Official Conference Proceedings 2010

Contents

Friday 9:00-10:30

Friday 9:00-10:30 Session 1 Room: Sakura A

Languages Education and Applied Linguistics (ESL/TESL/TEFL) 2/20

Session Chair: Pei-Yi Lee

0137 (No Full Paper)

Learning Strategies used in EFL Reading Comprehension

Neslihan ydemir, nadolu niversity, urkey

0232 No ull aper)

Incorporating Cooperative Learning in Extensive Reading

I Chia hou, Wenzao Ursuline College of Languages, Taiwan

0023 Proceedings age 19)

The Content-based Reading Approaches (COBRA) Model's Application to ELL and LD students

Pei Yi ee, Ta Hwa University of Technology, Taiwan

Friday 9:00-10:30 Session 1 Room: Sakura B

Taiwan Panels - Globalization and Key Issues in Education – 1/3

Session Chair & Featured Speaker: Tien-Hui Chiang

0700 Proceedings age 1771)

How Globalization Drives the Higher Education Policy of the State

Tien Hui Chiang, National University of Tainan, Taiwan

0704 (No Full Paper)

In search of a perfect curriculum: Cases from Taiwan

Yi Fong ai, National Dong Hwa University, Taiwan

Hsiu hao Liu, National Dong Hwa University, Taiwan

0702 (Proceedings Page 1789)

Self-Identification and Citizenship Education in a Global Context

Chou Sung Yang, National Chi Nan University, Taiwan

Friday 9:00-11:00 Extended Session 1 Room: Kashi

Educational Vision, Policy, Leadership, Management and Administration 1/7

Session Chair: Andrew Skourdombis

0328 No ull aper)

Candidate Teachers' Views On Classroom Management and Understanding – A Sample from the Anadolu University Education Faculty

Müyesser eylan, Anadolu University, Turkey

0578 (No Full Paper)

A Study on the Relationships between Junior High School Principals' Knowledge Leadership and School Innovation Management Effectiveness in Taiwan

Hwang hio Ruan, National Taipei University of Education, Taiwan

0265 No ull aper)

A Case of Institutionalized Poverty and Education in Indonesia: Towards a Theoretical Framework

Ernita Maulida, University of Huddersfield, UK

Glenn Hardaker, University of Huddersfield, UK

0016 (Proceedings Page 43)

The Political And Economic Arguments In Contemporary Classroom Teacher Effectiveness - Research And Inquiry

Andrew kourdombis, RMIT University, Australia

Friday 9:00-10:30

Friday 9:00-10:30 Session 1 Room: Ume

Technology in Learning 1/11**Session Chair: Calvin Wan**

0182 (Proceedings Page 569)

A Study on Developing MSN Virtual Learning Companion System based on Individual Cognitive Style for Microsoft Certification Course

Sheng Wen-sieh, Far East University, Taiwan

Min Ping Wu, Far East University, Far East University, Taiwan

0375 (No Full Paper)

Use of Cognitive Tools to Enhance Active Learning and Thinking

Bee Leng-hua, National Institute of Education, Singapore

0043 (Proceedings Page 150)

A Chinese Checkers Game for Active Learning

Calvin Wan, Hong Kong Polytechnic University, Hong Kong

Ronnie Cheung, Hong Kong Polytechnic University, Hong Kong

Macy Wong, Hong Kong Polytechnic University, Hong Kong

Friday 9:00-10:30 Session 1 Room: Hagi

Student Learning, Learner Experiences & Learner Diversity 3/12**Session Chair: Rob Townsend**

0127 (No Full Paper)

Beyond the Conspicuous: Acknowledging Diversities in Learner Expectations

Preeti Mishra, University of Delhi, India

0258 (No Full Paper)

Achievement Goals, Implicit Theories and Behavioural Regulation among Polytechnic Engineering Students

John Tang, National Institute of Education, Singapore

Woon Chia Liu, National Institute of Education, Singapore

0021 (Proceedings Page 110)

So you think you're ready for university? Barriers, needs and supports for mature age individuals accessing higher education.

Rob Townsend, La Trobe University, Australia

Friday 9:00-10:30 Session 1 Room: Kusu

Languages Education and Applied Linguistics (ESL/TESL/TEFL) 20/20**Session Chair: Martin Guardado**

0191 (No Full Paper)

A study Examining Attitudes in Regards to Using Tour Guide Simulations in English for Listening and Speaking with Secondary School Students

Surachai Rodngam, Thammasat University, Thailand

Monnipa Sompong, Thammasat University, Thailand

Runrawee Samawathdana, Chulalongkorn University, Thailand

0556 (Proceedings Page 548)

Reforming ELT Syllabus in Modern Pedagogical Context

M. Athar Hussain, International Islamic University Islamabad, Pakistan

Asad Abbas Rizvi, International Islamic University Islamabad, Pakistan

Nabi Bux Jumani, International Islamic University Islamabad, Pakistan

Session Chair: Carmen Guerrero Nieto

0489 (No Full Paper)

An inquiry into lesson study for elementary EFL teachers' professional development
Chiou hui Chou, National Hsinchu University of Education, Taiwan

0288 (No Full Paper)

Development of the Teacher Counselling and Guidance Attitude Scale
Meryem Demir, Anadolu University, Turkey

0246 (No Full Paper)

Globalization (or rather Westernization?): Is there any room for local knowledge?
Alvaro Quintero Polo, Universidad Distrital, Colombia
Carmen Guerrero Nieto, Universidad Distrital, Colombia

Friday 9:00-10:30 Session 1 Room: Matsu

Community, Culture, Globalization and Internationalization 1/9

Session Chair: Gavin Sanderson

0029 (Proceedings Page 129)

The Promise and Challenge of Global Higher Education Integration
Martin Janda, George Mason University, USA

0548 (No Full Paper)

'Barriering' in intercultural student communication on internationalising campus: A grounded theory exploration
Kazuhiro Iwano, Dokkyo University, Japan

0069 (Proceedings Page 12)

Black and white knights: globalisation, internationalisation and higher education
Gavin Sanderson, University of South Australia, Australia

Friday 9:00-10:30 Session 1 Room: Tsuki

Curriculum and Pedagogy 1/6

Session Chair: Bruce Knight

0188 (Proceedings Page 605)

LeMEx, Learning Medical Expertise A longitudinal follow-up study on learning medical expertise during undergraduate medical studies
Mikaela Allio, Finland

0452 (Proceedings Page 1271)

Bridging the competency gap between university education and biotechnology industry requirements - Novel pedagogy in India perspective
Arnab Kapat, Reliance Institute of Life Sciences, India
Subramaniam K.V., Reliance Institute of Life Sciences, India

0168 (No Full Paper)

Visioning Teacher Education Leadership: A 21st Century Reality in the Bachelor of Learning Management
Bruce Knight, CQ University, Australia
Cecily Knight, CQ University, Australia

Friday 10:45-12:15**Friday 10:45-12:15 Session 2 Room: Sakura A****Languages Education and Applied Linguistics (ESL/TESL/TEFL) 6/20****Session Chair: Keith Tong**

0142 (Proceedings Page 437)

Improving the Speaking Ability of Engineering Students at Khon Kaen University by Using an Oral Presentation Task

Nuch Sara hoksuan, Khon Kaen University, Thailand

0383 (Proceedings Page 1181)

A Critical Reflection on the Integration of Informational Technology into EFL Curriculum: An EFL Teacher's Inquiry

Jin shan hen, Chihlee Institute of Technology, Taiwan

0138 (No Full Paper)

"Communication for International Management": an organic approach to integrating language education and management education

Keith ong, Hong Kong University of Science and Technology, Hong Kong

Friday 10:45-12:15 Session 2 Room: Sakura B**Taiwan Panels - Globalization and Key Issues in Education 2/3****Session Chair: Tien-Hui Chiang**

0634 (No Full Paper)

The changing requirements of university entrance in Taiwan Is there a new paradigm emerging?

San San Shen, National Hsinchu University of Education, Taiwan

0655 (Proceedings Page 1739)

Localization of the global language: English literacy in a Taiwanese context

Damien Trezise, Chian Nan University of Pharmacy and Science, Taiwan

0633 (No Full Paper)

A comparison between the Taiwanese and German curriculum of teacher education for early childhood care and education at the tide of immigration

Fe Duen sieh, Kun San University, Taiwan

Friday 10:45-12:15 Session 2 Room: Ume**Technology in Learning 2/11****Session Chair: Hafizoah Kassim**

0161 (Proceedings Page 498)

ICT Tools in Schools with Constructivism for Learning Anytime and Anywhere.

Michelle eo, Monash University, Australia

0336 (No Full Paper)

Can Multimedia Learning Tools Enhance Creative Thinking?

Hafizoah Kassim, Universiti Malaysia Pahang, Malaysia

**THE JOB PERFORMANCE CAPITAL AMONGST CIVIL SERVANTS IN
MALAYSIAN EDUCATIONAL TECHNOLOGY DIVISION: AN ANALYTICAL
STUDY.**

Mohd. Sahandri Gani Hamzah Ph. D Assoc. Prof
University Putra Malaysia
sahandri@putra.upm.edu.my

Saifuddin Kumar Abdullah M Ed.
Jabatan Pengajian Politeknik
Kementerian Pengajian Tinggi Malaysia

sainash6565@hotmail.com

Abstract

This study was conducted using interaction survey method on 400 civil servants in the Educational Technology Division (ETD) and its network across Malaysia. The instrument used in the study was particularly developed to encompass all tasks and duties based on job specifications. Specific elements explored were factors influencing intrinsic and extrinsic motivation such as competency, workload, job satisfaction, spiritual astuteness, interest, work environment, reward, supervision and coaching, job performance, commitment and training. *Workload* indicated the lowest correlation with both types of motivation. All independent variables except for *workload* showed positive correlations with the dependent variable, signifying that every unit of workload added would decrease 0.12 units of job satisfaction. Four vital elements which were intrinsic motivation, extrinsic motivation, competency and job satisfaction formed the Job Performance Capital. The path analysis model of the Job Performance Capital demonstrated that every unit added would increase 0.318 units of job performance. Findings of this research implied that the job performance of the ETD civil servant and its network depended strongly on motivational elements with their own respective roles that were inter-connected to each other and should be dealt with forethought and prudence.

Key Words: Job, Performance, Civil Servant, Educational Technology Division.

Background:

The Ministry of Education of Malaysia is responsible in improving the quality of teaching and learning in schools across the country. This is in line with the hope of Ministry of Education of Malaysia (MOE) to achieve the first-class education standard in year 2015. In this context, the ETD and its network is responsible in implementing various educational support program especially to inculcate the use and integration of educational technology within teachers and students to improve the effectiveness of the teaching and learning process.

Based on the field of work, all the ETD and network staffs comprising of 2,248 people (385 ETD staffs, 664 BTPN staffs, 98 PTPB staffs and 1,101 PKG staffs) play an important role in realizing the dream of MOE to inculcate educational technology. Thus, programs and activities of all ETD and their networks depend a lot on commitment, work culture and satisfaction, competency, attitude and motivation of all officers and staffs.

Problem Statement

Education is one of the most important issues in the country and has always obtained major attention and big budget from the rulers. This scenario happens because education is every individual's need and belief. Through the school system, children and teenagers will be able to develop themselves and would not only ensure their future but also the future of their families and society. In conjunction to the aspiration, many studies relating to students' achievements has shown that the process of using systematic teaching system with numerous usage of relevant supporting materials is able to increase the mastery of students to the excellent level. Because of that, many ideas and initiatives have been generated to improve the quality of the nation's education, thus ensuring the quality of the teaching and learning process to be competent with the latest development and findings.

Thus, the Ministry of Education has planned various strategies besides providing sufficient learning facilities and trained teachers to schools equally between urban and rural schools as shown in the Main Education Development Plan (MEDP).

From one year to another, the MOE's budget for the teaching and learning process has increased with the hope that a better schooling system can be benefited by all students. However, the performance gap between students from the urban schools and the students from the rural schools is still wide. This situation is caused by the lack of quality in the basic facilities of learning and the related services which is still not satisfactory. Hence, many teachers admit that they lack the skills in teaching support materials and also that there is limited guidance and training given. This situation encourages the MOE to give more attention and to depend on more ETD officers, BTPN and PKG to be more diligent in providing education technology related services to teachers in outside the city especially in the rural areas. Hopefully this will give direct influence and the fruit can be seen through examination results centrally.

Besides directly providing educational technology, ETD and the network staffs and officers are also responsible in ensuring the level comprehension and skills of teachers relating to educational technology is always updated in line with the latest needs. In relation to that, the responsibilities and tasks that need to be completed by every ETD and their network staffs and officers are actually very heavy. Without the internal support and the continuous motivation, whether intrinsically or extrinsically within the ETD and their networks staffs and officers, it is difficult for the goal to be realised. In addition to that, there are various issues that challenge the credibility and mental endurance of the officers such as complaints of teachers on the lack of opportunities of being exposed to the trainings of teaching support materials and the lack of demand from schools towards teaching support materials that are produced by ETD.

Strictly speaking, the success of implementing any ETD and its networks programmes in the effort to ensure the quality of education depends fully on the effort and the initiative of the officers and their staffs. Because of this reality, it is very important that the administrators of the organization to obtain a complete illustration on the motivation level of the officers and the staffs be it intrinsically or extrinsically. All the factors leading to motivation need to be explored and researched so that it can be manipulated to help improve the officers' motivation. In relation to that, this study is an initiative for the exploration of those aspects, which later contribute

meaningful data to the policy makers to plan and make a blueprint to ensure the success of the goal of ETD and its networks.

Aim

Generally, this paper is to discuss the motivation level of work within the ETD and its networks staffs and the factors that influence their motivational levels.

Objective

Specifically, this paper is to:

1. Determine the level of influence of the chosen factors towards the work motivation of ETD its networks staffs.
2. Determine whether or not there is a significant relation between work motivation of ETD and its networks staffs and their performance in the organisation.
3. Explain the analysis of the flow of the work performance of ETD and its networks staffs.

Enquiry of Study

To achieve the above objectives, a few questions related are brought up:

1. What is intrinsic and extrinsic work motivation level within ETD and networks staffs?
2. What is the magnitude of influence of the chosen factors towards the work motivation level of ETD and networks staffs?
 - a) Competency
 - b) Commitment
 - c) Work Satisfaction
 - d) Spiritual Astuteness
 - e) Interest
 - f) Work Environment
 - g) Guidance
 - h) Received Rewards
 - i) Work Burden

- j) Work value
 - k) Training and its Suitability with Role
3. Is there a significant relationship between the work motivation of ETD staffs and its network with their performance in the organization?

Importance

The writings and explanations of this paper can help the ETD and the MOE in planning and implementing programmes and activities to improve the quality of human capital and also the ETD staff and network performance to achieve the aims and objectives of the founding of ETD. In relation to that, the ETD also provides the necessary needs for the ETD and networks staffs (such as infrastructure, work environment and job specification) to enable them to give excellent service for the customers (i.e. teachers and school administrators, library and media teachers and students) who are involved in the implementation of the ETD activities.

The response in the readiness of the ETD and networks staffs on the culture of technology will enable the ETD and MOE to plan programmes that will increase the effort to instil the technology culture within them. These programmes will be able to contribute towards the government's effort to realise the Main Education Development Plan in strengthening the educational system in this country.

Scope

The discussions in this paper focus on the intrinsic and extrinsic motivation matters of ETD and its network staffs and how strong are the factors in influencing the two kinds of motivation.

A Survey on Motivation

Motivation refers to action, direction, intensity and behavioural persistence (Gordon P.H. et al, 1983). Motivation in workplace is determined by three principles that are interpersonal need (Hackman J.R. & Oldham G.R, 1976) or intrinsic motivation, extrinsic motivation and basic psychological needs. The Two-Factor Theory (Herzberg 1966) puts stress on the

importance of intrinsic and extrinsic motivation. Psychologists of organisation state that intrinsic motivation is the result of direct relationship between employees and their work which is usually self-applied. Extrinsic motivation is formed based on the external environment of the workplace usually controlled by other individuals. The relationship between extrinsic and intrinsic motivation shows that when both results of intrinsic and extrinsic are attractive, it will contribute positively to motivation. Generally, the study also shows that intrinsic and extrinsic rewards are needed to improve motivation in workplace.

In the context of career, an employee's motivation is influenced by his or her environment, work atmosphere and satisfaction (Holden 1990/91). The competency concept is introduced in early year 2000 towards determining job performance (Mohd. Sahandri, 2008). This is because employees, amongst others, are influenced by several factors, like environment and ecology, perception, memory, cognitive development, emotion, behaviour and personality (Huitt, 2001).

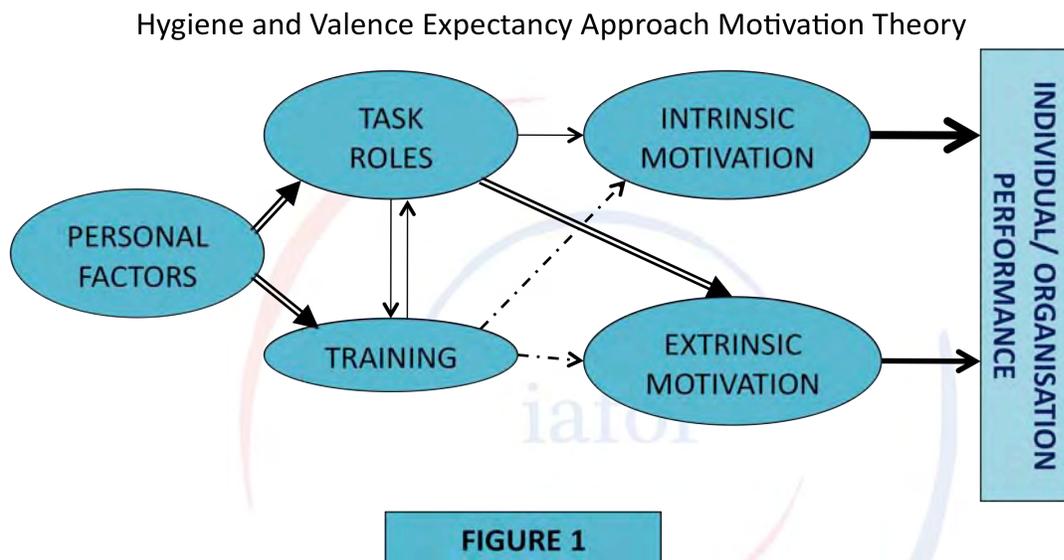

Rewards especially, can also stimulate motivation and generate the action to do an activity (Enabou & Tirole, 2003). At the same time, emotional and material support help staff to become more committed (Brandit. R , 1995) in doing an activity. Besides that, good and close relationships between staffs also influence the commitment within staffs (Abdullah Nordin, 1997). In relation to that, trainings given to PKG staffs also improve commitment and job performance within them (Mohd Sahandri, 2008). In fact, the good communication in organisation also encourages job satisfaction, job performance and job commitment and these can be considered as assets in an organisation (Mohd. Sahandri, 1998; Sharifah, Joni & Balan, 2001).

Continuous evaluation and improvements towards staff work motivation of an organisation needs to be given attention so that the performance of the organisation will always improve. With that, the report on public sector staffs shows normative commitment and a high work satisfaction level (Lem Boon, 1983) could be maintained and developed.

Conceptual Framework

This study considers the motivational parameters based on a few constructs and also theories related with the function and roles of the ETD and networks staffs as shown in Figure 1.

Conceptual Framework

Based on the conceptual framework in Figure 1, the roles and tasks done by the ETD and its network staffs and officers consists of 12 determined tasks specification. However, personal factors also influence the work culture in an organisation. Meanwhile, there are also basic needs that encourages motivation building either it is intrinsic or extrinsic. The relationship between individual and organisational needs as illustrated in some motivation theories and expectations directly influence the performance of the individual and the organisation. The whole interaction between constructs in the conceptual framework above will be elaborated by the determined variables in the instruments of this study.

Limit of Study

This study will be done in various units in the Educational Technology Division (ETD), the Ministry of Education Malaysia and networks which consists of State Educational Technology

Divisions (SETD), the Divisional Education Technology Centres (DETC) (for the state of Sabah and Sarawak) and Teachers Activity Centres (TAC) in all states. The respondents of this study are focused on two groups that are the ETD and its network staff and, library and media teachers and smart teachers. Because of that, the generalization of study is limited to all the ETD and its networks staff in Malaysia.

Design of Study

This study uses a combination design that encompasses the quantitative and qualitative approach. For the quantitative approach, the survey descriptive design is used. The descriptive research is a research that is aimed at explaining a phenomenon that happened (Murdock. K, 2002). This descriptive design will provide an illustration for a variable that is to be observed using statistical determiners to see the distribution and the pole and the data tendency. Two sets of instruments are used i.e. (i) Instruments for ETD and its network staffs and (ii) The teachers' response instruments for teachers who uses the facilities and services of TAC, DETC and SETD. The quantitative variables measured in this study are demographic backgrounds, motivation level, roles, personal factors and environmental factors which influence the respondents' motivation.

The qualitative design is used to observe the data from the open questions. This design will provide detailed information related to the studied phenomenon and is very suitable to obtain the real illustration related to the determined variables. Specifically, the qualitative design will be used to achieve the second and third objective of the study. The usage of the qualitative method will allow concept building and comprehension (Merriam, 1998 and Taylor dan Bogdan, 1998) which are very much needed to make evaluations and to give suggestions related to the motivational aspect of the ETD and its networks staffs.

Population and Sample

This population of study consists of all the ETD and its networks staff that are on duty in the nation. The determination of the accessible sample size is done by using the formula of Isaac. S & Michael W.B, (1979) where the needed sample size is $(t^2pq)/d^2$, where the value of t is 1.96, $d=0.5$, $p=0.5$ and $q=0.5$. Based on this formula, the minimum sample total needed is 384. After considering the correction factor that is, $n=n/(1+n/N)$, the number calculated is 400. The choice

of sample is by using stratified random sampling so that the external legitimacy of the study is high and the data generalisation can be done.

Instruments

The instruments of study consist of two sets that are the Motivation Instrument and the Roles of ETD and Network Staffs. The Motivation Instrument and the Roles of ETD and Network Staffs are divided into seven parts. Part A is the demographic information that encompasses age, experience, position grade and received awards. Part B and C involves personal factors and environment and is predicted to influence motivation that are competency, commitment, job satisfaction, spiritual astuteness, interest, working environment (physical, social, autonomy, rewards, coordination and guidance and job burden). Part D involves the intrinsic and extrinsic motivational items, while Part E is the items that relate to the training given and its suitability with their roles. Part F and G cover the roles of every sector in ETD and network and the overall summary of the respondents' roles. Both of these parts will form the summative score to view the performance of the sectors of ETD and network.

Parent Study

Due to the standard procedure in the preparation of a study measurement tool, a pioneer study has been implemented on 4th May 2007 in the Educational Technology Division (ETD) in Bukit Kiara, Kuala Lumpur. The study involved 30 ETD and network staffs from all sectors. Based on the response from the pioneer study, a few improvements have been done on the instruments of study.

The Legitimacy and Trustiness of the Instruments of study

The legitimacy of the front page and the instrumental content is determined through series of workshop and instrumental proofs by professionals in the fields and measured constructs. The qualitative response from the parent study can also be used to ensure the suitability of the meaning of the items in measuring the determined variables. The legitimacy of the instrument construct will be determined in the real study through the factor analysis because the calculation of the analysis can only be done when there is a bigger sample (more than 300).

Besides that, the trustiness of the study instrument from the results of the parent study and the cronbach alpha value is between 0.86 and 0.89 based on the study instrument segment.

Data Retrieval Procedure

The modus operandi of the study is in the form of survey method interaction where all the SETD and networks staff respondents will be placed in a special room in a state and will be given the duty to complete the study instrument with respect to the specific segments flexibly. The estimated timeline for this is between one and two hours where is administered by two researchers (one researcher from UPM and one from ETD). For the respondents consisting of teachers, the same procedures will be implemented.

Results of Study

12 factors have been determined and analysed with intrinsic motivation to view the relation status as shown in Table 1.

Table 1 : Factors Closely Related to Intrinsic Motivation

Intrinsic Motivation	Work Value	Commitment	Job Satisfaction	Work Performance	Spiritual Astuteness	Interest
Sig. (2-hujung) (**)	.70	.52	.50	.45	.44	.44
	Training	Competency	Reward	Guidance	Work Environment	Work-load
	.43	.42	.37	.36	.32	.07

Table 2 shows the Pearson correlation analysis findings on the significant level $p < 0.05$. It is found that there are two significant correlations in the moderate level with respect to extrinsic motivation, which are work value (.51) and work environment (.33). However, the interest factor (.32), rewards (.32), work performance (.31), competency (.31), commitment (.30), spiritual astuteness (.25), job burden (.23), guidance (.22) and job satisfaction (.20) shows low correlation with respect to extrinsic motivation.

The next analysis is to determine the relationship and contribution between the job motivation estimation variables and the work performance models with the ETD and networks staffs as concluded in Table 3.

Table 3: The Beta (β) Flow Multiplier and the Determiner Multiplier (Adjusted R^2) for the Motivation-Performance Regression Model of the ETD and Network Staffs

The Beta (β) and the determiner multiplier (adjusted R^2) in Table 3 is the result of variable regression of group 3 towards Group 1 and 2 variables. Meanwhile the results from variable regression of group 3 are on the variables of group 1, 2, 3 and 3(1). The retrieval of the regression analysis shows that there are ways which consider the variables where the beta (β) is significant statistically ($p < 0.05$) and also the non significant but meaningful variable conceptually as long as its beta (β) value is more than 0.05 (Aminuddin, 1994) or its equal correlation as explained by Hair Anderson, Tatham & Black (1995).

Independent Variable	Responsive Variable					
	Extrinsic Motivation (Column 1)	Intrinsic Motivation (Column 2)	Competency (Column 3)	Job Satisfaction (Column 4)	Indirect Work Performance (Column 5)	Direct Work Performance
Spiritual Astuteness		.090		.089		
Interest	.070*	.099	.231	.123	.209	.195
Training		.125		.076		
Job Value	.454	.475	.207	.057*	.176	
Commitment		.183	.133	.537		
Guidance		.061*	.115			
Rewards	.126				.184	.144
Job burden	.160		.076*	-.120	.063*	
Physical Environment		.054*	.071*	.137		
Job Satisfaction					.270	.139
Work Performance Capital						.318
Adjusted R^2	29.9%	57.4%	25.5%	57.1%	31.9%	38.1%

*Not Significant but Meaningful

The first column in Table 3 shows that there are four variables that will cause direct influence to the extrinsic motivation of the ETD and networks staff. All these variables contribute as much as 29.9 percent of the extrinsic motivation variance of the ETD and network

staffs. Interest ($\beta = .070^*$) is the insignificant but meaningful estimator while work value ($\beta = .454$), rewards ($\beta = .126$) and job burden ($\beta = .160$) are significant. In other words the interpretation of the value (β) means for every addition of one unit of interest will increase 0.07 unit of extrinsic motivation, an increase of one unit of reward will increase 0.126 unit of extrinsic motivation and an increase of one unit of job burden will increase 0.160 of extrinsic motivation.

The second column in Table 3 shows that there are 7 variables which will cause direct influence to the intrinsic motivation of ETD and network staffs. All these variables contributed to 57.4 per cent of the intrinsic motivation variance towards the ETD and networks staffs. The spiritual astuteness ($\beta = .090$), interest ($\beta = .099$), training ($\beta = .125$), work value ($\beta = .475$) and commitment ($\beta = .183$) are the significant estimators variables. Whereas guidance ($\beta = .061^*$) and physical environment ($\beta = .054^*$) are insignificant but meaningful estimators. In other words the interpretation of the (β) value means every addition of one unit of spiritual astuteness will increase the intrinsic motivation by 0.090 units. This is also the case for the addition of one unit of interest that will increase 0.099 units of intrinsic motivation. For every increase of one unit of training, 0.125 unit of intrinsic motivation will be increased, and addition for one unit of work value will increase 0.475 unit of intrinsic motivation, and with an addition of one unit of commitment will increase intrinsic motivation by 0.183 units. In relation to this, every increase in one unit of guidance and physical environment will increase intrinsic motivation by 0.061 and 0.054 unit respectively.

The third column in Table 3 shows that there are 6 variables which will cause direct influence to the competence of ETD and network staffs. All these variables contributed to 25.5 per cent of the competence variance towards the ETD and networks staffs. They are the interest ($\beta = .231$), work value ($\beta = .207$) commitment ($\beta = .133$) and guidance ($\beta = .115$). The workload ($\beta = .061^*$) and physical environment ($\beta = .054^*$) are insignificant but meaningful estimators. The implication from the interaction between all these variable estimators mean that every increase in one unit of interest, work value, commitment, guidance, workload and physical environment will increase competence by 0.231, 0.207, 0.133, 0.115, 0.076 and 0.071 unit respectively.

The fourth column in Table 3 shows that there are 6 variables which will cause direct influence to the job satisfaction of ETD and network staffs. All these variables contributed to 57.1 per cent of the job satisfaction variance towards the ETD and networks staffs. The spiritual astuteness ($\beta = .080$), interest ($\beta = .123$), training ($\beta = 0.76$), work value ($\beta = -.120$) and physical environment ($\beta = .137$) are the significant estimators variables. Whereas work value ($\beta = .061^*$) is the insignificant but meaningful estimators. In other words the interpretation of the (β) value means every addition of one unit of spiritual astuteness will increase the job satisfaction by 0.089 units. This is also the case for the addition of one unit of interest, training, work value, commitment and physical environment that will increase job satisfaction in 0.123, 0.076, 0.057, 0.537 and 0.137 units respectively. However, the variable estimator of job burden ($\beta = -.120$) shows inverse relationship that an addition of one unit of job burden will decrease the job satisfaction by 0.120 unit. This illustrates that the job satisfaction ETD and networks staff will drop if more workload is added to what was supposed to be there.

The conclusion of the estimator variable that affects and contributes towards the motivation and job performance of ETD and networks staffs is shown in the Performance Model of the Path Analysis Model in Figure 1.

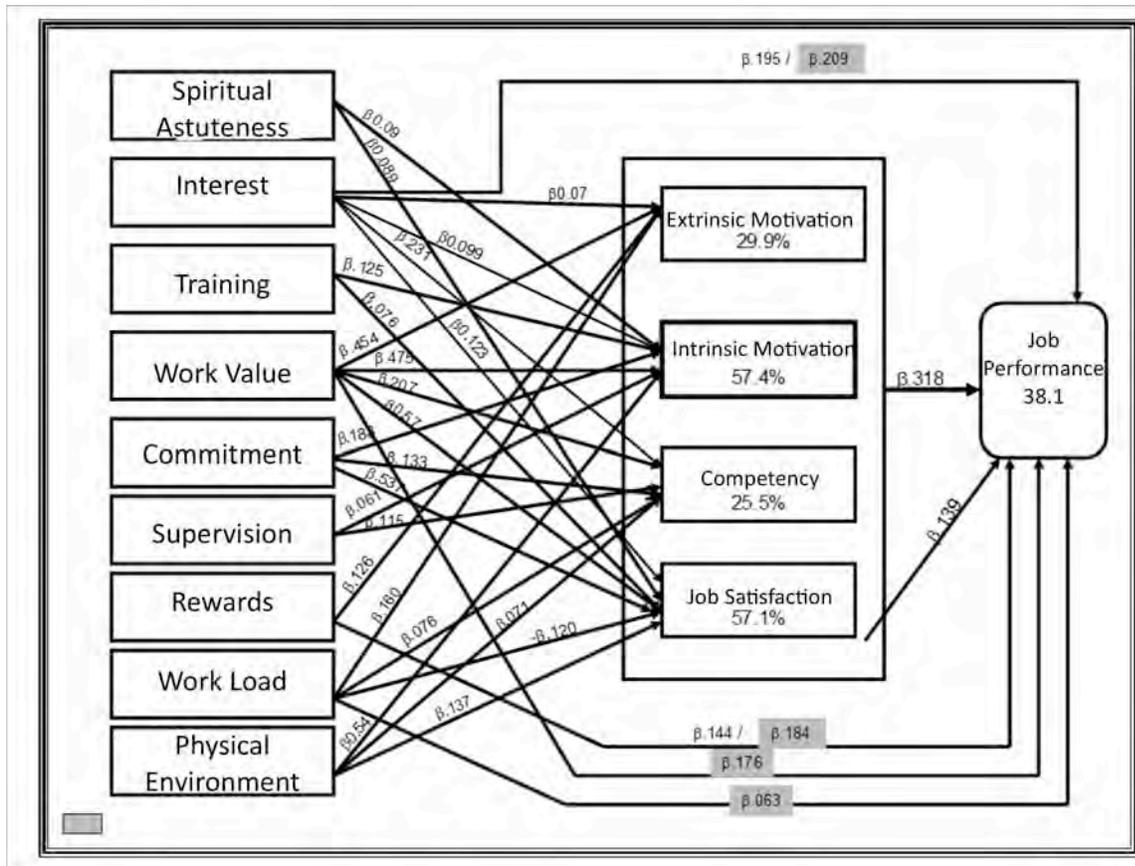

Figure 1: Performance Model of the Path Analysis Model

The fifth column in Table 3 shows that there are five variables which indirectly contributed to 31.9 per cent of the job performance variance towards the ETD and networks staffs. The sixth column in Table 3 shows that there are 4 variables which directly contributed to 38.1 per cent of the job performance variance towards the ETD and networks staffs. The spiritual interest ($\beta = .209$), work value ($\beta = 0.176$), rewards ($\beta = 0.184$), job burden ($\beta = .63^*$) and job satisfaction ($\beta = .270$) are the indirect variables interactions. In other words the interpretation of the (β) value means every addition one unit of interest and job satisfaction will increase job performance by 0.209 and 0.270 units respectively. Every addition one unit of work value, rewards and job burden will increase job performance by 0.176, 0.184 and 0.063 units respectively.

The interaction between the variables and their effects directly showed difference on the work performance model. This brings the biggest effect ($\beta = .318$), that is if one unit of work performance model is added it will increase work performance by .318 units. This is also similar

with interest ($\beta = .195$), rewards ($\beta = .144$) and job satisfaction ($\beta = .139$), thus the work performance will increase by .195, .144 and .139 respectively. Hence, the role of variable that has close relation to work motivation is important in estimating the work performance of an ETD and network staff.

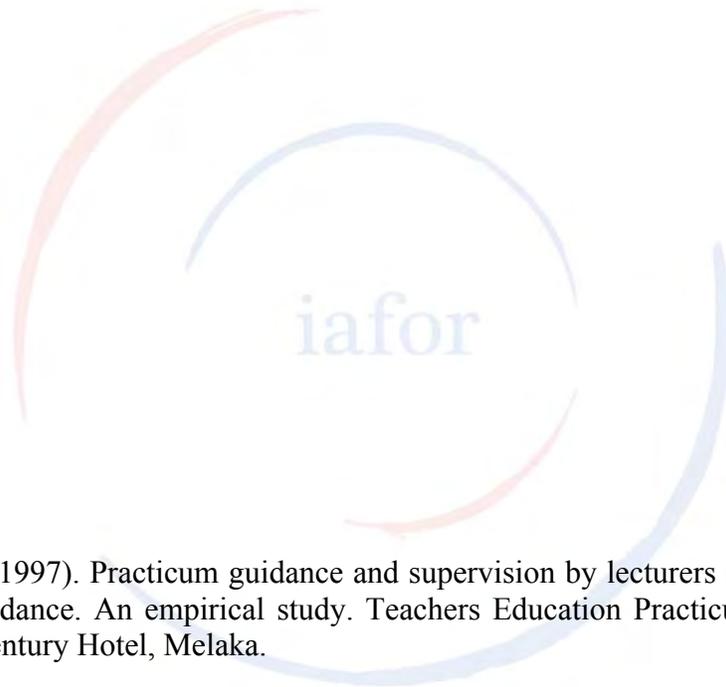

From the discussion of the retrievals above, it is clear that job burden gives less healthy impact to job satisfaction, but at the same time it could bring improvement towards the extrinsic motivation of ETD and network staffs. Overall, minters, work value and job burden affects job performance positively. All the variables detected do affect the intrinsic motivation of ETD and network staffs. Competency also directly influences the work performance, but studies shown that training would not contribute to intrinsic motivation. This means a big part of the training implemented have not meet the necessary needs of the competency of ETD and network staffs.

Discussion

Studies show that the extrinsic or outer factors do not show any relevance to extrinsic motivation. On the contrary the motivation of ETD and network officers are more intrinsic or in other words, high in work performance (mean of 4.65) and is encouraged by intrinsic motivation. This provides an assumption that ETD and networks placed officers in their respective scopes of duties based on suitable competency and expertise. Competency has contributed directly to work performance but studies have shown that training has no relevance to extrinsic motivation. This means that the trainings implemented does not meet the necessities of the officers' competency. The study has showed that increased job burden will decrease job satisfaction. This means that the administrators need to be sensitive to the job burden of officers and manage it so that the officers are not overtly burdened.

The zero order correlation analysis and double regression has helped the researchers to form another model called the "Work Performance Model" for the civil servants especially the

ETD and networks staffs and officers. In this model the contributor factor towards work performance has been classified into primary and secondary factors and is arranged into a contribution block or a model for extrinsic motivation. The primary factor contributed to the performance of intrinsic motivation, extrinsic motivation, competency and job satisfaction. The secondary contribution block is the spiritual astuteness, interest, training, work value, commitment, supervision, rewards, job burden and environment. Every contribution or capital has a contribution value towards job performance whether it is direct or indirect.

Abstract

Most of the learners nowadays are imaginative and actively participate more on graphical and multimedia presentations in classroom discussion. Viewing lecture videos has become a common activity in the comprehension of a certain lecture session. However, viewing the full length of the video is time-consuming. Viewers often want immediate access to specific parts of the lecture by jumping to its exact location.

This paper discusses the development of a Speech Recognition System that would condense the hassle of viewing an entire Tagalog Lecture Videos. This system is aimed to be a teaching tool that would allow searching of Tagalog texts from Tagalog-spoken speeches.

The system uses pattern matching technique to return the most likely time occurrence of the searched word. The system encompasses a database of tagalog word recording graphs that identify different types of sounds the human voice can make. The sound is identified by matching it to its closest entry in the codebook using Euclidean distance computation.

Though the experimental results yield an average speech recognition rate of 30%, the system still offers a supplemental tool to support learning and teaching. Providing immediate access on specific parts within lectures, this tool is found out to be useful as an aid in the comprehension and retention in knowledge and of learning Tagalog texts.

PROBABILISTIC SPEECH RECOGNITION FOR TAGALOG LECTURE VIDEO

1. Introduction

In today's technology, video recording of classroom lectures is easier, enabling more and more universities to post online videos of lectures while generating a vast range of topics. With the huge availability of topics, viewing online videos has become a common activity for students and educators in the comprehension of a certain lecture session. Students who missed an important aspect of the lecture have another chance to listen and view the online video which can be piped to their laptops or MP3 players. Although most of the contents in a certain video are useful, it is difficult and frustrating sometimes to go watch the full length video just to locate specific information within the lectures. Viewers often want immediate access to specific parts of the lecture by jumping to its exact location without going through the hassle of viewing the video from start to finish (Greene,2007).

During the past decade, the performance of automatic speech processing systems has improved dramatically, resulting in an increasingly widespread use of speech technology in real-world scenarios. The study and application of speech processing are no longer confined to research labs but are being deployed in a wide variety of applications. This research is an adaptation to answer one of the most important trends in speech-technology.

Probabilistic Speech Recognition For Tagalog Lecture Video, a spoken-word search tool, is designed to run on lecture videos that use the Tagalog dialect. It is a system that converts Tagalog speech audio into searchable text and points the user to the exact time frame of the most probable location of the searched Tagalog keyword. A handful of companies and research groups feature similar services, however their systems do not support much on Tagalog spoken speeches. Their systems have limited vocabulary size and are designed for English speakers having similar characteristics and accent. Despite several decades of research in this area, accuracy greater than 90% is only attained when the task is constrained in some way (Haven,i73). Moreover, a system that recognizes the Tagalog dialect is unavailable.

2. Review of Related Study

2.1 Local Related Study

2.1.1 Recognition of Tagalog Alphabets using Hidden Markov Model by Rolando D. Navarro Jr. of the University of the Philippines, School of Statistics, Dilliman, Quezon City

This study focused on the development of a system that would recognize an isolated Tagalog alphabet using the Hidden Markov Model (HMM). Linear Predictive Coding (LPC) was used on its feature extraction unit in the 12th order at 400 samples window length. At HMM training, each of the Tagalog alphabets to be recognized is represented by the HMM and the HMM parameters are estimated using a training observation applying to Baum-Welch re-estimation formulas. A series of codewords that represents an observation sequence is used to optimize the state sequence using the Viterbi algorithm for each of the HMM. Using either forward or backward procedure, the likelihood

of the observation sequence is computed. The HMM that gives the maximum posteriori probability yields the recognized word.

The experiments were conducted to selected adult fluent speakers of Tagalog at a controlled environment and giving an overall recognition accuracy of 85.5%.

2.1.2 Speaker Independent Continuous Speech Recognition of the Filipino Speech Corpus by Herbert Go, Regilyn Ordonez, Gift Dela Roca, of DSP Laboratory, UP Dilliman.

This project describes a method of a speaker-independent, word-level recognition for continuous Filipino speech based on the Filipino Speech Corpus, a project made by Guevarra. et al. of the DSP Laboratory in UP Dilliman. The recognizer starts with a Multilayer Perceptron that is trained to compute the phone posterior probability from the Mel-Frequency Cepstral Coefficients extracted from speech samples. A trigram language model and a lexicon containing the anticipated phonetic spellings of each word are then built and a start synchronous decoder is used to find the most probable word given the phone posterior probability, the language model and the lexicon.

Upon test and experiments, the word-level recognizer was only able to achieve an average of 32% accuracy during testing of continuous speech.

2.2 Foreign Related Study

2.2.1 Acoustic Model Adaptation based on pronunciation variability analysis for non-native speech recognition by Yoo Rhee Oh, Jae Sam, and Hong Kook Kim

In their paper, pronunciation variability between native and non-native speakers is investigated. They proposed a novel acoustic model adaptation method based on pronunciation variability analysis in order to improve the performance of speech recognition by non-native speakers. The acoustic model adaptation method is performed in two steps: analysis of pronunciation variability and acoustic model adaptation based on pronunciation variability analysis.

2.2.2 The Flattening Technique of Spectrum for Improved Pitch Extraction by EunYoung Kang, MyungJin Bae from Department of Information and telecommunication Engineering., Soongsil University, Seoul, Republic of Korea.

This research is about a new flattening technique of log power spectrum for a more exact pitch extraction in the frequency domain. It uses autocorrelation method to measure the regular harmonic spacing of the flattened log power spectrum and pitch extraction is done in the frequency domain. The experimental results of the research show better performance than the conventional autocorrelation method.

3. System Flow

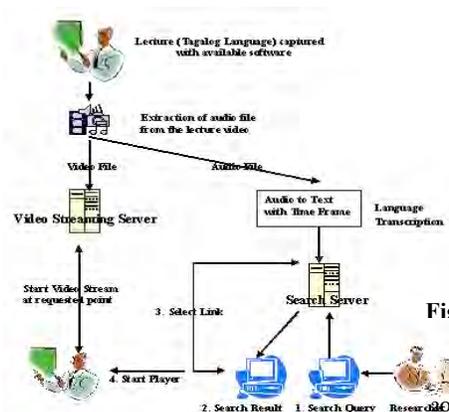

Figure 1: System Flow

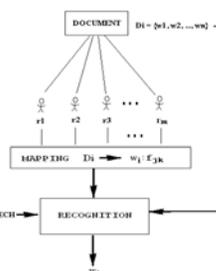

Figure 2: codebook

Figure 1 illustrates the overall idea of how the system functions. The lecture video is passed to a streaming video server which serves one's request to play and listen to a specific lecture video file. At almost the same instance, the system performs sound source separation, which is, the audio component of the video file is automatically extracted from the source and stored as WAVE format in the search server. A recording on each word of the training data is also stored in the search server that forms a collection of wav files (Figure 2). When a user submits a search term, the search page queries the codebook and return the most probable time occurrence of the search word in the lecture video file. The processes involved between the query and the result of the most probable time occurrence of the query is reflected on Figure 3. The block diagram of the speech recognition framework shows the different phases involved upon determination of word time occurrence. First into the pipeline is the pre-filtering phase of both source audio and search audio files that flatten all digital signals that are considered silence and unvoiced. The output is then a file that would apparently achieve end-point detection of words. Since spectral representation of the signal contains much of the information needed for the recognition, it can be used to represent each word and concisely capture the properties of the signal that are important for speech recognition. Spectral information from the segment of the speech signal is obtained using Fast Fourier Transform (FFT). The FFT outputs a representation value or a feature of each of the words that is used to matched in the codebook. For each of these comparisons, a distance is returned. The comparison that returns the shortest distance forms the most probable match. A time frame occurrence is then computed and displayed on screen.

4. Design Architecture

4.1 Block Diagram

The pattern-recognition approach to speech recognition is basically the process in which the speech patterns are used directly without explicit feature determination in the acoustic phonetic sense and segmentation (Rabiner, 1993). The method has two steps – namely, training of speech patterns, and recognition of patterns via pattern comparison. Figure 3 illustrates the methods used of finding the time occurrence of a spoken word in an audio extracted lecture video material using pattern recognition approach.

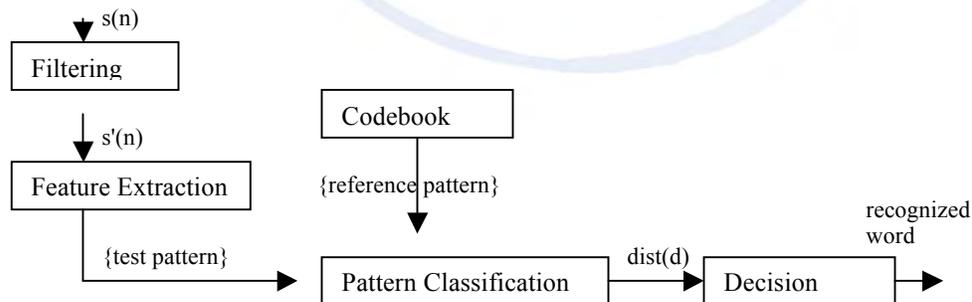

Figure 3: Text matching process diagram

The digital waveform representation of the input speech is pre-filtered to remove noise and unvoiced segments leaving the entire waveform representation as voiced and silence segments. Voice speech segments are then extracted from the digital wave form and are represented in a compact speech parameters using a windowed Fast Fourier Transform (FFT). FFT analyzes every word segment in the sampled audio file converting audio data into the frequency domain resulting

in a graph of the amplitudes of frequency components, describing the sound heard for that particular segment. These extracted speech parameters are then patterned-matched with the data in the codebook containing previously customized reference patterns. Computing the distance on each matched, the match with the shortest distance is assumed as the most likely word candidate.

4.2 Raw Data

WaveReader class reads and converts .wav files into parametric values at 256 samples to represent a single frame equivalent, overlapping at $\frac{1}{2}$ frame size on each of the frequencies in the waveform. Overlapping was necessary to paramount the representation of the frequencies. By this value, 171 frames are produced per 1000 milliseconds of recording.

4.3 Pre-Filtering

The simplest and the most straightforward classification in labeling events in speech are via the state of the speech production source – the vocal cords (Rabiner,1993). A three-state representation can be used on labeling speech: Silence - where no speech is produced; Unvoiced - in which the vocal cords are not vibrating resulting to a periodic speech waveform or are random in nature; and Voiced - in which the vocal cords are tensed and therefore vibrate periodically when air flows from the lungs resulting to a quasi-periodic speech. Figure 4 shows the labeling classification of one of the source test data. It shows an amplitude increase on the waveform when a word is uttered and a decrease in amplitude when no word is uttered at all.

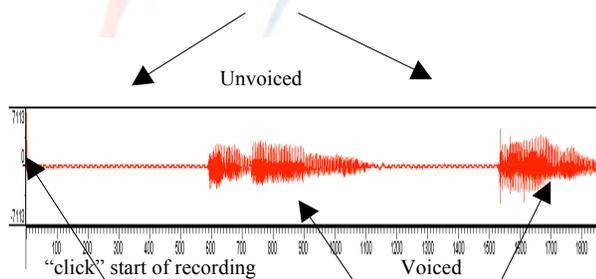

Figure 4: Spectrogram of the first 2000 milliseconds recording of the utterance "Alin ay ang iba ...".

Any vocal sample taken in a less than perfect environment will experience a certain amount of noise (Hayes,1996). The effect of additive noise and reverberation on speech, background noise or unvoiced as it is often called, exhibits a certain frequency characteristics. If the speech signal is examined over a sufficiently short period of time (between 5 and 100 milliseconds), its characteristics are fairly stationary; however, over long periods of time (on the order of 1/6 seconds or more) the signal characteristics change to reflect the different speech sounds being spoken (Deller,1999) . By this principle, a reference can be used to isolate each word in the source file.

To remove unvoiced segments without affecting voiced areas to isolate words, it is first necessary to get a sample of the room noise by itself (Deller,1999). This sample is usually the first 200 milliseconds of the utterance (excluding the data of the first 50 milliseconds as it generates a high frequency when one starts the recording) which provides the general frequency characteristics and threshold of the unvoiced segments. A technique called end-point detection algorithm uses the threshold value to identify and separate voiced from unvoiced part of the signal. Unvoiced segment removal is performed in time domain where the amplitudes below the threshold are discarded and assumed to be flat (zero). The algorithm below describes the separation of the words.

Search from the beginning until the energy chooses Upper Energy Threshold (ITU), then back-off towards the beginning until first point at which energy falls below Low Energy Threshold (ITL) is reached. This is the provisional beginning point N1. N2 (end point) is selected in a similar way.

That is, if $S(x)$ is the sample, $U(x)$ is the background noise, all in the frequency domain, then

$$S(x)_{\text{new}} = \begin{cases} 0 & \text{if } S(x) < \text{threshold} \\ S(x) & \text{otherwise} \end{cases} \quad (4.1)$$

where threshold is the average frequency magnitude from time 50 ms to 200 ms.

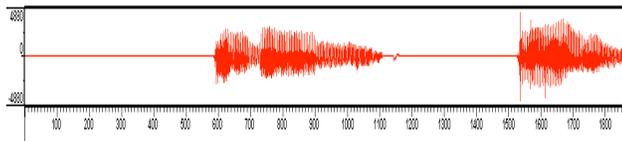

Figure 5: Spectrogram of the first 2000 ms recording of the utterance “Alin ay ang iba ...” after filtering stage.

Figure 5 is the result when the above algorithm is applied to the signal presented in Figure 4. It shows two representations of the speech signal; silence and voiced segments. A clear flat-line replaces where used to be unvoiced segments having common frequency characteristic. With this new resulting signal, words can be easily mined by a simple conditional statement and feed forward for feature extraction phase.

5. Feature Extraction

5.1 Hamming Window

The voiced segment forwarded from the previous phase for feature extraction usually contains a huge amount of data. In many digital systems processing, it is necessary to consider a small portion of the entire speech sample rather than attempting to process the entire sample at once

$$r(t) = \begin{cases} 1 & \text{for } (0 \leq t \leq N - 1) \\ 0 & \text{otherwise} \end{cases}$$

(Hayes,1996). The technique of cutting a sample into smaller pieces to be considered individually is called windowing and the simplest kind of window to use is the “rectangle”, which is simply an unmodified cut from the larger sample.

However, this type can introduce errors because near the edges of the window there will potentially be a sudden drop from a high amplitude to nothing, which can produce false “pops” and “clicks” in the analysis. The problem is recompense by slowly fading out towards the edges and multiplying the points in the window by a window function. One of the problems on this kind of solution is that

taking successive windows side by side with the edges faded out will distort the analysis because the sample has been modified by the window function. So that all points in the sample will be considered equally, windows are overlapped and to avoid distortion, the overlapped window functions should add up to a constant. It is defined as:

$$x = 0.54 - 0.46 * \cos(2\pi n / l - 1) \quad (5.2)$$

where x is the new sample amplitude, n is the index in the window, and l is the total length of the window.

5.2 Fast Fourier Transform (FFT)

The FFT is an optimized computational algorithm to implement the Discrete Fourier Transform (Deller, 1999). It takes a window of size $2k$ and returns a complex array of coefficients for the corresponding frequency curve. This algorithm has a complexity of $O(N * \log_2(N))$. It is because the data needs to be prepared by an operation called bit-reversal. During feature extraction, only the magnitudes of the complex values are used. The implementation involves two steps: shuffling the input positions by a binary reversion process, and then combining the results via a “butterfly” decimation in time to produce the final frequency coefficients. The first step corresponds to breaking down the time-domain sample of size 1 into 1 n -sized frequency-domain sample.

The frequency-domain view of a window of a time-domain sample provides the frequency characteristics of that particular window. In short, the frequency characteristics of a voice can be considered as a list of “features” for that voice. Therefore, combining all windows of a vocal sample and taking the average between them, we can get the average frequency characteristics of the sample. The frequency-domain of each word in the source can then be compared thru its frequency analysis with each cluster centered by some classification method.

6. Pattern Classification

The Euclidean Distance classifier uses a Euclidean distance equation to find the distance between two feature vectors.

If $A = (x_1, x_2)$ and $B = (y_1, y_2)$ are 2-dimensional vectors, then the distance A and B can be defined as the square root of the sum of the squares of their differences:

$$d(x, y) = \sqrt{(x_1 - y_1)^2 + (x_2 - y_2)^2} \quad (6.1)$$

This equation (6.1) can be generalized to n -dimensional vectors by simply adding terms under the square root.

$$d(x, y) = \sqrt{(x_n - y_n)^2 + (x_{n-1} - y_{n-1})^2 + \dots + (x_1 - y_1)^2} \quad (6.2)$$

7. Decision Rule

The concept with pattern matching technique in speech recognition is that enough versions of a reference pattern to be recognized are stored in the training set (Jelinek,1999). In the pattern comparison stage, direct comparisons between the unknown speech patterns to each possible pattern in the training set were exhaustively performed. These comparisons generate a value representing the distance between each word. The decision rule phase simply classifies based upon the distance of the value returned among the unknown speech recording and selects the lowest among the distance cost in the matrix. The shortest distance is returned as the most probable match to the search word.

8. Experiments

8.1 Test Setup

Recording of the training and testing sets were done in a controlled environment using ordinary PC microphone. Video recording of the text dependent lectures were done using existing video recording capable software's. Audio files are sampled at 16 KHz 16 bit mono format and windowed at 256 samples per frame. The training text is composed of a five word sentence recorded in a pan of 8 seconds and has two of the words repeatedly uttered at the start of the speech and at the end. All the experiments were done on either an Intel core 2 Duo 2.2 GHz with 2GB RAM PC or at an AMD Turion X2 Ultra Dual-Core Mobile 2.10 GHz with 3GB of RAM. This is due to the fact that recursive pattern comparison of the training set and codebook involved an enormous amount of processing power.

8.2 Experimental Results

The system test was divided into training and no-training modes. Training mode means a recording on each word has been performed by the speakers. No-training relies mainly on the available test patterns of previously made recordings. Figure 6 reflects the distance performance in searching the word "alin" in a trained environment. The graph shows significant information indicating the distance

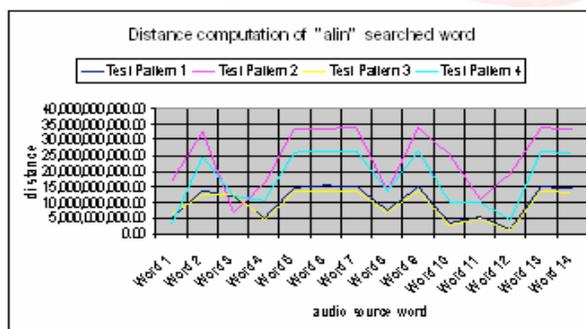

Figure 6: Distance of "alin" compared to each word in the source audio file.

corresponding to each word for every test pattern. Averaging the distances returned on each comparison indicate the most probable word frame location as

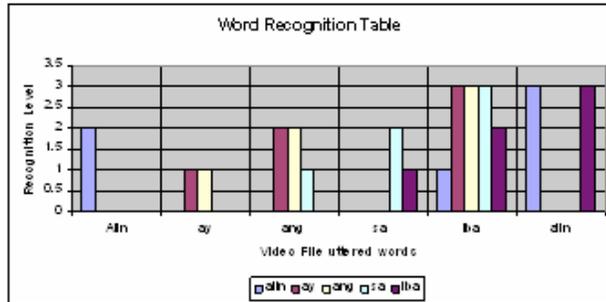

Figure 7: Word recognition level of “alin”

reflected on Figure 7. The figure shows that word 6, 1 and 5 in that order was assumed equal to the search word. Figure 8 and 9 shows the performance if no training is being made to the system. It clearly shows a change in the recognition rate giving a different probable word location.

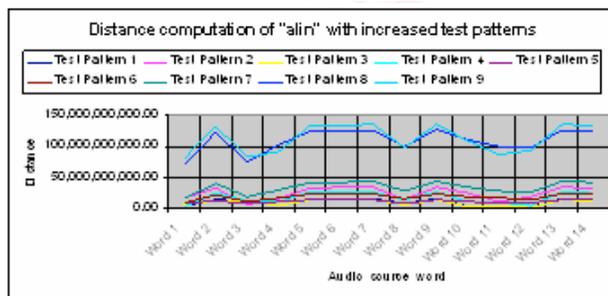

Figure 8: Distance of “alin” to each word in the source audio file at increased test patterns

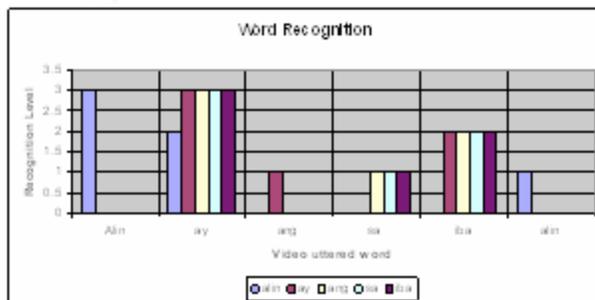

Figure 9: Word recognition level at increased test patterns

Experimental results of the system shows an average recognition rate of 30%. Moreover, an average of 30% drop off on recognition rate is returned if no training has been done. It was also notably noticed during the experiments that every time improper recognition of the word is returned, the second or the third in the rank of probable match is the correct word occurrence. The following results might be due to some facts that speakers cannot repeat precisely, on the same way, an utterance of the same word even on different trials, much more if no training has been done. Moreover, some digital representation of the most commonly unrecognized Tagalog words when examined shows a gap in between its digital representation (i.e. “iba”). The acoustic realization of stress from unstressed syllables affects spectral quality and intensity. In the case of the word “iba”, the signal representation of the word has a weak intensity and tends to have flatter spectral tilt that

probably was interpreted by the system as two separate words, consequently affecting the recognition rate.

Conclusion

Speech Recognition is naturally a field where huge amount of considerations has to be made in order to produce good recognition results. Our system generates recognition rate at an average of 30%. In a given signal, pattern matching technique is used to identify word frame location. End point detection technique is applied to break up voiced from unvoiced signal necessary for computing the distance on each test pattern to return the probable word location. On each word detection, considerations has to made on those instances wherein the frequency signal map of the word reveal a gap in between. Like for instance the word “iba”. Since the gap on the signal was assumed to reveal two words instead of one, it affects the distance computation and thus returning bad results. In studies of this kind, a good algorithm has to be implemented that would answer such instances on a signal. Although our system tries to address this type of situations, it was not able to perfectly resolve the problem.

Topic of the submission: Technology in Learning

Learner autonomy in one-to-one school English laptop programmes: Balancing access and authoritative knowledge

Phillip A. Towndrow

Centre for Pedagogy and Practice, National Institute of Education, Nanyang Technological University, Singapore.

INTRODUCTION

The use of computer-based technology in English language learning has had a mixed history. The early technical pioneers and writers in Computer Assisted Language Learning (CALL), particularly, Higgins (1988) and Pennington (1996) extolled the use of desktop computers in language skills development, motivation and learner independence despite, at times, inconclusive research-based evidence demonstrating the effectiveness of CALL in general classroom contexts (Chapelle & Jamieson, 1986; Garrett, 1991). More recently, new media and literacy practitioners have shown how computers and network connectivity offer opportunities for learners in writing, reading, research, assessment, self-expression, publication, autonomy and interest-based community building (Cummins, Brown, & Sayers, 2007; Dede, 2005; Gee, 2004; Hull & Nelson, 2005; Jewitt, 2002; Warschauer, 2006). But, realising the potential of contemporary technology to bring about sustained, equitable and challenging academic language work remains, overall, an elusive and often contentious goal for educational policymakers, curriculum designers and language teachers alike. The impact of ubiquitous mobile computing on students, teachers and the curriculum is a striking case in point.

At first sight, the notion of equipping each student with a wireless laptop is empowering and exciting, and according to Dressman and Wilder (2007) the introduction of mobile technology into language learning provides opportunities for positive pedagogical change. Yet, teachers in one-to-one laptop classrooms also face a multitude of complex issues including but not restricted to: administration, challenges to existing teacher-centric practices, conflicts with curriculum and assessment, and dissatisfaction with professional development opportunities and technical training. For example, in McGrail (2006) a small group of English teachers (n=6) showed keen awareness of how laptops could assist in addressing their students' needs. But the teachers were not happy about being omitted from discussions about who joined the laptop programme, how quickly it was introduced across the board and what the technology was meant to achieve given top-down institutional pressure to prepare students for high-stakes, standardised tests. In other studies, Khambari, Moses and Wong (2009) reported that teachers found the professional development they were given did not address their particular needs, and Murphy, King and Brown (2007) showed professional development content to be either too difficult or too simple for some—even within the same instructional group.

In my own research conducted in a Singapore high school operating an individual laptop ownership programme (i.e. parents are required to purchase computers for their children to use in school and at home) findings show teachers challenged in the utilisation of a wider base of expertise in their classrooms beyond the conventional wisdom derived from print-based resources and teacher-led, tightly structured instruction. However, before considering

some possibilities for educators and school administrators to pursue in accommodating laptops into mainstream language learning, some contextual background to the present study is necessary.

NATIONAL AND STUDY CONTEXTS

Singapore

Since its independence in 1965, Singapore has strived to develop a just and equal nation (Lee, 1998). Crucially, education has had a key role to play in meeting these objectives and the national education system is designed with two key ends in mind: (i) develop Singaporeans in the moral, cognitive, physical, social and aesthetic spheres of life, and (ii) foster responsibility to the community and country from which senses of purpose and identity can be derived (Ministry of Education, Singapore, 2009). The Singapore government is characteristically pragmatic in its form of governance and this orientation is clearly reflected in its educational policies. In particular, successive Information Technology (IT) Masterplans announced between 1997-2008, have emphasized the importance of technical skilling, customised learning, deep intellectual engagement, self-direction and flexibility in terms of where, when and how learning occurs (Ng, 2008). Looking forward, the government has invested heavily in an ambitious and extensive research, development and innovation agenda in digital media with the aim of creating a niche digital market share, wealth generation and job creation (Media Development Authority, Singapore, 2008). Overall, policy-makers in Singapore envision a future where:

Learners in 2015 will access the latest learning resources using personalised learning devices. Content will be delivered via ultra high-speed broadband networks. Learners can choose to learn at any place, leveraging on pervasive wireless access. Learners collaborate with one another over the network, using collaborative tools. Educators guide learners, by customising learning plans and resources, and using new assessment tools to monitor their progress. The habits of independent search, integration and construction of knowledge and the skills acquired from working together with others will equip our people to continue to adapt and learn. (Info-comm Development Authority, Singapore, 2006, p. 5)

The 1:1 Laptop Programme

Fox Hill Secondary¹ (FHS) is a well-established local institution given additional government funding and flexibility to develop holistic and innovative curricula and programmes designed to stretch its pupils to the fullest. Importantly, teachers at FHS are not tied to set texts and can plan yearly and/or half-yearly schemes of work (syllabi) independently at the departmental level. FHS is also implementing—through its own design and initiative—a school-wide infrastructure and curriculum development programme to improve its students' engagement in learning and strengthen their critical and creative capabilities. This plan consists of three interrelated components: (i) key programmes, (ii) people, and (iii) places.

The first element, programmes, involves redesigning the school's instructional delivery system so that each student has on-demand access to digital tools and resources both in and beyond school. As far as pedagogy and classroom practices are concerned, emphasis is to be placed, via the crucial mediation of the laptops, on using a variety of semiotic modes (Jewitt, 2008; Jewitt & Kress, 2003; Kress & van Leeuwen, 2001), promoting research and developing oral presentation skills.

¹ All names used in this paper are pseudonyms.

Second, teachers' professional learning is to be valued and catered to through leadership and collective learning activities. For example, teachers at FHS are expected to use their "protected time" (common non-teaching periods) to further enhance their understanding of their students' learning styles and preferences through individual and group-based critical reflection. The aim is that the protected time will facilitate better alignment between the use of suitable tools and resources to meet students' learning needs and interests.

Finally, with places, FHS has invested heavily in creating multifunctional and collaborative learning spaces around wireless, interactive technologies. The school makes extensive use, for example, of dedicated servers for video streaming, data-loggers and a fully functional, high-definition, media centre for student-produced projects.

METHODOLOGY

Research Design and Participants

Following design experiment prototyping practices (Bannan-Ritland, 2003) and descriptive/exploratory case study methods (Freebody, 2003; Hitchcock & Hughes, 1995), a three-year funded research project (including a one-year pilot) is currently being conducted at FHS to investigate and evaluate its laptop programme insofar as it relates to English language teaching and learning. In terms of scope, the participants include the teachers in the English department (n=18) and students from their respective classes in levels Secondary 1 to Secondary 3 (ages 13-15). Written informed consent was obtained from senior school administrators, teachers in the English department and parents or legal guardians prior to the commencement of the study. Students were also briefed about data collection procedures that affected them and assented, accordingly, by signing off on a class-based form.

Data Collection and Analysis

The data reported in this paper are drawn from two main sources: (i) an online survey that was administered to 357 Secondary 1 students (96.7% of cohort) to determine their laptop usage profiles in school and at home, and (ii) a series of classroom observations and follow-up interviews with a small number of teachers (see Towndrow & Vaish, 2009, for further details). The teachers taught a nominal sample of four lessons each (linked topically or thematically) and their tasks were video-recorded and simultaneously coded by the research team for a variety of classroom interactions and artifact production by students. The resulting quantitative data were processed using spreadsheet software to produce frequency statistics of the total amount of class time spent in various activities. The interviews were recorded digitally and transcribed verbatim. The interview transcripts were read and coded using a grounded approach (Glaser & Strauss, 1967). Initial codes were proposed and then progressively refined to identify and categorise the teachers' pedagogies, classroom practices and professional learning concerns.

ILLUSTRATIVE FINDINGS

Due to the lack of space, the findings presented in this section represent a very small part of the overall data set. Four aspects of the English language teachers' and students' work in laptop-based learning are illustrated: (i) teachers' goals, (ii) sources of authoritative knowledge in the classroom, (iii) frequency of students' use of instructional resource in

English language learning in school, and (iv) teachers' concerns relating to vigilance and instructional control.

Teachers' Goals

The information shown in Table 1 identifies the cognitive demands placed on students during the observed lessons. The overall pattern of events indicates that students were not required to analyse (identify constituent parts and purposes), evaluate (make judgements based on criteria and standards), or create (put elements together to form a coherent or functional whole). Where and noted, students were required to remember (23.1%), understand (15.4%) and apply (7.7%) in tasks set.

Table 1. Teachers' Process Goals in English Language Tasks

	Remember (%)	Understand (%)	Apply (%)	Analyse (%)	Evaluate (%)	Create (%)
Not selected	61.5	46.2	69.2	100.0	84.6	100.0
A little	15.4	38.5	23.1	0.0	15.4	0.0
Some of the time	23.1	15.4	0.0	0.0	0.0	0.0
Almost always	0.0	0.0	7.7	0.0	0.0	0.0

Sources of Authoritative Knowledge in the Classroom

Table 2 shows that when the legitimacy of knowledge and answers were given to issues and questions raised in the classroom, teachers or texts were the most frequent sources of authoritative knowledge. It is notable—given the potential access to information—wireless computing, media, the Internet and software were never used either individually or collectively. Crucially, students were neither consulted nor recruited as sources of knowledge. Many times, no sources of authoritative knowledge were referred to explicitly.

Table 2. Sources of Authoritative Knowledge in the Classroom

	Student (%)	Previous lesson (%)	Teacher (%)	Textbook (%)	Other text (%)	Media (%)	Internet (%)	Software (%)
Not selected	100.0	92.3	46.2	100	69.2	100.0	100.0	100.0
A little	0.0	7.7	23.1	0.0	0.0	0.0	0.0	0.0
Some of the time	0.0	0.0	7.7	0.0	23.1	0.0	0.0	0.0
Almost always	0.0	0.0	23.1	0.0	7.7	0.0	0.0	0.0

Frequency of Students' Use of Instructional Resources in English Language Learning in School

Table 3 provides a profile of students' use of various instructional resources (both print-based and digital) in the classroom over a range of time periods: daily, weekly and monthly. The most frequently used digital resource was electronic slideshow software (35.6%, once a week). Importantly, a sizable minority (approximately one third) never used software (e.g. mind- or concept-mapping, Comic Book Creator) or interactive and digital media (movies, photos, animations, games, virtual reality etc.) in school. Similar figures were recorded for usage at home.

Table 3. Frequency of Students' Use of Instructional Resources in English Language Learning in School

	Textbook (%)	Textbook + Worksheet or Worksheet (%)	Worksheet only (%)	Electronic Slideshow (%)	Word-processor (%)	Internet (%)	Software (%)	Digital Media (%)	Interactive and Apparatus (%)	Props and Apparatus (%)
Never	15.4	11.2	9.5	11.2	26.9	13.7	39.5	30.3	50.4	
Once a month	24.1	17.9	12.3	16.0	16.5	13.7	22.4	27.2	20.7	
Once a week	26.1	32.5	31.7	35.6	30.0	34.5	23.5	24.4	16.2	
Once a day	20.4	24.4	32.8	26.1	17.6	22.1	9.8	10.4	6.4	
More than once a day	14.0	14.0	13.7	11.2	9.0	16.0	4.8	7.8	6.2	

Teachers' Vigilance and Instructional Control

The content of post-lesson interviews and other conversations with teachers indicated that the teachers' concerns were diverse, highly personal and linked intimately to their own experiences and knowledge of the one-to-one innovation in the school. For example, a teacher remarked in an interview following an observed lesson in which she wanted to teach the structural and grammatical features of news reports:

Initially I allowed the students to use their laptops to type notes. Then I found some of them were surfing the net [behind my back].

And she added:

When I'm in class, I want the students to listen to me alone. And ... the computers take that away.

Another colleague (with long-experience in the school) had some experience of working with IT but remained anxious about its use in class. She explained:

I see the power of the tools. It's just one apprehension: class control. I can only do it after I am assured and I have got them [the students].

In sum, the data presented portray a mixed and contradictory picture of one-to-one computing in English language learning. On the one hand, the students and teachers at FHS possess the

tools to harness the power of mobile learning in ways that are consistent with its three-part, school-wide infrastructure and curriculum development programme. Yet, there were low reported and observed use of digital tools and new media in lessons. Furthermore, students were involved in a very limited range of cognitive processes during the enactment of tasks. The majority of work done involved receiving information. Students were seldom required to manipulate, combine or critique information or knowledge for themselves. Finally, it is noteworthy that teachers were concerned about maintaining vigilance and instructional control even when the affordances of digital tools and media were known. Under these restricted circumstances, then, it is not surprising that teachers and written texts were the dominant sources of authoritative knowledge in classrooms.

DISCUSSION

The inconsistent and sometimes angst-ridden one-to-one context at FHS is as perplexing as it is potentially fruitful. As outlined above, there is strong visionary government leadership and technological infrastructure building in place in Singapore, but there is something missing, something elusive that stands in the gap between policymakers' intentions and individual classroom-level implementation. It would not be wrong to state that the pressing demands of preparing students for high-stakes examinations can quickly deplete transformative thinking in lessons (especially when there is a lot of curriculum content to cover and time is limited) but the fixed and often non-negotiable nature of formal assessment is not necessarily at odds with on-demand student access to digital tools and resources. Arguably, when teaching/learning and assessment clash, pedagogy—understood as being more than just a set of instructional methods—is potentially misaligned. Thus, if one-to-one learning is to foster autonomy, the integration and construction of knowledge, teamwork, adaptation and new literacy practices in classroom-based language learning, then I maintain educational practitioners (teachers, researchers and students) need to understand, primarily, how learner independence, crucially mediated by technology, and teacher direction relate to each other in practical terms.

Teacher Direction and Learner Independence

There can be no doubt that teacher input is necessary for instructional interactions to occur and this is particularly true when access to information, knowledge and social media are pivotal in decision-making concerning the time, location, topic, pace and pathways in learning. Yet, as shown in Figures 1a and 1b, the association between (teacher) direction and (learner) independence is potentially variable and vitally context dependent. In formal situations, high levels of teacher direction and task framing tend to constrain and limit the scope and potential for independence (Figure 1a). The converse occurs when lower levels of teacher direction widen opportunities for learner independence to flourish, especially in informal contexts (Figure 1b).²

² I am indebted to Dr. Hayo Reinders for helping me conceptualise the relationships shown in Figures 1a and 1b.

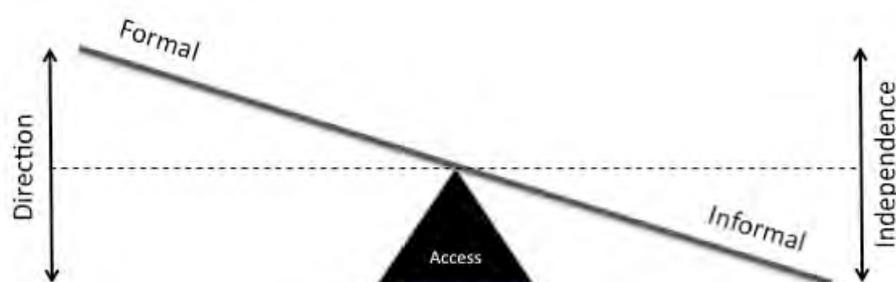

Figure 1a. High Levels of Teacher Direction in Formal Learning Constrain Learner Independence

Figure 1b. Low Levels of Teacher Direction Widen Opportunities for Learner Independence in Informal Contexts

Implications

If this conceptualisation is correct, then there are serious and pedagogically challenging implications for the ways in which school-based laptop ownership programmes in English language learning are designed, implemented and evaluated. Prototypically, two distinctive technology and new media scenarios are made possible and juxtaposed by wide access to media and information: (i) tightly framed, teacher-centred schoolwork, and (ii) more open and flexible informal usage. However, there is a double-pronged sting-in-the-tail, here. First, as learners become highly proficient independent operators, disparities between what they are exposed to with technology outside of school and what they are allowed to say and do within it widen. The unfortunate consequence is that technologically adept and knowledgeable students could become bored and possibly *enraged* by schoolwork that does not acknowledge or extend their capabilities, interests and dispositions (see Prensky, 2006, Tapscott, 2009).

Second, in an effort to maintain authoritative control over knowledge, some teachers in one-to-one learning contexts assign out-of-school tasks (e.g. homework) that only require the rudimentary and/or perfunctory use of technology. Such tasks might include word-processing, making wordy electronic slideshows or gleaning factual information from specified Websites. (Recall the data in Table 3 showed that one-to-one laptop students rarely created their own interactive media or multimodal texts, at home, for school-based purposes). Again, as functional as these assignments may be, they do not easily allow students to exercise significant pedagogical agency.

If teachers (and students) are to realise the potential of contemporary technology to bring about sustained, equitable and challenging academic work in one-to-one contexts, then they will have to face up to the inevitable reality—however disruptive it is—that ubiquitous ICT alters the axis of epistemic authority in teaching and learning towards students. Following Covey (2004) teachers might react that their concerns (e.g. lack of time and technical skilling) outweigh their influence to change working practices. However, teachers under these circumstances could become more effective if they focussed their attention on the things that they can do something about. The following section includes some recommendations about how teachers could be more proactive in one-to-one language learning.

RECOMMENDATIONS

The following recommendations relate to how teachers might increase their "circles of influence" (Covey, 2004, p. 83) in one-to-one language learning. Two broad suggestions are made that hinge crucially on teachers exercising leadership laterally in classrooms with students and in school departments with colleagues.

Partnership and Student Agency

If information technology and new media are to be used more productively as catalysts for curricula reorganisation and the growth of learner independence, then it is obvious that classroom interactions need to be designed and oriented more positively towards learners and learning. Normally, language teachers play a vital role in determining *when* access is granted to learning tools and instructional media but the matter of *how* they are recruited in meeting lesson objectives is not necessarily specified (or circumscribed) by curriculum designers in advance. If accepted, a path is opened towards a different (even non-combative) type of technology-mediated interactions with students.

One interesting possibility in this direction is Prensky's (2010) "pedagogical partnering" concept. Essentially, pedagogical partnering provides opportunities for students and teachers to focus on the aspects of learning they can do best. This involves giving students central responsibility for: finding and following their passion(s), using whatever technology is available, researching and finding information, answering questions and sharing their thoughts and opinions. For their part, teachers should: create and ask the right questions, give guidance, put material in context, explain, create rigour and ensure quality in learning. Crucially, technology supports pedagogical partnering and enables each student to personalise his or her learning processes. Technology might also be a medium for students to experience success in their learning (Brooks-Young, 2010).

But, in my estimation, there are two operating conditions that need to be fulfilled for ubiquitous technology in pedagogical partnering to be used meaningfully. First, students need to be involved in performance-based assessment tasks (cf. Hibbard, 2000) that allow them to use their content knowledge and learning-skills to demonstrate the achievement of learning outcomes where the complexity of tasks set is commensurate with the life-experiences they possess. For this to happen, students need to be able to make choices about what they present as evidence of learning having taken place and given flexibility in deciding on the strategies employed to reach curricula objectives. Experience shows that language students in one-to-one laptop programmes are ideally placed to exercise agency of this nature by using new media as channels for communication and wireless networking utilities as tools for peer-to-peer learning. However they need guidance in framing their ideas and implementing work-

plans within acceptable academic discourse and values. Additionally, teachers need to demonstrate leadership in classroom-based task design by letting their students share leadership in the domains of task implementation and assessment.

Second, the notion of what counts as authoritative knowledge in the classroom needs to accommodate more readily learning that occurs informally. What prevents (language) teachers admitting, for example, that knowledge or information taken from a computer game, blog posting, on-line status update or television programme is valid evidence in reasoned discussions, debates and judgements, in school. When this happens technology and learner independence will draw closer together and be truly mutually informing.

Collective Action

Issues relating to what can be done to expand language teachers' views of one-to-one learning are vexing but they are not intractable. One avenue would be to wait for the benefits of professional development programs in computer skilling and methodology to mature over time. But the flaw in this strategy is not that it takes time, but rather that it portrays teachers as poor, individual performers whose levels of competence can be improved through standardised and standardising professional development activities.

An alternative approach to one-to-one professional learning goes beyond the realm of an individual's action. Based on Boreham (2004) competence is not considered exclusively as an attribute of individuals. Instead it is equally a matter of collective action involving making communal sense of workplace events, developing and using a collective knowledge base and developing interdependency through cooperation and communication between sub-systems in an organisation.

If accepted, the notion of collective competence requires space for collective responsibility and mutual support for changes in workplace practices to occur (cf. Kennedy, 2005). This it is contended is only viable within an even broader framework of organisational learning. Data from the present study intimate the urgent need, therefore, for the operation of a theory of action relating to one-to-one learning that runs at the levels of the school, department or departmental sub-group. Elmore (2006) explains that a theory of action is a set of logically connected statements that link the actions of leaders to collective members of organisations to bring about improved practices. Crucially, school theories of action help colleagues understand *what* they are aiming to achieve and *why* this is important.

Working towards collective action is not a novel proposition but its application to English language one-to-one programmes is promising. Importantly, it is suggested that one-to-one learning is not solely an issue of individual competence. Seen from a wider, collective perspective, support for pedagogical change would seem to require strong, insightful and consistent leadership (not management exclusively), and knowing how to embrace complexity and foster diversity. Furthermore and most importantly, the development of teachers' one-to-one capabilities involves understanding how learning occurs in professional spheres of practice both formally and informally and allowing teachers' interactions to happen freely in these areas (see Fraser, Kennedy, Reid, & McKinney, 2007).

For example, I have witnessed a small group of teachers (not at FHS) create and operate within what Gee (2004) calls an "affinity space" that allowed them to transition from a collection of like-minded individuals towards a coalescence based around mutually benefiting

interactions. According to Gee, affinity spaces—commonly associated with on-line gaming enthusiasts—are composed of three elements and are characterised by several distinctive features: (i) content, (ii) a portal (e.g. places where interactions can occur: staffroom, corridors, canteens) and (iii) a generator that can organise, for example, content (e.g. a curriculum and the need to produce learning materials to support it).

Briefly, in terms of defining features, this group of teachers displayed many of the signature interactions of an affinity space (Gee, 2004, pp. 85-87). They:

- Had common interests, goals and practices not based on race, gender, age or social class;
- Were not segregated based on levels of expertise;
- Collaborated in the development of specialised knowledge and shared this extensively with others;
- Acknowledged and built each other's tacit knowledge; and importantly,
- Had no assigned leader.

Gee mentions that traditional school classrooms are not suited to affinity space interactions because of the status afforded to teachers and the set curriculum as sources of unquestioned authoritative knowledge. However, I maintain that teachers can successfully work in affinity-based spaces of their own devising. I am confident that teachers can bootstrap their own learning and provide leadership to their colleagues in ways that are peaceful and meaningful but not status-laden.

If I am correct about the efficacy and potential of teachers' affinity-based interactions, then school administrators and managers would do well to give as much time and space as possible to teachers to mix, match and discuss their work wherever and whenever they can. Teachers' pedagogic conversation is productive and should be seriously considered as an essential mark of inquiring, futures-oriented educators.

CONCLUSION

Within the context of a study of English language learning in a Secondary school in Singapore operating a one-to-one laptop ownership programme, illustrative findings showed how colleagues were seemingly hindered in their attempts to balance the demands of formal teacher-led direction with the autonomy that is potentially afforded by ubiquitous wireless access to the Internet and computer software. What resulted were low reported and observed use of digital tool and new media usage, and the enactment of rudimentary computer-based tasks.

Looking ahead, I have argued from an evidence base that the opportunities for positive pedagogical change in one-to-one language learning are realisable given two interrelated conditions. First, teachers need to know how learner independence that is crucially mediated by technology, and teacher-direction relate to each other in practical terms. Second (and not wishing to make light of the difficulties associated with classroom management) teachers need to recognise and respond positively to the ever-increasing reality that they no longer occupy the roles of sole source and arbiter of knowledge in the classroom that they once did when print-based and analogue resources ruled the day. Technology is no respecter of traditional epistemic authority and unquestioned procedures. So, what can be done (as FHS

wants to do) to improve students' engagement in learning and strengthen their critical and creative capabilities?

Teachers are not totally bereft of agency in one-to-one learning contexts even though the ground has shifted around them. I have recommended that they show leadership at their level in two ways by: (i) partnering (not battling against) students in task design—that is, allowing them to make decisions about how work is completed and assessed, and (ii) working collectively with colleagues drawing on commonalities and affinities that may go beyond (but certainly not circumvent) overt school-based structures. This second notion is at first sight unconventional and far-reaching because it challenges accepted (and largely unquestioned) notions of where expertise is located in schools. However, if students can create and operate in non-hierarchical affinity spaces, then teachers should be prepared to demonstrate that they can do likewise with positive results.

As mentioned at the beginning, research work at FHS is ongoing. It is planned that future published work will include detailed case studies of English language teachers' professional learning in one-to-one task design, implementation and evaluation. In the meantime, it is hoped the ideas presented here will prompt readers to reflect on their own pedagogy and practices within one-to-one or other technology-rich contexts. The following questions taken from Towndrow (2007) are offered as starting points for discussion with colleagues in schools and/or school administrators and managers.

1. Do you consider you are living in the Digital Age? If you do not think the Digital Age is currently influencing your personal and professional life, are there signs that it might do so one day soon? What can you do to prepare for this eventuality?
2. What is your stance on the challenges posed by ICT in your educational practice? Do you feel empowered or are you debilitated by what ICT has to offer?
3. How can language teachers and learners find out what ICT tools do and how they can be used to demonstrate the achievement of learning objectives?
4. Where is expertise located in your school and classroom?
5. Do you have any experience of collaborating with a colleague in the use of ICT in language teaching and learning? How did your project begin? How did your project impact on your own/your partner's teaching practice and/or professional learning?

ACKNOWLEDGEMENTS

This paper makes use of data from two research projects: (i) Enhancing criticality: A pilot project with IDM as pedagogical amplifiers in English classes at secondary level (LSL5/07/PT) funded by the Learning Sciences Laboratory, National Institute of Education (NIE), Nanyang Technological University, Singapore (<http://www.lsl.nie.edu.sg>) and (ii) Multimodal literacy in English language and literature teaching: The design, implementation and evaluation of a one-to-one wireless laptop programme in a Singapore high school (OER27/08/PT) funded by the Centre for Research in Pedagogy and Practice (<http://www.cripp.nie.edu.sg>) also at NIE. The Political And Economic Argument In Contemporary Classroom Teacher Effectiveness Research And Inquiry.

Introduction

This paper outlines the specific political and economic parameters that influence public education. In doing so, the paper examines theoretical aspects of the policy-making debate within Australia centred on effective classroom teaching practice and instruction. The paper implies that significant and global political and economic considerations invariably force governments to act thus exerting influence and control over educational matters including classroom teaching practice. To this extent, public education policy-making must grapple with prevailing political and economic considerations in so far as they involve and require an educational response.

There are four parts that comprise the paper. Part one expresses the main contextual arguments involved in clearly identifying, in broad terms, the political and economic forces that guide and control public education. The modern prioritisation given to change and disorder, particularly in terms of the economic, signifies the major challenge for education. In quite specific terms, this part of the paper provides the prevailing and broad-based economic argument that is the vital and important feature that propels change and transformation in terms that affects public education, the general work of schooling and classroom teaching.

The implicit facilitation of large-scale economic change occurs via the political process. The second part of the paper considers the major political imperative that has defined significant economic transformation and change in recent times. This imperative is described for the purposes of this paper as the movement towards State sanctioned dislocation and removal involving withdrawal from economic provisions and commitments that once drew upon State-based involvement. The contemporary and prevailing State sanctioned blue-print recommends and provides for market driven approaches including enhanced economic competition. The performative component of classroom teaching practice and its subsequent evaluation for systemic compliance is symptomatic of this contemporary mode of existence.

The third aspect of the paper discusses the core aspects of post-Fordist productive capacity in terms of preparation and 'job-readiness'. The new post-Fordist work order privileges demonstrative and performative capacity. To this extent, it is a skills-based new world, and education and training hold a distinctive and pre-eminent position. Classroom teaching practice is crucial for it directly links to individual student skill development.

Finally part four of the paper completes the argument by locating the apparent constant of change and dislocation within the terminologically accepted reference point of globalization. The major point emphasized here relates to control brought about by economic and political change. If one accepts the political and economic conditions portrayed at the start of the paper that have resulted, it is argued, in significant change and capital dis-organisation, the control and management, or in other words, governance of public education is paramount. In the current context, it is not surprising that education policy-making explicitly targets and emphasizes classroom teacher effectiveness and the evaluation of individual classroom instruction. Moreover and importantly, bureaucratic and policy-making arguments in support of the evaluation of individual teacher performance are sustained by positivist articulations of teaching practice. Their veracity is acutely questionable and contestable.

(1) Organised to Dis-Organised Capital: The Contemporary Milieux

The basis of organised capital production, the long established mode of productive exchange incorporates inter-related features (see Lash and Urry, 1987, p. 3). These features are characterised and suggestive of clear and structured relations of capital that now no longer dominate. Indeed, the post-

Fordist shift in productive exchange is based on disorganised modes of productive capacities that include non-uniform multi-dimensional individual abilities and talents for productive interaction and application.

Subsequently, the representative capitalist derivation of disorganisation has a conceptual but also tangible and real basis. Its affirmation in particular and individual western countries is somewhat different; nevertheless, prominent factors adhere to similar features and aspects (see Lash and Urry, 1987, pp. 5-7). Some of these include:

1. The growth of a world market combined with the increasing scale of industrial, banking and commercial enterprises...From the point of view of national markets there has been an effective de-concentration of capital.
2. The continued expansion of the number of white-collar workers and particularly of a distinctive service class (of managers, professionals, educators, scientists, etc.), which is an effect of organized capitalism, becomes an increasingly significant element which then disorganizes modern capitalism. This results from the development of an educationally based stratification system which fosters individual achievement and mobility and the growth of new 'social movements' (students', antinuclear, ecological and women's movements, etc.) which increasingly draw energy and personnel away from class politics.
3. Decline in the absolute and relative size of the core working class, that is, of manual workers in the manufacturing industry, as economies are de-industrialized. (Lash and Urry, 1987, pp. 5-7)

Disordered forms of capitalism signify economically systemic disaggregated conversion. Cultural and sociological features sustain it and propel it forward. But, its overall and foundational standpoint is built upon the productive capacities and features of capitalism itself without which it would not have importance, and moreover, would not eventuate.

Education is drawn into and cannot escape this maelstrom. On the contrary, education is not only a key part of this new world; it is one of the major facilitators of its existence and sustenance. Education through an articulated conscripted attachment to a provisionally enacted form of practical interaction produces desired outcomes. As a result, they are deemed necessary and indeed vital to the new world configuration and become de-facto policy-making inscriptions of governance. To comprehensively sense and grasp the relevance of education in this transformative transfiguration requires the elaborate discursive outline of the pervasive political and economic influence that has dominated modern contemporary times. It is also to specifically focus on schools and in particular the relevance and importance of classroom instruction and so classroom teachers.

Indeed, a major contention of this paper is to suggest that contemporary education policy-making emphasizes a re-casting of the problem and question of classroom teacher effectiveness. A specific current concern in education policy-making appears to have shifted focus and attention upon student learning, and in particular, academic underperformance. The contemporary neo-liberal emphasis on the standardization of education depicted by outcomes-based educational measures is central to policy reform strategies, particularly those that are unique to classroom instruction and student achievement. But, significantly, systemic neo-liberal audits of classroom instruction and student achievement are a prominent display of the success or failure of schools, their students and teachers. Teacher effectiveness research, particularly if it is solely defined by convoluted mathematical research designs limits its depictions of classroom practice and student achievement to the knowledge gained about teaching and learning from standardized external tests.

Consequently, the contemporary education system replete with its particular mechanisms and regimes of accountability, generally expressed as a set of education system policy-objectives and teacher personnel performance statements, obliges governments to provide an educational service. The Panoptic process of procedural surveillance that is the very formula of an imposed neo-liberal education order of governmentality over teaching practice dominates. For the school as an institution it means constant evaluations of student attendance figures (enrolments), and an attention to arbitrarily contrived numerical

comparisons of school performance-(standards) within and across geographic regions or zones and across a State. It is also characterised by attention to curriculum policy and its development. For classroom teachers it increasingly regards teaching and the work of teachers primarily for the formation of student skills. It is an agenda that has its genesis in aspects of economic performativity and relates very much to phases of a teacher's work that can be measured and verified through testing. Consequently, the role of the individual classroom teacher becomes increasingly "routinised and proletarianised" (Smyth & Shacklock, 1998, p.50) as they are "subjected to the discourses as well as the practices of managerialism" (Smyth & Shacklock, 1998, p.50). This for teachers means a performance regime that as expressed by Ball (1994) "begins with the testing of students, but raises the possibility of monitoring the performance of teachers and schools and making comparisons between them" (p.107). It also results in an "increase in the technical elements of teacher's work" (Ball, 1994, p.106) compressing, or perhaps in extreme cases, eradicating available room for expressions of professional autonomy and judgements.

(2) Commitments Withdrawn: Performance and Persistent Evaluation

The "advanced" (Rose, 1996, p.40) or neo-liberal political program is the major change in the "ideological environment of Australian schools" (Connell, 2002, p.323). Its specific focus is cast in terms of corrective intervention and redirection with a capacity to do something about a "practicable object" (O'Malley, 1996, p.193), for example, re-formulation of schooling practice away from the "limitations of the classical welfare state" (Connell, 2002, p. 323). This new conceptualisation, incorporating technologies of measurement and surveillance "of which the Panopticon and insurance are examples" (O'Malley, 1996, p.192), reflects programs of reform that have shifted key and core "coordination functions of nation-societies away from states and bureaucracies to economies and markets" (Pusey, 1991, p.3). The "trend line of change and rationalisation" (Pusey, 1991, p.3) having dismantled commitments to an equity agenda in Australian schooling, has been reconceptualised into a political program and process of strategic control that is justified in terms of efficiency and effectiveness.

A core feature of this new shift and formulation of schooling practice within Australia is the political and economic response to a sense of crisis. Its manifestation expressed in terms of "ungovernable democracies and of overloaded states" (Pusey, 1991, p.3) is preceded by core negative descriptions of developed economies the emphasis of which is centred on conditions of "directionless consensus and pluralistic stagnation" (see Pusey, 1991, p.17). A dominant free market orientation imbibed by the dynamics of reforming economic rationalisations and "systems of logic" (Pusey, 1991, p.11) provides a framework and base upon which public education policy determinations are made and enacted. The economic focus of this new market orientation advocated on grounds that exclusively presumes "system integration in which the burden of co-ordination is passed from the inferior medium of co-ordination of state bureaucracy to the supposedly better one of the economy" (Pusey, 1991, p.18) infiltrates public education policy development and enactment. In Australia it has resulted in, as Connell (2002) states:

the prioritization of 'training' over education, the partial privatization of universities, the increased subsidizing of private schools as a half-step towards vouchers, the continuing attempts to turn public schools into enterprises and principals into entrepreneurs, the invasion of public education by corporate advertising, the corporatization and fragmentation of Technical and Further Education (TAFE), the shift of research funding towards marketable products and processes, the adoption of business management practices in public education, and the 'outsourcing' of educational research and development. (p.323)

This sought after rise of a free and unfettered market agenda as a "contemporary technique of rule" (O'Malley, 1996, p.194) which "reinstates the morally-responsible individual" (O'Malley, 1996, p.194) also re-asserts individual initiative and risk-taking. It has re-cast pedagogic action and the work of schooling that for classroom teachers reflects a personal performative and individual representation of jurisdictional administration and management.

Fundamental to the current reform of public education is a system of self-management articulated in terms of a “new culture of schooling” (Ball, 1994, p.65), one that prioritizes “commodification and output indicators” (Ball, 1994, p. 65). Local school management allegedly free of the burdens of systemic constraint, are encouraged and empowered pursuing enterprising and innovative agendas for change. An indispensable and representative development of self-management based on the “illusion of autonomy and flexibility” (Ball, 1994, p.66) and brought by an adherence to free market principles of administration results in what is termed “steering at a distance” (see Ball, 1994, p. 66). As a disciplinary practice, it removes and re-locates authorial power away from those with an immediate and actual stake in education; classroom teachers, students and parents. Yet, paradoxically, it has resulted in the heightened and acute centralisation and convergence of authorial scrutiny onto those most exposed to its unequal excesses; classroom teachers and public school students.

The managerial conduit through which one can then map and record the “preferred teacher” (Smyth & Shacklock, 1998, p. 107) is a disciplinary process of exchange through forms of control that steers pedagogical action towards market imperatives and exemplars. Important characteristics include approaches that emphasize variety and responsiveness to market demands. The standardisation and normalisation of teacher’s work and classroom practice becomes a function of curriculum, the market and management approaches. The stratification experienced by the classroom teacher practitioner across these domains has invariably resulted in their objectified and commodified formation. The teacher becomes a deliverer, tester, technician, commodity-producer, performer, entrepreneur that is a resource and a cost and remains accountable (see Ball, 1994, p.49).

Indeed, the process of reform in public education has elevated management of pedagogic practice and the work of schooling so that it becomes a necessary function of exchange. Management becomes “an end in itself” (Ball, 1994, p. 71). The reformulation of public education so that it conforms to a free-market ideological outlook provides a mechanism through which delivery of key and dominant system outcomes can be attained. It “ties classroom practice, student performance, teacher appraisal, school recruitment and resource allocation into a single tight bundle of planning and surveillance” (Ball, 1994, p.71). Classroom teaching practice is re-made, and a good teacher/bad teacher dichotomy prevails. Significant differences in interest, between those that manage and those that are managed are unavoidable, notwithstanding policy document statements to the contrary.

We will engage the workforce in professional learning as part of an overall approach to service improvement. Leadership will be a major focus, as we know it is a major driver of improved performance. People must be developed and supported from the moment they choose careers in learning and development. (State Government of Victoria Education Blueprint, 2008, p.33)

This social re-adjustment for those involved in the work of schooling defines the reform process. “Self-management is the panopticon of modern educational organization” (Ball, 1994, p. 72) and power exerted through subtle means is control at a distance despite sentiments of engagement and professional collegiality.

The idealization and trumpeting of “new freedoms and possibilities of devolution and school-based management” (Ball, 1994, p.72) overplays distance and downplays control and steering. It occurs within a systemic nexus between “flexibility and constraint, autonomy and response” (Ball, 1994, p. 72). A devolved educational environment incorporating technologies of policy legitimization and regulation centralize the performativity of teacher pedagogic action. The “ideological co-optation of the moral and ethical consciousness” (Smyth, J., Dow, A., Hattam, R., Reid, A and Shacklock, G., 2000, p.86) of teachers where they are re-skilled and re-instructed to meet the demands of education consumers in a free-market re-focus classroom teaching practice. Market responsiveness as a guiding principle behind the performative classroom teacher practitioner signifies school based self-management.

Furthermore, the advanced neo-liberal “need for enhanced accountability” (Smyth, 2006, p.302) has occurred against a background of what Smyth (2006) terms “enduring myths” (p. 302), namely:

1. That we have a crisis in schools, attributable to schools, teachers, and teacher education.

2. That the way of fixing these alleged problems is by cutting schools and higher education institutions loose from a public education system and allowing them to be disciplined by 'market forces'.
3. Furthermore, that the way of improving 'quality' in education is by requiring close adherence to arbitrarily determined standards and targets, and ensuring compliance through forms of prescribed accountability.
4. That the language, rhetoric, models and modes of thought of the business sector are preferable and more appropriate to anything that can be developed by schools, students, teachers or teacher educators.
5. That the role of parents is that of judicious consumers exercising 'choice' of school that provides the best deal for them and their children, rather than active citizens interested in a system of education that is in the interests of everyone's children, not just those most adept at working the system. (Smyth, 2006, pp. 302-303)

Systemic conformity and methods of compliance bracketed and cushioned by accountability that is itself indicative of "a new industry, bureaucracy and language" (De Lissovoy and McLaren, 2003, p. 131) propels action. It "demands certain action be performed, while forcefully foreclosing on others" (Smyth, 2006, p. 304). The dilemmas that approaches of this kind provide are exacting and demanding. They marginalise and subordinate "educational and social justice values" (Ball, 2006, p. 92). Narrow and pragmatically restrained market focused actions predominate. Subsequently, suppression of any values laden debates and approaches is preferred thus elevating a "lexicon of expediency, pragmatics and financial necessity" (Ball, 2006, p. 92). Consequently, new kinds of teacher professionalism proceed and are advanced. Their specific localized frameworks intertwine career identification with school-based success and or failure. They also incorporate key features of economic characterisations largely of a prudentialist and enterprising kind, the new and transfigured post-Fordist expressions of educational engagement.

Indeed, the steady movement towards post-Fordist re-configurations of accumulation and production involve a re-intensification, or perhaps more specifically, re-investment in processes of valorisation. The implicit and key ingredient, incorporating a re-constituted attachment to a competitive skills base embedded within all sectors of the post-Fordist workforce is crucial. A vital aspect of a multi-skilled and highly flexible and productively adaptable post-Fordist worker cohort sustains the new economic transfiguration. In the maintenance of its generation is located an individual attachment to continuous pathways of education and training. It signifies a new 'spirit' epitomised through personal commitment to continuous and life-long training and learning. The aim here reflects the transient and impermanent nature of post-Fordist productive capacity and accumulation.

Classroom teaching practice and the outcomes of education have added significance in a new work order in which heightened levels of performative capacity dominate. The specific and measured evaluation of teacher effectiveness can be used to configure and determine effective instruction that meets the needs of a post-Fordist economy. This can be achieved at the system level leading to the identification of schools in terms of their academic performance relative to a system-sanctioned standard norm and or indicator. Schools that the education system deems 'under-performing' are specifically targeted and the specific evaluation of teaching practice becomes the subject of action. An important aim is the transformation of teaching practice through a concerted process of re-skilling. The major focus becomes actionable conduct performed and enacted on the classroom teacher in order to assist development of strategies of teaching practice that have been found to work in terms of enhancing individual student achievement.

(3) Transfigurations-The New Economy

The transfiguration of the old economy toward the new is characterised by a distinctive shift in Fordist production. The neo-liberal "expansion and metamorphosis of capitalism" (Bayart, 2007, p. 3) supercedes less functional modes of labour. The "replacement of Fordist types of work organization by less hierarchical modes of business management which emphasizes flexibility and the arrangement of production units in horizontal networks" (Bayart, 2007, p. 3) typifies the new shift. The old work order

typical of Fordist styles of labour and production including inescapable levels of “rigidity” (Harvey, 1990, p. 142) have declined. The new economy seeks to overcome Fordist rigidities. “Flexible accumulation” (Harvey, 1990, p. 147) best describes the present transfiguration in capital production.

It rests on flexibility with respect to labour processes, labour markets, products, and patterns of consumption. It is characterized by the emergence of entirely new sectors of production, new ways of providing financial services, new markets, and, above all, greatly intensified rates of commercial, technological, and organizational innovation. It has entrained rapid shifts in the patterning of uneven development, both between sectors and between geographical regions, giving rise, for example, to a vast surge in so-called ‘service sector’ employment as well as to entirely new industrial ensembles in hitherto underdeveloped regions. (Harvey, 1990, p. 147)

Operating in this post-Fordist world requires a new set of capacities and skills. Indeed, the competitive sustainability and competitive advantage of firms will rest on an employee’s training and ability to engage with the new economic and work order. Smaller work units will prevail incorporating a rationalisation and intensification of skill levels. Transferability of skill application embodied by functional utility is an aspect synonymous with the post-Fordist worker.

In order to achieve a seamless transition and transferability of skill levels, a change in knowledge is necessary. At its very core, a post-Fordist neo-liberal-hyper-economy utilises goods, services and knowledge. Economic activity is increasingly defined by a shift from “manufacturing and production of physical goods to information handling, knowledge accumulation, and production of knowledge goods” (Burton-Jones, 1999, p.12). The commodification of knowledge and its utilitarian and economic value re-defines capital production. The valorisation of individual productivity and efficiency rests on a capacity to integrate knowledge as an indispensable factor and ingredient of production. Computerisation incorporating information technology in all of its varied manifestations is central to this aspect of economic and industrial reform.

An important and key factor in this shift of production is education and the vital role of schools. New relationships between education and the economy in a changing society predominate and schools, including the type of pedagogical practice that they engage in, matters. A significant part of these new relationships is embodied in a rationalisation of knowledge, particularly for the post-compulsory school curriculum with now an emphasis on key and specific outcomes of knowledge. The movement towards a core curriculum for all students reflecting the “high and rising minimum threshold of knowledge and competence that is demanded by modern economies” (OECD, 1989, p.29) is important. It reflects post-Fordist shifts towards automation including the importance attached to knowledge generation as a crucial part of economic growth. There is clearly a human capital element to this aspect, one that fits a post-Fordist model of economic production. It responds to the rise of information technology as the new “basic” (OECD, 1989, p.32) in the school curriculum, notwithstanding the emphasis on making school education “more relevant to real-world labour market needs” (OECD, 1989, p.31).

The educational response to the alleged needs of a new economy and “new work order” (Smyth & Shacklock, 1998, p.78) characterised as the “new vocationalism”(see Smyth & Shacklock, 1998, p.78) highlights political and economic imperatives as major influences on education in contemporary times. Indeed, the regulatory needs of “fast capitalism” (see Smyth and Shacklock, 1998, p. 78) including the influence of an enterprise culture as “the new educational organiser” (Smyth & Shacklock, 1998, p.80), reconfigures individual productive capacity including the work of public school teachers. Moreover, the neo-liberal political and ideological regime of advanced production whose significance features prominently in re-constructed entrepreneurial productive engagement takes place within the “installation of neo-liberal forms of governance” (Davies & Bansel, 2007, p. 248), symptomatic of large scale global change.

Indeed, the advanced “neo-liberal theory of progress” (King and Kendall, 2004, p.143) has as an over-riding strategic locus, an economic characterisation that renders the State as less important than the ‘market’. Post-Fordist considerations of production that include heightened and elevated espousals of

economic competitiveness dominate. There is nothing inherently surprising in this development. A capitalist process of production must seek to re-create itself through innovation and creative endeavour (see Marx, 1990; Schumpeter, 1942). A process of economic globalization facilitates this mode of productive exchange. “Globalization intensifies competition which, in turn, stimulates innovation” (King and Kendall, 2004, p.144). This represents the post-Fordist connection between competitive intensifications, expressed through global exchanges and transactions of ‘fast capital’ and the urgent need for a renewed educational sentiment and settlement.

The economic and political configuration that the new educational settlement adopts also incorporates non-State based forms of governance. The new economic and political order that increasingly utilizes non-governmental means of representation, acts to control and confine. It is an order and form of governance that at its core has four distinctive characteristics and features. The first is an undoubted acceptance and reliance upon rationalist knowledge. The second is an emphasis on capitalist modes of production that in turn is dependent upon post-Fordist automated technology. Lastly, this means of production is largely managed through bureaucratic forms of governance (see King and Kendall, 2004, p.153).

Implicit in the contemporary post-Fordist structure of governance is transition.

Globalisation foregrounds education in specific ways that attempt to harness education systems to the rapid and competitive growth and transmission of technologies and knowledge linked to the national competitiveness of nations within the global economy. (Ozga and Lingard, 2007, p.70)

Governance becomes a question of transition, the emphasis of which is situated in methods of preparation for post-Fordist mechanisms of production. Indeed, the transformative structure of global capital including the necessary facilitation of one mode of production (Fordist) to another (post-Fordist), becomes the “object of transformation” (Balibar, 2009, p.307), and thus the accepted norm. Schools and classroom teachers form a tangible conduit and reference point for economically enacted change. Their exposure to transformative economic processes limits their functions towards the competitive needs of economic exchange. Under these conditions, teaching practice warrants particular attention for it is teachers and their specific classroom contributions that have added significance. The unique form of post-Fordist governance that globalisation can provide legitimizes active external regulatory interference steering education and what may constitute effective teaching practice in specific economic and vocational directions.

(4) Globalization

The individualization of pedagogical practice and action, and thus, the constructed and problematised account of effective teaching, is a planned scheme. Its derivation, if one accepts the formation of social inequality and exclusion through political and economic domination, is not necessarily located in relations of exploitation. Put simply, its contrived conceptualisation as a mechanised prospectus of surveillance and control is situated in post-Fordist and neo-liberal modes of corporate managerial existence as a form of governance. This in itself could be read as a form of exploitation, but is better cast generally in terms of “certain social arrangements” (Lea, 2009, p. 2) representative of the corporation now spread into all modes of employment, thus reflecting the pervasive “modern corporate structure” (Lea, 2009, p.2).

Indeed, it is this very notion of pervasiveness and immersion in a corporate dynamic of control and efficacy, generally symptomatic of unfettered and unrestrained modernity-globalization-that constitutes comparative and evaluative systems of performance and appraisal. This is not to suggest that globalization and all that this term entails reflects in itself a system, but it is to acknowledge that “we have been faced with a change of scale” (Bayart, 2007, p.6), one that is manifestly scientific (technological) and entwined within the economic and political.

Many factors have created a sense of the world’s unity both in people’s minds and as an objective configuration. Among these factors are new technologies, the development of the mass media and

transport, the extension of the market economy as a legitimate problematic (if not as a way of producing effective solutions), various ecological catastrophes, especially Chernobyl, the collapse of the Soviet Union, and the unprecedented fragility of the American territorial sanctuary. (Bayart, 2007, p.7)

Yet, to isolate and bestow singular causal factors upon such a transformative and episodic period of human history is to trivialise the event. Nevertheless, one can seek to map and outline its defining features. Marginson (1999), for example, considers the six aspects of globalization to be bounded by:

- Finance and trade;
- Communications and information technologies;
- International movements of peoples;
- The formation of global societies;
- Linguistic, cultural and ideological convergence; and
- World systems of signs and images. (p.21)

Each of these inter-related aspects as world systems “have a life of their own” (Marginson, 1999, p.20), and can and usually do “affect every part of the world, including educational institutions and programmes, and the subjectivities formed in education” (Marginson, 1999, p.20).

A primary consideration then in a new world of changing circumstances is the functionary capacity of a state in terms of its authority and control-governance. The political project of globalisation becomes a question of method. The problematics of systemic control in order to establish “governance without government” (Rosenau as cited in Dale, 1999, p.4), stems from and is linked to an expressed managerial function of rule. The genesis of comparative systems of evaluation is the result for public school teachers.

This is to be expected. The central and core mechanism of compliance that is established as an individual commitment to intensified modes of productive capacity requires devotion. It also needs and surreptitiously requests heightened expressions of individual motivation. This particular aspect may be viewed by some as new and hard-fought for expressions of rights and freedoms, previously restricted within workplaces, and especially in most schools. Indeed, neo-liberal interpretations of the new order are generally cast in terms of the removal and excision of bounded work-place regularities dismissive of employee input. An important example includes employee input into major decision-making at the level of the firm or school. Nevertheless, the post-Fordist work order implies and engenders control through the expected and functional capacities enacted by an adherence to system sanctioned norms and imperatives.

In addition, in rejecting totally positivist and ideologically empiricist conceptions of classroom teacher effectiveness, the very structure of narrow and technicist evaluations of teacher performance are also rejected. Indeed, by introducing mathematically organised schematisations of teacher evaluation, based in the main upon the learning outcomes of public school students, major and particular regions of the educational ‘space’-curriculum, context (school, classroom, peer effects, and so on) are not adequately considered. This type of epistemological reduction rather than producing vivid and accurate accounts of correlations between effective teaching practice and student learning, elevates absence and omission as part of the research and process of inquiry.

Indeed, the educational process in post-Fordist times becomes an activity whose major aim is the production of “use-values” (Althusser, 2009, p.188). The particular appropriation, generally in the form of a core and common set of curriculum options, tied to systemic assessment requirements, is therefore a vital component of pedagogic work. Pedagogical practice and the work of schooling is then the source of a nation’s economic prosperity by virtue of the preparation needed in skilling ‘on-demand’ sources of labour. School-based vocational education and training (VET) and recent proposed changes (The Bradley Review) to the higher education sector within Australia are a case in point.

A theoretical conception of classroom teacher effectiveness defined by the administrative constraints imposed by neo-liberal forms of governance warrants a total exploration of the experimental method favoured by its introduction. Globalization, one of whose characterisations is an intensified

attachment to altered pathways of economic exchange, confronts political control. Consequently, and perhaps not surprisingly, the political and administrative (bureaucratic) control through a distinctive and easy application of performative evaluation is chosen. The “absolute immanence” (Althusser, 2009, p.145) that specific positivist forms of scientificity and classroom teacher effectiveness research that prevails, releases a conceptualised view of the classroom that is ideological in character. The “Absolute Knowledge” (Althusser, 2009, p.146) that specific superstructural scientific approaches of effective teaching practice that dominate as a consequence of forms of governance that are enacted within globalised forces of economic exchange represent an obvious manifestation of power and subjectivity.

Subsequently, the performative quality of public school teachers becomes a focus for “widespread policy debate” (Connell, 2009, p.213). A vital aspect of the debate is a sought for policy articulation of what constitutes good and effective teaching. Indeed, as Connell (2009) puts it “What is meant by a ‘good teacher’ has thus become a significant practical question” (p.214). This in itself poses problematizations. The object of knowledge, which in this case is an empiricist determination and articulation of good teaching practice, through highly metricated systems of evaluation based on scientometric models of ‘effective teaching practice’ and pedagogical action, develops as a real phenomenon autonomous of contextual modalities. Representative of this “collapse into empiricist ideology” (Althusser, 2009, p.148), is the steady intrusion of a “politico-economic praxis” (Althusser, 2009, p.149) unmoved by any mediated sense of historical existence and attachment to an organic lived experience of the social. The reduction and subsequent identification through at its most extreme, the negation of difference, fulfils and mirrors the neo-liberal agenda of change.

A positivist science of classroom teacher effectiveness concerned with and sure of the “obviousness of facts” (Althusser, 2009, p.175) revokes the very objectivity it claims to espouse. A science whose primary goal is certain knowledge of effective teaching practice including determination of specific pedagogical laws that constitute that practice, incorporates the empiricist-positivist neo-liberal public education policy-making agenda. The aim sought is the evaluation of teacher effectiveness and performance. This in itself is theoretically based on a post-Fordist conception of productive capacity. It depends on a naïve characterisation of pedagogical practice that is essentially skills driven.

Conclusion

This paper has discussed the significant and defining aspects of change that characterize modern capitalist existence. These aspects reside predominantly in political and economic configurations centred specifically on the management of productive capacity for the control and maintenance of modern economies. Education, including schools and classroom teachers become important components in forcing the necessary economic adjustments required to maintain competitive advantage. Classroom teaching practice must be measured and constantly monitored so that it responds to and improves the skill level and academic achievement of individual students.

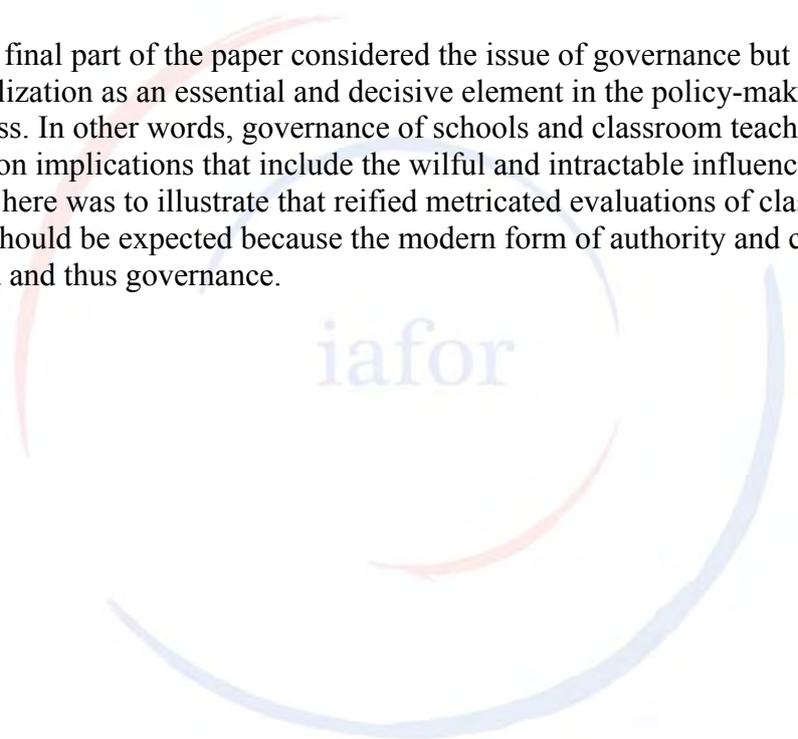

The paper has four distinctive parts. Part one discussed in broad outline, the large scale economic change evident in modern and contemporary societies. It featured, in a historical sense and perspective the role of capitalist production and accumulation in ushering in change. An important feature of this part of the paper is the necessary focus on the crucial need for continued adherence to methods of productive capacity that engender change, but also inevitably result in significant disruptions and transformations of existence; social, economic and political. It was argued in this part of the paper that education as the preferred treatment is central to the continued maintenance and accommodation of, in the main, economic change. This of-course has its consequences, and schools are also affected.

Consequently, the second part of the paper considered the political imperative as it is expressed in contemporary society. The ‘advanced’ or neo-liberal political plan and programme is dominant in schools. The major function of this political platform is the re-organisation and re-constitution of the work of schooling through a re-arrangement of pedagogical action and practice. The public school classroom teacher practitioner is the focal point upon which this altered means of action is to be instituted and enacted. In order to achieve major alterations of schooling and teaching practice, the

advanced neo-liberal political project generates new approaches that specifically relate to measurement of individual classroom teacher performance and evaluation. It does this through a broader political condition that is manifestly centred on and leads to withdrawal of pre-established and agreed to social and economic commitments and practices, that incidentally also possessed a historical connection-the Keynesian economic framework as an obvious example.

The third part of the paper dealt specifically with aspects of the new economic transfigurations that feature prominently in contemporary society. This part of the paper considered the post-Fordist shift in productive capacity and exchange. The replacement of Fordist work practices with post-Fordist approaches requires new skills and capacities that individuals need to acquire in order to function productively in a hyper-capitalist economy. Indeed, the continued economic prosperity of nations rests upon the productive capacity of its workforce and education has a vital role and part in its maintenance. For this reason, the interconnection between the economy and education produces and provokes heightened expressions of individual attachment to productivity and performance. This contributes to and culminates in summative evaluations of performance, both individual and systemic. As a result of this particular development, forms of governance and control are initiated that result in and reveal the foregrounding of education as an important and specific link to the market economy.

The final part of the paper considered the issue of governance but in terms that deal with the notion of globalization as an essential and decisive element in the policy-making debate on classroom teacher effectiveness. In other words, governance of schools and classroom teachers is symptomatic of broader globalization implications that include the wilful and intractable influence of a corporate dynamic. The aim here was to illustrate that reified metricated evaluations of classroom instruction devoid of context should be expected because the modern form of authority and control is in short a question of method and thus governance.

Abstract

In order for a global society to garner the commitment of all its member countries towards the issue of reduction of CO₂ emission, social change (i.e. change in people's beliefs, behaviours, or attitudes) needs to take place in these countries. This paper examines a case study of Thailand on environmental education through the medium of TV to consider how the mass media can contribute to social change as a part of information campaigns on global warming. The data were collected to investigate the correlation between media exposure, awareness, and behaviour through a combination of a focus group study of teenagers, a questionnaire survey at selected schools (size of respondents: 2,500), and in-depth interviews with environment and communication experts, and analysed quantitatively and qualitatively. The result shows that TV is a major information source for Thai youths, though exposure to media messages on global warming is limited due to a gap between the campaign's media strategy and the youths' preference. Meanwhile, the respondents' average awareness level of the issue remains somewhat low, and their lifestyle has not shifted to be more so-called 'eco-friendly' in response to the information they had received on global warming. The analysis has found no clear correlation among those variables. From those findings identifying the problems riddling the current campaign, this study suggests three recommendations regarding mass media usage in social information campaigns on environmental issues; that is appropriate selection of channels and broadcasting time, introduction of the entertainment-education strategy, and adequate messages in accordance with the progress of the campaign.

1. Introduction

Environmental commitment has globally gained recognition as a pressing issue today. Our global community has been facing climate change for decades—a crucial problem resulting from global warming. The Earth Summit held in Rio de Janeiro in 1992 and the fifteen successive annual meetings held by the Conference of Parties (COP) from 1995 to 2009 under the leadership of the United Nations have provided a platform for international dialogue on the topic of environmental commitment. Moreover, researches carried out on climate change and global warming over the last decades have facilitated the accumulation or compilation of knowledge on the said issue. In the Kyoto Protocol—adopted at the COP3 held in Kyoto in 1997 to urge countries to take action towards controlling global warming by presenting a specific emission reduction target—six types of greenhouse gases were isolated as factors of global warming. The list comprising these gases included carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), perfluorocarbons (PFCs), hydrofluorocarbons (HFCs), and sulphur hexafluoride (SF₆). Carbon dioxide was named as the ‘workable’ gas—or the gas whose emission could be curtailed—among all the aforementioned gases, and it was thus decided that reducing the emission of this gas was crucial towards avoiding the further deterioration of the global warming situation (United Nations 1998; UNFCCC 2008).

Nonetheless, attempting to reduce carbon dioxide emission is a big challenge for us human beings. This is because a large number of human activities lead to the production of the gas. Fossil fuels (including coal, oil, and natural gas) are burned towards the production of energy for carrying out necessary human activities, resulting in an increase in atmospheric carbon dioxide concentration. From this fact, it follows that a society seeking economic and social development would cause the emission of an even greater amount of carbon dioxide, thus worsening the environmental problem. Going by the number of carbon dioxide producing activities carried out in them, developed countries appear to be more responsible for carbon dioxide emission than developing countries. However, this does not mean that smaller economies need not work towards the reduction of CO₂ emission. In fact, they are saddled with a much harder task: they are expected to construct a new methodology satisfying the requisites of both socio-economic development as well as environmental commitment.

In order for a global society to garner the commitment of all its member countries towards the issue of reduction of carbon dioxide emission, social change (i.e. change in people’s beliefs, behaviours, or attitudes), along with the development of a new policy and new technologies, needs to take place in these countries. One of the strategic techniques towards facilitating social change is the undertaking of information campaigns. As communication researchers, the authors focus on the aspect of information campaigns and gain an understanding of the status quo global warming campaign implementations particularly in smaller economies as the fundamental knowledge—a starting point for better campaign planning. This paper examines a case study of Thailand on environmental

education through the medium of TV to consider how information campaigns on global warming can be practiced effectively through the mass media.

2. Information Campaigns

Information campaigns are a designed communication strategy disseminating pro-social information towards changing individuals' beliefs, attitudes, or behaviours, and eventually fostering a social change. Since the inception of marketing studies (e.g. Kotler and Zaltman 1971), the basic campaign design has become more refined. Applying the 4Ps of marketing, a pro-social information campaign carefully decides the message that is to be delivered (product), the means and location of providing the necessary services (place), the cost (including mental cost of changing beliefs, attitudes, and behaviour) (price), and the media which should be used to effectively deliver the message (promotion).

Without such consideration and planning, it is observed that a pro-social message does not normally permeate society even though the thing it advocates is 'good', 'easy to access', or 'affordable'. Rice and Atkin (2002) assert that the message should be designed on the basis of the needs, norms, and culture of the target population. As Rogers (1995) identified from his diffusion research, new ideas and products ('innovations' in Rogers' terminology) which are well-diffused have five characteristics. These include relative advantage, compatibility, less complexity, tryability, and observability. In particular, the compatibility of new ideas with people's existing values, beliefs, norms and culture, or needs is of great importance because human beings have selective attention and memory: their existing values, beliefs, norms or culture, or interests stemming from needs work as a filter and opposing or irrelevant new ideas are often ignored or forgotten.

At the promotion stage of pro-social messages, such as the one advocating the reduction of carbon dioxide emission, the use of two types of communication—mass media and interpersonal communication—should be considered. Both have advantages and disadvantages, but when used in conjunction or to supplement each other, the effectiveness of each is enhanced. The mass media deliver messages to a wider population at once and generate and direct public opinion (e.g. McCombs and Shaw's (1972) agenda-setting theory; Noell-Neuman's (1984) spiral of silence). On the other hand, interpersonal communication—particularly with opinion leaders—proves more effective vis-à-vis the decision-making process. In other words, the mass media can play a big part in making people aware of social issues while a personal communication network can work to persuade them towards changing their behaviour. Although beliefs, behaviours, and attitudes can be changed through either media messages or personal persuasion, this is more likely to happen when the mass media can generate a new environment which is more compatible with the message sought to be spread and personal communication prevails on people to adopt it.

3. A Case Study of Thailand

Thailand has been displaying steady economic development over the last few decades, achieving the world's 34th highest GDP in 2008 (World Bank 2009). In the Human Development Report (UNDP 2009), the country is grouped with those displaying a medium degree of development although its HDR index has shown an improvement since 1980s. Such social conditions have led to a change in the lifestyle of the Thai people, resulting in a higher percentage of carbon dioxide being produced in the country. For instance, the Thai people's consumption of electricity has been increasing by 6–8 percent every year, and in 2008, it reached a high of 22,000 megawatts—the equivalent of 322 million tons of carbon dioxide gas being emitted. By the year 2012, Thailand's annual gas emission is estimated to go up to 418 million tons (Electricity Generating Authority of Thailand 2009).

The above figures gain significance in the light of the fact that the Thai economy is agriculture-based, thus making it vulnerable to climate change. Water is considered to be one the key resources for Thailand's development; however, the country faces problems like water shortage and drought due to the climate changes caused by global warming. The rise in temperature causes changes in the country's rainfall pattern by negatively impacting the amount of rainfall it normally receives. The decrease in rainfall adversely affects farm produce such as corn, sugarcane, and rice and thus results in either a decrease in the annual harvest, the poor growth of farm produce, or disease outbreaks. The above naturally indicates that if the cycle of temperature rise and drought were to continue unabated, it would jeopardise the economy of Thailand. These severe effects of global warming on the country's economy automatically put Thailand in the high-risk group of countries affected by the phenomenon. All of the above facts point to the necessity of changing the Thai people's view on global warming, as also of changing their life-styles towards inculcating more eco-friendly habits for effecting a positive difference in the global warming scenario.

Some social campaigns on environmental issues have been already conducted in Thailand, and research has established that there is a certain correlation between people's exposure to media messages and their awareness regarding the issues. Penpinan (2001) studied the relation between media exposure, knowledge, awareness, attitude, and participation in environmental preservation in Thailand's Samut Prakarn area to confirm that there is a positive correlation between media exposure and knowledge as well as awareness on the given issue. Vorawansetha's (2003) study on the sea turtle preservation campaign in Chonburi area also revealed the existence of a strong correlation between the levels of media exposure and awareness. Similar results were found with regard to other social issues, such as HIV/AIDS prevention (Boonnamma 1998) and anti-corruption (Kochakorn 2001). Other researches have confirmed the relation between media exposure, attitude, and behavioural change, such as Nghanakao's (2000) study on pedestrians' compliance with traffic rules and Wangchaigchai's (2003) study on energy saving campaign.

However, there are some studies which are unable to prove the hypothesis that the knowledge of issues leads to behavioural change. For instance, the aforementioned Penpinan's study found that knowledge of an issue is in no way related to participation in its campaign-promoted activity.

Still, as studies of past campaigns in Thailand largely point to a tendency of linking media exposure, attitudes, and behaviour, the hypothetical scenario for this study is that there is a correlation between people's exposure to media messages dealing with global warming and their awareness of the problem as well as between people's awareness of the issue and their actual lifestyle.

4. Research on Thai Youth and Environment Education through TV

4.1 Data

In order to obtain data towards fulfilling the aim of this research, this study combined the research techniques of a focus group study, a questionnaire survey, and in-depth interviews. The focus group study was conducted to gather information towards framing a questionnaire. Eight Thai youths aged between 13 to 15 years were randomly selected. The questions to be posed to the focus group were formulated on the basis of a literature review on youth lifestyle and the effect of global warming on the world; however, the review was conducted in an unstructured manner.

The questionnaire survey was conducted at the middle schools located in all the five regions of Thailand. Using multistage cluster sampling, 2,500 students aged between 13 to 15 years were selected. Of these respondents, 32.2% were boys and 67.8% were girls. Those aged 13 comprised 29.1%, those aged 14 comprised 36.0%, and those aged 15 comprised 35.8% of the respondents. The questionnaire, framed on the basis of the results obtained from the focus group, consisted of 7 parts and 122 questions.

In-depth interviews were conducted to obtain supplementary data which would help to determine solutions for the problems identified through the questionnaire survey. The interviews were conducted with eight experts—two lecturers of mass communication, two scientists, one NGO staff member, one environmental news TV reporter, and two TV documentary producers. Although the interviews were unstructured, they were within the scope of the agenda setting theory pertaining to the mass media.

The data obtained through the questionnaire survey was quantitatively analysed while that obtained from the focus group study and in-depth interviews was analysed qualitatively. The quantitative data was divided into two groups—urban (Bangkok) and rural (other areas)—for a comparative analysis.

4.2 Findings

4.2.1 *Exposure to the Media Message*

The respondents were quizzed on their sources of information on the phenomenon of global warming so as to determine the Thai youths' pattern of media exposure. The result of this survey is summarised in Table 1. The most popular source of information on global warming was found to be TV (81.2%), followed by a great margin by teachers (5.1%), the Internet (3.2%), and the radio (3.1%). In contrast, the government agency—the original source of the majority of the information regarding global warming—was not recognised as a source of the same by those surveyed. This suggests that TV is the major source of information on global warming for Thai youths.

If we compare the results of the surveys conducted on urban and rural respondents, we will find slight differences with regard to the print media, personal media, and participatory media as sources of information on the issue of global warming. 4.9% of urban youths were exposed to the message of global warming through newspapers and magazines while 2.2% of rural youths were exposed to the said message through these sources. A similar trend is seen in the case of personal communication with others such as friends and parents. In total, 3.9% of urban youths and 2.4% of rural youths had selected this media category as an information source. On the other hand, rural youths depended more on the radio and Internet than did the respondents living in Bangkok (6.7% and 2.9%, respectively). The results of this comparison clarify that youths in Bangkok have access to various sources of information on global warming while those in rural areas strongly depend on broadcast and electric media for the same.

Table 1: Source of Global Warming Information for Thai Youths

	Bangkok		Rural Areas		Total	
	counts	%	counts	%	counts	%
TV	166	80.6	1,767	81.2	1,933	81.2
Radio	4	1.9	70	3.2	74	3.1
Movie	3	1.5	17	0.8	20	0.8
Internet	2	1.0	75	3.5	77	3.2
Newspaper and Magazines	10	4.9	48	2.2	58	2.4
Billboards	2	1.0	14	0.6	16	0.7
Teacher	10	4.9	112	5.2	122	5.1
Parents	6	2.9	35	1.6	41	1.7
Movie stars	1	0.5	18	0.8	19	0.8
Government office	-	-	3	0.1	3	0.1
Friend	2	1.0	17	0.8	19	0.8
Total	206		2,176		2,382	

However, when one looks into the details of the survey, it becomes evident that the level of the respondents' exposure to TV messages regarding global warming is rather poor. In Thailand, most of the TV programmes dealing with global warming are made in the documentary format, and thus hold no interest for teenagers. On happening to chance upon a channel broadcasting such a documentary, they would in all probability switch to another entertainment-oriented channel, such as Channel 7. As a result, they have no information on the type of programmes containing messages relevant to the global warming issue nor do they have enough information on the issue.

Teenagers appear to avoid watching documentaries because they feel that owing to the format's serious nature, they are too 'hard' to watch. However, the respondents of the survey mentioned that they might watch documentaries on global warming if they featured their favourite celebrities. The celebrities which they listed included pop singers, actors, and sports players. Another reason the respondents cited for their not watching the documentaries was the time at which they were usually broadcast—a time when teenagers usually do not watch TV—which was in sharp contrast to the time when entertainment programmes were broadcast.

4.2.2 Awareness on Global Warming

Statements describing various aspects of global warming were presented to the respondents and they were asked to respond with either ‘true’, ‘false’, or ‘I don’t know’ to the statements. This was done in order to gauge the respondents’ awareness of the issue. The statements that elicited maximum correct answers by the respondents, as represented in Table 2, are given below:

- Deforestation can cause a global flood in the future (92.6%);
- The unprecedented warm weather is a result of litter burning (90.4%); and
- Deforestation exacerbates flood during the rainy season (80.1%).

Table 2 Awareness of Thai Youths on Global Warming Issue

(%; within bracket =n)

Knowledge	Correctly Answered	Mis-understood	Don’t-know
Deforestation can cause a global flood in the future	92.6 (2,315)	2.8 (70)	4.6 (115)
The unprecedented warm weather is a result of litter burning	90.4 (2,260)	5.1 (127)	4.5 (113)
Deforestation exacerbates flood during the rainy season	80.1 (2,002)	6.2 (155)	13.7 (343)
Animal farming contributes to a warmer climate each year	25.4 (634)	28.9 (722)	45.8 (1,144)
Wasting fuel is a factor which contributes to shorter winters in Thailand	29.4 (735)	20.1 (503)	50.5 (1,262)

On the other hand, the descriptions which a larger number of respondents misunderstood or answered with ‘I don’t know’ were:

-Animal farming contributes to a warmer climate each year (misunderstood: 28.9%; ‘I don’t know’: 45.8%); and

- Wasting fuel is a factor which contributes to shorter winters in Thailand (misunderstood: 20.1%; ‘I don’t know’: 50.5%).

This result shows that teenagers understand simple, or rather, direct cause-effect associable relations such as deforestation and flood or heat and burning while they cannot associate animal farming or fuel wastage with global warming due to the indirectness of the associations. When comparing urban and rural youths, no significant difference is found between the two groups (see Table 3); instead they display a similar distribution pattern. On the whole, therefore, the teenagers’ average awareness level remains somewhat low—at the 60-plus-percent range—regardless of area of living.

4.2.3 Lifestyle Potentially Relevant to Global Warming

In the survey, teenagers were asked about their lifestyle potentially relevant to global warming in order to determine the manner in which they internalise the issue on a daily basis. As no significant difference was found between the urban and rural groups, the result is presented at large. Only one per cent of respondents were found to have changed their lifestyle in response to the information they had received on global warming so as to be more so-called ‘eco-friendly’ while the others were continuing to follow their old lifestyle.

One reason which the some respondents cited for not changing their lifestyle was their perceived lack of obligation with respect to saving water or electricity at school because they (i.e. their parents) paid tuition fees. These students felt that by paying the tuition fees, they had paid for the expenses incurred from their water and electricity usage as well. Other students blamed the social system—which they felt they could do nothing to change—as one of the reasons for upholding their lifestyle. They understood that burning garbage or throwing it into rivers causes environmental damage, but felt that teenagers could do little to stop these practices without administrative support. A voice from the focus group expressed the

Table 3 Comparison of Awareness by Area of Living

Area	n		S.D	t
Urban (Bangkok)	218	7.64	3.50	-1.53
Rural	2,272	7.99	3.21	

following sentiment: ‘we know that the disposing of litter by burning it is not a good idea, but we have no choice but to do so’.

4.2.4 Correlation between Exposure, Awareness, and Lifestyle

The correlation between exposure to media messages on global warming and awareness of the issue was analysed in order to examine our hypothesis. The coefficient of correlation was found to be 0.07 at the significant level of 1%, which means that there was no clear correlation between the two variables. Thus, the first part of the hypothesis could not be supported. This result hold good for both urban and rural cases.

Meanwhile, the coefficient of correlation between awareness and lifestyle was found to be 0.165 at the significant level of 1%. Again, this result showed no clear correlation between the two given variables, resulting in the second part of the hypothesis not being supported fully. The survey result, therefore, failed to confirm the relationship between exposure, awareness, and lifestyle.

5. Discussion

5.1 Problems in Media Messages

From the survey results represented in the previous section, we have been able to identify certain problems as regards media exposure, awareness, and lifestyle in connection with the issue of global warming. At the media exposure stage, the most crucial problem that came to the fore in our survey was that in Thailand, there is a gap between the campaign's media strategy and the youths' preference. At present, messages on global warming reach the public through TV documentaries: a format which youths are not familiar with; which are broadcast on a channel they do not often select to watch; and which are relayed at a time they do not usually watch TV. Clearly, the media's selection and message style do not match the youths' preferences.

Although Thai teenagers depend mainly on TV to obtain information on global warming, their frequent avoidance of documentary programmes dilutes the effect of their exposure to the message conveyed through them. They are selectively exposed to media messages and as a result, their understanding of the global warming issue is likely to remain at an unsatisfactory level. As exposure to the message sought to be conveyed is the starting point of all social information campaigns, the survey result suggests that global warming control campaigns in Thailand face the abovementioned challenge.

In order to overcome this challenge, employing the entertainment-education (E-E) strategy would perhaps prove effective. The E-E strategy is a communication strategy which works to foster social change by disseminating designed messages through entertainment products, such as TV/radio dramas, songs, and theatre plays (Singhal and Rogers 2001). That is, the E-E strategy is employed to provide people with information on certain issues while entertaining them at the same time. This strategy has been used all over the world with the aim of facilitating the success of information campaigns. The suggestion of some of the survey respondents of using celebrities in documentaries points to the need for E-E programmes.

Broadcasting hours and channels are also important factors in determining the extent of media exposure. Selecting the right (i.e. popular) channels as well as right broadcast timing increases the target group's level of exposure. In the case of Thai youths, TV channel 7 should be included as a message provider. It is also important to allocate programmes around prime time, although as environmental TV news reporter J. Bansang points out, environmental content faces difficulty in securing good broadcasting hours. He puts across his thoughts on the subject in the following words:

[E]nvironmental content is not profitable. It simply does not sell. So, environmental programmes are akin to trophies for TV stations, not money. As news coverage translates into money, naturally the 'trophy' programmes get less time... Also, experts believe that only news related to the economy,

politics, crimes, or something sensational makes for interesting news. Not environmental issues. Environmental news generally develops slowly, while other kind of news—for instance, political news—develops on daily basis. Whoever talks, it becomes news. So does crime. But as environment changes take place slowly, environment-related news develops slowly as well (in-depth interview, October 13, 2008).

The above viewpoint coincides with Maslow's hierarchy of needs (1954). Human beings are inclined to be interested in their basic or immediate needs rather than their future needs. Although environmental issues are by and large considered important, many people—even TV experts—feel that that the negative impact of these issues will affect them in the distant future and they thus do not accord the issues immediate attention. The thing which needs to be done in order to bring about a shift in their attitude is to impress upon them the need to address environmental issues on an immediate basis.

5.2 Problems Related to the Level of Awareness

As regards the problems related to awareness about global warming, the result of the survey makes it clear that not many teenagers are aware of some indirect factors resulting in global warming, although 'global warming' as an issue is widely known. This result suggests that the mass media's function of agenda-setting is working adequately: today, the young generation of Thais have realised that global warming is an important issue which they need to consider. However, the fact that teenagers' awareness remains at a relatively shallow level indicates a failure of the message design to stimulate their interest (or their desire for further information) and a lack of message strategy corresponding to the stage of change.

The failure to stimulate teenagers' interest is considered to stem from their selective media exposure. Thai youths stop receiving information on global warming at the initial level itself because it appears as 'hard', 'serious', or 'heavy'. If their initial exposure to the media message results in such an impression, it is bound to discourage them from gaining further knowledge on the issue.

Even though their initial exposure to the message results in kindling people's interest in the issue, people's awareness regarding the same will not progress unless another problem, which is detailed below, is solved. In general, the information which people need changes in accordance with the progress of the information campaigns. The level of understanding also varies from individual to individual. The campaigns are expected to provide appropriate information accordingly (Kotler and Lee 2008). In Thailand, however, the mass media have not been successful in delivering advanced messages with regard to global warming because they have not explored the various different avenues of spreading awareness on the issue and have exclusively relied on documentary programmes for the same. Therefore, many students have no knowledge of the causes of global warming or its consequences. As A.

Wongjareon—an NGO staff member—has pointed out in his interview, the campaign message which is widely shared is too simple, merely stating that ‘litter burning causes global warming’ or similar, with no information being offered to the public about why a certain action leads to global warming (in-depth interview, April 13, 2009).

5.3 Problems in Changing Lifestyle

During the course of this study, nowhere did we observe that people had undertaken a lifestyle shift to adopt a more environmentally conscious one. The problem here is not the fact that the shift has not occurred; rather, the causative factor seems to be the lack of internalisation of the global warming issue as well as the absence of a supportive social system.

The cases of respondents who had not changed their ways so as to curtail their use of water and electricity at school suggest that their grasp of global warming shares no link with their individual lifestyle. If they approach the issue of global warming as a matter of personal responsibility and internalise the implications resulting from it, they might extend the scope of their understanding of the issue to consider that their saving water and electricity would not only help their school but simultaneously help in reducing global warming. It may take time to diffuse new values and behaviour through a society, as Rogers (1995) acknowledges; however, it can never be effected without establishing a linkage between a social message and individual life (and its consequences in a global society). To teenagers, environmental problems might appear massive and beyond the scope of an individual’s responsibility, leading them to ignore them and never be motivated to take any action towards solving them. A comment from a respondent reflects this attitude:

A majority of my friends believe that climate change is a severe problem. However, they think that they will not live long enough to see its effects. They don’t think they can afford to help either (focus group of aged 13-15 years, 2008).

The latter point also prevents people from taking action to prevent global warming. The lifestyle of Thai youths as well as the majority of the Thai people is one which relies on traditional habitude owing to the fact that there is neither a systematic and well-planned approach towards environment preservation nor a context which encourages it. The respondents point out the need of a garbage disposal facility. One of the interviewees describes the situation as follows:

It is a difficult task to change certain aspects of people’s lifestyle, like the burning of litter. In some provinces, litter burning is prohibited in the city area and near the motorways, but the motivating factor behind this prohibition is the prevention of accidents, not global warming. ...local residents still continue to burn litter. Although the city area has a council bin service, we don’t see any local councils or government agencies encouraging a waste

separation process. The situation is even worse for residents living in remote areas. Waste is not collected by the council service, which means local residents will burn it whatever it the refuse may comprise: tire or plastic bag (Wongjareon, in-depth interview, April 13, 2009).

Establishing facilities and systematic support systems does not come under the ambit of the media's roles, although the media can address the institutions which have been established for combating the issue at hand, or at the very least, motivate the public towards addressing the institutions. In the case of Thailand, the mass media does not seem to have generated a certain climate of opinion as yet.

5.4 Conclusive Comment

The problems discussed above should by themselves serve as reasons why our hypothesis has not been supported through the results of our survey. We can summarise the reasons as such: the selective exposure of the public to the media messages leads to a shallow level of awareness, which in turn causes a lack of internalisation of the issue (see Figure 1). If and when these problems are resolved, the campaign on global warming control in Thailand would show a different level of development.

This paper has focused on the impact of media exposure, awareness, and the lifestyle of teenagers on Thailand's information campaign concerning the global warming issue. Although the result could identify the problems riddling the current campaign, further research will be required in order to get a full picture of the campaign as there are other variables which should be included in the analysis.

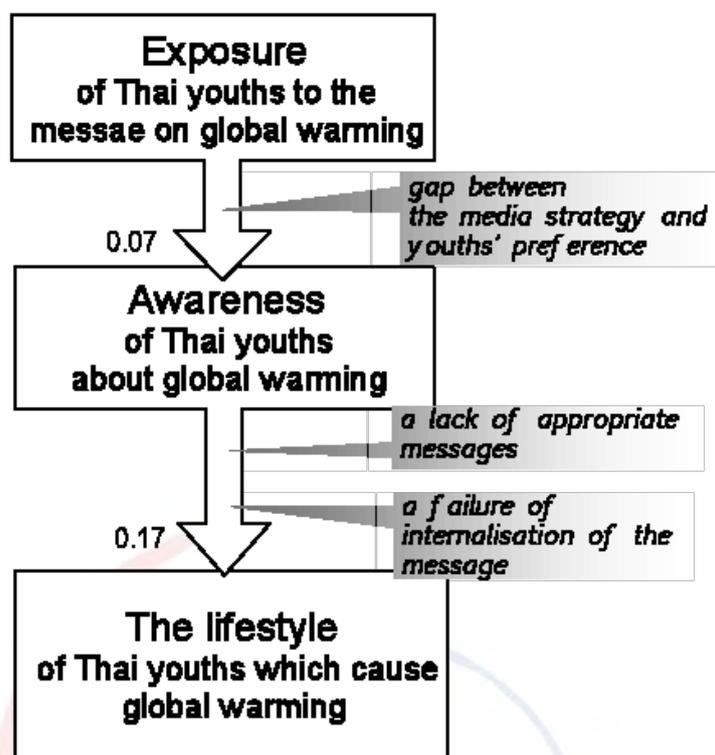

Figure 1: The examination result of hypothesis of this study.

6. Recommendations

As the campaign is still ongoing, this study would like to suggest—on the basis of its findings—some recommendations regarding mass media usage as a part of social information campaigns on environmental issues:

- (1) Appropriate TV channels and broadcasting hours should be selected. Since it is of great importance that the mass media deliver messages on environmental issues to a wider population, including the younger generation, it is recommended that for doing so, they make wider use of the TV channels which the survey result identified as teenagers' preferred choices. They should also consider allocating the prime time slot to informative programmes, or at least try to incorporate messages on global warming into other popular TV programmes and media, including the Internet, so that teenagers' exposure to the message would increase.
- (2) The entertainment-education (E-E) strategy should be introduced to improve the media exposure rate of the message. This research has identified the readiness of teenagers to watch E-E programmes. In fact, not only can such messages be relayed through TV or radio programmes, they can also be incorporated into music and

related promotion videos. While it is admittedly not an easy task to develop the content of E-E programmes so as to satisfy teenagers, it is not impossible either and can be achieved by conducting a detailed research on teenagers. Some cases may run the risk of the Archie Bunker effect (i.e. negative role models being regarded as 'cool'), but on the positive side, awareness on the issue would go up by implementing the E-E strategy.

- (3) Messages should be designed in accordance with the progress stage of the campaign. It is preferable that the media provide the information through a simple, short, and clear message. However, people do not maintain the same level of understanding and awareness as the campaign progresses. The message should be modified to provide new information in accordance with people's interest. Considering the use of websites or magazines to enhance the audience's understanding of the message and providing the needed information would be worthwhile.

Of course, for any campaign to succeed, other parts—such as the social system and education—need to be improved as well. Still, the mass media can prove to be a powerful tool in a social campaign when used properly and combined with other factors.

Abstract

Active learning has received considerable attention over the past several years. It has attracted strong advocates among teachers and students looking for alternatives to traditional teaching methods. This paper describes the design of a mini-IT contest, emphasizing on computer literacy education for year one university students. A software package for generating and maintaining question banks for a “Millionaire” type competition is developed. This “millionaire type” quiz game aims to arouse the natural interest of computing students by participating team-based competitions involving multiple rounds. This mini-IT contest cultivates an active learning environment and appropriate experiences for students to discover and verify their answers in a climate of mutual respect and open communications. Ultimately, the students are encouraged to become active learners by exchanging roles throughout the mini-IT contest. The competition was formally evaluated by students for enhancement of knowledge and learning through team efforts. Positive feedbacks were obtained from the students.

Keywords – *Active learning, Competition, Collaboration*

Introduction

Research over the past few decades suggests that students must do more than just ‘sit and listen’ – they must discover and understand knowledge through active discussion and engagement (Johnson, Johnson & Smith, 1998; Kao, et al., 2008; Moreno & Mayer, 2000). Active learning is often contrasted to the traditional lecture where students passively receive information from the instructor. It is presented or perceived as a radical change from traditional model of education in terms of teaching and learning (Prince, 2004). The empirical support for active learning is extensive. Bonwell and Eison (1991) conclude that active learning leads to better student attitudes and improvements in students’ thinking and writing. It surpasses traditional lectures for retention of material, motivates students for further study and develops their thinking skills (Wan, et al., 2010). Indeed, active learning is one of Chickering and Gamson’s (1987) “Seven Principles for Good

Practice”.

This paper describes the design of a mini-IT contest, emphasizing on computer literacy education for year one university students. The mini-IT contest injects a sense of competition to encourage active learning. It also provides a web-based environment for idea exchange and open communications. This project addresses each of these issues. First, it considers mini-IT contest as a tool to support computer literacy education. Second, it cultivates an active learning environment where students participate in team-based competitions. Students are motivated to think deeply about the important computer terms and concepts and engage actively in the learning process in order to become active learners. Finally, it promotes a collaborative competitive learning strategy that accommodates both collaboration and competition in a manner that better achieves the learning outcomes.

Literature Review

In recent years, educators have explored a variety of innovative teaching techniques that emphasize students' active learning. There are several reasons for this pedagogical transition from lecture-based teaching to system-based pedagogy. Some studies mentioned that certain students are motivated to learn when they are active participants in the educational process, especially when there are course activities that must be done in class (Friedman, Rodriguez & McComb, 2001; Rosato, 1995). Most importantly, through learner-centered activities, students can practice the necessary skills, such as, resource management, interpersonal communication, information management, systems management, and the use of technology (Kendall, 1999). Thus, it should come as no surprise that the common forms of active learning received considerable attention in the educational field.

A. Active Learning

Active learning is generally defined as any instructional method that engages students in the learning process (Prince, 2004). It requires students to do meaningful learning activities and think about what they are doing (Bonwell and Eison, 1991). The core elements of active learning are student activity and engagement in the learning process (Prince, 2004). The student activity has been chosen for this project, the mini-IT contest, and students are engaged to work in teams to win the competition.

B. Collaborative Learning

Collaborative learning refers to any instructional method in which students work together in small groups toward a common goal (Prince, 2004; Smith and Gregor, 1992). It means that

collaborative learning encompasses all group-based instructional methods, including cooperative learning (Cusea, 1992; Millis and Cottell, 1998). The essence of collaborative learning is student interactions rather than on learning as a solitary activity (Prince, 2004).

The elements of active learning and collaborative learning reflect well on the development of the mini-IT contest. The competition is a well-designed student activity that is introduced in the computer classroom. Active student engagement and interactions are promoted as the competition arouses the natural interest of the computing students by participating team-based competitions involving multiple rounds.

C. Introducing Student Activity – Competition

Just as with education, some forms of competition became formalized long ago in human history. That is, competition is bound by rules and becomes organized by specialists (Verhoeff, 1997). Indeed, education and competition are intimately related. On one hand, it is natural for students to compete. They seem to have an innate desire to compare themselves with others in every way. On the other hand, competition may be found vital in adult life that a society especially educates their young to compete (Cheung, et al., 2010; Verhoeff, 1997). Thus, it is necessary to incorporate competition into education to help students get used to it in later life. Many educators have supported the use of competitions but there is no general agreement as to what constitutes the best way of putting competitions to good use in education (Verhoeff, 1997). The simplest consideration of using competitions is that the beneficial effect derives precisely from the fact that it is a change from the regular curriculum. The actual mini-IT Contest details will be described in a later section.

D. Achieving Learning to Learn (L2L)

With the development of the active learning tools, such as the Mini-IT Contest, students have engaged themselves in the method itself – ‘the what’ of the learning is ‘the how’ (Hofmann, 2008)! Fredriksson and Hoskins (2007) explain how learning to learn (L2L) contains both affective and cognitive dimensions, with the affective dimension referring to social skills such as learning relationships, motivation, confidence, learning strategies, and the ability to overcome obstacles. The cognitive dimensions are concerned with the capacity to gain, to process and assimilate new knowledge and students organizing their own learning. Competitions can arouse students’ interests and motivate them to actively participate in the learning process. Moreover, the critical learning to learn need is achieved through students voluntarily participate in the competitions and enhance their higher order cognitive abilities, such that students can achieve genuine understanding and be able to apply and transfer the knowledge acquired. Indeed, L2L allows students to become

more effective, flexible and self-organized learners in a variety of contexts (Hofmann, 2008).

E. Promoting Student Engagement

An ideal classroom in the 21st century – “Active Classroom” should encourage students to think and not merely recite; task-focused and not simply sit and listen; and work in teams and not learn in isolation; and transcend across time and space, and not bounded by the four walls of the classrooms (Activate, 2010). The type of activity, like the Mini-IT contest, influences how much classroom material is retained (Prince, 2004). Wiggins and McTighe (1998) mentioned that good activities develop deep understanding of the important ideas to be learned. Thus, the activities must be designed around important learning outcomes and promote thoughtful engagement on the part of the student. Student engagement is the core element in active learning and there is considerable evidence to support the effectiveness of student engagement on a broad range of learning outcomes (Johnson, et al., 1998a; Johnson, et al., 1998b; Prince, 2004; Springer, et al., 1999). Hake (1998) examined pre- and post-test data for over 6,000 students in introductory physics courses and found great improvements for students in classes with substantial use of interactive-engagement methods. In addition, Redish et al. (1997) state that the nature of active engagement improved learning gains and not to the extra time spent on a given topic. Active engagement methods surpass traditional instruction for improving conceptual understanding of basic physics concepts (Laws et al., 1999). Thus, the mini-IT contest as an active engagement method will likely to support the students’ understanding of basic computing concepts and applications.

F. Promoting Student Interactions – Collaborative Learning

The core element of collaborative learning is students working together in small groups with extensive interactions to achieve a common goal (Prince, 2004). The results of meta-studies carried out by Johnson, Johnson and Smith (1998a, 1998b) found that collaboration improved learning outcomes relative to individual work across the board. For instance, with respect to retention, the results suggested that collaboration reduces attrition in technical programs by 22 percent, a significant finding when technical programs are struggling to attract and retain students (Prince, 2004).

It is evident that there is a strong relationship to support collaboration promotes a broad range of student learning outcomes. In particular, collaboration enhances academic achievement, student attitudes, and student retention (Prince, 2004). The above studies from Johnson, et al. (1998a, 1998b) also found that collaboration promotes interpersonal relationships, improves social support and fosters self-esteem. Collaborative learning provides a natural environment in which to promote effective teamwork and interpersonal skills (Prince, 2004).

Mini-IT Contest for Active Learning

The student activity designed here is the mini-IT contest to promote active and collaborative learning. It is a software package for generating and maintaining question banks for a “Millionaire” type competition. The Mini-IT contest is a small scale version of the Hong Kong Polytechnic University’s IT Contest. The project title “Mini-IT Contest” refers to a local contest held for year one university students at the Department of Computing in The Hong Kong Polytechnic University. This contest model has been used by various universities in Hong Kong (such as, Hong Kong University of Science & Technology; The Chinese University of Hong Kong; City University of Hong Kong and Hong Kong Baptist University) for developing students’ interest in computing subjects. Verhoeff (1997) stated a list of attributes and dimensions that are useful to classify and analyze the mini-IT contest (see Table 1).

Table 1 - Attributes of Mini-IT Contest

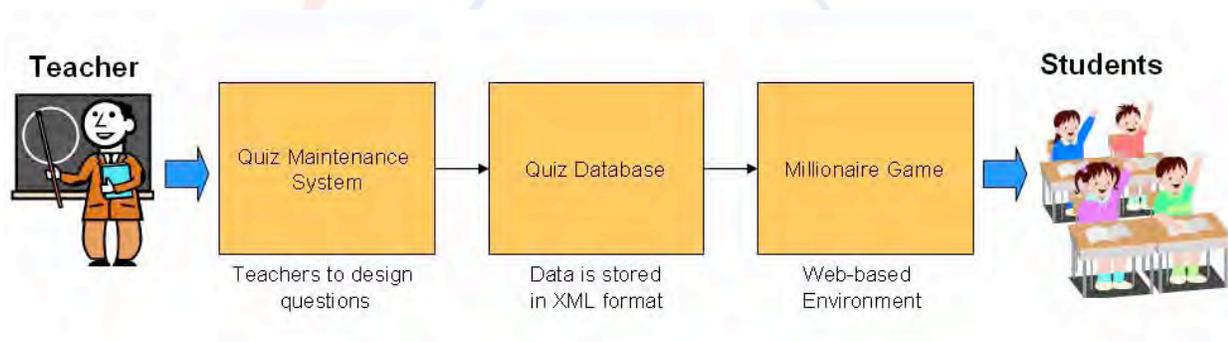

<i>Attributes and Dimensions</i>	<i>Mini-IT Contest</i>
Intended Objectives	<ul style="list-style-type: none"> • To support the Hong Kong Polytechnic University’s initiatives in promoting the 4 Ts in Active Learning – “<i>Thinking, Task-focused; Teamwork; Transcendence</i>” (The Hong Kong Polytechnic University’s website, 2010); • To develop a competition environment for supporting the transfer of computer knowledge to Year One university students; • To provide a web-based environment for exchange of ideas and open communications in promoting active and collaborative learning; and • To develop students’ teamwork skills in competition environments and to develop student trainers for the subject.
Fun-oriented Vs Serious	Fun-oriented – a “Millionaire” type competition
Spectator Event Vs Participatory Event	Participatory event – students are grouped into teams to compete for the final rounds of championship.
Individuals or Teams	Teams
Skill-oriented Vs Knowledge-oriented Vs Luck-oriented	Knowledge-oriented and luck-oriented
Fixed Format Vs Free Format	Fixed format – there are more than 300 questions in the question banks. The teacher is responsible to select 15 questions at various difficulty levels

	for each set of competition.
Follow-up to Participants	A formal evaluative process will be followed after the Mini-IT contest (e.g. overall results, student participation rate, student evaluation forms)

System Architecture and Implementation

The system flow of the “Millionaire” type quiz game is shown in Figure 1. The system is designed so that its implementation and administration will not suffer from the negative aspects of many active learning activities, such as the sacrifice of substantive learning time, administrative headaches, and unrealistic teacher preparation requirements (Ostapski, Cunningham and Williams, 2009). There are three main components in the system including the quiz maintenance system, the quiz database and the millionaire game.

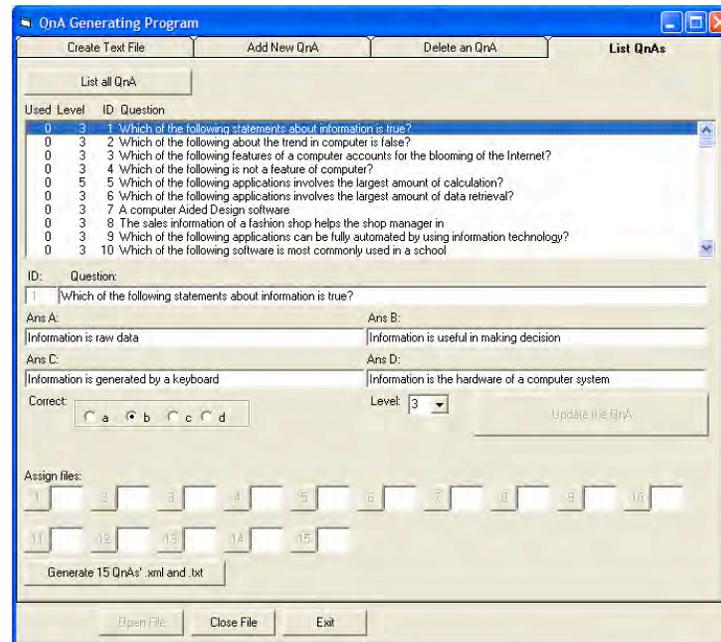

Figure 1 – The System Flow

A. Quiz Maintenance System

The Quiz Maintenance system is designed to provide a user interface which facilitates teachers to input and select the appropriate quiz questions, provide answers and determine the level of difficulty for each of the questions (Figure 2). In addition, the teacher may add, delete or update any questions in the database of the quiz system. Teacher can extract all the questions from the database in text format.

Figure 2 – Quiz Maintenance System

B. Quiz Database

The quiz questions will be stored in XML (Extensible Markup Language) format. The key advantage of XML is that it is designed as a human- and machine-readable format and its self-documenting format facilitates description of structure and field names as well as specific values. In addition, XML supports Unicode which allows most of the information to be communicated and to meet the challenges of large-scale electronic publishing (W3C, 2010). Each quiz database contains a number of questions and three databases are created. It is divided into different computer categories, computer concepts, computer applications and database applications. Each database has stored 300 records with details of quiz questions, choices of answer and level of difficulty from 1-15. Below is an example of a quiz question.

```
<props>
<question>A composite key contains
</question>
<ansa>complicated attributes
</ansa>
<ansb>only one attribute
</ansb>
```

```

<ansc>derived attribute
</ansc>
<ansd>multiple attribtes
</ansd>
<correctanswer_txt>a</correctanswer_txt>
</props>

```

C. Millionaire Game

A millionaire program is developed in flash format and it can be run in the web-based environment (Figure 3). Thus the game can be published to the Internet and accessed by students or users with Internet browser installed with flash player. This does not only enhance students' accessibility to the game but also enhance the in-class usability for the teachers. It is because the teachers can simply conduct the game in a classroom computer without complicated installations and preparation.

Figure 3 – Millionaire Game

D. Implementation Tools

The millionaire game is developed in flash programming language which runs in the client side. At the beginning of the game, the computer programme retrieves 15 questions from the database for each of the level of difficulty. The programme would then judge the correctness of the user's choice of answer. If the answer chosen is correct, the answer of the next difficulty level will be displayed. The core of the web-based environment is implemented by flash programming since it provides a simplified, fast way to create dynamic web content. Flash technology enables rapid development of web-based applications that are server and platform independent. With this program, the game can be published to the Internet and accessed by clients with Internet browser.

System Application

A. Quiz Nature

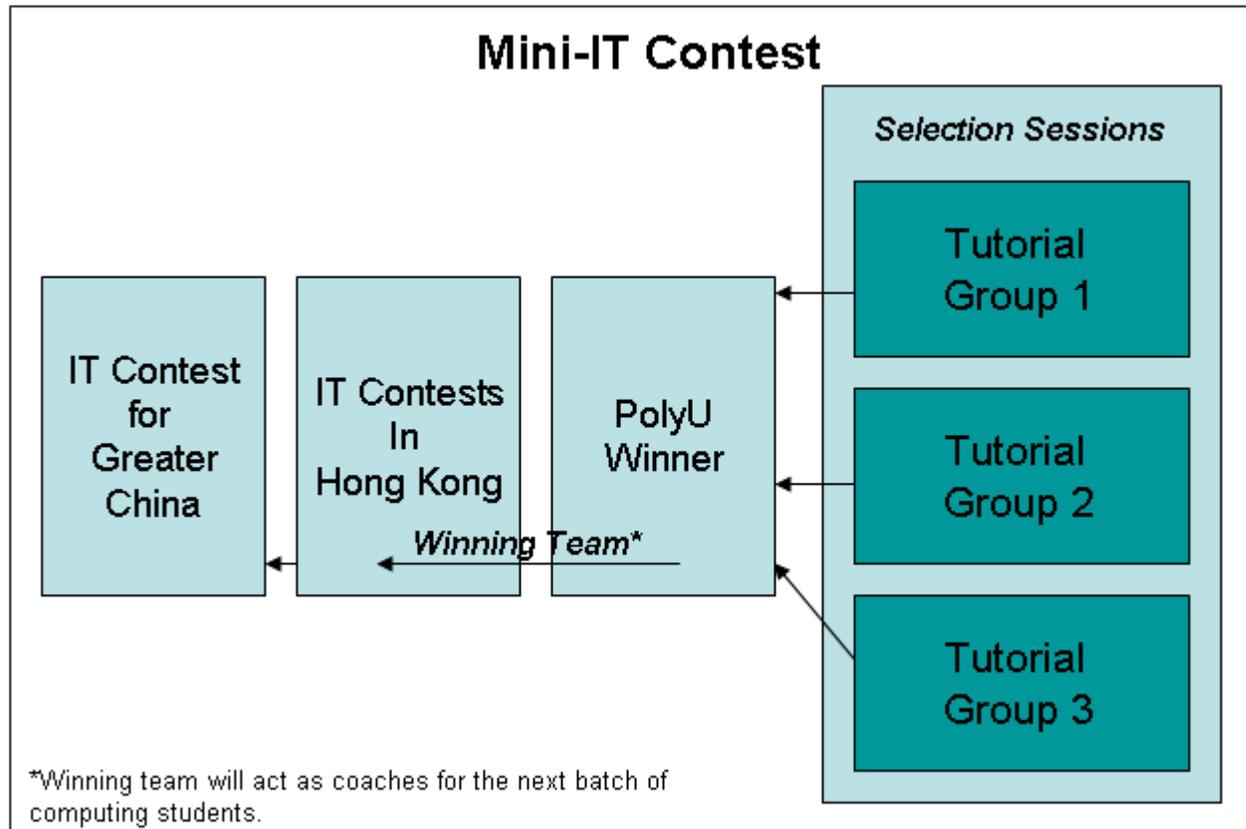

The competitions were embedded in the computer lab session to arouse students' interest and without disrupting class activities. Student participation was voluntary and not part of the course assessment. Each week, a team will undertake the quiz game and the results will be recorded.

B. Quiz Arrangement

This quiz competition was introduced to 70 students in an introductory course (Computer Concepts and Applications) in computing at the Hong Kong Polytechnic University. The course was running in 14 weeks with 2 hours lecture and 1 hour computer lab/tutorial class per week. These students were divided into 3 tutorial classes. For each tutorial class, we divided students into 6 to 7 teams, each with 4 students. The students competed with each other in teams through a "millionaire type" quiz game. Each competition was conducted in front of the whole class and each team was required to discuss the answers guided by a coach, contributing to the success of the game. When the quiz game finished, the difficulty level reached and the amount gained would be announced to the participating team as evaluation control. The winning team will be awarded various prizes for the competition awards.

The project cultivated an active and collaborative learning environment and appropriate experiences for students to discover and verify their answers for each team in a climate of mutual respect and open communications. The most successful teams in each of the 3 tutorial classes competed for the final rounds of championship.

Figure 4 – Mini-IT Contest and Its Relationships with External Competitions

Each team was supervised by a coach who acted as a trainer for the events. Ideally, each coach is a senior student who acts as leader in each of the tutorial group. He/she will select among the tutorial group teams to participate in the Mini-IT contest through selection sessions (also in the form of competitions). Those winning teams will be awarded a contract to work as a coach when the Mini-IT contest is scheduled for the next batch of computing students. Apart from mastering the computer concepts and applications, the winning teams will represent the University to compete other IT contests in Hong Kong and in Greater China. Figure 4 shows how the deliverables are being used by the Mini-IT contest, and their relationship with external competitions. The design and use of competitions can certainly motivate students' interests and participate actively in the learning process. Indeed, the concept of learning to learn is reinforced well as students will engage themselves in participating with various IT contests.

System Evaluation

A. Student Evaluation

A survey on "Millionaire" Quiz Game was conducted to determine if the Mini-IT Contest

successfully promoted active and collaborative learning, and learning to learn. There were 55 participants in the survey with positive results.

