."

Returning to high school English, most teachers already have more than enough to do every day. Mori (2007) conducted a survey of 108 junior and senior high school teachers of English in Fukui Prefecture and reported, among other things, that junior high teachers average 120 hours and 21 minutes of overtime work a month (28 days), and 80% of them exceed the number of work hours that might cause *karoshi* (death from overwork) estimated by the Ministry of Health, Labor and Welfare; at senior high

school, 60% of the teachers run the risk of *karoshi* by working overtime. Hence, it seems unrealistic to force these teachers to start doing CLT in addition to their old daily routines.

6. Comparison with Chile

It is often said "intercultural dialog" is important in this age of globalization and that in order to have dialogs with foreigners, we need to be able to speak English, so-called international language of the 21st century (e.g. Funabashi 2000). In a way, this is true, but does this mean that everybody in Japan needs to speak with foreigners in the 21st century? The answer is negative; only selected few have genuine needs for such communication in Japan, where everything is and will always be conducted in Japanese (e.g. Suzuki 2001). Besides, according to a survey of top international companies in Tokyo by Kirkwold et al. (1995), most of these companies do not need fluent speakers of English for their everyday operation; communication in English, when it is required, is primarily in written form, through letters, faxes, and e-mail. If so, CLT-based English instruction should only be an elective course for those who need or want it for one reason or another, but shouldn't be part of compulsory education. And yet, the Ministry of Education is trying hard to force CLT to every Japanese student, as we saw earlier. In this respect, I think we have a lot to learn from the decision that the Ministry of Education in Chile made regarding English education in that country.

In Chile, before 1998, "teachers were encouraged by the Ministry of Educaiton to use CLT methods. More specifically, they were encouraged to make regular use of group work"
(McKay 2003). But "(i)n 1998 the Ministry of Education presented an overall Chilean school curriculum reform that specified teaching objectives for various fields of study for primary and secondary schools," and "the major change in the [English] curriculum is the emphasis given to receptive skills (reading and listening) as opposed to productive skills (speaking and writing)" (ibid.). The rationale given for this change is that "for most Chileans, English will be used to access the growing amount of information available in that language, which will often be of a technical nature, rather than for speaking or writing. The Ministry believes that an emphasis on receptive skills reflects the local English needs of Chilean youngsters, who will need English to partake in a global economy and information network" (ibid.).

Chilean teachers of English are very happy about this change. McKay (ibid.) quotes a teacher she interviewed: "Before the reform, we were encouraged to use the communicative approach, but how are you going to do this with 45 students and evaluate them? Students don't like to speak English." Thus, the decision that the Ministry of Education in Chile made seems very reasonable and practical. But the Ministries of Education in Japan has gone in the opposite direction.

7. English as a Lingua Franca

Of course, the easiest suggestion for our Ministry of Education is to say that CLT should be demoted to second place in our compulsory education as well, and in senior high school and university, CLT-based courses should be offered only as electives. But I know this is easier said than done. In fact, a (blind) respect for CLT was so strong on the part of the Ministry of Education that, as we noted earlier, they even decided to introduce communicative English to elementary schools, believing that students will better cope with CLT later in high school if they get exposed to spoken English while they are still innocent children. There is no proof, however, that this is true. Indeed, many scholars and educators argue otherwise and strongly oppose to adding English to elementary school curriculums (e.g. Otsu 2004, 2005, 2006). Nevertheless, teaching English in elementary school is now official, and it starts in full swing in two years. So CLT is definitely staying in Japan. Then, given this situation, coupled with Japanese culture and the existing teachers, I would like to suggest adopting ELF (English as a Lingua Franca) in our school curriculums.

Following the previous educational reforms in 1991, Keio University was reported to have started a "language immersion program" (Hadley 1999), in which an emphasis was placed on cooperative learning and fluency, rather than on accuracy, in order to "foster a positive learning environment." A major aim in this program was said to be "to motivate students to speak English without undue levels of anxiety" (ibid.) This shift of focus from accuracy to fluency was a sensible decision to make, because, as McVeigh (2001) points out, Japanese students typically do not answer in class or refuse to, or even pretend not to know when called upon, since they feel instruction is difficult and are afraid of making mistakes (or even afraid of instructors). If so, why not make English grammar and pronunciation easier for Japanese students to handle by adopting suggestions like those in Suzuki (2001)? – e.g., we should accept utterances such as *He speak English*, *I goed to school*, *I have three*

childs, etc., all of which may be ungrammatical but are nonetheless fully meaningful; we should also accept L1 transfers like substitution of *th* with *s*, as in *Sank you* (for *Thank you*), as long as they are comprehensible. If these forms and pronunciations are accepted, students will certainly feel less anxious about speaking English.

It should be noted here that this kind of "modified" English is virtually the same as English as a Lingua Franca (ELF), whose lexicogrammar is characteristically much simpler than, but as systematic as, those of native speakers' English. In addition to reducing students' anxiety about correctly obeying complex linguistic rules, there is another good reason to adopt this kind of English in school education in Japan, to which we now turn.

Cogan (1995) pointed out that "the vast majority of [Japanese] students are not being prepared to live in an English speaking country or even to interact on a regular basis with native speakers of English," but as Hadley (1997) found out through his survey on cultural influence in Japanese ELT (English Language Teaching), "outside the educational field, Japan is blissfully happy to continue as a monolingual society" anyway. Moreover, according to Anderson (1993), even if Japanese students are ever called upon to use oral English to communicate, it may well be to interact with Chinese, Koreans, or other Asians; considering Japan's proximity to these countries, this is certainly not surprising. In fact, it must be part of the general trend of growing use of English between nonnative speakers from different countries worldwide, which in turn promotes development of various varieties of English.[ii] According to Jenkins (2006), through natural evolutionary processes of language contact, local linguistic and cultural influences "have led and are continuing to lead to the emergence of a range of educated L2 English varieties which differ legitimately from standard [native speakers'] English."

If we accept this general trend, English we teach at school doesn't have to be either British or American, although it has always been (tacitly) assumed that it has to be either variety. In this respect, our Ministry of Education too only says in its Course of Study that teachers should use "materials that are useful in deepening international understanding from a broad perspective, heightening students' awareness of being Japanese citizens living in a global community, and cultivating a spirit of international cooperation." If so, why not adopt ELF in our schools, since, as Jenkins (2006) writes, "(t)here is nothing "international about deferring to the language varieties of a mere two of the world's Englishes, whose members account for a tiny minority of English speakers"?

8. Obstacle

An English curriculum based on ELF would place its main focus on "the capability to render one's discourse intelligible for their interlocutors through a process of accommodation (for example, making repairs, paraphrasing, rephrasing, or even allowing for linguistic errors that might facilitate communication" (Sifakis 2009). Then, linguistic modifications Suzuki (2001) proposes are actually good examples of ELF accommodation that aims for more efficient communication between Japanese and non-Japanese and therefore use of them should be encouraged, not penalized, in ELF-based English classes. After all, the resulting English, just like other World Englishes, still works as an effective means of communication, and although it will inevitably have a Japanese "flavor," it will still be comprehensible even to native speakers of English (Suzuki ibid.).

But will teachers be willing to teach ELF? Sifakis (2009) reports that teachers in Greece say no, complaining that adopting this kind of English lowers the academic and professional standards of teaching. Since "(i)t is changes in teaching which keep pace with changes in testing and not vice versa" (Jenkins 2006), if examination boards embrace ELF, it is very likely that teachers will then follow suit. But are examination boards willing to accept ELF? The answer seems negative as well at the moment, which led Jenkins (ibid.) to write: "Unfortunately, their apparent inaction in this time of shifting sands means that they risk seeming to bury their heads in them."

In Japan, where educators are typically very conservative, adopting ELF in school education seems unimaginable at best. Currently, CLT is being strongly encouraged in the classroom, but examinations are still, for the most part, written tests based on academic English of British/American type, a very contradictory situation. Moreover, as in Greece, English does not have an official status in Japan, so "its knowledge is not necessary in carrying out important transactions" (Sifakis 2009). Therefore, even for English teachers, the majority of whom are nonnative speakers, English classrooms are the only domain of English use. Hence, their English can be largely characterized by management-oriented fixed phrases, and their communicative use of English outside the classroom, if any, "would have many

of the features of an ELF variety" (ibid.). Let's be honest here. If teachers' spoken English is ELF, it is not fair to expect students to speak like British or American native speakers. Hence, if CLT is to be taken seriously, it is strongly suggested that traditional written exams be replaced by oral tests that focus on fluency rather than accuracy, i.e. proficiency tests, of ELF. The teachers and students will then have a concrete motivation to practice communicative English à la ELF.

9. Conclusion

In this globalized world, even countries like Japan that are virtually monolingual have to have a certain number of individuals who are fluent in spoken English in order to develop/maintain peaceful and productive relationships with other countries. But to force every student, regardless of their personal interests or needs or even ability, to acquire good enough skills of communicative English is very impractical. To be honest, I am still of the opinion that English (CLT or otherwise) should only be offered as elective courses beyond the level of compulsory education in countries like Japan.

However, if CLT must be employed in compulsory education for one reason or another, it should definitely be based on ELF for the reasons given above, i.e., cultural constraint and the current trend of growing World Englishes. Conservative teachers may adamantly say, "We do not want to teach ungrammatical English like *a staff*, *four furnitures*, etc.," but what they don't seem to realize is that these forms simply reflect nonnative speakers' creativity, which is no less legitimate than native speakers' creativity that has produced expressions like *three teas* and *two coffees* for *three cups of tea* and *two cups of coffee*, respectively (Jenkins 2006). Notice that there is an unscientific prejudice behind this attitude against ELF, namely, the valuing of native speakers' language forms above those of nonnative speakers even though the former do not lead to greater communicative efficiency for the majority in international context of use (Ammon 2000). Although ELF may not be an omnipotent answer to ever-increasing needs for smooth international/intercultural communication, it is definitely more teachable to and more easily usable for nonnative speakers than native speakers' English taught through CLT methods will ever be.

Notes

[i] There have appeared over the years some entrance exams that include a listening section, the most notable of which is that of "Center Exam," which is the standardized state-administered college entrance examination. However, the written section of this exam's English part has the total of 200 points, whereas the listening section does only 50. Therefore, there are many high school students who ignore the listening section altogether when preparing for the exam as a realistic test-taking strategy. Incidentally, TOEIC has 50% of listening and 50% of reading.

[ii] The number of second language speakers of English is steadily increasing, giving rise to more and more language contacts all over the world; in fact, it is said that the number will soon surpass that of native speakers (Graddol 1999).

Assessing native pronunciation raters from different English variety backgrounds

Brian G. Rubrecht
Meiji University

As noted by Celce-Murcia, Brinton, and Goodwin (1996), pronunciation's place in foreign language teaching has been anything but static. At times, pronunciation has been viewed as a crucial element in the language learning experience, such as when the Audio-lingual method was the most common language teaching methodology. At that time, learners were encouraged to mimic the pronunciation of the target language as much as possible as a means to acquire the language. Later, other methodologies placed less emphasis on pronunciation, and in some cases so little attention was paid to pronunciation that it was all but ignored (e.g., in the grammar-translation method).

Many current teaching methodologies are based on communicative approaches that view the ultimate end of language learning to be communication with others. As such, teachers and researchers have begun to pay more attention to the factors that can enhance comprehension in communicative situations. Because pronunciation stands as one such factor, pronunciation's status in the teaching and learning of foreign languages has once again been elevated.

Even with the recent increase in second and foreign language learner's pronunciation studies, there remain several areas yet to be researched. In particular, it is apparent that although studies have shown positive effects for learners who have engaged in pronunciation training, what has been overlooked to date are listener perceptions of learners' pronunciation. In other words, what has yet to be examined are how listeners – especially native speakers – perceive learners' pronunciation. This area is crucial when one considers that listeners may come from different English variety backgrounds and therefore natively use different English pronunciation. There being no single "standard English" used in the world, it becomes necessary to determine how such native speakers perceive learners' pronunciation, as these differences could mediate the effects of pronunciation training, for what is deemed acceptable pronunciation by a speaker of one English variety may not be deemed acceptable by a speaker of another. These differences in pronunciation perceptions may be most apparent when training involves production of phonemes that are (a) not extant in the learners' native language, such as /r/ and /l/ in Japanese, and (b) natively pronounced differently by speakers of different English varieties.

The current article details research involving native English speakers from different English variety backgrounds rating native Japanese speakers' English /r/ and /l/ pronunciation prior to any pronunciation training. The article will begin by providing background to recent pronunciation research, particularly research that discusses rating language learners' pronunciation. Information about the research and its results will then be presented. This is followed by a discussion of the conclusions drawn from the research. Finally, the article will discuss future research directions.

Literature background

As mentioned, research regarding second and foreign language learners' pronunciation has seen dramatic swings, the most prominent increase of which occurred during the 1990s. Beginning in that decade, pronunciation, pronunciation instruction, and pronunciation training all became greater concerns for language instructors. Beyond the typical benefits of improved target language pronunciation for language learners (see below), instructors came to realize that pronunciation, being one component of oral production in the target language, had for too long been overlooked and that pronunciation can impact and influence not only how learners' speak in the target language but also how others perceive them to be as target language users. Pronunciation instruction and training came to be thought of as more than simply remedial activities aimed at a select few learners with highly discernable and/or detrimental pronunciation difficulties.

Understanding the basic mechanics of target language phoneme production has become a central concern for instructors. Even more importantly, the ability to teach those mechanics to learners has been noted to be "a skill that teachers cannot do without" (Benrabah, 1997, p.157). With this new awareness of and attention paid to pronunciation in second and foreign language classrooms,

instructors have begun to actively seek ways to efficiently incorporate effective pronunciation training into often already overcrowded curricula (e.g., Acton, 1997; Celce-Murcia, 1987; Celce-Murcia, Brinton, & Goodwin, 1996; Kendrick, 1997; Kenworthy, 1987; Levis & Grant, 2003; Lin, Fan, & Chen, 1995; Macdonald, Yule, & Powers, 1994; Makarova, 1996, 1997).

The need to include pronunciation as a mainstay in the foreign language curriculum is clear. Problems or difficulties with a foreign accent can give rise to miscommunication (Jarvis & Stephens, 1994). In EFL (English as a foreign language) settings, pronunciation remains an important component of foreign language manipulation, especially for international business personnel, scientists, and other professionals, as commerce, trade, and communication often relies on effective spoken English. In educational spheres, university instructors and academic research scholars in higher education can benefit from increased comprehension and proper utilization of English pronunciation, as they are often required to give presentations on their research at international conferences and must communicate with others in their field. Students can also benefit from having more comprehensible pronunciation, in particular those who wish to enter English-speaking colleges and universities to pursue higher degrees (Morley, 1991).

Recent research has shown the many benefits that pronunciation instruction and training can bestow upon learners. For instance, it has been revealed that learners more familiar and adept with the pronunciation of the foreign language under study, particularly after receiving pronunciation training, were able to improve their comprehensibility and intelligibility (Derwing & Munro, 1997; Derwing, Munro, & Wiebe, 1998; Kashiwagi & Snyder, 2003; Kenworthy, 1987; Munro, Derwing, & Morton, 2006) as well as their target language listening and comprehension skills (Bohlken & Macias, 1992; Major, Fitzmaurice, Bunta, & Balasubramanian, 2002, 2005). It has also been found that native speakers possess more positive attitudes toward non-native speakers deemed intelligible compared with those who are not (Bresnahan & Kim, 1993; Bresnahan, Ohashi, Nebashi, Liu, & Shearman, 2002, cited in Carlson & McHenry, 2006).

Even with these benefits readily apparent, there remains an area of target language production related to pronunciation and pronunciation training that has received little attention. In the above-mentioned research that focused on learners' improved comprehensibility and intelligibility after receiving pronunciation training, the research foci were always, unsurprisingly, the learners and their pronunciation production. This makes sense, as they are the ones learning the language and attempting to produce oral utterances in the target language. However, what is missing from this research is attention paid to the listening component of these comprehensibility and intelligibility checks, which in these cases are the raters of the learners' pronunciation.

Pronunciation has both productive and perceptive components (Brown, 1992). When reviewing the above-mentioned research, it is clear that the researchers either (a) assume the raters are fully capable of accurately rating the learners' speech simply because they are native speakers of the English variety the tested learners are learning and/or are expected to produce when in testing situations in the research or (b) give no consideration at all to the listeners' English background variety, as the only rater prerequisite is being a native English speaker. In either case, it would appear that there could be bias on the part of the raters to rate either in accordance with (a) the pronunciation of the local dialect or the pronunciation the learners were specifically taught or (b) whatever each individual rater's own English variety's pronunciation happened to be. The literature makes no mention of consideration for how comprehensible or intelligible learners' speech was for listeners outside of the "localized" area or to native English speakers with disparate English background varieties.

For instance, Derwing and Munro (1997), Derwing, Munro, and Wiebe (1998), and Munro, Derwing, and Morton (2006) conducted their research with ESL (English as a second language) learners in Canada. Their raters were native English speakers born and raised in Canada. The raters assessed the learners' speech in terms of accentedness and nativeness of prosody, but these ratings were based on how accurately or closely the learners could mimic the pronunciation of the English variety used by the raters (and, ostensibly, the pronunciation the learners were exposed to in the ESL environment and/or explicitly taught in the classroom). In other studies mentioned (e.g., Kashiwagi & Snyder, 2003), no indications were given regarding the raters' English variety background(s), which means that nothing is known about the criteria the raters used to judge the learners' speech. Not considering or providing information about such criteria is cause for considerable concern, for it may be suspected that, for

instance, a rater with an American English dialect would have different perceptions of what constitutes "correct" or "proper" pronunciation compared against a rater with a British English dialect. Having different perceptions would, in turn, influence how such raters would assess learners' pronunciation, either before or after conducting pronunciation training.

It is therefore apparent that current pronunciation research has not taken into account the raters' background English variety, as how the raters speak English may impact how they perceive spoken English, especially with regard to possible improvement by learners who have received pronunciation training. There is no single "standard" English that all English learners learn (whether they be native speakers or otherwise), nor is it the case that all learners are constantly exposed to the same target language pronunciation. As native English-speaking instructors can come to the classroom from all corners of the globe, they will naturally bring with them their own variety's pronunciation. Furthermore, instructional materials (e.g., textbooks audio CDs) may present accented speech both different from what the instructor uses and different from what is found in the learners' environment (e.g., the environment that lies outside the language classroom door). What is therefore apparently needed in pronunciation research is more consideration of the raters' background English variety as well as a determination of whether or not differences in English varieties can create disparate perceptions when rating learners' pronunciation.

