be applied. This is the strained relationship between the dominant and the dominated social groups. The individual members of the three-caste system in the nest-reproductive, workers, and soldiers-migrate to build other colonies due to harsh environmental factors. The order is transferred to another habitat, but the previous anthills remain uninhabited. The image of the anthill is like the state's image with the complex internal structures. Achebe makes the empty structure sustain the harsh conditions. These termites abandon their earlier nest t build other mounds just like the individuals who control the state. Now why has Achebe made it survive harsh conditions? The nation needs to cancel the projects of preceding governments and start anew. The anthill needs to be broken down which is yet to be done. This can also be an image in the socio-cultural situation. Decolonizing the African mind has to be urgently done. The 'anthill' (The British Empire's remains) needs to disappear. Frantz Fanon writes in his *The Wretched of the Earth*

...the passion with which the native intellectuals defend the existence of their national culture may be a source of amazement, but those who condemn this exaggerated passion are strangely apt to forget that their own psyche and their own selves are conveniently sheltered behind a French or German (or any western) culture which has given full proof of its existence and which is uncontested(Fanon 168).

African cultures are threatened by the intrusion of the western culture. There is an urgent need to retain the Africa cultural values in the age of globalization. Globalization is another Empire that is exerting its power over the locality. This fractured condition of existence in Nigeria is because of the lack of a 'culture education'. A 'culture education' is needed to enlighten the people on their societal values and customs. If education is the process of knowledge acquisition, culture education is the knowledge of societal values. It is a means by which skills are developed in language, oral traditions, music, dance, rituals, festivals, and traditional medicine, food ways. This is very important since it ultimately refer to the people's pedagogy of cultural values and acquisition of culture. Unless this is incorporated, the distinctive cultural/spiritual social material will gradually fade out. These features of a society/group (e.g. lifestyle, ways of living, value systems, and beliefs) must be preserved for the promotion of an ideal social order. Since culture defines an identity, it is an important part f the consciousness of the nation. It is an

integral part of the consciousness of the 'self'. A society without identity is as good as a dead land. A 'living' society is one that is conscious of its beginning, its preset standing among other societies and one that heads towards a secure ideal future. The Africans should not leave it unprotected in the hands of modern western civilization. In the name of globalization, the West penetrates the local tribes. These local cultures are at risk of extinction in the hands of the uncultured elites. In an attempt to suit the trend of globalization, they dissolve their cultural traits in the 'universal'. Now in the age of globalization, the threat of cultural decline and loss of identity is more apparent than previous centuries.

Today the western educational system serves a similar interest. It is much like the imperialist vision of the colonial period. It further exploits the postcolonial African and captures the African mind. There is a serious mental colonization going on. Nigeria had strong indigenous systems of knowledge acquisition before contact with the west, but this intervention of the imperialist west and its alien educational policies were responsible for cultural decay.' Culture education' is not part of the university educational system in Nigeria today. The acquisition of cultural heritage should be made compulsory. The study of indigenous African cultures and oral literacy performance in most schools in Nigeria is absent. The national policy on culture is very clear regarding the need to teach Nigerian cultural history and tradition from the primary school onward. But the implementation of the policy at the primary and secondary levels of education has not been conducted properly. In Nigeria the policies of Education are problematic. The government is not responsive since it bows to the fancy of its benefactors; the IMF, the World Bank, SAID etc. The military rule in Nigeria also contributes to the ongoing difficulties/defects in policies. Most of them are not products of university education and therefore seemed not to appreciate this tradition.

The southern part of Nigeria came into contact with Europeans first through trans-Atlantic slavers. Following the abolition of the slave trade, legitimate trade began to flourish. The start of a capitalist economy and consciousness into the indigenous scene had a catastrophic effect on the general psyche and spirit of the Nigerians. The Nigerian

cultural values had given way to accommodate the new spirit of ‘survival of the fittest’ and other western values. The consequence was immediate, hunger and starvation. Farmers had to forsake their indigenous systems of food production and become actively engaged in the mass production of cash crops. The western education introduced to Nigeria by the Christian mission schools became a threat to the survival of traditions, especially oral literary performance.

The indigenous belief systems had become ‘taboos’ that ‘civilized’ people (whom missionaries called God’s people) must not associate with any longer if they wanted to get to heaven. The influence of Christian religions has made it difficult to locate the authentic Nigeria citizen, for e.g. most Nigerians including those that are regarded as custodians of culture-Obas, Emirs, priests of local shrines, heads of traditional cults, herbalists etc are Arab, Jewish (European) by name. The Nigerian situation is one in which a nation compromises its identity and submits itself to a dilution in the so-called universal. So many years after independence, it has not attained an adequate level of development. The teaching of Nigerian cultures from the grassroots level is not given any priority at all by relevant agencies. As a result, the negative impression of the educated class prevails. The educational and cultural policies in Nigeria advocate this, but more exposure to relevant knowledge is necessary for cultural integration.

The indigenous leaders have converted to either Christianity or Islam and migrated to cities. They feel that their skills are now irrelevant and their services are no longer needed in a global capitalist economy. They are busy coping with the demands and daily needs of a capitalist economy. The impact of new information and communication technologies, global challenges of religion and cable satellites, western music and media is terrible. There is an over exposure of the nation’s children to foreign cultures and education. Children are denied access or are no longer interested in ‘local’ or ‘indigenous’ festivals, oral performances, moonlight stories etc. Their minds are now expanded through the acquisition of a globalized knowledge and this encourages them to ward off their true identity. Nigerian youth steadily become self-alienated and lose touch with their roots. This is the direction in which Nigeria is headed and it poses a serious threat to the

continuity of African Cultures. The local government can look for a way out of this. They can organize rich cultural events, institutional festivals. The teaching of culture and tradition can begin at home and must be continued into primary and secondary education. Such curriculum must be capable of giving the Nigerian child a new a positive consciousness of self as a Nigerian.

It seems that the 21st Century ‘globalization’ is here to diminish the importance of the nation states such as Nigeria. They can hardly raise the profile and identity of nationality groups that make up a nation state. Nigeria should be active in preserving important aspects of their culture and incorporate elements in the performing arts (music, dance, drama, traditional games) and project their cultures by satellite broadcasting to the rest of the world. Instead of a ridiculous enacting of other cultures, Nigeria should be actively engaged and committed to the preservation of its national elements. The pursuit of culture conservation, enrichment, and dissemination will certainly ensure a strong identity consciousness. They must make their groups operate in the twenty- first century, instead of allowing them to wither away with the modern pop culture. The people should break through the mental colonization and develop a positive attitude towards their own cultural values. A new and more spiritually oriented practice of world religions, which is set within the cultural milieu of the people, can be a possible way out of the tensions. There should be a renewed interest in African Culture. It should be introduced in schools at the basic levels. The local Government Councils should act responsibly to promote their rich cultural elements, not only internally but also at an international level. The writers should try to attach themselves to the locality in their attempts to fight against imperialism. They should aim at flourishing ethnic literatures with the portrayal of authentic African images. A unity in the multi-lingual diversity should be attained not through foreign aid, but by exploring and enriching their own material. A consciousness among the people is highly recommended to save the nation from cultural collapse. Professor Eghosa Osagie in his lecture said that a new idealism among the younger generation should be ignited. He is hopeful of a bright future. The nation is badly in need of seeds of revival. The twenty-first century has heaped opportunities and challenges ahead. The only way to contest is to be well equipped with one’s own precious resources. It is high time that the agencies

work together in the preservation of the languages and national heritages of Africa. The future of the great continent of Africa can be dazzling only if the people declare a true African Empire in its purest form.

*Asian Heritage within a European Nation: Examples of Ambiguous Hungarian Ethno-Politics
in a Globalizing World*

Introduction

The paper offers a new approach to ethnicity in a globalizing world regarding structural elements of Asian/Eastern ethnic markers used within the current ethno-politics of a European nation:¹ the examples come from recent Hungarian identity- and ethno-management,² which instrumentalizes a broad spectrum of cultural activities reaching from intrinsic language usage to Asian heritage in naming, clothing and in various symbols. This might be used to respond to globalization, as well as to sharpen ethnic boundaries³ against neighboring European nations and against 'other' ethnic groups living in Hungary⁴. This paper aims to introduce a variety of symbols referring to the ambiguousness of bringing Asianness and Europeanness together.

Firstly, a few crucial milestones in Hungarian history will be presented to show the interaction of Asian/Eastern heritage as well as Europeanness in Hungarian history. They seem to be mutually dependent both in Hungarian history and in the identity constructions of Hungarian people, because to believe in a common history is one of the basic ethnic markers.⁵ Moreover, some symbols will be introduced in the first chapter in relation to 'historical milestones'. A few examples show the application of these symbols.

Secondly, the paper determines current activities of cultural societies in Hungary. Within the scope of identity-management they use ethnic markers, which refer directly or indirectly to a different heritage contrasting neighboring European peoples. They accentuate the fact that Hungarians/Magyars hail from equestrian peoples of the Asian steppe; within that scope the Hungarian language is another crucial argument, because it is the only one in Central Europe which does not have Indo-European roots and it also has Asian ancestry. A close relationship to the language is offered by the 'Magyar runic script'. Later the role of ancient folk music and other typical Hungarian music-styles for present identity-management will be discussed.

Thirdly, the paper emphasizes that Hungarian nation building simultaneously underlines Asian-/Eastern heritage and Europeanness. Within this point it shows that this ambiguousness still plays a role within Hungarian ethno-politics and that the weight of each of the two indicators differs in relation to socio-cultural and/or political background. The role of the Hungarian language in nation building will be discussed shortly, too. Furthermore, there are eastern and European symbols used side by side. In some cases the mutual usage of both Asian and European cultural heritage melted into each other and led to hybridity; recent examples of hybridity within the wider scope of processes of 'glocalization' will be presented, too.

I)

When we look back to the late 9th century A.D., to the so called time of the Hungarian land seizure, the ruling dynasty was the Árpáds (Hung. Árpádok). Their name arose from Árpád, who was the head of the tribal federation in the year 895, when the Hungarians occupied the Carpathian Basin. The tribal federation was formed of seven Hungarian tribes (Hung. hétmagyarok = seven Magyars) named Nyék, Megyer, Kürtgyarmat, Tarján, Jenő, Kér and Keszi.⁶ These seven tribes unified for military reasons. During the 10th century they still settled separately within the Carpathian Basin.⁷

The historical development into a medieval state regime ran similar to other European state structures when leaders of ethnically related but rival tribes try to usurp power. The Árpád dynasty succeeded and István, the son of grand duke Géza, asked pope Silvester II. for a Christian king's crown. The coronation-ceremony was celebrated on December 25th 1000.⁸ This date marks *the* turning point in Hungarian history both from Heathenism to Christianity and from Asian tribal-societies towards the then European system of nobility.

Two further milestones in Hungarian history which are outstanding in the collective memory of the Hungarian people are the uprising against the Habsburg Empire in 1848/49 and the 1956-revolution against communism.⁹

The main symbol representing the time of the Árpáds is the striped Árpád-flag with four horizontal red and four horizontal white stripes.¹⁰

[picture: Árpád-flag]

In times of upheaval like in the above named uprisings the Árpád-flag – being deeply rooted in Hungarian history – symbolized the successful repeat of the land seizure as well as the power to defeat the enemies.

Another symbol referring to the time of the Árpáds is the *Turul*, a fabled bird, half falcon half eagle. In myth the Turul guided the Magyar tribes from the Asian steppe to the Carpathian basin.

[picture: Turul]

The fascist *Hungarian Arrow Cross Party* and later the neo-fascists transformed the symbol of the Turul into a “combat-bird”, defending the Hungarians and reclaiming areas, which Hungary lost after the Trianon-treaty.¹¹

The main symbol representing the time of king István / Stephen and the turning point to Christianity and towards Europe is the *Hungarian Holy Crown*. As early as 1256 the crown was named “Magyar szent korona” in Hungarian.¹²

[picture: Hungarian Holy Crown]

At this point one has to emphasise, that the crown itself predominantly *symbolizes* King Stephen and the adoption of Christianity, because it was not exactly this crown-model, which was used during his coronation ceremony: “[...] experts came to the conclusion that the Holy Crown was assembled into its current form during the reign of Béla III (1172-1196)”¹³. Five hundred years later the so called ‘doctrine of the crown’ was invented to make believe that it was King Stephen’s original one:¹⁴ The ‘doctrine of the crown’ first appeared in the years 1514-1515 when István Werbőczy wrote a summary of the Hungarian law entitled *Tripartitum*.¹⁵ After that time the doctrine was extended with legends: above all with the famous legend of King Stephen offering the crown to the Virgin Mary (Hung. Nagyboldogaszony) during the coronation. It happened to symbolically seal a divine contract between her and the Hungarian people; later the Virgin Mary became therefore *patron saint* and *regina* (queen) of Hungary.

At present the symbol of the Hungarian holy crown is used in manifold ways, above all to express *the* symbolic unity of Hungary with Christianity.¹⁶ The following examples are in touch with present reality:

Since January 1st 2000, the Hungarian holy crown has been preserved in the building of the Hungarian parliament. It shows the contrast of modern democracy with traditional value systems as well as the longing of the Hungarian people to have both a modern welfare state and a glorious and powerful history. Therefore the Hungarian holy crown is used as a symbol of the Hungarian kingdom, the Greater-Hungary of the time before Trianon.

*Szent Korona Rádió*¹⁷ promotes itself with the slogan “a tiszta magyar hang” which means “a pure Hungarian sound”. It plays features and music for listeners, who are national-

conservative and Christian¹⁸ – blogs on the homepage and Radio-features are critical of left-wing-parties, against Roma and Jewish people. Moreover, there is Szent Korona Televízió (= Holy Crown Television), too and it has the same qualitative and ideological aims.

Before one enters the home-page of *Magyarok Világszövetsége* (= World Federation of Hungarians) and of *Magyarok Háza* (= House of Hungarians), he or she will be welcomed with the Christian proverb “Isten hozott” (= welcome) and as *the* Christian Hungarian national symbol refers to the Hungarian holy crown in these pages.¹⁹

From December 27th-29th, 2009 the *IV. Szent Korona Conference* was held in the House of Hungarians in Budapest. Last year the conference was entitled “Szent Korona és Kereszténység” – The Holy Crown and Christianity.²⁰

[picture: conference invitation poster]

II)

In Semmelweis u. 1-3 in Budapest an accumulation of Hungarian cultural and ethno-political societies is located in the above mentioned named *Magyarok Háza* (= House of Hungarians). One of the most important societies in the House of Hungarians is the *World Federation of Hungarians*. Within its wide scope of activities in the year 2008 the Federation published “Selected Studies in Hungarian History” focusing on the following goal: “We hope that this publication in Hungarian and English will reach both Hungarian and English-speaking scholars, researchers and all those interested in learning about the true history of Hungary.”²¹ However, one has to be very careful, if somebody offers “the true history”, because the scientific theory of history tells us that the depiction of the past is always a construction based on different sources.²² The publication further aims to “reveal the hidden history that has, until now, not been allowed to come to light, and will correct the misinterpretations and half-truths that have been taught, and are still being taught as Hungarian history.”²³ In other words, the *World Federation of Hungarians* took on the mission to edit Hungarian history by avoiding an academic discourse.

The Asian heritage of the Hungarians plays a crucial role in this book, although it is not named as explicitly Asian – it is usually paraphrased with terms e.g. “eastern origin” or “Eastern family of equestrian cultures”.²⁴ It is important to mention the observance that the peoples settling in the Eastern parts of Europe during the first millennium did not distinguish between the different peoples from Asia coming in waves: “They all wore their hair in the same braided style, which was foreign to the inhabitants of the Carpathian basin. Their leather clothes, their weapons and their language all appeared to be the same.”²⁵

The Asian roots of the very important ethnic marker language – its influence on Hungarian nation building will be discussed in chapter III of this paper – are emphasized in many ways in the above named book; for example : “According to old stories which were recorded by the chronicles of the Hungarian kings of the middle Ages, Asia was the ancestral home of the Magyars and the Magyar language.”²⁶

Very close to the exclusiveness of the language seems to be the exclusiveness of the ancient *Hungarian Runic Script* (Hungarian: *rovásírás*).

[picture: Hungarian Runic Script]

Hungarian Runic Script originates from Old Turkish script and has an alphabetic character. It was used from the 7th to the 10th century A.D. Following the adoption of Christianity the Latin script took the place of the Hungarian Runic Script. Only the Szeklers, close relatives of the Hungarians, use their *Szekler Runic Script* (= *Szekély rovásírás*) to this day. The Szeklers use it especially in ethno-political contexts to underline their uniqueness in the mixed ethnic region of Transylvania.²⁷

The pentatonic melodies of Hungarian folk music are related by lineal descent to folk music of other predecessors from the Asian steppe like the Huns, Scythians, Avars and Turks. In any event, in ethnomusicology²⁸ the relevance of folk music history and folk music tradition for (collective) memory and national identity is obvious,²⁹ but it is easy to go over the top: “It is for this reason, that the Magyar *musical mother-tongue* is decidedly different from the folk music of today’s European cultures, that of the surrounding peoples, who are more or less related. The difference has several layers and it is complicated, but it reflects perfectly and honestly the eastern roots of the Hungarian culture, their feelings, spirituality and, through this, their thinking. In other words: it reflects in essence their entire mode of behaviour and philosophy of life.”³⁰

To research the interdependences of music with further cultural expressions of complex everyday life is usual in ethnomusicology – to hold traditional folk music responsible for feelings, spirituality, mentality as well as philosophy of life seems to be exaggerated: firstly, the spiritual background of this music, which originates in Asian shamanistic traditions, could not be transferred as a whole (in)to the modern life of Hungarian people. Secondly, there is no scientific evidence about the question of whether this kind of traditional music moves Hungarians more than non-Hungarians or if traditional folk music moves Hungarian people generally more than other styles of music.

When we observe the listening habits of Hungarian people regarding music with a typical Hungarian and/or with a national background we will find “nemzeti rock” (= national rock music) in first place. Most of the Hungarian bands playing nemzeti rock use the above named symbols – the Árpád-flag, runic-script, Hungarian holy crown - on stage or on their home-pages.³¹

A mixture of different heritage symbols is used by cultural societies, too. A striking example is the society named *Kárpát-Haza Nemzetőrség* (= Carpathian-Home National-guard).³² Their leader is named Lajos Papp; he postulated that he and his followers should wear snow-white clothes symbolizing the love of Christ.

[picture: Lajos Papp]

Another symbol which refers to the Christian background of society is the wearing of a double-cross (Hung. Kettős kereszt). However, since the sign of the double-cross means *gy* in runic-script, Lajos Papp and his followers interpret the double-cross as the indivisible “egy” (= one) and in their sense it is the symbol of ‘one nation’, ‘one home’ and ‘one god’. This interpretation via runic-script refers to Asian heritage culturally shaped by Christianity. Other symbols in clothing of the members of the Carpathian-Home National-guard refer more directly to the Asian heritage. Their hairstyle is like that of the equestrian peoples of the Asian steppe at the end of the first millennium; on the front of the leather-headband, at the forehead you may often see the Turul-symbol. The cut of their white shirt is named “szkíta ing” (= skythian shirt)³³ in Hungarian and it symbolizes the time of the above named Hungarian land seizure. Furthermore, the members of the Carpathian-Home National-guard wear the “tarsoly” on their belt. Equestrian peoples used this small bag mainly to keep their ‘essential-for-survival’ arrowheads in.

III)

Hungarian nation building is rooted in the times of the above named land seizure and in times of the establishment of the Hungarian kingdom. Therefore, early Medieval events are still in close connection to the Hungarian nation building of Modern Hungary. In the terms of the German historian Holm Sundhaussen the Hungarian nation can be interpreted as a “natural” nation, because it is held together by a common language: “A common language with some tradition (that is: not a newly created language but a more or less old-aged common language)

is regarded as another feature of a ‘natural’ nation. But the problems with a native language are the same as the problems with the common origin.”³⁴ Moreover, in this quotation Sundhaussen emphasises, on the one hand, the extreme importance of ‘a common language with some tradition’, but on the other hand, he refers to the same problems which attend the discussions of ‘common origin’, too.

Regarding the Hungarian nation building the ethnic marker language plays a crucial role: notwithstanding the fact that the Hungarian language (= Hung. magyar nyelv) has many affinities to the Turkish language family, too, the Finno-Ugric language theory has grown stronger since the middle of the 19th century, because it seemed to be more convenient for Hungarian scientists and politicians to have a European language-partnership than an Asian one. The Hungarian language was/is the glue for the different ethnic groups of the Carpathian basin and it is the main factor for considering themselves ‘Hungarians’ rather than simply ‘being citizens of the Hungarian state’: speaking Hungarian – being Hungarian. Furthermore, the exclusiveness of a language, which is totally different from languages of the neighboring peoples and ethnic groups has always been used in Hungarian identity-management to sharpen the boundaries between the *we-group* (= we Hungarians) and *the others*.

Even in the times of the land seizure many different ethnic groups like Avars or Slavs settled in the Carpathian basin and since the Early Modern times new ethnic groups like the Slavs (Slovenes, Serbs, Croats and Slovaks), the Gypsies or the Danube Swabians settled in the areas of the Hungarian crown. In the history of the Austrian-Hungarian Monarchy the development of the Hungarian language to national language status in the Hungarian Komitates of the Monarchy took place between 1791 and 1844. Hand in hand with that development and the raising of the Hungarian language to national language status went a process of assimilation, called *magyarization*, of other ethnic groups sharing the same territories with Hungarians.³⁵ Especially after the compromise of 1867 – Hungarian ethnopolitics established a nation, where the Hungarian language played an unchallenged role in schools and in administration. This *magyarisation* was successful, because the minority languages decreased continuously. At present they are mostly spoken hidden from the public, because today nearly all members of ethnic minorities in Hungary are bilingual and use Hungarian in public. Moreover, the language transformation changed the ethnic sense of belonging as well. Many Hungarian speaking people know that their ancestors were not Magyars from the Asian steppe, but they consider themselves truly Hungarians and they also believe in a common origin of the Hungarian nation. In that sense Hungarian nation building was ambiguous but rather successful.

When we further look at the role of the Hungarian language in comparison to neighbouring languages, it does not come as a big surprise that the Hungarian language could be used to express a high degree of Asianness,³⁶ if necessary. A certain degree of Asianness in language is not only crucial for Hungarian nation building, but sometimes it is more or less seen as an embodiment of homeland, as a means of perception and of self-image, too. For example: “The decisive role in the survival of the Magyar language until today was the fact that it was strongly separated from the European languages such as Slavic, Germanic and Neo-Latin. The writer Sándor Márai said, and he was exactly right, the *‘the sweet home is the mother-language.’* Language is our truly unique treasure; it is the assurance of national pride and the hope of survival. [...] In our language, there are an enormous number of connections that point toward the geographical and biological environment of life in times past, including ancient folk customs, and demonstrate the coexistence of people in an earlier society [...]”³⁷

Another aspect which goes hand in hand with language is the still lively tradition of Hungarian naming and there are still many Hungarians with a forename, which is a symbol of Asian/Eastern heritage like Árpád, Attila, Csaba (son of Attila), Emese, Géza, Hunor, Koppány, Réka (wife of Attila).

In the Introduction it was mentioned, that Asian/eastern and European symbols are used side by side, and that the mutual usage of both Asian and European cultural heritage caused them to melted into each other and led to hybridity, too.

[picture: celebration of March, 15th 2010]

In the picture you can see both the red-white-green flags of Hungary and red-white striped Árpád-flags side by side. The tricolor-feature – with reference to the French revolution – of the red-white-green flag originates from the times of upheaval against the Habsburgs in the first half of the 19th century.

Homi Bhabha stresses that cultural hybridity is understood as a dynamic recombination of elements that are rooted in different traditions.³⁸ In that sense, a hybridity is represented for example by the above named outfit of the followers of the *Kárpát-Haza Nemzetőrség*. There, we may observe a mixture of symbols of Asianness and Europeanness in the way, that the whole issue represents a hybrid form of betwixt and between. The expression of hybridity, as well as the mixture of symbols, requires the observer to find his or her individual *cultural translation*.³⁹

Another hybrid form can be found in the above mentioned Hungarian *nemzeti rock* representing a synthesis of different music styles: there are some pieces of music, which interlace Hungarian Folk music of Asian heritage with Hard Rock music originating in Western cultures. Furthermore, they use manifold Asian symbols in combination with Hungarian national symbols to underline the demand for the music ‘to be Hungarian’.

[picture: album covers of Nemzeti-Rock]

The strategy of mingling different symbols of Hungarian history is visible in daily Hungarian ethno-politics, too. I want to give one example. When Hungarian politicians want to underline their close relationship to the Hungarian nation and the Hungarian past they use the symbol of the *Magyar szent korona*, although Hungary has not been a monarchy since the end of the First World War. In the year 2000 it was the then Prime Minister Viktor Orbán, who decided that the Hungarian Holy Crown should be publicly kept in the building of the Hungarian parliament. In this way, the symbols of monarchy and democracy were brought together again. It was mentioned before, that the Hungarian Holy Crown is a symbol of Christianity and therefore in political imagery a clear signal against Communism. In summary, we can observe an interesting hybrid phenomenon of politicians in a pure democracy using former monarchist symbols.

In a broader sense, the above named examples can be interpreted as local answers to global phenomena, because they are expressions of so called ‘glocalisation’.⁴⁰ Historical roots and myths have been transformed into symbols, which every Hungarian is able to decipher easily. One of the main goals of Hungarian identity-managers is to express that Hungarians have much in common with each other in the same way that they differ from ‘other peoples’: “The Hungarians differ significantly in their appearance and culture from surrounding peoples, because they still possess certain signs of their *ancient eastern culture*.”⁴¹ In a second interpretative step, we also recognize that some symbols have the function to paraphrase and counterpoint Asianness and Easternness as well – for they provide for instance symbols of Christianity, Latin script, European style of clothing, Rock music etc.

Conclusions

“The only suitable criterion for the existence of a nation is the *national consciousness* of its members.”⁴² This statement of Holm Sundhaussen is very well applicable to the Hungarian situation as well: At first sight, for Hungarian people it mostly does not matter to what degree their Hungarian ancestry is considered Asian/Eastern in relation to European, because both are integrated elements of the national Hungarian consciousness. In the same way, the

symbols that have been introduced in this paper, are integrated elements of daily life in present day Hungary.