Table 2 – Summary of Evaluation Results

Overall rate (5=strongly agree, 1=strongly disagree)	
1. Have you studied computing during Secondary School studies?	3.73
2. Do you think the Millionaire Competition is relevant to the subject COMP 250?	3.73
3. Have you actively participated in the Millionaire Competition?	3.65
4. Do you think that there should be discussions within a group to help understanding the multiple choice questions in the Millionaire Competition?	4
5. Can the Millionaire quiz game enhance interest in learning (for IT concepts)?	3.45
6. Did you learn new computer concepts in the Millionaire quiz game (other than those taught in the lecture)?	3.34
7. Do you think that such kind of Game/Competition activities should be introduced in a subject?	3.73

In comparing the evaluation results with the subject marks, it noted that the student who got maximum mark 83.9 (A+ in the course) have rated the game 4.5; and the student who got minimum mark 37.9 (D) has not rated the game. Overall, students seemed to have a greater appreciation of class time and the quiz has enhanced their interests in the course. Students were motivated to excel in ways that traditional lecture cannot achieve.

B. Achievement of Learning Outcomes

The design and the development of the Mini-IT Contest are to promote active and collaborative learning. It involves reading, writing, discussion and engagement in solving problems, analysis, synthesis, and evaluation. It also emphasizes on teamwork that team members work cooperatively to solve problems (Lorenzen, 2001). This contest directly support the Hong Kong Polytechnic University's initiatives in promoting the 4 'T's in active learning (The Hong Kong Polytechnic University's website, 2010) :

“Thinking; Task-focused; Teamwork; Transcendence”

The contest is the beginning to develop a culture among students to promote active learning. A question bank is developed for the competitions, and promoted fore-runners in active learning. All the questions will address the developments in the subject area, with practical implications. By

participating in competitions, contributing their ideas, or acting as trainers for the events, learning is task-focused. By participating in teams and discussions among the tutorial groups, learning is not confined to the walls of the classroom. It can be taken anytime, anywhere beyond the class contact hours. This contest will also develop the concept of 'train the trainer'. When the winning teams become the trainer for the next batch of computing students, it is possible to have active learners to become trainers of their peer groups.

Conclusion

By having competitions injected into the learning environment, it provides a way to increase student interest in the subject area, promote active and collaborative learning, and reinforce learning to learn. This transitional pedagogy frames teachers as information managers, cultivating the conditions and environment under which learners are to learn the importance of knowledge, skills, teamwork, ideas exchange and open communications. It is believed that learning activities should be constructed to create a balance between cooperation and competition in order to enhance motivation and learning performance (Tauer and Harackiewicz, 2004). It is worth noting that the Mini-IT Contest is just the beginning, educators are encouraged to create learning activities to better reinforce active and collaborative learning.

Acknowledgements

The authors would like to thank The Hong Kong Polytechnic University and the University of South Australia for supporting this research.

Address (work): English Department, Islamic Azad University, Kerman Branch, 1st kilometer of Joopar Road, Kerman, Iran.

Submission reference number: 0020

Topic of submission: An investigation into the text books of primary schools studied in Iran in the academic year 2008 – 09 in terms of the degree of unity and coordination in attaching and detaching word stems to each other in compound words.

IMPORTANT NOTE

Persian words and examples in Persian alphabets have been used in this article using the Times New Roman font. In order to see them properly, files for complex script and right-to-left languages must be installed. I think that mentioning the procedure may help some people. If you know the procedure, please excuse me for the redundant information.

To install them (in Windows XP), please go to Control Panel, Regional and Language. Then in the “Languages” tab refer to “Supplemental language support” and checkmark the box next to “install files for complex script and right-to-left languages”. You may be asked to insert the CD of your Windows into your CD drive.

After installing the files, please go back to “Languages tab” and in the part “Text services and input languages” click “Details”. Next, in the “Setting” tab and in “Installed services” by clicking on “add”, add the language “**Farsi**” and its keyboard.

**An Investigation into the Textbooks of Primary Schools Studied in Iran in the Academic
Year 2008 - 09 in Terms of the Degree of Unity and Coordination in Attaching
and Detaching Word Stems to Each Other
in Compound Words**

Abstract

In this research all of the text books of primary school studied in the academic year 2008 – 09 (1387 – 88) are studied word by word. Compound words which have different written forms and the degree of coordination in attaching and detaching of different words from each other in them are especially cared for. Moreover, the degree of unity of spelling and coordination in different text books of the same grade and also different grades of primary school is compared. Data collection is done through studying all the words of all the text books. Regarding the type of the research, data collection and analysis, the research is descriptive. All the books of different grades of primary school studied in the academic year 2008 - 09 make the research population and because all the words in these books are considered, there is no randomization and all of them form the selected subjects. Data analysis is done through specifying the frequency and percentage of probable uncoordinations in written forms and also in attaching and detaching of different morphemes to each other. The results show that in some of the text books individually and also among all of them compared with each other there are some uncoordinations in terms of detaching and attaching word stems to each other in compound words.

Key words: Text books, Compound words, Morpheme, detached writing, attached writing

Title: An investigation into the text books of primary schools studied in Iran in the academic year 2008 – 09 in terms of the degree of unity and coordination in attaching and detaching word stems to each other in compound words.

1. Introduction

Knowing the correct spelling of each language is necessary for native speakers of that language and using incorrect spelling of words especially for educated people causes the negative view of other people. Based on the Persian alphabets, correct spelling of words includes not only using right letters but also the correct way of attaching different words and morphemes to each other. Unfortunately, in Persian the method of attaching morphemes to each other has become person specific and many uncoordinations can be found in different books and also in one book about similar morphemes.

Regarding this point that the foundation of learning how to write forms in primary schools, a lot of attention must be paid to the manner of writing, spelling and unity in detaching and attaching different morphemes to each other. Otherwise, a student who is at the beginning of learning how to write gets confused. This, in turn, results in more mistakes in spelling and more incorrect detaching and attaching morphemes to each other.

In this article all the text books studied in primary schools in Iran in the academic year 2008-09 (1387-88) have been considered word by word in terms of the degree of coordination and unity in detaching or attaching of the second word to the first one in compound words.

2. Review of literature

The researcher could not find any similar or related article or point in the site of Ministry of Education of Iran, Office of Programming and Writing Books and other related links searched in Google to use them for the betterment of this article and to mention them as the review of literature. To do this research, the field worker referred to many Persian books about the different kinds of compound words in Persian. Among these sources, I can mention “Persian Grammar” by Abdol Azim Gharib et al, “Persian Grammar” by Parviz Natel Khanlari, “Persian grammar” by Hasan Anvari and Hasan Ahmadi Givi, “Persian Grammar” by Mohammad Javad Shari’at, “Persian Grammar: the Lexical Categories and Merge” by Mahdi Meshkato-Dini, “Derivational Suffixes in Contemporary Persian” by Khosrow Keshani and “Instructions on Persian Writing” by the Academy of Persian Language and Literature.

These sources were used for a definition of Persian compound words, their different types and the different word classes which can make compound words in Persian. The definitions mentioned in these books are quoted in section 5.

3. Methodology

3.1. Research method

Regarding the nature of the article, data collection procedure and data analysis, research method is descriptive. In this article all the collected compound words have been studied based on the way of attaching the second word to the first one. Depending on the part of speech of the second word stem, they have been divided into verbal group (having a verb stem) and non-verbal group (having other parts of speech). Data has been collected through studying all the books word by word.

3.3. Data collection procedure

Because all the books studied in all grades of primary schools formed the research population of the article, all the compound words in all of them were considered one by one and those which had the possibility of being written in a different way of attaching or detaching words were noted down. So, no randomization was used to collect data.

3.4. Methods used to specify the source of each word

In any part of the article for the words collected from the books some numbers have been used which are sometimes accompanied with the letters “i” “a” or “c”. These numbers and letters which represent the book and the page from which the word has been collected are explained as follows:

1. A two-digit number has been specified to each of the text books studied in primary schools. The first digit, from 1 to 5, represents the first up to the fifth grade of the primary schools and the second digit is the fixed, specified number for each book based on its name. Table 1 shows the names of the books studied in primary schools and also the numbers specified to each of them. As it can be understood from the table, the first grade has five books, the second grade has seven books and the third up to the fifth grade each has eight books. As example, the book of mathematics of the first grade is specified with the number 14, that of the second grade with 24, that of the third grade with 34, that of the fourth grade with 44 and that of the fifth grade with 54.

item	names of the books of primary schools	book numbers of first grade	book numbers of second grade	book numbers of third grade	book numbers of fourth grade	book numbers of fifth grade
1	Persian (Reading)	11	21	31	41	51
2	Persian (Writing)	12	22	32	42	52
3	Sciences	13	23	33	43	53
4	Mathematics	14	24	34	44	54

5	Teaching the Koran	15	25	35	45	55
6	Heaven Gifts	-	26	36	46	56
7	Heaven Gifts (Workbook)	-	27	37	47	57
8	Social Sciences	-	-	38	48	58

Table 1

- In many cases in the article, a one to three digit number has also been added to the two-digit number of books which represents the number of the page from which the case has been extracted. For example, in table 2, in front of the verb stem “آلود” in the compound word “خواب آلود” number “31117” has been written. The figure “3” represents the third grade, the figure “1” represents the book “Persian (Reading)” and the three-digit number “117” represents the number of the page from which this compound word has been extracted. It means that this word has been collected from the page 117 of the book “Persian (Reading)” of the third grade.
- In some cases, the letters “i”, “a” or “c” accompany the number described in 2 above. These letters represent the words “introduction”, “appendix” and “cover” respectively and mean that the words have been collected from these parts of the books. For such cases sometimes the number of the page is also added to the fixed number of the book and sometimes it is not.

4. Research hypotheses

There are 2 hypotheses that the researcher tried to find out whether they are proved or rejected.

- There are probably some uncoordinations in terms of detaching and attaching words to each other in compound words in each of the text books of primary schools.
- There are probably some uncoordinations in terms of detaching and attaching words to each other in compound words among the text books of primary schools contrasted with each other.

5. Persian compound words

Meshkato-Dini (2007, 29) (in his definition of Persian compound words writes, “Compound Words can be analyzed into two or more word stems. Prefixes, suffixes, prepositions and some other grammatical morphemes can be used in their structures”. He mentions fifteen different types of compound words (30). Keshani (1992, 55-66) calls the present and past stems of the verbs [in Persian each verb has the two stems] used in the structure of compound words “verbal suffixes”, and the nouns used in the structure of such words “nominal suffixes”. Gharib et al (1988, 32) believe, “A compound noun consists of two or more words.” He explains nine different types of compound nouns in his book (32-33). According to Natel Khanlary (1991, 161), whenever a noun or an adjective has two or more components and each of them is meaningful in isolation, it is called a compound word. Anvari and Ahmadi Givi (1992, 96-97, 99-100, 151-156) have defined compound nouns and adjectives as words consisting of some components and mentioned sixteen different types of compound nouns and many more different types of compound adjectives. In the Instructions of Persian Writing by the Academy of Persian Language and Literature (2006, 5) one can read:

In recent decades, the most important different views regarding how to write Persian words have been about attached or detached writing of compound words.

The academy ... has chosen a middle way and has tried to write rules and regulations only for cases whose attached or detached writing is compulsory and leave the manner of writing the other compound words to writers' tastes.

In the continuation of this idea of "attached writing" and "detached writing" of compound words the Academy (2005, 39) brings up three solutions as follows:

1. Writing some rules for detached writing of all compound words and determining the exceptions.
2. Writing some rules for attached writing of all compound words and determining the exceptions.
3. Writing some rules for compulsory detached writing of some compound words and attached writing of some others and giving the choice for the rest of them to writers.

When approving "The Instruction on Persian Writing" the Academy chose the third solution and only determined the cases of compulsory detached or attached writing (The Academy, 2005, 39).

Regarding the detached and attached cases of compound words in the above-mentioned sources, especially "The Instructions on Persian writing", it becomes clear that rules cannot be easily codified for detached and attached writing of compound word in Persian and also they cannot be easily justified. However, we can expect the writers and editors of text books especially text books for primary schools to pay much more attention to unity and coordination of such words.

6. Data analysis

In this article all the compound words in the text books of primary schools are studied in terms of the attaching and detaching of the second words to the first ones in compound words. The researcher tries to point out all coordinations and uncoordinations used in the books and compare and contrast them with each other by using tables containing uncoordinations and mentioning frequencies and percentages of different cases.

2562 cases were collected consisting of 358 compound words. Many of these words are repeated a few times. From the 2562 cases, 1313 cases consisting of 231 compound words making 51.25% are those whose second word stem is a verb. These 231 compound words make 64.5% of the total number 358. The rest of the collected cases, 1249 ones, consisting of 127 compound words making 48.75% are those whose second word stem is not a verb. These 127 compound words make 35.5% of the total number 358.

Regarding that from among 358 collected compound words, those whose second word is the present or past stem of verbs make 64.5% and those whose second word is not a verb make only 35.5%, first verbal stems (consisting of a verb) and then non-verbal words (having a stem other than a verb) will be studied in terms of unity and coordination in attaching or detaching from the first part of the compound words.

6.1. Present and past stems of verbs in collected compound words in terms of manner of attaching to the previous word

6.1.1. An investigation into their manner of attaching to the previous word

Many uncoordinations can be seen in the way the present and past stems of verbs in compound words are attached to the previous words. Regarding their way of attaching, they can be divided into different group as follows:

6.1.1.1. Only detached in all collected cases

The verb stems used only detached from the previous words are shown in table 2. For each verb stem, one compound word in which it is used is mentioned as an example. The page number of the compound word is also given.

verb stem	example	gloss	page number of the example
ألود	خواب ألود	sleepy	31117
آموز	دانش آموز	student	1450
آمیز	رنگ آمیزی	color blending	2729
آور	جمع آوری	collecting	1383
انگیز	غم انگیز	sad	4666
بخش	جان بخشش	refreshing	5110
بُر	گچ بری	plaster molding	3841
بَردار	عکس برداری	photography	33105
بست	دل بسته	attached	51156
بین	پیش بینی	foretelling	4186
پُرس	احوال پرسی	greeting	2112
پرست	بت پرست	idolater	4519
پَز	شیرینی پزی	cooking sweets	4482
پوش	روپوش دار	insulated	4360
پیچ	هاسیم پیچ	coils	4371
پیما	راه پیمایی	demonstration	11102
تاب	شب تاب	shining at night	3154
تراش	سنگ تراشی	carving	48102
جو	جنگ جو	warrior	58105
چسب	دل چسب	pleasing	41166
خراش	دل خراش	heart-rending	5654
خوار	آتش خوار	fire-eater	51178
خوان	درس خوان	diligent student	2664
خیز	حاصل خیز	fertile	41127
داشت	یادداشت برداری	note taking	31141
دان	ریاضی دان	mathematician	5181
دی	چهارم دیده	experienced	51178
ربا	آهن ربا	magnet	1364
رسان	پیام رسان	messenger	5110

ریز	خون ریز	blood shedder	58105
زا	آسیب زا	harmful	3516i
زن	نفس نفس زنان	panting	32138
سرا	غزل سرا	poet	51156
شکن	قانون شکنی	law breaking	4162
شناس	زمین شناسان	geologists	5351
فرسا	طاقت فرسا	intolerable	4668
فروش	هارنگ فروش	paint sellers	4334
فشان	آتش فشان	volcano	5368
کار	برنج کار	rice sower	24155
کش	زحمت کش	hard-working	3811
کش	می کروب کش	microbicide	3388
کوش	سخت کوش	diligent	31125
گشا	دل گشا	pleasant	3141
گفت	پیش گفتار	preface	259i
نشان	آتش نشان‌ی	fire fighting	311a
نگار	پیام نگار	message taker	4515i
نواخت	یک نواخت	monotonous	4347
نورد	کوه نورد	mountain climber	32120

Table 2

6.1.1.2. Only attached in all collected cases

Table 3 contains those verb stems used only attached to the previous words in all the collected compound words. For each of them one example with the page number is mentioned.

verb stem	example	gloss	page number of the example
آ	خوش‌ای‌ند	pleasant	4197
باز	جان‌بازی	self sacrificing	3162
بود	کم‌بود	shortage	48116
تاز	پیش‌تاز	pioneer	4220
چین	گل‌چین	careful selecting	415i
خند	لب‌خند	smile	5610
داد	روی‌داد	happening	4352
ده	سازمان‌دهی	organizing	488i
رَس	دست‌رسی	being accessible	5858
رُفت	آبرُفت	alluvium	4829
کاو	کن‌چ‌کاو	curious	3273
کرد	روی‌کرد	aspect	11i
گزی	جای‌گزی	substitute	42105
نمود	ره‌نمود	leading	517i
نهاد	پیش‌نهاد	suggestion	2723

Table 3

6.1.1.3. Both attached and detached in collected cases

The verb stems studied in this part, all represent uncoordinations in the text books. They can be divided into some different groups.

1. Some of the verb stems in collected cases have been used detached in some compound words and attached in some others. A list of them with one example and page number of the example is mentioned in table 4.

verb stem	example for detached case in compound word	gloss	page number of the example	example for attached case in compound word	gloss	page number of the example
بَر	رنج بر	hard working	41108	پی امبر	Prophet	5880
خور	آب خوری	drinking cup	4819	دل خور	offended	41178
خورد	کرم خورده	worm-eaten	5126	سال خورده	old	4664
دوز	پیراهن دوزی	shirt-making	24135	کفش دوز	shoemaker	326i
زاد	امام زاده	offspring of an Imam	22150	علی زاده	a family name	517i
زد	بهت زده	astonished	4656	زبان زد	frequently mentioned	5626
سپار	خاک سپاری	burying	4178	ره سپار	setting out	5728
گذر	خوش گذران	one who lives in pleasure	48104	ره گذران	passers-by	4157
نما	قطب نما	compass	31137	راهنما	guide	2182
نواز	چشم نواز	beautiful	51187	دل نوازی	affability	5676

Table 4

2. Some of the verb stems are used detached in some of the collected compound words, but in the same others they are used both detached and attached. Table 5 shows one example for each of these verb stems in compound words in which they are detached. Table 6 shows the same verb stems in compound words in which they are used both attached and detached. The page number of one collected case and the frequency of the collected cases are also shown.

verb stem	example	gloss	page number of the example
باف	دست باف	hand-woven	389
بُرد	نام برده	mentioned	4427
بند	پیش بند	apron	4182
پاش	گل آب پاش	rose-water sprinkler	5345
پذیر	امکان پذیر	possible	361i
ران	کشتی رانی	sailing	3398

ساز	آهنگ ساز	composer	2167
سوز	آتش سوزی	fire	3160
شو	لباس شویی	washing machine	5824
کُن	آب گرم کن	geyser	3377
گذار	بنیان گذار	founder	5699
ماند	عقب مانده	dull	4123
نشین	کوچ نشینی	immigrating in different seasons	4841
نویس	اسم نویسی	enrolling	3487
یاب	راه یابی	entering	41137

Table 5

verb stem	compound word with detached verb stem	Page number of a case	frequency of the compound word	compound word with attached verb stem	Page number of a case	frequency of the compound word	gloss
باف	خیال باف	41178	2	خیال باف	113a	1	imaginer
بُرد	فرمان بردار	41153	1	فرمان بردار	51194	1	obedient
بند	دل بند	3212	1	دل بند	1567	1	darling
پاش	سم پاشی	4330	3	سم پاشی	4330	1	poisoning
پذیر	بخش پذیر	54111	17	بخش پذیر	44139	14	dividable
ر	دل پذیر	314a	4	دل پذیر	3135	18	pleasant
ران	سخن رانی	48118	3	سخن رانی	58129	1	lecturing
	قایق ران	1154	1	قایق ران	5835	1	sailor
ساز	نیم ساز	54127	5	نیم ساز	44163	4	bisector

گزار	خدمت گزار سپاس گزار	48115 4180	3 20	خدمت گزار سپاس گزار	4561 417i	5 2	servant thankful

Table 11

6.1.2. More considerable points in tables 2 to 11

All of the cases mentioned in tables 2 to 11 represent uncoordinations in the manner of attaching verb stems in compound words. These uncoordinations can be found in one book, among the books of one grade and also among the books of different grades. Even if the cases mentioned in tables 2 and 3 which are related to being detached or attached of some verb stems are contrasted with each other, uncoordinations in similar situations can be found. In all cases mentioned in tables 4 and 9, one verb stem has been used detached in some words and attached in some others. In all cases mentioned in table 6, 8, 10 and 11, one verb stem has been used both detached and attached in different occurrences of a single compound word. Some of the most prominent cases are as follows:

The verb stems “آ” (come), “آموز” (learn) and “آمد” (came) (as mentioned above in Persian both present and past verb stems are used) which all begin with the letter “ا”, are not coordinated based on the manner of attaching to the previous letter. They are respectively only attached, only detached and both attached and detached.

The verb stems “بَر” (take) and “بُر” (cut) and also “رَفَت” (went) and “فَتُر” (swept) which are spelled the same, are not coordinatedly attached to the previous words.

The verb stem “نَشِیْن” in the compound word “دَلنَشِیْن” (pleasing) is used in both detached and attached forms in the book number 45.

The verb stem “دار” in the compound word “پَسِتَانِدار” (mammal) is used in both detached and attached forms in the book number 33.

The verb stem “دار” in the compound word “دامداری” (animal husbandry) is used in both detached and attached forms in the book number 38.

The verb stem “گو” in the compound word “پیشگوی” (foretelling) is used in both detached and attached forms in the book number 41.

The verb stem “گو” in the compound word “راسِتگو” (truthful) is used in both detached and attached forms in the book number 36.

The verb stem “بار” in the compound word “خونبار” (blood shedding) is used in both detached and attached forms in the book number 51.

The verb stem “خواه” in the compound word “دلخواه” (desire) is used in both detached and attached forms in the book number 51.

The verb stem “رفت” in the compound word “پیشرفت” (progress) is used in both detached and attached forms in the book number 41.

The verb stem “فرم” in the compound word “حکفرم” (dominant) is used in both detached and attached forms in the book number 56.

The verb stem “گزار” in the compound word “سپاسگزار” (thankful) is used in both detached and attached forms in the book number 41.

6.2. Non-verbal words in collected compound words in terms of manner of attaching to the previous word

6.2.1. An investigation into their manner of attaching to the previous word

Many uncoordinations can be seen in the way the non-verbal words used in compound words are attached to the previous words. Regarding their way of attaching, they can be divided into different group as follows:

6.2.1.1. Only detached in all collected cases

The non-verbal words used only detached from the previous words are shown in table 12. For each of them, one compound word in which it is used is mentioned as an example. The page number of the compound word is also given.

word	example	gloss	page number of the example
آواز	خوش آواز	sweet singing	1172
آهنگ	خوش آهنگ	melodious	4126
باز	لج باز	obstinate	51190
بازی	تاب بازی	swinging	21125
بال	سبک بال	tranquil	4634
بیان	خوش بیان	able to speak frankly	2118
پرت	حواس پرت	absent-minded	51165
پشت	لاک پشت	tortoise	1198
پور	قاسم پور	a family name	24a
پیگر	غول پیگر	giant	3181
تن	پیل تن	giant	51185
جا	یک جا	all together	4526
جمع عیّت	کم جمع عیّت	having little population	48109
حرف	کم حرف	not talkative	3755
خط	خوش خط	having good handwriting	1287
دایره	نیم دایره	semi-circle	4469
دخت	سیمین دخت	a name	14a
دست	تنگ دست	poor	5148
دسته	گل دسته	minaret	2196
دفعه	یک دفعه	at once	2123
دوش	خانه به دوش	vagabond	12117
ذوق	خوش ذوق	having good taste	42125
رخ	گل رخ	beautiful	4115
رفتار	خوش رفتار	behaving well	2182
رنگ	خوش رنگ	of a pretty color	51138
روز	نیم روز	mid-day	41123
سال	بزرگ سال	adult	43103
ستون	چهل ستون	having forty columns	31125
سرد	خون سردی	cold blood	5172
شاد	دل شاد	happy	31125
صبر	کم صبر	not very patient	111a
صورت	خوش صورت	beautiful	51153
طرف	یک طرفه	unilateral	3828
عاقبت	خوش عاقبت	having good fortune	51189
فلک	چرخ فلک	merry-go-round	4385
قامت	خوش قامت	tall and handsome	4665

قسمت	خارج قسمت	quotient	4485
قلب	خوش قلب	kind	41144
قلی	نچف قلی	a name	41144
قیمت	گران قیمت	expensive	3840
کام	شیرین کام	having a sweet mouth	32152
کدام	هیچ کدام	none	5375
کس	هیچ کس	nobody	4123
گراد	سانتی گراد	centigrade	4834
گوشت	آب گوشت	a kind of food	4115
لیمو	آب لیمو	lemon juice	389
موقع	چه موقع	when	1179
نام	اندصاحب نام	they are famous	4662
نگران	دل نگرانی	anxiety	1571
وقت	هیچ وقت	never	2619
مزار	هفت مزار	seven thousand	44161
ممت	تربزرگ ممت	more ambitious	31154
هوش	کم هوش	dull	31128
یک	کدام یک	which one	5755

Table 12

6.2.1.2. Only attached in all collected cases

Table 13 contains those non-verbal words used only attached to the previous words in all the collected compound words. For each of them one example with the page number is mentioned.

Word	example	gloss	page number of the example
پاچه	دست پاچه	hasty	41178
پایه	کوه پایه	foot of a mountain	4825
چال	یخچال	refrigerator	3345
درست	تندرست	healthy	329
راه	گمراه	misled	5638
رضا	علی رضا	a name	447a
رگ	سیاهرگ	vein	43100
شاه	خوارزمشاه	a name	58105
شش	آبشش	gill	3325
عباس	غلام عباس	a name	152i
علی	غلام علی	a name	564i
گونه	چگونه	how	41105
مرغ	سیمرغ	a mythical bird	51129
مزد	دستمزد	wage	44131
ناز	گل ناز	a name	41113

یار	آبیاری	irrigation	4138
-----	--------	------------	------

Table 13

6.2.1.3. Both attached and detached in collected cases

The non-verbal words studied in this part, all represent uncoordinations in the text books. They can be divided into some different groups.

1. Some of the non-verbal words in collected cases have been used detached in some compound words and attached in some others. A list of them with one example and page number of the example is mentioned in table 14.

word	example for detached case in compound word	gloss	page number of the example	example for attached case in compound word	gloss	page number of the example
پا	هشت پا	octopus	4341	دمپای	slippers	34156
دوست	مهمان دوست	being hospitable	319a	رحمان دوست	a family name	2668
نامه	دانش نامه	thesis	5114	شاهنامه	name of a famous book of verse	11117

Table 14

2. Some of the non-verbal words are used detached in some of the collected compound words, but in the same others they are used both detached and attached. Table 15 shows one example for each of these non-verbal words in compound words in which they are detached. Table 16 shows the same non-verbal words in compound words in which they are used both attached and detached. The page number of one collected case and the frequency of the collected cases are also shown.

word	example	gloss	page number of the example
برگ	دم برگ	part of a leaf	4324
چه	چنان چه	if	3513i
خانه	بت خانه	idol-temple	2578
دل	خوش دل	happy	41178
رو	کمر رو	shy	4139
که	همین که	as soon as	2122
متر	میلی متر	millimeter	34163

گوش	بازی گوش	31143	3	بازی گوش	34159	3	playful
مرد	جوان مرد	3196	11	جوان مرد	32136	1	brave youth
مزه	خوش مزه	373	16	خوش مزه	368	2	delicious

Table 21

6.2.2. More considerable points in tables 12 to 21

All of the cases mentioned in tables 12 to 21 represent uncoordinations in the manner of attaching non-verbal words in compound words. These uncoordinations can be found in one book, among the books of one grade and also among the books of different grades. Even if the cases mentioned in tables 12 and 13 which are related to being detached or attached of some non-verbal words are contrasted with each other, uncoordinations in similar situations can be found. In all cases mentioned in tables 14 and 19, one non-verbal word has been used detached in some words and attached in some others. In all cases mentioned in table 16, 18, 20 and 21, one non-verbal word has been used both detached and attached in different occurrences of a single compound word. Some of the most prominent cases are as follows:

The non-verbal word “خانه” in the compound word “کتابخانه” (library) is used in both detached and attached forms in the book number 34.

The non-verbal word “متر” in the compound word “سانتی متر” (centimeter) is used in both detached and attached forms in the book number 54.

The non-verbal word “پزشک” in the compound word “دندان پزشک” (dentist) is used in both detached and attached forms in the book number 51.

The non-verbal word “به” in the compound word “گران به” (expensive) is used in both detached and attached forms in the book number 51.

The non-verbal word “تنگ” in the compound word “دل تنگ” (gloomy) is used in both detached and attached forms in the book number 41.

The non-verbal word “دیگر” in the compound word “یکی دیگر” (each other) is used in both detached and attached forms in the book number 35.

The non-verbal word “طور” in the compound word “چطور” (how) is used in both detached and attached forms in the book number 54.

The non-verbal word “قدر” in the compound word “چقدر” (how much) is used in both detached and attached forms in the book number 34.

7. Results

While analysing the collected compound words, many uncoordinations were observed. Nearly all tables represent them. Even some tables and sections, which represent coordination and unity in some parts, when contrasted with other similar parts show uncoordinations in the text books. These uncoordinations cause a lot of problems for primary students in learning how to write compound words.

Based on data analysis and what was mentioned about the tables, the two hypotheses can now be discussed.

7.1. Hypothesis 1: There are probably some uncoordinations in terms of detaching and attaching words to each other in compound words in each of the text books of primary schools.

By using the collected data, their analysis in the previous section (6), the different tables and what was mentioned about them, it can be understood that this hypothesis is not proved for some of the books and is proved for some others, meaning that some of the books are coordinated in terms of detaching and attaching different words to each other in compound words and in some others uncoordinations have been found. The two cases are discussed now.

7.1.1. Books in which uncoordinations have not been found.

In none of the books numbered 12, 13, 14, 15, 21, 22, 23, 24, 25, 26, 27, 31, 37, 42, 43, 44, 46, 47, 48, 52, 53, 55, 57 and 58, each compared and contrasted with itself, uncoordinations were not found.

7.1.2. Books in which uncoordinations have been found.

7.1.2.1. Book number 11 (Persian (Reading) of the first grade)

1. There are uncoordinations in the manner of attaching. The verb stems in the compound words “راه پی‌م‌ای” and “روی‌کرد” (refer to tables (rtt) 2 and 3), “دل‌سوز” and “خی‌الباف” (refer to table (rtt) 6).
2. There are uncoordinations in the manner of attaching the non-verbal stems in the compound words “لاک پش‌ت” (rtt 12) and “شاه‌نامه” (rtt 14).

7.1.2.2. Book number 32 (Persian (Writing) of the third grade)

The two words in the compound word “خوش‌بو” are detached on page 29 and attached on page 133 (rtt 21).

7.1.2.3. Book number 33 (Sciences of the third grade)

The verb stem “دار” in the compound word “پست‌ان‌دار” is used in both attached and detached forms (rtt 10).

7.1.2.4. Book number 34 (Mathematics of the third grade)

The word “خان‌ه” in the compound word “کت‌اب‌خان‌ه” is written in both attached and detached forms (rtt 16).

7.1.2.5. Book number 35 (Teaching the Koran of the third grade)

The word “دی‌گر” in the compound word “دی‌کدی‌گر” is written in both attached and detached forms (refer to section (rts) 6.2.1.3 and rtt 21)

7.1.2.6. Book number 36 (Heaven Gifts of the third grade)

The verb stem “گو” in the compound word “راست‌گو” has been written in both attached and detached forms (rts 6.1.1.3 and rtt 10).

7.1.2.7. Book number 38 (Social Sciences of the third grade)

The verb stem “دار” in the compound word “دام‌داری” has been written in both attached and detached forms (rts 6.1.1.3 and rtt 10).

7.1.2.8. Book number 41 (Persian (Reading) of the fourth grade)

1. The verb stem “گو”, “رفت” and “گزار” respectively in the compound words “پیشگوی”, “پیشرفت” and “سپاسگزار” have been written in both attached and detached forms (rts 6.1.1.3 and rtt10 and 11).
2. The word “تنگ” in the compound word “دلتنگ” has been written in both attached and detached forms (rts 6.2.1.3 and rtt 21).

7.1.2.9. Book number 45 (Teaching the Koran of the fourth grade)

The verb stem “نشین” in the compound word “دلنشین” is written in both attached and detached forms (rts 6.1.1.3 and rtt 6).

7.1.2.10. Book number 51 (Persian (Reading) of the fifth grade)

1. The verb stems “بار” and “خواه” respectively in the compound words “خونبار” and “دلخواه” are written in both attached and detached forms (rts 6.1.1.3 and rtt 11).
2. The words “پزشک” and “به” respectively in the compound words “دندانپزشک” and “گرانبه” have been written in both attached and detached forms (rts 6.2.1.3 and rtt 18 and 19).

7.1.2.11. Book number 54 (Mathematics of the fifth grade)

The words “متر” and “طور” respectively in the compound words “سانتیمتر” and “چطور” have been written in both attached and detached forms (rts 6.2.1.3 and rtt 16 and 21).

7.1.2.12. Book number 56 (Heaven Gifts of the fifth grade)

1. The verb stem “فرم” in the compound word “حکمفرم” has been written in both attached and detached forms (rts 6.1.1.3 and rtt 11).
2. The word “قدر” in the compound word “چقدر” has been written in both attached and detached forms (rts 7.2.1.3 and rtt 21).

7.2. Hypothesis 2: There are probably some uncoordinations in terms of detaching and attaching words to each other in compound words among the text books of primary schools contrasted with each other.

Using what was mentioned in data analysis, the table and other finding about the tables, it becomes clear that this hypothesis is proved about the text books when contrasted with each other. There are lots of uncoordinations in term of the manner of attaching and detaching of the second word to the first one in compound words.

8. Conclusion

Based on how the Persian letters of alphabet can attach to each other in written language and also based on using this important characteristic, it is necessary to pay attention to those morphemes and words which must attach to each other and those which must not. Of course, because of different types of morphemes and different possibilities of detaching and attaching them to each other, there can be many rules and details for them. However, organizing these rules and making

people obey them when writing are so difficult that even the Academy of Persian Language and Literature decides to choose a middle way as mentioned in section 5.

In writing Persian, unfortunately, different writers use different ways of detaching and attaching different words and morphemes to each other. However, it is very important for writers, compilers and editors of text books of schools, especially primary ones, to pay much more attention to being consistent and coordinated in this regard, especially in compound words.

As the article shows, the text books studied in primary schools in the academic year 2008 – 09 (1387 – 88), regarding the coordination in each book, are partly coordinated and partly are not. Meaning that some of these books (each compared and contrasted with itself) are coordinated in terms of detaching and attaching different words to each other in compound words and some of them are not. Considering all the books compared and contrasted with each other in this regard, they are not coordinated.

So you think you're ready for university? Barriers, needs and supports for mature age individuals accessing higher education.

Dr Rob Townsend, Acting Senior Lecturer & Senior Discipline Mentor
La Trobe Rural Health School, La Trobe University, Bendigo, Australia
robert.townsend@latrobe.edu.au

Abstract

Education research conducted in Australia has clearly identified that mature age individuals' experience a range of barriers in accessing, progressing and succeeding in university courses. The research also demonstrates that in rural and regional communities, mature age students from diverse backgrounds face additional barriers exacerbated by gender, ethnicity, age and the financial and time costs associated with geographic distance between communities and university campuses. However, the need to provide significant support to the groups who are under represented in higher education is a predominant theme within the literature and a lack of a cohesive approach to ensuring access to higher education and support for these cohorts to progress and reach success is a consistent theme. The Review of Australian Higher Education (The Bradley Report) identifies the need to increase higher education participation rates amongst groups which experience constraints and barriers to university education, including those in rural and regional communities.

Introduction

OECD comparative research of adult learning policies and practices in nine countries in Europe and Scandinavia contends that, despite reform agendas reshaping adult learning policies and practices, there are persistent inequities in terms of the provision of, access to, and outcomes of adult education and training (OECD: 2003). Research internationally has assessed adult education and training reforms against social programs and policies aimed at specific groups of individuals within society, including the unemployed, discouraged workers, early (forced) retirees, women returning to work, youth, Indigenous communities and people with disabilities (Noonan, Burke & White: 2004, Evans: 2003, Stevenson: 2003, James: 2001).

This research and other from the Asia Pacific region reveals persistently inequitable participation in education based on social class, gender (dis)ability and age, with correspondingly inequitable outcomes (Townsend: 2009, Jackson: 2009, Toppo: 2009, Satyanarayana: 2009, Nakano: 2009, Raghavan: 2009, Evans: 2003). Social inclusion as education practice is a multifarious concept in the culturally and linguistically diverse societies we now acknowledge. The challenge for governments and education agencies is to be able to 'see' the changing diversities of local regions and communities and to devise the flexibility to 'mingle' and network with these sub-groups. To be able to 'know' what they need and then negotiate a way to provide education services and resources that meet their needs and also contribute to the building of community capacity and cohesion by means of the development of social and human capital.

Education participation by adults is not readily translating into the building of human and social capital in localised community contexts. Race and culture, as experiences of community and as indicators of community cohesion and social inclusion, have been absent from debates around social and human capital development. Government-based education and training can be experienced as a form of social control and social reproduction, but it does have the potential to act as an agent of social relationship building, social cohesion and social justice.

Research on adult education from Australia, Japan, India, Malaysia and other Asia Pacific nations (Townsend, 2009, Jackson: 2009, Toppo: 2009, Satyanarayana: 2009, Nakano: 2009, Raghavan: 2009) uncovers these complexities with issues of population movement, migration, community participation, liberation through literacy, inter-cultural competence and social connection being motivations to access education and training. This paper explores access to and participation in university based higher education in diverse regional and rural contexts in Australia. This analysis will reveal that social, cultural and economic contexts and access to lifelong learning are inexplicably linked and will influence education policy and program development at local levels throughout the 21st century.

Review of Australian Higher Education

The Review of Australian Higher Education (The Bradley Report) has identified the need to increase higher education participation rates amongst disadvantaged groups including those in rural and regional communities in Australia. The report highlights significant workforce shortages and in particular, notes the need for urgent attention to increase higher education participation rates in rural and regional areas (DEEWR: 2008).

The Bradley Report (DEEWR: 2008) recommended that 40% of the Australian population be university graduates by 2030 via new equity policies, performance funding, research training schemes and research block grants. In anticipation of the current Labor government's new student demand driven system, some universities have enrolled well above government funded enrolment caps. However, an estimate of an increase in 450,000 higher education places by 2030 would expand the sector by an equivalent of 24 medium sized universities. Meeting this demand could cause budget blow-outs and the outcome of recent elections leading to a minority government could cause policy paralysis and an end to this bi-partisan agenda.

The Bradley Report (DEEWR: 2008) also deemed that the provision of higher education in regional areas throughout Australia needs serious policy and funding attention by all governments, including the additional allocation of \$80 million per year so that innovative, collaborative and local programs and solutions to higher education participation can be addressed.

Mature Age Barriers to Higher Education

Previous research conducted in Australia has clearly identified that mature age individual's experience a range of barriers in accessing, progressing and succeeding in university courses (Townsend & Delves: 2009; Kenny, McLennan, Nankervis, Kidd, Connell & Buykx: 2007) which is consistent with findings internationally. This research also demonstrates that in the rural and regional context, mature age students face additional barriers exacerbated by financial and time costs associated with geographic distance between communities and university campuses. Consistent with the Review of Australian Higher Education and key government policy directions, La Trobe University has identified the need to increase regional participation rates. A strong focus of these plans is enhanced relationships with the broader education sector including vocational training and community education providers.

A key component of the operation of the new La Trobe Rural Health School in regional Australia is facilitating students from non-traditional and disadvantaged groups to access and participate in higher education. Research (Kenny, McLennan, Nankervis, Kidd, Connell & Buykx: 2007) demonstrates that mature age students are an important group in health workforce planning, however, the need to provide significant support to this group is a predominant theme within the literature (Townsend & Delves: 2009, Bexley: 2008, Hammill & Awhina: 2007, Cullity: 2006).

Internationally, the lack of a cohesive approach to ensuring access to higher education and support for this cohort to progress and reach success is a consistent theme.

Direct recruitment of individual mature age adults, specifically those from rural communities and individuals from diverse backgrounds and abilities is an issue that has been discussed within Faculties without much direct action to address the barriers. Recent data from Australian Centre for Education Research (ACER: 2009) has revealed that although La Trobe University and other universities in Australia do attract students from a full range of equity categories, much more can be done to attract and 'coach' mature age individuals through the complex and often daunting process of applying for entry into a university course.

Allowing mature age individuals to have direct access to key academic staff who have the knowledge and skills to encourage mature age individuals to participate in the process of course selection, rather than just course administrators, can make a difference. Mature age individuals often want answers to complex questions with regard to part-time study options, timetables, key support services, flexibility and academic skills services. The information they require about these issues is often more detailed than currently provided and appointing key academic staff to act as contact points via email and telephone for mature age individuals during the initial application timeframe can make a significant difference to whether an individual applies for entry into a course.

The literature (Townsend & Delves: 2009) undoubtedly states that life and education transitions are significant issues for mature age individuals and especially so for those living in rural and regional communities. Most higher education institutions do not provide comprehensive transition support for mature age individuals accessing university. Programs such as summer school academic skills workshops and pre-entry counselling services could make all the difference to the self-confidence and skill base of mature age individuals wanting to access university courses, at both regional and urban campuses. These types of programs are common place in the community college sector of the USA and there is a need for Australian universities to embark on a range of pilot programs situated in vocational training and community colleges during the university application process in August to September each year, to provide information, counselling and academic skills to prospective mature age students.

Supporting the transition period for mature age individuals is a key gap in the services provided by higher education institutions in Australia however, such services are provided to the secondary school sector in supporting individuals from Year 10 onward to consider accessing university courses. Mentoring could also be provided as a key resource for prospective mature age individuals with current students being able to not just act as guides during Open Day and Orientation Week but in the intervening period when life and education transitions become key issues for mature age individuals.

Peer mentoring, peer tutoring and peer learning activities at many Australian universities are occurring in an extremely ad hoc manner and do not reflect an organisational commitment to, or philosophy of peer activities in a higher education setting. There is a difference between peer mentoring and peer tutoring/learning and these two programs need to be distinguished in any integrated model. Integrated and coordinated peer mentoring and peer learning activities would complement current curriculum and student services reforms by providing a value added learning resource to all students. There is significant research that reveals that peer mentoring and peer learning increases the access, progress and success of students from groups that have low participation rates in higher education.

Peer mentoring activities that support student transitions can occur as an integrated student engagement model, that incorporates; mentoring that engages students as they apply for access to university courses; mentoring that engages students in the vital first two years of their degree which supports social and academic skills development. Mentoring in the final year of a student's degree can encourage career planning, development and transition.

The model of regional development and education reinforcing each other can create a 'virtuous cycle of prosperity' however, consideration needs to be given to issues relevant to key equity groups such as the supply of affordable accommodation and the availability of part-time work for future students of all ages, familial circumstances and needs. Australia's university system is going to become more decentralised in the next 50 years as populations shift into regional hubs and cities (Hugo: 2010). Traditionally young people from low socio-economic backgrounds moved to cities in search for jobs, housing and possible future education and training. With the growth of regional cities in Australia, a new demographic trend of these cities becoming affordable and attractive choice for young people from low socio-economic backgrounds may see the demand for higher education places at regional campuses of universities massively out way the spaces and resources currently available.

University Access and Success

The beginning of the so called Australian 'regional education revolution' involving collaboration between universities and other training and education providers in specific regional areas has begun with state based research and reports on education performance and the context of higher education 2012-2025. Education statistics from the State of Victoria, in Australia has revealed that in 2007, 14.7% of students enrolled in Victorian universities and higher education providers were from low socio-economic backgrounds compared with a population distribution of nearly 25%. On the other hand, nearly 42% of students enrolled were from high socio-economic backgrounds compared with a population distribution of nearly 25%, on over representation compared to low socio-economic groups (ACER: 2009).

In relation to the targets set by the Bradley Report (DEEWR: 2008) of 40% of the Australian population accessing and completing a bachelor degree, the actual completion numbers in Victoria between 2005 and 2007 of around 29% reveal a need for notable growth in university participation and outcomes. Two key areas of analysis are required to assist in the achievement of the policy response outlined in the Bradley report. The first is identifying the actual components of this growth in terms of age groups such as 25-34 year olds and the 35 plus age group. With Australian population growth being relatively low via birth rates, the 18-24 age group is proving to be a small cohort for universities and so the older age groups are an obvious area of growth for this sector. The second issue requiring analysis is the role that migration will play in terms of domestic and international participation in university programs.

Australia has recently experienced a federal election campaign where population growth, migration and refugees were major political and policy issues. There appeared to be bi-partisan support for 'population sustainability', by lowering migration and humanitarian refugee intakes, however, this populist political stance actually endangers the new higher education policy framework by limiting the diversity of groups in the Australian community that could access and progress through undergraduate programs.

The Tertiary Education Plan for Victoria (DIIRD: 2010) has been developed as a guide to widening access to higher education to previously under-represented groups. The plan states that Victoria is well positioned to achieve 'something close to universal participation by 2025' (DIIRD: 2010: 12). However, the facts are that participation in higher education by people from

low socio-economic backgrounds, from outer urban fringes, Indigenous Australians and people from rural and regional areas has remained relatively unchanged for 20 years. The report states that: *Boosting participation by members of currently under-represented groups requires a multi-pronged strategy that takes into consideration the funding of higher education as well as aspirational, cultural and social factors, which will be particularly challenging to address (DIIRD: 2010: 16).*

A Regional Case-study

The Tertiary Education Plan for Victoria recommends that: *by 2025 each non-metropolitan administrative region should achieve at least a 10 percentage point increase in the proportion of people in the 25 to 34 age group who attain a bachelor degree qualification, and that by 2020 each non-metropolitan region should achieve at least a five percentage point increase in the proportion of higher education undergraduate enrolments of people from a low SES background (DIIRD: 2010: 20).*

The La Trobe Rural Health School was formed and commenced operation at the Bendigo campus of La Trobe University in the northern region of Victoria in January 2010. This new Faculty based school aims to provide a university departmental structure to support the implementation of the policy frameworks discussed to date. The Bendigo education plan is an innovative regional education plan facilitated by local government, regional education providers and interested parties to ensure that the northern region of Victoria becomes a 'learning region'.

This notion of a learning region has led to the development of a vision for 2025 of 'learning as a personal and collective value' where individuals are encouraged to believe that they can 'achieve anything' with residents given access to a diverse range of education choices locally with 40% of the local population having a bachelor degree and 98% of 20 year olds having completed year 12 or above. It is also aimed that the region develops an international reputation for training health and human services professionals. This vision means an increase of university places in the region up from 3,780 to nearly 6,000 individuals participating in undergraduate programs locally (City of Bendigo: 2010).

La Trobe University's Faculty of Health Sciences is one of Australia's leading health science faculties. The Faculty has developed a vigorous and extensive approach to strengthening health sciences education in rural and regional Northern Victoria through the development of the La Trobe Rural Health School (LRHS). The ability of the Faculty to deliver significant student growth and high quality learning and teaching outcomes has been recognised and supported by the Commonwealth of Australia with 63 million dollars of funding allocated through the 2008 Diversity and Structural Adjustment Fund and the 2009 Education Investment Fund. This major funding is being used for key staffing positions and a major regional infrastructure program.

In 2010, the LRHS achieved an astounding 30% increase in student numbers in a range of health and human services programs including nursing, para-medicine, social work, occupational therapy, dentistry, podiatry, speech pathology and public health. How was this achieved? The answer appears to be diversity! The LRHS now offers a diverse range of health and human services undergraduate programs for a diverse workforce within a diversifying community. The LRHS has utilised a multipart marketing campaign that supports the regional education plan where academic and administrative marketing strategies have involved participation in expos and events at schools, vocational training and community colleges, community organisation, Indigenous groups as well as marketing direct to the variety of health and human services providers throughout the region. Reaching out to a range of community events and workplaces means that the LRHS is talking to potential students in all age groups and from all socio-

economic and cultural backgrounds. This paradigm of universities reaching out rather than relying on 'open days' where individuals come to campus to seek information is an important change, it sends the message that the university wants diverse groups participating in their programs.

The second major issue is that of curriculum change and the 'care factor' for students that is built into curriculum and program delivery at universities. The LRHS has since 2009 been delivering new four year undergraduate Masters programs within a curriculum framework where the first two years of each program is based on the development of academic and professional knowledge and skills utilising an enquiry based learning (EBL) model of learning that is group and activity based. This new curriculum framework provides an academic and professional program that attempts to ensure that undergraduate degrees for health and human services are both knowledge and vocationally based. The EBL model and process encourages the diversity of the student population to work with each other so that in each subject, students form learning groups that cross disciplines, cultures, age groups and experiences which presents challenges but also highlights issues of group work, diversity, cultural competence and other issues that academic staff and students now have to confront on a daily basis on-campus.

Built within the first year experience of students in this new suite of 4 year programs are two specific mentoring programs that aim to improve the success of students. A peer mentoring program has been facilitated for the past two years that connects students in their first year of university with students in their second or third year to assist in the transition to academic and professional education. The program has been structured so that students can connect with others from similar backgrounds who understand their lives and needs and as such mature age students can be mentored by a mature student, younger students from rural backgrounds with the same and students from non-English speaking backgrounds with other NESB students, encouraging the development of social and cultural capital as part of the campus experience. This program is soon to be evaluated via an online tool and some preliminary data may be available soon. The main purposes of mentoring for first year mature age students has been to develop a more effective way of developing social networks for those students who often do not spend much time on campus outside of attending lectures and tutorials.

The second program is a discipline mentoring program where students meet as discipline groups such as nursing, social work, public health and so on and are linked to their main discipline academic that coordinates discipline activities throughout the first year of study that introduces the profession to the student. Discipline mentors organise fortnightly sessions where guest speakers from the professions, students in their final year and academic skills and student support staff provide relevant information to first year students to provide relevance to their early studies at university. This can consolidate any individual decision to study a specific course but it can also facilitate change via internal lateral transfers between courses.

These programs have been my passion as I am both the peer mentoring coordinator and senior discipline mentor, playing an integrated role encouraging current academic staff and students to engage with first year students to ensure that their university experience is one that connects them to university study, provides pastoral care, relevant advice and the development of social capital (Townsend, Delves, Kidd & Figg: 2010) within the university community.

Conclusions

With the outcome of the recent Australian election now certain, the Gillard Labor alliance government has reinforced the need to reform and expand the Australian higher education system. It is now widely accepted that this expansion means increasing diversity within this

education sector, but the how, why and how much, do not have universal agreement. Australian still has a three tier system of post-secondary education involving adult, community education (ACE), vocational education and training (VET) and higher education (HE) which has resulted in university education being characterised by less diversity, high unit costs, limited funding sources and where unconventional programs, subjects, students and institutions are viewed with suspicion.

Facing similar reforms and pressures, the USA has expanded differently and from a vastly more diverse base. The US higher education system is diverse in many ways, diversity in purpose, status, financing and costs are the variations that contribute to the scope and exclusivity of the US system. A major differentiation in the US that is being considered in Australia, albeit very quietly, is that, multi-purpose education institutions come in many forms. Urban and regional universities aim to meet the varied needs of cities and regions by becoming an education system within itself, often including community colleges that focus on the range of students found in locale, offering bridging and qualifying programs, four year university programs and graduate schools.

The key feature of the US system is that everything is considered higher education; everyone can go to college; tertiary, post-secondary, post-school, further education, vocational education, advanced education, adult education is the vocabulary of Australian, exclusive, fractured systems. Status hierarchies exist in American higher education as more subtle and complex structures but in one sense philosophically and practically there are gradations, not barriers to access and success.

Regional higher education policy in Australia needs to acknowledge something that urban universities do not; regional policy is about people, place, space and community (Swerissen: 2010). Regional communities develop social, cultural and economic identities around their place in society, their place geographically and historically as well as their place in the future as previously outlined in the Bendigo education plan. Regional communities and cities expect universities to support local people, spaces and places, they want high quality educational opportunities and increased participation and they expect local universities to contribute economically, socially and culturally via partnerships with local organisations and industries.

In terms of creating opportunities for access and success for mature age individuals, as well as people from low SES backgrounds and different cultural groups, community educational partnerships with schools, training colleges, community colleges to create early engagement and local pathways are crucial. Alternate marketing and selection processes and entry pathways into university programs recruit motivated individuals no matter their background coupled with student support programs with accommodation, part time employment, financial assistance and social support; these strategies can provide diverse growth with the Australian higher education sector. When we ask individuals, *'do you think you're ready for university?'* we also need to ask ourselves as higher education institutions, *'are we ready for the diverse students that want to participate in our university?'*

Article Title

The Content-based Reading Approaches (COBRA) Model's Application to ELL and LD students

Authors

Pei-Yi Lee

Ta-Hwa University of Technology, Taiwan

Biodata:

Pei-Yi Lee received her PhD in Curriculum and Instruction from Kansas State University, USA.

She is currently an assistant professor, teaching Reading Language Arts, language testing, Teaching English as a Second Language, and Curriculum and Instruction. She is interested in reading methods for English language learners (ELLs) and students with learning disabilities, teaching strategies for Teaching English as a Second Language, and Curriculum and Instruction.

She has implemented many ESL projects for Ministry of Education in Taiwan.

Abstract

The content-based reading approaches (COBRA) framework was constructed by Heerman (2002). The researcher reviews literature to support the idea that the COBRA model helps English language learners (ELLs) and students with learning disabilities (LD) gain achievement in content area reading. The researcher provides several reading strategies for teaching the COBRA skills for both ELL students and LD students. By drawing parallels between ELL and LD students, the researcher hopes to instigate discussion between the two differing methodologies.

Keywords: reading methods; content-based reading; English language learners (ELLs); learning disability (LD); middle school

The Content-based Reading Approaches (COBRA) Model's Application to ELL and LD students

Introduction

The framework of content-based reading approaches (COBRA) was developed by Heerman (2002). COBRA contains seven reading-learning objectives for subject matter classrooms. Lee's (2007) study investigated ELL teachers and LD teachers' perceptions of the importance of several specific reading strategies for helping their respective type of student learn to read, in which she consolidated seven of the COBRA goals into five: background knowledge; experiential learning; vocabulary; comprehension; and study and appreciation. Lee (2007) mentions that the structure of the COBRA model was designed to accommodate three interchangeable approaches: the communicative approach, the skills approach, and the strategic approach. Much literature shows evidence that the five goals of the content-based reading approaches (COBRA) framework provide ELL students and LD students with a great deal of help on content-area subjects. Drawing from her doctoral research, and following the five core COBRA goals, the researcher provides several strategies for teaching content-based reading to ELL and LD students.

Background knowledge

Literature for ELL students

Short and Echevarria (2005) state that "content-area teachers can provide rich, meaningful lessons that strengthen background information and promote the literacy of students learning English" (p. 1). They argue that like native English speakers, English language learners (ELLs) have differing levels of cognitive ability. "When ELLs struggle with schoolwork, however, teachers should be aware that the problem may be related to background knowledge rather than to intellectual ability" (Short and Echevarria, 2005, p. 10).

Duff (2001) argues that ESL students in mainstream social studies classes are often disadvantaged in several ways such as the lack the linguistic, cultural, and geographical knowledge to interpret oral/written texts. Therefore, activating ELL students' background knowledge is the foundation of learning the content-area subjects.

Peregoy and Boyle (2000) state that good readers will set a purpose for reading and bring several knowledge resources to bear upon the comprehension process, among them: decoding ability, language knowledge, background knowledge, written genre knowledge, familiarity with text structures, and comprehension-monitoring abilities. They also claim that "comprehension was better when reading the passage reflecting their own cultural tradition. In similar studies involving culturally familiar and culturally unfamiliar passages of similar linguistic difficulty, comprehension was higher for the culturally familiar text" (p. 5). In other words, familiarity with text content "alleviated limitations" associated with second language proficiency in text comprehension. It is clear that background knowledge is a powerful variable for both native and non-native English readers. However, it becomes doubly important in ELL reading because "it

interacts with language proficiency during reading, alleviating the comprehension difficulties stemming from language proficiency limitations. Therefore, building background knowledge on a text topic through first-hand experiences such as science experiments, museum visits, and manipulatives can facilitate success in reading” (Peregoy and Boyle, 2000, p. 5).

Heffernan (2003) suggests that teachers “conduct brainstorming activities before reading a text to supply students with the appropriate words and knowledge. Discussing appropriate vocabulary and phrases with students, surveying student opinions, or hypothesizing about a text are also useful techniques for teachers to employ” (p. 64). He believes that these techniques not only provide students the useful skills to activate background knowledge, but also give them the problem-solving skills to develop overall fluency.

Literature for LD students

It is helpful to activate LD students’ background knowledge prior to teaching them a text. Haager and Klingner (2005) state that “pre-teaching vocabulary helps students by providing them with background knowledge that can help them understand the topic they will be studying” (p. 349). They mention that pre-teaching will indicate what information is important and require their attention while reading. They suggest using a variety of pre-reading strategies to help LD students gain or retrieve their prior knowledge before they read such as graphic organizers, semantic maps or webs, and concept maps. In addition, they suggest that field trips, videos, live demonstrations, direct experiences through hands-on learning, multimedia presentations, websites, and guest speakers can provide further background knowledge to ELL students and LD students.

Guided imagery is one of the visualization strategies that “capitalizes on students’ active imaginations. Activities such as role playing, pretending, and daydreaming are natural elements of children’s play” (Buehl, 2001, p. 59). Haager and Klingner (2005) state that graphic organizers provide a visual or spatial framework for organizing the important conceptual relationships among new vocabulary words and help students who have difficulty understanding a concept. In addition, Santa (2006) states that to help students activate their background knowledge, think-pair-share is a very good strategy to help students by asking each pair to think about a topic and write down what they know about it, and then share their knowledge with the whole

Experiential learning

Literature for ELL students

Pierson and Glaeser (2003) state that “the language experience approach (LEA) to reading is a technique that draws upon the real life experiences of students” (p. 123). One example of LEA involves having students dictate a story about an actual experience to a teacher, or partner. Next, they copy the story, illustrate it, and read it over and over. In this way, students’ actual language becomes their reading material. They suggest that there are several important strategies

connected to LEA such as daily journal writing, description of art, and community-based reading and writing.

Literature for LD students

Haager and Klingner (2005) state that the LEA has been found as an excellent way to get nonreaders started with beginning instruction, and help students who have experienced failure in their initial reading experiences. They define language experience approach (LEA) as a “whole-to-part, constructivist approach that has been widely recommended for students with learning disabilities (LD),” (p. 230), and note that “it is appropriate for diverse, inclusion classrooms” (p. 230).

Vocabulary

Literature for ELL students

Wiesen (2001) states that authentic texts bring learners closer to target language culture, which can be highly enjoyable and motivating. Problematically, Mastropieni, Scruggs, and Graetz (2003) identify that content textbooks typically do not present material in a reader-friendly fashion, but instead contain densely worded paragraphs that include an overwhelming number of concepts, facts and details with insufficient explanation. Nichols and Rupley (2004) suggest some useful reading strategies such as semantic word maps, webbing, semantic feature analyses, and teaching relationships among words. They are effective tools that incorporate many of the guidelines for the active processing of vocabulary. Such vocabulary activities enable students to expand their vocabularies, understand relationships between the new word and existing concepts, and ultimately learn the meaning of the new word. These strategies, when matched with the appropriate instructional design, can become part of pre-reading activities, during-reading activities, and post-reading activities. When used as a pre-teaching activity these visual displays of words can activate and construct key concepts prior to reading, which help motivate and set a purpose for the reading task, while at the same time reinforcing the cohesiveness between vocabulary development and reading comprehension. According to Barry's (2002) study, visual aids, analogies, graphic organizers, note-taking, writing-to-learn, study guides, vocabulary activities, anticipation guides, and K-W-L are frequently used by more than 50% of the middle and high school teachers she surveyed.

Rodriguez and Sadoski (2000) state that the keyword method explicitly brings into play both verbal and imaginal processes because the keywords and the target words affect the development of vocabulary in the second language. The use of mental images creates appropriate referential interconnections between L2 verbal representations and the imagery system. Zhang and Schumm (2000) point out that “experiences and prior knowledge affected comprehension and recall, and that vocabulary knowledge, typically, may be a highly significant variable in United States ESL learners' success” (p. 4).

Literature for LD students

Haager and Klingner (2005) mention that students with learning disabilities (LD) require careful, systematic planning and instruction to help them acquire new vocabulary. They argue that when LD students lack the background knowledge and experiences necessary to understand new words, learning can be quite difficult. Then, “the focus should be on helping students make connections or associations between new words and previously learned information” (Haager and Klingner, 2005, p. 347). Many researchers advocate explicit instruction. However, it is more difficult for students with learning disabilities to obtain direct instruction and repeated practice in a general education than in a special education classroom. In addition, Lee and Vail (2005) state that “computer programs can be valuable tools to teach and to provide practice of new vocabulary or concepts in a general education classroom. They could also save teachers' instructional and preparation time” (p. 6).

Comprehension

Literature for ELL students

Hickman, Pollard-Durodola and Vaughn (2004) recommend “using culturally relevant texts as well as those that incorporate aspects of students' life experiences to draw upon prior knowledge to promote comprehension and retention of text concepts and new vocabulary” (p. 1). Opitz (1998) reminds us that “comprehension instruction for all developing readers must be sensitive to the total orchestration of cognitive, linguistic, and cultural variables in order for the literacy learners to construct meaning for the texts they are reading” (p. 92).

Fitzgerald and Graves (2005) seek to persuade teachers that they should use scaffolding reading experiences (SREs) to help educate ELL students. The SRE framework consists of a set of pre-reading, during-reading, and post-reading activities to use with any genre of text, including fiction and nonfiction. These pre-reading, during-reading, and post-reading activities will break down a complex reading task into smaller chunks to help tailor lessons to ELL students' abilities and needs.

Taguchi (2002) proposes some useful reading strategies to help ELL students achieve comprehension when they are reading narratives. These comprehension strategies are paralinguistic cues, including vocal qualities, intonation, stress, pause, tone, or speech rate; adjacency pair rules such as the use of the knowledge of conversation structure; background knowledge/experience; key word inferencing; logical reasoning; and speaker's intention. In addition, Kruger (2000) suggests several comprehension strategies for ELL students: skimming material for essential information and underlining it; organizing ideas by category and labeling them or diagramming them; reading by phrases and clauses to increase comprehension; summarizing; identifying themes, sequences, and main ideas.

Literature for LD students

Haager and Klingner (2005) state that LD students are poor comprehenders and “lack both the meta-cognitive skills to monitor their reading comprehension and the ‘fix-up’ strategies to repair understanding when it breaks down” (p. 355). They emphasize that “comprehension strategies are helpful for all students, but are critical for students with learning disabilities” (p. 355). They advocate many useful comprehension strategies such as text-structure-based strategies, interactive instructional model, K-W-L strategy, directed-reading-thinking activity (DRTA), answering comprehension questions (QAR), and collaborative strategic reading (CSR). Text-structure-based strategies refers to “the way the text is organized to guide readers in identifying key information and making connections between ideas,” (Haager and Klingner, 2005, p. 363) including compare/contrast structure. According to Haager and Klingner (2005), the interactive instructional model was developed specifically for LD students but also benefits other students, particularly ELL students by helping them with text comprehension and content area learning.

Directed-reading-thinking activity (DRTA) is a predicting strategy for helping LD students understand content area text. It was “developed to help students refine their purpose for reading and apply prior knowledge to understand text” (Haager and Klingner, 2005, p. 365), including reciprocal teaching. Haager and Klingner (2005) state that LD students often have problems locating specific information in text. Answering comprehension questions (ACQ) is a way to assess students’ comprehension of text, including question-answer relationships (QAR). They point out that students are taught to identify the different kinds of information needed to answer comprehension questions, as well as where to find the information before, during, and after reading. In addition, describing collaborative strategic reading (CSR), Haager and Klingner (2005) state that “initially the teacher presents the strategies (preview, click and clunk, get the gist, and wrap up) to the whole class using modeling, role-playing, and teacher think-alouds. After students have developed proficiency applying the strategies through teacher-facilitated activities, they are then divided into heterogeneous groups where each student performs a defined role as students collaboratively implement the strategies” (p. 367).

Mastropieri, Scruggs, and Graetz (2003) mention that frequently, secondary school content-area textbooks have readability levels that are even higher than the assigned grade levels. They emphasize peer-tutoring/peer-assisted learning strategies (PALS) that incorporate comprehension strategy instruction and elaborative strategies in history and science classes, tutoring interventions that appear to improve content-area learning while also improving reading comprehension strategies, and the use of Inspiration software that generates spatially organized graphic organizers to facilitate comprehension of content-area instruction.

There is no text that is completely explicit, students, especially LD students, must be skilled/trained at making inferences in order to fully comprehend what they read. Eilers and Pinkley (2006) state that the reading comprehension of students will be greatly affected by explicit instruction. Alfassi (2004) also claims that “the teacher's role is to explicate strategies for learning from text so that students perceive them as useful, meaningful, and beneficial” (p. 173). Teachers need to use direct instruction to directly teach students how to use inference to strengthen comprehension. The direct instruction includes explanation, modeling, and scaffolding to help students until they can be successful independently of the classroom environment.

Study and application

Literature for ELL students

Referring to ELL students, Wiesen (2001) suggests that “authentic texts are basic to communicative and proficiency-oriented foreign language teaching, because they contribute to authentic linguistic and strategic skills and are more interesting than edited texts” (p. 2). Nonverbal communication is an effective teaching strategy and needs to be given more attention in teacher development programs. Teachers must become aware of its largely culturally specific nature as well as the ways they actually use it and how it can be best exploited in ELL teaching (Lazaraton and Ishihara, 2005). Swanson (2005) has stated many strategies for helping students learn to read such as checklists/organizers. She recommends breaking tasks into small steps, and using simple lists to let a child know what steps to follow. In addition, she supports the strategy of adjusting students’ first language based nonverbal behavior so as not to confuse students when the first language based nonverbal behavior is employed concurrently with the verbal target language.

Literature for LD students

Lenz and Deshler (2004) suggest that cooperative learning, peer learning, and structured small group practice will help LD students improve their reading abilities, interpersonal skills, and social and problem-solving skills. They mention many organizers to help students catch the main ideas and make connections between other information and the text when they read such as visual organizers, structure organizers, and semantic organizers. Reciprocal reading is another effective method to enable LD students to activate four different comprehension strategies - predicting, questioning, clarifying, summarizing - which they apply collaboratively to help each other understand a text they are reading (Lenz and Deshler, 2004).

Paraprofessionals’ supplemental daily tutor scaffolding and individualized corrections may provide critical support in context reading skills (Vadasy, Sanders, and Peyton, 2005). Calhoon (2005) states that peer-assisted learning strategies (PALS), a reading comprehension strategy program at the high school level, significantly increased the reading comprehension skills of students with reading disabilities. Recent studies have shown that peer tutoring is very

effective for teaching reading comprehension strategies in remedial reading classes and in English classes at the middle and secondary levels (Mastropieni, Scruggs, and Graetz, 2003).

Conclusion

By drawing parallels between ELL and LD teaching strategies, the researcher aspires to introduce to both schools new teaching methods for promoting the COBRA skills set. While recognizing the inherent differences between LD and ELL student needs, this article provides for both LD and ELL teachers proven and effective methods of teaching core reading skills. Her study provides teachers of these two types of students (ELL and LD) with more sound and effective methods for teaching reading. A significant aspect of Lee's (2007) study is that it helps school administrators in the public school setting make decisions about how to evaluate cross-curricular teaching methods related to ELL and LD reading instruction. The literature for each of the five COBRA goals for English language learners (ELLs) and learning disabled students (LD) above shows rich support for the idea that the COBRA model is beneficial for teaching English language learners (ELLs) and learning disabled students (LD) in content area subjects.

The Promise and Challenge of Global Higher Education Integration

Martin A. Dada

Morgan State University

Madad1@morgan.edu

A paper presented at the Asian Conference on Education – Internationalization or Globalization:

ACE 2010, December 02-05

Osaka, Japan

iafor

Abstract

In order to stay competitive and also increase global access, internationalization strategies as an applied principle, draw on certain assumptions of globalization. While this approach has catalyzed promising innovations in educational delivery, it has also revealed the challenges of applying globalization principles to the core goals of education and recently, the pursuit of higher education integration. What are these promises and challenges? And how can we move beyond them?

This paper addresses these questions by exploring the conceptual goals of internationalization and globalization, key debates on the implications of globalization on higher education and the assessment of particular experiences of selected institutions on internationalization projects. Drawing on these sources, this paper aims to provide another sense of relationship between internationalization and globalization. By proposing a theory of complementarity that brings together internationalization and globalization principles, I argue that complementarity offers a conceptual framework for increasing access to higher education by working towards three goals: Internationalization strategies must grow beyond the dominant influence of building economically competitive higher institutions to other goals aimed at attaining international solidarity and educational partnership; Reshape trade liberalization in fair terms that globalization can deliver economic promises that can empower peripheral higher educational systems to build infrastructures necessary to attract cross border educational exchange especially those proposed under the General Agreement in Trade and Services (GATS) and build governments that are keen about making the dividends of global trade compliment institutional goals of research, multicultural growth, and increased access to quality education through internationalization.

The Promise and Challenge of Global Higher Education Integration

Martin A. Dada
Morgan State University
Madad1@morgan.edu

Introduction

The enormous transformation of university role from one that was based on producing research and the skills for national economic and social development to one that now extends largely to developing the capital skills required to sustain a growing global market economy has increased the vulnerability of university to global economic influences.

Those who take an upbeat view of an economic encroachment argue that higher education serves the economic interests of governments and plays a significant role in the development of modern societies. Several studies on the particular indicators of societal growth have reinforced the developmental role of higher education. For instance, studies have shown that the underlying long-term growth rates in OECD economies depend on maintaining and expanding the knowledge base (World Bank, Washington, DC).

However, critics of an economic encroachment have argued that even though knowledge contributes to the empowerment and development of all sectors of society (Burch 2005), current economic encroachment, as Jiang (2006), argued are deliberate effort of neoliberal world institutions such as the World Trade Organization and the World Bank to use knowledge and information interchangeably to serve their profit-seeking purpose. To this extent, they strongly advocate the economic value of 'knowledge' in the knowledge economy, and link it to technological innovation and economic prosperity (Jiang 2006).

Also, the internationalization activities noticeable in curriculum, commercial presences, student and academic exchanges, research collaboration, and institutional partnerships are sizeable practices that tend to build the infrastructure for a systemic integrated global academia. Philip Altbach and Jane Knight, (2006) note that the prospect of an integrated higher education is high as globalization continues to be a strong rationale stimulating substantial effort of international academic partnership and academic mobility.

The paper primarily responds to some of the concerns about the relationship between globalization, internationalization, and higher education integration as to whether they are three essential complimentary ingredients or three mutually exclusive concepts necessary for contemporary global higher education development. Although, it appears that the three concepts, globalization, internationalization and global higher education integration, are conceptual peers that can be either in harmony with each other, in conflict with each other or independent of each other. However, the interpretations of these terms and the relationships among them are complex

and multi-dimensional and can be framed differently in various contexts depending on the underlying ideology of the discourse.

From one, and dominant perspective, both Philip Altbach and Jane Knight conceive the relationship between globalization and internationalization as catalytic. Here, globalization is the economic, political, and societal catalyst propelling 21st century higher education toward greater international involvement (Altbach & Knight, 2006). From this perspective, the relationship between the three concepts may be interpreted accurately as causal. In which case, globalization, under an economic rationale is the compelling force that causes higher education to move towards greater global involvement and the idea of increasing global international education involvement can arguably be conceived as a measure of success in a globalizing economy that institutions must achieve.

From the perspective I take in this paper, the concepts of globalization, internationalization and higher education integration are differentiated yet uneasily fused together and intimately linked by the notion of complementarity. In this perspective, I propose that the merging of economies and its effect on higher education specifically in terms of universities practices of internationalization and integration through partnerships and collaboration are not necessarily causal. Rather, globalization as a theory and process has provided an influential economic framework that provides incentives for a voluntary participation in internationalization and integrative processes.

Globalization, Internationalization, and Global Integration Conceptualized

Globalization is widely accepted amongst scholars as an irresistible force transforming all aspects of contemporary society, politics and economy (Wolf, 2004). Its influence on economic systems is very profound and as a result, can be conceived from an economic perspective as a phenomenon by which economic agents in any given part of the world are much more affected by events elsewhere in the world (Wolf, 2004). Through the liberalization of trade, competition, free capital mobility and easy migration, blurring national borderlines national economies of the world tends to be integrating into one global economy (Currie et al. 2003, 11).

In the realms of higher education, globalization is a wake- up call for survival in the international environment (Suwanwela, 2007). This has led especially in the western world to the development of overall strategies for the organization of higher education institutions by public authorities, as well as to strategies by higher education institutions aiming to position themselves within the emerging higher education systems (Bleiklie, 2005). This is exemplified clearly by the European Commission Bologna Process, which is partly the European approach towards improving quality and international attractiveness of European higher education, its global positioning and converging systems of higher education (Gidley, J.M., Hampson, G.P., Wheeler, L., & Berded-Samuel, E. (2010).

Through internationalization activities, higher institutions continue to promote the interest of governments and private investors. Altbach (2009) defined Internationalization of higher

education as the process of integrating an international/intercultural dimension into the teaching, research and service functions of the institution. This definition only understands internationalization as a process and a response to globalization. Traditional international activities include the study abroad programs that allow students to learn about other cultures to providing access to higher education in countries where local institutions cannot meet the immediate national demand. Other related activities stress upgrading international perspectives and skills of students, enhancing foreign language programs, and providing cross-cultural understanding (Altbach & Knight, 2006). However, because the stimulation of globalization continues to expand the international activities of universities in volume, scope and complexities, the tendency is large too, to confuse internationalization with the process of globalization even when it is not economically motivated.

Marek 's (2001) discussion of internationalization gives a hint about the nature of higher education integration as the means to adapt the academy in different countries to the requirements of rapidly changing external world, especially by rearranging research, teaching and administration in ways that conform to a global standard. In fact, Susan Buck Sutton (2010) had argued that internationalization is increasingly turning to an outward process of positioning our institutions in global networks of learning and discovery, and engagement so as we are becoming part of an academic world larger than our institutions, hence we must reconsider internationalization in this light. Mostly, global integration in higher education has been triggered by a recent awareness of the potential of the knowledge society.

Reforms towards Global Integration

Universities around the world do not have equal means to conform to the emerging global standard. This has in part raised institutional competition and has become politically attractive in nations across the world to situate at least one if not more of their universities among top-ranking institutions. The motivation towards this strategic positioning of universities usually draws from a variety of economic, sociopolitical, and cultural notions of globalization.

The Caribbean and Latin American higher education institutions for instance actively pursued opportunities for cooperation with each other, building on existing strengths, in regional networks and with regional and international organizations. Both systems assumed that these processes are essential mechanisms for regional integration and internationalization, and must be an essential part of the agenda of the region's governments, and academic institutions

Also in Germany the education and research federal minister made a proposal to identify Germany's top-level institutions that can stand as lighthouses to secure Germany's competitiveness and economic future in the emerging knowledge society and to strengthen the international visibility of German universities as highly-quality institutions (Robertson, 2010). Generally in the past ten years, European higher education systems appear to have undergone exceptional integration. This is most clearly evidenced by the Bologna process. The Bologna

process is framed within the concept of internationalization as a systemic effort designed at making higher education more responsive to the requirements and challenges of global societies, economy and the labor market. It is a way of taking control of globalization and responding to its challenges (as cited in Doh, 2008).

Perhaps, the clearest example of integration reform is in the example of Brazil. In 2009, Brazil's Senate granted official authorization for the creation of a new kind of university – the Federal University for Latin America Integration, otherwise known as UNILA (Robertson, 2010). UNILA is one of three regional integration universities established by Brazil's President Luiz Inácio Lula da Silva in 2006 to promote Brazil's interests within the region and globally. Two other university projects created for similar purposes are the Afro-Brazilian University of Integration, and the University of Amazonian Integration. These Brazilian initiatives were the recent addition to a rapidly changing higher education landscape around the globe (Robertson, 2010).

These initiatives have in common a shared ambition to use international higher education networks to advance cultural, political and economic projects. However while the German initiative is aimed at transforming some its universities to world class positions, the Brazilian development projects were aimed at creating a 'supranational', 'global' and 'regional' university respectively, drawing upon staff and students from within the wider region, or from across south-south networks (Robertson, 2010).

In the last decade, there has also seen a veritable explosion in numbers of programs and institutions that are operating internationally. Qatar, Singapore and the United Arab Emirates stand out as examples of countries that have boldly promoted internationalization as a matter of national policies. They have recruited prestigious foreign universities to establish local campuses, with the purpose of increasing access for the local student population and serving as higher education center for their regions (Altbach, Reisberg, & Rumbley, 2009)

Integration Reforms: Opportunities and Challenges:

Keeping in mind that major national reforms are typically government policy driven, and given the manifestations of globalization, it is important to examine what opportunities and challenges the present day global context pose for universities throughout the world. In addressing this question, I want to pay particular attention to three principles of global capitalism, namely deregulation, privatization and standardization. These principles characterize the foundation upon which major government economic initiatives are built. Their impact on global higher education is enormous.

Deregulation.

In order for nations to easily engage in entrepreneurial activity, there is a movement to deregulate economic mechanisms and free up organizations and individuals. In the United States, The Virginia Commonwealth's commitment to decentralization and deregulation stretches well beyond the last decade, and the effort of the State Council of Higher Education for Virginia to establish a study to understand the strategies for advancing decentralization and deregulation of higher education is a testament to the impact of globalization on higher education

In some other national contexts, such as the People's Republic of China (PRC), the deregulation of higher education is discussed in terms of decentralization. The Chinese Communist Party acknowledged that over-centralization and stringent rules are detrimental to the initiatives and enthusiasm of local educational institutions (as cited in Rhoads, 2006). Hence, the Chinese Communist Party called for reform aimed at decentralizing the nation's higher education sector by devolving decision-making power from the central government to individual higher education institutions. A step like this allows more autonomy and flexibility to local governments and educationalists in directing the course of educational development (Rhoads, 2006). Translated to the higher education arena, universities throughout China are increasingly operating in an environment in which they are freer to make their own economic choices, and, in fact, with reduced funding from the national government seem to have no other alternative.

The expansion of deregulation is a clear attempt of escalating the role of entrepreneurialism in higher education. In many western countries, especially within the public university sector, deregulation policies had gone hand-in-hand with decreased state support and has created forms of economic entrepreneurialism some scholars have described as "academic capitalism"—a situation in which the primary objective of the university increasingly revolves around the generation of revenue and not essentially teaching and learning (Slaughter & Leslie 1997)

Opportunities and challenges in the practice of higher education deregulation. When deregulation goes along with substantial financial support by the state, then deregulation presents universities with the prospect to expand their agenda through their own inventive means. On the other hand, when deregulation is accompanied by reduction in state support, which happens to be the most common circumstances, universities are outwardly coerced to become entrepreneurial institutions and in many cases follow a path of increasing dependence on tuition and fees (Rhoads, 2006).

Privatization.

Another way in which global capitalism is reshaping university reform revolves around privatization. In some ways, deregulation and a decrease in support are the means for achieving a specific end, which is privatization. In a broader philosophical sense, this trend represents private interests assuming priority over the broader social good that higher education stands to fulfill. Furthermore, the deregulation of higher education has made "for-profit" and private universities increasingly viable. For example, in the United States, this trend is more evident in the "for-profit" higher education, where institutions such as the University of Phoenix quite successfully have carved out their own slot by stressing practical and vocational education over some of the more esoteric forms of learning characteristics of many U.S. universities (Rhoads, 2006). In the People's Republic of China, the private sector has appeared to help meet the challenging

demands of a massive population, as the nation increasingly seeks to build a workforce capable of competing in a global market place. However, and as a result of deregulation, the quality of private colleges and universities, as well as the for-profits, ranges quite significantly.

Privatization may also lead to increases in tuition and fees, since many public universities are compelled to shift to user-fees as primary sources of funding. By this, privatization can influence universities away from the ideal of increasing access for those at the bottom of income level low-income and making a university education more exclusive for the well-off.

Standardization.

The last area connected to the extension of global capitalism is a movement toward increasing standardization. This largely echoes the broader capitalist effort to standardize products and commodities for the benefit of global trade. The idea behind this is that when products and services are guaranteed to meet specified standards, then the risk to international exchange is decreased and global trade is enhanced (Rhoads, 2006). The same ideology has been promoted by the World Trade Organization (WTO) in their particular effort to treat higher education as a tradable commodity to be governed by similar rules guiding multinational trade agreements. In such policies as GATS, the WTO has attempted to frame the ways in which universities and their entrepreneurial personnel interact with other universities. Altbach, et al. (2009) however argued that globalization, regional integration, and the ever-increasing mobility of students and scholars have also made the need for internationally recognized standards among and between nations more urgent.

In many developing countries, public university programs do not have sufficient capacity to educate all those students who want to prepare themselves for global employment hence private universities, often of questionable quality – typically spring up to meet the demand. The process of enforcing global accreditation standards is arguably a response that serves the goal of standardization, and incorporating only institutions with the means of international reach around the world into common standards. Notable organizations such as the WTO and the United Nations Educational, Scientific, and Cultural Organization (UNESCO), have sought to develop an international quality-assurance agency to monitor global higher education projects. Rhoads (2006) notes that to resist these accreditation processes will result to situating one's university on an isolated island, away from the global market and the economic benefits of academic capitalism.

There are opportunities here in that as states withdraw their financial support they also lose a degree of control. And so many universities today are freer to be entrepreneurial and shape their own destinies. In the United States, for example, we see a flourishing for-profit sector of higher education that increasingly challenges the customary university for students. At the same time, we see a reduction in financial support for low-income students, as universities are forced to raise tuition in the face of massive budget dearth.

Bridging the gap: complementarity as a new form of assistance

Marginson (2004) illustrated that the current transnational markets in higher education are structured as a segmented hierarchy which reflects dominance in three aspects: between 'developed' and 'developing nations'; between English and non English language universities; and between the hegemonic power of the United States in world higher education' and higher education in the rest of the world. The unequal reputation, status and infrastructures create differences in opportunities and competitiveness. The noticeable gaps and rivalries however, can be overcome by goodwill and pursuit of mutual benefit. This will also translate into globalization, internationalization and integration processes delivering more measures of success.

The type of partnership exemplified in the case of a Nan Learning Center established by Chulalongkorn University, based in Bangkok, in collaboration with the newly upgraded Rajmongkol University at Nan, mirrors how institutions with more resources can compliment, and aid universities with lesser capacity in achieving their institutional goals. Suwanwela, (2007) noted that instead of Chulalongkorn University raising competition by starting a new campus at the northernmost province of Nan, a learning center was built on the Rajmongkol campus with relevant research laboratories and facilities to access to the library system at the main Chulalongkorn University. It provided advanced amenities to faculty and students at Rajmongkol as well as opportunities for researchers to conduct research on the ground. This gesture clearly demonstrates that the collaboration is geared towards mutual benefit.

Another example of university partnership embedded in complementarity is the Sasin Graduate Institute of Business Administration at Chulalongkorn University established about 30 years ago in collaboration with Kellogg School of Business at Northwestern University and the Wharton School at University of Pennsylvania. The College of Petroleum and Petro-chemistry at Chulalongkorn University began fifteen years ago in collaboration with the University of Oklahoma, Western Reserve University and Akron University. Suwanwela, (2007) stated that both cases were in response to the need in the region for particular manpower and research. To kick start the projects, professors from top universities in the United States came to teach and conduct. Students from Chulalongkorn University were allowed to spend research time at the United States counterparts. The financial obligations and management belonged to the Chulalongkorn University; both universities from the United States approached the relationship on the basis of moral imperatives upon which the idea of complementarity is founded. The collaboration certainly helped expand the sphere of reputation for the prestigious universities from the United States; the programs are unquestionably of goodwill to Chulalongkorn University in the pursuit of new advances.

With reference to the prestigious and competitive position of both Kellogg School of Business at Northwestern University and the Wharton School at University of Pennsylvania, internalization and collaborative effort could have been motivated by economic globalization precepts. As a result, such opportunities could have been perceived as an economic or business opportunity to amass profit from institutions with unequal capacity. With economic globalization conceived as a phenomenon by which economic agents in any given part of the world are much more affected by events elsewhere in the world, internationalization effort need to respond to globalization

forces with a caution of goodwill. By this, such capitalist principles that encourage the reduction of barriers to educational exchange globally can be couched to aid internationalization efforts only embedded in the traditional international activities that include programs that allow students to learn about other cultures to providing access to higher education and research facilities in countries where local institutions cannot meet the immediate national demand. Therefore, principles of deregulation, privatization and standardization when applied to higher education must pursue interests that generate educational benefits, and not primarily economic revenue. With a foundation in complementarity, the whole global university system appears at an advantage and better with such generous attitude.

Conclusion.

To conclude I want to stress that the increasing role of academic capitalism in shaping university relations suggests many opportunities and challenges for universities in globalizing times. As an example, I want to call upon the idea of 'offshore campuses in which universities in many advanced nations build a center in a host country, or what has been famously described as 'commercial centers'. Here academic capitalism brings universities in high demand to the doorstep of the consumers. Prior to this time, the only possible way to receive international education was through physical travel abroad. In some ways, one might argue that this trend may benefit the host country by reducing the problem of brain-drain that a travel abroad could have potentially caused when international students decide not to return to their home country.

However, within the context of academic capitalism, generating revenue becomes an end in itself, and many universities thinking of building offshore campuses come to tailor their lines of development to where the money is – just as we see in the commercial presences of American universities in Dubai. Sometimes these projects are carried out with little regard for the moral and social consequences of their actions. Just as entrepreneurship can sometimes lure corporations to engage in less than ethical acts, the same is true of universities and the pressures connected with academic capitalism. In my view, the most important challenge that the present-day environment poses for universities around the world is to find a socially just manner by which to embrace elements of academic capitalism that can foster internationalization efforts that increases access to university education, cross-cultural, and research exchange. Most importantly, we need to find a veritable balance between the need to generate revenue and the ideals of advancing a more just global educational community. Finally we need to develop frameworks for increasing access to higher education by working towards three goals: Internationalization strategies must grow beyond the dominant influence of building economically competitive higher institutions to other goals aimed at attaining international solidarity and educational partnership; liberalization trade liberalization in fair terms that globalization can deliver economic promises that can empower peripheral higher educational systems to build infrastructures necessary to attract cross border educational exchange especially those proposed under the General Agreement in Trade and Services (GATS), and national governments must be keen about making the dividends of global trade compliment institutional goals of research, multicultural growth, and increased access to quality education through

internationalization. Merely leaving universities and their international operations to the whims and caprices of the free trade is unlikely to achieve such a goal.

“Does Gender Matter?”
An Experimental Study of Gender Differences
on Music Learning

Dr. Dennis Ping Cheng Wang
Assistant Professor in Music Education,
Faculty of Education
University of Macau

dennisdma2000@yahoo.com

ABSTRACT:

The purpose of this study is to exam whether the gender differences would cause different music learning efficiency for the 1st grade elementary students and to determine whether there were any significant gender differences in music learning in Hong Kong, China.

The results of this study showed that both genders are equally interested in participating any music activities held in the classes. However, the results revealed that girls demonstrated better concentration during the class and better comprehensibility than boys on rhythmic dictation. Moreover, girls performed better on playing rhythms on the provided small percussion during the experiment. In the aspect of music reading and singing, girls not only had better understanding; but girls also sang more accurate pitches in singing songs than boys.

To conclude, in order to have the best results of music teaching and music learning, music teachers need to be alert the differences of learning ability on both genders, esp. many young boys usually have difficulty to sing in correct pitch in the early stage of music learning, and comprehend different combination of rhythmic patterns. Furthermore, more music activities and body movements can be included in music class so that children can learn music concepts, such as, rhythms, dynamics and tempos in the most nature and interesting way. At last, the music teachers should be careful the progression of teaching contents and keep track the progressions of each individual in the class.

Keywords: Music Education, Orff Method, Music Classroom, Learning Difference, Gender

**“Does Gender Matter?”
An Experimental Study of Gender Differences on Music Learning**

Dr. Dennis Ping Cheng Wang
Assistant Professor in Music Education,
Faculty of Education
University of Macau

PURPOSE OF THE STUDY

Many researches and reports have proved that male's and female's brains function differently. For language learning, male usually uses only left side of hemisphere of their brains, while most of females are able to use their both sides hemisphere of their brains, and this fact provides most female an advantage on language learning. Moreover, although men have more brain cells than women, women's brain cells have more neural connections among each brain cell, therefore, women have greater access to transfer data from left to right hemisphere areas. (Wang 2003) All of the above have shown that the different brain structures and functions between male and female may cause different behavior results in many aspects between the two genders.

This study is to examine the learning curve between 1st grade boys and girls in the music classroom in Hong Kong, China. The purpose of this research is to find out if there are any major learning differences and challenges between two genders in music learning at elementary school students so that the music teachers can be aware of the potential problems and have further solutions. Furthermore, the researcher also gives recommended music practices and activities which can be used in future music classes according to the results.

METHODOLOGY:

There were total on hundred randomly selected 1st grade students (fifty boys and fifty girls) with the age of 6 -7 who registered at the 1st year of two local elementary schools in Hong Kong, China participated in this study in the year of 2008. All of the randomly selected students equally had previously one semester music training at the local elementary school. The researcher divided the one hundred participated students into four classes with the number of 25 students in each class. All of the students were equally given pre-test and post-test in order to get the most fair and average results. The study was controlled in the sense that the four experimental classes were

ascertained to be of equal ability in their understanding of music before the experimental factor was applied. As well, there were no significant differences in age and mental capacity.

The purpose of this study is to exam whether the gender differences would cause different music learning efficiency for the 1st grade elementary students in Hong Kong, China. The methods of experiment included: rhythmic dictation and music class observation. “The Rhythmic Dictations” were planned as pre-test and post-test which were designed based on the level and concepts of their music textbooks and training in the previous semester before the experiment. Both of the questions of pre-test and post-test were identically same so that the results can reflect the truths and fairness of the study. The purpose of the pre-test and post-test revealed that although both male and female participants’ were under the same learning circumstance and environments, the results of the tests reflected the learning differences between two genders. “The Music Class Observation” can reflect students’ interests and willingness toward the music class. By observing students’ class participation, the music teachers and the researcher can discover the experimental students’ reaction and learning outcomes toward the current music activities and modify music methods used in the current music class.

In order to track students’ learning progress and differences, the authors also designed questionnaire for the music teachers during the period of experiment. The questionnaire seeks four types of information: (1) Teachers’ personal information; (2) Students’ music learning progress; (3) The current music materials and approaches used in the classroom; and (4) The weekly journal taken during the period of the experiment. The author believes that the responses of this questionnaires provides the most fair and reliable records of students’ learning progress. Not only can the teachers’ teaching methods and materials be traced and, but the process of each students’ learning progress were also recorded during the period of the experiment. Furthermore, the teachers' expectations and the weekly journal from the experiment were all included in this questionnaire.

RESULT AND CONCLUSION

The results of this study showed that both genders were equally interested in participating any music activities held in the experiment. However, the results revealed that girls demonstrated better concentration during the class and better comprehensibility than boys on rhythmic patterns clapping and dictation. Sax (2007)

advices parents and teachers in order to increase boy's attention and learning motivation at school by limiting boys' focus so that boys can be more concentrate in class. According to both pre-test and post-test, majority of girls showed better scores than boys. However, the results can not 100% indicated that the participated girls' "music ability" were better than boys'. The results of the tests might imply the personal interests toward the subject between two genders. In the experiment, girls also performed more accurate on playing rhythms on the provided small percussion during the experiment while the boys were more interested in playing the percussion instruments. In the aspect of music reading and singing, girls not only demonstrated better understanding on both exercises but girls can also sing more accurate pitches than boys.

The results of the questionnaire reflected that although 95% participated music teachers know what Orff Music Method, Kodaly Music Method and Dalcroze Music Methods are, there were only 34% of the music teachers used the approaches in their music class before. The lack of using the above mentioned international well-known music methods may cause the music class less motivated and inspired toward students. (Wang 2008). The results also revealed that more than 68% music teachers were aware that girls demonstrated better performance in the music class over boys while only 22% teachers believed that both genders perform equally well during the experiment. The result of the questionnaires was surprisingly shown that there were 46% teachers believed that the boys and girls can have better progress and perform equally well if the music teachers change their music methods and approaches in the class while there were only 12 % music teachers believes that the learning differences will be the same no matter if the approaches change or not.

The main finding of this study was to prove children in Hong Kong, China learning music differently due to the gender differences. As well, the results advice the local music teachers teach different gender students should use different approaches and strategies. The author suggests that in order to have efficient music teaching and learning, music teachers need to be alert the differences of learning ability on both genders, esp. many boys usually have difficulty to sing in correct pitches, and have challenges to comprehend different combination of rhythmic patterns. Kovalik (2008) also states that girls demonstrated better ability and comprehensibility on receiving and hearing music over boys. Furthermore, more music activities and body movements should be included in music class so that children can learn music concepts, such as, rhythms, dynamics and tempos in the most nature and motivated way. Moreover, music teachers should find solutions to help young boys comprehend different combination of rhythmic patterns so that boys can learn music efficiently. At

last, the music teachers should be careful selecting teaching contents and keep track of the progressions of each individual in the class. Music class can be more interesting and motivated if the teachers includes more music activities with the well-known international music methods in their music classes so that children can also learn music concepts, such as, rhythms, dynamics and tempos in the most nature way.

Abstract - Artificial Intelligence (AI) is one of the mostly used technologies nowadays and it is also one of the key learning areas for students in the field of computer science. The game of Chess was, for a long time, known as the "fruit fly" of AI. In order to facilitate students practicing their programming techniques and understanding the quality of their own program algorithm, one of the most effective ways is to organise AI programming competition.

Chinese Checkers is a well-known game in Chinese society, and The Association for Computing Machinery (Hong Kong Chapter) holds a programming contest of Chinese Checkers every year. The paper aims to develop a Chinese Checkers Game platform (mediator program) which serves as a communication channel facilitating two AI player programs developed by students to compete with each other, to judge the correctness of the moves and to identify the winning program. Game of Chess has been considered as an effective mean for people to train and develop logical, strategic and conscientious thinking. The Chinese Checkers platform provides not only an innovative learning environment for students practicing AI programming techniques, but also stimulate students' interest to learn actively. Through participation in the game, students actively study and develop their own AI programming algorithm and strive for improvements to be more successful in the game setting.

1. Introduction

Artificial Intelligence is one of the mostly used technologies nowadays, from computer games to household wares. Especially in the recent years, online computer and video games are widely developed. This make the Artificial Intelligence (AI) become more important because most of the games need the AI. It is foreseeable that the development of Artificial Intelligence will continue in the coming future [1]. It will help humans to make decision and solve problems, and understand further on human needs. The term "Artificial Intelligence" was defined in the mid-1950s. Nowadays it is defined as "the subfield of computer science concerned with the concepts and methods of symbolic inference by computer." The first project utilizing A.I. was traced back to 1955 when Carnegie Mellon University researchers developed a computer program to work through proofs resulting in theorems. In the late 50s, McCarthy developed a computer language known as LISt Processing (LISP). This is the language used for most artificial intelligence projects [1].

The Chinese Checkers is played on a game board which is in the shape of a six pointed star. It is playable with two up to six people at the same time. Each player uses pegs or markers in different colors and placed them within one of the points of the star. The objective is to move all the ten pegs across the board (move one step at a time or jump over adjacent pegs) to occupy the star point directly opposite. The player who first gets all pegs across wins. The game does not actually originate from China (nor is it a variation on checkers or Chinese chess), but was given that name in the United States to make it sound more exotic. When it was first released in Germany, it was called Stern-Halma, as it is similar to the older game of Halma except that the board is star (stern) shaped. The Chinese checkers board is laid out in a six-pointed star. The game pieces are usually six sets of colored marbles, ten of each color. The ten marbles are arranged as a triangle in the starting position in one of the corners of the star. Chinese Checkers is a common game in Chinese Society [2, 3]. The Association for Computing Machinery (Hong Kong Chapter) held a programming contest of Chinese checkers every year [4].

Game of Chess has been considered as an effective mean for people to train and develop logical, strategic and conscientious thinking [5]. In this project, it aims to develop a Chinese Checkers platform (mediator) to support active learning for students in the field of computer science. The system, built in Java programming language, facilitates two AI player programs developed by students to compete with each other, to judge the correctness of the moves and to identify the winning program. This allows the students to practice their AI programming skills.

2. Literature Review

2.1. Artificial Intelligence

Artificial Intelligence (AI) is the area of computer science focusing on creating machines that can engage on behaviors that humans consider intelligent. The ability to create intelligent machines has intrigued humans since ancient times, and today with the advent of the computer and 50 years of research into AI programming techniques, the dream of smart machines is becoming a reality. Researchers are creating systems which can mimic human thoughts, understand speeches, beat the best human chess player, and countless other feats never before possible. There are generally four possible goals to pursue in artificial intelligence [6].

2.1.1. Acting Humanly: The Turing Test Approach

The Turing Test, proposed by Alan Turing [7], was designed to provide a satisfactory operational definition of intelligence. Turing defines intelligent behavior as the ability to achieve human-level performance in all cognitive tasks, sufficient to fool an interrogator. Roughly speaking, the test he proposed is that the computer should be interrogated by a human via a teletype, and passes the test if the interrogator cannot tell if there is a computer or a human at the other end. For now, programming a computer to pass the test provides plenty to work on. The computer would need to possess the following capabilities.

- **natural language processing** to enable it to communicate successfully in English (or some other human language);
- **knowledge representation** to store information provided before or during the interrogation;
- **automated reasoning** to use the stored information to answer questions and to draw new conclusions;
- **machine learning** to adapt to new circumstances and to detect and extrapolate patterns.

Turing's test deliberately avoided direct physical interaction between the interrogator and the computer, because physical simulation of a person is unnecessary for intelligence. However, the so-called total Turing Test includes a video signal so that the interrogator can test the subject's perceptual abilities, as well as the opportunity for the interrogator to pass physical objects "through the hatch". To pass the total Turing Test, the computer will need to feature computer vision to perceive objects, and robotics to move them about.

2.1.2. Thinking Humanly: The Cognitive Modeling Approach

To understand how human thinks, understanding of the actual mechanism of human minds is essential. There are two ways to do this: through introspection - trying to catch human thoughts as they go by - or through psychological experiments. Once a sufficiently precise theory of the mind is identified, it becomes possible to express the theory as a computer program. If the program's input/output and timing behavior matches human behavior, that is evidence that some of the program's mechanisms may also be operating in humans. For example, researchers developed GPS in 1960s, the "General Problem Solver" [8], were not content to have their program correctly solve problems. They were more concerned with comparing the trace of its reasoning steps to traces of human subjects solving the same problems. This is in contrast to other researchers of the same time [9], who were concerned with getting the right answers regardless of how humans might do it.

The interdisciplinary field of cognitive science brings together computer models from AI and experimental techniques from psychology to try to construct precise and testable theories of the workings of the human mind. Cognitive science, however, is necessarily based on experimental investigation and the reader only has access to a computer for experimentation. It is noted that AI and cognitive science continue to fertilize each other, especially in the areas of vision, natural language, and learning [10].

2.1.3. Thinking Rationally: The Laws of Thought Approach

The Greek philosopher Aristotle was one of the first to attempt to codify "right thinking", that is, irrefutable reasoning processes. His famous syllogisms provided patterns for argument structures that always gave correct conclusions given correct premises. For example, "Socrates is a man; all men are mortal; therefore Socrates is mortal." These

laws of thought were supposed to govern the operation of the mind, and initiated the field of logic [11].

The development of formal logic in the late nineteenth and early twentieth centuries, provided a precise notation for statements about all kinds of things in the world and the relations between them. (Contrast this with ordinary arithmetic notation, which provides mainly for equality and inequality statements about numbers.) By 1965, programs existed that could, given enough time and memory, take a description of a problem in logical notation and find the solution to the problem, if one exists. (If there is no solution, the program might never stop looking for it.) The so-called logicist tradition within artificial intelligence hopes to build on such programs to create intelligent systems [1, 6].

There are two main obstacles to this approach. First, it is not easy to take informal knowledge and state it in the formal terms required by logical notation, particularly when the knowledge is less than 100% certain. Second, there is a big difference between being able to solve a problem “in principle” and doing so in practice. Even problems with just a few dozen facts can exhaust the computational resources of any computer unless it has some guidance as to which reasoning steps to try first. Although both of these obstacles apply to any attempt to build computational reasoning systems, they appeared first in the logics tradition because the power of the representation and reasoning systems are well-defined and fairly well understood [1, 6].

2.1.4. Acting Rationally: The Rational Agent Approach

Acting rationally means acting so as to achieve one’s goals, given one’s beliefs. An agent is just something that perceives and acts. In this approach, AI is viewed as the study and construction of rational agents. In the “laws of thought” approach to AI, the whole emphasis was on correct inferences. Making correct inferences is sometimes part of being a rational agent, because one way to act rationally is to reason logically to the conclusion that a given action will achieve one’s goals, and then to act on that conclusion. On the other hand, correct inference is not all of rationality; because there are often situations where there is no provably correct thing to do, yet something must still be done. There are also ways of acting rationally that cannot be reasonably said to involve inference. For example, pulling one’s hand off of a hot stove is a reflex action that is more successful than a slower action taken after careful deliberation [12].

The study of AI as rational agent design therefore has two advantages. First, it is more general than the “laws of thought” approach, because correct inference is only a useful mechanism for achieving rationality, and not a necessary one. Second, it is more amenable to scientific development than approaches based on human behavior or human thought, because the standard of rationality is clearly defined and completely general. Human behavior, on the other hand, is well-adapted for one specific environment and is the product, in part, of a complicated and largely unknown evolutionary process that still may be far from achieving perfection. This will therefore concentrate on general principles of rational agents, and on components for constructing them. We will see that despite the apparent simplicity with which the problem can be stated, an enormous

variety of issues comes up when we try to solve it. To achieve perfect rationality, it may not be possible in complicated environments because computational demands are just too high [12].

2.2. *Artificial Intelligence in Chess Game*

AI-based chess game programs combine intelligence with entertainment. On game with strong AI ties is chess. World-champion chess playing programs can see ahead twenty plus moves in advance for each move they make. In addition, the programs have an ability to get progressively better over time because of the ability to learn. Chess programs do not play chess as humans do. In three minutes, Deep Thought (a master program) considers 126 million moves, while human chess master on average considers less than 2 moves. Herbert Simon suggested that human chess masters are familiar with favorable board positions, and the relationship with thousands of pieces in small areas. Computers on the other hand, do not take hunches into account. The next move comes from exhaustive searches into all moves, and the consequences of the moves based on prior learning. Chess programs, running on Cray super computers have attained a rating of 2600 (senior master), in the range of Gary Kasparov, the Russian world champion [13].

2.3. *Chinese Checkers*

Chinese Checkers was first patented by Ravensburger, the famous German games company, under the name Stern-Halma in Germany in 1892. It was originally called “Hop Ching Checkers Game”. In Chinese Checkers, which can be played by 2 to 6 people, each person starts with a set of uniquely coloured pieces in the point of one of the stars. The objective is simply to be the first to move all the pieces across the board and into the star point opposite. Pieces move a single point or else hop over other pieces in order to advance their pieces as quickly as possible. The middle part of the game becomes quite a challenge as the options for hopping vary rapidly as the game changes shape. The player who can best create and take advantage of hopping opportunities will tend to win. The game is both complex but is also easy to play and learn, and it is considered as a suitable first game for very young children [2]. Chinese Checkers is one of the classic Chinese-Cultural board games. It also called “Marble Game”, as the main pegs of the game are marbles of various colors. The gaming board is a six-vertex star shape board that contains 121 positions for placing the marbles (Figure 1).

Figure 1 Chinese Checkers

2.3.1. *General Game Rules*

There are different variations of game rules and one of the popular one called “hop across”. In this game variant, each player puts his or her own colored marbles on one corner of the star and attempts to relocate them all to the opposite corner. Players take turns moving one marble, either a single step or a chain of one or more hops. A step consists of moving a marble to an adjacent unoccupied space in any of the six directions. A hop consists of jumping over a single adjacent marble, either one’s own or an opponent’s, to an unoccupied space directly opposite. The basic strategy is to find the longest hopping path instead of moving step by step. However, since one or more players can make use of whatever hopping ladders an opponent creates, more advanced strategy requires a player hindering opposing players in addition to helping himself or herself. Of equal importance are the players’ strategies for emptying and filling their origin and destination triangles. In the fast-paced variant of the game, game pieces may hop over non-adjacent pieces. A hop consists of jumping over a distant marble to a symmetrical position on the opposite side. However, jumping over two marbles in a single hop is not allowed [2]. This is the game rules that would be implemented and adopted in this project.

2.4. *Active Learning*

Unlike traditional lecture methods, active learning is a process in which students are encouraged to actively participate in the learning process, rather than “passively” absorbing lectures. It involves reading, writing, discussion, and engagement in solving problems, analysis, synthesis, and evaluation. Besides, it emphasizes on teamwork that partners or group members work cooperatively to solve problems [14]. Team learning is especially beneficial in that “weaker” students are taught by “stronger” students who can reinforce their knowledge by explaining the material to others. This ensures that all students within the group really understand the concepts being covered. Discussion is one of the most common strategies promoting active learning. If the objectives of a course are to promote long-term retention of information, to motivate students toward further learning, to allow students to apply information in new settings, or to develop students’ thinking skills, then discussion is preferable to lecture [15]. The idea of “Active Classroom” has been promoted as an effective teaching and learning approach to students [16, 17].

In this project, a Checkers Checkers platform is developed. In addition to facilitate the students with the opportunity to practice their AI programming skills and techniques, this creates a competition setting for the students. On one hand, it is natural for students to compete and to have an innate desire to compare themselves with others in every way. On the other hand, competition may be found vital in adult life that a society especially educates their young to compete. Thus, it is necessary to incorporate competition into education to help students get used to it in later life. Although there is no general agreement as to what constitutes the best way of putting competitions in education, many

educators support the use of competitions to drive learning benefits derived from adding competitive elements in the regular curriculum [17, 18, 19].

3. System Architecture and Implementation

3.1. System Architecture and Flow

The systems flow of the platform is shown in Figure 2. There are three main modules including the player module, the game judge module, the replay module and the display module.

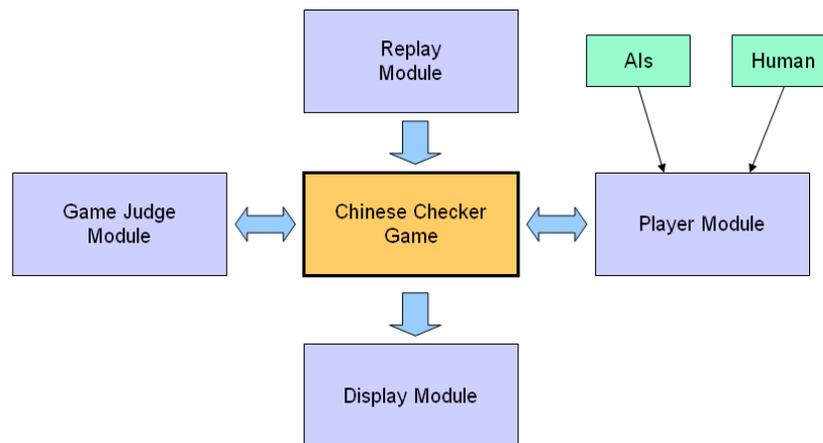

Figure 2 The System Flow

3.1.1. The Player Module

The player handle module is built to handle the players data. The module communicates with this module. It handles the AI's parameters from the player programs and to inform the AI players of the game details, e.g. which AI players to move, available position on the board, etc. In this platform, the system is able to handle 2 processes for the 2 AI and establishes connection.

The mediator platform starts the game by sending a message to each player, it first sends out a first message which is the sequence number of the player. The message contains the number "1" for the players who make the move first while the message contains the number "2" for the player who is expected to make the second move. The 121 positions of the playing board are numbered 1 to 121 from bottom to top, left to right. The AI players' home area is always numbered 1 to 10. The mediator platform gets a message from first player which contains the value of the position of the marbles move from and move to. For example, an AI player provides a value move from position "2" to position "5" (Figure 3). When the mediator platform receives the message from the AI player, the system clock stops, the mediator announces its move to its opponent AI player. At the moment, the opponent's clock restarts. The second player then starts his turn. The opponent player receives the changed position value of the opponent. The AI players

must maintain information on the current board configuration and must also ensure that each move it makes is valid.

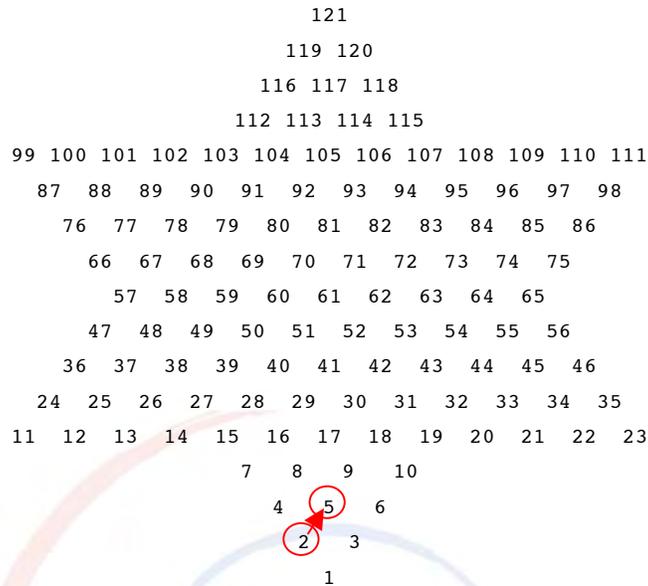

Figure 3 An Example of Movement

The clock in the mediator platform is different from a clock in a real chess game. During the time which one player is computing its next move, the other player may not carry out any computation. The mediator ensures this by suspending a player after receiving a move from it and resuming it before sending its opponent's move to it. Each AI player is given five minutes to make all its moves. Since the players and mediator run on a multiprogrammed operating system, the time used by a player is the time used by its process. The player must not fork any other processes. The player may decide to spend more time making certain moves and less making others. When a player fails to make all its marbles reach its opponent's home area within five minutes, each move thereafter must be made within one second. In other words, the mediator maintains two clocks, one for each player, initialized to zero at the beginning of the game. At any given time, only one of the clocks runs: that of the player who is computing its next move.

3.1.2. The Game Judge Module

For a 2-players game, the objective of the game is to move all of one's marbles into home area of one's opponent before one's opponent moves all his marbles into one's own home area. A game is considered a draw if player 1 makes the first move of the game, and player 2 moves all his marbles into player 1's home area one move after player 1 moves all his marbles into player 2's home area. At the beginning of a game, each player's ten marbles occupy a triangular area at an opposite side of the board. This is called the home area of a player. The four other triangular areas are calling neutral zones. Since the board is embedded in a hexagonal grid, each position on it is generally connected to neighbors in six directions, except when located at the boundary or a corner, in which case the

position has 5, 4, or 2 neighbors. At each turn, a player can move any one of his marbles into a neighboring position, provided that such a position exists and is not already occupied by another marble, either belonging to him or his opponent. A marble may also in one move, make a sequence of jump over other marbles, which either belongs to the player or his opponent. Each jump must be made according to the follow rule. Suppose that a marble at A jumps over a marble at B. The former will land at position C, where B is equidistant from A and C, and A, B, and C are collinear. The jump is only allowed if every position on the line AC (inclusive) exists, and none of these are occupied before the jump except A and B. When a marble is moved to an adjacent position, or takes a sequence of jumps, it may not end up in a position in a neutral zone. The intermediate steps of a sequence of jumps, however, may use positions in the neutral zones.

The game judge module provides static method to implements the above rules of movement and jumping. It checks whether a position is allowed to place marble, allowed to pass, or the position is out of board. The judge goes though all marbles to obtain a list of possible move. It checks the validity of marble movements. The platform checks firstly the nearest marble for the moving marble to identify whether the moving marble can jump over the nearest marble and whether number of jumps allowed from that position. Any checked vacant position is recorded, this avoids an infinite recursion. The checked vacant positions become the end result of checking because the positions recorded are the valid ones. Finally, the module also checks to see if the marble can move in a position next to it. The module also provides end-game checking, this is done by checking if all positions from 001-010 and the 112-121 are filled with opponent's marbles. Also if the AI gives an invalid move, the judge considers as losing the game.

3.1.3. The Replay Module

To let other programmers watch the passed competition. The replay can read the log files which have stored the turn and movement data, and then use theses data to display the movement of a game. The purpose of this module is not for competition, but to illustrate and replay any game records. This facilitates students to learn how an AI player performs in a particular game.

3.1.4. The Display Module

The display module is used to handle all the onscreen and visual elements. This includes menu of the mediator platform (Figure 4), the game status and the system clock (Figure 5), game results and ruling (Figure 6), etc. The user interface of the platform is designed to be simple and clear.

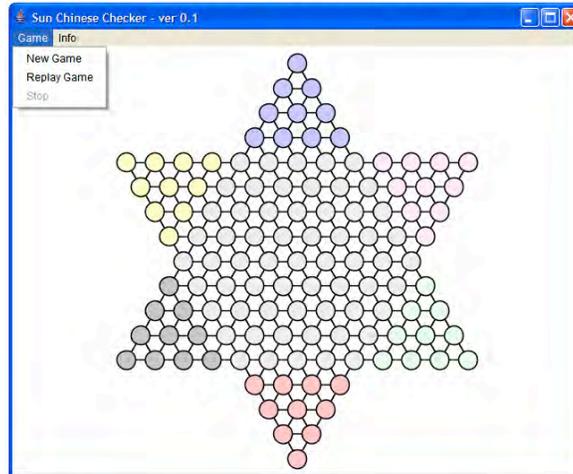

Figure 4 The System Interface and Menu

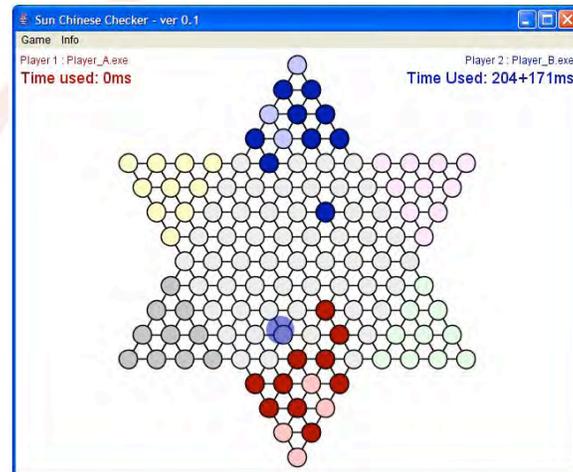

Figure 5 Game Status and System Clock

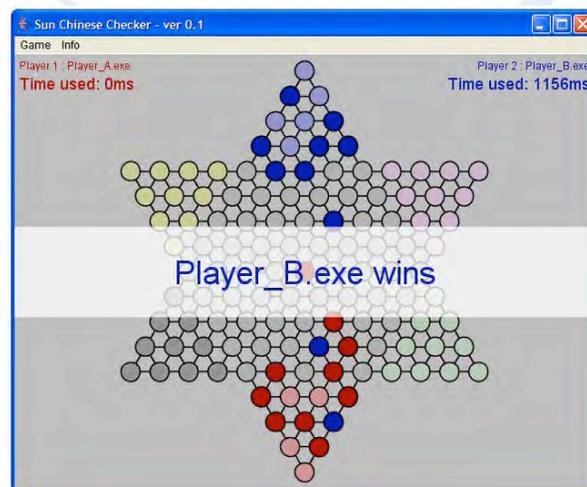

Figure 6 Game Results and Rulings

4. System Application

In the Chinese Checkers game competition, two AI playing programs, executing as separate processes on personal computers or workstations running Unix, play against each other using a common protocol mediated by mediator platform executing as yet another process.

Students are trained during the lecture about AI program algorithm. They are provided with the mediator program and an executable program developed by an ex-champion in the game competitions. The students can make use of the ex-champion program to compete with themselves and the AI programs they developed. In the development process, the students may amend and improve their AI programming algorithm in comparing their developed programs with the ex-champion. Students are required to work as team for the program development and the student would enter to the system for competition. This competition encourages students to think, discuss and apply the concepts delivered in lectures, together with the team-based approach, active learning is achieved. Besides, the champion in class would be encouraged to join the competition held by The Association for Computing Machinery (Hong Kong Chapter). This further enhances students to learn from students in different universities in Hong Kong.

5. Conclusion

This project is to implement a Chinese Checkers Game platform (mediator program) which is capable to facilitate two computer AI players to compete in a game. The system provides learners with greater convenience in terms of accessing the effectiveness of the computer programs they developed. On the other hand, active learning like game competition encourages learners to actively absorb the teaching materials through frequent thinking, tasks and discussions.

This new learning environment developed based on the latest technology and new educational research findings can help students to efficiently and effectively absorb the teaching contents. The platform provides not only an innovative learning environment for students practicing AI programming techniques, but also stimulate students' interest to learn actively. Through participation in the game, students actively study and develop their own AI programming algorithm and strive for improvements to be more successful in the game setting.

MANAGE AND PRESERVE A CULTURAL ASSET FOR YOUTH THROUGH A VIRTUAL GAMES (EDUTAINMENT GAMES)

Lia Yuldinawati, ST., MM.
Lecturer (Telkom Institut of Management)

CHAPTER I INTRODUCTION

The year to year era development creates the changing and shifting of both habit and culture of the people who live in a certain place. This development not only gives the positive impact and benefits for the people but also the negative ones.

One of the impacts of the development is the facilities of children's games which are becoming more various and modern. The variety of games provided by the games producer makes the young generation has freedom to choose the games they like. These video games are very modern and well-known by the young generation. We also can find these games in public games area to fulfill the needs of the young generation to play. Parents also can let their children play in this place because it is easy to be found in malls or near their houses.

Playing is the the basic needs for the children. That is why the games producers consider the children as a good segment for their marketing target. All of this makes sense because parents will try to do their best to fulfill their children's needs. Nowadays, based on the technology development, the popular games for young generation are video games such as SEGA, SPICA, Nintendo, playstation, tamiya etc. All of these stuffs are digital and up to date.

The modern games are adaptation from western culture into our culture. This is one of the factors that shift our own culture to western culture. The development of games automatically changes the habitual and cultural activity that will creates the changes of people's behavior and culture in the community. Actually, Indonesian people have their own children's games--traditional games rooted from people's culture in that community. There are many kinds of traditional games that are also interesting compared to the modern games. The traditional games are inherited but unfortunately their existences fade away and considered not up to date to the technology development. If we let this happened, these traditional games will be extinct.

The traditional games are the creativity from local culture rooted from the community. They are the picture or description of people who live in the community and they become the tradition. These games should be preserved and considered as valuable assets that can give positive contribution to the community and the nation in the future.

If we observe, actually there are basic differences between the traditional and modern games. The traditional games are not bought because they are created by using local material. The people's limitation of purchasing power created high imagination and creativity to create something. The limitation factors such as no appropriate equipments, materials, or facilities become good factors for the children to make them sociable and tolerant to share and play in groups so that they can enjoy it together. Because most of the local games are in the form of groups, these games can be a good entertainment, can develop cooperation, and create solidarity to each other. The value from traditional games is very high. Besides it is useful to train our five senses, languages, or other part of body, it also trains the interaction skills among the players (interpersonal potential).

Most people and parents consider that the traditional games are dangerous for children because the games use the available material; they are not up to date, dirty, and hick. These are the causes that make the children cannot enjoy these games or even do not know about them. This is irrational because the people do not know the advantages of the traditional games.

The modern games such as SEGA, SPICA, Nintendo, playstation, tamiya etc need children's high concentration to coordinate their hands, eyes, and mind. Generally, these modern games can give positive impact for the children because it creates the children to be more adept and imaginative. But unfortunately, most of these games are individual games and only can be played individually or in pairs so that there is no socialization and no direct interaction between the children. In modern games, children enjoy their own world without any verbal communication with their partner. Sometimes, they also do not want to share or lend their games to their friends. These will create the children to be more egoists, easily get angry, and it can trigger the fight. The modern games use the coordination of eyes, hands, and mind but only a little use of other body reflects so that the children tend to be passive. The characteristic of the modern games that is played individually makes these children easily get bored so that they tend to be consumptive. If they feel bored with the games, they will ask for the other new games and of course the price of the new games cannot be categorized as relatively cheap. Sometimes, the modern games display violence in the games such as wars, firing, and that can be kept in children's memory. Sometimes, children cannot differentiate that imagination in reality.

From the explanation above, we can see that children's games can shape the characteristics of young children from a very young age. Therefore, as parents, we cannot pretend that we do not care because this is about our children's characteristics that will shape who they are in the future.

CHAPTER II

RESEARCH OBJECT

West Java is a province in Indonesia. Its capital city of Bandung. Development of the Province of West is the first established in the territory of Indonesia . West Java Province is a province with the highest population in Indonesia. The Northwestern part of West Java province directly adjacent to the Special Capital Region of Jakarta, capital city of Indonesia. In 2000, the Province of West Java, Banten province divided by the establishment, which is located to the west. We have the discourse to rename the province of West Java Province Pasundan, taking into account the historical aspects of this region.

Ethnic Sundanese is an ethnic group that derived from west java. West Java is the province which have the highest population in Indonesia. West Java is close by with Jakarta as the capital city of Indonesia.

Sundanese culture is one of the many culture which is a source of wealth for Indonesian Nation. Area administrative boundaries in West Java divided into:

- North of Bandung District is bordered by West Bandung regency
- West side is bordered by West Bandung regency and Cimahi
- East of Bandung District is bordered by Bandung regency
- South of Bandung District is bordered by Bandung regency

Based on these positions, the city of Bandung is at a strategic location, in terms of communication and economic potential

Bandung population reaches 2,358,206 inhabitants with a total of 1,197,849 men and women soul 1,160,357 inhabitants.

Bandung Population by age and sex describes as follow:

CHILD AGE AND ADOLESCENT GROUP	MALE	FEMALE
0-4	93690	89239
5-9	84811	81945
10-14	87565	88710
15-19	114801	122642
TOTAL	380867	382536
TOTAL MALE AND FEMALE	763403	

This age group is actively playing educational games. Child age and adolescent group have 3 % of the overall total population. Bandung city population growth per year is 7,68% . The estimated number of residents in the coming year is 2,539,316 so the estimated number of child age and

adolescent group in the coming year is 7,617,948.

This is a very large quantity of population if more and more young age and adolescent group who do not care about traditional games then the virtual games so it can be estimated this game will be extinct in the near future.

CHAPTER III LITERATURE REVIEW

Through games, children will feel very happy. Their happiness makes the neuron in the brain connect to each other very fast to create new memory. That is why children learn something easily through games. The things learned by the children through games are:

- **Learning by playing**
When the children play, they also learn by keeping the balance of gross and fine motoric. As Reamonn O Donnchadha said in his book *The Confident Child* “games will give them opportunity to learn how to face personal life situation and also how to solve it.”
- **Games develops right brain hemisphere**
Through playing, the children have the opportunity to test themselves with their friends. Playing is the activity that uses right brain hemisphere and left brain hemisphere is sharpened when they are learning.
- **Games develop the pattern of socialization and children’s emotion**
Through playing, especially in group, children learn to socialize, to control their emotion, to share, to get and to refuse the situation they face. Through playing, children learn to develop emotion, self-esteem, and problem solving.

KINDS OF GAMES

Kinds of games are devided into:

Sports Games	Body contact	Mechanical Games	Fantasy Games
We can find sports games in children’s games. Sports are considered as an entertaining and fun activity.	This game is usually created because of the children’s imagination after they watch violence in movie or in modern games they play. This game is very dangerous and can result a serious effect for the children’s mental development.	This game uses computer or equipments like in modern games.	This game is created because of children’s imagination. In this game, children can imagine and create things based on their fantasy. We can find this game both in tradisional and modern games.

ADVANTAGES TRADITIONAL GAMES

Considering the importance of playing for children, parents should really pay attention and choose the most appropriate games for their children in order to develop children’s characteristics. It is very important because we want to shape our children’s characteristics to be a well-being individual.

Based on the explanation above, it is very clear that traditional games have more advantages than modern games. Traditional games have many forms and variations. At least, there are 750 kinds of traditional games and more still have not been listed.

West Java as part of Indonesia is one area that has many traditional games. Let us see what are the influences and advantages of traditional games children’s mental development. They are:

1. Developing children's creativity and natural intelligence

Usually in children's games, the material for games is directly made by the players by using the available material in their environment such as bamboo, orange skin, rocks, etc.

Sorodot Gaplok

This game uses flat stone with diameter around 20 cm. The number of players is 10 people divided into two groups. The draw is by throwing the stone. The team that can throw the stone to the nearest border line is the winner. The winning team then put the stone on the back of the foot and the other team arranges the stone in one of the line. From the distance around five meters, the team should ruin all the stones arranged by the opponent team. But if they cannot make it, they will take turn with the opponent team.

Gatrik

This game include two teams by using two pieces of wood or branch with different length. The player's skill to pry and hit the shorter wood with the longer wood without falling to the ground is the factor to decide which team wins the game. The players can collect score in *getok lele* stage. In this stage, the players pry and hit the shorter wood with the longer one. The player will be considered as the winner if they have passed the score that has been agreed at the beginning of the game.

2. Therapy for children

When they play, the children can shout, laugh, or even cry. This is good especially to develop their emotional stage.

3. Developing children's Intellectual Quotion (IQ)

Games can develop their knowledge by guessing something correctly. The examples of these games are:

Gagarudaan, Oray-Orayan

4. Developing children's Emotional Quotion (EQ)

Traditional games tend to be in form of group that create tolerant, sharpen emotional development, and create the togetherness such as:

1. Bebentengan,
2. Anjang-Anjangan
3. Kasti
4. Boyboyan

In this game, the players use tennis ball and smashed roof-tile that is as big as children's palm of hand. This game consists of ten children that are divided into two teams (attackers and keepers). The stack of smashed roof-tile should be rearranged by the attacker team. The keeper team should prevent the attacker from rearranging the stack of smashed roof-tile. The attackers should throw the tennis ball to the stack of smashed roof-tile and then they

should rearrange the stack. The keepers have to prevent them. The attacker team can be the winner if they are able to rearrange the stack and if the member of the team that is able to put the last stack shouts "Boy!" as the sign that the game is over.

5. Developing logics intelligence

In the traditional games, we also can find the games that use calculating technique especially for deciding the strategies or steps in the games, such as:

i. *Congkak*

Congkak is played by two people. In this game, they use congkak board with receptacles and 98 (14 X 7) tokens. Generally, congkak board is made by wood or plastics, and the tokens are made from cowrie shells, seeds, stones, marbles, or plastics. In congkak board, there are 16 receptables consists of 14 small receptables that face to each other and 2 big receptables in both sides. 7 small receptables and 1 big receptables on the right side are owned by the player.

The game is over if there are no tokens anymore to be taken by the players (all the tokens are in both big receptables of the players). The winner is the one who collects more tokens.

ii. *Lompat tali/Spintrong*

iii. *Bekel*

6. Developing children's kinaesthetics intelligence

The traditional games let the children move their body like jumping, running, twisting and turning.

a. The examples are:

i. *Lompat tali*

ii. *Sorodot Gaplok*

iii. *Heulang jeung Hayam*

iv. *Engklek*

v. *Enggrang*

The players use two bamboos with the height around 1.5 meters. In both bamboos, the player make place to stand on at around 15 to 30 cm height based on the capability of the children. The players stand in the place while they keep their balance. *Jajangkungan* or famous with *engrang*, can be played in many variations, like through playing soccer or taking the coin on watermelon by using mouth etc.

vi. *Balap karung*

Balap karung is usually played and very popular especially in our independence day. The players should put half of their body in a sack and then they should run or jump to the finish line. The winner is the player who comes first to the finish line.

7. Developing children's Spatial Intelligence

The roleplay (theatrical) is played by the children based on the concepts that they create.

8. Developing children's Musical Intelligence

The games use songs and traditional music instruments such as:

- i. *Ucang-Ucang Angge*
- ii. *Enjot-Enjotan*
- iii. *Calung*
- iv. *Wayang*

The game accompanied by *kakawihan* is telling us about the grandma's (nini) role as the children's keeper and grandpa (aki) who must take the children one by one. The grandpa should be very creative to persuade the grandma to give all children.

**CHAPTER IV
DISCUSSION**

TRADITIONAL GAMES VS MODERN GAMES/VIRTUAL GAMES

Some efforts have been done by many sides such as from cultural observers or related department to preserve the traditional games as cultural products that have high values and moral.

The last developed effort that will be conducted by Zaini and Hong community is a plan to build the Museum for Indonesian Games at Sasana Ganesha Bandung, but until now this effort has not been realized yet.

Besides that, many efforts that have been done by other cultural observers are by offering cooperation with the investors to develop their business by providing the local traditional games in their children's play ground. But unfortunately, no effort has been successful because the investors still consider this kind of investment cannot produce a lot of money and only small number of costumers gets interested in this business.

The effort that has been realized is so little and it just lasted for 2-3 months. After that, one by one, the business is closed. The effort to develop the traditional games is considered too idealistic for the business men so that they are still not interested to develop this business.

Games or video games are still number one choice for the young generation compared to the traditional games. Many games expertists from Indonesia create interesting games and those games have been marketed to the public. Unfortunately, the games that have been made by the gamers are adapted from abroad countries. Therefore, it will be better if the related department and cultural observers make the cooperation with the gamers to make the local games with local contents to preserve the traditional games into Indonesia games. If the children are introduced to the traditional games through video games, we expect that the children will know and get interested to play the traditional games.

This effort and the idea have not been realized yet. If they still cannot be realized, then what other efforts should be done to make the traditional games not only the name for our next generation. It is very sad if our next generation does not have cultural identity and they become egoistic and individualistic because their characters are developed through other culture and modern games.

TRADITIONAL GAMES THROUGHT EDUCATIONAL GAMES

Definition of **Educational games** from Wiklipedia are [games](#) that have been specifically designed to teach people about a certain subject, expand concepts, reinforce development, understand an historical event or culture, or assist them in learning a skill as they play. They include [board](#), [card](#), and [video games](#).

The following is brief list of game types:

1. Action:

Games that offer intensity of action as the primary attraction.

Reflex response is the primary skill needed to play these games well. The most common action games are shooters (Doom) and stealth (Metal Gear). Action games also include most sports titles, although some sports titles fall into the category of simulation.

2. Adventure:

Games that offer exploration and puzzle solving as the main attraction.

These games historically offered the most engrossing story, although their popularity has declined in the last 2 decades. Reasoning, creativity, and curiosity are the most common skills required of a good adventure game player. Pioneer adventure games include *Myst* and *Syberia*.

3. Puzzle:

Games that offer puzzles as the primary attraction to games. These games are most commonly released on low budgets via the web.

The people who play these games tend to be the oldest population of the game playing community. One of the most successful puzzle games is the famed *Tetris*, *Lemmings* and *Minesweeper*. *I.Q. Intelligent Cube* was another interesting puzzle game of limited success.

4. Role Playing:

Games that offer the player an opportunity to immerse themselves in the player character's situation.

Role Playing Games (RPG) continue their rich history in storytelling by embracing innovative ways to vary and report story. Characters tend to be rich, game play is long, and character management is technical in RPGs. Famous RPGs include, *Baldour's Gate*, *Fable*, *Might and Magic*, *Neverwinter Nights*, *Ultima*, and *World of Warcraft*.

5. Simulation:

The primary game play element of a simulation is its ability to match real world situations.

Simulations seek to provide enjoyment through reenactment. Combat simulations and racecar simulations are relatively popular in this game type. Simulations may also include social situation simulation such as *Sims* and *Leisure Suit Larry 1*. Major games include *Gran Turismo* and the *Tycoon* games.

6. Strategy:

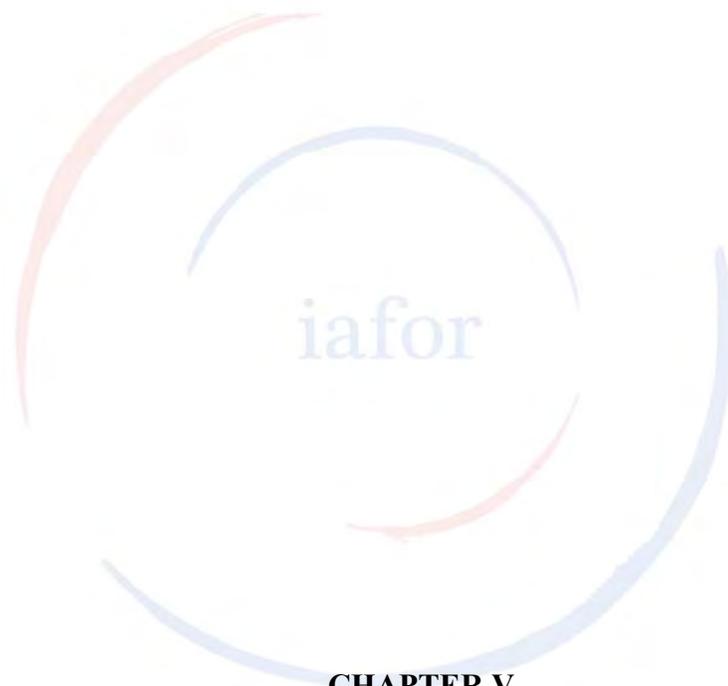

Strategy games entertain through reasoning and problem solving.

Early strategy games (e.g. *Civilization*) did not use much storytelling, although more recent games rely heavily on quality narrative. Games such as *Command and Conquer* are examples of story based strategy games.

In this research will be develop a game simulation type :

The primary game play element is a puzzle games. The reason for the selection of this puzzle games is because this type of game is easy to play and raises curiosity of young age to know what the image that used as object at this games. Puzzle seek to provide enjoyment through reenactment. This game type is the reason to manage national cultural heritage and to preserve cultural asset. Introducing traditional games through virtual situation games is to generate a sense of curiosity of young ages to know more a traditional games and eventually attracted to playing directly with their friends.

To revive traditional arts and culture, we must use the technology, management and marketing systems collaborated with with local cultural uniqueness. However, the content of art equipment based on local culture.

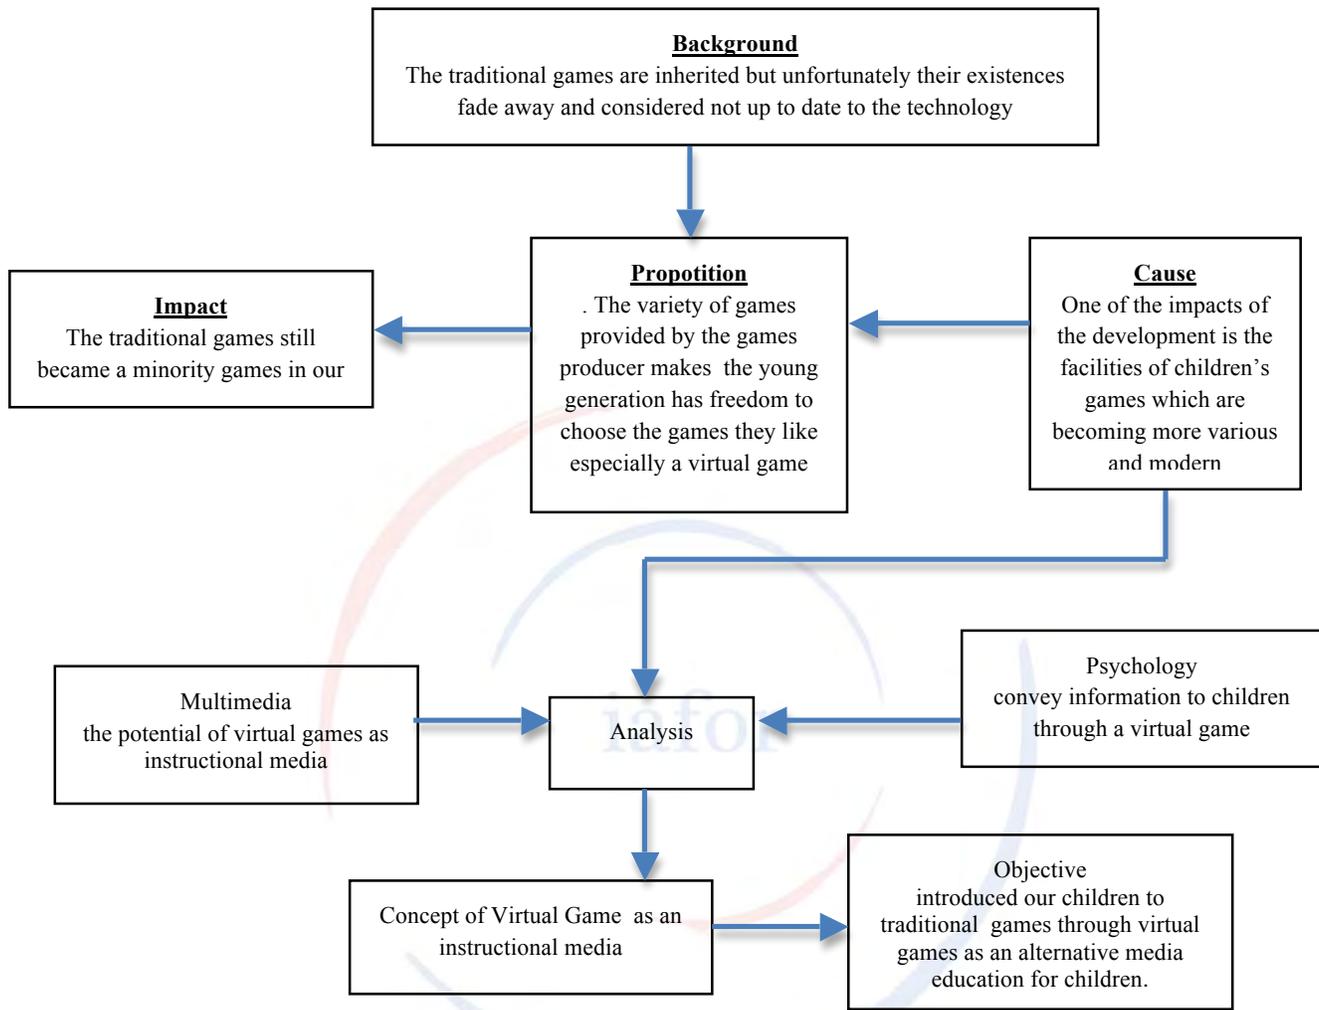

CHAPTER V CONCLUSION

An educational computer game can be defined as an electronic medium with all the characteristics of a gaming environment that have intended educational outcomes targeted for manage and preserve cultural asset.

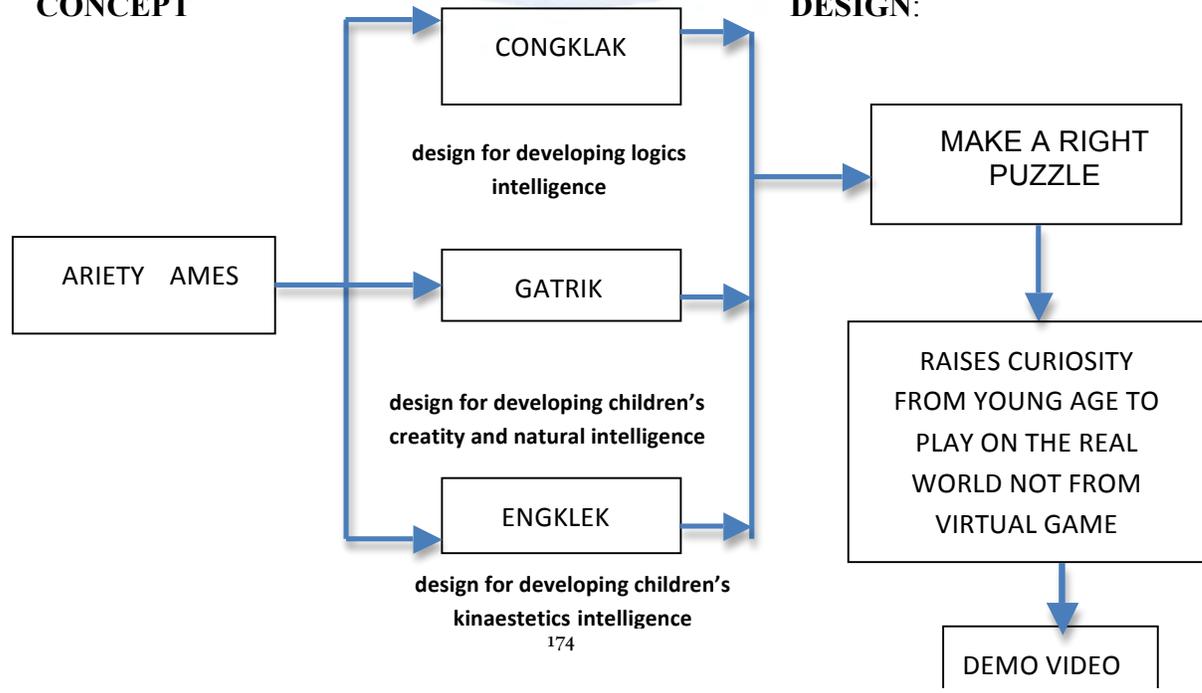

The simulation game selected because the simulation game which try to accurately depict real world situations, physics, and events as accurately as possible with others meaning a simulation is an imitation. So computer simulation games, are games that imitate a real-life situation. This is the best way for young age to know the best about their cultural asset and to stimulate them to make them interested so they want to know better and at the end they ultimately play in the real world with other children.

PATTERNS OF THOUGHT

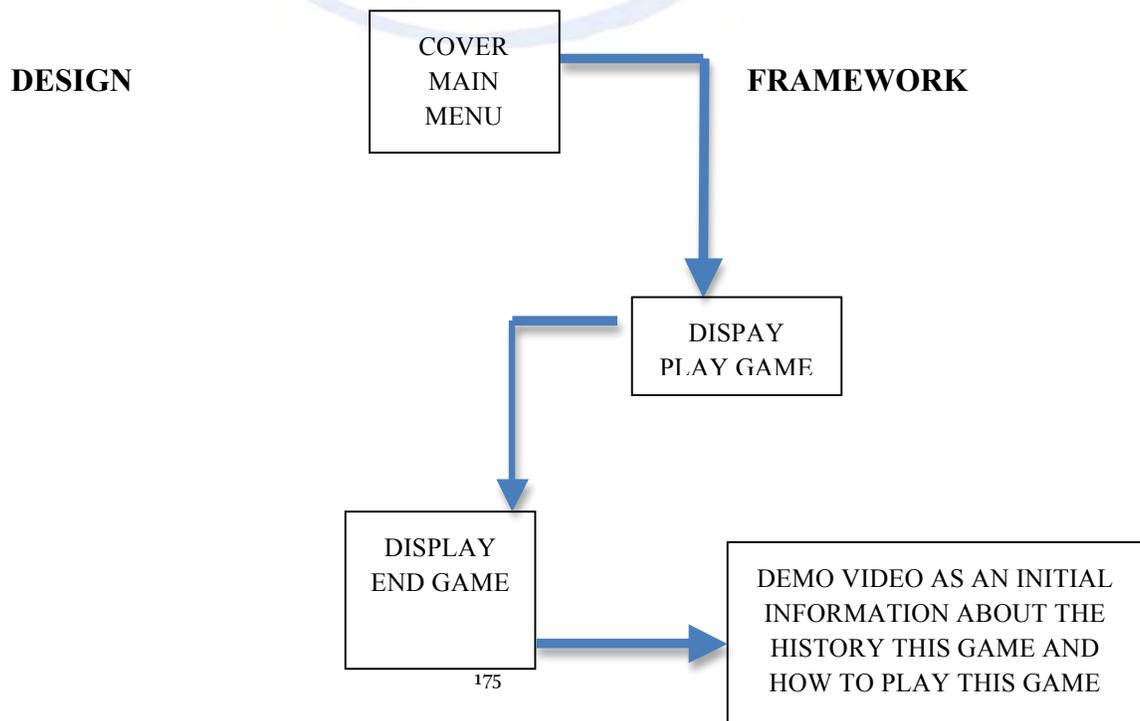

CONCEPT

DESIGN:

The reasons for choosing the games mentioned above are due these games easy to play and easy to find materials/tools so the young age expected to be inspired to try this games. The third game above includes three different education functions for young age representing gender, age groups and interests.

- Congklak is the games that often played by girls aged 7-12 years . This game is expected to create interest in the traditional game which is becoming obsolete by girls at that ages.This game is design for developing logics intelligence .This game use calculating technique especially for deciding the strategies or steps in the games
- Gatrik is the games that often played by boys aged 7-12 years. This game is expected to create interest in the traditional game which is becoming obsolete by boys at that ages.This game is design for developing children’s creativity and natural intelligence.The material for games is directly made by the players by using the available material in their environment such as bamboo, orange skin, rocks, etc.
- Engklek is the games that often played by boys and girls aged 7-12 years. This game is expected to create interest in the traditional game which is becoming obsolete by boys and gilrs at that ages.This game is design for developing children’s kinaestetics intelligence .On this game the children move their body like jumping, running, twisting and turning.

This demo was created to manage four step education on young age :

1. Attention from young age to traditional games that they know variety games on traditional games
2. Interest to traditional games so the young age want to try to play this games in virtually first
3. Desire of young age to try this game directly in the real world with their friends.
4. Action to play in groups and make this game as activities in daily life

This AIDA system is using in marketing today because of a diversity of games products. Using a system like this, allows a general understanding how to target a market effectively. This demo is one method that used in this research as a function to set a processes for creating, communicating and delivering benefit of traditional games to young ages. On preserve a cultural asset we must used marketing management as the art and science of getting young ages as a target markets and keeping and growing them to preserve and develop traditional games as one of a cultural asset.

This edutainment games is expected to become one of the newest way to introduce West Java culture to young age. Initial idea of virtual games is a media for entertainment but the entertainment as a main factor on the game will be develop into the act of learning through a medium that both educates and entertains.

These games should be preserved and considered as valuable assets that can give positive contribution to the community and the nation in the future. We hope traditional games as a cultural asset no longer became a minority games in our society. Therefore, the related department and cultural observers should jointly develop design a media education for children .We hope this demo design can create sence of selfbelonging for their culture to create a new attractive games for young age with a local contents to preserve national cultural identity and also introduced our children to the physical and local games through virtual games as an alternative media education for children.

The logo for iafor (International Association for Frontiers of Research) is centered on the page. It features the word "iafor" in a blue, lowercase, sans-serif font. The text is surrounded by two large, overlapping, semi-transparent circular arcs. The outer arc is light blue and the inner arc is light red, creating a stylized circular frame around the text.

Topic: Student learning, learner experiences and learner diversity

Students' yearning for practical and workplace experience

Meryl Pearce and Verity Kingsmill

Flinders University, South Australia

Abstract: This paper examines students' reflection on their learning associated with a topic component aimed at introducing them to the workplace. Results are from two environmental topics, one of which comprised 73% international students. The component required the students to work in pairs and conduct a simple environmental evaluation of a business, write a report for their client, and reflect on their learning. Results show that the majority of students felt that they were not ready to enter the workplace as a professional. This may be partly attributed to the varying experience that the students had and the fact that some of the international students had only been in Australia for a short time. Although a number of students expressed feelings of apprehension prior to the placement, on completion of the assessment most students stated that they had enjoyed the real life experience and practical nature of the topic. International postgraduate students, in particular, expressed a desire for the placement to be of a longer duration and more dominant in their university topics. While most students expressed a low readiness for the workplace, many expressed an increase in confidence as a result of the experience and also a clearer idea of their future ideal career. While students did not learn many new professional skills because the placement was too short, they were able to practice existing skills in a new context and with responsibility. Furthermore, students identified ways that they could gain additional professional and interpersonal skills to further prepare themselves for the workplace.

Key words: reflection on learning; professional skills; international students

Introduction

On graduating most students would like to gain employment in a position in which they can use their tertiary education. Graduates with an awareness of employers' expectations or familiar with the demands of the workplace are deemed more readily employable (Thomas & Nicita, 2003). Furthermore, if tertiary students believe that their topic assessment is real and will assist them in obtaining a job or have some long term benefit they have a more favourable attitude to the assessment (Lombardi, 2008; Struyven, Dochy & Janssens, 2005), and are more interested and engaged in the learning process (Centre for the Study of Higher Education, n.d.; Freudenberg, Brimble & Cameron, 2008; Scott, 2005). Given these reasons an industry-based assignment aimed at introducing students to the workplace and improving their readiness for work in the environmental management industry was introduced into an undergraduate and a postgraduate topic in 2009. The term workplace or industry, as used in this paper, refers to an organisation in which students could apply their learning gained from their tertiary environmental education (see definitions). The dual purpose of the learning component was firstly to train students in basic environmental evaluation skills and professional reporting styles, which they subsequently practiced (applied) in an industry setting. Secondly, students were required to reflect on their learning and their workplace readiness.

The way a topic is taught and assessed has an important role in the development of workplace relevant skills. Academics need to have a clear idea of the purpose of assessment particularly when it is linked to new styles of teaching and learning (with which students may be unfamiliar) such as work integrated learning (McLellan, n.d.). Apart from having clear learning objectives in mind, academics need to clearly communicate the purpose of the assessment to their students (Knight & Yorke, 2003). The component outlined in this paper had a dual purpose (stated above), which was clearly outlined to the students at the outset.

Aim of the research

The aim of the research, reported in this paper, was to assess whether the learning component enhanced students' awareness of the workplace and their readiness to enter the workplace. Specific objectives were:

- To garner students' perceptions on the value of the component conducted in industry compared to if it were conducted as an on-campus practical,
- To identify the range of professional skills the students developed through the component,
- To identify the range of personal and interpersonal skills the students developed through the component,
- To garner students' perceptions on their readiness to enter the workplace.

Definitions

The topic component (industry-based assignment) that is described here can be classified as work-integrated learning (WIL). Flinders University (2010) defines WIL as 'directed or supported educational activities that integrate theoretical learning with its application in the workplace'. Atchison et al. (2002) define WIL as 'all educational programs which combine and integrate learning and its workplace application, regardless of whether this integration occurs in industry or in the university and whether it is real or simulated'. Defining terms such as WIL (McLennan 2008; Patrick et al. 2008), work-based learning (Delahaye et al. 2007), capabilities (Stephenson 1992), authentic assessment (Bennett et al. 2001), and work readiness are, however, complex and often broad. The associated assessment can also be defined as authentic assessment, which is 'where activities represent the types of complex tasks performed by professionals in the field' (Edith Cowan University 2009).

Methodology

This section opens with a description of the industry-based learning component of the topics and is followed by an outline of the data collection methodology.

The component—which comprised five preparatory lectures, a brief industry placement and two associated assessments—was introduced into an undergraduate (n=29) and a postgraduate (n=11) topic in 2009. International students comprised 7% of the undergraduates and 73% of the postgraduates respectively. Only one of the international students spoke English as a first language.

Undergraduates and postgraduates received the same preparatory lectures and guidance and conducted the same assessment tasks. The reason that the component was the same for topics was that the postgraduate topic primarily served as an introduction for postgraduate students who were new to the discipline. The postgraduates were enrolled in a program of study (Masters of Environmental Management) that attracts students who want to re-train for a new career path. The postgraduate students had backgrounds ranging from dentistry, pharmacy, engineering, publishing, and political science, to other non-environmental disciplines. Despite being given the same assignment, the learning experience and assessment was student-driven, and the students could complete the component in a manner befitting their educational level.

The assignment required the students to act as Environmental Consultants to an industry. After being allocated an industry the students (working in their chosen pairs) were responsible for liaising with their client, establishing a time to conduct the evaluation, determining the depth and duration of the evaluation in conjunction with the client, conducting measurements and writing and delivering their final report to the client. The environmental evaluation entailed assessing the industry for opportunities where low cost, simple changes could be made to water, energy and waste related activities that would have potential environmental benefits, and not necessarily, potential efficiencies or cost savings for the industry. The report that was submitted to the client was purposefully not checked by the topic coordinator thereby placing full responsibility on the student. On completion of the component

students were required to reflect on their learning outcomes in a two-page individual assignment (worth 10% of the final topic grade) in which they were asked to answer the following questions:

- What are your perceptions of your industry experience compared to if this work was done as a university-based practical?
- What professional skills did you develop through the environmental evaluation of industry?
- What personal attributes did you develop through the environmental evaluation of industry?
- Comment on your 'readiness' to enter the environmental workforce. What skills (professional, personal, interpersonal) do you feel you still need to develop to ensure you are ready for work in the environmental workplace? How do you plan to gain these skills?
- Provide additional insights into your learning experience in this component.

The data presented in this paper were drawn from three sources—the two-page reflections assignment (that all students completed); a more detailed follow-up questionnaire on the learning process and outcomes (anonymous, voluntary); and students' evaluation of the topic obtained through an automated, online survey (anonymous, voluntary). The 22-question questionnaire sought to delve deeper into the underlying reasons for the answers given in students' earlier reflections. Approval to conduct the research was granted from the Flinders University Social and Behavioural Science Ethics Committee.

Potential sources of bias in the study

It is possible that the results obtained from the two-page reflections assignment may be biased because the assignment was worth 10% of the topic grade. The purpose of the assignment was however clearly emphasised and students were asked not to write notes on their perceived correct answer, but rather to reflect on the value of the learning experience. That is, if students' perceived the component to be a waste of time they were asked to provide reasons why they had learnt nothing from the process. Although a potential source of bias, the authors' believe that this was minimal as the students' reflections were remarkably candid. There was a 100% response rate to the reflections assignment, but only a 21% and 36% response rate to the voluntary questionnaire from the undergraduates and postgraduates respectively. The low response rate may be attributed to the fact that three months had lapsed and all the students had passed the topic by the time the questionnaire was distributed to the students (via email). Due to the low response rates to the voluntary questionnaire comparisons between the two sets of data were not possible.

Results

Students' perceptions of the industry experience compared to if the work was done as a university-based practical

Results showed that the majority of students (76% of undergraduates and 91% of postgraduates) perceived the industry-based assignment to be a useful exercise and a better learning experience than if it had been conducted as an on-campus practical under the topic coordinators supervision (Table 1). Students commented that if it were conducted as an on-campus practical it would not have been as 'real', nor would they have taken it as seriously because in industry they '...had to act as a professional...' and be '...more focussed and precise...'. Results highlight students' positive perceptions of the value of practical components of the topic. Students commented that the best aspects of the topic were the '...field work and practical learning outside the class', being able to see 'real environments and evaluate how they work' and the practical nature of the industry component as it '...gave an insight into the practical applications of our learning and knowledge and how these can address environmental management issues'.

Table 1: Students' perceptions of the learning experience associated with the assignment

	Better learning experience because it was based in industry (%)	It would have been better as an on-campus practical (%)	Did not answer or ambivalent (%)
Undergraduates	76	3	21
Postgraduates	91	0	9

Some students commented that the assignment was exciting and they felt more enthusiastic about it because it was real. A number of students expressed feelings of apprehension prior to the placement, stating that '...it was a more frightening experience dealing with an unknown industry' and forced them out of their 'comfort zone', however, they added that they had 'worked harder as a result'. Of note are the reasons for the feelings. The international students who expressed concern did so mostly in relation to their perceived inadequate English and communication skills (particularly as they would be dealing with industry professionals as opposed to their topic coordinator, who was accommodating in dealing with students from non-English speaking backgrounds). Other reasons for students' apprehension included the fact that they would be dealing with an organisation outside the university (and hence outside their 'comfort zone'), and also concerns over their readiness for the exercise. Students noted that they overcame the latter concern through thorough preparation prior to the placement. Many students expressed the value of having a team member with whom they could discuss ideas, provide mutual support and an opportunity to learn from each other—all of which helped them overcome feelings of apprehension. On completion of the component the majority of students stated that they had enjoyed the experience, had found dealing with the industry personnel to be less frightening than anticipated and felt they had successfully passed the assessment. Although the students' concerns were alleviated, they pointed to an area in the assignment design that needed addressing by the topic coordinator in future iterations of the component—this is addressed later in the paper.

The development of professional skills and personal attributes

Results show that while students did not learn many new professional skills because the placement was too short, they were able to practice existing skills (Table 2) in a new context and with a new position of responsibility. Many students commented on their increased confidence as a result of the industry-based assignment, and stated that as a result of the experience they now had a clearer idea of their ideal future career. Most undergraduate students stated that they had gained confidence as a result of the experience, although a relatively small number specifically listed (Table 3) confidence as a *skill*. Most students developed or reinforced interpersonal skills (Table 3). Interpersonal skills acquired through working with peers, increased confidence and communication skills were the most common skills listed by the undergraduates. As prompted by their assignment question, many students identified (Table 4) ways in which they could gain additional professional and interpersonal skills to better prepare themselves for the workplace.

Students' perceptions of readiness to enter the workplace

Over 70% of the students recognised that they were not yet ready to enter the workplace as a professional. Results showed little difference between the undergraduates' (74%) and postgraduates' (70%) perceptions. The main reasons given for a lack of readiness by undergraduates was that they needed to know more, needed more skills and more experience. Around 21% of students (Table 4) articulated that the readiness would come through university topics. The low level of work readiness among the postgraduate students may be attributed to the fact that 73% of the postgraduate students were international students, a number of whom had only been in the country a few months. Another reason was the varying prior environmental experience that the international students had, for example, some did not have any prior environmental education or environmental work experience (as outlined in the methodology). Others felt under-confident about their English speaking abilities. Even the

students who felt ready to enter the workplace identified aspects of their knowledge, skills, experience or attitudes that still required work to enhance their chance of gaining course-related employment. The few students who expressed both a readiness to enter the workplace and self confidence to conquer challenges had over 30 hours of environmental work experience (unlike their peers).

Table 2 The range of professional skills that students gained or practiced in the industry-based assignment. Each student could list any number of skills.

Skill	Undergraduate	Postgraduate
Workplace ethics	2	2
Decision-making	2	0
Professional communication	23	7
Time management; expediency	6	5
Work allocation	1	1
Information technology	1	0
Preparation, planning; organisation	16	4
Concise writing aimed at a professional reader; editing	12	5
Research; analysis	11	7
Professional conduct	8	4
Listening	3	0
Editing	1	0
Initiative	3	2
Observation	3	3
Problem solving; adaptability	1	1

Table 3 The range of personal and interpersonal skills that students gained or practiced in the industry-based assignment. Each student could list any number of skills.

Skill	Undergraduate	Postgraduate
Teamwork; cooperation	12	8
Communication within the team; listening	7	2
Confidence	8	2
Punctuality	2	1
Diplomacy	5	1
Compromise; flexibility; patience; respect	5	6
Assertiveness	1	1
Leadership	1	1
Conflict avoidance	2	2
Ability to motivate others	0	2

Table 4 The ways in which students planned to acquire more professional skills. Each student could list any number of ways.

	University topics	Course-related work experience	Environmental volunteer work	*Other	Did not answer this question
Undergraduates (%)	21	38	14	28	14
Postgraduates (%)	36	55	18	9	9

*Other included: learn from others; join a toast masters group or a range of societies; take on more public speaking opportunities; write reports; work on my curriculum vitae; better time management; communicate more; more contact with environmental organisations.

Another difference between the undergraduate and postgraduate students was that most of the postgraduates stated that they would have preferred the environmental evaluation of industry to be a larger proportion of the topic and much longer in duration. The majority of postgraduates stated that a four week period would be ideal, one student felt that six months was ideal and another wanted half of every topic to comprise work integrated learning. On the contrary, while undergraduate students recognised the value of becoming work ready and saw value in the industry component of the topic, nonetheless, they did not want the placement to be longer at the expense of the earlier content of the topic. This may be a reflection on how much they enjoyed the earlier component of the topic rather than a slight on the latter component, and their more distant graduation date (and concomitant need for work readiness). Undergraduates thought that they would have acquired (Table 4) more industry-specific skills by the time they were looking to enter the workplace—again, this perception may be attributed to their predominantly second year status. In contrast, the postgraduates' desire for the industry-based assignment to be longer shows a heightened career-mindedness which comes from having recently been in a career, their anticipated earlier date of entering the workplace (than the undergraduates), and also because some of the international students aimed to remain in Australia and apply for permanent residency (for which they would need secure employment).

Reflections on how to improve student learning outcomes

Based on personal reflection by the topic coordinator and student feedback some potential ways of improving student learning outcomes were identified for implementation in the 2010 iteration of the component (which was in progress at the time of writing this paper). These are outlined below.

Firstly, to overcome the students' feelings of apprehension prior to the placement students were a) provided with more information on the 'learning' nature of the exercise and the realistic expectations of the industry clients (i.e. the clients understood that they were dealing with students, even though the students were serving them in an Environmental Consultant capacity); b) students were encouraged to work in mixed groups (Australian and international students; postgraduates and undergraduates); and c) the content of the five preparatory lectures was changed to better prepare the students on how to conduct the environmental evaluation.

Secondly, given that the aim of the component was to introduce students to the workplace and improve their readiness for work in their chosen discipline, an alternative learning component was offered to students in 2010. The alternative component was a 20-hour (minimum) unpaid, work placement in an environmental organisation with an associated reflective assessment (worth 20% of the topic grade). Each student choosing this option was responsible for organising their own placement (they were not accompanied by peers in the topic). Students were advised to choose an organisation or discipline-focus (environmental management is a broad field) that they hoped to work in, in their future career. The anticipated value of this option was as follows: a) employers want students with prior environmental experience—volunteer experience is highly regarded by potential employers as it shows a deeper level of commitment (because it is unpaid); b) it provides students with an opportunity to prove their capabilities and get known by potential employers, who could also serve as referees in future job applications; c) develop and practice new skills specific to their ideal future career; d) it provides an opportunity for students to identify gaps in their abilities, knowledge and skills and an opportunity to redress the gaps in the remaining time before they graduate (which is mostly 12 months in the future); and e) it provides an opportunity to test whether it is really the job-focus they want (many graduates are not aware of the specifics of what a job might entail until they are in the position).

Given students' yearning for practical and workplace learning, work integrated learning needs to be introduced into more courses offered by universities, with academics shown the empirical evidence of the benefits.

Discussion of results

This study found that prior to completing the component and the two related assessments, students in the topics generally had a lack of course-related industry experience and were unaware of what industry expects of graduates. For second year and international students this result is not unexpected. While most undergraduate students had gained confidence through the topic component, nonetheless the majority felt a low readiness to enter the workplace. Alexitch (1994, cited in Archer, 2004, p. 27) found that where students had a perception of low readiness to enter the workplace, they attributed it to a 'lack of practical or field related experience'. In this study most students felt that the placement was too short in duration to fully develop a range of new professional skills. This factor was taken into consideration and in 2010 the number of visits and the time spent in the industry was thus doubled.

The raised confidence levels are a positive outcome that can be attributed to the value placed in the link between the assessment and 'real life experience' as perceived by the students. These findings thus concur with those of Dunlap (2005, p. 29) who found that over the course of a semester in which students had to conduct themselves as software engineers (in line with their course) and 'think like the experts', students' confidence levels on their ability and preparedness to enter the profession improved. Key factors in achieving the increased confidence levels were that the assessment 'reflect[ed] the true nature and requirements of the workplace' (p. 29). The value of experiential learning in building student confidence is also highlighted by Archer (2007) who examined the perceptions of undergraduate students from a number of Faculties on their readiness to enter the workforce. With increased confidence students were not only more confident to repeat similar tasks but also to address future challenges (Dunlap, 2005; Arnold, Loan-Clarke, Harrington & Hart, 1999). Greater confidence levels among students led to enhanced learning, development of employability skills (Freudenberg et al., 2008), and greater performance and achievements (Nicol & Macfarlane-Dick, 2005; Zimmerman, 2002).

The lack of workplace readiness identified through this study may be partly due to students not being used to reflecting on their learning or a lack of ability to easily identify their skills and capabilities and the links with their tertiary assessment. This was evident when students listed specific aspects of knowledge as skills in their reflections assignment. According to Stein, Isaacs & Andrews (2004, p. 252) students need to 'make connections with their own understanding' by practicing reflecting on their learning, and to be effective, reflection needs to be ongoing (Zimmerman & Schunk, 2001). Although some students had difficulty distinguishing skills from knowledge, from a workplace readiness perspective the students perceived a greater readiness for the workplace as a result of their knowledge. Similarly, in the study by Archer (2007) some students who had stated they were not yet ready to enter the workplace due to a lack of practical experience, nonetheless felt better placed to do so because of their knowledge and technical skills. In this study some of the postgraduate students who were new to the discipline felt that their work readiness would be enhanced with greater discipline-specific knowledge. Those students, regardless of whether they were undergraduates or postgraduates, who had many years of industry experience expressed greater workplace readiness than those without. Bandura (1977) outlines a complex range of reasons on how students perceive their self-efficacy, these include: the context of the study, achievements within the context, vicarious experience and personal factors. While Archer (2007) did not find that students personal attributes or developmental phase as factors influencing their perceptions of readiness, Zimmerman and Schunk (2001) found that the closer the students are to their ultimate goal of graduating and obtaining a job in their field of study, the more likely they are to be motivated in their remaining studies.

The level of challenge or complexity in tasks is important. Successfully completing challenging tasks leads to enhanced perceptions of competence, whereas if tasks are perceived as too simple the successful completion of them does not necessarily enhance perceptions of self-efficacy (Bandura, 1977) or motivation. The ideal is to set challenging but attainable tasks (Zimmerman & Schunk, 2001).

In this study a number of students who had many years of work experience or prior completed tertiary studies found the component 'too basic' to develop any new skills, although they practiced existing skills in a new setting. Archer (2004) however cautions that students' perceptions are not always accurate. Schunk and Zimmerman (1998) and Zimmerman (2002) distinguish between naïve and skilful self-regulators. Skilful self-regulators have more realistic perceptions of their abilities; they evaluate themselves against their personal goals; they take into consideration the strategies and methods used in the learning process, the context of the learning environment, the complexity of the task and their abilities. Skilful self-regulators are able to take responsibility for their own academic achievement; they see their success or failure as under their own control. In short, they link their success to the effort they put in to completing the task (Zimmerman & Schunk, 2001).