The research

Impetus

In order to ascertain if there may be indeed differences in native speaker perceptions of learners' pronunciation due to differences in English variety background, a preliminary study that focused on the production of the phonemic contrasts of English /r/ and /l/ in word-, sentence-, and narrative-level utterances as spoken by native Japanese EFL majors was conducted. The research was not concerned with any effects from pronunciation training. Rather, the learners' English speech utterances were rated by native speakers of American, Australian, and British English either in terms of phoneme heard (for utterances at the word level) or acceptability (for utterances above the word level).

The phonemes /r/ and /l/ were chosen because Japanese does not utilize either of these sounds. Instead, Japanese uses that which can possess wide phonetic variation and can range anywhere from being a "slightly retroflexed lateral approximant, through to an alveolar tap or flap" (Ingram & Park, 1998, p. 1163). These variations are often attributed to speaker differences, as this Japanese liquid (usually written phonetically as the flap /ɾ/ or, in some cases, as the alveolar lateral flap /ɺ/) has no precise point of articulation, which goes far in explaining why Japanese speakers of English often sound as if they are substituting /r/ for /l/ (and vice versa) when speaking English (Ohata, 2004). Having raters assess Japanese learners' pronunciation of /r/ and /l/, therefore, means that they would assess how well the learners can produce sounds not found in their native language and to which they have no native exposure. In terms of rating the potential effects of pronunciation training regarding such phonemes (i.e., through pre- and post-tests of learners' pronunciation), one should be able to see the level of effectiveness of the training and/or the level of awareness that learners display regarding their own pronunciation of the language under study.

Participants

The participants of the present study consisted of two groups: the learners and the raters. The learners were 24 native Japanese university students majoring in English, all of whom were freshmen who had volunteered to participate in the study. They had limited or no travel abroad experiences and at the time of the study had not received any specific English pronunciation training apart from what they may have encountered in the course of their English learning endeavors prior to university matriculation. All learners were considered high intermediate to advanced learners of English.

The raters were three native English speakers, all of whom were professional English instructors with extensive English teaching experience both in Japan and abroad. The raters natively utilized different English varieties: American English, Australian English, and British English. All three claimed to possess normal hearing.

Procedure

As the current research meant to ascertain if differences may exist between the perceptions of native English speakers with different English variety backgrounds regarding native Japanese EFL learners'

production of /r/ and /l/, three different yet similar PowerPoint presentations were constructed that would allow the learners to utter /r/ and /l/ at the word level, at the sentence level, and in a free narrative. For production at the word level, 35 /r-l/ minimal pairs were selected. These minimal pair words contained /r/ and /l/ in word onset position, as second elements of an onset cluster, in intervocalic position, and in word ending (i.e., post-vocalic) position.

To test sentence-level production, one word from each minimal pair was randomly selected and placed into natural-sounding sentences that consisted solely of one independent clause each. Only one word from each minimal pair was selected so that the testing time for each learner could be reduced. The free narrative was based on the learners discussing a six-panel cartoon of a man raking leaves in a park, only to have the wind blow away the leaves once he had gotten them all in a basket.

The presentation of the minimal pair words, sentences, and narrative cartoon and the recordings of learners' pronunciation went as follows. Each learner sat before a personal computer and was randomly presented one of three PowerPoint presentations, all of which had complimentary content. Onscreen instructions in each presentation told the learners that they would first see individual words, one at a time, and that with each click of the mouse they would be presented with another word. When a word appeared on the screen, they were instructed to say that word in a loud, clear voice with their best English pronunciation. They were allowed to consider each word's pronunciation before speaking. The 70 minimal pair words were presented at random and in different order, depending on the PowerPoint presentation. The learners were presented these three different presentations in order to reduce rater fatigue and to make it so that the raters would not come to guess what the next word is when it came time to rate the recordings.

Similarly, for the sentence-level words, the learners were informed that with each click of the mouse they would see a new sentence. They were instructed to take their time reading each sentence first before reading them aloud. There was no reason to randomly present the learners these 35 sentences because, when rating, the raters would understand which word was meant to be pronounced (e.g., "crime" or "climb") based on the context of the sentence. For the cartoon for the narrative, the learners were then shown all six cartoon panels at once. They were instructed to study the cartoon to understand what was happening. With each click of the mouse, they were shown each panel of the cartoon, one at a time. They were instructed to say as much as they could about what they could see in each panel, that is, to describe what actions were taking place and what the characters in each panel were thinking or feeling. After all six individual panels were viewed and discussed, the learners were once again shown all six panels together and were allowed to clarify or add further information if they so desired.

The recordings were made using audio recording software and an external USB microphone. Recordings were created at a rate of 44 kHz with 16-bit resolution and saved as WAV audio files. The researcher later edited the recordings so that any of the researcher's explanations to the learners during the testing and any periods of silence lasting longer than five seconds would be removed. Additionally, short, low tones were added in places in each recording (e.g., after every 10 minimal pair words) so that the raters could keep better track of where they were for each learner's recording. The recordings generally lasted between 12 and 15 minutes.

Each rater was provided with (a) a digital copy of the edited recordings, (b) one rating sheet for each learner, and (c) a copy of the narrative cartoon. The raters used high-fidelity headphones to listen to each recording and were instructed to take frequent breaks when rating to reduce fatigue. For the ratings, the raters were told to judge how well the learners pronounced /r/ and /l/ based on the pronunciation of these phonemes in own English variety. Stated differently, the raters were to judge how acceptable the learners' pronunciation was when compared against how those phonemes would normally be pronounced in their own dialect in their own variety of English and not, for instance, on how they know Japanese native speakers tend to pronounce these phonemes.

In the word section, for each word heard, the raters marked their rating sheet to indicate if they heard /r/ or /l/. If what they heard was either indeterminable or was clearly a Japanese liquid flap, they put a mark in the "?" space. For the sentence-level utterances, the raters rated each minimal pair word spoken as either "excellent," "good," "fair," "poor," or "unintelligible," based on how the learners pronounced that word when compared against what would be acceptable in the raters' own English variety. When rating the narrative section, the raters listened and provided a global score of the

learners' /r/ and /l/ pronunciation by using the same five categories used for the sentence-level utterance section.

Results

Because the aim of the current research was to determine if native English speakers with different English variety backgrounds similarly perceive /r/ and /l/ phoneme production, the data was searched for all instances of matches in ratings (i.e., when both the American and Australian raters claimed to hear an /r/ in a word section utterance or when both the Australian and British raters rated the /l/ production in a sentence-level utterance to be "good," etc.). Table 1 presents the number of complete match instances and the resulting percentages for the word, sentence, and narrative sections, as well as a breakdown of the number of matches in the word and sentence sections for /r/ and /l/ in the four word positions.

Table 1: Number and percentages of complete matches between the raters

Category	Amer. – Aus.		Amer. – Brit.		Aus. – Brit.	
Words–All	1459/1680	87%	1342/1680	80%	1348/1680	80%
Words–Word onset	580/672	86%	511/672	76%	520/672	77%
Words–Second element of an onset cluster	543/624	87%	509/624	82%	500/624	80%
Words–Intervocalic	125/144	87%	118/144	82%	122/144	85%
Words–Word ending	211/240	88%	204/240	85%	207/240	86%
Sentences–All	534/840	64%	421/840	50%	559/840	67%
Sentences –Word onset	225/336	67%	165/336	49%	218/336	65%
Sentences –Second element of an onset cluster	209/312	67%	159/312	50%	198/312	63%
Sentences –Intervocalic	38/72	53%	31/72	43%	53/72	74%
Sentences –Word ending	64/120	53%	66/120	55%	90/120	75%
Narrative	18/24	75%	11/24	46%	8/24	33%
TOTAL	4006/5064	79%	3537/5064	70%	3823/5064	75%

As can be seen from the data, the percentage of complete matches is generally relatively high, particularly for the number of matches in the word section. Matched ratings in the sentence section were somewhat lower but nevertheless occurred roughly two-thirds of the time. Narrative matches saw the lowest percentages of all, especially with the British rater matched against the other two raters. However, the data presented in Table 1 only indicate complete matches. Thus, while the British rater may have given a rating of "good" in a particular instance, the other raters may have given ratings of "fair" or "excellent," which are close but do not constitute complete matches.

Looking at the last line of the table, it can be seen that the total number of complete matches between the raters span a range of 70% to 79%, meaning matches occurred roughly three-fourths of the time. These results seem to indicate that while the raters were generally hearing the same phonemes and judging the learners' utterances with roughly the same level of acceptability, there were nevertheless indications that discrepancies existed, meaning that the raters were not always in agreement regarding the phonemes heard. It therefore appeared that there were a sufficient number of instances of mismatches between the raters to indicate that differences in English variety background may cause raters to perceive phoneme production differently.

To determine if these mismatches were statistically significant, One-Way ANOVA tests, followed by Tukey's HSD Post Hoc tests, were conducted. These 11 tests correspond to the same 11 categories found in Table 1. Only two ANOVA tests indicated statistical difference. The first such test was that of the "Words-All" group, $F(2, 5037) = 10.33$, $p < 0.0001$, with Tukey's HSD Post Hoc test (HSD = 0.049) indicating statistical differences between the mean differences of the American and Australian raters' ratings (MD = 0.094) and between the American and British raters' ratings (MD = 0.055). The second test that indicated statistical significance was that of the "Words-Word onset" group, $F(2, 2013) = 8.15$, $p = 0.0003$, with Tukey's HSD Post Hoc test (HSD = 0.025) indicating that there were

statistical differences between the mean differences of all three raters (American versus Australian MD = 0.137, American versus British MD = 0.074, Australian versus British MD = 0.063). Statistical significance was not found with any of the tests on the sentence-level utterances or the narrative.

Conclusion and discussion

The conclusion drawn from this preliminary study is that, statistically speaking, the background English variety of a native English speaker has no bearing on the pronunciation perceived of native Japanese speakers' /r/ and /l/ production in typical communicative contexts, that is, on pronunciation in connected speech. Native English speaking raters who utilize disparate English accents were generally found to hear the same phonemes spoken by the non-native English learners, or at least judged them similarly. Though statistical significance was found at the word level, specifically with /r/ and /l/ in word onset position, most oral communication occurs above the word level, that is, in utterances at the sentence level or in longer strings of discourse (e.g., a narrative, an explanation).

The results of this study therefore indicate that it is possible to use raters with different English variety backgrounds to assess learners' pronunciation. In other words, differences in English variety background may not necessarily cause discrepancies in acceptability judgments, at least when the utterances being judged are above the word level and provide context for the raters. However, several caveats exist that potentially present limitations to the study and may constrain the generalizability of the study's results.

First, this study used only three raters, and these raters came from three specific regions (i.e., the U.S., the U.K., and Australia). Different results might be found if native English speakers from different regions (e.g., Canada, New Zealand) had been used. Second, the raters were instructed to rate only the learners' /r/ and /l/ production. This is different from other research that considers comprehensibility and intelligibility on a broader level.

Third, it is understood that most verbal discourse occurs above the word level (i.e., in sentences or longer strings of discourse). While no statistical differences between the raters' ratings were found above the word level, it remains unclear if the flow of longer discourse contributed to pronunciation that matched each rater's perceptions of acceptability or if context clues from the connected speech utterances overshadowed any pronunciation deficiencies. Finally, it must be pointed out that any matches found in the data do not necessarily indicate good pronunciation on the part of the learners. All that was examined in this study was the extent to which the raters matched in their perceptions of the acceptability of the pronunciation heard. Thus, no inferences can be made from these results regarding how well the learners were actually producing the /r/ and /l/ phonemes.

A call can be made for continued research with pronunciation raters with different English variety backgrounds. Concerning the data from current study, further research could examine which specific words in the word section caused the most "mishearings" for the raters, that is, which /r/ words were heard more often as /l/ or vice versa, or which words were most often considered indeterminable. If trends in these mishearings reveal specific phonemes being misheard or phoneme location (e.g., word onset position) to be a source of mishearings, this information could then be applied to improve pronunciation instruction and pronunciation training in the second or foreign language classroom. Additionally, as the learners in this study had received no explicit pronunciation training, future research could be conducted that examines the effects of pronunciation training, such as by conducting pre-, post-, and delayed post-testing.

Comparing the Effectiveness of Using Monolingual and Bilingualised Dictionaries in Vocabulary Learning

Jyu-fang Yu & Chen-I Lee
Dept. of Foreign Languages and Literature
Tunghai University, Taiwan
No. 181 Chong-Kang Road, Sec. III, Taichung City, Taiwan, R.O.C. 407
ayu@thu.edu.tw; g941202@thu.edu.tw
886-4-23590253, ext. 49

Abstract

Researchers have long contended that monolingual dictionaries are more useful to L2 learners than bilingual dictionaries. Although monolingual dictionaries include relevant lexical information on the target language system, L2 learners of varied proficiency levels frequently seek the mother tongue equivalents of the unknown words in bilingual dictionaries. As a result of consumer reality, to use Laufer and Hadar's term (1997), bilingualised dictionaries began to appear in the late 1970s. While hybrid dictionaries have flourished for more than two decades, they do not seem to be as appreciated by L2 learners as a tool for meaning discovery as the other two types of dictionaries, monolingual or bilingual. Moreover, there is insufficient empirical evidence to support the claim that the juxtaposition of L2 definition and L1 translation of new vocabulary is more beneficial to vocabulary learning and retention. Thus, the current study focuses on the effects of dictionary type on vocabulary learning. The participants of the current study consisted of four classes of freshmen enrolled in the Freshman English Program for Non-majors. Two classes were labeled high achievers (48 students), while the other two were labeled low achievers (38 students). Both the high-achiever classes did significantly better in the K1 and K2 Vocabulary Levels Tests and the pretest. Following the initial round of testing, one high-achiever class and one low-achiever class were assigned to the Monolingual Group, while the other two classes became the Bilingualised Group. Results show that participants using monolingual dictionaries learned more words than those using bilingualised dictionaries. The Monolingual Group scored higher than did the Bilingualised Group in the delayed test two weeks later. As for the efficacy of dictionary use for vocabulary retention, the type of dictionary used did not appear to affect low achievers. For high achievers, however, the Monolingual Group did better in the post test and outperformed the Bilingualised Group.

Key words: **monolingual dictionary, bilingual dictionary, bilingualised dictionary, vocabulary learning**

The Disturbance on Evaluating Teachers' Teaching from the Colleges Students

Li Ju Chen / Associate Professor
Shu-Wen Liu/ Assistant Professor
Hui-Ju Chen/ Instructor
Chang Gung University
Chien-Ju Lan/ Instructor
Chang Gung Institute of Technology

Abstract
Teacher evaluation is to assess the teaching and then with the estimation to promote teachers' faculty development. The evaluating outcome will be the reference materials on teachers' promotion, curriculums selection by students, and administrations' re viewing curricula quality (Ellett, Annunziata, & Schiavone, 2002;Iwanicki,1990; Ribas, 2000). In order to evaluate the college teachers' teaching, we always ask students to assess through questionnaires. Which always includes teaching attitude, teaching materials, classroom management, teachers' characteristics, teaching content, teaching skill, assessment, teacher interacting with students, and so on (Arreola, 1995). But are they valid or reality? We hope to find the disturbance on evaluating teaching from the college students' opinions. And then explain the evaluation data fairly.
The research instrument is the questionnaire of the Opinion on Teaching Evaluation including 9 factors with 55 items. It was conducted on 950 college students who came from 32 universities utilized stratified sampling from North, Middle, South, and East of Taiwan. The results were found:
1.The teaching type and curriculum arrangement was high to disturb the assessing.
2.The disturbances were significantly different on the day/night school, the inquiry way, and the inquiry time.
3.Most of the disturbances were got lower scores by the students, while a few disturbances were got higher scores by them.
The study yielded the following thinking: (1) The instruction language of the questionnaire has better to write clearly and to describe the evaluation meaning. (2)Teachers should know the disturbed factors before the curriculum arrangement. That was their rights. The study pointed out some recommendations about the evaluating in college. It offers some stimulating ideas to researchers and practitioners for faculty development in college. These findings may reveal some useful information in developing policies, educational practices, research topics, and teaching strategies.

Lecture note taking in first year undergraduates
Dr. Pin-Hwa Chen
Chiu-Li Kuo -- Graduate student
Wan-Hsin Chang -- Graduate student
Department of Educational Psychology and Counseling
National Pingtung University of Education
Taiwan

Abstract
In Taiwanese colleges, lectures continue to serve as a primary delivery method for large-scale teaching. How do students learn from lectures? Note taking is a popular learning strategy among college students. Although previous studies on lecture note taking have recognized the effects of note taking on learning performance, little evidence comes from the works in realistic academic situations. According to the model of student self-regulated note-taking proposed by Van Meter et al. (1994), college student's lecture note taking is self-regulated by the student. It happens not only during the class but also after the class. Also, it might evolve throughout the term. Since the first year in college is a critical year for learning change, this study aims to investigate Taiwanese first year undergraduates' lecture note taking in a course and examine the relationship between lecture note taking and learning performance. Thirty-two freshmen enrolled in a two-seme
ster General Psychology class of a university in southern Taiwan were recruited as participants. Targeting the second teaching unit of each semester, "Biological Foundations of Behavior" for the first semester and "Memory" for the second semester respectively, it collected the notes taken by students during and after the lectures on these two units as well as students' performance on these two unit tests. Participants' notes were scored and standardized for quantity (number of content areas mentioned in notes/ total number of content areas mentioned in lectures) and quality (quality scores of content areas mentioned in notes/ total quality scores of content areas mentioned in lectures). The results showed that both the quantity and the quality of Taiwanese first year undergraduates' notes correlated with their learning performance positively and moderately, whether in the first or second semester. First year undergraduates' lecture note-taking did evolve in a
course. Not only the quantity but also the quality of notes increased significantly after a semester. Based upon the results, the implications of this study were discussed.