The protagonists of ethno-politics, identity- and ethno-management, however, are well capable of governing the appliance of these symbols and they use the ambiguousness of the Asian-European-past for their purposes. At present, the Asianness/Easternness of the Hungarians is principally used from different points of view to sharpen the boundaries with other ethnic groups and peoples living in Europe and the Europeanness of the Hungarians is used to sharpen the boundaries with the descendents of other peoples from the Asian steppe. All things considered, hybridity and ambiguousness in ethno-politics can be interpreted as the *local* Hungarian forms of answering the challenges of nation-building in a *globalising* world.

¹ The article is part of research project P 20 060 of the Austrian FWF.

² The author wants to point out that the term *ethnomangement* and its scientific concept is basically conceived as neutral – specifically it is not pejorative.

³ In the sense of Frederick Barth (ed.): *Ethnic Groups and Boundaries: the Social Organisation of Cultural Difference*. Oslo: Universitätsverlag 1969. See further: Frederik Barth: *Enduring and emerging issues in the analysis of ethnicity*. In: Vermeulen H., Govers C. (eds.), *The Anthropology of Ethnicity*. Amsterdam: Het Spinhuis (1994), pp. 12-32.

⁴ Fieldwork in Hungary showed that the members of smaller ethnic groups and minorities consider themselves to be national Hungarians in the sense, that they are full members of the Hungarian state, speaking Hungarian or being at least bilingual, holding a Hungarian passport and citizenship. Therefore many Hungarians, who want to highlight their ‘origin’ use symbols of distinction.

The Role of Media on Political Confidence, Democratic Values and Civic Participation in Authoritarian China

ZHANG Xinzhi
City University of Hong Kong

Abstract

This study examines the role of media and its linkages among political confidence, democratic values, volunteer membership and political actions in China. With increasing tight control from state-party and enlarging marketized conglomeration, the Chinese media are acting in a double role of political propaganda and liberty competition in the market. Will this double role lead to both increased political confidence and democratic values? What are the predictors of political participation? Using the fifth wave data of World Values Survey China 2007, it is found that in cognitive level, media provides neither support of political confidence or democratic perception. However, on behavioral level, media not only predict of recreation and political membership but also a significant predictor both types of political action (petition and boycott). Political dominant from Chinese media is decreasing. Media is becoming a channel for participation. The limitation of measurement and suggestions for future studies follow.

ZHANG Xinzhi (MA with *Distinction*, City University of Hong Kong) is a doctoral research student at Department of Media and Communication at City University of Hong Kong. His major research interests are: new media, political communication, social/political movement, TV journalism, and so on.

Introduction

The level of political confidence (or, political trust) in China is ambiguous. According to an international survey, Chinese government ranked 13 among 72 countries of perceived legitimacy (Gilley, 2006). To wit, CCP maintains its legitimacy mainly through three ways: education system, state-controlled media (Kennedy, 2009) and state-led patriotic campaign (S. S. Zhao, 1998). However, the Chinese government built its legitimacy upon this “performance legitimacy” and such legitimacy is quite unstable (D. X. Zhao, 2009). This argument is partly supported by the recent dramatically increasing number of collective actions, petitions (*shang fang*), mediation even other mass violence incidents (as noted by Cai, 2008). How the stable-maintenance measures conducted by the government and the subversion forces come along, and to what extent will such conflict alter the knowledge, attitude and behavior of average people? I choose the role of media (both conventional mass media and Internet media) and their linkage with political participation as the threshold to discuss this issue.

The role of media is important due to two reasons. First, the nature of media in China is taking drastically changes. From 1949 when PRC was founded, the state-controlled media system has successfully mobilized people from the whole nation to participate into state development and knowledge penetration (Bishop, 1989). However, started from 1990s, with the “conglomeration” (*ji tuan hua*) process, the media industry become a semi-business seeking economic benefits on the one hand and portraying positive nation-party image on the other (Lee, He, & Huang,

2006). Therefore, media in China are acting in a double “role”: both political propaganda equipment and commodity in the liberal market. To cope with this trend, besides some sensational entertainment news and large advertising pages, even some political “incorrect” messages can also appear on the media (Ma, 2002, pp. 22-23). Secondly, the Internet has altered the media landscape where the audiences are not merely receiver but also content generator (Leung, 2009) and conduct social networking, mobilizing collective action together with traditional mass media (Boyd & Ellison, 2007; Postmes & Brunsting, 2002). In some extreme cases, online opinion can even affect the decision of central government (Hand, 2006; Zhang, 2009, July).

However, concentrating on the media can only examine their changing nature, without articulating their effects on average people. Although some overseas Chinese scholars elaborated this double role from political economic, commercialization and globalization perspectives (Lee et al., 2006; Lee, He, & Huang, 2007; Y. Z. Zhao, 2000), the consequence of this double role is yet to be determined. As Lee and coworkers (2006) noted, marketization itself won't lead to democratization. How do the average people receive the media content? How people's perception of politics, civic and democracy is influenced by the double role media?

Regarding participation in China, two sides of voices are raised. For one thing, as argued by some domestic scholars, there is decline of political or civic participation in China, especially among youth. Youngsters in China today are no longer as active as their elder counterparts twenty years ago. They become more apolitical, having lower political-efficacy, being addicted to online games and care much about finding a good

job. However, for another, the number of collective protest rises dramatically together with an increasing number of NGOs and civic groups these years. While the collective actions are sometimes damage as its nature, most NGOs take the form of environmental, lawsuit to express their political appeal and negotiate with the government (Yang, 2005).

Examining the mechanism between media usage and civic participation, the study is conducted as the follows. First, I discussed the changing role of media within the context of changing nature of state and state-society relationship. Then I proposed two positive relationships between media use and two set of political participation at cognitive level: political confidence and perception of democracy. Next I build the linkage between such perception engagement and behavior participation with the indicators of civic organization membership and political actions recently done. And results and discussion follow.

The Double Role of Chinese Media

All media in China are controlled by CCP with “four unchanged principles of party-ruled media” (*dang guan mei ti si bu bian*), which are: the “mouthpiece” (*hou she*) nature of media is unchanged; all media are under the supervision of CCP; media professionals are under the leadership of CCP, and media should lead the public opinion in accordance with CCP’s order, respectively (Qian, 2006). Some domestic scholars considered that these principles are extremely taken into consideration during conglomeration (Y. Chen, 2002; Zhu, 2009). Even in the era of internet, the Chinese

government has strengthened its control over online information. A comprehensive system for internet censorship has been established, such as GFW (“Great Firewall”, referring to China national firewall), internet-police, monitoring center at public security and different kinds of information filter softwares. Besides party leadership and information control, in a recent case of Beijing Olympic, Chinese media have conducted “a campaign of mass distraction”, using large scale of positive propaganda and mobilization messages through which the audiences’ attention is distracted from more troubling issues such as inflation, unemployment, political corruption and environmental degradation (Brady, 2009).

However, this is only one side of the coin. Two interesting phenomena caught scholars’ attention. Take *Shenzhen Economic Special Zone Daily*, the official newspaper of CCP Shenzhen branch, as an example. within the same sheet of newspaper, the front page is much more inclined to political correct than inner pages (Lee et al., 2006). Another case is that within different types of media, print media is more restrictive than broadcast media while news media is more restrictive than cultural media as magazines, periodicals or TV show, radio phone-in programs (Ma, 2002, p. 23). So to what extend does Chinese media deviate from the political control?

From the prism of media type, as note by Ma (2002), electronic media are more liberal than print media. Take TV, with the 96.6% national penetration¹ and being perhaps the most popular medium in China, as an example. Two types of program are

¹ Data from CMM Intelligence Agency, available at <http://www.cmmintelligence.com/>

deviated the most from the mainstream of party-state in both program content and mode of interaction with the audience. One type is the abrasive journalism (also called investigation journalism). Learnt from its Western counterparts, the investigation program in TV sometimes stand against the government decision and being representative of those unsatisfied citizen due to the reform process, such as laid-off workers, lost-land farmers and the hard lives in under-developed remote villages (de Burgh, 2003). A recent study even argued that the professionalism among Chinese journalists are developed, which is similar to those in Western democratic countries (S. Zhang, 2009). Another type is the large scale TV reality show, imitating its overseas counterpart *American Idol*. From 2004 when Hunan TV held the first *Super Female Voice*, the annual TV reality talent shows in China raised several whirlwind enthusiasts of “TV Cinderella myth”. Particularly, besides mass scale voluntarily gathering² and voting, people are in favor of those apparent democracy displayed during the singing contests, acting as “democratic entertainment” in China (Jian & Liu, 2009).

Besides such TV programs, internet is another venue for people to conduct information flow. By July of 2009, China has over 382 million internet users, exceeding the overall population of US. Various controversial issues can be debated among online forum, blog, social networking sites and other channels. Although under heavily-guarded online environment, the Chinese internet users have alternative

² According to the voting statistics from official website of CMMC, in the 2005 competition, the champion got 3.52 million votes whereas over 8 million votes were made for the candidates ranked first three.

methods to “bypass” the block using tools like anti-blocking software, mirror sites, re-mailers, secret Usenet groups, and anonymous e-mail services (Lacharite, 2002). As noted by Endeshaw (2004), the state-internet relationship in China is like a never-ending “cat and mouse” game. Internet also serves as a “democratic institution” as netizens use Internet as a “mean of collective action” to challenge justice fairness even state legitimacy (Zheng & Wu, 2005).

So I argue that the Chinese media are delivering two (but no limited to) major kinds of messages. One is political propaganda message tight to positive nation image and another is the democratic related message. Moving a step further, how these two kinds of message come along and have what kind of effect of average people? Are people becoming more loyal to CCP, or more in favor of democracy? Next I will discuss a possible consequence of such messages from the perspective of audience, in terms of civic engagement at cognitive and behavior level.

Civic Engagement at Cognitive Level

Civic engagement refers to “a wide range of individual and collective social participation or action with potential consequences on the society, for achieving public goods or public concerned issues” (Son & Lin, 2008, pp. 332-333). Lots of scholars developed their approaches to identify different typologies or dimensions of civic engagement. Norris (Norris, 2002) listed three dimensions of civic engagement: political knowledge for the cognition of public events, political trust towards the political system and political participation (p. 217). This definition focused too much

on political issues while neglecting some daily engagement as trust, membership, volunteer jobs, and among many others. Later, Zukin and his colleagues (Zukin, Keeter, Andolina, Jenking, & Carpini, 2006) developed a more comprehensive measurement which includes “indicators of cognitive engagement” together with “civic indicators”, “political indicators” and “indicators of public voice” (pp. 57-58). That is, the concept of civic engagement must include measurement under both daily non-event participation (such as joining into association, keeping attention to news media, etc) and event-based participation (vote in the campaign, boycott, demonstration in a certain issue, etc), and both behavioral and perception aspects.

This section deals with perception aspects. Earlier study created a group of criterion variables as 1) level of political knowledge and 2) level of opinionating (Xenos & Moy, 2007). In China, I adopt political confidence (also named political trust), knowledge of democracy and perceived importance of democracy as three indicators of cognitive engagement. I choose these three concepts for two reasons: they are linked to the media performance in China, as Chinese media are delivering messages related to both. Moreover, this cognitive engagement may lead to actual political participation in behavior level, which I will elaborate in the next section.

Political confidence is the “cornerstone” of political survival and development within the country (Wong, Hsiao, & Wan, 2009), which is the level of trust and support based on the evaluation orientation towards the government performance. Political confidence can be divided into two aspects: the “diffuse” and “specific” (Easton, 1965). Specific support refers to the confidence of one or more specific

government outputs or political elites whereas diffuse support refers to the regime-level political objects. As noted by Hetherington (1998), as useful this division might be, it obscured the overlapping of measurement because any regime is consisted of several incumbents, and the diffuse case is more straightforward in measuring the political relevance, leading to the question of state legitimacy. I choose “diffuse” in my study due to two reasons: 1) in China, the “party and nation” (*dang he guo jia*) is always strictly combined, especially in political news appeared on the media. Most people cannot separate officials between government and CCP (Li, 2004) and treat two terms equally; 2) as China has been under CCP’s governance from 1949, the specific round of government administration may be altered³, but the whole political system may not be likely to change.

It is brought to scholars’ attention that political confidence level in China is “always” high, no matter how the questions are phrased (Kennedy, 2009). Previous scholars identified three possible reasons: 1) average people might be fear of expressing their alternative views, 2) Chinese traditional Confucian culture of “*Zhong*” (loyalty) towards the regime as it has been found that the Confucianism may impede people’s rejection of authoritarian values (Qi, 2008); and 3) the powerful effects of mass media and education system (Li, 2004; S. S. Zhao, 1998). However, alternative explanations are also raised. Chen (2005) found that average people may not dare to speak out their unsatisfactory of the government in some local survey

³ i.e. we may refer to “Bush’s administration” in 2000 to 2008 but now we refer to “Obama administration”. However, they are all political elites of US government. One may have lower trust of Bush but highly believe in the US government.

whereas in a comparison of political trust among China, Hong Kong and Taiwan, Wong et al. (2009) found that institutional factors are more powerful than culture factors for people's support of authoritarian regime (Wong et al., 2009). The tradition "blind loyalty" (*yu zhong*) of the regime has been abandoned by Chinese people and a new political culture is emerging (Chu, 2001). The effect of education system is somewhat ambiguous. People with higher education may be more critical of the propaganda information, but with the inequality of education in a large scale population, CCP still manages to retain a high level of trust (Kennedy, 2009).

Previous studies, however, left two questions unsolved. First of all, the role of media is not fully addressed. If the double role media notion is correct, then the confirmation of high trust level reveals only one side of the story. The high level of political trust does not necessarily indicate lower democratic perception, or lower level of willing to participate into political-oriented activities. Moreover, earlier studies neglected average people's resistance or critical view of government's propaganda. Therefore, to reveal the double effect of media, I introduce democratic values in my study.

The democratic values in China have a long historical background. It was first introduced to China during the Republican period of "*New Culture Movement*" and peaked at "*May 4th Movement*" in 1919. After PRC was established in 1949, democratic value has long been suppressed under CCP's authoritarian dictatorship. Even there are short period campaigns calling for diversity thoughts under the name of "hundreds of flowers, hundreds of thoughts" and reform of CCP's party daily

newspaper People's Daily, it was soon be muzzled and muted with years of suppression and chaos such as "anti-rights movement" and Great Cultural Revolution. The thoughts of daily life become diverse only until around 1978 due to the reform and open up policy. In the early and middle of 1980s, intellectuals played an pretty active role in promoting Western thoughts and democratic value, who are from three groups: researchers employed by International Academy of Chinese Culture while the other two groups are editorial committees of "going to the future" book series and "Culture: China and world" book series (Gu, 1999). Such penetration of democratic value was a crucial factor leading to *Beijing Spring Movement* and *Tiananmen Movement* in the summer of 1989. The politic control was pretty high after 1989. Only later in the middle of 1990s did the political concern of media content become looser, together with the conglomeration of media group and China's joining into Internet.

To date, per previous discussion on the role of media in China, although some sensitive and democratic content can be appeared on media, the relationship between that content and people's cognitive engagement is still to be confirmed. When treated Internet as a tool for communication, venue of public space, and a means for collective action, Internet has democratic implication and enable average user to interact with nation-state (Zheng & Wu, 2005). Therefore, the first hypothesis is posted:

H1a: Media usage level is positively associated with democratic values.

H1b: Media usage level is positively associated with political confidence.

Civic and Political Participation in China

Regarding the civic participation, the *Center for Information and Research on Civic Learning and Engagement* established a three-category scale: 1) civic dimension such as community problem solving, membership in an association, charity fund-raising, etc; 2) electoral activities such as regular voting, campaign contributions, etc and 3) political voice, such as contacting officials, print or broadcasting media, protest and petition, etc (Lopez et al., 2006). However, not all previous measurements can be adopted in the present study as most measurements do not meet the reality of China. For instance, the voting behavior and campaign participation in China are totally different from those in Western countries. Not only the different state-controlled political system in China only provides limited number of candidates (Shi, 1999), the motivation mechanism (J. Chen, 2000) and strategies to mobilize the voters are not totally as liberated as democratic societies (Jie Chen & Zhong, 2002). Arbitrarily using previous measures will lead to either invalid data or false explanation.

Here I define civic participation into two dimensions. One is the level of different civil membership while another is level of political actions. The civil membership in China thrived from middle of 1980s, although the term “civil society” in China quite immature (Yu, 2006). According to the official report from China Bureau of Civic Affairs, up to 2007, there are 386,916 registered NGOs, 694,715 self-governing mass organizations at the grass-root level with over 7 million of employees in total.⁴ In

⁴ Annual Statistics from China Bureau of Civic Affairs: <http://www.my12340.cn/article.aspx?ID=191>

terms of the type of membership, in an international survey, membership can be divided into three categories: religious association, “old” social movements (labor unions, professional organization and political parties), and “new” social movements (peace associations, environmental, human and women’s rights) (Schofer & Fourcade-Gourinchas, 2001, pp. 807, 815-816). This classification is derived from the perspective of social and political movement within democratic society, which might not be appropriate for China. Considering the social, political and historical background, Yu (2006) developed seven types of membership: mass organizations, autonomy organization, professional organization, environment organization and so on (Yu, 2006, pp. 121-122). This classification is developed within Chinese context, but it is too trivial and lack of parsimony. I combined adopt both of them and four typologies are addressed: 1) recreational membership, includes art/recreational and sports organization; 2) political organization (labor unions and political parties); and 3) professional organization (professional organization, environmental, human and women’s rights).

What the role of media is in mobilize or de-mobilized people’s civic participation? Previous studies have identified the role of media in mobilizing the civic and political participation. In democratic society, the when media is the channel of free information exchanging, media play a crucial role in mobilizing people’s participation. However, as the party-owned media in China, it was also found that the media coverage of different kinds of participation and its tolerance of such report is quite different. Those non-political civic group such environmental, civic rights or peace organization is

allowed whereas the SMO even utilized this opportunity to raise their political appeal (Yang, 2007). However, messages like petition boycott even large scale collective actions are normally prohibited in Chinese media. Therefore, here is another puzzle I proposed: in what extend will media usage affect different dimensions of civic participation? Two questions related to two hypotheses are illustrated:

H2: Media usage level is positively associated with organization membership.

H3: Media usage level is negatively associated with level of political actions.

Method

Data are retrieved from the fifth wave of World Values Survey (WVS, thereafter) conducted in China in 2007. WVS is an international, multi-level and random survey, repeating around every 5 years as “waves”. It aims to conduct longitudinal and cross-cultural measurement of a wide range of values such across over 80 countries/societies in the world. All the background information, sampling scheme, and questionnaire (written in both English and local language with rigid translation) with data (in SPSS format) can all be accessed and download on WVS official website: www.worldvaluessurvey.com.

Measurements

Mass Media Usage Media usage is measured according its medium in dichotomous variables. “1” stands for “used last week” versus “0” for “not used last week”. Daily newspaper, news broadcasts on radio or TV, printed magazines, in depth

reports on radio or TV, books, internet/e-mail are measured. Medium was then recoded into different types, which are print media (daily newspaper, printed magazine and books), broadcast media (news broadcast or in-depth reports) and new media (internet and e-mail).

Political Confidence Use a four-level-scale (1=not at all, 4=a great deal) to measure the trust level of several different government agencies including armed forces, the police, parliament, the civil services, social security system, the government, the political parties, and the justice systems. I combined them into three sets: military forces (armed forces and the police), judicial system (legislative system of Parliament⁵ and justice system) and government-administration system (the civil services, the government and the political parties).⁶

Democratic Values Here three sets of questions are retrieved: perceived importance of democracy, evaluation of democracy within the country, and support of a democratic political system.

Volunteer Organization Membership Totally nine kinds of organization were asked. For each item, the respondent was asked: whether you are a 0=not a member, 1=inactive member and 2=active member.

Political Actions Such questions in China are too sensitive and only in 2007 that

⁵ In China the parliament it is called National People's Congress (NPC), serves the function of legislation.

⁶ In the questionnaire, political parties was using the term “*zheng dang*” (政黨) without notification of whether the party refers to CCP or other democratic parties. In China, there are eight democratic parties. The role of these parties are mainly “jointly govern” and “supervision”. Here I don't care whether this is the reality. But to average people, they are under control of CCP. So I classify them in parallel with government and other civil services.

two questions were asked: sign and petition. Each respondent was asked: of such action, you “have done/might do/have never do”. The results are coded as interval variables.

Demographic Variables are served as control variables including gender, age, educational level, score of income, job category and occupation institution. All categorical variables were *contrast coded* by the author.

Results

Descriptive Analysis

In 2007, the WVS China survey was conducted by Research Center for Contemporary China (RCCC) in Peking University from Mar 25, 2007 to May 10, 2007. To cover the nation-wide universe of both sexes aged from 18-70 including the migrants, RCCC conducted “*GPS/GIS Assistant Area Sampling*” whereas respondents are sampled through stratified, multi-stage PPS (probability proportional to size) sampling.⁷ Finally 2015 valid respondents were drawn with a response rate of 78.6%, covering all provinces in mainland China.⁸

Demographic Variables As WVS covers a long list of detailed demographic measurements, I only select four basic measurements. The percentage of female (54.2%) is slightly higher than male (45.8%). Aged from 18 to 70, the average age is 44.76 with standard deviation of 13.32. Among 1990 valid respondents, nearly

⁷ Detailed technical information is available at <http://www.worldvaluessurvey.com/>.

⁸ The number of valid respondents shown in WVS official website is 1991. However, when running the SPSS dataset, the system indicated there are **2015** valid cases in all kinds of statistics.

one-third (28.4%) of the respondents have completed secondary university-preparatory as their highest educational level attained, followed by inadequately elementary education (26.1%) and completed elementary education (25.6%). Technical/vocational diploma (12.5%) and university with degree (6.3) are the minority. Among 1599 valid respondents, the average score of 10-level income scale (from 1=lower step to 10=tenth step) is 3.96 with the standard deviation of 1.874. In terms of occupation nature, among 1816 valid respondents, over half (59.4%) are self-employed whereas working in public institution (15.2%) and private business (15.1%) are almost equal. Only .4% (8 people) works in the private non-profit organization.

Media Usage Around one-fifth (23%) of 1999 valid respondents reported that they've used daily newspaper. In other medium, the percentages with valid respondents are: news broadcast on radio-TV: 75% of 2008; printed magazines: 16.7% over 1992; in-depth report on radio or TV: 54.4% of 1996; book: 18.9% of 1993; and Internet/Email: 11% of 1995, which is the lowest.

Political Confidence In a 4-level scale (1=not at all confident and 4=a great deal confident), the average score of confidence among seven government agencies is 3.16, with standard deviation of .542. Specifically, the central government ranked first in terms of confidence (M=3.32, SD=.636), followed by National People's Congress (M=3.31, SD=.642), armed forces (M=3.25, SD=.651), the political parties (M=3.19, SD=.691), the civil services (M=3.13, SD=.674), the justice system (M=3.04, SD=.71) and the police (M=3.01, SD=.723). In a single test of ANOVA, the difference between

means of confidence across seven government agencies is not statistically significant (F value=1.0088, p=.335, df=12).

Democratic Values when asking how about having a democratic political system in China, majority of 1233 valid respondents chose “fairly good” (59.4%) followed by “very good” (34.3%).

Volunteer Organization Membership The descriptive results in shown in Table 1. It shows that sport/recreation, art/music and labor unions are the major membership. Professional organization and religious organization is not the majority. However, chi-square test indicates that there is no statistical difference between the numbers.

Table 1. Inactive/Active Number of Volunteer Organization Membership

	Church /Religious	Sport /Recreation	Art /Music /Education	Labor Unions	Political Party	Environment	Professional	Total
Inactive	13.97%	20.13%	16.18%	15.99%	13.01%	11.08%	9.63%	100%
Active	7.88%	19.94%	18.49%	14.47%	19.29%	14.15%	5.79%	100%
Total	10.92%	20.04%	17.34%	15.23%	16.15%	12.61%	7.71%	100%

Political Actions As the only two questions related to political action, for signing petition, only 5.9% (119) of respondents reported they “have signed petition” in the last 5 years. However, over half of respondents (44%) thought they “might do” the petition and 47.3% chose “would never do”. For boycott, the actual behavior is even less (67 people, 3.3%) and 839 people (41.6%) thought they “might do” the boycott and 52.2% thought they “would never do”. Although the actual numbers of political actions are not so high, the willing to participate is quite considerable.

Hypothesis Testing

Result of media usage and cognitive engagement and shown in Table 2. Then OLS regression of civic participation upon two cognitive perspectives was conducted and illustrated on Table 3. Then logistic regression was carried out, two political actions being the dependent variables. Finally, the overall model was reported in Table 5.

Table 2. Standardized Coefficient of OLS Regression on Cognitive Engagement

Predictors	Political Confidence			Democratic Values		
	Military	Legal Sys.	Government	Democracy in Own Country	Perceived Democracy Importance	Supporting Democracy Pol. Sys.
Media Usage						
Print Media	.046	.026	.041	.023	.041	-.061
Broadcast Media	.043	.030	.034	-.009	.034	.001
Internet	-.018	-.071*	-.056	-.012	.036	.046
Demographic						
Female	.016	.017	-.009	.011	.031	.000
Age	.067*	-.006	.059*	.064*	.070*	-.051
Education Level	-.071*	.006	-.028	-.125**	.024	-.013
Employment Status (1=full time)	.031	.046	.059*	.038	.005	-.013
Income Level	.000	.045	.045	.079**	.009	.016
Occupation (1=self-employed)	.009	.056	.050	.013	.067*	-.031
Interest in politics	.244***	.282***	.271***	.199***	.118***	.020
<i>Model R²</i>	8.27%	9.76%	1.45%	7.07%	3.38%	.8%
<i>Final Adjusted R²</i>	7.61%	9.10%	9.80%	6.27%	2.59%	-
<i>F Value</i>	12.50***	14.85***	16.06***	8.78***	4.30***	.81***
<i>Valid N</i>	1398	1384	1388	1164	1242	1018

*p<.05; **p<.01; ***p<.001

Table 2 shows that conventional media has a no significant effect upon dimensions of political confidence while internet has a negative effect of trust of legal system. For democratic values, only print media has a marginal level of positive impact of importance of democracy. Demographically, higher education level leads to

lower trust in military and more democratic knowledge. Moreover, interest in politics is an important positive predictor of democracy cognition.