Zimmerman and Schunk (2001) state that requiring students to reflect on their learning will motivate behavioural change, and influence subsequent learning efforts. Furthermore it allows students the opportunity to identify things they would do differently in future to avoid some of their mistakes and to identify the skills they need to enable them to perform more effectively in future (Bailey, Oliver & Townsend, 2007). In this study while many of the students had part-time employment, this was not related to their studies or perceived to be of direct benefit for future discipline-related employment. Table 4 indicates that students aimed to improve their work readiness by acquiring the necessary professional skills mostly through further tertiary studies, volunteer work and work experience. Although pertaining to business-course graduates, in a study by Bailey et al. (2007) students identified extra-curricular activities (such as part time employment and volunteer work experience) as factors that led to their employment and also better outcomes during their university course. Gaffner and Hazler (2002, cited in Archer, 2004) cite a lack of understanding of the career planning process as a factor in low workplace readiness. To counter this one of the preparatory lectures in the component in this study focussed on the importance of career planning and highlighted the availability of resources that could assist students in preparing a curriculum vitae and securing course-related extra-curricular work and volunteer experience. The results show that despite the brevity of the experience many students gained a clearer idea of the type of job they want (and do not want) once they graduate.

Concluding statement

Not only are students' expectations changing in terms of what they want from their university experience (Sander, Stevenson, King & Coates, 2000), but employers expect universities to provide work ready graduates (Lombardi, 2008; Patrick et al., 2008). For this reason many universities are increasingly seeing their role as a combination of educational and vocational preparation (Alexitch & Page, 2001, cited in Archer, 2004), although this is a source of debate. Following in a path that commenced a decade ago in the United Kingdom (Knight & Yorke 2003) and in response to Australian Government policies, Australian universities are now placing a stronger emphasis on making graduates work ready (Flinders University, 2005; Griffith University, 2009; Queensland University of Technology, 2009). In this study, despite a low workplace readiness many undergraduate and postgraduate students commented on increased confidence and having obtained a clearer idea of their ideal future career. Students enjoyed and valued the practical focus of the topic and the opportunity to experience the workplace as an environmental professional. A further positive outcome was that most students expressed an increase in motivation to gain higher grades and gain workplace-appropriate skills through extra curricula activities. Furthermore, because of the new strategic policies of tertiary institutions, the positive learning experience outlined in this paper is set to become more dominant in university courses across Australia.

Introduction

The major responsibilities of academics in teaching institutions are teaching and research. Research and development is a significant component of quality higher education and is often the distinguishing factor between general and higher (specialised) education. Many academics believe doing research improves their teaching (Winkler 1992, Gamson 1995, Michael J. V. Woolcock 1997, Wenzel 2001). Universities and colleges often use evidence of research excellence to employ or promote staff on teaching contracts. The main claim of the teachers and administrators are that research activity can and does serve as an important mode of teaching and a valuable means of learning and thus research is a strong condition for teaching. But the critics (Boyer 1990, Hodges 1994, Hattie, J. & Marsh, H. W., 1996, Meyer 1998) claim that research and publication have become the primary means by which most professors achieve academic status, yet many academics are drawn to the profession precisely because of their love for teaching or for service. If lecturers recognise the ways in which their activities parallel those of students and take steps to involve students in research like activities, research can inform practice in facilitating learning' (Brew & Barnett 2000). However, accrediting agencies like ISO and NAAC give weightage to such research contributions associating it with quality teaching.

Higher Educational Institutions in India

The University Grants Commission (UGC), which was formally established in November 1956 through an Act of Parliament, is the statutory body of the Government of India for the coordination, determination and maintenance of standards of university education in India.

In India, there are different types of higher educational institutions: Research Institutes, Universities and Colleges.

Research Institutes are institutes of high standards with good infrastructure, run by funds from Government. There are also **Institutions of National Importance** that are university-level institutions established by Acts of Parliament and funded by the Central Government.

Most universities in India are '**affiliating universities**', which prescribe to the affiliated colleges the admission criteria and courses of study, hold examinations and award degrees. **University departments** impart postgraduate education and conduct and promote

research in a variety of disciplines. There are several kinds of Universities in India - Central, State, Deemed, Private and Open Universities. While **Central Universities** are funded directly by the Ministry of Human Resource Development, the **State Universities** are set up and funded by the state governments. **Deemed Universities** enjoy the same academic status and privileges of a university but have no affiliating colleges. **Private Universities** are self-financing in nature and approved by the Central Government. **Open Universities** offer distance learning programmes and have no boundaries such as that of campuses and territories.

One of the many ways in which Indian colleges are categorised is on the basis of funding. There are **Government Colleges** funded and managed entirely by the Government; **Aided Colleges** – funded by the Government and managed by a private body; **Self-financed Colleges** – funded and managed entirely by private agencies. All these colleges need to be affiliated to a regional university for purposes of recognition. The colleges affiliated to the regional universities give importance to general education of building a strong base in core and allied subjects thus preparing the students for employment or research.

The important ingredient of research in teaching activities in an institution of higher education boils down to ‘Research versus Teaching’ in the college environment. Juggling these two activities is a delicate balancing act for most college faculty. This leads to an interesting question: Do faculty in Indian colleges have the adequate time, resources, and support to conduct productive research if they have the aptitude for it? The objective of this paper is to find an answer to this question.

Data and Sampling

Primary data on the organisation climate in terms of contact hours, class strength, regular and occasional responsibilities shouldered by teachers, salary and service benefits along with the background information of the teacher (teaching experience, status of research and subjects taught) were collected from the college and university teachers of the southern districts of Tamil Nadu – namely, Madurai and Tirunelveli Districts.

Primary data on the selected variables were collected from 270 teachers by stratified random sampling, the strata being teachers of self financed colleges, aided colleges and Universities – 90 each. The questionnaire was administered in January 2006.

Methodology:

Attitude Towards Research Scale

To measure the attitude of the teachers towards research, Attitude Towards Research (ATR) scale was used. It consists of 30 items listed on a 7-point Likert scale. The score 1 represented the option “strongly disagree” while option 7 on the scale represented the category “strongly agree”. Some items were positively worded and some negatively worded. For the analysis of the data, all negatively worded items were reversed so that a higher numbered response on the Likert scale would represent positive attitudes.

Attitude Levels

The teacher respondents were classified into three categories - those having high, medium and low levels of attitude towards research. Arithmetic mean ($\bar{X} = 163.7$) and standard deviation ($\sigma = 18.8$) of the total attitude score of 270 respondents were computed. Scores above $\bar{X} + \sigma$ (182.5) were considered to be high level of attitude; scores below $\bar{X} - \sigma$ (144.9) were considered to be low level of attitude and scores in between $\bar{X} + \sigma$ and $\bar{X} - \sigma$ is treated as the medium level of attitude.

Research Productivity Index

A Composite Research Productivity Index was constructed by considering the number of conferences attended, paper presentations, publication of research papers and the minor and major projects completed by the teacher respondents. Weights were assigned at two levels. At first level, for each category, research activities were divided into four levels as international, national, state and regional and points 4, 3, 2 and 1 were given respectively. Then at the second level, considering the difficulty level of each research activity points 3, 2 and 1 were given to publications, paper presentations and conferences attended. For Projects points 2 and 1 were given for major and minor projects respectively. The sum of all these totals constituted Research Productivity Index. This sum was calculated for each individual respondent for further analysis.

Linear Multiple Regression was applied to find out the influence of select variables on the research productivity of the respondents. The present study aims to identify factors that influence the research productivity among college teachers.

The Research Productivity model used in the analysis is

$$Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_{11} X_{11}$$

Where

Y = dependent variable (Research Productivity).

The explanatory variables (X_1 to X_{11}) included in the model are: Sex of the respondent (0-male; 1- female); Type of institution (0-Self Finance; 1-Regular college; 2-University); Teaching Experience (in years); Subject taught (1-Humanities; 2-Sciences); Teaching hours per week; Number of subjects taught per semester (Average number of subjects); Class strength (Average number of students per batch); Number of responsibilities (regular and occasional); Monthly Salary (Gross salary per month); Number of service benefits; Teachers' Attitude towards research (Attitude Scores obtained)

RESULTS AND DISCUSSION

1. Background of the Respondents

There is extreme contrast among teacher respondents in self financed colleges and universities in terms of doctoral research as evidenced in Table No. 1. While the University teachers are compulsorily those qualified with a Ph.D. degree, only 6.7% of the self-financed

teacher respondents are Ph.D. holders. It needs to be mentioned that this 6.7% doctoral degree holders had completed Ph.D at the time of employment itself. The percentage of respondents who have completed Ph.D is significantly higher among aided college teachers as compared to self financed college teacher respondents. This is mainly due to the Faculty Development Programme (F.D.P.) provided by the U.G.C under which a maximum of two years' paid leave is provided to the teaching faculty in aided colleges. Unfortunately, this programme covers only a small number of teachers. In the case of self financed teachers, such a support is not given.

Table No. 1: Qualification of the Respondents in terms of Research Degree

Type of Institution	Ph.D. Degree			Total
	Not Registered	Registered	Completed	
Self Financed College	83.3	10.0	6.7	100
Aided College	40.0	13.3	46.7	100
University	-	-	100.0	100
Total	41.1	7.8	51.1	100

The percentage of respondents who have not even registered is significantly high for both self-financed and aided college teachers as the organisation climate in these institutions are not conducive to research. (Table No. 2). But for the FDP (Faculty Development Programme), initiated by the U.G.C., the percentage of teachers who have completed their doctorates would have been low among aided college teachers also.

2. Organisation climate

The teachers working in the universities have less teaching/contact hours (six hours per week) to enable them to concentrate on research whereas for the college teachers it is higher (sixteen hours per week). In self-financed institutions, it is much higher as it is arbitrarily fixed according to the whims and fancies of the management. Apart from teaching, the college teachers are also involved in other college-related responsibilities such as administration and community service.

The organisation climate in terms of contact hours, class strength which reflects the extent of evaluative academic work and teacher-student ratio, regular and occasional responsibilities shouldered by teachers, salary and service benefits along with their teaching experience is presented in Table No. 1. It is clear from the tabulated evidence that there is no parity in any of the indices listed amongst teachers working in colleges and university and even within those working in the different types of colleges. Excepting for years of service and salary all other indices are low for university teachers reflecting a better organisational climate. The same pattern is seen between aided colleges and self-financed colleges. Other than salary which is closer to that of the university faculty, the difference in organisational climate between aided and self-financed is only marginal.

Table No. 2: Organisation climate in different institution types

Background	Self Financed College	Aided College	University
Average Teaching Experience (years)	7.67	18.80	23.43

Average Teaching hours per week	18.33	16.57	6.13
Average Number of subjects taught per week	4.00	3.37	1.97
Class strength (Average number of students per batch)	48.96	42.30	20.53
Average Number of responsibilities	7.00	4.00	3.00
Average Monthly Salary (Rs.)	5346.67	23760.40	26600.00

Faculty at colleges (both) have more than a full load of teaching. Teachers may have some support staff in laboratories but not for lectures and administrative responsibilities. Further, teachers are required to be committed to the college community. In an academic year, a faculty member serves on about 4-7 committees related to miscellaneous college and department responsibilities. This leaves them little time for research during the academic year. They use summers and holiday breaks to conduct their research in an intermittent manner leading to problems such as discontinuity in research ideas, loss of time in reorganising, loss of enthusiasm and sometimes a shift in the science community's interest in the research area.

Faculty also encounter other difficulties such as little institutional support, lack of research facilities, limited support for travel and lack of external funding. In the face of such difficulties a high rate of motivation is necessary to pursue research.

3. Attitude towards research

College teachers need to be involved in research and community service in addition to their teaching activities. A teacher with a positive attitude towards research is considered to have the key ingredient necessary for a successful career. This attitude helps in identifying and successfully tackling the blocks that may occur in specific work environments.

Table No. 3: Attitude Levels Among Teacher Respondents

Type of Institution	Attitude Level			Total
	Low	Medium	High	
Self-Financed College	23.3	48.9	27.8	100.0
Aided college	15	60	25	100.0
University	12	70.3	17.7	100.0
Total	16.8	59.7	23.5	100.0

The attitude levels computed using the ATR scale presented in Table No.2 are most peaked for the university teachers and less peaked for the self-financed college teachers due to their work environment. The University teachers handle only Post Graduate classes and engage in research related activities. Infrastructural facilities available in the Universities are much

superior to those in colleges. However, it is clear that all teachers have a predominantly positive attitude towards research.

4. Research Productivity

Involvement in research may also take the form of research activities such as participation in conferences, presentation and publication of papers and involvement in non-degree research projects. Non-degree projects are funded by the government. Research grants sanctioned are classified as minor and major projects on the basis of the scope, period of study and the amount of research grant.

Table No. 4: Involvement in Non-Degree Research Activity:

Research Productivity	Levels	Type of Institution			All
		Self Finance	Aided College	University	
Conferences attended	Regional	0.56	3.42	9.38	4.50
	State Level	0.28	3.74	8.05	4.06
	National	0.11	2.61	8.35	3.73
	International	0.22	0.42	2.22	0.97
Papers presented	Regional	0.36	2.47	8.61	3.86
	State Level	0.20	1.77	6.62	2.90
	National	0.11	2.15	6.50	2.95
	International	0.00	0.41	2.27	0.91
Papers Published	Regional	0.07	0.92	4.11	1.72
	State Level	0.07	1.50	2.25	1.28
	National	0.00	1.33	2.86	1.41
	International	0.00	0.58	0.76	0.45
Research Grants received	Minor Projects	0.23	0.38	2.25	0.97
	Major Projects	0.14	0.14	1.17	0.49

Table No. 4 reveals the variations in research productivity among the teacher respondents from the various categories of institutions studied which is highly skewed in favour of University teachers in all forms of non-degree research involvement. The low level of involvement among the college teachers (both self financed and aided) is due to the unfavourable organisational climate in terms of higher work load, teacher-student ratio, number of subjects taught and college responsibilities (Table No. 5).

Another major impediment to college teachers is the limited and lack of access to resources including funding to pursue research. While awareness of the conduct of international conferences is high, costs involved and bureaucratic procedures are most important barriers to successful participation.

5. Organisation Climate and Research Productivity

The negative correlation coefficients explain the existence of moderate inverse relationship between teaching hours, class strength, number of subjects taught, the number of college responsibilities and research productivity whereas teaching experience and average monthly salary have a positive relationship with research productivity. (Table No. 5) Thus, a suitable work load with reasonable income will create a conducive working climate paving the way for enhanced research productivity.

Table No. 5: Co-efficient of Pearson Correlation between organisational climate indicators and Research Productivity

S.No.	Variable	Correlation co-efficient
1	Teaching Experience	0.51
2	Teaching Hours	-0.42
3	Class Strength	-0.46
4	Number of subjects taught	-0.36
5	College Responsibilities	-0.16
6	Average Monthly Salary	0.39
7	Attitude towards Research	0.22

Note: All the correlations are significant at $p < 0.01$, using a two tailed test.

To attain further insights, multiple regression co-efficients (β) from an ordinary linear regression using the research productive scores as the dependent variable were calculated. Table No. 6 presents the regression estimates of the effect of the selected variables on research productivity among college and university teachers of Madurai and Tirunelveli districts of Southern Tamil Nadu.

Table No. 6: Regression estimates on selected variables on research productivity

Variables	β	Std. Error	t
(Constant)	-109.472	34.995	-3.128
Type of institution	95.032	7.411	12.823
Teaching experience	5.027	0.859	5.853
Teaching hours per week	-2.643	0.884	-2.988
Number of subjects taught per week	-1.447	0.582	-2.404
Class strength (Average number of students per batch)	-0.415	0.175	-2.369
Number of responsibilities	-3.063	1.150	-2.663
Average monthly salary	0.608	0.001	8.094
Teachers' attitude towards research	0.470	0.162	2.907

Note: Dependent Variable: research productivity; Significance level: $p < 0.05$

Estimated regression coefficients suggest that while teaching experience, average monthly salary and the attitude of teachers towards research increase the research productivity, teaching hours per week, number of subjects taught per semester, class strength and the additional responsibilities decrease the research productivity. Thus, it is evident that the unfavourable organization climate (higher work load in terms of the above variables) results in lower research productivity. Among all the variables considered for study, the most influencing factor is the type of institution. The change of institutional

climate from self financed to college and university results in an increase in research productivity by 95%. The lesser work load to the university teachers combined with the better infrastructure and funding facilities available to them are the main reasons.

6. Causal Factors Inhibiting Research

The heavy workload and additional responsibilities of college teachers evolve as the major reason for not presently pursuing research as per the information furnished in Table No. 5. Lack of motivation is a distant second in the overall ranking of cited reasons among college teachers. These corroborate the finding that an overall positive attitude towards research is prevalent.

Table No. 5: Reasons for not involving in research

Reason	Type of institution		
	Self Financed College	Aided college	University
Not interested	-	6	47
High fees	6	1	-
Lack of time	7	12	48
Lack of expertise	1	2	-
Lack of motivation	14	18	5
Too many commitments	72	61	-
Total	100	100	100

Lack of interest/motivation is significantly high at 52% among the university teachers as the organisational climate for research is conducive in universities and hence the major factor affecting college teachers namely high workload and additional responsibilities do not apply for them.

In the present context of Globalisation and Privatisation, the need to get accredited has created an urge among the higher educational institutions to involve teachers in research due to requirements put forth by accrediting bodies on the institution. The current climate of continuing change in higher education has resulted in increasing pressures to be productive in research and publish even under unfavourable circumstances leading to a constant conflict of competing demands for faculty time.

Conclusion

A conducive atmosphere in terms of the organisation climate (teaching work load, teacher-student ratio and other institutional responsibilities) initiate the teachers to engage in research activities as there exist an overall positive attitude towards research which will increase the research productivity of teachers and quality of teaching at large.

Research and teaching are two pivotal activities in any college. But unfortunately research is not given due importance in colleges. College teachers with research aptitude must be encouraged and provided with necessary facilities. There are teachers with enormous potentialities. They are eager to do research but they are overloaded and also lack

infrastructure facilities. Privatisation, driven with a zeal for profit increases the workload, reduces the salary and faculty are pressurised to involve in research in order to get accreditation. The need for a conducive work environment is ignored. Hence, the self-financed institutions should be streamlined, especially with regard to workload and monetary emoluments. In aided colleges too, in the face of global competition and the need to maintain parity with international standards, the workload should be altered so as to facilitate research. The Government and the UGC should bestow their attention for the development of research in colleges by providing the infrastructure and resources necessary to make productive research a reality.

Evaluation of bilingual education in a nursery school in Taiwan

Cher Lin

Introduction

For the purpose of entering the globalization era and reinforcing the international competitiveness of Taiwan, the Ministry of Education (M.O.E) has been lowering the starting age for children to learn English, but only down to the age of 10, which in Taiwan is equivalent to year 3 in normal Taiwanese primary schools. However, more and more children in Taiwan are being rushed into an English learning environment at a young age (2 ~ 5). They are either sent to the monolingual (whole-day-English only) or bilingual (half-day-English only) preschools or nursery schools. This is a rapidly increased phenomenon in Taiwan. At present, it is really hard to find any private preschools where do not incorporate English classes or use English as the main medium in the curriculum programme (Chen, 1996; Hsu, 2000; Liao *et al*, 1999).

The reason why I am only mentioning the private sectors of preschools is that the public institutions are more controlled by the government, and in fact the primary schools up to the universities are all within the national citizen's educational system that the government has set up, so the institutions have to follow the rules of curriculum which would make the institutions unable to really implement bilingual education in practice in whatever way. Moreover, in the first National Ministry of Education Conference in 2004, the M.O.E announced a new regulation, which clearly indicates that any preschool using English as the only medium of teaching for the whole duration of a class is illegal. But, this has not prevented the practice continuing.

The major purpose of this study is to evaluate the bilingual education in Taiwan through investigating the opinions of the children, the parents and the teachers and examining the effectiveness of bilingual education in one of the largest established preschools in Taiwan.

How do children look at bilingual education?

From many unstructured interviews (daily conversations) and semi-structured interviews with 15 children in my focused class, I found that 12 of them like learning English, as the children found English classes fun and interesting. English classes provided a really lively environment, and teachers always used different games, songs or cartoons to hold the children's attention and to encourage them to learn. Because of the cultural differences, English teachers are more open to use their body language and facial expressions, sometimes they even have to make fun of themselves to heat up the learning environment. This is rarely seen during classes taught by Chinese teachers.

When I asked the pupils why they learn English, most of them did not know and

seemed confused by the question, I would suggest that this is because no one had asked them this question before, so they had not have chance to think about it. After they had a little thinking time, they answered me something like “because daddy and mummy want me to!”, “I want to go to America when I am older”, “I want to speak English like daddy/mummy”. Surprisingly, there were three children who have a very clear mind on this, and told me that they learn English, because they like it, and they want to learn more English when they get older. Every child expressed their own preferences of the different English sessions, which were watching videos, singing songs, playing games, reading...etc. 14 of them said “reading” first without much thinking, because they said during reading class, they could read out loud, and everyone had a chance to read a sentence or paragraph on their own. They also stated that they always learnt something from their reading book.

Most of them actively participated in every English learning activity, even when they had library hours during which they were free to take any books from the library (all the books in the library are English language) and read it on their own in the library corners. I found that some of the girls would share a book between two or three and read and discuss the contents of the book together in English. This is a result of the presence of Teacher E. Sometimes Teacher E gave the children the opportunity to play in the playground or ball-pool. During these times the children would shout and speak to each other in English. Although their English was not always correct, they were not afraid to speak loudly. Based on these two pieces of situational evidence, I found it difficult to distinguish whether the children like speaking English or not. It is however certain that they accept speaking English in the environment of the school. They also saw English as their main medium of instruction during school time. The children did not seem to see English as an academic subject that they have to learn in school, they simply speak it in the same way that they speak their mother tongue, Chinese. 2 or 3 of the the children with a more elavatedlevel of English would even use more colloquial language to express their feelings, expressions such as: “Oh my god!”, “Oh! No!”, “Oh! Yeh!”, “Nice one!”...etc.

In addition, from the parents’ questionnaires, I also found out that despite the fact that only half of the parents help the children to revise English at home, almost all of the children naturally use English sentences, short conversations or vocabulary even when they are at home in a Chinese environment. This fact emphasises that the children use English in the same way that they speak their mother tongue. These children are all aware that they will have to learn English as an academic subject when they enter the primary school level, but only 5 of the children were really excited and looking forwards to learning more complex language. The remaining children were actually quite scared and worried, as they were already having difficulties with English language learning. Nevertheless the children still prefer to have all the other lessons such as Art class, P.E. and music to be taught in Mandarin Chinese rather than in English, because they think Chinese is easier to understand. They feel that English is too hard and are more comfortable with lessons being taught in Chinese. Through my observations, I found that most of the children normally speak Chinese after their classes or when the English teacher was not around.

How do parents look at bilingual education and effectiveness of it?

There is no doubt that all of the parents wanted their children to learn as much as they could whilst they were young, in the hope that they could go on to a reputable higher education institution and then get a good job. I can reasonably conclude that the questioned parents wanted to secure their children's future by sending them to the bilingual school to learn English whilst they are young. The parents all come from the upper social class and at least one of the parents in the family was an English-speaker. Half of the parents thought of English as a necessary skill and that the ability to speak English is an international trend. Even if the children did not start learning English in preschool, they would still start learning since Year 3 in primary school. So why not give the children the chance to start earlier, and let them have more time to get used to the new language? The questioned parents also believed that if the children started learning a foreign language from a very young age, they would be more likely to obtain the pronunciation of a native speaker. They also believed that it is easier for children to learn a new language at an early age. 6 of the questioned parents have already thought further about sending their children to study abroad; it is therefore appropriate for the children to learn English now in order to prepare them for study abroad.

From the parent's perspective, almost all of them think that the present bilingual education in the subject preschool is effective, as the children are now able to speak English to any native speaker. It appeared to me that the only thing the parents cared about is whether or not the children have learnt English and have the ability to speak English. They did not, however, seem to be aware of any other factors which might influence a child's learning progress, otherwise they would give suggestions to the school or teachers or even find other preschools which provide better standards. Half of the parents were not satisfied with their child's English levels, especially their conversation and reading abilities. On the other hand, the other half are satisfied with children's oral and listening abilities. 10 of the questioned parents help the children to strengthen their English language abilities by practicing and revising English with them and giving them English picture books or video/audio learning materials.

If the parents can speak English and do speak English with the children at home, then the children's English ability appears to be better than children whose parents do not speak English. I also found that if the children live with grandparents (who speak Chinese dialects as their first language), or if the children can actually speak the other dialects, then the children's English language learning is not as progressive as that of the other children. This is particularly true in the area of pronunciations and tones. If the parents really want the children to learn English well, they cannot just rely on the school and teachers. Although ten of the parents are satisfied with the proportions of English language lessons and Chinese language lessons, they still think that there are many things that should be improved, such as the contents of the curriculum, English language abilities of Chinese teachers. Eight of the parents also think that the quality of the English teachers should be upgraded.

From my research I found that no one has ever thought to ask what the children think about issues related to the bilingual education, that is also the reason why when I

asked them questions during the interviews, they were all seemed confused and took some time to arrive at an answer. Although these children are still young and do whatever their parents ask them to do, it is still necessary for the parents or teachers to understand what the children think about it before telling them to do something. Treating the child more like an adult will make them become more independent and lead them to think more for themselves. This is one of Montessori's ideas. Moreover, it will also become easier to motivate the children if the parents and teacher is aware of the child's thoughts. This is just another traditional way that Chinese parents educate their children, which unfortunately includes a lack of communication with children. It is apparent that the Chinese parents only tell the children to do whatever they think is good.

How do teachers look at bilingual education and effectiveness of it?

All of the Chinese teachers are qualified as preschool teachers and five of them had obtained the certificate to work as preschool headmistress. The native-speaking English teachers, all held a degree from foreign countries (America, Australia, New Zealand and Canada), but did not have any qualifications for teaching at pre-school level. Teacher. G (Chinese teacher) informed me that because it is illegal to employ unqualified pre-school teachers, when the inspectors from the Ministry of Education come, all of the native English-speaking English teachers have to go through a back-door exit to hide in order to prevent the school from getting into trouble. It is clear that the qualifications of the teachers is a really important issue in some circumstances, primarily because pre-school children are at a very important stage for their emotional and physical development and need to be looked after carefully. It is for this reason that preschool teachers all over the world need to pass several examinations or undertake training related to psychology, theories on teaching young children.

Children from the middle and upper class have their mathematics and natural science lessons taught by the English teachers. Although the level of knowledge is not too advanced, it is still necessary for these teachers to be trained in a specific subject. I observed a mathematics lesson with a large class. The subject of the lesson was adding and subtracting, some of the children were experiencing problems understanding. As the teacher insisted on using the same method of explanation, the children's problems remained unanswered at the end of the class. Had this teacher been trained as a mathematics teacher, she would have been able to use different teaching methods in order to assist the students. Nevertheless, there are still some teachers good at teaching subjects other than that for which they were trained. For example, Teacher. E. was teaching natural science with Spring class. The topic that day was "plants". Every time a child raised their hand to ask question, the teacher would try different ways to explain, using as much body language as she could to help the children understand the process of photosynthesis.

Most of the foreign teachers at the school never intend to be a preschool teacher, but as the salary is twice as much as the Chinese teachers' and their workload is far less than that of the Chinese teachers, they simply see the job as a way for them to earn money. I am doubtful that they are able to teach the children to the required standard. The English teachers did not have many comments to the questions that I asked.

They did not seem willing to be interviewed for something they did not sign for. However, all interviewed teachers agree that the bilingual education at this school seems to be effective, but there is still significant room for improvement. They also think that the children's English abilities are impressive, especially in the areas of listening and speaking. But 14 of them feel that things need to be changed and improved in order to make bilingual education really effective. 4 of them think that the proportions of English and Chinese lessons are not right and need to be revised; there are too many English lessons. 10 of the teachers think that the curriculum and the textbooks should be replanned and redesigned.

What are the apparent advantages of bilingual education?

When children start learning a second language from a young age, children's English abilities are easily seen. They usually had at least 35 minutes of reading session everyday. During this period Teacher. E. would use one of the reading books from the reading list. Whilst conducting my research there, I saw them working through a number of Level 3 books on their reading list such as "Looking for Fang", "Birthday Cakes", "Tadpoles and Frogs", "Plants", "Living and Non-living Things"...etc. Teacher E always started from the front cover of the book, and asked the children "who is the author?" and "who is the photographer?" Teacher E would pose the questions in several different ways such as "Who wrote this book?", "who is the cameraman?" or "who took the pictures in this book?" This gives the children chance to understand different way of making sentences, and using different words. Through these reading sessions, children have the opportunity to practice reading, recognise new vocabulary and even other knowledge in the field of biology, mathematics, science...etc

Most of the children are of the opinion that they are good at English. This is a positive phenomenon, because it is important that these children have self-confidence which will definitely help in their learning process. I did not expect them to understand so much vocabulary in a completely different language at such a young age. Although they do not always use the correct grammar or tense, they can still communicate with English speakers, the main purpose of a language is communication. They are not afraid to speak out which is a good start too, because language learners do need courage to speak out and should not be afraid to make mistakes. That is a necessary stage that they have to go through in order to learn a language well.

What are the apparent disadvantages of bilingual education?

All of the children can easily read English storybooks or their reading books on their own, but in my focused class, 'Cynthia' is the only child who is able to read a Chinese storybook on her own, because she has been taught Chinese characters by her parents. There is only one hour and half of Chinese language a week. In the curriculum designed by the school, children are taught some simple Chinese characters which are usually used in daily life. However, due to time limitations, the children do not have enough time to learn and memorize these words, the rate of progress in Chinese is therefore quite poor and the children do not recognize many Chinese words. Although the children have a good learning environment and have great abilities in English

language, they are going to enter public primary schools after all, which means that they will need a period of time to get used to massive changes in their learning environment for English language learning. A coherent curriculum is really important to achieve a good standard in learning.

In addition, the children at this school have to get used to American English, and can only recognize the American accent. In my opinion the teachers should alert the children to the fact that there are many different kinds of pronunciations for the English language, as it is used in different countries. Otherwise they might always think that if people's pronunciation is different, then the children may think that that person is wrong. For example, Lilian is one of the children with a more advanced standard of English. There were several times that a small group of children came to me with some questions, as I was trying to make easier sentences for them to understand, I used words like apple, box, oven and cup. Due to the difference in pronunciation between English speakers and American speakers, Lilian said : "you are wrong! It should be pronounced like...." And Jay even said to me "you don't know how to speak English, but we do!" Then I tried to explain to them why I pronounced these words differently, but they still thought that I was wrong and there was nothing I could say to convince them otherwise.

Now, I am going to present the problems that I saw in the bilingual class in 6 different aspects, "teachers' beliefs", "teaching materials", "teaching methods", "special tutorials", "communication with children" and "co-operation and communication between Chinese and English teachers".

Differences beliefs

Most of the English teachers want to create a natural, pressureless learning environment, so they do not ban children speaking Chinese in the classroom. Their activities in the lessons are more centred around singing, playing games. They are also unlikely to give the children homework. Some of them have their own ideas about teaching, and clearly planned their teaching methods and materials. There are still a number of English teachers who do not put much effort into their work, and may just think playing games and singing is enough for the children to learn English well.

On the other hand, some teachers have very different beliefs in teaching. They emphasise an English-only learning environment, and may be really strict about this. They do not wish the Chinese teachers to help translating, and if children do not speak English in the classroom, they might punish children by deducting award points.

If the teachers do not have similar beliefs in teaching, then it will become hard to co-operate with each other. I also found that there is a very big gap of children's English level in different classes. For example, children in my focused class have much greater English ability compared with the children of the other classes. This is because Teacher. E. was very strict with the children, and she even wrote "No Chinese, English only" on the regulation board to remind the children. Despite her rather strict approach, I have to admit that children learn a lot from her lessons. However, I still think that the school should have discussed this issue with individual

teachers, to avoid differences in achievement levels between children and classes. Such an approach would probably be more favourable to the parents too.

Appropriateness of teaching materials

The main textbooks and activity books are both designed and published from their related publisher company, plus a series of reading books in different levels which are imported from abroad. Generally speaking, the textbooks provide simple and clear pictures with several sentences, which seemed to fulfil the children's demand. But most of the teachers think that they are too easy. Taking this into account, they designed their own teaching materials to back up the existing textbooks. I think it is really difficult to say whether the contents of the textbooks are easy or not. If the children were learning English as a second language, and do not use it for communication at school, then I would say that the content seems appropriate for children of this age range. If the child is in a bilingual learning environment, and if English is the only language they are allowed to speak in the classroom, I would definitely say that the contents of the textbook are much too easy for them. If it were not too easy then they would not have been able to communicate and understand their lessons for the past two years. In terms of the reading books, I think that the contents let the children learn other knowledge at the same time, they are also good practice for the learning of new vocabulary. I also think that children seemed disinterested in topics that they are not too familiar with, such as talking about the beautiful places in Western countries, the history of Western festivals...etc. Every holiday such as Halloween, Christmas, Chinese New Year, Easter and Thanks Giving, the school organises shows. For these occasions the children need to memorize songs or lines in English. Despite the fact that they may not understand them, they have to practice over and over again for a month. This is simply a way to show the parents how the children have done well in their English lessons.

Whether the teaching methods are suitable

Activities in the English lessons include revising the old topics, presenting new topics, drills, games, singing, competitions and work time. Teacher. E. usually introduced two ~ three different topics a week. For every topic, she firstly presented and clearly explained some sentences with simple grammar and several new items of vocabulary, then she would do a drill (both choral drill and chain drill). Next, she used the reading book for the children to practice reading and pronunciation, which was a good opportunity for them to naturally memorize the new words too. Then she would ask the children to make their own sentences using the patterns which had just been taught and the new words which were written on the board. There were always children who actively participated and those who would simply be daydreaming. They would do this for two ~ three lessons, then Teacher. E. would play some games or competitions with them to revise everything that had been taught. Most of the time, she asked the children what they want to do, play games, watch videos, have a competition...etc, and if children could not agree thing, they would be asked to vote. It is always really critical to use competition when teaching children, because the purpose of competition is to motivate. I found that competitions would result in arguments which then become a problem.

Children who like competitions are those who are better in English and more popular children in the class, but those who did not do well in the competition are normally those who are shy and perform below average with oral work. This might become a serious problem for those weaker children in the class, because they will be more and more afraid of hearing others saying “it’s all your fault”, “what are you doing? It is easy”...etc to them, which can make the children become less interested in learning English as a result. Teachers should therefore pay some attention to this issue. Preschool teachers usually do not teach children grammar on purpose, because English education is emphasising understanding the meaning and trying to avoid the input of grammar. I believe that children should be allowed to become a good language user, and not a scholar of language structure. Teacher. E does not really allow children to make any mistakes; she corrected their tense, singular/ plural, prepositions and irregular words most of the time in the class.

No extra tutorials

Within one school day, teachers can use some time to talk to children who have difficulty with learning language (Spodek & Saracho, 1993). In every class, there are always some children who learn new things really quickly, and some who cannot. During these two months of observation in Spring class, I found that their curriculum was twice as much as other classes. However, strictly speaking there were only 5~6 children who were actually up to date with the lessons, and rest of the children still could not really absorb new sentences, vocabulary and use them without difficulty. Teacher. E. did not give individual tutorials to help the slow learners, she just asked them to drill more times during the class, and if they did not know how to make a sentence or did not know how to answer the questions, she would just ask them to concentrate and listen to others in the class. So as a result, children who gain more award points are always those better in English. That is also the reason why those children I interviewed do not like learning English, because they think English is too hard, they can not understand what the teachers were saying and they do not know how to speak English. Teachers must give extra care to those who need extra help, otherwise the children will learn nothing (Lin, 2004).

Communication breakdown

Teachers need to have interactive relationships with students in order to help the children to agree with the functions and values of a language, then they will be able to stimulate their motivations, and raise their learning interest (Chang, 1995).

Teacher. E. Did not speak to the children much after lessons, I think this maybe because the children always had snack time or lunch time straight after the classes, and children were taught to go to the bathroom before their meal. Teachers also do not like them to talk too much during the meal time, otherwise children would be late for nap time or their next class. English teachers do not have to eat their meals with the children, so sometimes they would go out and come back just before the next class began. So the children were always closer to the Chinese teachers rather than English teachers.

Co-operation and Communication between Chinese teacher and English teacher

In this preschool, most of Chinese teachers do not communicate with English teachers very much. This is firstly due to the fact that the Chinese teachers have a very heavy work load, they have to decorate the classroom, write in the parents books, fill the children's water bottles, set children ready for breakfast, lunch and snack, put children in bed for their nap...etc basically they have to everything. Some of the English teachers might help, but some do not. Secondly, most of the Chinese teachers do not speak English fluently and sometimes they have problems understanding English teachers too. I consider this to be a problem as the children might copy the mistakes of the Chinese teacher. Whereas if the Chinese teacher and the English teacher have no problems with communication, then when they are talking in the classroom, it provides a good chance for the children to hear different kinds of conversations from that which they are used to.

Final Thoughts

Finally, I hope the public and parents can understand what these young children really think and want, and not just think "I am doing the best thing for my children, they are still young, they will not be able to understand how much I have done for them". They should instead try to ask children things like "do you like this arrangement?" before making them to do so. Although they are young, they still have very clear preferences and dislikes like adults.

Nevertheless, I still have to say that I was really surprised and impressed by their English abilities. I did not expect the children to know so many words and phrases. Although I do not agree with English-only strategy in the class, it seemed to create an efficient learning environment, maybe not a happy learning environment though.

I also think that teachers should use different methods to teach and help children with different personality and characteristic, because there are always some children like English and some do not, how to lead English learning towards a good direction is all up to teachers, so I might say that the main factor to influence the effective learning is teacher.

Effective learning needs more than a good teacher. In the other words, effective bilingual education involves many factors like the school's objectives, teachers' beliefs, teaching methods, parents' attitudes, children's cognitive level, children's personalities, dependence on mother tongue, hardware facilities, teaching materials...etc. Also everyone views language teaching from different angles and different people have varying criteria as well. The teachers and parents are of the opinion that bilingual education is a good idea, clearly children's English listening and speaking abilities are improved by the bilingual system. In my opinion there are still many elements of the bilingual system which can and must be improved. The government and schools must implement measures to prevent slow development and weakness of bilingual education.

Abstract

This paper examines the concepts of globalisation and internationalisation and argues that whilst the former has redeeming features and outcomes, some global forces have the capacity to impact negatively on many cultures and nations around the world by foisting upon them a homogenising universalisation based on a neoliberal economic rationalist, consumer-driven 'world culture'. Promoting international, intercultural and global understandings in higher education through internationalisation, particularly when underpinned by the spirit of 'internationalism', is one way of ameliorating this. Viewed this way, internationalisation processes can be a rescuing and redeeming 'White Knight' which battle against the potentially destructive 'Black Knight' elements of globalisation to help shape functional and moral outcomes from global processes. This is an excellent representation of internationalisation as a process which plays an important role in 'globalisation from below' or 'grassroots globalisation' which acts in a 'bottom-up' fashion on many 'top-down' global forces. The paper purposefully draws on literature from around the turn of the millennium when writers were beginning to place considerable focus on the current period of globalisation and its implications for the planet and its inhabitants. This body of literature provides a rich environment for drawing out understandings around globalisation and internationalisation that remain relevant for researchers and observers in the area today.

Keywords

Globalisation, Internationalisation, Internationalism, Higher education

Introduction

There are two ways of thinking about globalisation and Currie and Newson (1998) suggest that it is important to distinguish between them (p. 1). One is to consider globalisation as a 'process' or a 'mechanism'. That is, a non-ideological interpretation of the essence of the phenomenon that describes, for example, the nature of global flows of technology, economy, knowledge, people, values and ideas (Knight 2003). The other way is to view globalisation as the forces that are driving and shaping the process or the mechanism itself. Giddens (2002) provides an insight into this when he suggests that globalisation "is led from the west (and) bears the strong imprint of American political and economic power" (p. 1). It is evident, then, that globalisation can be appreciated both as a process, that is, "exactly what is 'global' about globalization?" (Held, McGrew, Goldblatt & Perraton 1999, p. 15), and also in terms of the ideologies that are driving the process and give form to global flows. Perhaps this is what prompts Stiglitz to reflect that "the idea of globalization is very simple" (2003, p. 51), yet "the world is a complicated place" (2002, p. 217). This paper unpacks both perspectives and suggests that internationalisation based on the spirit of 'internationalism' is a 'White Knight'

that can be mobilised by the discontents of globalisation to moderate its potentially destructive ‘Black Knight’ aspects. Throughout the paper the relationship between globalisation and higher education will be made explicit. The aim, however, is to initially focus the argument in this paper on the biggest stage possible; that of appreciating the essence of globalisation as a phenomenon affecting the human condition both as a process and as an ideology. In this way, an understanding of the implications that global forces have for higher education can be better gleaned.

Globalisation as a process

An appreciation of globalisation as a process is valuable because an understanding of this concept will also help tease out its relationship with the process of internationalisation. The two terms are related but each has a distinct meaning. Not only do many struggle to understand the meanings of both but the nature of the relationship between them is also elusive. In a bid to clarify the argument around globalisation, Held et al. (1999) suggest that the present period of ‘global transformations’ is historically unprecedented. They usefully describe the essence of globalisation as:

... a transformation in the spatial organisation of social relations and transactions – assessed in terms of their extensity, intensity, velocity and impact – generating trans-continental or interregional flows and networks of activity, interaction, and the exercise of power. (p.16)

Using the work of Held et al. (1999) as the backbone of this section of the paper is akin to taking Ockham’s razor to the plethora of literature that comprises many accounts of the multi-faceted nature of globalisation. In a parsimonious way, it simplifies the approach to understanding globalisation, without simplifying the concept itself. It avoids the confusion of trying to sort out what globalisation ‘is’ if one were to instead sift through the “hundreds of different views on globalisation; pro-, anti- and barmy” (Legrain 2003, p. 313). Held et al. (1999) suggest there are three different ways of looking at the phenomenon, that is, through the eyes of the ‘hyperglobalisers’ (or ‘hyperglobalists’), the ‘sceptics’, and the ‘transformationalists’. A summary of the main characteristics of the hyperglobalisers, sceptics, and transformationalists in relation to broad global flows is presented in Table 1.

The hyperglobalisers and sceptics occupy opposite positions to each other. The hyperglobalisers (called “radicals” by Giddens 2002, p. 8 and “deregulators” by Koenig-Archibugi 2003, p. 8 and “globalists” by Saul 2005) argue that contemporary global flows signify a ‘new world order’ where global mechanisms are superseding the function of the chief geo-political entity of the past two hundred years; the nation-state. Held et al. (1999) state that the hyperglobalist world generally reflects neoliberal economic perspectives and a belief that the free market will denationalise economies (p. 3). The nation-state would be obsolete (Callinicos 2001, p. 18). Nations would become fictions (Giddens 2002, p. 8). For hyperglobalisers, globalisation is the emergence of a truly global age “involving the triumph of global capitalism and the advent of distinctively new forms of global culture, governance and civil society” (Tickly 2001, p. 153).

In the case of higher education, the terms ‘global education’ and ‘borderless education’ spring to mind as expressions that suit the hyperglobalist position. Knight (2004) says that global education is worldwide in scope and does not rely on the concept of ‘nation’, that is, an entity defined by territorialised borders (p. 8). Advancements in Information Communication Technologies (ICTs), in particular, have leveraged significant opportunities for traditional and non-traditional education providers to see the world as their oyster and not be limited to particular countries for their student base. The hyperglobalist position would recognise the ways that the ‘global economy’ and ‘global governance’ are changing the face of higher education. That is, the commercialisation and commodification of education under neoliberalism and, by extension, the way that the World Trade Organisation (WTO) supports the opening up of educational markets to international competition through the General Agreement on Trade in Services (GATS) (Teekens 2000, p. 16). For Vitz (1998), such developments are the direct result of the decline of the modern state and are changing the face of higher education. Inayatullah and Gidley (2000) assert that “globalism is a driving force (...) the bureaucratic structure forces one into a position wherein the university and the self become corporatized” (p. 7). Another undesirable view of hyperglobalist education is expressed by Marginson (1999/2000):

The danger rather is *global convergence*: that the contents of the media and systems of ‘globalisation’, including the models of higher education we employ and the systems of international bench-marking that we follow, will push everyone, in every country, into common patterns of higher education, in which an (idealised) American university model becomes the only possible model. (p. 5, italics in original)

Table 1. Conceptualising globalisation: three tendencies

	Hyperglobalists	Sceptics	Transformationalists
What’s new?	A global age	Trading blocs, weaker geo-governance than earlier periods	Historically unprecedented levels of global interconnectedness
Dominant features	Global capitalism, global governance, global civil society	World less interdependent than in 1890s	‘Thick’ (intensive and extensive) globalization
Power of national governments	Declining or eroding	Reinforced or enhanced	Reconstituted, restructured
Driving forces of globalization	Capitalism and technology	States and markets	Combined forces of modernity
Pattern of stratification	Erosion of old hierarchies	Increased marginalisation of the ‘South’	New architecture of world order
Dominant motif	McDonalds, Madonna, etc.	National interest	Transformations of political community
Conceptualization of globalization	As a reordering of the framework of human action	As internationalization and regionalization	As the reordering of interregional relations and action at a distance
Historical trajectory	Global civilization	Regional blocs/clash of civilizations	Indeterminate: global integration and fragmentation
Summary argument	The end of the nation-state	Internationalization depends on state acquiescence and	Globalization transforming state power and world politics

support

Source: Held et al. 1999, p. 10.

In opposition to the hyperglobalists are the sceptics who believe that nothing has changed and that the 'old world order' continues through the pre-eminence and dominance of the nation-state. Hirst and Thompson (1996) called globalisation the "necessary myth" (see pp. 1-17). The heart of the argument of the sceptics is that "all the talk about globalisation is only that – just talk (...) the world carries on much the same as it has done for many years" (Giddens 2002, pp. 7-8). It is "old wine in new bottles" (Skelton & Allen 1999, p. 1). The sceptics believe that nation-states remain in control of their own interests and despite the emergence of global trade, economic interdependence is not historically unprecedented. Whilst global processes are introducing new supranational infrastructures which transform the way power is reproduced and contested, Held et al (1999) point out that, paradoxically, the nation-state remains the "near universal form of human political organization and political rule" (p. 425). Legrain (2003) states that "national borders are not about to disappear" (p. 9). Green (1997) qualifies this by observing that over 100 nation states have been established since the late 1960s, 18 of which have been officially recognised since 1991 (p. 157). Sceptics view talk of global governance as a Western project that seeks to maintain the hegemony of the world's rich and developed countries (Held et al. 1999, p. 6). They interpret globalisation as merely "the latest stage in the exploitation of the third world by the West" (Giddens 2002, p. xx). Sceptics take an emerging 'World Culture' to be an extension of Western culture. It could also be viewed more narrowly as "Americanization" (Prestowitz 2003, p. 6) although as Giddens (2002) points out, globalisation "affects the United States as it does other countries" (p. 4). Globalisation is a two-way street, despite the dominance of traffic in one lane. As suggested by Held et al. (1999), globalisation is "still highly asymmetrical (but) less Eurocentric or Atlantic-centric" than a century ago (p. 430).

The sceptics would acknowledge that although higher education around the world is changing, the fundamental geo-political unit of the nation-state still dominates the structure and function of individual countries' institutions of higher learning. National interests still drive national education systems. This, of course, does not discount the flows of scholars, students, technologies, and ideas around the world. It makes sense, however, to speak of them as processes aligned with the 'internationalisation' of higher education and 'transnational' education. Indeed, another term, 'cross-border' education actually emphasises the existence of national borders (Knight 2004). Inasmuch as nation-states are still the major determinants of much of human activity, it also has to be recognised that the world is largely dominated by the Western worldview. That is, there is a prevailing hegemonic order of nations, with those in the West (North) being key drivers of the new 'knowledge economy' or 'knowledge society' in which higher education plays a significant role. In relation to higher education Altbach (2002) notes that "the voices discussing internationalization are largely Western". Further, English, the most widely studied foreign language in the world and also the most widely used second language, is the dominant language of 'international' higher education (Altbach 2004). Of interest, Altbach (2004) says that even within the hegemonic West, there is an unequal balance of power, with the older and wealthier institutions restricting the ownership and distribution of 'commodified' knowledge.

The transformationalists occupy the remaining position and this is the thesis to which Held et al. (1999) and Giddens (2002) subscribe. Instead of signifying a totally new world order or reflecting more of the same as what has already passed, transformationalists believe that it is

a bit of both but with enough unique elements to distinguish itself from either. In the emerging environment, nation-states and national policies remain crucial, but nations are open to international trends and cross-border influences to an unprecedented extent (Considine, Marginson, Sheehan, & Kumnick 2001, p. 6). In the absence of true political global governance, nation-states are not passé, despite some changes to their ability to fully regulate and control, for example, information and financial flows. In Marginson's (2004) view, they have simply reorganised themselves to work with greater levels and layers of global interconnectedness. Rather than viewing globalisation as a singular condition or a linear process, transformationalists believe that it is a highly differentiated phenomenon across several domains of activity and interaction (Held et al. 1999, p. 23). It is historically contingent and has massive transformative power that is causing a 'shake-out' of societies, economies, institutions of governance and the world order. Further, it is replete with contradictions, uneven in its application, and its ultimate trajectory is not yet explicit (Held et al. 1999, pp. 6-7). This view is supported by Appadurai (1996) who suggested that "if a global system is emerging, it is filled with ironies and resistances" (p. 29).

A transformationalist view of higher education recognises elements of both the hyperglobalist and sceptic positions. Higher education is changing as a result of supranational *and* national forces. The trajectory of such changes, however, is not apparent at this moment. Indeed, for some, the future of the university is not even guaranteed. Vitz (1998), for example, notes that in the United States, many leading academics have already moved from universities into 'think tanks' or independent institutes. As such, the transformationalist account sees higher education as a contested area of human activity, with uneven and contradictory outcomes. Perhaps the most important element of the transformationalist view of higher education lies in its capacity to generate and usher in new ways of thinking to deal with societal and environmental challenges which are the result of activities along the local, national, regional, and global continuum. 'Transformative education', according to writers such as O'Sullivan (1999), Slade (2002), and Vitz (1998), is a necessity for the survival of humanity. A transformative curriculum would be informed by perspectives along the local-global continuum to equip students with the necessary knowledge, skills and outlooks to deal with the challenges they will encounter in life and work.

Discontents of the 'Black Knight' of globalisation

Whilst the previous section described globalisation as a process sans ideology, a value-rich appreciation of the phenomenon is useful because it addresses notions of power and influence associated with the "neoliberal project" (Held et al. 1999, p. 431) which has had a significant impact on global processes. Whilst this political ideology has broad implications for the human condition in general, it specifically affects higher education through a shift towards governance which is increasingly influenced by business values and market forces (Currie & Newson 1998, p. 2) pushed along by supranational entities like the World Bank, the International Monetary Fund (IMF), the World Trade Organisation (WTO). The aim of this section is to consider globalisation from the points of view of those who openly criticise what they perceive as negative, 'Black Knight' aspects of global processes. Bauman (1997), Sassen (1998), Stiglitz (2002) refer to these critics as the 'discontents' of post-modernity and globalisation and Held (2003) describes them as a "loose constellation of social movements (including the anti-globalization movement), trade unionists and (a few) politicians and intellectuals" (p. 166). Investigative journalists like Friedman (2000), Pilger (2002) and Monbiot (2004) should be added to this list. The discontents are a collection of

commentators, authors and organisations that, for a variety of reasons and from a multitude of backgrounds, essentially flesh out the observations of Held et al. (1999) that globalisation processes occupy an uneven and contested terrain, dominated by a neoliberal, market-based ideology and characterised by asymmetrical power relations. The discontents interrogate Gill's (1997) statement of "globalisation for whom and for what purposes?" (p. 205). Whilst not all discontents argue about the same things and from the same point of view, there is nevertheless a strong pattern to their arguments. They largely resonate with Dudley's (1998, p. 22) assessment of globalisation as a world system driven by an interconnected economy that is derived from the following independent developments:

- The aspiration of virtually all societies throughout the world toward Western materialist / consumer-based lifestyles;
- The penetration and near hegemony throughout the world of Western popular culture, particularly American expressions of this mass culture;
- The increasing dominance of Western, and particularly U.S., models of production and consumption;
- The increasing integration of world economies into a single global international market; and,
- Free trade and the new international division of labour.

Rather than riding the "high tides" (Mittelman 1997, p. 241) of neoliberal globalisation, the discontents advocate for a more democratic form. Ruggie (2003) suggests that the discontents form part of the "backlash" against globalisation, and argue against the highly uneven distribution of benefits, the growing imbalance in global rule making, and the increased vulnerability of people to forces that can result in economic instability and social dislocation (pp. 96-97). The discontents respond to the conflict that globalisation causes as it "pushes upwards (and) downwards (and) squeezes sideways" (Giddens 2002, p. 13). They take issue with global processes that pull and push societies in opposing directions (Held et al. 1999, p. 14), cause fragmentation, and create contingent and contradictory outcomes. Their ideologies generally approach ideas related to social justice, civil society, economics, the environment and the public good from different perspectives than the neoliberal view. The voices of the discontents are a sounding board for the 'fit' of global processes to the breadth of humanity's lived experience, and whilst their activities and views "may not resolve the great antinomies of power that characterize this world (...) it might help even the playing field" (Appdurai 2001, p. 20). As Friedman (2000) notes, they represent an important part of the process of 'globalisation from below':

The backlash against globalization is a broad phenomenon that is fed by many different specific emotions and anxieties. This backlash expresses itself in different forms, through different characters in different countries (...) they have come together to create a whirlwind that – for the moment – is only buffeting globalization systems but one day might become strong enough to destabilise it... (p. 329)

A few 'globophobes' would like to get rid of globalisation altogether. Koenig-Archibugi (2003) called these the "reversers" (p. 8). This paper, however, supports the position outlined by Giddens (2002) who says that "the problems of the world would not disappear with a retreat from globalization" (p. xxix). Legrain (2003) believes that stopping globalisation is not a solution (p. 64) and that the only one way forward is to "build a better globalization"

(p. 24). This echoes Biggs's (2002) sentiment when he says, "globalisation is upon us; it is less than helpful to command, Canute-like, the tide to retreat. Rather the wise thing would be to acknowledge what we cannot change, and focus on what we can change" (¶2). The solution is 'New Global' instead of 'No Global' (Koenig-Archibugi 2003, p. 9). As such, the view of 'destabilisation' adopted here is a reorientation of global processes to make them more effective and equitable. It is through the rumblings, ruminations, protestations and writings of this group of "peacefully protesting" (Giddens 2002, p. xxi) discontents that the argument is made that if the world is indeed going to be globalised, the opportunities presented by this era should be harnessed for the benefit of all of humanity and not just the privileged few in positions of political, cultural, economic, and military power. It is to this end that internationalisation processes as a 'White Knight' can be mobilised as a 'bottom-up' response to 'top-down' global 'Black Knight' forces.

Discontents in higher education: internationalisation as the 'White Knight'

Knight (1997) claims that globalisation has the potential to destroy many cultures in nations around the world by foisting upon them a homogenising universalisation (p. 6). Internationalisation, suggests Knight (1997), "is one of the ways a country responds to the impact of globalisation yet, at the same time respects the individuality of the nation" (p. 6). The critical statement by Knight (1997) that follows is that "globalisation can be thought of as a *catalyst* while internationalisation is the response, albeit a response in a proactive way" (p. 6, italics in original). This 'White Knight' view is generally supported by a number of other authors as outlined below and it is clearly based on the spirit of internationalism (described in the following section of the paper.) As put by Cambridge and Thompson (2004), 'international education' (used in the broad sense of 'internationalisation') has more recently "been used to denote an ideology of education oriented towards 'internationalism' and 'international-mindedness'" (p. 161).

Altbach (2004) says that whilst globalisation is about trends that have cross-border implications, internationalisation responds by being "the voluntary and perhaps creative way of coping with or exploiting globalisation" (p. 3). In the case of higher education, Altbach (2002) perceives internationalisation as specific policies and initiatives of countries and individual academic institutions to deal with global trends. Van der Wende (1996) sees internationalisation as "any systematic effort aimed at making higher education responsive to the requirements and challenges related to the globalization of societies, economy and labour markets" (p. 18). For Harman (2005), internationalisation is about structural adjustments institutions make in response to global flows, plus the opportunity to better understand other countries and cultures (pp. 120-121). Teekens (2003) adopts Knight's internationalisation approach and speaks of globalisation as a process of "increasing interdependence between economies in the various parts of the world". She says that whilst this creates many opportunities for "borderless learning", it also has the potential to create a global culture, "leaving little room for cultural diversity and self-determination" (p. 15). Teekens's (2003) view on the potential threat of globalisation foregrounds it as the 'Black Knight'. Back, Davis, and Olsen (1997) are more forthcoming in unclenching globalisation as the 'Black Knight', whilst alluding to internationalisation as the 'White Knight':

Internationalisation of higher education recognises nations and describes a process of interchange of higher education between nations. On the other hand, the term 'globalisation' lacks the spirit of cooperation of internationalisation and is seen as

something more threatening with overtones of imperialism or take-over. Thus globalisation of higher education suggests a supranationalism that straddles national boundaries, giving scant regard to the wishes of collaborating nations. (p. 42)

It is important to note that whilst internationalisation can represent the ‘White Knight’ response to global forces, it can also be interpreted as both a *reflection* and an *agent* of global forces. This view of internationalisation is evident in Rizvi’s (nd) statement that ‘international education’ (again, used in the broad sense of ‘internationalisation’) can best be viewed “as both an expression and a response to the general processes of globalisation”. Such a relationship is also inferred in the statement by the Australian Vice-Chancellors’ Committee (AV-CC) that “a concomitant of globalisation is internationalisation” (2001, p. 5) and in the assertion by Eckel, Green, and Affolter-Caine (2004) that internationalisation is a “sibling” of globalisation (p. 299). Some discontents of globalisation might see this as the ‘White Knight’s’ alter ego; a ‘Little Black Knight’! The interpretation of internationalisation as both a reflection and an agent of globalisation is based on the way that institutions, for example, have picked up on opportunities leveraged by broad globalisation processes. For instance, to satisfy the demand for learning English, many institutions in English-speaking countries (and in some non-English speaking ones as well) offer full fee English language programs for international students. Similarly, broad global forces can be said to have stimulated the significant flows of degree-seeking students from developing countries to more developed, English-speaking countries. Moreover, in many developed nations neoliberal economic rationalist measures have led to educational institutions having to seek sources of funding other than from the diminishing ‘public purse’. The resultant large international student programs in countries like Australia, United Kingdom, United States, and New Zealand are expressions of these broad global machinations. As well as institutions themselves being affected by global forces, they also respond to the needs produced by global forces. In doing so they act as agents who reinforce and extend the very forces that stimulated the response.

Internationalism – the essence of the ‘White Knight’

The section above portrays internationalisation as a mechanism that acts in a ‘bottom-up’ fashion against ‘top-down’ global forces. This section introduces ‘internationalism’ as a key concept inherent to discussions around ‘White Knights’ in the internationalisation of higher education. Whilst used less frequently than ‘internationalisation’, the words ‘internationalism’ and ‘internationalist’ are occasionally employed in the higher education literature. A definition of ‘internationalism’ is “the view that the nations of the world should co-operate politically, economically, culturally, etc and work towards greater mutual understanding” (Manser & Thomson 1995, p. 672). Quiggan (2003) provides a good sense of how internationalism relates to globalisation:

Internationalism is not a political movement like social democracy or neoliberalism, nor is it a central term in a body of argument, like globalisation. Rather, it is a general aspiration (...) As opposed to globalism, internationalism accepts the reality and legitimacy of national governments. This legitimacy arises in part from acceptance of the idea of the nation-state, that particular groups of people (nations) are bound together by ties of common history and language, and are natural units of governments. (¶ 1)

In a traditional sense, then, ‘internationalism’ contains a functional and even a moral imperative. This is evident in Knight’s (1997) assertion that internationalisation is concerned with “respecting and perhaps even strengthening local, regional and national priorities and culture” (p. 6). It is also evident in the work of Appadurai (1997) who uses ‘internationalism’ to describe the internationalisation of research in higher education. He promotes the “spirit of internationalism” and “critical internationalism” as ethical approaches to the “deparochialization of the research ethic” from a dominant Western view to a shared worldview (pp. 55-60). In the same manner, Hatakenaka (2004) suggests that “developed countries have traditionally supported internationalism principally to enhance mutual understanding among different cultures” (p. 4). Johnson (1996) speaks of academic communities worldwide as having “a certain internationalism” in the sense of being open to and accepting of other cultures (p. 84). For Jones (1998), too, ‘internationalism’ has a moral basis. He states that internationalism has an “intrinsically democratic foundation (and) looks to a world ordered by structures supportive of that functionalism which is embedded in accountability” (p. 143). Jones (1998) contrasts the ideal of internationalism against “unfettered capitalism” (p. 143) which he believes is driving globalisation processes. Such a view portrays internationalism as inherently good and globalisation as inherently bad. It should be noted, however, that the idea of globalisation itself is not necessarily a negative thing. It is the management of the processes and their outcomes that are contentious. In any case, internationalism, too, may be contorted by hegemonic forces, as evidenced by Scott’s (1998) view of “the old internationalism, still dysfunctionally dominated by the West” (Scott, 1998, in de Wit, 2002, p. 17).

A definition of ‘internationalist’ is “a person who favours internationalism” (Manser & Thomson 1995, p. 672). Singh (2002) speaks of the “new internationalist worker, citizen and learner” as someone who is supported by a university education based on innovative approaches to teaching and learning to meet the demands of the global economy (p. 1). For Cambridge and Thompson (2004), “internationalist international education” appeals to the standard definition of internationalism given above and is contrasted against “globalist international education” which is underwritten by free market values (p. 161).

Conclusion

This paper has sought to clarify the concepts of globalisation and internationalisation to leverage a better understanding of the phenomena themselves, the relationship between them, and also the ways in which they impact on, and are manifested in, higher education. The argument is deliberately drawn from literature evident around the turn of the millennium when there was an intense focus on trying to understand the essence of the current period of globalisation and its likely implications. It was in the decade starting from around the mid-1990s that people initially posed fundamental questions like ‘What is globalisation?’, ‘What is internationalisation?’, ‘What is the relationship between globalisation and internationalisation?’ and ‘What does this all mean for higher education?’ The paper demonstrated that globalisation can be viewed as a process from a non-ideological standpoint, and also as a vehicle that is driven by value-laden ideologies. The use of the work of Held et al. (1999) provided insights into both perspectives and suggested that whilst nation-states are not disappearing, their sovereignty has in ways been compromised by a range of supranational forces. Moreover, the trajectory of contemporary globalisation is not yet evident.

When viewed through an ideological lens, it has been shown that globalisation's discontents largely take issue with two matters. One is the 'neoliberal project' which essentially rules out any worldview other than that one in which outcomes are determined by business values and market forces. The other concern of the discontents is the emergence of a 'world culture' based on consumerist Americanisation; the 'Disneyfication', 'Coca-Colonisation, and 'McDonaldisation' of the world by 'America Inc'. For the discontents, these 'top-down' economic and cultural flows are 'Black Knight' global forces and need to be reined in for the sake of the planet and its peoples. One way to do this is through internationalisation as a 'White Knight' response which acts in a 'bottom-up' fashion that represents 'grassroots globalisation' and seeks to produce more equitable and moral outcomes from current flows of, for example, technology, economy, knowledge, people, values and ideas. In the case of higher education, institutions need to be responsive to the requirements and challenges related to life in a rapidly globalising world; one in which national borders and global flows which transcend them are both a reality. To this end, research, teaching and community engagement directed by the spirit of internationalism is likely to be found at the heart of many internationalisation responses. That is, a belief in co-operation, collaboration, respect and a desire for mutual understanding.

Given this paper focused on literature that engaged with emergent understandings about this epoch of globalisation, it is fitting to end it with some key observations of the time. Giddens (2002) remarks, "as we look round the globe at the end of the twentieth century, we can see cause for optimism and pessimism in about equal measure" (p. 81). Despite some remarkable advances in technology and economic development in the latter part of the twentieth century, the period was nevertheless marked by disillusionment and inequality (Delors 1996, p. 15). The uncertainty of milieu is well captured by Waters (1995) in the ambiguous claim that globalisation represented "the end of the world as we know it" (p. 159). If ever there was a time for education to come to the fore to help understand and meet the challenges of the future, this is likely to be it (O'Sullivan 1999, pp. 13-16). Internationalisation underpinned by the spirit of internationalism continues to have a big 'White Knight' role to play in all of this.

ABSTRACT

This paper focuses on a Business Etiquette class taught at the Faculty of Business Administration, Chiang Mai University, Thailand. The study herein aims to address some challenges of teaching international business etiquette to Thai undergraduate students who have not been exposed to the international, professional, and business world. The results of this study suggest ways to develop effective an international business etiquette pedagogy in terms of providing practical knowledge and cultivating tacit skills. This study was conducted through a participant observation method, with questionnaires used as a supporting research tool. The population of this research was 40 undergrad students studying in the Faculty of Business Administration and who participated in a Business Etiquette class during the 2009 summer semester. The study focuses primarily on pedagogies and learning assessment methods. Three main issues that are discussed in this paper are: students' general information, course development, and course outcomes.

Key words: Business etiquette, pedagogy, learning assessment, Faculty of Business Administration, Chiang Mai University

Introduction

Knowing and practicing proper business etiquette is not instinctual. The importance of knowing how to act and what is appropriate in a business setting can make a difference in business outcomes and business relationships. However, a number of studies have reported a significant decline in people's manners. In addition, many studies reported an increasing demand on executives to be sensitive to foreign cultures since international business is growing rapidly. The major factors that seem to have affected the diminishment of good manners are the decline in human interpersonal interaction in the high-tech workplace and the upbringing of children in households where proper manners were not encouraged (Mohn, 2002).

Academic institutes are well aware of this problem. They are actively finding ways to resolve such problems. Various business schools around the world have made etiquette training a part of the curriculum. The Faculty of the Business Administration at Chiang Mai University, Thailand is one of them. The faculty launched its Business Etiquette course as one of the elective subjects offered by Management Department in academic year 2005. The objectives of the course are to provide students knowledge and understanding of business etiquette in various dimensions and to cultivate such skills and attitudes in the students. The author is the one who proposed to open this course in 2005 and also currently the main instructor. In order to meet the objectives of this course, the author conducted this research using her class as a sample group.

The results of this study suggest ways to develop effective an international business etiquette pedagogy in terms of providing practical knowledge and cultivating tacit skills.

Teaching “business etiquette skills” is challenging, especially attempting to teach them to the students who have not been exposed to the international, professional business world. This research starts by analyzing the students’ general information (demographic and attitudinal), and then is followed by course development, and course outcomes.

Literature review

This section contains reviews of different teaching methods and learning assessment methods and examines their relative advantages and disadvantages. The author used these reviews to structure the questionnaires of this study.

Teaching methods

When choosing a teaching method, it is important to know the learners. For example, the instructors should know the students’ experiences, interests and goals. It is common that when asking the students what they wish to learn, they may not know enough about a subject to form an opinion. However, if they are involved in finding what they should learn and participate in selecting goals, they have a stronger sense of involvement. It is reported that youth learn best in an atmosphere of warmth and acceptance. In other words, to enhance students’ learning outcome, they should be actively involved in setting goals and planning their learning activities.

There are numerous ways that people learn. For example, a visual learner needs to see an item in writing to remember it. An auditory learns by having the information spoken to them or repeated by them. A kinesthetic learner may need to touch items to determine size, shape, texture, and weight in order to learn and remember. There is no one best way to learn. It is agreed by many educators that involving students in different teaching styles would reinforces the learning process, and as a result, strengthened their knowledge retention.

The followings are teaching methods that are widely implemented. This research uses these methods as a research structure (Hall, 2010; Helt & King, 1999; Newcomb, McCracken, & Warmbrod, 1993; Ohio 4-H Program, 1994; and Excellent Classroom Management Resources, 2010)

1. Lecture

Lecture is perhaps the most common form of education. It allows educators to deliver a large amount of information in a short amount of time. Factual material is presented in a direct, logical manner. Preparation is done by an individual and can be repeated on a routine basis for each new group of learners. Lecture is suitable to provide information to a large group of students. Auditory learners are the best receivers of lecture information. However, this method can cause learners to become bored and easily distracted. The educator who uses this technique should have proficient oral skills. The main drawbacks of this teaching technique are that it is a one-way communication, the audience is often passive; therefore learning is difficult to gauge. Effectiveness of this method is also highly related to time and scope of content.

2. Discussion

Discussion method is a two-way communication to exchange ideas through oral discussion. This method pools ideas and experiences from the student group. It is particularly effective after a presentation, film or experience that needs to be analyzed. It allows everyone to participate in an active process. Educator acts as a facilitator of the discussion by asking questions or makes comments, then waits for a response. Students are encouraged to contribute to this learning process by providing comments, answers, and also asking questions. Drawback of discussion method is that it is not practical with more than 20 students. Furthermore, if a few students dominate the discussion, while other students do not participate, the learning process would lose its effectiveness. In addition, this process is time consuming and if the instructor could not control the discussion, the discussion could get off track easily. Effective discussion session requires good question outline in advance.

3. Lecture with discussion

Lecture with discussion involves students, at least after the lecture. The instructor allows some time after the lecturing session for students to ask questions and also to challenge the knowledge they just learned. However, time constraints may affect discussion opportunities. Learning effectiveness is highly connected to to-the-point questions and discussion. Teacher should be prepared to allow questions during lecture, as appropriate. Teacher should also anticipate difficult questions and prepare appropriate answers in advance.

4. Demonstration

Demonstration method is when an educator both tells and shows what steps to take in an educational process. For example, educator teaches students how to cook by demonstration. By seeing a task performed, students are expected to be more aware of what materials are needed, remember steps in the process, and observe the final outcome of the task. This teaching method is proper for teaching students more on “how” to do things, not “what.”

4. Role playing

Role playing methods is when the educator places students into assigned roles where they act out ideas. This method provides opportunity for students to assume roles of others and thus appreciate another point of view. It also allows for exploration of solutions. In addition, by physically active involvement, learners of different types will retain more than if they merely sat and watched a skit or video performance. Each group of students differs in how the message is delivered and interpreted. It is important that if the educator is trying to make certain points in the exercise which are not obvious, then additional processing and discussion of the material are required to get the learning objective accomplished. The limitation of this method is that it is not appropriate for large groups.

5. Hands on (experiential)

One of the most dynamic ways to deliver information is to provide hands on activities. This opportunity may be highly directed or a free-form opportunity for learners to be creative and progress at their own pace. For example, a teacher may ask students to cook after they had learned the principles of cooking that dish. With this method, learners learn what they practice. It is noted that experiential learning may take much longer to accomplish but will be retained better by students. The number of

students and materials available may limit the amount of hands on experience an instructor can offer. The visual, auditory and kinesthetic learners all benefit from such technique.

6. Case studies

Instructors develop analytic and problem solving skills by giving students case studies. The case could either be a real case or a composed one. Case study allows for exploration of solutions for complex issues and also allows student to apply new knowledge and skills. The disadvantage of this method is that students may not see relevance to own situation. In addition, insufficient information can lead to inappropriate results. To use case study, students should have learned enough theories to apply to solve problems in the case. In other words, case study is not appropriate for elementary level.

7. Guest speakers

One way to spur students' interest is to bring in guest speaker. The instructor should select the guest speaker according to the focused topic. The guest speaker should not only be a specialist in that particular field but also be a good speaker who can summarize the main ideas and convey to the audience effectively. The successful guest speaker is the one who know enough to answer students' questions from his/her experience, not from the book.

8. Multimedia

Multimedia such as movies, video clips, and slides is an entertaining way of introducing content and raising issues. It is most effective when follows by discussion. It usually keeps the group's attention up and stimulates discussion. However, it can raise too many issues to have a focused discussion. This method would be effective only if the instructor prepares a well discussion outline after the multimedia presentation.

Learning assessment methods

An important part of learning occurs after information has been offered. The final step is taking time to review what has been learned. While high marks and good grades are desired in formal teaching, they do not always mean that the course has accomplished its learning objectives.

There is a variety of assessment methods used in academia to assess students' achievements. The instructor should choose those methods that most effectively assess the objectives of the unit of study. In addition, the choice of assessment methods should be aligned with the overall aims of the program. It may include the development of disciplinary skills such as critical evaluation or problem solving and support the development of vocational competencies such as particular communication or team skills. Therefore, when choosing assessment methods, the instructor should be concerned about both the immediate task of assessing student learning in a particular unit of study, and the broader aims of the program and the qualities of the students (Nightingale, Te Wiata, Toohey, Ryan, Hughes & Magin, 1996; and Brown, Rust & Gibbs, 1994).

Nightingale et al (1996) provide eight broad categories of learning outcome assessment which are listed below. Within each category some suitable methods are suggested.

1. Thinking critically and making judgments

One popular way of learning assessment is to focus on students' ability to think critically and to make proper judgments. These methods include developing arguments, reflecting, evaluating, assessing, and judging. Instructor may assign students to write an essay, report, journal, letter of advice to (about policy, public health matters), present a case for an interest group, prepare a committee briefing paper for a specific meeting, book review (or article) for a particular journal, and comment on an article's theoretical perspective. These methods are more suitable for graduate students than for undergraduate students.

2. Solving problems and developing plans

Instructors may give a problem to students and assign students to develop a plan to solve it. The process includes identifying problems, posing problems, defining problems, analyzing data, reviewing, designing experiments, planning, and applying information. The learning assessment methods are, for example, problem scenario, group work, work-based problem, prepare a committee of enquiry report, draft a research bid to a realistic brief, analyze a case, and conference paper.

3. Performing procedures and demonstrating techniques

Performing procedures and demonstrating techniques includes demonstration, role play, making a video, producing a poster, lab report, preparing an illustrated manual on using the equipment, for a particular audience, and observation of real or simulated professional practice.

4. Managing and developing oneself

Instructors can evaluate students' ability to manage and develop oneself in terms of working co-operatively, working independently, learning independently, being self-directed, managing time, and managing tasks. The methods include assigning students to document journal, portfolio, learning contract, and/or group work.

5. Accessing and managing information

The instructors can evaluate how students access and manage information such as when they do activities such as researching, investigating, interpreting, organizing information, reviewing and paraphrasing information, collecting data, searching and managing information sources, observing and interpreting. This evaluation method can be done through the methods of annotated bibliography, project, dissertation, applied task, and applied problem.

6. Demonstrating knowledge and understanding

Knowledge and understanding are the top priorities of learning evaluation in most academic institutions. To evaluate students' knowledge and understanding, instructors may apply methods such as written examination, oral examination, essay, report, short answer questions, true/false questions, and multiple choice questions (paper-based or computer-aided-assessment).

7. Designing, creating, performing

Instructors can also evaluate how well students design, create, and perform. These characteristics can be evaluated through methods such as portfolio development, presentation, and projects.

8. Communicating

One of the most important skills that students should be assessed is that of communication. Communication can be either one or two-way communication, and verbal or written and non-verbal communication. Methods to assess students' communication skills include written presentation (such as essay, report, reflective paper etc.), oral presentation, group work, discussion, debate, role play, and observation of real or simulated professional practice.

It is suggested that when choosing assessment methods, it is important to offer a variety of methods to students in the way they demonstrate their learning, and to help them to develop a well-rounded set of abilities by the time they graduate.

Materials and methods

This study was conducted through three research methods. The first method was review of related document including course syllabi. The second method was a participant observation. The author (as the course instructor) designed the course syllabus and lesson plan, and implemented the plan to the research sample group, who were the students taken the Business Etiquette course in the 2009 summer academic semester. Whilst performing as the instructor of the class, she observed responses of the students toward different teaching styles and learning assessment techniques. The last method is a survey by using questionnaires, pre- and post-study in class. The pre-study questionnaire asked about the students' general information and their expectations of this course, while the post-study asked about their learning outcome regarding content, pedagogies, and learning assessment techniques of the course. The author employed simple descriptive statistics including frequency and percentage to show results of this study. In addition, the author selected some students' feedback quotations to elucidate the meaning of the study results.

The population of this research was a group of undergraduate students who took a Business Etiquette class offered by the Faculty of Business Administration at Chiang Mai University. The selected samples of this particular research were (all) 40 undergraduate students of the Faculty of Business Administration participating in the Business Etiquette class during the 2009 summer semester.

Results

The results of this study are divided into three main issues: students' general information, course development, and course outcomes.

1. Students' general information

This research aims to find a recommendation on how to effectively teach international business etiquette to Thai students. Therefore, it is crucial to know and understand the nature of Thai students and their perception to different pedagogies. The information in this section was gathered by questionnaires distributed on the first day of class. The

information of all 40 students is presented as follows. (It is noted that some questions allowed more than one answer.)

1.1 Students' background

The participants in this study were 40 undergraduate students of the Faculty of Business Administration participating in the Business Etiquette class during the 2009 summer semester. The Faculty of Business Administration at Chiang Mai University offers four tracks of study: marketing, management, finance, and accounting. It was found that the majority of students (37.5%) were management majors and the rest were accounting (35%) majors, and marketing (27.5%) majors (see table 1). There were no finance majors in this class.

When classified by year of study, percentages of students in their freshman, sophomore, junior, and senior year were 15%, 32.5%, 32.5%, and 20%, respectively (see table 2). The students' ages ranged from 19 years old to 24 years old (see table 3). 65% of the students were female and 35% were male (see table 4).

Students indicated various reasons for taking this course: as an academic minor course (37.5%), as an academic major course (35.0%), for personal interest (25.0%), and because of friends' suggestions (12.5%) (see table 5).

When asked to evaluate on their own level of business etiquette, the majority of the students rated themselves medium (fair) (60.0%), and the rest rated themselves as good (35.0%), poor (2.5%), and very poor (2.5%). None of them rated themselves as excellent (see table 6).

Table 1: Students' academic majors

Major	Number of students	Percentage
Marketing	11	27.5
Management	15	37.5
Finance	0	0.0
Accounting	14	35.0

Table 2: Students' years of study

Year	Number of students	Percentage
1	6	15.0
2	13	32.5
3	13	32.5
4	8	20.0

Table 3: Students' ages

Age	Number of students	Percentage
19	2	5.0
20	16	40.0
21	12	30.0
22	8	20.0
23	0	0.0
24	2	5.0

Table 4: Students' genders

Gender	Number of students	Percentage
Male	14	35.0
Female	26	65.0

Table 5: Reasons for taking this course

Reasons	Number of students	Percentage
Major course	14	35.0
Minor course	15	37.5
Personal interest	10	25.0
Friend suggestion	5	12.5

Table 6: Students' own-evaluation on self-etiquette

Level	Number of students	Percentage
Excellence	0	0.0
Good	14	35.0

Very poor	1	2.5

1.2 Students' experiences, opinions, and preferences on different pedagogies (Prior to studying this course)

When students were asked what teaching methods they had experienced (students can give more than one answer), lecture was indicated as the most common method (97.5%), followed by case study (87.5%), site visits (40.0%), project-based learning (32.5%), seminar (37.5%), in-class exercises (12.5%), and games (12.5%). None of the student had experienced self-learning before (See table 7 line 1). The majority of the courses they had taken used the lecture method (87.5%) (see table 7 line 2).

Considering those teaching methods the students think if as most effective, the answers varied as follows: case study (25.0%), site visit (22.5%), project-based learning (15%), lecture (12.5%), seminar (12.5%), in class exercise (7.5%), and games (5.0%) (see table 7 line 3). Correspondingly, the least effective teaching methods in the students' opinions were lecture (26.0%), seminar (15.0%), project-based learning (7.5%), site visit (5.0%), self-learning (5.0%), and case study (2.5%) (see table 7 line 4).

The most preferable teaching methods, according to the students, were site visit (30.0%), lecture (25.0%), case study (20.0%), seminar (12.5%), and project-based learning (5.0%) (see table 7 line 5). The least preferable teaching methods were lecture (45.0%), project-based learning (25.0%), case-study (2.5%), site visit (2.5%), and in class exercise (2.5%) (see table 7 line 6).

When asked the preferred teaching method for the Business Etiquette course, the students were different from the students' preference of teaching method in general. This may be because the students were concerned about the nature of the course and its content (which was to be much different from other courses they had taken). The results showed that the teaching methods the students wanted this course to use were lecture (35.0%), case study (32.5%), in class exercise (17.5%), site visit (12.5%), and games (2.5%) (see table 7 line 7).

Table 7: Students' experiences, opinions, and interests on different pedagogies

Unit: Number of students / percentage

1.3 Students' experiences, opinions, and preferences on different learning assessment methods (prior to taking this course)

This part assesses students on their experiences, opinions, and preferences of different learning assessment methods.

When asked, students responded that the learning assessment methods they had experienced were (students can give more than one answer): multiple choice exam (97.5%), followed by class attendance (95.0%), true-false exam (90.5%), fill in the

blank exam (87.5%), long answer (essay) exam (87.5%), individual assignment (57.5%), and other methods (15.0%) (see table 8 line 1). The majority of the courses students had taken used multiple choices exam (57.5%), long answer (essay) exams (32.5%), and group assignments (5.0%) (see table 8 line 2).

The learning assessment method the students thought was the most effective was the long answer (essay) exam (72.5%). The rest of them answered group assignment (10.0%), fill in the blank exam (7.5%), multiple choices exam (2.5%), class attendance (2.5%), and other methods (2.5%) (see table 8 line 3). Correspondingly, the least effective learning assessment method in the students' opinions were class attendance (25.0%), group assignment (15.0%), multiple choices exam (12.5%), fill in the blank exam (2.5%), and long answer (essay) exam (2.5%) (see table 8 line 4).

The students' most preferred learning assessment methods were multiple choices exams (40.0%), long answer (essay) exams (32.5%), others (17.5%), group assignments (5.0%), fill in the blank exams (2.5%), true-false exams (2.5%), and individual assignments (2.5%) (see table 8 line 5). The least preferable learning assessment methods were long answer (essay) exams (32.5%), multiple choices exams (15.0%), fill in the blank exams (12.5%), class attendance (12.5%), true-false exams (7.5%), group assignments (7.5%), and individual assignments (7.5%) (see table 8 line 6).

Table 8: Students' experiences, opinions, and preferences on different learning assessment method

Unit: Number of students / percentage

Learning assessment methods	Multiple choices exam	Fill in the blank exam	True-false exam	Long answer (essay) exam	Group assignment	Individual assignment	Class attendance	Others
Student had experience in*	39 97.5%	35 87.5%	36 90.5%	35 87.5%	31 77.5%	23 57.5%	38 95.0%	6 15.0%

2. Course development

2.1 Course outline

This Business Etiquette course was developed in 2005. The course developer (the author) did extensive literature reviews on business etiquette topics from textbooks and related websites. As a result, she came up with 10 topics to be a component of this subject as follows:

- Chapter 1: Importance of business etiquette
- Chapter 2: Introduction and greeting
- Chapter 3: Formal meeting
- Chapter 4: Entertainment and social gathering
- Chapter 5: Conversation topic selection
- Chapter 6: Dining etiquette
- Chapter 7: Giving formal speech
- Chapter 8: Attire
- Chapter 9: Gift giving
- Chapter 10: Things to avoid in business etiquette

The course is a 3-credit hour course, in other words, the students had to be in class for a total of 45 hours during the semester. Each class lasted for 1 hour and 30 minutes, which means, for the entire course, the class met 30 times over a 6-week period (the class met everyday in summer semester).

The course schedule containing teaching plan, activities, and assignment due dates can be described as follow:

Table 9: Business Etiquette course schedule

Week #	Chapter	Activity	Assignment due
1	1 and 2	-Teach	
2	3 and 4	-Teach -Student presentation # 1 on Friday	Paper # 1
3	5 and 6	-Teach -Student presentation # 2 on Friday	Paper # 2
4	7 and 8	-Mid-term exam -Teach -Student presentation # 3 on Friday	Paper # 3
5	9 and 10	-Teach -Student presentation # 4 on Friday	Paper # 4
6	-	- Guest speaker on topic "Business etiquette in the real world" - Self and team assessment -Final exam	Self and team assessment results

- In-class activity 10%
- Self and team assessment 10%
- Presentations and papers (team assignment) 20%
- Mid-term exam 10%
- Final exam 10%

Total

100%

2.2 Teaching methods

The author (as an instructor of this course) applied several teaching methods throughout this course as explained below:

- a. Lecture – The instructor used lecture as the main teaching method and used PowerPoint slides as visual aids.
- b. Case studies – Case studies were used as appropriate. For example, the instructor gave a case study of culture differences and asked the students to analyze for the rationale of an unfamiliar culture and find a way to react properly in such situations.
- c. In class exercises – In almost every class, along with lecturing, the instructor prepared exercises such as practice handshaking, greetings, etc.
- d. Photo analysis – Since the students did not have real-world experience, it was assumed that they might not have been able to imagine what real-world business etiquette is like. Therefore the instructor used photos such as photos of people greeting each other at the embassy. Instead of using photos derived from Internet or books, the instructor used photos her in various professional situations so that she could explain the environment and context to the class. As a result, the students could become aware that such situations could really occur in their future life.
- e. Video clips – Selected video clips were shown in class such as a video of a professional public speaker explaining how to be a good speaker. Most of the video clips are in English, therefore, the instructor verbally summarized the content in Thai for the students after showing those video to help them overcome any language barriers.
- f. Group presentations – In addition to the lessons provided by instructor, students were assigned research on selected topics aligned with the course outline. The purpose was to get the students more mentally involved in the subject and to give them the opportunity to share their interests and knowledge with each other.
- g. Questions to people overseas – To study international etiquette, instead of learning only from written materials, it was deemed to be useful to get direct information from people of other countries. Along with learning about the countries' cultural differences, the instructor asked students to write questions that they would like to know about different cultures' etiquette issues. Then the instructor grouped those questions by countries and sent them to people overseas and brought answers back to the students. The people selected to answer those questions were native to their home country who are in t professional careers, e.g., such as engineers and university professors.
- h. Guest speakers – In the last class, the instructor invited a local professional businessman to be a guest speaker on topic “Business etiquette in the real world.” The guest speaker talked about his experiences including what he had done wrongly in the past and also how he learned from his mistakes. In addition, he talked about how important business etiquette is in practice.

2.3 Learning assessment methods

Learning assessment methods of this course included in-class activity, presentations and papers (team assignment), self and team assessment, and exams.

For in-class activities, students were encouraged to attend the class and participate in class discussions. In addition, students were assigned to work in teams on two assignments. Students were formed into groups of 4-5 students. The odd numbered teams were assigned to work on presentations and papers # 1 and 3, and the even numbered teams were assigned to work on presentations and papers # 2 and 4. In brief, the first assignment was designed to have students research ways of greeting and introducing in different countries. The second one was to research on food and beverage topics such as how to order food from an international restaurant menu. The third assignment was to design a script and do a role-play of giving speech in a formal setting. The last assignment was to select one team member and dress her or him in formal business attire and in business casual attire and explain to the class about the rationale of the attire selection. All members of the same team would get the same score. However, at the end of the course, the students were asked to do self and peers assessment on how they work in teams and they will grade each member including themselves.

Students were also evaluated by exams: mid-term and final exams. The exams were a combination of multiple choices, true-false questions, and long answer (essay) exam or so called descriptive explanations. The proportion of learning assessment methods are shown in part 2.1.

3. Course outcome

After the course was over, the students were asked to evaluate the effectiveness of the different pedagogies applied in this course and to give suggestions. In addition, they were asked to also evaluate the effectiveness of the different learning assessment methods. The results are as follows.

The pedagogies that the majority of the students thought have the highest effectiveness level were photo analysis (37.5%) and questions to people overseas (45.0%). The other pedagogies applied in this course that were rated high on high effectiveness level were: lecture with PowerPoint slides (55.0%), case study (50.0%), in-class exercise (50.0%), group presentations (65%), and guest speakers (42.5%). It is notable that 2.5% of the students rated group presentation on the lowest effectiveness level. The student mentioned in the questionnaire that it was because her team members did not get along well and she was the one who did most of the work (see table 10).

The students' suggestions to improve teaching methods are as follows: site visits (30.0%), more photos and videos (17.5%), more practice in class (15.0%), more examples while lecturing (12.5%), more student involvement (12.5%), video clips should have Thai subtitle (12.5%), and role play (2.5%) (see table 11).

When considering different learning assessment methods, a majority rated participation in class (57.5%), long answer (essay) exam (45.0%), and group assignment (45.0%) on a high effectiveness level, while they rated multiple choices exam (37.5%) and true-false exam (45.0%) on a medium effectiveness level. It is

notable that some students rated multiple choices exam (7.5%) and true-false exam (5.0%) on the lowest effectiveness level (see table 12).

The students' suggestions to improve learning assessment methods are as follows: more long answer (essay) exams (30.0%), more multiple-choice exams (15.0%), a combination of various evaluation methods (15.0%), and more group work (10.0%) (see table 13). All of the students' suggestions were similar to the methods used in this class.

Table 10: Students' feedbacks on different pedagogies

Unit: Number of students / percentage

Effective-ness Level	Lecture with Power Point slides	Case study	In class exercise	Photos analysis	Video clips	Group presentations	Questions to people overseas	Guest speakers
Highest*	9 22.5%	7 17.5%	8 20.0%	15 37.5%	9 22.5%	8 20.0%	18 45.0%	13 32.5%

Table 13: Students' suggestions to improve learning evaluation methods

Suggested learning evaluation methods	Number of students	Percentage
More long answer (essay) exam	12	30.0
More multiple choices	6	15.0
A combination of various evaluation methods	6	15.0
More group work	4	10.0

Discussion and conclusion

This part discusses challenges of teaching international business etiquette and ways to overcome those challenges. The rationales of the arguments were derived from the results of this particular study.

Challenges

The main challenge to teach international business etiquette to this group of students was that the students were familiar with being passive learners. The results of the survey show that the most common teaching methods that students had experienced was lecture. Even though the majority of them agreed that lecturing is the least effective teaching method, they preferred this course to be lecture format. This result implies that the students prefer to be in their "comfort zone" of being passive learners and having the instructor feed them with information than learning through other teaching methods that they thought to be more effective. The author would call it in this study as "feed me syndrome." Below are some direct quotes of the students' answers from the questionnaires:

"I want to be in an easy class. The content should be easy. The teacher should be kind. The exams should be easy and all students should get A." (Student A)

"I like lecture style because the teacher will tell us everything we should know and we can also read the book afterwards." (Student B)

“Lecture is good. There is no pressure on me, I just attend the class and it’s the teacher’s job to teach us. I don’t feel comfortable when being asked in class.”
(Student C)

“I don’t like the class that the teacher put us on the spot by calling individual student to answer the questions. If the teacher wants to ask, I want her to ask the whole class, not just one particular person.” (Student D)

The other challenges were that students ranged in the age between of 19 – 24 years old and had never or very limited experiences in the real business world and could not imagine the real world situation. As a result, they hardly understand what was to be expected about business etiquette and may not have be aware of the importance of it. A majority of the students rated their etiquette level at medium and some even rated it at lowest level.

Regarding learning assessment methods, even though majority of students agreed that long answer (essay) exam was the most effective learning assessment method, they expressed that it was the least preferable type of assessment method. The survey showed that most students had experience in taking multiple choice exams and majority of the courses they had been taken use multiple choices exam, so they preferred this assessment method the most. It is another significant notable point that students preferred to be in their “comfort zone” than to learn effectively.

Overcoming Challenges

To break through the students’ “comfort zone” or to resolve the “feed me syndrome,” the major strategy was to get students involved on a “fun” basis. For example, the instructor applied in-class activities such as having students practicing hand shaking and bowing in class. From the author’s point of view, having students get up and do physical activities had a positive impact on students’ learning outcome. Simultaneously, the students developed a good attitude towards this subject. In addition, as the instructor assigned students to work in team on particular topics where they could choose the content according topic to present to the class significantly stimulated the students’ interest. The results showed that students agreed that they learned more by doing so.

In addition, students enjoyed answering questions about real life situations from photos that the instructors showed in class and asked students to analyze the situations and find ways to properly act in those situations. This method was implemented along with lecturing, so it is easy to be applied to teach in a big classroom to a large number of students.

The research also showed that the activity of asking questions to real people overseas regarding different cultures and their perceptions got good feedback from the students. The key to success of this strategy was that the person overseas who answered the students’ questions must be in professional careers so that they can answer students intellectually and accurately.

According to the students’ feedback after the course was over, students preferred having various types of pedagogies used. This implies that instead of using one particular pedagogy; it should be more effective to apply several pedagogies at the

same time. The suggested pedagogies includes photo analysis, questions to people overseas, lecture with PowerPoint slides, case studies, in-class exercise, video clips, and guest speaker. Another pedagogy that was not been implemented in this class but was suggested by the students was the site visit or to taking students out to see the real thing, for example, taking students to a restaurant to learn how to use utensils in a formal dinner setting.

Regarding learning assessment method, it was found that after applying “participation” style, students enjoyed the class more and accepted that participating in class, doing team assignments, and long answer (essay) exams are effective ways of learning. Therefore a combination of those methods should be used as the main learning assessment method of this class.

Concerns

This research was conducted in the summer semester in which the class was small (40 students). Besides summer semester, this course will be offered every first semester for 3 sections: two for the Faculty of Business Administration students who will take it as their elective course and another one for the Faculty of Humanities students majoring in Home and Community who will take it as their requirement course. There will be approximately 60 - 100 students in each class. As one lecturer will teach the course and the classes will be bigger than at the time this research was conducted. The planned pedagogies and learning assessment methods should be adjusted accordingly. For example, the weight of class participation should be decreased due to the larger number of students. Furthermore, long answer (essay) exam may not be suitable for one instructor to grade 200 – 300 students, therefore, multiple choices may be a better choice to evaluate a larger number of students in order to keep up the validity of the students’ grades. The author would like to suggest that there should be further research to analyze the proper teaching methods and assessment that suits larger classes.

Beyond Centre-Periphery: Higher Education Development in South-East Asia

Introduction

Explaining and responding to marginalisation and inequalities in global educational systems has been one of the persistent concerns for educational administrators and researchers for years (Altbach & Gopinathan, 2005). Numerous articles and studies have grappled with this issue from a variety of mainly alternative perspectives, from the pro-development models to the counter-development ones. Among the more widely discussed explanations for the politics of education at the international level are various theoretical frameworks that draw upon different theories such as centre-periphery, dependency and neo-colonialism. These concepts have been both a source of inspiration and a centre of criticism for a variety of studies seeking to understand the inequitable structuring in international educational relationships, including higher education systems.

Though with different names and developed by different authors from various academic fields in dealing with the realities of inequalities in international settings, the ideas of “dependency”, “centre-periphery”, and “neo-colonialism” in education draw their source from imperialism and dependency theory developed by some sociologists and economists in the first half of the twentieth century (Altbach, 1998; McLean, 1983). Basing on Lenin’s notion of imperialism and some dependency theorists such as James Cockcroft and Andre Gunder Frank, Johan Galtung defined “centre-periphery” concept as part of a structural theory of imperialism (Altbach, 1998). This theory was first applied to explain the role of the intellectuals in the Third World by Edward Shils, who maintained that the centre-periphery relationship was a “natural” consequence of inequality. In contrast to Edward Shils’ proposition, Galtung and others, by introducing the concept of “neo-colonialism”, have blamed the Western industrialised nations for maintaining the peripheral status quo of the Third World. Neocolonialism, as further explained by Altbach (1998, p.23), is born out of “the wide-spread desire by industrial nations to maintain their dominant position” over the Third World even after the colonial era. According to him, the Third World countries are dependent on many of the products of education and modern technology from the wealthy industrialised nations, who possess wealth, technological innovations and well-established educational and research institutions. Closely related to such notions of “centre-periphery” and “neo-colonialism” is Wallerstein’s world system theory which proposes that the stratification of the world into countries of different development levels (the core, semi-periphery and periphery) is due to the evolution of the Western capitalist economy dated back to the 16th century. World system theorists argue that the cause of the poverty and backwardness of poor countries is their peripheral position in the international division of labour (Arnové, 1980; Caruso, 2009). In one word, the dependency paradigm share the same notion that the less developed countries (the “periphery”, the “satellite” or the “province”) are dependent upon the

more developed (the “centre”, the “core”, or the “metropolis”) because of the core’s domination and exploitation (Raggatt, 1983).

When translated into educational scholarship, the dependency thesis comes in various manifestations, which are either voluntarily and uncritically adopted by the Third World countries through education transfer or their continued use of the language of instruction from the former colonizers or which are deliberately planned by the industrial nations by means of educational programs and foreign aids to perpetuate the educational and political structures that “will ensure stability and a generally pro-Western orientation” (Altbach, 1998, p.23). Although such manifestations of centre-periphery framework have been analysed in various levels of education systems, probably a major part of studies following this tradition is found in higher education.

Centre-periphery framework was widely used in various studies seeking to explore the dependency of the Third World universities during the Cold War period. However, the end of the Cold War has changed the world system significantly with the collapse of the Soviet Union, the dominance of the US and the emergence of several Asian countries like Japan, Taiwan, South Korea, China, India, and Singapore in the global knowledge production system and the international economic power structure. Against this context, changes in South East Asian university systems reflect clearly the evolving discourses of centre-periphery (Postiglione, 2005). Ample evidence has shown how local educational policy-makers in the area have articulated with the convergent global discourse of knowledge economy with their own agendas. For example, while Malaysia embraces the vision of world-class universities, Thailand looks for universities of local wisdom (Postiglione, 2005). Besides, the robust cooperation in higher education among country members in this area as a desire to change their peripheral position also challenges the centre-periphery framework.

This paper, therefore, is set out to argue that in their attempts to uncover the inequitable structuring of the international higher education relationships, some scholars have focused almost exclusively on actions of metropolitan enterprises and adhered narrowly to Western/non-Western discourse, thus giving little attention to the agency of the local actors. This approach ultimately hides more than it reveals; it plays down not only the local agency in response to external forces but also risks exaggerating the ‘Western’ hegemony in the post-Cold War period.

The argument is laid out in three parts. The first part of the paper provides some critical account of dependency analyses of higher education in the Third World. The second part explores different reform agendas taken by policy-makers of some south-east Asian countries. After examining the development of ASEAN University Network as a challenge to the Western/non A Western narrow focus of centre-periphery framework, the paper concludes with a comment on centre-periphery theorising.

Centre-Periphery Framework in Higher Education

Being one of the pioneers of the centre-periphery concept in education, Phillip Altbach has used this framework in a wide-ranging books and articles to analyse the relationship between universities in industrialised countries and those in the Third World as well as universities within nations. He argues that universities in the international knowledge equation are stratified into the “centre” and the “periphery”, in which the centre, mostly located in developed Western

countries, plays the dominant role in giving directions and providing research. At the same time the peripheral Third World universities only “copy developments from abroad, produce little that is original, and are generally not at the frontiers of knowledge” (Altbach, 1998, p.20). He also notes that due to historical colonial tradition and the contemporary inequalities in economic power and resources, there is little likelihood that universities in non-Western countries can break away from the domination of the core.

Other provocative studies that link Third World universities to the workings of centre-periphery thesis are those of Mazrui (1975), Woodhouse (1987), Arnove (1980), and Berman (1983). These studies examine the relationship between the flow of cultural goods, the role of foreign donor agencies and the changing roles of universities in different periods.

Ali Mazrui (1975) describes the roles of universities in Africa as the most sophisticated instruments of foreign cultural penetration by employing concepts of cultural capital and cultural dependency. According to Mazrui, cultural dependency is the result of the historical and contemporary involvement of Western multinational companies in African education, which has shaped universities as “cultural corporations” dedicated to importing and spreading Western cultural goods, including course content, language of instruction, and evaluation system. By remaking African values in a pro-Western way, the universities function as a tool to “de-Africanize” their students to the point that these students emerge “cultural captives of the West.” (Mazrui, 1975, p.198). In the same line, Woodhouse (1987), in studying how a Nigerian school enroll students, points out that Western educational institutions, particularly universities, play an important role in elite formation and consolidation and hence of promoting dependency in Nigeria. He identifies two also identifies two distinct roles of Nigerian universities: to reinforce inequalities of the social class structure by privileging students from higher class while restricting opportunities to gain social mobility on those of lower class. Basing on Mazrui’s proposal for an autonomous African university, he calls for an alternative university model and a collective African determination, tenacity and innovation to bring about a cultural independence from Western metropolises (Woodhouse, 1987).

Robert Arnove (1980) and Edward Berman (1983) analyse the manipulative agendas of some US donor agencies on university graduates of Third World countries. Arnove (1980) points out that the Ford Foundation has recently revised its strategy for assisting higher education and related research organizations in developing countries. Rather than sending American intellectuals to conduct research in such countries, the Ford Foundation now prefers to attract their best intellectuals to the US graduate schools by means of grants and research fellowships, train them in the appropriate methodological tools of analysis and send them home to conduct research that would be too politically sensitive for Western scholars to engage in. Similarly, Berman (1983) explores how the US philanthropic organisations such as Carnegie, Ford, and Rockefeller foundation programming “enculturate” or “socialize” a generation of university graduates from developing countries in the ally recruitment race during the Cold War. On the basis of interviews with foundation personnel and archival research, he argues convincingly that the ultimate purpose of these programs is to mystify the indigenous elites, who would internalize the external hegemonic ideology (Berman, 1983).

As the above very brief and limited review has shown, the foregoing studies, convincing as they may seem, are bound to be limiting in certain respects, especially when they focus narrowly on the metropolitan educational intervention. All of the authors share the same idea that the

imported educational practices produce undesirable outcomes for the recipient countries, such as the intensification of social division and cultural alienation (i.e., the local students develop pro-Western attitudes and behaviours). They base on the assumption that peripheral actors unconsciously and uncritically “accept attendant ideologies that subsequently facilitate their own and their nation's subordination in the world system” (Clayton, 1998, p.488). Altbach, for example, argues that universities in the periphery only “copy developments from abroad” (Altbach, 1998, p.20) and function only as “consumers” or “distributors” of knowledge produced from First World countries. Similarly, Woodhouse notes that under the influence of educational technical assistance, indigenous students “willingly accommodate themselves to the cultural and economic needs of the metropole”(Woodhouse, 1987, p.122). For Arnove (1980), Third World academics are merely “conduits for the transmission of knowledge”, while for Mazrui and Berman, periphery actors “acculturate” or “internalize” Western ideologies through educational transfer. In one word, most of these accounts place as much emphasis on the hegemonic power of the metropolitan countries as on the passivity of the local actors.

Strong criticism levelled by writers such as McLean (1983), Noah and Eckstein (1992, 1998), Raggat (1983) and Clayton (1998) has generated perspectives that problematize this narrow focus on the power relationship depicted in centre-periphery analyses. McLean (1983) notes that the dependency thesis fails to give “sufficient weight to local reactions, and so overlooks “the degree and nature of dependency varies from country to country and that governments of peripheral countries have a positive and active role in modifying external influences” (McLean, 1983, p.39). Similarly, Noah and Eckstein (1998) point out that Altbach and Berman’s work is a misconception on the unidirectional nature of power. They argue that the dynamics, options and outcomes of the forms of dependence may not be the same in different stages, and to ignore the changes taken place in the power relationships in history is “anachronistic”.

The depiction of agency in centre-periphery analyses has also been severely attacked. Raggat (1980), basing his evidence on Soulez (1982)’s analysis of Tunisian government’s responses to two international organisations, dismisses the assumption that “the receiver at the periphery is essentially passive” as a “serious flaw” because it leaves “no space in the paradigm to explore how imported ideas and models, as they pass through different levels in the system, interact with deep seated cultural commitments and notions of cultural identity; and how they may be changed or rejected in the process” (Raggatt, 1983, p.3). In a similar vein, Noah and Eckstein write that such an assumption is “an exercise in oversimplification to picture the people of the periphery as mere objects of successful manipulation by the center” because “[t]he resilience and vigor of nationalism, local and national languages, and national cultures and historical traditions continue to mock all forecasts about the growth of a global culture” (Noah & Eckstein, 1992, p.175). Clayton (1998) also complicates this simplistic view of centre-periphery by drawing on a number of authors delineating different forms of resistance from the indigenous actors. The conclusion that, he argues, peripheral actors only unconsciously absorb hegemonic ideology and passively accept the exploitation is untenable (Clayton, 1998).

Eurocentricism in centre-periphery framework is another area of attack by authors embracing a recent post-colonial perspective. Postcolonial analyses in education, of which origin is based on literary or cultural works developed by poststructuralists such as Edward Said (1978) and Gayatri Spivak (1985), point out that the inherent deficiencies of centre-periphery framework lie in its economic origin derived from dependency theory as well as its exclusive binary opposition

between the European and the non-European (Tikly, 1999; Crossley & Tikly, 2004). Seeking to overcome such weaknesses, post-colonial theorists offer an alternative approach which drifts away from economic concerns to focus on race, culture and identity in education systems in explaining the reality of globalisation and education in post-colonial states (Tikly, 1999). In doing so, they emphasize less on the imposition of European culture on to non-Europeans and suggest a “more holistic and less Eurocentric understanding of the relationship between globalisation and education” (Tikly, 1999, p.610). Even so, however, this approach has led to contradictory understandings, either as a complicity of global capitalism on the one hand (Dirlik, 1994, cited in Tikly, 1999) or a risk of ‘a more far-reaching critique of European world-centrality and dominance than discourse theory ever managed’ on the other (Washbrook, 1999, p.610).

Although critics of centre-periphery framework in educational scholarship have convincingly pointed out several limitations of this thesis, their attitudes to its validity are not the same. Noah & Eckstein, on the one hand, dismiss the explanatory values of the framework as simplistic. They argue that the centre-periphery concept merely “substitutes new terms for old without adding significant explanatory power”, and thus is “a weak tool for comparative study” (Noah & Eckstein, 1992, p.174). On the other hand, scholars such as McLean (1983), Clayton (1998), and Raggatt (1983) and post-colonial theorists, while exposing the flaws of the approach and calling for either an alternative model (McLean, 1983; Raggatt, 1983; Tikly, 2001) or a “re-connection” (Clayton, 1998), all agree that the ideology that centre-periphery framework offers is still important, stimulating and necessary in unfolding the unequal relationships in international educational systems.

However, while problematizing the centre-periphery framework that implies Western/non-Western relations, most of these scholars do not depart from this axis; instead, they either argue or show that the relationship is bi-directional rather than uni-directional. They have not, in other words, gone one step further in exploring the more horizontal links in knowledge transfer between developing countries as well as the diverse local agendas in educational reforms that emerged during and after the colonial era.

In sum, the evolving discourse of the centre-periphery in the contemporary era needs further discussion. The next section explores in greater depth how policy makers of some Third World countries in South-East Asia articulate with the global discourse by taking different decisions in reforming their higher education systems. Particularly, an examination into the regional higher education cooperation through ASEAN Network University also serves as a challenge to centre-periphery framework.

Higher Education Development in South-East Asia in the Global Era

South-East Asia (SEA) is a cluster of 12 countries with vast development diversity, varying in geographical size, economic wealth, political ideologies and educational traditions (Lee & Healy, 2006). On the pathway to development and modernization, all the countries in the area, except for Thailand, carry with them the colonial past, which profoundly impact their contemporary higher education systems.

From a Common “Twisted Root”...

Altbach & Selvaratnam(1989) use the phrase ‘twisted root’ to refer to the common origin of contemporary higher education systems in Asia in general and in SEA in particular. According to them, the contemporary higher education systems in Asia are a replication of non-Asian models that were either imposed by the colonial powers or adopted voluntarily by the non-colonized state like Thailand. However, even the university system in Thailand also stemmed from ‘Western’ model. According to Altbach (1998), Thailand adopted ‘Western’ higher education model to develop their national university system in the second half of the 19th century as part of the self-strengthening strategy. Altbach also argues that such an implantation of ‘Western’ academic models has had a profound impact on higher education system in these countries, as evidenced by their continued use of the colonial language (English in Singapore, for example) or the current strong ties with the colonial powers (such as Singapore and Malaysia). Other traces of ‘Western’ imported models can be found in part of Indonesia (under Dutch colonial rule), the Philippines (colonized by both Spain the US) and Vietnam, Laos, and Cambodia (influenced by French colony).

Even after independence, no universities in the area chose to break away from the original models (Altbach, 1998). Instead, embarking upon a program of rapid socio-economic development based on the modernization theory model, governments have looked to industrialized countries through technical assistance or donor programs for reforming their universities, which have been considered “an engine of growth” that that would unlock the door of economic development and growth (Selvaratnam, 1988). It is also worth noting that although developed from a common platform of ‘Western’ model, universities in SEA find themselves at a disadvantage in acquiring a place in the frontiers of international academic and research network, largely due to their relative and varying lack of wealth, power and resources as compared to the industrialized countries (Altbach, 1998).

In the last decade, a wind of change has been blowing in higher education sectors in SEA. The collapse of the Cold War followed by the changed landscape in the world system and an intensified economic globalisation has placed higher education development in a new discourse. An unprecedented expansion of higher education is being observed in the area (Postiglione, 2005). Furthermore, like elsewhere the world, the implementation of university reform in SEA has been significantly affected by the promotion of neoliberal and other challenges of globalisation. Despite diversity in the region, universities in SEA face similar problems, including increasing student enrolments, financial constraints and the stress of the knowledge economy. Besides, the growing influence of international organisations such as the World Bank, Asian Development Bank have pushed universities to be more responsive to the market and emphasised such notion as accountability, cost-effectiveness, institutional autonomy and quality assurance in higher education reform (Lee, 2002).

From the above observation, it could be said that much of what has been happening in Southeast Asian higher education appears to be a dependent pattern of adaptations driven by ‘Western’ developed economies and ‘Western’ neoliberal discourse. However, the contemporary shifting of knowledge development in SEA, as in elsewhere increasingly challenges the relevance of centre-periphery framework in explaining the inequality of universities among the First “Northern” world and the Third “Southern” world.

...to Diverse Local Agendas in Contemporary Higher Education Reforms...

Spring (2009) rightly argues that the hardly any country imports exactly and passively the policy agendas of transnational organisations and networks. It is the local conditions and actors that determine the actual influence of such an adoption. Higher education reforms in SEA promise ample evidence to prove this point.

One of the first attempts to look closely at the dynamics between global and local forces in reforming South East Asian universities could be attributed to Postiglione (2005) in the article titled "Questioning Centre-periphery Platforms". As an attempt to address Altbach's question "Can universities in the periphery hope to become world-class universities that are able to produce and disseminate new knowledge and attract students and faculty from the core?", his analysis of Southeast Asian universities shows a shift in the centre-periphery equation. He argues that even in the past this paradigm was not sufficiently relevant to the orientation of Thai universities and the extensive privatisation and massification of higher education in the Philippines prior to colonialism. He also notes that the emergence of Singapore in the international knowledge system, and the stratification of higher education development among the countries (in relation to his classification of the region's economic development into high-end economies like Singapore, emergent economies including Thailand and Malaysia, developing economies including Indonesia and the Philippines, and transition economies such as Vietnam, Laos, and Cambodia) reveals "a significant resistance to status quo centre-periphery relations and a vast competitive potential to alter these relations" (Postiglione, 2005, p.220). This is a strong point as it attacks the common assumption of many centre-periphery authors who tend to label peripheral countries (or the South, the East, the non-Western, or developing countries) as homogeneously poor and externally dependent.

While his article contributes significantly to the understanding of the issue, his conclusion drawn from only an overview of each country seems to be inadequate. It would be more convincing if he could go further into a close examination of distinctive higher education reform decisions of some, or better, of each of the countries in responding to external pressures. This, in turn, could support the conclusion about the relevance of centre-periphery framework. One example to illustrate this point is the case of Malaysia, one of the 'developing economies' in Postiglione's classification, with its vision for a World Class university.

Malaysian universities followed the models of British universities in its early stage of development. Over the years, the trend has been toward adopting many aspects of American Higher education (Lee, 2004). Following global trends, many Malaysian universities have adopted a whole range of 'corporate culture' to improve accountability, efficiency and productivity (Currie, 1998, cited in Lee, 2004). Recently, in an effort to be the hub of higher education excellence in Southeast Asia, it has embarked on a national higher education plan from 2007-2020 to achieve world-class status among its universities. In 2007 the Ministry of Higher Education, Malaysia published a blueprint entitled the National Higher Education Action Plan 2007-2010 to spearhead the transformation of higher education in the immediate future. It also laid out strategies to achieve world-class universities in Malaysia through the APEX experiment, where a university will be selected to carry out the Accelerated Programme for Excellence (APEX). "Apex Universities" is a conceptual construct that represent the nation's centre of academic distinction, and will be given greater latitude in order to work towards achieving their world-class status (Muda, 2008). However, a world-class university means a share of greater

autonomy, but in Malaysia's case, the power of the state override the university constitution or by-laws (Lee, 2004). Clearly, the adoption of an external educational idea has been adapted to the local agenda.

It is clear that some analyses of higher education development in South East Asia have pointed out several missing points in centre-periphery framework. First, while giving recognition to the role of power and wealth in shaping the knowledge transfer map, several authors merely adhere to the domination or exploitation of the West as the cause of educational inequality while deemphasizing the role of local actors. The fact is, educators in one country might borrow an idea a Western country or an international organisation, but local conditions often do not allow it to be copied intact resulting in some forms of adaptation. Besides, the adoption of educational ideas is due to multiple reasons, not necessarily due to an imposition from outside. Of course in some cases, such as loans from the World Bank, governments are pressured to adopt their education agendas. Whether lent or through pressure there is no guarantee that a particular educational model will be exactly copied at the local level (Spring, 2009). According to Steiner-Khamsi (2004), one reason that an educational policy leader borrows a policy is to certify or decertify (i.e., to validate or criticize) a school policy by referring to an imaginary global community such as 'international standards' or to the concrete policies of another nation or global organization. In other words, they use external authorities to justify local actions. Externalization is particularly applicable during periods of political upheaval when politicians search for outside validation of their actions. But validation does not mean an exact copy of the policies of the outside authority.

...And ASEAN University Network...

Another aspect that seems to be a missing in most studies of centre-periphery framework when examining higher education development in Third World countries in general and in South East Asia in particular is its regional dynamics. Knowledge transfer could now be realized or legitimised by cooperation among the countries in this area through various activities, including knowledge exchange through ASEAN university network.

According to Berkens (2004), the ASEAN University Network was founded as another initiative to promote cooperation and solidarity among scientists and scholars in the region and to develop academic and professional human resources as well as to produce and disseminate scientific knowledge and information among the universities in the region. Predecessor of the ASEAN University Network can probably best be traced back to the founding of the Association of Southeast Asian Institutions of Higher Learning in 1956 as a non-governmental organization. This cooperation among Third World countries at that time was a manifestation of their resistance to "a largely Western-oriented knowledge and research system" (Selvaratnam, 1988, p.59). Further collaboration in education was the establishment of the Southeast Asian Ministers of Education Organization (SEAMEO) in 1965 with the purpose of promoting cooperation in education, science and culture in the Southeast Asian region. Among its various cooperation initiatives, Regional Institute of Higher Education and Development was dedicated to higher education and development.

An arrangement of 17 universities in the ten ASEAN countries, the ASEAN University Network emerged from a highly ambitious idea of the ASEAN leaders and the ASEAN Subcommittee on Education (ASCOE) to establish an ASEAN University. The ASEAN Studies Programme has

been one of the instruments to realise a regional awareness and identity through many activities such as student and faculty exchange program. The network attempts to better exploit the complementarity of the different universities by giving more room for initiatives of individual universities (Berkens, 2004).

So what does this imply about the centre-periphery framework? The movements among Third World countries towards regional groupings or a creation of organizations to facilitate knowledge transfer like ASEAN University Network is probably not uncommon in the world today, but what is noteworthy is that studies on this kind of 'horizontal' education tie are few and far between (Abdenur, 2002). Although several centre-periphery theorists as well as post-colonial theorists have recognized the role of South-South intellectual transfer, its scope and politics as well as the complex issues surrounding the legitimacy of this particular transfer, particularly in higher education, remain rather under-researched or uncritically examined (Abdenur, 2002). For example, some post-colonial theorists (e.g., Hikling-Hudson, 2004) tend to conclude that the forging of South-South collaboration would bring about an "independent traditional direction and financing with strings from the wealthy countries of the 'North'" (Hikling-Hudson, 2004, p.308) or a solution for the "deepest problem of colonial aftermath" (Ibid, p.309). In doing so, they still bind themselves to the North-South axis while blindly believing in the altruism in South-South cooperation and thus ignoring the asymmetrical geometry of powers among these nations. In fact, the most recent findings (e.g., Caruso, 2009; de Sá e Silva, 2009; Abdenur, 2009) have revealed how motivations, reasons and outcomes in South-South transfer and cooperation have changed over time, as well as how the politics and modalities of the process are influenced by the inequalities and differences within the North and the South alike (Chisholm, 2009).

Conclusion

In their attempt to understand the power relation underlying the educational transfer, some scholars tend to choose a specific framework as their lenses of observation. While this framework may be true for a number of instances, confusion happens when scholars use the same framework in other instances or at other points in time. This is because of their assumption that if a theory is true for a number of cases then it is true for all cases (Spring, 2009).

Centre-periphery theorists could risk making such a mistake if the lenses are not cautiously used. In fact, although this discourse was widely applicable in the past, its explanatory values have been massively assaulted due to a misconception of power relationship, an underestimation of local agency, and an overtly Eurocentric focus. Specially, the discourse is increasingly contested in the light of globalisation and new educational developments among peripheral countries. In this respect, higher education development and cooperation in Southeast Asian also serves as a 'case of deviance' to the centre-periphery framework for several reasons. First, the countries in this area are investing in higher education in ways that help them alter their position in the global area, both economically and politically. Second, the stratification of development diversity of countries in this region as well as the emergence of Singapore as a knowledge centre in the world also disturbs the centre-periphery paradigm. Finally, by adhering to the Western/non-Western discourse, centre-periphery theorists also blind them to the importance of knowledge cooperation among Third World countries, like the case of ASEAN University Network.

Might post-colonial theory be a promising framework that offers relevant explanations for the complex dynamics in of education cooperation and development, at least in the case of South-East Asia, given its rich colonial history? Arguably, this approach may be less Eurocentric as it claims, by recognizing the active role of local actors and becoming a more open-ended 'dialogue' through negotiation of cultural messages among different geometries of powers (Tikly, 1999; Washbrook, 1999). However, as pointed out earlier, besides its contradictory interpretations, the uncritical use of this framework may lead to a homogenisation of colonial experiences and the myopia of the complex dynamics in international educational development. The contribution of post-colonial theory to the understanding of the politics of international educational development is perhaps, at this point in time, still limited and controversial.

Clearly, centre-periphery approaches, either of dependency or post-colonialism traditions, will need to be altered to account for the complex international education relationships under globalisation.

The Influence of Contexts on Acquisition of "How Many" and Its Implication for English Education: the Case of Japanese Child Learners¹

Kazumi Yamada and Yoichi Miyamoto
Kwansei Gakuin University and Osaka University

1. Introduction

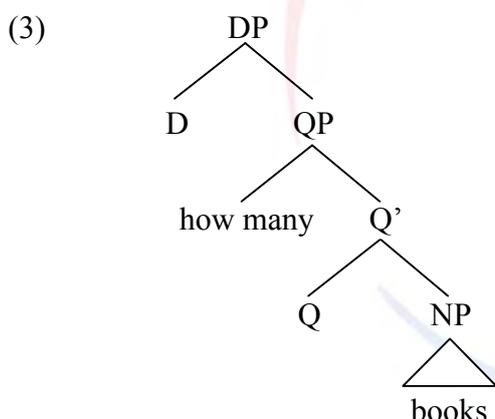

Following up on Yamada and Miyamoto's (2009) preliminary results, this paper reports experimental data on the acquisition of WH-questions such as (1) and directs implications for classroom instruction:

(1) How many books did John buy?

Syntactically, in one important respect, WH-questions of the type (1) are different from ones like (2):

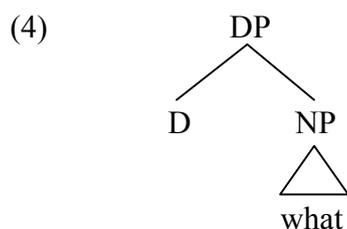

(2) What did John buy?

The WH-phrase *how many books* consists of two parts: *how many* and *books*. This WH-phrase has the structure roughly shown as in (3):

In (3), the Determiner Phrase (DP) is a “placeholder” for definite and indefinite articles, and the Quantifier Phrase (QP) is for quantifiers. Accordingly *how many*, being a quantifier, is in QP whereas *books* is in the Noun Phrase (NP) in (3). In (2), on the other hand, only the WH-phrase *what* is in NP, as shown in (4):

¹ We would like to thank Atsushi Uetoko, Business Manager/Language Counselor at Osaka YMCA Language Center Tennoji for his help with the child data collection, and the children at the center for participating in our study. The research reported here is supported by the Hakuho Foundation #09-B-026 (Principal Investigator: Kazumi Yamada).

Given the structural difference between (3) and (4), one important question, with respect to the acquisition of these two types of WH-questions, arises; namely, which constituent in (3) do learners think should be placed sentence-initially, either *how many* or *how many books*? This question does not arise in (4) since we only have one word, *what*, in this example. If learners know that a WH-phrase must be placed sentence-initially in English WH-questions, there is no choice, but the DP *what* must be raised to the sentence-initial position, as shown in (2).

The current paper deals with this very question for “complex” WH-questions of the type in (1), and the organization of the paper is as follows. Following the introduction here in Section 1, Section 2 introduces the theoretical assumptions relating to *how many* + N. Section 3 briefly reviews Yamane’s (2001, 2003) work on acquisition of WH-questions with *how many* by Japanese adult EFL learners. Section 4 introduces our experiment with Japanese child EFL learners; in which we provide experimental data showing that Japanese child EFL learners also rule in ill-formed WH-questions with *how many*, in a well-defined context. Section 5 discusses one implication for our experimental results when teaching English as a foreign language in classroom setting. Section 6 concludes the current paper.

2. Theoretical Background

Here we lay out our theoretical assumptions necessary for Section 3. We limit our discussion to a basic, but sufficient level. In passing, we provide some references for those who are interested in more fine-grained discussion on the points to be introduced.

Fiengo and Higginbotham (1981) observe that there is a contrast between (5a) and (5b):

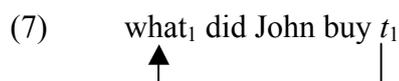

- (5) a. Who₁ did John buy [a book of *t*₁]?
 b. *Who₁ did John buy [every book of *t*₁]?

The only difference between these two examples is that in (5a), the object DP is headed by an indefinite article *a* whereas the universal quantifier, *every*, is the head of the object DP in (5b). This very difference leads to different interpretation of the object DPs in these examples. In (5a), the object DP is non-specific in the sense that no particular book is under discussion. Conversely, in (5b) the universal quantifier *every* forces the specific interpretation of the object DP; namely, a particular set of books must be under consideration in this example. In short, the contrast between (5a) and (5b) is the one between specific and non-specific DPs.

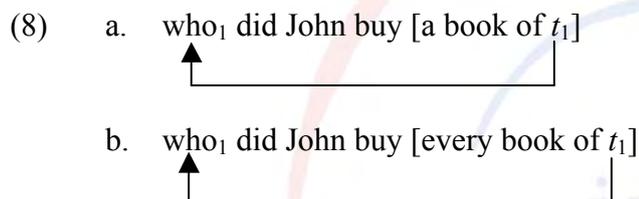

To account for the contrast between (5a) and (5b), let us start with basic syntax of English WH-questions. At the observational level, in English WH-questions, a WH-phrase must be placed sentence-initially, as exemplified in the contrast between (2), repeated here as (6a), and (6b):

- (6) a. What did John buy?
- b. *John bought what?

In normal circumstances, (6b) is possible only as an echo-questions. Under the framework of generative grammar, we capture this displacement property of WH-phrases with a notion of movement. For example, (6a) involves the movement of the WH-phrase *what* from the object position to the sentence-initial position as illustrated in (7):

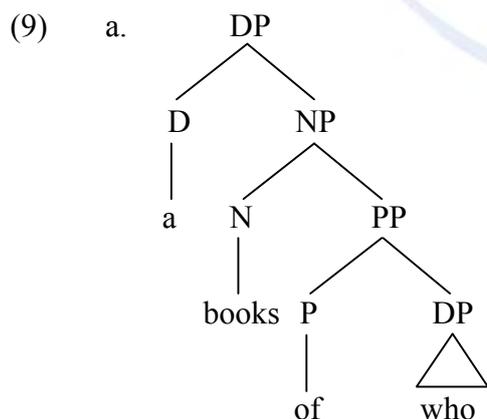

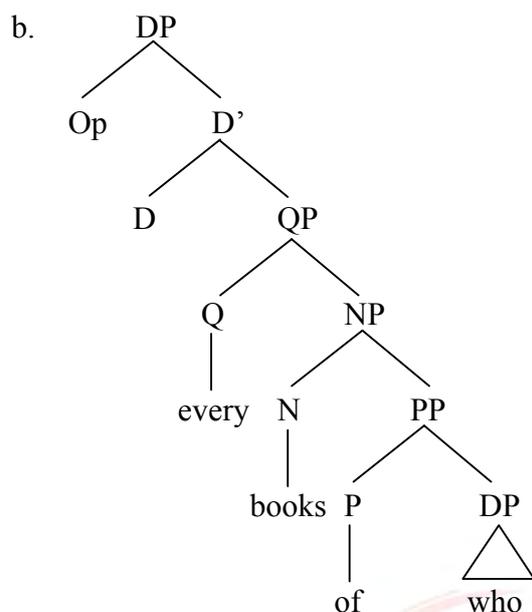

Likewise, in (5a, b), *who* should be placed sentence-initially via the movement of the WH-phrase in point as shown in (8a, b):

We can now rephrase the question to query what goes wrong with the movement of *who* in (8b).

We first assume that the specificity operator (Op), which substantiates specific interpretation, occupies the DP SPEC of a specific nominal. Accordingly, the object DPs of (5a, b) have the structures given in (9a, b):

Based on these nominal structures, we can account for the contrast between (5a) and (5b) by merely saying that the existence of the specificity Op, residing in the DP SPEC blocks the movement of *who* to the sentence-initial position. Although we do not elaborate the proposal under the recent generative framework, (9b) yields a minimality violation under Rizzi's (1991) framework. In contrast, no Op is present in (9a), and thus, nothing blocks the movement of *who*. As a result, no minimality violation occurs in this example.

Given this analysis of specific and non-specific nominals, let us return to the *how many* question in (1), repeated here as (10):

(10) How many books did John buy?

Enç (1991) shows that numerals allow specific and non-specific interpretation. This contrast appears overt in Turkish. Consider the difference in case-marking between (11a) and (11b).²

- (11) a. Iki kız-i taniyordum.
 two girl-acc I-knew
 "I knew two girls."
 b. Iki kız taniyordum.
 two girl I-knew
 "I knew two girls."

(Enç 1991: 6)

In (11a), the numeral is interpreted specifically, that is, this example introduces two girls from a previously given set. In this case, the DP in point is marked with an accusative case. In contrast, when numerals are interpreted non-specifically; no previously given set exists, they appear with no case, as shown in (11b). Accordingly, only (11a) can follow (12), which introduces a particular group of

² Abbreviations are as follows: acc (accusative marker), dat (dative marker), and Q (question marker).

children into the discourse:

- (12) Odam-a birkaç çocuk girdi.
 My-room-dat several child entered
 “Several children entered my room.”

(Enç 1991: 6)

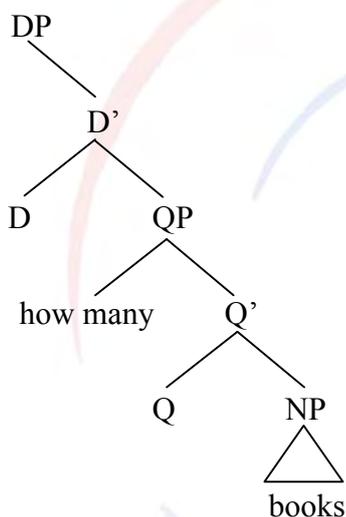

Although we do not observe any morphological difference, in the same way the English example in (13) is also ambiguous between specific and non-specific interpretation:

- (13) I saw two boys at the movies.

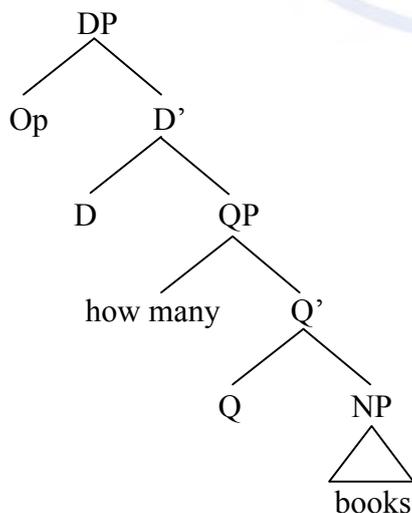

(Enç 1991: 8)

Hence, given that numerals in English permit specific and non-specific interpretation, *how many books* should have different structures according to its interpretation, as shown in (14a, b):

- (14) a. Non-specific interpretation

- b. Specific interpretation

It is worth emphasizing that regardless of whether the WH-phrase *how many books* is interpreted as

specifically or non-specifically, (15) is ungrammatical in English:

(15) *How many did John buy books?

Accordingly, EFL learners must know that the entire DP, *how many* + N is always raised to the sentence-initial position, independent of the structural difference between its specific and non-specific interpretation. If they have not yet acquired this particular property of *how many* + N, we predict that learners incorrectly have an option of moving *how many* alone to the sentence-initial position. Under the theoretical assumptions presented in this section, the raising of *how many* alone is blocked by the specificity Op when the WH-phrase in point is interpreted specifically. Accordingly, we predict that EFL learners who have not acquired the syntax of *how many* + N incorrectly accept WH-questions of the type exemplified in (15) only in non-specific context.

3. Previous Research on the Acquisition of How Many in Adult EFL Learners: Yamane (2001, 2003)

Yamane (2001, 2003) investigated whether or not the role of L1, namely Japanese, is involved in the L2 English grammar. A grammaticality judgment task was used in her experiment. Her 54 informants (Japanese university students) were asked to judge whether various WH-questions including the ones exemplified in (16) are grammatical:

- (16) a. How many friends do you have?
b. *How many did you buy pens?

The results show that her participants correctly ruled out WH-questions in which only *how many* is extracted (60.2% of the time); she therefore concludes that the role of L1 was not observed in the acquisition of *how many*.

Of particular interest is the fact that, in Yamane's study, the test sentences were given to the subjects without any context. This might have allowed her subjects to imagine any context under which each test sentence was used, and the subjects might have come up with "specific" context for *how many* + N. Given the theoretical assumptions of specific nominals discussed in section 2, the fact that Yamane's participants correctly excluded the raising of *how many* alone to the sentence-initial position might be considered instances of minimality violations. In order, therefore, to confirm whether learners have truly acquired the basic syntax of the DP *how many* + N, we need to control the context under which each test sentence is given, and examine both specific and non-specific contexts. We attempt this in our experiment reported below.

4. Experiment

In the first three sub-sections, we describe the methodology, and the final sub-section introduces the results of our control group and the child EFL learners.

4.1 Participants

Five Japanese children, who do not use English on a daily basis, participated in our study. The children took an English lesson once a week at Osaka YMCA Tennoji. All of the children were Japanese native speakers with exposure to English before age six. Their background information is given in Table 1.

Table 1: Background information of children

	Age	Sex	Exposure to English (age)
J1	9	F	4
J2	9	M	2
J3	10	F	1
J4	10	F	3
J5	9	F	5

As a control, five English native speakers were also included.

4.2 Material

The task used in Yamada and Miyamoto (2009) actually consists of 30 items including 10 types of a sentence with WH-phrase (e.g. *how many*, *whose*, *who*). Here, only the items involving *how many*, which are of our concern, are given in (17). In order to force a bias toward specific or non-specific interpretation, we incorporate test sentences into dialogues. An illustrative example is given in (18):

(17) Target sentences

- (i) *how many* questions in specific/non-specific contexts
e.g. How many did he lose pencils?
- (ii) *how many* + N questions in specific/non-specific contexts
e.g. How many DVDs do you have?

(18) Dialogue (e.g. *how many* question in specific context)

Charlie: Mary bought 5 pencils yesterday but she's already lost some of them.

Pikachu: How many pencils did she lose?

Charlie: 3 pencils, she said.

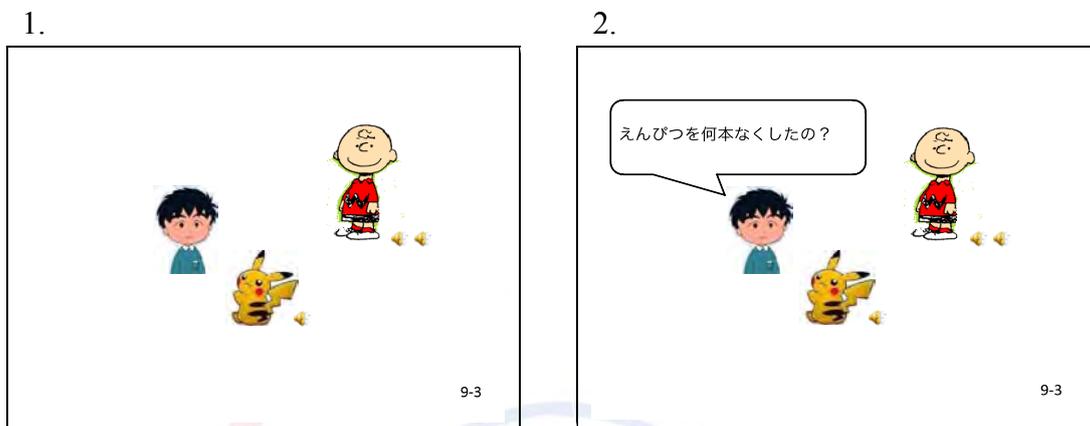

In the dialogues above, the underlined words '5 pencils' introduces a specific set into the discourse. Accordingly, *how many pencils* must be interpreted as a specific DP.

4.3 Procedure

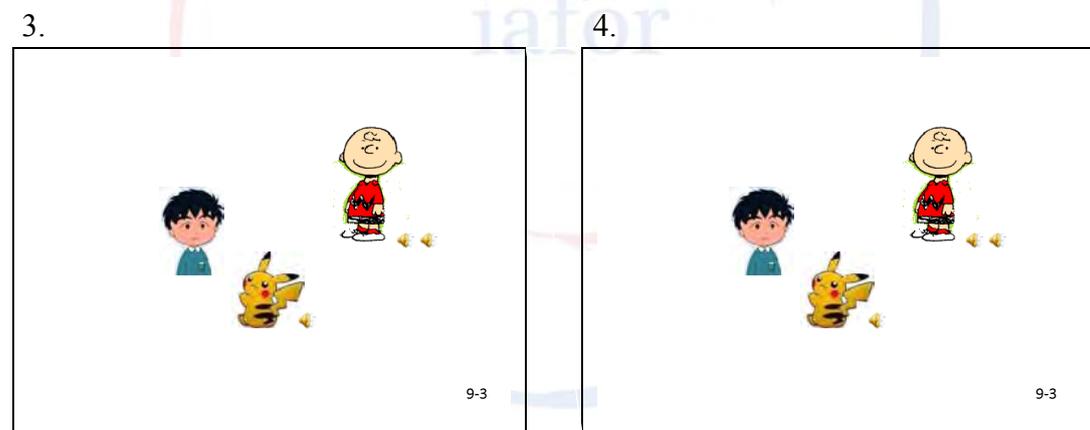

The participants were examined individually at the YMCA. The experiment was preceded by a series of instructions and by four practice items. The participants were told that they would be listening to a

series of dialogues consisting of 3 cartoon characters (Charlie, Kento, and Pikachu) together with their pictures (see (19) below). The children were also told that in the dialogues, Kento cannot speak English, so Pikachu would help him. However, since Pikachu might make errors, the children were required to listen carefully to Pikachu. The participants' task was to judge whether the sentences uttered by Pikachu in English (see (19-3)) were acceptable or not.

(19) Examples

Charlie: “Mary bought 5 pencils yesterday but she’s already lost some of them.” (Kento: Enpitsu-o nanbon nakushita no?)
 pencil-acc how many lost Q
How many pencils did she lose?

Pikachu: “**How many pencils did she lose?**” Charlie: “3 pencils, she said.”

4.4 Results

4.4.1 The Native English control

The five English native speakers categorically ruled out ungrammatical sentences where only *how many* was extracted (Table 2). On the other hand, they categorically ruled in grammatical sentences in which *how many* + N was extracted.

Table 2: English speakers’ results of the grammaticality judgment tasks (*=ungrammatical)

moved element	specific	moved element	non-specific
a. how many*	0/15 (0%)	c. how many	1/15 (6.7%)

b. how many + N	10/10 (100%)	d. how many + N	15/15 (100%)
-----------------	--------------	-----------------	--------------

4.4.2 The Child EFL learners

As Table 3 shows, there is a clear contrast between specific and non-specific contexts with respect to extraction of *how many*. In specific contexts, the child EFL learners ruled in sentences with *how many* extraction 46.7% of the time. On the other hand, they categorically ruled in such sentences in non-specific context (100% of the time)³.

Table 3: Children's results of the grammaticality judgment tasks

moved element	specific	moved element	non-specific
a. how many*	7/15 (46.7%)	c. how many	15/15 (100%)
b. how many + N	8/10 (80.0%)	d. how many + N	12/15 (80.0%)

To summarize, we discovered that Japanese child elementary EFL learners incorrectly accepted this type of sentence only when the WH-phrase in point was to be interpreted non-specifically. In contrast, when the specific interpretation of the WH-phrase was forced, the subjects only permitted the type of sentence illustrated in (1), repeated here as (20):

(20) How many books₁ did John buy t₁?

5. Educational Implications

The asymmetry between specific and non-specific contexts, observed with *how many*, suggests that unless we examine specific and non-specific contexts, we cannot conclude that learners have acquired syntax of English WH-questions of the type (1). The obvious conclusion from the experimental results suggests that learners have not realized that the entire DP *how many + N* must be raised to the sentence-initial position. We therefore believe it also important to incorporate specific and non-specific contexts in providing instructions for this type of WH-question in classrooms.⁴

When we observe *how many* questions in English textbooks, the context provided tends to be specific, incorporating information of the objects involved. In one of the English textbooks for the first graders in a junior high school, we have a dialogue of the following kind. Notice that in the picture, we already see six ducks, which makes the context specific.

(21)

³ In contrast, there is no obvious contrast between specific and non-specific contexts with respect to extraction of *whose*. This may not be too surprising given the possibility that *whose* is base-generated in the CP SPEC and the resumptive *pro* occupies the position within the object DP. For example, (ia) may have the structure in (ib):

(i) a. *Whose did you see mother?
b. Whose₁ did you see [(Specificity Op) pro₁ mother]

If the structure in (ib) is available in the grammar of the subjects, it is natural that no minimality violation occurs in (ib) since no movement is involved. See Yamane, Chen and Snyder (1999) for relevant discussion.

⁴ Since foreign language instruction is to start in 2011, our results from Japanese child EFL learners are particularly important.

② Ken : Do you see any birds ?
 Emma : Yes, I do.
 Ken : How many birds do you see ?
 Emma : Just a minute. I see six birds.

Ken : I see some plastic bags too.
 Emma : Oh, dear.

(NEW CROWN 1:37)

The fact that the context is specific in (21) then suggests the specific interpretation of ‘*how many birds*’ in the question, ‘*How many birds do you see?*’. Consequently, due to the existence of the specificity Op, even if the students have not acquired the fact that *how many* alone can never be raised to the sentence-initial position, the raising of the whole DP is forced for independent reasons. Learners therefore appear to reject correctly WH-questions like (22) in this case.

(22) How many₁ do you see [t₁ birds]?

We therefore ought to seek how to incorporate the distinction in point in teaching *how many* questions in class.

One of the contexts which favor non-specific interpretation is to use a verb of creation with *how many* + N (Diesing 1992). By their lexical nature, verbs of creation do not create specific context because any particular set of entities involved does not exist yet. In order to create exercises for questions with *how many* + N, we can therefore incorporate questions of the type exemplified in (23):

(23) How many stories₁ do you want to write t₁?

Another way is to create exercises in which those who ask *how many* questions cannot imagine any specific set of entities involved. In this respect, the exercise below is of the right kind:

(24)

Your Turn 表に、あなたがもっている品物の名前とその数を書き入れ、友達とたずね合って、それぞれの数を書きましょう。

	[例]	①	②
品物	CD		
名前			
あなた	15		
友達	10		

[例] A: I have fifteen CDs.
How many CDs do you have?
B: I have ten.

Tool Box 品物

1. CD シーディー
2. comic book マンガ本
3. MD エムディー
4. video game テレビゲーム

巻末 TB

(NEW HORIZON 1:45)

(Instruction for this exercise) Decide two items of your choice and jot down how many of them you have. Then, make a pair and ask your friend how many he/she has.

In this exercise, students are supposed to ask their friends *how many* questions. In this context setting, there is no way to imagine any specific set before the questions are asked. Accordingly, *how many* + Ns must be interpreted as non-specific DPs. If EFL learners never use *how many* questions exemplified in (22) in this type of exercises, we can confirm that learners have already acquired the basic syntax of questions with the DP *how many* + N.

6. Concluding Remarks

This paper examined the behavior of *how many* questions and showed that at the elementary level, Japanese child EFL learners raise only *how many* to the sentence-initial position. However, we also discovered that this type of mistake only occurs in non-specific contexts. This suggests that at the elementary level, Japanese child EFL learners have not acquired the basic syntax of *how many*. The fact that they did not raise *how many* alone is due to specificity effects, which may be considered as minimality violations (Rizzi 1990). Based on these findings, we suggest that in teaching the WH-questions under consideration, we need to control the context where these questions are given and incorporate non-specific context. We also suggest that one of the ways to force non-specific context is to use a verb of creation as the main verb. Of course, on the practical side, we still need to consider how to provide students with WH-questions of the relevant kind in the classroom setting, but we hope that this paper provides one instructional insight from the theoretical linguistic and second language acquisition research.

The Effect of Changing Presenting Style of Dynamic Display in Chinese for Learning Disability Students

Li-Chih Wang¹ Yi-Chan Chang²

¹ *Doctoral Program of Department of Special Education, National University of Tainan, Taiwan*

² *Master of Technology Development & Communications, National University of Tainan, Taiwan*

clundtle@gmail.com

Abstract The purpose of the present study was to find out the best conditions for reading comprehension by comparing the presenting speed (slow, medium and fast) and direction (vertical and horizontal) of dynamic display in Chinese. The participants consisted of 48 (27 males) fourth-grade learning disabled students. The materials for the present study are three essays, and the test-retest reliability, validity, style, and question numbers of these three essays were similar. The results indicated that there is no interaction between the speed factor and the direction factor. In regard to the speed factor, the learning disabled students performed significantly better at a medium speed (260wpm) than at a fast speed (350wpm). This was followed by the slow speed (171wpm). Regarding the direction of the text, reading comprehension with the horizontal script was significantly higher than with the vertical. The present study is backed up by previous studies. The findings are proof that a dynamic display in a suitable environment can assist learning disabled students.

1. Introduction

“Reading” is an essential learning tool and a major source of attaining knowledge in one’s daily life (Ko & Zhan, 2006). In general, knowledge in school is often learned by means of reading. In fact, the complexity of the reading process is very difficult to explain in simple terms. When learners encounters reading material, they must use their reading ability to identify words and combine this with their background knowledge to comprehend the deeper meanings of the content.

Because of the complexity of reading, when people run into reading difficulties, they usually do not know what to do with it. In a regular classroom, there will always be some students with low reading achievement, which is mainly because the teaching materials are often presented in the form of words. If the students have low reading comprehension, learning will be difficult for them. In General, various instructional methods are often used to improve students’ reading comprehension, such as reading comprehension strategies, and peer-assisted learning. (Reutzel, Smith & Fawson, 2005; Spörer & Brunstein, 2009; Spöre, Brunstein & Kieschke, 2009). However, from teachers’ perspectives, it is not easy to prepare instructional methods while also attending to students’ other needs.

Therefore, this study focuses on comparing the effects of a changing textual presentation for students with learning disabilities (LD), in the hope of finding the most effective and appropriate model for the school setting.

2. The changing of textual presentation

Readability basically means how easy it is to read a text. Comprehension increases when a reader meets a text with better readability (Chien, Chen & Wei, 2008). Furthermore, research has indicated that the speed and direction are both important conditions in dynamic textual representation (Chien & Chen, 2005).

2.1 Speed of Presentation

The rapid serial visual presentation (RSVP) is a method of dynamic textual

presentation. The difference between dynamic and static presentation is that dynamic textual presentation moves, so “speed” is one of the important factors for studying the dynamic textual presentation (Chien, Chen & Wei, 2008). In general, speed means the numbers of words per minute (wpm). Bernard, Chaparro and Russell (2001) studied the relationship between RSVP and reading speed at three levels (250, 450 and 650wpm). They found there was a significant difference between the three speeds, and the best reading comprehension occurred at a reading speed of 250 wpm (Bernard, Chaparro & Russell, 2001). The result of a recent study (Chien & Chen, 2005) also found the best reading comprehension existed at 260 wpm when they compared dynamic text at 171, 260, and 350wpm with static text.

Some researchers (Sun, Morita & Stark, 1985) compared the eye fixation time of reading in Chinese and English text, and they found the average fixated time per word was 0.26 second in vertical Chinese, and 0.27 second in horizontal English. In addition, a study into dynamic textual presentation in Chinese indicted that the participants could get a higher reading comprehension with the RSVP at 140wpm in a single line screen of 20 words.

According to several studies about different speeds, two studies (Bernard, Chaparro & Russell, 2001; Chien & Chen, 2005) showed that around 250wpm would result in the best reading comprehension, but another study (Sun, Morita & Stark, 1985) indicted better reading comprehension occurred at 140wpm. Therefore, the present study would examine the different reading comprehension speeds.

2.2 Direction of Presentation

The researcher found that reading comprehension increased in horizontal text compared with vertical text (Chien, Chen & Wei, 2008) The researcher found the best reading condition is 25 words in vertical text, and 20 words in horizontal text (Tsau, 2001).

Sz (1999) indicated that even though prior studies showed horizontal text increased comprehension for Chinese script, this may be due to reading habits rather than reading direction. As the eyes are located on the left and right of the face, overall, readability in horizontal text is better than vertical text so moving from right to left is physiologically easier. It requires more muscular energy for the eyes to move from top to down, so it quickly tires a reader (Tsao & Lin, 1998). However, reading habits also influences reading behavior.

2.3 Learning Disability Students' Reading

For the learning disability (LD) students, word-by-word RSVP could improve reading comprehension, and RSVP may attract LD students' visual attention (Wang,

2010). But even for normal student, there are still some arguments about the best RSVP speed, and there are no related studies about the adaptive RSVP speed for LD students.

In other words, because of the direction and sequence of visual attention, the readability of horizontal texts is higher than for vertical text (Tsau, 2001). This could be very valuable for LD students because LD students' visual attention is significantly delayed compared with non-disabled students' (Hoop, Swartz, Wakely & Kruif, 2002; Golden & Golden, 2002).

The present study focuses on text speed and direction in order to find a more effective method in which to present text speed and direction and improve reading comprehension for LD students.

3. Method

3.1 Structure

The independent variables in this present study are the three speeds (171, 260 and 350wpm) and the direction (vertical and horizontal). There are six factors in total, and the dependent variable is the LD students' reading comprehension scores.

The disturbed variables are the error between different methods, so the author controlled the following areas: the size and the font of the characters, the color of characters, and the background. According to prior studies, results indicated that reading comprehension is no different between 12pt, 20pt and 28pt on a personal computer (Chien, Chen & Wei, 2008; Russell & Chaparro, 2001), so the word size setting of the present study is 20pt. In the word font, no difference between sizes was found between Kaiu and Mingliu (Wang & Kan, 2004), so the word font setting of the present study is Kaiu. The result of prior studies indicated that the setting of black words on a white background could reduce glare (Wang & Kan, 2004), so the color of the characters and the background setting of the present study follows this setting.

3.2 Procedure

Participants would be told "This test was designed to measure your Chinese scores, so you should write down the answer." Every participant was presented with three texts in total. The reading materials were presented on a computer screen, and the participants would write the answer on paper after the material was presented. When the materials were presented, the words were shown word-by-word (the vertical text see Figure 1 and 2; the horizontal text see Figure 3 and 4). When the time for the first word was up, it would remain on the screen when the second word appeared. The full text of the article disappeared when the last word was shown and the time was up.

Figure 1 The beginning of the vertical text

Figure 2 The process of the vertical text

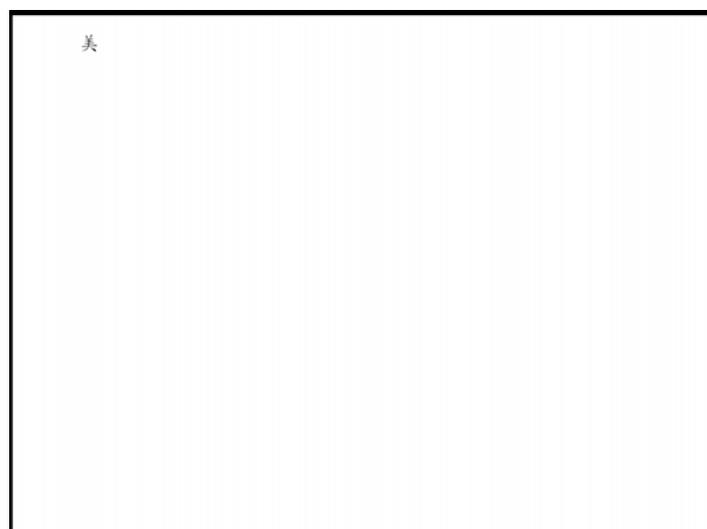

Figure 3 The beginning of the horizontal text

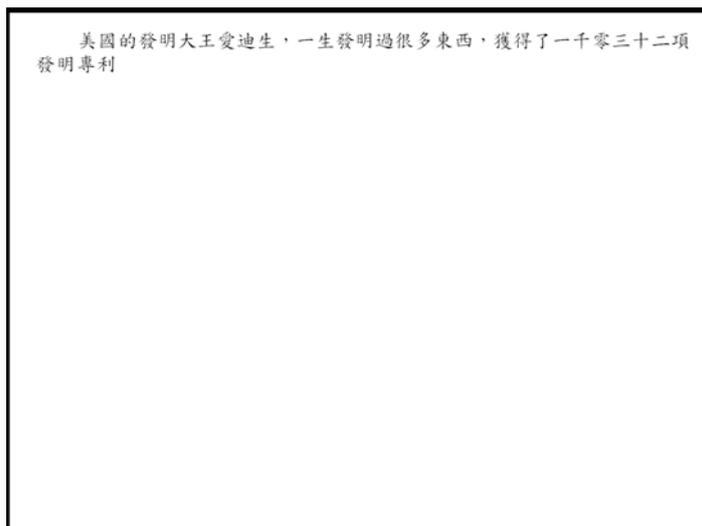

Figure 4 The process of the horizontal text

3.3 Participants

The participants of present study are 48 (27 males) 4th grade elementary school students, and identified by the county education bureau, as sharing a similar socio-economical status. Also the participants were from the same school as sampling from the same school would reduce the possible effects of the students’ large background discrepancies. All the participants were distributed into six groups (see Table 1). The participants that read in a vertical arrangement and at a slow speed (171wpm) are called SV group; the participants that read in a vertical arrangement and at a medium speed (260wpm) are called MV group; the participants that read in vertical arrangement and at a fast speed (350wpm) are called FV group. Furthermore, the participants read in a horizontal arrangement and at a slow speed (171wpm) are called SH group; the participants that read in a horizontal arrangement and at a medium speed (260wpm) are called MH group; the participants that read in a horizontal arrangement and at a fast speed (350wpm) are called the FH group

Table1 integration of six kinds of textual presented method^o

	Slow (171wpm) ^o	Medium (260wpm) ^o	Fast (350wpm) ^o
Vertical arrangement ^o	SV ^o	MV ^o	FV ^o
Horizontal arrangement ^o	SH ^o	MH ^o	FH ^o

The participants in the VS group saw the materials word-by-word vertically, and the frequency was 171wpm (about 21.05 seconds per word). The participants in the MV group, saw the materials word-by-word vertically, and the frequency was 260wpm (about 13.85 seconds per word). The participants in FV group saw the materials

word-by-word vertically, and the frequency was 350wpm (about 10.28 seconds per word). In addition, the participants in the SH group, MH group and the FH group, all saw the materials word-by-word vertically, and the speed were separated to 171wpm (about 21.05 seconds per word), 260wpm (about 13.85 seconds per word) and 350wpm (about 10.28 seconds per word).

3.4 Materials

The materials were selected from the Ho and Lee's study. They created "reading comprehension tests" for the LD students in a 4th grade elementary school. The selective criterions are literacy, number of questions, difficulty level and re-test reliability. The three items were narration (story), 9 questions for test 1 and 2, 8 questions for test 3 (1 text has 8 questions), a difficulty level of around 0.8 (0.776-0.806) and re-test reliability of 0.7 (0.687-0.743). In total there are 26 reading comprehension questions (Ho & Lee, 2003) (see Table 2).

Table 2 Title, Number of question, Difficulty level and Re-test reliability of Reading Comprehension Tests^a

^a	Title ^a	Number of question ^a	Difficulty level ^a	Re-test reliability ^a
Test 1 ^a	Edison ^a	9 ^a	0.806 ^a	0.692 ^a
Test 2 ^a	The Salt God ^a	9 ^a	0.773 ^a	0.687 ^a
Test 3 ^a	An Old Teapot ^a	8 ^a	0.776 ^a	0.743 ^a

3.5 data analysis

The present study used a two-way ANOVA to analyze the data to discover if reading comprehension scores differed between the three presented speeds (two presented direction), and examine if there is an interaction between presented speed and direction.

4. Examine presented speed and direction

The LD students' reading comprehension scores for the three presented speeds (171, 260 and 350wpm) and the two presented directions (vertical and horizontal) for dynamic display (see Table 3).

Table 3 Two-way ANOVA of LD LD students' reading comprehension scores

	df	MS	F
presneted speed	1	200.00	62.411**
presented direction	2	244.50	76.298**
Speed x direction	2	0.50	0.156

* $p < .05$, ** $p < .01$

According to Table 3, the LD students' reading comprehension scores for the presented speed and the presented direction didn't have an interaction (see Figure 5).

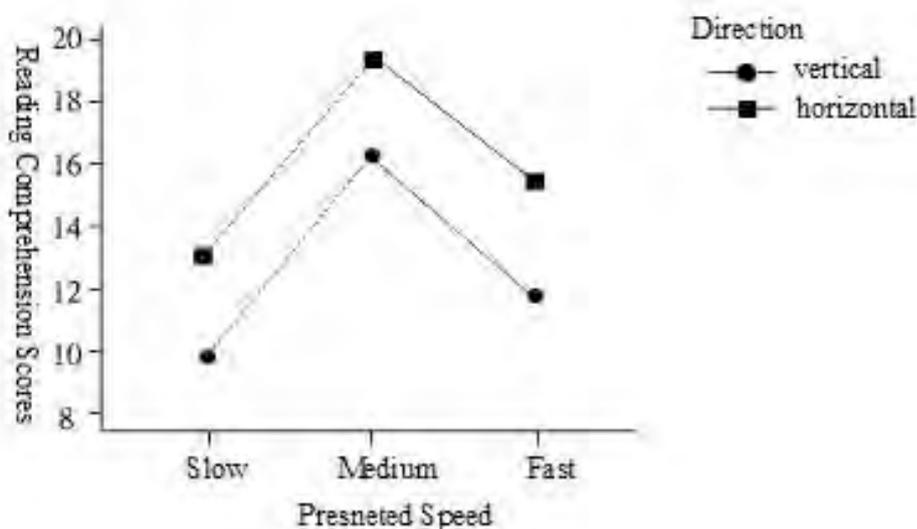

Figure 5 Profile of LD students' reading comprehension scores of presented speed and direction

As the two factors didn't show an interaction, we could examine the effects of individual factors (presented speed and presented direction) on reading comprehension scores.

Examining the direction factor, according to Table 3 we could know the two models (vertical and horizontal) had a significance of $p < .01$. LD students have a higher reading comprehension score for the horizontal text.

According to Table 3, the three models (slow, medium and fast) have a significant difference $p < .01$, so we carried out a Post-hoc (Tukey) (see Table 4).

Table 4 Posthoc of LD students' reading comprehension scores in three presented speed (Tukey)^a

	Slow-Medium ^a	Medium-Fast ^a	Fast-Slow ^a
Scores ^a	-6.250** ^a	4.250** ^a	2.000* ^a

* $p < .05$, ** $p < .01$ ^a

According to Table 4, LD students' reading comprehension scores at the medium speed were significantly better than the slow and fast speeds, and the reading comprehension scores for the fast speed was significantly better than the slow. Therefore, the best reading comprehension scores for LD students are found at a medium speed (260wpm).

5. Discussion and Conclusion

According to above, there is no interaction between speed and direction. Therefore, when the presented speed changed, the presented direction had no effect to the effectiveness of speed, and vice versa.

In the separate discussion on presented speed and presented direction, the results support the studies of Bernard *et al.* (2001) and Chien and Chen (2005). They found that LD students read in a similar way to non-learning disabled students, and had a better reading comprehension at around 260wpm. However, this result is different from the results of a study by Sun *et al.* (1985). This different may be due to the "single line screen. A single line screen is more difficult to read so a reader needs more time to comprehend the text; hence, the effectiveness of the slower speed. As the presented words of reading materials existed in single line screen, comparing to faster speed (250wpm and 350wpm) , readers could remember textual content more clearly at the slower speed (140wpm) easily.

The results also support previous studies that show horizontal text results in better comprehension when compared with vertical text(Bernard, Chaparro & Russell, 2001; Sz, 1999; Tsao & Lin, 1998).

According to the result of the present study, LD are similar to normal students, have a better reading comprehension scores at a medium speed (260wpm) on a dynamic display. Furthermore, LD students are similar to non-learning disabled students and get better reading comprehension scores in a horizontal presented rather than a vertical presented dynamic display. However, the present study doesn't focus on paper texts, so we can't claim LD student would get a better reading comprehension on a horizontal display presented on paper. If we want to examine this, we need to establish more empirical tests.

Some teachers like to use Computer Assistant Instruction (CAI) to support instruction in recent years. Therefore, the dynamic display is a very important issue, especially as LD students' visual attention is significantly delayed compared with non-learning disabled (Hoop, Swartz, Wakely & Kruif, 2002; Golden & Golden, 2002), so they may be affected by a bad dynamic display. Thus, researchers should focus on this issue in the future.

Furthermore, regardless of how interesting the instructional materials are, a better effect is only found in an adaptive setting.

Title: Interdisciplinary and cross-cultural value principles for legal English teaching

Author: Christiaan Prinsloo

Affiliation: Yonsei University, South Korea

Contact information: christiaanprinsloo@gmail.com

Topic: Language education and applied linguistics

Abstract

This integration of law, linguistics, and pedagogy emanates from (1) a general paucity in research on English for Academic Legal Purposes (EALP), and (2) an acute awareness of the decline of communication skills of L1 and L2 legal English learners. The research paucity could be attributed to the level of specialty that EALP requires of instructors and learners. Additionally, it is a subject that is inherently interdisciplinary, which complicates research procedures. The decline of communication skills of learners could be explained by the internationalization of the classroom, which leaves students ill-informed of and unprepared for law school expectations.

The purpose of this project is to merge the interdisciplinary foundations of legal English that could explain and improve EALP education. These foundations include legal, linguistic, and pedagogical perspectives. Legal perspectives comprise of the natural law approach and constructive interpretation, which are respectively drawn from jurisprudence and hermeneutics. Systemic functional linguistics is the linguistic perspective that explains how language functions. The pedagogical approach relies on a genre-based pedagogy that includes English for Specific Purposes and the New Rhetoric that underscores the cross-cultural dimension.

The process of identifying interdisciplinary and cross-cultural value principles consists of two parts. Firstly, the theoretical foundations are critically reviewed to explain the dynamics of legal English pedagogy. Secondly, theoretical principles are then identified from the various perspectives and synthesized to create a set of value principles that could advance EALP teaching.

Introduction

English Language Teaching (ELT) serves as a hypernym that refers to a prolific field of research about English instruction. In an attempt to taxonomize ELT one could subdivide the field into the teaching of English as L1 and L2 language. Both L1 and L2 teaching include English for Specific Purposes (ESP). Johns and Price-Machado (2001:44) describe ESP based on four invariable and two variable elements. The invariable elements refer to language teaching that is:

- tailored to the needs of the learner;
- connected to content, specific subjects, professions, and actions;
- focused on proper language for these activities; and
- different from generally used English.

The variable elements refer to language teaching that is:

- limited to the language skills to be learned; and
- teaching does not happen according to any predetermined pedagogy.

This definition leads to ESP being an umbrella-term for a larger taxonomy. Figure 1 shows a hierarchal diagram depicting the classification of ESP categories (Johns & Price-Machado 2001:44). The dark lines indicate the association between ESP and English for Academic Legal Purposes (EALP). The dark dialogue boxes position EALP and English for Legal Purposes (ELP) at different ends of the ESP spectrum.

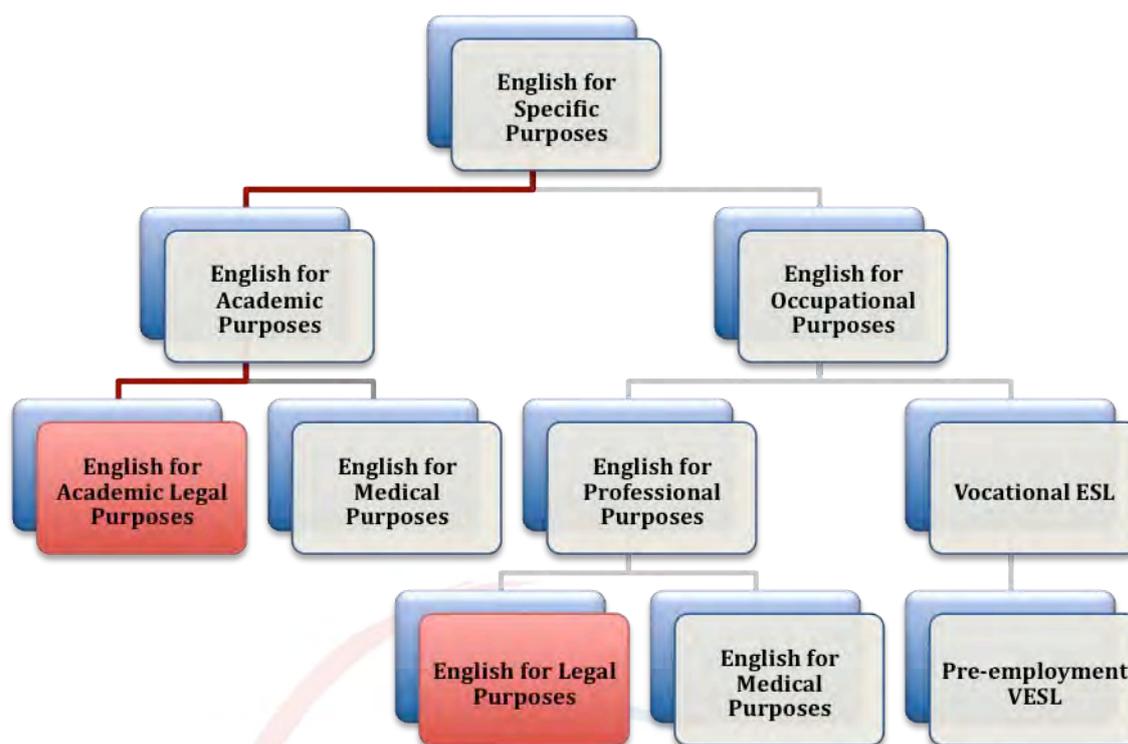

Figure 1: Taxonomy of ESP categories

Taxonomies enable us to distinguish the proverbial trees from the forest; they also allow us to notice how the forest functions as an interconnected system. Similarly, the various branches (no pun intended) of language teaching and learning are connected by virtue of belonging to the same language (forest) and/or discipline (tree). Yet, a taxonomy also illuminates incongruity.

The latest trend in legal English textbook design contradicts the assumption that EALP is different from English for Occupational Purposes (EOP) based on a distinction of purpose, focus, and skills (Hyland & Hump-Lyons 2002:2; Jordan 1997:4). For example, in both *International Legal English: A Course for Classroom or Self-Study Use* (Krois-Lindner, 2006) and *Legal English* (Haigh, 2009) the focus is on a comprehensive spectrum of skills that include academic and professional communication skills and literacy. In contrast with older EALP textbooks (Candlin, Bhatia, & Jensen 2002), recent publications seem to indicate an integrated pedagogical approach to the teaching of legal English skills in the L1/L2 international classroom. These contemporary examples seem to merge the purposes and outcomes of EAP and EOP, rendering the distinction between EALP and ELP somewhat redundant.

Paucity in EALP research

English for Specific Purposes is abounding with research; however, the subfield EALP is less explored. A number of **reasons** explain the **research paucity**.

- The lack of research could be attributed to the **level of specialty** that EALP requires in its teaching and learning. EALP is usually taught by EAP instructors who have not necessarily received formal legal training (Kurzon 1997:136). Conversely, legal

educators do not necessarily have the required language teaching expertise (Van der Walt & Nienaber 1997:v). As a result, legal educators and “EAP teachers will be seen as overreaching themselves and pretending to an expertise that they can only feign or simulate” (Bruce 2002:324).