Fostering Creative Thinking through Reading and Writing

Amber Yayin Wang
Department of English, National Taichung University, Taiwan
amberyy@mail.ntcu.edu.tw

ABSTRACT

The primary objective of this study is to understand if extensive reading or writing helps promote creative thinking. In total, 196 university students in Taiwan participated in the study by filling out a questionnaire and completing a creativity test, the Abbreviated Torrance Test of Adults (ATTA). This quantitative study concludes that creativity scores, especially scores of elaboration, are significantly correlated with attitudes toward reading or writing, and with the hours spent on reading or writing.

KEYWORDS

creativity, creative thinking, elaboration, reading, writing, reading habit, writing habit

STATEMENT OF THE PROBLEM

A large amount of research (Amabile, 1983, 1985, 1989; Brown, 1989; Guilford, 1981; Plucker, Beghetto, & Dow, 2004) has recognized creative abilities as essential in solving complex individual, social, and global problems. With such understanding, promoting creativity has also been one of the major issues in education (Le Métais, 2003; Pan et al., 2003; Sharp & Le Métais, 2000).

According to the literature, creativity is constantly associated with abilities required for reading and writing, and many factors that facilitate creativity can be encouraged through reading or writing activities (McVey, 2008; Sak, 2004; Scanlon, 2006; Smith, et al., 2000; Sturgell, 2008). Traits encouraged in English reading and writing appear to be the same traits creativity researchers have suggested for fostering creativity, such as the freedom and ability to communicate ideas (Amabile, 1996; Beghetto, 2005; Cropley, 1992, 1997; Gardner, 1988; Torrance, 1992), an emphasis on self-discovery (Amabile, 1996), and attention to the individual (Albert, 1980; Harrington, Block, & Block, 1987).

A certain amount of research has endeavored to design creativity courses through reading or writing activities (Annis, 1998; Chen et al., 2005; Zachopoulou et al., 2006). However, whether or not personal regular activities on reading or writing can help promote creative thinking has not been examined.

PURPOSE OF THE STUDY

Therefore, the primary objective of this study is to understand if personal reading or writing activities help promote creative thinking. By comparing students' creativity performance with their attitudes toward reading and writing and their hours spent on different reading and writing activities, it attempts to understand the relationship of creative thinking with reading and writing. With statistical evidence, this study intends to understand if students who spend more time reading and/or writing would perform better on a measure of creativity.

SIGNIFICANCE OF THE RESEARCH

Even though creative abilities have been viewed as critical in many domains and endeavors, research about how education can promote creativity has not been as robust as expected. Research that aims at promoting creativity tends to focus on planning a creative way to teach a certain subject (e.g., Chen, Bernard, & Hsu, 2005), or designing a special program outside regular curricula (e.g., Zachopoulou et al., 2006). Whether creativity can be developed simply through regular practices (such as doing extensive reading, having habitual writing, or simply taking a reading and writing course) have not been properly addressed. This study will (1) be beneficial to

many students if any regular practice can prove its value for fostering creative thinking, and (2) provide empirical evidence to verify the assumption that extensive reading and writing facilitate creative performance.

DEFINING CREATIVITY

Before discussing creativity research it is necessary to define creativity. Creative performance in this paper refers to the test results of the Abbreviated Torrance Test for Adults (ATTA). This study, using the ATTA as the measurement tool for creativity, adopts the Torrance research definition. Torrance (1965; 1966; 1988) defines creative thinking as the ability to sense problems, make guesses, generate new ideas, and communicate results. According to Torrance (1988, 2000b), and also Tayor and Sackes (1981), creative potential exists among all people, and can be improved through learning.

LITERATURE REVIEW

Factors that Facilitate Creativity

According to many researchers (Niu & Sternberg, 2003; Rudowicz, Lok, & Kitto, 1995; Straus & Straus, 1968), factors that influence different creative performances may be cultural or educational, and creativity can be fostered through teaching activities (Neethling, 2000; Torrance, 1987, 1988). Many creativity studies suggest traits that teachers should value and encourage in their students. Important aspects include cognitive factors, motivation, personality, and social factors.

freedom, resources, encouragement of originality, freedom from criticism (Amabile, 1996; Amabile & Gryskiewicz, 1989; Witt & Beorkrem, 1989)

First, for cognitive factors, creativity is suggested to be promoted through thinking, remembering, and reasoning (Campbell, 1960; Cropley, 1992; Pollert et al., 1969). Second, for motivation factors, traits to be encouraged are an emphasis on self-discovery (Amabile, 1996), autonomy, courage, curiosity, willingness, and task commitment (Beghetto, 2005; Cannatella, 2004; Cropley, 1992, 1997; Gardner, 1988; Torrance, 1992). Third, for personality factors, self-confidence, self-esteem, determination, persistence, tolerance for ambiguity, and the openness to new experiences are regarded as important for creative thinking (Amabile, 1996; Bean, 1992; Beghetto, 2005; Cannatella, 2004; Cropley, 1992, 1997; Diakidoy & Kanari, 1999; Gardner, 1988; Torrance, 1992; Von Eschenbach & Noland, 1981). Finally, social factors include independence, nonconformity, and the ability to communicate ideas (Amabile, 1996; Beghetto, 2005; Cropley, 1992, 1997; Gardner, 1988; Torrance, 1992).

As Ogilvie (1974) particularly emphasizes, the environment that fosters creativity should be one that "provides for both freedom of expression and good quality association reservoirs" (p. 129). In accordance with these suggested factors, the characteristics repeatedly rated as the most important for the creative person criteria are determination, curiosity, independence (in judgement and thinking), persistence, self-confidence, a willingness to take risks (Diakidoy & Kanari, 1999; Torrance, 1975; Von Eschenbach & Noland, 1981). Finally, in a series of studies, Torrance (1975) and Fryer (1989, 1994, 1996) confirmed that teachers who value characteristics which the experts think of as facilitating creativity actually help students to achieve high creative performance.

Reading, Writing, and Creativity

To encourage the characteristics that facilitate creativity, researchers have endeavored to design so-called creativity courses (Annis, 1998; Chen et al., 2005; Zachopoulou et al., 2006). In a latest research article, McVey (2008) elaborates, "any kind of writing is a creative act" (p. 293), and reading and writing should be promoted for "endless creative possibilities" (p. 294).

When examining the relationship among creative abilities and test scores of different subjects, Wang (2007) discovered that creativity test scores, especially the scores of elaboration, was significantly and positively correlated with English reading and writing scores. Although no empirical evidence of creativity progress can be seen to prove reading and writing help promote creativity, many studies

endorse the idea that reading, writing are linked with creativity (Sak, 2004; Scanlon, 2006; Sturgell, 2008). Sak (2004) demonstrates how reading and writing are incorporated in fostering creativity in the gifted classroom. Scanlon (2006) indicates how reading and writing are more important than mathematics and science for business in the real world. Sturgell (2008) presents how texts provide abundant resources for creative ideas to flourish.

After reviewing creativity literature, Smith, Paradice, and Smith (2000) summarize the essential elements to prepare a creative mind: knowledge of three categories (of the field in which one intends to create, of techniques that enhance creativity and factors that inhibit creative efforts, and of other fields) and behavior (learn something new everyday, seek out constructive criticism, incubation, and put knowledge to work). The elements are actually included in everyday reading and writing procedure: reading for cumulating knowledge, and writing for putting knowledge and personal ideas to work. In addition, from the above factors that facilitate creativity, many of the characteristics can be encouraged through a reading or writing classroom, such as thinking, remembering, and reasoning abilities, curiosity, self-confidence, tolerance for ambiguity, openness to new experiences, and freedom of expression.

The above review of creativity research brings evidence to support the following statements: (1) factors commonly found in the contexts of high creativity were abundant resources and emphasis on a child's personal growth and self-expression (Albert, 1980; Dhillon & Mehra, 1987; Dudek, Strobel, & Runco, 1993; Harrington et al., 1987; Lichtenwalner & Maxwell, 1969; Runco, 2004; Srivastava, 1982); (2) reading and writing are linked with fostering creativity (McVey, 2008; Sak, 2004; Scanlon, 2006; Smith, et al., 2000; Sturgell, 2008; Wang, 2007).

It appears that reading and writing tend to encourage critical ability, analytical ability, self-expressive ability, and self-discovery (CBEST, 2007). Also, the factors which are conducive to creativity can more easily be found in reading and writing activities. Nonetheless, it is a speculation, rather than a conclusion supported by empirical evidence. It is where this study finds its place by providing empirical evidence to this particular aspect.

RESEARCH QUESTIONS

Therefore, this study intends to answer the following questions: (1) Will personal attitude toward reading and writing influence creative performance? (2) Will more hours spent on reading and writing help improve the scores of a creativity test? (3) Will students of different educational backgrounds perform differently on the creativity test?

METHODS

Population and Procedure

The sampling subjects in this study were students in a university in Taiwan. Participants were solicited from four departments in the school: respectively from the departments of English, Chinese, Mathematics, and Information Science. Teachers in the selected classes helped encourage their students to voluntarily participate in the project. As an incentive, a 100NTD gift coupon was provided for every student who participated in the research. During regular class time, the participants filled out a questionnaire and completed a creativity test, the Abbreviated Torrance Test for Adults (ATTA).

Measurement Tools

Two measurement tools were employed: a questionnaire and a creativity test (ATTA). The questionnaire inquires information about (1) personal attitude toward reading and writing; (2) estimated hours spent on different reading and writing activities; and (3) background information. The background information includes gender and major.

The measurement tool used to measure creative thinking ability is the Abbreviated Torrance Test for Adults (ATTA). Based on the most widely used and most researched creativity test, the Torrance Test of Creative Thinking (TTCT) (Cramond, 1998; Rosenthal, DeMers, Stilwell, Graybeal, & Zins, 1983; Runco & Albert, 1985), the ATTA, the shorten version of the TTCT, has proved to be reliable and valid

(Chen, 2006; Goff & Torrance, 2000; Torrance, 1981, 1988, 2000; Torrance & Safter, 1990).

A report of the ATTA provides the Creativity Index (CI), a composite of any creative indicators plus four sub-scores: (1) fluency; (2) originality; (3) elaboration; (4) flexibility. The four creative components are scaled as 11 to 19. The overall creative performance, the CI, is ranked as seven levels, with values ranging from one to seven.

Students' attitudes toward reading and writing were surveyed through a 5-point Likert scale (5 = strongly agree; 1 = strongly disagree), whereas their self-evaluated hours spent on different reading and writing activities were rated through a 6-point Likert scale (6 = more than 15 hours a week; 5 = 11-15 hours a week; 4 = 6-10 hours a week; 3 = 1-5 hours a week; 2 = less than one hour a week; 1 = never).

RESULTS AND DISCUSSION

Table 1 Summary of Participants

Major	Male	Female	Missing	Total (N = 196)
English	6	49	0	55
Chinese	6	48	2	56
Information Science	28	7	3	38
Mathematics	29	18	0	47
Total	69	122	5	196

In this study, 196 valid surveys and creativity tests were collected. The majority of the participants were female students from departments of humanities. Except for the respondents who did not provide background information, there were 122 female and 69 male students: 55 from the department of English, 56 Chinese, 38 Information Science, and 47 Mathematics. Table 1 summarizes the background information of the participants. Also, the majority of participants from the departments of humanities were female, whereas most of those from the departments of science were male.

When analyzing the attitudes, the hours, and creative performance, differences on majors and genders were found in the whole sample. However, no significant gender differences could be noted within each department. Therefore, in addition to investigating the relationships of creativity with attitude and reading/writing time, differences in creative performance among groups of different majors were also explored. The results described here are organized as follows: (1) the relationship between creativity and attitudes toward reading and writing; (2) the relationship between creativity and hours on reading and writing activities; (3) the relationships between creativity and different majors.

Creativity v.s. Attitudes toward Reading and Writing

Significant correlations were observed between creative performance and students' attitudes toward reading and writing. Table 2 presents the significant correlations between any creative ability and reading attitudes. About positive statements about reading, a positive and significant correlation (elaboration $r = 0.172$, CI $r = 0.143$, significant at the 0.05 level) between creativity and the level of preference to discuss books indicates that the more one likes to discuss books, the better the one performed on the creativity test. Also, the more one enjoys reading, the higher the creativity test scores are (elaboration $r = 0.170$, CI $r = 0.161$, significant at the 0.05 level).

Table 2. Correlations between Creativity and Reading Attitudes

Total Sample (N = 196)	Like to discuss books	Enjoy reading
Elaboration	0.172 (*)	0.170 (*)
Creativity Index	0.142 (*)	0.161 (*)
Total Sample (N = 196)	Only read when required	
Fluency	- 0.198 (**)	
Elaboration	- 0.245 (**)	
Creativity Index	- 0.216 (**)	
Total Sample (N = 196)	Reading makes one bored	
Fluency	- 0.212 (**)	
Elaboration	- 0.294 (**)	

| Flexibility | - 0.206 (**) |
| Creativity Index | - 0.293 (**) |

* Correlation is significant at the 0.05 level (2-tailed)
** Correlation is significant at the 0.01 level (2-tailed)

As for negative statements about reading, negative and significant correlations still support the link between creativity and reading. The more one disagrees that he or she reads only when required, the higher he or she scores in the ATTA (fluency $r = -0.198$, elaboration $r = -0.245$, CI $r = -0.216$, significant at the 0.01 level). The stronger a student disagrees that reading makes him or her feel bored, the higher the creativity test scores are (fluency $r = -0.212$, elaboration $r = -0.294$, flexibility $r = -0.206$, CI $r = -0.293$, significant at the 0.01 level).

Table 3. Correlations between Creativity and Writing Attitudes

Total Sample (N = 196)	Only write when required
Fluency	- 0.173 (*)
Elaboration	- 0.235 (**)
Creativity Index	- 0.153 (*)
Total Sample (N = 196)	Writing makes one bored
Fluency	- 0.168 (*)
Originality	- 0.180 (*)
Elaboration	- 0.226 (**)
Flexibility	- 0.156 (*)
Creativity Index	- 0.255 (**)

* Correlation is significant at the 0.05 level (2-tailed)
** Correlation is significant at the 0.01 level (2-tailed)

Regarding attitudes toward writing, significant correlations were also observed. As Table 3 shows, significant and negative correlations were noted between creative performance and the following two statements: (1) one only writes when required (CI $r = -0.153$, significant at the 0.05 level); and (2) writing makes one feel bored (CI $r = -0.255$, significant at the 0.01 level). It means that students who have low creative performance tend to write only when required, and tend to feel bored when doing any writing activity. However, keeping diary, enjoying writing, and the preference to discuss writing did not seem to affect the creative performance.

Creativity v.s. Hours on Reading and Writing Activities

As for hours spent on reading and writing activities, significant and positive correlations were discovered between any creative ability and hours spent on the following activities: (1) reading for fun (fluency $r = 0.165$); (2) reading magazines or articles (fluency $r = 0.176$, elaboration $r = 0.150$, and CI $r = 0.170$); (3) reading online news (originality $r = 0.145$); and (4) writing assignments (originality $r = 0.171$). Table 4 indicates the detailed correlations. Still, hours spent on some reading and writing activities did not influence their creative performance; the activities include reading textbooks, newspapers, or personal blogs, and writing for fun, on BBS (Bulletin Board System), or on personal blogs.

Table 4. Correlations between Creativity and Reading or Writing Hours

Total Sample (N = 196)	Reading for fun
Fluency	0.165 (*)
Total Sample (N = 196)	Reading magazines or articles
Fluency	0.176 (*)
Elaboration	0.150 (*)
Creativity Index	0.222 (**)
Total Sample (N = 196)	Reading online news
Originality	0.145 (*)
Total Sample (N = 196)	Writing assignments
Originality	0.171 (*)

* Correlation is significant at the 0.05 level (2-tailed)

** Correlation is significant at the 0.01 level (2-tailed)

Creativity v.s. Majors

This section describes the results of the ATTA. The ANOVA was performed, and as Table 5 demonstrates, significant differences between the department groups were observed in their levels of creativity index (F = 6.124, *p* < 0.001), and every component ability, especially the ability of elaboration (F = 6.535, *p* < 0.001). Therefore, the following paragraphs explore how different each department group performed in the ATTA.

Table 5. Significant Differences on Creative Performance among Different Majors

Majors (N = 196)	F	Sig.
Fluency	3.069	0.004
Originality	2.308	0.036
Elaboration	6.535	< 0.001
Flexibility	2.166	0.048
Level of Creativity Index	6.124	< 0.001

Obviously, the majority of English-major (32.7%) and Chinese-major (33.9%) students demonstrated a high level of creativity (CI = 6), whereas the majority of Science-major (44.7%) and Math-major (27.7%) students showed an average level of creativity (CI = 4). Table 6 shows the frequency distributions of the CI in the four departments.

Also apparently, although Science-major students demonstrated the highest mean scores on the ability of originality, English-major students scored the highest in almost every aspect of the test. Table 7 compares the means and standard deviations of the scores of creativity index and the four sub-scores.

Table 6. Distribution of the Level of the Creativity Index (CI)

CI Major	1 Min.	2 Low	3 Below	4 Avg.	5 Above	6 High	7 Substantial	Total
English	0	0	3	11	7	18	16	55
Chinese	0	2	4	14	11	19	6	56
Science	0	1	4	17	8	7	1	38
Mathematics	3	5	9	13	6	7	4	47

* CI: (1) Minimal; (2) Low; (3) Below Average; (4) Average; (5) Above Average; (6) High; (7) Substantial.

Table 7. Means and Standard Deviations of the Scores on the ATTA

Creativity Major	Fluency		Originality		Elaboration		Flexibility		Creativity Index	
	M	SD	M	SD	M	SD	M	SD	M	SD
English	15.41	1.42	16.33	1.89	17.24	1.30	15.13	1.80	5.63	1.25
Chinese	14.63	1.64	16.30	1.99	16.64	1.53	15.00	2.03	5.05	1.29
Science	14.24	1.32	16.37	2.16	16.00	1.38	15.08	1.75	4.50	1.09
Math	14.23	1.83	15.32	2.49	15.32	1.92	14.17	2.07	4.09	1.65

* Scaled scores: Fluency, Originality, Elaboration, and Flexibility = 11-19; Creativity Level = 1-7.
** ANOVA shows significant differences between the groups.

Students with different majors take different required courses. Students from the departments of English and Chinese were required to take more credits on reading and/or writing courses, and they had more essay-type assignments than those in the departments of Science and Mathematics. To a certain degree, English-majors were required to take more credits than Chinese-majors in courses that require many reading and writing assignments, especially literature courses. However, students from the departments of Science and Mathematics did not take many credits on reading courses, nor did they register in any writing courses.