Table 3. Standardized Coefficient of OLS Regression on Organization Membership

Predictors	Organization Membership		
	Recreational	Political	Professional
Media Usage			
Print Media	.159***	.196***	.105*
Broadcast Media	-.031	-.032	-.068
Internet	.086**	.026	.067*
Demographic

<i>F Value</i>	35.70***	38.49***	
<i>Valid N</i>	1421	1418	

*p<.05; **p<.01; ***p<.001

Table 3 shows that except print media associated with all three kinds of membership. Internet is a positive predictor for recreational and professional membership. Education level, income level and interests in politics also foster all kinds of membership. However, full time employers are less likely to join recreational and professional associations, compared with their part time workers, students, and unemployed people. It is also found self-employed workers have smaller chance to join into art, music, or education organizations.

Table 4. Logistic Regression on Political Action (signing petition and boycott)

Predictors	Signing Petition		Boycott	
	Odds Ratio	Probability (=1/(1+odds))	Odds Ratio	Probability (=1/(1+odds))
Media Usage				
Print Media	1.843***	64.82%	1.421*	58.70%
Broadcast Media	0.912	47.69%	1.443	59.07%
Internet	0.941	48.47%	1.841	64.80%
Demographic				
Female	0.906	47.52%	0.666	39.99%
Age	0.847	45.87%	0.977	49.41%
Education Level	2.087**	67.61%	2.170**	68.45%

<i>LR Chi-sq</i>		121.90***		73.19***
<i>log likelihood</i>		-314.302		-199.736
<i>Goodness-of-fit Sig.</i>		.193 ns		.360 ns
<i>Valid N</i>		1430		1430

*p<.05; **p<.01; ***p<.001

In table 4, parameter coefficients were reported as probability mode, the critical points being 50%. Print media is positively associated with both kinds of political action. One logarithm increase in the unit of print media use, the probability of signing petition and joining into boycott will increase 14.82% and 8.70%, respectively, being other conditions equal. The possibility of political actions also increases with educational level and income level.

Discussion

1) The notion of “double role of media” should be further explained. That is, in

perception level, party-controlled mass media (both print and broadcast) failed to build a positive linkage with people's political confidence. Internet use even has a negative linkage with political trust. Meanwhile, media might not be an effective channel to promote democratic value. Chinese media currently are concentrated upon commercialization, depoliticalization, and internationalization, while the due to the audiences' dependency, CCP is losing ground to some commercial oriented media (Sun, Chang, & Yu, 2001).

2) In behavior level, media will arouse people to join into different level of membership and political actions. Look even further, from the descriptive analysis, we found that Radio and TV are the most popular media in China because in most underdeveloped remote area without daily newspaper and high illiteracy rate, RTV is the only information channel. Examine the beta value of RTV only, we can found that RTV is almost still delivering the "mandate" message: more political confidence, no democratic values, less organization membership, marginal level of political action. Therefore, the net effect of RTV is yet to be studied, considering its highest population in China.

3) Another possible explanation of media and participation is, most political and professional organizations are centering on or even subsidiary the CCP. For one thing, financially, take some intellectual groups as an example, they receive financial support from the government and develop their "research". This co-habitant relationship is defined as "patron-client model" (Ngeow, 2007). For another, administratively, take Chinese Academy of Social Science (CASS) as an example, as

a institution engaging into 1989 Tiananmen Incident, it still can “survive” and stay with the government. Because it receive CCP’s political direction intentionally while CCP also deliver radical political views through “regulation, guidelines, meetings, academic activities and financial, material and social encouragement” (Sleeboom-Faulkner, 2007, p. 83). Therefore, most high education groups or professional groups have become both think-tank and mouthpiece for government, rather than deviant dissents. This can also partly explain the opposite direction in my findings: the democratic value provide no increasing in membership but marginal increasing in political action. Because democratic values and political confidence are somewhat heading towards a different direction, given the contextual background of authoritarian China under CCP government.

Conclusion, Limitation & Suggestion

Per previous discussion, from three perspectives I conclude that 1) media in China is more than playing the double role of political propaganda and market competition. For one thing, it contributes nothing to help the CCP establish state legitimacy. For another, the increasing information flow magnitude contributes nothing to the democratic related actions. 2) Political participation is not moving on the “right” track of democratic participation due to the nature of state and nature of memberships, given the differential type of media and professional organization’s linkage with government. Therefore, 3) a further study of predictors of civic participation, especially political actions is in need, which also points out one of the

suggestions for further research.

In analyzing the effect of media upon people's democracy perception, this study (also the WVS) failed to include the alternative channel of information. In coastal cities in China, people can go to Hong Kong to buy or view some political sensitive books or periodicals. Another source is large scale of local-made piracy DVD. There are thousands of underground factory and retails selling piracy DVD in Shenzhen, Zhuhai, Xiamen, Sanya, etc. There are also numerous numbers of P2P and BT download sites in China,⁹ which is totally deviated from mainstream media in terms of content regulation, distribution flow and interaction between the audiences. We still need studies to reveal the new behaviors adopted by people after this new technology.

In addition, as pointed out by Zhang (2009), the classification of dimension of civic engagement in China is fairly crucial. Take "petition" as an example. If the "petition" is about supporting Beijing Olympic then it is more than welcome and will receive large proportion of media coverage. However, just think about Dr. Xu Zhiyong and Mr. Liu Xiaobo, after they "signed" the *Charter of 2008*, they were arrested and probably will be prosecuted due to the "crime of subversion of the state". However, it is still a myth of public's opinion towards such "outliers". Are such democracy thoughts popular enough? From the WVS result presented in "scale" or "scores", the democracy values in China are more than high enough. But to what extend and in what condition will such values transfer to behavior, or just be muted

⁹ When I was writing this article, notice came that the Radio-TV Film Bureau is going to close three major P2P sources website in China and mass resistance is aroused. The result is still no clear. But as a researcher, we may concentrate on the effect of BT downloading, which has been accumulated for years.

due to powerful nation machine?

Lastly, that comes to the old question of conducting public opinion research in China. Either the respondents may provide a “save” answer or the whole questions is being “harmonized” (deleted) before it is conducted. What is the real causal or interplay relationship between state, media, civic society and culture in China?

Abstract

Purpose: The purpose of this paper is to highlight the nature and use of a model of emotional intelligence (EI) characteristics in relation to members of natural resource management committees in Australia.

Approach: An overview of the impact of reforms in the public management domain upon the operation of Australia's natural resource management workflow framework is followed by a review of EI characteristics that are relevant to the goals and methods of natural resource management committees. A pilot study was conducted to test the relevance of an EI framework to the work of such committees. Some suggestions are made specifically pertinent to the Australian Government policy, in a region, which is a major player in resource management innovation both nationally and globally.

Findings: The outcomes of the pilot study provide a positive basis for the continuation of research within the area of EI and its influence on the operating effectiveness of natural resource management committees.

Originality and Value: Based on emerging research findings on EI and public sector management principles, this paper takes a user-centred view of the committee management process. Suggestions are made for EI applicable strategies, which will enhance the effectiveness of this EI-based novel paradigm in an Australian context. Based on the results of the pilot it appears worthwhile to conduct further in-depth studies to tease out further details of the applicability of the EI paradigm on the management of natural resource management committees.

Introduction

The direction of natural resource management in Australia has been driven, in part, by the need for global public sector reform. These reforms provided the foundation for the development of the current Australian natural resource management model which is based on the appreciation that solutions, which are locally driven, determined and implemented are amongst the longest lasting in their effect (Carson, White, Hendricks & Palmer, 2002).

After considering the need for community based solutions the State and Territory Governments initiated the establishment of locally driven natural resource management committees. It was considered that to successfully achieve community consultation and public participation, and to empower the community to take control of natural resource management issues (NSW Department of Infrastructure, Planning and Natural Resources, 2003), these committees would need to build rapport with the community, to negotiate, to manage change proactively and importantly, to provide leadership.

As these newly formed natural resource management committees began to operate it was observed by stakeholder groups, such as the Irrigation Industry, Landcare and local government, that some committees were more effective than others (Council of Australian Governments, 2006). This observation has prompted a review of the operation of the natural resource management model by the Australian Government. This review is intended to focus first on the economic and environmental aspects of the model. The review of these aspects will broadly address key targets, best management practices, methods for monitoring and evaluating the natural resource and on-ground expenditure. The social, or human component of the model will be reviewed in the context of whether the model has improved community awareness of natural resource management, aided in the adoption of information and new technology and whether the government support systems in place are effective (Australian Government, 2008). Even though there is research evidence which supports the importance of emotional competencies in the effectiveness of both individuals and committees to build rapport with the community, to negotiate, to manage change proactively and to provide leadership the review does not address this component.

The paper presents an EI Paradigm for evaluating the human component of the natural resource management model by establishing a model of individual and group EI and then testing the model through a pilot study.

Public Sector Reform and Natural Resource Management

Over the last 40 years, both within Australia and internationally, natural resource management has been shaped in part by the need for global public sector reform. The international public sector reform agenda has been highly complex and intricate, and while each individual country has developed reform programs and distinctive reform models and strategies it has been acknowledged that global public sector reform is driven by seven common factors (Australian Public Service Commission, 2003; Johnston, 2003). Globalisation, the ability to capture information and data, resource constraints and demographic changes in population are the first four identified drivers of change. It is the last three drivers of change, changing community expectations of government, the move from a closed system to a more participative and inclusive culture in policy development and changing attitudes towards government fuelled by rising expectations of citizens, which have had a marked impact on natural resource management (Tiernan et al., 2002).

Australia, along with countries such as New Zealand, Canada and South Africa, have embraced the final three drivers of public sector reform and developed natural resource management models which have replaced the traditional 'top-down' model of centralised management that relies on governments for planning and implementation with an approach that relies on participation by citizens through regional boards and committees (Beeton et al., 2006).

Australian Natural Resource Management Model

Successive Australian Governments have worked towards the implementation of extensive and significant public sector reforms. These reforms have focused on promoting efficient and effective resource management, responsiveness to clients, transparency in government operations, the opportunity for citizens to participate in policy making, fair dealing between government and citizens, and the ethical behaviour of public officials (Verspaandonk, 2001).

With a platform for public sector reform established by the Australian Government, State and Territory Governments commenced the introduction of major reforms in their key natural

resource management agencies. These reforms were based on community consultation and public participation and provided a strong commitment to working with the community to develop better policies and ways to deliver them (NSW Premier's Department, 2001). Within the context of these reforms each State and Territory Government made a commitment to ensuring that a structured process was developed that would build rapport with the community, provide a mechanism for negotiation, manage change proactively and provide leadership.

This new direction provided the mechanism in which the natural resource management model began to move from a closed system to a more participative and inclusive system (Keating, Davis & Weller 2000). In order to facilitate the implementation of this new model (Figure 1) the State and Territory Governments established natural resource management committees where membership was comprised of individuals from the community that were appointed by either a stakeholder based selection process or a competitive merit based selection process. It should be noted that while each State and Territory had a common agreement with the Australian Government with respect to the structures, legislative powers, responsibilities and reporting channels of the newly formed natural resource management committees there are inconsistencies between the States and Territories with regard to the name given to the committees, program administration, regional responsibilities and resourcing (Robins & Dovers, 2007).

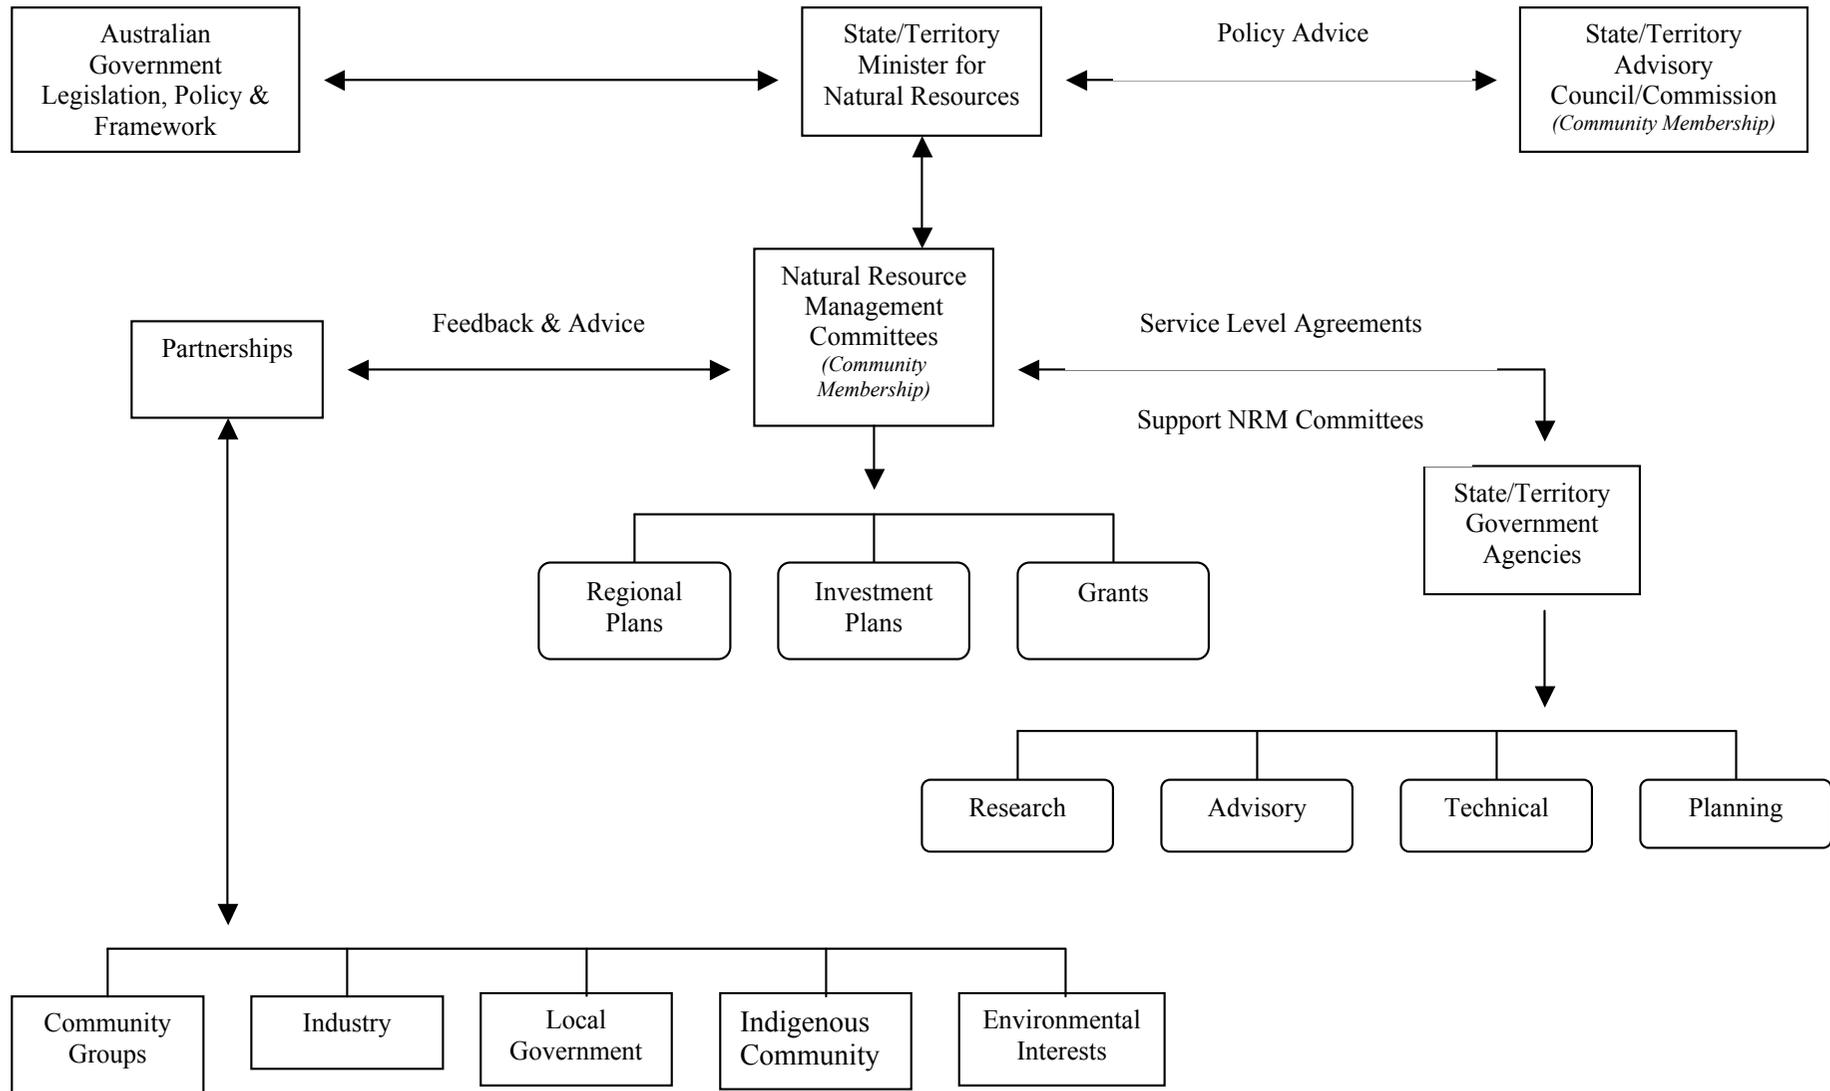

Figure 1: Model of Natural Resource Management in Australia (Schalk, 2008)

As these committees were established and began operation it was observed by stakeholder groups that some committees were more effective than others (Council of Australian Governments 2006). These observations prompted a review of the natural resource management model focused firstly on the economic and environmental aspects of the model. The review of these aspects will broadly address the relevance of regional key targets, the applicability of adopted best management practices, the methods for monitoring and evaluating the natural resource and on-ground expenditure (Australian Government, 2008). The social, or human component of the model will be reviewed in the context of whether the model has improved community awareness of natural resource management, aided in the adoption of information and new technology and whether the government support systems in place are effective in engaging the community (Australian Government, 2007).

Natural resource management goes beyond understanding the relevance of key regional targets, the applicability of best management practices, the methods for monitoring and evaluating the condition of the natural resource and the importance of public participation and community consultation. It should also focus on enhancing genuine community engagement by fostering social cohesion within communities and building both human and social capital. It is well recognised that in order to achieve long-term environmental outcomes, investments in people are critical (Australian Government 2007) and to date the Australian, State and Territory Governments have not reviewed the model in terms of natural resource management committee composition and their ability to make decisions and provide leadership (Schalk, 2008).

The Impact of Emotional Intelligence on Natural Resource Management

The management of natural resources in Australia is complex and often contentious, and therefore it is important to have natural resource management committees who are able to provide leadership and engage the community in natural resource management decisions (NSW Department of Infrastructure, Planning and Natural Resources, 2003). A study by Herkenhoff (2004) indicated that in environments where leadership and community engagement are vital those involved need emotional capabilities to inspire and empathise with the community. Higgs (2004), Moriarty & Buckley (2003) and Tischler et al., (2002) further highlight the importance of emotional capabilities in the success of individuals and groups by suggesting that performance and success are improved if the emotional competencies of conscientiousness, emotional resilience, motivation, interpersonal sensitivity and self-awareness are focused and developed. The literature further demonstrates (Cadman & Brewer, 2001; Druskat & Wolff, 2001a; Palmer et al., 2000; Welch, 2003) that the use of EI competencies is beneficial for predicting performance, selecting leaders and managers and building stronger teams. It is therefore not unreasonable to ask, in the absence of any review focusing on the human component of natural resource management, whether the current Australian model of participatory committees will productively serve the needs for the community and lead the way to sustainable natural resource management (Schalk, 2008).

EI is defined in many ways, but generally it is about people being able to assess their own feelings and thoughts, gauge the feelings and thoughts of those around them, and adjust their behaviour to respond to the right things in the right way at the right time (McLelland, 2004). Goleman (2004) suggests that EI is concerned with the integration of feelings, thoughts and behaviours to deal appropriately with any set of circumstances that may arise. According to Bar-On (2000) there are four main branches of EI which include the ability to be aware of, to understand and to express oneself; the ability to be aware of, to understand and to relate to

others; the ability to deal with strong emotions and control one's impulses; and the ability to adapt to change and to solve problems of a personal or social nature.

Studies by Cadman & Brewer (2001), Palmer et al., (2000) and Goleman (2004) have consistently demonstrated that EI is the factor that marks out individuals as leaders, innovators and effective managers. The following six examples show that EI contributes to the bottom line in any work organisation:

- The United States Air Force used EI tests to select their front line human resource personnel recruiters and found that the most successful recruiters scored significantly higher in EI competencies compared to unsuccessful recruiters (Cherniss, 2004)
- Individuals who displayed a set of six EI competencies were distinguished as star performers in a survey of over 300 top level executives from fifteen global companies (Spencer, 1997)
- Hunter et al., (1990) determined that in jobs of medium complexity, a top performer is 12 times more productive than those at the bottom, and in the most complex jobs, a top performer is 127 times more productive than an average performer. Goleman (1998) suggests that one-third of this difference is due to technical skill and cognitive ability while two-thirds is due to emotional competence
- In a large firm, using standard methods to hire division presidents, 50% left within two years mostly because of poor performance. When the firm started selecting based on emotional competence only 6% left within two years (McClelland, 1998)
- The ability to handle stress, which is identified as an emotional competence, has been linked to success as a manager and a leader (Lusch & Serpkeuci, 1990)
- In a study by Schutte et al., (2001) where participants were asked to complete a 33 item measure of EI, which assessed to what extent individuals characteristically perceived, understood, regulated and harnessed emotions, it was observed that individuals with higher EI performed better on cognitive tasks, and when encountering difficulties whilst performing those tasks they were better able to ward off the detrimental emotional effects of the difficulties and persist with the task.

Various literature also suggests that potentially, by introducing the concept of EI into the work environment the effects may be:

- Greater confidence in influencing and inspiring both colleagues and committee members by fostering positive attitudes and creating a sense of contribution and belonging (Palmer et al., 2000).
- An ability to build rapport with a diverse range of people and fostering a network of people built on goodwill and trust (Goleman, 2004).
- Being able to effectively listen and empathise while encouraging debate and open discussion, and orchestrating win-win situations (Goleman, 2004). This would provide employees with greater confidence to mediate and negotiate difficult situations.
- The cultivation of the ability to think 'outside the box' when change demands the application of new ideas to achieve results (Advanced Communication Skills, 2004).
- The further development of team collaboration and performance (Advanced Communication Skills, 2004) through being more aware of their personal emotions and their colleagues' emotions.
- Improving the team's ability to make decisions (Barbuto & Burbach, 2006).
- An improved ability to manage personal emotions, understand other people's emotions and to handle stress (Cherniss, 2000).

While it has been acknowledged that EI is critical in fostering teamwork (Druskat & Wolff, 2001a) the majority of studies have focused on EI as an individual competency. Natural resource management in Australia is based on the operation of natural resource management committees, which must function as a team and therefore it is critical to understand team EI. Druskat and Wolff (2001a) suggest that team EI is more complicated than individual EI because teams interact at more levels. This observation is further supported by Welch (2003) who reports that team EI is made up, not only of each individual's EI, but also from a collective competency.

Research by Druskat and Wolff (2001a) shows that three conditions are essential to a group's effectiveness. These conditions are trust among members, a sense of group identity and a sense of group efficacy. Even if these conditions are absent cooperation and participation are still possible but the team will not be as effective. To be most effective the team needs to create emotionally intelligent norms which will support behaviours for building trust, group identity and group efficacy. Creating awareness of emotions through team self-evaluation and seeking feedback, and regulating emotions through creating resources for working with emotion, creating an affirmative environment and solving problems proactively are the norms that are established by emotionally intelligent groups. This research showed that the most effective teams are the emotionally intelligent ones.

The literature suggests that the implications of EI can be broadly grouped into three categories. Firstly, Herkenhoff (2004), George (2000) and Tischler, Biberman & McKeage (2002) suggest that at an individual level EI is important in effective communication, building rapport and influencing others. Secondly, in commercial terms, EI is seen to underpin performance and in understanding and meeting customer needs (Higgs, 2004; Rahim & Minors, 2003; Schutte et al., 2001). Thirdly, in an organisational context, EI is seen as critical in fostering teamwork and motivating others (Druskat & Wolff, 2001b; Moriarty & Buckley, 2003; Welch, 2003).

Emotional Intelligence Paradigm for Improving Natural Resource Management

As previously discussed, the review of the Australian natural resource management model focuses on the relevance of key environmental targets, the adoption of best management practices and the improvement in a community's awareness of natural resource management. Traditionally, these outcome focused criteria have been used to measure the effectiveness of the natural resource management model, and subsequently extrapolated to measure the effectiveness of natural resource management committees.

In managing natural resources, decision-making processes can be complex and contentious, and often further hindered by the need to provide leadership and engage the community (NSW Department of Infrastructure, Planning and Natural Resources, 2003). Studies by Herkenhoff (2004), Higgs (2004), Moriarty & Buckley (2003), Tischler et al., (2002) and Druskat & Wolff (2001a) have indicated that in complex decision-making environments where leadership and community engagement are vital those involved need to have focused and developed emotional competencies of conscientiousness, emotional resilience, motivation, resilience, interpersonal sensitivity and self-awareness.

Figure 2 provides a new paradigm for the review of the natural resource management model, including the review of the effectiveness of natural resource management committees in terms of emotional competencies.