- In conjunction with expertise required in both substantive law and language pedagogy, EALP is also an **interdisciplinary field** that hinges on anthropology, linguistics, philosophy, psychology, and sociology (Conley & O’Barr 1998:1). The interdisciplinarity of the field could deter researchers. Ties to certain academic institution or disciplines often encourage disciplinary specialization, which discourages entry into the interdisciplinarity of EALP (Golbe & Gallagher 1999:282).
- In accordance with the interdisciplinary nature of EALP, Candlin, et al. (2002) identify the isolation in which **professional genres** have been researched without consideration of **professional practice**. This argument supports the claim above that the distinction between EAP and EOP is artificial. An isolated view of genre, for example, undermines the interdiscursivity between professional genres and their practices (Bhatia 2004:391; 2008a; 2008b; 2010).
- **Legal language** is notorious for its impenetrability because of its prolixity, nominalization, and fixed verbal chunks (Venturi 2010:22, Wydick 1998:3-4). These qualities of legal language deter outsiders from entering EALP. The ‘resistance’ that the legal profession displays against language and genre transformation maintains the veracity of the profession (Van der Walt & Nienaber 1997:v), but could also hamper the development of EALP.

Decline of communication skills

Together with the research deficit the **inadequate communication and academic literacy skills** of EAP students motivate improving EALP pedagogy. The frail reading and writing skills of undergraduate EAP students is an international phenomenon (Alaka 2010; Larcombe & Malkin 2008). Pretorius (2002) refers to it within the South African context as “crisis”. Although the calamity manifests across disciplines and cultures, additional language groups are particularly affected (Carstens 2008; Johns 1995; Read 2008). However, the occurrence of frail reading and writing skills is not isolated to EAP. In fact, it necessarily implies a skills shortage in the more specialized fields such as EALP.

It is for this reason that Deutch (2003:125) conducted an empirical needs analysis to determine the priorities of EALP curricula in Israel. Because law is such a linguistically demanding course, Larcombe and Malkin (2008:319) argue for additional language support for international and domestic Australian law students. In a similar vein Edelman (2010:112) argues for a foundational legal writing course not only for American law students, but also for law students around the world. Such acute international appeal for the development of an EALP program confirms that law students are in need of language support.

Motivation for interdisciplinary approach

How could the research paucity and frail communication skills of students be addressed? Perhaps the more important dilemma is where does one begin? Studies that attempt to

investigate the research paucity in the EALP field suggest that possible solutions, to the causes and effects of tenuous communication skills of law students, could be found in an **interdisciplinary approach** that triangulates the acquisition of legal language skills with applied linguistics and pedagogy.

Such triangulation is seen in the research of Bhatia, arguably the leading proponent in the EALP field. Initially Bhatia focused primarily on legal and business genres (Bhatia 1983, 1993). More recently Candlin, et al. (2002) straddle disciplines and propose a genre-based perspective to advance the development of legal English writing material, thereby infusing traditional legal studies with applied linguistic pedagogy. Bhatia (2008b:162; 2010) also proposes that academia and professional practice could compliment each other by considering the text-external factors of the production and distribution of knowledge. Bhatia acknowledges the foundational connection that exists between theory and practice, academic legal genres and their practical application that exists through a process called **interdiscursivity** (compare Hafner & Candlin 2007).

Similarly, in his Ph.D. thesis, Hafner (2008:42) recognizes the necessity to cross disciplines to address the problems of legal language education. Because of the domain-specificity of legal communication and the absence of legal education theory, the study is based on genre and literacy theory. Through a qualitative interpretive research method, Hafner investigates the design, implementation, and evaluation of online recourses for professional legal communication. Hafner triangulates qualitative data with genre and literacy theory (compare Deutch 2003 and Larcombe & Malkin 2008) thereby employing a **mixed methodology**.

In the context of EAP, Carstens (2008) describes the use of a **multidirectional model** for tertiary-level disciplinary writing. A **top-down** directionality refers to the curriculum designer that uses a set of design principles that are based on practice and observed verification. The **bottom-up** perspective provides the teacher and learner with the critical autonomy to employ the design principles as needed. “A **sideways** orientation promotes authenticity, increases student motivation and stimulates inter-departmental collaboration” (Carstens 2008:95). The multiple perspectives advocated by a multidirectional model inevitably require course designers and instructors to be vigilantly aware of the multidimensionality of the educational context. A multidirectional model is therefore implicitly interdisciplinary.

Bhatia, Hafner, and Carstens respectively show that, in order to address legal language and disciplinary writing, research should take into account theories that could explicate the pedagogical foundations of legal education and linguistics (compare Bruce 2002, Candlin, et al. 2002). Like Hafner and Candlin (2007) Bhatia and Carstens also endorse the continuum of theory and practice that should not be severed, but maintained through interdiscursivity and/or pedagogical multidirectionality.

In an attempt to address the causes of EALP shortcomings, it is my contention that (as a first step) more efficient EALP curricula should be designed with the aid of interdisciplinary and cross-cultural **value principles**. Supporting this conceptual and methodological aim requires an **emic and etic theoretical foundation** that includes legal perspectives, linguistic theory, and pedagogical approaches. No single theory explains all these disciplinary influences and a combination of theories seems most plausible.

Interdisciplinary foundations

The analysis of theory is based on a considered eclectic approach, which is similar to contemporary mixed method research that does not replace any theory; rather it draws on the strengths of the theories and methods that are needed (Johnson & Onwuegbuzie 2004:14-15). Considered eclecticism entails borrowing elements from various paradigms, approaches, and sources that construct a coherent integrated theory or model. An **emic legal perspective** is rendered by the natural law approach and constructive interpretation, which are respectively drawn from jurisprudence and hermeneutics. An **etic approach** stems from linguistic and pedagogical theories. Systemic functional linguistics is the linguistic perspective that explains how language functions. The pedagogical approach relies on a genre-based pedagogy that includes English for Specific Purposes and the New Rhetoric that underscores the cross-cultural dimension.

Although aware of the various debates within the different disciplines, it is not my intention to engage them at this stage. The purpose is to identify concepts that cross the interdisciplinary divide and nurture a cross-cultural approach to EALP.

Legal perspectives

Natural law and constructive interpretation

The **natural law** approach is often seen as the opposite of legal positivism, which considers law as it is rather than, as it ought to be. Natural law proclaims that written laws should be informed by morality and principles of justice to render it fair. Any rule that is not fair is therefore not law (<http://legal-dictionary.thefreedictionary.com>). Ronald Dworkin remains one of the most prominent natural law thinkers. Dworkin views **law as a social practice**, which should be improved through its **moral interpretation**.

Law as integrity asks judges to assume, so far as this is possible, that the law is structured by a coherent set of principles about justice and fairness and procedural due process, and it asks them to enforce these in fresh cases that come before them, so that each person's situation is fair and just according to the same standards (1986:229).

Criticism against Dworkin's theory is that it does not promote legal coherence. Society is constructed of various social groups with different agendas. It would be impossible to create a coherent moral legal system when the morality of all the different groups of a society is taken into consideration. But does this argument justify cultural, legal, or metanarrative hegemony?

Dworkin proposes **constructive interpretation** that could transcend metanarrative hegemony. Constructive interpretation relies on the chain novel and Judge Hercules metaphors. The **chain novel metaphor** is used to explain the litigation of a court case. Dworkin describes it as follows:

In this enterprise a group of novelists write a novel *seriatim*; each novelist in the chain interprets the chapters [s]he has been given in order to write a new chapter, which is then added to what the next novelist receives, and so on. Each has the job of writing [her] his chapter so as to make the novel being constructed the best it can be, and the complexity of this task models the complexity of deciding a hard case under law as integrity (1986: 229).

Similarly, judges adjudicate cases (or local narratives) by drawing on previous case law (or metanarratives) to “justly and appropriately” interpret present situations (Dworkin 1986:239).

The chain novel metaphor characterizes Dworkin's theory of interpretation as a **social historical endeavor** because successive interpretations are reliant on those created by our contextual society. Because of the sequence of time, one interpretation leads to the meaning attributed to the next.

The fictitious **Judge Hercules** is a metaphorical and metaphysical judge that has the ability to consider the entire corpus of law when he or she adjudicates a case. The impossibility of such a task implies that "the correct" interpretation would always elude us. Van Blerk (1996:100) criticizes the Hercules metaphor because, regardless of his/her vast legal database, s/he could still impose a politically motivated interpretation. "Hercules has been described as little more than Dworkin's '*judicial alter ego*', and a cross between the utterly rational Mr. Spock of Star Trek and ventriloquist Edgar Bergen's ingratiating dummy, Charlie MaCarthy" (Van Blerk 1996:100).

Perhaps the most insightful critique against and contribution to Dworkin's theory comes from legal scholar and literary critic **Stanly Fish**. Fish rightly argues that the field of legal interpretation is divided in two: "[...] between those who believe that interpretation is grounded in objectivity and those who believe that interpreters are, for all intents and purposes, free" (1983:271). Interpretation already occurs when principles for interpretation are formulated.

Fish describes interpretation as an enterprise that determines the intent of an author. Regardless of whether the text is literary or legal in nature we interpret to establish what the author desires to communicate. According to Fish, the author is **not a privileged interpreter**; the reader's interpretation is equally important (1999:509).

In terms of a theory of language, Fish postulates that words do not explicate their own meaning. Words only become meaningful in relation to interpretation and intention. "The assignment of intention can be, and often is, the occasion for dispute, and for a dispute that cannot be settled by pointing to the words since the words will only say what they will say in the light of an intention, and will say different things in the light of different intentions" (Fish 1999:510). Texts become visible through interpretation; however, literary and legal texts become indistinguishable from their interpretation. Or as Marmor suggests, instead of being the subject matter of interpretation, linguistic and textual facts are the products of interpretation (1992:74).

Similar to Dworkin's chain novel metaphor that situates interpretation socially, Fish is of the opinion that texts and readers are not isolated because they are connected through the social milieu of interpretation strategies. The mere existence of an interpretation community eliminates the possibility that judges objectively interpret cases (Fish 1983:355). As situated agents we interpret by virtue of our interaction with the world. We organize texts not after we create perceptions but during the act.

Linguistic theory

Within applied linguistics various theories explain how language functions, such as: genre-based theories (Halliday 1987, 2005; Hyon 1996; Paltridge 2007), sociolinguistics (Cook 2010), and postmodern perspectives including social constructionism (Gergen 1985; Burr 1995).

As a genre-based perspective SFL should be understood in terms of **three characteristics and three functions**: language as system of choices, language as text, and functions of language.

First, SFL considers language as a **system of linguistic choices**. Each choice produces variations in meaning. Or in an adapted Hallidayan (2005:134) metaphor, language could be viewed as a city plan (system) where traffic (meaning) could reach similar or different destinations through the similar routes (lexical and syntactic choices). Because of its dependence on various contexts, which necessarily imply various systems, language is seen as polysystemic.

Second, according to SFL language should also be recognized as **text** with social purpose. Christie (1999:760) describes the close relationship between text and context as follows: “text is known only because of the context that gives it life; conversely, context is known only because of the text that realizes it”. Language has to be understood within its broad **cultural and situational contexts**. The **cultural contexts** refer to the purposes, values, and shared experiences of culturally situated language users. The context of culture would therefore determine the nature (genre) of the text. **Contexts of situation** (the particularities of the city: streets and inhabitants) refer to extralinguistic variables such as vocabulary and grammatical models that decide the linguistic organization of the text (Carstens 2009: 33-34). Moving from cultural context to situational context implies a move toward specificity. The level of specificity is realized through the three contextual variables: field, tenor, and mode.

Finally, SFL relates to genre based on the **functions of language**. Language is functional because its structure shows the multiple purposes for which it was initially created. The function of language is theorized as three **metafunctions** accompanied by the three contextual variables (Carstens 2009:34-35; Christie 1999:760; Halliday 1978:143; Matthiessen 2005).

- The **ideational** (conceptualization) function explains the representation and construction of language experiences. The conceptualization of ideas is related to the contextual variable **field** (such as the legal discipline), which impacts choice of vocabulary, for example.
- The **interpersonal** function clarifies the character of relationships constructed by language use and is related to the contextual variable **tenor** (sense or meaning). Tenor affects expressions of attitude, necessity, obligation, and probability.
- The **textual** function of language recalls the structuring of language to produce coherent meaning, conveyed in the patterns of written or spoken texts. The textual function of language is related to the contextual variable **mode** that determines the style of genres. Text and context are therefore inseparable. Thus, within the various linguistic systems, language users organize language according to linguistic choices that convey ideas between communicators.

Systemic functional linguistics provides a valuable contribution to understand how meaning is created through language, and could explain the textual functions of legal language. Through the functions of language one could ascertain how complex legal vocabulary is conceptualized in the EALP curriculum. The interpersonal function of language could clarify the various languaged relationships of the legal discourse community; this community exists by virtue of the contextual variables field, tenor, and mode. The textual function could explain problematic legal language patterns that require additional explanation in the EALP

curriculum.

Pedagogical perspectives

Various pedagogical perspectives explain language education. These perspectives range from traditional method (Bell 2003) and skills pedagogy (Savignon 2001) to Kumaravadivelu's (1994) postmodern postmethod pedagogy. Genre-based pedagogy contributes to this article through the ESP and the New Rhetoric movements' applicability to EALP.

Genre-based pedagogy

Genre-based scholarship of the 1970s and 1980s mainly focus on psycholinguistic and cognitive linguistic theories and the process approach. However, since then the learner-centered classroom made way for the contextual situation in which learning occurs (Johns 2002:3). If one is convinced that the discovery-oriented process-based pedagogy of the 70s and 80s is unsatisfactory then the development of the genre-based pedagogy in the 90s serves as apt supplementary (Johns 1995:181).

A genre-based pedagogy provides an explicit and systematic explanation of how language functions in social contexts. It is therefore a socially grounded theory with its roots in texts and contexts. Writing is contextually situated and purposive. Through genre one learns why texts make certain linguistic and rhetorical choices in their communicative purposes.

Following active scholarship in the field since the early 1980s, Hyon distinguished: the ESP approach based on the Swalesian tradition, the North American New Rhetoric, and SFL of the Sydney School (which is discussed as linguistic theory) (compare Flowerdew 2005; Johns 2002; Paltridge 2007).

English for Specific Purposes

The ESP approach is based essentially on Swales' (1986; 1990) research on discourse structure and linguistic features of scientific research articles (Paltridge 2007:931-932). Swales emphasizes the **social purpose and structure** of spoken and written language (Flowerdew 2005:322).

Following Swales' definition of genre, in terms of communicative events and purposes, many scholars added variations on the term, but with more acute attention on the role of **social context**. Johns (2002:3), for example, describes genre as a **collection** of oral or written **responses** that meet certain social contextual requirements. Hyland (2003:21) defines genre as the **act** of using language in socially acknowledged ways. The characteristics of genres rely on the context of their creation and use. These texts relate different contexts to other comparable contexts thereby elaborating the contextual use of genre.

More recently Swales (2004) adapted the importance of **communicative purpose** as an essential attribute of genre. Instead, genre could be regarded as a 'metaphorical endeavor'. The following metaphors provide multifaceted views of genre (Swales 2004:61):

- Genres are **frames for action**: guiding principles for achieving purposes using language.
- Genres are **language standards**: expected conventions of layout and language.

- Genres are **prototypes**: instances of a genre are more or less similar to ‘core’ exemplars or templates.
- Genres are **speech acts**: the conventional actions a genre is intended to perform.

Bhatia uses Swalesian EAP as platform to increase the notion of genre as it manifests in legislative writing (1989). The application of genre is then extended when Bhatia argues that “[g]enre analysis requires input from a variety of disciplines to interpret, describe and explain the rationale underlying various professional and academic genres” (1993:13). Bhatia shows that different texts could belong to the same genre when they share the same communicative purpose.

Hyon (1996:695) indicates that ESP scholarship focuses particularly on the **formal characteristics of genres** while less attention is paid to the functions and social contexts of genres (compare Flowerdew 2005; Paltridge 2007). However, Bhatia’s earlier work anticipates his future conceptualization of genre as he continues to explore the interdisciplinary integration of legal and business genres (1997b), and eventually the critical genre analysis of the **interdiscursivity of genres** between ESP and professional practice. Interdisciplinary integration and the interdiscursivity of genres, is by implication a consideration of sociocultural contexts.

Genre analysis, from an ESP perspective, is generally recognized as the study of linguistic behavior in different settings, such as institutionalized academic and professional settings. Instead of describing language use, genre analysis attempts to explain: ‘*Why do members of specific professional communities use the language the way they do?*’ (Bhatia 1997a:313). To answer this question one would have to research, not only linguistics, but among others also: “sociolinguistics and ethnographic studies, psycholinguistics and cognitive psychology, communication research, studies of disciplinary culture, and insights from members of such specialist communities [...]” (Bhatia 1997a:313).

New Rhetoric

In contrast with the linguistic emphasis of ESP and SFL, rhetoric underscores “context, audience, demands of the occasion, and writing as a social activity” (Paltridge 2007:933). This shift in focus comes from North American composition classrooms that focus on product and form of writing. New rhetoric studies regard the **relationship between text and context** as important and argue that certain situations require genres to perform certain actions. New Rhetoric encourages research and analysis of the social contextual functions of genres instead of the formal textual features of genres (Hyon 1996:696, 703).

Genre is a reply to social circumstances that are elements of a socially constructed reality (compare Gergen 1985:266-275). “Genres, in this view, both respond [...] and contribute to the constitution of social contexts, as well as contribute to the socialization of individuals” (Paltridge 2007:934). Understanding genre, therefore, gives individuals access to community participation. Miller considers the use of genre as a “practical art” that allows us to achieve certain social goals (Miller 1984).

Genre theory’s relation and contribution to the present study emanates from its emphasis on communicative events and purposes and in acknowledging the cardinal role that social context plays in communication and the construction of meaning. In addition to identifying

the potential value of genre theory, a valuable connection is made through Bhatia's (2002:5) description of the goals of genre. Genre theory attempts:

- to represent and **account** for the seemingly **chaotic realities** of the world,
- to understand and account for the **private intentions of the author**, in addition to socially recognized communicative purposes,
- to understand **how language is used** in and shaped by the socio-critical environment, and
- to offer effective **solutions to pedagogical and other applied linguistic problems.**

Since communicative purpose is the primary characteristic of genre, the **analysis** of genre seeks to unravel obscurities about the text (artifact) (Bhatia 1997a:313). The methodological purpose of genre analysis is therefore similar to that of legal hermeneutics: “[t]he art or process of determining the intended meaning of a written document, such as a constitution [...]” (<http://legal-dictionary.thefreedictionary.com>). As applied by Swales (1990) and Bhatia (1993), genre analysis has integrated some of the contextual fundamentals necessary for a proper understanding of genre, though in a rather static way (Toledo 2005:1063). Swales, for example, composed the CARS (Create A Research Space) model for the analysis of genre. Through ‘moves’ and ‘steps’ a reader would begin the research process by identifying a text’s communicative purpose. Each move or step includes specific information needed to achieve this purpose (Toledo 2005:1063).

Synthesis of value principles

As a result of global migration **student bodies** are becoming increasingly **divers** (Read 2008:180). The diversity extends beyond nationality and disciplines; it includes diversity in linguistic, educational, and academic backgrounds (Bok 2006:18-19). For example, 15% of Melbourne Law School students come from: China, Singapore, and Malaysia (Larcombe & Malkin 2008:321). International students are not only attempting to comprehend course content, but they also have to come to terms with the “cultural and educational requirements of the dominant cultural literacy” (MacKinnon & Manathanga 2003:133).

The following tables summarize and explain the translation of interdisciplinary value principles to the EALP context. Cumulatively these principles attempt to show how the curriculum could resonate sensitivity toward its cross-cultural context.

Table 1: Legal value principles

Interdisciplinary foundation	Value principle	Translation of legal value principles to EALP
Natural law approach & constructive interpretation	Law as social practice	Similar to law, the curriculum is a social practice that should be improved through reinterpretation. The aim is not the curriculum as it is, but at it ought to be.
	Interpret a text not as it is but as it ought to be	
	Chain novel metaphor	Curriculum development should not stagnate, but develop <i>seriatim</i> . Similarly, pedagogical scaffolding could be used to impart structured knowledge and motivate gradual independent participation in the discourse community.
	Judge Hercules metaphor	Pedagogues and instructors should attempt holistic views of the curriculum, since the curriculum is part

		of a larger social discourse.
	Interpretation is not privileged	The curriculum is not the privileged domain of pedagogues and instructors, but should rely on the input of everyone involved in its pedagogical cycle.

Table 2: Linguistic value principles

Interdisciplinary foundation	Value principle	Translation of linguistic value principles to EALP
Systemic Functional Linguistics	Language is a system of linguistic choices	Similar to language the curriculum could be seen as a system of pedagogical choices with social purpose.
	Language is text with social purpose	
	Ideational function of language	Similar to language, the curriculum's ideational function enables it to conceptualize. The EALP curriculum should conceptualize its constituting parts through pedagogical choice-making.
	Interpersonal function of language	As language constructs interpersonal relationships, the EALP curriculum should bind the cross-cultural legal discourse community.
	Textual function of language	EALP teaching could produce coherent meaning through certain textual patterns, such as legal genres.

Table 3: Pedagogical value principles

Interdisciplinary foundation	Value principle	Translation of pedagogical value principles to EALP
English for Specific Purposes	Formal characteristics of genre	As ESP accentuates the formal characteristics of genre, the EALP curriculum should exhibit a level of formalism that reifies its goals and expectations, without being too flexible to appear <i>laissez faire</i> or too rigid to appear dictatorial.
	Communicative purpose and interdiscursivity of genres	Through its communicative purpose the curriculum should establish interdiscursivity between theory and practice.
New Rhetoric	Relationship between text and context	The EALP curriculum should establish an interdiscursive relationship between itself as text and the diverse contexts within which it functions.
	Genre is socially constructed	Similarly, the curriculum is socially constructed and should therefore reflect the cross-cultural dimensions of the international classroom.

Conclusion

In the light of postmodern pedagogy certain dilemmas seem unavoidable. Postmodern pedagogy could challenge genre theory as being incredulous metanarratives that favor certain genres above others. Similarly, EALP courses seem to favor the content of the American and British legal systems, which marginalizes legal content from the host country where the EALP course is presented. Consequently, existing metanarratives are proliferated. How is this situation reconcilable with Kilgore's (2004) postmodern supposition that existing social positions are challenged and that knowledge is constructed collectively, when it seems that certain knowledge (or EALP curricula) is (are) favored? Or, are some pedagogical

perspectives, in an Orwell metaphor, more “pedagogical” than others?

The curriculum is situated in a position of perpetual flux characterized by concepts such as: social historical endeavor, multidirectionality, interdiscursivity, constructive interpretation, and contextualization. In this regard Dworkin’s chain novel metaphor provides valuable direction. The chain novel is constructed through a series of socially and historically situated interpretations. Similarly, EALP curriculum development could be seen as a pedagogical chain novel constructed into being through socially situated cross-cultural interactions.

The translation of interdisciplinary value principles to the cross-cultural EALP setting attempts to find the illusive and delicate balance between a dynamic evolving curriculum and the stability that existing metanarratives provide; it attempts to find the balance between academic requirements and professional needs, and between collective social contexts and individual circumstances.

The Integration of Project-Based Learning and Japanese for Tourism in Thailand: A Case Study of Phetchaburi Rajabhat University

**Kamolthip Phonlabutra, Phd.
Phetchaburi Rajabhat University, Thailand**

Abstract

Japanese tourism ranks at the top of the list of income for the tourist industry in Thailand. Communication competence in the language of tourists is needed to service this group of people. Educational institutions and government organizations relating to the tourism industry should attempt to develop a human resource that can service this specific group of tourists completely.

This paper explores the opportunities for developing a curriculum of “Japanese for Tourism” for Tourism-majored students of Phetchaburi Rajabhat University, one famous tourist destination among others located in Phetchaburi. Major theoretical frameworks for the study include language for specific purpose and project-based learning. Findings illustrate the benefits and challenges of learners’ experiences in conducting projects regarding tourist attractions and services recommended for Japanese tourists obtained from the Tourism Authority of Thailand’s website. Also suggested are Proposals for curriculum development based on the findings and framework.

Keywords: Communicative competence, Japanese for Tourism, Language for specific purpose, Project-based learning

Introduction

Project-based learning (PBL) is an approach used to foster the student-centered learning principle and was initially introduced into English as a second language (ESL) education (Hedge, 1993). PBL is one of the means for promoting language and content learning in a foreign language. It requires a fundamental shift in the roles of teachers and students from traditional education. Research has shown that PBL is effective in motivation enhancement and supporting students to gain deeper understandings of content knowledge (Barron, 1998; Stites, 1998). These features of PBL reflect in the approach of teaching language for specific purpose (LSP) as well. LSP also emphasizes language and content learning in specific discipline. It aims to respond to students’ learning needs and their interest in specific areas.

Research in LSP and PBL has indicated positive outcome for language and context learning. However, most of the existing studies in second/foreign language education have been conducted in the ESL/EFL context. Furthermore, studies that integrate project work in language for specific purpose course are still very limited. The purpose of this study is to explore opportunities to develop the curriculum of Japanese for specific purpose, especially how to integrate PBL in the course. To accomplish this, the paper begins with an overview of the principles of language for specific purpose and project-based learning. These sections are followed by a discussion of the research result on the benefits and challenges of integrating project work in Japanese for tourism. The paper concludes with a proposal for the curriculum development.

Theoretical framework and previous studies of Language for specific purpose

Language for Specific Purpose (LSP) has focused on the teaching of languages for specific purposes (Dudley-Evans & St John, 1998). As English has become the international language of technology and commerce, the teaching of English for Specific Purpose (ESP) is dominant compared to that of other languages such as French, German, and Japanese. Hutchinson & Waters (1987) pointed out the new aspect of linguistic studies which shifted the rules of language usage to language use in real communication also significantly influences ESP. An important finding of the study shows that language varies greatly from one context to another, for example, spoken language and written language, and the language of commerce and language of sciences. This gave rise to the view that the language needed by a particular group of language learners could be identified by analyzing the linguistic characteristics of their specialist area (Hutchinson & Waters, 1987).

In addition to the important role of English as an international language and the revolution in linguistics study, developments in educational psychology focusing on the learners' attitude to learning also justifies the wide spread of ESP. It has been widely accepted that learners' needs and interests influence motivation to learn and the effectiveness of their learning. Developing courses relevant to learners' needs and interests are believed to improve learners' motivation, which contributes to learning process and outcome. The development can be achieved by taking texts from learners' specialist area such as texts about business for Business students, texts about tourism for Tourism students etc.

There are several definitions of ESP. Though there are some similarities and differences in the view of ESP, most studies agree on the aspect of specific needs of learners. Hutchinson & Waters (1987) saw ESP as an approach rather than a product. Analyzing linguistic characteristic and describing what people do with language do not necessary enable someone to learn a language. They proposed a learning-centered approach emphasizing an understanding of the process of language learning as a valid approach to ESP. Also, they maintained that ESP is not a particular kind of language, teaching material or methodology. They believed that the foundation of all ESP is the simple question: Why does this learner need to learn a foreign language? They suggested that to answer the question, three factors need to be taken into consideration; which are the learners, the language required, and the learning context.

Stevens (1988) made a distinction between four characteristics and two variable characteristics for the definition of ESP.

The absolute characteristics of ESP are:

1. Designed to meet specified needs of learners
2. Related in content to particular disciplines, occupations, and activities
3. Centered on language appropriate to those activities in syntax, lexis, discourse, semantics and analysis of the discourse
4. In contrast with 'General English' the variable characteristics of ESP:
 - 1) may be restricted to certain learning skills to be learned (for example reading only)
 - 2) may not be taught according to pre-ordained methodology

Dudley-Evans & St John's (1998) definition of ESP is different from Hutchinson & Waters' definition regarding ESP methodology. Dudley-Evans & St John argued that ESP teaching, specifically linked to a particular profession or discipline adopts a methodology different from the one used in General English.

By methodology, Dudley-Evans & St John emphasized the nature of interaction between the ESP teacher and the learners. They have made a distinction between the interactions as 'teacher' in General English class and the interaction as 'language consultant' in ESP class.

In contrast to Strevens' definition regarding the second characteristic of ESP, Dudley-Evans & St John believe that ESP teaching does not have to be related to subject content but should always reflect the underlying concepts and activities of the broad discipline. In conclusion, Dudley-Evans & St John provide the following absolute and variable characteristics of ESP definition.

1. Absolute characteristics

- 1) ESP is designed to meet the specific needs of learners.
- 2) ESP makes use of its underlying methodology and the activities of the disciplines it serves.
- 3) ESP is centered on the language (grammar, lexis, and register), skills, discourse and genres appropriate to these activities.

2. Variable characteristics:

- 1) ESP may be related to or designed for specific disciplines.
- 2) ESP may use, in specific teaching situations, a different methodology from that of general English.
- 3) ESP is designed for adult learners, either at a tertiary level institution or in a professional work situation.
- 4) ESP is generally designed for intermediate or advanced students. Most ESP courses assume basic knowledge of the language system, but can be used with beginners.

Each definition has validity but Dudley-Evans & St John's definition seems to be the most comprehensive. To meet specific needs of language learners, it is necessary to understand the process of language learning. Therefore, this study has adopted Dudley-Evans & St John's definition and Hutchinson & Waters' learning-centered approach for exploring Japanese for a specific purpose.

The most characteristic feature of ESP is needs analysis, which contributes to the course design. The pioneer and widely known work on needs analysis is John Munby's *Communicative Syllabus Design* (1978). Munby created a detailed set of procedures for identifying target situation needs (what the learner needs to do in the target situation) which is called Communication Needs Processor (CNP).

Hutchinson & Waters made distinction between target needs (what the learner needs to do in the target situation) and learning needs (what the learner needs to do in order to learn). They argued that Munby's target situation needs analysis is language-centered approach emphasizing a list of the linguistic features of the target situation but does not involve several aspects of language learning such as knowledge, skills, strategies, motivation, and the conditions of the learning situation.

Dudley-Evans & St John agreed with Hutchinson & Waters that Munby's CPN lacks an affective factor of language learning. They provided the following current concept of needs analysis;

- 1) target situation analysis and objective analysis: the tasks and activities learners will be using language for.
- 2) subjective needs: previous learning experience, cultural information, reason for attending the course and their expectations of it, attitude to the language learning.
- 3) present situation analysis: information about the learners' current skills and language use.
- 4) the learners usage needs: the gap between (3) and (1)
- 5) learning needs: effective ways of learning the skills and language.
- 6) linguistic analysis, discourse analysis, genre analysis: knowledge of how language and skills are used in the target situation.
- 7) what is expected from the course.
- 8) means analysis: information about the environment in which the course will be utilized.

Developing course design is a dynamic process (Hutchinson & Waters, 1987). As shown above, many factors and a variety of situations are involved in course design. However, as Swales (1989) put it, course design should be about *what* and *why*. Dudley-Evans & St John suggested that course design should not have to start from scratch. As with needs analysis, it could be learned from what has already been done. According to the authors developing a course outline includes two major stages:

- 1) beginning with target events and rhetorical awareness.
- 2) breaking target events and rhetorical awareness into skill areas.

Making decisions on target events and rhetorical awareness needs criteria to order. One criteria is when the target events are needed by the learners. Another criteria of language learning or using of skills is dependent on others, which needs linguistic building blocks for the support. Despite the need, there are not enough linguistic findings about language learning to help order all features of language according to its simplicity or difficulty. Dudley-Evans & St John also mention that any language course is not just about linguistic realizations and skills. It also concerns materials, content topics, learning processes and classroom interactions.

Project-based learning (PBL)

Beckett (2006) gave an extensive overview of project-based learning (PBL) in second and foreign language education by citing Hedge's (1993) work that PBL was introduced into the field of second language education about 17 years ago. This introduction aims at emphasizing the principles of student-centered teaching, PBL is not new. Many PBL researchers agree that its original concept concerning experiential learning, collaborative learning or problem solving originates from Dewey's work.

According to Beckett, PBL in second language and foreign language refer to 2 levels of language learning. The first level (a general level) is a language education approach that reflects student-centered learning within the framework of experiential learning. The second level (a specific level) has been described as an approach that support

comprehensible input, comprehensible output, and an approach with emphasis on teaching language and content.

Stoller (2006) noted that PBL conjures up other images as well. PBL can be referred to in-class group work, out-of-class activities cooperative learning or task-based instruction. For some researchers, PBL is confined to a single lesson, but most projects are done in week, semester, or even a full academic year. Most projects are content-driven. Some projects focus on real-world issues, while others emphasize an understanding of the target language culture.

The way PBL has been translated into practice varies depending on the diversities of different instructional settings such as student populations, instructional objectives, institutional constraints, and available resources. Because of the versatility of PBL, it is difficult to describe one single definition. Thus, Stoller offered conditions for effective PBL including:

- 1) having both a process and product orientation.
- 2) encouraging student ownership in the project.
- 3) extending over a period of time.
- 4) promoting the natural integration of skills.
- 5) emphasizing language and content learning.
- 6) requiring students to work in both groups and on their own.
- 7) obliging students to gather, process, and report information from target language resources.
- 8) requiring teachers and students to take new roles and responsibilities.
- 9) leading to a final tangible product.
- 10) ending with student reflections on both the process and the product.

The lack of empirical research on project-based second and foreign language education has been recognized by several researchers (Beckett, 2005; Guo, 2006) Most of the studies focus on EFL/ESL teaching and learning (Guo, 2006) Moreover, the available literature represents an anecdotal report (Guo, 2006; Stoller, 2006) PBL in different types of EFL/ESL programs have been used at different academic levels; elementary to university level (Doherty & Eyring, 2006)

Accepting that a few empirical studies have been conducted to evaluate the effects of project work on language learning, Stoller pointed out that numerous studies provide support for positive outcomes of project work. The positive outcomes include motivation and learner autonomy, motivation and self-confidence, motivation and interest, motivation and cooperative learning, development of expertise, meaningful input and output, and learner centeredness.

Because of paucity of empirical studies on project work, it is uncertain if motivation and associated outcomes arise from engaging in project work, or if motivation leads to active participation in project work. However, Stoller believed that the combination of the two aspects is likely to be influential in project-based learning.

Project-based learning reflects the conditions necessary for learner autonomy such as real choices, leadership role, and sense of control over one's own learning. In addition, project work allowing learner autonomy in negotiating theme, tangible outcomes, process, and individual roles are believed to increase sense of success which leads to

motivation enhancement. Also, self-confidence emerges when individuals perform tasks competently and accomplish their established goals.

Considerable research shows that motivated students who develop interest in curriculum goals and activities are willing to work hard on challenging materials. Project-based learning is perceived as good conditions for improved motivation and interest. Cooperative learning which is one of the most prominent features of project work leads to higher motivation and a more positive attitude toward learning.

The nature of project work that assists a student in applying, developing, and extending subject knowledge results in a growing expertise. Meaningful language input and output from learning a language in context and purposeful use of a language while engaging in project works is believed by many language professionals as important support for language development. The potential of project-based learning diminishes the gap between traditional classrooms and learner-centered that one might contribute to the reported success of project work.

Previous studies

Beckett (2006) pointed out that recent literature in second language studies has started to include goals other than the second language acquisition. The goals are such as promoting learner autonomy and independence, encouraging collaborative learning, creativity, and responsibility, nurturing critical thinking skills, academic discourse socialization, and content-based language teaching. Beckett explored teachers' goals for project-based instruction for immigrant ESL students in a secondary school in Canada. By taking the language socialization approach, the study found that there are several goals. They are fostering lifelong learning by the language socialization of ESL students into Canadian school and social cultures, challenging students' creativity, promoting independence, teaching decision-making, critical thinking, and cooperative learning skills, and teaching how to learn.

Guo (2006) examined project-based learning of EFL in China. According to Guo, several studies that include project works in English class have reported positive outcome such as enhanced motivation and more autonomy in learning of Chinese EFL students. Guo explored Chinese professors' perspectives on PBL of EFL learning. He found that despite the professors' recognition of benefits of PBL in EFL class, they raised some concerns as well. The concerns are that PBL challenges the traditional view of learning based on Chinese culture, the nationwide mandatory examination system, professional development, limited resource and big class size.

Project-based learning in less commonly taught languages is very rare. Sidman-Taveau, Rebekah, Milner-Bolotin, and Marina (2001) initiated PBL in Spanish at a large southwestern U.S. university. The research team used web-based Spanish language lessons to engage students in virtual cultural experiences and require them to take a virtual vacation on the World Wide Web. The project emphasized the exposure to authentic linguistic and cultural material, learning processes, and the students' linguistic output. The study illustrated that the PBL in Spanish lessons result in the students' creative work, application of linguistic knowledge into practice, positive attitudes towards the target culture, appreciation of the challenge to produce complex sentences which was beyond what was taught in the textbook. However, facilitator role and formative assessment are found to be issues.

Agreeing with Sidman-Taveau and Milner-Bolotin (2004)'s claim that a highly meaningful context is necessary for project-based foreign language learning, Mills (2009) integrated a virtual travel through francophone Europe in French curriculum. The project required French learners to play the roles of investigators traveling to different destinations and to report on their experiences in a travel diary, which finally resulted in a contribution to a French travel guidebook. The influence of the project was evaluated for how it affected the students' self-efficacy in the five goal areas of the Standards for Foreign Language Learning. The study indicated that there was significant improvement in students' self-efficacy in the areas of communication, cultures, connections, comparisons, and communities after learning experience with the project.

Project-based learning in Japanese for Tourism

Method

Research context

Phetchaburi Rajabhat University located in the western part of Thailand, Phetchaburi province. The university is among 43 Rajabhat universities around the country that provide a bachelors degree in tourism. All local 43 Rajabhat universities provide a tourism degree in order to respond to national strategies in promoting the tourism industry in every corner of the country, especially the province with international tourist attractions.

As the tourism industry flourishes in Phetchaburi, the local university provides a bachelor degree in tourism in order to develop personnel for the tourism industry. According to the tourism curriculum, tourism-majored students are required to take 6 courses in a second foreign language, either Chinese or Japanese. For most students, learning the second foreign language is their first experience, especially Japanese, as K-12 education in the province does not have a Japanese class. In addition, there is not a Japanese community in town, the opportunity to practice Japanese in the community is non-existent.

Considering the linguistic aspect, Thai and Japanese are different typology, which makes Japanese a difficult language for most Thai students. Moreover, taking 4 basic courses in Japanese seems to be insufficient for learning Japanese for Tourism 1 and 2, as Japanese for tourism includes a great deal of specialized vocabularies and expressions, especially honorific forms. Moreover, most textbooks in Japanese for tourism are written for Japanese majored students with an intermediate to high intermediate proficiency level, the beginning level students often find it difficult to learn Japanese for tourism.

The participants

The participants were Tourism-majored students of Phetchaburi Rajabhat University in Thailand. They were the third year students taking the last course in Japanese. The students had already taken 5 courses in Japanese, which was approximately 300 hours. Despite the fact that the number of learning hour could be considered as novice-high

level, lacking opportunity to use Japanese in communicative and authentic context resulted in low proficiency of Japanese.

Data collection and analysis

The project was designed as a part of a Japanese course “Japanese for tourism”. The main purpose was to increase the students’ motivation in learning Japanese and to experience from fieldwork about Japanese tourists for their future career. The students were teamed up in a group of 4 and explored Japanese tourist behavior at several tourist attractions and tourist service providers. The attractions and the service were surveyed from TAT’s website. As the website aimed to introduce Phetchaburi to Japanese tourists, the authentic nature of language and material were meaningful for the project work. The attractions and the service recommended to Japanese tourists included 1) historical spot; 2) natural spot; 3) hotel & Spa, 4) golf course. The analysis method for the study is content analysis. The data used for the analysis was the website, the students’ survey report, the students’ presentation, and relevant material.

Findings

Experience in the field

Learning by exploring the tourist attractions and services suggested to Japanese tourists by TAT resulted in the students’ insights about the attractions and service. Their findings were beyond Japanese lessons in the classroom. The students found the advertisement to attract Japanese tourists to historical places such as the three famous palaces and several temples in Phetchaburi might not be as effective as they expected. According to their interviews with official staff at the attractions and their own observations, very few Japanese tourists visited these places. The students offered suggestions for the small number of Japanese tourists; these historical spots may not be known to Japanese tourists or match their interest level. Other groups of students exploring natural spots such as beaches, mountains, and national parks in Phetchaburi found that Japanese tourists seemed to have interest in these spots but still in smaller numbers compared to other foreign tourists. However, tourism products that attracted Japanese tourists most are golf and spa. Therefore, hotels and resorts that provide golf course and spa service probably serve Japanese tourists far greater than natural tourist attractions.

Growing expertise (Japanese tourist behavior)

One concern for teachers of language for specific purpose is that most language teachers are not expert in context (which they do not need to be) so. As ESP professionals suggested, the teachers’ role is language consultant and facilitator for this kind of course. This study found that the students grew their expertise in their field from their project work. They understood Japanese tourists’ behavior much more than just learning Japanese in class. Some of their findings were supported by research in Tourism, but some were unique, probably due to the context and changing style of next generation Japanese. For example, the students found that the tourists prefer to travel in a group tour exclusively with Japanese, or travel with families and friends. Independent tourists are very rare. The students noticed that independent tourists from other foreign countries are far greater than the tourists from Japan. Students learned from Japanese tourists that being polite, being strict to time,

concerning with cleanliness and safety, and being discipline-oriented are very important. A unique finding is that Japanese tourists shopping souvenirs around beaches often negotiate product price with the sellers.

Motivation

As pointed out by several PBL studies the nature of project work that allows autonomy in learning, collaboration, problem-solving skill, real life and purposeful learning in meaningful context increases motivation. This is even truer when project work relates to discipline specific as supported by ESP and PBL professionals. The followings were students' reflection on how the project motivated their learning:

“The project is meaningful learning. It makes Japanese class more interesting”.

“It is a good combination between (Japanese) language and (tourism) content”.

“Learning from future work place is useful for our future career. Interviewing hotel managers and hotel staff is a good chance for showing our potential ”

“I like the challenging aspect of the project that we have to do independent study. It enhances our knowledge and skill. It provides more than what taught in a textbook. It promotes learning experience from the outside world”

Awareness of the needs

Learning from real context by involvement in the project, the students began to realize what should be top priority to promote tourism in this province to Japanese tourists. One group pointed out an interesting idea, the lacking of efficient public transportation in the province makes it difficult for independent Japanese tourists access to the attractions. Most tourist attractions in the province have no language support for Japanese tourists such as a brochure or instructions in Japanese. Most important is that many tourist attractions and service providers do not have a person who can communicate in Japanese. The students suggested having a Japanese brochure and instruction for Japanese tourists at all attractions. More importantly, Japanese language training should be provided to hotel staff and golf caddies that have direct contact with Japanese tourists.

Challenges

As mentioned above, the students' Japanese proficiency was beginning level, it was inevitable that a mismatch between the authentic material from the website introduced in the project and the students' ability to comprehend the material occurred. The authentic material reflects tourism language with its own rhetorical style. The teacher needs to provide information in Thai; otherwise incomprehensible material can demotivate the learning. However, recent studies in second language learning also provide evidence that second language learners can benefit from using their first language (Debski, 2006).

As the project work was a student-centered approach that needs to adapt to student level and motivation, requiring the students to present final product in Japanese in this class was significant pressure on the students. Thus, except the material provided by the teacher, there was little opportunity to expose the students to comprehensible input and output with the project work.

The context of learning Japanese as a foreign language in Phetchaburi is very challenging to encourage the students to use target language outside of the classroom as there is no speech community in the province. The fact that the tourist attractions, significant information providers, and the tourism product providers in Phetchaburi lack language support for Japanese does not promote learning Japanese for tourism.

Proposals for curriculum development

Considering needs analysis for curriculum development as suggested by Dudley-Evans & St John and findings from the students' project-based learning, the followings need to be taken into consideration for developing Japanese for Tourism for the students at Phetchaburi Rajabhat University.

- 1) Adding target situation in providing services of golf and spa into the course which usually includes only hotel services, food and beverage services, and shopping.
- 2) Inviting professionals who provide services of golf and spa to Japanese tourists to share their experience about the target events for task analysis for the curriculum development.
- 3) Analyzing linguistic features, discourse and genre from authentic material relating to golf and spa service. The examination of sentence patterns and lexis, and the gathering of linguistic information such as specialized vocabulary, phrases, and expressions relevant to target situations will support course design and lesson plan.
- 4) Providing support for learning needs such as study skills necessary for understanding unknown linguistic structure and vocabularies, for example, how to use various kinds of Japanese dictionary, and computer function that help read difficult Chinese characters in authentic material.
- 5) Integrating PBL in the curriculum with special designed language activities to promote comprehensible input and output relevant to the target situation.

Conclusion

The purpose of this study is to explore opportunities for developing a curriculum of "Japanese for Tourism" for Tourism-majored students of Phetchaburi Rajabhat University. While the findings of this study were limited by linguistic resource in the tourist attractions and service providers in the area, and the case study design, the following two conclusions can be drawn: (1) The integration of project work in Japanese for tourism promote experiential learning, expertise knowledge in tourism discipline, enhanced motivation, and awareness of the needs for linguistic support for Japanese tourists. (2) Students' learning needs and the learning context may affect the use of authentic material and comprehensible output, which is important for language development.

REFLECTIONS ON THE ENHANCEMENT OF THE LEARNING EXPERIENCE THROUGH VARIATION OF THE MEDIUM USED IN THE TEACHING OF LEATHER-WORKING TECHNIQUES

Perihan TUNÇ*

SUMMARY

At the Selçuk University Faculty of Vocational Education Department of Handicraft Teaching, major courses on leather working instruction have been taught in the 3rd year. In the 5th semester, in the design and production of leather clothing accessories course, the basic leather working techniques have been taught, modeled and produced by the students.

This study is a qualitative research to determine teacher trainees' opinions about the Composition Practice Method used in teaching leather-working basic techniques learning.

Third-year students at Selçuk University Faculty of Vocational Education Handicraft Teaching Department who have been exposed to the Composition Practice Method of teaching the basic leather-working techniques form the population of this study. Here, the aim is the follow-up of the process. The researcher attended the course and 15 students were randomly selected from among 60 teacher trainees which formed the sample of the groups.

Students share close and common opinions about the teaching of 'Basic Leather-working Techniques' and the assessment used in Composition Practice Method. They expressed that the techniques enhanced learning with permanence, motivated them to think for themselves, and helped them be creative. They stated both their positive and negative points of view about the method.

Students are aware of the improvement of cognitive, emotional, and psychomotor behaviors throughout this process. As their coordination and operating speed were increased, their ideas broadened, their enjoyment was enhanced, and their attention to color harmony increased.

Based on the responses collected, the researcher is convinced that using the Composition Practice Method brings added success to the teaching of basic leather working techniques.

Keywords; vocational education, leather working, leather-working basic techniques learning, Composition Practice Method, leather,

INTRODUCTION

At the Selçuk University Faculty of Vocational Education Department of Handicraft Teaching, major courses on leather working instruction have been taught in the 3rd year. In the 5th semester, in the design and production of leather clothing accessories course, the basic leather working techniques have been taught, modeled and produced by the students.

For basic leather-working techniques to be learned permanently, knowledge of the field, skills, and habits are essential. Students must: learn accurately (cognitive side), and believe both in the necessity and importance of the acquired knowledge (emotional side), then they must apply these at a level of expertise (psychomotor side). Teacher trainees must both learn the basic techniques themselves and be able to use the techniques to teach others. In class they prepare flashcards, which they then use in their own instruction.

Education is not just a time of preparation for students, it is life itself. For this reason, it should not be thought of as separate from life. The educational environment is not to be something broken away from real life and times, it is to be real, meaningful and significant disciplines (Şahin & Yıldırım). Actually, the educational environments should be areas in which one desires to live with the process

Visual aids are primary and essential in acquiring psychomotor functions. It is unlikely that a student will be able to perform a function he has not seen. In other words, the visual aids and course tools used are important elements in instruction. Nowadays, when even a simple product demands research and development, of course, we cannot train people without transferring time, energy and financial resources. Increasing technology, the use of knowledge, globalization, the Internet and mass media affect the whole learning process. Today's students come to class having already encountered various stimulants. For this reason, consideration and improvement of the quality of course tools presented to students is necessary in both vocational education and art education. In giving shape and meaning to life, an individual must be able to think with values and distinguish quality. Only those who can perceive in this way can be viewed as aesthetic. With this perspective, one can refrain from making superficial judgments and judgments based only on his own tastes. The most important characteristic of course tools is their appropriateness to the curriculum. With the help of these tools, students should be allowed to practice and improve their skills. In addition, the tools must be realistic, durable, and current. They should activate students' attention and ensure that they will produce an emotional reaction. These characteristics enable students to concretize concepts and catch some elements which could have been missed via visual materials (Demirel, 2001).

***Lecturer and doctorate student at Selcuk University, Turkey. ptunc@selcuk.edu.tr**

Supporting elements that make materials attractive are crucial. The approach of drawing attention (surprise), serves the purpose of keeping student's attention active. Thus, it is essential to introduce different stimulants. When the environment gets monotonous, breaks in learning begin and may continue.

When it comes to formation of figures, shape is most important. Materials must be familiar in order for students to internalize them with the highest level of attention and the least effort. The color scheme and its attraction are desirable characteristics (Demirel, 2001).

The basic leather working techniques are: cutting, shaving, adding, hardening, hemming, combining, smocking, decorating, and lining. However, as several methods are used in each technique, all these techniques require approximately 52 different applications (Gökçesu, 2002). Through the traditional method, the student displays the basic techniques on little squares or rectangular pieces, then glues them to a cardboard of A4 dimension and keeps them to use as course tools (or flashcards) when they are teaching their own classes. Later, they improve the techniques they have learned by making products such as jewelry, wallets, belts and handbags.

In general, this traditional method of teaching leather-working techniques has been the most common for many years. This is the method by which this researcher was taught, and observation and experience has shown that all other teachers and students used this traditional method. In this method, the student has the opportunity to use and reinforce the learned techniques with products in a short period of time.

Apart from this positive aspect, various negative aspects were observed. Students do not assimilate the learned techniques, but imitate their classmates, or practice in haste, or do not take the application seriously. It was observed that one student would practice a technique on a rather large piece, and then cut it up and distribute it to other students. Practical techniques which the student does not spend much time thinking about causes habitual insufficiency in transfer of the learned technique. Even though the student uses some techniques to produce an artwork, he cannot use other techniques at all.

Teacher trainees from the vocational education faculty need to learn these techniques thoroughly and accurately, not only for themselves but also for the quality of education of future students. When teacher trainees are ignored, not given adequate importance, or do not enjoy what they are doing, but just go through the mechanics of it; their high school students will also not be interested and these samples will not be closely observed and studied. For this reason, it could be said that simply made course tools may not be enjoyable or appreciated. While operating within the traditional method, the student is not interested in his classmates' projects, the course tools prepared, or artistic concepts such as composition, color, size, and proportion. The techniques are prepared quickly or borrowed from others. Although teacher trainees know what they should use as course tools, they do not seek to make anything original. After the techniques have been achieved, when they are asked about them, they confuse many of them, and do not remember some of them at all.

In order for these techniques to be learned well, the student must feel the need to produce something, but they do not use all the techniques on one product. In the process of learning these techniques, the student begins working on a product and he may struggle and remain deficient. Because the techniques are not improved, serious errors can result.

New teaching trends are needed to make learning permanent, pleasant, and delightful, and to get course tools to obtain the qualities desired. When learning becomes effective and permanent, individuals will use their creativity, profit from their personal learning strategies, experience the advantages of productive and fast learning, provide real learning experiences, and play an active role in the process of life-long learning (İşman, 2005).

During the process of learning basic leather techniques through the Composition Practice Method, the teacher trainees will improve their knowledge and skills in the areas of size, proportion, balance, harmony, color harmony, composition and design. For this purpose, observing one another's work with interest, attempting individual learning and a competitive environment will cause the need for a production strategy and a need for the product itself to be felt.

The method used by this researcher is expected to increase creativity, workmanship quality, the ability to observe acquired skills overtly, and also students' taking responsibility to punctually finish a product of desired quality, reflecting affective and psychomotor target behaviors. The course tools that are prepared by teacher trainees must be contemporary, colorful, and pleasant ... in addition to being instructional. With this in mind, each technique was required to be applied by illustrating it on creations, in order to form a meaningful composition.

The Goal of This Study

The **Composition Practice Method** is used by this researcher to teach leather-working techniques. The main goal of this study is to ensure permanent, full and accurate learning by making the learning delightful and pleasant. It ensures obtaining students' maximum participation and activating students' inner dynamics with efficient and fruitful application of vocational and art education techniques. Gathering the opinions of teacher trainees regarding the effectiveness of this method was the aim of the study. Teacher trainees were asked to respond to the following:

- 1) Evaluate the positive and negative aspects of the Composition Practice Method during the flashcard preparation process.
- 2) Which skills do you think you improved in using the Composition Practice Method?
- 3) Flashcards that you prepared were evaluated every week with feedback. What do you think about such a feedback?
- 4) How has the course gone from the beginning of this semester? What are your feelings about the process?
- 5) Do you think you learned all the techniques thoroughly and accurately? Do you remember all of them now?

- 6) What are your thoughts about the quality of your folder?
- 7) Explain how the techniques could be taught better.

METHOD

This study is a qualitative research to determine the trainees' opinions about the Composition Practice Method used in teaching leather-working basic techniques learning. This qualitative study of compositions is relevant to activity research.

Activity research includes the works of a practitioner by themselves or with the assistance of a researcher towards understanding and solving problems that appear during the application process. The proximity of the researcher to the data and his knowledge and experience are important. Activity research projects deal with collecting data about the problem focused on and working in its own environment through a specific time period (Yıldırım and Şimşek, 2006, p.78).

Experimental Group

Third-year students at Selçuk University Faculty of Vocational Education Handicraft Teaching Department who have been exposed to the Composition Practice Method of teaching the basic leather-working techniques form the population of this study. Here, the aim is the follow-up of the process. The researcher attended the course and 15 students were randomly selected from among 60 teacher trainees which formed the sample of the groups.

Data Collection

In the process of this study, it was felt that more than one data collection tool was required in order to get valid and reliable results in terms of the adequacy of the method used.

Observation records: In keeping with the purpose of the study, teacher trainees' techniques were observed during the learning process. Through the period of the courses attitudes and behaviors of teacher trainees such as listening to and following the course, practicing accurate techniques, and doing homework on time were all observed. It was announced that in each weekly class the flashcards would be critiqued, and evaluated.

Interview:

A semi-structured interview was conducted with two students who had both attended the same class at a vocational handicraft higher education institution, and then were able to pass the exam to enter the undergraduate program. They both completed their flashcard projects despite the fact that they had been exempted from this course. The interviews were recorded with an audio recorder.

Survey:

A survey including seven open-ended questions was given to the 60 teacher trainees. The answers are analyzed in Results and Interpretation. The questions were relevant to the goal of the study and expert opinions were collected.

Student Project Folder

The projects prepared every week by the teacher trainees were stamped to indicate their usage, and students were asked to compile a folder. Sample pictures were taken from this folder and are included in the appendices.

Data Analysis

The data was processed according to descriptive analysis. The descriptive analysis is organized and interpreted for presentation to the reader. The interpretation, the explanation, and study of the cause/effect relationships are essentials to reaching a conclusion (Yıldırım & Şimşek, 2006). The observations are the researcher's own observations. These observations are interpreted in Results and Interpretation. The recorded interviews were put into writing. Some characteristic comments are listed according to the data received from the survey. In addition, qualitative data are frequently mentioned.

RESULTS AND INTERPRETATION**Results based on observation**

This data was collected during four-hour classes over a ten-week period. Every class hour is 45 minutes. This research was carried out on three different groups composed of 18 individuals. In the beginning of the semester, teacher trainees were told that Composition Practice would be used in learning the basic leather-working techniques.

The aims of the method were clarified as ensuring permanent learning, being an interesting and enjoyable process, and enhancing the quality of the course tools to be prepared. Also, it was explained that their skills would improve with much practice.

With the purpose of motivating students, a showcase was prepared to exhibit flashcards. From time to time the students were asked what they thought about the flashcards. The researcher tried to present several samples of each technique to get a varied perspective of evaluation. General, technical and helpful information was given about the techniques. Each technique was separately demonstrated by the researcher/course instructor.

Teacher trainees were asked to select the composition that best integrated and clarified each technique, and to illustrate this by demonstration. In every lesson an average of five techniques were demonstrated. Techniques used alone or integrated with other techniques were pointed out and then listed on the board. Students were requested to study five samples for each technique.

The students were told to begin a composition in class and to ask about things they had trouble with while their work was observed. The next lesson, after the project was explained, the teacher trainees were called up one by one. Their projects were criticized--positive and negative aspects were mentioned. Each sample was stamped in order to prevent students' re-using projects. Many suggestions were given for improvement. The students were told what grade they received on their project. This application lasted 10 weeks.

In the first weeks, students often asked whether their composition was appropriate to the technique. In later weeks, they were much more confident.

At the outset of the course they were bringing simple composition samples, but in time they started to bring many resources to find the ultimate composition. They produced a serious competitive environment.

In the first week the technique of cutting was explained, demonstrated and practiced. After seeing some flashcards, the students were requested to apply the technique. Students asked questions and seemed anxious. The following week, the samples which students had completed were collected. Each was analyzed with positive and negative comments made.

The first projects were generally simple, and it was observed that the question of, "Is it acceptable?" was on their minds. As a typical example: the performance of one student was not up to standard, however, after having been told again what was expected and what was not acceptable, this same student produced one of the best compositions in the class.

Initially, the students' projects had many deficiencies in size, proportion, composition, arrangement, color, and material harmony. As time passed, the students became more careful and improved. The researcher was able to observe the atmosphere of competition which improved the quality of the projects and several experiences of art education: students were helping one another; exchanging materials, tools and compositions; critiquing or appraising each other artwork. A few weeks later, positive changes were seen in the students' work.

In addition to reports that working more carefully helped them improve, there were those who said that the preparation process was time consuming and tiring. They reported that they could not find leather in the desired color. Because a sizeable quantity of leather was necessitated, some students reported difficulty affording it. To deal with this problem some low-cost, or even free, leather was acquired from various shops and factories.

A conclusion can be drawn from these observations: although the advantages of this method outweigh the disadvantages, a negative aspect is the higher cost and increased time needed when compared with the traditional method. Beside this, only one student did very little work, and three students did not bring their work on time--but they completed it. According to the degree of difficulty of the techniques, sometimes one or two students from each group did not submit their work on the stated day, but completed it in the same week; others brought their work completed and on time.

Findings based on the survey

Seven open-ended questions were asked to the students/teacher trainees. These questions related to: the positive and negative aspects of the flashcard preparation process, their thoughts about which skills were developed through this method, their ideas about the evaluation, whether the learning was permanent or not, their feelings about the process, and their thoughts regarding the quality of course tools prepared, and their advice about how the techniques were taught.

1-Discuss positive and negative aspects of the Composition Practice Method during the process of preparing the flashcards.

Qualitative Data

The positive side is that our hand coordination improves as we work on the flashcard. We learn to be more objective in each composition. We definitely see an improvement every week. This is noticed by those around us. The negative side is that due to being busy with one style, time spent on other classes is reduced. **Sevcan**

The positive aspects are that techniques become more permanent. Help me not to forget. A wonderful folder remains in my possession. The negative side is the lack of time. I have difficulty finding a composition appropriate for the technique. **Merve**

Statements about positive aspects	Statements about negative aspects
<ul style="list-style-type: none"> - better comprehension of subject - sufficiently understood - helps me not to forget - separation into weeks helps to finish - helps me to think and to act upon my thoughts (2) - We learn where to do this technique - Good use of time - Encourages organization and carefulness - Easier to design a product - Positive for future stages of life - Important for the future - Leather is used without any waste - Being objective - Noticeable improvement - Improves taste - Improves coordination - enjoyable - Stays in my mind - Permanent - Wonderful folder 	<ul style="list-style-type: none"> - Less time for other activities (5) - Stressful preparing every week - difficulty in finding compositions (3) - too many techniques in some weeks - Unable to finish on time - Difficulty matching technique to composition - high cost - requires great effort - difficult finding colorful leather

<ul style="list-style-type: none"> - Excellent idea - Products are excellent - Enjoyable (2) - We learn well - Investigation is good - Meaningful - Beautiful - Related to real life - Encourage research - Reusable - Enable decision 	

Table no: 1 Positive and negative aspects of the Composition Practice Method.

The statements that students used to answer this question were listed. Repeated statements were indicated with numbers in parenthesis. In general, there are more positive statements about the method. These can be grouped as follows: permanent learning, contribution to improvement through various methods, and satisfaction with artwork produced. It was seen that the students' approach to how they benefited differed greatly. As they pointed out their improvements, being objective, design, decision making, thinking, applying what is thought, orientation to the research, and similar statements were used. Students find their work meaningful, enjoyable and beautiful. It can be said that there is a parallel between the purpose of this practice method and how the students benefitted.

Students explained that time consumption and difficulty are drawbacks. One student felt that working hard was negative. Yet, the starting point of vocational education is based on hard work. The researcher feels that this statement is not seen as a negative aspect of the method, but is the personal opinion of one who has not internalized vocational education. The difficulty in finding compositions was expressed as a negative aspect by three students.

The negative aspects seen are high cost—compared to costs of the traditional method—and having trouble finishing projects on time. Negative aspects are perceived that the cost is higher than traditional practice and bring out a problem to do on time. Doing homework completely and on time are important and basic necessary habits for teacher trainees. This is one of the habits that we are hoping to have students form during this process.

2-Which skills do you think you improved upon using the Composition Practice Method?

Qualitative Data

I can definitely use the leather in every application. I understand the subject better using the composition. I think I will use this method when I am teaching. **Ayşe K.**

I think my hand coordination has improved. I realized that the details contributed much to form a complete whole. **Ayşe G.**

Initially, I had difficulty finding compositions. Right now, if you ask me a technique, I can find the most appropriate composition from the design examples. I could even draw a composition if more time was given. My visual taste has really developed. I can make evaluations like: ‘This looks much better here’. **Merve**

Skills		
Use of leather in all applications	Learn techniques	Neat cutting
Better understanding (2)	Work with clarity	Use of imagination (2)
Coordination (7)	Importance of detail	Choice of model
Cognitive strength (2)	Apply the composition well	Produce original ideas
Broader thinking (2)	Visual taste	Think differently
Ability to be objective	Do homework on time	Gain skills that are permanent
Enjoyment	Do the best work	Products that coordinate with each other
Skill of clarifying	Get an idea about the appropriateness of the composition to the technique	Color and composition discrimination
Creativity (2)	Arrangement of composition	Skill of critiquing
Color harmony (6)		

Table No: 2 The acquired skills

Every student expressed himself with their own statements while responding to this question. Repeated statements were displayed by numbers in parenthesis. Students’ acquisition may be gathered into three main titles as: knowledge, skills, and habits.

Learning techniques, increased understanding, organizing the design, permanent knowledge, distinguishing color and design, complementation between products are all proof that there has been acquisition at the cognitive level.

Creativity, cognitive strengthening, wide thinking, objectivity, composition appropriateness, decision making, trying to make the best, developing the habit of completing homework on time, taking responsibility, working neatly, giving importance to details, development of visual taste, and using imagination are all related to acquisition at the emotional level. Improvement of coordination, neat cutting, and the ability to critique are related to acquisition at the psychomotor level.

It can be said that students’ knowledge, skill, and behavior have been changed positively.

3-Flashcards that you prepared every week, were critically assessed. What do you think about such an assessment?

Qualitative Data

I learn what my mistakes are. I work more carefully on the next flashcard. Neşe
I think it is right. Our instructor explains tricks of the trade that we could not see on our own,
 and helps us to notice and correct our mistakes. **Gülçin**

Positive Aspects	Negative Aspects
Totally accurate Discover something better Stop repeating mistakes (2) Enable to work carefully Helps to work differently Helps to work neatly Notice mistakes (3) Weekly assignments good- not stressful Self-improvement Relaxed in final exams Enable me to see my mistakes Learn what is right Getting ideas by seeing the best in the class Better learning Not making the same mistake See deficiencies Notice the lack of color harmony Knowledge about the correct use of the techniques Complete on time Learn the grades Not being stressed at the end of the term. Realize deficiencies (2) Wider range of view Self-evaluation Give more importance Not missing any details Enabled me to see my own improvement Work harder on my deficiencies	Hard to make deadlines Sometimes I get upset Stressful Lost interest

Table No: 3 Positive and negative aspects of the assessment method.

In this section, all the students considered the assessment positive. They can see how the assessment helps them improve. They respond positively to the criticisms made. They

understand that these criticisms are useful to see and correct their mistakes. It is essential to make them aware of their own mistakes.

It is obvious that they are making an effort to finish projects on time. One student found this kind of student assessment helpful and admitted that she may sometimes get upset. It is evident that one student is sometimes disappointed. Another student was influenced negatively by a criticism made regarding her classmate. As a result, the positive contributions of the assessment process to the learning process may be said to be greater.

4-How have the leather lessons gone since the beginning of the term? Write down your feelings about the term.

Qualitative Data

It was nice, but full. Some weeks I had a time crunch. Most importantly, I became more responsible. It enabled me to combine color, model, and technique integrity. I got upset many weeks, however, it encouraged me to do better. What seems excellent to me does not seem nice to others. **Mümine**

Process	
Positive aspects	Negative aspects
Nice (2) Enjoyable (4) Eagerness Fun (2) Productive Instructive Interesting Busy	Difficult Sometimes I got bored Tiring Rushed Intensive

Table No: 4 Positive and negative aspects of the process.

As they answered this question, teacher trainees, reported feeling the positive aspects of: nice, enjoyable, I became eager, fun, productive, instructive, and interesting. They reported feeling the negative aspects of: difficult, sometimes I got bored, tiring, and rushed. Whether the statement that the course seemed intensive is negative or positive can be debated. The statements ‘enjoyable and intensive’ were repeated four times. The statements ‘nice and fun’ were repeated also. According to these findings, the leather course was good and achieved its goal for students. However, it can not be ignored that the course was quite intensive.

5-Do you believe that you have learned all the techniques? Do you remember all of them?

Qualitative Data

Yes, I have learned the all techniques. In general, I remember them. But there are a few things we are stuck on or lack, however, I believe I know them. Yes, all the techniques are in my mind. **Mümine**

I have almost learned all the techniques. **Eda**

According to the data acquired, all the students think that they learned all the techniques. Two students explained that they may not remember one or a few techniques, but they would remember when they see them. The statements used are such as: I learned, I comprehended, I understand, it is perpetual, and I remember almost all of them. Thus, this can be said that the techniques were, in general, learned.

6-What are your feelings about the quality of your folder?

Qualitative Data

In general, I do not give importance to my work, but my flashcards were good. I can teach even young learners with the flashcards. **Derya**

When I look at my folder, I do not like the flashcards I made the first weeks. But, I think that my folder is encouraging. **Neşe**

The folder that I prepared could be nicer and neater. I believe that I did the best I could. But, it was not what I had hoped for. **Fatma**

According to what is understood from the data, students care about the folders they made themselves. They can compare the work from the first week with the work from the later weeks. They can realize their deficiencies; they can see their mistakes. They like them because they did the best they could. Furthermore, among the findings we see that some feel they have artistic value. Therefore, it may be said that students gave importance to their work, they realized their deficiencies, they enjoyed their work, and they find their work beautiful.

7-As for you, how can these techniques be taught better? Explain your suggestions on this issue.

Qualitative Data

The best way to understand the techniques is to set out a product. Techniques can be improved. Using various techniques some product can be made. **Hatice**

I have no idea how to teach it better. **Fatma**

Almost all the students expressed that techniques were well taught. Their statements were: permanent, effective, and good. Four students revealed that they wanted to apply the techniques on a product. Students think that they learned the techniques very well, but they wanted to work on the product.

Results based on the interviews

The interviews with the students were gathered into three main themes. They explained the reasons that they took the course despite being exempted from it, which skills they improved and whether they learned permanently or not.

1-Reasons for taking a course they were exempted from

The two exempted students were interviewed and they explained that they wanted to take this course because of the researcher/course instructor. During the interview, they were asked the reason, and they revealed they had neither any folder nor any sufficiently learned techniques.

‘We did not make a flashcard--our instructor was not experienced and that was her second year, so I felt inadequate in that issue’. **Özge**

‘I was exempted because I came with the external transfer exam. My friend and I decided to take the course because my department did not teach this intensively and because this would cause us to improve. **Selda**

2-Which skills have this method improved?

The views of these exempted students overlap with the others. Both students reveal that their coordination and the operating speed have improved.

‘For example, I am faster than I was initially’. **Özge**

‘This method enabled me to increase my speed, it improved my span of my thoughts, and I could see how to apply color harmony better. I can more clearly see which color to use where on the composition. **Selda**

3-Do you think you learned these techniques? How do you think you can benefit from them?

When these students are compared with the others, it can be seen that their awareness is greater than the others’. This is thought to be due to being graduates of a vocational high

school. They are aware that they can benefit from this through all of their lives, including fields outside education.

‘I will run into this everywhere. I think that I will look back on the techniques whether I am a teacher or not. For example, I will be able to teach something to someone else. I will show the techniques that I applied... Yes, I can count all of them. **Özge**

‘I think that I learned many techniques. Once they were taught as theoretic, we didn’t practice much. Throughout one term they gave techniques, then they wanted products and everyone did her best.

Frankly speaking, we did not make quality products; I took this course to enhance my quality. In my future, even if I don’t become a teacher, and open a shop or something, I am certain I will make more products by using these techniques. I can even open a shop. **Selda**

RESULTS AND SUGGESTIONS

Students share close and common opinions about the teaching of ‘Basic Leather-working Techniques’ and the assessment used in Composition Practice Method. They expressed that the techniques enhanced learning with permanence, motivated them to think for themselves, and helped them be creative. In addition, they were pleased to be able to keep the flashcards. There are many positive aspects of this application process. Also, they revealed their obligation of completing an average of five techniques in one week, and having to spend lots of time on this was a negative aspect of this process

Students are aware of the improvement of cognitive, emotional, and psychomotor behaviors throughout this process. As their coordination and operating speed were increased, their ideas broadened, their enjoyment was enhanced, and their attention to color harmony increased. They had improved.

The weekly assessment appears to ensure a positive and effective contribution to the students’ development process. They were able to recognize their own mistakes and correct them. They are upset when they think that their work is not appreciated. Students/teacher trainees felt that the classes go well, and are effective, but also view them as tiring and intensive. Students feel they learned almost all the techniques. While a majority of students think that their folders were very good, others indicated that their folders were not as they had hoped. In general, they appeared to be satisfied with their folders. Regarding the results of how these techniques could be better taught, almost all of the students express that they have learned well, but also state that they want to make a usable product. Results of the interviews and observations evidence a parallel with the results of the survey.

Vocational education is an entity of multiple disciplines that integrates mental, physical, and spiritual development and is fed by art education. Individual acquisitions enriched by their emotions, aim to reveal high quality, and the goal of producing functional items. Therefore, vocational education is one of the most basic needs of a society. The individuals who will take this education must have various qualifications. Also, the individual can succeed only if he

works willingly and enjoys his work. Currently in Turkey, the reasons for choosing vocational education are related to factors other than personal interest and ability. Students, who come from a low socio-economic class, are known to choose vocational education because of their parents' desires.

Another factor is the preference of vocational education by students who have a low academic achievement level. In the academic year 2005-2006, the Faculty of Vocational Training Education, Handicraft Education Department at Selcuk University received students whose university entrance exam results were below the 78th percentile. (Council of Higher Education, Student Selection and Placement Center: 2005-2006 Higher Education Programs and Quotas Guide, p.82).

Urgent measures must be taken to ensure education can be provided for those who are interested, not just for those who are unable to choose for themselves. The most important factor for enhancing quality in vocational education is the acceptance of students via aptitude tests.

Basic leather-working technique practices should be a separate course, not a lesson included in Techniques of Design and Production of Clothing Accessories. There should be another separate course for production of functional items.

Statements included in the decisions taken from the 16th National Education Ministry Consultation should be actualized:

The Vocational and Technical Teaching Faculties' curriculum needs to be renewed to involve, not rote memorization, but thinking, researching, interrogative, analysis, synthesis and evaluation orientated teachers... those who can use the changing technology, facilities/resources effectively. Moreover, Vocational and Technical Teaching Faculties must train teachers who are creative, critical, and scientific minded, who have aesthetic values related to man and nature, who use the latest information technology, and know a foreign language (Ref: Yazçayır, 2005, p.23).

Developing Intercultural Training Programs using Information Communication Technology in Higher Education in Japan: An Experimental Study for a Theoretical Framework of Teaching and Learning Methods

Yuko Kato

Abstract

As the number of foreign people living in Japan has rapidly increased in the last decade, the necessity for intercultural understanding among Japanese people and foreigners alike is becoming more imperative. Among various educational methods, Intercultural Training has been studied to develop intercultural competence which enables people to accomplish their aims, to act and relate effectively, and to have a meaningful life in various cultural contexts. Although Intercultural Training is implemented in higher education, some problems, such as difficulties in evaluation, lack of time and skilled facilitators, are reported. Therefore, the researcher aims at developing an original Intercultural Training program using information and communication technology with her co-researchers. This program intends to help teachers to overcome some of the problems implementing Intercultural Training in higher education and to make Intercultural Training more widespread. In this paper, the progress of this study and the experimental Intercultural Training programs organized for researchers and Japanese students are shown. In addition, theoretical and empirical research for studies of teaching and learning methods of Intercultural Training using information communication technology will be discussed. This study is supported by a grant from Fukui Prefecture in Japan and the Japan Society of the Promotion of Science (Grant-in-Aid for Young Scientists (B)).

Keywords: Intercultural Training, ICT, Higher Education.

1. Background

Intercultural Training (IT) has been studied in the USA to develop intercultural competence which enables people to accomplish their aims, to act and relate effectively, and to have a meaningful life in various cultural contexts. IT puts an emphasis on developing practical skills through empirical studies, which is also regarded as important in International Education, Multicultural Education and Intercultural Education (Mizuta, 1989). Although IT namely focuses on cultural backgrounds of different people, it is strongly concerned with developing

psychological aspects of communication activities in daily life.

However, some problems, such as difficulties in evaluation, lack of time and skilled facilitators, are reported in order to practice IT in higher education. The author, therefore, tried to develop an IT program as an educational support tool using Information and Communication Technology (ICT) as interdisciplinary joint research (refer to Note 1). It aims to overcome the above problems and enables more students to develop cultural awareness. In this paper, the progress of the IT using ICT, and an experimental IT program organized for researchers and Japanese students will be shown.

2. Studies relating to the IT using ICT

While there are many educational support systems using ICT, do programs treating IT exist? The programs aiming at promoting cultural understandings are mainly offered by commercial organizations. Although a few of them are in Japan, they are mainly found in the U.S. where IT originated. According to an investigation list of the Intercultural Communication Institution (SIIC, 2010), 37 organizations are carrying out cultural understanding training on-line in the U.S.

A common feature of these training programs is that they are commercial programs. The contents of the programs are not available for public use. The original purpose of these programs is to increase profits by training talented people who face cultural conflicts in multinational companies. Hence, neither the examples of using these programs in higher education nor performing academic research on these programs is reported.

As for the educational support systems using ICT in higher education, Learning Management System (LMS) such as Blackboard, Moodle is popularly used in Japan and the U.S. Although the use of LMS in Japanese higher education is gradually increasing (Center for ICT and Distance Education, 2010), studies about teaching intercultural issues online are found in the U.S. (Merryfield, 2003; Cheong and Martin, 2009; Martin and Nakayama, 2010). However, there are no reports on studies of the educational support systems specialized for IT.

Our original IT program using ICT was developed for cultivating students' intercultural understanding in higher education. In addition, this original educational support system has a self-learning function with game elements. These two characteristics cannot be found in LMS like Moodle and the training programs for company profits shown in the above.

In order for more students to experience IT, it is important to consider more effective methods. In this system, game elements are included for motivating learners. First, students will answer simple quizzes in relation to their intercultural understanding. Since it has some attractions with

audio and visual effects, it is not like studying but playing the games. As students complete more quizzes, they are exposed to more intercultural ideas and gain intercultural understanding in the process. In addition, the more students answer the quizzes, the more points they will get in this program. By getting many points, they will reach the final goal of the game to become “the Master of Intercultural Understanding”.

Although existing LMS such as Moodle could be effective, it cannot be denied that the “clickability” of our program makes navigating areas of personal interest easy and increases the students’ motivation to pursue the training. The original aim of this study is to increase the number of the students who have more awareness for intercultural understanding through IT. The educational support system in this study should attract not only the students who undertake intercultural studies but also various students in higher education. Therefore, this study considers that adding some attractive elements in the existing LMS is quite significant. Needless to say, the educational effects of adopting game elements in online education are already reported (Aldrich, 2009). Furthermore, it can be applied to theoretical frameworks for teaching-material development, such as the ARCS model (Keller and Suzuki, 1988) and Gagne's nine teaching phenomena (Tamaki, 2010). With the game elements as shown in the above, the educational support system developed in this study should be easier to access for all students.

3. Outline of the system

3.1. Making the contents of IT in the system

First, IT examples provided in many academic books were collected. Most examples were found in English literature such as Kohls and Knight (1994); Stringer and Cassidy (2003) and Hofsted et al. (2002). In Japanese, examples from Yashiro et al. (2002) were collected.

Next, we selected some keywords which are important for intercultural understanding. At the moment, the training examples are sorted by ‘culture’, ‘values’, ‘common sense’, ‘bias and stereotypes’, ‘communication styles’, ‘ethnocentrism’ and ‘cultural relativism’.

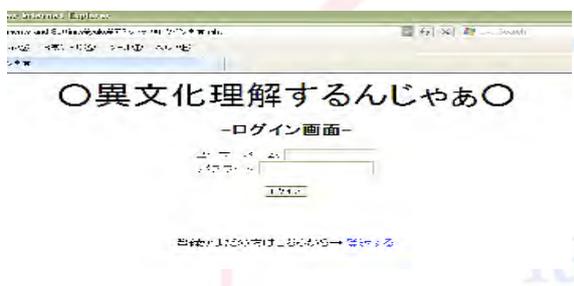

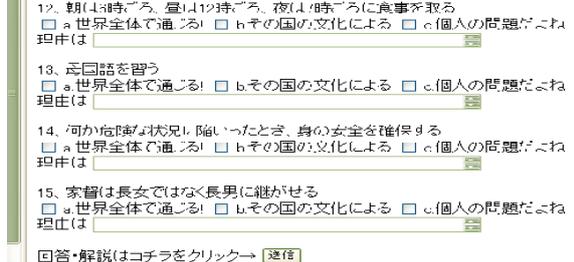

The third process was procuring copyright permission and adapting them for on-line application. This was the most significant and time-consuming part of the project, since there were two problems: it is impossible to implement the existence training examples without the authors’ permission due to copy right issues. Thus, to get permission for the source material was very time consuming. In addition, the training examples collected in processes 1 and 2 were basically prepared for classroom activities and workshops. For these reasons, in the third process, it was necessary to modify them for on-line based programs.

In the fourth stage of our research, text versions of our training programs were implemented. Since we made original training programs, we needed to examine their efficacy and modify them for grand scale online implementation. The pre-tests were implemented to the 441 students at 1 universities in Hokuriku area of Japan, between April and July 2009.

3.2. Outline of the system structure

Students answer the quizzes, and read through explanations of each question. The more they read the program, the more points they will get to become a “master of intercultural understanding”. Functions which show different opinions and carry out opinion exchange were added. Functions for teachers to analyze the results are now being developed.

Table 1. Outline of the system

	<p>1. Login Screen</p> <p>Students put their background information such as age, sex, birth place. After that, they login with password and nickname. Personal information can be observed only by an administrator or a teacher.</p>
	<p>2. Introduction</p> <p>Animations explain how to use this system. (Animations are created by Yumika Kamide, see Note 1.)</p>
	<p>3-1. Quizzes</p> <p>Other than simple quizzes, multiple-choice questions, fill-in-the-blank questions, and description questions are prepared.</p>

<p>① c どちらかといえば、個人的なことでしょうか。ただし、その地域の気候にも左右されますので、文化的となりえる可能性もあります。例えば、南太平洋の島サモアでは、窓のない家に住んでいる人々もいるのですよ。</p> <p>② b 信念・信仰の問題ですね。イスラム教では、蛙は神の玉座のあった水上にいたということから神聖なものと考えられているのですよ。ほかの宗教ではどうでしょうか？</p> <p>③ b 日本式に手を上げて呼び止めると、うっかり失礼にあたる行為になってしまう地域もあります。例えばギリシアでは、手の平を人に向けてはそなたを侮辱することになるので、それは避けなければなりません。</p>	<p>3-2.  <p>異文化理解するんじやあ。 あなたの異文化達成度 25%</p>	<p>6. Evaluation After finishing quizzes, their evaluation for intercultural understanding is shown.</p>						

3.3. Differences in Teaching and Learning Methods between IT and IT program using ICT

One of the most distinctive differences between IT and IT using ICT is found in teaching methods. Usually IT in the classrooms or workshops is implemented by teachers or facilitators, while IT using ICT is implemented by the preset programs.

Next, a difference can also be found in learning styles. In the learning process of IT through workshops, debriefing led by facilitators and group discussions is quite important. Although there are no facilitators in case of IT using ICT, functions which can display the inputted replies instantly, and have students share opinions in the forum will support students' learning process. In fact, the effectiveness of these functions in teaching intercultural understanding online has been reported in the U.S. (Merryfield, 2003).

3.4 Possibilities of IT using ICT

The original IT program using ICT would be able to solve some problems in implementing IT in higher education. First of all, it will help teachers to spend more time on rational explanation of intercultural understanding and intercultural communication studies in lectures. When introducing IT in the course, time is often a limiting factor. If IT can be learnt through ICT, students can learn it by themselves anytime, anywhere.

Secondly, IT with autonomous learning functions doesn't require professional guidance. In general, most programs without autonomous learning functions cannot be carried out without the guidance of a teacher. Some of them even require more than one teacher to effectively execute. From a practical standpoint, this is too difficult to have 2 professionals in a lecture. If the IT training can be accomplished through autonomous learning functions, it helps to solve the problem of lack of teaching professionals.

Lastly, ICT helps to spread IT more. Usually, students who don't take an academic subject called "Intercultural Understanding" or an intercultural based English class would never have an opportunity to try IT. Consequently, many students would never have a chance to gain intercultural understanding made available through the program. However, if IT can be learnt through ICT autonomously, more students have the opportunity to participate in IT programs. There should be hundreds of thousands of ways to gain Intercultural Competence, since it covers the whole range of human ability. IT is one of the effective methods for achieving this competence.

In order to understand the advantages and disadvantages of the programs more clearly, a trial program was implemented to university students and teachers. The aim of this experiment was find out if.) the online program can promote the respondents' interest in intercultural understanding, and 2.) it can help to solve implementation problems of IT discussed in the above. In the following section, the experimental usage of the trial program is shown.

4. The experiment of the original IT program using ICT

4.1 Methodology

The experimental IT program was organized in January 2010 and in July 2010. In the first step, 18 Japanese students at X University in Hokuriku area, and employees from Z City International Association tried the experimental IT program concerning ‘culture’ as follows:

Table 2. Experimental IT program using ICT (Source: Kato, et al. 2010, p.29)

Aim: Understanding the terms of culture	
1.	to think about the cultural influence on standards of behaviour
2.	to recognize that some behaviours can be either acceptable or unacceptable according to cultural values
3.	to widen the academic background concerning to the term “culture”
Questions and explanation sections	
<i>A. Beginners (students get 20 points after Finishing Questions)</i>	
1.	What is culture? Describe it in terms and words you imagine as much as possible.
2.	Explanations
<i>B. Intermediate Quiz (30 points)</i>	
1.	Following behaviours or values, choose A for common ones in the world, choose B for cultural, and choose C for individual.
Quiz 1:	A frog is a sacred creature, while an octopus is the devil incarnate.
A.	Universally recognized belief B. cultural belief C. personal belief
2.	Explanations
3.	Learn some key words concerning culture using a picture drawn by the researcher. In the following screen, some key words are displayed and students are required to divide them into numbers 1 to 3 in the picture.
4.	Answers
<i>C. Theoretical studying of culture with a closed test (40 points)</i>	
1.	Definition of culture (by dictionaries, and the common understanding of it in the academic field of Intercultural Communication)
2.	Functions of culture (Same as above)
3.	Elements of culture (Same as above)
4.	Cultural studies based on Psychology and Anthropology
<i>D. Advanced Quiz (20 points)</i>	
1.	Was your description of culture in question A.1 based on Psychology or

Anthropology?

After collecting opinions about the program and making some revision, in the second step, 1 Japanese facilitator and 2 American lecturers who specialize in intercultural communication also tried the program in July 2010. The researcher explained carefully the purpose of this experiment and guided how to use the program to the Japanese facilitator, American lecturers and people from Z City International Association in Japan, while students at X University tried the program without any guidance. The students were majoring in Engineering and had never experienced IT before.

After going through the above program, the respondents were asked the following questions:

Questionnaire for the respondents:

1. Have you ever been abroad?
2. If your answer was yes in question 1, please describe your experience concerning cultural differences.
3. Did you notice a diversity of cultures and values by studying this program?
4. If your answer was yes in question 2, in which quiz did you notice it?
5. Which quiz did you think was interesting?
6. Please describe your impressions of this program.
7. Please describe cultures, custom, countries you are interested in.
8. Please describe your ideas to make the program more interesting and effective.

Questions 1 and 2 are prepared to collect information concerning knowledge of culture which is based on the respondents' experience. Questions 3 to 8 are asking about the respondents' opinions and effects of this program.

4.2. Analysis

In the first step, 54.6% of the respondents who had never been abroad and 70.6% of all the respondents found the IT program using ICT is useful to promote intercultural understanding. As for the respondents of the second step, all of them agreed that they became aware of some cultural diversity due to the program.

Some students noted that "all of the contents of this program were quite new and interesting for me to read", and "It was an interesting program, since I'd never thought about cultural issues and never seen this type of program before." Some of them mentioned they want to know more about computer programmers around the world, while others answered they were interested in different customs and religions in the world. There is a comment which shows an interest in a specific

culture such as “I want to know more about China and Korea, since we are close but still have many differences”. Their opinions show that there might be a possibility that indifference towards different cultures might be reduced through the program. In addition, one student said “I want to know about Japanese culture more”.

None of the student respondents of this program had ever studied cultural issues before, so their interest in the program shows that these quizzes were to a degree effective in teaching cultural studies to them. In addition, these opinions indicate that there is a possibility that students who never thought about cultural issues would have further interest in participating in this program.

In addition, there were many opinions which indicate an interest in viewing other respondents' opinions on-line. After finishing the program, the respondents can read other respondents' answers immediately, indicating that an objective of this program using ICT was effective in getting students to learn from each other.

As for the content of the program, many respondents in the first step indicate that “it would be easier for us to start with familiar issues rather than academic cultural studies”. According to this, we arranged put quizzes about common sense first in the second step. Accordingly, all the respondents of the second step answered “the content is easier to answer since it starts with familiar issues”.

Let us now discuss if the aim of this experiment was achieved. The aim of this experiment was to examine 1.) if an online IT program can promote the respondents' interest in intercultural understanding, and 2.) if such a program can help to solve implementing problems of IT shown in section 3.4.

First, the findings indicate that the trial IT program using ICT successfully met the demands in the above. In the first step, students can learn intercultural issues through ICT without the guidance of the researcher. It indicates that the autonomous learning function of this program works well, and it will help to solve the problems of limits of time and lack of teaching professionals.

Secondly, the findings also showed that there is a possibility that students who major in various subjects other than intercultural issues can also have an opportunity to try IT using ICT.

Most of all, it succeeded in promoting the respondents' interest in intercultural understanding regardless of their academic background.

4.3 Further Discussion on Teaching and Learning Methods of IT using ICT

The findings also indicate that more rational studies on teaching and learning, and evaluation methods of IT using ICT, and more experimental research are needed. In the first step, some students showed their interest in cultural differences in their studying area. It indicates that the content of IT should be carefully considered and prepared in accordance with needs of participants.

As for teaching methods, the experiment showed that the program set in ICT removes the need for learning facilitators. Nevertheless, teachers still need to control and monitor students' learning progress. Different from usual teaching style, teacher needs to have more skills for teaching online.

Moreover, evaluation methods should be considered more carefully, as one facilitator mentioned in the questionnaire. The issues of evaluation always made IT difficult to implement in higher education (Kato, 2009).

Lastly, more empirical research based on the above theoretical framework should be implemented in order to make IT program using ICT more effective and meaningful tool in higher education.

5. Conclusion

In this experiment, the respondents learnt intercultural understanding by using the IT program on ICT. The program effectively removed a problem concerning the limits of time and the lack of teaching professionals available for teaching cultural understanding. The questionnaire revealed that sharing other peoples' opinions on-line was quite effective in generating interest about different cultural values in the respondents. The program also helped the participants appreciate the diversity of cultural values. These findings show the advantages of the IT program using ICT.

However, as mentioned in section 4, this experimental program needs more improvement. Theoretical framework, further modifications such as an effective display of explanations, an analysis system, more game elements, a forum to share views and discuss with others, an advanced database system, and more empirical research should be developed to make the program more effective. For further study, the findings from this IT program using ICT will be reviewed carefully to help students improve their intercultural competence in Japan and the rest of the world.

Running head: ASIAN AMERICAN PARENTAL INVOLVEMENT

Relationship of parenting practices to academic outcomes in Asian American populations

Abstract

This study examined the process of Asian American parental involvement and its direct and indirect effects on student academic achievement. To uncover directional processes working within this relationship, structural equation modeling (SEM) was conducted using data from a nationally representative sample of 10th grade Asian American students from the Education Longitudinal Study of 2002. Results indicated (1) significant direct effects of parent academic support, communication, participation, and expectation on achievement with the strongest direct effect being expectation; and (2) significant indirect effects of involvement dimensions on achievement via three mediators with academic support and communication being the strongest mediators.

Parental involvement has been a topic of increasing interest in education because of its effects on students' academic performance. Over the past several decades, parental involvement has been positively linked to students' academic achievement (Henderson & Mapp, 2002; Hong & Ho, 2005; Jeynes, 2007; Steinberg, Lamborn, Dornbusch, & Darling, 1992). Researchers and

the education community have come to recognize parental involvement as a multidimensional process that involves many levels and types of parent and child interaction (Fan, 2001; Grolnick & Slowiaczek, 1994; Hoover-Dempsey & Sandler, 1997; Sui-Chu & Willms, 1996; Wong & Hughes, 2006). The term *parental involvement* has evolved into a more inclusive definition that covers educational support at school, at home, and outside of the home (Epstein, 1996; Jeynes, 2007). Parental involvement as a construct refers to parent practices that support children's educational experiences, particularly factors relating to achievement, behaviors, expectations, attitudes, and goals. The multiple dimensions of parent involvement range from direct to indirect forms of parent participation in school-based and home-based activities that influence students' school success (Epstein, 2002; Hong & Ho, 2005).

Researchers and educators have also noted that parental involvement extends beyond school related activities. Parental involvement advocates have suggested that promoting children's success in school includes a wider range of involvement in all aspects of children's lives. Participating in activities such as social events, art events, or religious services provide children with additional educational opportunities (Barbour, Barbour & Scully, 2005). There is evidence to suggest that engaging in a diverse range of activities in addition to school activities facilitate positive educational outcomes (Eccles & Harold, 1996; Grolnick & Slowiaczek, 1994). In addition, parents who are involved in outside-of-school activities are more likely to be involved in school-related activities (Eccles & Harold, 1996).

Researchers have suggested that family plays an important and influential role in the educational experiences of Asian American students (Anguiano, 2004; Asakawa, 2001; Hardway & Fuligni, 2006; Park & Bauer, 2002). Studies on parenting style indicate that parents believe it is their responsibility to support children's educational activities; this involvement contributes to children's academic achievement (Chao, 1996). Successful parenting, then, means providing academic support and resources for their children (Chao, 1996, Chao & Tseng, 2002). Parental involvement has been found to be a significant factor in the completion of high school for Asian American students compared to other groups (Anguiano, 2004). It was also suggested that the structure of involvement might be different for Asian American families. For example, examination into the degree of parental involvement reveals home practices that are not typical of the traditional direct engagement in school-related activities (Kim, 2002).

The positive impact of parental involvement has been well documented in the literature. However, the process of parental involvement is still unclear. Studies have suggested that different parental involvement dimensions may function as mediators in the relationship between parental involvement and academic achievement (Fan & Chen, 2001; Grolnick & Slowiaczek, 1994).

While some factors may have direct effects on academic achievement, other factors may have indirect effects. This is called mediating effects and involves mediating factors. Mediating factors are possible mechanisms through which causal effects of one factor influences another factor (Kline, 2005). Conceptually, the process by which parental involvement affects academic achievement may involve mediating factors. For example, Hong and Ho (2005) found that parent participation in school activities had direct effects on achievement while aspiration and communication had both direct and indirect effects on academic performance. This suggests that aspiration and communication may be significant mediating factors in the process from

involvement to achievement. In their study of factors affecting student achievement trajectories, Sy and Schulenberg (2005) indicated that expectations influenced home environment and parent school participation. In turn, these two parental involvement factors were significant predictors of achievement. Chao (1996, 2002) suggested that parent practices such as academic support are directly related to student success in school. Parents of high achieving students also provided or participated in more activities that are educational for their children suggesting a direct influence of participation on achievement (Sijuwade, 2003). Hoover-Dempsey and Sandler (1995) proposed in their causal model of parental involvement that through academic support or participating in educational activities, parents are passing onto their children values about the importance of school. In addition, these interactions allow opportunities to communicate and practice successful school behaviors and attitudes, which may be beneficial for children's cognitive, intellectual, and psychological development. Given the uncertainty of the causal process, examining the structural process of parental involvement will contribute to the understanding of its influence on academic achievement, particularly for Asian American families.

The purpose of this study is to explore the process of parental involvement by examining the relationship between family involvement factors and students' academic performance. Using structural equation modeling (SEM) to analyze data from the Educational Longitudinal Study (ELS: 2002), this study addresses the following questions:

- 1) Which dimensions of parental involvement (i.e., parent academic support, parent-child communication, parent-child participation in school and out-of-school activities, educational expectation) have significant direct effects on Asian American student academic achievement?
- 2) What are the processes through which parental involvement factors directly influence student achievement; i.e., specifically, do parent academic support, parent-child communication, parent-child participation in school and out-of-school activities serve as important mediators between parental involvement dimensions and student's achievement in Asian American families?

Generally, researchers have focused more on direct effects of parental involvement on academic achievement. This study views parental involvement as a more complex process and considers direct and indirect operations of parent-child interactions based on findings that mediating factors may be involved in the effect of parental involvement on academic achievement. It is expected that parental involvement factors will be able to explain student academic achievement. It is also expected that parental involvement factors within the home have both direct and indirect relationships to student academic achievement.

Method

Data Source

This study analyzed data from the Education Longitudinal Study of 2002 (ELS: 2002). ELS: 2002 is a longitudinal study from the National Center for Education Statistics of the U.S. Department of Education. The purpose of ELS: 2002 is to track students' educational

experiences from high school to postsecondary education and/or employment sector using a longitudinal and multi-level approach. In its base year (2002), data collection began with a nationally representative sample of approximately 17,000 sophomore level students from 752 public and private schools across the United States.

Sample

A sample of 1,645 Asian American students was extracted for analysis. That is, this study focused on experiences and academic performance of this student group at one time point (10th grade). This sample included 724 (49.4%) females and 741 (50.6%) males. Analysis examined tenth grade data from students and their parents.

Variables

The variables selected for this study included items relating to home-based parental involvement practices and student academic achievement. There were four parental involvement factors and one academic achievement factor created for analysis. The four factors representing parental involvement were: *Academic Support (AS)*, *Communication (C)*, *Expectation (E)* and *Parent-Child Participation (PC)*. Each factor included items that have been identified as relevant to parental involvement processes (Eccles & Harold, 1996; Epstein, 2002; Hong & Ho, 2005; Hoover & Dempsey, 2005; Jeynes, 2007; Sy & Schulenberg, 2005)

The outcome variable measuring *Academic Achievement* included reading and math scores. Both 10th grade reading and math scores were measured using item response theory (IRT) scale scores.

Statistical Analysis

This study used structural equation modeling (SEM) to examine the relationship between family involvement and academic performance and uncover directional processes working within this relationship. The purpose of SEM is to explain relationships between variables in the most parsimonious and meaningful way possible. Through SEM analyses, it is possible to estimate a measurement model, identify relationships for measured and constructed factors, and identify structural relationships among factors. Analysis involved two steps within the SEM procedure: (1) factor analysis, which includes exploratory factor analysis, confirmatory factor analysis, and (2) overall structural model evaluation.

Results

The first objective of this study was to assess the adequacy of measurement models for each factor using factor analysis (FA) procedures. The first step was to determine the number of factors to include in the model through exploratory factor analysis. Based on the scree plot and eigen value greater than 1 criterion, three to four factors were suggested. After conducting separate exploratory factor analyses for the three-factor model and four-factor model, the four-factor model was substantively more meaningful. Therefore, the final selected model included four family involvement factors.

Finally, analysis of the structural relationship of the three proposed models yielded varying degrees of good fit. In comparing the models based on goodness of fit indices (Hu & Bentler, 1999), results indicated that all models had NNFI and CFI values well above .95, which

equals good fit. RMSEA value for the hypothesized model had best fit at .051, followed by alternative model 1 with .053. Based on comparison of all three fit indices, it was determined that the hypothesized model best represented the relationship between family involvement factors and academic performance.

The second and third objectives were to evaluate direct relationships between family involvement factors and academic achievement and whether the same factors function as mediators. Direct paths from each of the four factors to academic achievement yielded medium effects, which represents meaningful effects. Among these direct relationships, the highest relationship was from *Expectation to Academic Achievement* (.303). The direct effect of *Academic Support on Academic Achievement* was significant but in a negative direction, that is, higher academic support may be related to lower academic achievement. In other words, children who are not doing well academically have parents who display more academic support practices. All paths were significant except for *Parent-child Participation to Communication*. The largest path coefficient was from *Academic Support to Communication* (.870), followed by the path from *Expectation to Academic Support* (.462), indicating that the academic support dimension of family involvement influences the level of parent and child communication and indirectly affects academic achievement. *Academic support* and *Communication* may also function as mediators for *Expectation*. *Parent-child Participation to Communication* had the smallest effect and was not significant. However, the direct path from *Parent-child Participation to Academic Achievement* showed relatively medium effects. Based on the structural model, *Academic Support* and *Communication* were important mediators.

Discussion

The connection between parental involvement and academic performance is an area that has captured the attention of educators. What counts as involvement has expanded beyond attending school related activities to factors that occur within the home environment. This study was an attempt to understand the process of Asian American parental involvement practices within the home as it relates to academic outcomes. The hypothesis was that parental involvement factors would be related to student academic achievement and this relationship would have direct and indirect effects.

Results indicated that the four-factor structure of parental involvement was able to explain student academic achievement. Measured items representing each of the parental involvement factors (*Academic Support, Communication, Expectation, and Parent-child Participation*) were good indicators of their respective construct. The findings also suggested that the hypothesized model was a good representation of what occurs in Asian American parental involvement processes. Direct effects from *Academic Support, Communication, Expectation, and Parent-child Participation* were all significant for student academic achievement. Parental expectation as a direct influence was the strongest predictor of achievement. This was consistent with previous studies linking expectation with student success (Fan & Chen, 2001; Hong & Ho, 2005; Jeynes, 2007). Similar to other studies, expectation was also able to predict other home involvement practices (Sy & Schulenberg, 2005). Within expectations, there is the underlying message that parents convey to their children about the

value of education. Children's understanding of these values means that they also understand and adopt successful behaviors and attitudes that may contribute to success.

There was a negative direct effect between academic support and academic achievement, meaning higher parental academic support was related to lower student achievement. It would seem that family involvement in this case would not be beneficial for students. However, one possible explanation for this finding is that parents are more involved when their children are not doing well in school. They may participate more in direct instruction such as helping with homework when they see there is a need for assistance. Therefore, the negative relationship may actually represent positive family involvement.

This study also found that parental involvement factors may have direct and indirect relationships to academic achievement. Examination of possible mediating effects showed that academic support was the strongest predictor of communication, which then had a significant effect on academic achievement. It is reasonable to suggest that parents who engage in academic support practices also communicate with their children by discussing academic and personal issues. In addition, academic support practices may also function as opportunities for parents to convey educational expectations and that could influence parents and child communication. Another notable structural path was from expectation to academic support. That is, parent expectations predicted their participation in academic support practices. Expectation factored into the degree of perceived educational support from parents. It is possible to consider that if there is an expectation that students will achieve academic success, families will do whatever is necessary to help students reach that goal. For example, higher expectation would mean higher academic support (e.g. helping with homework and projects). The significant path from expectation to parent-child participation also adds evidence to the relationship between expectation and involvement practices. Although the effect size was small, the significance of the path as well as its subsequent significance on academic achievement represents parent engagement in a variety of activities to enhance student achievement. In looking at Asian American parenting and high expectation, children's academic success was associated with high involvement because parents believe it is their responsibility to provide children with many types of educational support, which will contribute to academic success (Chao 1996, 2002). This participation and interest in the daily lives and activities of children serves as positive influences on their success in school (Eccles & Harold, 1996; Grolnick & Slowiaczek, 1994). Overall, academic support and communications were important mediators in the family involvement process on academic achievement.

It is important for the education community to recognize parental involvement as a resource for students. The presence of increased diversity in schools means that students' needs are also diversifying. It is crucial that factors impacting academic achievement be recognized and fully explored. Understanding parental involvement processes of students from diverse backgrounds will help educators create more effective home-school connections. Specifically, in working with Asian American families, educators may emphasize the beneficial role of home environment and practices. Families and school can then work together to promote and strengthen home involvement strategies. Research that expands the understanding of the structure and function of family involvement will ultimately help educators improve the quality

of students' academic experience. Therefore, continuing efforts will be made towards reaching the goal of providing students with an optimal learning experience.

TEACHING ENGLISH THROUGH LOCAL AND FOREIGN LITERATURES

Prof. Maria Corazon Saturnina A. Castro, Ph.D.
Department of English and Comparative Literature
University of the Philippines-Diliman

Literature has many genres but for this paper, the term *literature* is qualified to mean the narrative form—that which tells a story. Storytelling is said to be the oldest form of teaching. Great teachers like Jesus Christ, Plato, and Confucius used stories to connect to their students/followers. In the ESL/EFL classroom, stories provide the foundation for the acquisition of language and function as a vehicle for language output. This paper will examine the reasons for using stories in language teaching; evaluate the kinds of stories that are suitable to the ESL/EFL students; and present strategies that can be adopted/adapted to suit different levels.

Why use stories in the classroom?

1. *To increase motivation.* Everyone enjoys listening to a story—whether it is the teacher’s personal anecdote or the students’ report on some strange or interesting thing that happened to them. Stories bring real communication into the classroom and provide an authentic reason for listening. In dealing with stories, learners experience the language of personal communication rather than the usual teacherese (register of the teacher) of the EFL classroom. Stories stimulate discussions and spontaneous natural responses. The sharing of stories gives the learners the chance to engage in interactive spoken language. In discussing stories, the teacher may ask students how they feel about the actions/motivations of characters; she may even ask them to provide beginnings or endings of stories. Doing such activities encourages the students to engage in collaborative discussions that can stimulate interest, perception, and imagination.

Stories help lower student anxiety. Theorists concerned with language teaching have emphasized the role of affective factor in foreign language teaching. Krashen, Burt and Dulay highlighted the role that reduced anxiety plays in the classroom. The naturalness and spontaneity of sharing stories decreases negative attitudes toward the difficulty of formal learning.

2. *To provide a meaningful context for decoding and processing language and to encourage students to be creative in their use of language.* As parents, we have always told stories to our children both to entertain them and to develop their critical thinking. It is believed that children who are not exposed to stories find it difficult to listen and understand for their power of imagination and their experiences are often too limited. Discussions on certain aspects of a story can polish the learners’ ability to express and defend ideas. In storytelling, learners listen to ideas, give their own and in the process develop new ones by listening to others. Through interactions, some vague impressions are foregrounded and sorted out.

Since there is less pressure felt during storytelling time, the students contribute more freely and respond more meaningfully.

Stories encourages learners to be creative in their use of language. One can do a lot of things with stories. For instance, teachers may ask students do story theater. Teachers simply give the students the plot and the students have the freedom to create their own dialogue, the names of characters, etc. This activity is often more acceptable to learners than asking them to repeat the story after the teacher for it allows them to focus on whole messages rather than word-by-word recitation.

3. *To reinforce language structure or vocabulary.* In presenting a story, we may focus on its general meaning but the story itself may be used as a vehicle for introducing new grammar structures and vocabulary. In a story, new words may occur in context making it easier for students to recall them. The learners may not know some of the words in the text but constantly exposing them to stories will help them develop confidence in getting meaning through contextual clues. The focus will not be on isolated words but on associative background.
4. *To develop the skill of predicting and getting the meaning of words from context.* Using stories in the classroom teaches the students to predict. Predicting involves a general knowledge of the world and the knowledge of the language system coming in contact to facilitate comprehension. Such activity encourages the students to work out meaning from context.

In storytelling, the teacher need not limit her questions to comprehension questions. She can ask prediction questions, opinion questions and experience questions. Prediction questions allow the students to guess about the plot of the story; opinion questions encourages them to express their own beliefs about the actions, characters and events related to the story; experience questions give the students the chance to broaden everyone's comprehension of some aspects of the story. Since there are no right or wrong answers with these types of questions, the students are more likely to participate and to be genuinely interested in listening to what others have to say. At the same time, the teacher is able to maintain the students' interest.

5. *To introduce a cultural context.* Traditional stories of other countries may illustrate differences but they can also indicate some similarities. Through stories, the students may experience unity/oneness with the various cultures found in an EFL class as they gain awareness of motives and patterns of human behaviour. Some motifs found in one culture may also be reflected in other cultures. Some values in one culture can also be reflected in the mind/psyche of another.
6. *To encourage listening.* Speaking entails listening and stories can be a rich source for listening practice. Listening in a foreign language is NOT easy but if done in the context of

storytelling, it becomes exciting, entertaining and enjoyable. According to Brewster (1991), students of learners' comprehension skill show that many aspects of the listening skill are mastered in contexts where social interactive skills are highlighted — a context that can very well describe a storytelling session.

7. *To encourage writing.* Stories may be used as take-off points for writing activities. For instance, the teacher may ask the students to complete stories, innovate/modernize fairytales, etc. Students are encouraged to develop a mastery of words to be able to express their stories in an interesting and captivating manner. Initially, students may use simple words but as they become more “at home” with the language, they may start using more vivid and specific diction.

Some points to consider when using stories in class

1. How are stories chosen?

- a. Choose stories appropriate to the learners. Stories should match the age and language level of the students. Fairytales, traditional stories which blend fantasy and reality and use repetitive language may be used with beginners. For the higher levels, the classics (modified or otherwise) may already be introduced.
- b. Choose stories with a simple structure. Look for a single, well defined theme; well developed plot; conflict resolution and interesting subject matter. Avoid stories with long explanations/descriptions, subplots or any device that breaks the flow of the story.
- c. Choose stories with positive values. In a classroom, the students not only learn the subject matter. More importantly, they should learn values from the teachers and their classmates and the activities that they do in the classroom. Stories must deal with the more positive aspects of human nature and universal themes. Stories must also be carefully chosen in terms of ideas and context presented especially if students come from different cultural backgrounds. Caution must be observed when stories have references to race, religion, or ideology. Learners will often fall back on previous conceptual knowledge and unfamiliar themes and contexts may present some problems in comprehension.

2. What kind of follow-up activities may be used?

- a. Ask questions — whether they are comprehension, prediction, opinion or experience questions.

- b. Have exercises in phonetics, morphology, syntax, semantics, etc. such as vocabulary exercises, sentence formation and generation, extracting meanings from context.
 - c. Do listening activities such as listening to poetry reading, listening to the oral reading of the story by an invited reader or by any member of the class.
 - d. Do oral activities such as group discussions, and choral interpretation.
 - e. Do written activities such as free and controlled compositions.
 - f. Do visual activities such as visual interpretations of the stories in the form of photography, painting, sculpture, etc.
 - g. Do creative drama activities such as student theater, puppet show, radio show.
3. *What other kinds of stories are suitable for use?* Aside from stories from literature, the teacher may also use:
- a. Personal experiences that are teacher or student generated
 - b. Newspaper reports
 - c. Stories developed from pictures/headlines/music
 - d. Any published selection of interesting short stories which can be adapted for different age groups and levels
 - e. Incomplete stories for which the students provide a beginning or an ending

How can we use literature to develop language skills?

Let me now show how the use of foreign or local literature can reinforce language skills. For the first illustration, the poem *Jabberwocky*, a nonsense verse written by Lewis Carroll is used. This piece can be used to target three levels of language—syntax, semantics, and discourse. The exercises that follow are meant for English 1 students (ESL) in my university. English 1 is Basic College English.

JABBERWOCKY

Lewis Carroll

(from *Through the Looking-Glass and What Alice Found There*, 1872)

’Twas **brillig**, and the slithy toves
 Did **gyre** and gimble in the **wabe**:
 All **mimsy** were the borogoves,
 And the mome **raths** outgrabe.

"Beware the **Jabberwock**, my son!
 The jaws that bite, the claws that catch!
 Beware the Jubjub bird, and shun
 The **frumious Bandersnatch**!"

He took his **vorpal** sword in hand:
 Long time the **manxome** foe he sought --
 So rested he by the Tumtum tree,
 And stood awhile in thought.

And, as in uffish thought he stood,
 The Jabberwock, with eyes of flame,
 Came **whiffling** through the **tulgey** wood,
 And burred as it came!

One, two! One, two! And through and through
 The vorpal blade went snicker-snack!
 He left it dead, and with its head
 He went **galumphing** back.

"And, has thou slain the **Jabberwock**?
 Come to my arms, my **beamish** boy!
 O frabjous day! Callooh! Callay!"
 He **chortled** in his joy.

`Twas brillig, and the slithy **toves**
 Did gyre and gimble in the wabe:
 All mimsy were the borogoves,
 And the **mome** raths outgrabe.

The fact that the poem is made up of nonsense verse makes it difficult for students to comprehend and appreciate the literary piece. Heightening the students' awareness of the structures would, however, assist them in understanding the poem. Initially, the students are asked to determine the word classes of the words in bold. As the students identify the word categories, they also analyze contextual clues to support their answers. For instance, *wabe* is labeled a noun and the category is affirmed by the preceding article *the*. The students are able to make generalizations regarding slots that can be filled by specific word categories. There are instances when a nonsense word may belong to two word categories and students are forced to look for more contextual clues to substantiate their answer. *Raths* may either be a plural noun (due to the -s ending) or a verb that is 3rd person singular present tense. The students need to take into account the entirety of the verse. The presence of the verbs *was* and *were* in the first stanza establishes the tense of the narrative which is in the past; hence, *raths* must have been a plural noun. The students are able to review various affixes that can be used to determine nouns, verbs, adjectives, and adverbs. Without them knowing it, they do morphological analysis and categorical selection that emphasize structural dependencies and hierarchies.

From syntax, the exercises can move to semantics. The students are asked to hypothesize on the possible meanings of the words in bold. In this stage, the linguistic environment plays a crucial role once again. For instance, the students may hypothesize that *vorpal* means magical and may support this observation by saying that given a hero without super powers, only a magical sword can slay a

monster as hideous and powerful as the Jabberwock. We see students actually processing word associations, collocation, and semantic restrictions.

Part of the exercises is the substitution of the nonsense words with existing words (those that are currently used) in English. Again, this is a test in vocabulary and word association. At the end of the exercise, the learners realize that words do not just combine freely with other words. There are some constraints that are due to the syntactic system of the target language. For example, the articles always precede nouns in NPs (noun phrase) and not the other way around. Other constraints are semantic in nature. Students observe semantic compatibilities between words having a particular syntactic form and function. *Magical, mystical, mighty* are possible substitutes for *vorpal* but students prefer *magical and mythical* because of the identical syntactic structure (-al ending indicating adjective). On the other hand, *magical, mythical, frugal, jovial* have similar ending and word category but *jovial* and *frugal* require the semantic feature +animate and therefore not appropriate to describing a sword.

My students enjoy this poem so much that they make their own scripts and actually act out *Jabberwocky* at the end of the term as part of their performance test. Basically all language skills are accounted for by the exercises in *Jabberwocky*—from form to function.

Another form of literature that I use in my class is *Noli Me Tangere*, a novel written by our national hero Dr. Jose Rizal during the 19th century. This novel is a required reading in High School so by the time the students are enrolled in English 1, they are already familiar with the general plot of the novel.

Noli Me Tangere
By Dr. Jose Rizal

Sample Exercise: Subordination and Coordination

Direction: Combine each of the following groups of short sentences into one effective sentence. Express the most important idea in the main clause, and put lesser ideas in subordinated clauses, phrases or words. Use coordination only for ideas of equal importance.

1. Crisostomo Ibarra is the son of a wealthy Creole landlord. He is betrothed to Maria Clara. She is the only daughter of Capitan Tiago de los Santos.
2. He has just returned from abroad. He learns that his father died in jail. His father was a free thinker. He stopped going to confession. The parish priest denied him a Christian burial. The parish priest of their hometown of San Diego was Padre Damaso.
3. Ibarra is first overcome with outrage. He is dedicated to uplift his people through education. He puts aside his plans for revenge. He wants to secure official approval. The approval is for the establishment of a town school.....

In this exercise (there are about 10 numbers), the students are presented with basic sentences and they are supposed to connect them using appropriate connectors generating only one grammatically correct sentence per number. This exercise targets cohesion and coherence. Connecting sentences requires the students to be aware of appropriate logical connectors for smooth transition of ideas. This exercise helps students determine which connectors exhibit relationships in addition, negation, comparison, contrast, cause and effect, and so on. Brevity and conciseness, two important features of writing, are also emphasized as students reduce structures via rewording and rearranging. At the end of the exercise, the students are asked to put together the 10 sentences they constructed. The result is the novel in capsule form. The product then becomes a take-off point for the discussion of other types of academic writing –one of which is the précis or the summary.

For my foreign students in the Intensive English Program (EFL class), I have tried an activity called *Pattern Stories* which I adapted from a Materials Course I took in England. This activity is appropriate to intermediate EFL learners. It is based on students intervening in a reading of the text to suggest what follows. The task is made more natural by a specialized kind of text; usually traditional stories which have repetitive structures are used in this activity. The prediction process which is a crucial part of the activity involves the class in a collective kind of story-telling. The following is an example based on an African folktale:

African Folktale

A spirit went to his father and said:

“Father, I want to be alive.”

“That is complicated,” his father told him.

“To be alive you must first think, next you must remember, then you must feel, then smell, after that you must see, next hear, and finally when you can do all these things, you are alive.”

“How can I do this?” the spirit asked

“**Go and walk in the world,**” said the father, “and get what you can where you can.”

The spirit followed a path through the forest and met a young man. The young man sat under the tree and frowned.

“Man,” said the spirit, “please help me, I want to think.”

“To think you need a mind.” Said the man.

“Can I have your mind?” asked the spirit.

“Certainly,” said the man and after he gave away his mind, he looked happy and young.

“Oh father, help me,” the spirit cried in fear.

“**Walk on through the world,**” his father said, “he who thinks also fears.”

The spirit came to the village and found an old man.

“Man,” said the spirit, “please help me, I want to remember.”

“To remember you need a memory,” said the man.

“Can I have yours?” asked the spirit.

“Certainly,” said the man and after he gave away his memory he looked happy.

The spirit looked at the path ahead but could not remember which way to go.

“Oh Father help me,” he cried.

“**Walk on through the world,**” his father said, “he who remembers also forgets.”

(the narrative continues with each stanza ending in the same line and students say this part in chorus)

Conclusion

Too often, it is not clear why stories are discussed in class. Are the stories used to find particular information on grammar or vocabulary? Are they used to test comprehension/understanding of the students of a general idea? Whether the stories are used to find information on grammar, test comprehension, or practice fluency, the teacher must be able to relate the activity to the needs of the learners, the general objectives of the lesson, and the integration of the language skills.

Education and Applied Linguistics (ESL/TESL/TEFL)

The logo for the International Association for Applied Linguistics (iafor) is centered on the page. It consists of the lowercase letters "iafor" in a light blue, sans-serif font. The text is surrounded by two concentric, semi-transparent circular arcs. The inner arc is light blue and the outer arc is light red, both appearing to be made of multiple overlapping segments.

SOME TECHNIQUES AND RESOURCES IN TEACHING ENGLISH
TO STUDENTS OF PUBLIC SCHOOLS
IN KAWASAKI CITY

By: Maria Elvira Uezono
Kawasaki City Comprehensive Learning Center
Board of Education, Kawasaki City
Japan
uezonomari@gmail.com
Education and Applied Linguistics (ESL/TESL/TEFL)

It was in the school year 2005 that I came across an offer to teach in the elementary school. At first I was hesitant because I knew that teaching elementary would mean singing children's songs which I was not yet ready to do.

Prior to my board of education experience, I taught English conversation to adults and review class in the school that my son attended. My classroom experience was limited to invitations to do lectures and I never had the chance to teach a class of elementary students. Needless to say, the BOE experience was something novel to me. New to the field, I would like to share my experiences and how I finally got around the various challenges I encountered in my 5 years of teaching in Kawasaki City as an English language teacher.

I believe that in doing this paper, I am able to give new foreign language teachers ideas on what to expect in a public elementary school in Japan. With a more concrete idea about what to expect, I am sure foreign teachers will be more emotionally prepared to teach in the classrooms.

My first teaching experience was a big challenge. I did not expect it was a '0' English environment. The children were just too nervous to hear words from a foreign speaker. The first reaction to my simple greetings of "Good morning" was a surprise look on their faces. Everybody turned quiet and waited what will be next. Simplifying the word 'Good morning' to 'HELLO' drew a better reaction

and some smiles were seen and a shy response of HELLO was heard whispered in the classroom.

Given such teaching and learning context, a foreign teacher wanting to teach in Japan must be ready to face some challenges which albeit, may still cause some apprehensions on the part of teacher.

It is important to first study the school prepared curriculum since there is no available official curriculum. If the school does not have one, the teacher must be ready to present one or offer one. The foreign teacher must communicate well with the Japanese teacher in charge. My knowledge of Japanese helped me develop not only rapport but more importantly professional relationship with the faculty. Most of the time, they can speak and understand English to a limited degree. My knowledge of the language helped me place my position within the faculty and established a good professional relationship.

Preparing simple lesson outlines for the Japanese teachers can help them feel at ease. Knowing the outline gives them some degree of confidence in dealing with the lessons. Keeping simple means starting lessons with words that the students can easily follow and presenting situations that are appropriate for the students' age and culture.

Weekend gathering with family and friends is not common. So it is best to present some greeting words in situations where they often see themselves in. For example, in the playground or supermarket, where often short conversations are made to politely acknowledge the presence of somebody they know.

In the early stage of learning a new language, students are unsteady in articulating words. They feel intimidated, and afraid of making a mistake. In Japanese society, making a mistake can be embarrassing. Instead of having surprise quizzes or recitations, the teacher must think of an option that will allow the students to practice the Target Language and the teacher to monitor the progress of the students' understanding of the language.

Children by nature are easily distracted, and getting their attention is a challenge and keeping them interested in the lesson can test a teacher's creativity.

How does the foreign teacher get the students' interest plays a significant part in my lesson preparation. For example, presenting an activity that incorporates the modern Japanese culture of exchanging calling cards on first meetings. Using simple greetings, class teachers (the Japanese teacher and the foreign teacher) can do a role playing to show how they can use the short greeting to start the lesson NICE TO MEET YOU which is a lesson in introduction.

Presenting lessons that will allow children to increase their vocabulary and help in their communication is a challenge. With no official textbook to follow, it is important to note the continuity of each lesson to make sure that a review of the previous lesson is always incorporated into the present lesson.

On first meetings I try to test the children's English comprehension by doing a short self introduction that includes four important points students maybe interested in.

For example; FT: Good morning! My name is Maria

I am from the Philippines

I live in Yokohama, Tsurumi

I have been here in Japan for more than (20) years.

Name

Country of origin

Present residential location

Number of years in Japan

Most students know when they hear the words MY NAME IS _____ . They can also pick up the word PHILIPPINES, and confidently guess my country of origin. The next will be YOKOHAMA TSURUMI which is of course very easy because they are familiar with these Japanese sounding names. Upon hearing the Japanese sounding names they are confident that is where I live. The last one can be a source of laughter for a couple of minutes as they joyfully guess my age.

I get their attention and encourage them to ask me questions about myself and my country. During this time I get to know my students, the class and their character. Children love to ask about my likes and dislikes. At this point, I form in my head my next lesson for them. Activities can start and we can continue to introduce new words/nouns so they can ask the same questions they asked me during the first meetings in English. I simplify my English answers in a way they can easily understand or repeat the same for them to practice with.

Example: Do you like _____? What ____ do you like?

I often reply in a very simple 'Yes, I do' or 'No, I don't' and often add 'I like _____' . If the Japanese teacher gamely participates, the class becomes more interactive and affective filter is lowered. When the Japanese teacher is popular among the students, the students are motivated to interact and participate freely in this exercise. It is also good to show that anyone can make a mistake and I often do this to assure the children that it is 'OK' to commit mistake, and that they will not be punished for making one. What is important is for them to practice the Target Language orally.

When words are difficult to pronounce and to remember, chants can be incorporated so they can use the rhythm to say the words. Repetition is important and as they do this routine they get to correct themselves without embarrassment. Singing songs and doing action songs are effective with the younger learners.

Example of chants to the beat of Queens' "WE WILL ROCK YOU"

Ss: What do you want? What do you want?

FT: (vocabulary) apple

Ss: repeats the word (vocabulary) apple

Depending on the class, I sometimes get lucky to find two or more students to gamely participate and try the conversation drill. I encourage them by giving the students a nice seal or sticker they can keep to show their parents.

Problems in pronunciation and word comprehension may also be supplemented by using visuals and games. Visuals and games make vocabulary learning fun and interesting if presented with funny pictures or pictures having characters they know. Other games can also be used as I often do to make sure they do not get bored each meeting. I love to introduce new games even when the pictures are the same. I play lot of games and add some short sentences to allow them to form their own words. An example of these games is the “DRAGON BALL.” In this game you will need a very nice danceable music that the children can enjoy and a ball or any object they can pass around while the music is playing. When the music stops I ask the whole class to ask questions in the Target Language and the person holding dragon ball/object will answer. The short reply is easy for a student to do alone, but asking the question can cause too much stress for a student so I prefer to ask the whole class ask questions in the Target Language as a practice for them to speak.

The PEEK A BOO is another game that helps in introducing vocabulary and a chance for the students to use the Target Language either in a question or in a sentence.

In this game, the material is an A4 size box with window like holes. I put numbers on the windows or letters of the alphabet that is often miss pronounced like letters L, M, R, D, T, C, Z, V. A picture that needs to be identified is placed and students will ask the teacher to open a window so they can take a peak of the picture. The students say OPEN PLEASE. After a few windows are opened, students get to identify the picture in the target language. They say IT’S A/AN _____

Another game is WHO AM I? After introducing colors and clothes names, I prepare some pictures of a boy and a girl wearing clothes we have learned. The target language is DO YOU HAVE (color and

the clothes) a yellow cap? Do you have a red T-shirt? Do you have green socks? Until they can guess who among the pictures is wearing the identified clothes.

Print activities too can be made fun. I learned from my first year of teaching that children love to collect signatures. Perhaps it is due to the fact that in Japan signing is not usual as people stamp *hanko* instead of sign documents. Signatures are done by famous TV personalities. After doing a conversation drill with a classmate, a student gets to collect signatures. Since this game requires them to collect as many signatures as they can in the classroom for a limited time, the game allows them lots of movement. They get to correct each other and this is far better than letting the teachers or adults around them hear their mistakes. During this game, teachers participate and surprisingly even adults enjoy the interaction.

Children also love to play cards. I have also adopted an original card game from Japan, “*KARUTA*”. In the old days this game was played in the royal courts of Japan during the long New Year celebration. A reader shouts some passages the players try to identify this card and throw the card away from the opponent. In my adaptation I would have my vocabulary in card form as pictures. The basic idea of any *karuta* game is to be able to quickly determine which card out of the set of cards is called out and then to grab the card before it is grabbed by an opponent. The class forms five to six groups with each group getting one set of picture cards. I usually ask the students to ask me questions in the target language and my answers are found in the cards for them to get first before their opponents. Of course the player with the most card wins and can either get a stamp or seal from me. The more cards they get indicate that their vocabulary is improving and can identify objects by listening to my answers.

The elementary class is focused on developing the children’s oral fluency in English. Instructions of formal structures takes secondary role as premium is given to the communicative competence of the students – that is to say, being able to articulate their intended message to the listeners. In general the grammar is not much of a focus, so during their delivery of the target language an article or two maybe missing but that is not given much attention. The focus is more on their speaking in public and their effort to get the message across. This according to some university professors is the extreme opposite of what is being taught in high school or middle school. But then again, encouraging the students to be orally articulate is important to motivate the young students to express

themselves clearly and in a manner that is still in line with the accepted norms in the society.

Knowing and understanding Japanese culture is crucial not only in the preparation and presentation of instructional materials but also in establishing good rapport with Japanese teachers from whom ideas and concepts for the instructional materials may be generated.

Communicative language learning is engaging for both the teachers and students. I enjoy the challenge I face each lesson preparation and learn a lot to improve a lesson that does not work well in some classes. Some children are also excited to try the target language. I often hear them use the target language during their own playtime or to surprise their Japanese parents and enjoy the unexpected reaction of taking up the challenge to answer their child the best they can.

Communicative language learning is effective if taught carefully. Functional language that can be applied in the childrens' daily activity. It is also important not to forget that competence in communicative language does not erase the need for training in grammatical structures. Elementary English language should also be a foundation towards a higher level of learning. When young learners overcome their fear of learning English it allows them to aggressively seek opportunities to better their knowledge.

The support given by the board of education, the schools faculty and the officers of the PTA(parent, teacher association) who tirelessly disseminate information to all parents in connection to the English language curriculum, bring about positive results to better the English language program for the Elementary school level.

I wrote this paper to share with those teachers in English wishing to teach in a country where English is not spoken first hand experiences and my encounters with situations where I thought giving up was the easy way out. Positively changing my attitude, and putting my energy into developing ways to encourage participation to the lessons, I realized that it was the greatest challenge ever in my professional career. Keeping up with the children and their present interest can be an exercise that keeps me young and happy with each day.

PERCEPTIONS OF STAKEHOLDERS ON POLYTECHNIC SOFT SKILLS

Abstract

Malaysian institutions of higher learning have been urged to produce graduates with skills that are highly regarded by employers and who are able to contribute to the country's prosperity and social capital. This challenge has been taken by polytechnics via the introduction of the Industrial Training Soft Skills (ITSS) module to their students. This paper will briefly provide a study of employers' feedback on the module. It was conducted using a survey questionnaire measuring employers' ratings of the importance of eight soft skills elements and the perceived level of students' competencies in them. The eight soft skills considered most important by employers are: time management; team work; communication; learning and interpersonal; problem solving; decision making; leadership and report writing. From the comparisons made, students are yet to meet the expectation of employers, particularly in decision making, time management, leadership and problem solving skills. By making soft skills more explicit to employers, the study can assist in identifying the nature of the gap that exists between the relevant stakeholders and determine the appropriate skills that need to be emphasised in the future. The findings are useful as reflective tools on ITSS curriculum design and delivery for Malaysian polytechnic education in preparation of students for industrial training and employment.

Introduction

The challenges currently faced by Malaysia are the development of a competent and effective workforce. Malaysia needs a workforce which is highly skilled and ready to face global competition. Hence, future employees should be able to work flexibly and intelligently across business contexts, responsive to economic, social, cultural, technical and environmental changes. This view is shared by institutions of higher learning, employers, and professional bodies. They agree that there is a need to develop a workforce that is highly skilled and ready to face the challenges of increased global competition.

However, to be able to work effectively in the workplace means more than just having the necessary technical skills. It requires the ability to apply a broad range of other skills learned in many contexts and through a range of experiences. This indicates that future employees should be equipped with both technical and non-technical skills. The non-technical skills are always referred to as soft or generic skills. Recognizing this need, Malaysian institutions of higher learning have been urged to produce graduates with skills that are highly regarded by employers and who are able to contribute to the country's prosperity and social capital. This challenge has been taken by polytechnics via the introduction of the Industrial Training Soft Skills (ITSS) module to their students.

This paper attempts to empirically explore the generic skills introduced in polytechnic education through the ITSS module. The study analysed employers' perceptions towards the importance and generic competencies of polytechnic industrial training students in the northern region of peninsular Malaysia, comprises the states of Penang, Kedah and Perlis. In addition, problems in defining soft skills in the higher

education context are outlined. This paper then presents and discusses the findings of the study and draws conclusions for education and curriculum development.

What are Soft Skills?

Soft skills are known as key, core, common, people, essential, generic, general or employability skills and so on, depending on contexts and regions. Golding, Marginson and Pascoe (1996, p. 17) for example define soft skills as those common to more than one occupation or field of knowledge. Bennett et al. (1999, p. 76; 2000) defined soft skills as those skills which can support study in any discipline and also skills that have the potential to be transferred to a range of contexts, education and workplace. The Commonwealth of Australia (2002, p. 3) refers to soft skills as employability skills, and defines its as “skills required not only to gain employment, but also to progress within an enterprise so as to achieve one’s potential and contribute successfully to enterprise strategic directions”. The definitions also describe soft skills as not industry specific, but useful in different contexts in the workplace, further study and adult life in general. In summary, soft skills are common to everybody and can be employed in any kind of environment.

The broad scope in soft skills definitions and terminologies has brought vast confusion in describing soft skills particularly between industry and academic. Among the institutions of higher learning themselves there is little uniformity in which skills can be identified as ‘soft’ or ‘generic’ and there is even more uncertainty as to how those skills are defined, as well as whether ‘skills’ is the most appropriate term. Indeed, the definition and understanding of the term “skills” has become more complex with overlapping between skills, qualifications, characteristics and attributes. Soft skills and hard skills also have been seen as a complementary to each other (Coll, Zegwaard, & Hodges, 2002) and cannot be clearly separated. Interestingly, the never ending discussion worldwide about soft skills is on terminologies used in the literature and at certain extent it is found to describe similar situations. Consequently, a different conception in defining and describing soft skills has led to disagreement and misunderstanding amongst stake holders.

In Malaysia, there are also no specific definitions on soft skills and terminology used (Aziz, et al., 2007; Shakir, 2009). However, the terms mostly known amongst Malaysian institutions of higher learning and industry are “soft” and “generic” skills or in Malay language “kemahiran insaniah”. Perhaps it also always closely describe as ethics and attitudes. Aiming to clarify the problem, the Ministry of Higher Education (MoHE) has come out with its own framework, and refers to soft skills as skills that can incorporate all aspects of generic attributes including cognitive elements associated with non-academic skills (Ministry of Higher Education Malaysia, 2006). Though there are no specific soft skills, the majority of these skills are very much related to attributes such as positive values, leadership skills, teamwork, communicative skills and life-long learning. Institutions of higher learning in Malaysia are allowed to adopt, and at the same time develop, their own soft skills elements which may vary from institution to institution or even within the faculties of one institution.

For the context of this study, soft skills have been referred to as skills which cut horizontally across all industries and vertically across all jobs and as a minimum proficiency required to successfully function in practical training or one's career field (adapted from Cotton, 2001) and the term usually used in the Malaysian context, "soft skills" and generic skills will be employed interchangeably.

Why are Soft Skills Needed?

Employers globally and locally insist that they need graduates who are equipped with both soft and hard skills for their future employees. Traditionally, employers looked for hard skills, work experiences or technical background in a particular area when hiring employees. However, this trend has changed gradually since the 90s. Indeed, employers recently have raised concerns that many graduates of tertiary institutions, are not "job-ready" (Maiden and Kerr, 2006 as cited in Fuller & Scott, 2009, p. 1). Employers claim that graduates still lack the soft skills needed in most workplaces (Ford, 2007; Saunders & Zuzel, 2010). Increasingly, employers are demanding skills from graduates which are outside the subject area of their course of study (Yorke, 2006). Employers seek employees with the right attitudes and dispositions toward work or individuals who are motivated, reliable, willing to learn and take responsibility for their own learning (Stasz, 2001). The finding by Workforce.com indicated that 67% of managers would hire an applicant with strong soft skills even if their technical skills were lacking (Kearns, 2001). Research by Branine (2008), found that the majority of organisations expect newly graduated professionals to have good transferable skills rather than excellent academic grades.

In addition, soft skills are seen as vital for success among employers. A study conducted by the Stanford Research Institute and Carnegie Mellon Foundation, involving Fortune 500 chief executive officers, found that 75% of long-term job success depended on people skills, and only 25% on technical knowledge (Hill, 2007). According to a Price Waterhouse-Coopers consultant, "Technical and job-related skills are a must, but they are not sufficient when it comes to progressing up the ladder. It is important to be technically sound, but one should also have the ability to convey the idea to the derogate masses in the simplest possible manner" (Iyer, 2005).

The Malaysian employers prefer graduates with generic skills among their graduate employees. Hence, to be employed graduates need to be highly competent and adaptable in the changing workplace amid stiff competition (Bakar & Hanafi, 2007; Muhamad & Idris, 2005; Quek, 2005). A research carried out by Dr Parmjit Singh of Asia Pacific Institute of Information Technology (APIIT) in 2004, showed that the top three complaints were that graduates have poor communication skills, lack initiative and lack creativity (Hill, 2007). Employers have expressed the view that graduates were often good technically and could produce engineering solutions to technical problems but often had weak non-technical skills and so failed to complete a project successfully" (Lee, 2003, p. 6). This statement by Former Deputy Human Resources Minister Datuk Abdul Rahman Bakar confirmed the findings of those study, "It is this lack of soft skills which is largely responsible for the difficulties faced by some 90,000 young people in finding employment" (*The Star*, Sept 23, 2007).

Institutions of Higher Education and Soft Skills

Knowing the importance of soft skills and realising of the lack of soft skills amongst graduates, institutions of higher learning have a vital role to play in imparting soft skills to students. The institutions of higher learning now have given more priority to better prepare students for employment (Dunne & Rawlins, 2000; Keep & Mayhew, 1999; Ministry of Higher Education Malaysia, 2005; Ong, Sharma, & Heskin, 2003). However, these institutions can only provide soft skills settings that are limited and confined to simulated environments, and the students might not be able to learn the real skills required. Hence, a missing link or 'skills gap' exists (Askov & Gordon, 1999; Atkins, 1999; Evers, Rush, & Berdrow, 1998; Kivinen & Silvennoinen, 2002; Morley, 2001; Robinson, 2000; Shivpuri & Kim, 2004), and this can only be rectified and established through actual experience.

In Malaysia, the call to incorporate soft skills into the curriculum has been seriously pursued by the Ministry of Higher Education (MoHE) for the past two years (Ministry of Higher Education Malaysia, 2005). Malaysian institutions of higher learning have been urged to review their curriculum to ensure graduates are equipped with skills and knowledge required by industry and employers. Soft skill subjects such as communications, problem-solving and language skills (especially English), have been introduced into institutions of higher learning (Shah, 2008). The importance of preparing students for their future working environments has been a key issue in both higher and vocational education particularly polytechnics. Hence, apart from the demand from the industrial sector, government policy was one of the reasons that engineered to the implementation of the Industrial Training Soft Skills (ITSS) module in polytechnic education.

The Industrial Training Soft Skills Module (ITSS)

The Industrial Training Soft Skills module was introduced by the polytechnic education system as part of the industrial training program. This is very important as the program can offer appropriate training contexts for students to practice the skills learnt immediately. It was designed for polytechnics with the aim of developing soft skills in students as preparation for the world of work prior to industrial training. The ITSS module consists of five elements: positive personality, communications skills, work etiquette, work exposure and report writing. It is a stand-alone module carried out in semester two and three for certificate and diploma students respectively. An hour credit has been allocated and students are not allowed to enrol for industrial training without first going through the module. As a stand-alone module, students are exposed to the theoretical underpinnings of soft skills prior to their practical training through a variety of teaching and learning methods.

Industrial training which commences after the completion of the module will be the real-world context for students in applying the soft skills learnt. During their industrial training, the students are evaluated by their employers and polytechnic lecturers. Therefore, employers are able to observe the application of soft skills through-out the duration of the five months training. Thus, application of soft skills elements identified in the module can be examined across industrial sectors.

Problem Statement and Objective of the Study

The ITSS has been implemented mainly due to the feedback from industry concerning the lack of soft skills amongst polytechnic students and graduates. Although the importance of soft skills has been acknowledged by the management strata of Malaysian polytechnics, the implementation of soft skills training in depth is still new in the Malaysian tertiary education system, particularly in polytechnics. Hence, questions have been raised as to how well the module has been implemented. It is therefore very important that the effectiveness of the module is evaluated. Not only do we need to determine whether the students have acquired the knowledge about soft skills, we also need to know whether they are applying what they have learnt, whether the skills acquired actually meet the employers' needs, which areas still need the most improvement in the module and lastly, how effective soft skills teaching is. Thus, the perceptions from three related groups; students, lecturers and employers were collected and investigated. This process is also known as a 360-degree feedback (Stasz, 1997; van der Heijden & Nijhof, 2004).

However, this paper will report only on the employers' responses, partly due to restrictions of space and time. But it can be argued that perceptions from employers are a crucial asset, given that they are the consumers of academic products. As an independent group, employers' feedback is considered as valid assessment in informing academia about the quality of their product. Indeed, they are the group who are able to provide valuable information on the application of students' soft skills in real work settings. In addition, it is also very useful in seeking information about the current needs of soft skills in the industry.

The study focuses specifically on the development of students' soft skills during the commencement of industrial training. This involves employers' perceptions on the importance of soft skills as practiced in the organization and perceived level of competence observed through-out their training. The employers in this study referred to training companies which directly involved in polytechnic industrial training program. Respondents were represented by the company human resource manager, supervisor or technician who had direct contact with polytechnic students during their training. The following research issues are explored:

- i. Employers' perceptions on the importance of soft skills as listed in the module;
- ii. Employers' perceptions of the level of students' soft skills while at training; and
- iii. Employers' perceptions of what soft skills are best developed in the workplace context.

Research Method

Instrument

The instrument used in the study was a survey questionnaire given that this is an exploratory study and questionnaires were divided into three parts: Section one

consisted of questions on the respondents' demography. The second section was designed to measure, in general, the preparation and importance of knowledge, skills, and abilities of polytechnic students in soft skills before the commencement of industrial training. The respondents were required to state their agreement on students' soft skills knowledge and ability using a scale from 1 (Disagree) to 6 (Agree). In section three, respondents were asked to rate the importance of the various soft skills elements and students' competency in performing these skills on a scale ranging from 1 (not important at all/not competent) to 6 (very important/very competent). This section required employers to answer the questions on the extent of students' ability in transferring the skills learnt while undergoing their industrial training. In addition, there was an open-ended question pertaining to the skills which were not included in the module, but might be appropriate to include in the module in future.

Sampling

Data was collected via mail survey. Population comprised selected companies participating in industrial training program. This sample was chosen with the rationale that 80% of polytechnic students in the northern region are placed in the same area. Furthermore, the lists obtained from the polytechnic industrial training unit are active companies. A total of 180 questionnaires were utilized and mailed to the identified companies. The survey was directed initially to human resource or personnel managers or to those managers or trainees superior responsible for training and recruitment. The rationale behind using these individuals is that they have a close relationship with, and knowledge of trainees due to the nature of their work. It is believed they would be qualified to comment on the trainees' soft skills because assessment of employees and industrial training students is an integral part of their job description. They were also believed to be the personnel who possess substantial experience in making judgments and opinions on the importance of soft skills or in a position to pass the questionnaire to the right person if unable to participate.

Analysis

The survey data were analysed using the Statistical Package for Social Sciences (SPSS) version 17. Descriptive statistics mean and frequency were used to analyse the importance and employers' perceptions of generic competencies of students. The employer's perceptions reflected the level of soft skills application amongst students during their industrial training. Indeed, a hierarchy established from the mean importance and competency level from the employers' perceptions will assist in examining the effectiveness of the module.

Findings and Discussion

The population included various companies from different backgrounds. The employers were categorised by sectors such as services, trading, manufacturing, finance, consultancy and government. A total of 107 questionnaires were returned which was equivalent to a 57% response rate. The majority of the respondents were from the service industry, making up 38.3%, with 41 companies. Trading companies contributed 25.2 % (n = 27) participation in the polytechnic industrial training

program, followed by manufacturing companies with 18.7%, (n = 20), government sector with 8.4%, (n = 9), finance with 6.5%, (n = 7) and consultancy with 2.8% (n = 3). Medium sized companies (number of employees from 10 to 50) seemed to form the biggest number of respondents involved in the polytechnic industrial training program with 43.9% (n = 47) as shown above. Small companies with less than 10 employees contributed 31.8% (n = 34), and large companies with more than 50 employees chipped in with 24.3% (n = 26). Thus, small and medium enterprises (SMEs) contributed 85.7%. This is in keeping with the fact that (SMEs) account for more than 90% of total number of businesses in Malaysia (Zakaria and Hashim, 2003 as cited in Juhdi, Jauhariah, & Yunus, 2007). About 40% of the respondents have a long term relationship of at least 3 years with the polytechnics. Of these 19.6% (n = 21) have participated in the program for more than 5 years (10 times). However, 60.7% (n = 65) of companies are still new to this program with experience of 2 to 5 times.

Employers' General Perceptions of Students' Soft Skills

This section explores perceptions of employers regarding students' soft skills preparation before the commencement of industrial training (Table 1). Generally employers are pleased with the polytechnics' preparation in imparting soft skills to students prior to industrial training (M=4.1963). They agreed that students with soft skills were also competent in technical skills (M=4.6448). This indicated the importance of soft skills to the organization. Students have found themselves to be able to practice their soft skills during their training (M=4.1028), and their soft skills are up to company's expectation (M=4.1402). However, it was reported that students' soft skills do not benefit the organization much. This could be due to the thinking that these people were only training students and a five months training period is too short for the supervisor to form a clear evaluation on students' contribution to the organization. For some, it is only a requirement to complete their studies, and their presence and position was on a temporary basis.

Table 1 General Perception of Students' Soft Skills

No.	Item	Mean
1.	Polytechnics students were equipped with soft skills before industrial training	4.1963
2.	Students with high soft skills were more competent in technical skills	4.6448
3.	Students practice their soft skills well while at training	4.1028
4.	Students' soft skills meet up company expectation	4.1402
5.	Students' soft skills benefited the organization	3.2897

Meanwhile, the comparison made between the students' knowledge before the commencement and at the end of their industrial training clearly indicates the progress and improvement of students' soft skills (Table 2). Decision making skills were reported as the skill area which had the highest improvement (+0.7476). The results revealed that the transferability and learning process relating to soft skills does occur. Soft skills are proven to be transferable but only to a certain extent. Input given by employers derived from their observation of students' performance throughout the

industrial training. This indicates that soft skills can be improved through learning and practice. The skill area with the weakest improvement was time management skills (+0.2524). While student performance in this skill has managed to stay above the overall mean, its variability is considered a cause for moderate concern. It is suggested that performance in this area may be improved simply by making this attribute a point for greater emphasis in the module. Additional emphasis might include procedures for industrial training students to strive to be “early” rather than just “on time” with regard to meeting deadlines or arriving for work. This emphasis could be reinforced by having the lecturer increase the weightage given to this criterion in the learning and teaching of the ITSS module.

Table 2 Students’ Soft Skills Competency in General

No.	Item	Mean		
		Beginning	Ending	Difference
	Students’ soft skills competency :			
i.	Decision Making	3.2991	4.0467	0.7476(1)
ii.	Teamwork	4.4019	4.7477	0.3458(5)
iii.	Problem Solving	3.6542	4.1776	0.5234(3)
iv.	Time Management	4.1121	4.3645	0.2524(7)
v.	Communications	4.0187	4.5514	0.0527(2)
vi.	Report Writing	3.9252	4.2523	0.3271(6)
vii.	Leadership	3.6075	4.0841	0.4766(4)
viii.	Learning and Interpersonal skills	4.1121	4.4579	0.3458(5)

**The number in bracket indicated the ranking*

Eventually, no matter how good the skills were rated, and regardless of employers’ satisfaction with students’ soft skills, the disparities still exist and are need to be improved (Table 3). Hence in minimizing the disparity, employers suggested polytechnics give more attention to certain skills. The results revealed that leadership skills are the skills that need to be improved the most (M=3.5888), followed by problem solving (M=3.3364), time management (M=3.2617), decision making (M=3.3084), communications (M=2.9533), teamwork (M=2.9252), report writing (M=2.9159) and learning and interpersonal skills (M=2.8692). This implied on area of greater emphasis in order to better prepare students for their internship (and ultimately permanent job) experiences. A study by Poh Yen et., al (2009) and Annie and Hamali (2006) on employers’ perception of Curtin and MARA University of Technology Sarawak campus revealed that leadership and problem solving skills has also been highly rated by employer.

Table 3 Students’ Soft Skills that still Lacking

No.	Item	Mean
	Soft skills that still lacking and need to be emphasis by polytechnic	
i.	Decision Making	3.3084(3)

ii.	Teamwork	2.9252(6)
iii.	Problem Solving	3.3364(2)
iv.	Time Management	3.2617(4)
v.	Communications	2.9533(5)
vi.	Report Writing	2.9159(7)
vii.	Leadership	3.5888(1)
viii.	Learning and Interpersonal skills	2.8692(8)

**The number in bracket indicated the ranking*

Leadership skills appeared to be the skills which are still lacking the most amongst polytechnics trainees, followed by problem solving and decision making. These skills initially were not placed as main skills in the ITSS module. The result gave a strong indicator of the rise of importance of these skills regardless of the academic level of students. These skills were not highly prioritised in the module as polytechnics are supposed to produce semi skilled workers (para-professional). However, the latest development seems to offer another perspective. These skills are needed in all situations regardless of the qualification. It is also a warning to academia that, in practice, soft skills are needed at all levels in an organization. The difference is in only the scope and context. These results also suggest the educational process may need to be revised in order to improve student workplace performance in this area. Communications skills were ranked fifth as the skills that were still lacking and needed to be emphasised by polytechnics. The ranking seems to reflect that polytechnic students are competence in this skill. Hence, less priority was given to it by employer compared to other skills. Finally, the learning and interpersonal skills became skills suggested as least priorities.

Employers were also asked to rate those skills according to their organization needs, using mean ratings obtained for the extent of importance were between 1 and 6, where 1 implies “not at all important” and 6 implies “extremely important”. As noted, these skills received mean averages ranging from 4.8 to 5.2, which highlighted differences and patterns. The highest priority was teamwork ($M = 5.2710$), followed by time management ($M=5.2430$), learning and interpersonal skill ($M=5.1776$), communications ($M = 5.0935$), problem solving ($M = 4.9907$), leadership ($M = 4.8692$), report writing ($M = 4.8318$) and decision making ($M = 4.8131$). The mean scores rated were ranged between 4.0 and 5.0 which were considered important, though their relevance varied with the size and nature of the business. No skills were rated less than 3.0 indicating the importance of these skills to the organization.

Table 4 Soft Skills Ranking by Company

No.	Item	Mean
	Soft skills ranking based on organization need:	
i.	Decision Making	4.8131(8)
ii.	Teamwork	5.2710(1)
iii.	Problem Solving	4.9907(5)

iv.	Time Management	5.2430(2)
v.	Communications	5.0935(4)
vi.	Report Writing	4.8318(7)
vii.	Leadership	4.8692(6)
viii.	Learning and Interpersonal skills	5.1776(3)

**The number in bracket indicated the ranking*

Perceived Importance and Competency Level of Identified Soft Skills

The results revealed that employers were more concerned with work-related skills that required trainees to manage time effectively, function as a team member, analyse and solve workplace problems confidently, be self-reliant, trainable and motivated as well as maintain professional ethical standards. Time management was ranked highest by employers with a mean score of 5.3069 followed by team work (M = 5.3014), communications (5.2687) and learning and interpersonal skill (M = 5.1811). The remaining four soft skills elements had a mean importance of less than 5. These were problem solving (M = 4.9813), decision making (M = 4.9782), leadership skills (M = 4.9393) and report writing (M=4.9065) respectively.

The ranking by importance also revealed a remarkable result particularly for communications skills. Typically, these are the skills always most universally valued by employers (Divine, Miller, & Wilson, 2006; Vice & Carnes, 2001) and academics alike (Hyman & Hu, 2005). In Malaysia itself, communication has always been a talk of the town and claimed to be the skills needed most by employer (Hoo, Nasuridin, Chai, & Ignatius, 2009). This outcome verifies the above result pertaining to skills which are still lacking and need to be emphasis by polytechnic. Although, it is always referred to as the most important skills, the result seems to suggest that communication is no longer the most important skills as in this study. However, Bennett (2002), instigates that there is no consensus in the academic literature regarding which particular soft skills are most and least important. It is dependent on the context and need of particular organization. The ranking usually end up in mixed result, however communication skills always occupied a leading position (Bennett, 2002, p.459).

The next measurement investigates the employers' perceptions of students' competency level. Employers' mean scores levels ranged from 5.0397 to 4.1713. As observed, mean scores competencies were generally lower than mean scores for importance. Nevertheless, the mean score for competency was above four, suggesting that polytechnic students had an acceptable level of soft skills competency but to meet industry's expectation, further improvement is needed. The skills that employers perceived polytechnic students, as most competent in ranking order, were teamwork (M = 5.0397), communications (M = 4.7687), learning and interpersonal (M = 4.5870), time management (M = 4.5810), report writing (M=4.5748), problem solving (M=4.3551), leadership (M = 4.3014) and decision making skills (M = 4.1713).

Table 5 Employers' Perception on the Importance and Perceived Level of Students' Competency Level of Soft Skills in Rank Order (n = 107)

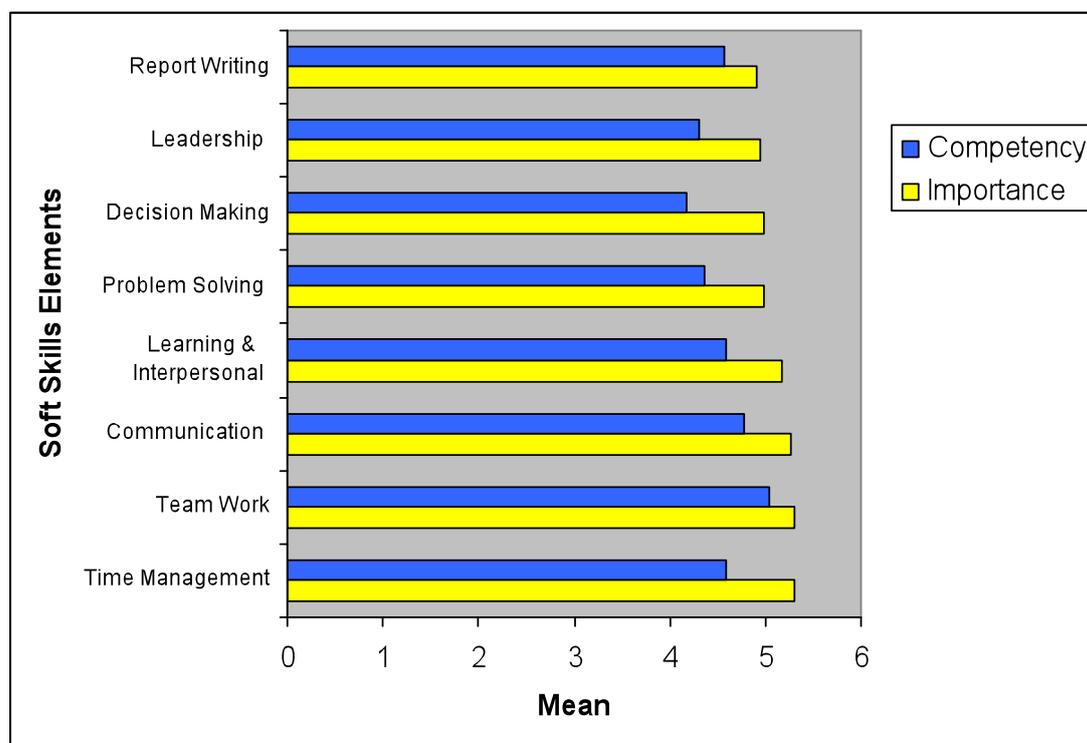

No	Soft Skills Elements (Important)	Mean	Soft Skills Elements (Competent)	Mean
1.	Time Management	5.3069	Teamwork	5.0397
2.	Teamwork	5.3014	Communications	4.7687
3.	Communications	5.2687	Learning & Interpersonal	4.5870
4.	Learning & Interpersonal	5.1811	Time Management	4.5810
5.	Problem Solving	4.9813	Report Writing	4.5748
6.	Decision Making	4.9782	Problem Solving	4.3551
7.	Leadership	4.9393	Leadership	4.3014
8.	Report Writing	4.9065	Decision Making	4.1713

The Comparison between Mean Score Importance and Competence

To further elaborate on this matter, comparison was made between employers' perceptions of the importance of soft skills elements with what they initially expected and observed with polytechnic trainees. The comparison hoped to spell out and ascertain the application of soft skills by trainees. Table 6 compared the mean scores of the importance of soft skills as expected and the actual performance of trainees as perceived by employers. A higher mean gap value denoted a bigger discrepancy between what is expected of the work force and trainee performance as perceived by the employers. The skill is considered deficient if the expected skill differs considerably from performance, but if their values are close, the employers' expectations then are very much fulfilled.

Overall, students seemed to be good in theory, they were poor in skills application. Employers on the whole voiced that, the polytechnic trainees were still not proficient in time management, teamwork, learning and interpersonal skills and communications. The similar result can be found in problem solving, decision making and leadership skills. Taking into account the relative importance of the skills to employers, the gaps-in-skills deficiency can be ranked in decreasing order as follows: decision making; time management; leadership; problem solving; learning and interpersonal skills; communications; report writing and teamwork skills. The analysis revealed that the decision making skills showed the highest mean deficiency (0.8473) compared to other skill elements. This was followed by time management (0.7259), leadership (0.6379), problem solving (0.6262), learning and interpersonal skills (0.5941) and communications skills (0.5000). Report writing (0.3317) and teamwork (0.2617) did not show much difference as indicated by the smaller gap between the expectation and the performance of students' competency. Generally, polytechnics students were rated above four for all the soft skills elements surveyed, which is not particularly poor *per se* but could be improved further.

Table 6 Comparison on the Employer's Perceptions on the Importance and Perceived Level of Students' Competency Level in Soft Skills

Conclusions

An imbalance in the demonstration of some of the soft skills is one of the problems which employers are facing with graduates or to be more specific trainees. The results from this study revealed that teamwork, time management, communications and learning and interpersonal skills were among the most important soft skills elements. Employers were happy with polytechnic students' competency given that none of the skills received a mean score of less than three. Of the eight skills, employers agreed that time management and teamwork skills were the most important. Students were found to be very competent in teamwork and communications skills. From the comparison made the gap between the importance and students' competency still exists. Students are yet to meet the expectation of employers particularly on decision making, time management, leadership and problem solving skills. By making soft skills more explicit to employers, the study can assist in identifying the nature of the gap that exists between the relevant stakeholders and determine the appropriate skills that need to be emphasised in the future.

These findings are very valuable as possible guidelines to academia for future planning. Generally, the results indicate those skills that should be given priority from the employers' perspective. Apart from that, it is also useful knowing which skills are considered important to be acquired by students before they undergo industrial training. In summary, this study suggested employers agreed that soft skills contained in the ITSS module are very important and up to current needs, but student application is still not up to their expectations. This indicated that full transferability

of the skills is yet to be achieved. Hence, feedback and communication loops between industry and polytechnics and vice versa should be strengthened and harnessed to the full potential. However, employers' perspectives cannot be the only basis on which to justify the effectiveness of the module. Perhaps, a study from other stakeholders such as teachers and students will verify the outcome expected. Therefore, to further enhance the overall outcome, further research should include a study of other relevant stakeholders.

There is compelling support for the argument that the teacher and his/her professional practice in the classroom constitute one of the most important, if not the most important, factors in lesson effectiveness (Rice, 2003; Sanders & Horn, 1998). The classroom teacher's intended and implemented practice is guided by the values and beliefs he/she subscribes to (see, for examples, Barkatsas & Malone, 2005; Seah, 2005), and much of this professional practice presents itself in the form of mathematical tasks, each of which is "a classroom activity, the purpose of which is to focus students' attention on a particular mathematical idea" (Stein, Grover, & Henningsen, 1996, p. 460). Specifically, this paper reports part of an exploratory study into students' perspectives of the types of tasks that are regarded as being especially helpful in their studies, situated in the middle years of schooling in the city of Chongqing, China. The research design of this exploratory stage of the study is based on the recently-concluded Task Types and Mathematics Learning [TTML] research project conducted in Australia by Peter Sullivan, Doug Clarke and Barbara Clarke. The findings of this project will be briefly reviewed in the next section. A case that relatively little is known about the Chinese mathematics classroom will be put forward. The research design will then be presented, accompanied by a reflection on what we learn in the process of translating the questionnaire used from the English language to the Chinese language. This will be followed by a report of the results obtained, ending with a discussion of the findings.

Mathematical tasks

The assumption in this exploratory study has been that mathematical tasks constitute the gateway to student learning of mathematics/numeracy, and that the form of these tasks as they are implemented in the classroom is the result of interactions between the teacher and his/her students, and amongst the students themselves. Learning tasks open the door to the introduction of relevant knowledge, skills and dispositions that students are expected to learn. Lappan and Briars (1995) expressed their view that the most important teacher decision that affects student learning concerns the selection of tasks. Mathematical tasks constitute one of the three components in Simon's (1995) Hypothetical Learning Trajectory, and its significance in this conception is all the more greater given that it is interdependent with another component, that is, hypotheses about students' learning process.

At the same time, teachers are sensitive to their own students' learning styles and needs, and their ongoing engagement and interaction with these learners situated as they are in the particular sociocultural context of the classroom regulate the ways in which the same task in a teacher's planning might operate differently in different classrooms. Boaler's (2003) study is an example of this, wherein different teachers with similar beliefs planned to give students similar tasks, yet these took on different forms in the classrooms. Indeed, Stein, Grover and Henningsen's (1996) Mathematical Task Framework demonstrated that there are three phases through which an intended task is set up by the teacher, then enacted together by teacher and students. This last phase is regarded as being especially important in determining student learning.

In Australia, the Task Types in Mathematics Learning [TTML] project set out to examine teacher use of three types of mathematical tasks: Type 1, in which the tasks are involved with the introduction to or use of models, representations, tools or explanations to exemplify the mathematics; Type 2, in which mathematics has been situated within a contextualised practical

situation; and Type 3, which are open-ended tasks. The experience of the 16 teacher participants who had been involved with the project over two years showed that prior to the project, teacher use of contextual tasks (type 2) was relatively less than the other task types. With professional development and support, however, teacher confidence and skill can be raised to the extent that all three task types are equally adopted by these same teachers (Clarke & Roche, 2010).

The Chinese mathematics classroom

East Asian students have been outperforming their peers from many other countries in international mathematics comparative assessments. Amongst the Year 4 participants in TIMSS 2007, 3 of the 4 top performing regions are East Asian (Hong Kong, Taiwan and Japan), with the other country (Singapore) being Southeast Asian geographically, but substantially East Asian culturally (Thomson, Wemert, Underwood, & Nicholas, 2008). In the Year 8 component of TIMSS 2007, the East Asian advantage is extended to an additional region, Korea; that is, 4 of the 5 top performing regions are East Asian (Thomson, Wemert, Underwood, & Nicholas, 2008). In PISA 2006, 2 (Taiwan and Hong Kong) out of the top 3 performing regions – and half (Taiwan, Hong Kong, Korea, and Macau) of the top 8 regions – are East Asian (Thomson & de Bortoli, 2008).

Subsequently, there has been much academic interest in how mathematics is taught and learnt in schools in East Asian nations. The academic and societal interest following Ma's (1999) book is a good example. More recently, an edited volume of academic writings on the mathematics pedagogical traditions amongst Chinese classrooms was compiled and published (see Fan, Wong, Cai, & Li, 2004). Also, Stevenson and Stigler's book, 'the learning gap: why our schools are failing and what we can learn from Japanese and Chinese education' has a second edition in 2006, 12 years after the first edition was published (Stevenson & Stigler, 1994): it does show that there remains much interest in East Asian education systems!

In particular, in recognition of the crucial role that teachers play in the pedagogical process, there has been research attention to the ways in which teachers in East Asia and their students interact with each other, with an aim to understand the respective didactic contracts. The growth in interest around the world in the Japanese Lesson Study, for instance, demonstrates this focus on how planned lessons play out in the classroom.

Despite being part of East Asia, however, the typical mainland Chinese mathematics classroom is relatively less understood, despite the long-term implications within China and without of (mathematics) education initiatives and norms in the world's most populous nation. Perhaps such research has not been disseminated in the English language. Nevertheless, international comparative studies such as the Learners' Perspective Study provide some insights into the Chinese mathematics classroom (see, for example, Clarke & Seah, 2005). In this light, the research design of this study had been set up with the objective of better understanding the pedagogical practices that are commonly found in mainland Chinese mathematics classrooms. In particular, we focussed on the mathematical tasks that are introduced by teachers, and how these are perceived by their students.

Stein, Grover and Henningsen (1996) proposed that any particular mathematical task takes on three forms as it is conceptualised, set up, and enacted. The last phase, whereby the teachers and their students interact and negotiate to enact the various mathematical tasks, is regarded as being especially crucial in determining student learning. Yet, the ways in which tasks relate to student learning have not always been made explicit (Simon & Tzur, 2004). Also, the nature of teacher-student and student-student interactions in the classroom varies from country to country. That is to say, the same mathematical task can be expected to be transformed in different directions once it is implemented in different classroom settings across different cultures. The nature of these negotiations as they pertain to the mainland Chinese classroom is thus significant in the context of deepening our understanding of how students respond to and engage in mathematical tasks in

general, and of how this plays out in high performing education systems (such as in China) in particular.

A feature of the wider study, which is made up of this exploratory phase and the subsequent detailed inquiry phase, is the privileging of student voice (Mitra, 2006) as a source of information and knowledge. Instead of working with adult informants, that is, the teachers, to achieve an understanding of how mathematical tasks are set up for and subsequently negotiated with their respective students, the study acknowledges the active roles which students assume in this process, and seeks to investigate it from their perspective. In so doing, it is hoped that the mainland Chinese students' attitudes, beliefs and self-goals will be made explicit, thereby enhancing our capacity to make sense of comparative research studies.

This paper will focus on a part of this exploratory phase of the study, one which seeks to provide answers to the following research questions:

- (1) What types of mathematical tasks are commonly used in Grade 5 and 6 classrooms in Chongqing, China?
- (2) What types of mathematical tasks are preferred by Grade 5 and 6 students in Chongqing, China?
- (3) Through what types of mathematical tasks do Grade 5 and 6 students in Chongqing, China learn the most?

Research design

The methodology being outlined here is applicable only to this exploratory phase of the study, which involves the collection of data and information from more than 1100 students in a major city in mainland China. Underlying the methodology is our subscription to the constructionist research paradigm (Wiersma & Jurs, 2009), which relates to our epistemological stance of constructivism. Thus, the research questions have not been structured in such a way to test particular hypotheses or theories. Indeed, it is evident from the discussion so far that there is a desire to understand the social phenomenon of the enactment of tasks in primary school mathematics lessons, as opposed to one of establishing relationships, determining effects and identifying causes.

This exploratory phase constitutes the first part of the wider mixed methods sequential explanatory design. In this phase, the research method adopted is the survey questionnaire. The 15-item questionnaire developed for and used in the TTML study was selected. Laid out over three A4-size pages, this questionnaire is a mix of Likert-scale items, ranking exercises, and open-ended questions.

The contextual information of several items in the TTML version was changed to accommodate the societal realities in mainland China. For example, a question in item 9 features the context of movie tickets costing \$13 for adults and \$7 for children. These ticket prices were changed to RMB25 and RMB12 respectively, to better reflect the societal context in China. Since student respondents were asked to rank the given mathematical problems rather than solving them, this change of numerical values is not expected to render the Chinese data incomparable to the Australian one. This adapted-version of the original questionnaire was then passed on to our bilingual co-researcher in China for translation into the draft Chinese version.

Validating the translation of questionnaire items

Back-translation of the draft Chinese-language version of the questionnaire – and the subsequent comparison with the original TTML version – was conducted in Melbourne to optimise the equivalence of item content across the two languages. It was believed that culturally-different ways of describing phenomena, and of teaching, might act as blindspots in the process of translating an

item from the English language to the Chinese language. Observed differences in meanings implied by the Chinese expression were discussed and resolved with our co-researcher in China.

We observed examples of how cultural sense-making of pedagogical concepts novel to one's professional setting can contribute to the representation of different ideas. The notion relating to "work on the same problem for more than one lesson" (item 7i) must have been one such novel pedagogical concept: the translated item reads in the following way after back-translation, "work on those questions which have appeared in many prior lessons". Similarly, the notion of open-ended questions must have been relatively new in the Chongqing context, for the item "work on questions where you have to give more than one answer" (item 7iii) became "work on those questions which have multiple ways of solving". Another example is in the ways in which textbooks are used by teachers and students across education systems: "work from a textbook" (in item 8i) was translated into "learn with the textbook".

Some of these threats to item content equivalence and to the questionnaire's experiment validity were due to the multiple possible meanings of non-technical terms in English, which has made it difficult for our co-researcher in China to discern the actual intention of the original question. For example, item 6 asks, "How do you know when you have learnt something in mathematics," in which the term 'when' was used as a conjunction to mean 'during the time that'. The Chinese-language version, on the other hand, demonstrates an interpretation of this term 'when' as being used as an adverb, posing the question of 'at what time', and in so doing, shifting the emphasis of the item from the intended 'how do you know' to 'when'.