CONCLUSION

From the above statistical evidence, the study confirms the relationship of creativity with reading and writing. Obviously, personal attitudes toward reading and writing will influence creative performance, and hours spent on certain reading and writing activities will help promote creative thinking. Therefore, creative thinking is strongly connected with positive attitudes toward reading and writing, and more hours spent on reading and writing.

In addition, from the above significant correlations between creativity and reading/writing (Table 2, 3, 4), the ability of elaboration constantly emerged as the most prominent and constant connection with reading and/or writing. Even in the results of the ANOVA (Table 5), the most distinct difference on creative performance among the four department groups appeared in the ability of elaboration. Originality and flexibility seem to be less differentiated among the four groups. Therefore, it is possible that a constant habit on reading and writing help promotes the ability of elaboration.

ABSTRACT

The year 2009 marks the completion of the first half of the UN Decade on Education for Sustainable Development (ESD). This provides the opportunity to critically reflect on what has been achieved so far and which tasks and challenges remain to be addressed in terms of education for sustainability in a country. The aims of this paper are: (i) to provide a comprehensive critical review of the National strategy for sustainable development of the Republic of Macedonia from environmental education point of view, and (ii) to provide an appropriate context for continuing dialogue and to identify a relevant framework for desired future action. Content analysis has been used to examine the quality of the National strategy for sustainable development of the Republic of Macedonia.

Our general conclusion is that the inclusion of environmental issues in the National strategy for sustainable development of the Republic of Macedonia is 'left to chance' and lacking in appropriate planning for consistency and theoretical grounding. There is a need to provide incentives to promote and foster ESD in The Republic of Macedonia by A National Strategy for Environmental Education for Sustainability for the United Nation Decade of ESD (2005-2014). It is important the Strategy to be used in conjunction with UNESCO's International Implementation Scheme, which provides more detailed background information and global directives for education for sustainable development.

INTRODUCTION

Support for the Preparation of the National Strategy for Sustainable Development of the Republic of Macedonia promotes national development based on three key pillars – economy, welfare and ecology. In this regard Republic of Macedonia should secure its citizens clear vision and perspective of the development of the country in the following 22 year range (2008-2030).

National Strategy for Sustainable Development of the Republic of Macedonia is of international political significance with regard to European Union (EU) integration. Sustainable development is the fundamental goal of the EU and the core of the European model of society. Through the status of the country candidate for EU membership since December 2005, Republic of Macedonia was obliged to prepare a National Strategy for

Sustainble Development.

Even though Republic of Macedona, as a country candidate for EU membership can not comply with the time frame set for the more developed countries of EU it still has to initiate its transformation towards society based on knowledge without any further delay. Building a society based on knowledge is not only crucial for quicker integration of the country in EU, but is primarily crucial for providing improved life standard of Macedonian citizens (Republic of Macedonia, 2008).

Raising the awareness of the citizens about the issue is one of the crucial elements for fulfillment of the goals previously set. The National strategy will achieve its ultimate goal only if it is understood and accepted by each and every citizen. Consequently it is rightly believed that in this respect education has an irreplaceable goal. The educational component of this strategy was the major force to engage in this research.

METHODS

The purpose of this article is to identify the quality of environmental education and/or education for sustainable development in the Support for the Preparation of the National Strategy for Sustainable Development of the Republic of Macedonia-draft document. Tasks of the examination are: (i) To identify to what extent EE and/or ESD are currently incorporated into this document?, and (ii) To identify the promise and prospects in the field of EE and/or ESD in The Republic of Macedonia?

We estimate the quality of the Support for the preparation of the National Strategy for sustainable development of the Republic of Macedonia by contents- which explicitly include environmental education (EE) and ESD. Content analysis has been used to examine the extent to which EE and/or ESD are addressed within this document.

We analyzed this document by Indicators for education for sustainable development (UN, 2007a) and Suggestions for developing a national strategy for environmental education (UNESCO, 1980). The indicators are determined by the objectives of the UNICE Strategy for education for sustainable development. They are focus on ESD issues and not on sustainable development as such.

RESULTS AND DISCUSSION

Republic of Macedonia is dedicated to undertaking measures for complete implementation of the basic principles encompassed in the Renewed Strategy for Sustainable Development of EU from 9 June 2006 - 10117/06. Out of the ten principles of the Macedonian sustainable development, (Human rights promotion and protection, solidarity within and among generations, open and democratic society, citizen involvement, business and social partners involvement, political coherence and governing, politics integration, making use of the best knowledge available, protection principle, polluter-pays), the educational component is solely mentioned in the principle for citizen involvement. The principle states: "The Republic of Macedonia (RM) enhances the participation of citizens in the decision making process. RM promotes education and public awareness on sustainable development. RM informs its citizens about their impact on the environment and their options for making sustainable decisions".

One of the key goals of the Macedonian vision for sustainable development and state mission is interdepartamental policy which supports the society of knowledge. Support of the development of the society based on knowledge in the Republic of Macedonia will provide the citizens with the key competences and functional literacy which determines the global competitiveness and at the same time develops the citizens' relation towards sustainable development. The success in the annulment of the unsustainable trends

largely depends on the higher education including sustainable development education at every educational level including education on topics such as sustainable energy usage and transportation system, sustainable consumption, health, media competency, and responsible world citizenship (Republic of Macedonia, 2008).

In the Support for the Preparation of the National Strategy for Sustainable Development of the Republic of Macedonia, EE and/or ESD are completely marginalized. In the paragraph "Awareness raising of the environment and education" ESD is explicitly mentioned. It states: "Awareness raising about the environment such as education in the field, are important steps towards achieving sustainable development. The condition of the environment maybe improved if the citizens recognize their own power, their own responsibility, and their ability to contribute to the development and advancement of the environment. Healthier environment may not be achieved only through accepting the new legislation, however it may be achieved only if the citizens understand and support this legislation and at the same time respect the individual responsibility for protection and the advancement of the environment.

The general condition of the education is by all means reflected in EE and/or ESD. Having this in mind we will address EE through the SWOT analysys conducted in this document.

Strengths

 In line with this strategic document education is considered the key factor for achieving the goals for sustainable economic development. A major precondition for the development of education in the forthcoming periods should be the increase of educational expenses. Indicators exist that the educational component of GDP will increase. This will undoubtedly reflect positively on the development of the school network in the country. Currently it consists of over 1000 primary schools, about 100 secondary schools, 4 state universities as well as several private universities. This means that major infrastructural investments for enhancement of the education are not necessary. Primary and secondary education in The Republic of Macedonia is mandatory and the enrollment in primary education is high.

Even though the existence of the strategy for development until 2005 in the document is considered as strength, we can unfortunately state that it contains serous weaknesses in terms of EE, especially in terms of ESD (Srbinovski, 2005b). These terms are barely mentioned. With regard to the legislation we will state that the basic laws in the field already exist. This is a solid foundation for further reforms in the sector.

It is of crucial importance that in the last years the number of students attending private studies is significantly increased. Consequently the competition between state and private universities is increased. This was supposed to improve the quality of the education process itself, since the republic of Macedonia already started the restructuring of the higher education according to the bologna Declaration. The process of education modernization is stimulated by a larger member of international and bilateral donators (for instance EU TEMPUS program). It was expected to provide transfer of the experiences in the educational sector.

Weaknesses

 Apart from the stated strengths of the educational process, Macedonian education is facing with several significant weaknesses. The same have negative influence in the area of EE and/or ESD. Low quality of the educational system is basic weakness of the Macedonian education. According to the performed evaluations on international level, the level of student knowledge is low in comparison to the EU countries and the neighbouring countries.

For example, the results of the Third International Mathematics and Science Study (TIMSS) confirm the relatively low level of student knowledge (The International Study Centre and The International Association for the Evaluation of Educational Achievement, 2000). TIMMS (1999) was designed to provide trends in eight-grade mathematics and science achievement in an international context. Thirty-eight countries participated in TIMSS 1999. Six content areas were covered in the TIMSS 1999 science test: earth science, life science, physics, chemistry, environmental and resource issues, and scientific inquiry and the nature of science. These topics were included in the Environmental and Resource Issues: pollution (acid rain, global warning, ozone layer, and water pollution), conservation of natural resources (land, water, forests, and energy resources), food supply and production, population, and the environmental effects of natural and man-made events. Macedonian students' performance in environmental and resource issues was significantly lower than the international average. Macedonian students had a significantly higher average only compared to students in Morocco, the Philippines and South Africa (The International Study Canter and The International Association for the Evaluation of Educational Achievement, 2000).

The following weakness is result of the insufficient resources for maintaining and capital investments. The main part of the expenses is used for payment of the salary to the employees. The part planned for maintaining of the premises, supplying teaching materials and the rest of the equipment to modernize the educational process is insufficient. Furthermore many schools lack classrooms. The lack of classrooms results in conversions of labs and other specialized rooms into classrooms. All of the above mentioned facts reduce the quality of the educational process. The researches of Srbinovski M. (2005b) have shown that the priority in improving the quality of EE and ESD should be given to the improving of classrooms and improving the other conditions in the schools. Many schools in our country do not meet the pedagogical minimum for normal teaching process.

Disbalance between the number of graduates and the real demand on the labor market-economic reality also has negative influence on the general atmosphere in schools. In a situation when the gradutes did not acquire the appropriate skills, the business sector is forced to invest in additional training of the new gradutaes.

Many factors determine the quality of educational system. The emphasize is given to the quality of the sylabuses, the teaching materials as well as the methods and techniques of instruction. Reserach done by Srbinovski (2003a, 2004 and 2005); Ismaili et al. (2007), Srbinovski & Palmer (2009); Srbinovski et al. (2007 and 2009), Abazi et al., (2009) etc., have shown that in our curricula and didactic materials exist serious gaps and weaknesses in terms of EE and/or ESD. Education is still dominated by traditional teaching and frontal methods. Memorization of the contents without developing the other skills is still required from the students. (Srbinovski, 2003b, 2004b, 2005a,b, 2006). In such circimstances the functional knowledge is completely neglected.

Environmental education should strive to transform the entire country into one educational community. Therefore the need of appropriate reach to the groups and communities in the educational process still exists. The data confirm that a low level of enrolment still exists among certain groups (for instance Roma population and a young people from distant rural communities). Finally the general state is determined by the incomplete implementation of the legislation. This applies to the incomplete secondary legislation or the administrative capacities to apply the same.

Opportunities

The strategy lists several opportunities. The first one results in introduction of IT skills

through the project "Computer for every student". During the implementation of the project the improvement of the quality of the educational process is expected as a result of the opportunities given by the IT technology. Nevertheless, the educational practice has shown that the number of factors complicate the implementation and the realization of this project's goals. Although in many schools the computers were installed they are not functioning up to date.

Certian possibilities for development of educational system come out of the usage of the IPA funds. Republic of Macedonia has access to all of the components of these funds planned for educational development . The component IV funds can be used to promote life long learning and acquiring new skills and knowledge.

Redesigned VET programs tend to satisfy the labor market needs. The same are predicted to reach 1/3 of the entire number of students. The close cooperation with the private sector guarantees better success of this project.

Framework strategic coherence 2007-2013 predicts coordination of the reforms from several sectors. The educational reforms can be realized only if other reforms in the country are implemented at the same time.In that way the educational reform is completely supported by wider community.

Threats

The primary threat to the reform in the educational system are the insufficient financial resources. The implementation of the reforms requires additional financial means.Therefore the solution should be sought either in providing additional resources or redfining the consumption of the existing one. We can expect these processes in the future to be limited beacause of the slow implementation of the legislation, meaning the Bologna Process and VET law.
A serious threat to the education in general is the process of population aging and the expected decrease in numbers of the school population in the republic of Macedonia. The demograhic trends and expectations point to drastic decrease of school population in the following decades. At this moment a complete estimation of the possible consequences of this threat to the educational system does not exist.

Decentralization process enters the second phase and the transfer of competences from central to local government proceeds. Unfortunately this process is followed by many problemes, some of them influence the education directly.

The increase of number of the private educational institutions caused increased number of students studying there especially at undergraduate level. In absence of control and monitoring of this process there are risks related to the quality of education in the country.

The problem of introducing systems of good governance related to SD is present even in developed countries but is even more emphasized in countries with less capacities and experience in this area. Republic of Macedonia belongs to the second group because the concept of SD is not sufficiently build in the governing system. The constitution of the Republic of Macedonia contains the basic philosophy of SD and prescribes equal economic and social opportunities for the citizens as well as appropriate protection of the natural resources, flora and fauna. Nevertheless, decision making processes and the implementation of the policies and legislation in the Republic of Macedonia reflect limited awareness of SD on all levels of government and society, lack of policies for SD, inappropriate cooperation among policy makers from different sectors and using of the approach "from top to bottom" in decision making which causes difficulties for incorporation of the dimension of SD in the sector policy. Usually, relevant national government individually create economic, social and evirionmental policies rarely provide

cohesion of the policies from aspect of SD. In addition there is a lack of such cohesion regarding the sector legislation because they insufficiently include the dimension of SD (Republic of Macedonia, 2008).

Sustainable development and ecology are almost neglected and in the National draft program for educational development in the Republic of Macedonia 2005-2015. Sustainable development is mentioned in the introductory part where it is stated that the National program attempts to give full contribution to realization of sustainable development, improving the society and its affirmation as equal and respectable member in the European and wider environment " and page 23 where it states "Investment in education, training, science and research are always payable investments and are the strongest factors of the national competency and competitiveness and also basic factors of the SD of the country" (Srbinovski, 2005b).

CONCLUSION

The understanding of the concept of SD is basic assumption of creating and implementation of appropriate policies for ESD. In that regard raising of the awareness of SD on all levels should be a permanent task of the formal, non-formal and informal education. People are the core of SD and only well educated population can contribute to the realization of the principles of SD/ The National strategy of SD of the Republic of Macedonia has major weaknesses and draw backs from the point of view of ESD and EE. The notions EE and ESD are not even mentioned . They are treated in the general framework of education, the SWOT analysys points out that the Macedonina education which means EE and ESD and in very specific situation in which it can be expected that thae positive sides and opportunities will be inferior compared to the threats and weaknesses.

Our general conclusion is that the inclusion of environmental issues in the National strategy for sustainable development of the Republic of Macedonia is 'left to chance' and lacking in appropriate planning for consistency and theoretical grounding. There is a need to provide incentives to promote and foster ESD in The Republic of Macedonia by A National Strategy for Environmental Education for Sustainability for the United Nation Decade of ESD (2005-2014). It is important that the Strategy be used in conjunction with UNESCO's International Implementation Scheme, which provides more detailed background information and global directives for education for sustainable development.

ORGANISATION AND MANAGEMENT OF NON-PROFIT PRIVATE HIGHER EDUCATION IN A MULTI-ETHNIC, MULTI-LINGUAL ENVIRONMENT

Dennis Farrington and Alajdin Abazi
South East European University
Republic of Macedonia

Abstract

The South East European University (SEEU) was founded in 2001 in Tetovo as a non-profit university established by co-operation between the Organisation for Security and Cooperation in Europe (OSCE), USAID, the European Commission and the Government of the Republic of Macedonia (or fYRoM) as a contribution towards conflict prevention following the breakup of the former Yugoslavia and the conflict in neighbouring Kosovo. The Republic of Macedonia has a significant Albanian-speaking population, about 25% of the total, but until the establishment of SEEU there was no legalised provision of higher education in that language.

There has been a gradual transition from a centrally managed project to a modern form of organisation and governance attracting favourable comment from OECD-IMHE and the European Universities Association (EUA), most recently in July of this year. Although originally treated as a private university to circumvent the legal obstacle preventing teaching in Albanian in public institutions, in 2008 SEEU was granted by the Parliament of the Republic of Macedonia the status of public-private, non-profit university, the first in the region, reflecting its emphasis on working in the public interest. The case study illustrates the different stages of the transition, the problems encountered along the way, and suggests lessons to be learned in implementing similar initiatives elsewhere.

Introduction

The Republic of Macedonia (R Macedonia or fYRoM) is a small country in Europe formerly part of the Yugoslav Federation, from which it seceded peacefully in 1991. Before 2001 the higher education system consisted of two state universities teaching in the Macedonian language, a member of the South Slavonic group, and one unrecognised private initiative teaching in the Albanian language, a distinctive language with Indo-European origin.

The Law on Higher Education 2000 was a first stage in a gradual process allowing recognised higher education to be conducted in a language other than Macedonian. At that time only non-state institutions were permitted to teach in the Albanian or other minority languages, subject to a number of restrictions. The establishment of the first (and as yet the only) not-for-profit private (since March 2008 public-private) recognised and accredited university in R Macedonia, operating in the public interest, but teaching primarily in the Albanian language, presented a unique challenge. The Law permitted the university's foundation as a private entity but did not distinguish between profit and non-profit institutions and, while imposing certain licensing and operating requirements, left the organisational structure to the university's founders. What is described here is the process of transition from the original project developed in 2000/2001 to the current structure, influenced by external factors including the political processes in this small country, now a candidate for accession to the EU. The current status of public-private, not for profit, implies that the University, while independent of the state, operates its programmes in the public interest, is eligible for government funding based on contract,

and re-invests all surpluses in educational activities or operating reserves.

Background

The governance, leadership and management of a modern university represent a range of complex and critical challenges. How to ensure 'good governance' of universities is a recurrent theme in Europe, the United States and other parts of the world: presentations at the August 2009 European Association for Institutional Research (EAIR) Conference in Vilnius, Lithuania, received papers from China and Taiwan and participants from other countries in Asia in addition to those from Europe, Africa and North America. As R Macedonia is a European state, and Macedonian universities are members of the European Universities Association (EUA), we follow in particular developments in Europe. As the introduction to the EUA Report 'Managing the University Community: Exploring Good Practice' (EUA, 2007) states, sound governance is one of the top issues on the work agenda of European university leaders today. It was the topic of two conferences of EUA in 2007 and 2008 focussing on the linkages between higher education and society, and on ways of engaging the academic community, of teachers and students, in planning and development of institutions, and the theme of governance engaged participants in the EUA conferences in Prague, Czech Republic and in Giessen, Germany in 2009. The EUA Report also illustrates the barriers to institutional management including 'the difficulty inherent in abandoning the comfortable dependence on government for the more challenging aspects of true autonomy.' The case studies in the EUA Report, the issues arising from the EUA Institutional Evaluation Programme, Workshops on Governance and Leadership and Trends Report V, coupled with the research undertaken by the Centre for Higher Education Policy Studies (CHEPS) for the report 'The extent and impact of higher education governance reform across Europe' (2006, DG Education and Culture) provide a useful background to the development of sound governance in the SEE region as institutions change from a position of subservience to detailed state intervention to one of partnership with the state. As Lambert and Butler in 'The future of European universities: Renaissance or decay?' (CER, 2006) state, 'Many decades of state domination has [sic] left most European universities with limited autonomy and poor systems of governance.'