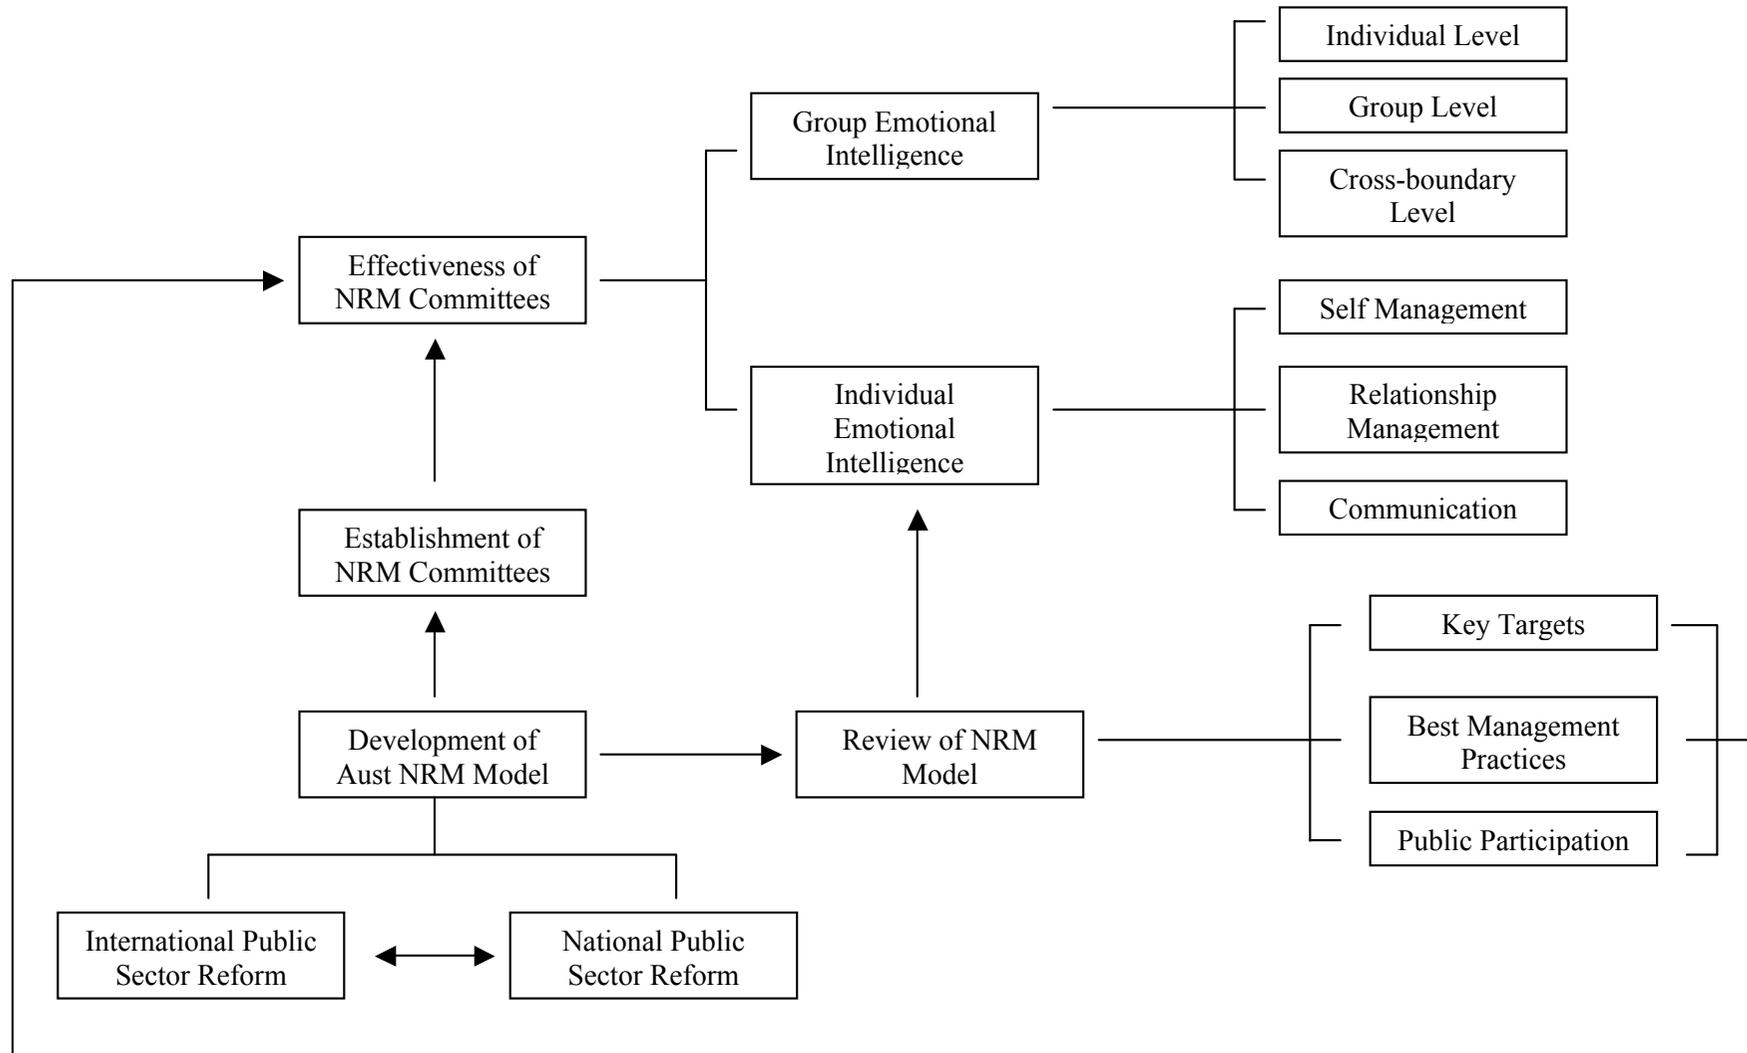

Figure 2: Emotional Intelligence Paradigm for the Review of the Australian Natural Resource Management Model

To review the natural resource management model in terms of emotional competencies it is important to consider measuring both individual and group emotional competencies. Individual emotional competencies influence the interpretation of and behavioural response to emotion, which over time builds a system of collective beliefs about issues such as trust, safety and group efficacy. Group emotional competencies define the ability of a group to develop a set of group norms that influence the interpretation of and behavioural response to emotion in a constructive and positive way (Druskat & Wolff, 2001b).

The EI Paradigm identifies three individual emotional intelligent components and 17 corresponding individual EI competencies (Table 1). The components and competencies are based on the Goleman (2004) model of EI that aims to measure the four basic concepts of self-awareness, self-management, social awareness and relationship management. These four concepts encompass the skills and knowledge identified by Davidson et al., (2008) that contribute to the effective operation of individual members on natural resource management committees.

Table 1: Individual Emotional Intelligence Components and Scales

Components	Scales
Self Management	<ul style="list-style-type: none"> • Self-Development- manages one’s own time, energy and abilities for continuous personal growth and maximum performance. • Adaptability/Stress Tolerance - maintains balance and performance under pressure and stress. Ability to effectively cope with ambiguity and change in a constructive manner. • Self-Control - manages and control emotions and behavior in the face of interpersonal conflict. Demonstrates patience, rarely overreacts or loses control. • Trustworthiness - demonstrates and practices high standards of personal and professional integrity. Displays honesty and candor. Creates trusting relationships with others. • Strategic Problem Solving - analyses a situation, identifies alternative solutions, and develops specific actions. Gathers and utilises available information in order to understand and solve organisational issues and problems. • Achievement Orientation - accomplishes tasks, projects and assignments on time and with quality
Relationship Management	<ul style="list-style-type: none"> • Building Strategic Relationships - initiates and cultivates strategic internal and external networking relationships that foster both individual and organisational

Components	Scales
	<p>goals. Builds and maintains effective and collaborative relationships with diverse internal and external stakeholders.</p> <ul style="list-style-type: none"> • Conflict Management - negotiates and effectively resolve interpersonal differences with others. • Leadership/Influence - utilizes appropriate interpersonal styles and approaches in facilitating a group towards task achievement. • Interpersonal Sensitivity/Empathy - takes actions that demonstrate consideration for the feelings and needs of others. • Team/Interpersonal Support - assists, motivates, encourages and supports others who depend on each other to accomplish tasks, projects and assignments • Collaboration - establishes and develops cooperative, supportive and collaborative working relationships with others.
Communication	<ul style="list-style-type: none"> • Written Communication - expresses written thoughts and ideas in a clear and concise manner. • Two-Way Feedback - keeps others informed in a timely manner. • Oral Communication - conveys oral thoughts & ideas in a clear and concise manner • Oral Presentation - presents individual and organizational viewpoints to groups in a clear and persuasive manner. • Listening - listens and understands the verbal communications of others

Source: Envisia Learning, 2008.

Group EI in the EI Paradigm has been divided into three levels; individual, group and cross-boundary. These levels are then divided into six dimensions, which are further divided into nine norms (Table 2). The levels and dimensions are based on Goleman’s EI framework of awareness and regulation of emotion at multiple levels (Goleman, 2004).

Table 2: Group Emotional Intelligence Norms

Levels	Dimensions	Norms
Individual	Group Awareness of Members	1. Interpersonal Understanding: is the degree to which a group attempts to understand the needs, perspectives, skills and emotions of its members. This norm relates to the ability of members to build bonds among themselves.
	Group Management of Members	2. Confronting Members Who Break Norms: is the degree to which a group addresses member behaviour that goes against agreed behaviour or is harmful to group effectiveness. This requires empathy, self-control and persuasion. 3. Caring Behaviour: is the degree to which a group treats its members with respect, supports them, seeks their perspectives, and validates their efforts. This norm contributes to members identifying with the group.
Group	Group Self-awareness	4. Team Self-evaluation: is the degree to which a group is aware of how it is performing. An Emotionally Intelligent group will be aware of their collective moods and will seek out information to assist in evaluating how well the group is working.
	Group Self-management	5. Creating Resources for Working With Emotion: is the degree to which the group allows time and resources for addressing member emotions. 6. Creating an Affirmative Environment: is the degree to which a group stays positive and optimistic in the face of challenges. 7. Proactive Problem Solving: is the degree to which a group anticipates problems and takes action to prevent them as well as taking action to address challenges.
Cross Boundary (External)	Group Social Awareness	8. Organisational Understanding: is the degree to which a group seeks to understand the needs and concerns of those outside the group.
	Group Management of External Relationships	9. Building External Relations: is the degree to which a group actively and strategically builds relationships with other people and groups who can affect their performance and provide resources.

Piloting the Emotional Intelligence Paradigm

A pilot study using an Environmental Management Program Project Team was designed and conducted to determine whether the EI Paradigm could be successfully applied to the review process of the natural resource management model. The pilot study used a self-report survey

of EI and entailed the distribution of both an individual EI survey and a group EI survey to each of the eight committee members. Two observers, who regularly attended committee meetings, were also asked to complete the group EI survey. Three sets of survey data were collected to facilitate data triangulation and to provide a detailed EI profile for the committee. The first and second sets of data collected targeted individual committee members and provided individual committee member EI profiles along with a group EI profile. The third set of data collected was observer data, which provided an assessment of group EI for the committee as a whole.

The preliminary outcomes of the pilot study determined that there was a moderate level of agreement of the existence of emotionally competent group behaviours, along with the perception that the committee operated more effectively in the dimension of self-awareness at individual and group levels than at self-regulation at individual and group levels. The study also indicated that there was a need for improving the effectiveness of members giving and receiving feedback and creating resources to successfully work with the emotions of the committee (Sofa & Schalk, 2008). These findings provide a positive basis for the continuation of research in the area of EI and its influence on the operating effectiveness of natural resource management committees.

Conclusion

The pilot study indicated a positive impact of the EI paradigm on the management of natural resource management committees. The management of natural resources is complex and often contentious, requiring natural resource management committees to have, or acquire, skills that will enable them to provide leadership and engage the community in decision making processes. Further studies in this area could assist to map particular strategies for the development of the EI competencies of conscientiousness, emotional resilience, motivation, interpersonal sensitivity and self-awareness of committee members. The pilot study also indicated that there was a need for improving the effectiveness of members giving and receiving feedback and creating resources to successfully work with emotions. If the results of replicated studies confirm the need for the development of competencies in the areas of giving and receiving feedback it would be beneficial to design interventions, training content or meeting protocols to address this identified area of need.

**The Route to the West and the Way Back to the Native:
The Historical Studies of Westernisation
and Nativism of Taiwanese Modern Theatre**

Su Peikai, PhD Candidate at Department of Drama & Theatre,
Royal Holloway, University of London

In the first half of the twentieth century, the theatrical form of Western origin was new and first introduced to Taiwan. Its appearance on this island henceforth suggested a conceptual opposition to something 'old' as well as many different styles of native drama currently performed on the island, ranging from theatricals of *nanguan* and *beiquan* music through several hybrid forms which were all conventionalised and characterised by the operatic acting and the dramatisation of several old themes. Since then, Western-styled theatre had been thought of as a modern form of theatre, and there were countless efforts could be seen in Taiwan, shown and shared by many theatre practitioners, to assimilate numbers of Western repertoires onto the Taiwanese stage. First through the Japanese colonisation and then through the post-war rapport with the United States, the twentieth century had seen quite a historical background that paved the way for many local theatre practitioners—mostly the well-educated youth—to have a direct contact with a variety of Western theatricals and thereby to absorb considerable dramatic novelties from abroad. For many of them, the native theatricals—*qizi*, *luantan*, *gezai*, or the like—were not only the old-time recreation, always repeating themselves in form and in style but were too narrowly used and affiliated with many local liturgical functions to seriously carry out any artistic depth. Many young theatre practitioners, who received the modern education and grew up with an intellectual contact with the outer world, tended to turn their eyes to other new sources of inspiration rather than the native theatricals which, they generally believed, were obsolete and old-fashioned. This strain of thought recurrently dominated the Taiwanese theatre throughout the twentieth century, vigorously viewing and entitling the appropriation of foreign-styled theatre to better excavate and articulate the deeper and wealthier level of art. With that, many young theatre practitioners were largely oriented to expanding and strengthening their understanding of Western theatre, leaving the native forms of theatricals, albeit many had been there in Taiwan for over hundreds of years, so belittled and estranged from their life.

The problematics of Westernisation

This paper aims at reviewing the reception history—as well as the affected

historiography pertinent to representing this reception—of the Western theatre in Taiwan. I intend to briefly outline how Taiwanese theatre practitioners over a long period of time have been intensely and variously appropriating a considerable body of Western repertoires and theories, and argue how it then results in such a far-reaching consequence that around the early 1990s the backbone theories of historiography and theatre studies were made up by a package of knowledge borrowed directly from the West. Ever since the very inception in the Japanese colonial time, the arrival of new theatrical forms of Western origin had been warmly accepted and designated as *xinju* (literally New Drama) in Taiwan, which could be said corresponding with the current movement of *shingeki* (New Theatre) in Japan and arguably could even find roots back to the modern theatre in Europe and the United States. Through the Japanese colonial expansion, Taiwan and the theatrical activities happening on this island had in fact been included in a large geopolitical terrain of modernisation which, if understood from the perspective of Japanese colonial homeland, was principally an enterprise of Westernisation, a nationwide task to emulate the Western powers in many ways through which Japan as a colonialist empire passed ever since the Meiji Restoration. This cultural and political practice of modernisation/Westernisation was likewise assumed in colony Taiwan to modernise and thereby to uplift the local culture in the colony with an aim to emulate the progress of the Japanese colonizer or even the Western powers.¹ The genesis of *xinju* in Taiwan under such a colonial climate was the case in point for it was often understood as an imperative means to modernise and renovate the native theatrical culture by absorbing, albeit indirectly through the mediation of Japanese colonisation, a variety of eminent repertoires and devising methods from the West.

Absorbed accordingly was a range of relevant theories from the Western context onto post-war Taiwan. Especially by the 1990s with more and more scholars trained at prominent Euro-American universities returning to Taiwan, some seminal theories, e.g. realism, modernism, or postmodernism were therewith introduced to Taiwan and there built up a theoretical niche for these returned scholars to examine the local theatrical activities. Ma Sen's *Xichao xiade zhongguo xiandai xiju* (The Chinese modern theatre after the upsurge of Western tide) and Zhong Mingde's *The Little Theatre Movement of Taiwan* were two weighty volumes of such a kind whose conscious use and appropriation of Western theories among realism, modernism and postmodernism indeed enabled their understanding of local theatre capable of much interpretive depth. The problem, however, is that each of these theories carries, by

¹ I discuss this situation somewhere else in another chapter of my dissertation tentatively titled 'Colonial Modernity'. Chapter unpublished.

definition, a specific meaning and historical significance in their original Western context, which when appropriated altogether in some non-Western regions are likely to implicate—or even predetermine—a mode of temporal progress that evolves consecutively, if not spontaneously, from realism, modernism to postmodernism. Such a temporal implication—always narrowly reinforcing a Western archetype of temporality through which non-Western regions adopt to self-fashion the progress of local development—is uncritically assumed and widely disseminated in Taiwan. The theatre historiography that was brought to the fore in the 1990s by Ma Sen or Zhong Mingde was typically subject to this Westernised temporality. With his specific coinage of *xichao* (literally a ‘Western tide’) to describe and to reiterate the inexorable impact of the Western influence ever happened twice to Taiwanese theatre over the twentieth century, Ma Sen regarded the theatrical past after what he termed as ‘two upsurges of Western tide’ as respectively and characteristically partaking of realism and modernism, and so the theatre history as having progressed from one to the other. And Zhong Mingde concerned himself with the social and political excitement congregated in the so-called Little Theatre Movement around the 1980s, for which postmodernism was introduced and promulgated by him as an analytical framework to timely rationalise (and to historicise) the radical experiments ever seen in the Movement. He therefore even stood out as one of faithful proponents of postmodernism in the early 1990s, calling attention to what he supposed to be the postmodern performance of Taiwanese theatre, raising and causing several historical inquiries made with an apparent focus to pressingly ask—and debate—whether Taiwanese theatre by then had been turning postmodern.² Preoccupied with various guiding theories appropriated from the West, the local historiography through the intellectual interplay of different schools of Western thoughts turned out so much like a testing ground, upon which local theatrical activities were constantly inspected, criticised, defined and loaded with meanings inspired decidedly from an acquired framework of thoughts. This is what I mean by the problematics of Westernisation: the reception of the West that in effect facilitates not only the introduction of Western repertoires, dramaturgies, and devising methods but, more profoundly, the assimilation of a whole pack of Western thoughts to constitute an epistemic basis in shaping and determining the local knowledge production. Since the first encounter with the Western-styled theatricals in the early colonial time, the need for the westernisation has come in embryo and later thrives on to an extent that even a Westernised temporality has been so ingrained in theory, in practice and in every aspect of theatre-making. The theory-conscious use of Western thoughts to expedite

² Several debates actually happen between Ma Sen and Zhong Mingde. See Ma Sen, *Xiju: Zaomeng de yishu* (drama: dreaming-making arts), Taipei: Rye Field Publishing Co., 2000, p303-07.

the theorisation of local historiography may be understandable in the first place. But it later on insinuates a historical trajectory underpinned by a Westernised temporality that at some practical level holds back any historical inquiries sequent to the premature promulgation of postmodernism, simply because there are no longer any other new guiding theories available to theoretically carry on the historical narrative beyond the exhaustive use of postmodernism. How and where are we going to move on from here?

It would be very inappropriate to rigidly regard every non-native form of theatricals or tenet of thoughts in Taiwan as still Western or Westernised. Over a long span of time Taiwanese theatre practitioners have been devoting incredible effort to pursue and accommodate a large amount of Western repertoires, devising methods or relevant theories, and many of these foreign imports have as yet been commonly accepted, established, and found home on this island. What I call into question, however, is a sense of Westernisation in Taiwan that is so deep rooted to such an extent that it preconceives a Westernised viewpoint—epistemically and/or ontologically—in the local knowledge formation, reproduction and circulation. When the theatre history of this island is therefore understood as having evolved smoothly from realism to modernism and as also having reasonably assured the postmodernist inclination ever seen in the Little Theatre Movement, it, however, largely leaves out a phenomenal rise of what I would like to regard as a nativism launched and engaged by a small group of theatre practitioners coming from the Movement. Unlike their previous penchant for adapting devising methods directly from the West, some young theatre practitioners, who just quickly rose from the horizon in the Little Theatre Movement, suddenly shifted their attention to the local folk culture in search of creative inspiration amid many native forms of theatricals and folk activities. This turn to the native culture could be best exemplified in U-theatre's 1989 renowned *shuo-jihua* (the project of retrospect), in which the members of U-theatre declared to seek out an ideal manner of performing style that should be 'in connection with the forefather' and also 'in conversation with the modern people'.³ The design of U-theatre's Project was to extensively learn and extract the native performing or liturgical essence from the folk culture and, more importantly, to have it properly modified and represented for the modern regeneration. Such a nativist attempt to find folk roots for new theatrical expression, albeit not intended for the direct revival of the native folk culture, was by no means postmodern. Rather, it entailed the deliberate introspect into the root of

³ The phrase comes from the production proposal of U-theatre's 1989 production titled '*Shuo: xunzhao zhongkui*' (Retrospect: in search of Zhongkui). Quoted from Liu Changrang, *Youjuchang shuojihua de linian yu shijian zhi yanjiu* (U-theatre in 'the project of tracing back'), MA diss. Taipei National University of Arts, 2005, P2.

one's own culture, so as to search for an ideal mode of performance originally and genuinely generated from within. However, with the staple historical narrative seemingly concerning itself with the formalist analysis, formulating and expanding upon the postmodern (or postmodern-like) performance of Taiwanese theatre, the sudden rise and fall of this nativism was ignored.⁴ Even today, we do not see any historical accounts ever taking this nativist turn into serious consideration, nor can we see any of them making a breakthrough, or a revision, to the extant historiography and the encroachment of Westernised temporality thereof. As a result, the appeal to return to the native turns out, so as it seems to me, to be a short-lived movement incompatible to the thematic concern of most historical accounts, largely left out there unexamined, let alone its legacy or possible historical significance in relation to this island's long history of westernisation.

To find the nativist venture a place in the contemporary historiography, my paper is dedicated to rethinking the history of theatre in Taiwan after its long contact with the West. I would like to argue that the evocation of the native ever seen around the early 1990s is practically a nativism which, from my viewpoint, is by no means an intended movement or the postcolonial revenge against this island's the long-term Westernisation, nor as an artist twist in search of the alternative way of devising theatre. Rather, the rise of nativism is supposed a spontaneous, albeit quite belated, feedback in response to (and also in consequence of) the local reception of foreign theatre. But for the chronic reception of the West, there would have been no need to designate any idea or practice as native or nativist. That is, the appeal to return to the native in Taiwan is a reflective mechanism that arises causally in the face of the penetration of Western influence and this island's entanglement of modernity. And my job here is to gauge in depth historically to reason out the cause and effect of nativist conscious in Taiwan within the historical context that has long been subject to the Western influence and thereby to also reflect the questionable historiography that is essentially conditioned by the Westernised temporality and historicism.

⁴ There are still some researches touching on U-theatre's nativist attempt. Liu Changrang's MA dissertation is a comprehensive survey of U-theatre's activities during the Project of Retrospect. Craig Anthony Quintero's PhD dissertation titled *Performing Culture/Cultural Performances: The Little Theatre Movement in Taiwan* at Northwestern University draws U-theatre's nativist attempt as an example to discuss the unmentioned side of Little Theatre Movement in Taiwan.

**Where Shall We Two Meet, in East or in West:
When Po-shen Lu's *The Witch Sonata—Psalm of Macbeth* Encounters with William
Shakespeare's *Macbeth***

[ABSTRACT]

By using *tai-yu* (*min-nan-hua*, Taiwanese local language) to stage William Shakespeare's *Macbeth*, Po-shen Lu produced an experimental performance in the southern part of Taiwan in 2003. When he produced *Antigone* in 2001, Lu was challenged by his critics in three aspects: 1) the tradition of *tai-yu* theatre of Tainan Jen Theatre and that of Western plays, 2) audience reception in Taiwan, and 3) the advantages and disadvantages of integrating *tai-yu* with Western classic texts. In spite of these criticisms on his theatrical productions, Lu has continued helping Tainan Jen Theatre transform into a professional theatrical troupe since he became an artistic director in 2002. By analyzing how and why Lu staged his *The Witch Sonata—Psalm of Macbeth* in the socio-historical context of intercultural adaptation, I propose to re-evaluate Lu's artistic contribution to the theatrical development in the southern part of Taiwan. I would argue that Lu is not only challenging Taiwanese reading of Shakespeare but also exploring the possibilities of *tai-yu*'s theatricality, in a view to bringing new life to Taiwan's intercultural theatre.

[KEY WORDS]

Lu Po-shen, *tai-yu*, William Shakespeare, Tainan Jen Theatre, intercultural theatre

Introduction

After Po-shen Lu produced *Antigone* in 2001, Tainan Jen's Western plays produced in *tai-yu* met with numerous applauses. With these encouragements, Lu continued doing a project on staging Western classic texts in *tai-yu*.¹ In 2003, Lu, the new artistic director of Tainan Jen Theatre, used *tai-yu* (*min-nan-hua*, Taiwanese local language) to stage William Shakespeare's *Macbeth*. While producing these western plays in *tai-yu*, Lu has been challenged not only Taiwanese audience's reception but also Tainan Jen Theatre's traditions of *tai-yu* theatre. In this project, Lu tires to create a highly successful intercultural performance and explore the possibility of *tai-yu* theatricality. However, is such intercultural theatre acceptable in Taiwan? In order to reevaluate Lu's artistic contribution to Taiwanese contemporary theatre, firstly we undertake a study of socio-historical context of Tainan Jen Theatre to discuss how the troupe develops its *tai-yu* theatre. In the second part, we focus on Taiwanese audience reception towards Lu's *the Witch Sonata—Psalm of Macbeth*. In the third section, we analyze the advantages and disadvantages of integrating *tai-yu* with Western classic texts.

Tainan Jen Theatre and *Tai-Yu* Theatre

The development of Tainan Jen Theatre can be traced to the movement of "little theatre" during the 1980s.² Although the concept of "little theatre" was introduced by Man-kuei Li in 1960, such a theatrical movement did not flourish until the 1980s. In the mid-1980s, Taiwan's little theatres started to have divergent developments. Some focused on the expressions of

¹ Tainan Jen Theatre's Western classical dramas in *tai-yu* includes Sophocles' *Antigone* in 2001, William Shakespeare's *Macbeth* in 2003 and 2007, Samuel Beckett's *Endgame* in 2004 and *Footfall* in 2006, and Aristophanes' *Lysistrata* in 2006.