After the last translated version of the questionnaire was validated, hardcopies of this finalised version in the Chinese language were then printed, ready for administration in participating primary schools.

Participating schools and students

Data were collected in 2009 from 1109 Grade 5 and 6 students from 15 classes across 3 (state) primary schools in Chongqing city. Six hundred and nine of these students were in Grade 5, and five hundred were Grade 6 students. Chongqing is a major inland city in Southwestern China, situated at the confluence of the Yangtze and Jialing Rivers. This city with a population of more than 31 million is of economic and political significance to China. As is elsewhere in China, and indeed in the East Asian culture, school education is a social leveller, and parents place a high emphasis on their children's achievement in school.

Results

Research question 1

The first research question is: What types of mathematical tasks are commonly used in the Grade 5 and 6 classrooms in Chongqing, China? Items 7 and 8 in the questionnaire provide the information relevant to this question. In each of these questions, respondents were given a list of classroom activities (item 7) and teaching activities (item 8), against each of which a student is invited to tick in the box which corresponds to the frequency of the activity. The collated results are shown in Table 1 below.

As can be seen in Table 1, in terms of classroom activities, Grade 5/6 students in Chongqing were most likely to be engaged in working out how to do questions for themselves (item 7iv), with 70.05% reporting that it took place almost every lesson, and a further 19.63% reporting that it took place about once a week. The question type varies though, as a large percentage also reported doing questions in which they practised what the teacher had showed them (item 7vi) almost every lesson and about once a week. In terms of question/task type, the majority of students reported working on

Table 1
Frequency (Percentage) of Occurrence of Classroom and Teaching Activities

Code	Never	About once a term	About once a month	About once a week	Almost every lesson	Valid n
	0	1	2	3	4	
7i Work on the same problem for more than one lesson	673 (61.29)	137 (12.48)	122 (11.11)	118 (10.75)	48 (4.37)	1098
7ii Make up your own maths questions to solve	228 (20.77)	197 (17.94)	262 (23.86)	325 (29.60)	86 (7.83)	1098
7iii Work on questions where you have to give more than one answer	123 (11.27)	118 (10.82)	285 (26.12)	334 (30.61)	231 (21.17)	1091
7iv Have to work out how to do questions for myself	20 (1.83)	31 (2.83)	62 (5.66)	215 (19.63)	767 (70.05)	1095
7v Work on questions that are about people using mathematics in their lives	30 (2.76)	41 (3.78)	131 (12.07)	363 (33.46)	520 (47.93)	1085
7vi Do questions in which I practise what the teacher showed me	59 (5.40)	102 (9.34)	199 (18.22)	416 (38.10)	316 (28.94)	1092
8i Work from a text book	53 (4.84)	49 (4.47)	111 (10.13)	293 (26.73)	590 (53.83)	1096
8ii Work from a worksheet	74 (6.76)	57 (5.21)	201 (18.36)	525 (47.95)	238 (21.74)	1095
8iii Answer questions the teacher has written on the board	27 (2.46)	45 (4.09)	73 (6.64)	235 (21.38)	719 (65.42)	1099
8iv Work on information from the newspapers or magazines	384 (35.26)	181 (16.62)	271 (24.89)	193 (17.72)	60 (5.51)	1089
8v Use calculators	557 (50.68)	329 (29.94)	116 (10.56)	84 (7.64)	13 (1.18)	1099
8vi Use computers	742 (67.45)	138 (12.55)	98 (8.91)	99 (9.00)	23 (2.09)	1100

questions that are about *people using mathematics in their lives* (item 7v): 47.93% almost every lesson, and 33.46% about once a week. On the other hand, what appeared not to have happened in the Chongqing mathematics classroom is students *working on the same problem for more than one lesson* (item 7i) (61.29%). The other two classroom activities, that is, *students making up their own mathematics questions to solve*, (item 7ii) and *students working on questions in which more than one answer is expected* (item 7iii), did not appear to exhibit dominant patterns of occurrence.

With regards to the teaching activities posed in item 8, the data collected suggest that *student answering questions which their teacher had written on the board* (item 8iii) took place very frequently, with 65.42% citing it as occurring almost every lesson, and a further 21.38% reporting that such activity took place about once a week. The majority of students reported that they are *working from textbooks* (item 8i) almost every lesson (53.83%) and about once a week (26.73%) and *from worksheets* (item 8ii) almost every lesson (21.74%) and about once a week (47.95%). *The use of newspapers and magazines* in mathematics classes was less frequent, it appeared, with 35.26% reporting that it never occurred and 16.62% that it occurred only once a term. The majority of the respondents reported that *use of calculators* (item 8v) and *of computers* (item 8vi) was not very common, with 80% reporting that *computer use* never occurred in their classroom or it only occurred once a term, and 80.62% reporting that *calculator use* never occurred in their classroom or it only occurred once a term.

Given the possibility that teachers may organise their pedagogical activities differently in Grade 6 to prepare students for secondary schooling, we were interested to examine if there were any statistically significant differences between activities in Grade 5 classrooms and activities in Grade 6 classrooms. To this end, the conduct of chi-squared (χ^2) tests at $p < 0.001$ revealed that statistically significant differences exist between Grade 5 and Grade 6 response patterns for all activities except the first three listed in Table 1. For example, as illustrated by Figure 1, with regards to the classroom activity “*Do questions in which I practise what the teacher showed me*” (item 7vi), the examination of the observed cell frequencies with $\chi^2(4, 1092) = 66.75, p < 0.001$ revealed that more Grade 6 (16.39%) than Grade 5 (12.55%) students in Chongqing reported that this activity occurred almost every lesson (coded 4, see Table 1), more Grade 5 (19.23%) than Grade 6 (18.86%) students indicated that this occurred about once a week (coded 3), more Grade 5 (10.90%) than Grade 6 (7.33%) students indicated that this occurred about once a month (coded 2), more Grade 5 (7.23%) than Grade 6 (2.11%) students indicated that this occurred about once a month (coded 1), and more Grade 5 (4.67%) than Grade 6 (.73%) students indicated that this never occurred in their mathematics classrooms (coded 0). This aspect of the results will be elaborated in a future publication.

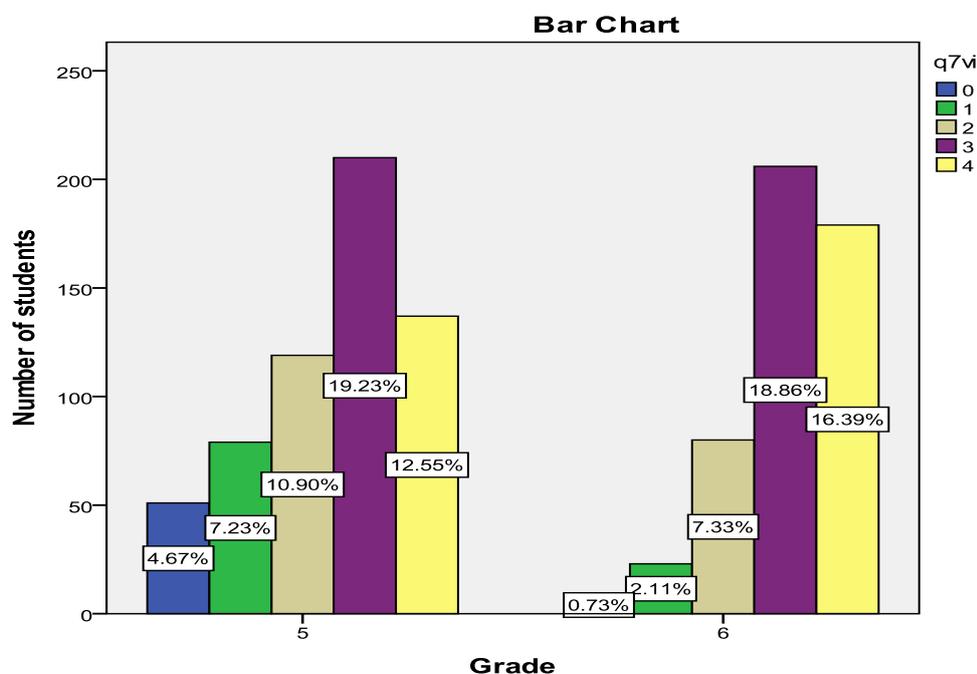

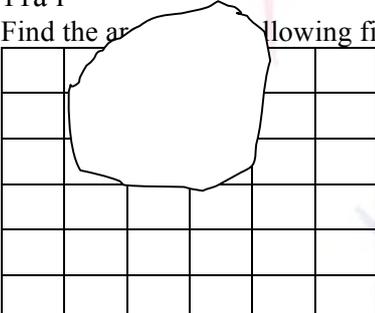

Figure 1. Grade 5 and 6 students’ observed cell frequencies for the classroom activity ‘Do questions in which I practise what the teacher showed me’ (item 7vi).

Research question 2

This question was posed as “What types of mathematical tasks are preferred by Grade 5 and 6 students in Chongqing, China?” Data for this research question came from Items 9 and 11 in the questionnaire. In each of these two items, each respondent was asked to rank a set of three questions according to the extent to which he/she likes the question, where ‘1’ would be placed beside the favourite item, and ‘3’, beside the least liked. The distribution of responses is shown in Table 2 below.

Table 2
Grade 5/6 Students' Ranking of Favourite Mathematical Tasks

Item number and Question	Task type	Favourite	Like next best	Like the least	Valid n
9a i An adult cinema ticket costs RMB25, and a child ticket costs RMB12. How much would the tickets cost for 2 adults and 4 children to watch a movie?	2	514 (47.24%)	463 (42.56%)	111 (10.20%)	1088
9a ii 2 adults and 4 children spent RMB120 on movie tickets. How much might an adult ticket and a child ticket cost?	3	380 (35.12%)	321 (29.67%)	381 (35.21%)	1082
9a iii $25 \times 2 + 12 \times 4 =$	1	377 (37.55%)	286 (28.49%)	341 (33.96%)	1004
11a i Find the area of the following figure. 	1	247 (22.74%)	311 (28.64%)	528 (48.62%)	1086
11a ii If the area of a figure is 10 square units, what might the shape of the figure be?	3	335 (31.54%)	395 (37.19%)	332 (31.26%)	1062
11a iii An athletic track is made up of two straight sections and two semi-circles. The straight section is 100m long. What is the area of the athletic track? 	2	464 (42.73%)	400 (36.83%)	222 (20.44%)	1086

Focussing on question 9 alone, it can be seen from Table 2 that amongst the three question/task types, type 2 (contextualised questions) was nominated the favourite (47.24% of the valid nominations) and the second favourite (42.56% of the valid nominations) question type. This question/task type was also nominated by 10.20% of the students as being the least liked question.

On the other hand, the other two question/task types were nominated as the least liked items. There is a rather similar observation for the three question/task types featured in question 11. The most number of nominations (42.73% of the valid nominations) for the favourite question/task type was associated with type 2 (contextualised questions), and the most number of nominations (48.62% of the valid nominations) for the least liked question/task was associated with type 1 (model/representation/explanation type questions).

Respondents were also invited to provide a reason for the nomination of a particular question as being the favourite amongst the three questions (9i-9iii and 11i-11iii) in each of the two sets of questions (9 and 11). The reasons given by the respondents were coded into 9 categories, as shown in Table 3.

Table 3

Codes for Reasons Cited by Respondents in Ranking Exercise

Codes	
1.	Challenging (more complex, lots of steps / have to think / I learn something new / improve)
2.	Easy to do / understand (instructions clear) / I'm good at this / we do this a lot
3.	Real life scenario
4.	Involves a model / drawing / grid
5.	Multiple solution strategies available, need to devise own strategies
6.	Has more than one possible answer
7.	Fun / I like this type of operation (eg division) or topic (eg area)
8.	Numbers not words
9.	Other

The following bar charts (Figures 2-4) show the percentage of student respondents in each coding category (1-9) for each question in item 9 (9ai, 9aii and 9aiii respectively in Figures 2-4).

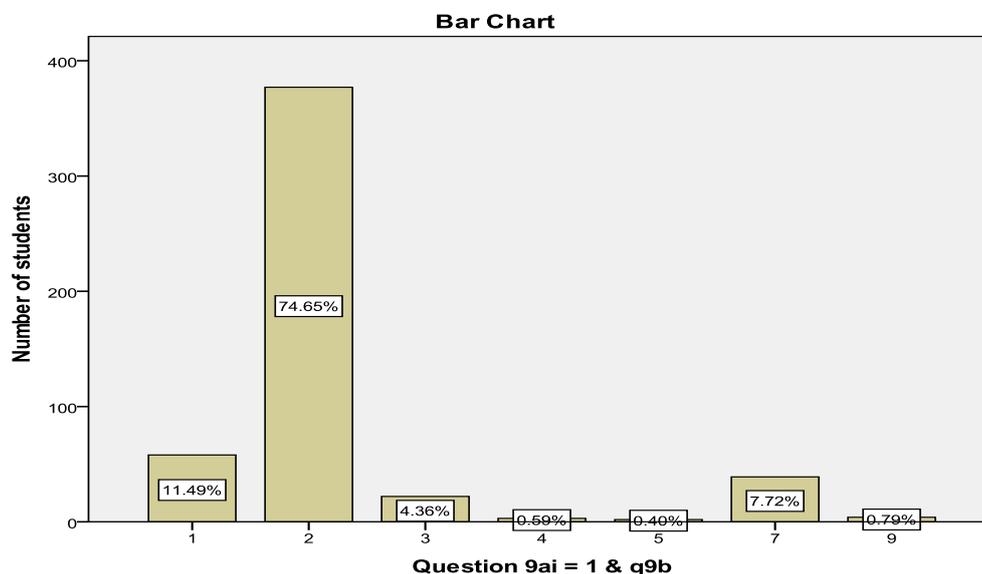

Figure 2. Percentages by coding category for ranking Item 9ai (task type 2) as their favourite.

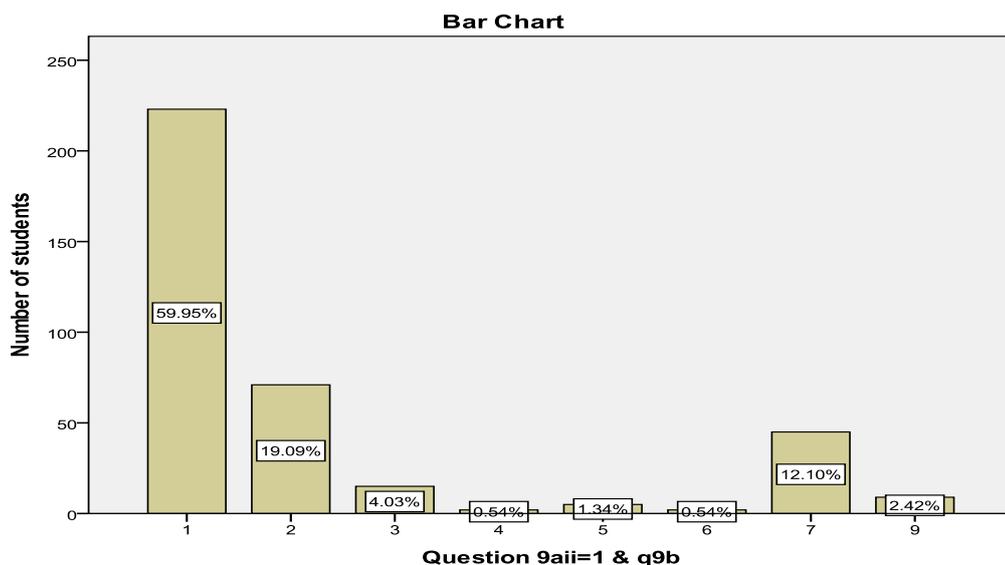

Figure 3. Percentages by coding category for ranking Item 9a ii (task type 3) as their favourite.

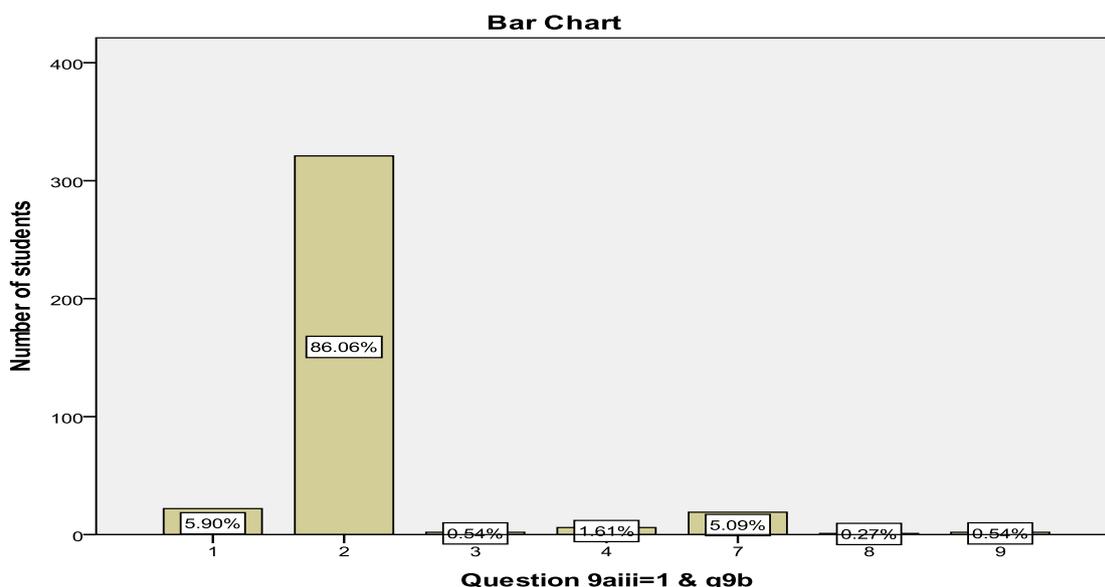

Figure 4. Percentages by coding category for ranking Item 9a iii (task type 1) as their favourite.

It can be observed from figures 2-4 that amongst the Grade 5/6 students surveyed, the majority of those students who ranked Type 1 tasks as their favourite (86.06%) valued these tasks because they are “easy to do / understand (instructions clear) / I’m good at this / we do this a lot” (coding category 2). Students who ranked Type 2 tasks as their favourite did so for one of two dominant reasons: “Challenging (more complex, lots of steps / have to think / I learn something new / improve)” (coding category 1, 11.49%), or “easy to do / understand (instructions clear) / I’m good at this / we do this a lot” (coding category 2, 74.65%). On the other hand, type 3 tasks were ranked favourite amongst students for three dominant reasons: “Challenging (more complex, lots of steps / have to think / I learn something new / improve)” (coding category 1, 59.95%), “easy to do / understand (instructions clear) / I’m good at this / we do this a lot” (coding category 2, 19.09%), or “Fun / I like this type of operation (eg division) or topic (eg area)” (coding category 7, 12.10%).

This examination can be repeated with item 11 of the questionnaire. Figures 5-7 summarise the results for items 11a i, 11a ii, and 11a iii respectively.

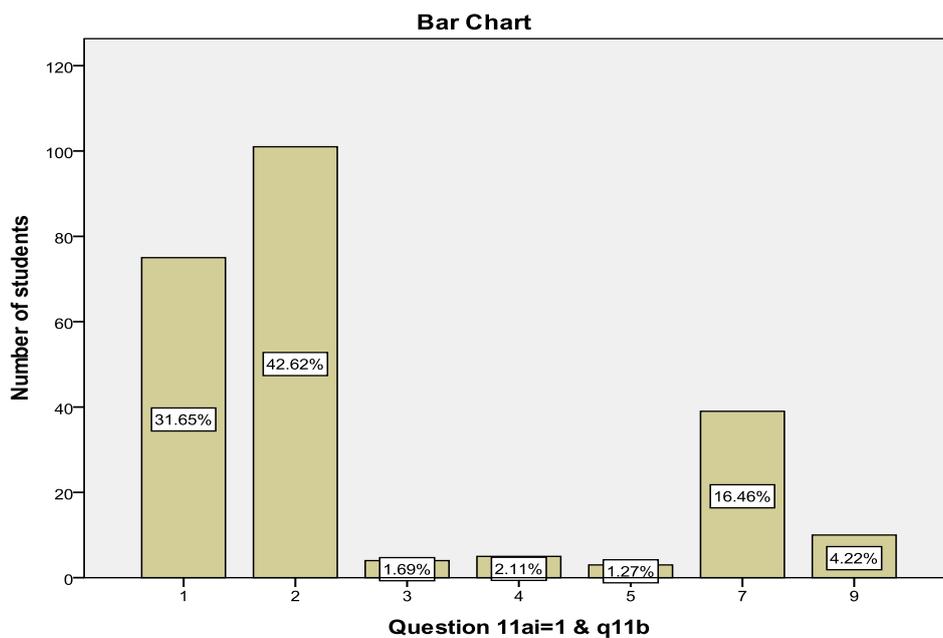

Figure 5. Percentages by coding category for ranking Item 11a i (task type 1) as favourite.

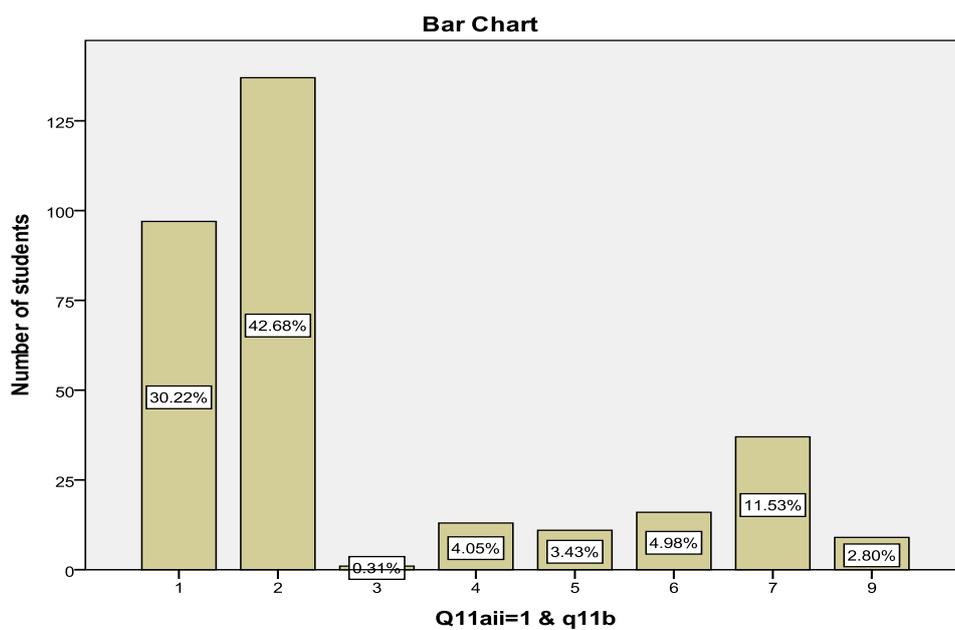

Figure 6. Percentages by coding category for ranking Item 11a ii (task type 3) as favourite.

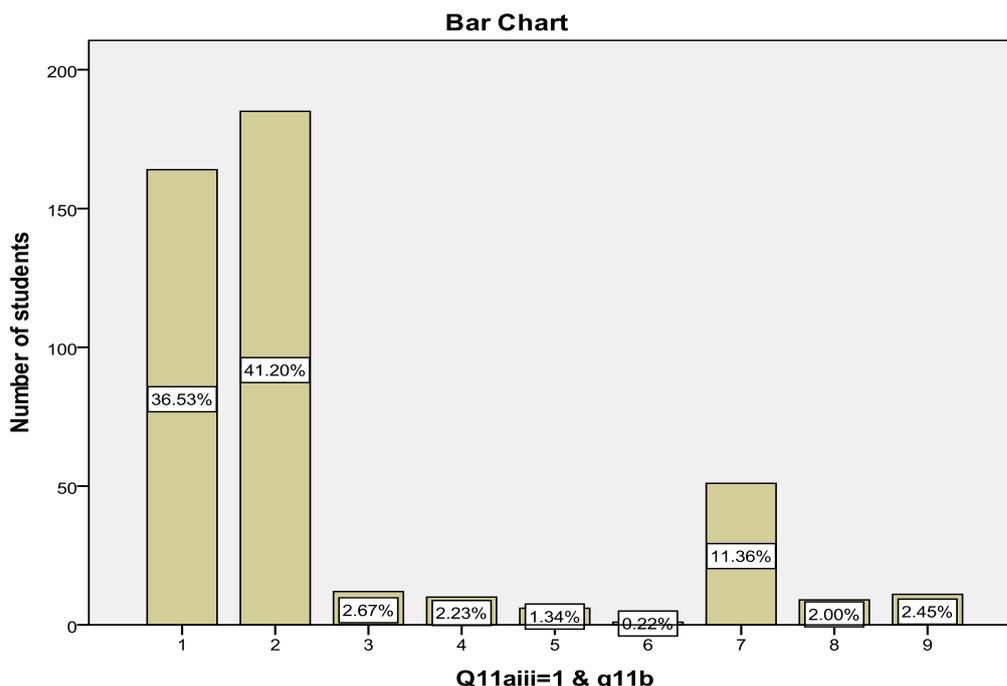

Figure 7. Percentages by coding category for ranking Item 11a iii (task type 2) as favourite.

It can be observed from figures 5-7 that amongst the Grade 5/6 students surveyed, those students who ranked type 1 tasks as their favourite valued these tasks for one of the following three categories of reasons: “Challenging (more complex, lots of steps / have to think / I learn something new / improve)” (coding category 1, 31.65%), “Easy to do / understand (instructions clear) / I’m good at this / we do this a lot” (coding category 2, 42.62%), and “Fun / I like this type of operation (eg division) or topic (eg area)” (coding category 7, 16.46%). Type 2 tasks (item 11a iii) were nominated as favourite by students for the same categories of reasons, namely, coding categories 1 (36.53%), 2 (41.20%), and 3 (11.36%). Similarly, the same reason categories (30.22%, 42.68% and 11.53% respectively) corresponded to student nomination of task type 3 (item 11a ii).

It is worth noting that across both items 9 and 11, student reasons for nominating particular questions as being their favourite amongst task types 1, 2 and 3 were deemed to be dominant in the sense that the reason categories collectively accounted for 84.43% to 91.14% of reasons provided for each question.

Research question 3

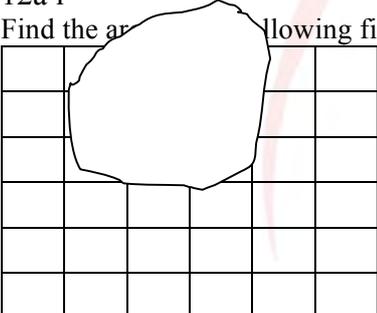

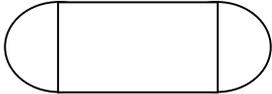

The third research question is: Through what types of mathematical tasks do Grade 5 and 6 students in Chongqing, China learn the most? Responses to items 10 and 12 of the questionnaire provide the requisite data to help us better understand the nature of such tasks. Table 4 summarises the collated frequencies.

Looking across the three types of questions/tasks in question 10, the data shown in Table 4 indicate that the majority of student respondents found themselves learning the most from task type 3 (open-ended questions) (75.88%), followed by task type 2 (contextualised questions) (60.48%), and least from task type 1 (model/representation/explanation type questions) (62.96%). Interestingly, this trend was not observed amongst the three question/task types in question 12. In fact, as shown in

Table 4, it seems that a similar number of respondents associated the most learning with task types 1 and 2, the second most learning with task types 2 and 3, and least learning with task types 1 and 3.

Table 4
Grade 5/6 Students' Ranking of Mathematical Tasks from which they Learnt the Most

Item number and Question	Task type	Learn the most	Learn second most	Learn the least	Valid n
10a i An adult cinema ticket costs RMB25, and a child ticket costs RMB12. How much would the tickets cost for 2 adults and 4 children to watch a movie?	2	167 (16.75%)	603 (60.48%)	227 (22.77%)	997
10a ii 2 adults and 4 children spent RMB120 on movie tickets. How much might an adult ticket and a child ticket cost?	3	758 (75.88%)	161 (16.12%)	80 (8.01%)	999
10a iii $25 \times 2 + 12 \times 4 =$	1	151 (16.17%)	195 (20.88%)	588 (62.96%)	934
12a i Find the area of the following figure. 	1	387 (39.17%)	265 (26.82%)	336 (34.01%)	988
12a ii If the area of a figure is 10 square units, what might the shape of the figure be?	3	266 (27.45%)	345 (35.60%)	358 (36.95%)	969
12a iii An athletic track is made up of two straight sections and two semi-circles. The straight section is 100m long. What is the area of the athletic track? 	2	478 (48.33%)	332 (33.57%)	179 (18.10%)	989

Student respondents were also invited to provide reasons why particular tasks help them to learn most. The same codes as those used in analysing students' favourite task types (see Table 3) were used here. It can be observed that amongst these Grade 5/6 students, the most dominant reason cited for learning the most from type 3 tasks (as represented by item 10a ii) was that of "Challenging (more complex, lots of steps / have to think / I learn something new / improve)" (83.51% of students).

As observed above, student ranking of the three questions in item 12 according to which would have afforded the greatest learning opportunities was rather equivalent across the three task types.

An examination for the reasons which the students attributed to their respective ranking choices revealed that regardless of task type, the one deemed to be helping the students to learn the most was so for the dominant reason category again of “*Challenging (more complex, lots of steps / have to think / I learn something new / improve)*”, made up of 83.20% of students for task type 1, 74.90% of students who ranked task type 2 first, and 74.81% of students who ranked task type 3 first.

Findings

Based on the results presented above, we propose tentative findings in this section. With regards to mathematical tasks which are commonly used in Grade 5/6 classrooms in Chongqing, it was found that the following activities were dominant: working from textbooks and worksheets, answering questions which the teacher has written on the board, answering questions which allow for student practising of what the teacher has shown, and working out how to do questions themselves. On the other hand, the students reported that activities involving working on the same problem for more than one lesson, or activities involving the use of calculators or computers, took place rarely, if at all. Statistically significant differences were found between the responses of Grade 5 and Grade 6 students for 9 of the 12 activities used in this study.

In particular, three task types have been explored in this study. Type 1 tasks pertain to the introduction to or use of models, representations, tools or explanations to exemplify the mathematics; Type 2 tasks refer to contextualised practical situations; and Type 3 tasks are open-ended tasks.

The majority of the Chinese students nominated Type 2 tasks as their favourite or second most liked. On the other hand, most of them nominated Types 1 and 3 tasks as their least liked, and consistently so for the former. Across all task types, one or more of the following three categories was cited as the reason for being nominated most liked: ‘challenging (more complex, lots of steps / have to think / I learn something new / improve)’; ‘easy to do / understand (instructions clear) / I’m good at this / we do this a lot’; and, ‘fun / I like this type of operation (eg division) or topic (eg area)’.

There is no sufficient evidence, however, that favourite task types translate to opportunities where students learn most. This is not to say that there were consistent nominations of the task types through which students learnt best, although Type 3 tasks were commonly cited. What was consistent, however, was the reason students associated with any task type which helped them learn best, that is, ‘challenging (more complex, lots of steps / have to think / I learn something new / improve)’. Thus, it appears that the extent to which students learn best is regulated by student valuing of *challenge*, regardless of task types.

Concluding remarks

Three types of mathematical tasks were examined in this research study. In general, it may be proposed that Grade 5/6 students in Chongqing, China liked to engage with tasks involving contextualised, practical situations most, followed by open-ended tasks; and then tasks involving representations. While a variety of reasons were given for preferring particular task types, a majority of these fall into one of three reason categories, which we will loosely associate with the valuing of *challenge*, *confidence*, and *fun*. In class, on the other hand, these students reported being given tasks involving problem-solving or practice work from textbooks, worksheets and/or questions written on the board, with little or no use of calculators and ICT technologies, nor of extended investigations. Further investigations will be made in the next phase of this study to help us understand better the extent to which these classroom activities match the students’ task type preferences, as well as the nature of the differences in the relative frequencies of use of these classroom activities between Grade 5 and Grade 6 classes and between genders. In terms of the task

types which students learn most with, the data do not show any definitive trend, although there appears to be a skew towards open-ended tasks. Interestingly, student learning from mathematical tasks did not appear to be in line with student preference of task types. However, it seems that student valuing of *challenge* has consistently accounted for those mathematical tasks with which students learnt most. The possibility that effective mathematics learning is associated with particular features of mathematical thinking and activity, and that such values can manifest through a variety of task types, would be one objective of investigation in the next phase of this study, involving targeted inquiry with a sample of participants purposively selected from amongst the 1109 students.

Title: A New Bilingual Instructional Model: Health studies in Thai secondary school level
(Samawathdana R., Chinokul S., & Wattanaburanon A.)

ABSTRACT

The purpose of this paper is to introduce a new bilingual instructional model for Health Studies in a Thai secondary school. Health Studies is one of the most difficult subjects for the bilingual students within an L1 context; the main obstacle being the complicated English topical terminology that is used. Therefore, it made sense that a new instructional model, which incorporated Experiential Learning Theory (ELT) and Content and Language Integrated Learning Approach (CLIL), should be developed. Consequently, in an attempt to promote more effective bilingual learning, this model is now in an experimental stage. The model teaching course for Health Study is named "HEC" (Health Studies module based on Experiential Learning Theory and Content and Language Integrated Learning Approach). So far the student response has been positive in both their attitude to learning and their task performance. HEC has been evaluated by focusing on several different aspects of the model and by using a questionnaire employing a 5-point Likert scale. The model was then analysed by seven qualified experts with an average result of 4.87. It is hoped that this HEC model will contribute to the development of an innovative and effective bilingual teaching model within an L1 context.

Key Words: bilingual, instructional model, Health Studies, Experiential Learning Theory (ELT), Content and Language Integrated Learning Approach (CLIL), HEC, attitude, task performance

1. Introduction

English language is now the most widely taught foreign language in the world. English is the language that people use to communicate through numerous forms of media; libraries, schools, and telecommunication systems. The increasing quantities of teaching materials are also available in English (Crystal, 2003; Richard, 1985). Many studies have supported that language learning is most meaningful when the language is used as the medium of receiving information or in real communicative environments and situations (Genesee, F., 1987; Curtain & Martinez, 1990, p. 202; Baker, C., 1993; Dalton-Puffer, C., 2005). Thus, many countries have provided bilingual teaching by integrating English language content subjects into the classrooms in order to enable learners to develop the ability of using English as a global language.

Thailand is one of a number of countries where the Ministry of Education (MOE) establishes a policy of developing bilingual teaching as part of innovative school projects under a law called Basic Education of Thailand (Ministry of Education, 2008). Teaching health studies at the secondary level is one of the main content subjects which are provided in Thai bilingual education. Therefore, the implementation of the Content and Language Integrated Approach (CLIL) for teaching health studies in English encourages the use of health content discourse in authentic communicative situations.

A study of the needs in a bilingual program in a Thai secondary school where the experimental process take place, indicated that the students had negative attitudes towards health studies, with difficulty in understanding technical terms being cited as the main cause (Samawathdana, 2009). In addition, negative attitudes and low motivation make language learning more difficult. Thus, it is important for teachers to be aware of, and to encourage positive, attitudes in their pupils (Gardner -- Oxford, 2001, p. 168).

Consequently, the development of a new way of teaching to bilingual students is a necessity and a challenge for the teachers. This paper aims to describe the model named "HEC" (The new Health Studies module based on Experiential Learning Theory and Content and Language Integrated Learning Approach). This bilingual teaching model for Health Studies was constructed by synthesising Experiential Learning Theory (ELT) and Content and Language Integrated Learning Approach (CLIL). Though in experimental stages, the expected outcomes of the HEC model are directed at investigating two main areas, health behaviour and the ability to use English for specific content communication.

The details of the research outcome will be presented further after the implementation has been completed. Since the HEC model has been approved by seven qualified instructional specialists, here demonstrated is the theoretical framework, the HEC model, and the model's implementation.

2. Theoretical Framework

2.1 Experiential Learning Theory (ELT)

Kolb created the Experiential Learning Theory (ELT) from the work of Dewey, Lewin, and Piaget (Kolb, Boyatzis, & Mainemelis, 2002). Dewey's experiential educational theory claimed that a way of teaching and learning that values the individual and collective learning is gained by lived experience (Dewey, 1938). Lewin's experiential learning was based on social psychology and the well-known T-Group project where learners can share a common objective, and act together to achieve the learning objectives (Lewin, 1951). Kolb explains, "Stated most simply, Piaget's theory describes how intelligence is shaped by experience." Two of the processes studied by Piaget, accommodation and assimilation, have particular relevance to understanding the ways in which experience informs thinking (see more in Kolb, 1990; Jacobson and Ruddy, 2004, p. 13).

All stressed that the centre of learning lies in the way of processing experiences, in particular, critical reflections on experiences and the meanings we draw from them. Learning in terms of ELT means "the process whereby knowledge is created through the transformation of experience" (Kolb 1984, p. 41). Learners build deep understanding and expertise by cycling through the four steps of the experiential learning cycle: concrete experience, reflective observation, abstract conceptualization, and active experimentation (Kolb et al., 2002).

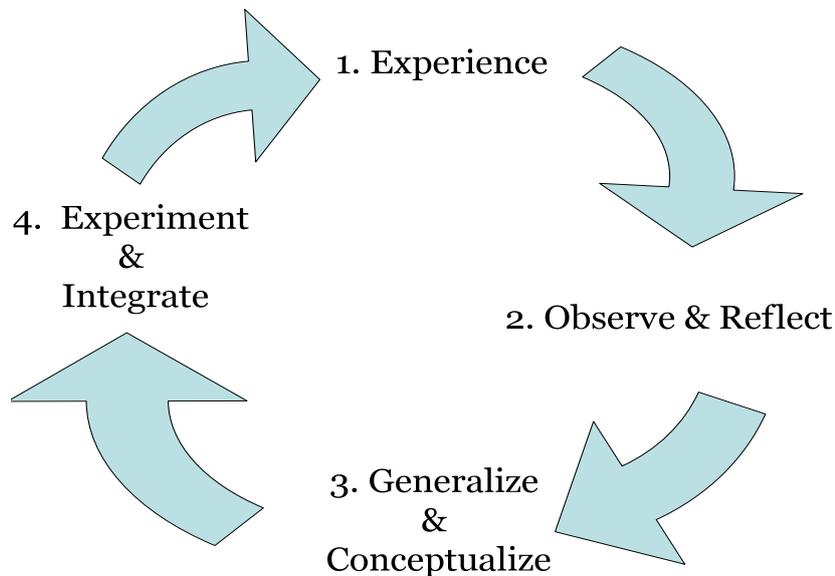

Figure 1: Experiential Learning Theory's Cycle (Kolb, 1984)

- Concrete experience (feelings): Learning from specific experiences and relating such learning to people. Being sensitive to other's feelings.
- Reflective observation (watching): Observing before making a judgement by viewing the environment from different perspectives. Attempting to look for the meaning of things.
- Abstract conceptualization (thinking): Logical analysing of ideas and acting on intellectual understanding of a situation.
- Active experimentation (doing): Having the ability to get things done by influencing people and events through action. Includes risk-taking.

Kolb's ELT provides opportunities for students in leadership programs to explore effective behaviors in handling the myriad of tasks they will face, and it also has generative power to be used as a reflective tool for those who teach in those programs. Others (Armstrong & McDaniel, 1986; Jackson, 2002; Holman, Pavlica & Thorp, 1997; Katz, 1990; Kayes, 2002) have argued that learning how to access all four modes and learning styles can help potential leaders become flexible and discerning in responding to organizational problems. Moreover, ELT encourages students to be passive learners and have a more active role in their classroom. The marketing education literature has proposed numerous activities, such as games and simulations to foster experiential learning (Crookall, D. & Oxford, R. L., 1990; Anselmi & Frankel, 2004; Bobbitt, Inks, Kemp, & Mayo, 2000; Daly, 2001; Gremler, Hoffman, Keaveney, & Wright, 2000; Hamer, 2000; Petkus, 2000).

2.2 Content and Language Integrated Learning Approach (CLIL)

CLIL is a general term that covers diverse ways of using a foreign language in instruction (Nikula, 1997). CLIL has been widely used in Europe since the 1990s, largely due to the language policies. Moreover, the policies were an important part of The Action Plan of the Commission of the European Communities from 2004-2006 urging the member countries to promote language learning and linguistic diversity. It has been written: “CLIL has a major contribution to make to the Union’s language-learning goals. It can provide effective opportunities for learners to use their language skills now rather than learn them now for later use.” As a result, the schools that wished to introduce a CLIL approach were able to receive increased support (Commission of the European Communities, 2003). It is well known that many countries use English as an L2 or as EFL.

When teaching a subject through a foreign language, it is sometimes necessary to use the pupils’ L1 to clarify the content. Especially for young learners, some content can be taught first in their mother tongue and afterwards in the foreign language. In order to make understanding and the language-learning process easier, teaching methods are of an illustrative and concrete character. Teaching is more comprehensive and more concise than when it is carried out in their mother tongue (Nikula & Marsh, 1997, pp. 52–54). The same concepts are repeated several times in different manners. Phrases and expressions related to the school day, repeated day after day, are an important part of the teaching norm. It is sometimes difficult for struggling learners to understand what is being taught in a foreign language, but if familiar with the often repeated routines and structures of instruction being used, learners are able to predict what will happen next. The CLIL research that has so far been conducted on education in Europe suggests that its results are quite encouraging both in terms of language development and subject mastery (e.g. Huibregtse, 2001; J’appinen, 2003; Laitinen, 2001).

CLIL is the use of an L2 in the teaching of non-language subjects (Dalton-Puffer, 2006). According to (Mehisto, Marsh, & Frigols, 2008). CLIL is a tool for the teaching and learning of content and language. The essence of CLIL is the integration of a dual focus: (1) Language learning is included in content classes (e.g. maths, history, geography, science, civics, etc). This means repackaging information in a manner that facilitates understanding. Charts, diagrams, drawings, hands-on experiments and the drawing out of key concepts and terminology are all common CLIL strategies. (2) Content from subjects is used in language-learning classes. The language teacher, working together with teachers of other subjects, incorporates the vocabulary, terminology and texts from those other subjects into his or her classes. Students learn the language and discourse patterns they need to understand and use the content. In addition to a focus on content and language, there is a third element that comes into play. Learning skills constitute the third driver in the CLIL triad. The three goals of content, language and learning skills need to fit into a larger context. There are also principles in CLIL to be aware of in order to apply them into the teaching process. The principles can serve as a reference point for lesson planning. The principles or CLIL drivers can be further broken down as follows into teacher and student outcomes for CLIL lessons (Mehisto, Marsh, & Frigols, 2008).

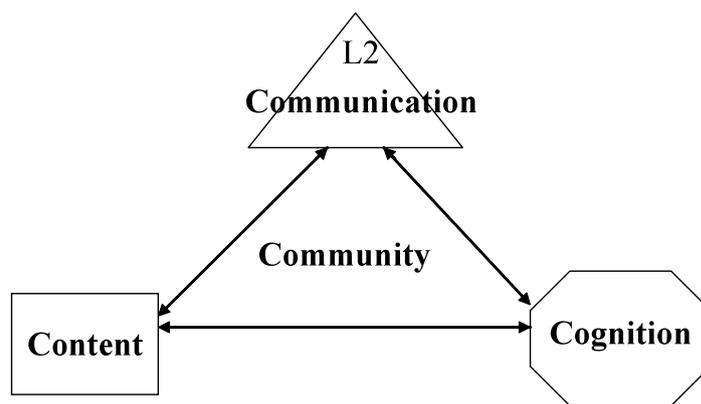

Figure 2: The 4 Principles of CLIL (adapted from Mehisto, Marsh, & Frigols (2008)).

- (1) **Cognition:** Content, language and learning skills outcomes are articulated in co-operation with the student's learning building on the student's existing knowledge, skills, attitudes, interests and experience. The student analyses the achievement of learning outcomes independently, with other students, and with the teacher, then work to set a new goal. The student synthesizes, evaluates and applies the knowledge and skills acquired in several subjects.
- (2) **Community:** Students feel that being members of a learning community is enriching. Students have the self-confidence and skills to work within a group and the local community, balancing personal interests with those of other students. Teachers, (and parents, employers, etc) are partners in their education. Students can define their role within the classroom, the local area and a global context.
- (3) **Content:** Content is clearly linked to the community within and outside of the classroom. Students apply new content and develop related skills through experiential activities. The content is substantive without being overwhelming. Content from various subjects is integrated. Cultural content is integrated into all subjects.
- (4) **Communication:** Students actively use the right to participate in activities and communication in the classroom and in the community. Desk placement, displays on classroom walls and other available resources support learning and communication. Students and teachers co-construct and negotiate. Meaningful language and communication skills are developed in all subjects.

2.3. Health Studies in Thai Secondary Schools

According to the Ministry of Education of Thailand (2008), many schools in Thailand are using or are going to use the Basic Education Core Curriculum B.E. 2551 (A.D. 2008) which replaces the Basic Education Curriculum B.E. 2544 (A.D. 2001). The school where this study was involved used the curriculum under the Ministry of Education (MOE).

2.3.1 The Basic Education Standards of Thai Education under the Ministry of Education's curriculum for Health Studies also covers the content of Physical Education, together they are composed of five themes as presenting in Table 1 (The Ministry of Education of Thailand, 2008).

However, the Standards for Health Studies is only composed of four of the five themes, the third theme is reserved exclusively for Physical Education. Secondary level has eight main subjects: Maths, Sciences, Social Studies, Thai Language, Foreign Languages, Home-economics and Technology Studies, Art Studies, and Health and Physical Studies. Health and Physical Studies are unique in that just one period of each is provided per week. There are two terms in an academic year, with each term comprising 20 weeks. Since the Health Studies curriculum represents 0.5 of a credit (one term), it consists of 20 periods (hours). Table one illustrates theme contents with indicators and learning standards for Mathayom 2 or Grade 8 (See Table 1).

Table 1 Standards and Indicators for Health Studies in Mathayom 2 (Grade 8) (Thai Ministry of Education, 2008)

Key Stage Indicators for Grade 8	
Strand 1: Human Growth and Development	<p>Standard H1.1: Understanding of nature of human growth and development</p> <ol style="list-style-type: none"> 1. Explain changes in physical, mental, emotional, social and intellectual respects among teenagers. 2. Specify factors affecting growth and development in physical, mental, emotional, social and intellectual respects among teenagers.
Strand 2: Life and Family	<p>Standard H2.1: Understanding and self-appreciation; family; sex education; and life skills</p> <ol style="list-style-type: none"> 1. Analyse factors influencing attitudes about sexual matters. 2. Analyse problems and effects of having sexual intercourse at school age. 3. Explain methods of self-protection and avoid sexually transmitted diseases, AIDS and unwanted pregnancy. 4. Explain the importance of gender equality and conduct themselves appropriately.
<p>Stand 3: Movements, Exercises, Games, Thai and International Sports</p> <p style="text-align: center;">This theme is exclusively Physical Education.</p>	
Strand 4: Health Strengthening,	Standard H4.1 : Appreciation and skills in health strengthening; maintaining

<p>Capacities and Disease Prevention</p>	<p>one's health; disease prevention and strengthening capacity for health</p> <ol style="list-style-type: none"> 1. Choose to use health services with proper reasons. 2. Analyse effects of technological applications on health. 3. Analyse medical advancement affecting health. 4. Analyse relationship of the balance between physical and mental health. 5. Explain basic characteristics and symptoms of those who have mental health problems. 6. Recommend methods of self-conduct for managing emotions and stress.
<p>Strand 4: Health Strengthening, Capacities and Disease Prevention</p>	<p>Standard H4.1: Appreciation and skills in health strengthening; maintaining one's health; disease prevention and strengthening capacity for health</p> <ol style="list-style-type: none"> 7. Develop their own physical capacities so as to meet the criteria prescribed.
<p>Strand 5: Safety in Life</p>	<p>Standard H5.1: Prevention and avoidance of risk factors; behaviours detrimental to health; accidents; use of medicines; addictive substances and violence</p> <ol style="list-style-type: none"> 1. Specify methods, factors and sources of assistance and rehabilitation for drug addicts. 2. Explain methods of avoiding risk behaviours and risk situations. 3. Apply life skills for self-protection and avoid emergent situations conducive to dangers.

2.3.2 Health Studies learning process as suggested by The Ministry of Education of Thailand, (2008)

The goal of Health Studies is to encourage good health and an improved lifestyle for individuals, families and communities. Students can gain knowledge and self-confidence and apply their

knowledge to daily life. Students must be aware of their health and physical ability. It is important to strive to build a good and safe lifestyle based on Thai standards. There are a variety of learning processes in the physical and health education group. They depend on a student's abilities, needs and interests. There is an emphasis on activities such as planning, practice, tests and assessments in order to improve decision-making. Activities include encouraging good health and active learning. Students must practice management and communication skills, as well as be responsible and able to face problems. They learn to take care of their own bodies and health.

2.3.3 Learning Measurement and Assessment as suggested by Thai Ministry of Education, (2008)

Learning measurement and assessment is necessary for learning management. The measurement and assessment of students is useful in many ways. For example, past information helps to monitor students' progress, adjust activities to meet students' needs, help students become aware of their own ability and learning development, discover new things and solve problems. The National Education Act B.E. 2551, Section 26, states clearly that schools must evaluate students. Teachers have to evaluate students in many areas, including their development, behavior, learning techniques, participation in activities and examinations before receiving a final grade. Therefore, teachers should evaluate students based on the following principles, so that the Health Studies' learning process is in agreement with the National Education Act:

- Formative Evaluation and Summative Evaluation covers knowledge, skills, processes and values. The emphasis is on using the evaluation results to improve teaching and learning processes and achieve the curriculum goals.
- Authentic Learning and Assessment reflects students' ability and performance.
- Assessment during Teaching and learning processes evaluates the work and work processes of learners.
- Student Participation involves self-evaluation, evaluation by friends or groups of friends and evaluation by related persons.
- Evaluation of Students in All Areas includes behavior, observation of learning patterns, and participation in activities and tests that are suitable for each grade level and subject.

2.4 Designing an instructional model

Instructional models provide procedural frameworks and steps for preparing a basis of instruction for classrooms with a systematic production of instruction. They incorporate fundamental elements of the instructional design process including analysis of learners' needs, determining goals and objectives (Braxton, S., Bronico, K., & Looms, T., 1995). Models help to visualize the overall plan of teaching and evaluating processes, classroom management, and content planning. A model should be judged by how it mediates the designer's intention, how well it can share and distribute a work load, and how effectively it shifts focus away from itself toward the object of the design activity (Ryder, 2001). Instructional models prescribe how combinations of

instructional strategy components should be integrated to produce a course of instruction (Braxton et al., 1995).

An instructional design model is a three-phase process. In the first phase, a needs assessment is performed. This phase is followed by a design phase. In the third phase, instruction is developed and implemented. In this model, all of the phases involve a process of evaluation and revision. The Hannafin Peck design model is simple but elegant in the way in which all three phases are connected to "evaluate and revise". This may not be a model designed for a novice, but its focus on constraints in relation to quality and complexity is appealing (Hannafin, M. & Peck, K., 1988).

Rapid Prototyping Design Model is a four-level process that is intended to create instruction for lessons as opposed to entire curricula. The process stages include performing a needs analysis, constructing a prototype, utilizing the prototype to perform research and installing the final system (Tripp & Bichelmeyer's, 1990).

Bloom's (1976) Model of School Learning is an input-process-output model. It is based upon extensive analysis of research literature and Bloom's own research. Instead of the age-old thinking that there are good learners and poor learners, Bloom believed there were faster learners and slower learners. The model has three categories: student characteristics, instruction, and learning outcomes. One of the strengths of this model is that Bloom considered the role of attitudes in the instructional process, such as the subject matter, school, and attitudes towards oneself as a learner. It is also interesting that Bloom's model presented time factors as an outcome of instruction. Learning rate, which is a time factor, is important because the learning process skill has been identified as a major goal of instruction, in addition to content area achievement.

To synthesise a bilingual instructional model for Health Studies based on ELT and CLIL, the model was constructed by recruiting the components of an instructional model, on which a needs analysis was conducted beforehand. (See Figure 3)

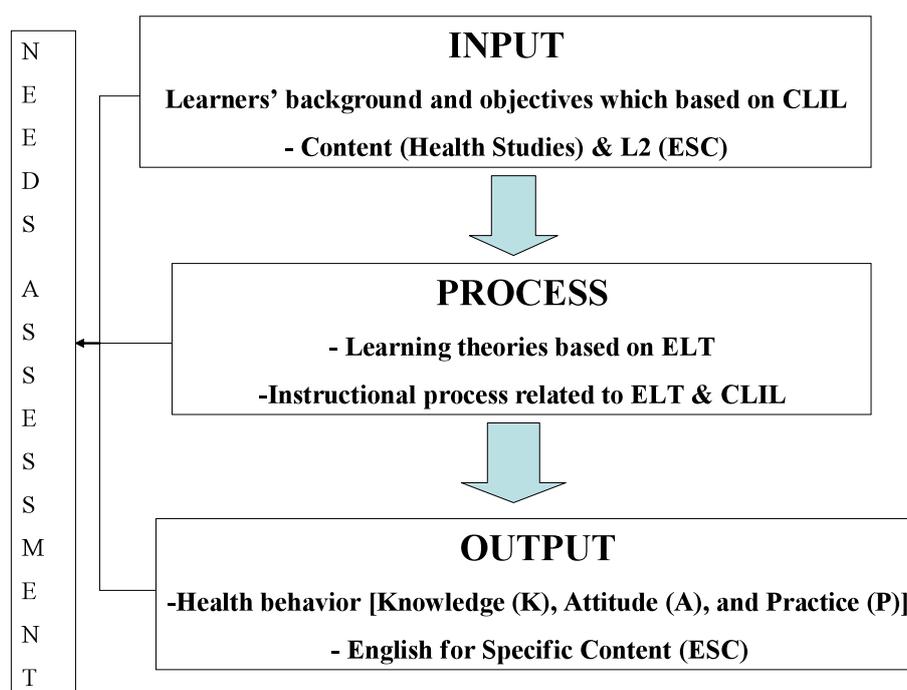

Figure 3: Study Framework for Developing HEC Model

The components of instructional models from Braxton's et al. (1995) and The Hannafin Peck (1987) was integrated into Bloom's model in order to produce a new clarified model.

- Learning theories which suggest that the effectiveness of instructional models are based on learning theories (Braxton et al., 1995).
- Needs assessments which provide goals and objectives of learning, content, learning processes, and evaluating processes (Hannafin and Peck, 1987; Tripp and Bichelmeyer, 1990).
- Input-process-output (Bloom, 1976)

This HEC model relied upon the curriculum and instructional expertise of seven qualified experts as well as their vast experience. Also, an advisor and a co-advisor, of a well-known Thai institution, assisted in guiding the design. The experts responded to questionnaires and evaluation forms concerning the model handbook, lesson plans, and evaluation instruments using the five-point Likert scale (Likert, 1931) with an overall average of 4.87. In addition, the suggestions in the open-ended parts mostly focus on the Health Studies' content and the evaluation pattern. Comments made addressed the amount of content involved and the issue of time consumption, as well as there being concerns over the evaluation pattern whereby the items in both the pre- and post-tests were not balanced with the content of the units. The suggestions were taken into consideration and alterations were made to the lesson plans to solve the time issue, and the test blueprint was reorganized to better measure the evaluation system.

Presently, the experiment is at its 11-week mark which implies that two units and a midterm examination have been covered. It has been determined that both the response from the learners' attitudes toward the learning process as well as task performances garnered positive results.

3. The new Health Studies module based on the Experiential Learning Theory and the Content and Language Integrated Learning Approach (HEC)

Objectives in HEC model aim to develop the learners in two areas: (1) To enhance the learners in health behavior; and, (2) To develop the ability of the learners in communicative skills focusing on English for Specific Content. The content used in HEC model is demonstrated by giving an example of a Health Studies course for learners in Grade 8. The model learning process, evaluation, and instructional steps are here described as the following parts.

3.1 HEC model content recruited the use of the Health Studies content for Grade 8 learners under the Ministry of Education of Thailand curriculum to ensure that the learners are able to cover the curriculum of Thailand at the same time as the non-bilingual programme learners. (See Table 2).

Table 2 Unit Planning for Health Studies M2 (Grade 8) for Term 1 Academic Year 2010

Lesson No.	Unit/Content	Weighting Score (%)	Number of Learning Periods	Week No.
1	Introduction	-	1	1
2	Unit 1 Learning Teen Sexuality	20	4	2-6
3	Unit 2 Sexually Transmitted Diseases & Public Health Agencies in Our Community	15	5	7-10
	Midterm Examination	10	1	11
4	Unit 3 Teen Social Lives	10	2	12-13
5	Unit 4 Teenage Emotions	10	2	14-15

6	Unit 5 Teen Risks	15	4	16-19
	Final Examination	20	1	20
	Total	100	20	

Scoring system for Term 1: scores throughout learning (formative evaluation) 80: score for final examination 20 (summative evaluation)

3.2 HEC model learning process

The model is developed and adapted using Kolb’s ELT cycle and integrated the CLIL approach with respect to the learning theories of cognition, behavior, motivation, and social within the learning process. To design the units and lesson plans, the teacher should be aware of each stage; for example, observing and reflecting the experience, conceptualizing using debriefing for the learning, and then creating a new experience.

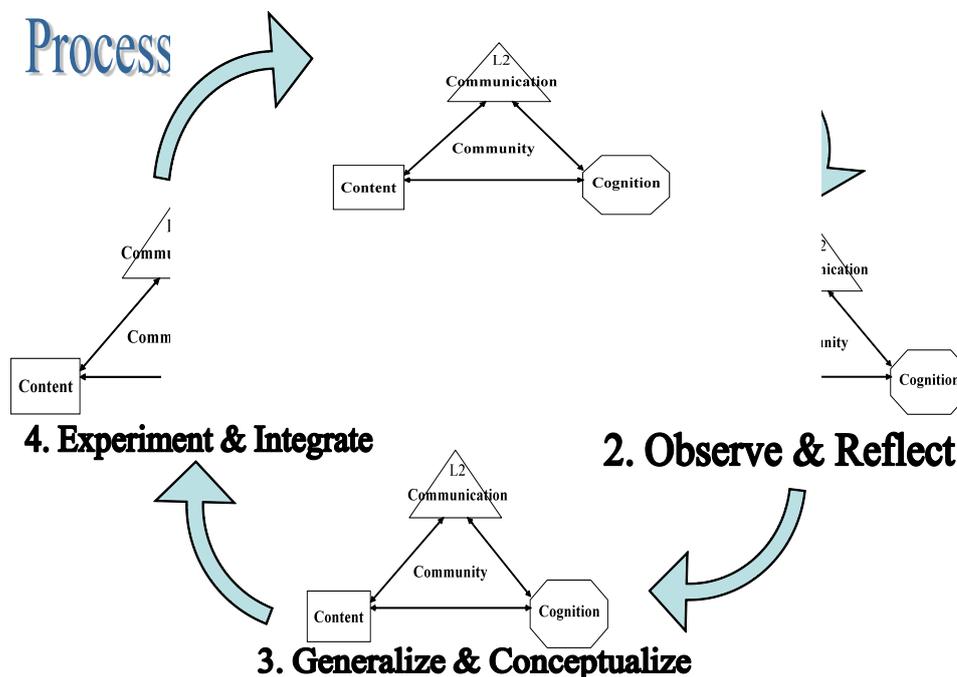

Figure 4: Learning process of HEC model

Figure 4 demonstrates a part of the model, the learning process of HEC model which is composed of four learning stages. Each learning stage integrates subject matter content (Health Studies) and communicative skills related to English for Specific Content (ESC) of the four dimensions of

CLIL approach, content, communication, community, and cognition. The four integrated ELT and CLIL are (synthesised from Kolb, 1984 and Mehisto, Marsh, & Frigols, 2008).

(1) Experience: acquiring experience by practice doing. The teacher provides activities by simulating the situation or environment which encourages the learners to learn new experiences relating to the Health Studies content in L2 (ESC). The learning processes should apply both the content of a subject matter and develop ESC skills through experiential activities. Therefore, the learners should be able to apply the learning to their real lives and be able to adapt themselves into their social community.

(2) Observe & Reflection: when the learner consciously reflects back on that experience. The teacher provides activities by simulating the experience relating to the content subject and LSC. The simulated experience should involve activities which the learners can observe and reflect upon using thinking processes individually and then discuss with others using LSC communicative skills.

(3) Generalize and Conceptualize: where the learner attempts to conceptualize a theory or model of what is observed. The teacher provides activities which learners can debrief to manage and categorize the ideas of the learning content. The learning content is related to the subject matter (Health Studies) and L2 (LSC). The LSC is focused on technical terms using communicative skills while the learners are participating in the learning process. In this stage the learners should generalize and crystallize the ideas into abstract concepts.

(4) Experiment and Integrate: where the learner is trying to plan how to test a model or theory or plan for a forthcoming experience. The teacher provides authentic activities and encourages the learners to apply and integrate the abstract concept from the third stage into the concrete by practicing doing (experiment) using Health Studies content and LSC communicative skills. The students should be able to produce a new experience by performing or presenting their new creative abstract concept into their new real life experience.

3.3 HEC model evaluation

The evaluation in HEC model focuses on two main areas which are health behavior and English for Specific Content (LSC) communicative skills. The first area, health behavior, in this context means knowledge, practice, and attitude toward health content. The second area, LEC communicative skills, means the ability to use LSC for writing, speaking, reading, and listening skills. The evaluation composes of learning measurement and assessment by planning a formative evaluation in each unit plan using both qualitative and quantitative data. For qualitative data, teachers observe learners' performance during the learning process, and for quantitative data, teachers analyze the qualitative data then transfer this data into quantitative data by constructing scale criteria. Table 2 presents an example of selected topics from the Health Studies content which shows the weighting score between the learning process, midterm, and final score. The grading scale for evaluating the learners is simple and is no different from the other subjects at the secondary school level. For example, a Grade 4 has a score range of 80-100; a Grade 3 is

from 70-79; a Grade 2 is 60-69, a Grade 1 is 50-59, and a score under 50 represents a failure of the course.

4. Implementation of the Instructional Steps in the HEC Model

The model is an ongoing experiment in a Grade 8 or Mathayom 2 bilingual programme with 47 learners studying about half of all subjects, including Health Studies, using English as a medium of learning. The experiment will take 20 weeks (one hour a week). The mixed methods of qualitative and quantitative have been used to collect the data to be analyzed. Namely, pre-test compared with post-test, task performance for each unit, questionnaires for learning attitude and semi-structured interviews will be included as part of the data to be analyzed. For preparation purposes, a guideline of the steps is shown as part of the HEC model.

Step 1: Planning and preparing, is the step that the content (Health Studies) teacher and L2 (English) teacher co-operate in planning and the selecting of the content for the learners. Then the content teacher creates lesson plans and prepares activities following the HEC model.

Step 2: Arranging and managing the learning process, is the step at which the teacher provides the learning process of the HEC model (See Figure 4). The activities may apply the use of games and simulations into the process. The important four stages of the HEC model must be included.

Step 3: Collecting and evaluating learning outcomes, is the stage where the teacher designs the measurement and assessment of the learners by using formative and summative evaluation from the HEC model. The evaluation covers knowledge, practice, attitude, and ESC communicative skills performance toward the learning objectives.

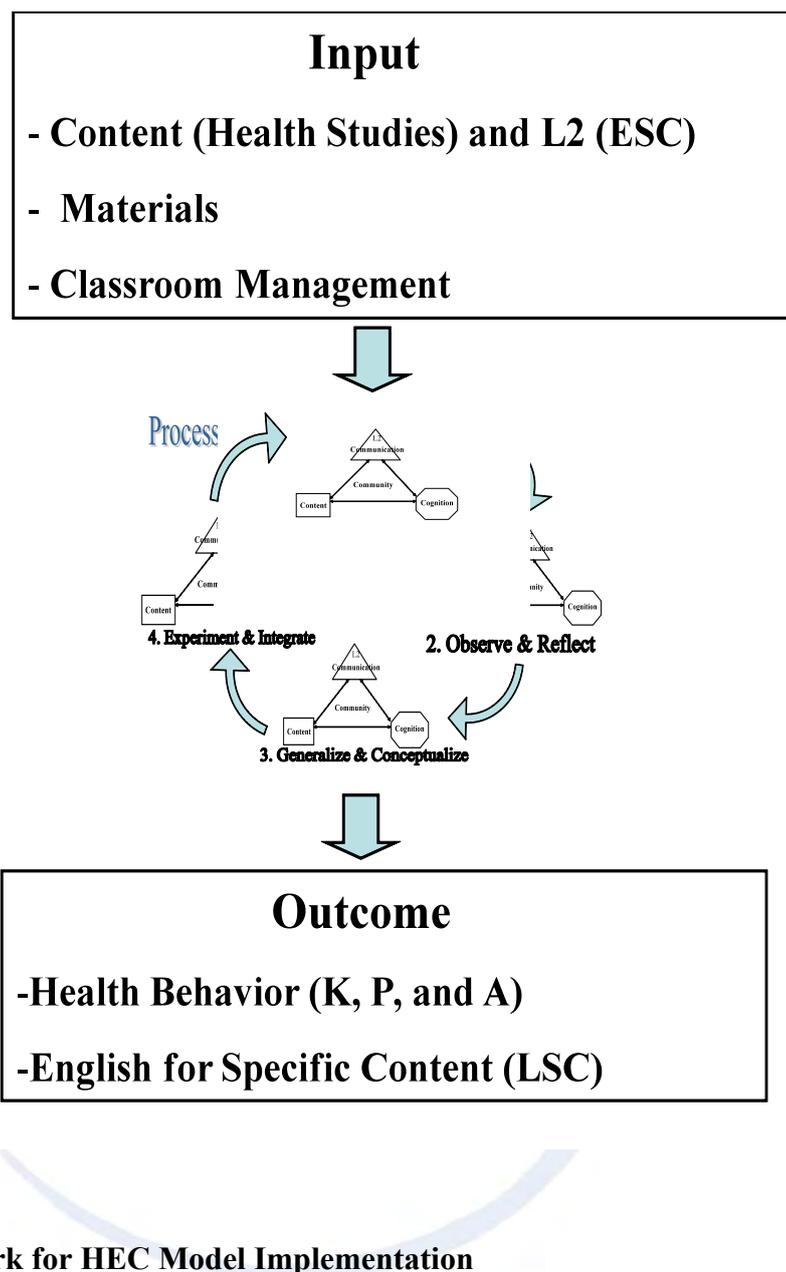

Figure 5: Framework for HEC Model Implementation

Figure 5 illustrates the framework used to implement the model into a bilingual classroom.

- Input for learners are Health Studies content and ESC communicative skills
- Process of learning in the HEC model as demonstrated in Figure 4
- Outcome of learning in the HEC model which focuses on health behavior (knowledge, practice and attitude) and ESC communicative skills performance

5. Conclusion

The purpose of this study was to construct a new Health Studies instructional model for bilingual teaching in an L2 context to benefit and fulfill the needs of learners and learning attitudes for Health Studies. The model is based on the Experiential Learning Theory (ELT) and the Content and Language Integrated Learning Approach (CLIL) by synthesizing Kolb's Learning Circle and The 4 Principles of CLIL by Mehisto, Marsh, & Frigols (2008). The reviews of learning theories based on ELT and CLIL, the components of instructional model design, as well as the nature and content of a Health Studies curriculum have been included in order to introduce the HEC model into an L1 environment in an innovative manner.

Why is the HEC model based on both the Experiential Learning Theory and the Content and Language Integrated Learning Approach? Focusing first on experiential learning, this study has reviewed the effectiveness of applying ELT into the learning process and for designing classroom activities, providing situations in which students are able to acquire and assimilate the technical terms of a particular language. It has therefore been determined that applying ELT into the HEC model seems to suit a major part of the Health Studies' learning process within a bilingual secondary classroom. With respect to the use of CLIL for this model, the idea of providing and integrating the subject matter (Health Studies) with the learning content knowledge (ESC) for the multi-purpose of learning is the intended aim of the CLIL approach. This idea seems to perfectly meet with the learning objectives of the HEC model. In other words, though ELT and CLIL equally offer effective and beneficial strengths, it has been deemed most advantageous to utilize both the Theory and the Approach to maximize the Model's potential.

It must be pointed out, however, if one is considering a design using the HEC model, users should be aware of each school's core curriculum learning standards concerning the subject matter, as well as the national educational requirements, and be prepared to facilitate all.

The future results from the HEC model experiment, which is at the half-way point of its investigation, may suggest further details once completed. In the interim, this model may be adapted and altered in a suitable way to instruct bilingual learners in other subjects. It is also hoped that this model will be beneficial in being able to solve some problems regarding a better understanding of the content knowledge as well as the learner attitudes.

Influence of interactive white board (IWB) for cognitive load theory used in elementary school regular-classroom and special education

Ho-Hsiu Lin

National Tainan University

1. Introduction

In this research, cognitive load theory was used to understand the nature of study. Interactive white board (IWB) has been adapting to education of elementary school. Information and communication technique were combine to find the balance of teaching and learning. The main purpose is to enhance the ability of teaching program design for teacher.

1-1. Cognitive load theory

Cognitive load theory was based on concept of human factors. This theory was widely used to discuss the nature and application of education. John Sweller presented the structure and function of cognitive load theory in 1994.[1,2] Paas, Renkl, and Sweller maintain the use of cognitive load theory in the process of cognition and teaching design and the closed relationship of teaching design and working memory load.[3]

There are three types of cognitive load, intrinsic cognitive load, extraneous cognitive load and germane cognitive load respectively. Inner and outer load are the main problem for the students those have learning difficulties. Different problem sources of disabilities need different program skill.[4,5]

The lack of Long-term memory will influence learning ability directly. Capacity of working memory includes working memory and deal efficiency. The result was direct influence by over and uniform information.[6]

Lewis and Mayer maintain that students will confuse with wrong understand in word questions.[12] These results show that teaching design combines cognitive load and base model knowledge will have best performance.

1-2. Information and communication technique

Information and communication technique (ICT) were apply to education in recent years. Bransford's research showed that there were no obviously relationship between the amount of funds and the will of teachers and the performance of

learning.[7] In this research, the influence of ICT will be particular discuss. The structure of ICT teaching environment based on IWB was showed in figure 1.[8-11]

Figure 1. IWB environment structure

2. Experiments

2-1. Research structure

This research is focus on the different mathematic teaching media. Interactive white board, overhead project, traditional paper educations were used to discuss the influence of learning efficacy. Structure of research was showed in figure 2.

Figure 2. Research structure

2-2. Research participant

Participant in this article includes: 90 persons of third grade regular classroom, 6 persons of third grade mathematical difficulties. In these participants, there are 30 persons in IWB education, 30 persons in overhead project education and 30 persons in traditional education. And all 6 persons who have mathematical difficulties were in IWB education. All regular students were come form same school but different classroom. Students come from same school have same society status

2-4. Research tools

Self-made drawing book: traditional education model used copies for students, computer science was used in overhead project, and IWB used the electronic white board.

Self made questionnaire: these questionnaires were focus on the learning ability, degree of satisfaction and same direction of learning. There are 15 questionnaires and scoring in 5 degree. The contents of these questionnaires were cognitive load theory arranging anew.

Self made interview form: opinion of researcher and parent of students in math difficulties in exam.

Self made teaching daily record: records of relation information about students in the exam, includes data, subject, materials, self survey, individual responds, back coupling of same generation, special event, province thinks and equal direction degree.

3. Results and discussions

3-1. Regular students

3-1-1. Questionnaire results

The result of students of third grade with three education models was show in table 1. In exam F, questions 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14 and 15 were obvious significance. These items were comparing below and the result was showed in table 2.

Table 2. Turkey of different model

Question	Learning efficacy of different model		
	IWB \square OP \square 1 \square 2 \square	OP \square TP \square 2 \square 3 \square	TP \square IWB \square 3 \square 1 \square
2	-.500*	-.067	.567*
3	.100	1.900*	-2.000*
4	-.300	2.133*	-1.833*
5	-.300	2.267*	-1.967*
6	-.167	2.133*	-1.967*
7	-.200	2.100*	-1.900*
8	1.667*	1.000*	-2.667*
9	1.733*	.467	-2.200*
10	.167	1.800*	-1.967*
11	.067	2.000*	-2.067*
12	.067	2.233*	-2.300*
13	-.367	2.600*	-2.233*
14	-.133	2.500*	-2.367*
15	.133	2.567*	-2.700*
Total score	1.967	25.633	-27.601

* $p < .05$, ** $p < .01$, *** $p < .001$

3-1-2. Analysis

Situation of fills in answers of students in third grade showed that IWB and project have better performance in learning ability and degree of satisfaction than traditional teaching model. Software representation of IWB was better than project. There were no obviously different in other degree of direction. For overall benefit, overhear project can replace parts of IWB system.

3-2. Mathematics difficulties students

3-2-1. Questionnaire results and diary records

Generalize of questionnaire and daily record, effect of information raise sharply. For example, students feel exciting and satisfied when they record their ideas through IWB. In the other, students show high interaction and individual learning in reading and discussing self-made drawing book.

3-2-2. Interview results

Direction degrees were arranged through interview and province thinks. Process of answer questions by students can be record by software. It is easy to arrange by teacher in the future. Students are easy to be attracted by sounds and light when computer system was used. The key factor of learning of student is the guidance of teacher. No matter in design of education contents or body language. Self-confidence increase is one of the most effects in IWB. Students can be a teacher one day.

4. Conclusions

The result of this research showed that equipment limited, operate difficulties, class media, teacher style and difference of student must be concerned with IWB education.

Abstract. The purpose of this study is to investigate how early childhood teachers use fictions and nonfictions to facilitate young children's learning and development. 7 teachers working in different public kindergartens in southern Taiwan participated in this study. Research data included observations, interviews, and records of classroom book collections. Data were then analyzed inductively. Preliminary findings of this work-in-progress study indicate that the participant teachers present fictions and nonfictions in different ways and for different purposes. In addition, the children in their classrooms have more access to fictions than to nonfictions.

Key Words: Informational Text, Nonfiction, Kindergarten, Children's Literature

Introduction

Children's literature plays an important role in early childhood classrooms; children's books facilitate children's emotional, social, intellectual, and linguistic development (Temple, Martinez, Yokota, & Naylor, 2002). Children's books are especially important when it comes to literacy instruction (Vacca, Vacca, Gove, Burkey, Lenhart, & McKeon, 2003). Previous studies have showed that by employing appropriate instructional strategies with children's books, such as read alouds (e.g., Duke & Kays, 1998; Palmer & Stewart, 2005), drama and play (e.g., Putnam, 1991), Directed Reading-Thinking Activity (e.g., Tompkins, 2003), literature circles (e.g., Stien & Beed, 2004), book club (e.g., Heller, 2006), and so on, children's literacy skills will be enhanced.

Children's literature includes a wide variety of genres, such as traditional literature, poetry, fantasy and science fiction, realistic fiction, historical fiction, informational books and biographies (Temple et al., 2002). Among them, fictions or narrative stories are seen as the

most accessible and meaningful form for young children to learn (Egan, 1988). On the other hand, researchers also emphasize the importance of nonfictions or informational books (e.g., Pappas, 1991). They suggest that the ability to read and write informational texts is critical (Duke, 2000). Children without this ability might encounter difficulties as they move to upper grades (Chall, Jacobs, & Baldwin, 1990). Due to the fact that texts in different genres present ideas in different ways, it has been suggested that children's ability to read and write one genre does not transfer from the competence with other genres (Donovan & Smolkin, 2002; Duke, 2000). Fictions generally include the following elements: times and places, character(s), a beginning event, a problem, attempt(s) to solve the problem, outcomes, and resolution (Vacca et al., 2003). Nonfictions on the other hand include the following commonly seen features: topic presentation, description of attributes, characteristic events, category comparison, final summary, and afterword (Pappas, 1987). Therefore, teachers should provide opportunities for children to explore different genres and help children develop the ability to read both efferently and aesthetically (Rosenblatt, 1991).

As research focused on the use of fictions and nonfictions in early childhood settings gets more and more attention in recent years in other countries, research related to this area is still needed in Taiwan. Therefore, the purpose of this paper is to present the preliminary findings of our work-in-progress study that investigates how early childhood teachers use fictions (stories) and nonfictions (informational texts) to facilitate young children's learning and development. Specific research questions include: (1) In what context and under what circumstances do teachers use fictions or/and nonfictions? (2) In what ways do teachers present fiction and nonfiction books to young children?

Methods

7 teachers (all females) working in different public kindergartens in southern Taiwan participated in this study. A description of the 7 participant teachers is outlined in Table 1.

Table 1. Description of Participant Teachers

Participant Teacher	Age	Educational Background	Years of Teaching	Children's Age level
A	34	Bachelor's Degree	12	5
B	35	Pursuing Master's Degree	11	Mixed (4 & 5)
C	38	Pursuing Master's Degree	17	5
D	34	Master's Degree	7	5
E	35	Bachelor's Degree	10	4
F	31	Bachelor's Degree	8	4
G	41	Pursuing Master's Degree	16	4

Three types of research data were collected. (1) Observations: These teachers were invited to choose two books, one fiction and the other nonfiction, and read/present these books to their students. Their presentations were videotaped and transcribed. (2) Interviews: Semi-structured

interviews with these teachers were then conducted. During the interviews, the participant teachers were asked to describe their reasons for book selections, their observations of children's responses and reactions, and their own perceptions of their use of children's literature. (3) Classroom book collections: Titles and genres of books to which children had access were also recorded.

The following steps were followed to analyze the research data: (1) Teachers' presentations and interviews were videotaped/audiotaped, transcribed verbatim, and annotated. (2) Significant meaning units were marked and extracted. (3) A list of emerged codes was created, compared and contrasted. (4) A list of emergent themes was created and listed.

Preliminary Findings

Data analysis is still ongoing. The following is a summary of our preliminary findings. (1) The participant teachers use fictions and nonfictions for different instructional purposes. The teachers tend to use fictions to teach children moral lessons or to guide children's behaviors, while nonfictions are used more often in formal thematic unit activities to provide children concrete facts or knowledge of the world. (2) The participant teachers use more calm, formal language to present nonfiction books; however, their presentations of fiction books tend to be in the form of oral language with dramatic expressions. (3) When presenting nonfiction books, the participant teachers tend to focus more on the pictures or photos. Written texts sometimes are skipped and technical vocabulary is simplified or replaced. When using fictions, teachers present both illustrations and texts, and normally the entire story plots will be introduced. (4) The participant teachers often select books that connect to children's life experiences, whether fictions or nonfictions. (5) While the participant teachers report that the books they select for children are 50% fictions and 50% nonfictions, however, the classroom book collections contain much more fictions than nonfictions.

Improving the Speaking Ability of Engineering Students at Khon Kaen University by Using an Oral Presentation Task.

***Nuchsara Choksuansup **Suttirat Rujikietgumjorn ***Karl Eric Griffith
Faculty of Humanities and Social Sciences, Khon Kaen University, Thailand.**

ABSTRACT

The purposes of the study were to investigate the effect of participation in oral presentation on students' speaking ability of engineering students and to investigate the students' opinions toward oral presentation.

The subjects of the study were 30 randomly selected students who were studying in fourth year, Faculty of Engineering, Khon Kaen University. This study was conducted for nine weeks in the second semester of the academic year 2009.

The methodology was focusing on enhancing students' speaking ability through the individual oral presentation tasks. The pre and post speaking tests were employed to evaluate the interview skill, and the results showed how students applied the improved skill in a different context. Other research instruments were teacher, peer feedback and students' opinion questionnaire.

The results revealed that after participating in the oral presentation course, the post-test scores were significantly higher than the scores at 0.05 level. The analysis from students' opinion questionnaire revealed that the students had a positive opinion towards the oral presentation course.

The results could be summarized that oral presentation is effective for increasing the students' speaking ability and it is recommended that the course should be further used as a tool for language classes.

Key Words: Oral presentation task, Speaking ability

Introduction

As the most used language, English is referred to the global language, world language and international language (Graddol, 1997; Jenkins, 2006; Kachru, 1991; McKay, 2002; Modiano, 1999; Nunn, 2007). This shows that English is now important and becomes a powerful language in the world. Moreover, there are 700 million to 1 billion English speakers in all regions of the world (Crystal, 2003). In Thailand, English has been taught as a foreign language for many years since the primary school to the university levels (Ministry of Education, 1999). However, Thai students cannot perform in English well, especially in speaking skill (Aoki, 1999; Maurice, 1986). Brown (1994) stated that speaking skill is difficult for foreign language learners because it requires the ability to choose the appropriate elements in the social interactions. There are several reasons why Thai learners cannot speak well, especially for non-English major students. For example, they are too shy to speak and they are worried of making mistakes or losing face; they do not know how to speak; they tend to use their mother tongue rather than the target language and they lack opportunities to practice. Moreover, the Thai curriculum and teaching methodology are possible factors. In the 1996 academic year, the teaching of English mainly focused on reading and grammar rather than speaking (Ngogbungkla, 2007; Fungchomchoei, 2005; Saezhong, 2005; Siriphotchanakorn, 2005; Burudpakdee, 2004).

Accordingly, this results in many problems in Thailand, especially for industry. In 2006, Seagate decided to invest a new plant in Malaysia and Singapore instead of Thailand. Since the unqualified engineers available in Thailand were the main factor for their decision (Russell, 2007). This situation affects the Thai economy. In 2010, more than 14,654 engineers will be unemployed because foreign companies will invest their projects in other countries (Russell, 2007, p.13). Cochrane & O'Donoghue (2008) stated that future engineer graduates are confronted with the rise of challenging in the competitive world. In addition to engineering skills, clear English communication and excellent oral presentation skills are required to become successful engineers in globalization world (Ali & Kassim, 2006; Cochrane & O'Donoghue, 2008). Students must be able to use appropriate language to convey the message and outstanding presentation skills not only academic setting, but also at workplace setting (Elainel, 1995). For engineering students in Khon Kaen University, English is taught as an ESP (English for Specific Purposes) course. Engineering students have to study eight credits of English; English for Science and Technology I and II and Technical English for Engineering (Khon Kaen University, 2008). These subjects are provided to improve English skills of engineering students to support their future career prospect. Although they have learned English in many courses, they still have a problem in communication. The problem may be because they have limited chances to practice speaking. Moreover, they do not have confidence when they have to speak.

To develop students' competence and increase opportunities to practice in communication, task can be a good support for teachers (Nunan, 1996). Moreover, task is a movement compatible with communicative competence that supports language learning in the classroom and it will help students to interact with the real world. The popular task widely used in communicative language classroom is oral presentation (Siriphotchanakorn, 2005). Oral presentation can be used to help students to practice speaking. This is because in oral presentation process, students have to search and prepare specific information, organize the idea to make a clear presentation. Furthermore, students have to rehearse their presentation to make it accurate and fluent before giving the presentation. This should enable them to speak more effectively. It is obvious that when students give an oral presentation, it involves speaking, listening, interpreting and asking and answering

questions, which are considered a kind of communicative activity. Oral presentation also helps students construct knowledge on various topics and develop speaking and thinking step-by-step to achieve positive results (Osborn, 1994).

This study wants to promote the benefit of oral presentation when it is used in the classroom. Moreover, it will give more opportunities to engineering students to practice their English for communication. The main purposes of this study are 1) to investigate the effects of participating in oral presentation on student's speaking ability of engineering students at Khon kaen University 2) To investigate the students' opinion toward the use of oral presentation. The research questions were as follows

1. Does oral-presentation improve students' speaking ability?
2. Does oral presentation provide a positive opinion toward English language?

Literature Review

The main topics reviewed for this study are studies on English for Specific Purposes (ESP) education, needs analysis, communicative competences, communicative tasks and oral presentations as a task. Also presents and compares related research findings.

1. English for Specific Purposes (ESP)

English for Specific Purposes has been defined as an approach for language teaching which is based on the learner's reasons for learning (Hutchison & Waters, 1987). The basic question for ESP is why the learner needs to learn a foreign language. Therefore, needs can be defined by the reasons students are learning English, and those reasons can change study methods (Hutchison & Waters, 1987). Nowadays, industry is developing very fast and many foreign companies locate their new plants in Thailand. Therefore, ESP is very popular, especially at universities. Strevens (1988), for example, stated that ESP has several advantages. First, learners know what they need to learn. Content is specially designed for each group of students because they know what they need. Second, students have motivation to learn in order to achieve their specific purposes, which are different from general English needs. In addition, ESP is like an investment because students know what they need to learn before making the decision to study. However, the most important characteristics of ESP are focusing on learners' interests and motivating them so that they will be able to manage real situations in their future careers. For engineering students, they may have to communicate at work by using English language, so ESP is necessary for them.

2. Concept of needs analysis

A needs analysis reflects the student's ability to understand the linguistic features of a target situation (Hutchison & Waters, 1987). The identification of needs is the method used to explain the problems and solutions. Robinson (1991) defined *needs* as an activity, including collecting information, in order to serve the learners' study and job requirements, what the learner needs to learn and the personal purposes to their study or their job requirement. Titcomb (2000) defines needs analysis as a method of identifying and evaluating needs in a community. Engineering students around the world need to work with foreigners nowadays, not only in Australia, America and Europe, but also in Thailand. Evidence indicates that globalization influences industrial needs and global engineers must be able to communicate on cross-national

projects. For this reason, Thai engineers need to practice communicative language skills in English in order to prepare and adjust themselves to face the new century (Riemer, 2002).

3. Communicative Competence

The basic idea of communicative competence is the ability to use language suitably in a real situation and to have more than just grammatical competence in order to communicate effectively (Hymes 1972). Hymes' ideas about communicative competence affect the field of second and foreign language teaching. It can help ESL/EFL teachers promote and encourage students' communicative skills. In addition, communicative competence requires that teachers provide activities, exercises and materials that will facilitate and expedite the acquisition of English (Burudpakdee, 2004). Moreover, They stated that ESL/EFL teachers should concentrate on tasks that will support students in improving their competence in communicating and using appropriate language levels (Marton & Ramsden, 1988).

For engineering students, one serious problem is that they lack the motivation to learn English because they think English is difficult for them (Raimaturapong, 2008). Thus, it is necessary for English teachers to encourage them to learn English or to find some materials or interesting tasks in order to support their learning. Giving an oral presentation is one important task that allows an engineering student to learn and practice the kind of English that he will encounter in the new globalized millennium (Ali & Kassim, 2006).

4. Communicative Tasks

Classroom tasks are important to develop students' English speaking competence. Tasks may also be called activities, and an activity can consist of various kinds of things that the teacher assigns students to do (Nunan, 1996). The Thai Ministry of Education (1999) has stated that tasks are activities that can be used to help teachers and learners in learning English. Focusing on speaking, speaking tasks are activities that concern speakers in using language for the purpose of success in an important goal or objective in a speaking situation. Finally, tasks are any activities that a teacher assigns to students; moreover, tasks are defined as language use in language learning contexts (Sari, 2004). Nunan (1996) suggests that communicative tasks contain a goal, input, activities, setting and role. The input of tasks might be verbal or non verbal. A task is not an exercise but an activity, for the activities must relate to input. The goal of tasks is to improve students' communicative competence. Finally, the setting can be a classroom or group work outside of class. Besides, teachers should be responsible for creatively adding to role play settings by encouraging students to try to participate in classroom activities. Also important, however, is that students enjoy doing the activities in class (Nimkannon, 2006).

5. Oral presentation as a Task

Oral presentation is one kind of speech often given in a business, technical, professional or scientific environment (Mandel, 1993). On the other hand, Eggleston (2003) stated that whenever you are asked to appear in front of one or more people for the purpose of explaining, educating, convincing, or otherwise conveying information to them, you have a presentation. Nowadays, oral presentations are becoming more important in the business world. Therefore, it is necessary to provide students practice in giving oral presentations in their careers.

To understand oral presentation skills; how oral presentations help students develop their speaking abilities, it may be necessary for students to learn oral presentation skills. Hall (1996) classified presentation skills into seven elements: content, organization, non-verbal communication, visual aids, fluency, pronunciation, vocabulary and grammar. Content focuses on the interest level of information and the clarity of the key points. Organization contains the

components of introduction, thesis, supporting examples and details, and conclusion. Non-verbal [noun] relates to using eye contact and body movements. Visual aids are quite important because they can attract the audience's attention and can be created by considering the situation and content. Fluency is determined as the message is delivered by considering how the speaker uses notes or memorization. Pronunciation consists of accent, tone, and stress on key words. Vocabulary and grammar should be concise, clear and smooth.

Siriphotchanakorn concludes there are four benefits of giving oral presentations: students 1) practice English speaking, 2) collaborate in the classroom, 3) increase their confidence in speaking English in front of people and 4) practice presentation skills. McGovern (1997) states that oral presentations are a good way to let students express themselves in English and also give the teacher a chance to listen to the students. In addition, it is claimed that oral presentations promote students to practice speaking and encourage both speakers and listeners to become productive partners in the ESL/EFL classrooms (Abe, 1999). As a result, students who are both speakers and listeners can share some ideas and information before giving oral presentations. After giving oral presentations, students might be asked to discuss with, or provide comment for, their friends. This activity helps students interact with the real world, give them more chances to practice English speaking, organize ideas, and increase their self confidence. Therefore, it is likely to help them enhance their English speaking ability.

Research Methodology

The population or focus group of this research was fourth year industrial engineering students in the second semester of the 2009 academic year at Khon Kaen University, Thailand. Thirty students were randomly selected as the participants.

The design of this present study was one-group pre-test and post-test. This means the sample firstly did the pre speaking test. Then, they were participated in oral presentation course for 9 weeks. During the course, students were required to do 3 oral presentation assignments. After finishing the course, they were asked to do the post speaking test.

The research instruments of this study comprised of 1) pre- post speaking tests, 2) oral presentation assignments, 3) observation checklist, 3) peer and teacher feedbacks, 4) students' opinion, 5) oral presentation guidebook and short example video.

Research procedure and data collection

The collection of data took place during the second semester of the academic year 2009. To provide a clear illustration of the data collecting process, the research procedure is presented as figure 1. Details on the collection of the data are explained as follows.

1. First, students took the speaking pre test. In the test, students were interviewed about their personal information and topics related to their future careers. Student interviews were recorded by videotape. Two assessors marked these tests.

2. Students then took the course for three hours per week for nine weeks. In each week, the researcher taught students how to give oral presentations in various situations and also gave them key words that are often used in giving oral presentations. Students were assigned to do three oral presentation tasks on different topics according to the results of the needs analysis. The reason for using different topics was to prevent students from memorizing speech for just one topic. However, students were provided with the topics beforehand in order to prepare themselves. One session of the course was reserved for teaching reading in order to teach the students how to read, summarize and come up with the main ideas of their sources. An extra session called a "rehearsal session" was arranged so the students could practice on a stage. This helped them become aware of their problems and their mistakes. In addition, students had an hour

and a half per week to study by themselves (watching the oral presentation video and searching for information).

3. All of the students' presentations were recorded and rated by one rater and the researcher using an observation checklist. The other students also gave peer feedback to the presenter by using the peer feedback checklist. Teacher feedback was provided for students in the form of written comments.

4. The researcher set aside class time for discussion and special activities intended to point out student problems and provide opportunity for further training.

5. Students took the post test. They were interviewed on the same topic as the pre test (on personal information and their future careers).

6. Students were asked to give their views on using oral presentations to study English communication on the student opinion.

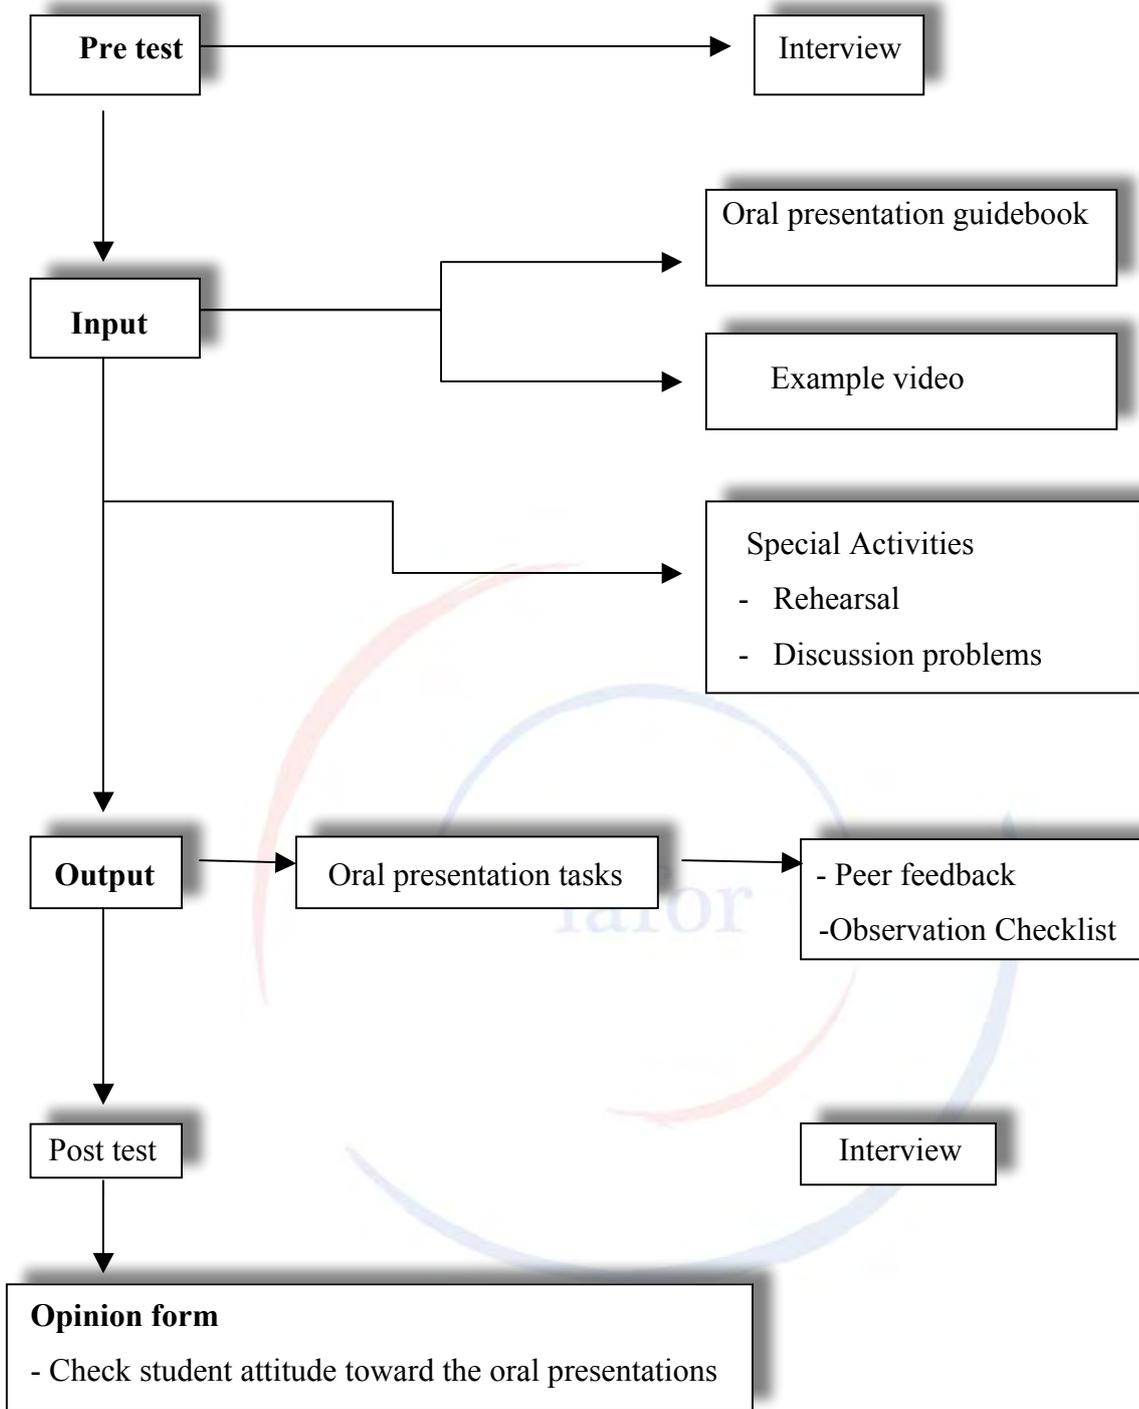

Figure 1 Research procedure

Data analysis

The data was analyzed by the various methods; it can be divided into qualitative and quantitative types. The data gained from research instruments and its statistical methods are described as table:

Table 1 data analysis

Research Instruments	Data analysis method	Result gained
1. pre and post speaking test	mean and SD and T-test	Scores determined the improvement of students' speaking ability after participating in oral presentation course.
2.The oral presentation assignments	mean and SD	Students' scores of 3 oral presentation assignments represented the students' improvement while participating through the course.
3. The students' opinion form	Mean, SD and Grouping.	Students' opinions toward the oral presentation course.
4. Teacher and Peer feedback	Mean, SD and interpreting	Students' improvement after they got some feedbacks and how students response to the feedbacks.

The result of the study

1. The result of the Pre and Post speaking tests

The objective of the interview pre and post tests was to examine the participants' communicative, or speaking and listening abilities, before and after taking the oral presentation course. Each student was interviewed for five minutes in each test. Their pre and post speaking test scores were assessed by two raters following the analytic scoring scale. The comparison was made between pre and post test. It was shown as the table below:

Table 2 The comparison between the pre-test and post-test scores

Pre-test Score (36)		Post-test Score (36)		Paired Differences		T-value	Df	p*
Mean	S.D.	Mean	S.D.	Mean	S.D.			
22.16	4.16	27.51	4.00	-5.35	2.58	-11.357	29	.000

2 tailed-test

*p<0.05

Table 2 shows the mean score of post-test ($\bar{X} = 27.51$, S.D. = 4.00) is greater than the score of the pre-test (= 22.16, S.D. = 4.16). The t-test analysis points out that the change in the mean scores is significant at $p < 0.05$. This indicates that students improved their speaking abilities after they participated in the oral presentation course. The findings gained from comparing the pre and post speaking test scores in order to examine the improvement in the students' speaking abilities, it could be generally concluded that the teaching of the oral presentation technique positively affected their speaking abilities. Because the pre and post speaking tests were of an interview type, it follows that the oral presentation technique can help students apply their speaking skills in a new circumstance.

2. The results of the oral presentations assignments between learning in oral presentation course.

There were 3 assignments during the course which aimed to determined students' progresses. These assignments were scored by two raters; the results of the assignments were analyzed as follows.

Table 3 The scores of each assignment (between test)

Statistics	assignment 1	assignment 2	assignment 3
\bar{X}	12.01	12.98	13.87
S.D.	2.62	2.24	1.88

The data from table 3 shows the data from the oral presentation assignments showed that students gradually improved their oral presentation skills from the first assignment to the last assignment. This indicated that continuously practice of oral presentations increased the students' oral presentation skills, which was an important factor in the development of their speaking abilities. An oral presentation is therefore one useful method for foreign language instructors, and they should be added to the curriculum as one type of task to promote students' English speaking skills.

In addition, the result of the pre and post speaking test and the oral presentation assignments were analyzed to examine the reliability and correlation between the raters. The results indicate that the inter-rater correlation on the pre and post speaking tests and the three oral presentation assignments were high and significant at $p < 0.05$. Moreover, the post test correlation score was higher than the pre test, emphasizing the reliability of the data on students; improvement after learning English communication through oral presentation.

3. The results from teacher and peer feedback

3.1 Teacher feedback

After collecting all of the comments for the first oral presentation assignment, reading from their script was the students' main problem. Students tended to read their scripts the whole time. Most of them seemed not to understand what they were talking about. They made very uncomfortable presentations with lots of information but without organization.

After students received their feedback, they had two weeks to correct their errors and prepare themselves for the second presentation. Students seemed to develop in some ways but there were still some mistakes. On the second oral presentation, most of the students used transition words much more effectively. They now knew when and how they could use them. Moreover, they had more preparation time than for the first oral presentation assignment. Although they still used

scripts, they did not, in general, read it the whole time. It was clear from the words they used that they understood more about their topics, and they could answer their classmates' questions quite clearly and without difficulty. They spoke with more confidence but still had some grammatical mistakes and mispronunciations. For example, students made errors like "*I will going to work in the big company*" or they missed to pronounce some final sounds in words such as "*knowledge*" and "*ignorance*". From the first oral presentation assignment to the second oral presentation assignment, students gradually reduced the frequency of their mistakes. Furthermore, students asked for more comments and suggestions on how they could make their presentations better.

Finally, on the third oral presentation assignment, the students showed their strongest improvement. The researcher, as the teacher, noticed a big change in their development between the first oral presentation assignment and the third oral presentation. The students could speak longer and they prepared better. The students presented their talks more confidently and systematically. They could give more examples and use their own experiences to support their presentations. Every student used appropriate transition words and seemed to understand the information clearly before they talked. They used more body language and gestured properly to make their presentations more attractive. The students performed well on the question and answer part of their presentations as well, inviting the audience to ask questions and responding quite well. They acted more professionally and knew how to handle unexpected situations. However, there were still some mistakes, such as with pronunciation and structure, but the incidence of these problems depended on students' baseline knowledge. Those starting with more problems needed a much longer time to solve them. Nevertheless, it was clear that the oral presentation course successfully developed the students' confidence and presentation technique.

3.2 Peer feedback

The peer feedback helped train students to take more responsibility in class. Besides practicing for their talks, students needed to listen to their friends as well. Data was collected from both the rating scale and open-ended sections of the checklists (total = 116 scores). The content of the peer feedback is summarized in the Table 4 below.

Table 4 Peer feedback results

Evaluation statement	Oral presentation Assignment 1 116 (%)	Oral presentation Assignment 2 116 (%)	Oral presentation Assignment 3 116 (%)
1. Good preparation	95.52 (82.34%)	98.24 (84.68)	105.23 (90.71%)
2. Clear pronunciation, easy to understand	95.05 (81.93%)	99.25 (85.56%)	102.52 (90.96%)
3. Good eye contacts and gestures	97.52 (84.06%)	98.14 (84.60%)	102.76 (88.58%)
4. Good media	97.88 (88.37%)	99.52 (85.79%)	103.70 (89.39%)
5. Good organization	95.47(82.30%)	99.82 (86.05%)	103.70 (89.39%)

To summarize, the peer feedback forms revealed to the presenters the opinions of the audience on their presentations. The results show that the students agreed that their peers improved in their oral presentation techniques and speaking abilities in many ways. Furthermore, they had to evaluate their classmates, so they knew what criteria were necessary for their own presentations. However, it is noticeable that even though students were trained before evaluating their peers, they still seemed to be too kind. It might take much more time to train them to give and accept critical comments. Regardless, peer feedback effectively encouraged students to do better on future presentations.

4. The result of students' opinion toward oral presentation

Table 5 Students' opinions toward oral presentation

Statements	Mean	S.D.	Interpretation
1. Oral presentations are interesting to give?	4.33	0.547	Agree
2. Oral presentations are interesting to listen?	4.00	0.643	Agree
3. Oral presentations encourage me to speak English	4.30	0.702	Agree
4. Oral presentations help me improve my English speaking abilities.	4.33	0.661	Agree
5. Oral presentations can encourage me to study English.	4.20	0.761	Agree
6. Oral presentations help me develop my grammar and vocabulary.	4.07	0.691	Agree
7. Oral presentations help me gain more confidence.	4.27	0.691	Agree
8. Oral presentations improve my critical thinking skills and help me organize my thinking better.	4.13	0.681	Agree
9. Oral presentations prepare me for studying in other subjects.	4.10	0.795	Agree
10. Oral presentations prepare me in applying for a job.	4.43	0.568	Agree
11. Oral presentations will be useful for me in my future career.	4.63	0.556	Strongly agree
Overall opinions	4.25	0.483	Agree

The results in table 5 showed that the students thought the oral presentation course was useful for improving their speaking ability and prepared them in applying for a job. The average of the students' overall opinion towards the oral presentation course was 4.25 which meant that in general students had positive views toward the use of oral presentation technique.

Additionally, the students were asked to reply the open-ended question at the end of the questionnaire. The answers from the open-ended were additional opinions on the comments, problems and suggestions on improving speaking abilities by using oral presentation. They stated

that they had more confidence and more chances to practice. They know their mistakes and how to solve them. Also they required more time to do this course.

Discussion

This discussion part is based on the two hypotheses: oral presentation enhances students' speaking ability, and students had positive opinion toward oral presentation. The discussions are presented as follows.

1. Oral presentation enhances students' speaking ability.

The first discussion focuses on the reason why students improved their speaking abilities during the course. In the oral presentation process, students needed to rehearse many times in order to make their talks accurate and fluent. This related to the studies of Levis and Grant (2003), Seazhong (2005) and Siriphotchanakorn (2005), who studied about the effect of participating in oral presentations. The studies show that when students rehearse their presentation many times, this can help them improve their presentation technique and their speaking skills. They get more chances to practice and they realize some of their mistakes before giving their presentations. This enables them to speak more effectively.

They also could listen to the comments and feedback provided by their teacher and peers. This supports the findings of Reilly (1988), Dobie (1999), King (2002), Seazhong (2005) and Cochrane & O'Donoghue (2008), which show that students gain more confidence when they get more chances to practice and rehearse in front of their teacher and peers because they realized their mistakes and learned how to solve them. Also, the findings of the present study agree with studies by Mika (2001), Ali and Kassim (2006) and Talberg (2006), which emphasized the importance of teacher and peer feedback. They argue that this feedback were the contributing factors to the improvement of student speaking ability. In this study, the teacher provided specific comments on what the students did wrong on their presentations. Students seemed to read this feedback more carefully and asked for more suggestions in order to apply them in their next presentations. Students tried to help their classmates with positive comments on the peer

feedback, and those comments seemed to encourage their classmates quite well. At the beginning of the course, the students were trained on how to evaluate their peers' presentations with critical comments but the training was short. It would have been beneficial to have more time to train them so peer feedback would be more objective and realistic. Although peer feedback was not as critical as the teacher's feedback, it gave the students a task to do while they were listening to their friends' presentations. In addition, evaluating other people's presentations made the students organize their own presentations better. They knew what criteria were used for assessing and they could see their classmates' mistakes and avoid them in their own presentations. In conclusion, the oral presentation activities provided more opportunities for students to practice and helped the students gain more confidence in speaking.

2. Students having positive opinion toward oral presentation

The results of the students' opinion survey showed that the students had positive overall opinions toward the oral presentation course at 4.25 out of 5 on the Likert-scale. This finding confirms the second question, which is similar to the results of studies in similar contexts such as Seazhong (2005) and Siriphotchanakorn (2005). These previous researchers studied the opinions of students toward giving oral presentations in speaking classes. Most importantly, they also found that students believed that oral presentations helped them improve their speaking skills.

Most of the students strongly agreed that oral presentations would be useful for their future careers. They also agreed that oral presentations could prepare them for applying for jobs. Future Thai engineering students have to face new technical problems and an increasingly competitive world that requires clear communicative abilities and presentation skills. The students' positive opinions toward oral presentations imply that this group of students realized the problems they face and that they had the confidence they needed to address these challenges after taking the course. It can be suggested to language instructors that activities like oral presentations encourage students to practice and improve their speaking competence.

The recommendations of further studies

1. Further research should include students from other faculties.

2. A variety of interesting oral presentation topics should be provided for the students to use for practice, not only about their future career but to practice in various situations. In addition, they should be encouraged to apply their ideas to other environments.

3. Further research may put more focus on specific discourse use in oral presentation Thai EFL students.

Course Learning Outcome Based Evaluation of Teaching and Students Assessment (CLObETSA) System

Anwar M. A., Naseer Ahmed
Al Ghurair University
P. O. Box. 37374
Duabi UAE
{anwar, naseer }@agu.ac.ae

Abstract

The success of a course taught in an academic institution require effective learning outcome assessment with a vital process, well documented results, and improvement in the delivery as well as contents of a course after analyzing the course learning outcome results. This paper presents a simple and easy to use system that facilitates instructors to record and analyze the course learning outcome results. The course assessment committees also benefit from the system proposed in analyzing the results and suggesting the improvement in a course and get a more accurate insight of the student level of competency achieved in a course learning outcome.

Keywords: Assessment Plan, Evidence Collection, Evidence Analysis, Reporting Results

1. Introduction

The direct assessment measures in conjunction with other indirect measure provide a strong base for assessing various CLOs and overall objective of a particular course. Direct assessment method is, however, the most important and key element in demonstrating a satisfactory (or otherwise) performance level in meeting and achieving the requirements of each learning outcome of the course. Classically, the assessment is the collection and interpretation of information about what, how much, and how well students are learning [1]. The assessment process is an essential part of a typical instructional model encompassing various critical steps; plan → teach → assess → analyze → improve and it refers to various tasks/processes enabling various stake holders to make informed decisions for making students' learning experience more interesting and valuable.

The right information at a right time by the right people to the right people guarantees the success of any organization. The academic institutions are not the exception. As instructors, our experience shows that, due to one reason or the other, the required assessment data for various courses offered in a particular semester is either not complete late or not documented properly in accordance with the policies and procedures laid down by individual colleges or departments. The success of the instructional model depends on accurate and timely availability of the assessment data compiled by course instructors to the designated assessment committees of the colleges/departments who are entrusted with the responsibility of suggesting various strategies and improvements actions in order to meet stated course and program outcomes which ultimately help an academic institution in achieving its declared institutional mission and goals.

ABET EC2000 [2], states that the institution must have an efficient assessment process to insure that each program objective/outcome of an academic program is successfully met. There must be a proper system in place for documenting an ongoing evaluation and closing the loop by communicating a suitable feedback for implanting required improvement actions, where appropriate. The individual courses of a program are an integral part of the program as

success or failure of each course eventually determines the overall success of a particular program outcome. This fact necessitates a well planned and systematic assessment and evaluation process at the course level. Particularly, the assessment of advanced courses (especially capstone, senior project, internship, etc.) can have a significant role in measuring the degree of achievement of various program outcomes in accordance with pre-defined curriculum matrix and standards. The course assessment data/results guides all stake holders (instructors, academic advisors, educational managers, and internal/external assessors) about how the course was taught and assessed, what kind of difficulties students had faced, and how this information might be useful improve the contents as well as the delivery of that course.

This paper describes a model system CLObETSA to carry out above mentioned course assessment activities timely, efficiently, and effectively. The system also helps academic institutions in establishing a culture of assessment by providing an “easy to use” MS Excel tool for instructors responsible for teaching various courses of the program.

We are confident that the proper and timely implementations of this system by the course instructors will not only minimize their efforts and time for maintaining the assessment record of students but will also provide an efficient method for keeping a track of individual achievement of their students. This system will also provide tangible quantitative evidence that would facilitate instructors in suggesting desired improvements/corrective actions for future offerings of the course.

The system architecture and the details of each module are described in Section 2 of this paper. Section 3 discusses various aspects that are necessary for closing the loop. The conclusion and future work is presented in Section 4.

2. System Architecture

Detailed system architecture of the CLObETSA is shown in Figure 1. This system comprises of four major modules which are listed below.

- a) Assessment Plan Module
- b) Instruction and Evidence Collection Module
- c) Evidence Analysis Module, and
- d) Reporting Results Module

The CLObETSA system has been successfully implemented on a programming course taught as a part of Bachelor of Science in Computer Science and Engineering (CSE) program offered at the College of Engineering and Applied Sciences of Al Ghurair University (AGU), Dubai. AGU is a reputed university of United Arab Emirates (UAE) and its programs are accredited by the Ministry of Higher Education and Scientific Research, UAE. The system has been implemented using a prototype MS Excel based tool. This system shall be later upgraded using appropriate web-based technologies. A number of other templates were also used while implementing the CLObETSA system which are also discussed and presented in the following sections.

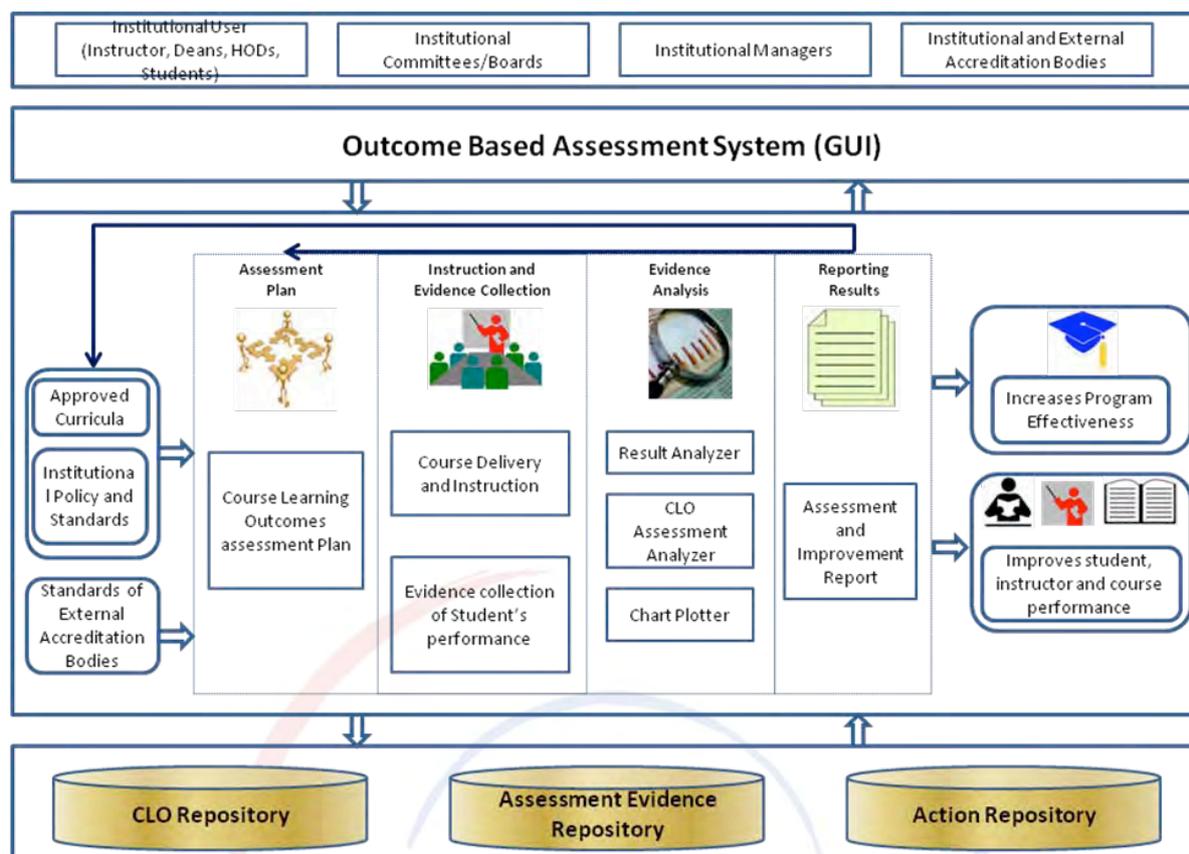

Figure 1: CLObETSA System Architecture

2.1. Assessment Plan Module

To carry out a meaningful and effective assessment, planning is the first major step that helps in identifying and employing appropriate assessment methods to quantify the success of a particular outcome/objective. In the academic context, a course syllabus is the first document that provides a strong base for preparing a course assessment plan as it contains vital information about the course design, delivery and assessment. This document also serves as an understanding or a contract between student, instructor and academic institution. A model course syllabus typically presents a framework outlining the course goals/outcomes along with the relevant information about various strategies for achieving these goals/outcomes [6]. At AGU, each syllabus is prepared using a standard template. The course instructors are required to provide all necessary details regarding course description, course learning outcomes, course content, assessment methods, and all related activities that are necessary for achieving stated course learning outcomes. The syllabus also contains an assessment matrix linking CLOs with various assessment methods. Each instructor is assumed to be competent enough in developing appropriate CLOs covering the entire syllabus while considering the desired levels course and program goals using Bloom's Taxonomy [3]. Once the course learning outcomes are specified, their assessment becomes straight forward [4, 5].

The assessment plan module consists of two standard templates that allow the instructors to develop the syllabus of a course along with a detailed course assessment plan. The main purpose of these templates is to standardize the documentation and data collection process in one format that would consequently make the whole exercise of data analysis and evaluation lot easier and efficient. Few selected portions of the template indicating the course

assessment plan for a “Introduction to Programming (ENG 204)” course is shown in Figure 2.

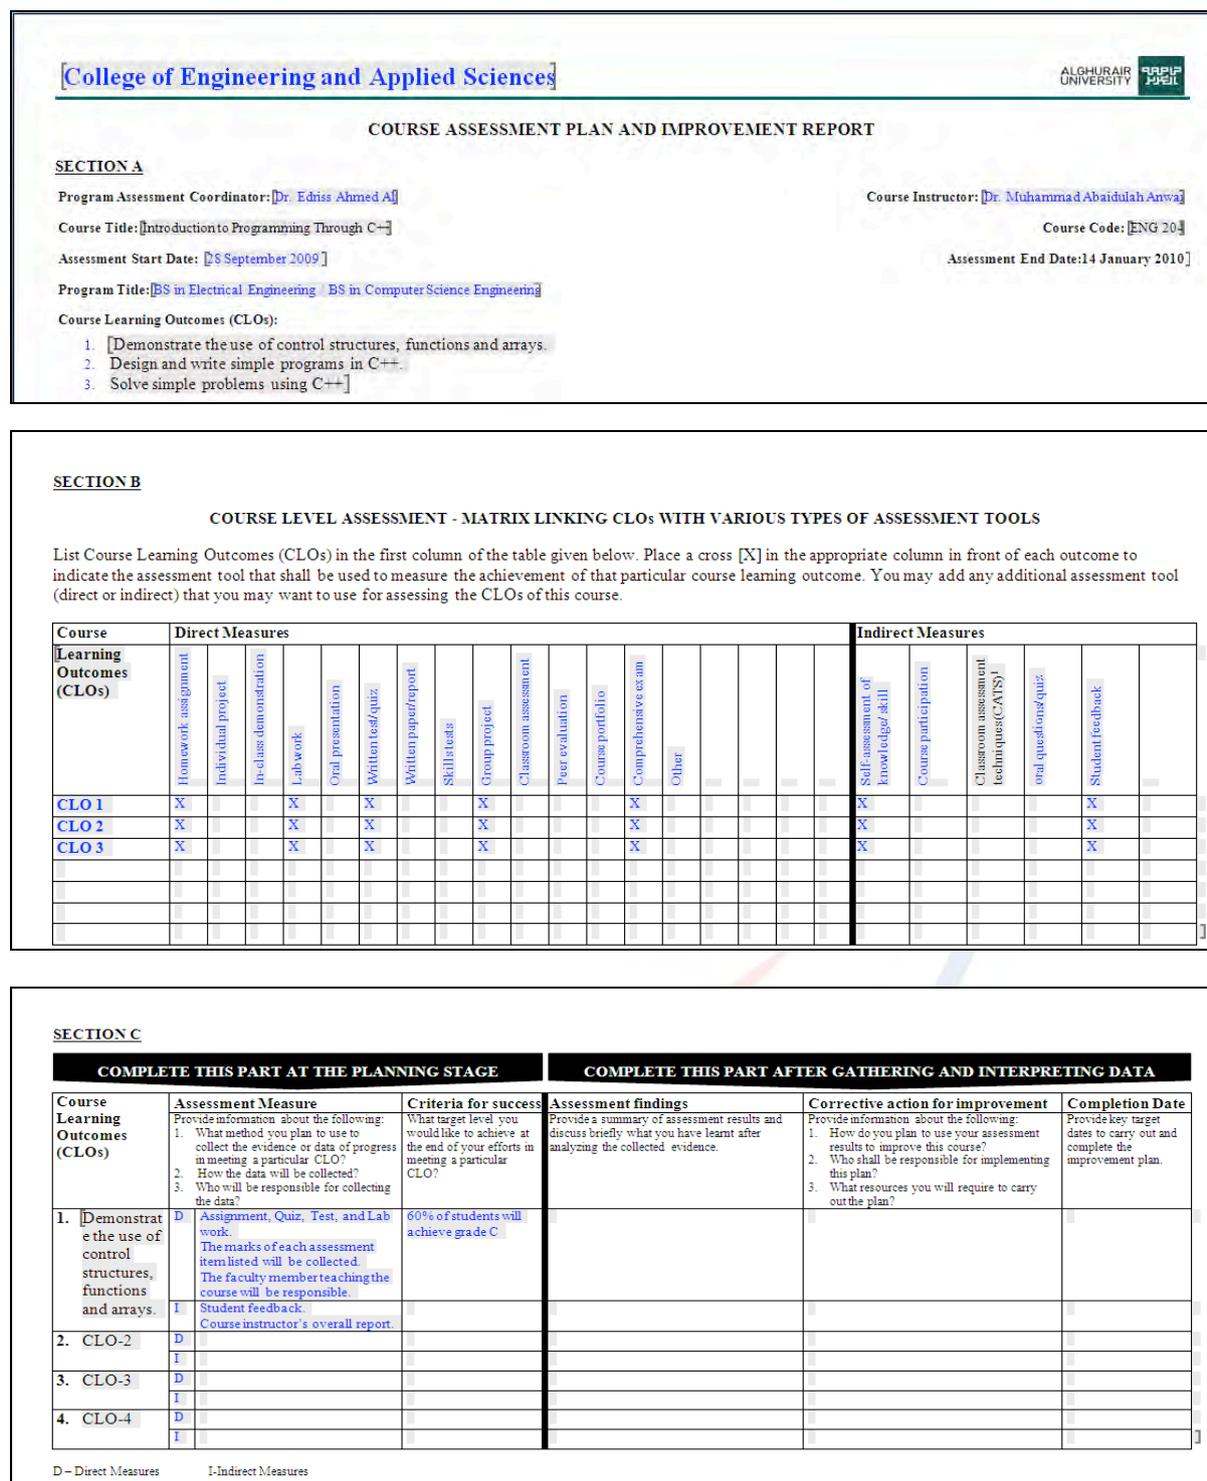

Figure 2: Course Assessment and Improvement Template

This template is used to design and document a comprehensive course assessment plan using a variety of direct and indirect methods. As shown, the assessment plan template comprises of three sections; Section A documents the basic information about the course and its CLOs whereas Section B presents a matrix linking CLOs with various direct and indirect assessment methods. Section C consists of two parts. First part that contains information

about the assessment measures and the success criteria is filled during the planning stage of course assessment. The second part of Section C is filled after gathering and interpreting the evidence as it provides an opportunity for the course instructor to record the results of the assessment and how these results will be used for introducing changes to improve future course offerings. The success criteria or benchmark set at the planning stage of the course assessment are compared with the results obtained from the CLObETSA and accordingly the appropriate improvement actions are suggested. This part of section C is filled after the teaching and assessment of a course is completed.

The template also allows the faculty to document their course assessment plan using both direct and indirect assessment methods. The direct assessment method is used to measure the degree of each student's achievement in a particular course learning outcomes/objective once the student has completed the course. These direct methods may include classical as well as non-classical methods [6]. At the planning stage of the course the instructor is required to set the success criteria for every CLO of the course that would serve as a benchmark for comparing the assessment results obtained at the completion of the course. Typically the success criteria are set in terms of two numbers (i) average class achievement level (e.g. 70% marks or grade C) and (ii) a percentage of the students exceeding the pre-set achievement level (e.g. 60% of the students are expected to achieve 70% marks or higher or 60% of the students are expected to achieve grade C or higher). Similar success criteria are set for each CLO of the course. The CLObETSA employs the standard assessment process that requires each instructor of the course to:

- a. Develop an assessment instrument (assignment, test, project, case study etc.) consisting of certain questions/tasks which are designed to assess either one or a combination of CLOs of the course.
- b. Map assessment instrument questions/tasks to CLOs based on the assessment plan recorded in Section B of the template.
- c. Evaluate and mark the assessment instrument and enter each student's marks for every question/task into the designated worksheets of the CLObETSA system.

2.2. Instruction and Evidence Collection Module

The second module of the CLObETSA system is called "Instruction and Evidence Collection" which facilitates the course instructor to document the course assessment plan and to keep a track of marks obtained by each student in every assessment instrument. The back-end of the system provides a complete linkage of the course information with the course assessment plan and thus the instructor does not have to re-type the course information on every sheet of the MS Excel Book time and again. This module uses a separate sheet for each CLO of the course to record/document the assessment data of each student for various assessment instruments used in the course.

AT AGU the assessment instruments are generally divided into two categories; (i) continuous assessment (assignment, project, quiz, case study, essay, laboratory work, major tests, etc.) and (ii) final examination. An image of the MS Excel Sheet illustrating the "CLO Assessment Plan" for the course ENG 204 is shown in Figure 3. This sheet shows various assessment instruments administered for this course along with the marks and their appropriate linkage with each CLO.

				FE		100	35	35	30		
Final Exam		% Weight		40	14.00	14.00	12.00				
TOTAL				100	33.06	35.03	31.92				

Figure 3: Assessment Plan Worksheet

The method of entering the data for one assessment instrument, for example, “Final Examination (FE)” is explained in the following paragraph.

The total marks for this instrument are 100 and these are entered in Marks column. The allocated percentage weight for the final examination is set at 40%. This instrument had 10 questions and was designed to test all three CLOs of the course. The total marks of the questions that were meant to assess CLO-1, CLO-2, and CLO-3 were 35, 35, and 30 respectively. These values were entered under the columns CLO-1, CLO-2, and CLO3. The formulae are set to compute the percentage of each assessment instrument in different CLOs.

Figure 4: CLO Assessment Data Recording Worksheet

The instructor entered the marks obtained by each student in every assessment instrument administered in the course at the designated CLO assessment data recording sheet. The MS Excel Book allows as many worksheets as the number of CLOs entered for a course in the assessment plan. A portion of the image of MS Sheet illustrating the “Course Assessment Data recorded for the CLO 1 of the course ENG 204 is shown in Figure 4. The method of entering the data for one assessment instrument say Final Examination (FE) is explained below:

Total marks for this instrument were 100 and the corresponding allocated weight for the CLO-1 was 35. The instructor entered marks obtained by the first student in the questions

relating to the CLO-1 that were 23.5 as shown under “Final Exam” column, i.e., this student received 23.5 marks in questions that were designed to assess CLO-1 of the course. Similar data was entered for the marks obtained by this student in questions relating to other CLOs of the course in sheets designated for entering the data for CLO-2 and CLO-3. These sheets are not shown here due to the limitation of space. The formulae are set in the MS Workbook to compute the percentage contributions of various assessment instruments in achieving each CLO of the course.

2.3. Evidence Analysis

Once the evidence is collected and recorded, the analysis of the course assessment becomes straight forward. The instructor is just required to enter the assessment data of the course into the evidence collector worksheet. The remaining part of analysis is done automatically through linked worksheets with in-built formulae in accordance with the standard policies of the institution. Triangulation is an important feature of effective assessment [11]. The more tools used to assess a specific course learning outcome, the greater the likelihood that assessment will be both, valid and reliable. Therefore, both direct as well as indirect assessment tools are used for assessment.

The instructor designs an assessment item consisting of a certain number of questions to assess selected course topics and consequently the course learning outcomes. The instructor uses the Bloom’s Taxonomy guidelines [3] while preparing such assessment item. An articulation matrix, or any other method, is used to map the assessment questions to the CLOs. There are three components in this module; (i) Result Analyzer, (ii) CLO Assessment Analyzer, and (iii) Chart Plotter.

2.3.1. Result Analyzer

The marks recorded in individual CLO worksheets are linked with the result analyzer worksheet. The result analyzer computes the overall result of each student based on his achievements in every assessment instruments (assignment, quiz, lab work, project, case study, final examination etc.) administered in the class. Another worksheet is used to analyze and compute the achievement levels of each and every student in all CLOs of the course. The corresponding images of these worksheets are shown in Figure 5 and Figure 6, respectively.

The grade analyzer is an important part of this module. The grade analyzer worksheet provides the overall performance and analysis of the grades of all students in each class (or section, if the course was taught in more than one section). The MS Workbook allows the instructor to view the entire analysis both in table and bar chart formats. This worksheet provides a complete statistics for each section that consists of grade distribution, average marks, standard deviation, and the computed value of the course performance. Figure 7 presents a view of the grade analyzer worksheet and the generated bar graph for the course.

Figure 6: CLO Assessment Analysis Worksheet

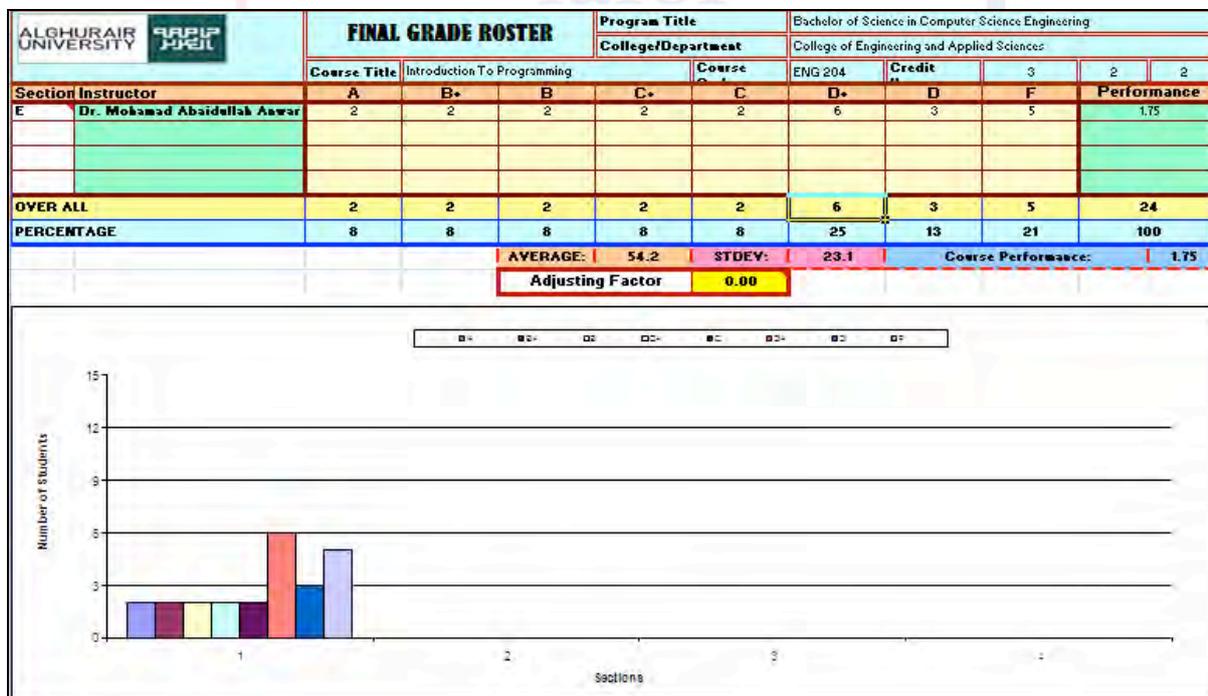

Figure 7: Grades Analysis Worksheet

2.3.2. CLO Assessment Analyzer

This module is a central part of the system as it provides the vital statistics about the achievement levels of various CLOs of the course. The achievement levels are categorized

from level 0 (below 50%) through level 1 (50% - 60%) level 2 (60% - 70%) to level 5 (90% - 100%). The achievement levels of students in each CLO of a course are computed in counts and percentages which are then used to generate graphs. The success criterion set at the planning stage of the course assessment for each CLO is compared with the results obtained in the CLOS Assessment Analyzer and appropriate decisions are suggested for course improvements. An image of the CLO assessment analyzer worksheet is shown in Figure 8.

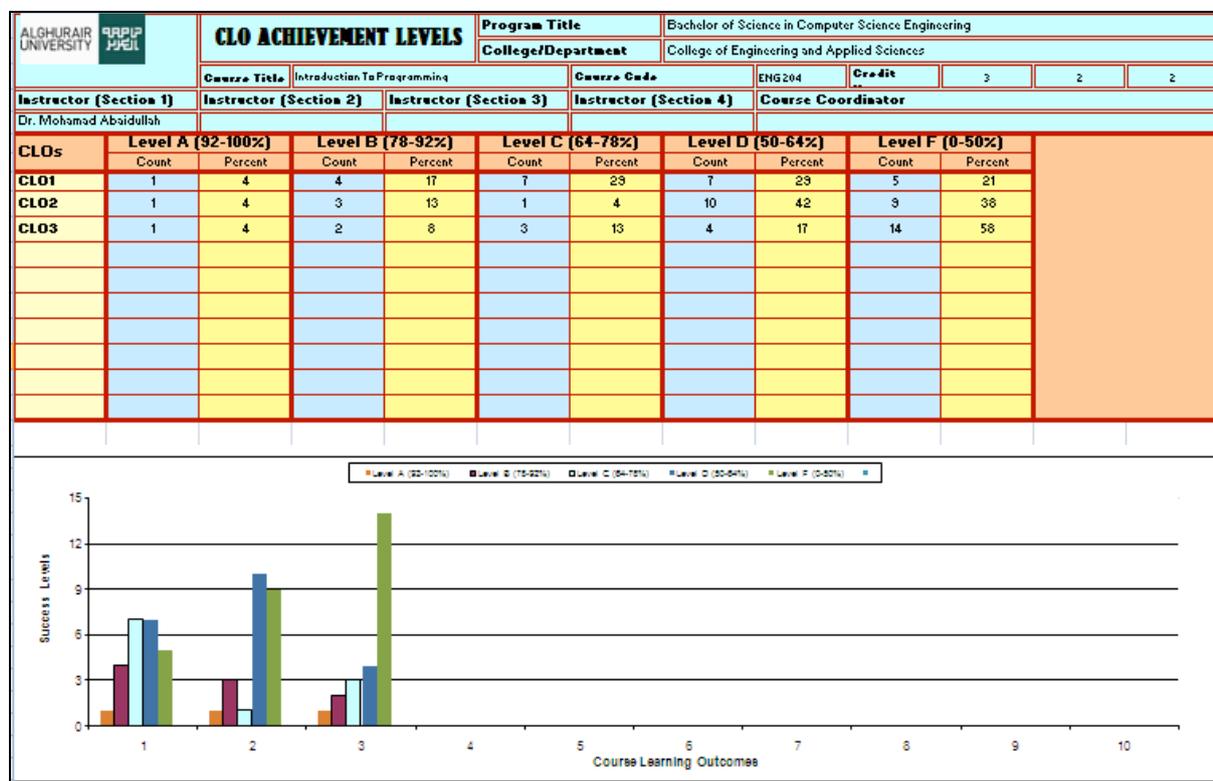

Figure 8: CLO Assessment Analysis Worksheet

3. Closing the Loop

Closing the Loop is the final step of the course assessment process. It allows course instructors to review and utilize the assessment results by suggesting changes that might be necessary to improve the quality and standard of future offerings the course with an aim of enhancing the overall effectiveness of the course. This is done by completing the designated part of the “Course Assessment and Improvement Template” (Section C of the Figure 2). The instructors must address the following three important areas;

- a) Assessment findings: Instructors provide a summary of assessment results and discuss briefly what instructors have learnt after gathering and interpreting the assessment data for each CLO.
- b) Corrective action for improvement: Instructors provide information about :
 - i) How do they plan to use the assessment results to improve the course?
 - ii) Who shall be responsible for implementing the plan?
 - iii) What resources will be required to carry out the plan?
- c) Completion date: Instructors provides key target dates to carry out and complete the suggested improvement plan.

4. Conclusion

We presented a simple and efficient system to plan and implement the process of assessing various CLOs of a course taught in an academic program. We have demonstrated that it is user-friendly and easy-to-use system. Various templates designed as a part of this system have been found to be very effective in documenting and recording the assessment data in a standardized format that makes the collection and interpretation of assessment evidence as well as the process of closing the loop much more effective and efficient. The system was designed and implemented using MS Excel Workbook as a prototype tool that will be further refined and upgraded to a web-based system using advanced tools and technologies available in the field.

Acknowledgement

The authors wish to acknowledge the support of Alghurair University for its support to develop and implement this system.

EFL and Maternal Involvement in the Suffering of Korea

Hyekyung Kim

University of Alberta
Edmonton, Alberta, Canada

Introduction

In modern societies, there is no doubt that social origin and characteristics of parental socioeconomic status are associated with the educational success of their offspring. This consensus has led to an abundance of educational research world wide exploring the topic of social reproduction or the impact of parental participation, including in Korea. In fact, over the last few decades Korean parents' involvement in their children's education is strikingly noticeable, even in light of their deeply rooted culturally grounded enthusiasm for education. English as a Foreign Language (EFL) education, in particular, is marked by a frantic competition. Korean mothers are posited in the middle of the rhetoric between education and success, vilified frequently for their excessive action, while at the same time, recipients of social sympathy. Various studies have been actively produced on this issue from feminist, sociological, and anthropological perspectives in the educational research area during the last decade (Abelmann, 2003; Cho, 2004; Chung, 2010). Despite high academic interest in this matter, it can be suggested that human suffering inherited within the Korean educational frenzy has been less paid attention to. In this paper, Korean mothers' involvement in their children's education is explored through textual interpretation, drawing out the historical and culturally specific sociological, semiotic, and critical sensibilities of the Korean educational situation. Using the social science process of *bricolage* (Levi-Strauss, 1974), the study draws on semantic elements in electronic and print media for the gathering of 'texts' that are interpreted hermeneutically to reveal the multidimensional ways that mothers' involvement in EFL practices contributes to the more generalized problems in Korean education. The study is projected as a work of social and cultural healing and hence attempts to articulate ways in which both motherhood and education might be re-thought in contemporary Korea.

Textual Interpretative Approach

This study is hermeneutic in character as its research method relies on textual interpretation. As Ricoeur (1981) defines hermeneutics as "the theory of the operations of understanding in their relation to the interpretation of texts" (p. 53), hermeneutics is the reading, the interpretation, of messages and texts under the assumption that human beings experience the world through language. Gadamer (2004) believes that understanding comes from interpretations embedded in our linguistic and cultural traditions, which contribute to our inherent prejudices. According to both Gadamer (2004) and Ricoeur

(1976, 1981), to understand what the text says is to be engaged in a conversation with a text, bringing researcher's prejudices into play – a dialogue that encompasses our understanding of the matter at issue, including our self-understanding. A central task of textual interpretation in this study, therefore, is to understand how meaning/prejudice is formed within the complexity of the Korean EFL context and to acknowledge that meaning is always conditioned by hermeneutic tradition in a form of language within historically specific social and cultural settings.

In this study research texts, defined by Ricoeur (1981) as “any discourse fixed by writing” (p. 145), were gathered from the pre-existing and emancipated from the face-to-face or direct reciprocal oral communication. Selection of texts has been likened to the process of *bricolage*, coined by Lévi-Strauss (1974). The French term, “*bricoleur*” refers to the kind of practices that are performed by a handy-man with materials and tools that are at hand by appropriating pre-existing materials which are available and ready to use (Schneiderman, 2002). Various texts that strike as interesting have been used for processes of sense-making and looking for other relevant texts which enable interpretive activities to move back and forth between the specific and the general of the Korean EFL educational context.

EFL Education in Korea

English language education began in Korea in the 1880's with Christian missionary schools (Kang, 2007), agents of Western imperial powers. In this context, obviously, Koreans' interest in English was not entirely coincidental nor simply a romantic curiosity. The symbolic power of English was crucial during the transition from pre-capitalism to capitalism which marked Korea's very abrupt move toward globalized capitalism. As Kang (2007) noted, not a small number of public figures reached important positions by utilizing their English skills throughout the period of upheaval from the 1900s to the 1960s. The family wealth accumulated by these individuals and their high status, in particular, inspired Koreans toward new modern values, which Lee (1999) describes as individual liberty, equality, reasonableness and material wealth. Since that time, as Kang (2007) and other scholars (Yoon, 2007; Park, 2007) argue, English has been taken as an important means of success in life in Korean society and a signifier of personal competence, in the severe competitive battle for entrance into both college and eventually the job market.

In addition to the legacy of colonial factors during the process of modernization of the state, the catalyst in the chemistry between Koreans' status-consciousness and parents' enthusiastic involvement in children's education have always been government policies on a combination of economic growth and education. Successive governments' active adoption of strident neoliberal agendas since the 90's, particularly, has aggravated the incoherence of policies in the regular school system (Shim & Park, 2008; Shin, 2007) alongside the emergence of the rhetoric of globalization as government propaganda,

which ignited a frantic dash to English education, cynically termed as *young-o yol pung* (English fever), *young-o gwang pung* (English gale), *young-o byoung* (English disease).

This tricky situation pushed parents away from regular school programs and into the private tutoring market. Parents' concerns have become heavier and their demand for private tutoring is no longer regarded as an option, but rather it is now considered a parental duty to provide children with such essential requirements for survival in kindergarten to grade 12, and also in higher education programs. Even unborn children are signed up for prenatal English class (*taegyo-young o*). Within this climate, the English tutoring market has grown massively in response to increasing demand from anxious parents, thereby taking advantage of Koreans' deep rooted tradition of educational zeal (Cho, 2008; Nah, Tae & Jang, 2007). As Lee (1999) laments, without doubt "[e]ach family has a deep conviction that their children should get the best education regardless of their ability to support their education" (p. 191). In contrast to those parents who provide their children with English tutoring as an essential requirement for survival, not a small number of middle- and upper middle class parents support their children, with a different vision, mostly of prestigious schools around the world, hiring private tutors to prepare for the SAT (Scholastic Assessment Test) and college consultants to help prepare the right application portfolio for admission. As a result, the number of children sent abroad to study English has increased in the last decade, and new transnational families have emerged, the so called, 'wild geese' (*girogy*) families.

According to the *New York Times* (Onishi, 2008), Koreans make up the largest group of foreign students in the United States and the second largest in New Zealand after Chinese students. Yet, unlike other foreign students, South Koreans tend to go overseas starting in elementary school — in the belief that they will absorb English more easily at that age. The wild geese families have shifted Korean familial culture:

"The phenomenon is the first time that South Korean parents' famous focus on education has split wives from husbands and children from fathers. It has also upended traditional migration patterns by which men went overseas temporarily while their wives and children stayed home, straining marriages and the Confucian ideal of the traditional Korean family.....Now, there are also "eagle fathers," who visit their families several times a year because they have the time and money. Those with neither, who are stuck in South Korea, are known as "penguin fathers."

This transnational shift was followed by a rapid increase in educational expenditures after the Korean national bankruptcy, also known as the IMF crisis, in 1997, a product of the complexity of the global economic age. A report from the Bank of Korea estimates that 8.2% of average household expenditures has been spent on children's education in 2009, compared to 2.6% in the U.S., 2.2% in Japan, 1.4% in the U.K during the year of 2007, and 0.8% in France, 0.9% in Germany in 2008 (Kim, 2010). Finally here we see how capitalism, under the guise of globalization, is a primary root of Korean EFL issues, and that EFL issues including the Koreans' educational enthusiasm need to be examined in a more multidimensional way, such as questioning the notion of success in life (Sorenson,

1994). In the next section, the relationship between education and success in the Korean mind will be discussed in more detail.

Historical Root of Education and Success

The cultural roots of Korean educational enthusiasm stem from the inseparable linkage between education and success which can be traced back to Korean family culture and pre-capitalist social structure. The biggest influence came from Confucianism, adapted as state orthodoxy by the Choson Dynasty (1391-1910) (Lett, 1998; Kim, 2008). Even up until today, certain aspects of Confucianism have persisted most strongly in the predominantly urban capitalist society of contemporary Korea: the “traditional emphasis on social stability and hierarchy... have continued to structure important aspects of work, gender relations, and family life” (Kim and Finch, 2002, p. 122). The civil service examination and occupational division of the Choson Dynasty are archetypal cases of the legacy of the relationship between education and success. For Lett (1998), the civil service examination (*gwago sihum*) was a sign of educational success and an ideological link between family and state. By passing the civil service exams, a man (literally only male) obtains a government position. The hierarchical characteristic of the Confucian perspective of social organization also divides occupational status into four groups. The lowest class of occupational discrimination was renamed manual labor, *sam di* (three Ds: Dirty, Difficult, Dangerous), in the 80s and 90s, and is currently occupied by migrant workers from mainly South Asia and China. The impact of contemporary *sam di* has been to create such a significant income gap between high school and college graduates that competition for education has increased.

I strongly agree with Lett’s (1998) endeavor to attribute Koreans’ current deep rooted disdain and avoidance of manual labor to the legacy of Choson’s elite, and its influence on the rapid rise of the urban middle class and upper class of the 1990s in Korea. Therefore, it seems necessary that the inter-relation between class formation and education alongside income inequality has to embrace a range of issues such as construction of Korean motherhood (Kim, 2009; Nah Tae & Jang, 2007; Cho, 2004; Kim, 2004), marriage culture (Kendall, 1996), housing (Yoon, 1996) and consumption patterns (Nelson, 2001). In the next section of the paper, details of maternal practice will further reveal the complexity of this issue.

Maternal Practice as Social Classification

Social Reproduction

Yoon (2007) referred to English as ‘a colony in our mind’ in his work. The post-war history administrated by the U.S. government was followed by the Korean elite group, who mainly studied in U.S. universities. This historical fact alone has positioned English as a power *per se*. Children’s education has been prioritized in the everyday life of Korean mothers (Park, 2007; Kim, 2004; Cho, 2004; Cho, 2008; Kim, 2001). The

mastery of English has especially become an essential ingredient for survival and success (Yoon, 2007; Kang, 2007). This means, drawing on Bourdieu's (1984) theory of capital, English is considered as cultural capital in Korean society and, as such, is believed to promote social mobility. From a sociological perspective, this situation also could be viewed as a matter of structure and agency, related to the question, "What is the world made of?". Drawing on Bourdieu's (1977) concept of 'practice', Korean mothers' action/reaction can be called a 'practice' because it communicates meaning through language (discursive to be identified), images (visual in terms of semiotic representation), and bodily movements (embodied and internalized) in the Korean EFL educational context. Maternal practice in the Korean EFL context is a reciprocal process - a tension between agency and structure - and a joining process in social reproduction by producing cultural capital. Although mothers' supporting their children's education is taken for granted as a universally accepted parental responsibility in any society, the excessiveness of Korean mothers' involvement in children's education should be understood as an economic practice in the culturally and historically specific context. To produce cultural capital (e.g. English language skills and knowledge), an economic exchange (e.g. paying for tutoring, sending children abroad, working part time jobs to pay for tutoring) sets in motion a fierce competition, a series of uses, some symbolic, some fungible for other capital, that are practiced in a concrete reality in contemporary Korea. This calls into the question the relevance of the class concept which seems to be inseparable from the relation between education, success and reproduction.

Korean columnist, Kim (2010) writes that he has a strong sense of *deja vu* about the caste system of the Choson Dynasty when he looks at today's Korea. The column laments that the history of Choson's caste system is being repeated in contemporary Korean society, this time an individual's life is not determined by a slave paper but by the status of the university from which his/her diploma was obtained. Kim's (2008) critique of Korea's academic clique, *hakbeol*, is a contemporary social malady: universities have been arranged in rank order from the top to the bottom and only a handful of top ranked institutions has power in a 'winner-takes-all game'. This is just as Bourdieu (1984) described: "[a]cademic capital is in fact the guaranteed product of the combined effects of cultural transmission by the family and cultural transmission by the school" (p. 23).

Bourdieu's conceptualization of the interrelation between education and social reproduction seems valid when it is applied to the social structure of the Choson Dynasty. Although social differentiation and affiliation were framed by Choson's hereditary caste system, indispensable determinants of reproduction of the system were, as Bourdieu (1977) illustrated, principles of the generation and structuring of practices and representations "which can be objectively "regulated" and "regular" without in any way being the product of obedience to rules, objectively adapted to their goals without presupposing a conscious aiming at ends or an express mastery of the operation necessary to attain them" (p. 72). Based on the intergenerational transmission of cultural capital, Bourdieu's theory of social reproduction and cultural capital class stratification lies in the conceptualization that the culture of the dominant class is transmitted and rewarded by

the educational system. Social structure of the Choson dynasty was reproduced successfully for generations by means of reproducing ruling class subjects and accommodating them to the given structures of cultural capital through Confucian curricula, as a symbolic violence.

Women used to be the group who were assigned most both explicitly and implicitly to develop particular culture and class meaning. Their social (home) and pedagogical (school) contexts were limited to inside the home so that male dominance of the society could be perpetuated in the structure of patriarchy. The outcome of women's education was assessed semiotically in the representation of their way of walking, speech patterns, dress, and behavior. Bourdieu's (1977, 1984) refers to this as *habitus*, which in Korea eventually lead to a form of social exchange, a marriage. The concept of *habitus* can also be a tool to explain why younger and younger children are directed toward EFL education in Korea. Hiller and Rooksby (2005) interpret Bourdieu's concept of *habitus* as "a way of knowing the world, a set of divisions of space and time, of people and things, which structure social practice" (p. 284). From Bourdieu's (1984) theory of reproduction, it could be suggested that Korean mothers who participate in children's education can be seen as social agents who navigate and accommodate themselves to relatively new forms of Korean capitalist social structure so that they become "the social agents whom the sociologist classifies as producers not only of classifiable acts but also of acts of classification which are themselves classified" (p. 467).

Institutionalized Motherhood

Reay (1995) described fathers as 'a majority of silence' in her qualitative study on parental involvement in children's education. While the texts on parental involvement are "frequently written in terms of neutral, context-free parents" (p. 337), the research revealed that most of the activities were carried out by women. The case of the Korean mothers' educational practice is more complex than that of British mothers in Reay's research. Korean mothers are a fully recognized group in the society, yet, their practice is assessed by means of reward, punishment, and frequently, encouragement. Mothers' practice in children's education in contemporary Korea is associated with the ideology of the so-called *hyonmo yangcho* (a wise mother and good wife), the ideology of a 'Confucian woman' (Koh, 2008). Today, under capitalism the representation of 'wise' and 'good' women has been transformed into the practice of 'the capable' and 'the entrepreneurial'. Good mothers in contemporary Korean society have to possess material resources and know-how to support their children's success by trading higher quality of educational products. Two articles published by news media agents confirm this reality.

In March, 2010, a thirty four year old woman was arrested for shoplifting at a bookstore in Busan in Korea (Oh, 2010). She said to the police "I didn't mean to steal it. But it happened before I realized. My family is having bad times but I wanted my children to learn English badly." The stolen item was a DVD set of children's English lesson. The original intention of the mother came from the desire to be a 'good' mother for her

children's education. More on-line comments on the news article revealed sympathy and criticism of the polarization of Korea's social structure.

Another article published by *The New York Times* was entitled 'For English Studies, Koreans Say Goodbye to Dad' (Onishi, 2008). Remarks of a wild goose mother reveal her eagerness and determination to school her children in a foreign country without any hesitation:

"We [my husband and I *emphasized by the author*] talked about coming here for two years before we finally did it," said Kim Soo-in, 39, who landed here 16 months ago with her two sons. "It was never a question of whether to do it, but when. We knew we had to do it at some point."

The wild goose family phenomenon reflects the complexity of the Korean EFL educational context as a pivotal point of cultural shift, emerged after national bankruptcy as known as 'IMF Crisis' (1997). The article presents the wild goose mother's belief that English fluency would increase their children's chances of gaining admission to selective secondary schools in South Korea and ultimately to a leading university in Seoul. Hermeneutic interpretation of these articles seeks to understand the experience of the mothers and elements of reality underneath the texts. In so doing, we can expose hidden power imbalances and challenge the status quo. Furthermore, we can not afford to neglect the economic benefits to lead English-speaking countries of this Asian influx.

Meanwhile, from a sociological perspective, wild geese mothers make an effort to produce cultural capital, taking their young children to the habitus of English speaking culture and nurturing them. In doing so, children's English skill are expected to reach the linguistic competence "an unconscious mastery of the instruments of appropriation which derives from slow familiarization...which, like an art of living, cannot be transmitted solely by percept or prescription" (Bourdieu, 1984, p. 66). The reality is that these mothers are rewarded as being capable and entrepreneurial. In terms of maternal practice in children's education as a capitalist accommodation in contemporary Korea, the intensity of involvement with a wide range of social members accompanied with an imperative condition can be possibly understood as two strands: first, that of a historical contemplation in terms of a traditional concept of maternal, and second, that of a development process of Korea as a capitalist society.

Cho's (1991) 'uterine family' is a plausible starting point for the reason why many Korean women still agree with the ideology of *hyonmo yangcho*. In the Choson Dynasty, the most important virtue of Korean women was the absolute obedience to patriarchal control which was masked as filial piety. Women of the society were compensated for their being docile, allowed some degree of power of control over a limited area of the family which consisted of children, daughters in law, and servants – the "Others" in the community. Cho (1991) terms this compensation as a uterine family. In historical narratives of movies, novels, and many other forms, it is often shown that an elderly

woman in a family runs her own family, and her authority is symbolized with a bunch of keys to the rice storage shed.

Second, the legacy of this custom has been transformed into a wife's role in the financial management of the modern family, eventually, the biggest group of consumers since the free market system was activated in Korea. The negotiation system as a form of uterine family was a kind of junction point between pre-capitalist society and capitalism of Korean women's positioning as the largest consumer within the unpaid labor class. The compensated financial authority of women is often mistaken as a position of liberation while Korea was achieving economic success because Korean women's educational opportunities increased despite their marginalized position in the job market. In *Yonhap News'* reported analysis of an OECD report on the employment rate of women in 2007 (Im, 2010), the employment rate of women with post secondary school diplomas was identified as the lowest among OECD members. According to an article in the *Washington Post*, "[t]here is a 30 percent employment gap between men and women [in Korea], the fourth-largest gap in the world. Even if women choose to stay on the job, they have no guarantees of career advancement Women in South Korea make 38 percent less money than men, the largest gender gap in the developed world" (Harden, 2010). In this broader context we see that Korean women's economic practice entails mainly consuming, which signifies their social status; family management, buying a home, and purchasing educational products become natural class determinants. Inspired by Hartman (1981), it could be suggested that Korean women's situated position in the family is a locus of gender, class and political struggle in the patriarchal and capitalist nature of the relationship that shapes family life.

The intriguing title of the article published by the *Wall Street Journal*, "South Korea Becomes Fertile Spot for Luxury - Survey Respondents Express Little Guilt about Splurges, Appreciate Craftsmanship" (Ramstad, 2010), suggests a close interconnection between Korean women's consumption patterns and status consciousness. The survey by McKinsey & Co. focused on people who have purchased luxury goods, found that such products appeal more to South Koreans shoppers than to those in other countries. Nelson (2001) suggests that Korean women's consumption behavior reflects its unique combination of resilient cultural tradition and sudden material wealth, how Korean traditional non-monetary values as social status intersect with the peculiarities of housewives' consumption patterns. Nelson's (2001) study also points out that Korean middle- and upper middle-class housewives not only engage in consumption of fancy imports and children's private tutoring but also practice a conscientious style of book-keeping that includes non-monetary entries on the ledger, such as social status-oriented indicators, e.g., age, class, gender, and residential area. It is not incidental that the demography of women in the marketing of private tutoring and the luxury goods in Korea is overlapping in the housing market as well. A report from the Korean Teachers & Education Workers' Union (Chung, 2010) revealed that housing price and parental educational attainment are closely related with students' achievement of the College Scholastic Ability Test for the 2010 school year: the question, "Where do you live?" implies "Which school are you sending your child to?" (Choi et al, 2010).

Suffering

One of the impetus in this educational frenzy is a fear of entrapment in the cycle of social reproduction in contemporary Korean society. There is no longer a myth of dragons from a village brook (successful persons from working class families) in Korea. The fear is so powerful and contagious that most parents and children become insensitive to suffering, a phenomenon which no human being deserves in terms of education. In an episode of investigative reporting, nine year old elementary school children who were interviewed confess to the reporter (KBS, 2010):

“I wanted to die. I have too much homework to do from school and many different *hagwon* [tutoring school]. But I can’t think about it because my mother would be very sad if she knows this.”

“I have wanted to die whenever I thought about too much stuff that should be done.”

“My mom looks like a witch when she beats me when I don’t finish homework. Yes, she is a vicious witch!”

One of the psychological manifestations of this report is that children are often diagnosed with hair-pulling disorder (Trichotillomania), the result of pressure of a large amount of work around school and *hagwon* and tightly designed *hagwon* schedules. In an interview Son, a pediatric psychiatrist, explains that “These stressed kids pull their hair out. Sometimes, some of them even eat them and it is identified in the excretion process.” A mother of a grade-one daughter tells the reporter about those cases which are seen frequently around her:

“Most of those mothers whose children have hair loss from a repetitive self-pulling of hair hush up. They never even mention that their children are under stress. To see those kids breaks my heart. I also sometimes ask myself why I should force my grade-one child to go to so many different *hagwon* after school.... But are there any other alternatives for us? This is our undeniable reality [in Korea].”

Endless Korean teen suicides related to academic achievement makes the whole society heartless (Park, 2010), and the news that all four members of a Korean wild goose family apparently committed suicide over financial and psychological difficulties in May, 2010, doesn’t surprise the society any more (Tan and Masters, 2010). Lee and Larson’s (1996, 2000) studies examine psychological distress and physical symptoms including the higher rates of clinical depression, as experienced by adolescents while enduring highly demanding examination stress. And those symptoms are widely termed in Korea as *ipsi jiok* (exam hell), *sam-dang-sa-lak* (If you sleep four hours a day, you will fail the entrance exam but three hour sleep will make you succeed), *yaja* (Students and teachers stay in school until late night even after the regular timetable), *ipsi byung* (entrance exam disease), *go sam byung* (high school senior disease). Koreans’ unhappiness over the financial and psychological costs of education is so widespread and, often, cited as a reason for the country’s low birthrate, which, at 1.15 in 2009, is one of the world’s lowest” (Onishi, 2008; Kwok, 2010). These are all indicators of social suffering in Korea.

Human suffering is associated with life conditions and often social suffering is shaped by powerful social forces. (Kleinman & Kleinman, 1996) Suffering is also said “to comprise feelings of depression, anxiety, guilt, humiliation, boredom and distress.” (Wilkinson, 2005, p. 16-17) Wilkinson’s definition continues: “[p]eople are held under the yoke of material deprivation, with the perpetuation of social injustice, and from the denial of their civil liberties” (p. 17). According to these views, we might say that Koreans are suffering from educating and being educated.

Ironically, Bourdieu’s critics claim his theory to be static and locked into an unchanging endless cycle, continually reproducing itself (Harker, 1984). A common thread in both this criticism and the fear of Korean mothers is that there is no room for human agency in a frozen-looking structure. Human suffering which is obviously inherited in such a frantic educational reality seems to be quite closely related to human agency, that is, a practice. It seems meaningful to think about Kim Yeseul who put up a *deajabo* (a hand-written poster), titled as “Today, I leave university, actually I deny it” in the campus of the Korea University on March the 11th 2010 (Kim, J-H, 2010).

“...I have been running the [pre-drawn] track for the last 25 years. Although I made it to enter one of the prestigious universities in Korea, I feel something is wrong... Today, there is no more ‘great learning’ in universities; they have already been degraded to the status of subcontractors of large companies.”

Harker (1984) advocates Bourdieu’s intention, asserting that if practice is a dialectical production, then social change “would involve a disruption of the habitus’ controlled perception of historical circumstances (the destruction of false consciousness, the overthrow of a ruling hegemony), and a refocussing on a new set of principles, (a ‘true’ consciousness, a counter-hegemonic transformation)” (p. 121)

In the hermeneutic sense, an interpreter or Heidegger’s (1962) Being-in-the-World is subject to the way in which an object has already been understood in the tradition where the interpreter belongs. Being a part of the Korean EFL educational imperative is too difficult for any individual to withstand. In other words, in this reality it is too overwhelming for an individual to have the freedom to make a decision for his or her own happiness. As a result, members of the community are not able to care about one another and instead forget their interdependency within everyday life. When we think about the painful truth of human suffering of today’s youth and adolescence, the current situation of Korean education might be Koreans’ temporal and spatial response to the process of global capitalism and it might be interpreted as a failure of historical understanding. The sufferings of parents and teachers in terms of educating their children appear to be another hermeneutic failure. Smith (2003) suggests that the mission of the hermeneutic scholar, which all of us might want to try to understand, is to answer the question of “what makes life Life ...not playing with words; this is asking for the

conditions under which it is possible for us to say that we are alive...and that living seems worthwhile, not just something to be endured until its putative end.” (p. 85)

Abstract: Drawing on the best practices of three internationally recognised values education and character education programs- Living Values Education Program (LVEP), Character Education Partnership (CEP), and the Australian Federal Government's Values Education initiatives-this study analyses the curriculum documents for two subjects in Bangladesh primary education, namely the curriculum and textbooks for Social Studies and Islamic Studies . The analysis aims to provide insights into: 1) What values are incorporated, how are these values defined, and what descriptions and visual features are used for representing these values; 2) What personal and social skills are emphasised; 3) The extent to which the content, learning exercises, and the classroom activities a) link to the needs and real-life experiences of the children; b) enhance children's natural interest, curiosity, and attention; c) develop higher-order cognitive skills; d) provide opportunities to explore values of their own and others, and to enact the values. This article will also provide implications for the curriculum developers, textbook writers and the subject teachers in of social studies and Islamic studies.

Introduction

Countries across the globe are increasingly adopting programs in schools to foster the values and good character of students. An effective values and character-development approach promotes the knowledge of core values, an awareness about values, and the enactment of values in personal and social lives. Values should be articulated explicitly in the school curriculum. An engaging and meaningful values education curriculum encourages all students to express their opinions freely, involve their real-life experiences and genuine interests, and empower the students by nurturing the whole-child.

The constructs described above are included in the concept 'Holistic Education', the essence of which is that education should involve both the heart and mind of learners, relate the learning to "human experience" and develop the ability to "think reflectively, imagine, dream, create, intuit, and emote"(Johnson, 2010, p. xix). Four essential criteria of Holistic Education, as suggested by Ron Miller (1991, as cited in Johnson, 2010) are (a) developing the learner as a whole person, (b) creating a conducive learning environment supported by an equal relationship between and within students and adults, instead of a relationship based on power and authority; (c) Linking the curriculum to the life experiences of learners; and (d) building the judgment and reasoning ability to critically examine and define values in cultural, social, and political contexts.

This article seeks to explore the extent to which primary education in Bangladesh supports the concepts of holistic education in developing values in children. It first discusses the best practices of three programs in the field of values education, and then analyses the Bangladeshi curriculum documents. The remainder of this article is organised under the following headings: Discussion of Three Programs, Effective Teaching-Learning Strategies for Values Education, Analysis of Bangladeshi Curriculum Documents, Results and Discussion, Implications for Curriculum and Textbook Developers, and Conclusion.

Discussion of Three Programs

This section will describe the guiding principles and key components of three programs which support the concept of holistic education. The three programs include one character education program in the US, the Character Education Partnership (CEP); one international values education program, the Living Values Educational Program (LVEP); and the Australian Federal Government's Values Education initiatives, which will be referred to as Values Education in Australian Schools (VEAS) from this point onward. This section will describe those guiding principles and key components of these programs which support the concept of holistic education mentioned earlier.

Introduction to the Programs

Since its inception in 1993, the CEP has been pioneering the character education movement in the USA (Character Education Partnership, 2008), and is guided by the Eleven Principles of Effective Character Education (Lickona, Schaps, & Lewis, 2007). LVEP is a specially developed values education program, which was founded in 1996 with help from UNICEF and the Brahma Kumaris. It is now spread over about 80 countries (LVEP, n.d.). Finally, in Australia, the Federal Government's emphasis on values education was officially established in 2003 with the publication of the report, the Values Education Study (Lovat & Toomey, 2007). Later in 2005, the National Framework for Values Education in Australian Schools (DEST, 2005a) came into effect. The framework serves as the basis for all values endeavours in Australian schools, providing the vision and the guiding principles of an effective values education program.

Best Practices in these Programs

Developing the whole-person. An effective character-development approach, according to the guiding principles of CEP, promotes the knowledge of, awareness of (feelings and love for values), and the enactment of values in personal and social lives (Lickona, et al., 2007). Similarly, LVEP considers the potential of education in nourishing three aspects of human character: "thinking, feeling, valuing". Growing as a whole person requires the emotional, intellectual, spiritual, and physical development and LVEP cares for these four dimensions of learning (LVEP, 2009, p. 3). Likewise, VEAS recognises one of the good practices of values education as being the development of student agency, a concept which is based on "the premise that schooling educates for the whole child and must necessarily engage a student's heart, mind and actions" (DEEWR, 2008, p. 40).

Teaching-learning environment. The three programs are all based on the premise that relationships in school should be scaffolded by a sense of respect and care, providing a safe and supportive school environment for students so they develop social, as well as, self-management skills, and feel safe and secure in exploring their own values, in acting out these

values, and in developing capacity to take responsibility for local, national and global issues (DEST, 2005a; Lickona, et al., 2007; Shea & Murphy, 2007).

Meaningful and challenging curriculum. Teachers should pay attention to the inherent skills, ability, and interests of individual students, and develop and implement diversified teaching strategies that best address student needs. Moreover, the school curriculum should increase student interest and involvement highlighting their real-life experiences, ensure active participation of all students, and support academic competence by developing “thinking habits” (curiosity, critical thinking etc.), “work-related habits” (hard-work, determination etc.) and “social habits” (cooperation, responsibility, honesty etc.) (Character Education Partnership, 2008, p. 10; DEEWR, 2008; Lickona, et al., 2007)

Values and related skills in various contexts. CEP follows the principle that core human values such as honesty, trustworthiness, care, compassion, fairness and justice help children grow as good human beings and moral citizens, while performance values such as critical thinking, diligence, perseverance and commitment to work enable children to enact the core values and achieve the best in their academic and professional life (Character Education Partnership, 2008; Lickona, 1996; Lickona, et al., 2007). LVEP nurtures self-reflective ability by bringing learners in contact with twelve universal values selected for the program (Hawkes, 2007; Shea & Murphy, 2007). VEAS strives to develop students’ personal and social skills, judgements and planning ability, civics and citizenship understanding and skills, understanding of their relation to the school and wider community, and a sense of confidence, achievement and self-esteem (DEST, 2005b).