Under pressure from the commitments given in the Bologna Process, reflecting also the work of the Council of Europe's Legislative Reform Programme in Higher Education and Research (1991-2000) (LRP), increasing emphasis on accountable governance of autonomous universities is reflected in such legal provisions as the introduction of a Board into the University of Prishtina in what is now the Republic of Kosovo as early as 2003 and Councils into state universities in R Macedonia in 2008. There is recognition of the importance of similar bodies in strategic planning, human resources development, diversity in financing, quality assurance and audit in the laws and practices of R Serbia and Bosnia & Herzegovina. South East European University has had a Board since 2002. The principles are recognised throughout South East Europe, although the details differ. If institutions are to maintain their autonomy they need to demonstrate that they are capable of, and can be trusted in, looking after their own affairs.

A number of published documents, including the University's own Strategic Plan and Reports and reports from OECD-IMHE and EUA, have identified the difficult problems in higher education associated with the disintegration of the former Yugoslavia and formation of R Macedonia in 1991. Foremost among these problems was the lack of provision for legalised and accredited higher education in their own language of the significant Albanian minority population (representing some 25-28% of the total). SEEU was founded as a result of OSCE initiatives to redress this problem while providing opportunities for interethnic and multilingual learning. Initial donations totalling some €35m were obtained from different sources, about 50% from the US. A 'clean slate' was available on which to design the ultimate best form of governance for such an institution. The European influence was prominent, given the secondment of a senior university

administrator from the UK who had also worked since 1994 in twelve countries of the former Yugoslavia and Soviet Union in legislative and governance reform. Administrative help, and assistance with formulating a sound system of governance, were also offered through a USD3m USAID linkage, but the US approach, based on the experience of state universities, although welcome and valued, was not fully applicable in the European context and available resources were switched into curriculum development in specific fields. The results of some European Union TEMPUS projects, particularly in the area of quality management, have also been useful. All the most modern approaches to governance have been considered carefully, and appropriate ones incorporated into strategic planning and organisational change. In addition much emphasis was placed on the outcomes of the LRP, during which the second author developed a structural model for higher education legislation based on analysis of laws and practices across all of Europe. This structural model assisted the development of the R Macedonia laws from 2000 to the latest law of 2008, as well as the laws of other countries in the region.

Description

Since donors were understandably cautious about how their significant contributions, some USD17m in the case of the US plus the USD3m project already referred to (and a further USD3m linkage from 2004-2007), €5m from the EU (€2.25m more in 2006) and the balance of an initial total of about €35m, were to be managed, the University was set up through an International Foundation (IF) established in Switzerland in 2000. This controlled the international funding, and a National Foundation (NF) was established in R Macedonia to comply with local law and to manage local funding, licensing, permits for construction, tax issues, etc. The first author was appointed as Director of the NF and the second author as a member of the IF and NF. Construction of the University using prefabricated buildings started in March 2001, and continued during the period of considerable political unrest leading to the conflict of summer 2001. The University opened to its first 860 students in October 2001 and the Director of the NF took up his position as Rector. The second author became the founding Secretary-General and accordingly resigned from the NF.

During the first year of operation the IF maintained full control over financing, staffing and other resources including a € 20m building schedule and developed, through management consultants based in Switzerland, all the University's initial academic and other policies. The NF was advisory, participating along with other local experts in the construction of the first curriculum. In early 2002 the Boards of the two Foundations formed a Joint Board, to which were delegated most of the functions of the IF, and which from then on determined all financial, academic and other policies of the University. With the adoption of the first University Statute in autumn 2002, as the University matured and tripled its student numbers, the structure of Board and Senate common in new higher education laws in the region was adopted, the Joint Boards becoming the Board, which gradually relinquished its control over details of academic work, while still maintaining the final say over the University's 'educational character and mission.' The IF with few residuary powers was dissolved in 2004, the NF was also dissolved, and a new Foundation created essentially as a trustee of the assets of the former IF and NF. The current SEEU Foundation has identical membership to the University Board. In 2007 the structures were developed further, with decentralisation of some functions to Faculties, and in 2008/9, in a University having grown to 8600 students and 400 staff, a more sophisticated resource allocation mechanism has been put in place. In July 2009, the EUA Institutional Evaluation Programme (IEP), which reported favourably on the University's governance structures in 2005, published its report of a follow-up study which again commended the structure and made recommendations relating to the university-faculty relationships.

The SEEU Foundation, in addition to acting as trustee of the donated assets, also acts as a fund-raising vehicle for the University. In this connection, it has contracted with

Indiana University Foundation (IUF) to deposit some of its reserves with the IUF to fund staff and student exchanges with the US, and scholarships. The University Board and Foundation are constituted of nine members, three from outside the country - one of whom from western Europe is President, one other from 'new' Europe and one from the US,- three from the community in Macedonia representing business, academic and public interests, and three from the University Senate. There is a proposal to increase the membership to 11, taking into account the provisions of the new Law on Higher Education adopted in R Macedonia in 2008 and the size of the University. Of these six members would be from outside the University. The Board has the strategic functions normally associated with a Council or Court in a UK University and those modelled on the British system in Asia and Australasia.

Certain decisions including amendment of the Statute, closure, merger or transformation of the University and other issues as determined by the University Board, require a special form of vote including both national and international external members. The latter protects the 'public' investment, albeit that investment, apart from the site itself, has all been internationally funded, while the former protects the Macedonian interest.

Issues

Unsurprisingly, the path of progress has not always been smooth. Some issues have taxed us, including the following:

(i)   The input of the donors and their expectations set against the autonomy of the institution as provided in the Constitution, the Laws on Higher Education and the University's statutes. Naturally the decision to donate was based on each donor's assessment of the need for the initiative and how it could be controlled effectively in such a volatile climate. (Leading in fact to an armed conflict in summer 2001). USAID in particular undertook extensive preliminary investigations. All of them required extensive reporting for developed, and different, systems of accounting and audit which did not then exist in R Macedonia and therefore took up considerable IF resources. In addition, sometimes donor representatives, who were constantly changing under normal diplomatic rotation, sought to influence the academic curriculum in various ways. It is difficult to balance academic and institutional autonomy, and the University's own strategy based on market demands and political reality, against the demands of donors, and it is a tribute to the diplomatic skills of the first President of the Board that generally speaking we managed to offend scarcely anybody. As the IF transferred its authority to the Joint Boards and subsequently to the national structures, and as SEEU grew in stature and recognition, donor influence directly on SEEU has decreased, although scholarship providers wishing to secure value for money sometimes seek to change practices established for good reason. Instead, generally speaking, the international community takes positive steps to help SEEU to collaborate with institutions outside the country.

(ii)   Continuous political upheaval and changes in attitudes towards the University. Changing coalition governments had electoral prospects always on their minds so the attitude of the parties to the university initiative varied considerably. Tetovo had had a 'private citizens' initiative' unrecognised university since 1994, closely associated with, and drawing staff and students from, the equally unrecognised 'Albanian University of Prishtina,' the result of the expulsion by the Milosević regime from the University of Prishtina of the Albanian workforce and students in 1991. The stated aim of SEEU was to provide opportunities for students at the unrecognised Tetovo University to enter accredited, quality higher education and then for that initiative to

quietly terminate. However the authorities of that initiative were not willing to go so quietly, public opinion was not ready for what was perceived as a u-turn, and campaigning for its 'legalisation' continued until 2004, when a new State University of Tetovo was created essentially from the old one. While attracting praise from all sections of the community, from the Government, Parliament, local businesses, members of the public and students, and continuously from the international community, SEEU still receives virtually no state funding and derives almost all its resources from student fees. Hence the Board's duty to maintain the financial solvency of SEEU is critical and its strategic planning abilities vital.

(iii)   The problem of achieving equal treatment of ethnic groups while maintaining the mission to contribute to the provision of higher education in the Albanian language. This has been a difficult process because while on the one hand SEEU wished to be open to all, in practice to have more than about 25-30% students entering to study in the Macedonian language would, at least in the early days, have caused major political problems. This occupied many hours of debate in the IF and subsequently. A major pressure up to about 2003 came from the US Embassy and USAID, as already noted, generous donors, which wished the University to move rapidly to increasing the use of the English language, perhaps even to the extreme view that no student should graduate unless achieving a high level of English competence, in effect becoming a kind of American institution. No pressure of that kind came from other donors and the strongly European-oriented board members managed to resist this on academic and practical grounds. SEEU's Board had to balance this pressure against the obvious difficulties in providing professional courses in local disciplines – it was not clear for example why an Albanian speaker who had also to work in the completely different Macedonian language and wished to become a local lawyer should need to devote large parts of her/his study to becoming fluent in a language (s)he might never use in her/his professional career. SEEU did so by developing the concept of 'flexible use of languages' which could be the subject of another discussion! Students are admitted in language groups according to the resources available, principally human resources. For now, suffice it to say that it was possible to steer a middle course which benefitted students of all linguistic abilities while preserving a commitment to help students in internationally marketable fields to learn English (and indeed French). Having a mixed Board with a wide range of expertise and interests helped to iron out the problems associated with the adoption of this policy.

(iv)   Difficulties in effecting a transformation from the 'state' mindset to the private/ public-private one. Apart from focussing on the reality that, at least after the cessation of the active work of the IF, nothing was done for us unless we did it ourselves, this relates to the adoption of the 'Nolan principles' (originating in the UK) of operation of the Board. From the start the strategic planning and development of the University was concentrated in very few people, not all but mostly internationals, who had no political or other connections in Macedonia. Recruiting and training of Board members who have a real commitment to the University is not easy, and together with colleagues in other universities in the Region (Macedonia, Albania and Bosnia-Herzegovina) we have applied for TEMPUS funds to allow us to move this forward.

(v)   Inevitably, finance. Relying almost entirely on student tuition fees which are higher than those charged at the state universities, somewhat lower than those charged by the for-profit private institutions, means that we have to be highly responsive to the market and spend a considerable amount of time and

resources on ensuring quality. SEEU has a highly developed quality management structure, with practical steps taken through staff evaluations, teaching observation, research selectivity, staff development and student involvement to ensure that we remain at the top of the quality league in the region. Somehow or other we have to break away from old ways of thinking relating to the structure and remuneration of the academic profession. Research undertaken by one of our Faculties indicates that overcoming the traditional mindset has been one of the key issues facing our graduates entering the world of compulsory education, one that requires continuing support of our alumni through programmes of continuing education, close liaison with employers and so on. Developing new approaches to work, and thus having a more stable and incentive-led remuneration policy, is an essential element of quality enhancement and therefore our appeal to students and their parents. The governing body – the University Board - has to take the lead in this.

In addition, the University was founded, planned in all aspects (financial, estates, academic) and opened in a more or less fully functioning form in less than twelve months. A remarkable achievement, and essential in the volatile political climate of 2001, but a number of policies and procedures were introduced, and academic programmes developed, which had to be changed significantly within a year or so of starting operation, since there had been relatively little interaction with the local prospective staff. Significant sums of money were spent on what was with the gift of hindsight, inappropriate procurement, particularly of IT systems, vehicles and ancillary premises. IT was a particular problem, as the IF entered into contracts which had significant recurrent financial consequences, particularly licensing. All of these systems have now been replaced with software developed in house or available free. The moral of this story is that if you have time, take it. Look carefully at the medium term objectives and design systems around them.

Conclusion

What have we learned from all this which can be applied to other projects? We accept that it is unlikely that something exactly like SEEU will be created in similar circumstances. While the experience of SEEU has been debated as a potential solution to the otherwise segregated higher education in Kosovo, and as identified by OECD, EUA, OSCE and others as a 'model' at least for the region if not for the wider world, the political circumstances are dissimilar. So we concentrate here on what works well and how others might learn from our experience. We think that it is important for potential donors, e.g. USAID to learn from positive experiences and to appreciate the constraints under which projects operate.

First it is important to have the right leadership. In our case the first four years of our development were led by a highly experienced and influential diplomat. He directed the transition from the project to the present structure, skilfully deflecting irrelevancies and refusing to be side-tracked. He was supported by an experienced former rector of a Swiss university who subsequently made a major contribution in the area of organisation and financial control. Their joint legacy leaves an institution with strong international and national support, well-managed and financially viable. A transition to a fully locally sustainable structure is envisaged over the next four years or so, but the international input remains important to us.

Second, it is important to move as quickly as possible to a governance structure reflecting the structure proposed in the Council of Europe report so far as consistent with the laws of the country. In this respect also, SEEU provides a model for the region, albeit it is not quite so strictly circumscribed by domestic law as the state institutions, but there is still

much to be done on training and developing members of the governing board so that they are less reliant on foreign expertise. However, the structures developed are of interest for all countries in transition and for institutions which are considering changes in their forms of governance, particularly where there is private-public interaction. We have concluded that a step by step development of different forms of governance over a period of time, involving at all stages relevant stakeholders (donors, staff, students) alongside changing external environments, has enabled us to devise a system meeting modern standards and fit for purpose.

Finally, do not be thrown off course by short-term perturbations in the local political and social climate. Stick with the mission: naturally if circumstances dictate a change in direction, follow the trends, but establish a clear strategic planning framework within which changes can be effected in a sensible way. This is probably the most difficult area to manage. It requires a combination of a consultative, collegial approach and strong management.

European studies in Hong Kong: between local and European realities
Dr. Béatrice Cabau, Hong Kong Baptist University

Dr. Béatrice Cabau
Hong Kong Baptist University
cabaulam@hkbu.edu.hk

The theme "'Local Problems, Global Solutions?" echoes an interrogation brought about with the increased pattern of internationalisation of higher education. Even if internationalisation aims at transcending boundaries within the academic arena, it might induce academics and decision-makers to overlook some local peculiarities. These peculiarities, challenges, and sometimes problematic situations, require mixed solutions with a local and global dimension. This is the reason why contextualisation plays a major role, as for the failure or success of an academic programme.

Hence, one of the key features of a successful academic programme is the attention given to a combination of various factors. Among these factors we may mention the profile of the students, their expectations, the newly introduced Outcomes-Based Teaching & Learning (OBTL) educational philosophy as well as the shift observed in the academic discourse from traditional academic knowledge to the need to include skills and attitudes, the current socio-economic situation of the country/region where the programme is offered, the needs and expectations of potential employers, the support provided by representatives of the community… Another challenge is the ongoing trend to integrate professional experience (short-term internship) or/and to include an academic semester abroad in undergraduate programmes. Needless to say that this list is not exhaustive. The main aim of this paper is to illustrate how the above-mentioned factors are dealt with in the frame of the European Studies Programme (French stream) at the Hong Kong Baptist University (HKBU).

Globalisation, internationalisation and contextualization

For several years now, the process of "globalisation" and "internationalisation" has been recurrently analysed in the discourse about higher education worldwide. Altbach defines globalisation as typically making reference to "the broad economic, technological, and scientific trends that directly affect higher education and are largely inevitable in the contemporary world." (Altbach, 2009:23), while describing internationalisation being more related to the "specific policies and programs undertaken by governments, academic systems and institutions, and even individual departments to deal with globalization" (Altbach, 2006:123). Internationalisation may be seen as increasing the process of globalisation by forging a common platform for intercultural exchange without little room for cultural diversity (De Wit, 2002) and by relying upon the use of English as academic *lingua franca*. Nevertheless, some don't consider globalisation as a monolithic phenomenon: "It is nuanced according to locality (local area, nation, world region), language(s) of use, and academic cultures" (Marginson, S. and M. van der Wende, 2007:5). It seems then inevitable to adopt a contextual approach to investigate the facts and trends to be observed in higher education in any given country/region.

Contextualisation is here to be understood as the knowledge and appraisal of the local context at the national and institutional level, since the context includes

> "the culture, the political and legal system, the stage of economic development, or the economic system at one point in time. It also includes the history, the geography, its ecology, and all that has transpired over time and in space that have produced what and why a context is the way it is today." (Tsui, 2006)

National and institutional contexts as well as the overall aims of the universities and where they want to position themselves nationally, regionally and internationally play here a major role. Bartell (2003) and Davis (1995) pointed out to the importance of these contexts as for the internationalisation policy of universities. Hence, various factors such as the system of values of the country, its social and economic environment, its historical development, etc. together with the education system as a whole have to be taken into consideration when elaborating and implementing an academic programme: "options cannot be discussed without taking into account the particular national policy context of a higher education system, and in particular its tradition and culture" (UNESCO, 2006).

Internationalisation at Hong Kong Baptist University (HKBU)

Founded as a private college in 1956, Hong Kong Baptist University became a publicly funded institution in 1983. The University set up its language policy with English as medium of instruction in 2003, while encouraging proficiency in Putonghua (Mandarin). Baptist University […] strives to be "an outstanding university in China" and believes that a "worldwide vision" will enhance its capacity to act as "a gateway between mainland China and the global community. Thus, HKBU aspires to be a good national university and its goal through internationalisation is, first and foremost, to serve the motherland" (Chan, 2006:212). The University seeks to enhance its position as an international gateway between mainland China and the global community by strengthening its international networks, as expressed by the president of Hong Kong Baptist University:

> "It is because we can claim to have found our roots, or cultural footing, only after we thoroughly understand our own history and culture. This is essential if we are to understand and appreciate the cultures of other countries. This also enables us to develop our national and global perspectives, so that we may indeed live and work in our heterogeneous community and multicultural environment" (Ng, 2001; quoted in Chan 2006:106).