² Wei-jan Chi indicates that the movement originated from André Antoine's Théâtre Libre in Paris and W. B. Yeats' Abby Theater in Dublin at the beginning of the twentieth century. Chi also points out that "the movement concerns with left-leaning, anti-mainstream, anti-colonialism, democracy and community politics." (212) Besides, the literal meaning of "little" is the small auditorium that contains only 350 seats. Later, "little theatre" becomes a genre, a fashion and a movement of theatrical development. However, after these ideas were introduced by Li, they were distorted by ROC government and served as the revolutionary power for Taiwanese theatre during the 1980s. During 1980s, the movement of little theatre in Taiwan was a reflection that Taiwanese people as well as theatres were liberated from the oppression of the hegemonic government.

individualism or personal emotions. Some aimed at becoming professional theatre companies.³ Others have turned out to be “community theatres.” Tainan Jen Theatre, once considered as a community theatre, was established and became the first modern theatre troupe in the southern part of Taiwan after World War II.

In 1987, Tainan Jen Theatre was founded by Rev. Don Glover, a Catholic Church father, and Jui-fang Hsu, the previous leader of the troupe. At the very beginning, the troupe was named “Hwa Deng Theatre Troupe” (華燈劇團) and its enthusiasts were mostly composed of Tainan people. When the troupe was initially founded, none of the members was familiar with the theatre. With the help of the graduates of the colleges of Art, the troupe started to have a prototype of the theatre, and then its participants also knew how to run an acting company. In 1992, the troupe was included in a project for developing the community theatre that had been conducted by the Council for Cultural Affairs (CCA) for three years. During these three years, the organization of Hwa Deng became more stable and stepped to the biggest and well-organized troupe in Tainan area. In 1997, the name “Hwa Deng” was changed to the current one, Tainan Jen, to mark the tenth anniversary of the troupe’s birth. Meanwhile, the troupe changed from an amateur community theatre into a professional one. From then on, the troupe has not only produced new plays and theatrical adaptations but also devoted to the projects on Theatre-in-Education (TIE) and Youth Theatre that provide teachers or students a chance to receive theatrical trainings.

Near the end of 2002, Jui-fang Hsu resigned from the troupe; meanwhile, Lu became a new director who was in charge of the development of the company. From then on, the contents of Tainan Jen’s performances have changed, too. From 1987 to 1992, Tainan Jen’s productions focused on localism, such as domesticity and Taiwanese daily life. After the troupe was conducted by the CCA in 1992, the quality of the performances was promoted and its content drew close to the modern life in Taiwan. Believing in various performance styles of the theatre, Hsu invited Lu to stage Sophocles’ *Antigone* in 2001. For the audience, it was seemingly surprising that Lu used *tai-yu* to produce an ancient Greek tragedy in a Tainan historical site, Koxinga Shrine, for the first time. After that, many critics gave Lu positive comments and Chien-chung Lu, one of the critics, illustrates,

Different from the historical and cultural background of ancient Greece, the pathos in Taiwan’s contemporary life is not as strong as that in Greek tragedy. However, the tone and the language of Tainan Jen’s *Antigone* give us the possibility of intercultural interpretation.⁴

³ In fact, no professional theatre company has developed in Taiwan since the 1980s because some troupes, such as Ping-Fong Theatre Company, the Contemporary Legend Theatre Company, and Godot Theatre, still have no permanent theatres and theatrical administrators.

⁴ See Chien-chung Lu’s drama review on *Antigone—Greek Tragedy V.S. Taiwanese Pathos: Afterthought of Tainan Jen’s Bird and Antigone*. (《安蒂岡妮》劇評—希臘悲劇台灣情:《鳥》與《安蒂岡妮》觀後感) <

Yu-hsiu Liu also has a similar attitude towards the play and she says,

Tainan Jen's *Antigone* is one of highly successful adapted plays in Taiwan. On one hand, it does not distort the original. On the other hand, it skillfully fuses the local color of Taiwan with western plays... Such a play shows us a successful example that Taiwanese could have an international perspective through this play.⁵

The positive feedback encouraged Lu to take Shakespeare's *Macbeth* as his second theatrical experiment. In 2003, with the translator, Ting-pang Chou's help, Lu expurgated several scenes from Shakespeare's original text of *Macbeth* and maintained thirteen scenes in the *tai-yu* version.

The reason that Lu used *tai-yu* to stage *Macbeth* is related to the practice of sound spectrum. Sound spectrum, considered as a theatrical training, helps the actor to find his or her way to play the character precisely. By figuring out and controlling the voice and body language of the character, the actor can naturally unearth the role that the playwright would like to portray in the play. Lu asserts,

The notion of sound spectrum comes from Constantin Stanislavsky's Physical Actions and Vsevolod Meyerhold's Bio-Mechanics. Actors can find out the characters' sound spectrum by playing the characters' personalities and desires. After that, actors can control the tempos of the characters' sounds and body languages. And Shakespeare's lines and verses can be interpreted precisely. Thus, sound spectrum can help not only the actors to play characters of the play precisely but also the audience to enjoy this kind of audio imagination. Furthermore, audience can experience the dramatic illusion and images of the play. (Shen 73-4)

Thus, in Lu's *The Witch Sonata—Psalm of Macbeth*, *tai-yu* not only helps the actors to perform the characters correctly but also maintains the beauty of Shakespeare's verses.

After Lu's *the Witch Sonata—Psalm of Macbeth* was toured around Taiwan in 2003, Lu won much appreciation. Hsueh-chen Liu says in her review,

The rhythm of *tai-yu* is more poetic than that of Mandarin Chinese. It is marvelous to see Tainan Jen to interpret Shakespeare's play in *tai-yu*. Five actors' amazing skills bring the audience to the world of Shakespeare's *Macbeth*. It could be thought as the first-rate performance that I have ever seen.⁶

From these criticisms, Lu seems to do successful experiments on integrating western plays with *tai-yu*. However, the achievements of these adapted plays in *tai-yu* are questionable. When the project on staging western plays in *tai-yu* was ceased in 2007, Tainan Jen produced no more

tai-yu plays. Instead, Lu produced western dramas in other ways.⁷

Fig. 1. Three witches use the drum as a caldron to perform the witchcraft. (Photo by Yu-han Tseng and photo courtesy of Tainan Jen Theatre)

There are three reasons that Lu used *tai-yu* to stage western dramas. The first one was related to political reasons. In 2001, Tainan Jen Theatre had a project on staging western plays in *tai-yu* for three years. Coincidentally, the political condition changed at the same time. In 2000, Shui-pien Chen, the President Candidate of Democratic Progressive Party, won the President Election in Taiwan. Different from Kuomintang's policy, Chen and his colleagues emphasized the recovery of local culture, including the usage of *tai-yu* and the recognition of Taiwanese literature. Tainan Jen's project not only fit in the DPP's political assertions but also served as government's propaganda medium to broadcast the localism of Taiwan.

The second reason that Tainan Jen staged western plays, especially Shakespeare's plays, is related to the fashion that has started since the movement of little theatre during the 1980s. When the Martial Law was lifted in 1987, many acting companies started to produce or adapt Western plays, especially ancient Greek dramas and Shakespeare's plays. For instance, the Contemporary Legend Theatre produced *The Kingdom of Desire* which was adapted from Shakespeare's *Macbeth* in 1986. Later, the CLT continued adapting *Hamlet* in 1990, *Medea* in 1993, *Oresteia* in 1995, *King Lear* in 2000, and *The Tempest* in 2004. Godot Theatre Company

⁷ After *the Witch Sonata—Psalm of Macbeth* was produced, Lu had a plan to recover the way that Shakespeare produced his plays in the Elizabethan Era. Since 2005, Lu has continued doing theatrical experiments on three Shakespeare's plays—*Romeo and Juliet* (2004), *Hamlet* (2005-6), and revised *Macbeth* (2007). This series of plays is later called "Shakespeare Unplugged." However, only revised *Macbeth* was performed in *tai-yu*, and others were in Mandarin Chinese.

produced a musical play, *Kiss Me Nana*, which was adapted from *The Taming of Shrews* in 1997, *A Midsummer Night's Dream* in 1999, and *Othello* in 2008.

The third reason that Tainan Jen Theatre used *tai-yu* to stage *Macbeth* is related to its tradition. Tainan Jen had produced many *tai-yu* plays because Tainan locates in the southern Taiwan where most of the inhabitants in Tainan are *tai-yu* speakers. Tainan Jen's first *tai-yu* drama, *Taiwanese Comic Dialogue (Tai Yu Xiang Sheng)*, was produced in 1990. The themes of its following productions in *tai-yu* concerned about localism in Taiwan. In 1998 and 1999, the troupe produced two Western dramas in *tai-yu* (Eugene Ionesco's *The Gap* and Anton Chekhov's *The Marriage Proposal*), but the scale of these productions was not as big as Lu's adaptations. Before 2001, the way that Tainan Jen applied *tai-yu* to stage Western plays is to get close to the local people. Thus, Tainan Jen's Western plays before 2001 were adapted to cater for the audience's taste. After 2001, when Lu reused *tai-yu* to stage Western plays, he believes that he could put much emphasis on the maintaining not only the spirit of the original text but also the verses of the play. Therefore, in Lu's belief,

Those who do not understand *tai-yu* would not completely depend on the language; instead, they could enjoy its sound. But for those who understand *tai-yu*, they will be surprised that *tai-yu* can bring new life to the performance. (Shen 52)

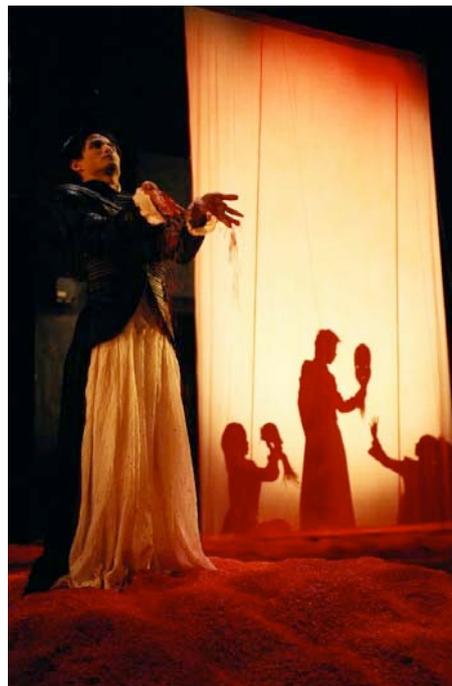

Fig. 2. The way that the red rice husks flow through Macbeth's fingers symbolizes his hands with Duncan's blood. The shadow show is applied in the performance to portray Macbeth's inner world. (Photo by Yu-han Tseng and photo courtesy of Tainan Jen Theatre)

Audience Reception in Taiwan

After *The Witch Sonata—Psalm of Macbeth* was produced in 2003, it impressed the Taiwanese audience for Lu's daring experiment on the theatrical design. When the audience enter the auditorium, the floor is covered by the husks of the rice which is painted in red color. With the change of the light effect, it provides the audience with an uneasy and horror phenomenon especially when the witches appear or Duncan is murdered. In addition, Lu adopts the vocal, a piano, and a percussion instrument to create mood music. Lu also applies many performance techniques, such as the use of stilts or a shadow show to portray Lady Macbeth's desire and ambition. The way that Lu uses the androgynous witches is also impressive. The audience seems to be impressed by its visual and sound effects, but quite a few people appreciate the use of *tai-yu* in the play.

In some positive comments, most critics aim at the sound effect of the play. For instance, Chien-hung Lan thinks Lu has successfully presented the visual and sound effects of the performance. Wen-lung Chang also exclaims,

I adore those players for their excellent body language, power and strength of their voices. The audience have been charmed by Lu's production even though *tai-yu* may trouble their understanding of the play.⁸

In Chang's comment, the audience may enjoy the dramatic illusion that Lu created, but the problem that integrates *tai-yu* with Western plays cannot be ignored. In Taiwan, Mandarin Chinese is the official language and so are the characters in use nowadays. During the past decades, when Western plays were adapted in Taiwan's theatre, these plays were performed in Mandarin Chinese all the time. Definitely, these Western drama texts are written in Mandarin Chinese, too. However, when the Western play is translated into *tai-yu*, the meaning of the word might be twice removed from the original text because *tai-yu* does not have its own signs that the readers always speak *tai-yu* through Chinese characters. Ling-ling Shen also indicated the problem of the language in this play and she says,

The gap between *tai-yu* and Mandarin Chinese must be connected by phonetic symbols, and then the meaning of the words can be generated. However, these phonetic symbols cannot be read by everyone. Although the play is a contribution to the translation, the translator has to make efforts to find out proper words for translation. (75)

As for the problem of the translation that Chou used in the play, I take Banquo's words as an example to examine how Taiwan's audience evaluates the play. In scene one of *The Witch Sonata—Psalm of Macbeth*, when Macbeth and Banquo return from the battlefield, they meet

⁸ See Chang's drama review on *The Witch Sonata—Psalm of Macbeth* in Tainan Jen official website <<http://www.tainanjen.org.tw/command.htm#劇評類>>.

three witches. After being informed of becoming a future king, Macbeth is shocked and Banquo says,

老大兄，你ná會chiah青驚，ná像驚聽著chit款好tāi？
希望恁照實講，恁是無iáⁿ--ê，
或是真正像恁展現--出-來-ê ań-ne？
恁用伊chít-má尊貴ê頭銜，
Kap料想伊會升官、做國王，來祝賀我chit位同伴，
Hô伊聽kah bāng-su-su想kah失神。Á我，恁soah無講siáⁿ。
若準恁有才調看thàng時間ê種子，
知iáⁿ toh一粒會puh-iⁿ，toh一粒bē，
做恁kā我講，我bē求恁恩賜，mā m驚恁ià-hūn--我。

(*The Witch Sonata—Psalm of Macbeth*, Scene I)

Good sir, why do you start; and seem to fear
Things that do sound so fair? I' the name of truth,
Are ye fantastical, or that indeed
Which outwardly ye show? My noble partner
You greet with present grace and great prediction
Of noble having and of royal hope,
That he seems rapt withal: to me you speak not.
If you can look into the seeds of time,
And say which grain will grow and which will not,
Speak then to me, who neither beg nor fear
Your favours nor your hate. (*Mac*, Act I, scene III)

From the quotation, Chou's translation combines Chinese characters with Roman phonetic symbols, but the reader may be confused with those strange words if they do not learn Roman phonetic symbols before. In addition, the words or the idioms that Chou used are not colloquial even though Lu tries to present Shakespeare's blank verses in so-called poetic *tai-yu*. Thus, a tragic end of the play may become a comic relief because of the gap of the languages.

When Macbeth laments on the death of Lady Macbeth and his doom in Act V, scene v and says, "To-morrow, and to-morrow, and to-morrow," the translation "明á再，koh明á再，koh再明á再" has made the audience laugh. The reason that the audience may laugh at the tragic end of Lu's *The Witch Sonata—psalm of Macbeth* is related to the translated words that cannot convey the messages of the original. That is to say, the audience cannot be moved and grasp the deeper meaning out of the performance. Wan-yi Yang, one of the audiences, mentions,

Although the theatrical elements of the play are abundant, it is a pity to see the performance that could not reach the deeper sensibility of the original play. Briefly speaking, there is a gap between the emotional expression and the structure of the

play.⁹

Besides, when the actors are not familiar with the language that they speak, it is also difficult for them to express their feelings. Definitely, the audience cannot get the strong feeling from the performance. Oscar G. Brockett also points out,

Figures of speech are likely to seem contrived and bombastic if the actor does not appear to be experiencing feelings strong enough to call forth such language spontaneously. Shakespeare's plays may be damaged in performance if actors do not rise to the emotional demands of the poetry. Therefore, the very richness of expression can be a stumbling block for both performer and reader. (109)

Fig. 3. Lady Macbeth stands on the stilts in front of Macbeth. The exaggerated and standing tall image of Lady Macbeth symbolizes her desire and ambition that are greater than Macbeth. (Photo by Yu-han Tseng and photo courtesy of Tainan Jen Theatre)

Advantages and Disadvantages in Integrating *Tai-yu* with Western Classic Texts

Before the discussion of the advantages and disadvantages in integrating *tai-yu* with any Western classic text, the qualities and characteristics of *tai-yu* should be first recognized and identified. *Tai-yu*, like any other dialect in the world, vividly embodies the regionalism in one certain locality. Even though Taiwan is not geographically vast and people who speak *tai-yu* find little difficulty understanding the other *tai-yu* speakers, *tai-yu* still varies slightly from place

⁹ See Yang's drama review on *Tainan Jen's The Witch Sonata—Psalm of Macbeth* in *Performing Arts Review* < <http://www.paol.ntch.edu.tw/e-mag-content.asp?show=1&id=1250601> > .

to place, whether in accents or usage of words. When hearing some special accents or figure of speech, one may easily recognize the speaker's cultural or social identity. Therefore, *tai-yu* functions as a cultural index to represent one's upbringing background.

However, in Taiwan, *tai-yu* can do more than as a cultural index showing one's cultural background; it, furthermore, works politically as a collective cultural heritage to shape a strong ethnical consciousness within *tai-yu* advocates. Although more than half of Taiwanese speak *tai-yu*, *tai-yu*, being oppressed for long for political reasons, has never been recognized as one of official languages used in Taiwan, or at least as a common cultural fact until the last decade of the 20th century. With the rising awareness within people to revive local cultures and the supportive encouragement from the government grants, *tai-yu* suddenly turned out to be a representative of a long-lost cultural icon victimized by colonialism and dictatorship. *Tai-yu* becomes a strong currency of languages marking culturally and politically correct when producing any artistic creation. It is no less a huge rebound than a prisoner finally being released from a dominating and confining political censorship; many productions are performed in *tai-yu*, and some performers who never speak *tai-yu* must master this new skill to demonstrate their liberal-mindedness to all races and explore more selling points. This change in language using and performing technique has come to its high tide in the first decade of the 21st century. However, this change comes too quickly that we may start wondering if there might be some problems in accommodating.

As a matter of fact, *tai-yu* never really disappears from any theatrical work, though we seldom saw theatrical production in full *tai-yu* before 1990. *Tai-yu* has often been associated with local peasants or unsophisticated country life. Thus, when Taiwan's society finally produces plays in full *tai-yu*, it asserts firmly that the use of *tai-yu* is a cultural and social fact; moreover, it marks the recognition of *tai-yu* as one of the official languages—no longer marginal! Furthermore, in terms of its trait of freshness (full *tai-yu* has seldom been used in theatre before the 1990's) and localism, *tai-yu* does much in inviting more possibilities in representing a foreign work to Taiwanese audience. Take *Antigone* (2001) for example, Lu is very much aware that what he faces is no one but Taiwanese viewers. It is quite compulsory for him to help his audience relate to a play that is totally foreign to them. Language could function as a bridge. Using *tai-yu* could not only be one of many ways to communicate with the audience who could not read Shakespeare's original texts in English, but also create a strong sense of freshness and dramatic surprise on stage.

Moreover, in order to preserve the Shakespearian style of the blank verse, the translator, Ting-pang Chou, also adopts the similar style and has the performers recite *tai-yu* verses on stage. As a result, many compliments to this theatrical challenge in mixing *tai-yu* and the Shakespearian verse never ceases and sees this theatrical invention as a way to explore more potential in

applying *tai-yu* in theatrical forms.

However, staging *Macbeth* in *tai-yu* is simply like a two-blade sword, which not just diminishes the hindrance of the language gap, but meanwhile creates more new gaps in translation and adaptation. As we have mentioned before, though *tai-yu* has been accepted widely because of the improvement of democracy in Taiwan, the late prohibition against speaking *tai-yu* still has a strong residual pernicious influence over the young generation. To the young generation, *tai-yu* might be as foreign as Greek and hard to understand. Therefore, a theatrical work in full *tai-yu* could be a “politically local” production, but “culturally foreign” to young viewers. Moreover, apart from young viewers, young performers also encounter similar problems. Many audience find it difficult understanding young performers’ *tai-yu*, since these young performers are not 100% *tai-yu* native speakers. Actually, Taiwanese use a blend language mixed with *tai-yu*, Hakka, Mandarin Chinese, and sometimes a bit of Japanese. Young performers could not master *tai-yu* completely, and they might pronounce wrongly, which also cause communication gaps between the audience and performers.

If *tai-yu* is a “foreign in usage” but “local in culture” language to some viewers, translation would play a huge part in helping the audience understand the theatrical work. One must bear in mind that, like many regional dialects, *tai-yu* is a spoken language and there is no written convention and commonly approved written characters in it. In order to write *tai-yu* down, one must utilize Chinese characters, and especially in Chou’s case, English and Roman phonetic symbols to note down *tai-yu*’s pronunciation.¹⁰ It may not be too difficult to understand the adapted play by means of “hearing,” but it definitely causes problems in “reading” the play, since one needs the training of “decoding” this multiple writing system. As a dramatic text, Chou’s revised *Macbeth* in 2007 may cause constant breaches in semantics and semiotics. For example, in Scene 7, as the porter answers the door knock, he says,

Lònglònglònglòngsiáng--lah--oh
Káhit hit--a--leh--lahē-tàng kāê á kap
h³--aLònglònglònglòng soah ah (Scene 7, p.10)¹¹

Here we see at least two different language systems: Mandarin Chinese characters and Roman phonetic symbols. When reading this part, he or she needs to understand these two languages. However, Roman phonetic symbols are not widely accepted by the mass, which makes the translation even less readable and accessible to the audience. So the misinterpretation and

¹⁰ Roman phonetic symbols were first introduced into Taiwan by Western missionaries, so this system of language is now commonly used in Christian churches, which makes this system even less popular and accepted, since Christians are minors in Taiwan.

¹¹ This part is newly added and revised in the version of 2007, different from that of 2003. Its English translation is as follows:

“Knock, knock, knock! Who is at the door? Holy Ghost!
Are you the one who acted Liu Wen-zong in *Pilihou*? Come! Liu Wen-zong!
You can come in to prepare your matches and gasoline for setting fire.
Knock, knock, knock! Will you stop knocking?” (my translation)

misunderstanding might be foreseeable; for example, people may understand “Lòng, lòng, lòng” as “long, long, long” in English and refer this expression as a something’s length instead of its sound.

However, citing various Taiwanese cultural elements and using *tai-yu*, though creating interest to local viewers, does not mark the cultural identity of *The Witch Sonata*. In producing *The Witch Sonata*, Lu still applies the form similar to that of *Macbeth*, and intentionally “de-orientates” the East-ness of his production: his performers recite blank verses, and addressing each other by their English names. Moreover, we do not see local Taiwanese theatrical factors, such as Gezaixi (Taiwanese Folk Opera) or Taiwanese Puppet Theatre, emerged in Lu’s production. However, the audience are constantly reminded that they are watching a non-Western play, since they are consciously reacting to the ambiguity of Taiwanese performers speaking English names and *tai-yu* at the same time.

Conclusion

Then we might conclude, without *tai-yu*, Lu just duplicates and revises a *Macbeth* similar to any other performance under this title. Thus, *The Witch Sonata* is simply a production with much cultural debris repressed together without referring to a specific cultural identity. This is Patrice Pavis’s idea of “cultural collage”:

They [the intercultural theatre] cite, adapt, reduce, enlarge, combine and mix various elements without concern for a scale of importance or value....Although these cultural collages have nothing blameworthy in themselves and resulted in productions of intense beauty and great power, they nevertheless do not pretend to understand a civilization, and they choose their forms and techniques without regard for their ethnological function in their home cultures. (9)

After seeing Lu’s production, we could hardly label *The Witch Sonata* as a Taiwanese theatrical work, since it applies none of Taiwanese theatrical elements, nor understand it as a Western classic. Lu does not pinpoints the values and importance of acting *Macbeth* in *tai-yu*, and how *tai-yu* helps shape the cultural identity of *The Witch Sonata*. *Tai-yu* would only be a cultural excuse for directors like Lu to appeal for people’s ethnical consciousness and sympathetic emotions, but hardly help people access to the authentic Shakespearian texts with proper regard to the home cultures. Lu’s *The Witch Sonata—Psalm of Macbeth* indeed brings new life to *tai-yu* theatre as well as Shakespearean performances in Taiwan. However, when Po-shen Lu’s *The Witch Sonata—Psalm of Macbeth* encounters with Shakespeare’s *Macbeth*, what kind of performance does the play belong to? Neither an Eastern play nor Western drama, Lu’s *The Witch Sonata—Psalm of Macbeth* is simply a production of cultural collage.

ABSTRACT

Male and female adolescents had significantly statistical difference in gender role perceptions. For behave same as gender, male adolescents had tendency to practice according to their role perceptions. While female adolescents' role perceptions followed the culture norms but there was a tendency not to practice according to such perceptions. The image of good female and male adolescent was presented through personality and social expectation.

INTRODUCTION

In 2009 the Epidemiological Division of the Ministry of Public Health found that almost half of all AIDS cases were among young people aged 15 to 29 years. The cause of this problem was format of Thai relationship which expected to gender and different of gender role between Thai male and women. In the past, sexuality was considered an unacceptable topic of discussion with Thai adolescents and parents inevitably avoided it. If their adolescent inquired about sexually-related topics, parents would often give them misinformation. Currently, parents are not the only sources of information regarding sex, with the mass media being most prominent. Unfortunately, though, such sources can also communicate incorrect information and messages to adolescents. While sex education is a subject beginning in primary school, teachers are not confident enough to teach it, sometimes because they themselves lack the necessary knowledge and skills to teach the subject effectively and encourage the adolescents to trust them as advisors. Even parents, who are the closest to their adolescents, also fell frustrated in talking with their adolescents and advising them. Because of there difficulties, adolescent often resort to friends, books, or even commercial sex workers in order to learn about sex. Some receive incorrect information from these sources, and this antagonizes several, social problems, such as prostitution, rape, sexual transmitted disease and AIDS. Consequently, this study on the perceptions and sexual behaviors of adolescents' can be beneficial in obtaining baseline data in order to develop effective sex education programs as well as to formulate effective reproductive health policies. The objective of this research was to (1) study the perception and behave same as gender (2) study the sexual inequality of adolescent and (3) study the culture of categorization between good female and good male.

METHODOLOGY

The study entailed obtaining both survey research using questionnaires created out of focus group discussions and qualitative research. The sample groups were 600 adolescents which get from systematic randomization. Qualitative data was collected

from in-depth interviews, focus group collaborate non-participate observation. Quantitative data were analyzed using the Chi-square test to determine relationships between variables. Qualitative data were analyzed using content analysis.