Effective Teaching-Learning Strategies for Values Education

Values-centred pedagogies place students at the centre of all activities, teach values explicitly, respect all students, and create a positive environment for student voices to be heard (DEEWR, 2008). These pedagogies provide room for communicating feelings and thoughts about values, and acting out these values by practical and meaningful actions. Most importantly, the pedagogies foster the ability of students to relate what they learn to their real life experiences (DEEWR, 2008).

Children learn moral and citizenship values in schools from four sources: direct instruction, participation in action, critical reflection and observation (Halstead & Pike, 2006). The first three of these are directly related to the explicit teaching of values.

Direct instruction. Values can be taught through “systematic and explicit” instructional strategies such as *discussion, problem solving, co-operative learning*, and the portraying of virtues through *real life stories or fictions* (Halstead & Pike, 2006, p. 141). Values should not be imposed on learners, rather they should be discussed (Zajda, 2009). Teachers need to ensure that students are expressing themselves honestly and openly and not just conforming to what teachers might perceive as ‘correct’ responses (Halstead & Pike, 2006).

Participation in guided action. Arthur and Wright (2001, as cited in Halstead & Pike, 2006) describe three different ways that students can develop their understanding of values through “experiential learning”. These include: (a) “simulations”, such as “mock

elections” and “mock trials”; (b) “involvement in school activities”, such as developing school and classroom rules, debating school policies in the School Council, and engaging in Peer Mediation; and (c) “extra-curricular involvement” in Community Service Projects. Through *extra-curricular activities* and Service Learning, it is possible to develop essential citizenship skills, such as co-operation, respect, conflict-resolution, leadership, and a sense of responsibility to the wider community (Gage, 2004).

Critical reflection. Johnson (2010) defines thinking skill as “a cognitive process broken down into a set of explicit steps which are then used to guide thinking” (p. 140). Critical thinking includes the methods of and attitudes towards “problem solving, decision making, inquiry, or higher-order thinking” (Bataineh & Alazzi, 2009, p. 55). Inferring, comparing and contrasting, analysing, support-a-statement activities, decision making (originality, cost and benefits, reach solution), ordering, and evaluation/critique are critical thinking skills (Johnson, 2010).

Critical thinking skills that are necessary to be able to reflect on one’s own action include:

... the ability to interpret, analyse and evaluate ideas and arguments, to recognize false assumptions and conclusions, to assess the validity of generalizations, to distinguish between relevant and irrelevant information, to see through bias and propaganda, to use evidence impartially, to assess the strengths and weaknesses of an argument, and to draw justifiable conclusions. (Halstead & Pike, 2006, p. 150)

Classroom provisions like Circle Time and Philosophy for Children, at primary level, and debates, discussions, and activities for rational decision-making and reflection, at secondary level, are aimed at having students think critically and reflect on their beliefs, values and experiences. For example, when participating in Circle Time activities, all students get an equal opportunity to give voice to their feelings and ideas, and thus learn to: respect others’ opinions; develop qualities like co-operation, empathy and care; and together form a shared culture in the classroom (Halstead & Pike, 2006). School assemblies, sports activities, community councils to work with local government, student leadership programs, classroom and school decision-making, buddy programmes, peer mediation, student fundraising activities, let the students apply values in meaningful contexts (DEST, 2005b).

Analysis of Bangladeshi Curriculum Documents

The compulsory primary education in Bangladesh extends over a five-year period for children aged between 6 and 10, and mandates “the physical, mental, social, spiritual, moral, human and aesthetic development of the children” (NCTB, n.d.-a). The latest education policy, the National Education Policy 2009, endorses that the main purpose of education is to build mindful, rational and moral citizens who have respect for their own and other religions, and are open-minded, tolerant of other’s opinion, secular, patriot and productive (MOE, 2009).

Values in Key Learning Areas

There are fifty terminal competencies in primary education in Bangladesh, which the children are expected to acquire in the five-year period (NCTB, n.d.-b). These competencies are further organised into the subject-wise Essential Learning Continua (ELC) of the six subjects

taught in primary level (NCTB, n.d.-c). There are some competencies that necessitate the development of various values in children. The key learning areas to which the competencies are linked are Environment Studies (Society) [also referred to as Social Studies] and Religious Studies (Islam, Hinduism, Buddhism or Christianity).

Documents for Analysis

In this study, the curriculum and textbooks of Social Studies (SS) and Islamic Studies (IS), developed and distributed centrally by the National Curriculum and Textbook Board (NCTB), Bangladesh, have been analysed. **Islamic Studies** is chosen because majority of the total population are Muslims. Textbooks are for Grade 3, 4, and 5 as there are no SS and IS textbooks for Grade 1 and 2. All materials were translated from Bengali to English before analysis.

Analysis was carried out using the **generic literary approach** (Brown & Brown, 2010) in which the author reads the text, identifies the key ideas and presents analysis of the findings with examples from the text.

Results and Discussion

Aim of Curriculum

The **SS** curriculum aims to develop awareness among children of the environment surrounding them, and make them active members of that environment. The educational philosophy emphasised in the curriculum of **IS** is that if we develop belief or faith in Islam and follow the teachings of the Quran (the Holy Book) and the Hadith (sayings of Prophet Muhammad), we will be able to build our character and contribute to developing a peaceful society. This curriculum makes children familiar with the Islamic teachings on the virtues and values of human life.

Terminal Competencies

Sixteen TCs are linked to the curriculum of **SS**. In a broader sense, the concepts that the TCs cover are listed below:

Table 1

Terminal Competencies in Social Studies Curriculum

Key Concepts	Description
Equity, tolerance, inclusion, and democratic living	Respecting diversities; living peacefully in a society with all; adherence to democratic rules and regulations
Rights, duties and responsibilities	Knowledge, understanding, and exercise of fundamental human rights; awareness of rights, duties and responsibilities in personal, social, school, and civic lives; active participation in family,

	school, and society services
Personal, moral and social qualities	Achieving qualities such as righteousness, responsibility, discipline, civility, punctuality, and coexisting with others
Environment, its pollution and protection	Elements of environment; factors causing its pollution; effects of pollution; awareness of environmental protection and conservation
National identity	Knowledge of and respect towards national history, heritage, and culture; knowledge of geography of Bangladesh
Spirit of Liberation War, patriotism, and nationalism	Knowledge of national symbols, anthem, map, and flag; history and background of Liberation War; inspiration of patriotism, nationalism, and solidarity
Social and national resources	Knowledge of social and national resources and their wise use and conservation
Population problem in Bangladesh	Knowledge of the factors causing population growth; effects of population growth on fundamental rights, environment, and the state
Manual labour	Developing interest in manual labour and respect towards manual labourers
Introduction to other cultures	Knowledge of and respect towards other cultures; Cultures of Asia, Europe, Africa, India, Myanmar, Japan, and Malaysia as case-studies
Universalism, international relations and world peace	Universal solidarity, cooperation, understanding and establishment of world peace

For most of these concepts the content is presented in a single textbook chapter.

The SS curriculum is usually a combination of content taken from history, geography, and civics and is aimed at developing students to become good citizens (Brophy & Alleman, 2009). This is also the case in Bangladesh primary education. The problem, however, is that when a curriculum includes numerous topics as content goals, i.e. has an emphasis on breadth, it runs the risk of following a very shallow approach at the expense of depth. It is often the case that social studies teachers rely largely on textbooks, and most of the time the textbooks provide a broad but shallow information range, covering disconnected topics without a central focus on any particular big theme (Brophy & Alleman, 2009). As a result students often leave school without a deep understanding of the issues or any lasting effect on their citizenship identity. Bangladeshi SS curriculum and textbooks are not free from this problem. It has not been possible to give a big picture of any concept. Children gain “miles wide but inch deep” knowledge on everything. They are not mastering useful skills for their lives, neither are they acquiring deep understanding of the curriculum content.

In the curriculum of primary IS, one of the five terminal competencies is about building ‘Akhlaq’ or character. Students are expected to learn about and follow the religious teachings that entail character formation. Grade 3 students learn the significance of obeying parents,

behaving well with classmates and guests, exchanging greetings, being compassionate to living creatures, telling the truth and serving humankind, and are expected to act accordingly.

Grade 4 students learn to understand what 'character' is and be motivated to develop these ideal characteristics. They learn about the importance of obeying and respecting parents, teachers, elders, and being affectionate to juniors. Also included are responsibilities to neighbours; patience; the merits of being truthful and keeping promises; and the demerits of being greedy, wasteful, and spiteful. The Islamic teachings encourage children to practise good habits and avoid bad habits.

Grade 5 students learn to comprehend the meaning of 'Akhlaq' (good character) and build their character in the light of Islamic education. This includes being able to understand and communicate the meaning of honesty, forgiveness, mercy, and care to parents and living creatures. Students learn about the significance of patriotism, and how to love and serve the country. There is teaching on the merits of helping, performing and encouraging good deeds and preventing wrong doing.

General Format and Language of Textbooks

While SS materials are aimed to develop civic and citizenship values, IS curriculum mostly emphasises private or moral values. IS textbooks convey the message that every action of Muslims will be judged in the Hereafter; one should follow the teachings of Quran and Hadith to satisfy Allah and to create a peaceful world.

Textbooks are divided into distinct chapters with a section for exercises at the end of the chapter. All textbooks are written in first person (we). For example, "We will take care of these [roads] and will maintain cleanliness to live a healthy and pleasant life" (NCTB, 2003b, p. 4). There are very few exceptions to this. For instance, in the IS-3 (IS-Grade 3) book, a scenario presented in the section "Behaving Well with Classmates" is as follows:

Ashik is your classmate. He could not come to school. He is not feeling well because of fever. He is suffering from headache. You will visit him. You will wipe out his body and rub his head. You will give him support. (NCTB, 2003a, p. 39)

Everything is presented as merely a model of what the students can do, but no guidelines are provided as to how the learners can do these things practically. Moreover, the tone of the content is sometimes authoritative. Students are left with very little scope for realising the necessity of making moral judgements or the process of doing this. Instead, the content prescribes an ideal form of how children should think, behave or act in their personal or social lives.

For example, at the end of an SS-3 book chapter, a list of *promises* that "we" [the students] will make to prevent environmental pollution is provided (p. 5). There is almost no room for

learners to think about or ask questions like "Why would I do that?" or "What if I do not do that?" In the same book, children learn about school rules in the chapter "Discipline in Family and School" in this way:

Everyday we will come to school in time. We will bring things like book, notebook, pencil, eraser etc. Will attend assembly regularly. Will follow teachers' advice. Will behave well with classmates and others. Will eat lunch on time and play. Will return to classroom after bell rings. Will take part in annual cultural program, sports, and other events. Will keep the classroom and school yard beautiful and clean. Will come out in order when the school ring bells, then will go home." (NCTB, 2003b, p. 25)

In this example, the children are not asked to formulate ideas from their daily experience regarding what they do or should do, but are merely provided with a prescribed list, reminiscent of strict military discipline.

Social studies books do not include any stories, either fictional or real-life. The only exception to this, found in the third grade book, is a story about electing the class-captain. The Islamic studies books, however, contain a number of stories from the lives of Prophets and saints of Islam.

For both the subjects, there is no mention of content goals, terminal competencies or expected outcomes in the book chapters. Although references are made to the content learned in previous grades, links to other key learning areas are not provided in any of the textbook chapters. Moreover, the key ideas and terms in the chapters are rarely elaborated.

Disconnected and Superficial Content

The textbooks present several disconnected and shallow ideas without actually referring to how the students can relate what they have learnt to their lives. For example, in SS-3 book a chapter includes content on the various roles we take in society, and information on different religions and religious customs. It is not clear how just by knowing about customs and festivals of four religions, students will be able to develop respect for religious diversity.

The same chapter includes some discussion on people of differing gender, age, occupation and nationality. There are some promises that the students need to make to maintain religious harmony in society. Students also learn that they need to respect all people, irrespective of economic conditions, be caring and passionate to domestic workers, respect and help all, irrespective of nationality and religion. In conclusion it is said that *world peace* can be established in this way. This single chapter contains materials on many diverse and complex concepts with almost no opportunities provided for students to discuss or explore these topics in greater detail.

Another example of the textbooks relying only on words to teach values is evident in a SS-3 book chapter, where content related to respect towards manual labour is provided. After describing the significance of keeping the house and surroundings clean and tidy, and the children's role in doing this, an introduction to manual labourers and various professions in Bangladesh is given. In the later part of the chapter the book says, "We will not fear any work. We will not hate any occupation. We will love to work by ourselves" (p. 58). Children come to know,

There is a necessity of having manual labourers and different groups of professional in our society. We depend on them to fulfill our needs. We will respect all manual labourers and professionals. We will also respect all sorts of work. (NCTB, 2003b, p. 62).

Children are encouraged to repeat 'promises' instead of examining how they can reflect the values in their own lives. Moreover, the content related to some crucial terminal competencies (such as 'human rights' in the SS-3 book) is presented in a very limited way.

Values are not Defined Explicitly

The textbooks do not provide learning activities which allow students to investigate the nature of values, the significance of a particular value in life, and the way the presence or absence of values can affect the feelings of others. Values are sometimes mentioned as part of the discussion on big issues, but are not treated as being important in their own right. In addition, there are almost no activities for children to explore and share their values, and commit moral actions as part of the curriculum. Thus, there is little motivation provided that might encourage children to practice these values independently in their lives. The content on values does not provide opportunities for students to reflect on their own behaviour and consider the ways in which their actions do or do not represent the values. Following are some examples of narrow representations of values.

The chapter 'Social Virtues' in SS-4 textbook (NCTB, 2004b) says, "We will follow the rules of society. We will achieve moral and social virtues like justice, dutifulness, good conduct, punctuality, and coexisting with others". There is, however, no definition of these qualities.

The only instance of defining values or virtues is found in SS-5 textbook: "To behave well with others is called good manner" and "Doing activities in time is punctuality" (NCTB, 2005, p. 18). In the discussion of social qualities, children are first told to create and attend social and school clubs and organisations since "the basis of the clubs and organisations are unity, collectiveness, cooperation etc." They are then encouraged to follow the principles of "truthfulness, justice, dutifulness, discipline, civility, good conduct, tolerance, compassion, punctuality etc." since "these are our social qualities" (p. 21). The above qualities are, however, not defined.

Moreover, there is very little focus on values and skills that children need to develop for success in their personal, academic, and professional life. The ways to achieve skills like conflict resolution, decision making, problem solving, goal setting, and controlling one's own emotions are also not mentioned in the textbooks.

Limited Opportunities for Moral Action and Service Learning

The books describe the ways children can act responsibly with regard to their family, school, local community, and the nation. For example, in the SS-4 textbook students are encouraged to take part in school activities, such as growing gardens and making fences to protect those, and building school library. It is suggested that "...we will also build libraries in our home, neighbourhood, and our local community" (p. 2).

The same book tells elsewhere:

We will ask for opinion of all in the community. We will make decisions about keeping the community clean and tidy. We will select a place for garbage disposal based on the opinion of majority. We can take various steps to maintain the law and order of the community. (p. 108)

In the SS-5 textbook, students are encouraged to organise a "Plant Fare" or activities for "Social Forestation" in their local community (p. 5). They can also help the community members become self-dependent by arranging special events, in cooperation with the department of agriculture and other non-government organisations, to provide the members with information and materials for growing fruits and vegetables. Other suggested activities are taking part in garbage collection, waste disposal, and pest control, as well as repairing houses, bridges and other buildings after any natural calamity.

The students learn from textbooks that the way to be involved in such activities is joining scouts or girl guides and school clubs. However, there are no suggestions for ways in which service learning in the community can be implemented through school-based activities if there are no such clubs in a school. It seems that the majority of activities depicted in the textbooks are beyond what could be achieved within the school context and so opportunities for fostering student agency in the broader community appear to be very limited.

Activities in Curriculum and Textbooks

The SS curriculum suggests that a wide range of creative and interesting teaching-learning strategies, such as excursions, visual aids, narratives, stories, and personal encounters with events, be used so that information exchange and interactive learning experiences help develop children's knowledge, self-motivation and sense of responsibility towards the social and natural environments. But, the chapter-wise planned activities given in the curriculum are mostly listing (i.e., "write in notebook") tasks. The only exceptions to this listing task are the observation of days of children's and human rights, teacher observation of student attitude and behaviour with regard to the value 'respect', election of the class captain, collecting neighbour's name and a short description, and preparing at home two short questions related to culture.

In the SS books the main type of student activity is making entries in given lists or tables, which are, in almost all cases, situated immediately below a paragraph containing the factual information. Students are asked to list information that they found in the passage above the table. There is almost no scope for children to think beyond the given content. Some

exceptions to this literal level fact-finding exercise, however, were detected, and these were in the fifth-grade book. In the first instance, the students are requested to think about necessary developmental activities in their local community and list these in the given table. They are informed that the lists produced by all may have similarities and differences depending on the needs of the respective community. This activity appears to provide a chance for students to learn how to compare and contrast different sources of information. However, immediately after this learning exercise, a list of major developmental activities that may be required for communities is provided, thus, once again prescribing the ‘right’ answer and limiting the student opportunities to construct their own understanding. The other exceptional cases are listing five rules that any club, society or organisation may have; observing the condition of environment of home and surroundings and listing three properties; listing three qualities of a leader known to the learner; listing possible causes of pollution from students’ “own experience”; thinking about and listing additional [to the given content] ways of environment conservation; and finding ways to upgrade the social status of women.

Other than listing, the only activity found in the textbooks is a Mind Map exercise in the SS-5 textbook. A circle is drawn with the words “Causes of Environmental Pollution” written at the centre and twelve lines diverging from it. One of the lines is labeled “leaving garbage anywhere”. A mind map is usually used to extract background knowledge on a topic and can serve as a starting point for further inquiry; the ideas are organised into categories and interconnected by links (Budd, 2004; NSW, 2006). However, this Mind Map activity is not asking the children to brainstorm or add anything new to the given content. The passage above the diagram includes all possible causes of environmental pollution, and therefore this Mind Map is just another form of listing activity found throughout the books.

Making entries to lists and tables is also the major suggested activity in the **IS Curriculum**. There were only a few isolated cases where other activities were suggested:

- Group Discussion: About truthfulness, keeping away from greed
- Role play: Guest and host
- Writing and illustrating morals of a story in notebook
- Storytelling: One student will read the story written in book and others will listen

Although suggested in curriculum, the IS books do not include any student activities, except only one case where seven planned activities were listed at the end of the IS-4 textbook chapter “Akhlāq” (NCTB, 2004a). Six of those activities are, however, listing, and the information required for the lists is provided in the text.

Exercises in Textbooks

In the textbooks, the exercise section includes questions of these types: filling in the blanks, identifying true/false statements, matching, multiple choice questions, and answering short and narrative questions. There are no reflective or thought-generating questions in the exercises. Answers to the questions are given in the chapter. It seems that the aim is only to test the student’s ability of fact-finding from the chapter passages. For example, the following matching exercise (p. 67) in the SS-3 textbook copies statements as they are inside the chapter:

Table 2

Example of a Matching Exercise

Column A	Column B
a. Relations of captain to us	Respect
b. What will we show to elder's opinion	Responsibility of captain
c. To maintain class discipline	Democratic attitude
d. To Collect opinion of majority is	Classmate
	Cooperation

In a SS-4 textbook chapter, titled “Our responsibilities in family and school”, the statements (p. 4) for filling in the blanks are:

- a. We --- in school. (study)
- b. We will not --- anything on the school buildings or walls. (write)
- c. We will build --- in school. (library)
- d. We will read books of the library and will put the books ---. (at right places)
- e. Girls aged between six and ten form --- in the school. (‘Flock of Yellow Birds’)

These sentences in the exercise are also copied word-by-word from the chapter. For the understanding of readers of this article, answers are given inside parentheses.

In general the answers to the questions in True/False and Multiple Choice exercises are almost self-evident and require little thinking or evaluation. This kind of task requires the lower-level thinking processes of retrieving and restating concrete ‘facts’ and does not engage higher-level thinking processes such as evaluation or analysis. Children are also not given opportunities to consider or discuss the effects and consequences of presence or absence of values on themselves and others.

Implications for Curriculum and Textbook Developers

The connections that a curriculum should make with learners are Intrapersonal and Interpersonal (Johnson, 2010). Intrapersonal connection means fostering one’s own intelligence and emotion, utilising inherent qualities like reflectivity, creativity and imagination, and attending to personal needs and interests. Conversely, interpersonal connections include understanding the nature of humanity and the dynamics of interpersonal relationships, feeling and showing empathy for others, and developing the necessary skills to communicate and coexist with others in society (Johnson, 2010).

The document analysis shows that the primary curriculum materials in Bangladesh make little effort to establish these sorts of connections. Although the curricula of both subjects recommend taking into account the natural curiosity and investigative mind of young learners, as well as their age-specific capacity and need for learning, the textbook content does not reflect this recommendation.

The textbooks provide mainly ‘lower-level’ skills such as retrieving and restating facts and lack diversity in teaching-learning strategies. It is possible that teachers supplement their

lessons with sources and activities other than those provided in the textbooks, and endeavour to engage students in more active and meaningful learning (Brophy & Alleman, 2009). A range of student-centred and constructive learning activities that could augment the teaching of values in Bangladeshi primary schools were described in the **Effective Teaching-Learning Strategies for Values Education** section of this article. Some other useful strategies for teaching values are: Analysing Values (identifying and analysing facts to be able to recognise varying values positions), Clarifying Values (exploring and sharing own values and understanding those of others when the teacher deliberately raises a question regarding values), Consequence Charts (brainstorming on the possible consequences of an action or a decision), Decision-Making (choosing from multiple options by analysing and evaluating the possible choices), and Moral Dilemmas (finding a reasonable solution to a real or imaginary conflicting situation) (NSW, 2006).

Conclusion

It can be concluded that the primary curriculum materials in Bangladesh provided almost no opportunities for learners to discuss, reflect on and practice the values. Moreover, the given materials and recommended teaching practices are generally didactic and prescriptive in nature and do not foster the higher-order cognitive skills that would assist students to analyse and internalise the values. This analysis indicates that, in general, the primary curriculum materials do not adhere to the principles and practices of holistic education recommended by the proponents of character and values education programs.

Abstract

This paper is a study of adopting constructivism in making sense of learning to look at how the use of technology is integrated in Singapore schools to engage students in learning to think and to learn anytime and anywhere. The impact of globalization has led to the implementation of technology use in many schools for learning. The ‘globalized classroom’ refers to the 21st century learning environment with the change in the education curriculum towards student-centred learning with ICT, or learning with the information and communication technologies in schools. Learning technologies have led to unprecedented access to vast repositories of information, with ease of access to a myriad of learning resources. Although the current debate is whether ICT is good for students, I think it is crucial to look at understanding how the learning process can be improved with the varied uses of ICT to facilitate effective and meaningful learning with our technologically savvy students instead. This paper is to bring the discourse to a more active level of leveraging on the technological advances for teaching and learning. The framework will focus on the 4 roles of ICT as a tool in learning anytime and anywhere in relation to social constructivism to enhance the learning process. The 4 categories of ICT tools for:

1. Information
2. Situating
3. Construction
4. Communication

Introduction

Singapore has done remarkably well and has risen from being just a “little red dot” in the 1960s to a global city and a developed nation in the 21st century with the use of technology in the education system during the years when globalization as a process has affected the world. More and more schools in Singapore, with the support of the Ministry of Education (MOE) are pushing the frontiers of learning by harnessing IT as an essential tool in teaching and learning through the implementation of the education policy; Masterplans for ICT in education since 1997 (www.moe.edu.sg). One of the important impacts of globalization on education has been the transition of strategies adopted by the government’s response to the globalised economy with the emphasis and use of Information and Communication Technologies (ICT) in teaching and learning in Singapore schools. MOE has started online portal for primary, secondary and tertiary students to facilitate learning and teaching. Students also access the Internet or World Wide Web to make use of the appropriate ICT tools for knowledge, discussion, evaluation, communication and presentation.

According to Singapore’s Senior Minister Goh Chok Tong’s APEC Education opening speech, he emphasized that “education can no longer be built upon purely domestic foundations.” He said that “Globalization is here to stay” and he talked about “how successful our respective societies can cope with globalization” will depend on “how our educational systems respond to it”. He recommended the use of computers to “make learning fun” and allow “pupils access to a vast pool of valuable resources the world over”. With a world that is rapidly changing, the Senior Minister wants our young to:

“reach out to the world, understand the complexities and the potential of globalization, and live and compete in the global village. Education must arm them with the tools to succeed in this new world. This new world will comprise the New Economy and the Old Economy. Computers and IT literacy are therefore as important as the traditional alphabets, books and logic learning.” (MOE, 2000)

Thus, knowing to read and write is no longer seen as adequate in the context of the 21st technology-based society. The students have to be inculcated into more in-depth knowledge of learning technologies for learning. Thus young Singaporean students are encouraged to “speak the language of Science and Technology” to communicate with their peers worldwide and use it to advance themselves and Singapore and consequently a system that has all computers and IT training for educators and teachers in Singapore in a large scale (MOE, 2000)

What is learning anytime and anywhere? According to Smith (2002), to meet the challenges and opportunities of the 21st century IT based information age and to reap the benefits of the opportunities presented by globalization, the new system of education and learning has to support the teachers and students to break the boundaries of time and space; for learning that transcends boundaries (Smith, 2002). Learning anytime and anywhere with interactive whiteboards in class, use of computers within and beyond the school, emerging technologies such as emails, Skype, module blogs, discussion forums, blogging, chat, YouTube, social networking and the use of mobile phones create this new system of ubiquitous knowledge. Thus, education and learning should apply a wide range of online activities for

communication, for knowledge, for higher-order thinking and evaluation that aid the teacher and students beyond the classroom and towards a student-centred learning to enhance the learning process (Douch, 2009).

With the coming of the global era, new connections are being electronically forged from the concepts of “global village” and “networked communities” and are gaining prominence in learning design. The new reality is that the old traditional rote learning is fast becoming obsolete due to the pressures of technologies on the role and purpose of learning. The traditional classroom may be replaced by “virtual” communities of learning as new forms of delivery are devised and the purpose of learning is tested against the demands of the digital age. The use of educational learning technologies has also led to unprecedented access to vast repositories of information and ease of access to high quality teaching and learning resources for learning anytime and anywhere (Khine & Fisher, 1999). But, how can the use of ICT tools improve the learning process for students and how can students be able to derive knowledge from the vast disorganized information?

Learning styles are varied amongst students and are never a “one size fits all” theory and neither is teaching about purely delivering content. As such a model cannot embrace all the complexities of learning (Khine & Fisher, 1999). It is essential to be aware of different learning and teaching strategies within the framework of learning theories. To establish effective pedagogical practice for teaching and learning with the new technologies, I draw upon the constructivist paradigm which emphasizes on how students make sense of learning. The work of the cognitive constructivist theorists and of the socially oriented constructivists Lev Vygotsky whose learning paradigm emphasizes on the construction of knowledge through the historical and social context. Vygotsky (1978), argued that knowledge is formed and thinking happens through the exchange and shared notions with others (Vygotsky, 1978). The work of the cognitive constructivist theories has had considerable influence on current pedagogical practices and how learning occurs.

1. Social Constructivism and Learning

The constructive paradigm as advocated by Piaget (1981) and Bruner (1990) stresses that information that gets into the mind has to be constructed by the individual through knowledge discovery with emphasis on how a student constructs knowledge. Learning takes place when the student can construct knowledge and apply its meanings to new situations. Vygotsky (1978) emphasizes activity, person-in activity and on mediation through social cultural tools such as language, writing and numbers for examples, in his concept of cognitive situated learning. Central to Vygotsky’s (1978) theory of cognitive development is the notion of a “zone of proximal development” or ZPD in which is the zone of the “distance between the actual development level of a child as determined by independent problem solving and the level of potential development as determined through problem-solving under guidance or in collaboration with capable peers” (Vygotsky, 1978). Basically, Vygotsky seeks to explain the role and importance of social context for learning and students’ cognitive development which is based on the students’ ability to learn how to use social tools such as computers and culturally-based tools such as language and numbering systems through interactions with other students and teachers who socialize the students in their learning (Vygotsky, 1978).

Thus, the ZPD provides key implications for teachers as Vygotsky’s ZPD encourages social context for learning and needs to be associated with activities that involve applying learned knowledge in the real world tasks within a meaningful cultural context as well as the need for the student to internalize knowledge and skills before using these knowledge and skills

during social interaction. Additionally, Duffy and Cunningham (1996) emphasized that success in the zone of proximal development theory requires good support for learning or what they term as scaffolding or affordances of the environment which allows for learning in the real world context and in student being assimilated into the cultural context and history of the individual student.

The use of ICTs can be effective only when it is grounded in the theoretical foundations of the learning sciences. There is a need to ensure that students are exposed to real life authentic situations in the world to enhance learning and to lend itself to meaningful use of learning technologies within schools in Singapore. The emergence of the web and related learning technologies makes it both desirable and viable to not only access and manage information than previously thought, but to transcend to a learning process of sharing, communicating, analyzing and evaluating information with the learning community anytime and anywhere. There are various types of ICT-based tools available to help students to think, to learn, to collaborate and to communicate with their peers, their teachers and even the professionals for learning whilst providing some insight into the future of learning of the borderless society. Emerging technologies and adoption of these learning technologies has allowed teachers and students to locate information, to access information at a greater breadth and depth for learning and for communication purposes beyond the four walls of the classrooms.

2. The 4 Categories of ICT tools for Learning

Many educators believe that the most important goal of education is for students to learn how to reflect on and diagnose their own performance. According to Schon (1987), students should be encouraged to become “reflective practitioners” while Salomon, (1998) argues that instead of letting computers simulate human intelligence, human should instead be made to simulate the computer’s unique computing capability and to be able to use it a cognitive tool (Salomon, 1988). Therefore, students should be self-regulated learners responsible for setting their own goals, determining their own strategies and monitoring their own learning. Besides that, students should be using the ICT tools to retrieve information from the internet to find the solution to the problem or the task at hand, to constructing data after analysis of relevant information and in presentation of the information with the help of the ICT tools for learning to be effective.

For self-motivated and individualized learning at the students’ own pace, at anytime and anyplace, ICT tools can be used to help students in their work, that is, as productivity tools like word processing software, spreadsheets, computer-aided design (CAD) tools and graphics packages. ICT tools can also be employed as intellectual partners that enhance and instil in the student's ability to think. Searching the web may provide students with different perspectives or information but it has to be used in connection with ICT tools that facilitate critical thinking and higher order learning. Accordance to Jonassen (2000), the role of ICT tools should be changed from that of technology-as-teacher to technology-as-partner in the learning process (Jonassen, 2000). Therefore, ICT tools facilitate thinking and knowledge construction when students learn by doing and when student are conversing, collaborating with others, and discussing, arguing and building consensus among members of a community, and supporting discourse among the knowledge-building communities. When students are reflecting and articulating what they have learnt, these ICT tools are engaging and supporting students’ internal negotiations and meaning making thus constructing personal representations of meaning, and supporting mindful thinking. (Jonassen et al., 1999).

Depending on the intended instructional purposes, ICT can play various roles to facilitate the learning process of learning anytime, anywhere. The 4 categories of ICT tools for:

1. Information (for visual, audio, and text information)
2. Situating (students can experience the context through simulation games and virtual reality)
3. Construction (evaluating and constructing knowledge, through web authoring)
4. Communication (synchronous and asynchronous like emails and online conference)

(Chen, Hsu & Hung, 2000)

2.1 Use of ICT as Informative Tools

The use of ICT tools as informative tools is to foster learning and knowledge acquisition that transcends the physical boundaries of the classroom in Singapore. But what exactly are informative tools in the educational context? And “How is it possible to derive knowledge from the vast store of disorganized data and information?”

Informative tools are computer applications that provide huge amounts of information in the form of text, sound, graphics or video and examples of informative tools include resources available on the World Wide Web and multimedia dictionaries or encyclopedias and does not require much reasoning or processing of thinking for information except that it is an access to vast depositories of data and information (Chen, Hsu & Hung, 2000). Oliver and Hannafin (2000) investigated the use of ICT tools to manage and manipulate internet-based resources by 12 middle school students. The main objective was to find out how internet resource tools were used, from searching for data to the presentation of the data and resources collected. The tools were proposed to support higher order thinking about hypermedia resources to help students frame and solve open-ended problems. Higher order thinking referred to efforts in processing and understanding information through analysis, reasoning, organizing, synthesizing and evaluating for the above case. It was found that tools alone were inadequate to help students manage hypermedia information for solving open-ended problems. Students used more lower ordered functions such as collecting information than higher order tools; analyzing or reasoning (Oliver & Hannafin, 2000). In accordance with the constructivism theory, students will benefit from ICT tools for information when they hypothesize, analyze, reason with and evaluate about the problems with peers, the teachers and the learning community to make sense of the knowledge. The combination of scaffolding and tool support may help student to develop more advanced epistemological beliefs and to ultimately apply tools more strategically toward understanding and resolving complex, open-ended problems (Oliver & Hannafin, 2000).

Thus, informative tools to search for information may be helpful but they are not adequate on its own. However, if students also make use of strategic or modelling tools to solving problems using higher order thinking skills for evaluation, organization and analysis of information will students be able to benefit more and gain from this informative aspect of the ICT tools. In addition, teachers can play a crucial role in facilitating the learning of students by scaffolding the curriculum, giving a broad outline and limiting the extent of ICT used

purely as informative tools for students. Teachers can select the appropriate technology and teaching pedagogy that is most effective for analyzing and thinking about domain knowledge to elicit effective learning for students. Students who make use of technologies such as podcasting, blogs, discussion forums, YouTube, social networking sites and the use of the internet are already exposed to ubiquitous information and are now more connected to one another anytime and anywhere and to the world more than ever before. Archived lectures or lessons in audio and video, for example through podcasting and other archived course material are easily accessible for learning at nearly anytime and at any place. Students can even watch and get details of the latest human genome or the live webcams of various places thousands of kilometres away (Douch, 2009). Therefore, to leverage on the ICT tools for information, educators have to take note that assigning our students to use the technology for information is not a passive one-size fits all pedagogy but we strongly need to encourage students to analyze, appropriately scan and think about the authentic and relevance of the domain knowledge, be more engaged when they are collaborating, reflecting and in learning anytime, anywhere in the constructivist paradigm.

Use of ICT tools for information and knowledge is one of the advantages and benefits of technology to engage students in learning that transcends boundaries anytime but using it alone for information is definitely inadequate to enhance learning as students do need to incorporate the construction, and communication with the learning community to leverage on the full potential usage of ICT to improve the learning process.

2.2 Use of ICT as Constructive Tools

The use of ICT as constructive tools refers to the general purpose of using the computer software for manipulating of information, for constructing students' own knowledge and to visualize the ideas for students' own understanding. Students are able to produce a product with these tools for a specific instructional purpose. One example of ICT as constructive tool is web authoring applications where students can create their own web pages to communicate their thoughts and opinions to others anytime and anywhere.

Jonassen and Carr (2000) discussed learning using technology from a constructivist perspective. They stated that computers could be used as mindtools to construct meaningful learning and to facilitate learning of higher order thinking skills. Mindtools refer to computer applications such as spreadsheets, databases, modelling tools and hypermedia authoring tools that allow students to present and reflect on what they have learnt using different representational formalisms (Jonassen and Carr, 2000). Mindtools engages students in higher thinking skills such as evaluating, analyzing, synthesizing, elaborating, designing, and problem-solving and in decision making skills. Thus, besides the role of ICT as constructive tools it is also a mind-extending cognitive tool as well; thus students who are actively involved in the construction of their own knowledge with the help of the ICT tools learnt the most (Jonassen and Carr, 2000). According to Jonassen (2,000), ICT tools such as the above mentioned modelling tools allow students to show how ideas are dynamically related as dynamic relationships are causal. Knowing the causes of events or conditions would help students to predict them although it may be impossible to prevent them but to try to avoid or minimize harmful effects. Spreadsheets, expert systems shells and simulation systems are examples of software tools for representing dynamic relationships. Spreadsheet construction and use involve a variety of mental processes that require learners to use existing rules, generate new rules describing relationships and organize information with the emphasis on identifying relationships and translating those relationships in terms of higher order rules (or

macros). When users develop spreadsheets to describe knowledge domains, they will be thinking deeply (Jonassen & Carr, 2000).

With the wide array of information available and to make meaningful selection, interpretation and organization of information, students who use these database construction is making the best use of technology to improve their learning process. Database construction is an analytical task that calls on a variety of critical, creative and complex thinking skills and students will have to decide what information should be included and how to organize the information and objects, their attributes and their relationships have to be carefully considered when building a data model. The students will then have to look for the information to be captured in the database. The searching and sorting of the database required to answer queries can generate a variety of comparisons and contrasts based on which fields are selected for searching and sorting. Intellectually these processes require the organization and integration of a domain of knowledge. There are software tools available for drawing semantic networks or concept maps (Jonassen, 2000).

Additionally, the use of semantic organization software known as semantic networks/maps which are diagrams showing concepts and their interrelationships, also assist students by representing the knowledge structures that students have stored in their minds (Jonassen et al., 1993). These maps are used by students to represent what they know or are learning as networks of concepts. In fact semantic network software is visualization tools for externalizing or representing mental semantic network of schemas (ideas) as concept maps. When students construct concept maps to represent their understanding of a knowledge domain, they reconceptualise the knowledge domain by continuously using new propositions to elaborate and refine the concepts that they already partially know which contributes to learning.

2.3 Use of ICT as Situating Tools

Situating tools are the computer applications in which the students are in an environment where they may experience the actual scenario and happenings of the context at hand. Examples of such scenarios of context include simulation, games and virtual reality. Hogle (1996) examined the use of computer games to increase students' interest and motivation in learning as well as to enhance higher order thinking. He said that simulation and games might improve several kinds of cognitive learning strategies including organizational strategies when students pay attention, self evaluate and encourage themselves in the process of learning through simulation and games. Hogle (1996) stated that games and simulation encourages memory strategies such as grouping, imaginary and in structure review and compensatory strategies such as guessing the meaning intelligently (Hogle, 1996). To Hogle (1996), successful play required extensive critical thinking and problem solving skills but he noted that the educational benefits of the games depended very much on the intended aim and objective of the game and the context in which it is used (Hogle, 1996). In addition, software tools also known as "expert system shells" are available for use which allow people to build their own expert systems and as building experts systems requires students to synthesize knowledge by making explicit their own reasoning, thereby improving retention, transfer and problem solving ability of the users for interpreting knowledge (Jonassen et al., 1993). Thus, when students are able to leverage on these software tools, it is indeed eliciting student-centred learning mirroring the constructivism theory that knowledge is formed and thinking happens through the exchange and shared notions with others and helping in students'

retention and understanding and in application of knowledge appropriately. The use of ICT as situating tools does assist students in their process of learning meaningfully and effectively anytime and within the school compound or at anywhere. ICT tools need to be used for different functions and the next section of ICT as communicative tools for learning is effective especially when it is used for constructing and sharing knowledge with others for learning anytime and anywhere in the constructivist paradigm.

2.4 Use of ICT as Communicative Tools

Through the use of ICT as communicative tools, it allows students to be engaged in learning anytime, anywhere and with any devices. Communicative tools refer to the computer applications that mediate communication between students and teachers or between students and peers at anytime, anywhere and with any devices without physical boundaries. Emails, electronic bulletin boards, chats, teleconferencing and electronic whiteboards are examples of ICT being used as communicative tools. The interactive or communicative element engages students towards an epistemic usage of text. Wells (1990) defined such epistemic engagement with written text as “tentative and provisional attempt on the part of the writer to capture his or her current understanding as the writer or some other reader interrogates the text in order to interpret its meaning” (Wells, 1990, pp. 369-405). Thus, when students defined the topic as important followed with posing and solving problems and theorizing about the context are in fact involved in higher order thinking skills such as analyzing, synthesizing and in interpretation and evaluation of information and knowledge (Wells, 1990).

Students who use emails and Skype, or constructing own websites by uploading their data through blogs, videos and reviews of products for discussion and communication are actually interacting with one another asynchronously or synchronously through these technologies. Synchronous activities such as presentations, video conferencing, quizzes and group discussions; all of which can facilitate the teacher-student interaction or student and students either at the same location or even a different location from learning to teaching between the learner and the facilitator or among other students. Synchronous conferences are made possible when two or more computers are connected to each other to communicate with each other in real time. Synchronous conferences support networked learning communities consisting of teachers and students communicating with other teachers, students and experts who help to enhance both teaching and learning.

Global network technology can provide students with the platform to develop their social, communication and collaboration skill through participating in online discussions. With exposure to greater diversity in perspectives through participation in global discourse, the students' outlook will become less parochial and worldlier. However, for live discussion to be productive, students must be focused in their conversation, like planning a project, debating an issue or resolving a problem with real and relevant contexts for more meaningful learning. They will be more intellectually focused when they collaborate to create or construct an artefact like a report, a multimedia presentation or providing solutions to a problem. It is important for the success of synchronous conferences to pose interesting, engaging questions, problems or assignments for students to resolve in synchronous discussions. If the topic of discussion involves higher order thinking, synchronous conferencing may well support critical, creative and complex thinking (Jonassen, 2000).

Asynchronous communication is different from synchronous conferencing primarily in the level of reflective and constructive thinking that it allows. Harasim (1990) found that students

see themselves as reflecting more while engaged in computer conferencing than when engaged in face-to-face or telephone conversations. Students are analyzing more when they have time to consider and construct responses. Computer conferencing supports social negotiation of ideas about content that is being studied, as well as the collaborative construction of new knowledge. As groups of thinking individuals provide different perspectives and interpretations, debate, argue and compromise on the meanings of ideas and concepts, they are indeed deeply engaged in knowledge construction. The use of asynchronous and synchronous conferencing does engage students in critical, collaborative and self-regulated thinking in the students' learning process.

3. Towards a New perspective on Learning

With careful planning, ICT-based teaching and learning can be effective. Students learn with these ICT tools and from collaboration with other students. These are all the common activities of the IT savvy youths of today and these "digital" young are attracted to these technologies, as today, they are actively communicating, collaborating and learning together. Active and engaged learning allow students to be involved and interested in their own learning path which gives them a sense of ownership and motivation in their learning. Based on the social constructivist theory, when students are sharing and constructing meaningful learning with their peers, the educators and the collaborative community of learners through the use of technology, they are learning effectively and meaningfully. Thus, educators need to provide the appropriate scaffolding and support through the learning environment to facilitate this collaborative and authentic socially-constructive approach. We should also harness that ICT-fascination for the educational benefits of our students. In so doing, we are also preparing the workforce of the future, who will have to be creative and critical thinkers; flexible individuals adaptable to change and becoming life-long learners in this innovative and science/technology economy (O'shea M.P, 1999). We have to realize that the 21st century society instructional paradigm has shifted from the traditional rote-learning information providing concept to student-centred learning with self-discovery on the part of the students adopting learning technologies for meaningful learning. The learning paradigm is that of individualized, engaged learning with higher-order thinking skills that encompass analytical, evaluative skills of learning for life-long learning with the use of ICT tools (Jonassen, 2000). Integrating technology into the learning process means that educators need to maximize the use of technology in situations where students are engaged in the learning process.

We should ensure that the ICT tools, its software programmes and the teachers' instructional approaches function in unison as a bridge between the knowledge to be learned, and the students need to learn. New technologies are changing not only what students learn, but also how they learn. Curricula must align with the demands of the digital age by focusing less on knowing facts and more on strategies for learning. The teacher serves as a facilitator and not as the sole provider of information. Access to education should not be confined to schools, colleges and universities. Learning opportunities resides in homes, community centres, art galleries, museums and workplaces. It should be more about the choice in how the students prefer to learn. Advocate "learning to learn" that encourages students to learn in a best way that best matches their individual characteristics and needs. However, most researches to date suggests that ICT-based teaching and learning are not always more effective than traditional teaching and learning practices. It is essential to be aware of the need to develop a complex matrix of integrated learning tools and teaching strategies within the framework of learning theories, pedagogical practices and evaluation techniques. Then it is possible to achieve an enhanced learning outcome in technologically driven society.

Future learning environments should be inherently flexible to facilitate support for the divergent needs of current, past and future generations. There is a need to identify the varying learner behaviours, interpersonal communication skills, and preferred learning styles. There needs to be full interplay between ICT tools, communication, and cognitive development and behaviour. It is argued that learning in the future should aim to support the lifelong learning of all individuals through the intelligent software and teachers and students' self-directed learning environments characterized by flexible, ubiquitous, mobile delivery at anytime and anyplace.

Conclusion

This paper has enabled a discussion of a theoretical framework of constructivism in making sense of learning and how ICT is used to engage students in learning to think and to learn anytime, anywhere in the globalized world. It is inherently clear that ICT tools can be a very powerful tool to explore the potentials of maximizing students' learning. Integrating technology into the learning process means that educators need to maximize the ICT tools for active and engaged learning. Active and engaged learning allow students to be involved and interested in their own learning path which provides ownership and motivation in their learning. Currently, students are sharing and constructing meaningful learning with their peers, the educators and the collaborative community of learners through the use of ICT. Thus, educators need to provide the appropriate scaffolding and support through the learning environment to facilitate this collaborative and authentic socially-constructive approach.

Today's youth are very IT savvy and have become accustomed to a world in which they can search for, download and share digital music on the internet. Their creativity and desire for innovative thinking is paving the way for more innovative uses for technologies and what is now needed are the hardware and software solutions that will permit students to seek out and creating new knowledge through the current web 2.0 applications or in the virtual world such as "Second life".

A 1-day Situational Learning/Tour in MCU/a University: Perceived Effects on English Learning

Pey-chewn Duo

Min-hsun Su

Ming Chuan University, Taiwan

Abstract

This study investigated how elementary school students and teachers perceived the effects of a one-day English situated learning/tour in Ming Chuan University (MCU) on students' English learning, based on a survey research study conducted in Taoyuan in Fall, 2008. Situated learning refers to the concept that "learning and doing are inseparable and that learning is a process of enculturation" (Hendricks, 2001, p.302). Lave and Wenger (1991) have pointed out that learning would be more effective if learners are able to interact or operate real tasks with their peers in a context/culture-embedded learning environment. In order to meet the purpose of the study, a total of 273 elementary school students and 13 teachers from the region surveyed responded to the questionnaire. Results of the study showed that the majority of the students and teachers hold a positive attitude toward the effects of situated instruction on students' English learning. The participating teachers pointed out that students were motivated to use English to express themselves and interact with peers and teachers in the situated learning environment. Most teachers believed that the situated classrooms gave students the opportunity to use English and improve their English ability. Similar responses found from students' feedback showed that the majority of them enjoyed the situated instruction and gained more confidence in speaking English. Students responded that they were less afraid to speak English and more willing to speak English after the one-day English tour experience. They also thought their English ability in speaking, reading, listening and writing were improved after participating in the one-day English tour.

Keywords: situated learning, one day tour, English village, beliefs/perceptions

Introduction

In Taiwan, English learning occurs mostly inside traditional classroom settings which are often characterized as test-driven, teacher-centered, and structure-based. The focus of English instruction is on the learning and drilling of linguistic structure and vocabulary to help students attain better grades and pass examinations. Students seldom have the opportunity to produce or use the language inside classroom settings. And since the major languages used in Taiwan are Mandarin and Taiwanese, Taiwanese students who learn English as a second/foreign language also find it unnecessary to use the target language outside of classroom settings. Thus, many students have claimed that they are afraid to speak English

and failed to use the language after years of English study (Hsieh, 1995).

In order to improve this situation, many Taiwanese parents send their children to private language institutes or study tours overseas in the hope that their children can pick up the target language more easily and successfully if they are immersed in the environment. Many have come to believe that if one wants to learn English well, one needs to spend money to go abroad for English learning. Similar problems also occurred in Korea. According to Trottier (2008), over 25,911 young children in Korea were sent overseas to study in the year of 2007. In order to reduce the numbers of students being sent abroad to study English, the Korean government have worked on developing English Villages that simulate real communities in the English-speaking countries. *Paju Camp*, which opened on April 3, 2006, is one example that illustrates this kind of situated learning environment. “The objective of English Village is to provide the public...with opportunities to put everyday English into practice and improve their language skills” (Gyeonggi English Villages, 2006). Students who come to the English Village are expected to use English and *only* English to communicate their needs in authentic-like settings (e.g., hotels, restaurants, etc.). Within the real-world like settings, students learn how to use the target language while observing others tackle with tasks (e.g., how to order a meal) and problems that might happen in native-speaking countries.

The English learning environment and education system in Taiwan is similar to that in Korea; thus, many have thought of transferring the English Village experience from Korea into Taiwan (2006). The Taoyuan County government, for example, has devoted much time and effort in developing similar situated learning settings to offer students context-embedded learning environments. So far, the Taoyuan government has set up three International English Villages, including Chung Li Village, Wun Chang Village, and Happy English Village (Taoyuan English Village, 2006). Each English Village is consist of a range of different simulated settings, such as airport, restaurant, hotel, and etc, to immerse students in contexts similar to real life situations.

A newly developed addition to the already established English Villages in Taoyuan County is the one-day English tour in Ming Chuan University (MCU), Taoyuan campus. The one-day English tour started from September 29 targeted its population mainly on elementary school students in Taoyuan County. Students come in to experience a one day English tour in a series of simulated settings. During their stay, they experience six situated settings, including 1) exploring American History; 2) on the airplane and immigration; 3) hotel check-in; 4) eating and food in the USA; 5) museum tour; 6) English-your passport to the World. Then at the end of the day, the students are brought to classrooms by their teaching

assistants and are asked to give a mini speech on what they learned and saw during the English tour.

In contrast to the traditional English classrooms, this kind of English Villages and English tours are “characterised by a more progressive, humanistic pedagogy which recognises the importance of promoting the sociocultural, developmental process of L2 learning as opposed to its mere outcomes” (Trottier, 2008, p. 74). It adopts “situational classroom teaching”, which according to Tsay (2008) is “the teaching that occurs in some simulated classrooms. The settings in the classrooms are made to look like the real, first-hand environments, such as airport customs, a cafeteria, etc.” (p.174). Tarone (1995) suggested that it is necessary for L2 teachers to provide learners as much exposure to authentic language learning interaction context as possible, and the target language interaction should be more than teacher-student communication, student-student interaction is also required for the students. Thus, to make language learning effective, immersion classroom curricula should “help students approximate functional competence in a wider range of settings (social as well as academic), and increase peer-peer interactions in the target language (Dahl, 1997, p.4). Lave and Wenger (1991) have also pointed out that learning would be more effective in context-embedded situations when learners are aware of it and are able to interact or operate real tasks with their peers in the situations. Furthermore, it has been proven that when the culture of the target language is integrated into the language learning process, there is a great chance that student could enjoy the language learning more (Genc & Bada, 2005).

The core concept that underlies the English Village is revolved around situated learning theory. Situated learning theory, also refers to as cognitive apprenticeship, community practice or legitimate peripheral participation argues that learning occurs in culture embedded contexts. Current theories of situated learning (e.g., Lave & Wegner, 1991; Vygotsky, 1978, Brown, Collins, & Duguid, 1989, etc.) suggest that the activity of learning is not an individual endeavor but rather the interaction and collaboration with others within a community. As Saloman (1993) pointed out, “knowledge is socially constructed through collaborative efforts to achieve shared objectives in cultural surroundings...” (p.3). It is considered as the “process of enculturation” (Brown, et al, 1989) in which we adopt “the norms, skills, beliefs, language and attitudes of a particular community” (Woolfolk, 2007, p,348). The theory shares the view with Vygotsky’s socioculture theory which asserts that learning should be embedded in particular settings or “a specific community of practice” (Woolfolk, 2007, p347). In the words of Vygotsky’s (1978), cognitive development happens through the interaction with more experienced and capable individuals (experts) in the zone of proximal development (ZPD). Through scaffolding and support from others, the novice learners are able to learn and internalize the knowledge and experience obtained from the experts. The process of moving from a novice learner to an expert learner is referred to as the process of culture transmission.

A similar concept developed by Lave & Wegner (1991) is called legitimate peripheral participation which asserts “that the mastery of knowledge and practice requires newcomers to move toward full participation in the sociocultural practices of a community” (p.29). It is a process in which a novice learner becomes more acquainted with the tasks, values, culture and language of a community.

The concept of situated learning clearly distinguishes itself from that which supports traditional learning theories (Hendrick, 2001). Wegner (1998) pointed out that learning in traditional settings is often assumed as having a “beginning and an end” and “that it is best separated from the rest of our activities” and “is the result of teaching”. Lave & Wegner (1991) argues that traditional classroom settings take out and abstract the context in which knowledge should be co-constructed through interpersonal interaction. In most traditional classroom settings, “children are taught concepts outside of their specific uses to increase general learning so that broad transfer to many situations can occur” (Hendricks, 2001, p. 302). One example given by Brown, et al (1989) is the rote memorization of vocabulary. In other words, formal schooling assumes that we learn about “what” (facts) and are expected to be able to transfer and generalize the “what” into the knowledge of “how” when given the situation. Nevertheless, many who hold the position that learning should not be decontextualized believe that when learning occurs outside of its context, it *cannot* be transferred and generalized to real world situations. It is, as a matter of fact, bounded to the context in which knowledge is learned. For Lave and Wegner (1991), in a situated learning environment, nothing should be fixed or deliberate since in real-life situations, we never play by script, either. Thus, within a situated learning environment, teachers are no longer the organizers who are in charge of curriculum planning and sequencing. They should, instead, become facilitators who create a supportive learning environment that encourages individuals’ cognitive development.

The concept of situated learning has been applied in different learning fields, including the field of second language acquisition (SLA). One area of research in SLA is CALL (computer-assisted language learning) (Swain & Deters, 2007). Zhau (1996), for example, explored the use of the World Wide Web in SLA within the framework of situated learning. Kumar, Anjaneyulu & Gupte (1997) presented a situated learning based CALL system named VIDYA which employs a number of CALL principles that includes the mastery learning in the situated learning context, student modeling of language constructs, dynamic courseware presentation, and a generic courseware evaluation technique. Jones, Squires and Hicks (2008), also incorporated the concept of situated learning by using a 3D online learning environment to achieve the following purposes: 1) to enable students to use the targeted language in context-embedded settings; 2) to create an environment in which students are allowed as much input as possible; 3) to be able to incorporate the culture of the targeted language; 4) to

give teachers the necessary tools for helping students to develop their language ability; 5) to provide a system/program that is flexible and accommodate to teachers' teaching needs. The study showed that students participated in the study did improve their spoken language skills within the authentic and situated 3D interactive learning environment. While a constructive viewpoint has taken a stand and been integrated/applied into the field of SLA (Swaine & Deters, 2007), little studies have been done to find out the effects of situated learning on language learning. Therefore, the purpose of the study is to investigate how students and teachers who participated in the one-day English situated learning/tour in Ming Chuan University (MCU) perceived the effects of situated instruction on students' English learning. Specifically, the research questions asked were:

1. How do students perceive the effects of one-day English tour on their English learning?
2. How do teachers perceive the effects of one-day English tour on students' English learning?

Method

The study utilized survey research design. The purpose of the survey design is, "to provide a quantitative or numeric description of trends, attitudes or opinions of a population by studying a sample of that population" (Creswell, 2003, p. 153). By conducting survey research and using multistage probability sampling, the researcher infers the results to the population of Taiwanese students and teachers in the elementary schools. The sample population for the research study included mainly elementary school students and teachers who participated in the one-day English tour in Ming-Chuan University, Taoyuan Campus in Taiwan during Fall, 2008. A total of 273 elementary school students and 13 teachers from the region surveyed responded to the questionnaire.

Two questionnaires were designed in order to fulfill the purpose of the study. One was aimed for students to find out their perceptions of the effects of one-day English tour on their English learning. The survey contains 10, 6-point likert scale questions, ranging from 6 (strongly agree) to 1 (strongly disagree). The questionnaire for teachers is a self-designed open-ended questionnaire that contains two questions asking teachers their perception regarding the effects they think one-day English tour might have on students general English learning ability.

Data collection was conducted by the researchers and the teaching assistants who participated in the one-day English tour. Participants were asked to fill in the surveys at the end of each English tour. The data were collected through cluster and random sampling during the semester. The nature of the study was explained to the subjects, and their cooperation was asked. The subjects were reminded that honest responses are preferred, and no right or wrong answers existed. Participants were also assured that their responses would be kept completely confidential.

SPSS 12.0 was used for the quantitative data coding and analysis. For qualitative data (i.e., the open-ended questions), the researches did a general overview of the information collected, looking for common themes. Established patterns among the themes revealed generalizations that emerged from the data sets.

Results

Research Question 1: Students' perceptions

Table 1 shows students' perception toward the effects of one-day English tour on their English ability. Results indicated that most students hold a positive attitude toward the effects of one-day English tour on their overall English ability ($M=4.61$ $SD=1.03$, $\mu=3.5$, $t=17.86^*$, $p<0.05$). They thought the one-day English tour is beneficial to their English learning. They also reported of having gained more confident in speaking English, and were less afraid as well as more willing to speak English after participating in the one-day English tour. When asked if they thought the one-day English tour had an effect on their English ability. The majority of them also hold a positive attitude and responded that they believed their English ability in speaking, listening, reading and writing improved.

Table 1 Students' perception toward the effects of one-day English tour on their English ability (n=273)

Item	Mean	SD	μ	one sample t value
1	4.41	1.18	3.5	12.76*
2	4.71	1.19	3.5	16.76*
3	4.80	1.17	3.5	18.34*
4	4.83	3.28	3.5	6.73*
5	4.74	1.19	3.5	17.28*
6	4.16	1.36	3.5	8.09*
7	4.51	1.24	3.5	13.46*
8	4.94	1.15	3.5	20.70*
9	4.62	1.17	3.5	15.80*
10	4.44	1.29	3.5	12.00*
Total	4.61	1.03	3.5	17.86*

Note 1: * $p < .05$

Note 2: SD= Standard Deviation; μ =Hypothetical Mean

Note 3: Likert- type response scale ranging from "6=strongly agree; 5= agree; 4=somewhat agree; 3=somewhat disagree; 2= disagree; 1=strongly disagree"

Research Question 2: Teachers' perceptions

This study also contained an open-ended questionnaire aimed for teachers. The purpose was to have a better understanding of how the teachers perceived the effects of one day English

tour on students' English learning. The question asked was, "In your opinion, do you think students' English ability can be improved by attending one-day English tour? Why or why not?" A total of 13 teachers wrote down their opinions. Among the 13 responses, 8 teachers responded positively toward the effects of one-day English tour on students' English learning. From their observation, they thought the one-day English tour helped to improve students' English ability in a general sense.

A few findings were generated from their responses. First of all, the majority of them indicated that the one-day English tour provided an English environment for students to actually use the target language. As one teacher pointed out, "*students' English ability can be improved from immersing in an English environment*". Following this comment, another teacher stated that,

Yes. I think it helped. Students need to try to express themselves "on their own" in different settings. Through guidance and modeling from the teachers, students' communication skills will definitely improve.

Second, some teachers also pointed out that students are less afraid and more willing to speak English during the activities. One teacher illustrated this point by stating that "*students are more willing to speak English because they are encouraged to use the language in each setting*". Third, the participants indicated out that the one-day English tour is new and interesting to students; thus, students' motivation can be increased and will be more motivated to learn English. As one teacher put it,

students' English ability will improve by participating in this kind of activity because the curriculum design itself is fun and interesting. It can increase students' learning motivation. Plus, the lessons are taught by foreign teachers and this is new and novel to many students.

Finally, a few teachers also pointed out that the tour helped to increase students' vocabulary.

The one-day English helped students to learn many vocabulary words they can use in their daily lives. It also helped to review the vocabulary words students learned in the past. It is a great English learning activity.

Nevertheless, there were 5 teachers who weren't certain of the effects of the one-day English tour. Although they agreed that it can increase students' interests in learning English and give them a wider perspective of different cultures, they were not sure if students' English ability can be improved within one day. As one teacher puts it, "*Students are more willing to talk, but*

it's hard to estimate their improvement in English just in one day". Another teacher supported this view by adding, "one day is probably not enough if we want to see improvements in students' English ability. Perhaps a longer period of time would be more beneficial".

Discussion

Based on the results above, the majority of students and teachers perceived the effects of one-day English tour with a positive attitude. A few common findings were generated as follows. First of all, the one-day English tour created an English environment that is beneficial for students' English learning. According to Park & Oxford (1998), English village program is proven to be a very efficient way to achieve an English immersion learning environment for the learners. It provides numerous opportunities for students to use the target language. In Wighting, Nisbet and Tindall's study (2005) of an English camp in China, they also concluded that a number of opportunities of using conversational English in meaningful context and authentic situations are provided, and students are highly motivated to speak English with native speakers. Moreover, they revealed that the students actually benefited from the instructional methods used in the English camp. The Chinese teachers that participated in the camp also indicated that they learned new teaching methods in the camp as well.

Secondly, students showed more confidence in speaking English. This is probably due to the fact that situated learning environments are different from formal classroom situations in which communication is less likely to occur and errors/mistakes are not valued. As Park and Oxford (1998) concluded after their investigation of the 5-week summer intensive program in a Korean institute, the strength of this kind of program was "its effectiveness in overcoming fear of communication and promoting self-confidence in speaking (p.111)". And when students feel they are in a safe and protected environment with their familiar peers, they would feel less nervous about practicing the target language (Senior, 1997).

The third important finding in this study is that one-day English tour helped to improve students' English ability. The finding in this study supports Tsay's study in 2008. In Tsay's (2008) study, she found that although the one-day study tour only lasted one day for the students, this kind of English immersion program still successfully improved the participants' English in speaking and listening. Participants' ability of learning of specific vocabulary was also improved, and their interest in learning English was enhanced.

Last but not the least, it is also found that the one-day tour helped to increase students' interest in learning English. Students showed great interests, preference, and high value in learning English in the meaning context with real authentic English interaction with native speakers. It provides learners a challenging and authentic English learning communication opportunity that helped maintain their interests in English learning. As indicated in many

studies (e.g., Woolfolk, 2007; Ren, 2007), it is critically important for educators to keep students' interest in learning.

Conclusion and recommendation

This research project was set out to investigate how students and teachers participated in the one-day English situated learning/tour in Ming Chuan University (MCU) perceived the effects of situated instruction on students' English learning

Form practical contribution, it is hoped that by providing a cope of how students and teachers perceive situated learning, educators in related fields might have a better understanding of the nature of one-day English tour and modify their instruction based the research results. The findings of this study could provide insights to teachers and serve as a foundation for various educational programs that aim to help their learners become successful in learning the target language.

After careful review of previous literature, it is found that although there has been much discussion and research on situated learning and SLA, very little empirical research is done on the effects of situated learning on second language learning. Consequently, it is hoped that the results of this current research project would add to the body of knowledge in the field.

An Exploration of African Students in Malaysia

UCSI University
Malaysia

Abstract

The exploratory study is an attempt to understand the reasons that prompted African students to study in Malaysia, the challenges encountered and the coping strategies used. The research on such topics among international students is well documented but studies on international students in Malaysia are scarce. The sample included 155 African students studying in two private higher education institutions in Malaysia. A questionnaire was administered. The results indicate that most of the students chose to study in Malaysia because English is used as the medium of instruction. The challenges they face include developing friendships with Malaysian students. Keeping in touch with family and friends back in their home country is the highest ranked coping strategy.

Introduction

The impact of globalization and internationalization on higher education has created a market for the active recruitment of international students, especially in Asia. According to a report by UNESCO Institute of Statistics (2009) or UNESCO-UIS, the number of students pursuing tertiary education has increased five-fold over a period of 37 years. The enrollment of 28.6 million in 1970 grew to 152.5 million in 2007. More specifically, this growth has been active in East Asia and the Pacific where a twelve-fold increase has been recorded. Malaysia is one such country that has contributed to this growth through the privatization of its higher education and the recruitment of international students. She is listed as one of the three emerging contenders in the development of student mobility across the globe (Verbik and Lasanowski, 2007).

The country's multi-racial and multi-cultural background attracts students from different countries in Asia such as Indonesia, India, Vietnam, China, and Myanmar. In addition, the options for different programs, especially in undergraduate education have made Malaysia an attraction to students because they are able to transfer to other countries such as Australia, New Zealand, the United Kingdom, and the United States because of the twinning agreements between countries (Yoshino, 2010).

Sirat (2008) pointed out that Malaysia became a preferred destination for higher education for Middle-East students after the September 11 tragedy. Stricter visa regulations that followed deterred international students from studying in the United States. Conversely, students from different Sub-Saharan nations have been enrolling in private higher education institutions in Malaysia because it is easier to obtain a student visa to study in Malaysia as compared to the United States. Consequently, there is a broader diversity spectrum of student population in higher education institutions in Malaysia.

One of the challenging tasks for most higher education institutions in Malaysia with the increase of cultures and cultural groups is to ensure that the international students

cope well with the adjustment to the host country and the learning environment. Studies related to the factors that attract international students to countries such as the United States, the United Kingdom and Australia and their adjustments are widely documented (Ramburuth and Tani, 2007). However, similar studies related to international students in Asian institutions of higher education are limited. Specifically, studies on international students in Malaysian higher education institutions are equally limited.

Hence, this exploratory study is an attempt to investigate the possible factors that influenced African students' decision to enroll in private higher education institutions in Malaysia and the challenges of coping with living and studying in the country's cross-cultural environment. Specially, the foci is on identifying the reasons these students chose Malaysia as a destination for higher education, the challenges they face studying in this country, and their ability to adjust and or thrive in their host country as well as the new learning environment. The research questions are:

1. What are the factors that attracted African students to Malaysia?
2. What are the challenges faced by African students in Malaysia?
3. How do African students cope with living and studying in Malaysia?

The limitations for this study include the sample of African students enrolled in only two private higher education institutions. Hence, generalizations of the results may not be viable. However, it is important that this topic of study is further explored because it has implications for international student recruiting, understanding African learners, and teaching and learning in the classroom.

For the purpose of this research, the definition of an internationally mobile person is adapted from the UNESCO-UIS' (2009) description, which states, "The UIS defines internationally mobile students as those who study in a foreign country of which they are not a permanent resident." (p. 35).

International Students in Malaysia

Currently, students across the globe have more options for higher education, especially with the marked increased of countries that are keen to develop its ability to compete as an education provider internationally. There is a 53% increase of mobile students globally since 1993 (UNESCO-UIS, 2009). Sugimura (2009) described an emerging flow heading to countries in the Association of Southeast Asian Nations (ASEAN) region. This mobility includes students from the Middle East and African countries. The former's influx may be attributed to the impact of the September 11 attack on the United States while the latter group's presence may have resulted as an outcome of the cooperation between African and Asian nations (Sirat, 2008; Sugimura, 2009).

The enrollment of international students in Malaysia has increased steadily over the past decade with the country's aim to enroll 100,000 by 2010. The National Center for Higher Education Research Malaysia (NCHERM, 2009) reported that a total of 70,426 international students were enrolled in institutions of higher education in 2008. Approximately 71.9% of this population was studying in private higher education institutions while 28.1% were students at the public institutions. In addition, this

recent report identified the representation of countries among these students according to enrollment number. From 2003 to 2005, students from mainland China were the biggest group with Indonesian students being the second biggest. However, this changed in 2006 with Indonesian students being the largest group while students from China have become the second largest. Students from Bangladesh and Pakistan were the third and fourth largest groups from 2003 to 2006. This trend changed in 2007 where Iran and Nigeria replaced these two countries in the Indian Continent. The latter group represents the majority of African students in Malaysia.

African Students in Malaysia

African students' are the most mobile international students (Mulumba, Obaje, Kobedi & Kishun, 2008). According to Maringe and Carter (2007), it is estimated that one out of 15 foreign students in the United Kingdom (UK) is an African. Their study is one of the few that investigated the possible reasons these students decided to study in the UK and their experiences as international students. The results indicated that there were more push than pull factors that encouraged this mobility, which include economic and political reasons as well as the lack of higher education opportunities in the home country. The main pull factors include the recognition and prestige of obtaining UK qualifications. Recommendation of friends was an influential factor for African students who chose to study in the UK for the first time. The concerns among the students who chose to study in the UK include the financial demands and the inability to pay for their studies.

The research literature on African students' decision to study in Malaysia as well as their experience living and studying in this country is scarce. Unfortunately, there are unfavorable newspaper reports about African students' criminal activities and other social problems.

Methodology

A questionnaire survey was developed to seek certain information related to the three research questions for this study. Several statements linked to the three research questions were designed to inquire more detailed information. Convenience sampling was the primary method employed to obtain participants as the two private higher education institutions enroll quite a substantial number of African students.

An email was sent to the respective lecturers who had African students in their classes to obtain permission to administer the survey for one institution. An informant was identified to help administer the survey to African students in another institution. A total of 155 completed surveys were tabulated using SPSS 16 to determine the frequency and percentage of responses to each statement. The answers were ranked according to the highest frequency and percentage of the combined "strongly agree" and "agree" responses.

Table 1: Demographic characteristics

Country	Frequency	Percent
Nigeria	73	47.1
Eritrea	3	1.9
Kenya	11	7.1
Uganda	15	9.7
Botswana	26	16.8
Cameroon	4	2.6
Sudan	7	4.5
Tanzania	10	6.5
Mauritius	1	0.6
Somalia	1	0.6
Zimbabwe	4	2.6
Total	155	100.0

Table 1 shows the diversity of African countries represented among the participants, which are mostly from the Sub-Saharan region. This indicates the high mobility of students from this region. The largest representation from this sample is the Nigerian students who comprised 47.1% of the students surveyed. The second largest is from Botswana.

Results and Discussion

It is interesting to note that more than half of the students surveyed chose to study in Malaysia because its programs are conducted in English and the possibility of transferring to a native English speaking country is another factor that is highly rated. Another interesting factor is the availability of recruiting agents in the respective African countries or regions.

Forty-six percent of the students indicated that agents in their home countries recommended Malaysia as a higher education destination. The weaker factors are the recommendation of friends and also the multiracial context of Malaysia as indicated by the respective 31.0 and 34.8 percentages.

Yoshino (2008) pointed out that English as a medium of instruction in Malaysia offers international students an alternative “English speaking” country for higher education. Most of the English medium programs are offered by private higher education institutions. In addition, many of these institutions have dedicated marketing departments that recruit nationally and internationally. These factors may have contributed to the higher enrollment of international students.

Table 2: Factors for choosing Malaysia

	Frequency	Percent	Ranking
The tuition fee in Malaysia is affordable	56	36.2	8
The medium of instruction (teaching) is English	89	57.4	1
The multiracial context of Malaysia	54	34.8	9
The tropical weather	59	38.0	7
The recommendation of friends already studying in Malaysia	48	31.0	10
The recommendation by agents in own home country	72	46.4	3
The possibility of transferring to another country such as Australia, the US, and the UK	80	51.7	2
Malaysia is a relatively safe country	69	44.5	4
The education fairs that promoted Malaysia	67	43.2	5
My family encouraged me to study in Malaysia	61	36.4	6

The “transferability” factor indicates that Malaysia may be perceived by international students as a transit country where completing an undergraduate degree is not a priority. The availability of numerous franchise programs with Australia and the United Kingdom in Malaysia provides another option for international students who would like to pursue such a curriculum.

The data for the section pertaining to the challenges of studying and living in Malaysia investigated the students’ in-class and out-of-class experiences. The first ranked item describes a high level of agreement, 70.9%, among the African students that it is easy to develop friendships with international students from other countries as compared to Malaysian students, which is indicated by a low level of 10.9% agreement. More often than not most international students go through a certain period of adjustment and transition while studying abroad. Similar experiences of having to cope in a new environment and adjusting to a new culture may create a sense of group acceptance because they are facing the same challenges in and out of the classroom. Conversely, the data indicate that developing a relationship with Malaysian students is an arduous task. This implies that Malaysian students may be perceived as being indifferent to or intolerant of other cultures.

Table 3: Challenges of living in Malaysia

	Frequency	Percent	Ranking
It is easy to make friends among Malaysians	17	10.9	10
It is easy to make friends among other international students	110	70.9	1
It is easy to understand the lecturers	48	31.0	5
It is easy to search for accommodation	42	27.1	8
The orientation sessions provided useful information	77	49.6	4
It was challenging to work in groups for group projects	83	53.5	3
It was difficult to work on individual assignments	43	27.8	7
Most students find it difficult to understand the African accent	44	28.4	6
It was difficult to adjust to the local food	84	54.2	2
It was difficult to buy groceries and other basic necessities	26	16.8	9

More than half of the African students agreed or strongly agreed that it is difficult to adjust to the local food. Approximately 54% of the students stated that it is difficult to work in groups, which is a normal challenge because individual behaviors may become a communication barrier. This challenge is amplified when cross-cultural issues and concerns are not systematically addressed as part of the classroom learning experience.

The most important coping mechanism for these students is making sure that they are in touch with their family and friends back home. Approximately 83% of the students either agreed or strongly agreed that this helps them to cope with the challenges of living and studying in Malaysia. The second ranked item is the academic focus where 76.8% of the students indicated that this is important. Completing their studies and doing well is one of the primary objectives of sojourning to Malaysia. Hence, keeping in touch with lecturers is ranked 4th as a priority coping strategy with 72.2% of the African students either agreeing or strongly agreeing to it.

The lowest ranked item, 56.7%, which indicates the possibility of initiating friendships with Malaysian students, is consistent with the African students' opinion that making friends with the former is a formidable task. This is an area that requires some thought about diversity in the classroom and is a very important issue to address because the world has become increasingly borderless as the mobility of individuals become more fluid.

Table 4: Coping Strategies

	Frequency	Percent	Ranking
Having fellow Africans on campus helps new African students to adjust to the new environment	114	73.5	3
Initiating friendships with Malaysian students will help new African students to adjust to the new environment	88	56.7	10
Initiating friendships with other international students will new African students to adjust to the new environment	110	71.0	6
Becoming a member of the African Student Association will new African students to find a sense of belonging	91	58.7	8
Keeping in touch with other African students at other campuses creates a sense of belonging to a wider community	108	69.7	7
Staying focused on academic achievements is highly recommended for all African students	119	76.8	2
Learning more about Malaysia and its people will be helpful to reduce any form of cultural miscommunication	91	58.7	8
Keeping in touch with family and friends back home helps to reduce homesickness	128	82.6	1
Keeping in touch with lecturers will help to reduce frustrations about completing assignments	112	72.2	4
Staying active in extra-curricular activities will help to build good relationships with other students	111	71.6	5

Conclusion

Malaysia as a small and developing country has positioned herself as a hub for higher education and is aiming at increasing its international student population. However, the challenges faced by the higher education institutions that enroll them have to be identified, discussed, and delineated as part of a bigger system that intends to work towards world class standards in university education. One of the key issues is to begin to understand the different groups of international students who are in Malaysia and the challenges they face while living and studying here. Additionally, the experience of Malaysian students and staff in working with international students is another area that needs to be explored.

An Embedded Information Literacy skills Training in PBL Model for Uncertainty Reduction:
A Comparison of two Designs of PBL model

Loh Kah Heng ^a ; Yushiana Mansor ^b

^a Taylor's University ; ^b International Islamic University Malaysia

Abstract

Problem-based learning (PBL) enables learners to learn from a “real world” problem. PBL incorporates uncertainty naturally as a source of intrinsic motivation and a stimulus to learning which appears as the natural provocations for real learning. This is very much different from traditional approach where students and lecturers believe that the purpose of teaching and learning is the reduction of uncertainty and the main resources to uncertainty reduction are teachers and textbooks. Students in PBL environment must possess high level of communication skills, ability to identify and define problems, seeking and evaluating information and use it effectively. These skills are embraced under the broad term of information literacy skills (ILS) to reduce uncertainty and enhance learning performance. Little research has been done on ILS training to reduce uncertainty of PBL Students. This paper aims to compare the difference in uncertainty reduction of science and engineering students in the two designs of PBL model. 78 students (Winter 2010 Semester) from American Degree Transfer Program of Taylor's University College in Malaysia participated in this study. Solomon Four-group quasi experimental design was utilized in this study. The independent variables were PBL models and pretesting while dependent variables were uncertainty level. Uncertainty construct was developed and designed to measure an individual's real or anticipated uncertainty level with regards to the cognitive, affective and physical dimension in a 30-item self-reporting, numerically measurable questionnaire. Results from the analysis of T-tests, factorial ANOVA, One-way ANOVA and ANCOVA showed that PBL model with embedded ILS training out performs the PBL model without embedded ILS in terms of uncertainty reduction. This paper contributes to the PBL research field of embedded ILS training as tools of empowerment to transform university students into independent and lifelong learning students. The results reported have implications for design of PBL curriculum by integrating ILS training with collaboration from academic librarian and subject facilitator to empower PBL students in exploring and maximize their potential in deep learning approach and knowledge acquisition in PBL environment.

Keywords: Problem-based learning, information literacy skills, uncertainty reduction

INTRODUCTION

Traditional lecture system where students and lecturers have the common understanding that the purpose of teaching and learning is the reduction of uncertainty (Lee, 1998) has been practiced in universities and institutes of higher education in Malaysia for decades. They believe that knowledge consists of right answers and learning is the memorization and reproduction of these answers (Perry, 1970). Students are spoon fed with the “prepackaged knowledge” with examination results serve as an indicator of academic performance and achievement in learning. Information seeking is in a “passive mode” through receiving “correct answers” and factual knowledge from lecturers and textbooks, which are perceived

as the main resources to uncertainty reduction, problem solving is considered as associated with a definite answer. Students always treated uncertainty as a source of anxiety, rather than a natural provocation for learning. This approach may undermine the process of learning and incapacitates student inquisitiveness and initiative. On the other hand, PBL incorporates uncertainty naturally as a source of intrinsic motivation and a stimulus to learning. Genuine uncertainty and doubt are the natural provocations for real learning. In PBL, facilitators present the scenarios of the learning experience so that students can discover the principle for themselves. PBL students will be stimulated by cognitive dissonance while they are encountering an ill-structured problem. The associated uncertainty acts as a catalyst which provokes real learning. They will begin to seek for information to fill the gaps between what they know in their existing knowledge base and what they do not know. This activity accompanies the appearance of reorganisation, stability, and progressive development or learning (Lee, 1998). As the higher education in Malaysia is emphasizing on outcome-based education (OBE) where PBL is considered as one of the learning approach under the framework, uncertainty reduction has emerged as an important construct in measuring learning.

Students in PBL environment are required to actively seek for information from a variety of information sources, make sense of the information to reduce uncertainty and fill their knowledge gap. PBL approach which is associated with challenge, incongruity, anomaly, and discrepant event in the problem cause the university students to experience cognitive dissonance (Keller, 1983). They experience uncertainty reduction during information seeking activities such as questioning, snooping and information searching to align themselves from the cognitive dissonance into a state of equilibrium (Keller, 1983). The uncertainty reduction process during problem solving activities enabled students to better understand the problem in learning task and add value to their learning experience.

The Problem

With the increased exposure and wider access to search engine technology and technology skills, PBL students believe that they already possess information skills, which Majka (2001) described that they may be functionally information illiterate. With the overconfidence of the information skills, students are able to fulfill simple information needs, searching information to answer simple question that exhibits only surface learning. However, they are unable to explore deeper concepts or determine if they have really reduced uncertainty successfully. They are unmotivated to learn and consequently this will affect their learning outcome. Research shows that this phenomenon can be viewed as the overconfidence in their information technology proficiency but lack of critical awareness (Armstrong et al, 2001; Brown et. al, 2003; Edwards, 2006; Jones 2002 and Logan, 2004). PBL educators on one hand, feel that university students have the information technology skills to use search engines to search for information in uncertainty reduction process, on the other hand complaint that student's presentation of proposal in PBL continue to decline in quality, which is due to exhaustive dependence on inappropriate online information resources. They are not aware of the subtle difference between information literacy skills and information technology skills, and the important role played by ILS in successful PBL implementation. PBL educators have over estimated the competence and capabilities of university students in ILS and omitted the importance of ILS which helps students to acquire an empowering set of "navigational" skills. This set of skills includes the ability to determine what information is needed, how to access this information effectively, efficiently at the same time evaluate the needed information and its sources critically while incorporate the selected information into

his or her knowledge base and value system. ILS also includes empowering students to use information effectively to accomplish a specific purpose individually or as a member of a group as well as understand the economic, legal, and social issues surrounding the use of information so as to access and use information ethically and legally. Overconfidence of the information technology skills as perceived by university students themselves and omission of PBL educator in embedding ILS in PBL will limit students' ability to reduce uncertainty and successfully participate in team work so as to explore their full potential in deep learning in PBL environment. This will also restrain the incorporation of generic skills which include critical thinking, communication and problem solving skills in PBL.

The Purpose of the Study

This research aims to study university students' uncertainty reduction with different designs of PBL model in the same physics course. The design of PBL model is shown in Figure 1.

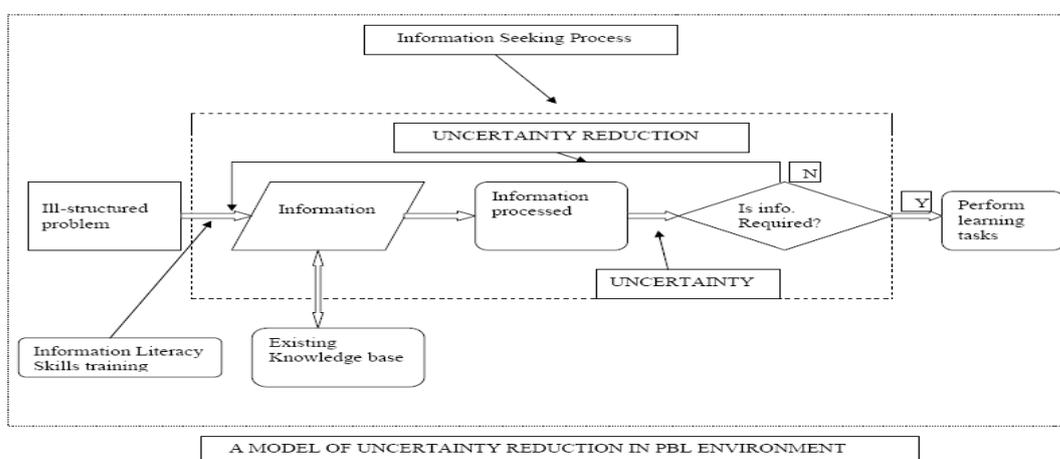

Figure 1. Designs of PBL model with / without information literacy skills embedded

The null hypothesis and its subsidiary null hypotheses of this study state that

H_{01} : There is no statistically significant difference in uncertainty reduction for university students in PBL model with embedded ILS training and PBL model without ILS training in PBL environment.

H_{01a} : There is no statistically significant difference in cognitive uncertainty reduction for university students in PBL model with ILS training and PBL model without ILS training in a PBL environment.

H_{01b} : There is no statistically significant difference in affective uncertainty reduction for university students in PBL model with ILS training and PBL model without ILS training in a PBL environment.

H_{01c} : There is no statistically significant difference in physical uncertainty reduction for university students in PBL model with ILS training and PBL model without ILS training in a PBL environment.

LITERATURE REVIEW

It has been known that human's daily activities are involved with uncertainty (Weber, 1997). These uncertainties will shape our action in seeking additional information to resolve unknown situation. Because of uncertainty, people seek information to make decisions and solve problem. It can be seen that uncertainty occurs in all aspects of our life. Generally, anxiety, concerns, emotions that we might encounter are due to uncertainty.

In a PBL environment, students are presented with ill-structured problem which creates a cognitive dissonance (Keller, 1983) or state of disequilibrium on them. The ill-structured and problematic nature of PBL problems is designed to create an imbalance or "cognitive dissonance" (Festinger, 1962) in the learner which motivates a search for explanations. In PBL, engagement in the problem comes before any preparation or formal study. Thus, during problem solving process, uncertainty is a possible disorder in student's cognitive state, which includes missing knowledge about the existence of important concepts or associations between concepts, incorrect association, or mistakes in procedural information (Reggia, 1990). This disorder in cognitive state leads to affective symptoms of anxiety to perform the tasks and lack of confidence in solving the problem. PBL students are actively involved themselves in questioning, snooping, and searching for information to reduce uncertainty and reenter a state of equilibrium. Kuhlthau (1993) defined uncertainty as a cognitive state which commonly causes affective symptoms of anxiety and lack of confidence. Her research shows that uncertainty and anxiety can be expressed in the early stages of the information search process and uncertainty due to lack of understanding, a gap in meaning, or a limited construct initiates the process of information seeking. Krikelas (1983) defined information need as the recognition of the existence of uncertainty, and information is "any stimulus that reduces the uncertainty". Shannon and Weaver (1949) posited that information itself refers to the reduction in uncertainty about the state of an event after a message has been sent relative to the uncertainty about the state of the event before the message was sent. Information theory defines uncertainty as lacking of information to choose from an exhaustive and well-defined set of possible states though it is not a complex set (Shannon 1949). Gate (1995) paraphrases Shannon's theories into the concept which suggested that information is the reduction of uncertainty.

Study on online learning shows that uncertainty reduction will enhance learning (Kati Mäkitalo 2004). Kuhlthau (1993) maintains that information seeking to reduce uncertainty is actually a complex learning process in a series of phases. Learning is always associated with knowledge acquisition, whereby users' cognitive state will be changed due to the change in uncertainty level. Even though information is the reduction of uncertainty, but it takes the university students to recognise when, and what information is needed and at the same time have the ability to effectively locate, evaluate and use the information needed. Yovits and Foulk (1985) found that in some situations information may increase the uncertainty of a person. Thus, a certain level of information literacy skills will definitely be advantageous to university students in reducing uncertainty as it enables them to effectively retrieve relevant information to solve problems, and not overload with information unnecessarily. University students can effectively reduce their uncertainty by acquiring, developing or improving the subject knowledge and ability to predict, infer or estimate through information seeking. Attitude towards uncertainty changes with the change in understanding of a situation. Rankin (1999) articulated that ILS are essential to the learning process, and problem solving process

in PBL parallel to IL competency standards set for higher education. Research showed that shifting to independent learning in PBL has made ILS fundamental to students' survival and success (Wales and Harmon, 1998). In PBL, uncertainty is effectively reduced when student is empowered and takes control of his own learning through effective information seeking.

Much research have emphasised on the uncertainty experienced by the users in information seeking and searching process. However, an important aspect which has not gained much attention in information searching is the impact of the ILS on uncertainty reduction. This research aims to compare the uncertainty reduction of university students while searching information to perform learning tasks in two designs of PBL models, namely PBL with ILS embedded and PBL without ILS embedded.

METHODS

The Sample

A total of 78 undergraduate students who have registered the winter-2010 Physics course in American Degree Transfer Program at Taylor's University College (Malaysia) participated in this study. The list of these students was obtained from the registrar office at Taylor's University College. These participants were randomly assigned to two PBL sections, one section with ILS training embedded in PBL process (treatment) while the other without ILS training embedded (control). Half of the participants in each section will be pretested. Thus, four groups of participants were formed in this study.

Research Design

This study utilized Solomon Four-group quasi-experimental design by setting up two experimental groups (with ILS training) and two control groups (without ILS training) for the experiment. The design is rigorous and robust enough to eliminate variations that might arise because of experiences and contaminate the validity of the study (Koul, 1992; Kothari, 2003). One experimental group and one control group were administered the pretest on uncertainty. The experimental groups were exposed to a two-hour ILS training conducted by the facilitator in collaboration with librarian while the control groups denied. All the four groups were post tested upon the completion of the PBL activities.

Treatment

The collaboration between the facilitator and librarian enabled the treatment of the IL skills training conducted to the two experimental groups at the beginning of the PBL process. Each training consists of two phase, the first phase was a 40-minutes lecture of IL knowledge conducted by the facilitator, while the second phase was 80 minutes hands-on ILS training session conducted by a librarian in the library training room.

The contents of the lecture included the five standards of IL for higher education, the importance of these standards and how to relate and apply the five standards as they participated in PBL, such as how to

1. determine the nature and extent of the information needed,
2. access needed information effectively and efficiently,

3. evaluate information and its sources critically and incorporates selected information into his or her knowledge base and value system,
4. use information effectively to accomplish a specific purpose, individually or as a member of a group,
5. understand many of the economic, legal, and social issues surrounding the use of information and accesses and uses information ethically and legally.

The librarian conducted a “mini-PBL” session in the second phase by giving four learning tasks related to the assessment of the project bibliography to work in small groups. The tasks were:

1. make a list of information sources,
2. describe the need of citing information sources in a bibliography,
3. identify the element included when citing a book or websites, and
4. identify a list of criteria that could be used to critically assess an information source.

These tasks involve the three elements of information literacy instruction outlined by Nahl-Jakobovits (1993) – critical thinking or information evaluation skills, information use skills, and learning to learn or enjoying the benefits of information success.

Instruments

The independent variable of this study was type of PBL design. The experimental groups were trained in a two-hour ILS program in the Physics related area by facilitator in collaboration with the librarian. The dependent variable was student’s uncertainty reduction. A carefully crafted problem that triggered the learning activity was given to all participants, with 20 minutes perusal time. The pretest of uncertainty level was administered to an experimental group (E_1) and control group (C_1). The pretest instrument is a questionnaire, consists of 30 items of uncertainty construct which record their thinking, feeling and action in terms of cognitive dimension, affective dimension and physical dimension. The 2 control groups, C_1 and C_2 will immediately follow the normal process of PBL and information seeking activity to solve the problem. The experimental groups will undergo a two-hour ILS training session, arranged in two separate phases prior to information seeking process of the PBL activities. All participants will then be post-tested on their uncertainty level at the end of the PBL process while they submit their report or solution. The dependent variable can be computed using SPSS to determine the gain score of the uncertainty level in each item attributed to the uncertainty construct.

RESULTS AND DISCUSSION

The objective of this study was to determine the differences in university students’ uncertainty reduction with different designs of PBL model in the same physics course, by comparing students’ uncertainty scores in three dimensions: cognitive, affective and physical, across the treatment and control groups. In order to examine whether this objective was achieved, it was imperative to test the three subsidiary null hypotheses before the main null hypothesis H_{01} was investigated. If all three subsidiary hypotheses have shown significant result, it was very likely that the hypothesis H_{01} will exhibit a significant result. Further analysis can be carried out to confirm this prediction. A summary of the F statistics and p values for the main effects and interaction of main effects of Factorial ANOVA tests was tabulated as shown in table 1.

Table 1. F statistics and p values from Factorial ANOVA

Dependent Variables	Source	MS	df	F	p
Cognitive Uncertainty	Treatment	71.33	1	4.88	0.030
	Pretest	2.92	1	0.20	0.656
	Treatment x Pretest	27.33	1	1.87	0.175
	Error	14.60	74		
Affective Uncertainty	Treatment	141.09	1	5.066	0.027
	Pretest	17.25	1	0.619	0.43
	Treatment x Pretest	9.88	1	0.355	0.553
	Error	27.85	74		
Physical Uncertainty	Treatment	112.00	1	3.63	0.061
	Pretest	44.00	1	1.43	0.236
	Treatment x Pretest	100.74	1	3.27	0.075
	Error	30.83	74		
Total Uncertainty	Treatment	955.23	1	5.44	0.022
	Pretest	17.53	1	0.100	0.75
	Treatment x Pretest	388.82	1	1.931	0.17
	Error	175.46	74		

Testing null hypothesis H_{01a}

A 2 x 2 between-group Factorial ANOVA was performed on the cognitive dimension of uncertainty posttest scores for the four groups. Table 1 shows the results of this analysis. There was no significant interaction ($F_{1,74} = 1.87$, $p = 0.175$) between the two main effects. It can be concluded that no pretest sensitisation was present. An investigation of treatment effect on posttest scores ($F_{1,74} = 4.88$, $p = 0.030$) revealed a statistically significant result. This implied that embedding ILS training in PBL design had an effect and this effect existed without any prerequisite. The cognitive uncertainty of university students attending PBL with embedded ILS training was significantly reduced (posttest scores lower than pretest scores) despite the presence of pretest. Thus, H_{01a} was rejected in favour of its alternative hypothesis. It follows that there was a statistically significant difference in cognitive uncertainty reduction between university students in PBL model with embedded ILS training and PBL model without embedded ILS training in a PBL environment.

Testing null hypothesis H_{01b}

A 2 x 2 between-group Factorial ANOVA was performed on posttest affective dimension of the posttest uncertainty scores for all four groups of participants. From the results in table 1, there was no significant interaction ($F_{1,74} = 0.355$, $p = 0.553$) between main effects. It can be concluded that no pretest sensitisation was present. An investigation on treatment effect of posttest scores ($F_{1,74} = 5.066$, $p = 0.027$) revealed a statistically significant result. This implied that embedding ILS training in PBL design had an effect and this effect existed without any prerequisite. The affective uncertainty of university students attending PBL with embedded ILS training was significantly reduced (posttest scores lower than pretest scores) despite the presence of pretest. Thus, H_{01b} was rejected in favour of its alternative hypothesis. It follows that there was a statistically significant difference in affective uncertainty reduction between university students in PBL model with embedded ILS training and PBL model without embedded ILS training in a PBL environment.

Testing null hypothesis H_{01c}

A 2 x 2 between-group Factorial ANOVA was performed on physical dimension of uncertainty posttest scores of all four groups of participants. From the results in table 1, it was evident that no significant interaction ($F_{1,74} = 3.267, p = 0.075$) between the two main effects. It can be concluded that no evidence of pretest sensitisation was present. An investigation on treatment effect of posttest scores ($F_{1,74} = 3.632, p = 0.061$) indicated that no statistically significant result was obtained. Since the above test disregards the pretest information available for the pretest groups, it should not be considered conclusive evidence against the treatment (Braver, 1988). Thus, ANCOVA on posttest scores with pretest scores as covariate was performed to compare the physical uncertainty scores between groups E_1 and C_1 . The results were shown in table 2. Result from ANCOVA, ($F_{1,37} = 1.55, p = 0.221$) indicated similar finding to previous results, no statistically significant result was obtained.

Table 2. ANCOVA for physical dimension of uncertainty for groups E_1 and C_1

Dependent Variables	Source	MS	df	F	p
Physical Uncertainty	Treatment	54.28	1	1.55	0.221
	Error	35.03	36		

ANCOVA with Pretest as covariate

An independent sample t-test was thus conducted on post-test scores of physical dimension of uncertainty for groups E_2 and C_2 . The result was shown in the table 3. Result from independent sample t-test showed that 19 participants in the treatment group ($M = 25.58, SD = 2.93$) and 20 participants in the control group ($M = 30.25, SD = 4.99$), demonstrated a significant difference in physical dimension of uncertainty level ($t[37] = -3.538, p = .001$). This indicated that the physical uncertainty of university students attending PBL with embedded ILS training was significantly lower than those attending PBL without embedded ILS training. Thus, H_{01c} was rejected in favour of its alternative hypothesis. It follows that there was a statistically significant difference in physical uncertainty reduction between university students in PBL model with embedded ILS training and PBL model without embedded ILS training in a PBL environment.

Table 3: Independent sample T-test on posttest physical uncertainty for group E_2 and C_2

		Independent Samples Test							
		t-test for Equality of Means						95% Confidence Interval of the Difference	
		t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper	
PHYSICAL dimension of the uncertainty	Equal variances assumed	-3.538	37	.001	-4.6711	1.3202	-7.3461	-1.9960	
	Equal variances not assumed	-3.584	30.979	.001	-4.6711	1.3034	-7.3294	-2.0127	

Since all these subsidiary null hypotheses were rejected in favour of the alternative hypotheses, it enabled the researcher to predict that there was a significant difference in uncertainty reduction for university students in PBL model with embedded ILS training and PBL model without ILS training in a PBL environment. Further test on this hypothesis was conducted to verify this prediction.

A 2 x 2 between-group Factorial ANOVA was performed on overall scores of posttest uncertainty of all four groups. Table 1 showed that there was no significant interaction ($F_{1,74} = 1.931, p = 0.169$) between the two main effects. It can be concluded that no pretest sensitization was present. An investigation on treatment effect on posttest scores ($F_{1,74} = 5.44, p = 0.022$) revealed a statistically significant result. This implied that ILS training has an effect and this effect existed without any prerequisite. The ILS training thus significantly reduced uncertainty of university students (posttest scores is lower than pretest scores) despite the presence of pretest. Thus, as anticipated in the prediction, H_{01} was rejected in favour of its alternative hypothesis. It follows that there was a statistically significant difference in uncertainty reduction between university students in PBL model with embedded ILS training and PBL model without embedded ILS training in a PBL environment.

An independent sample t-test was also performed for the two groups with pretest and posttest. Results in Table 4 showed that the reduction of uncertainty scores between the posttest and pretest, DELTAUNC, for 20 participants in the experimental group ($M=16.10, SD = 14.35$) and 19 participants in the control group ($M=6.79, SD = 13.92$) demonstrated a significant difference in uncertainty reduction ($t[37] = 2.055, p = 0.047$). These findings can also infer that university students in PBL model with embedded ILS training experience better uncertainty reduction than those university students in PBL model without embedded ILS training.

Table 4 Independent sample t-test for uncertainty reduction between E₁ and C₁

T-Test										
Group Statistics										
group identifier		N	Mean	Std. Deviation	Std. Error Mean					
DELTAUNC	experimental group with pretest posttest	20	16.1000	14.3523	3.2093					
	Control group with pretest posttest	19	6.7895	13.9227	3.1941					
Independent Samples Test										
		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
DELTAUNC	Equal variances assumed	.080	.779	2.055	37	.047	9.3105	4.5315	.1288	18.4922
	Equal variances not assumed			2.056	36.982	.047	9.3105	4.5279	.1360	18.4850

IMPLICATION

The result from this study will serve as an indicator of the success of reforms made on the university teaching approach. Educators and facilitators can use the results of this study to learn how information literacy skills program can be integrated in the PBL approach to overcome the challenge of implementing PBL in their courses. The study provided

information on the strength of collaboration between facilitators and librarian in designing a tailor-made information literacy skills training session for PBL students to accommodate their needs. One implication is that universities and colleges begin to emphasise information literacy as a standalone course or embedding it into the curricula can significantly impact students' uncertainty reduction in PBL environment. While this study cannot provide a guideline for adoption of PBL approach in every course in higher education, all courses could consider embedding information literacy skills training emphasising the respective subject matter into their curricula. This will train students to be information literate and facilitate lifelong learning, transforming the skills from student empowerment into knowledge worker empowerment in their future profession.

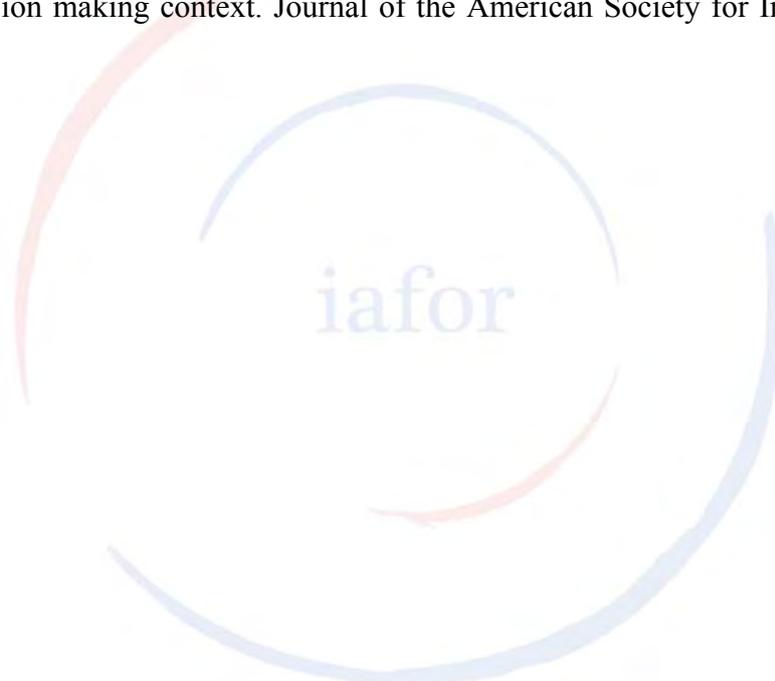

CONCLUSION

In this study, incorporation of uncertainty in the learning tasks was evidenced by the overall high uncertainty level in the pretest that students demonstrated, and the uncertainty may have reduced after seeking the information to fill the gap. The more confident they are in seeking the information, i.e., more competent in ILS, the better uncertainty reduction and understanding in the resolution of the problem, consequently perform better in the learning tasks. The positive results gained due to the experimental intervention confirmed the effectiveness of information literacy skills in student empowerment. This intervention encompasses problem solving skills, critical thinking ability, team work, effective information gathering and use the information ethically to reconstruct the information into knowledge and communicate among the members within the group. The success of the intervention endorses the successful implementation of PBL approach in helping students to overcome the anxiety due to uncertainty built in the authentic learning task in PBL. The information literacy skills required by the students have to be identified in advance and planned with explicit learning objectives based on the knowledge, skills and attitudes required by the other educational components in the curriculum. Much of the challenge lies in identifying the information knowledge and skills actually needed by students, teachers/tutors and ultimately practitioners and then work to incorporate these into the curriculum (Rankin, 1996). The result from this study will serve as an indicator to the success of reforms made on the university teaching approach.

ABSTRACT

Globalization and the evolution of the knowledge-based economy have caused dramatic changes to reforming and restructuring higher education in most Asian Pacific countries. Thailand is of no exception in an attempt to internationalizing its higher education and has tried to develop themselves into regional thriving education hubs by exporting higher education services to mainly their neighbouring countries. Unfortunately, many diversity initiatives and internationalization programmes do not engage students in enough direct inter-group contact necessary for mutual understanding of diverse perspectives of complex issues to take place. The paper proposes transformative learning theory which its focal point is considered the process of constructing knowledge through critical reflection on the content, process, and premise of an experience. It begins by outlining a framework for developing transformative learning practices in international higher education.

The paper continues to draw on the role and function of 'international' universities: "Learning and teaching for transformation" which explores meanings and practices of education, participation and social change; and an emerging "cooperative inquiry" grounded in shared values and principles. While the internationalization has been strengthened the diversity has been inevitable. The paper thus reports on pedagogies that foster transformative learning in a multicultural education programme and describes how faculty can support diversity and internationalization by applying essential elements in transformative learning. As University lecturer of an international post-graduate programme, the author positioned her role as a learning facilitator. She discusses her experiences on the implementation of transformative learning into the teaching and learning process and how it encourages her students to interact and learn within and from diverse communities.

Introduction

In the process of internationalization of higher education, the nature of competitiveness is being particularly highlighted. Many of Asian Pacific countries are strategically committed to promoting their higher education services overseas. However, it is criticized that globalization forces many of the higher education institutions in Asia countries to follow global practices and ideologies without developing their own unique systems and honouring the rich traditions and cultures of their own countries. Under the impact of globalization, learning from the other systems is desirable, but the management of higher education institutions should consider avoiding duplicating without proper alteration and contextualization. Thailand is unexceptional. Undoubtedly, improving the

quality of higher education is necessary, especially since Thailand aspires to become the “Educational Hub” of the Asian region. While indulging to the game of marketing and exporting higher education to other regions, it is necessary to ask ourselves genuinely whether internationalization of higher education has really enhanced and enriched teaching and learning experiences in the campus and ensured education quality.

As part of Mahidol University’s determination to become a world class university, several activities for the promotion of internationalization of education are encouraged and supported. The University actively collaborates with over 130 overseas academic institutions and international agencies in research, curriculum development, staff and student exchange. It has international students from over 50 countries enrolled. To claim success in internationalization, the University must achieve progress in several interconnected areas. Responsible internationalization cannot be simply a matter of taking advantage of income-earning opportunities, but must be based on a firm commitment to social justice. The courses, research and instructional programmes must provide an introduction to the complex global environment. These activities, along with opportunities for international experience, help to prepare our students for active participation in the global economy and society.

The paper argues that preparing future leaders and citizens for a highly interdependent world requires a higher education system where internationalization promotes cultural diversity and fosters intercultural understanding respect, and tolerance among people and where the internationalized curriculum is committed to the pursuit of the notion of global citizenship. Such internationalization of higher education contributes to building more than economically competitive and politically powerful. It represents a commitment to international solidarity, human harmony and helps to build a climate of global peace. In doing so, transformative learning experiences find its balance to bridge between diversity and human harmony. They create collaborative and cooperative learning environments where students’ learning and interaction among diverse groups can be enhanced. Transformative learning experiences increase students’ interaction with locals in the host community by incorporating students in research and teaching activities (Kuh *et al*, 1994)

Increasing Demand for Higher Education Services in Asia

Exporting higher education services emerged in the 1980s and 1990s and is now becoming a global, market-oriented and private industry prevailing not only among those developed countries but also in the Asia-Pacific region. Australia and Singapore have already been established their international networks by setting up international academic offices and collaborating with partner institutions to attract overseas students to study in their own countries. Asia will dominate the global demand for international higher education for the next two decades. In forecasting global demand for international higher education, Bohm, Davis and Pearce (2002) find that the global demand for international higher education is set to grow enormously. The demand is forecasted to increase from 1.8 million international students in 2000 to 7.2 million international students in 2025.

The pace of internationalization of higher education, in fact, has expanded speedily in recent years as a result of the rapidly globalizing world of disintegrating country borders and supranational network of capital and knowledge (Bauman, 2002). The activities of internationalization may include international movement of students between countries; international links between nation states through open learning programmes and new technologies; bi-lateral links between governments and higher education institutions in different countries for collaboration in research, curriculum development, student and staff exchange, and other international activities; and export of education where education services are offered on a commercial basis in other countries, with students studying either in their home country or in the country of the providers (Harman, 2005).

The two concepts, internationalization and globalization, are very different in their approach and carries different consequences for different nations (Yang, 2002). They have often appeared in the discourses of various levels over their meanings and rationales (Fok, 2007). Yang (2002: 85) argues that “internationalization lies in an understanding of the universal nature of the advancement of knowledge” that is based on the common bonds of humanity. Knight (2004) also depicts that internationalization of higher education should help enhance students competencies and create a culture or climate on campus that promotes and supports international/intercultural understanding. This conception echoes to De Wit’s (2002) refines definition of internationalization of higher education which is a process integrating an international/cultural dimension into the teaching, research and service functions of the institutions. Knight’s (2004) view is of reference value in that internationalization of higher education needs to aim at preparing future leaders and citizens to address global issues and challenges like shaping sustainable development, international solidarity and global peace in a highly interdependent globalized world. Slaughter and Lesslie (1997) put forward a more severe critique in that globalization imperatives are of the nature of power, control, economy and efficiency. Thus, Yang (2003) contends that global exchange, under such a context, in economic, cultural and education domains will continues to be unequal. He adds, “Globalization, therefore, never meant global equality” (Yang, 2003: 273)

In recent decades, the role and policy of higher education has been significantly affected by the impact of globalization. Though we have been alerted in the discourse of global competition and the outcome of inequality with regard to the aforementioned conditions of globalization, what is really prevalent today is the intensity and the extent of internationalization activities occurring in higher education institutions especially in the Asia-Pacific region. In order to ensure that their higher education systems can compete globally and to survive and prosper in this fast changing world, higher education administrators have got hold of the belief that running a university becomes a customer-focused enterprise. Thus, university curriculum is market driven and students are customers.

To ensure they can share a significant portion of the pie in the higher education market, higher education institutions have developed a variety of promotion and marketing strategies such as recruiting quality professors, developing twinning programmes, forming international alliances, effective use of information technology and technical superiority, etc. University faculties have also needed to participate in the game of marketizing their knowledge (Mok, 2000) and have been mindful of their performance in

terms of efficiency indicators such as research output, student evaluation scores and other managerial initiatives.

Universities involved in the internationalization process need to revisit the strategies adopted as to whether they are learning from the Western traditions or they are duplicating without proper adaptation and deliberate contextualization. In fact, a great number of developing countries have worked in line with Western paradigm. This would create a dependency culture in the internationalization and also help reinforce the America-dominated hegemony (Chan, 2008; Mok, 2008). While Thailand and other Asian countries adopt English as a medium of instruction (MOI), use curricula designed by the Australian, British and American scholars and follow international benchmarks (Yang, 2002), they have not gone through adequate and proper contextual analysis to see whether these types of policies are compatible with indigenous cultures and local practices. Asian scholars are engaging in the game of “paper-chase” for the Research Assessment Exercise in that research outputs should be published in English, preferably in Science and Social Science Citation Index international journals while publications in local languages and local journals is regarded as of little importance. Reflecting from my experience, faculty staff is forced to produce research articles more in English and more in international journals.

In the interest of the customers – students, the university lecture will become a speech show that must carry the function of entertaining rather than analysing; such that the classroom is in danger of becoming a meaningless place nothing but “licensing and professionalism without the substantive knowledge and ethics of profession” is to be offered (Yang, 2003: 278), leaving those of educational values far behind. It is thus important to realize that internationalization is perceived differently in the West and in developing societies.

Internationalization and Diversity: Challenges and Risks in Higher Education

Internationalization has also been linked to the improvement of students’ outcomes. Vincenti (2001) notes a range of competencies supported by well-structured immersion and international study programmes such as gains in awareness, understanding, and appreciation of host culture and language; increased adaptability, critical thinking, self-esteem, independence, reflective thought, and interest in the welfare for others; more tolerance and acceptance of people who are different from themselves; more frequent and active participation in internationally oriented activities; a valuing in the elimination of barriers to intercultural interactions; an increased open mindedness to other cultures; and a strong decrease in ethnocentrism (Vincenti, 2001).

However, the prioritising of diversity and internationalization within higher education is due not only to external demands to equip students for a more global workplace and accreditation pressure on the administration. The priority also arises out of benefits students acquire when interacting with students who differ from themselves racially and

culturally (and in many other ways), in order to understand and value each other—the “liberation” goal of liberal education. Studies indicate that supporting student encounters across difference is linked to improved student outcomes, and that under optimal conditions, improving diversity on and off college campuses enhances inter-group understanding and relations, the ability of students to engage in more complex thinking, and students’ consideration of multiple perspectives (Hurtado *et al*, 1999).

Both diversity and internationalization are needed to create diverse learning environments to prepare individuals who are willing and able to engage with those who are different from themselves (Bennett and Bennett, 1994). Slimbach (2006) notes that historically, diversity and internationalization initiatives on campuses have been disconnected from each other. Although diversity and internationalization should be allies since they both strive to reach across barriers that divide, they are often pitted against each other as adversaries. While it is true that they have different beginnings, advocates, goals, and strategies, they have much in common and have much they can offer each other.

The first problem that arises when considering international programmes abroad as a means to internationalize, is that the option as it currently functions does not affect enough students to make much of an impact. The second problem is that study abroad programmes do not typically encourage students to engage meaningfully with members of their host communities. Finally, the majority of students in international programmes avoid challenging themselves to cross multiple boundaries of difference.

Reflecting from my own observation, international students often isolate themselves in foreign enclaves rather than associate with indigenous people. The international students bring with them unexamined ethnocentric attitudes and rather than learn with and from the locals. It could be concluded from my own observation that the nature of the relationships and interactions between international students and the local people is not balanced in power and it is not sustainable after the group leaves. In addition, the interaction does not foster the investigation of problems that arise from local perspectives.

The international students experienced only superficial cultural encounters and minimal language learning, this may do more to reinforce stereotypes than to dispel them, and so study abroad programmes such as the one described above, do little to diversity or internationalize the campus or affect deep change in individuals.

Slimbach (2006) describes an alternative to this insensitive intrusion and states,

“Some students find a way that is small enough, immersed enough, ecologically ‘soft’ enough, long enough, connected enough, structured enough, cheap enough, and hope-filled enough to support deep changes in their and others’ lives” (Slimbach, 2006).

In the research on intercultural study, Vincenti (2001) concludes that the most important factor in determining the success of a student international programme’s promoting positive attitude change is the amount of “*direct intergroup contact*”. Programmes that

encourage participants to learn the language, live with the people, serve under national leadership, complete community study projects, and reflect critically upon their personal identity and beliefs hold great potential for helping participants to overcome ethnocentrism and develop intercultural competence.

A factor that could create problems for diversity is when internationalization and diversity are not equally valued and pursued. Factors that help to promote positive change in the campus climate include planning, assessment, and support of diversity and internationalization initiatives (Torres *et al*, 2003).

Perhaps most crucial to success of diversifying college campuses and internationalizing institutions of higher learning is the type of interaction that transpires among different communities. In order for change to occur, interactions must be more than casual. Meaningful, sustained, face-to-face interaction among people who are different from one another, socially, economically, ethnically, culturally, or ideologically must be promoted in a supportive environment with structures that encourage investigation and reflection. Collaborative and cooperative activities in which students work toward a common goal and promote relations and interactions across ethnic groups, maximizing intercultural learning holds great potential for deep change to take place within students, a type of learning may refer to as transformative learning experiences.

What is Missing in Internationalization of Higher Education?

When students cross social, economic, ethnic, racial, cultural, gender, religious, or ideological boundaries with the support of faculty who provide structured academic assignments fostering reflection, deep change can result. Faculty can support diversity and internationalization by applying essential elements in transformative learning

Francis (1993) provides a snapshot of the state of internationalization in the province of British Columbia, Canada, and serves an important contextualizing function for later research by Whalley (1997) and Maidstone (1996). These two researchers also adopt a transformative interdisciplinary and learner oriented approach to internationalizing higher education and its curricula, instruction, and administration. Steiner (2000) supports Wachter's (2000) position and argues that internationalization requires and promotes the development of a new consciousness that includes the intercultural as a central component. Steiner (2000: 73) discusses on internationalization as a "learning oriented cultural understanding model". Bond (2003: 8) defines what she terms a "transformational approach" as one that "produces reform, which requires a shift in the ways in which we understand the world".

According to Liddicoat (2004: 71), internationalization needs not only deal with newly arriving students from other places, but also with local students who bring their own language, culture and identity to the learning context and who equally need to be able to respond productively to the cultural contexts in which they now find themselves. This approach places intercultural competence as the central outcome for all participants,

whether international or domestic students, faculty or staff.

Differences are often seen as problematic: the cause of separation, the flash point for aggression, the source of dissonance and suffering. Encounter with differences, however, can be an invitation to develop higher awareness through intrapersonal and interpersonal work, an opportunity to increase consciousness and enlarge our sense of humanity and personal humanness through transformative learning experiences.

Transformative experiences “alter our consciousness, forcing us to look at ourselves and world around us in different ways” (Slimbach, 2006). They involve first-hand concrete experiences, often when one is vulnerable and one’s limitations are exposed such as in encounters with difference. They can be emotional and contain adversity causing one to rethink former ways of understanding challenging basic assumptions.

Referring to transformative learning and its concept, Mezirow (1991) articulates what he terms transformative theory that emphasizes “meaning how it is constructed, validated, and reformulated” (1991: xxi). He notes that meaning is an interpretation that is formed through both perception and cognition and that meaning is made both unintentionally and intentionally. Becoming aware of meaning schemes and these three types of meaning perspectives can particularly help people who communicate across cultures to understand themselves as well as those from other backgrounds who have different ones (Boyd and Myers, 1988).

Cranton (1994) argues that these differences in approach (rationale versus emotional) and the different ways students experience transformation, indicate that no single mode of transformative learning exists. She notes that differences in learners, learning contexts, and teachers all influence learning and adds that not all learners and teachers may feel comfortable with transformative learning, and not all situations lend themselves to it. While this is an important limitation to acknowledge, cross-cultural encounters provide the ideal environment for transformative learning to take place, and for the teachers and students who are predisposed to it, this type of learning provides great potential for change.

In addition, Romm, Patterson and Hill (1991) confirm that failure of social interaction with domestic students was a major source of course dissatisfaction for international students. Research findings inform us that a number of factors affecting the study life of overseas students, such as students’ aspiration, perception of their courses and institutions, impact of culture and values on learning environments, learning autonomy and styles of learning (Harman, 2005). Consequently, internationalization should integrate an intercultural dimension into teaching, research and community service in order to enhance academic excellence and promote the notion of social responsibility and community engagement in societies.

Hence, what is missing in the internationalization process is higher education that should be embedded with the vision of preparing future leaders and citizens to address global

issues and challenges like shaping sustainable development, international solidarity and global peace in a highly independent globalized world, in order to achieve those visions, transformative learning practices should be applied in University programmes.

Transformative Learning Experiences: the Missing Links

The president of Brown University, Ruth Simmons, once stated that “the goal of university was not to get yourself a better job: education is about transforming your soul” (Simmons, 2001). It sent shivers down my spine. Are we creating university programmes that transform our souls?

This section mainly discusses on my own transformative learning experiences in teaching a group of graduate international students registered for M.Ed in Educational Management. The group comprises of 18 students from different Asian countries such as Sri Lanka, Vietnam, Bhutan, Maldives, China, and Thailand. As a lecturer of international programme at the University, I often position myself as a learning facilitator, I integrate self-awareness, critical reflection, and reconstruction of previous assumptions that will contribute to transformative learning via an experiential and process-focused approach. Banks (1997) views teaching studies from different backgrounds at a transformational level where students view issues from the perspectives of the ethnic groups being studied.

Teaching students in the international environment can no longer simply be about the transmission of knowledge to students, but needs to focus on equipping students with the tools required to make sense of the knowledge and realities around them. The focus needs to be more on concepts and processes as well as critical analysis.

Learning in the diverse community exposes learners to different ways of thinking, feeling, and doing. I relate a transformative learning experience I encountered as an international graduate student in the UK. I found my usual ways of being are likely to be called into question as I engaged with the people who speak different languages and have different ways of life. I realize that as we study other cultures that there is more than one valid and acceptable way to be human may provoke new and unsettling questions and open possibilities we never considered. My graduate life in the UK relentlessly, often painfully, confronted me with my own edges; and I found it necessary to deal with them in order to stay. I later found that working at and with our edges offers the possibility of personal integration and expansion. I also share my graduate’s transformative learning experiences to the class. I conclude when we encounter significant differences, we are given the opportunity to develop awareness and to go over our edges, our own limited self-definitions, to an expanded sense of our humanity. I emphasise to students that they recognise and embrace the potential for personal development, even transformation that their educational choices can create.

I am attempting to break free from the institutional barriers that help reproduce the institution of which I am now a part. I am learning about the theory as it exists in books and journal articles, aware that I am simultaneously experiencing transformations on a series of conscious and unconscious levels. After a transformative awakening to feminist theory during my doctoral studies, I have come to recognise that I cannot look at the world the way I did before. There is a need to include experience and emotion in my writing and teaching. I have encountered a literature that I never knew existed, a place where research starts with an investigation of the interactions in everyday life (Smith, 1999). The ability to cross disciplines and to work in transdisciplinary spaces has allowed me to change and will eventually allow the disciplines to change with the next generation of interdisciplinary students.

Teaching diversity should reflect a commitment to explore personal perspectives of difference as well as the shaping effects of these perspectives upon all aspects of our teaching. To benefit from the immense richness of diversity in our classrooms, it is essential to explore the messages delivered and internalized during the course of our own development. Biases and prejudice mark everyone; but the “difference-sensitive”.

I want to find an approach to teaching and learning that could provoke or enable new ways of seeing and, possibly, being for our students. In the event, it is the students’ encounter with alternative methods of teaching—the use of cooperative learning methods and a reflective learning diary as the assessment—that provide a catalyst for transformative learning. This approach proves to be a significant challenge to students’ prior assumptions, causing negative reactions amongst the cohort but also prompting critical reflection and some profound changes in understanding. Students are continually reminded that our whole self is involved in the process of communicating and that these two components overlap and interact; they cannot be strictly separated. Passages written by students in English in final papers will be used as illustrations.

I reflect some of learning methods fostering transformative learning which I conduct in the class. I usually begin the class with an ice-breaking activity to ease the students and to be a linkage to the lessons. In one particular qualitative research class, one activity is introduced in order to explore cultural blind spots. Students are requested to break into pairs and write down five things about themselves. Two of these things must be true, and three must be false, though regularly assumed by others to be true. Exchanging their lists of information, classmates identify which characteristic he or she believes to be true or false about their partners. After partners disclose which items are actually accurate, and which are not, they discuss the reasons for their assumptions. The activity concludes with a large group discussion, during which the students are prompted with several discussion questions: *Did you notice any pattern to your assumptions? What aspects of your partner’s visible identity caused you to make such assumptions? How did it feel to have someone make false assumptions about you based on your visible identity?*

It is necessary to be constant in searching out the traces of our “identity perspectives” in our engagement with students and our encouragement of their engagements with each other, in the materials we select for learning, and in the diversity issues we raise

explicitly and those we avoid altogether. A critical step, then, in creating a culturally safe learning environment is bringing into consciousness our cultural “blind spots.”

Such activity provokes a discussion of the perception and classification of people and behaviours based on appearance. It clearly suggests to students that making these assumptions is natural. The students learn to analyze the socialization that results in partial views of the people around them, as well as their tendencies to highlight or ignore specific aspects of an individual’s identity based on preconceived notions of that individual’s visible reference groups. The importance of checking and understanding assumptions and the reasons for making them is always emphasized. The purpose of such activity is to guide students in identifying cultural blind spots and their effects on their personal lives and the lives of others, particularly in the classroom and in the workplace. Taking that step will lead to a paradigm shift in views of diversity that extend multicultural knowledge and appreciation of others to include personal self-reflection and the transforming awareness of our own cultural blind spots.

Field trips are also active learning method in my class. Since the campus is located in the suburb of the capital city, it is surrounded by the local Thai community which is best represented Thailand. The mutual learning takes place among local and foreign students when they engage in peer observation and discussions around common concerns with people in contexts that they were previously isolated from. One Sri Lanka student notes, “Today was the day I opened the door to the other side of the world”. The account of another student shows how seeing the local school management in the community causes her to reflect on the people endure, which she had been “oblivious” to before. She writes:

“We went to the local school in Nakorn Pathom, a 30 minute drive from University but it seems like another part of the world. The small sized community school offers only primary level. There are only six teachers including the principal who takes teaching’s role. The principal admitted that during our visit, the students in at least 3 classrooms are left unmonitored. The principal pointed out that the school has requested for the English teacher position for over a year but it has been put on hold given the poor circumstances and remote distant (from the capital city). None of pre-service teacher would choose here as their ‘preferable choice’. The attendance rate of the students is low since they are made to help out their parents at home. The future of those kids seems uncertain, I wonder what the future career would be for these children while they still struggle to survive. It’s hard to think clearly when realising how much people suffer and how oblivious I am to it”.

An important outcome or evidence of change in students and faculty is a renewed vision of the world and our place in it. While it is impossible to produce final solutions to world problems, it is important to envision the world we hope to create and consider what type of person is needed to sustain such a world. As educators, it is necessary to consider what type of learning experiences will help prepare students who will fashion such a world. If we envision a world with fewer armed conflicts, reduced levels of poverty, and more just forms of governments, then our task is to provide the educational opportunities in which transformative learning experiences can take place, where students are infused with respect for other cultures that arises from a humble awareness of being deeply connected with and responsible to not only those of their own group, school, race, nation, but those

who share a common humanity. It is this vision and the process of re-envisioning that will help both faculty and students find hope when faced with the complexities and harsh realities of a world that is marked by glaring injustices and inequality.

Conclusions

Higher Education Institutions need to create positive future by defining the real aim and mission of higher education in the internationalization process. Internationalization of higher education should be motivated by education for global citizenship rather than dominated more by the desire for income than better education. Internationalization of higher education should be committed to encouraging democratic inclusivity and ethical living. Internationalization of higher education should be imbedded with these missions and values that provide the global society with a future. This will affect the way courses and programmes are delivered and life in the campus is conducted. This also demands cultural change driven by educationists inside the campus and policy makers at the system level.

The article shows that students' learning and interaction among diverse groups can be enhanced when faculty create collaborative and supportive learning environments outside the class, which increase dialogue and build bridges across communities of difference. This paper demonstrates that transformative learning experiences can be used by faculty to minimize the problems and maximize the potential for diversity and internationalization in higher education. Although transformative learning may not suit all students, teachers, and situations, it is being used with some success in three programs at one university in which students cross boundaries of difference and encounter change. In addition, faculties should help promote change by delivering the message that multicultural and intercultural characteristics of mankind in the globe are respected and that will help transform higher education institutions into sustainable learning communities that could support the learning need of a future global citizenship.

IVLE Secure Exam Browser - the secured way to testing

Lilian Lim

Jeffery Tay

Centre for Instructional Technology, National University of Singapore

Abstract

As the use of technology advances, the way traditional assessment is delivered changes. Both summative and formative assessment measure progress and guide learning; whether done face-to-face or online. Any form of assessment needs to ensure validity, reliability and fairness. Online assessments need to address security, flexibility and authentication issues in order to ensure successful implementation. In this paper, we share the experience in implementing an online secure assessment through the University's Course Management System, IVLE (Integrated Virtual Learning Environment). Students attempt the test or examination questions and submit them within a secure environment; supported using Juniper Virtual Private Network (VPN) solution. The advent of tabbed browsing in Internet Explorer, which was used on the online assessment PCs, created a possible channel for accessing content in background tabs. This created another security challenge for secure online testing. As a result, a client application, the IVLE Secure Exam Browser was developed and implemented in last quarter of 2009. It locks down a Windows PC to create a safe environment for conducting an online assessment via IVLE. It is developed using Microsoft.NET with a client / server architecture. The following paper examines the university's need for an online secure assessment, its benefits, the issues encountered (in administration, technical support and logistics), the customized features of IVLE Exam Secure Browser and future enhancements. This paper concludes with a discussion about the notion that ever-changing needs seem to be driven by technical demands rather than educational requirements.

Background

IVLE, the University's Course Management System, has delivered numerous online secure assessments since Academic Year 2006/07. It began with a simple request for an online examination, which lead to the demand for a secure assessment system. We reviewed and explored a number of third party products but eventually leveraged on NUS campus infrastructure; using Juniper VPN solutions to address security. This is to ensure that only authorized users can take the test or examination upon successful authentication before they are allowed to login into online secure assessment. The secure environment also known as IVLE Secure Assessment also addresses three main areas: students are unable to surf the internet;

cannot access their external emails and cannot save/view any content to/from external media (e.g. thumb drives).

Despite several enhancements to improve the system, we faced new challenges. The advent of tabbed browsing in Internet Explorer 7 created a possible channel for viewing content in multiple tabs thus causing a loophole when students attempt the online secure assessment.

To counter this, CIT (Centre for Instructional Technology) developed the IVLE secure exam browser; a client application in mid-2009. With the initial deployment of a prototype version to the currently working model, we have implemented it in several examinations this year. The client application locks down all applications in a PC; provides easy access for site administrators to manage users, files and secure browser settings (password management). Should security be breached, an alert notifies the system administrator immediately for investigation. The logs captured by the system also allow auditing after the examination.

IVLE secure exam browser is developed using Microsoft.NET with a client/server architecture. It is now a robust and secure system that serves the NUS community.

The need for an online secure assessment

Back before Year 2006, NUS staff started to use the IVLE assessment tool for examinations. Students have to take their online examination in a PC room, monitored by staff. The benefits of having online then was to take advantage of the assessment tool's automatic marking features and the ability to immediately generate the student's progress and tracking results after the completion of an examination.

Associate Professor Erle Chuen-Hian Lim at the Yong Loo Lin School of Medicine said that "students feel that computer-based testing is fairer instead of being projected on a wall, the high resolution images and photographs - which had to be printed prior to this - were delivered directly to the student's desktop display and seeing them this way made them clearer and sharper," he said.

As we progresses, with the use of the assessment tool for examination purposes, the issues of validity, reliability and fairness were somehow addressed but not fully, in the aspects of security. Thus the challenge was to deliver the online examinations through a secured environment. This secured environment must prevent students from:-

- surfing websites for answers
- reading emails
- using instant messaging services
- copying questions to local or external drive
- opening files locally from the PC or externally from thumb drive

Our development history

So the transformation of a simple online assessment tool started to evolve. In Academic Year 2006/2007, CIT launched a new service known as IVLE Secure Assessment where we leveraged on Juniper's Secure Access SSL VPN platforms to securely deliver online examinations to its students. The new network could completely "encapsulate" a student's notebook computer that he could not look at the hard drive or open up Internet Explorer. Such is its ability to exert total control over the network environment that it can even limit the student to just a blank screen.

Progressively, Juniper application enhancement was to tighten the security with more restrictive security policy. Not long after (Nov. 2008 to Feb. 2009), we were challenged with new technology and this challenge was the introduction of tabbed browsing in Internet Explorer 7. It created a possible channel for viewing content in multiple tabs. So in situation where questions are set that the following question may have answers to the preceding question, the ability to view in multiple tabs became a loophole for students during an online secure assessment.

The search for third party

We started the search for third party products or solutions on the market that can secured the web browser. There are many such similar products and to help narrow the search, below are the factors to be considered:-

- Allow ease of updating and one-point creation of the list of applications to be blocked
- The examination system needs to be QTI compliant so that questions can be conveniently uploaded from our University's Course Management System to vendor's system
- Allow single sign-on integration
- Support on-site server, in campus

These are the following products and solutions that were reviewed as at December 2008:-

- BrowseControl
- ExamSoft
- Secureexam Student
- Secureexam Browser
- Customised online exam system by local vendor

The vendor's online exam system has to be integrated with IVLE. Student submits the answers through the online exam system and the question inputs have to be transferred to IVLE for final marking. To ensure that this area is validated, an audit check program needs to be customised to ensure that records are updated or returned successfully and correctly to IVLE database. This has elevated to a high-stake concern on the management of the examination results.

- Thin Client with VMWare

The thin client offering for desktop virtualization with ability to provision and switch to exam desktop during a secure examination. Security is guaranteed because:-

- thin client does not have the ability to store any data
- exam desktop will be installed with only basic OS (Windows XP)
- These exam desktops will be deleted once the exam is completed.
- Exam desktops used a virtual network which is shut off from normal internet

Each thin client cost about S\$800 (inclusive of thin client, LCD, keyboard and mouse); and the need to provision resources on server side to cater for the 140 virtual desktops (about 14 of 2xQuad Core, 8GB Ram servers). But in terms of support, thin client was not part of Campus IT infrastructure then.

There was not one reviewed products or solutions that was a total solution for us to adopt. We then extended our search over to open source solution. In mid-2009, a prototype secure client browser was developed using open source codes. It was a potential direction to further enhance this client application. Thus the IVLE Secure Exam Browser was born in Q4 of 2009. This new client is developed using Microsoft.NET with a client / server architecture. It locks down a Windows PC (XP and above) to create a safe environment to conduct an online assessment via IVLE. The PC must be one where students do not have administrator rights too. We customised our product with the following features:-

- Password management; to open, close and return to browser
- Administrator/single control interface (allow user to set settings, all in a single page)
- Lock down URLs
- Firewall
- Restrict keyboard
- Restrict internet access
- Restrict URL
- Restrict disk access
- Restrict time

Security testing on the product was also carried out by our campus Security team and an external security company. This is to verify that this solution is fully secured to deliver an online examination; and it can be run with confidence.

Finally in January to March 2010, we successful deployed the IVLE Secure Exam Browser during trial runs and actual examinations. The Final Professional Examinations paper for Medicine and Surgery delivered on March 2010 for about 250 students has proven to be a stable and secure solution.

The Benefits

The deployment of the IVLE Secure Exam Browser definitely addresses the issues of security, flexibility and authentication. The biggest issue, security, has been overcome with the application itself. Flexibility was demonstrated, the client application can be easily installed and run the service anywhere. We have conducted several online examinations in different computer cluster/lab; and with Faculty of Law, which is located in another campus. We ensure only authorised students or users can access and view the examination questions in IVLE. The first authentication is to upload the list of students who are allowed to access the secure environment. The second authentication is where users need to login into IVLE Secure Assessment with their NUSnet User ID thus authenticated through the Exchange server. Lastly, within IVLE, the class has to be granted access to take the quiz. You may understand better from the screen captures shown in the following section under ‘Features of IVLE Secure Exam Browser’ or refer to Annex A to walkthrough on the activation of IVLE Secure Exam Browser.

It has helped us reduce downtime and increase productivity. There was a significant improvement with the use of IVLE Secure Exam Browser as compared to the previous solution. As gathered from our customer’s feedback this year (see below), there were close to zero glitches for the examinations.

*“The exam went without a hitch - and only one computer had problems - am so grateful to u all”
– Academic staff, Assoc Prof Erle Lim, March 2010*

“...CIT colleagues for working with us to enhance the secured examination, over this 1-2 years. Jeffery’s innovation of using the client apps’ browser is really effective and the M5 MEQ exam ran very well this year without any glitch.” – Administrative staff, Mr Shawn Chang, March 2010

The Challenges Faced

Despite the successfully implementation, these are the challenges faced or still facing:-

1. Logistics
Students take their online examination in a designated computer cluster in campus. They are being invigilated by administrative staff and examination invigilators. Like usual,

staff still need to verify the students against their photo on the student matriculation card. Our campus, do not have computer cluster that is big enough to host a cohort of students in one sitting. Thus students are split into groups and take the exams online in batch. While the first batch of students is taking their online examination, the second batch will have to wait in a holding area. This is to ensure that the two groups will not get to meet each other after the first batch of students complete their online paper.

2. Network and hardware stability

Each examination scenario is different. Although we have been running it over a few semesters, there are occasional issues on network congestion, dis-connection of the PCs from the network and memory issues on the PCs. These are situations that are beyond our control. Thus contingency plans are required. We will always have at least 5-10% of unoccupied PCs as stand-by so when a PC is 'down', the student will be immediately moved over to the unoccupied seat and continue his examination without much disruption. We may also choose to fall back on the normal running (without the secured environment) of the IVLE Assessment tool with more vigilant monitoring by staff. And in the worst case, we will postpone the examination – a scenario which we have yet to experience.

3. Administrative support

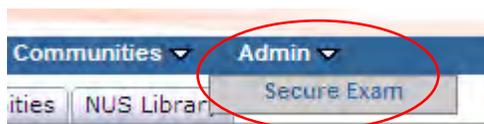

The need to assign dedicated staff to support this service is still required. Having examination online does not reduce the number of support staff. The Computer Centre's network team is also required to work closely with us on the infrastructure needs.

4. Decentralisation of the administrator features

For each examination, the students' IDs need to be uploaded into the secure system so that they will enter the secure environment to take their online examination through IVLE. Thus we grant the staff in-charge with administrator rights so that he or she can conveniently start IVLE Secure Exam Browser through the set up of the User Management and Secure Browser Settings. We are beginning to see that non-IT staff are receptive in the managing and running of online secured examinations.

Features of IVLE Secure Exam Browser

The features of IVLE Secure Exam Browser will be shown in the following screen captures. The administrative settings are done through IVLE. Only authorized personnel will have access to the administrative view of the IVLE Secure Exam Browser in IVLE.

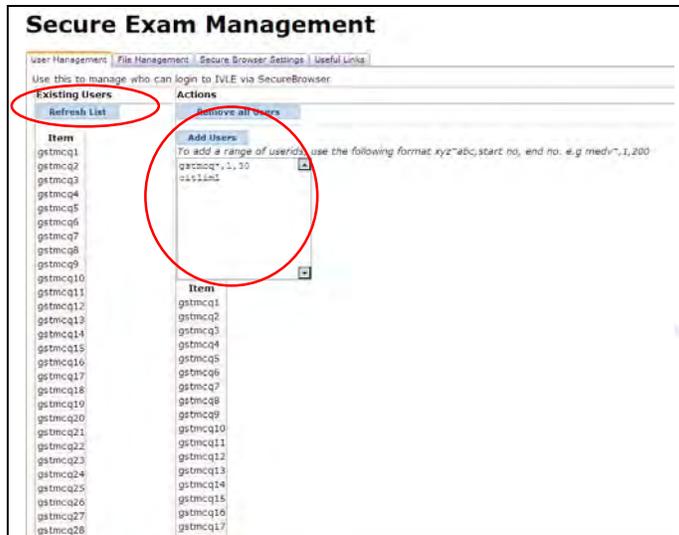

The IVLE Secure Exam Browser administrative settings consist of the following:-

1. User Management

2. File Management
3. Secure Browser Settings

1. User Management

List of NUSnet user IDs have to be entered through the User Management. Only user IDs entered here will be allowed or granted access to the Secure Environment. These are class students/authorized users that will be taking the examination or test during the examination date and time.

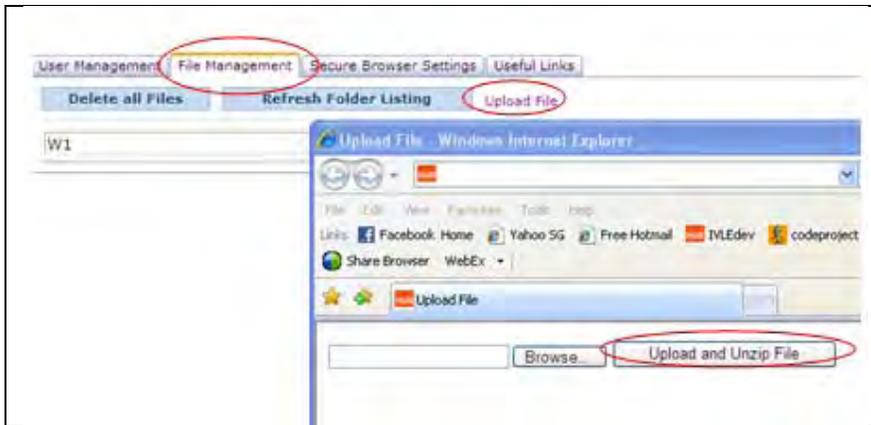

2. File Management (to be used for uploading of PowerPoint file only)

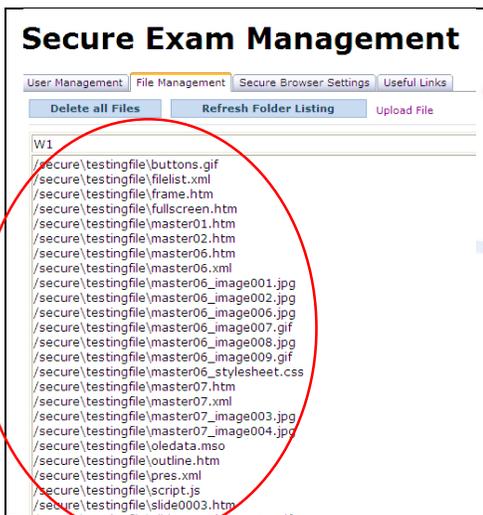

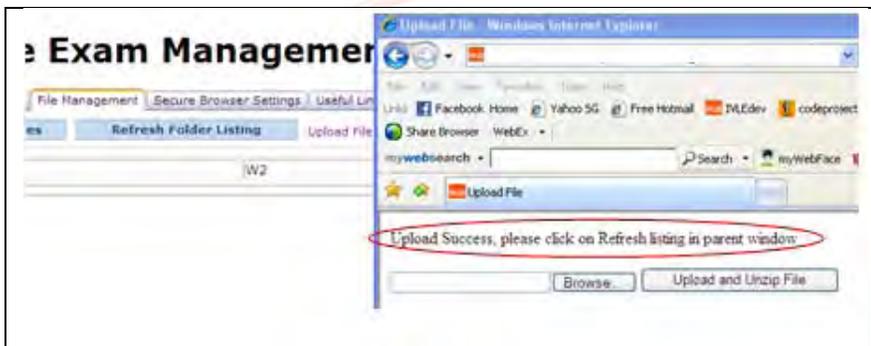

This feature was created for user who wants to leverage on the security of IVLE Secure Exam Browser. The examination questions are not delivered IVLE Assessment instead through PowerPoint slides. Thus the system was developed to accept zip file format. User has to zip their PowerPoint html files into a zipped file.

2.1 Upload File

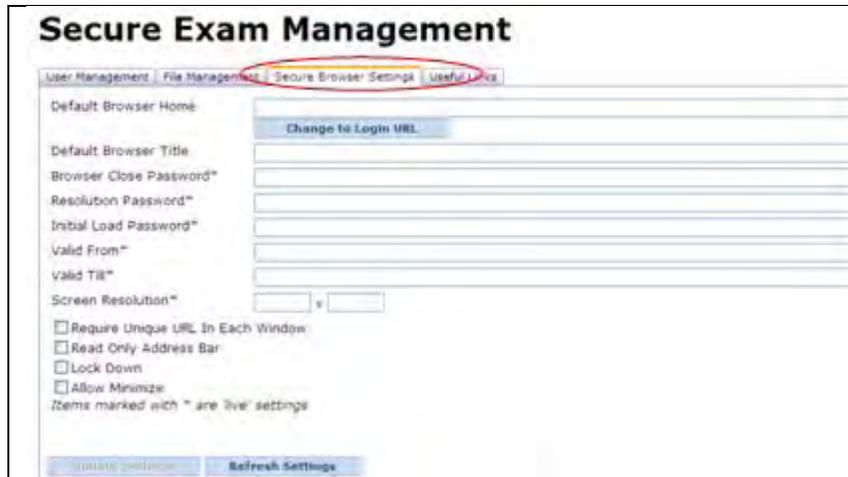

Browse file and then click the “Upload and Unzip File” button to upload and unzip the files into the server’s secure folder.

Upon successful upload and file being unzipped in the server, you will see below screens:

3. Secure Browser Settings

3.1 Set – Passwords

Item as seen in screen	Purpose/Function
Initial Load Password	To authorise entry to the secure environment with a valid password.
Browser Close Password	Need a password to close the browser/window thus prevent accidentally closure of the window by student.
Resolution Password	To resolve unforeseen logouts; support staff can enter password to promptly assist the student to quickly re-enter into the IVLE secure assessment/environment. Note: Support staff will still need to take down the student name/user ID in the log sheet. The system will also capture invalid operation that may be attempted by users or system issues that may occur.

3.2 Set – Valid Date and Time

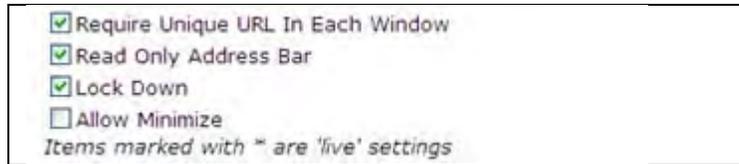

The time here does not refer to the start and end time of the assessment. It is to allow administrator to determine the date, and the duration where the secure environment can be made accessible to the list of authorized students/users. Thus it is recommended that the estimated time to be input in the “Valid Till” field, should have allowance to cater to delays, at least 30 mins after the assessment ending time. This is to ensure that the secure environment is still valid or open.

The valid till time set here also acts as an automatically shut-down feature of the IVLE Secure Exam Browser from all PCs running the secure client application.

Valid From*	17 Nov 2009 05:00 PM
Valid Till*	17 Nov 2009 05:50 PM

3.3 Recommended default settings

The 'Allow Minimize' option is to enable users the option to manually resize the browser window.

Future Enhancements

It is now a robust and secure system that serves the NUS community. Our plan is to enhance the system so that it is able to support multiple concurrent sessions which can be administered by many different requestors. It would also be an advantage if students can do their online examination anytime and anywhere, with fool-proof verification that the person taking the examination is the actual student. We have reviewed some online proctoring products that may address this challenging issue but will not be able to justify the cost against the needs for now. There are more challenges ahead. However, as an in-house application, CIT has the flexibility to customise the application according to the ever-changing technological landscape as well as to our clients varying needs.

Conclusion

In this paper, we have shown that the advances made in developing and delivering an online examination in a secured environment in our context has been driven by technical demands rather than educational requirements. Even if there was change request by our customers, they are mostly to deal with the online assessment interface and/or the features. Though the series of development from IVLE Assessment tool, to IVLE Secure Assessment till the latest IVLE Secure Exam Browser application; it was the technology challenges that we have to counter to ensure that our online examination system provides reliability, security, flexibility and a sound framework on authentication.

Annex A

Walkthrough on the activation of IVLE Secure Exam Browser

1. Activate the Secure Exam Browser, client application

You (support staff) will need to login to the local PCs with Administrator logins. (You must liaise with the PC cluster administrator for technical support.)

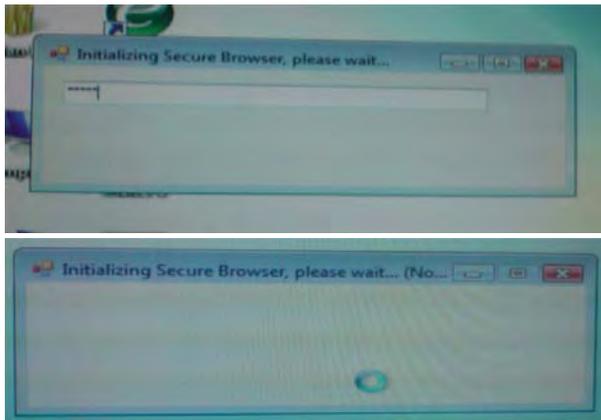

For the first time the Secure Exam Browser application file has to be saved on the desktop of each PCs. You can get this “updater.exe” file from the IVLE Secure Exam Administrator. (It can be downloaded from the IVLE>Admin>Secure Exam>Useful Links tab>Updater Program link.) Subsequently, upon clicking the “updater.exe” file, it will automatically get the latest copy from the server. Click on the “updater.exe” file to activate the secure exam browser application.

2. Start the Secure Browser

You (support staff) will see a screen, “Press any key to start SecureBrowser” This may take a while or longer as the application is locking down all the PC’s applications.

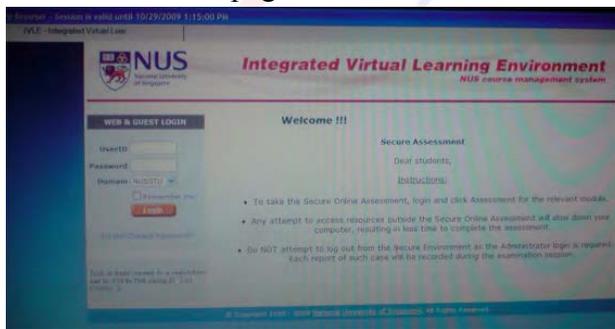

3. **Set Initial Load Password (optional) – Password required to load the Secure Browser**
You may need to enter password to initialize/load the Secure Browser.

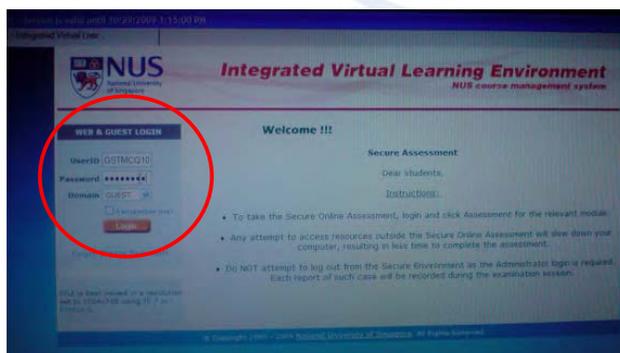

4. **Accessing the Secure Environment or Assessment**

4.1 Display of IVLE homepage:-

Upon your successfully entry to Secure Browser, you will be directed to the IVLE Secure Assessment homepage.

- 4.1.1 Only authorized students may enter their NUSnet userid to begin their secure assessment.

- 4.1.2 The student has successfully entered IVLE Secure Assessment. He/she may click on the 'notebook' icon to select and access the online assessment.

Topic of the submission: Technology in learning

The logo for the International Association for Frontiers in Education (iafor) is centered on the page. It features the word "iafor" in a light blue, lowercase, sans-serif font. The text is surrounded by several overlapping, curved lines in shades of blue and red, creating a circular, abstract design.

ABSTRACT

The development of computer and Internet technology has brought a new learning approach. However, because of the individual difference among learners, it is important to provide proper assistance and guidance in the learning process. This study uses the software robot technique to design a virtual learning companion, Confucius, on the popular MSN platform to play the role of a learning companion 24 hours a day on the Internet to give learners assistance. Confucius provides different learning guidance methods according to the different learning cognitive styles to help learners learn more efficiently. This paper conducted the experiment to the 104 college students and the learning content is Microsoft Certification Course (MCTS-70620). The result shows that when the learning guidance method of Confucius is discussion mode, the learning performance of learners whose cognitive style is field-dependent is higher than that of the learners whose cognitive style is field-independent. However, when the learning guidance method of Confucius is lecture mode, the learning performance of the field-independent learners is higher than that of the field-dependent learners. The result is similar to the finding of Garger and Guild (1987) that field-dependent learners prefer the learning situation which they can discuss and interact with the others, and the field-independent learners prefer lecture mode in the learning process. Therefore, this study called the grouping that fit learners' cognitive styles the adaptive group; otherwise it is called the non-adaptive group. Finally, this paper conducted the analysis of learning performance to these two groups. The finding suggested that the learning performance of the adaptive group learners is significantly higher than those of the non-adaptive group learners.

Virtual Learning Companion, Individual Cognitive Style, MSN platform, Microsoft Certification Course

Introduction

Technology development has changed the traditional teaching approach (Chen & Ko, 2010; Chen & Wang, 2008; Guan, Tsai, & Hwang, 2006; Hong, 2002), and prevents learning from being limited by time and space (Berge & Collins, 1995; Kaiser, Tullar, & Mackowen, 2000; Raquel, 2002). In recent years, the popularity of e-learning has revealed the trend and importance of the application of information technology (Graham, 2002). Therefore, information technology has been considered as a critical learning supplement and how to effectively apply it to increase learning performance is an important issue.

In the environment of e-learning, instructors not only have to teach learners knowledge but most importantly they have to provide learners with adaptive assistance and guidance in their learning process to help them learn more efficiently (McFadzean & Nelson, 1998; McFadzean, Somersall,

& Coker, 1999; McFadzeav & McKenzie, 2001). However, instructors, because of the heavy workload, are usually not able to effectively provide the real-time guidance to learners 24 hours a day. Learners, therefore, need the assistance of virtual learning companions. The concept of virtual learning companion is that along with the instructor and the learner, there is one peer learner for peer interaction in e-learning environment to help the learner learn more efficiently (Chan & Baskin, 1988, 1990). Hence, it is an important issue to build a virtual learning companion system to assist learners learning 24 hours a day.

However, because of the individual differences among learners, there is no guidance method that can be adaptive to all of them. Researchers suggest that instructors need to learn a different set of teaching skills for teaching online (Brower, 2003; Easton, 2003). Besides, the learning materials are usually based on the viewpoints of instructors but not based on learners' needs, and it could result in opposite learning effect. Drummond (2000) believed that the reason of opposite learning effect may be the disregard of learners' cognitive styles. Dunn and Dunn (1994) found that when the teaching methods and materials fit learners' cognitive styles, it improves not only learners' learning performance but also their learning attitude. Hence, a good design of virtual learning companion should be adaptive to learners' cognitive styles to assist them to learn more effectively.

Moreover, constructivists suggested that instruction should be learner-centered (Brooks & Brooks, 1993). Learners are thinking individuals, hence instructors should provide them with opportunities to develop their potential ability and help them gain thinking, inferring and problem-solving abilities in the learning process. Therefore, it is necessary to build a virtual learning companion system that provides different guidance according to different cognitive styles. Furthermore, according to the statistics of InsightXplorer Ltd. in March, 2008, MSN Messenger is the most popular instant communication system in Taiwan and the user population has exceeded eight million. Hence, this study uses the technique of software robot to design a virtual learning companion that can provide adaptive guidance according to individual cognitive style through the MSN platform to help learners study more efficiently.

Literature Review

Virtual learning companion

Chan and Baskin (1988) first proposed the concept of virtual learning companions. A virtual learning companion is a partner that can accompany learners to study in the e-learning environment. In other words, beside the instructor and the learner, there is a virtual learning companion helping the learner acquire knowledge anytime and anywhere.

Webb (1982) discovered that through the help and message supplied among learning companions, it can increase learning performance. Besides, through the interaction with virtual learning companions, learners can engage in the learning situation to increase their concentration, engagement, and learning attention (Hsu et al., 2007). Hong (2002) found that when there is an absence of interaction with learning companions in e-learning environment, it causes learners the feeling of isolation and decreases their learning satisfaction (Hiltz & Wellman, 1997; Rovai, 2002; Rovai & Wighting, 2005). Arbaugh (2002) also pointed out the positive relationship between learning satisfaction and the interaction among the learners, the instructor and the learning companions. Christensen, Anakwe & Kessler (2001) discovered that students who participate in e-learning prefer to interact with other learning companions. Moreover, in the learning process, through the interactive relationship of the encouragement, explanation, interpretation, instruction and demonstration among learning companions, it is easier to reach study goals (Hooper, 1992; Slavin, 1995). Therefore, it is a critical issue to build a virtual learning companion system to support learners and to prevent the feeling of isolation.

However, because there are individual differences among learners, the guidance of the virtual learning companion system cannot be built only on one method to adapt to all the learners. Renzulli (1994) also pointed out that when the guidance method and the learner's cognitive style are consistent with each other, it makes the learner learn easier and more delighted, and have better attitude towards learning (Dunn and Dunn, 1994) while the learning performance will not be decreased (Drummond, 2000). She & Fisher (2003) found that if the instruction methods correspond to learners' cognitive styles, it will make the greatest learning effect in the change of subject concept. Therefore, in order to assist learners to learn more effectively, it is important to build a virtual learning companion system that can provide different guidance methods according to individual cognitive style to assist learning more efficiently.

Cognitive style

Messick (1984) defined cognitive styles as "characteristic self-consistencies in information processing that develop in congenial ways around the underlying personality trends". Witkin, Moore, Goodenough and Cox (1977) referred cognitive style to the individual differences in perception, thinking, problem solving and learning. Cognitive style is a hypothetical construct and it is the special individual style or method when engaging in cognitive activities (Witkin & Goodenough, 1981; Riding & Cheema, 1991; Morgan, 1997). Among different cognitive styles, there are many studies about field-independence and field-dependence. This cognitive style was first purposed by Witkin et al. in 1954 and was also named psychological differentiation (Witkin et al., 1962) or field articulation. This cognitive style uses the embedded figures test (EFT) as the measurement instrument to measure the field independency degree of the subjects (Messick, 1962).

Witkin et al. (1962) used field independency to divide cognitive styles into the two categories, field-dependence style and field-independence style. Field independency is to measure the degree that the subject overcomes the influence of the irrelevant field elements while recognizing the related portion under the specific situation. The less a person is influenced by the irrelevant elements, the more analytical or field independent the person is. On the contrary, the easier a person is influenced by the irrelevant elements, the more global or field dependent the person is (Wu, 1987).

Chapelle and Roberts (1986) found that field independent learners are not influenced by the social orientation and the extrinsic motives, and prefer analytical learning and independent study. Field independent learners think they can learn more, faster and easier through independent study. On the other hand, field dependent learners are much influenced by the external environment, and the social orientation and extrinsic motives. They prefer global and collaborative learning, and accept peer guidance to reduce learning anxiety and increase learning interest. Garger and Guild (1987) also discovered that field dependent learners prefer the learning environment where they can interact and discuss with the others, and that field independent learners prefer the teaching method of lecture mode.

In short, cognitive style is the individual perception and memory in information processing, and it is also the tendency of problem solving and learning. It is a non-intelligence personal characteristic but it can influence learning. In terms of field independency, it affects the individual response to the environmental change and the learning materials. Therefore, when discussing learning performance, it is necessary to concern the influence caused by cognitive styles.

Virtual learning companion system (Confucius)

The designed virtual learning companion system of this study, Confucius, can assist instructors to provide learners guidance and assistance after class 24 hours a day. Confucius is able to help learners practice class content through two-ways interaction by using real-time Questions and Answers (Q&A). When learners can't give the right answer, Confucius provides two guidance methods, the lecture mode and the discussion mode, to assist learners to solve the questions.

The lecture mode guidance supplies the related information and contents to learners when they have learning errors. As shown in the figure 1, when Confucius proposes a question to the learner (block A) and the learner gives a wrong answer, Confucius will provide the correct answer (block B) and the webpage with the supplement teaching materials prepared by the instructor (block C).

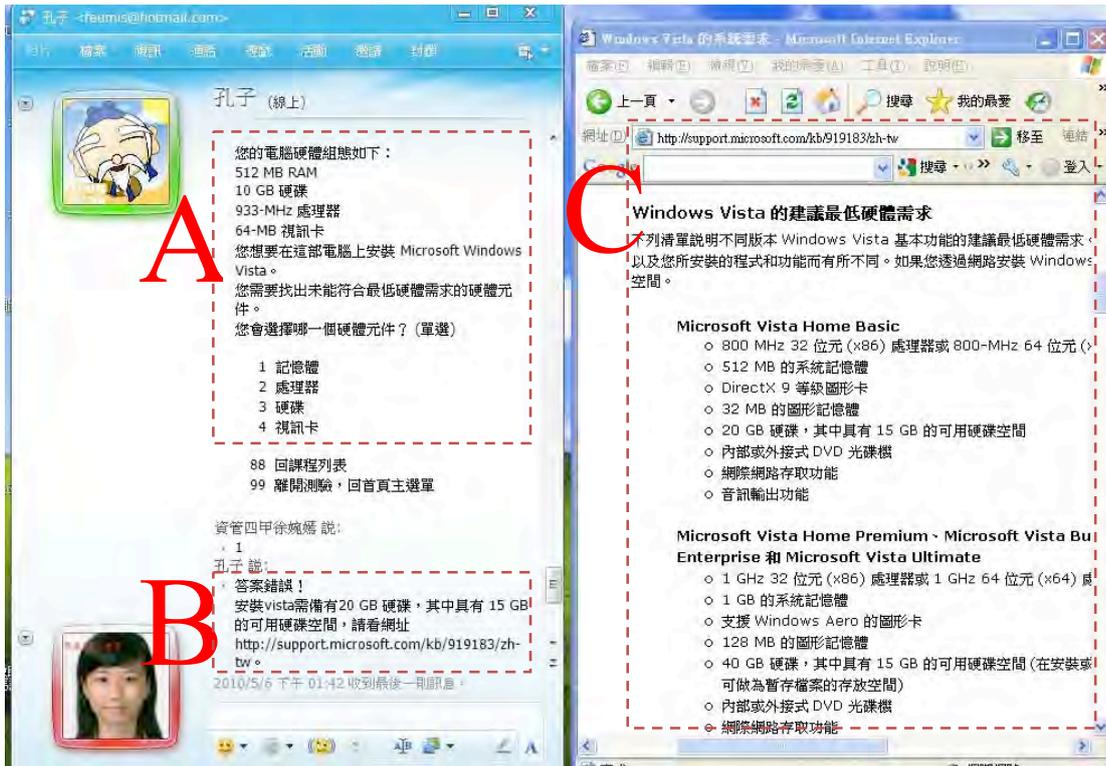

Figure 1 Lecture mode guidance of virtual learning companion

The discussion mode guidance is to provide peer discussion when learners have learning errors. As shown in the figure 2, when Confucius proposes a question to the learner (block A) and the learner gives a wrong answer, Confucius will search the database to find the online learners who have the correct answer and randomly choose some of them to be the list for peer discussion (block B). The learner, at this time, can choose one of them to discuss the question. Then, Confucius will inquire if the selected peer learner agrees to do interactive discussion (block C) and connect it to the discussion window (block D).

Figure 2 Discussion mode guidance of virtual learning companion

Research Methodology

This study adopts the certification exam of Microsoft technical specialist (Exam-70620¹) as the instruction content and the factorial design as the experimental design method to explore how the guidance methods of the virtual learning companions in e-learning environment influence the learning performance. This paper uses the formal 70620 examination held at PROMETRIC test center to collect data of learning performance, and employs quantitative analysis method to analyze it. The instrument of the quantitative analysis is the statistic software, SPSS. The goal of the experiment is to discuss the following questions.

1. If the different guidance methods of the virtual learning companion will make college students have different learning performance on Microsoft certification course?
2. If the guidance of the virtual learning companion will make variant cognitive style learners have different learning performance on Microsoft certification course?
3. If there is any interactive effect between the guidance methods of the virtual learning companion and the cognitive styles on the learning performance?

Experiment Content

Microsoft technical specialist exam (Exam-70620) is used as the instruction content in the experiment. Exam-70620: Windows Vista, Configuring, became available in January 2007. Exam-70620 test takers should have the ability to resolve issues concerning network connectivity, desktop operating systems, security, and applications. Their ability should also include addressing logon problems, performing password resets, and resolving most issues with desktop applications. When test takers pass the Exam-70620 that held at the PROMETRIC² test center, they will earn the credential of "Microsoft Certified Technology Specialist (MCTS): Windows Vista, Configuration".

Our experiment course teaches the learners to prepare for this exam and earn the credential. The related experimental activities include curriculum instruction and the use of virtual learning companion system after class. Before the course, the instructor introduces the teaching goals and contents. Then, the students are divided into different experimental groups. After class, students practice the instruction contents through the assistance of the virtual learning companion system.

Research Design and Variables

This study adopts the experimental method. Before the experiment, a self developed examination

¹ <http://www.microsoft.com/learning/en/us/exam.aspx>

² <http://www.prometric.com>

of Exam-70620 is used to confirm whether students have consistent prior knowledge. Students, then, take the computerized EFT (Figure 3) to determine their cognitive styles, and are randomly divided into the groups with the two different guidance methods, shown as table 1.

The independent variable of the study is the difference of the guidance methods of the virtual learning companion and the dependent variable is the learning performance. The measurement of the learning performance is based on the learner’s formal score of the Exam-70620.

Table 1 Experiment design

Experiment Groups	Cognitive Style	Guidance methods of virtual learning companion
Experiment Group 1 (EG1)	Field-dependent style	Discussion mode
Experiment Group 2 (EG2)	Field-dependent style	Lecture mode
Experiment Group 3 (EG3)	Field-independent style	Discussion mode
Experiment Group 4 (EG4)	Field-independent style	Lecture mode

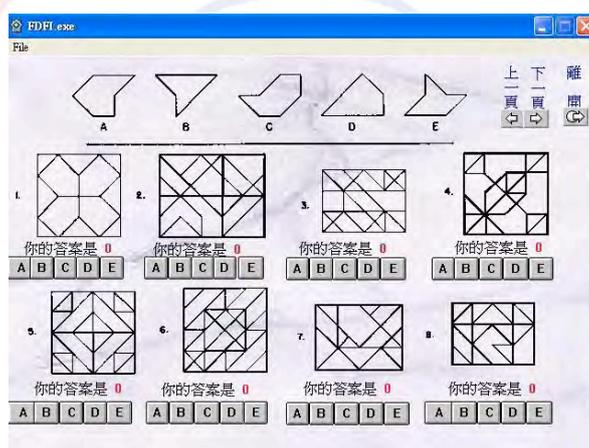

Figure 3 Computerized EFT

Experiment Subjects and Procedure

The experiment subjects include the 192 freshmen and juniors at one university of science and technology. 61.5% of them are male students, and 38.5% are female students; 59.4% of the students are freshmen, and 40.6% are juniors.

The experiment period lasted 12 weeks. In the first week, a self developed examination of Exam-70620 was used to measure the prior knowledge and the computerized EFT was used to explore students’ cognitive styles. In the second week, according to their cognitive styles, students were randomly assigned to the 4 experimental groups and Confucius, the system of virtual learning companion, was introduced to them. From the second week to the eighth week, the instruction was given by the same instructor and students were asked to use the virtual

learning companion system after class. In the ninth week, students took the formal examination held at PROMETRIC test center. In the thirteenth week, the self developed examination of Exam-70620 was used to do the follow-up exam to evaluate students' memory of the instruction content.

Research Results and Discussions

The study subjects include the 192 university students. Before the experiment, the 192 students take the EFT to classify their cognitive styles. The EFT was edited by Messick (1962). The main measurement includes two parts and each part has 16 items for the subjects to find the embedded simple figures in the complicated figures in ten minutes. Because the EFT identifies cognitive styles along a continuum which score range is from 0 (field-dependent) to 32 (field-independent) depending on the number of figures traced correctly. This paper has followed a statistical procedure of using the upper and lower 27% of the EFT scores to identify extreme field-dependent and field-independent subjects (Spanier & Tate, 1988). The 52 out of the 192 subjects who have taken the EFT are field-dependent (their EFT scores locate at the lower 27% and their average score is 5.38) and they are randomly assigned to experimental group 1 and 2. The 52 of the 192 subjects are field-independent (their EFT scores locate at the upper 27% and their average score is 22.14) and they are randomly assigned to experimental group 3 and 4, shown as table 2.

Table 2 Four experiment groups

Experiment Group	Cognitive Style	Guidance Methods of Virtual Learning Companion	Numbers of Learner	Average Scores of EFT
EG1	Field-dependent style	Discussion mode	26	5.38
EG2	Field-dependent style	Lecture mode	26	
EG3	Field-independent style	Discussion mode	26	22.14
EG4	Field-independent style	Lecture mode	26	

In order to examine if their prior knowledge of Exam-70620 is significantly different, a self developed examination of Exam-70620 is adopted as the pre-test. The pre-test grades of the four experimental group students are analyzed by one-way ANOVA to discover if the four group students have significant different prior knowledge for Exam-70620. The result shows that their prior knowledge for Exam-70620 is not significantly different ($F=2.114$, $p\text{-value}=0.103>0.05$), shown as table 3.

Table 3 One-way ANOVA for pre-test of 4 experimental groups

	Sum of Squares	df	Mean Square	F	Sig.
--	----------------	----	-------------	---	------

Between Groups	45925.962	3	15308.654	2.114	.103
Within Groups	724173.077	100	7241.731		
Total	770099.038	103			

The result of the quantitative analysis shows that the scores of Exam-70620 of the four experimental group students rise after Microsoft certification course (shown as table 4). This outcome suggests that the two learning guidance methods with the course instruction have positive effect in increasing learners' learning performance. In addition, according to the pair-samples t-test, the test scores of all experimental students have significant difference (p -value <0.05). Therefore, it shows that the course instruction and virtual learning companion guidance have significant effect on learners' learning performance.