This is the reason why the president of HKBU preferred to use the term "translocalisation" instead of "internationalisation" in the perspective of recruiting mainland students and collaborating with Chinese universities (Chan, 2006, 213). He explained the use of this term as follows:

> "under our one-country-two-systems political arrangement, we have a rather unique situation in Hong Kong. The term translocalisation enables us to include mainland students, whose presence constitutes a very important part of our campus diversity." (Ng, 2001; quoted in Chan, 2006:106)

In fall 2009, there are altogether 207 students from 26 regions/countries (among which 41 will continue on for the spring semester) at Hong Kong Baptist University. Twenty-five of these students are French and ten of them will stay two semesters. Among these 207 students, 38 are German and only one of them will stay two semesters. China and the United States are also well represented with respectively 36 and 32 students. At the same time, 182 HKBU students are studying as exchange students outside Hong Kong. Twenty-nine of these students are Year III European Studies Programme students in France, Germany and Austria. The number of mainland China students is expanding rapidly (HKBU, International Office, 2009a).

Last year, the HKBU International Office conducted a university-wide survey to collect UGC-funded undergraduate students' views on academic exchange programmes. The survey aimed at gathering information from students on their needs and desires, as well as possible barriers that hinder them in participating in academic exchange programmes. The survey has revealed the top four concerns that deter a student in taking part in exchange programme: financial difficulties; perceived difficulty in credit transfer; worry that participation in an exchange programme will prolong studies and/or delay graduation; fear of being unable to enrol in the desired/needed courses at the host institution. The top four benefits perceived by the students were: personal enrichment; gain first hand knowledge of another culture; learn another language; live in a different geographic area (HKBU, International Office, 2009b).

Some facts and trends in Hong Kong education

On 1 July 1997, after more than 150 years of British control, Hong Kong was handed back to the Chinese authorities and became a Special Administrative Region of the People's Republic of China. Ethnic Chinese constitute 95% of the city's population of nine million inhabitants. Financial services, trading and logistics, tourism, and producer and professional services are the four key industries in the Hong Kong economy.

The language policy of the Government is to enable students and the working population to be biliterate in written Chinese and English and trilingual in Cantonese, Putonghua and English (Education Commission, 2006:24). The status of English as an official language in Hong Kong is guaranteed by the Basic Law, the mini-constitution promulgated by the National People's Congress. As the recognized global language, its market value is very high and it also echoes Hong Kong's policy "One country, two systems". From 1998, most secondary schools were ordered to use Chinese rather than English as the medium of instruction (MOI). Textbooks are written in standard modern Chinese, but teachers lecture in Cantonese, the dominant dialect in southern China and

the mother-tongue of most students. Cantonese differs greatly from Mandarin (Putonghua), the Chinese national language. A 2009 decree allows more secondary schools to use English as the result of "persistent complaints in the community that English standards had fallen because of the so-called mother-tongue teaching policy." (Lau, 2009) Nevertheless, the language proficiencies of Hong Kong students seem to be gradually improving (Education Commission, 2006:29).

The 2000 Education Reform, which is student-focused, aims

> "to enable every person to attain all-round development in the domains of ethics, intellect, physique, social skills and aesthetics according to his/her own attributes so that he/she is capable of life-long learning, critical and exploratory thinking, innovating and adapting to change; filled with self-confidence and a team spirit; willing to put forward continuing effort for the prosperity, progress, freedom and democracy of their society, and contribute to the future well-being of the nation and the world at large" (Education Commission, 2006:5).

Hong Kong has 12 degree-awarding higher education institutions, including eight institutions funded by the public through the University Grants Committee (UGC), three self-financing institutions and the publicly-funded Hong Kong Academy for Performing Arts. Eighteen percent of the 17 to 20 age group are offered first-year-first-degree places through the institutions funded by the UGC. For students with Hong Kong Advanced Level Examination results, the Joint University Programmes Admissions System is a scheme and the main route of application to apply for admission to publicly-funded degree and selected sub-degree programmes offered by the eight UGC-funded institutions[i].

In Hong Kong as in many other countries, "there has been a growing emphasis on the "outcomes" of higher education. In other words, evaluators are looking for new data and indicators to demonstrate that students have mastered "specific objectives as a result of their education" (Altbach, Reisberg & Rumbley, 2009). The idea behind is that usual indicators, namely "inputs, activities and research outputs, such as resources used, classes taught, and articles published […] provide no indication of the degree to which HEIs [higher education institutions] actually develop the knowledge and skills of their students" (OECD, 2008:3). On the contrary, "learning outcomes refer to the personal changes or benefits that follow as a result of learning. Such changes or benefits can be measured in terms of abilities or achievements." (OECD, 2008:7) The UGC has strongly encouraged HEIs to move away from the traditional content-based mode of teaching and delivery to an outcomes-based teaching and learning approach (OBTL) in order to enhance student learning and teaching quality. At BU, course syllabi are usually presenting what the students will be able to do in terms of knowledge and understanding, skills and attitudes.

A major reform is being implemented in the secondary school curriculum which will be shortened from seven to six years (a three-year junior secondary and a three-year senior secondary). The normative length of the undergraduate university curriculum will expand from three to four years. This so-called "3+3+4" structure began at senior secondary level in 2009, with the first admissions to the new undergraduate curriculum being in 2012. This new academic structure will have substantial resource implications for Hong Kong universities in terms of staffing and estates. This will be particularly the case in 2012 when there will a double intake of students during the transitional year from the old to the new curriculum. About 1,000 new academic staff are expected to be recruited in the sector by 2012. Hong Kong's HEIs have been engaged in planning four-year undergraduate curricula.

It seems that greater emphasis is put on the graduates' preparation for the world of work, which echoes the belief that "preparing students for competence in the workplace is a major goal of higher education" (OECD, 2008:11). This is, of course, mainly due to the morose economic context: nowadays, the unemployment rate stands at 5.4%. The gross domestic product for 2009 as a whole is now forecast to contract by 3.5-4.5% in real terms. In July 2009, the values of Hong Kong's total exports and imports of goods both fell markedly, by 19.9% and 17.8% respectively over a year earlier. It is expected that the

unemployment rate will continue to face upward pressure as business sentiments remain cautious and employers are generally conservative in hiring new hands.

The European Studies Programme (ESP) at HKBU

The Bachelor of Social Sciences (Honours) in European Studies (then Bachelor of Arts) was established in 1994. It is centred in the Department of Government and International Studies. It is the only major academic programme in the Hong Kong Special Administrative Region, which focuses on Europe, the European Union and, more specifically, on the French- and German-speaking countries within that continent. It is unique in that it offers the opportunity of a systematic study of European political, social and economic affairs in combination with foreign language acquisition (French or German). It is already a four-year course: two years of full-time study in Hong Kong, a third year spent in Europe with academic study and, whenever feasible, working experience in companies or institutions, followed by a fourth year in full-time study in Hong Kong. Political science provides the disciplinary core, which is underpinned by history and contemporary area studies. Knowledge of Europe is deepened by the Honours Project, a dissertation (in French or German) in which students conduct their own research into a particular subject related to Europe[ii]. The annual student intake is set at 36 students, to be equally distributed between the French and the German stream of the course.

The curriculum devotes considerable room to language study. The first year French language seeks to introduce the French language in context of living, studying and working in the French speaking areas of Europe. Students at the end of this course achieve the A2-Level of Competence of the Common European Framework of Reference for Languages (CEFR) laid down by the Council of Europe. The CEFR is a document

> "which describes in a comprehensive manner i) the competences necessary for communication, ii) the related knowledge and skills and iii) the situations and domains of communication. […] [The CEFR] facilitates a clear definition of teaching and learning objectives and methods and provides the necessary tools for assessment of proficiency. The CEFR has become a key reference document and valuable tool for educational and professional mobility"[iii].

The Year 2 language course aims at equipping students to pursue academic studies as well as internships in France during year III. Final year language classes help the students to reach a sufficient and autonomous level in spoken/written French language; collect useful information about French civilisation and contemporary society; and last but not least, acquire the right attitudes that will enhance their learning and communication strategies. Students at the end of this course achieve the B2-Level of Competence of the CEFR. The course systematically focuses on topics related to academic writing and students' own research for the Honours Projects. It is worth mentioning that all language courses in the new four-year course curriculum have been retitled "Language in Context" to illustrate that language learning is multi-purposed and context-oriented (daily life communication, academic environment, and professional setting).

European Studies subjects are integrated in the language-related area background studies. It means that from the very first semester, language classes include themes related to European societies. This is essential, since "although businesses based in French and German-speaking countries are well represented in Hong Kong, the two languages have no salient presence in the community, and their appearance in curricula is a result of the colonial past more than of anything else. There is virtually no potential exposure to them outside the classroom" (Humphreys and Spratt, 2008:316). Nevertheless, the French community is the most important one in Asia with 7,000 nationals and Germany with approximately 2,500 nationals is Hong Kong's most important European trading partner (600 German companies).

The Year III study component in Europe is carefully constructed to meet individual students' interest and academic performance, predominantly within the range of Social Sciences and Business. Students also undergo intensive and rigorous training in French up to certified proficiency level prescribed for full-time academic study and/or professional activities in French speaking countries. The European Studies course maintains student exchange programmes with universities in Europe, such as for the French stream: École Supérieure des Sciences Commerciales d'Angers (ESSCA) and

CIDEF (Centre International d'Etudes Françaises) at Angers; Centre International d'Etudes des Langues (CIEL) and École Supérieure de Commerce, at Brest ; Institut d'Etudes Politiques and École Supérieure de Commerce, Dijon ; Institut d'Etudes Politiques (Sciences-Po) at Lille; Institut d'Etudes Politiques (Sciences-Po), Paris ; Institut de Management Europe-Asie (ISUGA) at Quimper ; Institut d'Etudes Politiques at Rennes and Institut d'Etudes Politiques at Strasbourg. Several years ago, some students spent a full academic year at Lausanne, Switzerland (Cabau-Lampa, 1999).

When the Programme was launched, it seemed that the French stream would have to face a big challenge, i.e. to offer internship positions to Year III students while in France. In fact, this was mainly due to the fact that the academics originally involved in the elaboration of the programme had limited insight of the French educational and vocational culture. In France, "an issue that seems to be consistently raised by stakeholders […] is the lack of parity of esteem between academic qualifications and VET [Vocational Education Training] qualifications when seeking or keeping a job, especially for young people entering the labour market." (Recotillet, 2009:4). The situation is different in Germany, where there is a social consensus on the value of apprenticeship training. The consequence in the German educational system "is its emphasis on a strong interlocking of theory and practice [which is] particularly well exemplified in the apprentice system […] that combines practical knowledge and early integration into the working process with a deepening of theoretical knowledge in school." (Brunstein, 1995:92). From an external point of view, it seemed then that the German stream was more successful, not to say profitable for students' interests, since German companies were generally more "generous" than their French counterparts in terms of internship positions. Nevertheless, the situation has gradually changed and the reputation of the French stream in that regard improved due mainly to two factors: first of all, the morose economic environment and the increasing rate of unemployment in Germany (as in the rest of Europe) is affecting German employers' enthusiasm to offer trainee positions to our Hong Kong students. Second of all, when the French stream students graduate look for a first job, their full year exchange programme at a renowned political/business institution in France compensate most of the time their lack of professional experience in the eyes of potential recruiters. The fact that our students "survived" in an academic French-language environment so demanding as for methodology, communication and presentation skills, analytical thinking… make them very interesting candidates on the Hong Kong job market.

Students' profile and expectations

A study of the Hong Kong Chinese (language) learner is beyond the scope of this article. Nevertheless, it is essential to refer here to some of the discourse frequently heard in the Hong Kong academic setting as for the differences between the Western and Chinese learning style and process, attitudes and beliefs about effective teaching, relationship teacher-students, teachers' and students' expectations. As Kennedy (2002:431) points out, "the learning styles adopted by Chinese learners are often attributed to 'Confucian values'", according which self-assertion and individualism are discouraged". But Hong Kong has been a British colony for over a hundred years and exposed to Western thoughts and cultures before the 1997 retrocession to China. Hence, "Confucianism may be too narrow a focus for understanding the behaviour of Hong Kong Chinese people." (Chan, K.w, 2008:262) However cautious the teacher has to handle these stereotypes, these differences do exist. It is important to mention here that a large majority of ESP teachers are Europeans; furthermore, as already mentioned, Year III students spend a full academic year in Europe.

According to a survey of students and faculty members from six different departments spread over four Hong Kong universities, Western teachers are generally more inclined to consider problem-solving and critical thinking as more challenging and important learning than foundational knowledge than their Hong Kong Chinese colleagues. Furthermore, they consider "rote memorization […] as antithetical to understanding", whereas memorization can also be a "means toward understanding the content *as it is authorized*" (Pratt, Kelly, Wong, 1999:246, 253). There is also a difference in the teacher-student relations and attitudes between expatriate Western faculty members and their

Hong Kong Chinese counterparts: the former tend to create a more egalitarian relationship with their students, while preserving some distance in order to remain fair and objective in their learning assessment (Pratt, Kelly, Wong, 1999:247). In our European Studies Programme, our task is to explain our students going to France that they should not expect (all) French teachers to be ready "to participate in extracurricular activities, have an open-door policy with their office, and be available and willing to talk to students about all manner of things." (Pratt, Kelly, Wong, 1999:248). They are not to ask for their lecturer's notes. On the other hand, they should be ready to be challenged by the French teachers to think aloud and defend what they know, and "in turn, [they are] expected to challenge the content presented by teachers and texts, as a means of coming to understand that knowledge" (Pratt, Kelly, Wong, 1999:249).

Every Hong Kong teacher is aware of the importance of avoiding any situation where a student might "lose face", i.e. having his/her status lowered in front of others. This is the reason why some students are reluctant to speak out and rather passive during classes. Hence, one of the major problems for (second) language teachers is to get more student oral response (Tsui, 1996:146). The result is that "Hong Kong students are usually characterized as hard-working and diligent but lacking in creativity and originality" (Kennedy, 2002:432). We may here quote again Kennedy (2002:442), when highlighting the fact that most of the time, the Chinese second language learning is often presented as incorporating a deficit, with "inferior" learners and old-fashioned modes of learning. He correctly concludes that "Chinese learning styles' are far more subtle and complex than they are often made out to be. Common assumptions, such as the notion that memorization and understanding are mutually exclusive categories, may be in need of reappraisal." It is also here important to remember that French or German is their fourth language (after Cantonese, English and Putonghua).

Traditionally, in Hong Kong as in many other parts of the world, German generally evokes the images of trade, industry and technology, whereas French is associated with arts and culture. Hence, it took a few years for the applicants to understand that they should not expect courses related to French architecture, literature... A 2003 study involving more than five hundred Hong Kong tertiary students (among which Hong Kong Baptist University ESP students) and aiming to explore their motivation towards the learning of English, Putonghua (both compulsory languages) and a chosen third language (French, German, or Japanese) highlighted the importance of the integrative dimension, i.e. the extent to which respondents wanted to be like target language speakers, for French and German (Humphreys and Spratt, 2008). As for the two compulsory languages, English emerged as a "highly rated language" and the respondents considered that "being able to speak English was regarded as more a part of their Hong Kong identity than being able to speak Putonghua, which they seemed to see as a not altogether welcome necessity of modern life" (Humphreys and Spratt, 2008:322, 320). The three chosen languages also presented the advantage of a possible promotion of motivational engagement, since they were not compulsory.

There is no doubt that the one-year stay in Europe included in our programme represents the highest attraction point for Hong Kong students. Whereas some years ago, some of them had some difficulties in grasping the profile of our programme, i.e. social and political studies oriented, it seems now that they are more aware of the high expectations of host institutions in France – not only political studies institutions but also management/business schools (Cabau, 2008). These last years, the number of our graduates desiring to prepare a Master's degree in France represents one fifth of a cohort. Every year, one or two of them are offered a scholarship through the French and the Belgian academic support network in Hong Kong.

Concluding remarks

According to our experience, an academic programme incorporating a large dimension of foreign language and culture has to preserve a delicate equilibrium between diverse interests and objectives (educational, economic, social, political…) of different partners (students, teachers, higher education decision-makers, local and foreign potential employers, foreign partner institutions, embassies/consulates, chambers of commerce…) at different levels. The components of an undergraduate course must reflect the needs of

the local and foreign community in terms of human resources on the job market, but also respond to students' increasing demand to pursue postgraduate studies. It is in this perspective that the new OBTL educational philosophy should be understood: students are to acquire theoretical knowledge together with task-oriented skills and behavioural techniques and should develop strong communication skills in various formats. The HKBU European Studies Programme is trying to encompass local and European perspectives in its curriculum. This dual academic scope means that one of its motto has to be "flexibility" and that it relies upon the strength of a diversified network which needs to be constantly cultivated. As teachers, we have the responsibility to equip our students with multi-faceted competencies, i.e. knowledge, *savoir-faire* (how to do), *savoir-être* (how to be) and *savoir-agir* (how to act). These competencies should be transferable for successful transitions to work, and ultimately, careers within global companies/organizations as well as for further postgraduate studies.

Inter-Ethnic Tolerance among Malaysian Youth: Reality or Fantasy

Fazilah Idris, Phd
National University of Malaysia

Abstract

Malaysia is a model of a successful multi-ethnic, multicultural, and multi-religious society (Lijpahrt, 1977). And the diversity of its population is an asset as well a challenge to the government. The main challenge is how to integrate the various ethnic groups while not violating their uniqueness or disrespecting their belief systems which may contribute to ethnic conflicts. As such, the country requires vigorous effort, including researches that can adopt new perspectives for maintaining harmony and unity. Considerations should go beyond common topics of economy, social, education and politics. Instead, we should identify the inner strengths of our individual youth. Hence, this study discusses the relationships between knowledge, attitude and religious personality in measuring the inter-ethnic tolerant behaviour among middle youth of Malaysian multi-racial community. A total of 563 secondary students voluntarily participated in the study and completed the Universal Religious Personality Inventory (URPI) and the Inter-ethnic Tolerant Behavior Questionnaire (IETBQ). Path analysis was carried out to determine the interdependencies amongst all the correlates and their influences on perceived inter-ethnic tolerant behaviour. The correlates consisted of knowledge, religious personality (pro-social behaviour, ritual behaviour, and anti-social behaviour), and attitude. As a result, a suitable model which is able to explain the inter-ethnic tolerant behaviour among Malaysian youth was established.