RESULT and DISCUSSION

Perception, behave same gender and sexual inequality of adolescents. Results from this study found that there is a significant statistical difference in gender role perceptions of both male and female adolescents. Half of the male adolescents had a low level of such role perceptions. While the majority of the female adolescents (51%) had high level of role perceptions and there was relationship between age and gender role perception among female adolescent. The lower age, the higher the level of perception was found. On the contrary, no relationship between age and perception was found among male adolescent.

As far as gender power relations are concerned, in almost every situation female adolescents had comparatively lower decision making and bargaining power than male adolescents. In other words, male adolescents dominated in all such situations, while female adolescents shouldered almost all the burden. Only in temporary sexual relationships did female adolescents have equal or even more decision-making and bargaining power than men.

The study further found that the female adolescent generally perceived it was their duties to perform domestic chores which was corresponded with the Thai social value. What was different was the perception that most women adolescent felt they were no less capable to be in the important and honored position in the society than men while most men adolescent perceived they were more capable than women.

Female and male adolescents agreed that like men, women should learn about sexuality. Concerning sexual expression, while most female adolescents valued the significance of cultural norms which prevent them from expressing their sexual feelings, men were allowed to express such feeling freely without any stigmatization.

When men and women adolescents entered into relationships, the study disclosed that women had more decision and bargaining power than men. Once they became lovers, women adolescents had less of such power since men adolescents were the ones who determined the situations to meet and initiated the physical contact, and insisted for sexual relations which proceeded "little by little." Such insistence could be classified into three natures. First, the male adolescents exerted physical power over their female partners. In certain cases, the female adolescents initially resisted but were permissive toward the end following their partners continuing physical exertion. Finally, the two parties were mutually concurred to have sexual relations. Moreover, the first sexual intercourse of the male adolescents was found to be predetermined contrary to the female adolescents which was unexpected.

After sexual relations, female adolescents generally felt that were of lesser value due to their lost virginity. They feared being abandoned by men as well as getting pregnant. On part of men, they not only feared that the women would become pregnancy but they also developed a sense of belonging to the woman.

The study revealed that men made the decision whether or not to use contraception during their first sexual relationship. In cases where male adolescents believed that they would definitely have sexual intercourse, they obtained contraceptive, usually condoms and emergency contraceptives. If unprepared,

withdrawal was used as an alternative. Men also decided upon the use of contraception in subsequent relationships. Female adolescents reported that they were reluctant to select a contraceptive method for themselves as well as to inform their partners to prepare themselves, since they feared being accused of being sexually experienced. The popular place to buy contraceptives among adolescents in this study was the local convenience store. Few people were inside the store, and others outside of the establishment had no knowledge of what transactions were being made. It was also discovered that female adolescents did not dare to buy condoms. Rather, it was men who did so.

Therefore, men's sexual practices tended to be in line with their perceived role expectation, largely because it was in their interest to do so (i. e., great freedom to have sexual relation). On the contrary, female adolescents' role perceptions followed the cultural norms (the women should not know about sex or have premarital sexual relation), however their actual behavior tended to go against this norm. Moreover, male adolescents believed that women should not be as sexually free as men, and they even disliked female adolescents who were so. This reflects a double standard and gender inequality among the sampled male and female adolescents in this study.

Categorization of good male and female adolescents. The meaning of good female adolescents followed an idea of adolescents was the person who had properly behave. The clothes were the importance thing to divide good or bad female adolescents. Furthermore, the personality of good female adolescents should be cheerful, positive thinking, respect to other people, polite, innocent and express a few of wish about gender.

In contrast, the image of good male adolescents should be gentleman, polite, self-confident, leader and friendly. Thai social often hoped that male adolescents were omniscient, excellently in associate with other people, freely to study for successful life. The night activities of male adolescents were drinking of spirits and traveling to cabaret such as restaurant and brothel.

In conclusion, good male adolescent had various measurement standards more than good female adolescent. The reason was that sexual relationship of male adolescent differed from female and inequality of assignment. The majority of male and female adolescent believed their premonition in choosing good or bad male or female. Further, they did not wear condom with the lovers that they belief that their partner were good.

In view of the above, it can be concluded that the viewpoint of adolescent showed on meaning of good female and good male and also the double standard of gender role perceptions will have been tendency to infect with AIDS. At the same time, we can help them reduce the risk to infect AIDS using campaign and giving education. It will be succeeded if the trainer comprehends gender.

RECOMMENDATION

The Ministry of Education should develop the educational curriculum on gender equality at both the family and societal levels. This is to equip the learners with the awareness on their rights ; the decision to refuse or bargain ; and the mutual decision between men and women at every reproductive health process from the beginning to termination of relationship

The campaign on condom use should not heavily emphasize on prevention of HIV/AIDS since the adolescents generally did not wear condom with their partners or lovers due to their confidence of not being infected. Therefore, to increase condom use among the adolescents, emphasis should be placed on condom use as effective and easy method of pregnancy prevention. However, campaign on AIDS prevention has to be paralleled.

BEFORE RELIGION: On Magnus Hirschfeld's Encounter with Asia and the Quest for a New Symbolic Order of the Sexual

By J. Edgar Bauer
Writer

"Sexuality is the paradigm."

Susan Sontag¹

1. The German-Jewish physician Magnus Hirschfeld (1868-1935)² was one of the most distinguished theorists in the history of sexology, and the foremost sexual minority rights activist in the twentieth century. In November 1930, shortly after completion of his five-volume opus magnum *Geschlechtskunde auf Grund dreißigjähriger Forschung und Erfahrung bearbeitet* [Sexual science treated on the basis of thirty years of research and experience], he left for the United States of America, where he had planned a lecturing tour. Having reached San Francisco in March 1931, however, he decided to extend his travel to a world trip, eventually visiting Japan, China, Indonesia, India, the Philippines, Egypt, and Palestine. Back in Europe by April 1932, Hirschfeld became increasingly aware of the menace that the rise of Nazism meant for his life and work, and decided not to return to Germany.³ A year later, Hirschfeld published in Switzerland the report of his world journey titled *Weltreise eines Sexualforschers* [World journey of a sex researcher], which was soon to become one of the founding texts of the then emerging discipline of sexual ethnology. The following elaborations focus on Hirschfeld's travel report against the backdrop of his sexological key contentions and seek to assess their significance for a symbolic order of the sexual beyond the constrictions imposed by closed schemes of sexual distribution.

2. The core of Hirschfeld's sexology is constituted by what he termed *sexuelle Zwischenstufenlehre* [doctrine of sexual intermediary stages], a set of key premises purporting a biologically grounded deconstruction of the Western ideology of binary sexuality sanctioned by the Abrahamic creation narratives and the religions invoking their authority. Throughout his oeuvre, Hirschfeld sought to prove on the basis of a careful reading of the sexed body that the postulation of a dichotomous division between men and women is unwarranted. Hirschfeld's critical endeavours in this regard were all the more demanding as he was well aware that the binomial scheme of sexual distribution had become the actual cornerstone of the specific Western understanding of the human, which, through the mediation of Christianity, resumed and radicalized the millenary assumption of a hiatus between two mutually exclusive sexes: the exemplary Adam is a man because he does not possess the sexual attributes of Eve, his human Other. Rejecting this premise, Hirschfeld contended that a human being is neither man nor woman, but at the same time man and woman in unique and therefore unrepeatable proportions. On these assumptions, Hirschfeld's doctrine led to a re-inscription of sexual difference in an open-ended framework of natural continuity, and adumbrated therewith the post-modern contestation of closed schemes of sexual subsumption.⁴

3. The scope of Hirschfeld's paradigm shift can be elicited from the motto he chose to open the crucial treatise he published in 1905 under the title *Geschlechts-Übergänge* [Sexual

Transitions].⁵ The quote in question is a brief sentence by the philosopher Gottfried Wilhelm Leibniz that runs: "Tout va par degrés dans la nature et rien par sauts."⁶ Applying this general principle to sexuality, Hirschfeld concluded that the allegedly distinct groups of sexuality are actually transitions within the pervasive continuity of nature. Contrary to the either/or scheme of traditional assignation to one of two sexes, the idea of sexual gradation allows in principle for infinite variations of sexual constitutions depending on the way the poles of the masculine and the feminine combine at each of the different layers of sexual description. In Hirschfeld's time, such layers were assumed to range from the sexual organs and the secondary sexual characteristics, to the sexual drive and the way psychological traits are articulated in culture.⁷ Arguing that sexual difference is not determined in relation to one single excluded alternative (male or female), but in relation to an open ended system of as yet only partially realized combinations of the masculine and the feminine at the different descriptive layers, Hirschfeld concluded that the sexuality of each and every individual is characterized by a unique complexity. Since from a Hirschfeldian perspective sexual difference is defined within the framework of potentially infinite sexual varieties, all differing from one another and undergoing change throughout the individual's life, the number of sexualities has to be conceived as being co-extensive with the number of sexed individuals.⁸

4. In consideration of Hirschfeld's basic premises, it becomes apparent that he did not intend to establish—as has been oftentimes suggested—a theory of homosexuality as a "third sex" intermediate between the heterosexual male and the heterosexual female.⁹ Although the relative popularity of the term "third sex" in the twentieth century was mainly due to the impact of his activism, Hirschfeld was keen to stress that he never used the concept in his scientific publications, but only in the context of his popular-educational writings.¹⁰ Opposing the categorial suppletion of binary sexuality through a third sexual constitution, Hirschfeld re-conceptualized the allegedly third sex in a quintessentially de-totalizing and de-totalized manner. Thus, he severed sexual difference from its traditional references and assumptions, and reframed it within the ever-diversifying continuum of nature. Since on Hirschfeld's premises the third sexual alternative evinces itself as being merely a "fiction" added to the already fictitious categories of male and female,¹¹ its occasional rhetorical postulation does not entail a revocation of his fundamental insight that "all human beings are intersexual variants."¹² Regardless of his denial that the "third sex" category could be "something complete or even almost closed in itself," however, Hirschfeld assigned to it the function of an indispensable "makeshift"¹³ designed to overcome the "extremely superficial scheme of classification into man or woman."¹⁴ In the context of Hirschfeld's new serial scheme, therefore, the postulation of a third sexual constitution does not entail the finitization of sexual alternatives, but, on the contrary, it leads to the acknowledgement that, on principle, there is no final completion of the series of possible sexualities. Notwithstanding their common dismissal of the cogency of the sexual binomial from the liminal perspective of the excluded, the suppletive and the serial conceptualizations of the third sex envisaged, lastly, very different emancipatory aims. While the tripartition model adds a third alternative without necessarily transforming the self-understanding of the alleged majority according to the binary pattern, the open-ended model challenges from the outset the very possibility that such a majority be constituted by questioning the theoretical validity of its cohesion.¹⁵

5. Going far beyond the mere normalization of the third sex as a fact of nature, Hirschfeld articulates already in *Sappho und Sokrates* (1896), his first sexological treatise, the essential traits of his future sexual doctrine. Resuming and expanding on the leitmotifs of Charles Darwin's grasp of sexuality, Hirschfeld resorts in this context not only to the theory of recapitulation of phylogenesis by ontogenesis, but also to the reality of a bisexual primary disposition, whose traces or 'remainders' can be readily perceived at the physiological level:

"Every man keeps his stunted womb, the uterus masculinus and the superfluous nipples until death; likewise, every woman [keeps] her useless epididymis and her spermatic cord."¹⁶ Arguing analogically, Hirschfeld points out that, with regard to the psychic center of sexual sensibility, one can definitely assume that, here also, residues of the drive subsist that, on the whole, are eventually destined to disappear."¹⁷ Since "in their primary disposition all human beings are with respect to their body and soul bisexual,"¹⁸ the inexhaustible diversity of sexualities results not from qualitative, but from quantitative differences that are determined by the way the primary sexual disposition reacts to processes that hinder or advance its development. Furthermore, Hirschfeld underlines that the later a particular sexual difference is developed, the more significant the influence the "residual" sex has on it.¹⁹ Thus, whereas gradual deviations occur less frequently with regard to the primary sexual characteristics, and more frequently with regard to the secondary ones, in the case of tertiary characteristics such deviations occur even more frequently, as is shown by the high incidence of sexual orientations at variance with the supposed norm. Based on these variabilities, Hirschfeld unmasks the purported naturalness of the binomial sexual hiatus as an unwarranted concealment of sexuality's endless transitions deployed in consonance with nature's pervasive continuities.

6. In correspondence with his overarching critical commitments, Hirschfeld sought to illuminate the dim precincts of sexual half-truths and prejudice. In the first editorial he wrote for the periodical *Die Aufklärung* [The Enlightenment], Hirschfeld frankly declared his intent "to fight for the freedom of humankind" with the "fair weapons provided to us by precise investigations."²⁰ His specific aim was to shed light on the parochialism of Western "mores" (*Sitten*) that deflect from or silence the sexual facts ascertained by science and therewith hinder the emergence of a truly universal sexual "morality" (*Sittlichkeit*). In no uncertain terms Hirschfeld advocates supplanting the theological foundations of the sexual by well-grounded scientific premises apt to prevent the unnecessary strife between natural and human laws, science and morals, and indeed between "pure truth and true purity."²¹ Well aware of the overwhelming task posed by the "sexual misery"²² of twentieth-century humanity, Hirschfeld closes his editorial with an explicit reference to eighteenth-century classical Enlightenment:

"And like 150 years ago the 'Enlightenment' (*Aufklärung*) meant the end of political absolutism, so our 'Enlightenment' (*Aufklärung*) pursues a no lesser goal: the end of the absolutism of mores (*Sitte*) – that autocracy, which, unkindly and unworldly, wishes to accord validity only to its own petrified views: the end of servility."²³

Mindful that absolutism fosters servility not only within the confines of governmental policy, Hirschfeld envisages its dismantlement wherever the alleged universality of factually provincial sexual mores is invoked to subjugate the individual. Consistent with the ethical-emancipatory project of *Aufklärung*, Hirschfeld envisions the deployment of the individual's unique sexual differences in the framework of a universal history liberated from the yoke of theological teleologies.

7. The significance of Hirschfeld's report on the journey he undertook between 1930 and 1932 resided in its being one of the first systematic contributions to sexual ethnology, a science that he considered to be, "with regard to its contents, the oldest, with regard to its method, the youngest one"²⁴ among the sexological disciplines. Since "the *biological* and *pathological* foundations in the field of sexuality" are the same for all humanity, sexual ethnology, in Hirschfeld's understanding, has to deal with the extreme diversity of "sociological consequences, solutions and assessments"²⁵ indicative of humankind's response to the complexities of its own sexual nature. Hirschfeld's premise that, despite all cultural variability, the sexual dispositions and drives—"taken as a whole"²⁶—are common to all

nations and races, however, was by no means meant to corroborate the constrictive patterns of traditional sexual binarity. On the contrary, Hirschfeld's work is a constant reminder of the boundless diversity of sexual constitutions that is ascertainable in all times and places. Since this diversity, however, challenged the way historical cultures to the present have been organized, they understandably reacted with the propagation of "symbolic and idealistic explanations" of sexuality that Hirschfeld disqualified as being merely "*a posteriori* constructions."²⁷ As Hirschfeld further underscored, owing to such constructions, "every nation (and every religion) is convinced that its [sexual] mores are morality in the *objective* sense" and is inclined "to reject all other mores as more or less immoral".²⁸

8. Given the Nazi cultural policies, *Weltreise* had to be published in Switzerland a year after Hirschfeld's return to Europe. As a "principled supporter of the emancipation *movements* of all nations,"²⁹ Hirschfeld made his "libertarian attitude"³⁰ throughout the book abundantly clear, contending that the drive to freedom is a "natural law"³¹ inherent in all men and nations, and that "once awoken, [it] can be checked only temporarily."³² Well aware of the entangled configurations of oppression in Asia, he criticized European imperialist policies, while refusing to idealize the cultural differences commonly associated with Asia's exoticism. Thus, Hirschfeld castigated not only the repressive politics of the colonial powers of the time, but also the curtailment of human liberties resulting from the mostly millenarian traditions of the colonized nations themselves. Although he acknowledged the cultural relativity of his views on debatable issues such as corpse copulation in the Malabar coast³³ or the erotic preference of Egyptians for people having a squint,³⁴ Hirschfeld was far from relativizing his stance when focusing on murderous or life-threatening practices such as widow burning, the exposure of female babies or the circumcision of women. In this connection, it is especially noteworthy that notwithstanding his assessment that Hinduism and Buddhism are more tolerant religions than Christianity with regard to non-normative sexualities, Hirschfeld openly admitted his dismay in view of the roles women have been forced to assume in the social fabric of Far Eastern cultures.

9. Hirschfeld's emancipatory pursuits were not limited to the field of sexuality. Toward the end of his life and prompted by the rise of Nazism, Hirschfeld sketched out a conceptualization of race based on biological assumptions comparable to those of the *Zwischenstufenlehre* and leading to similar unsettling results. His most comprehensive elaborations on race are included in *Phantom Rasse* [The race phantom], a series of articles that began to be published in 1934—a year after the publication of *Weltreise*—in a German-language newspaper in Prague, but was never completed due to Hirschfeld's unexpected death. In analogy to his critique of closed schemes of sexual distribution, Hirschfeld maintained that there are no clear-cut, fixed differences between the races, but only gradual racial variations between individuals. Thus, the sexological premise that all human beings are sexual intermediaries, is paralleled by the assertion that, "strictly speaking, from the point of view of biology, all human beings are hybrids."³⁵ Like in the case of his sexual doctrine, Hirschfeld's elaborations on race are guided by Jean-Baptiste Lamarck's philosophical thesis that, with regard to the infinite fullness of inherited characteristics and forms, "all classifications of living beings are ultimately only 'artificial instrumentalities,' [for] Nature herself [...] knows neither classes nor species."³⁶ Dissolving the categorial closures superimposed on her by man, Nature's fullness fosters—in Hirschfeld's depiction—a sense of humanness irreconcilable with the schemes of sexual and racial classification utilized in the (self-)identificatory processes of individuals throughout history. Resonating with the results of his sexual deconstructions, Hirschfeld's analyses of closed schemes of racial distribution makes racial groupings appear as merely taxonomic *fictions* that fade away in the face of racially unique individuals. Thus, in view of the fascist and fascistoid self-misapprehension

of culture as a product of the so-called racial purity, Hirschfeld underscores: "culture is the result of racial mixings, and only this mixing saves from barbarism."³⁷

10. In his treatment of race, Hirschfeld certainly drew on his personal experience as a Jewish non-Aryan who had traveled through Asia, and confronted the greatest cultural diversity ever brought about by humankind's racial spectrum. Signally, when depicting sexual, racial and cultural diversities in his travel report, Hirschfeld did not assume that Western mores (or any given mores, for that matter) could offer the paradigms required for judging or condemning Asian insufficiencies in dealing with those diversities. Rather, he regarded Oriental and Western articulations of sexuality and race as essentially related and deficient configurations within a cultural continuum requiring critical analysis as a whole. Elucidating this cultural relatedness by an example, Hirschfeld argued that the difference between the stomach-slapping of Ceylonese forest people and the buttocks-slapping of Bavarian dancers is hardly greater than that between the nose-rings of Indian women and the earrings of their European counterparts.³⁸ Being "basically the same,"³⁹ such cultural manifestations and commodities suggest that, ultimately, there "is no essential difference between 'primitive' and 'civilized' people."⁴⁰ Like in the case of sexual or racial individuation, Hirschfeld considers the cultural specificity of mores, institutions and artifacts not as the result of discrete or isolated qualities, but of gradual differentiations within an open totality. On these assumptions, any concrete cultural actualization is suitable not only to be understood through its relationship to the continuity in which it is embedded, but also to be critiqued by gauging its still unrealized potentialities.

11. Given the "internationality of all sexual problems of humanity"⁴¹ and their intersectionality with issues of race and culture, Hirschfeld was keen to stress that their solution cannot be found within the purview of religious asceticism. As a student of religions and religiosity, however, Hirschfeld warned against simplistically equating asceticism with the religious worldview in general.⁴² Accordingly, he distinguished between religions inimical to sexuality (like Christianity) and those favorable to it (like Islam),⁴³ and eventually maintained that "deep religiosity and sexuality by no means exclude one another."⁴⁴ Hirschfeld's nuanced assessments of religion are based on a wealth of observations concerning the understanding of sexuality in the Hindu and Buddhist traditions,⁴⁵ in the monotheistic spiritualities of "Moses, Jesus, Mohammed,"⁴⁶ and even in minority religious formations such as Shinto,⁴⁷ Jainism,⁴⁸ and Zoroastrianism.⁴⁹ More importantly, his purview of Asian religions is completed by references to religious groups with an outspoken favorable appreciation of sexuality that range from tantrism⁵⁰ and the mystical-erotic sect of the Baul, renowned for their carezza-method of love,⁵¹ to Din-I-Illahi, the short-lived ecumenical religion founded by Akbar the Great (1542-1605).⁵² Although Hirschfeld's treatment of religious diversity in Asia seems designed to acquit religion *per se* from the charge of being inimical to sexuality and erotic love, it soon becomes apparent that, from Hirschfeld's perspective, no historical religion is suited to satisfy the theoretical demands made by his sexology and by the new sexual ethics it entailed.

12. Beyond examining the interactions between historical religions and sexuality, Hirschfeld made during his trip inquiries into residual or subjacent cultural contents that could hint at a weltanschauung very different from the views of reality propounded by full-fledged religious traditions. In this connection, Hirschfeld reported, for instance, that in Bali "still reigns an extensive pansexualism, an erotic all-love, which was perhaps the reason why many nations in the past gave sexual valences to all beings and things."⁵³ More importantly, in his search for extant traces of prehistoric cultural configurations, Hirschfeld studied the unabated magical and ritual relevancy of lingams in widely dispersed locations between Japan and Western

India. He mentions, for example, that remains of a phallus cult associated with hopes for fertility and male progeniture have survived in Japanese rural areas independently of Buddhism and Shinto.⁵⁴ In Batavia, the present-day Jakarta, Hirschfeld observed such a desperate yearning for fertility that the mere resemblance of a cannon with a phallus was reason enough to attract annually thousands of women from all parts of Java who presented their offerings in exchange for pregnancy.⁵⁵ Later on in his journey, scholars from the University of Benares pointed out to Hirschfeld that the incorporation of the lingam to the cult of Siva represented a rather late religious development, and therewith strengthened the sexologist in his conviction that the lingam cult is "not only older than Hinduism, but even older than religion in general."⁵⁶ Hirschfeld's pronounced interest in possible evidence for a worldview previous to the emergence of current religions is especially apparent in the chapter titled "Lingam triumphs over Siva,"⁵⁷ as well as in the passages relating his visit—just before his final departure from India—to the lingam shrines in Elephanta, an island off Bombay. At this site, "where the territorial ascendancy of Siva ends and Allah's single lordship begins,"⁵⁸ Hirschfeld imagines the godly lingam addressing the crowds of believers in terms that come close to his own Goethean- and Nietzschean-inspired vitalism: "I am the organ and the symbol of all-destructive Siva, who brings ruin, war and death to men, but I am at the same time the organ of eternal re-birth, the emblem of life that continually renews itself through love, of the 'Die and become!'"⁵⁹

13. Notwithstanding his interest in lingams and yonis as tokens of a pansexual, fertility-oriented pre-historical period,⁶⁰ Hirschfeld had good reasons for not idealizing the phallic apotheosis that antedated the emergence of historical religions. On the one hand, he unmistakably rejected the binomial scheme of sexual distribution that underlies the prehistoric sacralization of reproduction. On the other, he was keenly aware of the shortcomings of a sexual life devoid of the ethical parameters conveyed by the great religious traditions. While acknowledging their ethical advantages, Hirschfeld did not overlook that world religions continue to assume a concept of binary sexuality that derives from the primitive lingam/yoni disjuncture. Against this backdrop, Hirschfeld's doctrine of sexual intermediaries purports an epochal break with the male/female divide that has been prevalent ever since the emergence of culture. In accordance with this line of argument, Hirschfeld evokes throughout *Weltreise* diverse instantiations of sexual intermediariness that openly resist being pressed into binomial sexual patterns. Thus, he refers not only to art-historical cases ranging from androgynous Buddha statues in Japan⁶¹ and the double-sexed Siva represented as Arahana-rismwar,⁶² but also to the contemporary occurrence of non-homosexual transvestite and homosexual male impersonators of women in the Kabuki theatre,⁶³ Balinese transvestite dancers,⁶⁴ and even homosexual and pseudo-homosexual yogis.⁶⁵ Despite the wealth of evidence he reports in this regard, however, Hirschfeld avoided making elaborate emancipatory claims concerning the sexual minorities he encountered throughout his journey. Given the appalling impression that the alienated condition of women in Asia made on Hirschfeld, it is no wonder that he considered their emancipation to be the most urgent task of the libertarian politics he advocated.

14. While documenting the diversity of sexual mores (Sitten) Hirschfeld came across during his trip, *Weltreise* diagnoses their inadequacy as point of departure for developing a sexual morality aspiring to universal validity (Sittlichkeit). As Hirschfeld maintains toward the end of his travel report, the ethics needed for attaining the future "United States of Earth"⁶⁶ rests on the premise that humanness exists only in the fractionation of individuals, and is perverted whenever a sexual group, race or culture claims exclusive rights to its accession. Focusing on the nuances and complexities that mark the individual's uniqueness, Hirschfeld developed an encompassing program that moves from the lucid acknowledgment of the biological basis of

human sexuality, to visions of a libertarian culture facilitating the realization of the potentials inherent in irreducible sexual diversity. This overarching vector of Hirschfeld's sexual thought is encapsulated in his life motto: *per scientiam ad justitiam*. Although an essential part of his critical program consisted in dissolving the categorial fixations of sexuality, Hirschfeld acknowledged the legitimacy of provisionally resorting to categorial reductions for the sake of research and therapy. In this context, Hirschfeld's redefines the grasp of sexual constitutions, on principle, as an asymptotic task informed by the awareness of the ultimate ineffability of the individual's sexual difference. Given the inherent boundaries of any epistemic pursuit, the inevitable gap between the always perfectible scientific understanding of sexual difference and its implementation for the sake of sexual justice becomes the actual site of the categorially non-subsumable individual, whose sexual liberation begins with the dismantlement of the closed regimes of gender that constrain the inexhaustible diversification of natural sex.