Table 4 Pair-samples T test analysis of four experimental groups

Experimental group		Mean	Std. Deviation	Mean	Std. Deviation	t	Sig. (2-tailed)
EG1	Post-test	818.46	88.450	469.231	128.582	18.608	0.000
	Pre-test	349.23	82.996				
EG2	Post-test	780.19	95.544	429.423	95.547	22.917	0.000
	Pre-test	350.77	86.576				
EG3	Post-test	770.62	75.020	469.462	123.635	19.362	0.000
	Pre-test	301.15	91.185				
EG4	Post-test	839.12	88.105	520.654	130.481	20.346	0.000
	Pre-test	318.46	73.031				

Since this study is to discuss if the learning guidance methods, learners' cognitive styles, and the interaction between them have different effect on the learning performance of Exam-70620, this research takes the learning guidance methods and cognitive styles as the independent variables to do two-way ANOVA analysis on learners' learning performance (shown as table 5).

Table 5 Two-way ANOVA analysis of four experimental groups

Source	Type III Sum of Squares	df	Mean Square	F	Sig.
Intercept	6.691E7	1	6.691E7	9101.030	.000
Cognitive Styles	797.538	1	797.538	.108	.743
Guidance Methods	5940.346	1	5940.346	.808	.371
Cognitive Styles * Guidance Methods	74097.846	1	74097.846	10.079	.002
Error	735183.308	100	7351.833		
Total	6.773E7	104			

The result of Table5 shows that both the effects of individual cognitive styles ($F=0.108$, $p\text{-value}>0.05$) and virtual learning companion guidance methods ($F=0.371$, $p\text{-value}>0.05$) are not statistically significant. It means that learners with different cognitive styles and virtual learning companion guidance methods have no significant difference on learning performance. However, the effect of the interaction between individual cognitive styles and virtual learning companion guidance methods is significant ($F=10.079$, $p\text{-value}<0.05$). Hence, this result shows that the individual cognitive styles and the guidance methods of the virtual learning companion have interactive effect on learning performance.

In order to further understand the interactive effect between individual cognitive styles and guidance methods of virtual learning companion, this study uses Least Significant Difference (LSD) as the post-hoc analysis, shown as table 6. The result shows that the difference of the learning performance between EG1 and EG3 ($p\text{-value}=0.047$), EG2 and EG4 ($p\text{-value}=0.015$), EG3 and EG4 ($p\text{-value}=0.005$) are all significant.

Table 6 post-hoc analysis of four experimental groups

(I) Group	(J) Group	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
EG1	EG2	38.269	23.781	.111	-8.91	85.45
	EG3	47.846*	23.781	.047*	.67	95.03
	EG4	-20.654	23.781	.387	-67.83	26.53
EG2	EG1	-38.269	23.781	.111	-85.45	8.91
	EG3	9.577	23.781	.688	-37.60	56.76
	EG4	-58.923*	23.781	.015*	-106.10	-11.74
EG3	EG1	-47.846*	23.781	.047*	-95.03	-.67
	EG2	-9.577	23.781	.688	-56.76	37.60
	EG4	-68.500*	23.781	.005*	-115.68	-21.32
EG4	EG1	20.654	23.781	.387	-26.53	67.83
	EG2	58.923*	23.781	.015*	11.74	106.10
	EG3	68.500*	23.781	.005*	21.32	115.68

*. The mean difference is significant at the 0.05 level.

From the difference of the learning performance between EG1 and EG3 ($p\text{-value}=0.047$), it shows that when the guidance methods of the virtual learning companion is discussion mode, the learning performance of field-dependent learners is higher than that of the field-independent learners. Then, from the difference between EG2 and EG4 ($p\text{-value}=0.015$), it reveals that when the learning guidance method of the virtual learning companion is lecture mode, the learning

performance of field-independent learners is higher than that of the field-dependent learners. In addition, from the difference between EG3 and EG4, it presents that when learners' cognitive style is field-independent, the learning performance with the lecture mode is higher than that with the discussion mode.

The result is similar to the finding of Garger and Guild (1987) that field-dependent learners like to discuss and interact with the other learners, and field-independent learners prefer the teaching method of lecture mode. Hence, this study suggests that providing field-dependent learners with the learning guidance method of discussion mode (EG1) and field-independent learners with the lecture mode (EG4), it meets learners' cognitive styles. The grouping that fits learners' cognitive styles is called the adaptive group; otherwise it is called the non-adaptive group (EG2 and EG3), shown as table 7.

Table 7 Experiment design of adaptive group and non-adaptive Group

		Guidance Methods of Virtual Learning Companion	
		Discussion mode	Lecture mode
Cognitive Style	Field-dependent style	EG1 Adaptive Group	EG2 Non-adaptive Group
	Field-independent style	EG3 Non-adaptive Group	EG4 Adaptive Group

Then, the research uses t-test to explore if the learning performance of the adaptive groups is higher than that of the non-adaptive groups, shown as table 8. Table 8 shows that the learning performance of the adaptive groups is significantly higher than that of the non-adaptive groups (p -value=0.002). Besides, to discover that with the different instruction methods if there is any significant difference on learners' long term memory, this study conducted the follow-up exam. Since the result of the follow-up exam shows that the learning performance of the adaptive groups is still higher than that of the non-adaptive groups (p -value =0.001), it means that providing different cognitive styles learners with different learning guidance methods can effectively increase their learning performance.

Table 8 Post-test and follow-up exam of adaptive group and non-adaptive Group

	Group	Mean	Std. Deviation	t	Sig. (2-tailed)
Post-test	Adaptive Group	828.79	85.384	3.192	0.002
	Non- adaptive Group	775.40	85.188		
Follow-up exam	Adaptive Group	764.77	93.856	3.459	0.001
	Non-adaptive Group	703.42	86.875		

Conclusion

The goal of this study is to design a virtual learning companion, Confucius, to play the role of a learning companion 24 hours a day on the Internet to assist learners to learn more efficiently. In the meanwhile, this paper discusses if there is any significant difference among the learning performance of learners with different cognitive styles when using different learning guidance methods in the learning environment on MSN platform. The findings are summarized as below.

1. When the learning guidance method of the virtual learning companion is discussion mode, the learning performance of the field-dependent learners is higher than that of the field-independent learners.
2. When the learning guidance method of the virtual learning companion is lecture mode, the learning performance of the field-independent learners is higher than that of the field-dependent learners.
3. The learning performance of the adaptive group is significantly higher than that of the non-adaptive group.

The finding suggested that when the guidance methods of the virtual learning companion correspond to individual cognitive styles, it can efficiently increase their learning performance. This result is similar to the viewpoint of Kraus, Reed and Fitzgerald (2001) that the well designed e-learning environment can make learners with different cognitive styles have the same learning performance. Besides, Dunn and Dunn (1994) found that when the instruction and teaching resources correspond to learners' unique learning styles, it can increase their learning performance and learning attitude. Through different learning guidance methods, the virtual learning companion designed by this study can efficiently help learners develop their own learning styles and teach them in accordance with their aptitude.

In short, this study found that when the learning guidance method is designed based on individual cognitive styles, and it can increase their learning performance on Microsoft certification course. Specifically, when the virtual learning companion provides the mechanism which corresponds to learners' learning styles, makes learners actively participate in learning, and gives them timely feedback, it increases their learning performance. This result is also similar to the finding of Meyer (2003) that the successful learning in the Internet environment is highly related to learners' cognitive styles. Through the understanding that learners with different cognitive styles have their particular learning approach, the researcher hopes to provide this viewpoint as the reference for the other instructors in designing teaching activities to increase learners' learning performance in the e-learning environment.

Creativity development pattern and its effectiveness in creative teaching in elementary school teachers

Hosseini A.S.

PHD Professor, Tehran University, Tehran, Iran

Abstract:

Nowadays, the study of creativity from the viewpoint of education is receiving attention from educational researchers and planners. With regard to educational plans, objectives, content, and other factors, educational systems have an important role in the development or suppression of creativity in students. Teachers play a crucial role in this regard.

This paper addresses creativity as an educational approach, reviews the related theories and patterns of creative learning, and deals with teaching creativity to teachers generally, and Iranian teachers specifically. This idea has been proposed and studied by the researcher. The main focus of this program is the pattern of creativity development, in which five basic aspects of teacher performance have been dealt with: contextual-social, affective-cognitive, mental, educational, and physical aspects.

A part of this study deals with the effect of the program and the pattern of creativity development on teachers' skills. Data analysis by T-test for this quasi-experimental research indicated the positive effect of the program and led to the confirmation of the research hypothesis. Feedback from the teachers regarding their change of performance in the classroom, in spite of the passing of several years, indicates that they made positive use of the pattern.

All the teachers participating in the course stated that attending the course helped them to move away from teacher-centered toward learner-centered classes, which has made their students very enthusiastic.

Introduction

The importance and necessity of creativity and its ever-developing process in the present time has attracted the attention of researchers and educational planners towards the study and analysis of creativity from the educational point of view. Considering their plans, objectives, content, and educational facilities, educational systems have an important role in the activation or suppression of creative abilities in individuals. Therefore, most communities have focused their attention since long ago on the revision and modification of the curricula and educational plans with the purpose of helping the development of creative abilities in children and adolescents. Today's students are more technologically capable and expect the educational experience to acknowledge this. The old tried and true methods may no longer be effective because current technological development are changing the learning process (Simplicio, 2000). Simplicio stated that teachers must be willing to utilize different strategies, methodologies, and approaches to instruction, they must be willing to change their methods and criteria of evaluation.

A number of authors have suggested attributes of innovative teaching and identified personal characteristic of innovative teachers (Fatt, 2000; Ritchhart, 2004). A creative teacher is seen as the one who is consistently curious and constantly seeks out new ways to improve her or his teaching abilities. In addition to improving their skills, teachers must also increase their

understanding of student needs and preferences and constantly seek out new ways for transmitting knowledge (Simplicio, 2000).

However, as teacher review promotional materials from creativity training programs, they should seek those programs that have the strongest research and evaluation bases to ensure that the desired effect have been documented.

Whatever programs are used or strategies are taught, teachers should be aware that transfer from the context in which they were taught to other situations will likely not occur unless they take time to assist students with seeing and practicing other application (Hunsaker, 2005).

Fatt (2000) assert that great teaching requires an open relationship between the teacher and students. Teachers should provide students with opportunities to have input into classes. This interaction between teacher and student helps the teacher identify the particular abilities and needs of each student. Ritchhart (2004) also emphasized the importance of teacher – student interaction. In a truly creative classroom, the students are doing more than learning the curricular content. Innovative teachers create opportunities for student expression, such as open – ended assignments or student – led discussions. Ritchhart (2004) identified two areas of creative teaching – curriculum and instruction. According to him, creative teachers look to shape curriculum and present it in new, more productive ways. A creative approach to curriculum involves finding new topics for students to explore. A creative approach to instruction involves finding new approaches or ways of presenting information.

The creative teacher will find multiple methods to engage students. (Jaskyte et al, 2009).

Studies on creative teaching found that teachers placed a great emphasis on their interpersonal relationship with students (Dacey, 1989; Horng et al, 2005; Lynch, 2001).

Creativity training programs have general support among students, educators, and parents (Roell, 2002), with what Saxon, Treffinger, Young, and Wittig (2003) call " customer satisfaction " (p. 68); though in a study of one competitive program, teachers were more supportive than students, and younger students were more positive than older students (Frasier, Winsted, & Lee, 1997).

We Iranians, too, need a fundamental and profound revolution in our educational system in order to revive this ability, which itself requires an awareness of our present situation so that we can plan for enhancing our educational system.

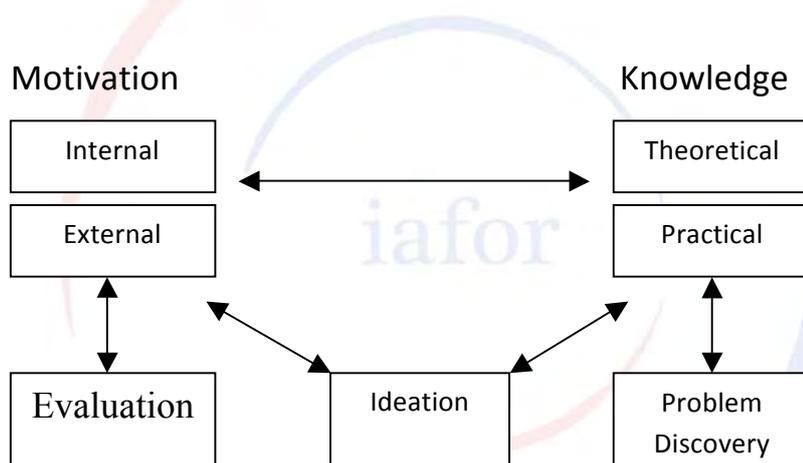

Considering the educational system in our country, we find that there is still a long way to the situation that can pave the way for the development of creativity in children and adolescents. Therefore, research into different educational elements and their roles in nurturing creativity in students is of great importance. Teachers, from among effective educational elements and factors, play a crucial role. The author has proved, via several research studies, that teachers are capable of replacing their previous teaching methods with a

creative approach, in spite of the serious obstacles such as a stereotyped curriculum, if they are provided with a suitable educational structure (Hosseini, 2002; Hosseini, 1998).

Creativity as an educational approach

Runco and Chand (1995) stated that a creative thinking is one that leads to innovative thoughts, solutions, and insight, which requires interactive components and processes, as presented in the following diagram.

Runco and Chand's (1995) model of creative thinking.

Runco and Chand (1995) tried to represent the complex structure of creative thinking and creativity through this pattern. They stressed the importance of knowledge and motivation in developing creative thinking. Theoretical knowledge is simple information that creative thinking gets involved with, whereas practical knowledge is the strategic thinking that Runco and Chand call metacognitive ability.

Ranco and Chand's study shows that motivation, especially internal motivation, is of importance in discovering the problem. Motivation increases when the student is free to choose the tasks to be performed, as this makes the task meaningful to the student. Rango and Chand suggest that instructors allocate a lot of time to the problem-related skills, because they are no less important than problem solving itself and, in doing so, external motivations are utilized to nurture internal motivations. They emphasized that motivation depends upon cognitive and metacognitive processes such as recognition.

Learning theories

Cognitive learning theories, which started in early 1960's, have influenced our understanding of creativity. These theories view thinking as a structural process (Houts and Krug, 1995). Houts and Krug reported that creativity can be considered as both a cognitive and an affective attempt. According to the cognitive theory, the brain is involved in an ongoing process of creating (p.288). Treffinger et al. (1983) proposed the creative learning model as a combination of three levels.

The first level of the creative learning model consists of several cognitive and motivational factors called divergent functions. There is great emphasis at this level on openness, seeing and feeling various possibilities, which serves as the basis for creative learning because it involves a large variety of thinking and

feeling processes that play a major role in learning. Cognitive factors include flow of ideas, flexibility, innovation, and improvement, and affective factors involve curiosity, interest in reaction, taking risks, etc.

The second level consists of the higher-level, more complicated processes of thinking and feeling. Moreover, the emphasis at this level is on dealing with the complicated feelings and tensions that are involved in mental imagery and bringing about psychic security and freedom. This includes cognitive factors such as application, analysis, synthesis, ..., and affective factors such as peace and nurturing values.

The third level emphasizes the involvement of the learner in real problems and challenges. The cognitive factors at this level include independent investigation, self-orientation in learning, resource management, and creation of products.

Moreover, Williams (1970) designed the cognitive-affective pattern for the development of creativity in children. The cognitive domain encompasses knowledge, reasoning skills and what Williams calls algorithm, technical skills, and particular talent; the cognitive domain is generally among the educational objectives of the teacher and depends on the experience and capabilities of the learner.

The affective domain includes esthetics, feelings and affects of the individual. Williams believes that the students' evaluation of their own creative activities as well as those of others pertain to this domain. Davis and Rimm

(1985) maintain that arousing creative thinking is possible through attitudes constructive to creativity. (Fosco, 2001) Thus, it seems that the affective domain is as important as the cognitive domain in developing creativity. Davis and Rimm (1985) stated that creative attitudes should be taught in all creativity programs. Williams (1970) believes that in spite of the importance of the affective domain, it rarely receives attention and teachers are not able to evaluate affective behavior.

Torrance (1980) is of the view that the most effective methods in teaching creativity are those that have paid attention to both cognitive and affective domains to create motivation and provide opportunities for active learning. For instance, using creative arts (such as theater) has been effective in teaching creative thinking to children.

On the basis of the advanced theory of creativity, proposed by Renzulli (1993), students should allocate some time to dealing with the ideal principles of learning. Learners, teachers, and the curriculum should pay attention to these principles.

Different individuals have different abilities, interests, and learning methods; in a desirable and appropriate learning situation, the learning method that is suitable for each student is taken into account. Renzulli suggested that teachers encourage the tendency towards creative activities through the interests of the students. The more and the stronger the interest, the more the creativity that the

students exhibit. Also, the curriculum should be planned in accordance with the individual abilities, interests, and learning methods of the students (p. 176).

Of the basic elements in the curriculum are the structure, content, and methodology of the subject matter. In the structure of a matter, the important item is not the set of information and facts, and the precise method of thinking about the information should be considered. Many people know many things in a particular field, but do not know the correct way of thinking about the matter. Regarding the content of a matter, there are two issues to be considered: first, which items a curriculum or course should include, and second, what is the appropriate level of complexity of the content (Hosseini, 2002, p. 104).

Renzulli (1993) also emphasizes the role of teachers as the consultant and model in creativity growth. Teachers should have mastery in their field, and be familiar with different teaching methods, and take advantage of them. Moreover, the teachers' motivation and their interest in their job have a critical effect on desirable learning.

In the school enrichment model (SEM), Renzulli and Reis (1985) promoted creativity in schools. The followings are the objectives of SEM:

- 1- Prompting and improving creativity in gifted students.
- 2- Improving the quality and range of the enrichment program for all students.
- 3- Providing regular educational programs, and developing cooperation instead of competition among teachers and staffs participating SEM.

Renzulli and Reis (1985) reported that SEM also improved self-esteem and learning abilities of students. Renzulli revised and modified his SEM frequently. For instance, in a revision of his model, Renzulli (1994) stated that “all learning experiments should be provided for all students, such that each student can follow any path suitable for his/her individual abilities, interests, and learning. If we do not develop specific methods to achieve this ideal, our educational system will decline as a result of the view point of uniformly appropriate education is similar for all individuals” (p. 33).

Teacher creativity educational program:

To provide a creative atmosphere in the class and nurturing the abilities of their students, it is necessary for the teachers to be familiar with creativity and have a positive view toward it. Moreover, they should be acquainted with creative teaching skills and the strategies to develop creativity. Thus, they should receive an education on these items.

Mc Dunof and Mc Dunof (1987) stated that only a limited number of American faculties and universities held creativity teaching course. By expressing regret about these results, Fasko (2001) pointed out the universities such as the Central Creativity University of Northwood in Midland and Michigan , which paid attention to creativity in the recent decade. In these universities, it is suggested to provide a relaxed and peaceful setting, such that students feel that they are free to discover their creative talents. This survey leads to uncovering of creative experiments, expansion of curiosity, creativity and innovation.

In an experimental study, Blumen (2002) evaluated the influence of teachers' educational workshops on cognition creativity and educational progress of second year primary school gifted and ungifted students.

According to Pardo, factors associated with schools and teachers have the most significant effect on students' performance in developing countries. Bloom (1985) believes that the important role of teachers in expression of abilities has been proved. But the teachers do not know the individual eligible for education of gifted students.

The studies carried out by Blumen (2002) demonstrated that trained teachers have an important effect on creativity performance, education progress, and the cognitive growth of students, both in gifted and ungifted students. Considering these results, he suggested continuous and regular training for teachers, particularly for those in developing countries.

Creativity education program in Iran :

Considering the key role of teachers in nurturing students' creativity, the author (2002,1998) established creativity education program for teachers. During the program, the teachers trained 70 hours. First, they got familiar with the nature and essential concepts of creativity in a 15-hour educational workshop, and then they learned methods of creativity education in a 25-hour course, and applied the methods in their classrooms. The creativity growth model which was established on the basis of creativity theories in 1999 by the researcher, was thought

in a 30-hour educational workshop, and the efficiency of the model in increasing the skills of creative teaching was tested.

This study evaluated the effect of creativity education program on knowledge, attitude and skills of teachers. The paper only addresses the effect of the creativity education program in general, and creativity growth model in particular, on the teachers' training skills. However, it is necessary to explain the creativity growth model in classrooms.

Creativity growth model:

Teacher performance can be evaluated from different points of view. Herein, we discuss five essential aspects of teacher performance:

- Contextual-social,
- Affective- cognitive,
- Mental,
- Educational, and
- Physical aspects.

The social structure of classes has a deep effect on learning process. Having the security feeling is the primary condition for a creative classroom, since students should be able to ask any question and participate in discussions without being worried. The mutual respect of teacher and student result in improvement of self-confidence in students. Moreover, as was mentioned above, a fundamental characteristic of creative individuals is that they are highly self-confident.

Amabile (1983) considers evaluation and completion as killers of creativity. Although the essence of evaluation cannot be denied, it is sometimes essential to give students some tasks without evaluating them. In such case, self-evaluation by students can be employed.

Furthermore, if the evaluation is qualitative, and its goal is to make the student aware of what he/she has done, its negative effects are reduced.

Competition will result in the feeling of humility in students. Hence, it is necessary to take advantage of intra-individual completion; i.e., the competition of each individual with him/herself, instead of inter-individual competition.

The existence of freedom of thought, speech and, movement are necessary to provide a creative classroom.

The affective-cognitive structure: Researchers consider the existence of affective-cognitive backgrounds essential for creativity growth (Williams, 1970; Torrance, 1990; Strenberg and Williams, 1997).

Curiosity, involving ambiguity and dreams, and ability to take risk are the most important factors in a creativity-making affective-cognitive structure. Providing the opportunity for observation, testing, and searching the surrounding environment, and experiment is essential. By sensitizing students to different scientific and social problems, a competent teacher can play a crucial role in this concern. Rational risk taking is accompanied by test and consideration of new and unusual methods. Additionally, involving complexity and enjoying this complexity is important in creativity growth of children. As was mentioned in the previous section, dreams can also play an important role in training.

Although the appropriate mental structure for creativity growth is not only considering the divergent thinking, considering the shortcomings in divergent thinking it is necessary to prompting this ability. If teachers value unusual ideas, they can promote their students' innovation ability. Many innovations and inventions have begun an unusual and strange question. Therefore, should encourage the unusual and seemingly irrational questions and responses of students.

Besides, if students are asked to focus on different aspects of a problem, the possibility of finding numerous different questions is increased. The quality of questions proposed by teacher has a determining effect in this regard and can

lead to higher flexibility in students. By enhancing the quantity besides the quality, a teacher can increase the students' flexibility (Hosseini, 2002, p. 131).

The physical structure has also an important role in stimulating the students' creativity ability. Taking advantage of visual stimulants appropriate to the educational topics, making use of puppet play, ... can provide a suitable structure for creative activity of students and teachers.

Educational-teaching structure: It is one of the most important aspects of teacher performance. By making use of creative methods and strategies of education, a competent teacher can creatively teach even inappropriate contents, and provide a creative space in the classroom.

After getting familiar with the different aspects that can be effective in maintaining a creative atmosphere in classrooms, and active and creative education, different examples in various courses are provided in terms of different aspects and structures. In the final section, some examples will be provided.

Objective of the study:

Evaluating the effect of creativity education program (creativity growth model) in providing the skills of creative teaching was one of the main objectives of the study.

Education skill: Education is defined as the interaction between the teacher and student in order to learn and behavioral change. The skills of creative teaching were the skills which provide the opportunity required for students' creativity education. The skills were then evaluated using a questionnaire).

Research hypothesis:

Creativity education program will lead to an increase in creative teaching skills of teachers.

Samples and study population:

Study population was all teachers of primary school, in the 19 education regions of Tehran . 120 teachers were randomly selected from regions 2, 6, 9, 13, and 16, out of which 60 teachers were randomly assigned to experiment group and 60 to the control group.

Data collection tool:

The questionnaire to evaluate the skills contained 35 items, and was designed according to a 5-point Likert scale. The reliability of the questionnaire was determined to be 87% according to internal consistency of Cronbach alpha test. Moreover, considering the good theoretical basis and consensus of specialist, the face and content validity of the questionnaire was confirmed.

Methodology:

Both experiment and control groups filled the questionnaires. Afterwards, the experiment group participants attended a 70-hour educational course in one month. Then, after acquisition of skills, the experiment group members put the skills into practice, and in the next session reported their performance, and received feedbacks.

Subsequently, the two groups were given the final test to reveal the effect of creativity education program on teachers' skills.

Data analysis:

To test the research hypothesis, T-test was used for independent groups.

The following table demonstrates the results of independent T-test between the experiment and control groups in terms of skill.

Table 1: Mean comparison of skill test of experiment and control groups.

Test	Group	Mean	Sum	S.D.	T value
Before the course	Experiment	59.62	60	10.65	0.11
	Control	60	61	14.2	
After the	Experiment	68.64	60	10.57	

course	Experiment	68.64	60	10.57	2.53
	Control	60.62	61	14.1	

$$T = 2.65$$

Table 2 provides the results of independent T-test between the experiment and control groups in terms of skill. Concerning the results at the d.f.=119 and the confidence interval=99%, the T-value determined to be 2.65, which is greater than the T-value of the statistical table (T=2.33). Therefore, the experiment and control groups are not significantly different in terms of skill. As can be observed in this table, the T-value obtained before the course (T=0.11) was smaller than the T-value of the statistical table, which implies that the two groups were not significantly different before the test. However, in the post-test, the obtained T-value (T=2.53) was greater than the T-value of the statistical table, indicative of a significant difference.

Table 2: Did the educational course increase your teaching skills?

Statistical index	Extremely	Quite a bite	Moderately	Slightly	Rarely	Total
Frequency	53	7	0	0	0	0
Percentage	88.3	11.7	0	0	0	0

Discussion and conclusion:

As it was shown, the educational program and creativity growth model (Hosseini, 1998) increased the skills of creative teaching in teachers.

One reason for the success of the model was considering the different effective elements in education and teaching. Considering the affective, cognitive, social, and physical aspects of the classroom besides the mental aspects provide a suitable opportunity for teachers to be able to employ creative teaching methods more appropriately.

Responding an open-ended question on the effect of the model on their teaching skills, they considered that after getting familiar with this model, they promoted a creative atmosphere in their classrooms. This resulted in the

participation of students in classes and the class activities with a higher motivation, such that students preferred to stay in their classroom even in the break time, and continue their activities.

All teachers stated that by attending the course, their classes moved away from teacher-centered classes toward the classes on the basis of learners' activities, and this made students very enthusiastic."

"By passing the course, my class was completely moved away from teacher-centered class, and students take control of the class. The class became such sincere and highly motivated that students did not pay attention to the break time..."

"Learning lessons by creative performance was very joyful for all students, even for slow-witted ones. Employing this method, all were very interested in learning, and participate in lessons and discussions."

"This course created a new view point toward the way of teaching ... a vivid and enthusiastic relationship is created between teacher and student, such that students are thirsty for finding the answers."

Teachers state that:

I find the students thirsty for finding the answers.

My classroom is full of motivation.

Now, I am trying to employ more innovation in teaching lessons.

The students do not care for the break time anymore.

Parents of students explain that their children are got better toward the nature and their surroundings.

Bashful and stuttering students became active in class, and they can explain what they want.

The things I learned from the students are two times of the things they learned from me in previous years.

This method evolved the children and introduced me as a successful teacher.

Now, the students are able to imagine and create what I say.

In general, from the teachers' point of view, the effects of this course were as follows:

a) Teacher

- Moving away from the frameworks and clichés.
- Moving away from teacher-centered classes.
- Enjoyability of teaching for teachers.
- Changing the attitude toward teaching and managing the classroom.
- Using qualitative evaluation methods.
- Increasing the power of thought and innovation.
- Employing various heuristic methods.
- Providing psychic security in classrooms, such that students can ask any questions.
- Creation of a deep respect and emotional relationship with the students.
- Elimination of competition, and not comparing the students with each other.

b) Students:

- Thinking beyond the class hours.
- Enjoying the class hours.
- Students' activity.
- Proposing various answers.
- Increased self-confidence.
- Sincere cooperation among students.
- Deeper learning of lessons.
- Better social relationship.

- Improving the imagination and creation abilities.

Abstract

The goal of medical education is to assist students to become knowledgeable, responsible physicians for clinical work and research. Therefore, better understanding about the ways in which students learn is vital. LeMEx project aims to investigate the learning of medical students and to develop medical teaching and teaching methods so that they satisfy the needs of the students and their future patients.

Research problems: What kind of a study orientation do students have? How does medical knowledge become organized into wholes? How does the thinking of students develop? How can the learning follow-up data be used for continuous quality assessment in medical education?

The study cohort (N = 343) consists of students who began their education in the fall 2006 at the medical faculties of the Universities of Oulu and Turku in Finland. The same cohort of students is followed up over the period of their studies and the progress is tracked by conducting annual evaluations.

Methods: IGSO-measurement is used to investigate the study orientation of students. A concept map is used to investigate the student's ability to organize knowledge into wholes. A case assessment is used to investigate the ability to apply medical knowledge and skills to practice, and to comply with professional ethics and enacted regulations in patient encounters.

This study provides longitudinal scientific knowledge about the development of students' learning outcomes and it has relevance when developing learning-based quality assessment methods. It serves also as an example of a research based evaluation process and it gives globally applicable tools for researchers.

1. Introduction

LeMEx is a research project aiming to investigate the learning of medical students during the medical education, and to develop medical teaching methods. LeMEx is a longitudinal follow-up study and its sample consists of students who began their education in the fall of 2006 at the medical faculties of the Universities of Oulu and Turku in Finland. Research groups of the study are multidisciplinary where medical and educational expertise meet.

1.1 Background

Every year in Finland a growing number of students begin their studies in medicine. Between 1997 and 2005, the number of study positions increased by 70% [1]. This reality has forced universities to pay more attention to the content and quality of medical education. The increasing student group-size and the growing need to renew teaching methods are challenges for the development of medical education. The renewal of basic studies has also been at the forefront of discussions in medical faculties. As a result, the number of optional studies has increased [2] and further emphasis has been placed on learner perspective, early patient contact, communicative skills and multi-professional co-operation. The continuous growth of medical knowledge sets great challenges for education. Over the last few years, integrated and interactive forms of teaching have partly replaced the previously predominant teaching mode of discipline-specific lectures.

1.2 State of medical education research

During the last decade medical education research community has debated strongly about the role of research in the field [3], [4]. Although medical education research has experienced tremendous growth [3], most studies are still small and carried out within a single medical school [5]. Other significant problem is that the research is mainly based on the biomedical tradition where the goal is often to prove that for instance a drug is effective [6]. Therefore many researchers are not familiar with existing theories, and that can restricts their analysis to a descriptive level. It is common that methods are taken from clinical research into the domain of social sciences, without questioning the impact. [3]

It is noteworthy that typically clear minority of papers published in the journals of medical education have any theory basis. Even if theories have been used they can be seen as justification for an approach, not as assumption to be proved or disproved by experiment. Therefore theories remain inert and no growth of knowledge occurs. [7]

In medical education research the top four areas of interest have been curriculum and teaching related issues, skills and attitude relevant to the professionalism, individual characteristics of medical students, and the evaluation of students [4]. As highlighted in all notable medical education journals there is a need for change. Research should help to determine how or why things work educationally rather than simply aiming to prove that they work. It has frequently been pointed out that the most effective ways to improve medical education research are multiprofessionalism, co-operation between multiple institution and adding variety to the perspectives on research [3], [6]. At the same time there is a need for high quality research that can exploit and promote relevant educational theory, and improve patient care [8]. In addition no longitudinal research information exists about the development of the students' thought processes

and knowledge during medical studies. Nor are there any tools applicable to the follow-up study of Finnish medical education.

1.3 Challenges of medical education

The purpose of medical education is to assist students in becoming responsible medical professionals and researchers. A high standard of learning during basic education is a prerequisite for the development of expertise and a sense of professional responsibility. Instruction in the field of medicine is especially challenging, because medical knowledge is renewing itself rapidly and the students may find the amount of the knowledge included in the degree programme overwhelming [9]. Several studies have pointed out that, owing to the complexity of medical knowledge, misunderstanding and misconception of the taught content are not infrequent among medical students [10], [11]. Some of the misconceptions may even endanger patients.

Ideally, the study orientation of medical students should be directed towards insightful learning and enhancement of the depth of knowledge and understanding throughout their studies. Internalized knowledge accumulates into knowledge structures, increases as studies proceeded, and is not promptly forgotten after exams and courses. It is applicable and lays a foundation for flexible and creative expertise [12]. Moreover, in-depth learning enhances student motivation and the development of a sense of control [13]. Internalized knowledge also manifests itself, as studies progress, in the development of the student's medical thinking and ability to make clinical inferences.

The demand for depth in medical education sets challenges for curriculum planning and the choice of teaching methods and modes of student work. Problem-based and evidence-based teaching methods over the past ten years have provided the tools for deep learning. Moreover, there is a growing tendency to use the concept mapping method [14] to support insightful learning [15-17]. Concept maps have also been used with success in the evaluation of medical learning. [18-20] Ideally, the development of medical education should be based on contextual research data about the processes of medical learning [21]. From the basic education development point of view, it is crucial to inquire into the quality of the learning processes and the accumulation of insightful knowledge when studies proceed. Such follow-up inquiries should be conducted not only in connection with exams, but also every term or academic year to obtain an overview of the situation. To accomplish this, relevant tools are needed.

The theoretical framework to be applied to medical education must draw more effectively on the biopsychosocial approach, which advocates a holistic view of the individual and consequently required from physicians, good interactive skills and ability for holistic thinking. More attention must be paid in medical education to the teaching of all above skills.

2. Aims of the study

The purpose of this study is to investigate the development of professional competences, thought processes and accumulation of medical knowledge during the education and to develop teaching methods so that they satisfy the needs of both the students and their future patients. Furthermore, we want to inspect medical students' study orientations in order to find out the methods of supporting the students in the insightful learning process.

Research problems:

1. What competences do medical students possess and in what stage of education these competences develop?
 - How does medical knowledge become organized in wholes during the course of medical education?
 - How do the student's medical thinking develop in the course of the studies?
 - How do the students see, at different stages of their education, their role and duties in the doctor-patient relationship?

2. What are the study orientations like and how do they develop during undergraduate studies?
 - What is the study orientation of medical students like at different stages of medical education?
 - What does the study orientation tell about a progress of the studies at different stages of medical education?
 - What is the meaning of the socio-cultural background on their study orientation?
 - What kind of support the students need during their education and in what way they can be answered?

3. How can the collected data be used as a tool for continuous quality assessment in medical education?

3. Subjects and methods

The need for longitudinal learning outcome follow-up studies is generally acknowledged, but such studies are difficult to accomplish [22]. LeMEx pilot study was conducted in 2005. The longitudinal study design was adopted for the current main study, which began in 2006.

3.1. Subjects

The study sample consists of students who began their education in the fall 2006 at the medical faculties of the Universities of Oulu and Turku in Finland. At the University of Oulu, 125 students began their studies in the degree programme for the Licentiate in Medicine degree, while 47 students began in the Licentiate in Dentistry degree programme. At the University of Turku, the figures were 125 and 23. In addition, 23 students in Turku began studies to be retrained from nurses to physicians. The total number of the study population was 343.

3.2. Methods

Student progress is tracked by conducting annual evaluations. An initial evaluation of the relevant aspects of the medical students' learning processes was performed in the first week of their studies.

Aim 1) What competences do medical students possess and in what stage of education these competences develop?

- The method consists of applied projective techniques [23]. Sample patient cases are used to investigate the students' ability to draw on organized bodies of knowledge, to apply medical knowledge and skills to practice, and to comply with professional ethics and enacted regulations in patient encounters. A case assignment is performed in the fall term of the first year of study and at the end of each academic year. The content of the assignments is modified for the various stages of the evaluation process according to a plan.
- A concept map is used to investigate the student's ability to organize medical knowledge into wholes at different stages of medical education. A concept map assignment is performed in the fall term of the first year of study and at the end of each academic year. The content of the assignments is modified for the various stages of the evaluation process according to a plan.
- Medical students will name five characteristics that best describe the characteristics of a good physician. Assignment is performed in the fall term of the first year of study and at the end of each academic year.

Aim 2) What are the study orientations like and how do they develop during undergraduate studies?

- The IGSO (Inventory of General Study Orientation) instrument is used to measure the study orientation of medical students. An awareness of the student's study orientation at different stages of education enables a better understanding about the studying process and emergent problems [24]. IGSO measurement is conducted in the spring term of the first, third and sixth year of study.

3.3. Data processing and analysis

Both qualitative and quantitative methods are applied to the processing and analysis of the research data. For the processing of the study orientation inventory data, explorative factor analysis (primary component analysis, rotation; Varimax normalized) are used. Concept map data is processed through qualitative phenomenographical analysis. Patient cases and characteristics of a good physician are inspected with content analyses method.

4. Expected results and the significance of the study

In the report "Oppimisen ohjaaminen yliopisto-opetuksessa" (Guiding Learning in University Education), is pointed out that "for the university to be able to perform its basic task, a seamless integration of research, teaching, and studying is needed. The primary criterion for successful planning, implementation and evaluation of teaching are the students' learning and the development of their scientific thought processes." [25] In LeMEx study an attempt is made to apply the above principle. This study is a rare process, in which the learning and development of the same students are followed up at regular intervals from the beginning of the studies until graduation. At the same time, the study is part of the regular teaching development process and will produce a wealth of knowledge about the development of medical competences in long-term

education. In addition the data attained from this study has relevance when developing learning-based quality assessment methods.

5. Research group

LeMEx research group is multidisciplinary and consists of researchers from the fields of medicine, education, computer science and nursing science.

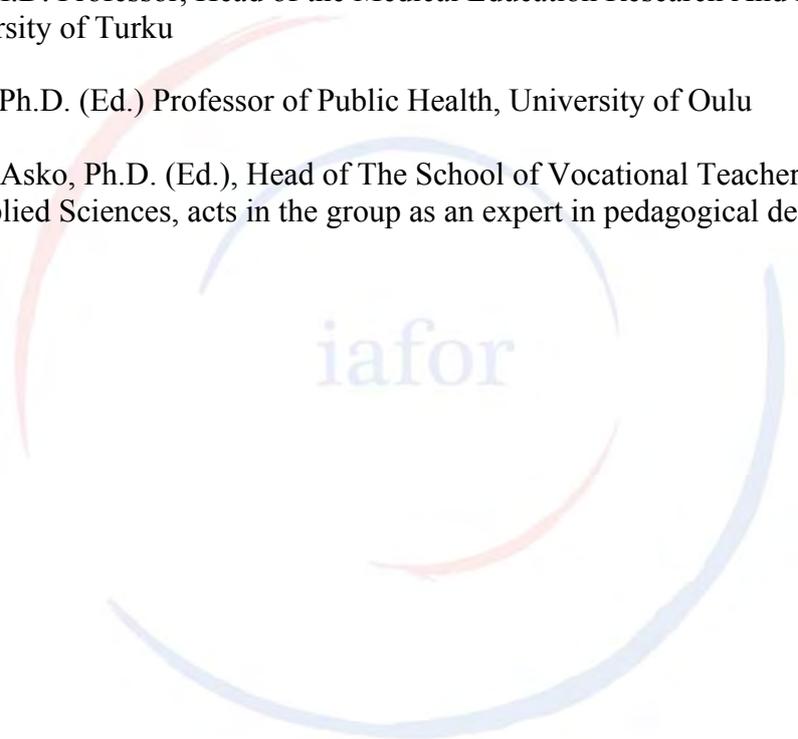

Research group leaders:

VAINIO Olli, M.D. Professor, Dean of Medical Education at the Faculty of Medicine, University of Oulu

KÄÄPÄ Pekka, M.D. Professor, Head of the Medical Education Research And Development Unit of the University of Turku

TAANILA Anja, Ph.D. (Ed.) Professor of Public Health, University of Oulu

KARJALAINEN Asko, Ph.D. (Ed.), Head of The School of Vocational Teacher Education, Oulu University of Applied Sciences, acts in the group as an expert in pedagogical development and research

The Role of Aesthetic Congruity on Visual Design Education in Hong Kong

Derry Law

The Institute of Textiles and Clothing, The Hong Kong Polytechnic University

Abstract

Visual design is defined as the development of a relationship between visual forms and the receiving individuals. It is challenging to educate students on ways to determine the appropriate combination of non-verbal forms of presentation, such as color, proportion, and design principles which are able to elicit an intended response from the targeted audience. Therefore, it is important to train students to have visual sensitivity and educate them to ensure that they understand and recognize the necessity of structural (physical form) and communicative requirements (symbolic meanings) in designing visual presentations. However, the degree of aesthetic congruity in students can influence the level of understanding and creativity in the development of visual displays. Through the grounded theory method and practice activities that involved visual displays, 130 Hong Kong university students who were enrolled in a fashion visual communication course were observed with particular attention on their aesthetic congruity and development of visual display designs. The result shows that both design and non-design major students have a high level of tendency to look for design elements with high aesthetic congruity to create visual displays that makes their ideas look similar to each other. To enhance the visual sensitivity of these students and lessen the impacts of their aesthetic congruity, a new practical approach was developed. By assigning students with situations that are unrelated to the display theme, it is found that the impacts of aesthetic congruity are lessened when they create a visual design to attract different consumer segments through fashion preferences, brand identity, market positioning, and mood. In addition, the aesthetic cognitive knowledge of the students has also been widened. This research contributes new insights to design education by taking into consideration, students who have a strong sense of aesthetic congruity and strong perceptions towards the symbolic values of design elements.

Research Background

Design Education

Stimulating student creativity in design related subjects is always a challenge. It is argued that to inspire a number of new ideas and possibilities for a problem, brainstorming is highly recommended (Aleinkov, 2002). However, the method has been criticized in that new ideas may be generated, but the best idea will still be unknown (Fogg, 2003). Corepley (2001) suggested that a hierarchical technique can point out the attributes of a problem and generate many new solutions at the same time. However, the number of ideas depends on individual aesthetic perception and the impact of his/her surrounding environment (Dewey, 1929). West (1991) suggested that the best way to generate, select and organize new ideas is through visualization. Thus, mind-mapping is commonly adopted to capture and organize concepts, by linking different ideas together and presenting them on a map (Buzan, 2000, Rittuel, 1984). Apart from determining the best ideas through organizing them in a systematic manner, Bulter and Kline (1998) suggested that stimulation of student creativity can be realized through the association of different aspects towards a problem. The construction of a new idea through relating unrelated aspects helps to come up with unexpected options. It also stimulates creativity through divergent thinking (Cave, 1997). Gordon (1961) also shared similar thoughts in unrelated association with reference to an analogical thinking process to create new ideas. However, the success of the method relies on the ability of the creator to link and explore existing and previous components, and how they are put forth into a new direction (Dewey, 1958). Even though there are various creative-thinking methods, the critical factor of generating a creative idea lies in the creator himself/ herself. The challenge to maximizing creativity is to change the habitual thinking paradigm (Boden, 1993) and understanding the emotional drive that creates exciting intuitions in the mind (Osborn, 1948).

Aesthetic Congruity

Human beings respond differently towards the cognitive understanding of design elements (e.g. line, proportion, color, etc.). The different response is controlled by the internal processing algorithm of perceived aesthetics of different cultural groups (Veryzer, 1993; 1999) towards the understandings of the elements. Lauer (1979) proposed that the elements include various design principles. He argued that design preferences are learned from daily life and not innate. Also, there is a direct affiliation between design preference and aesthetic congruity. People tend to prefer design elements that are congruent to his/her aesthetic algorithm and therefore, unconsciously use it to judge design (Veryzer, 1999). However, the perceived symbolic meanings behind an object itself also intensify the process, evoking either positive or negative responses that determine the final response to the object (Bloch, 1995). Of course, the response of humans to aesthetics is not absolute; it is subject to change when one interacts with different aspects in life (Kreuzhauer & Malter, 2005). The affective responses generated by environmental stimuli can further affect cognitive judgment towards the aesthetic elements of an object (Eagley & Chaiken, 1993).

Chinese Perception on Aesthetics

Creativity is not associated with individuality in Chinese society; it has to cater to societal expectations (Rudowicz and Yue, 2002). It is very important to consider social harmony

by paying attention to general aesthetic preferences when creating something new among the Chinese (Dunn, Zhang and Ripple, 1988). However, it is also necessary to be innovative at the same time (Rudowicz and Yue, 2002). Both views are important to the Chinese, making the creative process different from the West which emphasizes on individual expression. For instance, Fan (2000) determined that there is uniqueness in terms of the interpretations of the symbolic content of design elements. Social perceptions and creative traits affect the evaluation of creative work (Csikszentmihalyi, 1988; Yang and Wang, 1999). Also, the uniqueness of aesthetic preferences is highly associated with the perceived symbolic messages of the applied design elements (Li, 1994). These preferences provide a sense of vagueness in standards. Liu (2006) suggested that the Chinese conceptualize human life as a free state whereas the West takes on a cognitive-rational spirit in interpreting beauty.

The literature states that Chinese people not only focus on individual expression, but also the degree of expected social acceptance towards the design elements during the creative process. Thus, they may rank aesthetic congruity as an important factor while selecting a combination of aesthetic elements for creative work. However, this has not been thoroughly studied in research on design related education. Thus, this study aims to study how aesthetic congruity influences the creative process by applying unrelated aspects to stimulate the analogical thinking of students. It is anticipated that the findings will contribute to the current knowledge in design related education.

Methodology

In order to investigate the impact of aesthetic congruity on the level of creativity, the grounded theory method (Strauss and Corbin, 1990) was selected and experiments were carried out. Subjects were divided into groups and instructed to complete two visual display assignments, based on the same theme to generate visual data for assessing aesthetic congruity. A combination of design elements (e.g. color, design principles, apparel styles) were compared between the different types of work. To investigate and understand the rationale behind the selection of the design elements and their symbolic interaction with the students, focus groups were established. In this study, 130 students from the Hong Kong Polytechnic University enrolled in *Fashion Visual Merchandising* were invited to participate as a course credit. In order to evaluate the impacts of aesthetic congruity on creativity, students were instructed to set up two window displays. For the first task, all of them were asked to develop a window display with a certain type of product. The students then participated in a discussion at the first focus group to share creative concepts and the rationale behind the selection of the design elements after completion of the task. After three months, the same student groups were required to set up a second window display with a specific theme – “casual wear for college students”. In the second task, unrelated aspects (Boden, 1993; Dewey, 1958; Osborn, 1969) were applied in setting the project brief. Apart from instructing the students to work on the casual wear window display, they were to go on a picnic with an assigned route. The students had to visit the assigned checkpoints and observe the details in the surrounding environment from the viewpoint of design elements. Photos were taken during the trip and all the design concepts were required to be linked with the selected design elements,

such as color scheme; display layout; form of the props; mannequin selection; set design; and fashion styling direction. Students had to explain the rationale behind the design element combination in the second display during the follow-up focus group. There is diversity in the aesthetic backgrounds among the participants, who range from fashion design, retailing to marketing majors. The differences made the findings comparable and all-rounded. Qualitative data were analyzed in accordance to the research process indicated by the grounded theory, including three phrases of coding: open, axial and selective (Corbin and Strauss, 1990; Strauss, 1987; Strauss and Corbin, 1990). The findings were categorized in an open-coding procedure; different codes were generated and relationships were formed to facilitate further data collection. Additional data collection was implemented in axial coding to obtain information with regards to the relationships previously formed. For the axial and selective coding, theoretical sampling was done in which the participants were selected based on the emerged concepts in previous coding. (McDaniel and Gates, 1998). Finally, the central concepts were developed from selective coding to wrap up the research.

Findings and discussion

A grounded theory analysis of the narratives from the ten focus groups among the 130 participating Hong Kong university students generated findings in two key areas in the selective coding stage. These two areas are the standardization of aesthetic form and the enrichment of aesthetic perception, respectively

The standardization of aesthetic form

Students were asked to set up a window display for a fashion store by applying design and color principles during a hands-on lesson. Focus groups followed to collect the rationale behind the choice of design element combinations. The findings showed that there are standard aesthetic patterns that govern the selections. These patterns can be divided into two areas, namely, 1) contextual bounded aesthetics, and 2) form perception. For contextual bounded aesthetics, it was found that the need to perfectly match an occasion was very high in terms of the symbolic message of the props, color and design principles. Figs.1 and 2 are fashion displays for lingerie and children wear, respectively. They give a feeling of elegance and being high-end. The students tended to select materials and colors that exhibit lavishness, such as burgundy velvet, vintage wooden colored furniture, and a floral picture with a white female human form mannequin for the lingerie display. For the children's wear display, burgundy satin, paired with wine glasses and a glossy black backdrop were selected to present an elegant image. The students claimed that the selected materials were congruent to the requirements for the selected mood, and precisely matched the mood. Although the students were instructed to develop a creative display under a predetermined mood; that is, elegance, it was found that the students adhered to social interpretations of elegance and therefore, made the final decision based on general expectations. In terms of form perception, the adoption of vintage wooden furniture (lingerie display), and wine glasses (children's wear display) implies that subjects had a specific perception of elegance, which also governed the choice of props to a certain extent. Furthermore, it was found that the degree of creativity in the students was also governed by the perceived social response. This served as the standard or the marking scheme for their creative work. It was found that the students

greatly intended to meet perceived social standards due to the high expectations of “group face”. If the students went too far and came up with ideas that deviated from the perceived standards, they may be afraid that they might be criticized by the instructor or other classmates. The criticism will give them a feeling of “losing face” in public which is not desirable for Chinese people. Therefore, they tend to choose design elements and color schemes that are congruent to general expectations. Consequently, their creativity was suppressed.

Fig.1 Fashion display 1 (stage one)

Fig.2 Fashion display 2 (stage one)

Enrichment of aesthetic perception

The same groups of students were told to complete another window display at the end of the course. Unrelated aspects were integrated into the project, in which they were required to visit an assigned location, take pictures at the checkpoints and apply them to the final display. A theme was given to all of the students, which was to complete a display that sells casual wear for young college students. Figs. 3 and 4 are the final products. It is found that there is a significant difference from the first round of displays. For Fig. 3, the students were assigned to a location that has a beautiful seaside. For Fig. 4, the students were assigned to a location with many Chinese temples. The resulting work revealed that the students deviated from the general perceived image of a college student. Also, no campus-inspired props and backdrop, colorful or dynamic graphics were included in the display. The data collected from the field trip were transformed and adjusted in order to integrate with a casual and youthful feeling. It was indicated from the focus group that there is a difference in the cognitive understanding of the assigned location when unrelated aspects were used. As they were forced to integrate ideas from the assigned locations, the focus on matching contextual aesthetics was lessened and

shifted to the transformation and integration of ideas from the trip to match the college casual wear theme. Therefore, the semiotics and perception of the “right” design element combination for casual wear became less important. The aesthetic perception of the students was also enriched when they took the elements of the visited site into consideration for the youthful casual wear display. The shift of focus even allows the students to pay close attention to minor details on the trip and turn them into a core concept in the display. As a result, the students are not focused on the degree of aesthetic congruity and the expansion of ideas from the trip dominated the creative process of the window display.

Fig.3 Fashion display 3 (stage two)

Fig.4 Fashion display 4 (stage two)

Conclusion

Aesthetic congruity plays an important role among highly conformed groups such as the Chinese during the creative process. By applying unrelated aspects, the focus on fulfilling perceived aesthetic standards can be diverted. Unrelated materials taken from different surroundings have enriched the individual aesthetic perception of the students involved in this study, which helps to stimulate other possible views in the design process. Consequently, this leads to an improvement in creativity.

Abstract

The first objective of this study was to present a conceptual framework based on technology acceptance model (TAM) to examine the students' acceptance of wireless internet incorporating two intrinsic motivation attributes, namely, computer self-efficacy and satisfaction. The second purpose of the study was to measure and validate the interrelationships among three exogenous constructs of the model – perceived ease of use, perceived usefulness and computer self-efficacy. A total of 285 students from five faculties (Education, Human Science, Economics and Management Sciences, Engineering and ICT) in the International Islamic University Malaysia (IIUM) were randomly selected using quota sampling technique. In this study, it was postulated that the Wireless Internet's perceived ease of use and perceived usefulness, in addition to students' computer self-efficacy, would positively influence students' satisfaction to accept it. Instrument reliability and validity were performed by Rasch analysis using Winsteps version 3.49. The results of the study were analyzed by Structural Equation Modeling (SEM) using AMOS version 18.0. The study revealed that while both perceived ease of use and usefulness exerted a direct positive influence on satisfaction, computer self-efficacy indicated an adverse influence on it. The results also demonstrated significant positive interrelationships among the three exogenous constructs of the proposed framework.

Introduction

Since the development of the concept of the Internet in 1968, when the US Department of Defense connected four sites via a computer link, its use has increased by leaps and bounds from an estimated three million in 1990 to approximately 50 million in 1998 (Garland *et al.*, 1998) to 800 million in September 2004 (Internet World Stats, 2004). According to Dinev & Koufteros (2003), it has got widespread use in economic and social arena and brought forth immense benefits to the users as evidenced in job productivity, information access, and technology updates, as well a surfeit of social networks. Now getting increasingly used for educational purposes, it has had significant impact on learning both at school and at home ((Jonasson, 1997; Hamer, 2001) involving learners using technology to learn (Forsyth, 1999), thereby changing the very nature of society (Agarwal, 2000).

According to Roblyer (2006), educational technology comprises a combination of the processes and tools involved in addressing educational needs and problems with an emphasis on applying the most current tools such as computers and other electronic technologies. This was echoed by Baek, Jung, and Kim (2006), who argue that emerging educational technology would usher in one of the most exciting areas of change in education; some of these emerging trends will be manifested in wireless connectivity, merged technologies, handheld devices, artificial intelligence, virtual systems (Roblyer, 2006). Integration of these emerging trends into conventional learning environments, according to Kingsley (2007), may improve learning, facilitate problem solving and stimulate creativity. This will also help the educational institutions address many of the barriers encountered by those willing to pursue higher education (Duhaney, 2005).

There are three main categories of technology usage in educational environments: (a) instructional, (b) productivity, and (c) administrative (Roblyer, 2006). Many of the emerging educational technology tools address functional areas such as drill and practice, tutorial, simulation, instructional games and problem solving. The research conducted by Woods, Baker, and Hopper (2004) suggests that instructors primarily use the online learning system (OLS) as a non-interactive course management and administrative tool to transfer information. Of late, the usage of emerging educational technology, according to Bernard *et al.*, (2004), embraces an increased application of collaborative learning. And, Debevec *et al.*, (2006) opine that the practice of such technology has increased to a great extent in visual presentation, simulation, accessing course materials and World Wide Web resources.

Wireless Internet in IIUM Context

In a survey conducted in different universities in Australia, Oliver and Towers (2000) observed that according to students, about 80% of their university teachers used technology in regular ways as part of the teaching and learning program. In Malaysia, the implementation of technology in teaching and learning activity has attracted great interest from the practitioners in the higher education institution (HEI), which have started to adopt and implement information and communication technology (ICT) solutions as a source for flexible teaching and learning process (Azizan, 2010). This helps students surf the internet and get its access through their laptops, personal computers, mobile phone and PDA. In line with this technological development, International Islamic University Malaysia (IIUM) has also provided the infrastructure of wireless internet to its community, thereby helping the learners in getting access to their subject related materials and keeping up with the current information updates.

Despite the benefits that such increased technological options can provide, there are still many barriers to the successful integration and usage of emerging educational technology such as Wireless Internet within educational environments (Roblyer, 2006; Wozney *et al.*, 2006). Though widely adopted, there are many aspects of the usage and implementation of this technology that need to be studied and empirically documented. While Wireless Internet access has been provided for quite some time now at IIUM, there are some barriers that need to be addressed for its smooth implementation. First among these relate to the connectivity for the infrastructure. The second factor is the speed of the internet, and the third is its accessibility, which of course varies according to the areas and individuals. Finally, the lack of adequate facilities for the adoption of the infrastructure is also considered for this study to determine its implementation and use as experienced by the students.

The broad objective of the study was to examine modeling of IIUM students' satisfaction in accepting wireless internet. It would further measure and validate the interrelationships among the three exogenous constructs of the model, namely, perceived ease of use, perceived usefulness and self-efficacy. For this purpose, technology acceptance model (TAM) was used as the theoretical framework; this model and the various constructs used in the study were described in the next section.

Technology Acceptance Model (TAM)

Extensive research has been conducted investigating the variables associated with technology acceptance in a wide variety of settings (Agarwal & Prasad, 1998; Dillon & Morris, 1996; Taylor & Todd, 1995b). As a result, several theoretical models have been developed to explain both users' intention to use technology, and actual technology use (Venkatesh *et al.*, 2003). The Technology Acceptance Model (TAM), proposed by Davis (1989), is one of the most profound frameworks frequently used to explain computer-usage behavior and constructs associated with acceptance of technology.

The model affirms that the adoption of a technology is determined by the user's intention to use, which in turn is influenced by his or her attitudes towards the technology. It is very likely that the variability in these attitudinal and behavioral constructs depends on the user's perceptions—perceived usefulness (PU) and perceived ease of use (PEU) (Ahmad *et al.*, 2010). While PU indicates the extent to which the use of the technology will improve his or her performance is promising to advance one's work, PEU represents the degree to which the technology seems to be free of effort (Davis *et al.*, 1989). This model postulates that behavioral intention mediates the effects of PU and PEU, the two constructs of extrinsic motivation as shown in Figure 1.

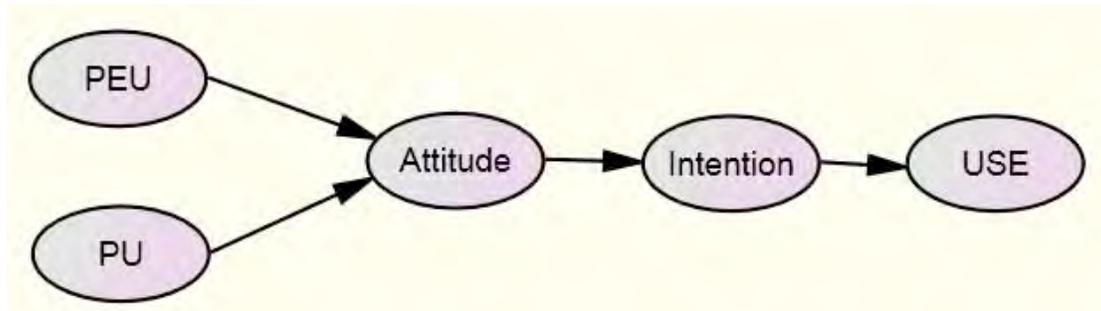

Figure 1: Constructs in the Technology Acceptance Model (TAM)

As TAM is reasonable, simple, and robust (Venkatesh & Davis, 2000), the study on TAM has been receiving continual interest from decision-makers, practitioners and researchers. While it has received extensive empirical support through validations and applications for its power to predict the use of information systems (Davis, 1993; Taylor & Todd, 1995b; Venkatesh & Morris, 2000), recent meta-analyses suggest that the understanding in this area could further be enhanced if several overriding issues are addressed (Ma & Liu, 2004; Schepers & Wetzels, 2007; Yousafzai *et al.*, 2007).

According to Thompson *et al.*, (2006), perceived usefulness and perceived ease of use are not the only valid factors related to technology acceptance, especially with newer technologies. There is the need for TAM to incorporate additional factors or integrate with other IT acceptance models for improvement of its specificity and explanatory utility (Agarwal & Prasad, 1998; Mathieson, 1991). Further research into the generalizability of factors associated with technology acceptance and refinement of acceptance models has been recommended (Sun & Zhang, 2006; Thompson *et al.*, 2006). Previous studies also recommended that Technology Acceptance Model (TAM) should be modified to comprise additional components required to explain more than 40 percent of technology acceptance and use (Legris *et al.*, 2003). Therefore, in this proposed hypothesized model as shown in Figure 2, two other intrinsic motivation attributes – satisfaction and self-efficacy – were incorporated into the original TAM.

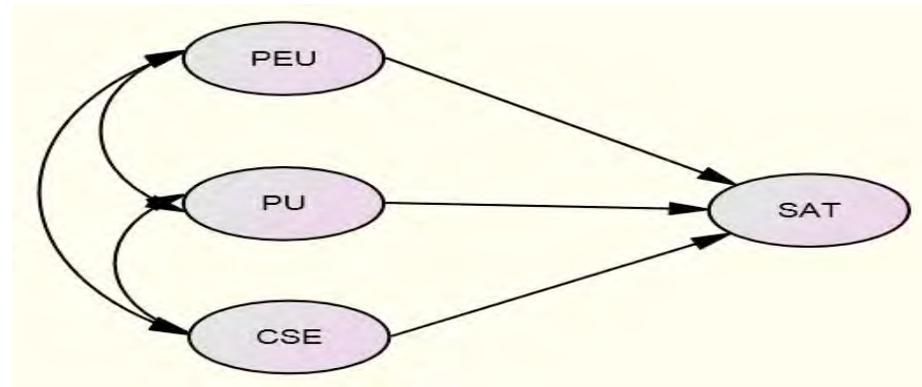

Figure 2: The Proposed Hypothesized Model of Wireless Internet

Perceived ease of use – Satisfaction

The significance of perceived ease of use in technology adoption is highly pronounced in the technology acceptance model (TAM) proposed by Davis *et al.*, (1989). Langeard *et al.*, (1981) observed that in choosing between available service delivery options, the customers deem the effort expended in utilizing service delivery to be essential, with the superior the service delivery, the greater the customer satisfaction (Churchill & Suprenant, 1982). In their respective studies, Szymanski & Hise (2000) and Dabholkar & Bagozzi (2002) considered convenience and ease of use to be important antecedents of e-satisfaction. In other related studies, Shamdasani *et al.*, (2008) regarded ease of use as one of the dimensions of service quality and explored its impact on consumer satisfaction in using self-service internet technologies. Along this line, Huang (2008) found the impact of e-consumers' perceived ease of use mediated by their behavioral attitude on their satisfaction statistically significant. As such, this study posits:

H1: Perceived ease of use exerts a direct influence on students' satisfaction in adopting wireless technology.

Perceived Usefulness – Satisfaction

In the extant literature, there have been a no. of studies done vis-à-vis the effect of perceived usefulness on consumer satisfaction (Anderson *et al.*, 1994). According to Huang (2008), perceived usefulness is observed to have an impact on consumer satisfaction mediated by their behavioral attitudes. Clemons and Woodruff (1992) stated that perceived value might directly translate into the formation of overall feelings of satisfaction. In their study, McDougall and Levesque (2000) corroborated this argument by noting that perceived value is a significant driver of customer satisfaction. It is thus hypothesized that:

H2: Perceived usefulness positively influences students' satisfaction in their acceptance of wireless technology.

Self-efficacy – Satisfaction

According to Bandura and Schunk (1981), self-efficacy is defined as one's judgments about how well one can perform various courses of actions in different prospective situations fraught with many unpredictable and stressful elements. This was echoed by Aiken (1993), who opined that self-efficacy stands for a person's expectation of his/her capability in learning or performing certain behaviors that will translate into desirable outcomes in a particular situation. In the learning process,

it conveys students' judgments about their cognitive capabilities to accomplish a specific academic task or particular goals (Schunk, 1991a). In the context of Internet use, it denotes to a user's belief in his/her capabilities to organize and execute courses of Internet actions required to produce given attainments. This, Eastin & LaRose (2000) asserts, is a determining factor in efforts to close the digital divide between the experienced Internet users and the novices.

Research confirms propositions that self-efficacy influences the choice as to whether or not to engage in a task, the effort made in performing it, and the level of persistence required in accomplishing it (Bandura, 1977; Bandura & Schunk, 1981; Delcourt & Kinzie, 1993). It influences how people feel, think, and behave (Bandura, 1986: 393). According to Ahmad *et al.*, (2010, p. 271), the inclusion of self-efficacy as an intrinsic motivation construct offers 'deeper and richer understanding of why and how the technology is used'. Self-efficacy beliefs have been extensively reported as a prime factor in gauging the success or the lack thereof in the usage of computers by individuals (Cassidy & Eachus, 2003).

In their study, Compeau & Higgins (1995) empirically tested a 10-item measure of computer self-efficacy (CSE) and found significant relationship between CSE and outcome expectations and use. In a further empirical validation of the CSE instrument developed in this study, Compeau *et al.*, (1999) reaffirmed the evidence that CSE influences an individual's behavioral orientations toward information systems (IS). According to a study performed among university students, Agarwal & Karahanna (2000) found CSE to be a key antecedent of perceived ease of use and was strongly influenced by an individual's ingenuity with IS. Along this line, Havelka's (2003) study perceived significant differences in CSE among students in different areas of academic discipline. In light of such findings, it is imperative on the part of the researchers to assess students' self-beliefs about their academic capabilities as well as the acknowledgement of this aspect as being instrumental to their motivation and academic achievement (Pajares, 2002).

From various prior studies performed on the relationship between CSE and behavioral intention to use or infusion (Wu *et al.*, 2008; Ahmad *et al.*, 2010) and the latter with individual satisfaction (Huang, 2008; Shamdasani *et al.*, 2008), it is inferred that there is a relationship between CSE and satisfaction through the mediating effect of an individual's behavioral intention. Against this backdrop, one purpose of the present study is to validate an extended technology acceptance model (TAME) by incorporating computer self-efficacy and satisfaction as two intrinsic motivation attributes in the proposed model. In so doing, the study examines the direct and indirect effects of computer self-efficacy on students' satisfaction in their acceptance of this wireless technology. It is thus hypothesized as:

H3: computer self-efficacy positively influences students' satisfaction in accepting wireless technology.

Methodology

The data for this study were obtained through a survey questionnaire administered on students of a comprehensive public university in Malaysia. A total of 285 students from five faculties (Education, Human Sciences, Engineering, ICT and Economics) were randomly selected using quota sampling technique with the students having laptops as well as wireless connection. Since all the students are from the same university, the researchers were able to collect it from the students residing at various students' hostels. Follow-up procedures were made to the respondents in case of any undue delay felt by the researchers.

The sample size was deemed adequate for the application of structural equation modeling (SEM) to address the research objectives. Data analyses were performed with SPSS version 16.0. In

order to analyze the structural relationships among the various constructs, AMOS software version 18.0 was applied.

Research Instrument

A questionnaire consisting of items validated from prior studies that measured four constructs of interests, namely, perceived ease of use, perceived usefulness, computer self-efficacy and satisfaction in adopting wireless internet were developed and modified to address the research hypotheses. A five-point Likert-type scale asking the respondents of the extent of their agreement/disagreement to the items constituting the constructs in the questionnaire was used.

Perceived Ease of Use (PEU) and Perceived Usefulness (PU)

Items for perceived ease of use and perceived usefulness in the survey were updated and measured by an instrument developed and validated by Davis (1989) and Chen *et al.*, (2002) and Venkatesh and Davis (1996).

Computer Self-efficacy (CSE)

Items for computer self-efficacy in the questionnaire were modified by combining survey items developed and validated by Compeau and Higgins (1995).

Satisfaction

Items for satisfaction were adopted and modified by an instrument developed and validated by Chen and Wells (1999).

Reliability and validity of Instrument

In order to measure the reliability and validity of the instrument, Rasch analysis was performed using Winsteps version 3.49. The results of Rasch analysis indicate that (i) items and persons measured reliably ($r = .99$ and $.88$ respectively), (ii) all items measure in the same direction (pt measure corr. > 0.25), (iii) most items show good item fit and construct a continuum of increasing intensity. The results also demonstrate that the majority items Infit and Outfit MNSQ were acceptable range (0.50 to 1.5). Table 1 presented the list of the valid items, their mean, standard deviation, and Cronbach's alpha .

Table 1: Measurement of the variables of the hypothesized model

Constructs	Items	Item Measure	Loadings	<i>M</i>	<i>SD</i>	α
	PU2	Using the Wireless Internet enables me to download learning materials from the internet	0.61	3.729	1.031	

Perceived Usefulness	PU2	Using the Wireless Internet enables me to download learning materials from the internet	0.61	3.729	1.031	0.741
	PU7	Wireless Internet helps me access online database to enhance my research	0.63	3.656	1.031	
	PU8	Using Wireless Internet allows me to obtain multimedia facilities	0.59	3.512	1.019	
	PU9	I can use Wireless Internet free-of-charge at the campus	0.56	3.961	1.059	
	PU10	Using Wireless Internet allows me to brows different website, e-mail, and chat with others	0.63	3.824	0.970	
Perceived ease of Use	PEU4	With Wireless Internet, I find it easy to access online database to do research	0.54	3.361	1.134	0.677
	PEU5	It is easy for me to become skillful in navigating the Internet using Wireless facility	0.63	3.473	1.053	
	PEU9	Wireless Internet allows me to access learning materials from LMS	0.65	3.736	1.029	
	PEU10	Wireless Internet is easy to use	0.55	3.305	1.163	
Computer Self-efficacy	SE1	I am capable of using Wireless Internet	0.53	4.045	0.912	0.771
	SE4	I have the skills required to use Wireless Internet to enhance the effectiveness of my learning	0.69	3.915	0.945	
	SE5	I know how to save and print journals/articles from online database using Wireless Internet	0.84	3.926	0.999	
	SE6	I can easily go through the steps of downloading software	0.80	3.782	1.028	
	SE10	I can do blogging using Wireless Internet	0.35	3.624	1.105	
Satisfaction	SAT1	IIUM Wireless Internet is beneficial to my learning process	0.50	3.550	1.151	0.729
	SAT2	Overall I am satisfied with the Wireless Internet service provided at the university	0.77	2.582	1.118	
	SAT4	I am satisfied with wireless service provided by the ITD	0.72	2.743	1.178	
	SAT5	I am satisfied to access Wireless Internet from the Mahallah	0.60	2.203	1.138	

Results

Confirmatory Factor Analysis (CFA) was run for each of the 4 measurement models namely, CFA-1 (PEU), CFA-2 (PU), CFA-3 (CSE) and CFA-4 (SAT); in each case, a few items were removed due to the violation of estimation. The revised 4 CFAs for each of these latent constructs showed an adequate fit to the empirical data [CFA-1: (χ^2 (df=2) = 5.132; p = 0.077; RMSEA = 0.074; CFI =

0.981; TLI = 0.944); CFA-2: (χ^2 (df=5) = 13.969; p = 0.016; RMSEA = 0.079; CFI = 0.966; TLI = 0.933); CFA-3: (χ^2 (df=5) = 18.228; p = 0.003; RMSEA = 0.097; CFI = 0.969; TLI = 0.938; CFA-4: (χ^2 (df=2) = 3.751; p = 0.153; RMSEA = 0.056; CFI = 0.993; TLI = 0.979). The Confirmatory Factor Analysis (CFA) for 4 measurement models is shown in Figure-3.

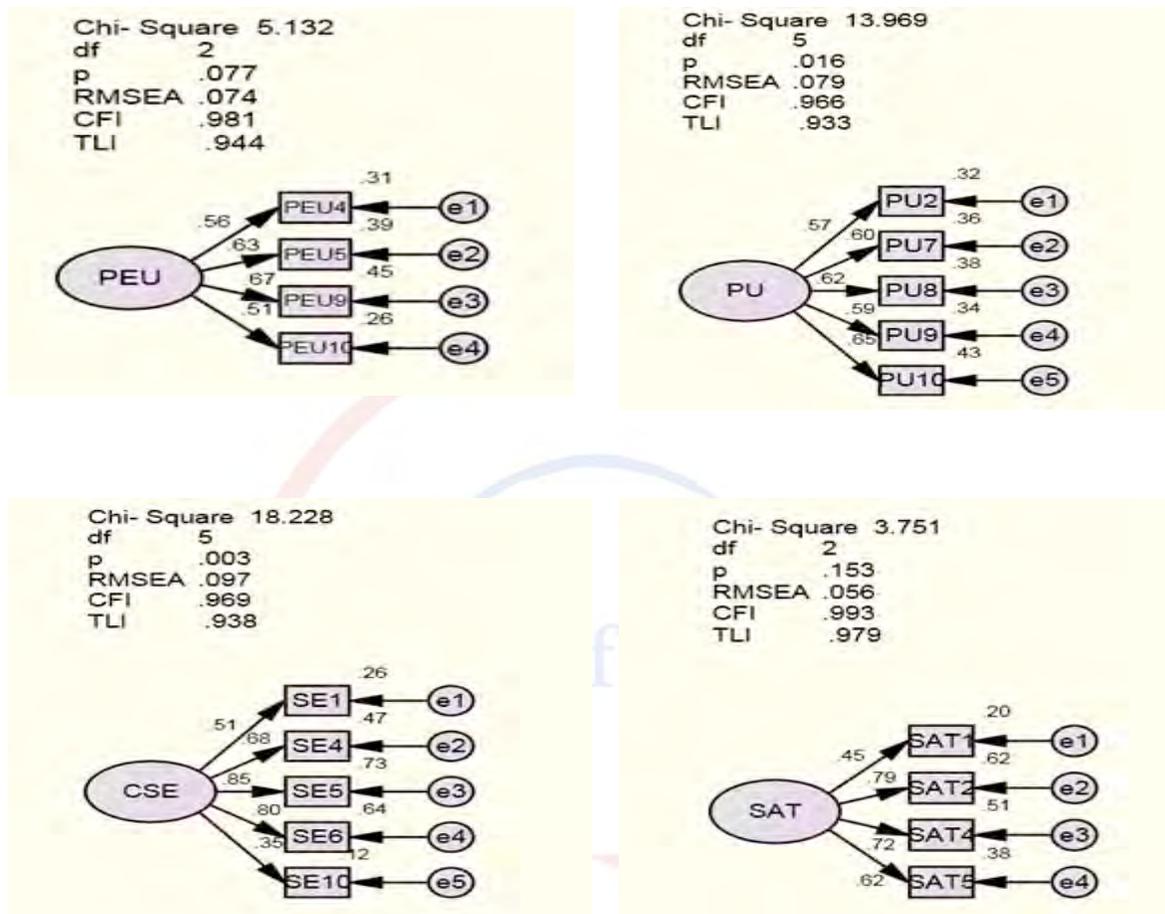

Figure-3: Confirmatory factor analysis for 4 measurement models

Estimating the Hypothesized Wireless Internet Model

The structural equation modeling was adopted to examine the hypothesized model, which integrates the four measurement models of the latent constructs, namely, perceived ease of use (PEU), perceived usefulness (PU), computer self-efficacy (CSE) and satisfaction (SAT). In this model, the majority of the items exhibited a loading greater than 0.60, with the highest and the lowest being 0.84 and 0.50 respectively. The overall statistical analyses demonstrated a satisfactory fit of the hypothesized model to the empirical data: Chi-square, χ^2 (df=84) = 151.803; p < 0.001; RMSEA = 0.053; CFI = 0.941; TLI = 0.926. However, the model requires revision due to negative path coefficient between CSE and SAT ($\beta = -0.10$) contradicting with the hypotheses. Further, p was found to be significant, as shown in the Figure-4.

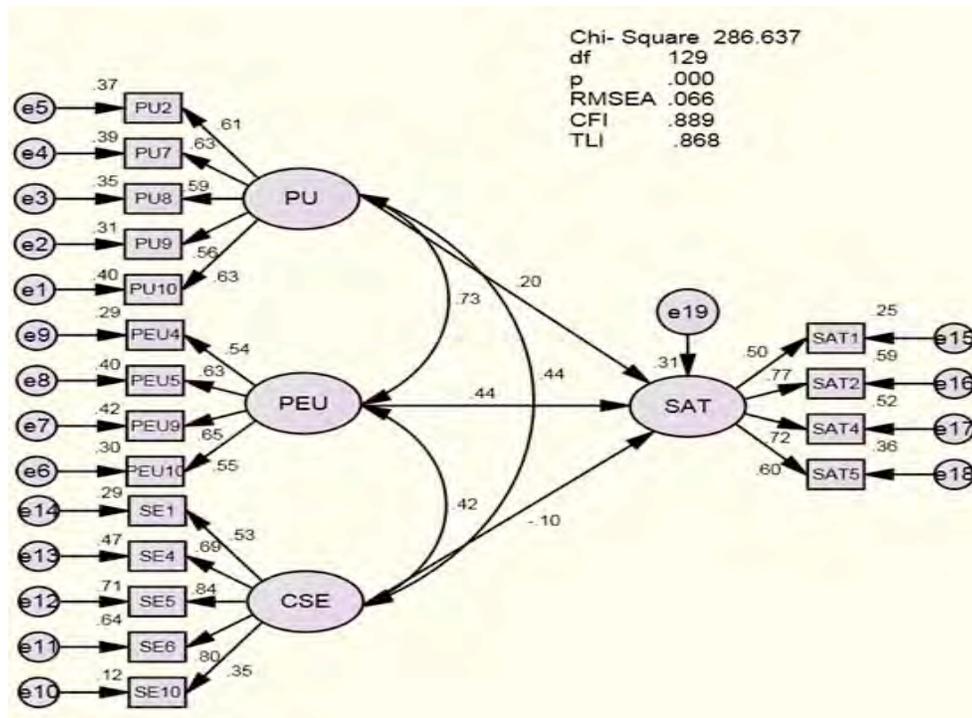

Figure-4: Hypothesized Model

The Revised Wireless Internet Model

In the third stage, the hypothesized model was revised and estimated in order to examine its overall adequacy. The results indicated that the parameters of the revised model were free from offending estimates. The overall goodness-of-fit statistics of the model showed a satisfactory fit to the data: the Chi-square was statistically non-significant, χ^2 (df=86) = 154.962; $p < 0.001$; RMSEA = 0.053; CFI = 0.940; TLI = 0.926.

The model was evaluated according to the standardized path coefficients, as shown in figure - 5. As expected, hypotheses H1 and H2 were supported with both perceived ease of use ($\beta = 0.32$, $p < 0.001$) and perceived usefulness ($\beta = 0.21$) demonstrating significant influence on students' satisfaction. In addition, the interrelationships among the exogenous variables were tested in the structural model. The relationship between perceived ease of use (PEU) and perceived usefulness (PU) was found to be very significant ($\beta = 0.74$). The other two relationships, namely, between computer self-efficacy (CSE) and PEU, and CSE and PU, had also statistically significant influence ($\beta = 0.40$, and $\beta = 0.43$, respectively). In addition, all path coefficients of the casual structure were statistically significant at 0.001 levels, and were of practical importance, while the strongest value of the standardized path coefficient of perceived ease of use on satisfaction was 0.44. The data demonstrated that perceived ease of use was moderately more influential than did the perceived usefulness in affecting the students' satisfaction in using Wireless Internet.

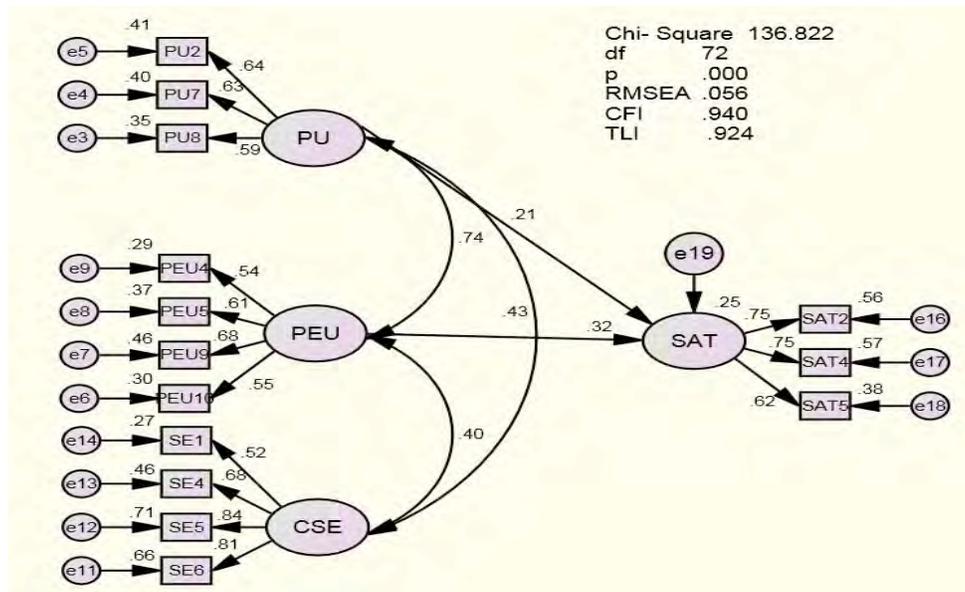

Figure-5: The Revised Wireless Internet Model

Discussion

The findings of the study have expanded the existing body of knowledge on TAM in several ways. First, the hypothesis that perceived ease of use having a positive direct influence on satisfaction stands validated. This comes in line with earlier studies (Szymanski and Hise, 2000; Dabholkar and Bagozzi, 2002), which found convenience, similar to the construct ease of use, to be a prominent factor in e-satisfaction. However, in their study, Shamdasani *et al.*, (2008) observed that ease of use mediated by service quality did not show a high influence on satisfaction.

With the revised model, the influence of perceived usefulness on satisfaction was found to be slightly above that of the hypothesized model, crossing the threshold value of 0.20. This was congruent with the prior study done by Shamdasani *et al.*, (2008) where they considered the perceived value as perceived usefulness with a positive direct influence on satisfaction. In another study, Huang (2008) discerned a significant impact of perceived usefulness on consumer satisfaction mediated by their behavioral attitude toward the acceptance of B2C websites.

As regards the effect of computer self-efficacy on satisfaction, it was revealed in an adverse direction ($\beta = -0.10$), thereby invalidating the hypothesis. However, its impact on satisfaction might be reflected through its interrelationships with the other two latent constructs, i.e., perceived ease of use and perceived usefulness.

As evidenced from the revised structural model, the influence of perceived ease of use on students' satisfaction was captured in terms of their easy access to getting technical support from Information Technology Division (ITD) and learning materials from Learning Management System (LMS), online course registration and in using wireless internet without having to take recourse to any user manual. However, the study revealed that some barriers still persist; these were manifested in the inadequate speed experienced by the students in downloading the materials from the internet and accessing research materials from online research database. Besides, it was not easy to getting connection to and registration for wireless facility as perceived by the students.

Regarding the influence of perceived usefulness on satisfaction, it was manifested in students getting access to downloading materials from the internet, to obtaining multimedia facilities and to

online database to further their research. However, in this study, students articulated their limitations vis-à-vis slower speed compared to the LAN as well as getting wireless internet access from anywhere and anytime in the campus.

Conclusion

As information technology is increasingly used in education, its integration to learning has had immense significance in fostering technology-based education among the students of a university. By extending the technology acceptance model (TAM), this study examined the impact of the acceptance of wireless technology among the IIUM students' satisfaction. Two new latent constructs, namely computer self-efficacy and satisfaction were incorporated in the original framework of TAM. While the study validated two hypotheses – positive impact of perceived ease of use and usefulness on satisfaction, it did not support the third one between computer self-efficacy and satisfaction. The results demonstrated significant positive interrelationships among the three exogenous constructs of the proposed framework.

Limitations and Recommendations

The research findings have some important implications for the wireless internet service provider at IIUM. The study exhibited a few difficulties in using wireless internet for learning in terms of speed, connectivity, downloading the materials, accessing online research database, and registration facility. The service provider would do well to address these issues to better cater to the needs of the students, thereby enhancing their satisfaction in using wireless internet.

This study was conducted among the students of five faculties of IIUM. In order to generalize the findings, it thus calls for inclusion of a larger sample size comprising all the faculties of the university; that would make the study more comprehensive in nature.

Future research on cross-validation of the model could be done to shed light on the moderating effects of various demographic attributes on students' satisfaction. The gender, faculties, and nationalities of the students might be explored in this regard.

Topic: Community, Culture, Globalisation and Internationalisation

INTRODUCTION – CONTEXT AND CURRENT PRACTICE

The strategic plan of a Gulf Nation's education council, unveiled in June 2009 outlined a range of reform initiatives. Their aim was to promote a bilingual, critical thinking approach to learning in secondary schools and so better prepare pupils to enter university where English is the language of instruction. 'Being able to communicate effectively in both English and Arabic isn't a luxury, it's a necessity' (Council Director 2009).

Only 6.5% of grade 12 students achieved the prerequisite score for direct entry into regional universities this year (May 2010). The remaining students need to attend foundation English courses. The cost 'bleed[s] 30 per cent of the budget of higher education institutes annually. This has been going on for 15 years. It is time to address this and solve it' (Council Director - 29/06/2009).

As a result, a project (PP - Professional Partnership) was introduced in 2008 whereby local staff in grade 10-12 public schools work with overseas trained teachers to deliver (in English) inquiry-based learning schemes in Science, Maths, IT and English. The aim is to expose students to university style education at an earlier age. At the end of June 2009, an initiative was introduced to extend the school day by 90 minutes (EDI = Extended Day Initiative) to allow for more rapid improvements.

'The point is not about keeping kids in school for longer hours, but giving them more time with their teachers. Teachers need to focus on problem solving and developing students' analytical skills, not rushing through the syllabus. This is about less time on exams and more time on learning skills' (Spokesperson - 29/06/2009)

Press reports suggested the EDI was guided by feedback from a parents' survey and after studying the number of instructional hours in other OECD countries.

The research question posed in this study is:

- 1) How has the EDI impacted on the lives of the teachers who work at, students who attend and families whose children attend a girls' grade 10-12 public school in the region?

THEORETICAL FRAMEWORK AND LITERATURE REVIEW

There is little published literature on the impact of the vast array of reforms currently underway in the Gulf education system and no published literature on EDIs in the region. Most existing literature on school time structure hails from the US.

To understand the implications of the EDI in the public school system, it is necessary to explore the political, educational and cultural backdrop, as well as to establish a working definition of 'extended day' as it is understood in this context.

This review is approached from a social constructionist perspective. It questions systems 'in which western ways of seeing the world are automatically assumed to be the right ways, which

[are then] impose[d] on others' (Burr 1995:7), systems whose policies are 'market driven' (Corson 2002:5-8) and which emerge from 'humans attempting to promote their individual or collective visions of what they wish their worlds looked like...to package [them] as [a] neatly manageable solution to so called language problems' (Morgan & Ramanathan 2007:450).

Political → Educational → Westernised models

'The [Gulf region] has accommodated globalisation...within a policy of linguistic dualism whereby English is associated with business, modernity and internationalism and Arabic is associated with religion, tradition and localism'. According to Kazim (2000), because of a lack of governmental accountability, 'Language education policy and planning decisions [are] liable to be a hit-and-miss affair' (in Clarke 2007:584).

Although Arabic is the national language in the Gulf, it is not spoken by the 85% of its workforce (Heard-Bey 2005:360). The 'extreme reliance on hiring....mostly Western or Western orientated expertise has resulted in an uncomfortable dependence on the English language and meant that ...the production of local knowledge [is] severely stifled' (UNDP in Karmani 2005:91).

There has been much speculation about what will happen to the region's economy as the oil resources dwindle. Much of the discussion surrounding its competitiveness within the global arena revolves round educating its youth.

Local education systems have been frequently criticised by internal and external sources (Kazim in Clarke 2006:226). The MENA World Bank Development Report in 2008 attacked the emphasis on 'rote memorisation'... 'If [students] are rewarded for copying...they have no practice in producing new ideas... Since innovation and novelty dominate competition in the business world, this anachronistic memorisation-based curriculum must be abolished' (Crotty 2010).

In the face of such disparaging comments, Karmani (2005) feels that government agencies have been duped by international speculators to 'unwittingly give rise to a virulent self-serving mercenary culture' (p91). Nowhere is this more evident than in the educational sector.

Overseas 'experts' bring overseas models of education. For some, it is too early to measure their success, for others they have been a 'disappointment because foreign experts failed to consult with [local educators]'. This has 'created a passive resistance with nothing being implemented because the reform [is] perceived as foreign' (Research spokesperson 10/04/2010)

School day structure → Extended day → Teaching staff → School environment

Falling student achievement levels are the concern of education councils around the world. As a result, large scale reform efforts proliferate; with school day structure forming an integral part.

Historically, adaptations to the school day have taken three forms:

1) Altering the length of the school year - *Year round schools, summer programmes, 9 weeks study followed by 3 weeks off*

The school calendar in the US has remained static since the 19th century. The standard 6.5 hours linked to an agrarian system and the long summer breaks, a legacy of wealthy city dwellers' demands. Whilst the US continues to trial radical models involving year round schooling, the summer vacation suits the needs of many residents in the Gulf region who use this time to visit family in their countries of origin.

2) Transforming the time structure - *block scheduling (double periods), guided study hall electives and school advisories*

Some teachers in western educational settings worry that block scheduling (double periods which allow for more time to focus on literacy and numeracy skills) narrow the curriculum to core academic subjects at the expense of others. Western education provides timetabled slots for drama, music, art, PE and self-study periods in the senior years. Other than PE, no provision for these subjects is made in grade 10-12 Gulf public schools. The school gyms are ill equipped and the lessons are often 'snagged' by teachers of other subjects.

3) Extending the day - *increasing the length of time students spend in classes at school, whether they be mainstream or remedial* (National High School Center 2007).

In its basic form, this means adding more hours to the school day but it is crucial to differentiate between 'types' of time

Allocated school time	Hours set by school requirements but includes assemblies, recess and other non instructional activities
Allocated class time	
Instructional time	Hours devoted to formal instruction or learning, although much of this time could be lost to poor quality teaching and student inattention
Academic learning time	The time in which students are actually engaged in learning.

(Types of time - adapted from Silva 2007:2)

The correlation between time and student achievement gets stronger with more engaged time. Studies show more allocated school time results in no or only a slight improvement compared with those students who receive less (Silva 2007, Fisher 1970, Karweit and Slavin 1981).

In addition, a great deal of classroom time is lost to interruptions and test preparation (Smith in Silva 2007); of particular significance in the Gulf where, historically, between 30-40 days a year are lost to exam-scheduling.

Student engagement and teacher training

When the focus is on ‘engaged’ time (Silva 2007, Pennington 2006, Bussard, 1999), a key consideration is the professional development of teaching staff. The expectation that local teachers in the Gulf will use progressive approaches when they have not experienced this kind of teaching or teacher training is a leap of faith.

In his work with teacher trainees in the Gulf, Clarke (2006:231) noted a number of binary oppositions when it came to ‘traditional and ‘modern’ approaches to teaching:

Traditional	Modern
teacher centred	learner centred
passive	active
learners as homogenous	learners as heterogeneous
low motivation and self esteem	high motivation and self esteem
teaching as easy	teaching as complex

The majority of teachers currently in Gulf schools fall into the ‘traditionally’ trained sector. In-house/on the job professional development provided by PP colleagues can assist here. Pennycook, (Hall 2000:98), however, says communicative language activities are not ‘empirically preferable’ but ‘cultural preferences...and this means the classroom becomes a site of cultural struggle over preferred modes of teaching and learning’.

Another important factor is that many teachers in the area are expatriate Arabs and on yearly contracts. The perceived/real threat to their jobs from western trained teachers can make them: a) ready to take on any reform initiative in the hope of guaranteeing their contract renewal, b) insecure in their personal and teaching career and/or c) unwilling to invest their energy in a system where they are considered actors, not agents of change (Troudi 2010:115, Karmani 2005:93/94)

Environmental factors

The financial outlay required to action a country-wide reform is huge, however, the awareness of associated expenditure is often not fully realised. Under-functioning work environments contribute to low morale and lack of enthusiasm to action initiatives (Silva 2007:8). Students in local public schools are expected to study for 6.5 hours in environments which lack basics such as effective air-conditioning systems, computers, libraries, Internet and canteen facilities.

Culture (Community, Parents and students) → Education → Consultation

‘National governments are deemed irresponsible’ if they fail to provide students with adequate provisions for learning the language of ‘global opportunity – now universally perceived as English’. Yet, many inhabitants in the Gulf perceive the influx of ‘western’ teaching staff as a ‘threat to indigenous beliefs and traditional social hierarchies’ (Morgan & Ramanathan 2007:455)

With this in mind, the curricula have been further re-designed to incorporate teaching materials aimed at honouring the region’s heritage and culture. Whilst this might go some way to acknowledging what Holliday (1999) refers to as ‘large culture’; ethnicity, national and geographic boundaries, tradition, religion, language and their effects on people’s everyday lives, Corson writes that, generally, ‘There is little consultation with parents or teachers apart from the carefully chosen few who share in the government’s ideologies’ (Corson 2002:8).

This lack of consultation can impact heavily on ‘small culture’; ‘any kind of cohesive behaviour and shared constructs within a social group’ (Troudi 2005:9, Hammersley and Atkinson in Holliday 2007:39). Issues surrounding transportation, food provision, family routines, sleep patterns, homework schedules, social occasions and holiday periods are important factors here in this region.

Consultation

Research on successful extended day projects in the US shows that all involve staff and parent consultation, evaluation and review. Without these, the schemes are met with resistance (MacGibbon 2010, Wrobel 1999, Silva 2007).

METHODOLOGY

This exploratory study is approached from a critical social constructionist perspective and employs survey methodology.

The research group consists of 16 teachers, 4 parents and 98 students at a grade 10-12 girls’ high school (403 students: 40 teachers). I worked for two years as a full time member of the teaching staff at the school; for one year before the extended day initiative was introduced and, during the first year of the extended day initiative. I am closely linked to the participants and the situation under investigation.

The study incorporated two research methods, 1) survey methodology; one teacher and one student questionnaire. Several questions were open-ended and respondents were encouraged to answer in Arabic.

2) Semi-structured interviews were incorporated to provide a 'more fine-grained analysis' (Cohen 2007:96).

Participants and Procedure

Ethical protocols were implemented prior. Students from all sections and grades were targeted but participants within those grades were randomly selected. All teachers present were given the opportunity to complete the questionnaire (34 in total).

Both student and teacher questionnaires were piloted, responses noted and adaptations made. Initially, the questionnaires were in English. It was clear, however, that bilingual questionnaires would render broader and more heartfelt responses.

Findings and data analysis

Prior to this research study various information was gathered from both the education council and at a school level. It is worthy of mention as it provides a valuable context.

The extended day was brought about because the country under investigation ranked substantially lower than the OECD average for instructional hours (Spokesperson 2010). PISA results show, however, the number of instructional hours a student receives does not necessarily correlate to student achievement.

Parent meetings at the beginning of the school year (September 2009) were dominated by a strong vocal reaction towards the introduction of the EDI. The mothers, 56 in total, voiced their anger over non-consultation and mentioned the negative impact lengthening the school day would have on their family life.

Student questionnaires distributed by the education council in March 2010 asked 5 yes/ no questions unrelated to the extended day. Below there was a space for 'other comments'. 88.8% of students voiced their concerns over the EDI. They commented on inadequate lunch provision, exhaustion and depression due to the hours spent at school. They also requested the last period be used for homework and for the length of the school day to return to its 2009 finish time of 2.15pm.

These findings are in keeping with the analysis of data gathered in the student and teacher questionnaires compiled for this study and further validated by the findings from the semi-structured interviews conducted with both students and parents.

Students

Seven students were interviewed. Four students spoke in either Arabic or Arabic/English. Three students spoke in English. Several common themes emerged and these were coded.

Understanding the rationale behind the initiative

Generally, the students understood that the EDI had been introduced by the education council to increase the hours of maths and English study and so better prepare them for university.

Some students saw no benefit in the initiative. Two students felt their level in English had improved, although they put this down to the student-centred teaching strategies employed by their teachers rather than the extended day (S0014 A & B).

S0012 pointed out that other subjects might be more important to students wanting to get into university:

‘ And maybe they make the [the extended day] to make our English level better, [and] it is a good thing. But when it is related to go in a university...that is not a good thing because we are just not depending on the English in our life. We have so many different subjects to study. I have many subjects where my level has gone down....I am in the science grade so I have to study the science subjects but I don't have time to prepare them for the next lesson and that is why my marks have decreased’ (S0012).

Impact of the initiative on school life

A key issue for the girls was the fact that they felt continually tired and could not study effectively in the last two periods of the day; period 8, 2.10-2.50pm and period nine, 2.50-3.30):

‘I notice in periods 8 and 9 the students...are unable to concentrate... and the next day they will ask the teacher to repeat what she said and this makes a delay in the syllabus’ (S007).

‘[In periods 8 and 9] even the teachers do not make us study anything. They can see our batteries are flat’ (S008).

The air-conditioning units in the classrooms are noisy and ineffectual. It is impossible to hear student contributions unless standing close by. Classroom temperatures average between 25 - 29 degrees centigrade and temperatures outside, where the girls spend their break time, average 42 degrees C in May and June.

When asked about what happened in periods eight, approximately half of the respondents said they studied just like the rest of the day; with the remaining half saying they were too tired to study. In period nine, however, 90% of students said they were too tired to study.

A contributing factor to the tiredness appeared to be the lack of nourishing food available for the girls at the school canteen. Bread rolls filled with labneh(cream cheese) zaatar(a mixture of thyme, sesame seed and olive oil) with sliced black olives and a sugary fruit juice drink were the only food choices. This selection did not vary during the school year with juice and water the only canteen options available during the second short prayer break at 1.10pm. The facilities

lacked refrigeration which meant any food could not be stored safely. ‘We don’t like to eat the same items day after day. If they [the students] eat it daily, they start to feel bored and they say away from those items and this will affect their health’ (S007)

Some students said they had lost weight as a result (S0011). Others said that if they needed to go to speak to a teacher at the beginning of break, they would find the food had sold out by the time they arrived. ‘We are waking up at 5 am and that’s a very long period; five and a half hours I didn’t eat (S0012). First break is at 10.30am

When asked to rate their enjoyment of coming to school on a likhert scale pre and post-extended day, 4.10% chose the lowest score (1) pre-extended day. Post-extended day 46.57% of students made this choice.

Impact of the initiative on home life

In the past, the inadequacy of the canteen provision was not an issue because students would eat lunch with their families at home. Lunch the main meal of the day in the region is eaten around 2pm. It is more an institution than a meal. It is a time for families to reconnect; to discuss their school and work day. Culturally, there is an added dimension, for a person of Arabic background feels absolutely no pleasure in eating or drinking alone (Lipson J & Meleis I 1983).

The late school finish has had far reaching consequences for the family unit. ‘[The extended day] has affected my life with my family a lot. There are conflicts between us. I come home and they are all sleeping. I have to eat alone so sometimes I don’t eat’ (S008).

‘The effect of [the extended day] on my family is also very clear. Last year when I used to return home at the same time as my family we used to come together at the table....After, we used to sit together and everyone would talk about their day. Now when I come home I eat alone it makes me feel alone and I’m not happy with this situation’ (S007).

‘I get home at 4.30pm and I’m very tired. My family has eaten without me...They can’t wait until I get home...Last year I ate with them.... Now, my mother and father miss me, “Where are you my daughter? We don’t see you properly this year.” ...I only talk with them at the weekends’ (S0012).

Another issue was to the disruption to prayer times. Muslims pray five times each day. The school day ends when it is time for *asr* prayer. This means that the first priority for a student when they get home is to pray. For some students, however, they are too hungry and tired so they do not say *asr* at the allotted time but wait and say *asr* and *maghrib* (*evening*) prayers together. This practice is acceptable according to Islam, however, those who pray at the allotted prayer times receive the most rewards. (S0010, S007)

Difficulty in meeting assignment deadlines was mentioned by all students. They said they frequently missed out on sleep to complete their homework; going to bed at 11.30 and much later if there was an impending exam (Aysha; a student's mother).

'Eleven thirty is the maximum because my eyes will be closed after that actually! And then I wake up at 5' (S0012).

'As for other girls, their level has gone down due to getting home later and the reduced time for home study' (S0010).

For those who did not manage to get their homework done, they tried to do it when they arrived at school; with the implication that it was rushed and possibly copied from a friend. Teachers were spending more class time going through homework tasks in class because so many of the students had not completed them. Some students said that teachers allowed them to do homework in their classes if they were double periods or if it was period 9 (S008 & S0010) but some 'do not take time into consideration; that we have a lot pressure and projects to finish.'

Although some girls had noticed an improvement in their English marks and thought that more time spent at school gave students the opportunity to achieve a 'high percentage for entry to the specialisation of their choice' (S007), others had made no significant improvement in their marks and considered the decision:

'[It's] all negative and there is not one advantage and I always ask myself why did they make this decision?' (S0010 & S0011)

Teachers – Impact on School life

Sixteen teachers responded to the questionnaire. They came from a cross section of faculties at the school and had been teaching between 3-31 years; with a mean of 11.6 years' experience.

87.5% of teachers said they had changed their teaching style to accommodate the girls' inability to focus on their studies due to fatigue. Strategies included: allowing students to do their homework in class; especially in double periods and having students prepare and present parts of the class.

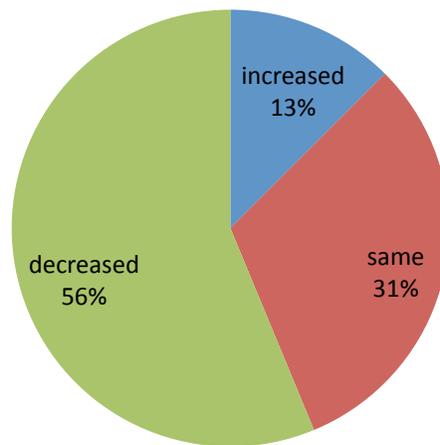

One teacher said, 'The homework levels this year have 'overheated' the students but we try to approach tasks and activities the best way we can.' Another said, 'I don't make my lessons demanding because the students can't concentrate'.

The introduction of the education reform has seen an influx of 'licensed teachers' from overseas. Their role is to teach classes rather than to work in consultation with staff. Expatriate Arab teachers whose contracts come up for renewal annually clearly saw this as a cause for concern. Slightly under a third of teachers felt they did not have security in their job. 'Continual changes in education always mean the renewal process for teachers in uncertain'. Another teacher

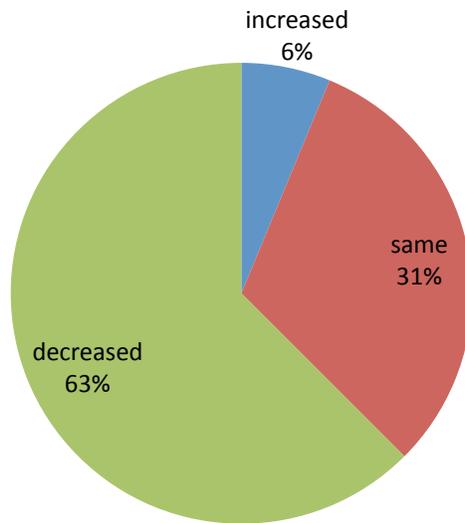

commented, 'I used to love teaching and did a lot for my career, recently, I have lost interest due to pressure'.

Fifty percent of staff had taken more sick leave than the previous year. Reasons cited were tiredness, fatigue, physical and mental pressure caused by the extended day. The pie charts below illustrate how the extended day has impacted on teachers' willingness to undertake activities other than face-to-face contact time with their students.

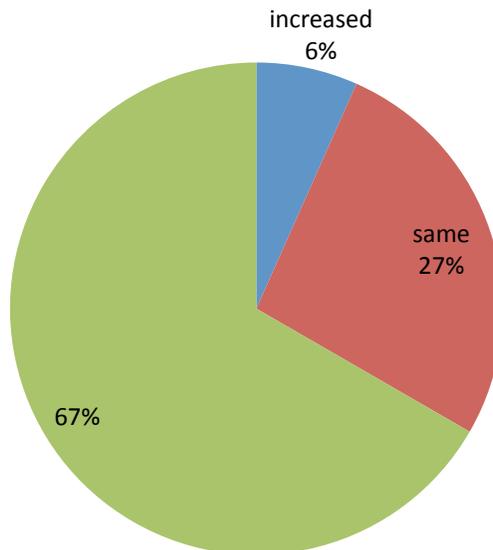

To what extent has the extended day affected your willingness to do your job?

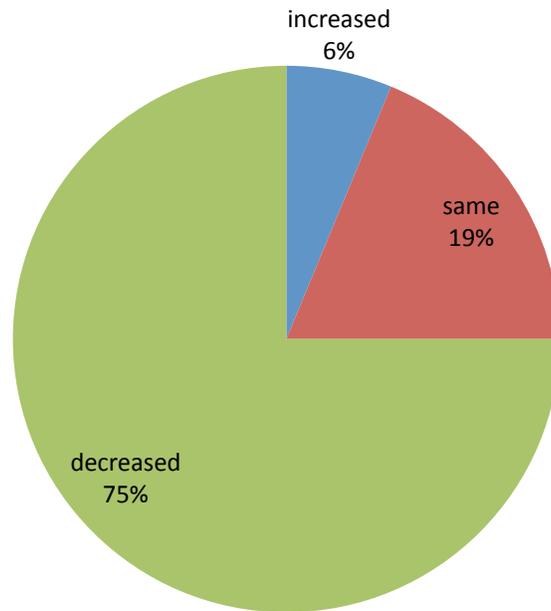

To what extent has the extended day affected your willingness to contribute to other school projects such as continuous professional development?

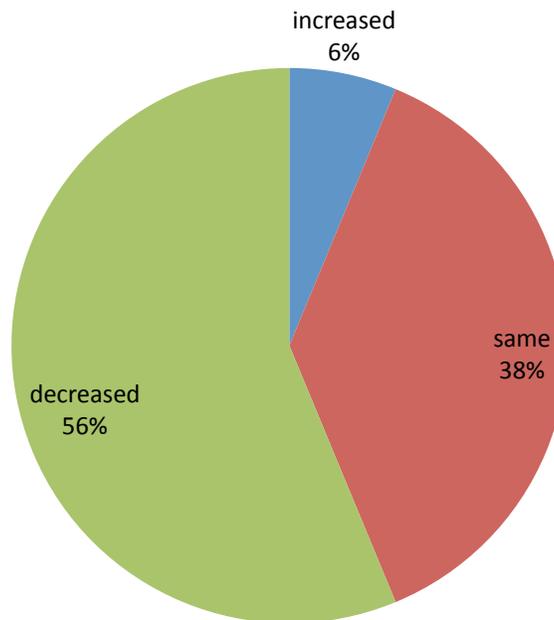

To what extent has the extended day affected your willingness to contribute to other school projects such as departmental meetings?

To what extent has the extended day affected your willingness to attend ESL training?

To what extent has the extended day affected your willingness to work with the overseas provider's staff?

Teachers - Impact on Family/home life

Half of the respondents were parents as well as teachers; with an average of 3.29 children. Of the teachers who had maids, 28.6% said they relied on their maids 'more' and 28.6% 'much more' than the previous year. They expressed their concern that they were leaving the upbringing of their children to their maids. One teacher said, '[When I came home] I saw that my maid had hit my son but there is no other choice [than] to have her look after my children at the moment.'

Of the three teachers who responded to the questions on the impact of the extended day on their children in grade 10-12 schools, all said it had impacted negatively on their children's family routines, homework routines and well-being. Two said there had been a negative impact on their child's academic progress and one said it had remained the same. One said there had been a positive impact on their child's attitude to prayer; with two noting a negative impact.

When asked to comment on the impact of the extended day on their personal/family life all sixteen respondents commented that it had proven detrimental to maintaining and building healthy family relations. '[The extended day] has disrupted the continuity of family life. Now it is very frustrating and painful. Our existence lacks meaning.'

Parents – Impact on family life

In an interview with the parent council leader, Aysha, she said many mothers had noted a decline in their daughters' overall health and well-being since the introduction of the extended day. Issues cited included, increased prevalence of headaches, lack of appetite and insomnia together with a craving for sleep.

She said the 'parents are tired because of their kids' tiredness. Their nerves are frayed. The extended day has given us problems that have no beginning and no end. Everyone is tired, whether they are the mother, father; whether young or old'.

'Before the family would come together for lunch and supper. Now, in a family of seven members you find only three sitting together. I am saying this now so that they find a solution for this extended day in the future. Can I see any benefit? No, it has harmed both; as students and parents'.

In April 2010, the school was inspected by an external UK monitoring agency. During this time the inspection team spoke to Aysha. She said they told her they would mention the opinions of the parents in their final report to the education council. Aysha said that whilst she thought the council respected the parents, it should have consulted them first before introducing a reform with such far-reaching consequences; 'Nobody asked us...to see whether we agree or disagree'.

As parents' council leader Aysha had frequent contact with parents at the school in the study and other schools. 'Parents ask me why you didn't go to X, (the council headquarters) to talk about the long day?'

'I [have] take[n] many names and many numbers. I need to take a big group with me, not a small group to [let the council] know all the people didn't like the long day....If we are

going, I can bring a group from each school. Never mind; for our children I can do anything. I am not afraid from anyone, only from Allah. I can meet with any supervisor’.

She said that many parents wanted to blame the arrival of overseas school providers for the fact that the students’ standards in Arabic had declined and to say that they were here to weaken the religious commitment of the people in the region. She had a very strong message for those who adhered to this belief. ‘If you want to put your brain under your feet and mimic everything on the internet and the TV that means it is you who are lost. You are not using your ‘wazei’ (religious compass). ..If you find a boy or girl is lost, it is happening from the upbringing in the house itself not from outside influences’.

Others have said that the late finish to the day interferes with the students’ ability to say the ‘asr’ prayer. Again, Aysha intimated that students needed to have more self-discipline and not to blame western influences; ‘if kids want to pray, they pray’.

Even though she was happy to acknowledge the positive impact of English usage in primary schools; ‘now my son who is in grade 4 knows words that I didn’t know at secondary school’, she and the other parents interviewed had seen no real improvement in their children’s marks since the introduction of the extended day.

‘My daughter has improved in English but she was always good in English. Maths not too much [of an improvement]. Other subjects have gone down [geology and physics]’.

‘Maths is already OK and no sign of improvement in English’ (Maryam - parent).

IMPLICATIONS AND RECOMMENDATIONS

Students

Students currently study core curriculum subjects for 6.5 hours a day. The introduction of practical subjects such as drama, music, art, PE and options for autonomous study could prove more conducive to developing students’ creativity, critical thinking and problem solving skills.

Teachers

Teachers feel the continual changes being made to their profession are being done to them rather than for, by or with them. This is leading to tacit and sometimes open resistance.

Extensive professional development opportunities should be made available to all teachers.

Temporary teachers could be employed whilst full time teachers participate in short-term full-time accredited courses in a university environment. Once up-skilled, the teachers would return to the school; value-adding expertise which would be led at a local, grass roots level.

Parents

Although over four thousand parents were surveyed by the education council in early 2009, none of the questions broached the subject of the extended day. An invitation to parents to air their concerns, thoughts and suggestions would be one way that the council could demonstrate its respect for the families of the children who attend its public schools.

Environment

Malfunctioning school equipment, inadequate cooling systems and canteen facilities together with lack of books in the library, computers and other essential teaching and learning resources are hindering the day to day running of this public school and many others like it. The school infrastructure needs improvement before educational reforms can be effectively implemented.

External assessment

An external assessment instrument currently used by the education council to assess student improvement shows little difference in marks for grade 11 students before and after the extra 26.30 days of teaching and learning the students received as a result of the extended day.

	Difference in mean standardised score 2009 - 2010
Arabic Reading	23.49
Arabic Writing	-7.86
English Reading	0.85
English Writing	-0.68
Mathematics	0.92

An extra 90 minutes a day has added 26.30 school days to the school year (based on a 6.5 hours contact time per day). Yet, 45 days a year are given over to exam scheduling. If the exam timetable took 9 days each semester, the earlier school finish time could be reinstated and the amount of contact time remain the same; $(45.0 - 26.3 = 18.7 \text{ days})$.

Evaluation

How do we know if this initiative has made a difference to student achievement and the development of critical thinking? In the interests of transparency, findings to evidence the efficacy of the extended day initiative should be made available.

CONCLUSION

Results of this research highlight the need for extensive consultation with all stakeholders prior to the implementation of educational reforms based on overseas models.

Power of the Test of One-way Anova

After Transforming with Large Sample Size Data

Abstract

The purposes of this study of One – way ANOVA were to investigate the power of the test of One – way ANOVA after transforming with large sample size data by using Real Data and used 5 sample sizes of 60, 90, and 120 students to see if there were any difference among the tests and which method yields to the most suitable result and at which sample sizes. The samples consisted of 3,600 Mathayomsuksa students in Thailand by using the Multi – Stage Random Sampling. The instrument for the study included the questionnaire of democratic child-rearing that score reliability was 0.719. The findings were explained what the factor effecting power of the test of One – way ANOVA.

Keywords: power of the test; One-way Anova; data transformation; large sample size

1. Introduction

The probability of a Type I error began in medical research, such as testing on a newly developed medicine, where researchers were trying to avoid the error. In order to achieve this, the researchers must define the level of statistical significance as low as possible. The probability of a Type II error would then be considered next. In addition, it was found that in the behavioral science or social science, researchers tend to avoid Type I error by defining low level of statistical significance too. Nonetheless, there are people who argue that the restrictiveness on the level of statistical significance may contribute to test error. It was because independent variables may have actual influence on the dependent variables. However, the researcher may not be aware of the influence due to low level of statistical significance. In some situations, they should pay more attention to the Type II error but less on the Type I error so as to obtain a suitable level of power of the test (Hays, 1994: 283 – 285). Howell (1992: 204) stated that the design of experimental research that restrict the level of statistical significance or define low level of statistical significance will increase probability of Type II error and reduce power of the test. (Ong-ard Naiyapat, 2001: 4 - 5) said that at low level of statistical significance, researchers would find difficulty in obtaining the results for the experiment. Researchers should design research with power of the test that is suitable and consistent with the condition of the research rather than placing emphasis on the level of statistical significance.

Cohen (1988) was the first statistician who gave attention and emphasis on power of the test in behavioral science or social science researches. Cohen indicated that power of the test statistics is the probability that Null hypothesis will be rejected when the

E-mail address: Natcha.m@hotmail.com, Natcha@tsu.ac.th

null hypothesis is false. Moreover, it is also the most important part of the information on test statistics that can be applied to research data. The Power of the test refer to the probability that null hypothesis will be rejected, which can be written as $(1 - \beta)$. The power of the test has relationship with the Type I error or level of statistical significance, represented by (α) , which is the probability that null hypothesis will be rejected when the null hypothesis is true. The Type II error, represented by (β) , is the probability that Null hypothesis will be accepted when the null hypothesis is false. The power of the test is useful when making research plans such as creating criteria for determining sizes of a sample or defining level of statistical significance. Power estimation can be divided into two types which are priori and posteriori power analysis. The priori power analysis can be done by studying documents and related researches. This will indicate effect size which is an index that measures the influence of independent variables on dependent variables. The result will be used for determining the size of the sample which is based on the effect size. The posteriori power analysis can be evaluated by using several programs namely SYSTAT, SAS, SPSS, GPOWER and UCLA (Myer & Well. 2003: 212 – 215).

The abovementioned facts showed that power of the test is important to the hypothesis testing of test statistics and research design. As there are very few information, documents and researches related to power of the test in the country, the concept has not been highly regarded or widely recognized among researchers. Thus, the objectives of this research are to study influence of the power of the test in theoretical aspect so as to promote the knowledge of the concept in a wider circle and show that the power of the test is important to the experimental research in the behavioral science or social science. The result of the research would be presented as an alternative for other researchers to adopt accordingly. The power of the test depends on three factors (Ong-ard Naiyapat 2001: 6 – 7; Stevens. 2002: 195 - 196) which are level of statistical significance (α - Level), sample size and effect size. There are many ways to enhance the power of the test including flexibility in determining level of statistical significance; increasing the sample size. The basic assumption of one way analysis of variance are 1) data must be obtained from the population with normal distribution, 2) data must be obtained from sampling method, 3) experiment must adopt sampling method, 4) variance of data in each level of experimental process must be equal and independent. These basic assumptions of the statistical parameters are very important because the estimation of the statistical value is related to the sample, sample distribution and population. Sir Ronald Fisher, the inventor of "analysis of variance" method, had explained the relationship among average, variance and normal distribution that normal distribution has two important characteristics which are average and variance. Average value would measure the bias of the estimator. Variance would measure accuracy of the data. When the data distribution is skewed or non-normal, the average value will not reflect the actual value. It is concluded that if the basic assumption of statistics is violated, the obtained statistics would be a poor parameter. (Ho Yu. 2005: Online) In order to prevent this problem, it is important to use normal distribution. The method that can transform data into data set with normal distribution is data transformation. It would also allow researcher to analyze variance of small-size sample group without violating the basic assumptions.

There are many statisticians who give detailed definition and explanation of data transformation namely (Kirk. 1968: 63) who defined data transformation as change of set of scores with definite characteristics. Kirk explained that the three main reasons for data transformation in variance analysis are 1) to obtain homogeneity of variance, 2) so that the data will be normal distribution, 3) increase effect size of the experiment. Data transformations consist of 1) Square – root Transformation, this method is used

when the average and variance in the sample group are proportional, 2) Logarithmic Transformation, this method will be used when the average and standard deviation is in proportional. 3) Reciprocal Transformation, this method is used when the square average and standard deviation of the sample is proportional. Angular or Inverse sine Transformation, this method is used when average and variance is proportional and the data set has binomial distribution.

Moreover, the new generation statisticians, such as Myers; & Well (2003: 223 – 224), and Maxwell; & Delaney (2004: 117) gave their concept of data transformation as process that transform data set from non-normal distribution to normal distribution and reduce heterogeneity of variances by applying logarithm and square root in the calculation. Nonetheless, the disadvantage of data transformation is the difficulty in interpretation. It can be summarized that data transformation can transform data set which has a skewed distribution into normal distribution and reduce heterogeneity of variances. In addition, data transformation also has effect on power of the test by increasing its value. Monte Carlo simulation based researches showed that test statistics, which was obtained from analysis of transformed data, gave higher power of the test statistics than using raw data and non-parametric statistics. (Rasmussen; & Dunlap. 1991: 809 – 820, Freeman; & Modarres. 2003: online) and Nopparat Krataithong (1999) conducted studies on format of data transformation that can transform data into a data set with normal distribution. The best format was considered on percentage of null hypothesis that was accepted. Their studies were based on Monte Carlo simulation and actual data.

From various documents and related researches, the researcher realized that a good experiment design must considered many related factors such as level of statistical significance and sample size for instance. Researchers have to determine appropriate value of sample size and effect size in order to obtain a suitable level of power of the test. In order to obtain appropriate point, the researcher aims to use secondary data which is an actual data so that the researcher can see various situations simultaneously and obtain the best condition. With SPSS program, we will determine whether different data transformation methods, power of the test of one-way analysis of variance at different level of statistical significance and sample size would have different values or not. The objectives of this research are to study power of the test of one-way analysis of variance by using actual data under the following conditions 1) when the sample sizes are different, while the data transformation method and level of statistical significance remain constant; 2) when different data transformation methods are used, while the sample size and level of statistical significance remain constant; 3) when there are different level of statistical significance, while the sample size and data transformation method remain constant.

2. Research Methodology

This research would study on the problem with actual data which is secondary data taken from the report on “The Causal Model of some Factors Affecting Critical Thinking Abilities” (Natcha Mahapunyanont. 2010). The scopes of the information for this research are;

2.1. *Variable for this research are student level variables:*

2.1.1. *Independent variable*

Independent variable is prior achievements in term of grade point average. In this regard, the researcher has divided prior achievements into three groups which are high-score group (student with GPA from 3.50 and above), medium-score group (students

with GPA between 2.41 – 3.49), and low-score group (students with GPA between 0 – 2.40).

2.1.2. *Dependent variable*

Dependent variable is non-academic learning outcome or variable of the democratic child rearing practices as perceived by students.

3. Population and Sample

1. Population that were used in the research on “the Causal Model of some Factors Affecting Critical Thinking Abilities” were students who are studying in the 7rd thru 12th grade of the basic education institutes under the Office of the Basic Education Commission, the Ministry of Education. The total number of population was 1,184,048 students (230,704 students from the 3rd grade level and 953,344 students from the 4th grade level).

2. The sample that was used in the research on “the Causal Model of some Factors Affecting Critical Thinking Abilities” was obtained from Multi - Stage Sampling in 90 schools under the Office of the Basic Education Commission for the year 2008. The sample consisted of 3,600 students (40 students from the 3rd grade level and 20 students from the 4th grade level from each school).

In this research, the data collected by the researcher are student-level data from 3,600 students. The data set has skewness of 0.258 and kurtosis of -0.526. The tool for measuring level of the democratic child rearing practices as perceived by students which is used as variable in the test is 4-levels rating scale which consistent with Cronbach (α coefficient) that is equal to 0.719.

4. Research Procedures

1. The population is a fake population taken from the secondary data collected from actual source. The specified sizes of the sample group are 60, 90 and 120.

2. There are three types of data transformation methods which are logarithm, square root, and reciprocal transformation and the use of raw data.

3. Using specific one-way analysis of variance to calculate test statistics. There are 3 implementation levels. There is equal experimental unit in each level.

4. Conduct test on assumption at .05 and .10 level of statistical significance.

5. Using SPSS program to calculate test statistics.

5. Experimental Implementation

1. Determine size of the sample group for the study (conduct study on only large-size sample groups). Sizes of the sample group are 60, 90 and 120.

2. In order to obtain desired size of the sample group, a sampling of data that was collected from the actual source was made on 10 sample groups. The data set has a skewness of about 0.258 and a kurtosis of about -0.526. The researcher used SPSS program to conduct sampling by using the menu “Data→ Select cases” then choose “Random select of cases”.

3. 30 sets of data were transformed through three data transformation methods, and raw data were used for the research.

For square root transformation, the formula is $X' = X^{1/2}$.

The formula for logarithm transformation is $X' = \log_{10}X$.

The formula for reciprocal transformation is $X' = 1/X$.

4. Test whether the data set has a normal distribution. If the curve is asymmetry, the researcher would conduct data sampling again from the original data set.

5. Test for homogeneity of variance. After the data has been transformed by four transformation methods, the researcher will test for homogeneity of variance. If the data lack homogeneity of variance, the researcher would conduct data sampling again from the original data set.

6. After testing for homogeneity of variance, the researcher would conduct F-test by simultaneously conduct one-way analysis of variance and analysis of power of the test. Then the researcher would change level of statistical significance from .05 to .10 and the size of the sample group. This process is repeated for all 30 sets of data.

6. Research Result

The result of investigated power of the test of one-way analysis of variance when sample sizes were different but the transformation methods and the level of statistically significant were constant.

Table 1 Power of the test of one-way analysis of variance with real data.

sample sizes	alpha .05				alpha .10			
	RAW	SQRT	LOGT	RECT	RAW	SQRT	LOGT	RECT
n = 60	0.555	0.589	0.553	0.540	0.644	0.646	0.646	0.637
n = 90	0.721	0.732	0.743	0.736	0.812	0.821	0.832	0.824
n = 120	0.837	0.847	0.856	0.861	0.893	0.902	0.908	0.913

RAW = raw score

LOGT = logarithmic transformation method

SQRT = square – root transformation method

RECT = reciprocal transformation method

From table 1, it was found that at the .05 level of statistical significance and when the size of the sample group is 30; power of the one-way analysis of variance test that is obtained from reciprocal transformation has the lowest value of 0.540. It is also found that at the .10 level of statistical significance and when the size of the sample group is 120, power of the analysis of variance tests that were obtained from reciprocal transformation has the highest value of 0.913.

The research results are as following:

1. At the .05 level of statistical significance and when the sizes of the sample group are 90, and 120; power of the test that are obtained from the three data transformation methods and raw data increase in rather close amount. However, when the size of the sample group is 60, power of the test that is obtained from square root transformation has the highest value. Powers of the test that is obtained from logarithm and reciprocal transformation have slightly lower values than the other methods. At the .10 level of statistical significance and when the sizes of the sample group are 60, 90 and 120; power of the test that are obtained from the three data transformation methods and raw data increase in rather close amount. In this regard, when the sample sizes are 60 and 90, the powers of tests increase noticeably.

2. At the .05 level of statistical significance and when the sizes of the sample group are 90 and 120; power of the test that are obtained from the three data transformation methods and raw data increase in rather close amount. However, when the size of the sample group is 60, the power of the test that is obtained from square root transformation has the highest power. Meanwhile, powers of the test that are obtained

from logarithm and reciprocal transformation and raw data have close values. At the .10 level of statistical significance and when the sample sizes are 60, 90 and 120; power of the test that are obtained from the three data transformation methods and raw data increase in rather close amount. When the size of the sample group is 120, power of the test that is obtained from raw data has the lowest value. Nonetheless, the figure is close to the value obtained from the other three data transformation methods.

3. When the level of statistical significance increases and the sizes of the sample group are 60, 90 and 120, power of the test that are obtained from raw data increase slightly. When the level of statistical significance increase and the sample size are 60 and 120; power of the test that are obtained from square root transformation increase slightly. Meanwhile, when the sizes of the sample group are 90 powers of the tests increase noticeably.

4. When the level of statistical significance increases and the sizes of the sample group are 120; power of the test that are obtained from logarithm transformation increase slightly. However, when the sample sizes are 60 and 90; power of the test increase noticeably. When the level of statistical significance increases and the sample sizes are 120; power of the test that are obtained from reciprocal transformation increase slightly. However, when the sizes of the sample group are 60, 90; power of the test increase noticeably.

According to the research result, it can be summarized as

1. When the size of the sample group increases, while data transformation method and level of statistical significance remain constant; the power of the test would increase in accordance with the first hypothesis.

2. When different data transformation methods are used, while size of the sample groups and level of statistical significance remain constant; powers of the test are indifferent. The results are consistent with the second hypothesis.

3. When the levels of statistical significance increase, while size of the sample group and data transformation method remain constant; the power of the test would increase in accordance with the third hypothesis.

Students' Awareness on Plant Cultivation Learning in Technology Education

Akihito KITO

Yokohama National University

Abstract

The purpose of this study was to investigate students' awareness on plant cultivation learning in technology education. One hundred fifty-three 7th graders participated in the questionnaire. The results of analysis of the collected data indicated that students who had many experiences of plant cultivation tended to have a higher awareness about pleasure, interest, effectiveness and importance on plant cultivation learning. Also indicated that students who had the experience within one year tended to have comparatively high awareness. Based on these findings, it was concluded that the continuations of plant cultivation learning had an influence on students' awareness through elementary and junior high school.

Keywords Technology education, Plant cultivation, Students' awareness level, Junior high school

Introduction

Cultivation that grows and manages the plant spread in technology education regardless of the school kind. It is the valuable opportunity for children and students to practice the cultivation with sowing, sprinkling water, transplantation, bud picking. In general, it is understood that the plant cultivation is indispensable for children and students as learning chance of the growth of sensibility. In plant cultivation learning, children and students observe the plants at close range. Also they check the knowledge about biology and agriculture, through the practice. Such an approach is valuable because they can deductively deepen thinking and understanding. There were several studies on plant cultivation learning (Hosotani et al., 1999; Ishida et al., 2001; Ishii, 1990; Potter, 1994; Sasaki & Nishiuchi, 2005; Takemura, 2009; Toyama, 2009). These studies, however, did not look deeply into students' awareness connected with their experiences of plant cultivation. For teachers, it should be vital to know what students were aware of on plant cultivation, given that flexible lesson plans are necessary to reflect students' actual state. The aim of this study was to investigate students' awareness and experiences on plant cultivation learning in technology education.

Method

Subjects

In February 2010, a survey was conducted with 153 7th graders (first-year junior high school students). All those students were on the register in one junior high school at Osaka prefecture.

Instrument

In the survey, we defined 4 words to questionnaire items for awareness on plant cultivation: Pleasure; Interest; Effectiveness; Importance. These form was a multiple-choice single response with five options: Definitely yes; Probably yes; Uncertain; Probably no; and Definitely no. We also defined the items on experience of plant cultivation.

Procedure

Students were asked for the survey by their technology education teachers during technology class. For computation, a 5-point scale was used to score every response: i.e., 5 points for “Definitely yes,” 4 points for “Probably yes” and so on in order.

Results and discussion

The means of all students for awareness level on plant cultivation is shown in Table 1. On all items, students' awareness levels were more than score of 3. Table 2 shows the students' experiences of plant cultivation. The number of students by number of experiences of plant cultivation is shown in Table 2-1. The number of students by recent experience of plant cultivation is shown in Table 2-2. Table 3 shows the students' awareness by experiences of plant cultivation. The difference of students' awareness on number of experiences of plant cultivation is shown in Table 3-1. The difference of students' awareness on recent experience of plant cultivation is shown in Table 3-2. Table 4 shows the number of students who experienced cultivation on each plant (Top 40). Table 5 shows the plants in order of number of students who experienced cultivation. The plants on open field cultivation are listed in Table 5-1 and 5-2. The plants on container cultivation are listed in Table 5-3 and 5-4. Figure 1 shows the result of cluster analysis.

Figure 1

Result of cluster analysis:

Types of plants by number of students' experiences of cultivation

Using a t-test, the difference between the two groups was tested for each item. Against any item that did not show a uniform variance of the mean value in magnitude, a Welch's t-test was performed. On all items, the awareness of students whose number of experiences of plant cultivation was 10 or over were significantly higher than that of students whose number of experiences of plant cultivation was up to 5 (Table 3-1). As a result, it was indicated that students who have many experiences of plant cultivation tended to have a higher awareness about pleasure, interest, effectiveness and importance on plant cultivation. The awareness of students who experienced plant cultivation within one year were significantly higher than that of students who experienced plant cultivation more than 1 year ago, on 3 items: pleasure, interest and effectiveness (Table 3-2). It was therefore indicated that students who had the experience within one year tended to have comparatively high awareness.

Because experiences of plant cultivation had an influence on students' awareness, we determined to grasp the structure of these plants. A cluster analysis by Ward's method was performed on the collected data through standardization (mean=0, standard deviation=1). Consequently, 40 plants were classified into 4 types. Figure 1 shows the plants that each type

includes. The A Type cluster included the plants, such as Morning glory; Tomato. Accordingly, the A type cluster could be explained as “Frequently cultivated plants particularly by container at both school and home.” The B Type cluster included the plants, such as Bitter melon; Cucumber; Eggplant; Strawberry; Tulip. Accordingly, the B type cluster could be explained as “Frequently cultivated plants particularly by open field at home.” The C Type cluster included the plants, such as Loofah, Rice plant, Sweet potato. Accordingly, the C type cluster could be explained as “Frequently cultivated plants particularly by open field at school.” The D Type cluster included the others. The D type cluster could be explained as “Several times cultivated plants.”

Conclusion

This study surveyed and analyzed students' awareness on plant cultivation learning in technology education. Our conclusions were given below:

1. It was indicated that students who had many experiences of plant cultivation tended to have a higher awareness about pleasure, interest, effectiveness and importance on plant cultivation.
2. Also indicated that students who had the experience within one year tended to have comparatively high awareness.
3. Forty plants that students had cultivated were classified into 4 types: the A type “Frequently cultivated plants particularly by container at both school and home;” the B Type “Frequently cultivated plants particularly by open field at home;” the C Type “Frequently cultivated plants particularly by open field at school;” the D Type “Several times cultivated plants.”

These findings demonstrated the need for the continuations of plant cultivation learning had an influence on students' awareness through elementary and junior high school. In next studies, we wish to examine the problem of cultivation skill of students in technology education.

Study on required abilities of interpersonal communication in manufacturing industries in Taiwan

Prof. Farn-Shing Chen¹, Yi-Chia Cheng^{2,*}, Lun-Chang Yeh², Tien-Hui Yeh²

1. Introduction

1.1 Motivation

What the interpersonal communication refers is the transmission of thoughts and ideas, and the behavior of understanding each other. In all occasions, when human beings have interaction, different opinions could happen. That's why we need negotiations. Good negotiations come from good communication competencies.

Chao (1995) pointed out that the twenty-first century is a "communication age." Gaps between people would be resolved by communication; the distance between countries would be also shortened by communication; and from interpersonal relationships to international negotiations or world trade, everything requires effective communication.

"Interpersonal communication" has become an academic subject in the modern workplace. Interpersonal relationships play a significant role. If there is no good interpersonal communication, interpersonal relationships are definitely poor.

Wood (2002) and Montgomery (1988) pointed out that relationships are the product of interpersonal communication, and the way of communication depends on the quality of interpersonal communication, Wang (1996) also found that interpersonal communication competencies will influence interpersonal relationship, and Cheng (2007) pointed out "meta-communication" in his book, *Interpersonal Communication in the New Theory - the Principles and Techniques*. He thought that all verbal or nonverbal communication acts include the side of "meta-communication", which means "read between the lines."

Interpersonal relationships and interpersonal communication are influential, when used in the workplace, the influence is evident. Whether getting together, different opinions, or communication with each other, we must rely on basic competencies such as listening, speaking, reading, writing and integrated abilities. Scholars from everywhere focus on this issue, and Devito (2007) also believed that the competencies of communication and of getting together with each other are very important among human beings. It is because that we need to communicate with ourselves and even to communicate with others. They are both important parts of developing interpersonal relationships.

Detroit and Mich (1999) had the sample of 1,000 employees from international interpersonal decision-making, interpersonal resources and global management companies. The results found that more than 30% people thought what a good director needs is have basic competencies, interpersonal competencies. Steers (1994) have suggested from his studies that

how important is effective communication as following four reasons:

- (1) Let our feelings and emotions be attached to the human body.
- (2) Affect the ideas, attitudes and behavior among people.
- (3) Through the use of formal communication channels, it helps strengthen the formal organizational structure.
- (4) Tools about activities to provide, receive, and exchange information with each other.

In brief, we have learned that interpersonal communication in the workplace employment is basic competencies. Therefore, the study will base on the concept of high-level technical practical employees in the manufacturing industries and discuss what communication competencies they need. The conclusions will provide institutes to cultivate talent pool in mechanical manufacturing industries and the indicators of communication competencies for freshmen.

1.2. Aims of the study

In this study, we will discuss senior technical staff of employment in machinery manufacturing industries whose interpersonal communication competencies required for the actual mechanical manufacturing industries by the practice-oriented concept of high-level technical employees, therefore, the purposes of the study include as the follows.

- (1) Find the meaning of interpersonal communication, and discuss the importance of interpersonal communication in the workplace.
- (2) Propose the required interpersonal communication competencies of high-level technical employees in machinery industries.
- (3) Induce the items and targets of required interpersonal communication skills for high-level technical employees in machinery manufacturing industries.

2. Literature

2.1 The theory of interpersonal communication competence

Spitzberg and Cupach (1984) mentioned that the individual not only effectively achieve his communication goals, but also rely on information conveying appropriate social behavior in the model of interpersonal communication competence theory. Therefore, the timing of communication between people is the key to achieve effective communication. Spitzberg and Cupach (1984) gave the definition of interpersonal communication competence as communication motivation, communication knowledge and communication skills of three parts; communication motivation and communication knowledge belong to personal inner competencies; and communication competencies belongs to the external behavior competencies. Also, Spitzberg and Cupach's (1984) model of interpersonal communication

competence theory mentioned communication motivation, communication knowledge, and communication skills need to take into account what the individual's internal needs and what the situational factors are. The communication goals must suit benefits to each other as well.

2.2 The definition of interpersonal communication

Spitzberg (1993) thought that people constantly change in the social environments, and work hard in maintaining relationships with each other. The success or failure of relationships is the competencies of interaction. Therefore, the better communication competencies people have, the better listening comprehension people have. Chen (2004) thought interpersonal communication is a meaningful process of communication. For individuals or groups in the communication process it is presented as an interaction and it exists a responsibility and significance in the process of communication. Sie (2002) mentioned interpersonal communication is the process of sending, and receiving and received information. Shu-Li Wang (2000) thought interpersonal communication is the appropriate use in the appropriate context. Daniel & Michael (1998) expressed the competency of communication is determined by the decision of each other, which involves knowing how to communicate, how to control the correct communication behavior, and who to react.

2.3 The motivations of interpersonal communication

Schutz (1966) believed the reason why people interact is to satisfy interpersonal needs, so he thought there were three motivations of interpersonal communication.

- (1) Control: the reason why people communicate is to influence others and to maintain personal power.
- (2) Inclusion: the reason why people communicate is to have more satisfying partnership and interaction.
- (3) Affection: the reason why people communicate is to maintain each other's love, worship and enthusiasm. People need to care about or be concerned about, to guide others or be mentored, and to deliver or receive emotions.

Because people have different experiences for the motivations mentioned above, Schutz (1966) combined personal differences in order to predict the situations for same people in different environments.

2.4 The types of interpersonal communication

According to the definitions of communication studies, we can induce the views of various scholars as the follows (quoted from Wang, 2000).

- Types of communication: include self-communication, interpersonal communication and

organizational communication; self-communication is the communication of talking oneself, and the basis of one's own cognitive activities; interpersonal communication is also called dyad. Everyone has opportunities to give feedback in the communication circumstances. It is also the most convincing one; and organizational communication aims to achieve the common goal of individuals and organizations, and to benefit to each other. The object is suitable for the formal collective communication behaviors in a large group.

- The number of persons in communication: include intrapersonal communication, mass communication, and interpersonal communication; intrapersonal communication refers to self-talking, self-suggestion and self-comforting and so on; mass communication refers to proceeding in large groups and the object is the general public; interpersonal communication refers to communicate in one to one or in small group.
- Happenings of feedback: include one-way communication and two-way communication; one-way communication means no response or feedback between each other and the point is the communicator emphasizes on delivering information or doesn't get information back after the reaction; and two-way communication means getting response or feedback between each other and the point is the communicator emphasizes on delivering and receiving information for others.

2.5 Principles of interpersonal communication

Rudolph & Kathleen (translated by Duan-Jhen Zen, Ling-Min Zen, 2000) thought interpersonal communication included four follows.

- Continuity of interpersonal communication: the communication can be verbal and nonverbal, and it often continuously deliver message which people inferred or defined.
- Coding of interpersonal communication messages: the interpersonal communication between people is purposive, however, when communicators were aware of the purpose is different from each other.
- The purpose of interpersonal communication: the chat between people is a purpose, whether it is meant to be noted by those who communicate.
- The relationship of interpersonal communication: the interaction involves two levels. One is present in the emotions; the other is who the controller is. People decide who gets more power in the communication.

Therefore, one may dominate the communication when the other is dominated. When a person wants to control, the other could ensure his own power. Or when one wants to give up power, the other doesn't want to take responsibility. Through verbal and nonverbal communication behavior, it defines and clarifies the relationship of complementary or symmetrical nature. Complementary relationship happened less conflict, but the symmetrical relations happened more equal power.

2.6 Functions of interpersonal communication function

As above mentioned, Wilmot (1987) pointed out that interpersonal communication contains five features:

- (1) The main function of interpersonal communication is to achieve self-expression, interpersonal relationships and instrumental goals.
- (2) Interpersonal communication allows us to define ourselves in the eyes of others.
- (3) Interpersonal communication provides a social structure. Through interaction, people created standards of behaviors, the system of interpersonal role, and criteria to assess the standards of behaviors.
- (4) Interpersonal communication can link to other social systems. Messages can be conveyed through different media, and one of the important medium is interpersonal communication.
- (5) The main purpose of interpersonal communication is to suit interpersonal needs. Needs is the main desire of our lives, and the involvement of others becomes our social needs.

A complete function of interpersonal communication is listening, speaking, reading, writing and integrated abilities. They are all close to our life. In any workplace, communication must rely on the above features. We can cultivate a good relationship by adjustment and practice.

2.7 The criteria to assess interpersonal communication

We induced many views of various scholars in the literature about communication, and found that the following three criteria which get the greatest support from theoretical and empirical researches are suitably applied to interpersonal situations, and they are representatives about communication competencies. The three criteria assessment as follows (Rebecca, 1997; Stephanie, 1998):

- Appropriateness: the degree which communicators achieve goals through the appropriate Interaction.
- Effectiveness: to achieve the purpose of conversation.
- Adaptability: the abilities of changing behaviors and aims to meet needs. It includes six elements as appropriate disclosure, wit, articulation, social composure, social experience and social confirmation.

2.8 Relations between workplace and the competencies of interpersonal communication

In many studies, all of them have expressed similar literature, such as Luo's (2005) "research on the playfulness and interpersonal communication competence of the accountants in elementary schools" indicated that the accountants had above the average level of

playfulness and interpersonal communication competence. The accountants were found to have higher-than-average playfulness and good competencies in interpersonal communication. In the playfulness survey, respondents got the highest scores in the statement “find pleasure in it” and lowest scores in “retaining a childish heart and having fun.” In the survey for interpersonal communication competencies, the highest scores went to “articulation” while the lowest went to “wit.” Non-full-time staffs presented better “composure” and “articulation” than full-timers. “Overall playfulness” and “appropriateness” presented a highly direct relevance and “overall interpersonal communication competencies” and “physical and mental relaxation, being humorous and carefree” presented a highly direct relevance. The relevance between “wit” and “physical and mental relaxation, being humorous and carefree” was evident. “Physical and mental relaxation, being humorous and carefree” was the most effective factor in predicting the levels of “appropriateness,” “wit,” “ferventness,” “maturity,” and “overall interpersonal communication competencies.”

Zong-Ting Zuo’s (2007) “the relationship between interpersonal communication competence, conflict management styles and training needs among semiconductor industry employees” showed that “interpersonal communication competence” and “conflict management styles and training needs” showed a significantly negative relevance.

Gan-Chieh Fan’s (2007) “an investigation study for the required academic insurance knowledge and personal abilities for staffs in insurance company” concluded that not only keep learning in professional skills, but soft skills are just important as professional skills. The top 5 soft skills are communication, AQ, positive attitude, EQ and ability to work as a team. Appropriate classes such as professional moral behavior, EQ, emotional behavior are suggested to offer in school. And top 5 licenses are Investment-Linked Insurance Sales Agent, life insurance agent, property insurance agent, underwriting & claim committee of life insurance, and financial planner. However, entry level in actuarial license is higher, it is not necessary for insurance consultants. On the other hand, if insurance consultant is able to obtain such license, his/her career will excel others in very short time.

Tz-Yu Lin’s (2008) “a study on the relationship among degree of expertise, interpersonal communication and creativity—with academic institute researchers as an example” showed it had partially relationship between “expertise and creativity”, and “interpersonal communications and creativity”, so postgraduate ought to enhance their expertise and interpersonal communications, then their creativity should be risen.

2.9 Foreign definition about interpersonal communication competence

Effective communication is essential to workplaces, communities, and families. Employees with positive communication skills contribute to organizational productivity, enhance interpersonal relationships with coworkers and clients, and create opportunities for promotion and advancement (ITAC). According to various literature reviews, we can develop

communicative indicators for high-level technical employees by the principles of interpersonal communication, functions, criteria, and types. This study uses core competencies of ITAC as references.

Ohio Department of Education proposed integrated technical and academic competencies (ITAC) which career-focused education needs in 1999, integrating academic, technical, getting-a-job knowledge, skill, and attitude. Core ITAC includes six standards, each of which has competencies and key indicators, and “communicating effectively” is included of them. Here are competencies of “communicating effectively” (ITAC, 1999):

- Application of basic communication skills
- Application of oral communication skills
- Application written communication skills
- Writing Applications Technology
- Application of listening skills
- Application of a speech or presentation skills
- Application of graphic communication skills
- Communication skills of Applied Arts
- Application of Multimedia Presentation
- Build graphics and charts
- To establish a personal relationship

Besides, Carnevale, Gainer, and Meltzer said, “on the job, workers spend an average of one and a half to two hours per workday reading forms, graphs, charts, schematics, manuals, and computer terminals” (1990). Whether included as an extension of recognized basic skills (Herman, Bramucci, and Litman, 2000; SCANS, 1991) or as an essential skill in its own right (Carnevale, Gainer, and Meltzer, 1990; HRDC, 2001), the skill people use when they work with workplace graphics such as charts, graphs, tables, forms, flowcharts, diagrams, floor plans, maps, and instrument gauges (the Work Keys Locating Information skill) is increasingly recognized as a basic skill. Under the “Reading” basic skill of the Secretary’s Commission on Achieving Necessary Skills (SCANS), the skill “locates, understands, and interprets written information in prose and documents--including manuals, graphs, and schedules--to perform tasks” is included. In addition, the report states that the skill includes the ability to use “tables, graphs, diagrams, and charts to obtain or convey quantitative information” (SCANS, 1991). In their “list of categories of academic and employability knowledge and skills identified as part of the NSSB Common Framework,” the National Skills Standards Board (NSSB) states that part of the reading skill is the ability to “understand and use written information that may be presented in a variety of formats, such as text, tables, lists, figures, and diagrams...” (Herman, Bramucci, and Litman, 2000).

According to the literature views, this study induced five categories which are listening,

speaking, reading, writing and integrated abilities. We could find good communication skills are positively related to good working emotions, ability of getting along with others, and working effectiveness from above literature. Also, if employees have good listening, speaking, reading, writing and integrated abilities, they work effectively in the workplaces.

3. Method

This study focused on understanding required interpersonal communication competencies in workplaces. We used some approach as follows:

- Document analysis: according to the purposes of the study, we emphasized on literature about interpersonal relationship competencies in workplaces to collect, analyze and synthesize.
- Focus Groups: it is the most effective way to use the discussion of the group to collect information by the group leader. Hence, inviting experts to focus on communication competencies in manufacturing industries is the most effective way to build up competencies and indicators of communication. We invited six members in the group that includes two experts in academic institutes of vocational education, two experts in manufacturing industries and two experts of linguistics. First, explain the purpose of this study and give related information by a brief description; secondly, ask experts to discuss and correct interpersonal communication competencies and key indicators in listening, speaking, reading, writing and integrated abilities; finally, integrate experts' opinions and suggestions to confirm interpersonal communication competencies and indicators.
- Delphi Technique: The Delphi Technique was originally conceived as a way to obtain the opinion of experts without necessarily bringing them together face to face. First, we must determine the topics, and then develop the questionnaire by the literature and topics. The study wants to build up the competencies and indicators by the Delphi Technique.

4. Findings

We invited six members in the forum that includes two experts in academic institutes of vocational education, two experts in manufacturing industries and two experts of linguistics. The forum was held to determine how to define what abilities of interpersonal communication employees need in the workplace. The summary of the forum is as table 1.

Effective communication is essential to workplaces. If employees have positive communication skills, they will contribute to organizational productivity, enhance interpersonal relationships with coworkers and clients, and create opportunities for promotion and advancement. Therefore, most experts focus on abilities of "comprehension" of listening and reading, abilities to make a summary which belong to writing, and abilities to speak clearly and correctly; the abilities almost include that comprehending supervisors' or

customers' needs, clarifying messages received, selecting proper communication language and tools, conveying correct information to the target person, communicating basic messages in a language other than Chinese, and overcoming communication barriers and so on.

Table 1

The summary of the forum

communication competencies	
A	<ol style="list-style-type: none"> 1. Abilities of communication and coordination with customers 2. The main barrier of communication is to "comprehend" what customer needs. 3. Employees need adequate abilities to read manuals.
B	<ol style="list-style-type: none"> 1. Employees should have abilities of "reading comprehension" about projects and manuals. 2. Employees should have abilities of "listening comprehension" about what technical terms supervisors give. 3. The parts of "listening" and "reading" should be provided for basic staff, and the parts of "speaking" and "writing" should be provided for management staff. 4. Cultivating patience of listening is required.
C	<ol style="list-style-type: none"> 1. Employees should have abilities of using graphics and charts to explain professional data. 2. Employees should have own abilities of listening, speaking, reading and writing. 3. Reading and writing belong to the linguistic part, and listening and writing belong to operation in practice.
D	<ol style="list-style-type: none"> 1. Listening, speaking, reading and writing should be defined to two parts. One is for face-to-face, and the other is through the media. 2. Effective communication is to achieve consensus.
E	<ol style="list-style-type: none"> 1. Listening, speaking, reading and writing are all-round education. 2. Listening, speaking, reading, writing and integrated abilities should emphasize on respect, listening, and styles of speaking. Speaking skill is required. 3. Employees should have abilities to write down the key points and make a summary of what people say, and clearly express the content or edit the brochure from the information.
F	<ol style="list-style-type: none"> 1. Employees should have abilities to explain the steps of operation. 2. Employees should have abilities to speak out and read out technical terms in foreign language on manuals.

5. Conclusions

In this study, we used document analysis and interviews for the purpose of this study, and discussed related required interpersonal communication competences for high-level employees in workplaces. We found communication competencies should include listening, speaking, reading, and writing abilities. We also developed the following abilities of high-level technical employees after experts' discussions:

- Listening: high-level employees should have abilities to correctly evaluate, organize, identify, and master the content, process and steps of operating functional equipment. Besides, employees should have abilities to get the points from listening to machinery and equipment manuals or briefs; of course, foreign technical terms should be followed.
- Speaking: high-level employees should have abilities to correctly express and explain content of the manuals including foreign technical terms, characteristics and life cycles

of equipments, and details of management.

- Reading: high-level employees should have abilities to correctly read devices, related professional terms, papers, and manuals; of course, foreign technical terms should be followed.
- Writing: high-level employees should have abilities to correctly draw procedures of operation and motors, to use technical terms, to edit working plan, to decide what graphics, diagrams, and drafts to illustrate content of work, and to present products by papers.

6. Recommendations

Interpersonal relationship and communication has significant influence to the practical work from the literature reviews. The better people interpersonal communication competencies are, the better interpersonal relationships are. Thus it may be known that if employees want to have good performance in workplaces and get supervisors' identification, you must have good communication competencies.

Currently there are no communicative indicators for high-level technical employees in manufacturing industries. The study expects to provide communicative indicators to check if new employees have such basic competencies, and to guide courses of academic institutes as references.

Models of English Teaching Design for Future Employees in China's Petroleum Production Industry

Guo min

Xu yuan na

Northeast Petroleum University School of Foreign Languages

Daqing City, Heilongjiang Province, China

[Abstract] Models of English teaching in non-native English speaking countries are very important in English Education, especially in the discipline of teaching English as a second language. In China, English is widely used, therefore English teaching design requires more specificity, especially for special purposes such as teaching English for industrial workers. A number of successful models used in western countries are good references for English teaching in Chinese petroleum production areas. Experience indicates that the “1+1 model” is an effective approach for teaching future oil field workers.

Here the “1+1 model” means a two-year college English study; in which the first year is designed for acquiring basic knowledge, the teaching form being mainly classroom teaching and the second year designed for site training and practices in oil fields. The model follows four basic principles: establishing a target, cultivating standards, designing and following a process, and effective evaluation. Additionally, cooperative teaching and effective learning are encouraged in this model.

Transitioning to the “1+1 model” requires not only a change in teaching methods or means, but also a philosophical shift in the concept of English instruction, that is, a move toward the realization of a “student-centered” approach, emphasizing self-study and the acquisition of practical skills. The first part of the paper is the main theory of teaching models and briefly discusses some teaching models in other countries, such as Australia's Technical and Further Education, Competency Based Education, etc. The second part describes the design of the “1+1 model” for the teaching of English to oil industry workers. The third part details the conditions the model needed for implementation and describes a method for evaluating the model.

[Key words] Petroleum Production Industry; Future Employees; Models of English Teaching;

1. Theory

China's petroleum production industry is flourishing quickly, with increasing interest in communication with foreign countries, versatile persons especially who can grasp foreign language are needed urgently. That needs a good teaching system, English teaching design comes first.

1.1 Definition of models

A model is an example of the target language a teacher shows learners to help them notice language patterns, or to encourage them to imitate. This could be a sentence, a model of an intonation pattern, or an entire text, such as an example of a writing genre

[1]. A model of teaching is a description of a learning environment, including our behavior. These models have many uses, ranging from planning lessons and curriculums to designing instructional materials, including multimedia programs^[2]. The model here means a two-year college English study; in which the first year is designed for acquiring basic knowledge, mainly with the form of classroom teaching and the second year designed for site training and practices in oil fields. The model observes four basic principles: establishing a target, cultivating standards, designing and following a process, and effective evaluation. Additionally, cooperative teaching and effective learning are encouraged in this model.

1.2 Some teaching models in other countries

1.2.1 The Australia's Technical and Further Education, TAFE

Australia's technical and further education (TAFE) system, which offers a wide range of courses providing education and training for employment at the operative, trade, and paraprofessional levels, as well as general education and literacy programs^[3]. Individual TAFE institutions (usually with many campuses) are known as either colleges or institutes, depending on the state or territory. TAFE colleges are owned, operated and financed by the various State and Territory Governments. This is in contrast to the higher education sector, whose funding is predominantly the domain of the commonwealth government and whose universities are predominantly owned by the state governments^[4]. The characteristics of TAFE is practicability, short term and low tuition fee, curricula cover all areas and with flexibility. The most important is that its curricula can fit in with the need of the market; it symbolizes the most advanced technological requirements; state government' supports make it have great advantages to guarantee the teaching quality.

1.2.2 Competency Based Education, CBE

Competency-based Education is defined as an instructional system in which competency training is at the top place, it aims to provide students with the knowledge and skills. It focuses on learner performance in reaching some specific objectives. Competency Based Education focuses on outcomes of learning. CBE addresses what the learners are expected to do rather than on what they are expected to learn about. CBE emerged in the United States in the 1970s and refers to an educational movement that advocates defining educational goals in terms of precise measurable descriptions of knowledge, skills, and behaviors students should possess at the end of a course of study^[5]. CBE is a functional approach to education that emphasizes life skills and evaluates mastery of those skills according to actual learner performance. It was defined by the U.S. Office of Education as a "performance-based process leading to demonstrated mastery of basic and life skills necessary for the individual to function proficiently in society" (U.S. Office of Education, 1978). The superiority over other approach is its competency meanwhile its emphasis on students' self study and evaluation. Although the above two each has its own background, it also has something in common, that is, practice comes first.

2. "1+1" model of English teaching design

2.1 Training goal and requirements for future employees in China petroleum

production industry

In broad sense, training goal is to transport qualified students to enterprises or companies. Qualified students here mean that they are not only qualified for their major but also for the second language, English. It is a professional training model in campus or classroom. Teachers or instructors pay more attention to their competence or ability training in their future job on the base of grasping their basic knowledge. In some way, we can say the training goal is a double aim, which symbolizes both professional knowledge and ability. Training requirement is a kind of quality control. “*University English Curriculum Teaching Request*” (issued by Department of Higher Education of China, 2007) stipulated explicitly that the purpose of university English teaching is to cultivate students’ ability to use English, especial in listening and speaking, so that they can use English effectively in their future study, work, while enhancing their self study ability and literacy level to adapt to China’s social development and international communication; to cultivate students’ ability to read, write and translate so that they can use English to exchange information. That is to say, as a student, you need to learn how to use English and can communicate with others in English. Different stages have different requirements. There are three-level requirements, elementary level, intermediate level and the advanced level requirements. These three requirements include English language knowledge and practical skills, learning strategies and cross-cultural communication and other aspects. Students are required to improve their listening comprehension, oral expression, reading comprehension, writing ability and translation. Take Daqing Oil Field (Heilongjiang Province) as an example, Daqing is the biggest oil field in China, is also one of the few largest sandstone oil fields in the world. Daqing Oil Field insisted on talents’ first, science and technology is at the top of its developmental strategy; human resources achievement as its first resources. One of the developmental strategies to construct international competitive transnational enterprise groups is talents’ training. According to survey, Daqing Oil Field has a set of talents’ training system, for example, it has “professional instructors” mechanism, professional instructors are experts in oil field; sign training agreement with young technicians; different training subjects, etc. It works well, but in some way, it is a big cost, it can not satisfy all the needed posts, especially the post related to using English language. University and enterprise cooperation is a good choice. It paves a good way to English teaching design. Not only does Daqing Oil Field need talents with excellent English, but also other oil fields need talents for their development. China petroleum industry needs someone who knows not only his career, his specialty, but also his English proficiency.

2.2 “1+1” models

2.2.1 Definition

In most universities in China, the subject, English is taught through all the four years, two-year-basic English, two-year specialized English. “1+1” models here mean one-year the basics of English learning which including listening, speaking, reading and writing; one-year language training, two years study and practice is a cycle. The first year is module 1 and the second year module 2. According to the syllabus in our

university, students need to fulfill requirements in general level during the first year; teachers pay more attention to students' basics of English. The second year is to improve their comprehensive ability to use the language. It cycles. The third year is a new start, but it has differences in curriculum. It comes to a higher level, the fourth year, the highest level.

2.2.2 Training process

From general level to the highest level, training process is very important. Module 1 is mainly carried out in classroom. According to the requirement for future employees, we need to establish corresponding teaching models. First, we establish experimental class A and B at random; meanwhile choose some control classes to contrast. Experienced teachers are chosen to become an experimental team. The curriculum of experimental class A and B is set according to training modules, which feature with task-based, double-targeted language teaching.

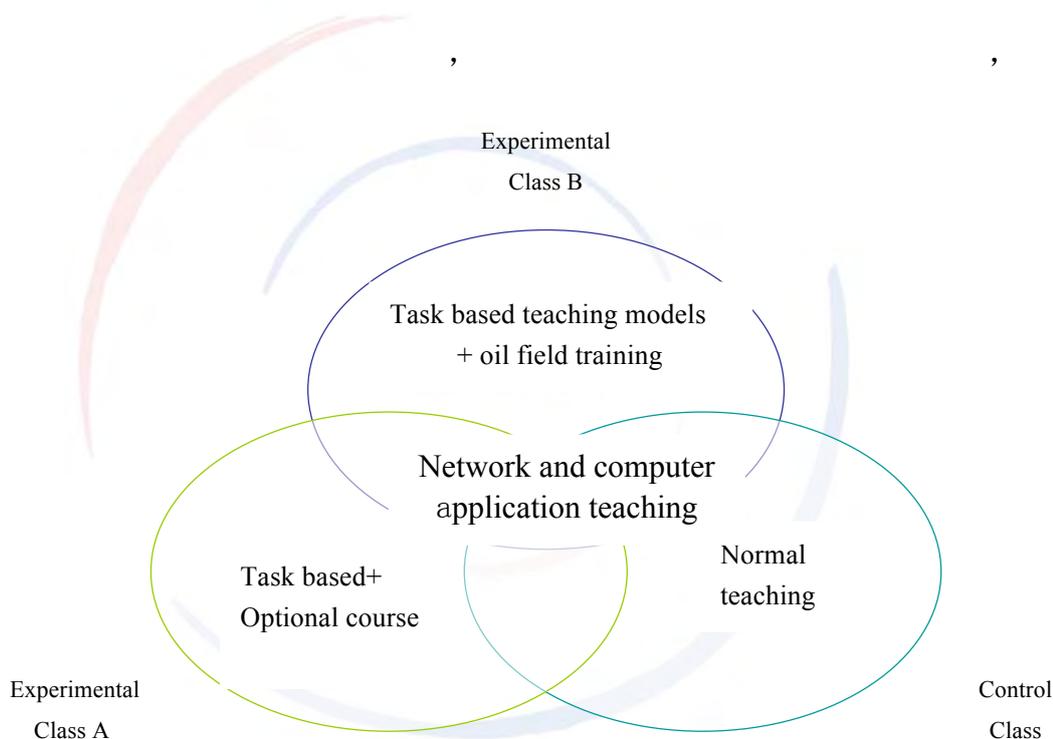

Figure 1

Computer Networks and Internet have been growing rapidly in China. They play a key role in all aspects of modern society including, of course, language education. In Figure 1, no matter in which class, networks and computer application teaching method is used, which makes language teaching more efficient. In control class, normal teaching model is used as other normal classes, in which computer networks and internet are not used in teaching. The advantages of using networks and computer application teaching are that students and teachers are free to log on the course at any time and anywhere. In experimental classes, language learning is divided into two

parts: one is viewing, listening and speaking; the other is reading, writing and translating, all the learning activities and practices can be done in campus local area network. We use front text books which online courses are included, students become the center of the class. In experimental class A, there is an optional course for students; in experimental class B, students have access to training in oil fields. Then we set up a set of files for each student, then compare the experimental results, meanwhile set up a set of teaching system, which including students' study, self-assessment, evaluation from faculty, teaching effects and training effects, etc. Module 2 is mainly stressed on the cooperation between campus and enterprises. The key point is to establish a set of cooperating mechanism. Selecting a training center in Daqing oil fields, a series of teaching and training criterion, quality control and evaluation system are built according to enterprise personnel standard and evaluation criterion. For example, language training in experimental class A is mainly hold in site for extemporaneous translation and language laboratory simulation training; but in class B, there is .only language laboratory simulation training. Procedural and terminating evaluation is used here. So teaching design is critical to the whole teaching process. Teaching design needs to act according to the different knowledge type and different class to carry on. The modern cognition psychology summarizes the knowledge for declarative knowledge, procedure knowledge and strategic knowledge, different knowledge type need different teaching design. It is critical that teachers train first.

2.3 Implemental condition and evaluation

2.3.1 Implemental condition

It is critical that school authorities support the program, with the supervision and support from school and the active participation of enterprises, the oil field teaching modules can be guaranteed. Most of all, experimental classes should be equipped with experienced teachers who are trained in advance. We chose 4 teachers of different age group, two of them have site translation experiences; one is good at oral expressing; one has the experience of studying abroad. The four are all good at language theory and computer networks.

2.3.2 Teaching assessment

Teaching is a complex and personal activity that is best assessed and evaluated using multiple techniques and broadly-based criteria^[6]. Teaching assessment is a broad term that includes testing, it is an assessment of whole teaching activity. Effect on teaching is mainly discussed here, which is carried out by formative assessment and summative assessment. Formative assessment of teaching can be carried out by teachers and instructor in site, for example, put questions to students in classroom, give students assignment regularly, a quiz, unit examination, etc. The purpose of assessment is for instructors to find out what changes they might make in teaching methods or style, course organization or content, evaluation and grading procedures, etc., in order to improve student learning^[6]. Summative assessment is to measure learners' achievement. The purpose is to form a judgment about the effectiveness of a course. In our university, each academic term should have a test. We design different assessing ways in general, such as appraisal designs between students, students to teachers, student's self-appraisal, teacher's self-appraisal, enterprise to university. The

most important is to react positively to the feedback from all the assessment.

3. Conclusion

“1+1”model of English teaching design is just a point by contrast to education. It is a try to design oil-field teaching models in university. It can connect campus and enterprises together. Other countries success in training talents enlighten us that education is a big project, it needs government’s support and participate, it needs support from different communities.

Tacit Learning for Women's Career Development to the School Superintendency

Yong-Lyun Kim
Hankuk University of Foreign Studies

Career development can be defined in two primary ways: 1) as the type of formal education and preparation a person receive, and 2) as the type of informal learning (tacit learning) a person gains through career experiences and professional relationships. Using these definitions, the purposes of this study are: 1) to investigate the effect of career mobility factors on women school administrators' career development and 2) to identify how the relationship between the factors and women's career development varies across two participant groups – aspiring and non-aspiring women central office administrators for the superintendency. For the data analysis, this study employs Structural Equation Modeling (SEM) statistics. As a conclusion this study confirmed that tacit learning from direct job experience and indirect experience gained from professional relationships has a greater effect than formal education and training on women's career development. This effect of the factors, however, varied according to their aspiration to the superintendency.

The literature focused on gender issues in the school superintendency has been growing for two decades. Tallerico (1999) divided studies of women and the superintendency into three categories: profiles, patterns, and practice. These categories respectively identify the 1) disproportionate numbers of women to men superintendents, 2) different career pathways (pipelines) of women superintendents as contrasted with their men counterparts, and 3) limitations facing women who wish to be superintendents. With the issue of women in the superintendency many studies have produced findings related to job characteristics, leadership styles, and the professional perceptions of incumbents rather than issues related to career development to the superintendency (Maienza, 1986; Brunner & Grogan, 2007). In particular, studies that identify the relationship between determinant factors and women's career development are rather unusual.

Kim and Brunner (2009) found that women travel career pathways to the superintendency are different from men's pathways. While many men administrators work in line-role positions and move vertically up to the superintendency, women generally travel through staff roles and their career mobility patterns are more often horizontal. Discussions of the different career paths taken by women begin to touch on the topic of career development, but rarely do these discussions note the variations in the women's preparedness for career development such as formal and informal learning. With a blind eye toward the question of what constitutes superior preparation, differences between one who are in the superintendency and the other who are school administrators (except superintendents) could result in explicit variation in preparation profiles and candidates' capacities for superintendency positions. In order to provide fuller explanations regarding whether variation in career mobility patterns affect women's movement into the superintendency, research must be focused on factors of career development and their possible relationship to superintendency access.