SOURCES OF STRESS AMONG UNDERGRADUATES AT MALAYSIAN UNIVERSITIES

Mansor Abu Talib, PhD
Noradilah Md Nordin, B.Sc
Department of Human Development & Family Studies
Faculty of Human Ecology
Universiti Putra Malaysia
Email: mansorat@putra.upm.edu.my

Abstract summation

The present study was carried out to determine the major sources of stress among undergraduates at Malaysian public universities. This paper reports major stressors experienced by the student population according to field of study and year of study. The study also found a significant difference in the level of stress between field of study and year of study. Findings of the study suggest that specialised intervention through guidance and counselling or psycho-educational activities can be tailored to meet the needs of this group.

1.0   Introduction

Stress has been defined as the strain that accompanies a demand perceived to be either challenging or threatening and depending on its appraisal, may be either adaptive or debilitating (Sanders & Lushington, 2002). According to Evans and Kelly (2004) stress is a disease and could indicate a complex dynamic transaction between individuals and their environments. Day and Livingstone (2004) defined stress as a psychological threat, in which the individual perceives a situation as a potential threat. Therefore, what can be seen is stress being defined in negative terms based mainly on individual evaluations. Stress levels can also be measured and factors that contribute to stress may be identified. Sources of stress are known as stressors.

Today, students in institutions of higher learning are subjected to many experiences that could contribute to different kinds of stressors. The UK Council Report CR112 (2003) stated that students in institutions of higher learning experienced changes from a structured and general education from that of school and home to a less structured university life that could result in an impact on their mental health. As such, mental health status is often a reflection of their level of stress. According to the report, students currently face challenges such as competitive job markets and demands, financial burdens and the pressure to get their degree.

A decade ago, Garrison (1995) stated that today's university students are unique whereby the following factors have a propensity to influence their behaviour: (a) isolation and its consequences; (b) their understanding of the boundaries between faculty, staff, and administration and students; and (c) their reason for going to university. Garrison and Hersch, cited in Hernandez and Fister (2001), claimed that the most striking difference between today's university and students of 20 to 30 years ago is their profound isolation from adults and from a traditional cultural context. They feel isolated from the decision-making resources and experience the 'lonely responsibility' (Garrison, 1995, p.11) of looking out and caring for themselves, and are often expected to resolve problems isolated from a cultural context.

In terms of psychological and social development, most university students can be categorised as young adults as these students are generally in the transition between adolescence and adulthood. Young adults who are undergoing developmental transitions and pressure to master new age-related tasks can be particularly vulnerable to the general stresses of academic demands and social life on campus.

Sax, Astin, Korn, and Mahoney (1995) stated that today's students are increasingly disengaged from the academic experience and are less involved in learning than they are in social endeavours. Hernandez and Fister (2001) claimed that the proliferation of technology actually leaves many students unskilled in social graces and incapable of developing appropriate relationships with peers and faculty

members. In addition, today's college and university students also have blurry perceptions of the boundaries between themselves and the faculty. This 'loosening of boundaries' (Hernandez and Fister, 2001) reflects the operationalisation of their isolation from accepted social and cultural norms. This results in them failing to see themselves as functioning in the same social hierarchy as the faculty. Instead, they see themselves functioning within a structure in which all members are peers.

Roberts, Golding, Towell, and Weinreb (1999) in their study of British university students found that there was a higher level of mental health problems experienced by this group compared to a non-student population matched for age and sex. Surtees, Wainwright, and Pharoah (2000) in their study conducted at the University of Cambridge found that around 20% of students reported at least one problem causing substantial worry during each of the three annual academic assessments. Around one in five women and one in ten men reported an episode of either depression or anxiety during each of the assessment periods indicating that psychological morbidity appeared to peak at times which coincided with university examinations. Six per cent reported suicidal ideation and one percent of students annually reported actual suicide attempts. The study also noted that six per cent of women even reported multiple problems with diet during this period.

Evidently, too much stress can lead to negative effects such as smoking behaviour (Magid, 2009) and poor psychological well-being (Honglin, Yu-Cheung, Moa-Sheng and Christine, 2009). Sherina, Lekhraj and Nadarajan (2003) found that 41.9% of medical students at one Malaysian university experienced emotional disorders as an effect of stress. Apart from that, Zaid, Chan and Ho (2007) indicated that 46.2% of medical students in a private medical school in Ipoh, Perak, Malaysia exhibited emotional disorders. Emotional disorder is the result of unmanaged stress that leads to negative consequences.

In Malaysia, the number of students entering institutions of higher learning increases every year. According to statistics from the Ministry of Higher Education Malaysia, there were 223 968 undergraduates in 2006 and the number increased to 247 881 undergraduates in 2007. Therefore, the increasing number of students in institutions of higher learning needs to be given due attention since the topic of stress among undergraduate students is important and has been of concern to many parties. Thus, a study should be conducted to identify the major sources of stress among students in the university. This is significant since previous research has proved that having poor psychological well-being could lead to negative consequences such as suicidal behaviour and the feeling of hopelessness (Kay, Li, Xiou, Nokkaew and Park, 2009). Hence the present study was undertaken with the following objectives:
1. To identify major sources of stress among Malaysian undergraduates
2. To determine a significant difference in level of stress among Malaysian undergraduates from different fields of study and year of study

2.0   Previous Research
Ross, Shannon, Niebling, Bradley and Heckert (2008) indicated that, the major sources of stress among the college students they investigated were "change in sleeping habits", "vacations or breaks", "change in eating habits", "increased workload" and "new responsibilities". Abdulghani (2007) concluded that the main sources of stress among medical college students at King Saud University in Saudi Arabia were "their studies" and "home environment". He also found that first year medical students had a higher prevalence of stress (74.2% of respondents) followed by second year students (69.8% of respondents), fifth year (49% of respondents), third year (48.6% of respondents) and fourth year students (30.4% of respondents) respectively.

Sreeramareddy, Shankar, Binu, Mukhopadhyay, Ray and Menezes (2007) found that the sources of stress among medical students at Manipal College of Medical Science in Nepal were "staying in hostel", "high parental expectations", "vastness of syllabus", "test or exam" and "lack of time and facilities for entertainment". In addition, this study also indicated that the prevalence of psychological morbidity was higher among students with a basic science background compared to those with a clinical science background.

Seyedfatemi, Tafreshi and Hagani (2007) concluded in their study that the major sources of stress among students at the Faculty of Nursing and Midwifery in Iran were related to the interpersonal ("finding new friends" and "working with people they did not know") followed by the intrapersonal

("new responsibilities" and "started college"), environmental ("increased workload") and academic sources of stress ("placed in unfamiliar situations" and "waiting in a long line").

Dahlin, Joneberg and Runeson (2005) indicated that there was a significant difference in terms of the degree of pressure or level of stress among first, third and sixth year students. The respondents in this study were medical students at Karolinska Institute in Stockholm and the study concluded that first year student's exhibit the highest degree of stress compared to third and sixth year students. There was a significant difference of degree of stress and it was also stated that medical students experienced higher depression levels than the general student population.

Stanley and Manthorpe (2002) in their survey of academic staff at the University of Hull found that over a third of their respondents reported their experience of having supervised students who were experiencing a mental health problem. In terms of problems presented, 60% of problems were classified as those with minor mental health problems, while 28% were described as experiencing 'severe' or 'life threatening' mental health problems. They claimed that this pattern was not significantly different from that of staff in other institutions. The difficulty most frequently experienced by the staffs was students' inability to acknowledge their problems or to accept help (27%).

Zaid et al., (2007) indicated that there was a significant difference of emotional disorder in terms of year of study among medical students. The first and final year students had a higher prevalence of emotional disorders and among those who experienced extreme levels of stress, it was often due to examinations (68.3% of respondents) and among those who were not involved in a romantic relationship (51.7% of respondents).

Woolfson (1997) in a study conducted at the University of Wisconsin found that 92% of students who were presented to the University counselling service showed signs of academic impairment - 16% were mainly depressed, 43% moderately depressed and 41% had severe depression.

3.0   Hypotheses
To study the major sources of stress among Malaysian undergraduates, we test the following hypotheses.
Ho1:   There is no significance difference of stress level among social science, technical and science Malaysian undergraduates.
Ho2:   There is no significance difference of stress level among first, second, third and fourth year Malaysian undergraduates.

4.0   Research Method

4.1   Population and Sample
The population for the study comprised of undergraduates students at Malaysian public universities. From the twenty public universities in Malaysia, five universities were randomly selected. The universities were Universiti Putra Malaysia (UPM), Universiti Sains Malaysia (USM), Universiti Kebangsaan Malaysia (UKM), Universiti Malaya (UM) and Universiti Malaysia Sabah (UMS). Initially, a sample number targeted in this study was 1500 Malaysian undergraduates. However, only 1468 Malaysian undergraduates were recruited as respondents in this study. The sample size in this study was calculated through a software i.e. the G*Power 3 software (Faul, Erdfelder, Lang and Buchner, 2007). At the confidence interval level of .95, with the power of 95% and the alpha of .05 and with small effect size of .02, the calculation based on the G*Power software found an estimated sample size of 1229 respondents to be appropriate. Thus, the sample size in this study is sufficient to represent the characteristics of the undergraduate student population in Malaysia.

A multistage cluster sampling was used to select the respondents. The sample of undergraduates from five universities was generated by stratifying them according to fields of study, namely, Science, Technical and the Social Sciences. These categories were selected according to the classification given by the Ministry of Higher Education in Malaysia. Then, one faculty or school was randomly selected from each field of study. Next, each field of study was stratified again according to year of study, i.e. cohort year 1, 2, 3 and 4. Then, the sample was selected from each year of study with assistance from the faculty or school administrators. The questionnaires were distributed during class periods and were collected on the same day by the researcher.

4.2   Procedure
A self administered questionnaire was used in this study. Written approval was obtained from the Dean of each faculty or school. They then helped identify classes where data collection could be conducted. Then, the researcher and appointed enumerators distributed the questionnaires during the class period. Before administering the questionnaire, the researcher explained the purpose of the study to the respondents and they were told of the anonymity and confidentiality of their responses and their right to withdraw from the study.

4.3   Measurement
The major source of stress was measured using an adapted Student Stress Survey (SSS) by Ross, Shannon, Niebling, Bradley, Heckert and Teresa (1999). The scale contained 31 items that was developed based on two scales i.e. the Student Stress Scale by Insel and Roth (1985) and the Taylor Manifest Anxiety Scale by Taylor (1953) and other potential sources of stress that were identified based on the reviews of literature. Items were carefully conceptualized to suit the culture and experiences of Malaysian undergraduates. The Student Stress Survey used in this study was translated from English into Malay and the "forward translation" procedure was employed.

The SSS comprised four subscales or dimensions i.e. interpersonal (4 items), intrapersonal (13 items), academic (7 items) and environmental (7 items) sources of stress. Respondents were asked to check each item they had experienced during the current university year by either stating "Yes" or "No". A higher score indicated a higher level of stress. The minimum and maximum score was 1 and 62 respectively. The reliability coefficient determined by Cronbach's Alpha was 0.79.

5.0   Data Analysis
Data for the study was analyzed using the Statistical Package for the Social Sciences (SPSS), version 16. Firstly, descriptive statistics i.e. frequency, percentage, mean, standard deviation, minimum and maximum were used to describe demographic information and sources of stress among Malaysian undergraduates.

Secondly, a one-way ANOVA was used to determine the significant difference of stress levels among Malaysian undergraduates in terms of field of study (Social Science, Technical and Science) and year of study (first, second, third and fourth year).

6.0   Results

6.1   Description of Demographic Information
Descriptive statistics was used to describe demographic information i.e. age, gender, ethnicity, religion, institution, field of study and year of study among respondents. Firstly, a formula (mean ± 1S.D) was used to categorize age of respondents into three groups. From the data analysis, it was found that the majority of respondents were 20 to 21 years old (M=20.83, S.D = 1.459). There were 400 (27.5%) respondents aged 22 and above and 15.5% of respondents aged 19 and below.
There were 894 or 61.3% female and 564 or 38.7% male undergraduates in the study. These comprised 835 or 57.4% Malay, 418 or 28.7% Chinese, 126 or 8.6% Sabahan or Sarawakian, 69 or 4.7% Indian and 12 or 0.5% from other ethnic groups. As for respondent's religion, the majority (869 or 60.3%) were Muslim, Buddha (330 or 22.7%), Christian (175 or 12.14%) and Hindu (67 or 4.6%). This percentage reflects the current normal distribution of undergraduate students in Malaysian universities.

As for distribution by institution, there were 321 respondents from UPM or 22% of total number of respondents. This was followed by UMS (299 or 20.4%), UM (298 or 20.32%), USM (296 or 20.2%) and UKM (252 or 12.2%).

There were 299 or 20.4% social science respondents, followed by science (480 and or 33.3%) and technical undergraduates (466 or 32.3% of respondents). Finally, as for year of study, the highest number of respondents composed of second year undergraduates with 483 or 33.3% of respondents, followed by first (441 or 30.4%), third year (411 and 28.3%) and fourth year undergraduates (115 or 7.8%).

6.2 Description of Major Sources of Stress

Respondent's major sources of stress were assessed in this study. Descriptive statistics were used to identify major sources of stress with 60% and above of response rate reported by the respondents. The analysis of data revealed that, on average the respondents scored 48.961 on the Student Stress Survey (S. D = 4.993). The percentages of the responses to each item on the Student Stress Survey are shown in Table 1.

From 31 items on the Student Stress Survey, the analysis found that the top ten sources of stress were "new responsibilities" with 85.5% of respondents' stating that they were stressed by it. In other words, most Malaysian undergraduates were experiencing intrapersonal sources of stress which was related to their newly found responsibility as students in the university. According to Erikson (1964), at this stage, young adults need to focus on important things in life such as getting married, having a special girl or boyfriend and a career that will provide a stable future in life. These important developmental tasks required of young adults contribute to the new responsibilities that young adult need to face. Hence, if young adults failed to adapt to the situation, it would lead to negative impacts such as social isolation and stress.

The interpersonal source of stress as major source of stress found in this present study was similar to that found in a study by Shannon et al., (1999). They concluded that a major source of stress among respondents was the intrapersonal dimension. However, the item which contributed most to interpersonal stress was "a change in sleeping habits". The researchers used 44 items on Students Stress Survey to measure the sources of stress and the respondents were undergraduate students at a mid-sized Midwestern university in the United States.

Similarly, Seyedfatemi et al., (2007) concluded that major source of stress was related to the interpersonal dimension. However, the most stated item that contributed to stress was "finding new friends". The researchers used the Student Stress Survey to measure the sources of stress and respondents were undergraduate nursing students at the Iran Faculty of Nursing and Midwifery at a tertiary institution in Iran.

The results of this present study showed that the other major sources of stress was "an increased workload", followed by "a change in social activities", "putting a task on hold for extended period of time", "an anticipation of graduation" "a change in sleeping habits", "change in eating habits", "speaking in public", "lower academic grade than anticipated" and lastly stress due to "computer problems".

Table 1: Percentage of respondents reporting each sources of stress using SSS

CATEGORY	YES n (%)
Interpersonal	
Change in social activities	76.4
Fight with boyfriend/girlfriend	30.1
Roommate conflict	20.3
New boyfriend/ girlfriend	17.4
Intrapersonal	
New responsibilities	85.5
Change in sleeping habits	66.8
Change in eating habits	65.5
Speaking in public	65.4
Financial difficulties	58.6
Outstanding personal achievements	46.7
Decline in personal health	39.8
Minor law violations	39.2
Held a job	16.5
Death of a family members	12.3
Death of a friend	7.2
Severe injury	4.9
Influence to use alcohol or drugs	3.1

Academic

Increased class workload	84.4
Anticipation of graduation	69.6
Lower grade than anticipated	60.1
Change of major	20.7
Search for graduate school/job	20.4
Serious argument with instructor	3.8
Transferred faculty/school	3.6

Environmental

Put on hold for extended period of time	71.3
Computer problems	60.0
Waited in long line	57.7
Change in living environment	57.7
Vacation	54.8
Placed in unfamiliar situation	43.4
Messy living conditions	25.4

6.3 Hypotheses Testing

Ho1: ***There is no significance difference of stress level among social science, technical and science Malaysian undergraduates.***

To test Ho1, a one-way ANOVA was used in this analysis. The analysis found a significant difference of stress level with an F-ratio of 5.780 which was significant at the 0.05 level (p = 0.003). Therefore, Ho1 was rejected. In conclusion there was a significant difference of stress level among Malaysian undergraduates from different fields of study with technical undergraduates having the highest stress levels (mean = 49.613 and S.D = 5.06) followed by science undergraduates (mean = 48.783 and S.D = 5.243) and lastly social science undergraduates (mean = 48.589 and S.D = 4.92). This result was supported by Dahlin et al., (2005) who indicated significant difference of degree pressure in terms of field of study. The researchers found that medical students experienced a higher degree of pressure than the general student population in Karolinska Institute.

Table 2 shows the top five sources of stress as reported by Social Science, Science and Technical undergraduates surveyed in this study. Quite a similar pattern was noted with intrapersonal and academic sources of stress as major sources of stress. Regardless of field of study, the undergraduates experienced pressure or stress due to "new responsibilities", "increased class workload" and "change in social activities".

Table 2: Top five sources of stress according to field of study

Social Science	Science	Technical
New responsibilities (Intra)	Increased class workload (Acad)	Increased class workload (Acad)
Change in social activities (Inter)	New responsibilities (Intra)	New responsibilities (Intra)
Increased class workload (Acad)	Change in social activities (Inter)	Put on hold for extended period of time (Envt)
Anticipation of graduation (Acad)	Put on hold for extended period of time (Envt)	Change in social activities (Inter)
Change in eating habits (Intra)	Spoke in public (Intra)	Anticipation of graduation (Acad)

Note: Intra=Intrapersonal, Inter=Interpersonal, Acad=Academic, Envt=Environment

Ho2: ***There is no significance difference of stress level among first, second, third and fourth year Malaysian undergraduates.***

Using a one-way ANOVA, the analysis revealed that there was a significant difference of stress level with an F-ratio of 5.767 which was significant at the 0.05 level (p = 0.000). Thus, Ho2 was rejected. In conclusion, there was a significant difference in stress levels in terms of year of study with students in the second year having the highest stress level (mean = 49.41 and S.D = 4.659) followed by third year (mean = 49.307 and S.D = 4.659), fourth year (mean = 49.211 and S.D = 7.01) and lastly first year students (mean = 48.152 and S.D = 4.532). This finding was similar with research conducted by Dahlin et al., (2005) which found significant differences in degrees of pressure according to year of study. However, the researchers indicated that first year students at Karolinska Institute experienced the highest degree of pressure and this contradicts findings from this present study which found second year as having highest stress levels compared to students from the other years.