15. Contrasting with the historically sanctioned fixation of the sexes, Hirschfeld's new scheme of sexual distribution purports that each individual embodies a unique sexuality, and as a consequence, that the number of sexualities is potentially infinite. On the premise that human beings combine in different and non-repeatable proportions the poles of masculinity and femininity, Hirschfeld's doctrine dismisses the issue of sexual *identity* defined according to a binomial or ternary scheme as an ideological burden from the past. Furthermore, it transforms the question of sexual *self-identification* into an endless task, since categorisations function, at most, as provisory approximations that must be constantly readjusted as multi-level sexual complexity metamorphosizes throughout the life of the individual. Although Hirschfeld did not always deal in detail with the consequences of his doctrine, his efforts to cope with the sexological aspect of biographies along with his continuous attempts to refine his theoretical instrumentality make it apparent how relevant diachronic differences were to his overall grasp of the sexual. Since in his understanding, sexual alterity is not determined within a dual or triadic pattern, but within an open-ended scheme of unique sexual constitutions, all differing in gradually diversified aspects from one another, sexuality evinces itself as being always a sexuality of difference: "hetero-sexuality."

16. Hirschfeld's programmatic pursuits were closely related to his personal interpretation and adaptation of Jewish religion and history. In this connection it is apposite to note that despite his self-understanding as a Jew, he did not embrace the creationist monotheism of normative Judaism. As a member of *Deutscher Monistenbund* [German Monist League] founded by the eminent Darwinian Ernst Haeckel (1834-1919), Hirschfeld subscribed, instead, to a pantheistic view of Nature that countered essential aspects of traditional Jewish teachings. Notwithstanding his a-theological stance, however, his conception of sexual emancipation as a political, future-oriented process is reminiscent of Ancient Israel's prophetic tradition and shares core assumptions of the same Messianic legacy that influenced Marxism and Zionism. The transformation and re-contextualization that this legacy underwent in Hirschfeld's oeuvre were profound.⁶⁷ On the one hand, the biblical theologumenon of an almighty God was replaced by the conception of an inexhaustibly creative Nature, whose ground traits go back to Baruch de Spinoza's philosophical understanding of *natura naturans*. On the other hand, the creational teachings regarding the binary sexual constitution of humankind were supplanted by an understanding of sexuality that escapes the grids of any finite system of sexual distribution. On these premises, Hirschfeld's Messianic-inspired blueprint of sexual emancipation reclaims the irreducible sexual diversity emerging from Nature as the point of departure for realizing, in the concretion of history, a libertarian culture capable of fostering the deployment of the individual's unique sexual potentialities.

17. At the very end of *Weltreise*, Hirschfeld includes some reflections on the issue of Jewish assimilation that close as follows:

"Only [the love of humanity] can bring back the lost paradise, the golden age, only [this love] can create the organism of humanity, created on the soil of Freiligrath's words of hope:

"Despite all that, despite all that – the time comes despite all that,
When all around man will hold out the brotherly hand to man
Despite all that.""⁶⁸

Since the topos of the golden age in the cited verses by German socialist poet Ferdinand Freiligrath (1810-1876) are a clear clue to the emancipatory futurity Hirschfeld envisioned, it becomes apparent that what he termed "the assimilation of Judaism into Humanity" constituted an essential aspect of the Messianic hope encoded in the poem's repeated "Despite all that." From the standpoint of Hirschfeld's libertarian conception of history, the advent of a time of universal reconciliation coincides with the effective acknowledgment that there is difference of value only "between individual human beings," and that "national, family, religious, professional, ethnical or other forms of appurtenance"⁶⁹ are to be subordinated to the individual's worth and merit. Consequently, Hirschfeld's oeuvre exposes and challenges the axiological asymmetries resulting from unexamined constructs of sex, race or ethnical belonging, and delineates a non-essentialist naturalism of infinite diversity, in whose ambit the individual occupies an irreplaceable point of transition within the continuities of nature. In Hirschfeld's demarche *per scientiam ad justitiam*, the acknowledged uniqueness of the individual constitutes the indispensable condition for realising the ethical commonality of the human.

18. As his single most important contribution to uncovering humanity's true sexual constitution, Hirschfeld's doctrine mandates a radical reassessment of the Western articulation of sexuality following from the conflation of the Creation narratives of Adam and Eve and the originally Pythagorean axiology opposing being and maleness to nothingness and femininity.⁷⁰ While Hirschfeld's deconstructive endeavours confront Freudian psychoanalysis as the most encompassing theoretical deployment of the phallic apotheosis that marks occidental history, the encounter with Asia during his world trip offered him a broader anthropological-historical perspective for gauging the deep rootage of binomial sexuality in the pre-religious, symbolic patterns of the lingam/yoni dichotomy. Since the basic premise illustrated by this most archaic articulation of sexual binarity retained its pervasiveness throughout cultural history, it throws light on the radical novelty of Hirschfeld's thoroughly counterintuitive assumption of potentially infinite sexualities. Against the backdrop of Hirschfeld's science-based and libertarian-aimed doctrine, the symbolic order of binomial sexuality and the consequent imaginary of the phallus/lingam can only resort to argumentative strategies of reiteration to keep a semblance of its pervasive validity of old. The new symbolic order necessitated by Hirschfeld's sexual doctrine and its assumption of a penis/clitoris continuum resets the representational agenda beyond the simplistic conveniences of thought patterns that operate on the basis of the opposition between male fullness and female emptiness. The chance and challenge of the symbolic order ensuing from Hirschfeld's critical pursuits is to represent potentially infinite sexual variability with the prosaic means of finitude. In this light, the symbolic of the sublime evinces itself as the true representational site of sexual difference.

³ Since 1920, Hirschfeld had been a target of defamation and physical aggression orchestrated by the German fascists. Thus it was not totally surprising that soon after Hitler came to power in 1933, the Institute for Sexual Science Hirschfeld had founded in 1919 was closed, and its extensive library as well as its sexual-ethnological collections were destroyed. A year later, in 1934, the Nazi regime deprived him of the German citizenship. After moving to Ascona in Switzerland and then briefly to Paris, Hirschfeld finally settled in the city of Nice, in the south of France. There he died on his 67th birthday, May 14, 1935 as a stateless person.

⁹ Sigmund Freud was the most influential figure that interpreted Hirschfeld's sexological contentions in this sense. Thus, in a passage targeting primarily Hirschfeld, Freud wrote: "Die homosexuellen Männer, die in unseren Tagen eine energische Aktion gegen die gesetzliche Einschränkung ihrer Sexualbetätigung unternommen haben, lieben es, sich durch ihre theoretischen Wortführer als eine von Anfang an gesonderte geschlechtliche Abart, als sexuelle Zwischenstufen, als ein 'drittes Geschlecht' hinstellen zu lassen." (Freud, Sigmund: *Eine Kindheitserinnerung des Leonardo da Vinci*. In: Freud, Sigmund: *Studienausgabe. Band X: Bildende Kunst und Literatur*. Hrsg. von Alexander Mitscherlich u.a. Frankfurt am Main: S. Fischer Verlag, 1969, p. 124) / "The homosexual men who have undertaken an energetic action against the legal restriction of

their sexual activities, like to be exhibited by their theoretical spokesmen as a sexual deviation that is separate from the beginning, as sexual intermediary stages, as a 'third sex.'"

Women with physical disabilities and their able-bodied community: Lessons learned from rural Thailand

Theeraphong Bualar, PhD
School of Management Science
Silpakorn University
Phetchaburi IT Campus, Cha-Am
Phetchaburi, Thailand 76120
thiraphong@yahoo.com

Abstract

Community is very important for people with disabilities. This article, which draws from face-to-face interviews, explores the nature of social interaction between women with physical disabilities and their able-bodied community. Findings from in-depth interviews with 20 physically disabled women in northeastern Thailand indicated that their community involvement was hampered by over protection from non-disabled people around them. Despite showing their ability to cope with daily life, physically disabled women still failed to convince non-disabled people to believe in their contributions to the wider community. The author argues that this was due to stereotypical ideas of their family members and false impressions of women with disabilities. In addition, the non-disabled community obviously failed to grasp the magnitude of physically disabled women's community involvement, ignored their contribution and left them behind wider community.

Keywords: Physical disabilities; Disabled women; Gender and Disability; Social sector; SE Asia

Introduction

Women with disabilities are one of the most marginalized groups who need to be socially recognized in the development process. This article, therefore, attempts to investigate the interplay between women with physical disabilities and their involvement in community in northeastern Thailand. From Disability Survey Report

in 2008, 288,373 people with disabilities out of 756,606 registered with the Department of Disability Empowerment living in the northeast of the country (Thailand, Survey Report, Department of Disability Empowerment, 2008). Among women with disabilities registered with the Department, physically disabled women are the highest. The Survey report recorded 139,242 out of 313,274 women as having physical impairment.

From mainstream development perspectives, people with disabilities have been in the spotlight recently because disability severely hampers the process of development because most societies consider people with impairments burdensome and they believe that those people are economically non-productive (Barnes, 1991; Asch and Fine, 1988).

Finkelstein (1980), Oliver (1990), Whyte and Instad (1995) contend that studies of disability require a paradigm shift away from the clinical approach towards community involvement. They assert that a disability study must be seen in the context of ordinary social interaction. Their arguments clearly illustrate that people with disabilities require social contexts within life. Consequently, sociologists and disabled people have challenged the justification of the medical model and demanded that the disability study be influenced by a social model (Oliver, 1990; Barnes, 1991). This social model will explain how people with disabilities can be socially recognized and they must receive equal opportunities to be recognized and participate in social activities in the community (Edmonds, 2000).

Among women with different classifications of disability, women with physical disabilities are more marginalized and are usually excluded from the non-disabled community (Asch & Fine, 1988). Moser (1989) pronounces that low involvement in community-based activities impoverishes rural women including rural women with physical disabilities. Several studies of physically disabled women found that their bodily impairment had negatively influenced their participation in their community (Thomas, 1999; Anderson & Kitchin, 2000; Orme, 2001; Mays, 2006; Crooks, Chouinard & Wilton, 2008; Bualar, 2009; Nixon, 2009)

Many scholars and academics have produced research on people with disabilities; however very few of them have been interested in gender and disability or disability in community participation which keeps women with physical disabilities in an inferior position in a rural community. Additionally, it should be emphasized strongly that the overwhelming majority of writings on disabled women have failed to address the situation of women living with physical disabilities in rural areas in developing countries. The interplay between physically disabled women and their wider community therefore became the focal point of this article.

Social Expectations, Culture and Women with physical disabilities

Women with disabilities are the most vulnerable group among the vulnerable groups, simply because their public identity is eliminated by the social construction of womanhood and their physical disabilities, which make them less visible in a community. To comprehend the subject of women with physical disabilities in its entirety, a discussion on the social expectations of women with disabilities, disabled

women in the context of the public sphere and how they are different are discussed below.

In theory, social expectations of women can be divided into traditional and non-traditional or feminist expectations. Traditional expectations confine women to motherhood and depict them as subservient persons and followers. These expectations, as such, categorize women to be stay-at-home workers and to be obedient. Non-traditional or feminist expectations hypothesize that human beings are equal. Women are able to receive higher recognition. Women become self-confident, liberal, wise and ready to participate in the wider community (Fiske & Glick, 1995).

Because of their physical impairment, mainstream society does not expect motherhood from women with physical disabilities. In addition, these women are not included in feminist expectations because they are not socially and economically independent. Social expectations from mainstream society minimize the interests of physically disabled women in the public sphere. Evidently, physically disabled women tend to obey the social expectations or social norms manipulated by non-disabled people, making them feel uncomfortable in their community, and they do not realize the importance of their contributions to the public sphere. These social expectations encourage physically disabled women into believing in social control so that they finally find themselves alienated from the public sphere and public participation in community-based activities (Mackelprang, 1993; Gleeson, 1999; Reinders, 2000; Krieger, 2003).

Women with physical disabilities will feel doubly oppressed because of being women and disabled. MacFarlane (1994) clearly postulates that being a woman is one thing, but a disabled woman is likely to face more hardship in her life than those who are non-disabled. The non-disabled community and bodily impairments will reinforce social prejudices in the case of women with physical disabilities. On one hand, physically disabled women will be excluded by non-disabled people when it comes to economic resources such as employment opportunities while on the other hand, these women will be socially barred from playing primary roles such as motherhood, pregnancy, denial of sex or finding partners because the borderline between customary roles and disability are clearly demarcated by social attitudes. Oliver (1990) illustrates inextricable links between disability and women because, as he pronounces, disabled women are naturally associated with dependency, vulnerability and fragility. Implicitly, physically disabled women could become very passive and represent negative images in a community of non-disabled people (Morris, 1991).

Closely aligned with social expectations of disability, culture plays a pivotal role in shaping social attitudes influencing individual performance, social inclusion and self-esteem because, as Parker insisted, culture will condition human behavior and social structures which require public obedience (Parker, 2003). A cultural account of disability concentrates on all aspects of cultural matters such as gendered disability, minority and disability (Morris, 1991; Begum, 1992). Those who share a common culture of signs and symbols will have strong potential to oust those who hold deviant ones. Thus it becomes evident that the association between disability and culture is acutely significant (Shakespeare, 1994).

Shakespeare (1996) further extends his analysis to point out social prejudice. He explains that social prejudice is implicit in cultural identity, in language and in the socialization process. He also postulates that all cultures negatively respond to disabled persons and suggests that the social construction of disability should be redefined to reflect cultural oppression and social prejudice against disabled people. Culture and social prejudice become inextricably interwoven to continually reinforce social attitudes toward physically disabled women in a community (Davis, 2002). The problem of disability does not lie with the persons with disabilities but the way that culture together with social prejudice is constructed to create problems for these women.

Dominant groups in community seek to impose their own judgment and core values. They encode their interests into norms which they aspire to generally enforce. Failing to abide by the core culture or rejecting the core values ends up with social sanction and punishment which Gramsci (1971) conceptualizes as the core culture of dominant groups producing hegemony. Since this hegemonic culture is constructed by non-disabled people, women with physical disabilities fail to catch up with the non-disabled culture. They are categorized as social deviants and they will be judged by the construction imposed by culturally imposed normalcy (Morris, 2004; Zitzelsberger, 2005; Mays, 2006; Hughes, 2007).

Women with physical disabilities and their body in society

People always explicitly or implicitly make, send and dissipate their codes, signals and information to other people with body language and its interaction, such as

smiles, grinning faces, happy faces, etc. Goffman postulates that body language reflects powerful relations in social life which denote physical gestures, position and conduct which he refers as '*body idiom*' (Goffman, 1979). Body and society are inextricably interwoven because people will pay attention to physical appearance and its interactions in daily life. Goffman's argument reveals two aspects of body. Firstly, the relationship between physical appearance in society and secondly, the relationship between embodiment and daily life.

Sociologists strongly believe that the body is socially embodied by social structures, social norms, folklores and social attitudes. As such, the body's definition and its value are not judged only by the owner of that body, but also by other people in the community (Turner, 1996). As a result, a body is merely a set of social practices.

The human body is best regarded as a potentiality in everyday life and social activities. From this argument, the body as a set of social practices is derived from the perspective of symbolic interactionism. The body plays an active role in social context and it can be best argued that an individual's human body is trained, constructed and socialized by the culture of its given society (Hughes, 2009).

In their anthropological work, Depoy and Gilson studied the relationship of social class and a body in everyday experiences. They found that the body in society possesses certain cultural capital which is illustrated through action and practices (Depoy & Gilson, 2004). As a result, a body is conceived as a system of signs which is a carrier of social meanings and the importance of the body in representing culture and shared meanings in society (Naemiratch & Manderson, 2009). Therefore, it can be interpreted that the human body is a source of power relations.

Society judges a woman's body as a source of beauty, and this beauty is well accepted by mainstream society. In other words, disability is defined in the opposite way.

Whilst beauty is judged as angelic, disability is judged as diabolic. Women in daily activities have to care about their beauty because their beautiful appearance will encourage them to encounter other people. Butler (1993) also conceptualizes that beautiful bodies of women are framed and embodied by (non-disabled) heterosexual persons. As a result, it can be said that beauty and attractiveness in body are deeply gendered and to be read by other persons under the context of social norms.

Thinness, slenderness, beauty and attractiveness are therefore typical norms of typical women, and women have traded on physical appearance to attract people (Nosek, Young & Rintala, 1995; Sobsey & Doe, 1991; Thomas, 1999).

As clearly discussed, disabled women easily become victimized because they are deformed and not beautiful. As a result, mainstream society will not accept their physical appearance as typicality. Therefore, social spaces between communities and deformed women will be clearly demarcated just because disability fails to pass society's criteria of mainstream beauty. As such, women with disabilities fail to participate in social activities because they are trapped by the definition of beauty given by mainstream society. Eventually they will lose their self-confidence in the public arena, and self-estrangement could become prominent and damage their self-esteem. In this case, the mainstream society is sending a powerful message to women with disabilities and such a message is strong enough to subvert disabled women's intentions to involve themselves in social activities.

Women with physical disabilities and Otherness

Bringing otherness to women with physical disabilities is a product of social prejudice against disability which leads to spatial relations; therefore physically disabled women who step into the public sphere will be perceived as having otherness. Simone De Beauvoir (1949: 53) explains that the perception of women having otherness in society is not derived from biological difference but from prejudice and manipulation that brand women (with physical disabilities) as being *'the other'*.

According to De Beauvoir, physically disabled women may perceive themselves as *'The Other'* in the public sphere; they are the other to non-disabled persons. They suffer from the social attitudes that perfect people have ideal bodies and a dominant culture judges them by their bodies and looks, making these women invisible. The Otherness feeling among women with physical disabilities derives from an imbalance in power resulting from their limited choices of being accepted by the general public.

Kabeer (1999) elaborates on women and otherness by investigating the interplay between *'otherness'* and *'power'*. She argues that power has both a positive sense and negative sense to women. In the positive sense, power refers to the capacity of women to exercise their power in their community. On the other hand, power could be applied to the most negative sense which refers to *'power over'*. *'Power over'*, in other words, can refer to threats, coercion and violence which finally makes women with physical disabilities alienated and having otherness in the wider community.

Kabeer's argument strongly associates with Sen (1983) and Agarwal (1997). They argue that women's identity in a community is vague and weak. The identity of women with physical disabilities, however, is weaker than non-disabled women because they receive double discrimination from their community which drives them to alienation and otherness.

In all, social expectations of disability, culture and otherness are controversial issues which eventually result in social denials imposed by non-disabled people. Since these influences are so strong, women with physical disabilities feel uneasy and uncomfortable joining in with the wider community and moreover they will possess otherness, which is a real cause of being less visible in community-based activities.

Explaining the research

Based on field research, this article examines the interplay between women with physical disabilities and their able-bodied community. Semi-structured in-depth interviews were conducted from November 2008 – January 2009 in northeastern Thailand. The first phase of this study was a reconnaissance survey of physically disabled women addressing their feelings of loneliness in their families and communities. Interview checklists were pre-tested by ten disabled women. In addition, some experts in disability studies in Thailand were asked to review the checklists. After pre-testing, some changes were made to correspond with the test results. The complete checklist was designed to examine physically disabled women's feelings of loneliness and to investigate the stereotypical ideas of non-disabled people in the community.

For physically disabled women, the complete checklist was designed to ask five questions:

1. How does she feel about her role in her family?
2. How does she feel about her family in general?
3. What does she think about the non-disabled community?
4. What does she think about community-based activities?
5. Does she agree that a community-based activity captures her interests in community involvement? If so, why? If not, why not?

For key informants from the non-disabled community, the complete checklist was designed to ask the following questions:

1. What do they think about women with physical disabilities in general?
2. Do they find difficulties when dealing with physically disabled women? If so, why? If not, why not?
3. How do they facilitate physically disabled women during community participation?
4. Do they agree that community participation increases these women's community involvement? If so, why? If not, why not?
5. Do they agree that community participation raises the public awareness of disability?

In the second phase, the complete checklist was used to interview participants.

Sampling design and the selection of participants.

The research was conducted in northeastern Thailand – the poorest area of the country. Using purposive sampling, the provinces of Nakhonratchasima and Kon Kaen were selected. Then, the poorest sub districts from each of these provinces were purposively chosen.

Criteria for the selection of disabled participants included (1) being between the ages of 18 – 60 years; (2) being a woman with physical disabilities which affected normal life activities; (3) not having any intellectual impairment or mental disorder; and (4) being able to communicate verbally.

The names of physically disabled women were given by the Office of Social Development and Human Security from Nakhonratchasima and Kon Kaen. According to the criteria, forty women with physical disabilities were recruited. Then the Human Security Official and I contacted these women and explained the objectives of the research to them. Eventually, only twenty physically disabled women agreed to participate.

I also introduced a triangulation method into the in-depth interviews. Key informant interview method was also introduced to cross check data from physically disabled participants. Key informants from the non-disabled community were purposively selected for focus group interviews. Key informants consisted of two local politicians, two local government officials of each Sub-district Administrative Organization, two Village Headmen from each sub district and disabled family

caregivers. After learning the purpose of this study, they agreed to give in-depth information

Data and information collection

The selected participants in this study speak in a northeastern Thai dialect. In order to avoid miscommunication, I employed four local field assistants. We used a semi-structured checklist with face-to-face interviews to collect data and information. In order to protect the privacy of the participants, their names were fictitious and their biodata remained anonymous. The interviews took place at their homes and lasted for two hours. Each interview was tape-recorded and then transcribed verbatim.

The participants

Of the 20 participants, 15 per cent were aged 20 – 30 years, 50 per cent were between 31 – 40 years, 25 per cent were between 41 – 50 years and 10 per cent were between 51 – 60 years of age.

The common disability types were loss of limbs and arms (50 per cent) followed by post-polio conditions (30 per cent), half-paralysis, joint defects and spinal injury (10 per cent each). 60 per cent had become physically disabled as a result of accidents; 20 per cent were born disabled and another 20 per cent were disabled because of illness. More than half of participants had had physical disabilities for between 5 – 10 years (70 per cent), 20 per cent for 11 – 20 years and 10 per cent for more than 20

years. Most of participants were single (80 per cent) while the rest of them were married and widowed (10 per cent each). Only 20 per cent had children.

None of the participants were well educated. More than half of them received a primary-education certificate (60 per cent). 10 per cent had a secondary-education certificate. 20 per cent were able to read and 10 per cent were illiterate. In Terms of dependence, 15 per cent were dependent on their parents, 75 per cent on their relatives, and 10 per cent on their husband and their sons or daughters. Their employment opportunities were very limited. Most of them were unemployed (75 per cent). 15 per cent had raised poultry while 10 per cent did knitting and sewing.

I also found that most of these physically disabled women were interested in community-based activities. However, only 30 per cent reported that they occasionally participated in community-based activities, but only when invited.

Results and discussion

After the interviews, I grouped the responses by statements. All quotations below were taken from these interviews. I began with the sense of loneliness felt by physically disabled women, followed by the thoughts of the able-bodied community about women with physical disabilities.

Overprotection by the family and the sense of loneliness felt by physically disabled women

It is clear that these women rarely feel good when they are left behind. Findings clearly indicate that family members usually keep these women at home during the day. Their family members use 'womanhood' and 'impairment' as their excuses for not allowing these women to participate in the wider community. Overprotective family members deter disabled women from participating in community life because they hypothesize that these women are vulnerable to health complications and exploitation if they are away from their families. Family members, however, have no time to pay attention to these women because they must be out at work from dawn to dusk. During the day time, these women stay at home alone and they feel lonely. For instance, Jennifer, a 30-year-old woman, said:

'My younger sister, who takes care of me, says that community-based activities are not worthwhile because such activities are for able-bodied people and the activities can cause more health complications. She says that home is best.'

These findings are strongly supported by theories of erroneous impressions of women with physical disabilities, for example in the descriptions from Oliver (1990), Morris (1991), Barton (1996), and Shakespeare (1996). Social expectations of physically disabled women have influenced the attitudes of family members toward these women. Family members tend to restrict the involvement of physically disabled women in public activities. Permission to let these women be away from their families is seldom granted. The internalization of the roles of physically disabled women is heavily based on family influences. Excuses from family members have

placed these women under close confinement which eventually makes them feel lonely in daily life.

Family ignorance is the most unwanted situation because physically disabled women need affection from their families. However, when I did an in-depth interview with one of the family members of these women, they explained that they did not mean to make these women lonely. They have to earn more income to support the medical bills for their disabled daughters if necessary. One mother who takes care of her 25-year-old disabled daughter reported that:

'My husband and I do our best to support her emotionally and personally. We are not rich enough to cover her medical bills, so we work harder on our farm. In the morning, I prepare her three meals and everything she needs. When we come back at dusk, she likes to talk with us before her bed time.'

This clearly indicates that family members are trying to overprotect their disabled relatives and keep them at home. After listening to their disabled daughter during in-depth interview, the answer is different. Their daughter said:

'I understand that my parents have got to work harder. I feel ashamed of this since I have become a poor amputee. While they are working in the field, I am doing nothing in the house. I do not want to be in the house alone every day. The house is deadly quiet during the day time. I want to go out with them but they always refuse my request.'

The answers from her parents and herself indicate that she is unintentionally over-protected by her parents. Her parents intend to keep her in a safe place like home, however good intentions sometimes do not yield good results because, in this case, their daughter feels lonely. Although she can do her daily activities such as taking a shower, toilet use or having three meals, she has still developed a sense of loneliness. Most non-disabled family members will not interpret this situation as family denial because as they claim, they are doing the best things for their disabled members. It seems that family members are satisfied with their contributions to physically disabled family members. Their answers stemmed from a feeling of 'ableness' and they claimed that their disabled family members deserved this sort of support. Eventually, physically disabled women had conditioned themselves to accept what their family members had done for them. It can be best argued that these women had internalized their family's attitudes towards their disabilities. Sandra, a 40-year-old woman, reported that

'As we are poor, I believe that my family has done their best. I should not take a risk of going out to participate in community-based activities. If anything wrong happens to me, they cannot afford the medical bill. So I think staying home is best.'

Being economically non-productive, women with physical disabilities have to rely on family support. Families containing these women, however, have limitations – for example, they have to be very careful with the household income and cut back on household expenditure. Therefore, physically disabled women tend to reduce their

involvement in the community if such activities consume financial resources (Morris, 2004; Pagan, 2009; Taub, Mclorg & Bartnick, 2009). Community-based activities held far away from home usually cost money. Family members who take these women to community-based activities lose their chance to earn a wage that day. Even if some women with physical disabilities are mobile enough to take part in community-based activities alone, their family members would have to cover the cost of participation such as travelling costs, the possibility of health complications or any another unwanted situation. Perceiving that women with physical disabilities were economically burdensome, to let them join community-based activities regularly could result in heavy economic pressures.