Career development can be discussed in two primary ways: 1) as the type of formal education and preparation for a career that a person receives; and 2) as the type of informal learning related career experiences—experiential, or tacit learning—a person encounters (Nestor-Baker & Hoy, 2001; Reber, 1989; Wagner, 1987; Wagner & Sternberg, 1985). Formal learning, such as educational credentials is generally assumed to have a positive impact on career development, especially on entry levels of career mobility (Bills, 1988; Spilerman & Lunde, 1991; Useem &

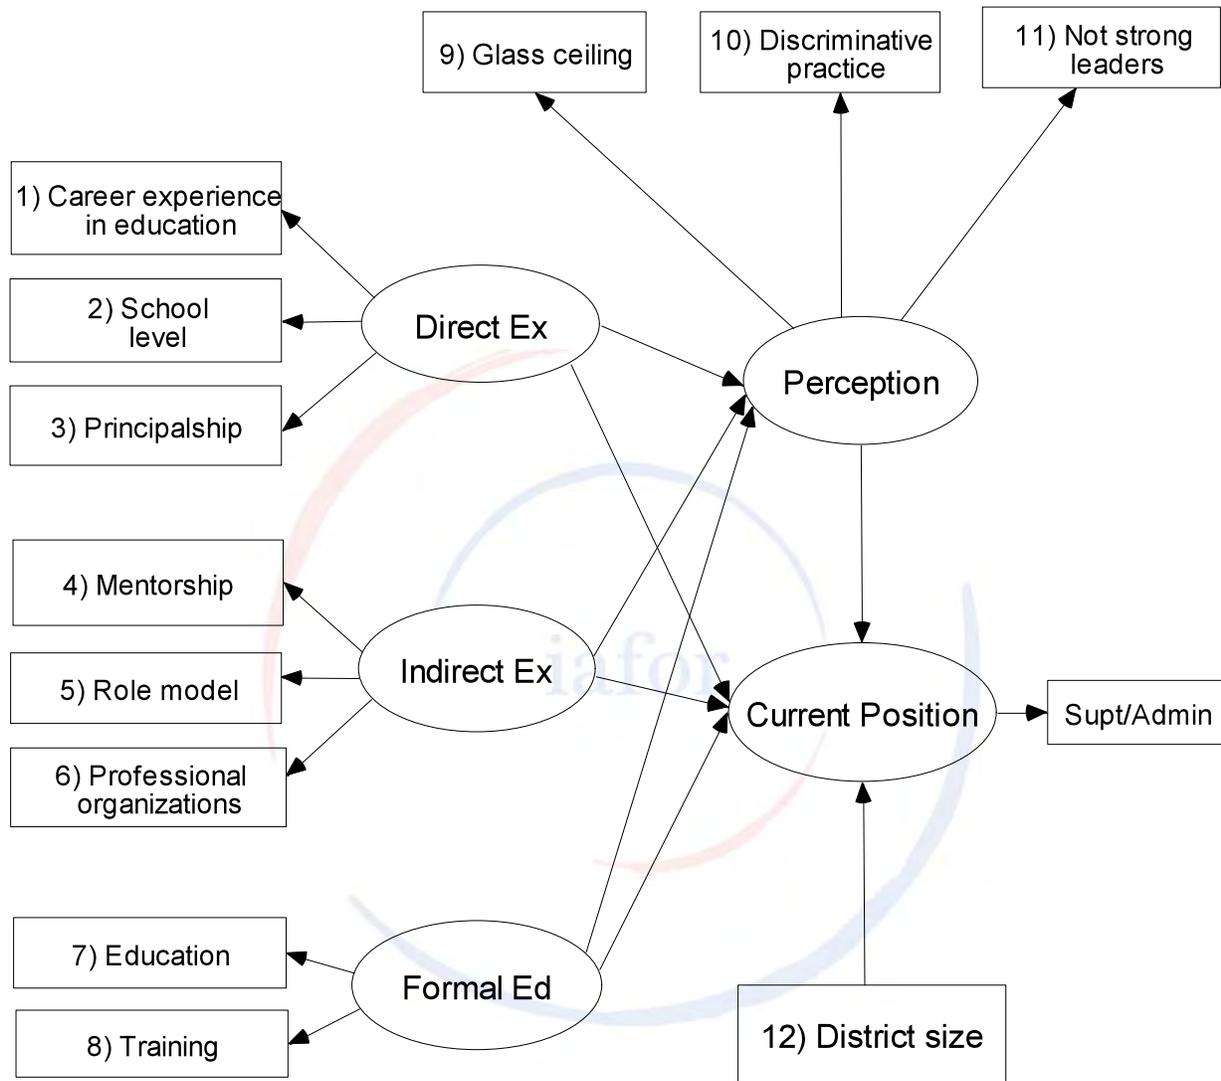

Karabel, 1986; Wernick, 1994). However, it is not clear whether this factor has a consistent impact on the processes of career mobility toward top leadership positions such as school superintendency.

As informal learning, the acquisition of tacit knowledge has been perceived to make a difference in the effectiveness of leadership practices as well as the process of career development (Bjork & Mueller, 2006; Reber, 1989; Wagner & Sternberg, 1985). The focus of the studies has been to confirm the sources and means of the acquisition of tacit knowledge; how tacit knowledge could be acquired from real-world experiences (Bjork & Mueller, 2006; Nestor-Baker & Hoy, 2001; Reber, 1989), rather than tacit knowledge itself; what kind of tacit knowledge is exactly needed for leadership practice and career development. This study also consider the acquisition process of tacit knowledge as one way of informal learning which constructs a knowledge structure with regards to career development.

This study aims to investigate what kinds of preparation and experiences (career mobility factors) make a difference between women superintendents and women central office administrators (including aspiring and non-aspiring women administrators to the superintendency) in their career development. In addition, this study identifies how the relationship between career mobility factors and women's career development varies across the women's groups whose aspirations to the superintendency differ. For this purpose, career developmental factors will be investigated by comparing women superintendents, first, to aspiring women central office administrators, and second, to non-aspiring women central office administrators. The analysis of this study employs four conceptual career mobility factors: 1) *direct career experiences on the job*, 2) *indirect career experiences from professional human relationships* – these two career mobility factors concern tacit learning, 3) *formal education and training* – this factor relates to formal learning, and 4) *personal perceptions of discrimination in the selection and hiring processes*¹ – this is a factor which may or may not mediate the relationship between other mobility factors above and women's career development.

¹ For distinction from general descriptions, career mobility factors and indicators of this study are marked with italics throughout the whole paper.

Figure. Initial Model of Hypothesized Relationships between Career Mobility Factors and Women’s Career Development

Variable Label & Name

- 1) Career experience in education
- 2) School level of first administrative position
- 3) Principal experience
- 4) Mentorship
- 5) Role model
- 6) Professional organizations actively belong
- 7) Education - highest academic degree
- 8) Professional training experience
- 9) Perception of glass ceiling in selection
- 10) Perception that school boards do not actively recruit women
- 11) Perception of school boards that women are not strong leaders
- 12) District size

Data Source and Research Design

Data Collection

The database of American Association of School Administration (AASA) membership and Market Data Retrieval (MDR) were combined to ensure that the surveys reached both AASA members and non-members. The whole population of 2,500 women superintendents mailed surveys. In addition, 3,000 women holding (school district) central office positions of assistant superintendent or higher were randomly selected from the combined database and mailed surveys in August 2002.

Approximately 5,500 surveys were mailed to samples and 1,301 completed surveys were returned (23.7 percent of return rate): 723 superintendents (28.9 percent of return rate) and 578 central office administrators (19.3 percent of return rate). Nearly 30 percent of the total population of women superintendents is represented in this study, while approximately 20 percent of women central office administrators in the sample is represented.

Analysis and Hypotheses

This study investigates the relationship between career mobility factors and women's career development toward the school superintendency. Structural Equation Modeling (SEM) is used to identify the indirect effect which may occur via mediator factor (*personal perception of discrimination* in the study) as well as direct effect of the factors on women's career development.

The data collected from the survey was entered into the Statistical Package for Social Sciences (SPSS) 15.0 software for descriptive analysis, and the statistical software program of Analysis of Moment Structures 7.0 (AMOS) for inferential analysis. To compare group differences, the present study conducted three structural equation modeling (SEM) tests with the same predictors (the four conceptual factors and one controlling variable – district size) but with different dichotomous dependent variables, three combinations of women's groups: Group A includes women superintendents and overall central office administrators including aspiring and non-aspiring women administrators to the superintendency. Group B consists of women superintendents and aspiring women central office administrators, and Group C includes women superintendents and non-aspiring women central office administrators.

The research hypotheses are grounded in two primary assumptions about women's career development and the four conceptual (latent) career mobility factors. First, the study assumes that four conceptual mobility factors directly relate to women's career development. Second, the impact of the factors associated with learning preparedness could be influenced by personal perception of discrimination in the selection and hiring processes. Thus, women's personal perception functions as a mediator variable in the relationship between career mobility factors (learning preparedness) and women's career development. The hypotheses based on these assumptions follows:

- Hypothesis 1. Direct effect – four latent factors are directly related to the current administrative position of women (being a superintendent or central office administrator).
- Hypothesis 2. Indirect effect – the statistical effects of *direct experience*, *indirect experience*, and *formal education and training* on women's career development are mediated by *personal perception of discrimination in the selection and hiring processes*.
- Hypothesis 3. Group differences – all relationships and effects of career mobility factors

vary across the three targeted groups of this study; superintendents, aspiring women administrators, and non-aspiring women administrators.

The result of CFA attested the validity and reliability of the model (Kline, 1998). CFA is generally used to determine the quality and dimensionality of scale and statistical model construct in terms of face validity, reliability, and internal consistency (Harms & Biocca, 2004). The CFA result of this study with 11 indicators revealed all acceptable values across the indices of the model fit: $\chi^2 (29) = 54.0$ ($p < .05$, Joreskog's value = 1.9)²; GFI = .99; NFI = .96; CFI = .98; RMSEA = .03. One thing that should be notified is that the indicator of *role model* is excluded from the analysis because of the low factor loading (-.2.5) that could cause serious damage to model construct validity. Finally, the 11 variables of the structural model were used for subsequent analyses in this study.

Results

For hypothesis 1, the model tested linear relationships between the career mobility factors and women's career development (being a superintendent or a central office administrator), controlling for *district size*. The same model but with different group combinations tested hypothesis 2 and 3. For hypothesis 2, both direct and indirect effects of the factors were checked across three model tests. As the last step of the analysis, hypothesis 3 was tested by comparing the group of women superintendents to aspiring and non aspiring women central office administrators.

Direct Effects of Career Mobility Factors

Hypothesis 1. Four latent factors are directly related to the current administrative position of women (being a superintendent or central office administrator).

All values of the model fit indices in this model test were acceptable: $\chi^2 (45) = 150.8$ ($p < .001$, Joreskog's value = 3.4); GFI = .98; NFI = .92; CFI = .94; RMSEA = .043. Examination of beta coefficients indicated that three career mobility factors, including *direct experience on the job*, *indirect experience from human relationships*, and *personal perception of discrimination in selection processes*, had significant direct effects on women's career development (see Table 2). More specifically, among the factors in this analysis *indirect experience* had the strongest positive effect on women's career development ($\beta = .18$, SE = .43, $p = .014$), whereas no significant effect of *formal education and training* was found ($\beta = .10$, SE = .13, $p = .101$). This result pointed out that the two groups (women superintendents and women central office administrators) had an obvious difference in terms of human relationships for career

² Note that a Chi-square statistics of 54.0 on 29 degrees of freedom in this CFA has a small p-value indicating some lack of fit. However, because the chi-square test of absolute model fit is sensitive to sample size of the input variables (Weston & Gore Jr., 2006), investigators often turn to various descriptive fit statistics such as NFI and CFI to assess the overall fit of the model. According to Joreskog (1969), one way to address the concern about chi-square being sensitive to sample size is to divide the obtained chi-square by its respective degrees of freedom, and the outcome should generally be less than 5. For this CFA model the calculation yielded the acceptable value (1.9). χ^2 s throughout the analyses in this study (the model tests for Group A, B, and C) have the Joreskog's values that are all less than five.

development (*indirect experience* which were measured by *mentorship* and *professional organization experience*). However, formal education measured by *highest degree* and *training experience* was not a significant factor in this study, which means that women central office administrators had about the same level of education and training experience as did the women superintendents, so this factor did not explain well the variation of career difference between the groups.

Thus, partial support was provided for hypothesis 1, where *indirect experience* and *direct experience* had positive effects on women's career development, while personal perceptions of discrimination had a negative effect on career development ($\beta = -.10$, $SE = .03$, $p = .000$). In more general terms, the more indirect and direct experience women administrators have, the greater their job opportunities for the superintendency, and the lower their perceptions of discrimination, the more likely they will gain the superintendency. Also, this study found no significant difference in *formal education and training* between the groups.

In addition, a strong negative effect of *district size*, the controlling variable, on the women's career development was found ($\beta = -.39$, $SE = .007$, $p = .000$), indicating that while women central office administrators generally work in large school districts, women superintendents have their current positions in comparatively small school districts. Finally, an examination of the squared multiple correlations ($R^2 = .291$) indicated that four career mobility factors and district size accounted for 29.1 % of the variance in women's career development (being a superintendent or a central office administrator) in this model test for Group A.

Table 1. Direct, Indirect, and Total Effects of Career Mobility Factors

	Variable Name	Direct Effects	Indirect Path	Indirect Effect	Total Effect
Group A	Indirect Experience	.177*	Indirect Ex → Perception → Current Position	-.014	.163
	Direct Experience	.128**	Direct Ex → Perception → Current Position	.000	.128
	Formal education	.102	Formal Ed → Perception → Current Position	.000	.102
	Personal Perception	-.102**			-.102
	District Size	-.393**			-.393
Group B	Indirect Experience	.099	Indirect Ex → Perception → Current Position	-.008	.051
	Direct Experience	.059	Direct Ex → Perception → Current Position	-.016	.084
	Formal Education	.087	Formal Ed → Perception → Current Position	-.002	.085
	Personal Perception	-.190**			-.190
	District Size	-.330**			-.330
Group C	Indirect Experience	.172*	Indirect Ex → Perception → Current Position	.001	.176
	Direct Experience	.175**	Direct Ex → Perception → Current Position	-.005	.167
	Formal education	.140*	Formal Ed → Perception → Current Position	.000	.140

Personal Perception	-.035	-.035
District Size	-.382**	-.382

Note: ** $p < .01$, * $p < .05$

Indirect Effects of OCM Factors

Hypothesis 2. The statistical effects of direct experience, indirect experience, and formal education and training on women's career development are mediated by personal perceptions of discrimination in the selection and hiring process.

The model tests for three women's groups also checked the indirect relationship between career mobility factors and women's career development, which were mediated by the *personal perception of discrimination in the selection process*. The result from the model test for Group A indicated that although *indirect experience* had a modest effect on personal perception ($\beta = -.014$, $SE = .55$, $p = .068$), no statistically significant indirect effects of all factors including *indirect experience* were found. In the similar fashion to the result of this model test, no indirect effects were significant in both model tests for Group B and C.

The factor of *personal perceptions of discrimination* slightly mediated the effect of the *direct experience on the job on the current position* (-.016 for Group B and -.005 for Group C), but both were not significant (see Table 2). This result suggested that women's formal and tacit learning preparation for career development to the superintendency did not have significant influence on their personal perceptions of discrimination in the selection and hiring processes, and these perceptions did not mediate the relationship between their learning preparation and career development. Thus, no support was provided for hypothesis 2 in these three model tests.

However, the result of the descriptive data analysis of this study illustrated a different aspect of women's perception of discrimination. The analysis yielded relatively high mean scores for corresponding survey questions asking about the personal perception across the three targeted groups (see the section of Perception of Discrimination in Table 3), which means that women in educational administration generally had strong perceptions of gender-biased discrimination in the selection and hiring processes. Finally, these two results supported the idea that although women, regardless their current positions, have strong and negative perceptions of discrimination in selection processes, these perceptions did not significantly explain the relationship between their formal/informal learning preparation and career development.

Table 3. Mean scores of variables

Variable Label	Mean (SD)		
	Super-intendents (n = 723)	Aspiring administrators (n = 203)	Non-aspiring administrators (n = 340)
Direct Experience			
1) Educational Experience	5.85 (1.46)	5.92 (1.55)	5.44 (1.78)
2) School Level of first administrative position	3.34 (1.99)	3.59 (1.95)	3.82 (2.04)
3) Principalship Experience	3.66 (1.86)	2.45 (1.84)	2.01 (1.53)
Indirect Experience			
4) Mentorship	.73 (.44)	.60 (.49)	.60 (.49)
5) Role Model	.24 (.43)	.37 (.48)	.39 (.49)
6) Professional Organizations actively belong	3.42 (1.44)	3.19 (1.48)	2.73 (1.31)
Formal Education & Training			

7) Education – highest academic degree	3.34 (.86)	3.30 (.87)	2.94 (.95)
8) Professional Training experience	4.32 (1.83)	4.07 (1.76)	3.83 (1.73)
Perception of Discrimination			
9) Perception of glass ceiling in selection	1.91 (.73)	2.15 (.73)	1.91 (.71)
10) Perception that school boards do not actively recruit women	2.02 (.73)	2.26 (.74)	1.98 (.75)
11) Perception of school boards that women are not strong leaders	2.91 (.76)	2.34 (.69)	2.13 (.76)
12) District size	3.44 (1.66)	4.67 (1.80)	4.89 (1.89)

Note. 1. Subtotal does not add up to 1301 (total) because of missing (35) in the question about aspiration to the superintendency.

Group Differences in the Relationships

Hypothesis 3. All relationships and effects of career mobility factors vary across the three targeted groups of this study; superintendents, aspiring women administrators, and non-aspiring women administrators.

The result of the model test for Group B indicated that some indices values did not meet the general standard of the model fit: $\chi^2(45) = 168.2$ ($p < .001$, Joreskog's value = 3.7), GFI = .97; NFI = .86; CFI = .89; RMSEA = .053. The values of NFI and CFI were below .90 and RMSEA was higher than .05, indicating a poor fit (Weston & Gore Jr., 2006). On the contrary, all indices values of the model test for the Group C were higher and better than the acceptable levels: $\chi^2(45) = 152.7$ ($p < .000$, Joreskog's value = 3.4); GFI = .98; NFI = .90; CFI = .93; RMSEA = .047. The squared multiple correlations (R^2) for current position (dependent variable) in this analysis were .187 for Group B and .333 for Group C. Compared to the model for Group A ($R^2 = .291$), the model for Group C had more power in explaining the relationship between career mobility factors and women's career development, while the model for Group B had less power in explaining the relationship than the models for Group A and C. Considered that the dependent variable had a dichotomous value in these model tests, these results regarding the model fit indices and the squared multiple correlations reflected that there were obvious group differences between superintendents and non-aspiring administrators (Group C) in terms of four career mobility factors, but relatively small differences between the group of superintendents and aspiring administrators.

Table 4. Comparison of Goodness-of-Fit Measures and R^2 s

Tests	χ^2 (df)	GFI	NFI	CFI	RMSEA	R^2
Test for Group A: (Supts + Aspiring + Non-aspiring)	150.8 (45) P = .000	.98	.92	.94	.043	.291
Test for Group B: (Supts + Aspiring)	168.2 (45) P = .000	.97	.86	.89	.053	.187
Test for Group C: (Supts + Non-aspiring)	152.7 (45) P = .000	.98	.90	.93	.047	.333

As an indicator of the direct effect, standardized regression weights (coefficients) of career mobility factors varied across the three targeted groups. In the model test for Group B, only *personal perceptions of discrimination* was the significant factor among the four career mobility factors. The coefficient value of *personal perceptions* increased by negative .088 from that of the model for Group A (see Table 5), which means that aspiring central office administrators generally more perceive glass ceiling, discriminatory practices, and gender-biased perceptions of school boards in selection processes than the group of superintendents. However, the coefficient

values of the other career mobility factors became diminished and not significant in the test for Group B, indicating that the factors of *direct experience*, *indirect experience*, and *formal education* were not significant factors in explaining the group differences between superintendents and aspiring administrators in their career development. Therefore, this result supported that these two groups had similar characteristics in terms of their learning preparation that included both formal and tacit learning for career development.

The result of the model test for Group C included an apparently opposite pattern to the previous analysis for Group B in the relationship of the factors. There were three significant career mobility factors: *indirect experience*, *direct experience*, and *formal education and training*, whereas *personal perceptions* was not significant in this analysis. This result demonstrated that the characteristics of non-aspiring administrators were typically different from those of superintendents in terms of these three career mobility factors pertaining to formal and tacit learning preparation for career development. Interestingly, the significance of *formal education and training* for Group C had changed from the models for Group A and B, which suggested that when comparing superintendents and non-aspiring administrators, *formal education and training* became a significant factor explaining group differences in women's career development. The impact of *personal perceptions* had also changed in this analysis. Non-aspiring women administrators generally perceive less gender discrimination in selection processes than do superintendents and aspiring women administrators. In addition, *district size* had a consistent and negative impact on women's career development across the model tests.

Table 5. Group Comparison with Standardized Regression Weights

Coefficients (Direct effects)	Group A	Group B	Group C	Critical Ratios		
				A - B	A - C	B - C
Indirect Ex	.177*	.099	.172*	.825	.056	.743
Direct Ex	.128**	.059	.175**	1.258	-.659	1.848
Formal Ed	.102	.087	.140*	.071	-.180	.237
Perception	-.102**	-.190**	-.035	1.444	-.1.524	2.884*
District Size	-.393**	-.330**	-.382**	-2.438*	-.884	-1.582

Note. If critical ratio is greater than or equal to 1.96, then the coefficient is significant at the .05 level.

Finally, partial support was provided for hypothesis 3, namely all effects of career mobility factors on women's career development vary across the targeted groups in this study. As far as indirect effects of three career mobility factors associated with learning preparation, no evident indirect effects of the factors mediated by *personal perception of discrimination* were found across the groups. Regarding the direct effects of the factors, the relationships and the strength of the factors' impacts were changed across the groups, especially, the model test for Group B had the diminished coefficients (direct effects) of all factors except *personal perceptions*. The group of aspiring administrators generally had similar characteristics to the group of superintendents in terms of formal and tacit learning experiences for their career development, but they had the strongest perceptions of discrimination in selection processes among the groups in this study. The model test for Group C, however, yielded apparently different results from the model test for Group B. The group of non-aspiring women administrators had different characteristics to the group of superintendents in formal and tacit learning preparation for career development, whereas there was no significant difference between the two groups in *personal perceptions of discrimination in selection and hiring processes*.

Conclusion and Recommendations

Conclusion

Tacit learning could be a way to explain why some people reach higher leadership positions, such as the school superintendency, than others. As this study affirms that women superintendents more likely learn successful know-how about their career management from professional relationships and job-oriented experiences, so tacit learning becomes more influential factor in women's career development to the top leadership position in educational administration than formal learning. However, this result does not necessarily mean that formal learning is unimportant in career development. Rather, this study implies that educational credentials and professional training are generally considered as required qualifications in the process of career mobility to top leadership positions.

Although some studies have proposed a positive and strong relationship between formal education and career advancement (Spilerman & Lunde, 1991; Useem & Karabel, 1986; Wernick, 1994), the outcome of this study reminds us the literature that affirms academic intelligence acquired through formal education tends to be overestimated in the evaluation of job performance, leadership effectiveness, and one's career management (Nestor-Baker & Hoy, 2001; Wagner & Sternberg, 1985). Meanwhile, tacit learning in contrast to formal learning has been underestimated, especially in the process of career mobility to top leadership positions. Indeed, considered that career development is a matter of well-balanced preparedness for future mobility, tacit learning, in addition to formal learning, should be one of the primary ways to achieve career goals.

When preparing for career development, therefore, it is necessary to think about how to strategically develop one's career by building an effective human network and accelerating job-related experiences as well as fulfilling required qualifications. For example, women's professional experience and knowledge in line-role positions such as principalships significantly helps to improve their practical knowledge and job opportunities for career development. In this respect, it is also important for educational service providers to ensure how to embed the components of tacit learning into the curriculum of educational programs (formal learning) for school leadership such as superintendent certificate courses.

Recommendation

Based on the findings of the present study and limitations of the data set, several recommendations may be helpful for future studies. First, the investigation of career mobility factors in this study was conducted with only women administrators. For gender comparisons, future research could include data for both genders to provide more gendered-information in relation to career development to the top leadership positions. Second, it is important to develop a well-rounded survey questionnaire that fits on the purpose of the study and contains appropriate questions (indicators) for career path/development. Using affluent and appropriate indicators enable a study to produce more reliable and accurate outcomes. Third, this study focused on the influence of tacit learning for one's career development. The future study could center more on how to facilitate tacit learning in the settings of formal education for school leadership and career development such as principal and superintendent certificate programs.

Implicit, stand-alone or integrated graduate attributes for Undergraduates: an analysis of program outcomes

Abstract

The purpose of this paper is to measure the change in program outcomes that result from the introduction of an integrated approach to the teaching of graduate attributes in an undergraduate degree. Following on from two case studies taken between 2005 and 2009 (MacVaugh & Jones, 2009) in the UK university sector, the method applied here is a statistical analysis of grade distribution; pass rates, and progression of learners through their (various) management related degree programs within one of the two business schools between 2006 and 2010. This analysis exposes a clear divide in success between those who began with an integrated attributes program and the comparatively poorer performance of those who began with a stand-alone skills course. Given that this divide takes place within the same faculty, with learners from differing programs sharing core modules (providing something akin to a control group) the findings provide original quantitative evidence supporting the existing qualitative work in the field. The contribution of the paper is to highlight the measurable value of privileging academic skills in the curriculum planning process and the need to make these explicit for the learner.

iafor

Introduction

In any end-of-term module, course or departmental meeting it is common to hear tutors bemoan falling standards in graduate attributes. Classic examples such as problem identification, thesis development and support, clear writing, answering set questions, oral presentation and communications, and appropriate referencing are among those most often critiqued. Of course poor ability in such skills is not for want of research and writing on the topic. For example, since the popularisation and expansion of higher education in the UK and elsewhere, there has been a parallel explosion in the number of pedagogic texts, journal articles and websites available offering advice on graduate attributes education. Given that many educators are now contractually obliged to engage with this research as part of staff or professional development, and given that many first year undergraduate students are often specifically taught academic 'skills,' it seems appropriate to evaluate the ways in which pedagogic research has informed teaching practice.

Graduate attributes have been referred to by a number of terms including graduate attributes, generic attributes, transferrable skills and core skills. Each term reflects a slightly different understanding of the concept. However, the term graduate attribute is used here to denote a broad range of skills, values and dispositions with which a student will leave university that are not specifically technical or disciplinary. Examples include critical thinking, various forms of literacy, interpersonal skills problem identification, thesis development and support, clear writing, answering set questions, oral presentation and communications, and appropriate referencing. These range from highly complex conceptual attributes to more concrete skills. The present paper focuses on foundation academic skills such as essay and report writing, formal presentations, desk research, critical reading and evaluation of media and other published materials, and teamwork/team building skills.

By examining the literature in this area, it is possible to see why an institution, faculty or individual educator may be drawn to one side or another of this well-trodden debate. On the one hand is the argument that graduate attributes are inseparable from the discipline in which they are enacted (Marginson, 1994). Some reasons include: that it is often difficult to remove performative skill from declarative content in many disciplines; that such removal reduces student motivation, and that research focused academics value such attributes less than discipline specific mastery. On the other is the argument that some skills such as critical thinking can be taught separately (for example Norris, 1992). This stems from the reasoning that such skills have an intrinsic existence that is separate from disciplinary content. Further it is argued that such skills have a transferable value in the workplace; and that some academics lack the experience and/or motivation to adequately teach academic skills alongside their subject specific knowledge. A consequence of this is the suggestion that 'stand alone' programmes are appropriate to support a diverse profile of higher education students,

The following sections debate the value of teaching academic skills via 'integration,' 'separation' or in some cases 'not at all.' In doing so the literature review argues for the need to develop a more grounded, understanding of graduate attributes and their teaching as academic skills. It suggests the need to situate the teaching of academic skills within the curriculum in a way that is informed by the local (institutional and departmental) culture and by the learning needs of students.

Following on from two case studies taken between 2005 and 2009 (MacVaugh & Jones, 2009) in the UK university sector, the method applied here is an analysis of module means, standard deviations, and the progression of learners through their

(various) management degree programs within one of the two business schools between 2006 and 2010. Changes in academic skills courses offered during the period of investigation are highlighted in table 1, and overviews of success indicators from core modules in the program are presented in tables 2-5.

The findings demonstrate that students who participated in an 'Integrated' skills program in their first year; one that has specifically set out to teach graduate attributes integrated with the learning outcomes of the modules making up the core curriculum of the faculty, have significantly higher performance in core modules shared with student who began with 'Not Integrated' skills courses (and those who took none at all). This illustrates the efficacy of the newer integrated design. The conclusions are written primarily for Educators and those involved with Higher Education management, who will find the analysis an appropriately robust defence of skills integration over the too common (and polar opposite) practices of skills being taught separately or in some cases, not at all.

The graduate attributes debate and the teaching of academic skills

Interest in the skills acquired by learners in higher education has increased in the last two decades. 'Graduate Attributes' are increasingly prominent in the modern university. They are becoming evident in the publication of statements of attributes that learners will achieve upon completion of their studies and in the inclusion of attributes in subject or course outlines. Despite this overt interest however, there remains conflicting research into the ways in which such attributes are conceptualised, located within the higher education curricula, and rendered explicit in such a way that they may be taught.

Universities regularly include lists of attributes on their web pages or prospectuses. These lists may include: cognitive, analytic and problem solving skills, rational inquiry, ability to confront unfamiliar problems; capacity for independent critical thought; and self-directed learning; openness to critiques of received wisdom; ability to express ideas orally and in writing; ability to participate as a team member. At a subject level, graduate attributes are frequently included in subject or course outlines or objectives, often as a mandatory institutional requirement and so are given significance in the curriculum. After more than ten years, graduate attributes are still of central interest in the higher education literature and many of the key issues remain unresolved (Barrie, 2004, 2006; Bath, Smith, Stein, & Swann, 2004; Butler, 2006; Gilbert, Ballatti, Turner, & Whitehouse, 2004; Kreber, 2003; Leggett, Kinnear, Boyce, & Bennett, 2004; Mills & Sharma, 2005; Phillips & Bond, 2004; Sumsion & Goodfellow, 2004; Tapper, 2004).

Bennett et al. (2000) discussing generic skills, defines them as those skills which can support study in any discipline and which can potentially be transferred to a range of contexts, in higher education or the workplace. However, there several problems associated with notions of graduate attributes including questions of definition and the possibility of transferability. All these questions raise doubts as to what the term attribute refers, and how much commonality there is amongst the various stakeholders in their understanding of the term.

There are three broad approaches to helping learners develop the variety of explicit skills typified by the term Graduate Attribute: *embedded*, which involves the skills being developed within the curriculum; *stand-alone* in which the skills are developed in free standing modules rather than integrated into the curriculum; and *work placements*, which are aimed at developing learners' work related skills (Drummond et al. 1998). The embedded approach to teaching academic skills, (with

the associated problem of some educators *not* embedding them), is probably the one most frequently used in higher education. Proponents of stand-alone teaching of skills argue that there are clearly identifiable features of many graduate attributes such as critical thinking, team work, communication skills that make it possible to practice them in a concentrated and focused manner, which can then be utilised across a range of disciplinary areas. There is an influential and long running debate in the literature on critical thinking regarding its generalisability (Davies, 2006; Ennis, 1992; McPeck, 1981; Norris, 1992). Ennis and Norris, for example, are proponents of the view that critical thinking is a skill and can be taught independently of content². Further, many academic staff will argue that large classes, content heavy courses and limited contact time mean that teaching staff do not have the time or experience needed to teach skills and in many cases do not consider it to be part of their role (Jones, 2009) and hence that many academic skills should be taught separately from content.

However there are a number of powerful arguments for the embedded teaching of skills. The first is the limited transferability of such skills. The idea of transfer is taken to mean that skills learned in one context can be used in another context (Misko, 1995). There is evidence to suggest that transferability of academic skills is limited (Barnett, 1994; Lilly, 1995; Lohrey, 1995; Marginson, 1994; Misko, 1995; Perkins & Salomon, 1994) and Misko (1995) clearly points to the failures of transfer of skills from education to the workplace. What is apparent is that if transfer is to take place, the skills of transfer must be explicitly taught (Misko, 1995; Perkins & Salomon, 1994).

The second factor is that many learners are assessment-driven (Biggs, 1999) and so unless skills are taught in a way that is central to the curriculum and valued through assessment practices, they will not be taken seriously by learners and given marginal status. Thus in many existing curricula the graduate attribute *is* discipline mastery; such as a deep understanding of Tort Law, rather than the tools used in its acquisition and use, such as Para-legal skills, critical thinking, problem solving etc. in the case of professional Law degrees.

The third factor is that graduate attributes often appear to exist in relation to content knowledge. Regarding critical thinking for example, McPeck (1990) argues that disciplinary knowledge already contains the essence of critical thinking. Further, Smith (1992) points out that that one of the key elements of critical thinking is knowledge and that it is not possible to think critically unless one has knowledge of the topic. In other words, critical thinking and problem solving are carried out using a particular body of knowledge and all the conventions accompanying it. There is a considerable body of evidence both empirical and theoretical to suggest that graduate attributes are part of disciplinary knowledge rather than isolated from it (Alexander & Judy, 1988; Baron & Sternberg, 1987; Nickerson, Perkins, & Smith, 1985).

But the debate should not necessarily be characterised by its extremes. Davies (2006) has shown how critical thinking, to continue the example, is at least in part a general skill that can be taught independently of the discourse of the disciplines. Davies (2006) argues that the split between generalists (associated with the teaching of stand-alone skills) and specificists (who would have skills taught specifically within their discipline) is unhelpful and proposes instead an integrated approach that

² An example of material designed to teach critical thinking external to disciplinary content is the 'Rationale' program (see Austhink <http://www.austhink.com/rationale/>).

combines the two. This has strong face-validity as educators from both traditions agree that what is of prime importance is that the objectives in teaching such skills are made clear to learners, but that they will only be understood if applied in relevant contexts.

Method

Following the approach espoused by Davies (2006) 'Southwest University' began to organise graduate attributes in the Business and Management program in a way that was both explicit but also embedded. The first attempt to codify this experience began in 2008 with a research question: *How does the use of an 'embedded skills' or a 'skills taught separately' approach support the learning objectives of an undergraduate Business and Management program?* Earlier work into Graduate attributes has suggested that some of the barriers to the teaching of attributes include their often tacit nature, their separation from disciplinary understandings and a lack of understanding about the nature of these attributes (Jones, 2009). The findings of that study (MacVaugh and Jones, 2009) addressed these problems through the suggestion that an 'Integrated' approach; i.e. one that integrates the explicit teaching espoused by the stand-alone method and the close association with disciplinary knowledge championed in the embedded approach, better supported Business and Management learners.

From 2006-2010, Southwest University Business and Management learners were increasingly taught academic skills in an overt and transparent way that arose out of and was integrated with disciplinary knowledge. The module and group of associated activities came to be named 'Management Development' in 2009. At Southwest learners benefited from the opportunity to first *understand* academic skills and then *enact* them in real and meaningful tasks, specifically coursework assigned in other modules. In parallel, other learners in the business school (such as those from Accounting, Joint or Combined studies) did not take the integrated module, but rather may or may not have participated in a traditional, university wide (stand-alone) skills module known as 'Study Skills'.

While collecting data about the business and management learners' experiences we also noted ancillary data that suggested learners on other programs found coursework on common modules in the faculty more challenging. In fact, towards the end of the study many personal tutors were suggesting that some learners elect to 'audit' (take without credit awarded) the Integrated module to improve their academic skills. The department of Marketing was a notable exception in that in 2009 they began their own integrative skills program. Synthesising the findings from the initial study and the literature (above) leads us to propose:

P1: Learners who participated in 'Integrated' skills modules will achieve better marks on assignments in other modules at level one (whose form or practice had been discussed in the Integrated skills module) than those who had not.

P2: Learners who participated in 'Integrated' skills module will achieve better marks on assignments at levels two (where these assignments mirror the skills whose form or practice had been discussed in the Integrated skills module) than those who had not.

This can be summarised in our major research question (MRQ):

MRQ: To what extent has the introduction of an Integrated approach to the teaching of Academic Skills changed the performance outcomes of learners on the Business and Management program?

To that end the method applied is a mix of both the original qualitative data and a recent quantitative analysis. It follows the pattern: identify the key changes to the business faculty's curriculum that can be obtained from the original case study data; make comparisons of course results at level 1; make comparisons of course results at level 2, and highlight other significant outcomes not suggested in the original case.

Findings

Southwest case study review:

A review of the academic skills course materials from 2005 provided the starting point for research at Southwest University. The materials describe a 12-week 'Study Skills' module, originally designed centrally by the university in 2001, which includes taught sessions and practical seminars. The content was tied to a well known study skills text, and covers a broad range of student activity including: report and essay writing, research and library work, time keeping, examination preparation, Harvard style referencing, and note taking. The Business and Management demarcated version of the module was, itself, not a compulsory element of the degree program, but was only substitutable for another similar module from within the university scheme. The 2009 study (MacVaugh and Jones) categorises this module as 'stand alone.' Thus in 2006 the only academic skills education offered to learners in the business faculty was 'Study Skills' or in a few instances, none at all.

Although the next stage in the research was a planned review of the 2006/2007 module results, a follow up interview with several level-one tutors was scheduled in 2007 following information that the current module leader was giving up the role (MacVaugh and Jones, 2009). At the meeting of module tutors the formal module review agenda was abandoned in favour of a discussion of the future of 'skills' given two significant problems: 'lack of application' of the skills learned by learners at levels two and three, and 'poor attendance' at the skills sessions during the last four weeks of the semester. The memo written after this meeting concludes that a 'stand alone' module tends not to deliver academic skills that can be applied across different modules and was considered 'less valuable' to learners than working toward content module assessments. For the 2007/2008 run, the newly appointed study skills module leader changed the method of delivery to an approach linked to the course assessment for HT101 (Organisational Behaviour), a core requirement for all learners in the faculty. Thus in 2007-2008 there were three academic skills routes offered to learners in the business faculty 'Study skills,' 'Business and Management Study Skills' or in a few instances where learners joined the faculty at level two or three, none at all. In 2008/9 the study skills program integrated not only HT101 assessment preparation, but also the academic skills implicit in other modules, such as BM101 (The Management Environment).

In the final phase there was a further interview with level-one tutors (MacVaugh and Jones, 2009). They revealed that during 2008/2009 a new Business and Management degree program had been developed that in 2009/2010 would replace the existing program. This has important implications for year one as the University had decided to move from a ten 'short' modules in a split year system to either eight short modules or four 'year long' ones. In many faculties and courses this led to the dropping of 'Study Skills' from degree programs, the 'including' of such skills within

other first year modules, or the development of discipline related skills modules. The Business and Management program chose instead to extend their skills program, to include the current 'integrated' skills content, work placement preparation, and to act in conjunction with academic tutoring to provide weekly support in small groups. In terms of the old scheme this a 20% increase in learner contact time applied to the development of Graduate Attributes. The new program (named Management Development) further integrated with the curriculum by supporting both the updated Business and Management modules and a new, year long, integrated project which allows learners to demonstrate ability in the Graduate attributes that were an explicit part of the curriculum. Table 1. (Below) provides a timeline of the integration of Business and Management curriculum aims with the historic Study Skills program:

Program/Academic Year	2005/2006	2006/2007	2007/2008	2008/2009	2009/2010
Business and Management (Also incorporating the International Business and Human Resource specialism's)	BM160, a version of the university wide XX160 'Study Skills' module	BM160, a version of the university wide XX160 'Study Skills' module	BM160, stand alone but revised to support HT101, a core module in the business school	BM160, stand alone but revised to support several common modules in the business school	BMN101, an integrated year long program that supports assessment and personal development across most elements of the curriculum
Joint honours within Faculty (Media, Tourism, Leisure, Hospitality, Business Information Technology)	BM or XX160 'Study Skills' module	BM or XX160 'Study Skills' module	XX160 'Study Skills' module. (New BM160 not available)	XX160 'Study Skills' module (New BM160 not available)	Must take skills module if offered in joint program (BMN101 not available)
Joint honours outside of Faculty (Sports Science, Psychology, Social Sciences, Combined Studies)	BM or XX160 'Study Skills' module	BM or XX160 'Study Skills' module	XX160 'Study Skills' module (New BM160 not available)	XX160 'Study Skills' module (New BM160 not available)	Must take skills module if offered in joint program (BMN101 not available)
Accounting and Financial Management programs	BM160, a version of the university wide XX160 'Study Skills' module	BM160, a version of the university wide XX160 'Study Skills' module	FM160, a version of the university wide XX160 'Study Skills' module	FM190, a stand alone year long program that supports personal development	FM190, a stand alone year long program that supports personal development
Marketing and related programs	BM160, a version of the university wide XX160 'Study Skills' module	BM160, a version of the university wide XX160 'Study Skills' module	MM160, a version of the university wide XX160 'Study Skills' module	MM160, a version of the university wide XX160 'Study Skills' module	MM190, field specific but integrated with faculty curriculum
Business and Management level 2/3 entry	Should have credit for an 'equivalent' module	Should have credit for an 'equivalent' module	Should have credit for an 'equivalent' module	Should have credit for an 'equivalent' module	Should have credit for an 'equivalent' module

Table 1. A summary of academic skills provision by degree cohort: Darker shading indicates increasing integration of skills with core of the Business School's curriculum

Statistical data analysis:

The qualitative analyses present two possible paths for exploring the effect of changing from a stand-alone approach to an integrated one. The first is to treat each module taught in each year as an independent event. The second is to aggregate the modules taught as stand alone in one category and those taught as integrated in another. In the first instance the data were processed as a set of independent events. This showed differences between learners studying different degrees, but many pair wise comparisons made interpretations difficult, and gave more detail than is necessary to answer the research question.

The qualitative data points to the use of the second approach, combining modules into 'integrated' and 'not integrated' categories gives results that are easier to interpret.

Integrated: BM160 from 2007/2008, BMN101, MM190

Not Integrated: BM160 until 2006/2007, MM160, other XX160 modules from across the business school

Where data was not available for which study skills module a learner had taken it was assumed that they had taken a non-integrated equivalent module. This was the case for learners taking their first year modules before 2005/2006, learners transferring to 'Southwest University' in their second year from abroad, and learners who took other study skills modules from across the university. Marks are recorded as a percentage score where 40% is a pass and 70% is the level needed for a first. 95% significance tests are used in all cases.

P1: Learners who participated in 'Integrated' skills modules will achieve better marks on assignments in other modules at level one (whose form or practice had been discussed in the Integrated skills module) than those who had not.

When performing t-tests with independent samples, the first step is to use Levene's test for equality of variances to determine whether the two groups can be assumed to have equal variances or not. Where this test shows a significant difference in the variances of the two groups, equal variances cannot be assumed in the t-test. In this case, equal variances could not be assumed for MM101 and BMN104. Following this, t-tests showed a significant difference for HT101 with a significance level of 0.002. The differences for MM101 and BM101 were positive but not significant (0.107 and 0.576 respectively). BMN modules were only available in 2009/2010 and so very few learners took these modules and not BMN101 (the integrated study skills module), meaning that these results were not significant (BMN102: 21; BMN103: 21; BMN104: 3; BMN105: 0). Table 2 (below) highlights the average marks achieved on these common modules from the Business School by learners categorised by their participation in an Integrated or Not Integrated skills module:

		ht101_mark	mm101_mark	bm101_mark
Not Integrated	Mean	43.9	50.4	43.8
	N	454	113	436
	Std. Deviation	17.14	18.31	19.69
Integrated	Mean	48.3	53.6	44.7
	N	200	142	186
	Std. Deviation	15.68	12.23	17.92
Total	Mean	45.2	52.2	44.0
	N	654	255	622
	Std. Deviation	16.82	15.28	19.17

Table 2: Marks achieved in core modules at level one by two cohorts, those participating in Integrated or Not Integrated skills modules.

BM101 does not show a significant difference between learners taking Integrated and Not Integrated study skills modules but, as discussed, the study skills module was not specifically integrated with this module until 2008/2009. Splitting the study skills modules further by which modules they were integrated with gives the following results. An ANOVA test was used as there are more than two groups for comparison. This was significant at 0.042, with the highest learning outcome from learners who took BM160 in 2008/2009. The difference between those taking BM160 in 2007/2008 and Not Integrated modules was not significant. Table 3 (below) indicates that learners who took the study skills module now integrated with BM101 gained significantly higher marks than those who did not.

		bm101_mark
Not Integrated	Mean	43.8
	N	436
	Std. Deviation	19.69
BM160 0708	Mean	41.2
	N	91
	Std. Deviation	18.99
BM160 0809	Mean	48.1
	N	95
	Std. Deviation	16.22
Total	Mean	44.0
	N	622
	Std. Deviation	19.17

Table 3: Performance of student on BM101 indicating an increase in mean scores for student taking the 0809 version of BM160

Further, BMN102 was designed to replace and build upon the content of BM101 and BMN103 that of HT101. Combining marks from these modules means that BMN102 and BMN103 can have a larger control group for comparison. Repeating the previous procedure, Levene's test for equality of variances showed that equal variances could be assumed for HT101/BMN103 but not for BM101/BMN102. Table 4 (below) shows the result of t-tests indicating that learners taking an integrated module perform better than those taking a Not Integrated one (both at 0.001 significance level).

		ht101_bmn103_mark	bm101_bmn102_mark
Not integrated	Mean	44.1	44.4
	N	475	457
	Std. Deviation	16.91	19.49
Integrated	Mean	48.0	48.8
	N	312	298
	Std. Deviation	15.72	17.41
Total	Mean	45.7	46.1
	N	787	755
	Std. Deviation	16.55	18.81

Table 4: Learner performance on comparative core modules at level one from 2006-2010, indicating better performance where learners have taken an Integrated skills module

P2: Learners who participated in 'Integrated' skills module will achieve better marks on assignments at levels two (where these assignments mirror the skills whose form or practice had been discussed in the Integrated skills module) than those who had not.

Since the newer BMN coded (rather than BM) modules have only been running for one academic year, no learners taking these modules have finished any second year modules yet, so the comparison is between those taking the integrated BM160 or MM190 and stand alone study skills modules. Levene's test showed that equal variances could be assumed for BM203, BM206 and MM203, but not for HT201 and FM205. The t-tests were significant for BM206 (0.015) and HT201 (0.006).

		bm203_ mark	bm206 _mark	ht201 _mark	mm203_ mark	fm205_ mark
Not Integrated	Mean	48.4	45.4	49.9	52.9	42.3
	N	432	125	331	314	178
	Std. Deviation	15.47	16.57	18.62	13.85	20.43
Integrated	Mean	49.6	53.2	54.0	54.5	36.2
	N	140	34	149	128	19
	Std. Deviation	14.08	15.35	13.42	12.80	27.91
Total	Mean	48.7	47.1	51.1	53.3	41.7
	N	572	159	480	442	197
	Std. Deviation	15.14	16.58	17.27	13.56	21.25

Table 5: Learner performance in common modules at level two indicating generally higher performance for those who participated in Integrated skills modules at level one.

Table 5 (Above) shows that four out of five second year modules show higher marks from those learners who took an integrated skills module, although the marks for BM203, MM203 and FM205 are not statistically significant.

MRQ: To what extent has the introduction of an Integrated approach to the teaching of academic skills changed the performance outcomes of learners on the Business and Management program?

Our results suggest that the introduction of an integrated approach to the teaching of academic skills has increased the performance outcomes of learners in the Business and Management program in both first year and second year modules. In particular where the Integrated module has specifically taught the skills indicated by the module outline for a content module, the performance of learners has markedly increased. We suggest that superior performance in core modules due to preparations at level one empirically supports the value of teaching integrated yet explicit skills. This modular performance providing a better chance those learners develop broader Graduate attributes resulting from their participation in the program as a whole.

Conclusions

This paper has considered the teaching of academic skills and argues that what is most important is the careful integration of the both the content and the context that informs the curriculum (Jones, 2009). Earlier work into graduate attributes has suggested that some of the barriers to the teaching of skills include their tacit nature, their separation from disciplinary understandings and a lack of understanding about the nature of these attributes. The work done by Southwest University takes an important step towards addressing these questions in a way that fits with the particular conditions of that university. The integration between stand alone and embedded in this case means that learners are taught skills in an overt and transparent way that arises out of and is integrated with disciplinary knowledge. Thus learners are given the opportunity to understand the skills first, and then enact them in real and meaningful tasks.

Beyond that which was exposed in the case study of Southwest University (MacVaugh and Jones, 2009) this paper has provided robust evidence of the correlation between participation in an integrated skills course and success in other modules in a degree program. This is not simply the case in the year of the skills support, but also has a visible effect into year two of the program where no such support is provided. These results can be considered impressive given the large cohort sizes of the program, which usually result in lower course averages; and because the shift has also influenced other departments within the faculty to change their skills programs in a similar manner.

While the findings presented in this paper are encouraging there are, however, some limitations to the study. The approach presented at Southwest is still new and so the findings presented here are tentative. It will be important to measure the performance of learners who participate in the new Management Development program when they attempt core faculty modules at level two. Further we found it difficult to gain a statistically significant analysis of year three modules, as at this level departmental cohorts tend to take specialist modules with small class sizes rather than modules common to the faculty as a whole. Also, while the number of learners in the sample is sound (N value is well over 2000 for core modules), the sample is taken from a single faculty. Hence the findings must be interpreted with some caution. A further limitation of the study is that it does not include the student voice (though this is part of our ongoing work) and hence the judgements about the success or otherwise of the programmes is presented from a program management rather than student perspective.

There are a number of implications that arise from this study. The first is the value of including graduate attributes in the planning process and making the needed skills overt for the learners whenever possible. In the Integrated skills module at Southwest University learners were specifically asked to apply skills to assessments assigned in other modules. This brought the curriculum designed 'behind closed doors' to the forefront of the student's attention. Second is the value of linking the teaching of skills to the common or disciplinary curriculum. With the Southwest case, we have demonstrated a measurable change where departments have reorganised academic skills education to reflect the content seen as core to the entire program. The third implication is the need to consider the barriers to the operationalisation of graduate attributes in each particular context and hence to examine the ways of overcoming these barriers in a creative way. This can take a number of forms and this paper suggests that a move from stand-alone teaching or an 'implicit' approach to an embedded one is a valid option; especially when attempting to overcome student's 'strategic learning' when it tends to favour working towards assessed goals rather than broader scheme aims (Biggs, 1999).

We are aware that similar suggestions exist within the higher education community, but feel they are important to restate here in conjunction with our analysis given that the implementation of such suggestions often face the barrier of "faculty budget" holder(s). At this point the many and well known qualitative arguments; such as engagement and class participation (Gilbert et. al, 2004) for spending money on academic skills fall away as finance advisors demand quantitative evidence of their worth. In the case of Southwest University the personal tutorial team successfully used the data above to support the argument for more contact hours in the Management Development program at a time when other departments were closing their comparable skills courses. We feel that this paper should go some way to providing support for others involved in the graduate attribute debate, and are keen to hear of other examples exploring the use of integrated programs to support attributes development.

In our future research we plan to examine the ripple effects of the move to not only integrated attributes education, but also to a more integrated and active learning-led program as a whole. We are aware of a growing number of business programs in the UK with similar goals (Gosling and Mintzberg, 2006; Parrott, 2009). For our part we are currently in the process of measuring student outcomes in second and third year modules at Southwest University as they become increasingly tied to core faculty themes, rather than specialised depending on the research area of the faculty member teaching the course.

Oral Presentation

A Case Study: Four English Professors' perspectives and Pedagogical Practices

Shih Chih Kuo

National Chiayi University, Taiwan

Introduction

In this research I study what professors believe about the role of discussion in learning, why they advocate this approach, and what specific techniques they use to support discussion in their university classrooms.

According to Sharan B. Merriam (1988) "A qualitative case study is an intensive, holistic description and analysis of a bounded phenomenon such as a program, an institution, a person, a process, or a social unit." Hence, John W. Creswell (1994) states that "A qualitative study is defined as an inquiry process of understanding a social or human problem, based on building a complex, holistic picture, formed with words, reporting detailed views of informants, and conducted in a natural setting." In addition, Denzin and Lincoln (1994) emphasize that qualitative research involves an interpretive, naturalistic approach to its subject matter.

In this study, I pursue the qualitative case study principle and have placed emphasis on understanding through looking closely at people's words, actions and records. In addition, I examine the patterns of meaning which emerge from the data presented in the participants' own words. My task, as a qualitative researcher, is to find patterns within those words or actions, and to present those patterns for others to consider, while remaining as exact as possible in recording the world of the participants as they experienced it.

I aspire to discover patterns which emerge after close observation, careful documentation, and introspective analysis of the research topic. This study relies much on descriptive case analysis since it examines specific phenomena, within the pedagogy practices of professors at a private prestigious research university in the U.S.A.

Literature Review

The values of classroom discussions for students' learning are plentiful. Kenneth E. Eble writes (1988), "discussion develops the individual skills of formulating and expressing ideas and opinions. Discussion offers the opportunity for widening the student's perception of learning and of ways of learning and for making distinctions in the use of fact, opinion, belief, rumor, proof, value judgments, and the like" (p. 88).

Joyce Gall and Meredith Gall (1990) claim that research has found that the discussion method is effective for five types of students learning outcomes: 1) general subject matter mastery, 2) problem-solving ability, 3) moral development, 4) attitude change and development, and 5) communication skills (p. 25).

Barbara Gross Davis (1993) asserts that "class discussion provides students with opportunities to acquire knowledge and insight through the face-to-face exchange of information, ideas, and opinions. A good give-and-take discussion can produce unmatched learning experiences as students articulate their ideas, respond to their classmates' points, and develop skills in evaluating the evidence for their own and others' positions" (p.63).

Stephen Brookfield and Stephen Preskill (1999) suggest that conversation invites students to practice the dispositions of hospitality, participation, mindfulness, humility, mutuality, deliberation, appreciation, hope, and autonomy. In addition they suggest that classroom discussions help students to: 1) explore a diversity of perspectives; 2) increase students' awareness of and tolerance for ambiguity or complexity; 3) recognize and investigate their assumptions; 4) encourage attentive, respectful listening; 5) increase intellectual agility; 6) learn the processes and habits of democratic discourse; 7) develop the capacity for the clear communication of ideas and meaning; 8) develop skills of synthesis and integration (pp. 22-23).

William Ewens (2003) stresses that "compared with the traditional lecture method, discussions elicit higher levels of reflective thinking and creative problem solving, including synthesis, application, and evaluation. There is also evidence that information learned through active discussion is generally retained better than material learned through lecture" (p. 27).

Joseph Lowman (1995) stresses that:

"A useful classroom discussion, unlike a dormitory bull session, consists of student comments separated by frequent probes and clarifications by the teacher that facilitate involvement and development of thinking by the whole group. Dynamic lecturers captivate a class by the virtuosity of their individual performances. Exemplary discussion leaders accomplish the same end by skillful guidance of the group's collective thinking processes" (p. 159).

McKeachie and Kulik (1975) review research at the university level comparing the efficiency of lecture and discussion in encouraging students' learning and claim that the discussion pedagogy is more helpful than the lecture approach for inspiring students to have a positive view of learning as well as an incentive to learn.

David Bridges (1988) asserts that discussion is concerned with the development of knowledge. He believes that discussion is more serious than conversation in that it requires the participants to be "mutually responsive" to the different views expressed as well as to be disposed to or "affected by opinions one way or another in so far as they merit acceptance or approval" (p. 15). Stephen Brookfield (1991) also notes that "discussion is one of the most effective ways to make students aware of the range of interpretations that are possible in an area of intellectual inquiry" (p. 18). Roland Tharp and Ronald Gallimore (1988) emphasize that as students interact during discussion, they construct an understanding of the topic. Peter Frederick (1994) stresses "the fundamental value of discussions is that through them students develop a sense of ownership and responsibility for their own learning" (p.100).

While discussions can be effective in helping students think critically about what they are learning (Bridges, 1988; Brookfield & Preskill, 1999; Ewens, 2003; Frederick, 1994; Lowman, 1995; Welty, 1989), fostering effective discussions can be challenging (Brinkley, et al., 1999). To have effective discussions, professors must know what goals they wish to reach and plan appropriate strategies to attain those goals (Davis, 1993; Welty, 1989).

Participants

I invited professors of literacy, language or humanities, teaching at a research university in the U.S.A. to participate in this study. Participants of both genders were invited. After sending out eighty recruiting emails and after having talked to more than ten prospective participants face-to-face in their offices, four professors agreed to participate in this study.

Methods of Data Analysis

In order to understand each professor's take on discussion as a method of teaching I asked each: (1) why they advocated this teaching method, (2) what strategies they used, and (3) what they thought they had learned about leading discussions over time.

I used a constant comparative method (Glaser & Strauss, 1967) to analyze each individual case. Each individual case was first treated as a comprehensive case in and of itself. Later I did a cross-case analysis attempting to build a general explanation that fits each of the individual cases, even though cases vary in detail (Yin, 1994, p.112). I specifically looked for why professors said they advocate discussion as a method of teaching; how professors incorporate discussion in their classroom and what strategies they use to do so; how professors form discussion questions; how professors conduct discussion; how professors encourage participation; what, in these professors' minds, make a good discussion leader and a successful discussion; and what environmental factors influence classroom discussions.

Using Interview Data to Understand Individual Participant's Perspectives and Pedagogical Approaches to Classroom Discussion

This study examines each of my 4 participants' perspectives and beliefs about discussion as an approach to university teaching. Data in this study are taken from each participant's interview transcripts, their course syllabi, and their teaching handouts. Data have been organized to focus on my research questions. These categories are: 1) reasons for advocating discussion as a method of teaching, 2) strategies used to incorporate discussion in the classroom; 3) characteristics of a successful discussion leader and of a successful discussion, 4) techniques used to encourage participation, and 5) classroom environmental factors that support discussion. Each individual participant's case has an introductory profile, a general set of reflections on his/her teaching, followed by a discussion of these five categories. In order to protect the anonymity of the participants, all participants are identified by pseudonyms. Exact titles of participants' courses have not been given; instead, a more general description has been provided to preserve participants' anonymity. I have also cited outside sources, where applicable, that support observations and insights that are made.

Discussion and Findings

My analysis of these interviews generated six categories: (1) reasons for using discussion as a major vehicle in teaching, (2) strategies for incorporating discussion into one's teaching, (3) characteristics of a good discussion leader, (4) characteristics of successful discussions, (5) strategies for supporting participation, and (6) important classroom factors.

A Closing Commentary

Faculty research and publishing achievements also have the potential to support or enhance classroom discussions. Most of my participants agreed that a command of one's subject matter is a fundamental to success using a discussion method of teaching. This is supported in the literature as well (see Brinkley, et al., 1999, p. 36; Welty, 1989, p.42). Being well prepared for each class session is just one part what it means to get ready to teach using discussion as the major tool. A good discussion leader must be able to explain difficult topics in down to earth ways complete with examples, details, analogies, and metaphors. They must present facts and

concepts from related fields and be able to present and discuss viewpoints other than their own. Overall, they must keep their focus on the student and value each student's ability to think independently about issues. These conclusions are also supported by past research, particularly as they relate to respecting students as individuals (Barnes, Christensen & Hansen, 1994, p. 27).

Importantly, each of my participants wished that they had had help learning to teach using discussion as the major method of instruction. Each of them talks about how they learned over time and how over time they learned to prepare in important ways. Importantly, participants in this study say they are ready and willing to share their teaching experiences and pedagogical insights.

Participants' Beliefs about Various Classroom Discussion Strategies (Organize by Popularity)

Participants \ Beliefs	Dr. Malone	Dr. Clark	Dr. Doyle	Dr. Thurtle

Business like atmosphere			√ (ideal environmental aspects for classroom discussion)	

**I interviewed professors as to what strategies they used. The information in the parentheses is the category of questions that were asked. In this instance, “What strategies do you use to incorporate the discussion method in your classroom?”

Conclusion

This qualitative case study has attempted to understand how four professors perceive and go about facilitating discussion in their university classrooms. A constant comparative method of data analysis – both within-case and cross-case analysis -- has been used. I have moved back and forth between concrete bits of data and abstract concepts, between inductive and deductive reasoning, between description and interpretation. I began with one professor, her interview, the observations and field notes I made, and the teaching materials I collected. I then compared this professor profile against other professors from the same data set. These comparisons lead to categories that were then compared within and across cases. Comparisons were constantly made within and between levels of conceptualization with the result being the model I flesh out here. I see a model as a visual aid or picture which highlights the main ideas in a process or system. The model presented in this chapter includes words and diagrams intended to give an understanding of classroom discussion as a key to effective teaching. I was particularly interested in understanding what beliefs need to be in place as well as to identify what teaching strategies support discussion in the university classroom.

Findings from interview data suggest that there are lots of reasons to advocate for discussion as a major teaching method in college classrooms. Dr. Malone believes that classroom discussion is a way for student to embrace what they have experienced in their reading. Dr. Clark thinks classroom discussion is most effective when conducted as a two-way process. Dr. Clark sees classroom discussion as a provisional act; something someone engages in on the way to reaching a conclusion. And, Dr. Thurtle sees discussion as mirroring learning; showing students how one idea builds upon another.

Beliefs

Below is a listing of the key things professors said they believed about discussion as a teaching method:

- ✓ Active engagement in key to learning (Professors said they took a student’s ability to discuss what was read as evidence of learning);

- ✓ In order for discussion to work as a teaching method, students and instructors must share a common experience (or text), students and instructor need to be interested in pursuing the world of ideas, and students and instructors need to be willing to engage each other;
- ✓ Knowledge is something learners construct rather than something teachers impose;
- ✓ Discussion is seen as the provisional act one engages in on the way to reaching a conclusion;
- ✓ Good discussions encourage in-depth understandings;
- ✓ One should not answer each and every question that a student might have about a topic under discussion;
- ✓ Allowing students to answer some question on their own encourages creativity and critical thinking;
- ✓ The most important characteristic of a good discussion leader is the ability to listen to what other people are saying;
- ✓ Good discussion leaders need to be able to ask challenging questions;
- ✓ Discussion mirrors learning in that students can see how one idea builds upon another.
- ✓ Classroom discussions are most effective when they are conducted as a two-way process;
- ✓ Knowing student names support discussion;
- ✓ A good discussion leader is polite, open-minded, and always ready to support students who have risked sharing their opinions;
- ✓ A good discussion leader should have two characteristics: the ability to be neutral and the ability to listen;
- ✓ A relaxed and friendly atmosphere is important;
- ✓ Grades for classroom participation are not necessary;
- ✓ The classroom environment is important; an ideal environment should be roomy and have a table around which everyone can sit and face each other. If no table is available, a circle allows students to exchange ideas with each other easily;
- ✓ Space is important as sometimes ideas need to be dramatized to be understood;
- ✓ Media (LCD projector, screen, television monitor, playback unit, and computer) is important as it opens up new ways to present materials and it gives students new ways to understand the material being covered;
- ✓ It is important to use one's course syllabus to provide a structure for discussion;
- ✓ Silence, as a strategy, promotes discussion;
- ✓ The use of humor often enlivens a faltering discussion;
- ✓ One way to organize instruction is by listing topics and questions for discussion; This also helps professors and students stay on track;
- ✓ Assigned readings and pop quizzes make students aware that they are responsible for knowing the course material.

Practices

While beliefs are important, classroom observations reveal that practices often trump beliefs. Despite what they said, the following principles seem to guide practice:

- ✓ Keep class size small;
- ✓ Learn student names;
- ✓ Arrange the room to facilitate face-to-face interactions;

- ✓ Use course syllabus to structure the course and delineate responsibility;
- ✓ Give students ownership of the class by allowing them to make some key decisions (Just remember that you have to live with what they decide so don't offer them the opportunity to make decisions you can't live with!);
- ✓ Use the blackboard to create a daily agenda and to make the day's events predictable.
- ✓ Use handouts to structure the class and keep students organized;
- ✓ Help students get organized by walking students through the course schedule and the course requirements;
- ✓ Provide background information as a way of beginning conversations;
- ✓ Use technology to make abstract concepts concrete;
- ✓ Provides demonstrations of how one systematically thinks through problems in the discipline being taught;
- ✓ Provide lots of opportunities for students to apply analysis strategies they have been taught through class demonstrations;
- ✓ Keep lectures short and use them to introduce students to key piece of vocabulary and key ways of thinking through the materials in this discipline;
- ✓ Use questions to raise the level of conversations;
- ✓ Use wait time to allow students to organize their thinking and to respond;
- ✓ Restate questions if students do not seem to understand what are being asked;
- ✓ Support students as they attempt to answer questions raised by others;
- ✓ Scaffold students responses when it is obvious they are having difficulty responding.
- ✓ Use humor, eye contact, and wait time to signal that you are listening;
- ✓ Restate what you have heard;
- ✓ Draw generalizations from specific examples which students can understand;
- ✓ Accept partial and incomplete attempts at answering questions;
- ✓ When things do not go as expected, change directions and consider approaching the topic from a new direction;
- ✓ Use drama to enact difficult pieces of text and to support student understanding;
- ✓ Assume a particular student's question is everyone's question unless it is obvious that that isn't the case;
- ✓ Use graphics to demonstrate how people in this discipline think through problems in a systematic fashion;
- ✓ Assume comprehension until you have reason to assume otherwise;
- ✓ Accept and encourage multiple interpretations;
- ✓ Do not move ahead and leave students who are having difficulty understanding behind.
- ✓ Put off questions which distract;
- ✓ Restate and summarize what students have said so that it is clear to the class;
- ✓ When students generate a new insight (one you hadn't thought of before) give them the praise that is their due;
- ✓ Before moving on to a new topic or closing down a conversation make sure that everyone has understood the major points and are more or less on the same page;
- ✓ In preparation for tomorrow's lesson, overview the new material that students will be encountering;
- ✓ Use evaluation techniques that ask student to synthesize what they have learned and that operate to extend the conversation that has been going on in the class;

- ✓ Use technology (like email and blogging) to extend conversations that have been started in class.

All four participants argue that using a discussion method of teaching enhances students' critical thinking. They also argue that because of this single characteristic, discussion as a teaching method has more merit than other teaching pedagogies. Making discussion central to one's teaching requires advance preparation of one's syllabus, the effective use of questioning strategies, and the ability to scaffold student learning. Further, the physical classroom environment is important. Furniture needs to allow for face-to-face interaction. Class size needs to be kept small. Technology needs to be available to support and extend classroom conversations.

Each of the participants in this study worked to refine their ability to teach via class discussion through self-evaluation of their teaching over an extensive period of time. They all learned to consider students' opinions, needs and interests first when designing their courses. They take students' evaluations of their courses seriously and use students' comments to help them make changes. Respect for students and a desire to help them learn are seen as major goals.

In their interviews, all say that they have faced and have accepted the challenges that come with electing to teach via discussion. One of these challenges is isolation as all say that they have had to develop their classroom techniques alone rather than through discussion or collaboration with colleagues. Drs. Malone and Doyle reported that they developed their discussion pedagogy through replication and modification of the techniques they experienced from the teachers they had themselves in college. Drs. Clark and Thurtle say they learned how to teach using the discussion method through trial and error.

Factors That Affect Classroom Discussion

My research data suggests that there are three key components to a discussion method of teaching: 1) beliefs; 2) practices; and 3) environment. While I summarize all of the beliefs that these professors held above, for the most part a good discussion leader believes that learners want to learn. He or she also believes that talking about an issue leads to a deeper understanding of that issue and in this way teaching and learning is enhanced. Good discussion leaders also have skills. While I have summarized the strategies that these professors used above, what is clear is that they know how to ask important questions and support learning by keeping the conversation going. This is not always easy and their learning is never complete. Environment is a third essential. Class size, space, face-to-face conversations, and having technology handy are key. In addition to these physical elements there are important psychological elements that are needed including the creation and maintenance of a supportive environment conducive to talk.

I believe the materials I have presented here make teaching by discussion less daunting and more rewarding for faculty who choose to utilize the discussion method in their university classrooms. In order to encourage professors to share challenges, reflections, and insights through discussions and to establish better practices, a faculty mentor program has been shown to be enormously important (Savage, Karp & Logue, 2004). Mentor programs, if well developed support new faculty become part of the university community, lessen feeling of isolation, and help the novice teacher masters effective educational practices.

Study Contribution to Theory/or Practice

In the study contribution to theory or practice, I analyzed my participants' perspectives on teaching and my personal observations of my participants' teaching practices. These findings reveal that what my participants said they believed about effective teaching did not always show up in their actual teaching in the classroom. Interestingly, this wasn't always a negative slippage. Each of my participants did some things better in practice than they were able to talk about as a theoretical perspective on effective teaching. The reasonable explanation for these incongruities is that they are natural, and are probably beneficial. The discrepancy between what one believes and what one does allows theory to serve as a self-correcting device. To support this process I would suggest that novice faculty interested in mastering the use of discussion in their classroom: 1) note down what they believe and why they think discussion is important in learning, 2) film their own classroom teaching for a period of time to see if their beliefs match their practice, and 3) if there are discrepancies, seek help from more experienced colleagues. Of course, once through this process is not enough. After completing this cycle, it is important to once again set up another round of research by re-stating what one now believes and examining these new beliefs against one's actual teaching practices.

I see the finding of this study as a resource for enhancing the use of discussion in university classrooms. I see classroom discussion as supporting students' in making connections to what they already know as well as supporting the development of critical thinking. I see understanding how to support discussion in the classroom as a tool for the expansion and redesign of curriculum as well as a way to support creative teaching. This study shows that the infrastructure which supports teaching, like educational technology, can be use to effectively extend the discussions which are started in the classroom, thus allowing professors to continue as well as begin much needed conversations with students.

There are several additional contributions that this study makes:

- (1) this study contributes to theory by suggesting that the closer the believe system, relative to discussion, is to practice, the more likely discussion as a method of teaching will be successfully implemented.
- (2) Along similar lines, this study has identified a range of strategies that professors use to support classroom discussion. Given my careful review of the literature I can assure readers that this study identifies more specific strategies that support discussion than do any of the studies currently reported in the literature. My study has talked specifically about what strategies professors use that support, what techniques they use, and how they organize the classroom.
- (3) A third contribution this study makes is that it shows the short-coming of what universities are currently doing to support conversation as an instructional methodology in university teaching. One common theme across professors was that they had little or no support from the university itself or from colleagues in their departments. Currently, at this institution (and I suspect a good many institutions across the world) there seems to be no vehicle for more experienced faculty who teach using a discussion method to talk with or support younger faculty who are interesting in teaching using discussion as a primary method.
- (4) my study shows that even when professors think they are supporting discussion, there is still a tendency to talk too much. As a group, we professors, need to become much more cognizance of how much we talk and what kind of talk is truly supportive of learning.

Suggestions for Further Research

This research has led to new questions and areas of research: 1) What challenges do new or junior faculty encounter when they attempt to implement discussion in their university teaching? 2) How can experienced faculties best interact with new faculties to develop discussion pedagogy? 3) What curricular engagements might be developed to support new faculty “live,” or experience firsthand, the power of discussion teaching? 4) What teaching support might institutions of higher education provide junior faculty? And which, of all those resources which are now being provided, do young faculty members find truly supportive?

Enhancing IT Literacy in an English Medium of Instruction Liberal Arts College in China

Haifei Huang and Dave Towey

BNU–HKBU United International College

mikehuang@uic.edu.hk davetowey@uic.edu.hk

Abstract

Education in the People's Republic of China (PRC) has been evolving over the past few decades, and basic courses to improve computer (IT) literacy have been developing, especially over the last decade. As the PRC has become more powerful economically, the English language has also risen in importance. As part of the innovation in PRC education, the United International College (UIC), a new Liberal Arts college in Southern China, was founded in 2005. UIC is one of the first English Medium of Instruction (EMI) colleges in the PRC. All non-Computer Science major students in UIC are required to take an introductory Information Technology (IT) course, as part of UIC's effort to enhance students' IT literacy. This paper describes the situation for students taking this course at UIC, outlining their background and some unique aspects of their college experience. The paper traces the history of IT literacy efforts in the PRC, and specifically in UIC.

This paper identifies some of the special challenges facing the design and delivery of an introductory IT course in the Mainland Chinese context, especially in an English medium of instruction institution.

1 Introduction

This paper describes some of the issues related to the teaching of an introductory Information Technology (IT) course as a required subject to all non-Computer Science major undergraduate students at the United International College (UIC), a new Liberal Arts College in southern China. At UIC, the IT course, like most other courses, is taught through English. The vast majority of students at UIC, however, do not have English as their first language, and UIC is their first experience of learning at an English Medium of Instruction (EMI) institution.

The paper is structured as follows: the remainder of this Introduction section outlines IT literacy (Section 1.1), and the background of aspects of education in the People's Republic of China (PRC) (Sections 1.2.1 to 1.2.3); the United International College (UIC) is introduced in Section 2; and the introductory IT course taught at UIC, IT1010, is explained in Section 3.

1.1 IT Literacy

IT Literacy (also referred to as Computer Literacy) has been defined variously, but can basically be understood as the ability to use computers and (information) technology effectively (Mason & Morrow 2006, Hoffman & Vance 2008, Gupta 2006, Epperson 2010).

This ability may be crucial to students for the success of their academic study, but it is also increasingly seen as essential for job prospects after leaving colleges, and even while at college: a glance through employment offerings invariably includes a reference to “good computer skills.”

At UIC, the curricula are designed to enable graduates to develop certain attributes, referred to as Graduate Attributes (GAs) (HKBU Centre for Holistic Teaching and Learning 2010a). Among the GAs for UIC’s students are Computer Literacy and IT Skills, which are interpreted as not only the skills required to use basic computer applications, but also a confident attitude when faced with IT problems or new, unfamiliar software to be learned (UIC 2010b).

1.2 People’s Republic of China (PRC)

The People’s Republic of China (PRC) was founded in 1949. The PRC began economic reforms in 1979, prior to which time the economy was centrally planned (Morrison 2009). Since that time, the PRC’s real Gross Domestic Product (GDP) has grown at an average annual rate of about 10% (Morrison 2009), and over the past decade or so, the PRC has become a significant global economic power (Rajan 2003). China’s economic growth has improved Chinese living standards, and helped raise hundreds of millions of people out of extreme poverty (Morrison 2009). With the economic growth, and increasing support from the PRC Ministry of Education, the number of PRC students studying abroad also increased dramatically: according to the Ministry, in 2009 about 1.12 million students were studying abroad, about 800,000 of whom at tertiary level (PRC MoE 2010).

1.2.1 Education in the PRC

In the PRC, education is divided into three categories (CERNET China Education and Research Network n.d., Brandenburg & Zhu 2007): basic education, higher education, and adult education. Basic education includes compulsory elementary education and senior secondary education, with an optional pre-school system before elementary school education. Compulsory education starts at the age of seven and lasts for nine years: six years of elementary, and three years of junior secondary education. Senior secondary education usually starts at the age of sixteen and is divided into two types, academic secondary education and vocational secondary education. Junior secondary school graduates wishing to continue their education take a locally administered entrance exam, on the basis of which they can make a choice. In the academic secondary school, students are educated for three years and also prepared for the National College Entrance Examination (NCEE) (Yu & Suen 2005), after which they may be admitted to study at a higher education institution.

Higher education at the undergraduate level includes two-and three-year junior colleges (short-cycle colleges), and four-year colleges and universities. Short-cycle colleges typically award associate degrees, while four-year colleges and universities award bachelor degrees or higher. Master degrees and PhDs are usually offered by universities and research institutions which have been accredited by the State Council.

1.2.2 IT Education in the PRC

Since 1997, when the PRC Ministry of Education issued guidelines on the structuring of IT courses for non-IT major students (PRC MoE 1997), almost all PRC colleges and universities have created such courses. Most of these courses, however, focus on a basic knowledge of computer systems, Windows OS, and basic Office software (Wang & Wen 2004, Zhao & Yang 2009).

As more of the basic materials began to be taught in primary and secondary-level schools, the courses offered at tertiary-level became obsolete. A second set of guidelines was issued by the Ministry, urging an update of these courses (PRC MoE 2006). Accordingly, many universities have adopted the new curriculum and have increasingly included new topics such as multimedia, information security and databases (Gong & Yang 2009).

1.2.3 English in the PRC

With the opening up and internationalization of China, English has received a lot of attention in the PRC. For most school entrance examinations, e.g., NCEE (Yu & Suen 2005), English is a required examination subject. Additionally, many universities require students to pass the College English Test (CET) (Zheng & Cheng 2008) in order to graduate.

Currently, English study in China starts from Grade 3 in elementary school, and continues for more than ten years (PRC MoE 2001b). Although a great deal of time and effort has been invested in improving English proficiency, so far the results have not been as impressive as anticipated. It was reported that reading and grammar were over-emphasized in English classes, with a resulting situation where many students could not speak fluently, or understand what people say, even after more than ten years of study (Lin 2002).

At the turn of the 21st century, in order to meet the economic challenges of globalization and technological advances, the PRC Ministry of Education began to encourage third-level institutions to use English to teach some major courses (PRC MoE 2001a). Currently, many universities in China have adopted this strategy (Wu 2007).

Although not yet very popular in the PRC, from 2004 to 2006, three English Medium of Instruction (EMI) third level institutions were founded.

2 United International College

One third-level EMI institution in the PRC is the United International College (UIC)¹, jointly founded in 2005 by Beijing Normal University and Hong Kong Baptist University. UIC is the first full-scale cooperation in higher education between Mainland China (PRC) and Hong Kong. It is situated in Zhuhai, Guangdong Province, just north of Macau SAR, and west of Hong Kong SAR.

In its first year of operation (2005), UIC received about 300 students. The student intake has now increased to about 1,000 per year, with the current student population around the full capacity of about 4,000.

In addition to the increases in numbers, the typical student enrolling in UIC has also changed: in 2005, most students had a weaker academic background, they spoke Cantonese Chinese as their first language, and they often had difficulties with English proficiency; more recent student cohorts have stronger academic profiles, speak Putonghua (Mandarin Chinese), and have a comparatively high English proficiency.

2.1 UIC's Educational Philosophy

UIC was founded with goal of creating an innovative international education model for China that can contribute to the welfare of the nation and the world (UIC n.d.).

The mission of UIC (UIC n.d.) includes the following

- To integrate creatively and dynamically international and national experiences of education in China.
- To promote Whole Person Education with local and international relevance.
- To promote liberal arts education by tapping into both classical Chinese and Western cultural traditions.
- To develop an innovative Four-Point Education Model that unites the forces of the college, the students, the parents and society for the delivery of our education programs.

2.2 English at UIC

UIC is an English Medium of Instruction (EMI) institution, which means that, with a few exceptions, all courses are delivered in English. Although the English proficiency of newer students is improving, the fact that the majority of students do not have English as their first language, and that UIC is probably their first experience of an EMI institution, mean that many are not immediately equipped for study at UIC.

¹ <http://www.uic.edu.hk>

The English Language Centre (ELC)² at UIC is the unit responsible for all General English language courses, and for the overall provision of English Language services to the university.

To assist students with the transition from secondary schooling to tertiary-level, the ELC runs an English Enhancement Programme before normal classes begin. This programme is explained in Section 2.3.2.

Throughout their entire period of study, students have general English classes, which are delivered in small groups of about 20 students per class. These classes are designed to enhance the general English proficiency of students, and to provide them with the communicative skills relevant to academic, business, and social contexts (ELC 2010b).

The ELC also runs a semester-long course on Academic Reading and Writing (ARW), which all students take in their first year. The course aims at raising students' specific language ability in reading and writing academic texts of their own major disciplines.

A final resource made available to students by the ELC is the Writing Resources Centre (WRC), where students can go to get assistance with their English writing.

2.3 Freshman Experience at UIC

2.3.1 Dormitory Life

At UIC, as with all universities in Mainland China, all students are required to live in college-provided accommodation. This may be the first time for many students living away from their families. Since UIC student accommodation consists of rooms housing 2 or 3 students each, each student must share their room. Because of China's One Child Policy (Fitzpatrick 2009, Fong 2004), this is also often the first time for them to share a room.

2.3.2 English Enhancement Programme

All Year 1 students who come to study at UIC, before the commencement of their normal academic courses, are provided with one to two weeks of an English Enhancement Programme (EEP) run by UIC's English Language Centre (ELC).

During this programme, students are introduced to the English environment of UIC, and assisted in preparing for their normal courses. For the duration of the programme, the students are grouped into teams to attend lectures, tutorials, and workshop-like activities. The programme usually culminates in a performance competition, where each of the teams showcases their achievements.

² <http://www.uic.edu.hk/elc>

2.3.3 Clubs and Workshops

In addition to the clubs and activities run by the students themselves, the ELC also arranges a large number of English-medium clubs. Most of these clubs are open to all students, but Year 1 students must choose at least one, and attend this club every week. The themes of the clubs vary according to the interests of the faculty running the club. In the first semester of the 2010–2011 academic year, there were over twenty clubs offered, covering regular themes such as the drama or debating, and some more unusual ones such as Navajo Culture or Women’s Issues (ELC 2010a). Students usually take part in the club for 1 hour per week. Several academic workshops, targeting English proficiency exams such as IELTS³ or TOEFL⁴, are also run on a weekly basis by the ELC.

2.3.4 Mentor Caring Programme

To help students to integrate more quickly into the UIC college life, and ease their transition to studying in UIC’s EMI environment, a Mentor Caring Programme (MCP) (UIC SAO 2010) was set up. This programme pairs groups of 10–15 students with a faculty member (the mentor) from the students’ study programme. The mentor (frequently a native English speaker) meets with the students throughout their first year, both in a group and individually. As well as being an extra opportunity for the mentees to practice English, this programme allows the mentor to serve as a friend, and help them resolve difficulties associated with college life.

2.3.5 Whole Person Education (WPE)

One of the underlying ideals of UIC’s approach to education is the need to educate the Whole Person (Section 2.1), an undertaking coordinated by the Whole Person Education Office (WPEO).

All UIC students go through WPE courses or training in eight areas: language culture, experiential development, voluntary service, sports and culture, environmental awareness, emotional health, experiential arts, and adversity quotient (WPEO 2010).

The WPE approach has proven both very successful and popular, and has influence the approaches taken to teaching other courses at UIC.

2.3.6 Semester 1 Study Plan

All degree programmes at UIC require four years of study (UIC 2010a). The courses taken over these four years are categorized as:

1. General Education Required courses
2. General Education Elective courses

³ <http://www.ielts.org>

⁴ <http://www.ets.org/toefl>

3. Core/Major Required courses

4. Major Elective courses

5. Whole Person Education modules

Many of the programmes at UIC have identical or very similar courses in the first year. Typically, a Year 1 student's timetable will include a large proportion of General Education Required courses, including Chinese and English. Students also take the introductory IT course (IT1010) in their first semester.

3 IT1010: Information Technology

The IT1010 course is designed to introduce students to the fundamental concepts of Information Technology (IT), and develop students' confidence in using computers and computer applications (Huang & Towey 2010). Another goal of the course is to develop the "problem-solving perspective", one of several skills Computer Science has been argued to be able to offer to a Liberal Arts education (Walker & Kelemen 2010).

In the course, students are introduced to the background of Computer Science, and the modern IT sector. Some of the major IT organizations are introduced, and current IT issues and questions are discussed. The basic architecture and design of a computer is explained. Software applications useful for students of all majors are introduced and, where possible, more than one alternative is presented: whenever possible, free alternatives to common proprietary software are also presented. Students are also introduced to strategies for purchasing and maintaining computer systems.

The course is compulsory for all non-Computer Science major students, and is taken in their first semester at UIC. Typically, about 1,000 students take IT1010. The students are grouped into about 10 large sections, each with an individual instructor and Teaching Assistant (TA). All students follow the same syllabus, with the same course materials and final exam.

3.1 IT1010 History

Since the course was first introduced in 2005, it has been restructured according to the principles of Outcomes-based Teaching and Learning (OBTL) (HKBU Centre for Holistic Teaching and Learning 2010b).

The original aims and content have also been modified to move away from proprietary software and basic operational skills, to more theoretical issues, alternative software, and attitudinal objectives (UIC 2010b).

Because the English proficiency of many of the newly arrived students was not always very high, the delivery of the course required some special steps, including provision of translations, Chinese-speaking Teaching Assistants (TAs), and additional consultation times with Chinese-speaking staff

Linked to the ideals of Whole Person Education (Section 2.3.5), teams and teamwork were adopted as the main structures for teaching and assignments of IT1010.

As the course content evolved to include new technologies, the course delivery also changed. When first taught, the delivery was based on the traditional lecture/lecture notes model, where each instructor prepared their own slides and notes, and distributed them to their students. Later, instead of each of the instructors essentially delivering a separate IT course, all instructors began to use the same materials (slides, handouts, etc.). The course then evolved to using a single main website and single electronic Bulletin Board System (BBS) for all students in the course. In the third year of the course, Content Management Systems (CMS) were included in the content, and a CMS (Joomla (Joomla n.d.)) was used to manage the course website. The IT1010 Content Management System Joomla was later replaced by a Course Management System (MOODLE (Moodle n.d.)), which also became the main teaching support system used by UIC.

A detailed discussion of the IT1010 content is provided in Huang & Towey(2010).

3.2 IT1010 Course Delivery

IT1010 is delivered over the course of a single semester, usually 14 or 15 teaching weeks, with three lecture hours, one computer lab contact hour, and several consultation hours each week.

Because UIC is an EMI, the IT1010 course is delivered through English. As explained in Section 1.2.3 though, many students, especially in the early years of UIC, had a lower English proficiency. To help these students, one measure taken was to have a multi-lingual teaching team, especially for the support team of teaching assistants (TAs).

The large number of students (about 1,000), compared with teachers (5 to 10 instructors, and about 5 TAs) has also been a constraint. With these ratios, small class sizes are not feasible.

To further assist students, videos have been produced showing IT1010 staff illustrating how to use some of the IT applications in the course. These mini-videos are made available for the students to access whenever they choose.

Because of the size of the classes, getting immediate, direct feedback on teaching is impossible. However, UIC places a great deal of emphasis on the quality assurance of teaching. IT1010 conducts online feedback exercises every 4 weeks of semester, and holds staff meetings immediately afterwards to address any issues that appear in the student comments. Students are also encouraged to approach both instructors and TAs with any questions or complaints. The MCP mechanism (Section 2.3.4) also provides students with an alternative avenue to raise problems, and in the past many mentors have been able to convey the worries or frustrations of students to the IT1010 staff.

A very successful strategy developed by another unit at UIC, the Teaching English as a Second Language Degree programme (TESL)⁵, is the student Teaching Assistant (sTA) initiative (Towey 2010). Similar to this, the IT1010 will attempt to recruit more

⁵ <http://www.uic.edu.hk/~tesl>

senior students to act as sTAs to the new students, and provide an additional bridge between the instructors and the staff.

4 Summary

This paper has outlined some of the issues surrounding the of teaching an introductory-level Information Technology (IT) course to non-Computer Science students, through English, in the United International College (UIC), a new Liberal Arts college in the People's Republic of China (PRC).

Acknowledgment

The authors would like to thank all the staff and students involved in the IT1010 course, in particular Dr. Haipeng Guo, the Programme Coordinator for Computer Science at UIC.

Topic for submission: Language Education

An Investigation of the Use of Language Learning Strategies at Four Senior High Schools in Taiwan

Background

In the last two decades, there have been numerous studies concerning learning strategies used by language learners. These studies have been conducted mainly to find out what strategies learners use, as well as what factors affect these choices. Although there have been many reports on findings of learner strategy use among ESL/EFL learners, the light shed on high school learners is limited.

In order to help high school teachers facilitate their students' English learning, the major aim of this study is to identify learning behavior and tendencies that are representative of high school students in Taiwan. The most important feature of Taiwanese high schools is that sophomore students need to choose a study track (Natural Science or Social Science) relating to their major in university. Consequently, current study is aimed to investigate the correlation of language learning strategies with learners' study track.

Research on Language Learning Strategies

In the 1970s, language learning strategies (LLS) are defined as device and methods for acquiring knowledge about languages and using information to improve competence in L2. For example, in Rubin's (1975) study, LLS were defined as a kind of techniques or devices which help learners to acquire knowledge while learning language. In another study, Bialystok (1981) added that LLS were methods and conscious enterprises to take advantage of accessible information to improve second language learning.

Later, in 1980s, some researchers defined LLS as mental operations, concerning a set of operations and actions which help learners to accomplish learning tasks and regulate L2 learning. To give an example, Weinstein and Mayer (1986) defined LLS were behaviors or actions which were specific and the learner used the processes to facilitate acquisition of information. Based on Rubin's definition of LLS, learning strategy was a set of operations, steps, plans and routines for learners to regulate learning (Rubin, 1987). According to Chamot (1987), LLS were defined as techniques, approaches or deliberate actions that are to facilitate the learning and recollect the information of both linguistic and content area. In the beginning of study, the researcher regarded LLS as actions to aid the acquisition, storage and retrieval of information. Later, Oxford (1990) claimed that "language learning strategies are specific actions taken by the learner to make learning easier, faster, more enjoyable,

more self-directed, more effective, and more transferable to new situations.”

Subsequently, LLS are recommended as a special thought or behaviors taken by learners in order to comprehend new information and make learning easier, faster and more effective. For instance, Oxford (1993) and Mohamed Amin Embi (1996) both regarded LLS as actions to improve students' skills and process of second language learning. They have proved that successful language learners make use of a wide range of learning strategies; in other words, less successful learners might benefit from knowing how to use language learning strategies effectively.

A number of research studies have utilized a questionnaire developed by Oxford (1990), the *Strategy Inventory for Language Learning (SILL)* to collect data on foreign language learners (e.g. Cohen, Weaver & Li, 1998; Nyikos & Oxford, 1993; Olivares-Cuhat, 2002; Oxford, 1990; 1996; Oxford & Burry-Stock, 1995; Wharton, 2000). The *SILL* is a standardized measure with versions for students of a variety of languages, and has also been used in studies that correlate strategy use with variables such as attitudes, motivation level, learning styles, gender, proficiency level, culture, and language teaching methods (Bedell & Oxford, 1996; Bruen, 2001; Green & Oxford, 1995; Nyikos & Oxford, 1993; Oxford & Burry-Stock, 1995; Wharton, 2000).

Oxford's Classification of Language Learning Strategies

In the 1990s, Oxford (1990) developed a new system of language learning strategies after she evaluated and analyzed others' classification of language learning strategies. Oxford divided language learning strategies into two major categories: direct strategies and indirect strategies. All direct strategies depend on learners' mental processing, and learners are assumed to be able to learn directly through those strategies by themselves. Three subcategories- memory, cognitive and compensation strategies are involved in direct strategies.

Memory strategies are the methods to help learners store and acquire new information (Oxford, 1990). For instance, learners use the rhyme to memorize the similar words, such as “parrot” likes eating “carrot”. Cognitive strategies involve direct analyzing, summarizing or note-taking of the target language (Oxford, 1990). People usually jot down the notes when they are listening to the speech. Usually, learners relate new information to existing information, then to form and revise internal mental models. Compensation strategies are the skills that let learners to make up for their lack of knowledge in the process of compensating the target language (Oxford, 1990). For

example, learners guess wisely and logically according to the context in listening and reading tests.

On the other hand, indirect strategies are practical to solve the problems in four language skills: listening, reading, speaking and writing (Oxford, 1990). Three subcategories of indirect strategies are introduced: metacognitive, affective, and social strategies.

Metacognitive strategies make learners manage, conduct or organize their learning (Oxford, 1990). For example, learners arrange learning plans and set future goals by themselves. Meanwhile, they find out the mistakes of learning, and figure out the ways to improve. Affective strategies help learners to manage their emotions, attitudes, and motivations of language learning (Oxford, 1990). If learners achieved the goal which was set before, they would reward themselves such as encouraging through buying something or doing something they enjoy.

Social strategies are moves that having interactions with other people, just like cooperating and discussing with others (Oxford, 1990). When learners face some problems of learning, they seek for solutions by asking friends or instructors for assistances. Furthermore, empathizing with others, like becoming aware of others' thoughts and feelings when learners are in teamwork is also a kind of social strategy.

Factors Influencing Language Learning Strategies Use

Language learning strategies use were influenced by several factors, and in some previous studies, researchers have indicated that learning attitude, beliefs (Oxford, 1990), gender, motivation (Kaylani, 1996), learning style and year of study (Nyiko & Oxford, 1993) might relate to the use of learning strategies.

Many studies had discussed the relationship between gender and language learning strategies use. For example, Green and Oxford (1995) found the female learners used language learning strategies more frequently than the male learners, especially in the social and affective strategies. Similarly, the researcher in Taiwan investigated 977 Taiwanese senior high school students about their learning style and the use of language learning strategies; the result showed that gender had an influence on language learning strategies' choice (Yang, 1993). Yang found that the female learners used more compensation, metacognitive, affective and social strategies than the male learners.

Later, Green and Oxford (1995) used the SILL (Strategy Inventory for Language Learning) to analyze the use of the language learning strategies of 374 students at the University of Puerto Rico, and the study showed that those students who used language learning strategies more frequently tend to be more successful in academics. Park (1997) used SILL to investigate the relationship between language learning strategies and second language proficiency of 332 Korean university students. Park found that participants' English level was positively correlated with the use of language learning strategies.

In conclusion, according to the review of related studies on EFL learning strategies, it is learned that make use of various learning strategies would benefit the process of English learning. Studies have supported that high-achieving students used learning strategies more frequently than low-achieving students. It is also found that female learners used more various learning strategies than male learners. However, due to the particular learning environment in Taiwanese high schools, limited studies have been conducted to explore the relationship between the use of English learning strategies and students' study track. To fill the gap of research literature, participant's study track became one of the significant variables in this present study

Methods

This study was an attempt to investigate the learning strategies of EFL students at four senior high schools in Taiwan. More specifically, it is hoped to answer two questions:

1. What kind of English learning strategies do high school students report themselves as using?
2. Do study track and gender influence the use of these strategies?

Participants

There were 657 senior high school students participating in this study (male=361; female=296). They came from two public schools and two private schools. The four schools are average schools, neither particularly strong nor weak. Participants were second year and third year students, and their study tracks are either Social Science or Natural Science respectively. Students must choose a study track when they are sophomore at a senior high school in Taiwan. The study track determines the major of the student in university. Students in the track of Social Science tend to major in humanity related subjects (e.g. Business, Languages, Politics, Law...etc.) when they enter the university. On the contrary, students in the track of Natural Science will major in science related subjects (e.g. Engineering, Mathematics, Medicine...etc).

Therefore, there are more male students in the track of natural science, and vice versa.

Instrument

The major instrument employed in this study was a questionnaire based on Strategy Inventory for Language Learning (SILL) version 7.0 (Oxford, 1990). SILL comprises six categories of 50 items of self-report questionnaire for non-English speakers learning English as a second or foreign language. The translated version in Chinese by Yang (1992) was adopted in this study. The reason to use Chinese version is due to high school students' limited English ability which may result in misunderstandings.

Results and Discussion

The Use of Language learning strategies (LLS) by the Participants

The major purpose of this study was aimed to investigate the strategies used by the senior high school participants in this study to learn English. The result shows that the compensation strategies were used most frequently among the six kinds of strategies (see Table 1). It indicates that Taiwanese high school students prefer to guess when encountering unfamiliar vocabulary or information. Metacognitive strategies followed by compensation strategies were ranked the second. Social and cognitive strategies were ranked in the middle-frequency use range. Participants ranked memory strategies the fifth. Affective strategies are the least used learning strategies.

Table 1

Descriptive Statistics of the Use of Language Learning Strategies

Category	N	Mean	SD	Rank
Compensation	657	3.14	.60	1
Metacognitive	657	3.08	.78	2
Social	657	3.06	.78	3
Cognitive	657	2.92	.62	4
Memory	657	2.78	.62	5
Affective	657	2.63	.68	6
Total	657	2.93	.68	

The Use of LLS by Male and Female Participants

Compensation strategies were adopted most frequently by the 361 male students; while metcognitive strategies were ranked the highest by the 296 female students (see Table 2). On the other hand, male students rated metacognitive strategies top second and social strategies the third. However, female students ranked social strategies the

second and the compensation strategies the third. Interestingly, the ranks of the last three categories of LLS are the same among both female and male students. In terms of the frequency of use, female students used language learning strategies significantly more often than male students.

Table 2

The Use of Language Learning Strategies among Male and Female Participants

Category	Male (N=361)			Female (N=296)			p-value
	Rank	Mean	SD	Rank	Mean	SD	
Memory	5	2.60	.59	5	3.01	.58	.000
Cognitive	4	2.74	.57	4	3.14	.60	.000
Compensation	1	3.05	.56	3	3.25	.65	.039
Metacognitive	2	2.86	.76	1	3.32	.73	.000
Affective	6	2.54	.69	6	2.75	.64	.057
Social	3	2.82	.76	2	3.30	.73	.000
Total		2.77	.65		3.13	.65	.000

The Use of LLS by Grade 11 and Grade 12 Participants

There is no distinctive difference in the use of LLS among 11th graders and 12th graders (see Table 3). The rankings of the six types of LLS were identical. Compensation strategies were ranked the most frequently used learning strategies by both groups. Second top strategies were the metacognitive strategies, followed by social, cognitive, memory, and affective strategies.

Table 3

Use of LLS by Grade 11 and Grade 12 Participants

Category	Grade 11 (N=315)			Grade 12 (N=342)			Sig.
	Rank	Mean	SD	Rank	Mean	SD	
Memory	5	2.68	.57	5	2.85	.65	0.079
Cognitive	4	2.86	.60	4	2.97	.62	0.247
Compensation	1	3.14	.66	1	3.15	.55	0.985
Metacognitive	2	3.05	.76	2	3.10	.79	0.657
Affective	6	2.57	.65	6	2.69	.69	0.241
Social	3	3.03	.76	3	3.08	.79	0.657
Total		2.88	.67		2.97	.68	0.212

The Use of LLS by Participants of Social Science and Natural Science Track

The use of LLS by the students of different learning track was also investigated.

Compensation strategies were ranked the most frequently used language learning strategies by the participants of the track of Natural Science (see Table 4). Metacognitive and social strategies were listed the second. Students of this track ranked affective strategies the least used LLS among the six kinds of learning strategies. On the other hand, participants of the track of social science used metacognitive and social strategies more often than other strategies. In addition, compensation strategies were ranked the third by this group of students. Similar to the previous rankings, cognitive, memory, and affective strategies were less used by the participants of the track of social science. In conclusion, students of the track of social science used every kind of language learning strategies more frequently than the students of the track of natural science.

Table 4

T-test Analysis of the Use of LLS by Participants of Different Study Tracks

Category	Social Science (N=283)			Natural Science (N=374)			Sig.
	Rank	Mean	SD	Rank	Mean	SD	
Memory	5	2.97	.54	5	2.62	.63	0.000
Cognitive	4	3.08	.57	4	2.79	.63	0.003
Compensation	3	3.21	.62	1	3.09	.59	0.205

Affective	6	2.73	.63	6	2.56	.70	0.122
Social	1	3.23	.73	2	2.93	.79	0.013
Total		3.07	.63		2.82	.69	0.015

The Most Frequently Used Learning Strategies by Participants

According to the results shown in Table 5, the learning strategy "To understand unfamiliar English words, I make guesses" was used most frequently (M=3.88) by male participants. Moreover, three of the compensation strategies were listed among the top five learning strategies by male learners. Two of the cognitive strategies were used frequently, too. On the other hand, female learners liked to use the learning strategy "If I can't think of an English word, I use a word or phrase that means the same thing" (M= 4.07) more often than other strategies (see Table 6). In addition, it was found that female learners tend to use metacognitive strategies to learn English more frequently than male learners.

Table 5

Five Learning Strategies Used Most Frequently by Male Participants

<u>Learning Strategies</u>	<u>Category</u>	<u>Rank</u>	<u>Mean</u>	<u>SD</u>
----------------------------	-----------------	-------------	-------------	-----------

To understand unfamiliar English words, I make guesses.	Compensation	1	3.88	.99
If I can't think of an English word, I use a word or phrase that means the same thing.	Compensation	2	3.52	1.07
I practice the sounds of English.	Cognitive	3	3.44	.99
I read English without looking up every new word.	Compensation	4	3.33	1.00
I find the meaning of an English word by dividing it into parts that I understand.	Cognitive	5	3.29	1.55

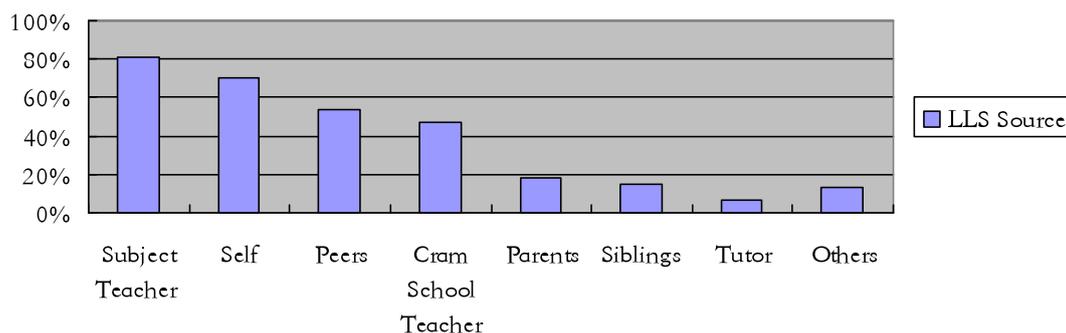

Table 6

Five Learning Strategies Used Most Frequently by Female Participants

<u>Learning Strategies</u>	<u>Category</u>	<u>Rank</u>	<u>Mean</u>	<u>SD</u>
If I can't think of an English word, I use a word or phrase that means the same thing.	Compensation	1	4.07	.82
To understand unfamiliar English words, I make guesses.	Compensation	2	3.90	.92
I say or write new English words several times.	Cognitive	3	3.74	1.09
I have clear goals for improving my English skills.	Metacognitive	4	3.71	.97
I pay attention when someone is speaking English.	Metacognitive	5	3.69	1.07

The Sources Where Students Learned the Learning Strategies

Many of the students (81%) reported that their English teachers at school were the major source where they learned the learning strategies (see Figure 1). However, participants themselves (71%) were identified the second important source; then was the peers (54%). Followed by the peers are the teachers at cram schools to teach the students learning strategies (47%). The last three sources were parents (18%), siblings (15%), and tutor (13%).

Discussion

The major goal of this study was to investigate the current status of the use of LLS by senior high school students in Taiwan. According to the results shown in last section, compensation strategies were used most frequently by 657 participants. Affective strategies were ranked the least-use LLS. The results indicate that most Taiwanese high school students often guess the meaning of unknown words/phrases when they listen or read English passages. Nevertheless, they seldom relax when they feel challenged for using English, and they seldom offer themselves a reward when do well.

Moreover, female students and male students had different preferences for language learning strategies (see Figure 1.). Female students preferred metacognitive strategies to compensation strategies and reported using metacognitive strategies most frequently. It shows that female students are more willing to learn from making mistakes and like to schedule their study plan. Meanwhile, the results reveals that females students tend to use LLS more frequently than male students in every strategy group. It also echoes the findings of some research studies (e.g. Green & Oxford, 1995; Bremner, 1999). In addition, female students like to learn English through interacting with others; male students showed less interest in interaction.

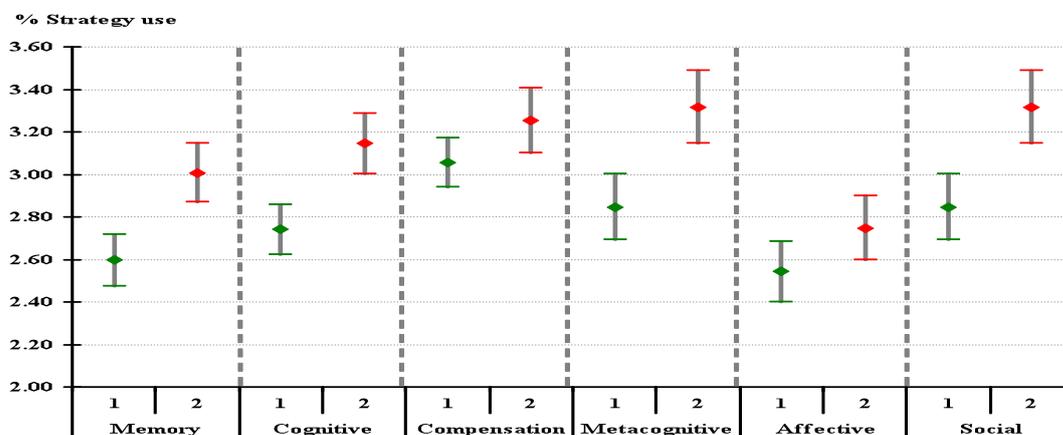

Figure 1. Difference between gender and the use of language learning strategies (1=male students; 2=female students)

Another important finding of the current study is the investigation of the use of LLS between two different learning tracks of students (Social Science vs. Natural Science). It was found that the students at the track of Social Science tend to use metacognitive strategies and social strategies more frequently than other learning strategies. On the contrast, students at the track of Natural Science use compensation strategies most frequently (see Figure 2). The results parallel the relationship between gender and the use of LLS. It is because that more male students were at the track of Natural Science (male 68%; female 32%), and more female students were at the track of Social Science (male 33%; female 67%) in this study. In fact, the gender ratio in the current study is consistent with the demographic data of the test takers of the Joint College Entrance Examination (Han, Wang, & Chen, 2010).

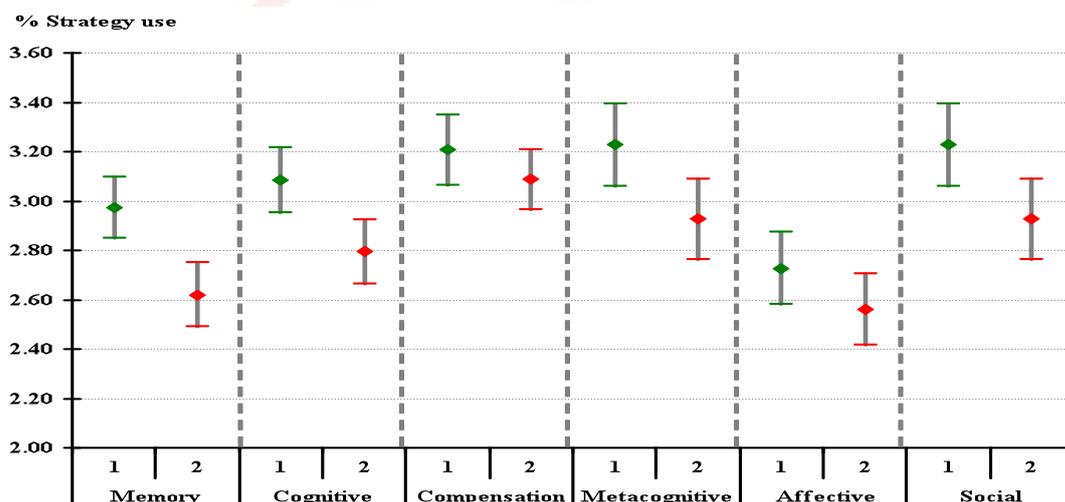

Figure 2. Differences between students' study tracks and the use of LLS (1=Social Science; 2=Natural Science)

Conclusion

In this study, some general findings concerning Taiwanese high school students' English learning strategies were presented. It was found that compensation strategies were used more frequently than other learning strategies. Affective strategies were reported to be the least frequently used. We also found that there was a significant difference between genders in the use of all six groups of learning strategies. Female students reported using these strategies significantly more frequently. There were also significant differences in the use of LLS by students at the track of Natural Science and Social Science. Students at the track of Social Science used learning strategies more frequently.

One important implication of this study relates to the infrequent use of affective strategies and memory strategies. Teachers at high school could provide more specific trainings in affective skills and memory skills. It was also noted that male students did not use learning strategies as frequently as female students. Therefore, teachers need to offer more guidance for male students to experience these strategies and know the types of strategies that suit them. Future research studies are encouraged to investigate whether the different frequencies in the use of language learning strategies by students of different study track are related to students' English proficiency. It is hoped that with more endeavors to study language learning situations among high school students, we thus know the effective way to help them enhance English competencies.

How are cultural influences reflected in perceptions of Vietnamese students studying at Australian universities?

Introduction

Going overseas for study is becoming a prevalent tendency in many Asian countries. Students coming from Asian nations not only have to handle different teaching and learning styles but also face a different culture. Some studies have investigated the influences of the various cultures which international students encounter during studying in western environments (Kato, 2001; Pho, 1999; Ha, 2001; Le, 1992; Phuong, 2001; Ballard & Clanchy, 1991; Ellis, 1995; and Biggs, 1996). These studies identify the understandings of international students in general and Vietnamese students in particular regarding the cultural influences to which they are usually exposed to western universities including Australia.

Asian students usually bring their own cultural traditions with them when they study overseas. Ballard & Clanchy (1997) question “Why should the cultural and social backgrounds of international students make such a difference to the ways they study when they enter Western universities?” (p10). Consistent with Ballard & Clanchy, Te (2000) gives typical evidence of the experience of Vietnamese students to demonstrate the incompatible cultures:

A Vietnamese student who sits quietly and listens attentively to the teacher wants to express respect to his teacher. This behavior has often been misinterpreted by the American teacher as passivity and non-responsiveness. It is also out of respect that the Vietnamese student avoids eye contact with the teacher when speaking or being spoken to. By American standards, a person acting in this way would appear suspicious, unreliable, or mischievous. In Vietnamese culture, however, looking into somebody's eyes, especially when this person is of a higher status (in age or in social or family hierarchy) or of a different gender, usually means a challenge or an expression of deep passion. The proper respectful behavior is to avoid eye contact in talking who is not an equal or the same sex. (p1)

The above examples would be convincing evidence to indicate the cultural influences towards Vietnamese students who are studying in Australia.

In an article titled “ Exploring ‘Cultures of Learning’: a case of Japanese and Australian classrooms” in *Journal of Intercultural Studies*, Vol. 22, No. 1, 2001, Kato discussed the influences of different cultures in learning. In this study, Kato argued and described the differences in the perceptions of local students and international students arising from different cultures. The author mentioned “culture” in educational contexts; “Cultures of Learning” in a cross-cultural context; the differences in the ‘culture of learning’; differences in teaching approaches; and teacher-student relationship.

This paper will elaborate on some relevant points from Kato's argument which would fit the Vietnamese context. The focus of this article is to examine and describe the cultural influences which are reflected in perceptions of some Vietnamese students studying in an Australian tertiary institution. First, the literature review of Vietnamese and Australian contexts will be drawn. Second, the perceptions of Vietnamese students will be highlighted with regard to cultural influences. Finally, there will have some discussions of the implications for Vietnamese students and Vietnamese education, and also the directions for further research.

What is going on: A review of the literature

Vietnamese context.

In the past, Vietnam was dominated by China for thousands of years, and parallel with the influences in culture, language or political, education is still impacted by Confucianism. Confucianism is a progressive ideology which heightens the values of morals, humanity and tolerance among humans. Furthermore, Confucian ideology praises peace and condemns inhuman wars. These ideas are valuable and true in any circumstances and in any society. The Confucian influence in education has been quite apparent until now. However, in the educational field, some ideas of Confucianism are not suitable and outdated in current societies, especially in Vietnam – one of the countries which are on the way to integrate with the world.

Importantly, Phuoc (1975 cited in Ellis, 1995) indicated that “the Confucian model is teacher-centered, closed, suspicious of creativity, and predicated on an unquestioning obedience from the students” (42). Generally, traditions may contain elements to hinder progress and create inappropriate attitudes towards improvement (Tong 2000, cited in An, 2001). One aspect of Vietnamese tradition is reflected in the hierarchy of both the society and education systems (An, 2001). This hierarchy makes the traditional Vietnamese teaching-learning style a teacher-centered one-way form of communication. In recent years, these traditional styles are changing towards student-centered approaches. However, the changes are not yet very effective, as embedded thoughts of Vietnamese generations towards the traditional education remain very strong.

In the classroom, students are only allowed to speak or ask the questions with the permission from their teacher. Otherwise, questioning the teacher is considered to be rude and unacceptable. The students' responsibilities are to obey teachers and show good behavior towards their teachers. They are trained to be thankful to the teachers. Hoang Tuy (2000:54) said that owing to the hierarchical system and the notion that “the teachers know the best”, the teaching becomes dictatorial and the learning becomes forced and passive. Consequently, this is the reason why the Vietnamese student “finds it easy to imitate, but difficult to do creative works” (Nguyen, 1998. p20).

Regarding the teacher-student relationship, it can be said that teacher-student relationship in one of the most important factors contributing to the success of educational outcome. Nguyen (2000: 68) states that “the relationship between teachers and students in the most important to the classroom environment” (21). However, the connection between teacher and student in Vietnam has tended to be ignored. As mentioned above, this flaw comes from Confucian ideology which teaches the young generations to always keep harmony

with their elders and teachers. According to Irwin (1996), in Vietnam, the hierarchical structure of society according to Confucian ideology was emphasized in three main relationships: king/subject, teacher/pupil and father/children. In this model, the role of women is apparently ignored and neglected.

Australian context

In Anglo-Australian higher education there is a notion that tertiary education emphasizes the potential for extending the students' knowledge base, and for the creation of "new" knowledge. This notion is rooted in the relationship between teaching and learning strategy, and the relationship of cultural attitudes to knowledge which inform them. Ballard & Clanchy (1997) believe that higher education in Australia is based on an extending attitude to knowledge; therefore, the teaching strategy directs the students to independent and critical thinking, the development of a capacity for abstraction, and the expansion of knowledge.

Western education in general and Australian education in particular often requires from the teacher a combination of "the theoretical, the personal and the political" (White, 2006). Moreover, White indicates that, teachers not only equip themselves but also know what should be required from students. For example, teachers would "require students to focus on their own educational experiences and identity, and demands the articulation and documentation of beliefs, values and philosophy" (16). White (2006) establishes five key elements of learning:

- Creativity derived from risk-taking and daring.
- Support and encouragement for students, especially when working in unfamiliar ways.
- Collaboration and collegiality in dealing with challenges, negotiating and solving problems.
- Encouragement and inclusion of innovative thinking and ideas (including the personal and the political).
- Exploration of ideas and learning through the creation of performance rather than learning about ideas through discussion and reading only.

Hofstede (1986) reveals that, in Australia, along with most other Western societies, education is designated as having small power-distance relationships. Hofstede indicated that the power-distance flexibility impacts the nature of the teacher-student relationship (see Table 1)

TABLE 1

Differences in Teacher/Student and Student/Student Interaction Related to the Power Distance Dimension

SMALL POWER DISTANCE SOCIETIES	LARGE POWER DISTANCE SOCIETIES

<ul style="list-style-type: none"> • stress on impersonal “truth” which can in principle be obtained from any competent person 	<ul style="list-style-type: none"> • stress on personal “wisdom” which is transferred in the relationship with a particular teacher (guru)

Re-printed from:

Hofstede, G. (1986). Cultural Differences in Teaching and Learning. *International Journal of Intercultural Relations*, Vol. 10, pp. 301-320.

It is quite apparent to see the the nature of teacher/student interaction in western education which includes Australia. This is exhibited as “small power distance societies” with the characteristics such as “student-centred education”, in which teachers expect students to find their own paths”, “students may speak up spontaneously in class”, and “student allowed to contradict or criticize teacher”.

The reflections of cultural influences on the perceptions of Vietnamese students

Ballard & Clanchy (1997) showed in their study of *Teaching International Students* that “All our students enter university with expectations, knowledge and behaviors which have been shaped not merely by their individual personalities but, more fundamentally, by their previous educational experiences and their own cultural experiences” (p9).

In order to establish whether the above idea is true or not, it will be discussed as follows. I will use as evidence my personal experiences in Vietnam as well as in Australia. Moreover, some further evidence will involve informal discussions with Vietnamese students, who are studying

master of coursework in different faculties at La Trobe University, Victoria, Australia. Beside, these ideas will be consolidated by a variety of the relevant resources.

Regarding learning styles

Hong, Huong and Cuong all said that they are puzzled in approaching the independent learning styles. They revealed that, in Vietnam they were trained to be obey teachers, and the outcomes of their work mostly depended on the instructions from teachers. An (2002) made a comment that, because of the effect of the Confucian ideology, Vietnamese learners are usually dependent and passive. Complementing this point, Lee (2001) said that “based on Confucian values, students usually follow their teachers’ instructions without any criticism” (p6). These ideas reflect exactly the learning styles of many Vietnamese students. According to Hofstede (1986) in western classrooms “teacher expect students to initiate communication”. This point is quite compatible with our own experiences during studying at La Trobe University. In the first semester, some other Vietnamese students and I enrolled the unit Intercultural and Communication in Education. During the lecture, teacher often divided class into different groups which were mixed with local students. In the group discussions, the Vietnamese students – myself included – did not feel confident in expressing our own opinions, and we usually followed opinions from the local and other international students. We recognized that, local students were very self-reliant in their study, and they paid more attention in their own ideas rather than meeting the expected answers for their teachers.

Vu reported that, in class activities such as group discussions or group presentations, Vietnamese students usually eluded being presenters. I also realized that Vietnamese students seem to avoid arguing and debating with others about conflicting ideas. If they think differently from other students, especially with teachers, they often do not write or say their own thinking, and they seemed to be expected to do what the majority think and value. Engholm (1991, cited in Irwin, 1996) comments the influences of traditional culture on behavior of each other of Vietnamese people that (Confucianism) “...is a practical code of conduct to follow in everyday life, a manual for managing human relationships harmoniously”(p7). I suppose that the above characteristics not only occur on Vietnamese students but also on international students, especially Asian students. These are quite unlike with the “small power distance societies” described by Hofstede “students allowed to contradict or criticize teachers”. Bigg (2003) founded that “Many university teachers report difficulties in teaching international students” (p121). These teachers complain about international students that:

- ‘They rote learn and lack critical thinking skills’
- ‘They are passive; they won’t talk in class’
- ‘Progressive western teaching methods won’t work with Asian’
- ‘They appear to focus excessively on the method of assessment’
- ‘They don’t understand what plagiarism means’
- ‘They stick together... won’t mix with locals’
- ‘They do not easily adjust to local conditions’
- ‘They tend to look on lecturers as close to gods’

Bigg did not agree to the above points. He asserted that “teach better, and you’ll address the problems presented by international students” (p139) In my opinions, I also do not

totally agree with some above points. Typically, Asian students in general and Vietnamese students in particular almost recognized that western teaching styles are progressive and better than educational framework in their host nations. Furthermore, Asian students are still getting used to this process. It is easy to understand that Asian students are often immersed in the culture of their own countries, so they usually find it difficult to adapt immediately with teaching styles in western environment.

Regarding the commenting on student's learning outcomes, Vu, Hung and Thanh all reported that, during the course, Vietnamese students frequently took great pride in the teacher's rare compliments. These are implied as an affirmation of their genuine success in studies. Due to the influence of Vietnamese culture, like many other international Vietnamese students, Vu revealed that "I am occasionally suspicious of the sincerity of complimentary comments that Australian teachers usually employ in class and wonder whether their praise is a bit hackneyed and whether my work is actually excellent or not so as to further endeavor in the future". This is actually different from our culture, in Vietnamese culture, the teacher appears to give compliments only to students who richly deserve to be justifiably praised.

The following comparative information of Mezger (1992) would give a conclusion of learning style in term of different cultures.

Table 4 Cultural Shift Required in LEARNING STYLES

OTHER CULTURE	WESTERN CULTURE
Reproductive rote learning is dominant.	▶ Analytical and sometimes speculative learning is expected.
Passive reception of information is expected.	▶ Critical reception of information is expected in reading, writing and verbal interactions.
Memorisation and imitation is expected.	▶ Analytical and critical thinking and sometimes speculating and hypothesing.
Learning all information given.	▶ Selective learning of keys concepts and details.
Activities of summarising, identifying, describing and applying formulas and information.	▶ Activities of questions, judging, recombining ideas and information into an argument. Sometimes research activities.
Characteristic question is What?	▶ Characteristic questions are Why? How? How valid? How important and sometimes What if?
Aim of learning is 'correctness'	▶ Aim is 'simple' originality and reshaping material into a different pattern. Sometimes 'creative' originality.
Reading source usually limited to one	▶ Reading widely is expected.

text and teacher notes.	
Reading the text at great depth in great detail.	▶ Skim and selective reading of many texts, articles and reports.
There may be limited resources available for student use in some countries eg. libraries.	▶ Extensive use of library and other resources (eg. media, experts, colleagues) is expected.
Circular patterns of thinking and reasoning.	▶ Logical linear patterns of thinking and development of logical arguments and opinions is expected.
The written word is seen as the truth and the goal of learning.	▶ The written word is seen as a tool for learning.
Learning and studying in one's own language.	▶ Learning and studying in a second language.

(p157)

These are the comments made by a Vietnamese postgraduate student in the USA. They are not necessarily Mezger's interpretations – she cautions the reader against believing too much in these generalizations. These are very broad generalizations that do not necessarily apply to all international students in general and Vietnamese students in particular or to all Western students in Universities

There are several Vietnamese sayings which imply the sacrosanct role of the teacher such as:

Khong thay do may lam nen

You would do nothing without a teacher

Or

Nhat tu vi su, ban tu vi su

Whoever teaches me a letter, he should be my teacher

Or

Cha me sinh con, thay cho cuoc song

My parents give me birth, but my teacher made a man of me

These above sayings mostly draw the teacher-student communication regarding cultural influence in Vietnam.

With respect to teacher-student relationship

Hung, Thanh and Huong revealed that the teacher-student relationship in Australian class is equal, opened and approachable. Hung said that, in his first few classes, he did not dare to make eye contact with the teacher as he thought it was rude. Complementing these thoughts, Ballard & Clanchy (1997) judge that:

Many international students feel shocked and embarrassed at the disrespectful behaviour of Australian students in the presence of their teachers. They also feel awkward with the informality displayed – calling a lecturer by his or her first name, remaining seated when the professor enters the room, walking through a door ahead of a tutor. (p18)

Actually, I realize that almost all Vietnamese students felt shock when they saw the behavior and communication between local students and teachers. As mentioned above, the teachers in Vietnam are always seen as being superior. Thus, when talking or addressing the teacher, Vietnamese learners always say “thua thay”, “thua co” to show their great respect. “Thua” is a very polite form which is used before a personal pronoun to talk to someone superior. Like other Vietnamese students, I felt reluctant to call teachers by their first name which I only used to call my friends in Vietnam. Moreover, the form of address between the teacher and Australian students gave me the impression that they seemed not to show reverence to the teacher.

Another thing I have discovered is that Australian teachers often treat students like their friends rather than their students. Dr. Peta, a lecturer at La Trobe University stated that ““We are not teachers – we are facilitators of learning developing lifelong learners”. Vu and Huong said that in their class, teachers usually encouraged them to express their own thinking and personal experiences no matter wrong or right. After that, teachers often made a comment or suggestion about the mentioned issues. The most important thing I have realized is that teachers always respect our personal ideas and experiences. This is worth noting that teachers said they are interested in our own experiences. Bigg (2003) shows that some characteristics of international students, especially students come from Confucian heritage societies make teaching them easier rather than difficult. To be influenced by host culture, we are often not confident to express our own ideas to teachers as we are afraid being wrong. Wei (1977) said that Vietnamese students usually avoid showing problems to outsiders because that is a revelation of their weakness. We concern more about *losing face or saving face*.

In addition, rest of the Vietnamese students – myself include - usually thought that in class the more we keep quiet the more we showed respect toward our teachers. The lecturers realized that, and they tried to change our approach in various ways, such as: encouraging us to discuss and sharing opinions; seating us with local students; asking us to engage in group discussions. Moreover, teachers required students in general and Vietnamese students in particular to say “My understanding is ...” or “in my personal experience, I think/suppose that ...”, instead of saying “I do not know” or “I have no idea”. To sum up, the usefulness I have learnt from teacher-student relationship in Australia are:

- A close distance between teachers and students
- The empathy and encouragement from teachers towards students
- The casual and informal environment in class
- Respect of teacher toward our own experience
- No avoidance in term of exposing the weaknesses in front of teachers

However, it is worth noting that, all of the teachers are different. Some are more strict and more formal, some not so. Some focus on content, some on relationships, some on learning facts, some on learning general principles, some on solving problems, some on theoretical frameworks. Generally, the teachers in Australian universities are easier to communicate than the teachers in Vietnam.

What are implications for Vietnamese students who are going back Vietnam after studying in Australia?

It can be asserted that, almost all Vietnamese students, who are studying in Australia, could understand and appreciate the positiveness of the new teaching and learning approaches in term of holistic education. However, this does not mean that holistic education could apply immediately to Vietnamese situation upon return. There is a meaningful proverb in Vietnamese that “Chuoì dao bang vang khong the lap vao mot luoi dao bang sat” (A golden knife handle cannot fit in a metal knife). In other words, we cannot bring the entire holistic contents in education to Vietnamese education. Furthermore, Vietnamese students, who return to Vietnam, is only a small number, so we should not be able to change the education system in Vietnam overnight as this is impractical and infeasible. We should try our best to incorporate new approaches to teaching and learning in some ways.

One of the most important things which Vietnamese, who will return to Vietnam as teachers will try and implement, is to replace the step by step teacher-centered approach by the student-centered approach learnt in Australia. Teachers should respect the feedbacks from students, and students should be free to express what they understand or what their confusion about the lecture material is. In addition, teachers should not impose and enforce their ideas on students' study. Instead of saying “Do your homework tonight”, we should say “Try and do your homework tonight”. In this way, we might reduce the pressure and enforcement on students, and students themselves would appreciate the encouragements from teachers rather than the orders. However, to successfully apply this way, the consensus of a small number of people is not enough, it really needs cooperation from other teachers, students and parents. Moreover, we should try to organize the class to become a cooperative learning environment. There should be more discussions in classes which now rarely happen in Vietnamese schools. However, the attempts of a few people are not strong enough. It needs a consensus of a whole society especially from the educational administrators of Vietnam.

Conclusion

This paper has taken up some ideas from Kato (2001). It has continued and developed the idea of cultural influences of international students during studying overseas. It includes challenges, hurdles, cultural shock and different teaching and learning approaches. The paper explored the range of feelings of Vietnamese students regarding coping with cultural differences, from puzzled, unconfident, passive, and isolated to be coming confident, active, interested, cooperative, and independent learners.

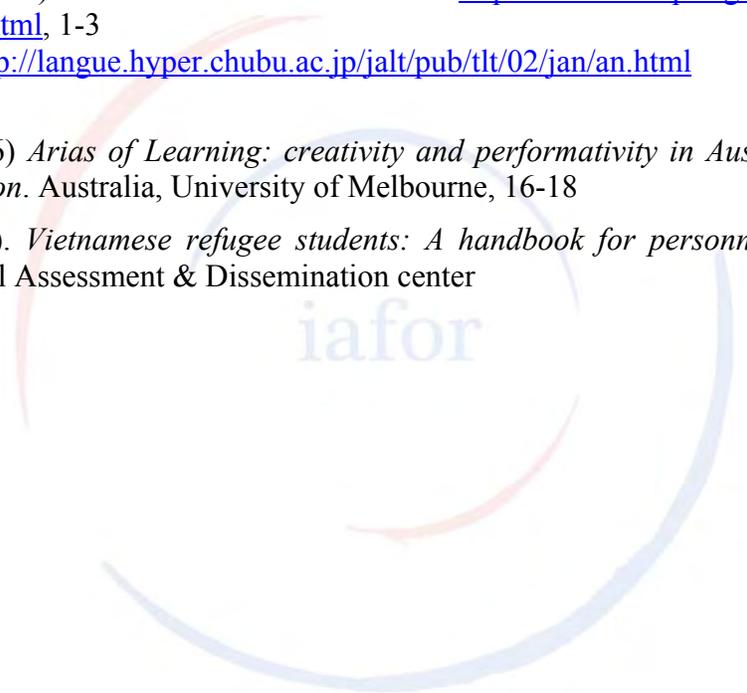

This paper based on reliable direction in the study of Kato in term of intercultural learning. However, the paper used the data from several discussions with a number of Vietnamese students who are studying in Australian universities. Most of the information comes from my personal experiences and other Vietnamese students in both Vietnamese

and Australian contexts, especially at La Trobe University. Moreover, data has also been included from other Vietnamese scholars who have already conducted the studies about the perceptions of Vietnamese students, such as Pho (1999); Phuong (2001); Ha (2001) and Le (1992) Thus, the drawn information would be not highly representative for all Vietnamese students who are studying in western countries in general and in Australia in particular.. In the next studies, I will attempt to give a more comprehensive and adequate analysis to consolidate the idea of cultural influences of international students during in studying overseas.

1. Introduction

English is increasingly deemed important in Japanese society, but Japanese graduate students need more than language proficiency to perform worldwide. That is, there are certain “conventions” and strategies that need to be acquired to join and thrive successfully in the world of academe. Yet, compared to that in the US that provides effective training for novice academics, currently there is no consistent system in Japan (Kira & Kitano, 2008, p. 29). This paper provides a descriptive account of what one university implemented to foster Japanese graduate students’ professional development.

In order to provide adequate training needed for young Japanese scholars to perform competitively, a mentoring program was devised. Mentoring has been used extensively in certain areas including business and medicine to promote individual’s career success, but has only recently been adopted in graduate education for individual’s academic development (Wright-Harp & Cole, 2008, p. 4).

Our research questions are as follows:

- i) Does mentorship provide effective and adequate training needed for graduate students to perform competitively (e.g., attending conferences, publishing in journals, etc.) in academic forum?
- ii) What kinds of benefits are gained by the mentees?
- iii) What factors are conducive to the benefits accrued by the mentees?
- iv) What are the obstacles in providing effective mentorship program?

In order to facilitate our investigation, qualitative data were collected from 15 graduate students, mostly from master’s level, in the course of three years, between fall 2007 to fall 2010. Two doctoral students’ accounts of sponsored conference attendance are also included.

Japan currently lags far behind other developed countries in terms of hosting students from overseas (MEXT, 2010a). Without an influx of students from overseas, Japan will

not be able to perform competitively in the international academic arena. Internationalization of Japanese institutions is therefore in dire need, which implies the need to elevate the quality of Japanese education. To begin with, research on the experiences of graduate students', particularly those at master's level should be explored (See Johnson et al., 2007, p. 64). In particular, research on the mentorship of Japanese students in the area of applied linguistics is missing in academic dialogues. For these reasons, this study sheds important light on the area of professional development on the part of young Japanese applied linguists.

2. Theoretical Framework

The theoretical underpinning for the mentorship emerged from the notion of sociocultural theory (Vygotsky, 1981). In the following, sociocultural orientation is explained, followed by a definition of mentoring.

2.1 Sociocultural Theory

Our theoretical perspective draws on sociocultural theory (Vygotsky, 1981). Sociocultural theory describes the genesis of knowledge to stem from social interaction that first appears on an intermental plane, which then is transformed and internalized on an intramental plane. Thus, according to Vygotsky (1981), *all* learning is not direct but rather mediated. Furthermore, sociocultural theory acknowledges the expansion of competence on the part of the learner with the help of an adult or a more capable peer. This expansion of competence, or in sociocultural term the *zone of proximal development* (ZPD), reflects not the current, already attained ability but the future ability of the learner which could only be manifested through collaboration (Lantolf & Thorne, 2006, p. 20). By reflecting these notions of interaction and ZPD, we have come to visualize mentorship as inherently connected to the expansion of the learner's cognitive development.

2.2 Mentoring

Now, the notion of "mentoring" needs clarification. Wright-Harp and Cole (2008) define it as:

a process whereby one guides, leads, supports, teaches, and challenges

other individuals to facilitate their personal, educational, and professional growth and development through mutual respect and trust.
(p. 8)

Wright-Harp and Cole (2008) distinguish mentoring from advising, as mentoring comprises more all-encompassing features where more commitment on the part of the mentor is expected. More precisely, academic mentoring includes at least three elements: (a) emotional and psychological support, (b) role modeling and (c) career guidance (Ku et al., 2008, p. 366).

Johnson (2007) claims that mentees can accrue eight types of benefits from participating in mentorship. They are: (a) scholarly productivity, (b) professional skill development, (c) networking, (d) initial employment, (e) professional confidence and identity development, (f) career eminence, (g) satisfaction with program and institution, and (h) psychological health benefits. In this paper, to evaluate the positive effects of the mentorship program, we refer to the first three of the eight categories (i.e., scholarly productivity, professional skill development, networking). This is because the students are still enrolled in the master's program and the effects the mentorship have on the students after they leave the program is beyond the scope of this paper.

3. Methodology

The majority of the data comprise the self-study (Loughran et al., 2004) and narrative inquiry (Connelly & Clandinin, 1990) where the participants reflected on their involvement in the mentorship. Self-study evolves from the notion of reflective practice (Schön, 1984) in which one's own experiences are used as knowledge source for practice. In this sense, it is a self-regulated and intuitive process. In narrative inquiry (Connelly & Clandinin, 1990), the participant shares his/her narrative with the researcher. In essence, this too is a reflective practice. This told narrative is an intellectual rendition of actual experiences. It is a personal meaning-making process, an idiosyncratic interpretation of the past, hence it might not be a true rendition of what had *actually* happened but yet is a guiding force of the tellers' action and the source of their philosophical orientation.

3.1 Participants

This study involves 12 mentees, or protégés, who have been selected between 2007 and 2010 to participate in the mentorship offered at an urban private university in Tokyo. They are all graduate students majoring in TESOL (Teaching of English to Speakers of Other Languages) or applied linguistics. There are four mentors in total, to each one mentee is assigned. The profiles of the mentors are given in Table 3-1, and those of the mentees are given in Table 3-2. All names of the mentees are pseudonyms, except for Lumi who is one of the writers of the present paper.

Table 3-1 Participants: Mentors

No.	Name	Gender	Age	Title	Area of Expertise
1	Ken	M	60s	Professor	Psycholinguistics
2	Josh	M	50s	Professor	Language Testing
3	Sean	M	40s	Assoc. Prof.	EFL Teaching
4	Mitzi	F	40s	Assoc. Prof.	Sociolinguistics

Table 3-2 Participants: Mentees

No.	Name	Gender	Status	Year	Mentor
1	Saori	F	D	2007(F); 2008(S)(F)	Ken
2	Mark	M	M	2007(F)	Josh
3	Kohei	M	M	2007(F); 2008(S)(F)	Mitzi
4	Shiho	F	M	2007(F); 2008(S)(F)	Mitzi; Sean
5	Kosuke	M	M	2008(S)	Josh
6	Takumi	M	M	2008(F)	Josh
7	Masayuki	M	M	2009(S)(F)	Ken
8	Naoto	M	M	2009(S)(F)	Josh
9	Tomoko	F	M	2009(S)(F)	Sean
10	Lumi	F	M	2009(S)(F); 2010(S)(F)	Mitzi
11	Shu	M	D	AILA 2008	-
12	Yuki	F	D	AILA 2008	-

D=Doctorate; M=Master's

S=Spring (1st) semester; F=Fall (2nd) semester

In early spring, the advertisements for the following academic year's mentorship positions are announced, and graduate students are invited to make their application. While the program is primarily for the TESOL master's students, graduate students in the applied linguistics strand in master's and doctorate programs are also permitted to apply. The priority for the TESOL students was instigated due to an external government research funding provided specifically for the TESOL program.

3.2 Data Source and Analysis

The data collected include retrospective surveys and reflective essays on having been involved as a mentee. First, the surveys were completed anonymously as to gather honest reactions to the mentorship program. Responses were used to identify common key themes among the mentees. Then, more detailed anecdotal accounts in the form of reflective essays were collected. The mentees were advised that these essays would *not* be anonymous, and will serve as feedback for the mentors. The survey data together with the three of the eight benefits identified by Johnson (2007) (i.e., scholarly production, networking, professional skills development) served as the thematic nodes for qualitative analysis.

4. Findings & Analysis: Participants' Voices

Findings and analysis of the participants' reflection essays are presented in this section. The themes are categorized into subsections that were derived from Johnson (2007) and themes that emerged from the surveys.

4.1 Scholarly Productivity

The mentorship program of the current study aims at providing effective and adequate training needed for graduate students to perform competitively in academic forum. In this respect, scholarly productivity receives high attention in evaluating the program's success. In the following section, accounts on scholarly productivity are presented, especially focusing on publishing, and presenting at conferences.

4.1.1 Publishing

Writing up an academic paper was mentioned as a valuable experience by all mentees. Those who wrote papers for abstracts and presentations for conference meetings expressed the writing process to be beneficial for both skills development as well as deepening their expert knowledge on their research field. Masayuki and his mentor Ken worked on the analysis of public opinions about the new English study guideline. Masayuki asserted that the research results were of great interest to him, and after writing a paper for an educational corporation, he stated:

Since it was the first time for me to write such an official report, I could learn how the professional research institution conducts the research and how the professional study report should be. (Masayuki, Fall 2009)

Overall, Masayuki expressed conducting research and writing a report was a valuable experience for his future research and career.

Takumi also mentioned that the research process provided him with experience that leads to his future research career. He was involved in proofreading a draft for a book on language testing. Takumi mentioned how he used various skills, including using statistical analysis software, and searching for and reading related articles so as to write a research paper. He described the process as advantageous:

...reflecting my experiences as a research assistant, what I have achieved was valuable especially to my future research for MA thesis. Basically by working closely to the professor, I learned many things that I did not learn by attending classes. (Takumi, Fall 2008)

Although the previous participants focused only on the bright side of the process of publishing, Kohei, who presented at two conferences and wrote two papers along with his mentor, expressed stress in writing a paper. Nonetheless the overall impression is positive, since he shows his eagerness in applying what he learned in the research process:

To be honest, the process of writing the paper and doing the analysis were very tough. However, after successfully finishing presentation, I was filled with a sense of achievement...Based on the experience, I

would like to apply for the presentation if there is a next chance. (Kohei, Spring 2008)

On the other hand, one of the participants (i.e., Saori) wrote papers not for a particular aim but to keep track of her research and submit them to her mentor (i.e., Ken) on what she was researching. She reflects on the process as follows:

...having given the chance to privately write reports for the sake of Ken's research was meaningful and was strong motivational factor throughout the process. It required a wide range of knowledge, interest, and patience to overcome this task; hence the fact that I was assisting Ken's research was an important aspect to carry out the study in this broad field. (Saori, 2007)

Although not directly taking part in publishing, having being involved in conducting research, some of the participants mentioned their development of new perspectives in terms of teaching and research. Mark mentioned in his essay:

...the program has exposed me to detailed insight into the workings of research and university life at the professional level...these projects helped me to develop those skills essential to being a teacher who not only teaches but one who also does research. (Mark, 2007)

Lumi similarly stated:

Having participated in the assistantship, I have learned that research is not a granted special privilege of the researchers done by "outsiders", but an on-going professional development for teachers. Being a research assistant meant, for me, the break with traditional approach to language learning and teaching. (Lumi, Fall 2009)

The participants' comments reflect their awareness of being (becoming) a teacher and researcher, which means the mentorship program offered the participants experience to develop not only as a researcher but also as professional teachers. From the accounts, it can be inferred that publishing allowed the participants to develop their professional skills that shape their future career.

In addition, participants who attended international conferences such as Shu, Yuki,

Shiho, Kohei and Lumi, expressed their professional development as well as heightening of their self-esteem and confidence.

4.1.2 PRESENTING

Those who presented or participated in international and/or domestic conferences mentioned their rewarding experience, gaining access to deeper knowledge of the field as well as sharing the research findings with other scholars who contribute to the same field of academic interest.

Saori, after presenting at a local workshop with Ken, reflected on her rigorous research as well as on the final presentation as a very fruitful experience. Hearing other speakers present was beneficial for her:

I reflected on my own presentation during other people's lectures, and began to recognize things I was not aware of at the time of my presentation. (Saori, Fall 2008)

Presenting in front of an audience gave the participants the opportunity to reflect upon their own presentation skills. Presenting did not serve as a mere end itself for many participants, but also as a means to share and receive feedback from the audience.

Masayuki also presented with Ken at the same venue a year after. He expressed his sense of fulfillment after conducting research and presenting along with Ken:

...the lack of prior comprehensive studies on this issue also made this research meaningful not only for me but also for the people involved in English education in Japan. Actually, many people seemed interested in our study, and I received many positive feedback comments from the audience after the presentation. For these reasons, the research and the presentation that I conducted with Ken were great experiences for me. (Masayuki, Fall 2009)

The reciprocal effect of the presentation fosters self-esteem of the participants, resulting in the rise of interest as well as confidence in their presence in the academic field. Shiho, who presented at an international conference, describes her similar sense of satisfaction

in having presented and shared ideas and issues at the conference:

Although we had only four audiences, I enjoyed giving a presentation in front of them. I enjoyed sharing our findings with researchers from another country (i.e., Indonesia) and answering their questions. They were eager to listen to our presentation and gave us interesting comments. This experience made me want to go to more international conferences and share my ideas with more researchers from many more countries. (Shiho, Spring 2008)

Making presentations was not always easy, as Shiho states, but the sense of accomplishment outweighs the hardship. Shiho states:

Although it had not at all been easy to complete this project and I often had to sacrifice my own research for the thesis...my experience of giving a presentation at an international conference taught me the enjoyment of sharing ideas with other researchers and helped me build self-confidence in working as a researcher. (Shiho, Spring 2008)

The account reveals the program being challenging but at the same time productive to equip the participants with the skills as well as confidence to enter the professional world of research.

Kohei, who attended another conference in Nagoya, reflected that he was able to make a link between the graduate course's content and actual research cases. Since the research was strongly connected to what he had learned in the course, this led him to become more interested in sociocultural theory and the related topics. Having presented at two conferences and served as a Teaching Assistant (henceforth TA), Kohei makes his final reflections as follows:

Without this assistantship, I might have had limited perspectives in academic area. This assistantship surely gave me wonderful opportunities to broaden my academic interest, to build my confidence in many aspects, to cultivate teaching skills, to foster linguistic skills in academics and to develop the quality as a researcher. (Kohei, Fall 2008)

Two doctoral students who attended AILA, Shu and Yuki, mentioned that

conference presentation has highly benefited their future research career. Shu stated, “the AILA conference provided me with a great opportunity to grow as a researcher” (Shu, 2008). Yuki offers a more concrete vision as to developing as a researcher:

I am enthusiastic to find out the extensive empirical research and projects that has been done by academics around the world. This will help me build strengths of both as a novice researcher as well as a teacher...I am looking forward to having discussion with researchers and teachers from different countries regarding improvements to teaching and programs for the betterment of learners. (Yuki, 2008)

Besides the participants who actually presented at conferences, those who only attended as audience also commented that they benefited in various ways. Naoto and Lumi stated that they gained how to make presentations effectively, as well as developing their interest in the field. Naoto states:

The conference had a section on language testing with some of the presentations related to my M.A. research. Each presentation of the section was very interesting to me and they taught me how to make presentation effectively in the limited time. After the all presentations finished, I became confident that I will be able to organize presentation as great as they did. (Naoto, Spring 2009)

Lumi, after attending an international conference along with Mitzi, reflects:

The presentation skills of the scholars served as a useful reference for the future, and I learned that researchers must have the skill to convey their theory not only via written but through oral means as well. (Lumi, Spring 2009).

Conference presentation is a major factor in developing the participants' self-esteem as a researcher and holds a great motivational effect on pursuing their future academic career. Some of the accounts revealed that the participation in conference itself has served constructively in terms of getting to know the conventions in the professional world.

4.2 NETWORKING

Developing professional networking is also one of the benefits mentioned that can be

attained through the mentorship program. Although not directly related to conference settings, Mark, for example, stated the importance of networking in relation to a project he was involved in:

Through this project I was able to meet people I ordinarily would not have been able to meet. Hopefully I was able to establish professional friendships that will last a life-time. In this way the GTR position helped me to network quite extensively, which was also one of my reasons for joining a graduate program in the first place. (Mark, 2007)

Yuki explicitly states the benefit of having the opportunity to socialize and to get to know prominent researchers from around the world:

...I was able to exchange ideas related with my field of studies and was able to look into my research from a different angle. (Yuki, 2008)

Shu, who also presented along with Yuki, similarly stated getting response from other researchers was beneficial:

The AILA symposium gave me a precious opportunity to report on my study in front of researchers from various countries in the world and to get feedback from them. (Shu, 2008)

In order to develop academically, socializing and exchanging opinions at an international level is essential. Some of the participants who have attended international conferences were able to appreciate the networks that are established among the researchers from all over the world.

4.3 Professional Skill Development

Among the various experiences and benefits that appear in the participants' reflection essays, two major professional skills are focused on in this section: Teaching skills that are obtained by serving as a teaching assistant, and research skills attained through conducting research.

4.3.1 Teaching Assistant

Some of the participants were involved in teaching in university settings, thus serving as TAs. The three participants, Shiho, Kohei and Kosuke, were given opportunities by

their mentors to take charge of a certain period of time in class and teach. All three participants expressed the teaching difficulties at first, but they came to know how to take the students through the class. Shiho reflected on her teaching as follows:

When I first stood up in front of the class and took students through reading an article, I got very nervous, and to be quite honest, there were a few times when I felt reluctant to go to class. Because it was only due to my lack of experiences standing up in front of people and giving lectures, however, I gradually became used to being “teacher” and started to enjoy taking them through articles. Many students commented on this course...when I read their comments, I was very moved and, at the same time, motivated to become a teacher myself. (Shiho, 2007)

As can be inferred from Shiho’s statement, getting used to teaching requires time and practice. Kohei went through a similar process in developing his confidence in teaching:

I had felt a pressure in front of the classes and almost always encountered difficulties in teaching the content matter as well as managing classroom atmosphere. I think I was not confident in my management skill as a teacher as well as language skills to teach content matter. (Kohei, Fall 2008)

Kohei pointed out that the continuous commitment in teaching has enabled him to enhance his quality as a teacher.

Kosuke served as a TA as well, but his duties were more inclined to helping out the professor’s (i.e., mentor’s) class rather than teaching and doing class management himself. Nevertheless, his presence in the university-level class gave him the opportunity to experience and gain classroom-related knowledge. He mentioned:

...it was very fun and informative for me to join students’ discussion, because they have a lot of experiences and opinions in studying and teaching language...I always brought these meaningful discussions to Josh after each class... I could see the class from both teacher’s and student’s point of view and found there were many cues and techniques to manage a class in English. (Kosuke, Spring 2008)

The participants’ TA experiences have led them to gain confidence as teachers and to

develop their skills as teaching professionals. This is an important effect of the program, especially because the program is being offered to the TESOL majors. In addition to the teaching skills, participants repeatedly mentioned the attainments of research skills as well.

4.3.2 Conducting Research

As may be inferred from the previous sections, all of the participants mentioned their sense of their own development as a researcher. Those who were involved in conference presentations described their development through actually preparing for and participating in the conference. Similarly, those who did not actually present but experienced some work on research process also noted their progress.

The general consensus was that the program offered them the opportunity to gain deeper understanding of the research field as well as knowledge in academic research methods, attaining academic research skills such as analyzing and writing papers. Tomoko expressed how she was able to gain deeper knowledge of qualitative research, which she found new and interesting. She stated:

By using qualitative research methods, there are data that can not be obtained through numbers and statistics, which is very appealing to me. I would like to refer to this experience when I design my own MA thesis research. (Tomoko, Spring 2009)

Similar to Tomoko's account on coming to know a new research method, other participants also expressed their joy in these encounters and showed eagerness to apply them to their own research. As a whole, the program can be evaluated as successful in enhancing the participants' professional knowledge and skills, as well as their self-esteem as researchers and teachers.

6. Discussion

Given the overall positive accounts for the mentorship program, it could be said that the program was successful. The numerous benefits the mentees claimed to have accrued would help their future academic and professional performances. Yet such program does have limitations. First, mentorship calls for time, effort and funding. Coordinating

a successful program involves seeking, maintaining and nurturing assistantship provided by mentees. This cannot be done without care on the part of the mentor (Ku et al., 2008, p. 373; p. 375). This time-consuming effort should be rewarded by making it a part of tenure and promotion process (Wright-Harp & Cole, 2008, p. 9). By doing so, this can propose a win-win situation for both the mentor and the mentee. In contrast, if no such provisions are made, less faculty members would volunteer to be a mentor, thus less number of students being mentored. This would be an unfortunate outcome, as Johnson (2007) reports how “the vast majority of those not mentored report regret at being unable to find a willing mentor” (p. 204).

Second, we have discovered that not all mentoring experiences are uniformly relevant. That is, the students’ level of satisfaction and sense of achievement reflected the productivity of the mentee. Such productivity cannot be accrued by the mentee alone. The work done collaboratively between the mentor and the mentee determines the quality of the mentorship to a large extent (Johnson, 2007, p. 196).

The mentor could enhance mentee’s professional confidence and identity by providing a forum where mentorship could lead to productive graduate and post-graduate activities. Johnson (2007) refers to this chain reaction as “social heredity” (p. 197) where the quality of mentorship provided by a mentor could have far-reaching consequences on the mentee, largely contributing to the successes (or failures) of the protégé. Specifically, “protégés are more likely to adopt the professional demeanor of the mentor and sharpen many of the profession-specific skills crucial to eventual success” (Johnson, 2007, p. 195). This social heredity, or the passing of qualities from a senior to a junior scholar, could result not only benefits for the novice scholar, but for the senior scholars as well (Johnson, 2007, p. 198).

In sum, the mentor could accrue the following benefits by providing successful mentorship:

- a) personal satisfaction from witnessing growth and development in protégés;
- b) personal fulfillment and meaning;
- c) creative synergy and professional rejuvenation;

- d) networking;
 - e) motivation to remain current;
 - f) friendship and support;
 - g) reputation for talent development.
- (Johnson, 2007, p. 1999)

6.1 Limitations

While the analysis illuminates positive effects of mentorship in the field of applied linguistics, this study suffers from two shortcomings: the small sample size, and the public nature of the essays. To begin with, the experiences of the mentees are context-specific, largely shaped by the nature of the task and the relationship they had with their mentors. This does not allow for any generalizations.

Second, the mentees knew that the reflective essays would be read by their mentors. Hence it may have deterred them to give honest opinions, hence documenting only the positive dimensions of the mentorship program. However, the survey allowed for some anonymity, thus inviting any negative feedback, if any.

7. Conclusion

The results show how successful mentorship could lead to research productivity including reviewed journal publications, book chapters, and conference proceedings while the mentee is still a graduate student. This in turn enhances the probability of post-doctoral performance eventually leading to a successful and productive faculty membership (Wright-Harp & Cole, 2008, p. 14). Given the positive impact it has on the graduate students, it leads us to conclude that there is a pressing need to create more mentoring programs at all levels and on a national basis (Wright-Harp & Cole, 2008, p. 14). Mentorship could provide a pathway for the needed positive transformation of the academy, in order to provide sound, effective academic training (Herman & Mandell, 2004, p. 206). However, positive and successful mentorship program requires numerous elements for its success. For example, an ideal mentor should be committed to mentoring, be accessible, be open-minded, be supportive, be sensitive and considerate, be respectful, trusting,

understanding and empathetic (National Academy of Sciences, National Academy of Engineering Institute of Medicine, 1997, in Wright-Harp & Cole, 2008, p. 9; See also Zelditch, 1990, p.1). In sum, the ideal mentor should possess excellent motivational skills and be committed to nurturing students, believing that mentoring is satisfying and rewarding (Wright-Harp & Cole, 2008).

Given the commitment on the part of Japanese Ministry of Education, Culture, Sports, Science and Technology in providing competitive and sound post-secondary education, a project known as Global 30 was launched in 2009 (MEXT, 2010b). This project addresses the need for the Japanese institutions to provide attractive, competitive education for Japanese and international students in Japan. By emphasizing globalization, Japan hopes to contribute significantly internationally. A successful and effective mentorship needs to be maintained and monitored to assure the nurturing of novice scholars who can participate in global arena. In order to do this, institutional commitment is indispensable.

The study on mentorship relationship is still at its infancy, especially in the field of applied linguistics and it is hoped that exploratory qualitative research would provide ways for theory building (Johnson et al., 2007, p. 65). It is hoped that this paper contributes to such endeavor.

1.0 Introduction

Languages in Malaysia are accepted not only as a mean of communication but they are seen as means to ensure the country's development. The status of the Malay Language or Bahasa Malaysia (BM) as the national language needs to be uphold, having English Language as the second language and on top of that, without neglecting the importance of other languages.

After the independence in 1957, education in Malaysia has gone through many dramatic changes and one of them was to upgrade the standard of the Bahasa Malaysia as the national language. The national language is used as a mean to unite all the races in Malaysia. Language shift in Malaysia has been an ongoing concern for many years. Language is seen to motivate unity among the many races and as a mean to develop the country.

Even though BM is widely used as a language for all formal correspondence in Malaysia, it lacks of terminology for science and technology. In the new world of globalisation and modernisation, Malaysian government cannot avoid from taking drastic actions which may be seen as retreating to the past. Language is again seen as a factor that influences a success of a nation. English has become the second most important language (Asmah, 1992) even though it is the only non-native language taught in all schools. In the mid-1990s, the government urged the tertiary institutions to use English in teaching technical courses and at the same time, senior government ministers including the ex-prime minister, Tun Dr Mahathir Mohamed have become convinced that the standard of English Language in Malaysia has deteriorated and may jeopardize the nation.

Despite the dissatisfaction voiced out by many, in 2003, the government had introduced the teaching of Science and Mathematics in junior primary and secondary classes via English medium (Ridge, 2004). It was convinced that by integrating the language and content would increase the students' content and language competency. The future generation of Malaysia will be able to accept challenges of globalisation and Information and Communication Technology. However, after six years experimenting using English to teach Mathematics and Science in schools, Malaysian educational authorities have accepted the view that these subjects are better taught in a language best understood by students, which is BM in national schools, Mandarin in Chinese and Tamil in Tamil schools (Lotbiniere, 2009). The, English-medium education policy, introduced in 2003, will be phased out, from 2012, in junior and secondary schools .

Higher education institutions, including polytechnics and community colleges, will need to adapt to these changes in the language policy. Future students will face greater challenges. They will need to improve their English and be competent enough to study at polytechnic which will maintain the usage of English in their teaching and learning. Polytechnics will need to take initiatives to improve their students' knowledge of content in English, and upgrade the bilingual competencies among lecturers. If these challenges can be overcome polytechnics could produce future graduates who are good academically and can demonstrate language competencies which are acceptable to employers.

2.0 Overview of Language and Employability

For these past years, there have been concerns that the higher institutions do not produce graduates who meet the needs and expectations of employers. The issue of not having Malaysians who are proficient in English language is widely discussed in industry and education. Realizing this, the Malaysian government has taken serious measurements to overcome this problem. One of the steps is to enhance the importance of English. English is the language of science and technology, therefore, Mathematics and Science subjects are best taught in that language (New Sunday Times, 21 December 2008). Higher institutions such as polytechnics, accept the importance of English as the language used in teaching technical subjects. Despite the dominance

of English in teaching ICT, the relationship between teaching ICT and English continues to stimulate discussions, because of the tension between the current English proficiency levels of students and their teachers, and the demands of employers for communicative competence in English in the workplace.

2.1 Language and employability

Employers have frequently voiced their disappointment at the quality of graduates who do not meet the job market requirements (Industry Dialogue, 2008). It is mentioned that graduates lack hands-on knowledge and relevant skills and the industries were not keen to take on the task of training new employees. Students are expected to graduate with employability skills also known as job readiness skills. One of the employability skills is communication skills (Latisha & Surina, 2010). The graduates' poor communication skills in English and their inability to articulate a line of thought in either English or BM are among the employers' complaints (Industry Dialogue, 2008). A lot of research documents claims that, graduates' lack of competency and poor communication skills affect their ability to secure jobs (Lee, 2004; Nurahimah, 2002). According to Tan (1999) based on a needs analysis 60 percent of students in Malaysian Polytechnics had low proficiency in English, not enough for career advancement. It was reported that only 600 from the total of 13000 graduates who registered with Human Resource Ministry for jobs in service and marketing sectors in the first 10 months of the year 2002 were employed, while the rest were rejected due to their poor command of English and lack of communication skills (Fairuz, 2003). The decline in the standard of English is not only felt in the academic circle but also in diplomatic services (Asmah, 1992). In another survey conducted by Nurahimah and Rosmawati (2002), discovered that employers perceived the graduates were not prepared with written and oral communication skills in English.

This causes difficulties for the graduates to find a job after they have completed their studies. It becomes a nation worry when the mission to produce human capital which is IT literate, independent, highly motivated and competitive (Education Ministry, 2000) seems not been accomplished when the ex-Human Resource Minister, Datuk Dr. Fong Chan Onn revealed the feedback from employers that a number of unemployed graduates lack of communication skills, unable to use computers and lack of team spirit (Cruetz, 2003). Due to these, Malaysia has set up RM70million fund to retrain unemployed graduates and teach them skills such as communication, English Language and creative thinking (News Straits Times, 8 March 2009).

I believe the ministry has been accommodating and sensitive towards employers' needs and prepare programmes which involved collaboration and cooperation between industries and the ministry. In addition to this, several actions have been taken in order to increase to proficiency level in order to meet the minimum required standard claimed by future employers; among them are conducting dialogues with industries and setting up graduates' development programmes which involve participation from industries. It is hoped this initiative will help the unemployed graduates to be able to fully adapt their generic skills thus creating wider opportunities to secure jobs.

2.2 ICT in Malaysia

Information Communication Technology is seen as the field where English is used as medium of instruction and the graduates of polytechnics should prepare themselves to be semi-professional group who might need English for their career advancement. ICT in Malaysia has been identified as one of the factors that contribute in achieving the mission proposed in Malaysia Education Development 2001-2010. ICT development is seen as the important driver for positioning Malaysia as competitive knowledge based economy, global ICT and multimedia hub (MOSTI 2007). One of the challenges for the nation is to develop an economy system which is based on

knowledge or K-economy. K-workers or knowledged workers are the people who create information and knowledge and integrate it into business (Turban et.al, 2001).

Therefore, graduates who are proficient in English which is the language used in the ICT era have the advantage to utilise their generic skills. They will be able to learn on their own and explore the world of IT and become future workforce who is K-worker, IT literate, independent, with high motivation and competitive in line with the mission proposed by the Higher Education Ministry. Hamidah (2001) discovered a significant relationship between English language proficiency and Information Technology (IT) literacy. IT literacy is affected by the level of proficiency in English, the language of technology. Garcia-Vazquez, E., Vazquez, L. A., Lopez, I. C., & Ward, W. (1997) found out that there is a significant connection found between proficiency in English and standardized achievement scores.

It is a concern for the nation that Malaysia has a sufficient supply of graduates with technical skills which includes ICT but the demand for graduates is low despite the economic growth in the country (Singh & Singh, 2008). It has being said that graduates with employability skills attract future employers. If one of the employability skills is ability to communicate in English (Latisha & Surina, 2010), then a low level of English competence will have a negative impact on employability.

In this paper I examine in detail what are the components of competency in English that employers are seeking. If we can specify in sufficient detail the perceived needs of employers and compare them with the perceptions of students and their teachers, we might have a better basis for identifying appropriate structures and strategies for the content and pedagogy of integrating English language with the teaching of ICT in Malaysian polytechnics.

2.4 English Language Programme in Malaysian Polytechnics

The tertiary institutions including polytechnics have taken the next step and starting 2009, English is used as a medium of instruction in teaching technical subjects. The Department of Polytechnic and Community College Education (DPCC), Ministry of Higher Education, Malaysia is aware of the needs to improve the ongoing language programmes and supports progressing in polytechnics and community colleges. Among the support programmes was to prepare the subject lecturers with English courses before implementing the language shift. The three-phase language programmes enhanced the skills and abilities of the lecturers in using English in class. English lecturers were trained and they became the facilitators in this programme. In addition to that, DPCC gives opportunities for the industries to contribute by organizing industry dialogues, annually since 2006. The main objectives of these dialogues are to foster closer ties with the industry and to have first-hand feedback on current trends pertaining to the human capital needs of the industry and nation. DPCC is aware the importance of engaging the needs of the industries and how the polytechnics and community colleges can fulfil those needs for the national as well as the international market.

The general aims of English syllabus are to develop students' confidence and fluency in English and to enable them to function effectively at the workplace. Besides that, the graduates should be able to practise independent learning and self-monitoring as well as to develop appropriate study skills. The objectives mentioned in the syllabus include the graduates being able to communicate effectively with Malaysians and non-Malaysians (English Syllabus, 2002). Industrial visits and gradual exposure to ESP brought awareness amongst the English lecturers of the needs to have an English language programme tailored to the needs of the students and at the same time, sensitive towards the expectations of the students' prospective employers.

3.0 Methodology

This paper explores the language skills needed at the workplace and future expectations for graduates in IT. In order to find the language needs, both quantitative and qualitative data are used. A mixed method research is opted for this study. This study was conducted in a few phases and it involved two groups of respondents: students and trainers.

3.1 Sampling

For this study, I have employed purposive sampling which involved ICT students of polytechnics and industrial trainers. In purposive sampling, the researcher identifies the characteristics of the population of interest and locates individual with those characteristics (Johnson & Christensen, 2008).

3.1.1 ICT Students

The sample was chosen based on two criteria: experience in learning English in polytechnic and had undergone industrial training. The respondents should have undergone English for Technical Purposes when they were in semester 1, 2 and 3. The researcher was interested to investigate the perceived needs of the ICT students who have taken English courses in polytechnic. Their experience in learning English in polytechnic and during their industrial training helped the researcher to get a description what their language needs for academic and occupational purposes.

3.1.2 Industrial trainers

The other group of respondents was the industrial trainers. The researcher was interested to find out the needs and expectations of the trainers. Their needs and expectations of the use of English in the workplace are important in this study. A semi-structured interview with was conducted.

4.0 Methods of Data Collection

4.1 Questionnaire

The questionnaire was developed based on a study on language and ICT literacy skills by Hamidah (2001) and Juriah et.al (1997), English and ICT syllabus used in polytechnics and Information Technology Checklist questions from CAUDIT (The Council of Australian University Directors of Information Technology) IT Literacy Policy. Questionnaire is a self-report data-collection instrument and researchers use them to obtain information about the thoughts and perceptions of research participants (Johnson & Christensen, 2008).

The findings of the questionnaire were used to find out respondents' perceptions on the language needs and perceived level of IT literacy. The students were asked to evaluate their own proficiency level and mark the language needs at their training places. Responses were gathered from participants who learn English in polytechnic and have undergone their 6 months Industrial Training Programmes. They were asked to express their language needs pertaining to learning IT and training place.

4.2 Interview

For this study, I have conducted two types of interviews; retrospective and semi-structured. Interviewing is an important way for a researcher to check the accuracy of-to verify or refute- the impressions he or she has gained through observation (Fraenkel & Wallen, 2000). Interviews allow opportunity for researcher to prompt or probe the participants when necessary (Johnson & Christensen 2008).

Retrospective interviews can be structured, semi-structured, or informal (Fraenkel & Wallen, 2000). The aim was to find out further clarification and explanation on the language needs of the ICT students. This type of interview was conducted in a group of five students. These students have participated in the earlier stage of the data collection; which was the questionnaire administration.

Semi-structured interviews were conducted with industrial trainers. The data gathered from the interviews was pertinent to give rich data of the needs of trainers. This method of data collection will help the researcher to allow participants provide historical information on their fields (Creswell, 2009). Concerning this, researcher conducted face-to-face interviews with eight industrial trainers. Their responses on the language needs of the ICT students for training place were important to discover the expectations and demands of future employers and ICT students.

5.0 Findings and Discussion

The findings are categorized into two sections: students' perceptions, and discussion of the four sub skills of reading, listening and speaking and writing.

5.1 Students' perception

Results from the questionnaire distributed, described the ICT students' perception on their language proficiency. Students were most proficient in Bahasa Malaysia (BM) which is the national language in Malaysia. English as the second language were graded as little. Since English is not one of the requirement subjects to study at polytechnics, it is expected that most students is with average or low level of proficiency. Table 1 below describes the perceptions of students regarding their language competency.

Table 1

Languages	Expert		Average		Little		None		Total
	F	%	F	%	F	%	F	%	
Malay	55	80.9	9	13.2	4	5.9	-	-	100%
English	-	-	19	27.9	45	66.2	4	5.9	100%
Others	4	5.9	3	4.4	2	2.9	59	86.8	100%

F : Frequency; % : Percentage

Based on the students' perceptions on their language proficiency, it reflects students are most confident in Malay and none perceived themselves as experts in English. The students were asked to indicate their proficiency in English skills and the highest mean score was reading (3.83) then followed by listening (3.26), writing (2.58) and the lowest mean was speaking (2.75). A six-point rating scale was used to get the students' perception on their skills in English. Students of polytechnics perceived themselves as either with average or little competency in English. Their evaluation on their own competency of using the language showed there was a tension between the level of English proficiency and level of expectation among trainers. The trainers expected students of polytechnics to be of average competency level. However, during the interviews, the trainers accepted students, regardless their low English competency level but kept on stressing on the needs for them to improve their English.

The students claimed they needed English especially when it involved IT. They accepted that most terminologies and content were in English, therefore they need this language for better

understanding. The students used English to do their own research and to gain better understanding of ICT subjects. Besides that, they made friends with people from other countries and exchanged views and opinion to improve their knowledge. They needed to do their own reading in order to master the IT. Even their lecturers encouraged them to learn more on their own. They know English is the language of IT and to master IT they need the language.

5.2 *Students' perceptions of needed competencies*

The students were asked to answer some questions to describe their industrial training placement. All polytechnic students are required to join companies related to their field and get some real work experience. Students were either assigned to companies in order to get places to be trained. Unfortunately, it is getting harder even to secure a place to get training due to many reasons and one of them is the economic condition. Most of the students decided to do their industrial training recommended by lecturers or seniors. Table 2 is the description of places where the IT students went for their Industrial Training.

Table 2

Background of Industries	Frequency	Percentage
Industrial Sector		
<i>Private</i>	46	67.6
<i>Government</i>	22	32.4
		100%
Industrial Placement		
<i>Services</i>	25	36.8
<i>Management</i>	20	29.4
<i>Engineering</i>	13	19.1
<i>Others</i>	7	10.3
<i>Non Response</i>	3	4.4
		100%

From the responses given, many students did their training at private companies more than government. English as a second language is widely used in private companies especially when they deal with international businesses.

The students were given the opportunity to choose the companies in which they preferred to undertake their training. Most of them chose companies based on the location, recommendations from friends or suggestions from lecturers. The economy situation can be one of the factors for the students not to be too selective in choosing a place to be trained. Even though, English is the second language used in Malaysia, it is widely used in private companies. It may vary in ways and intentions but I could say that it has its own place. The role of English may not be the same but both students and trainers accepted that English has its own purpose and use even in government sectors and fully-owned Bumiputera companies. Respondents claimed during their training, English was used sometimes both formal and informal interactions. They needed to be able to use English to fit both situations.

The role of English at the training places is highly influenced by the nature of the companies and most of the time is based on the work or projects they are involved in. Usually, companies which deal with government projects may use BM and English is used in multinational companies. Based on the students' responses, they claimed English was used during formal and informal interaction. Formal interaction scored the mean of 3.88 and informal interaction with the mean of 3.55. They responded based on six-point scale and 6 as being very important. I could say this

shows regardless either it is a government or private company, English is still used at the workplaces. The students ranked the most important English skills at the workplace and claimed listening skills, with the mean of 3.88 as the most important. Reading with the mean of 3.86, speaking with 3.63 and finally, writing with 3.48. Writing skills was seen to be the least important skills required during their training.

For this study, majority of the students did their six-months training at private companies and 32.4% underwent their training at government companies. These private companies include private local and private international. Government linked companies may involve some deals with private international companies. Overall, background of the companies and duties assigned to these students contributed to the language needs and expectation at the training places.