As for sources of stress according to year of study, a similar pattern was found in the interpersonal, academic and intrapersonal dimensions. However, stress due to "anticipation of graduation" was reported as high by third and fourth year students as they prepare to leave the university and enter the challenging and demanding job market.

Table 3: Top five sources of stress according to year of study

First year	Second Year	Third Year	Fourt Year
New responsibilities (Intra)	Increased class workload (Acad)	Increased class workload (Acad)	New responsibilities (Intra)
Increased class workload (Acad)	New responsibilities (Intra)	New responsibilities (Intra)	Put on hold for extended period of time (Envt)
Change in social activities (Inter)	Change in social activities (Inter)	Anticipation of graduation (Acad)	Anticipation of graduation (Acad)
Change in living environment (Envtl)	Put on hold for extended period of time (Envt)	Change in social activities (Inter)	Increased class workload (Acad)
Change in eating habits (Intra)	Change in sleeping habits (Intra)	Put on hold for extended period of time (Envt)	Change in eating habits (Intra)

Note: Intra=Intrapersonal, Inter=Interpersonal, Acad=Academic, Envt=Environment

7.0 Conclusion and Recommendations

Chickering's (1969) vectors of college student development have been marked as an important theory in understanding the tasks required to be accomplished by college or university students. Later, this psychosocial development model was modified based on the earlier model. He suggests that establishing identity is the key developmental issue that arises during the university years. He proposed seven vectors that include developing confidence, managing emotions, moving through autonomy toward interdependence, developing mature interpersonal relationships, establishing identity, developing purpose and developing integrity. This psychosocial theory focuses on the personal and interpersonal aspects of university students' lives as they accomplish various developmental tasks, or resolve the inevitable crises that arise. However, at the same time, this developmental task may be hindered by problems that may contribute to stress among the undergraduates. Thus, sources of their stress need to be identified so that necessary measures can be undertaken by respective parties especially the student affairs department that oversees students developmental needs and processes.

According to Chickering (1969), the process of transition to college or university is marked by complex challenges in emotional, social, and academic adjustment. At this stage, students commonly question their relationships, directions in life and their developing self-worth. Some students succeed in finding creative ways to make the transition constructively and adapt to university life as fast as possible, whereas others may feel overwhelmed and unable to effectively meet the demands of their newly founded roles. This is clearly evident from the finding of this study where "new responsibilities" was the number one source of stress experienced by the undergraduates.

The demand to quickly adapt to university demands is complicated by the fact that most undergraduates are living away from home and living with minimal parental support for the first time in their lives. Thus, the separation and individuation from parents are crucial developmental tasks facing late adolescents and these could affect personal, social and academic achievement.

Mental health is of great concern to all. Understandably, certain forms of psychological disturbances may be common in university student population such as anxiety, depression, suicidal ideation and personality disorder behaviours. In fact Reports from the Higher Educational Offices (HEO) counselling services in the UK have indicated that an increasing number of students with severe mental health problems were being identified (Phippen, 1995).

There is a notion that an individual student operates differently both at the personal and environmental levels. It is therefore important that student development personnel must understand the dynamic factors which contribute to the young adult development process. Student development personnel need to differentiate between a developmental problem of late adolescence and young adulthood as compared to the more serious and possibly diagnosable disorders. It is then important to make clear the difference between problems primarily tied to normal developmental struggles such as autonomy, identity, and intimacy (Chickering, 1969) and the more severe or chronic forms of psychological disturbance. Since, the result of this study point out that sources of stress are different according to year of study, specialized intervention geared to address this issue can be tailored to meet their developmental needs. Issues such as adaptation to university life that demand understanding and acceptance of new responsibilities need to be managed with assistance from all university staff, especially academic and student affairs personnel.

Teaching English as a Foreign Language (TEFL) in Japan

-A contrastive study between Greece and Japan-

Georgios Georgiou, Yasushi Tsubota, Naoshi Hiraoka, Masatake Dantsuji
Kyoto University

Abstract: It has been a long-held belief that Japanese speakers of English suffer from a low level of proficiency. Although this seems to have become a priority of the government policy, Japan still lags behind. Through a comparison with Greece and the use of the Greek State Certificate of Language Proficiency (KPG)[1] this paper presents the shortcomings of the Japanese education policy and proposes a look at the European initiatives on the basis of learning strategies.
Keywords: TEFL, KPG, CEFR, ELP, English Language Education, Japan, Greece

Introduction

It has been a long-held belief that Japanese speakers of English do not fare well in English language proficiency exams. Although their reading abilities seem to suffice for mere extraction of information, Japanese learners of English often have difficulty communicating in English properly. Results from international examinations such as TOEFL attest to this reality. In the past few years the government has tried to address the issue with a new reform focusing on the development of learners' communicative abilities. This paper draws upon a comparison between Japan and Greece, a member of the European Union, and the Council of Europe's policies with regard to the CEFR[2] and ELP[3], to discuss the weaknesses in the Japanese education policy. Moreover, a test-experiment at Kyoto University of the KPG, a foreign language proficiency exam designed in Greece with the European Council's policy in mind, verifies the communicative inadequacies and attempts some suggestions based on the direction of the Greek educational system towards autonomous learning and the European initiatives.
Objectives

The main objective of this paper is to determine the extent to which the latest reform has been able to meet the curricular goal of improving the communicative abilities of Japanese learners of English in Japan, and also to provide suggestions towards improving English language education in the country. Towards that end, the paper attempts a contrastive study of the Foreign Language education policies in Greece and Japan respectively, through an examination of the objectives and methodologies each system implements for teaching English. The fact that Greece is part of the European Union could also provide a broader comparison between the Japanese and the European education policies. Finally, an experiment of the KPG proficiency examination was conducted at Kyoto University in order to evaluate the English language education the students received in high school and test it against the more communicative oriented foreign language policy followed in Europe. The selection of Greece was owing to the fact that it is the researcher's country of origin, where he has had previous experience teaching English. Also, by international standards such as the TOEFL exam that is held in both countries, the respective results of Greek learners are higher than those of Japan.
Current situation in Japan

The Prime Minister of Japan in his Commission on Japan's Goals in the 21st century in 2000 made a point of the fact that Japan ranked 180th out of 189 countries that year in the TOEFL examination[4]. Several years later, in 2007[5], the results of the internet-based (iBT) version of the TOEFL exam, which includes a speaking component as well, were still low; the individual scores for the reading and listening parts were both 16 out of 30, for speaking the score was 15 out of 30 and for writing, 22 out of 30. The same year for Greece the scores were 22 for listening, 23 for reading, 20 for speaking and

[5] Test and Score Data Summary for TOEFL Internet-Based and Paper-based tests. (2008)

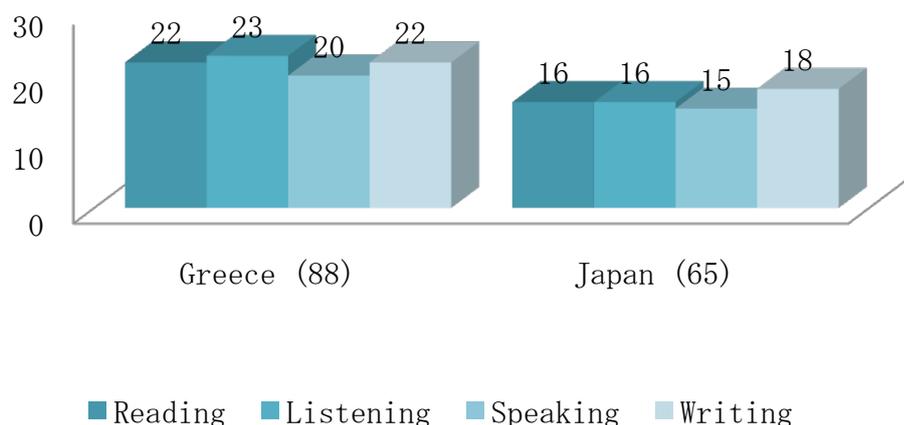
22 for writing, with an overall score of 88 against 65 of Japan. (fig. 1). The scores didn't vary significantly in 2008 either, with 86 for Greece and 66 for Japan.[6]


Fig. 1: TOEFL scores.

The failure of the Japanese to become successful learners of English has spawned a great amount of literature over the years trying to account for this inability. One significant factor often cited pertains to the linguistic differences between the two languages. These can be broken down into two major subcategories, namely genealogical and typological (Dantsuji, 2003). English is a language of Indo-European origin whereas Japanese is regarded as unrelated to any known language family (Higa, 1977). Other differences relate to the grammatical structures with English following an S-V-O word order, while Japanese follows an S-O-V structure. Finally, phonological differences related to the number of vowels as well as the type of consonants in each language, as well as differences in the respective syllabic and prosodic structures are also listed as significant impediments in the learning process.

Furthermore, Koike and Tanaka (1995) argue that Japan, being an island nation, has had very little direct contact with speakers of other languages over the years. Clark also brings forward social and cultural traits among Japanese such as shyness and embarrassment at making mistakes and, finally, Clément, Gardner, and Smythe, (1977) introduce motivational parameters such as the learners' linguistic self-confidence, which is regarded as a significant factor influencing second language acquisition (Clément, Gardner, & Smythe, 1980), since highly anxious students have been noted to be critical of themselves and their performance.
Greece

Greece is a member of the European Community and therefore is directly affected by the political, social as well as educational policies; consequently, both the European and Greek policies regarding foreign language education will be examined.
European Policy

The Council of Europe, founded in 1949, is an organization working towards European integration; one of its principal aims[7] is "to achieve a greater unity between its members for the purpose of safeguarding and realizing the ideals and principles which are their common heritage and facilitating their economic and social progress." Since 2003 the Council has encouraged all its citizens to be able to speak two languages in addition to their mother tongue in order to promote plurilingualism within the Union[8].
Plurilingualism

---

[6] Test and Score Data Summary for TOEFL Internet-Based and Paper-based tests. (2009)
[7] article 1(a) of the Statute of the Council of Europe (1949)
[8] European Commission, DG Education, Training and Youth.

Plurilingualism, a concept defined in the Common European Framework of Reference for Languages (CEFR, Council of Europe, 2001, p. 4), refers to the ability of an individual to employ different languages in varying cultural contexts for effective communication. Multilingualism, on the other hand, refers to the co-existence of more than one language in a particular society. Plurilingualism is, therefore, an individual concept, whereas multilingualism is a societal concept[9]. One of the basic premises of plurilingualism is that many of the European languages are closely related to each other, either because they belong to the same 'family of languages' (e.g. Germanic languages) or because they have influenced one another through the course of time in some way. Consequently, most European languages happen to share several linguistic elements, such as grammatical structures or vocabulary items and, therefore, when students learn a new foreign language they build upon their previous experience on how to learn a foreign language in general.

The Common European Framework of Reference for Languages (CEFR)

Increased mobility, better working relations and more effective communication within Europe have made language learning a top priority. That is why the Council of Europe put together the Common European Framework of Reference for Languages: Learning, Teaching, Assessment (CEFR), as the main part of the project "Language Learning for European Citizenship" held between 1989 and 1996. The intent was to provide a basis for the mutual recognition of language qualifications gained in different contexts through the use of objective criteria in language proficiency description. The CEFR, therefore, constitutes a set of guidelines aimed at describing achievements of learners of foreign languages across Europe. More specifically, it provides a comprehensive description of what language learners are supposed to be able to do at each stage of the learning process in all four skills in order to be able to use a language for communication purposes and interact effectively in specific linguistic and cultural contexts. It categorizes learners into three major divisions, which can be in turn subdivided into six levels:

A. <u>Basic User</u>
      A1 - Breakthrough
          A2 - Waystage

B. <u>Independent User</u>
          B1 - Threshold
          B2 - Vantage

C. <u>Proficient User</u>
      C1 - Effective Operational Proficiency
          C2 - Mastery

In November 2001 a European Union Council Resolution[10] recommended the use of this educational tool in setting up systems of validation of language competences. Since then, the adoption of CEFR has seen an increasing use in the reform of national curricula across Europe as well as international consortia for the comparison of language certificates.

European Language Portfolio (ELP)

Along with the CEFR the Council of Europe has been promoting the European Language Portfolio (ELP), which has attracted a lot of interest worldwide. The ELP was designed in 2001 to support the development of plurilingualism by enhancing motivation and support for lifelong learning (Goullier, 2007). It has steadily gained popularity in all European member states as well as worldwide interest. It is a personal document with three components. First, the language passport, which provides a summary of the owner's linguistic competences through formal language qualifications as well as significant experiences related to foreign language use. The second component is a detailed language biography that describes the owner's experiences in each language. Finally, there is a dossier, which contains a selection of work that its owner believes best exemplifies his/her foreign language competences. Both the ELP and CEFR have been established as educational tools for foreign language learning, especially for cultivating communicative competences.

Foreign language policy in Greece

In Greece the institutions in charge of education are the Ministry of Education and Religious Affairs and the Pedagogic Institute (P.I.). Compulsory education is nine years, spanning ages 6 to 15, with 6 years of primary school and 3 years of junior high school, followed by 3 more years of senior high school. English is taught in all years starting from the third grade of primary school. In 2003 English was introduced in the third grade of primary education for three hours per week. In the first grade of junior and senior high school English is taught for three hours per week, while in the second and the third grades it is taught for two hours per week.

Since the 1950s Greece has been following contemporary approaches to Foreign Language teaching in public schools[11]; the communicative approach, task-based learning in the 1980s, while in 2001 school education started to shift towards student-centered learning with the development of the Cross-Curricular/Thematic Framework (C.C.T.F)[12] by the P.I. The underlying idea is that teaching should be directed towards helping the learner learn how to learn and eventually develop autonomy for lifelong learning. As for foreign language education, the main objectives are for students to develop the linguistic ability to communicate in different linguistic and cultural environments to act effectively in real situations of communication, predictable or not, using linguistic, paralinguistic or/and non-linguistic means.

The market is rather competitive in Greece with a large number of private English schools thriving across the country, so publishers revise their course books on a regular basis, while all books focus on the development of all four skills. Recently they also had to adapt their course materials to the Council of Europe's propositions and the CEFR in order to be able to be included in the Ministry's list and be considered an appropriate and adequate material for exam preparation. Owing to that all publishing houses, including smaller local ones, are represented in the list[13].

English language teachers in Greece are all university graduates holding a degree from a faculty of English Language and Literature, where language, psychology, pedagogy, methodology, literature and ICT are some of the compulsory subjects in the initial training of Primary and Secondary school teachers at Universities (Chryshochoos & Chourdaki, 2005). It should also be noted that all courses are conducted in English.

Japan

Compulsory education in Japan is also nine years, with 6 years of primary school, 3 years of junior high school, and 3 more years of senior high school as well. English as a subject in public high schools was offered for 5 hours per week until 1981 but the number of hours has been reduced to 3 since. The instruction of English in primary schools officially began in 2002; however, the curriculum does not specify a compulsory number of lessons per school year or grade (Nikolova, 2008). It is not common for Japanese to take up a second foreign language while in high school; they usually do so after entering university.

Given that entrance into the prestigious national universities is based to a great extent on entrance examination scores, English education has been guided by this examination system. (Brown & Yamashita, 1998, Widdows & Voller, 1991). In 1994 the Japanese Ministry of Education (MEXT) introduced the new Course of Study Guidelines which, for the first time, set the development of students' communicative abilities in English as a primary goal of high school English education followed by the Action Plan in 2003 setting the new objectives for English language education. These new strategies coupled with the long received contributions of the JET[14] program were treated as hopeful steps for English instruction in Japan.

Action plan

The Action Plan (2003) was put forward in response to the increasing criticism targeting Japan's English education policy as not being able to bear fruits. The Action Plan was proposed after a series of changes had been made in the Course of Study - the national guidelines. It is worth noting that the productive and practical communicative skills are not only mentioned and elaborated on but the Ministry has determined the primary objectives of foreign language education in its entirety to be communicative in particular. The main objective is for all high school graduates to be able to ''communicate in English,'' and college graduates to be able to ''use English in their work'' (MEXT, 2003a, Section 1).

Japanese policy and discrepancies observed

Despite the shift towards a more communicative approach to language learning/teaching in public high schools, with the Action Plan in 2003 very little can actually attest to the change in foreign language education to date, mainly due to deeply rooted practices in the Japanese society. The main discrepancies observed affect the core areas of teacher training, the teaching methodology adhered to, the textbooks used in classrooms across the country, and the powerful influence of the university entrance examinations on the educational system.

Teacher training

There are various issues regarding the training process Japanese teachers of English undergo in order to obtain their teaching qualifications. Iida (2004) raises questions as to the value of peer teaching, a widely used method across Japan for teacher training, where one college student plays the role of a teacher and the other students play the roles of students, stating that real students vary in motivation and ability and therefore this practice cannot actually reflect an actual teaching environment.

In-service training

Asaoka (2003) reports that actual guidance is almost non-existent and most students participating in her study of in-service programs in secondary schools in Japan "were asked by their supervisors to teach in any way they liked ... [while] there was no particular meeting in advance" (p. 7). Also, Iida (2004) points out that the teachers supervising the teacher trainees have never studied TESOL, ESOL or SLA theory nor do they belong to any research institutes, concluding that "this is not unusual", which means no advice, or suggestions, can or will be supported by SLA theory or practice for young trainees.

Regarding the teachers' qualifications the MEXT has set the minimum requirement levels of language proficiency that secondary school English teachers ought to reach to be eligible to teach, namely STEP pre-first level, TOEFL 550, or TOEIC 730. Ishida (2002) surveyed 1,278 English teachers about taking English proficiency tests such as TOEFL, TOEIC, or STEP; among those 1,278 teachers questioned only 673 had taken a language proficiency test and the results are quite revealing. Of those who took the TOEFL test 3% achieved a score of 550-579, 1% achieved 580-599, and 2% scored over 600. On the TOEIC test, 3% achieved a score of 730-809, 2% reached 810-899, and 1% achieved a score over 900. 51% of respondents attempting a STEP test passed STEP 2nd grade, 27% passed Pre-1st grade, and 10% passed 1st grade. What is evident from the above is that only half of these 673 English teachers obtained scores that met the minimum requirements set by the MEXT. (fig. 2).