Women with physical disabilities and the non-disabled community

It seems obvious that participation within a community is highly significant because community can construct self and identity (Turner, 1996). A sense of belonging and social esteem therefore can be derived from community involvement. The regular involvement, however, sometimes requires strength and financial contributions from community members. Women with physical disabilities are one of the most vulnerable groups that are excluded from participating because of poor health and low financial contributions.

With respect to physically disabled women, despite having received rehabilitation from hospitals, they lack self-confidence in dealing with the general public.

Moreover, many women with physical disabilities are advised not to risk their health

in community participation. As a result, it is better not to risk having multiple injuries in community activities. For instance, Rebecca, 50 years old, highlighted this point:

'I don't want to risk my health. Doctors and medical staff asked me not to stay around outside my house because I might have more health complications. My husband and my son agreed with them. When there is any village meeting or temple fair, my husband will be our household representative. Sometimes, I would like to join such activities, but my health should come first.'

Theoretically, the more people with disabilities confine themselves to home, the more they are excluded from the community. If non-disabled people in a community rarely see physically disabled women, they will fail to include them in mainstream society (Priestley, 2004; Pescosolido, 2001). In rural communities, physically disabled women usually obey the advice given by doctors and medical staff because risking their health in community participation might not only end up in poorer health but also result in higher medical bills.

Apart from the health conditions discussed above, non-disabled people in a community do not know how to deal with physically disabled women. Generally, community-based activities are organized in either temples or government buildings which are hard for these women to get to. Temples and government buildings are not *'user-friendly'* to them and other disabled people. There is no friendly toilet, no ramp for wheelchairs and no facilities to support their participation. It can be concluded

that their community participation is clearly restricted by unfriendly facilities which explains why these women are excluded from wider community.

Unfriendly physical facilities are not the only factor that can hinder their participation – misunderstandings toward disability also weakens the social status of these disabled women. While an unfriendly physical environment affects their physical strength, misunderstandings toward disability strongly affect their psychological well-being. Debra, 30 years old, told me about misunderstandings toward her disability:

'Although I cannot walk perfectly, I like to join community-based activities such as temple fairs or village meetings. However, I always encounter flawed impressions from non-disabled people like the village headman. He fears that I might get more hurt. Then he usually asks me to stay at home. I understand that he has good intentions but he might be over-worried. I try to tell him that I am able to do anything but he and his people seem to ignore me.'

Her response shows that non-disabled people do not understand disability. One of the misunderstandings results in false impressions which can discourage women with physical disabilities from wider community. Indeed some physically disabled women are capable enough for some participation but false impressions from non-disabled people in their community make them feel anxious and upset.

Theoretically, community involvement is an instrument to empower disabled people and get them back to normal life. Twenty women with physical disabilities

interviewed indicated that their contribution in community was not strong enough to overcome the false impressions felt by the non-disabled community. When dealing with physically disabled women, non-disabled people in the community laid a much greater emphasis on medical rehabilitation than on social rehabilitation; therefore it seems that the non-disabled community has learned very little about disability (Swain, French & Cameron, 2003). If the whole community fails to address the stereotypical perspectives on disability from non-disabled people, getting women with physical disabilities back to normal life in their own communities will be extremely difficult.

Apart from normal people in the community, local politicians, local government officials and village headmen do not understand women with physical disabilities either. After asking two local politicians, two local government officials of each Sub-district Administrative Organization, two Village Headmen from each sub district and disabled family caregivers during focus group interviews, I discovered that they had stereotyped physically disabled women.

Local politicians who provided an allowance to disabled people in their jurisdiction said that these women looked frail and impaired. One local politician said to me:

'She does not look normal when she is walking or filling out forms. I am sure that the more she moves herself alone, the greater risk she may encounter. I do not feel comfortable when she comes to my office. I feel easy to talk to her non-disabled family members.'

This response from a local politician clearly indicates that physically disabled women are seen in a negative light. Their negative perceptions have a major impact on community involvement among these disabled women. When asked about facilities for community-based activities or meetings, local government officials expressed their limitations. Jack, a local government official who has worked with disabled people for five years said:

'Since we use government buildings, these physically disabled women have to understand that the facilities are not for them. We always tell them to send someone who can represent them at the meeting if they do not feel happy to come. Family members are best. Although these women cannot participate in our meetings, they will get some information later because we will send a fieldworker to disseminate information from the meeting to them at home. We try our best to do everything for these women.'

Facilities are an important factor that can either promote or hamper community participation among women with physical disabilities. Since local governments are understaffed and overloaded, formal community meetings or activities are mostly held at their offices or in urban areas. Local government officials use meeting rooms in government buildings as meeting places. There are no special facilities for physically disabled women.

These local government officials do not provide many facilities for women with physical disabilities during meetings. Lack of staff and lack of budget are their excuses for lack of facilities for these disabled women. Local government officials

fail to draw the attention of physically disabled women to persuade them to join community-based activities. In addition, local government officials tend to do everything for these women. Doing everything for women with physical disabilities may yield negative effects because non-disabled officials will misinterpret their needs. The best things in the perspectives of local government officials may not be equally good in the mindsets of these disabled women. Because of poor facilities, women with physical disabilities may ignore wider community participation.

I also explored gender issues in disability and community involvement and found that there was a gender gap involved with the community participation process. These are some typical responses from two village headmen and their staff when they dealt with physically disabled women.

'We have no problem at all if they are men because we can touch them. They (disabled men) will never be too shy to ask one of us to take them to the toilet and we don't feel bad, either.'

'We have failed to convince their parents or their family members. Very few parents or family members allow these disabled women to join community-based activities such as disability campaigns or group therapy in the city. They don't want to let their disabled women come with us alone. Probably, they fear for possible injuries. However men with physical disabilities are flexible and their family members are willing to let them come with us.'

These responses clearly indicate that village headmen and staff found some difficulties when dealing with women with physical disabilities. There were two factors influencing the gender gap: physically disabled women along with local government officials, village headmen and their family members or their parents.

Local government officials and village headmen think that women with physical disabilities are more difficult to handle because they are women, whereas the staff are mostly men. The problem becomes worse if these disabled women ask for help that local male staff find awkward to give, such as toilet use or touching some parts of their body during group activities or meetings. In this case, physically disabled women may also feel uncomfortable. Family members of these women are therefore the best source of help.

According to the quotation above, local government officials understand that parents or family members do not want to let their disabled women out of their sight. In addition, local government officials and village headmen fail to convince parents and family members of the benefits of community participation. They therefore they tend to pick up men with physical disabilities because they think that it is easier to get permission from their parents or their family members.

Many parents and family members do not know why able-bodied community is significant for physically disabled women. They know only about disability allowances and medical rehabilitation, but they do not know that there are other activities involved with community. These stereotypical ideas clearly indicate that local government officials and village headmen have failed to disseminate

information about the benefits of community participation to the families of people with disabilities.

Conclusion

Findings in this article clearly show that the non-disabled community strongly believes that women with physical disabilities need special protection from family members only. This set of beliefs influences the community involvement of physically disabled women because family members and non-disabled people will deter these women from exposure to the wider community because they unintentionally impose overprotection on these women.

Protection is necessary for physically disabled women, but over-protection has paralyzed their identity in community. Perceiving that disabled people are beneficiaries, women with physical disabilities feel inferior to non-disabled community members because these women will internalize their anxiety, fear and distress when in public.

The non-disabled community does not understand why community involvement is very important to women with physical disabilities. The only thing they know about disability is that it is the responsibility of the family, not of society; therefore the family is the primary unit to accommodate these disabled women. Because of poverty, family members do not have the time to take care of these women and they do not have enough money for medical bills. In practice therefore, physically disabled women are left at home. It can be postulated that the best place for these women is

not within the non-disabled community, but either within their own family or some disability institution or so-called private space. What they have given to these disabled women is full of good intentions; however these good intentions fall into the traps of overprotection, medical models and a charity-based approach (Campbell, 1992).

Family members, local politicians, local government officials, village headmen, local staff and the non-disabled community as a whole unknowingly govern women with physical disabilities in an unfair way and prevent them from having opportunities to enjoy participatory community-based activities. Rules and regulations governing community participation are prioritized and finalized by non-disabled people, not physically disabled women, which make them feel alienated and develop a sense of otherness in the public sphere (Begum, 1992; Lloyd, 1992; Charles, 2000).

To ensure their high levels of involvement in the community, women with physical disabilities must be given complete access to community participation right from the decision making stage. Without high levels of involvement in the community by these women, positive outcomes such as social inclusion effectiveness, physically disabled women's empowerment and the sustainability of community participation cannot be realizable in practice.

I assume that different disability types and different age groups of disabled women may provide different responses. I would therefore suggest that researchers should broaden their focus when dealing with genders with disabilities and community participation. In order to make disability research findings more comprehensive,

disability research objectives should really incorporate both qualitative and quantitative methodologies.

Perception of Satisfaction with Schizophrenic Patient's evolution after Psycho-educational Family Program

Alejandra Caqueo-Urizar¹, José Gutiérrez-Maldonado², & Marta Ferrer-García²

¹Universidad de Tarapacá, Chile

²Universidad de Barcelona, España

ABSTRACT:

The aim of this research is to determine the level of satisfaction of relatives of patients with schizophrenia, users of the Public Service of Mental Health in the city of Arica, Chile. Forty-one expressed an interest in participating. They were randomly assigned to one of two groups. One group comprised 18 caregivers who were participated in a multifamily intervention program at the mental health center. The second group (waiting list) comprised 23 caregivers who would not receive any kind of family intervention until the first group finished the program.

The results on satisfaction indicate that the experimental group manifests to be more satisfied in the area of patient's evolution.

Psycho-education improves among the relatives the level of satisfaction with the patient's evolution and, has also positive consequences on the relationship between patients and their relatives.

Keywords Satisfaction - Caregiver - Schizophrenia - Public mental health service

INTRODUCTION

Evidence of the efficacy of psychological intervention in the treatment of schizophrenia is increasing. Family intervention programs favor the integral treatment of the disorder rather than the use of psychoactive drugs alone, and have gained considerable support among therapists. Research and clinical work have shown substantial evidence of the efficacy of these family interventions, especially if patient relapse, attitudes and quality of life are considered as outcome measures (Gutiérrez-Maldonado, Caqueo-Urizar and Ferrer-García, M., 2009; Gutiérrez-Maldonado and Caqueo-Urizar 2007; McDonell 2003; Kung 2003; Berlung et al. 2003). Several obstacles for the implementation of these programs in the mental health services have also been noted, such as the lack of training of therapists, poor organization of mental health care, a lack of interest in families shown by the services and a certain level of stigmatization. (McFarlane et al. 2003; Gutiérrez-Maldonado and Caqueo-Urizar 2006).

Research on family intervention has mainly focused on relapse as the main outcome measure. Only a few studies to date have centered on reducing the caregivers' burden and on improving their quality of life (Shimodera et al. 2000; Gutiérrez-Maldonado et al. 2005). Additionally, though a large number of studies of issues related to the negative consequences for the caregiver

are available, few publications have focused on interventions aimed to reduce those negative consequences, and fewer still have evaluated the efficacy of these interventions while also examining relatives' satisfaction with the care provided by mental health services. Satisfaction of caregivers who use the services has been observed to be inversely related to the burden experienced, highlighting the importance of considering satisfaction as a measurement (Sherman 2006). So the measurement of satisfaction has emerged as an important reference point for the development of services, and is a significant indicator of service excellence (Svensson and Hansson 2006). The most commonly used method for evaluating satisfaction with mental health services is the administration of self-report questionnaires to patients and family members (Perreault et al. 2006). The results of research into this topic are contradictory. Some studies show high levels of satisfaction among relatives regarding mental health services (Grella and Grusky 1989; Vicente et al. 1993; Ruggeri and Agnola 1993; Cuevas et al. 1996; Haertl 2005), but others have found high levels of dissatisfaction (Grosser and Vine 1991; Hatfield et al. 1997; Solomon et al. 1997).

A number of studies have evaluated the level of satisfaction in immigrant users of mental health services. Most, however, have been conducted in developed countries. It is particularly important to conduct research in contexts elsewhere in the world which are likely to present different social and family conditions (Jackson et al. 2007; Carlson et al. 2007).

The main aim of this study is to compare levels of satisfaction in two groups of caregivers of patients with schizophrenia at the ambulatory mental health service of Arica, Chile. The first group participated in a family intervention project, and the other group did not.

METHOD

PARTICIPANTS

The study was conducted at the ambulatory mental health service in Arica, Chile. Patients attend this outpatient service monthly, seeing the nurse and receiving their medication. In the event of decompensation, they are sent to the Psychiatric Unit of the Central Public Hospital until they recover from the psychotic state, at which point they are attended at the Mental Health outpatient services. These centers are staffed by a psychiatrist, two psychologists, two social workers and two nurses.

Arica is a city in northern Chile, with a population of slightly under 195,000 inhabitants. The city's economy depends on fishing, agriculture and mining. Once relatively affluent, the city has been hit by economic recession in the last 20 years, and unemployment rates have risen to 12%. The extended family is the most common family unit, with several generations living together. The relatives of the patients of this ambulatory mental health service were contacted and informed that a family intervention program had been planned. Forty-one expressed an interest in participating. They were randomly assigned to one of two groups, based on a previously generated random number table. One group comprised 18 caregivers who were participated in a multifamily intervention program at the mental health center. The second group (waiting list) comprised 23 caregivers who would not receive any kind of family intervention until the first group finished the program. So the total sample comprised 41 main caregivers (31 females and 10 males) with an average age of 54.2 (SD \pm 15.0) years. 58.5% lived with a partner and 43.9% worked outside the home. Mothers of patients accounted for 63.4% of the sample, fathers 14.6%, siblings 9.8%, spouses or partners 4.9%, and children 2.4%. Protected residence monitors, who are paid by the Mental Health Service to care for patients in 12-h shifts, accounted for 4.9% of the sample. The average period of co-residence was 28.6 (SD \pm 9.7) years. Patients are mainly males (26 men and 15 women) aged between 19 and 66 years. Mean age of the first outbreak was 19.6 (SD \pm 2.9), and mean duration of illness was 13.6 years. Nearly two-thirds (63.9%) of the

patients were diagnosed with paranoid schizophrenia. Most patients were not employed (90.2%) and did not receive a public pension (58.5%). There were no statistically significant differences between the two groups.

INSTRUMENTS

The Family Questionnaire (FQ, Cuevas et al. 1995) was administered. Most of the original items were maintained, although some of the questions were shortened in order to ensure comprehension and some of the more difficult items were removed. Scores on each item range from 1 (positive) to 3 (negative). The lower the score, the higher the satisfaction level. A total score can be obtained (range 25–75), or two partial scorings: one corresponding to satisfaction related to the assessment of the patient's changes (range 10–30) and another corresponding to the level of satisfaction with the mental health service (range 15–45). In this study was only considered the first level of satisfaction. The Cronbach's alphas were: 0.83 for the items related to satisfaction with the patient's changes; and 0.85 for the items related to satisfaction with the mental health service.

PROCEDURE

The caregivers were evaluated at the ambulatory mental health center where patients attend monthly controls. Evaluation was conducted individually in both groups by psychologists working at the center. Considering the low educational level of the carers, the questionnaire was delivered in an interview format and completed by the psychologist based on participants' responses. The group receiving family intervention participated in a weekly multifamily psycho-educational program consisting of five modules with a total of 18 sessions. The modules focused on the family's experience of schizophrenia, psycho-education, skills to improve family cohabitation, relatives' self-care and the evaluation of the intervention (Gutiérrez-Maldonado and Caqueo-Urizar 2007).

RESULTS

A marginally significant difference was observed in satisfaction with the patient's evolution, with the family intervention presenting higher levels of satisfaction ($F = 3.76$ $P = 0.060$; Experimental: 15.22, $SD = 2.34$; Control: 16.57, $SD = 2.08$).

Examining the caregiver and/or patient variables that might affect the influence of the family intervention on the level of satisfaction, an interaction was found with the receipt of a public pension in the evaluation of patient's changes ($F = 7.495$; $P = 0.002$). Caregivers who participated in the family intervention program and whose relatives did not receive a pension were more satisfied than those whose relatives received one (Experimental without pension: 14.00, $SD = 1.65$; Experimental with pension: 16.44, $SD = 2.35$). Another variable that affected the level of satisfaction in the evaluation of patient's changes was patient's educational level ($F = 7.869$; $P = 0.001$). Regarding the evaluation of the patient's evolution, in the family intervention group, caregivers of relatives with medium-high educational level were more satisfied than those of relatives with low educational level (Experimental, medium-high educational level: 14.00; $SD = 1.48$; Experimental, low educational level: 17.14, $SD = 2.19$). In the group of participants who did not receive family intervention, the reverse was true: caregivers of patients with low educational level showed higher levels of satisfaction (Control, low educational level: 15.20, $SD = 1.64$; Control, medium-high educational level: 16.94, $SD = 2.07$).

DISCUSSION

Few studies have examined satisfaction in the individuals who are not the direct receivers, but who are affected or involved in the treatment—that is, the caregivers and/or treating professionals (Ruggeri and Agnola 1993). It has been suggested that low levels of interaction between relatives and the mental health services is one of the fundamental sources of burden (Dixon 1999; Merinder et al. 1999; Sherman 2006).

Caregivers of the group that received family intervention tended to exhibit more satisfaction in the area of patient's evolution. This result is particularly significant in connection with the psycho-educational treatment offered by the service and the resulting relationship between the patient and the caregiver, especially in the light of the hypothesis that relates family stress with the probability of relapse (Barrowclough and Tarrier 1995). Additionally, these elements of the patient's evolution emerge as interesting indicators of the efficacy of the intervention. Perceiving these changes in the patient can also constitute a significant feedback element for the psychologists in charge of the family intervention.

It is surprising that caregivers in the experimental group who did not receive a public pension felt more satisfied than those of patients who did receive one. Though contrary to expectations, this finding may be because caregivers of patients who receive a public pension are aware of the limited nature of this support and of the need for more resources for the treatment of their relative.

A study conducted in Spain (Cuevas et al. 1996) found that receiving financial help from the government did not influence caregivers' satisfaction. Unlike our study, Cuevas's analysis was carried out in a developed country, with a greater amount of resources for assistance and with many patients receiving some kind of financial support. Other research has shown that receiving financial help generates benefits in the families (Barry and Busch 2007).

Finally, caregivers of patients with higher educational level reported higher satisfaction, indicating that these patients may present better functioning and may have fuller access to social resources, factors which would have an influence on the caregivers' level of satisfaction. It has been suggested that low levels of interaction between relatives and the service is one of the fundamental reasons for dissatisfaction and one of the main sources of burden (Dixon 1999). Therefore, there is a clear need for greater financial resources in order to establish care and follow-up program for relatives, and for increasing the public benefits for these patients and their families.

A limitation of this study is the lack of anonymity, which may have influenced participants' responses. Another limitation is that we used only one measure of satisfaction, FQ: the fact that its response scale has only three steps may have reduced the variation in satisfaction scores. Future studies should include other measures such as the Experience of Caregiving Inventory (Joyce et al. 2000), which may add considerably to the interpretation of the satisfaction data.

Considering the importance of providing quality service, the systematic evaluation of public mental health services should be a priority. The data obtained in studies of this kind will offer particularly useful feedback and guidance for the care of patients and their families.

The results of this study are part of a main research published on *Community Mental Health Journal*, 2009, 45:285-289.

ASIAN CONFERENCE ON THE SOCIAL SCIENCES

18-21 June, Osaka, Japan

Vietnam's MDG report card: An assessment
of progress on reproductive health

Ramona Vijeyarasa

Affiliation: School of Social Sciences and International Studies, University
of New South Wales, Australia; Email: rvijeyarasa@gmail.com

Abstract

The Millennium Development Goals (MDGs) were published along with 18 specific targets and 48 indicators in August 2001. Five years away from the 2015 deadline, Vietnam's MDG achievements are commendable, but a significant number of obstacles remain, particularly in the area of gender equality. Issues such as sex-selective abortion, the barriers faced by youth in accessing abortion, contraception and sex education, as well as high rates of maternal mortality in ethnic minority areas, are evidence of dire shortcomings in terms of sexual and reproductive health and rights.

My presentation draws on interviews, conducted from December 2008 to October 2009, with staff from the United Nations Country Team (UNCT), international organisations, local NGOs and donors, in order to illustrate persistent gaps in key international commitments made by Vietnam relating to reproductive health and gender equality more generally. Together with government data and other studies on Vietnam, the data from my interviews illustrate shortcomings otherwise not demonstrated by Vietnam's performance when measured against the MDG indicators. I propose a disaggregated data analysis and argue for greater accountability for other global commitments made by the Government of Vietnam, at both the International Conferences on Population and Development (ICPD) in Cairo in 1994, and the Fourth World Conference on Women in Beijing in 1995, as well as in the Convention on the Elimination of Discrimination against Women (CEDAW).

Key words: Vietnam, MDGs, reproductive rights, gender equality, ethnic minorities, sex-selective abortion

**Vietnam's MDG report card:
An assessment of progress on reproductive health**

*Ramona Vijayarasa
School of Social Sciences and International Studies,
University of New South Wales, Australia*

Vietnam's progress in respect to the Millennium Development Goals (MDGs), a set of eight development outcomes focused on health, education and other aspects of human security, is undeniable. The MDGs, seven of which measure poverty and related barriers to equality in Global South countries, were published along with 18 specific targets and 48 indicators in August 2001. Vietnam has received significant accolades for its achievements, particularly with regard to infant and child mortality (see MDGs 4 and 5) (World Bank, 2006: p. 100). There is no evident gender gap in primary and secondary school enrolment, Vietnamese women have one of the highest labour force participation rates in the world, and Vietnam has one of the highest percentages of women in national parliament in the Asia-Pacific region (World Bank, 2006: p. 115).

However, current progress in these areas does not allow us to fully assess the extent to which adequate government machinery exists to promote gender equality. Nor are the MDGs able to measure the extent to which there is genuine will among government stakeholders to achieve these global goals, or if there is an holistic and accurate understanding of the meaning of gender equality. Progress on MDG 6 on HIV/AIDS and malaria, which looks beyond Vietnam's achievement by 2015 (MDG Monitor, 2007; Wells, 2005: p. iii), does not reflect the particular experience of Vietnamese women living with HIV/AIDS; moreover, the maternal and reproductive health indicators of MDG 5 do not fully reflect the specific experiences of ethnic minority women or high rates of abortion, including among young adolescents, as well as other barriers to sexual health.

The purpose of my presentation is to illustrate that reaching the MDGs by 2015 – in particularly MDG 3 targeting gender equality and women's empowerment and MDG 5 on universal access to reproductive health, – will nonetheless leave a number of significant challenges to achieving gender equality for Vietnamese women in practice. Using Vietnam as a case study, I argue that progress cannot be adequately assessed without disaggregation of data and a more in-depth comparison against other global commitments.

There are certainly many advantages of having goals defined by specific benchmarks against which all states can be held accountable. However, as one critique has noted, a "rights-based perspective towards health embraces issues that go far beyond the formulation of quantitative goals such as MDG 1 or 4" (Volkman, 2006: pp. 59-60). The World Bank has also recognized a lack of consensus on measures of poverty, despite the methodological consensus reflected in the MDGs (World Bank, 2006: p. 24). Indeed, although the MDGs reflect some agreement on what variables should be measured, there

are multiple indicators absent to adequately present the extent of sustainable development towards global equality and security. Other writers highlight the immeasurability of many of the goals, when we do not have accurate baseline data and cannot adequately measure change (Attaran, 2005: pp. 955-961). In the words of one UN expert at the management level, these problems are heightened by the fact that the Vietnamese Government “works very hard to have policies which measure-up on an international stage” and not necessarily in practice (Anon., Management level, UNCT, pers. comm., 15 December 2008). Rather than dismiss the MDGs due to their shortcomings, however, my purpose is look at the situation of reproductive health in Vietnam through the lens of the MDGs to reveal some of the remaining gaps needing to be addressed if gender equality and women’s empowerment is to be attained.

My research was conducted as part of a larger doctoral research project on trafficking in Vietnamese women and draws upon interviews with staff from the UNCT in Vietnam, international organizations, local NGOs and donors, conducted between December 2008 and October 2009.¹ I sought interviewees’ thoughts on the key obstacles to women’s empowerment in Vietnam, ministerial capacities in relation to gender equality, and the current state of Vietnamese women’s reproductive rights. I also discussed with interviewees the experiences of women at the margins, including adolescents and women from rural communities. One limitation of this material is the lack of first-hand commentary from government staff, leaders of the Vietnam Women’s Union, or women from rural and minority communities. Moreover, the opinions of my key informants cannot fully represent the experiences of women across Vietnam and do not completely reflect more recent progress by the government. What my research does show are the views of some key stakeholders, particularly from the international community, who are working to implement laws, policies and programs against gender inequality in Vietnam.

I should also note that I do not wish to suggest that the Government of Vietnam is ignorant of the current shortfalls. *Nhân Dân Online* reported that Dr. Nguyen Ba Thuy, Deputy Minister of Health and General Director of the General Office for Population and Family Planning, conceded the extent of further work required in a speech delivered on World Population Day in 2009. While maternal mortality ratios may have fallen, the Deputy Minister noted the large difference between regions and admitted that family planning services fall short of demand, especially for young people. He also criticized reproductive health care and family planning programs for their lack of a close tie with programs to control sexually transmitted diseases, particularly HIV/AIDS (‘UN and Ministry of Health appeal for investment in women’s health’, 2009). I explore these and other shortcomings in more depth in this presentation.

1. Reproductive health and the MDGs

¹ All but one of the eight interviews cited in this paper were conducted in English. One interviewee responded via email in Vietnamese, with translations provided by Do Thi Thai Thanh. All of the interviews in English were transcribed by the author, and the transcripts of all interviews are on file with the author. The comments of all informants have been quoted without editing. I obtained permission from the Human Research Ethics Committee at the University of New South Wales to conduct this research.

In this section, I provide a brief introduction to the key entitlements involved in the right to sexual and reproductive health. I also provide an overview of MDG 3, on gender equality and women's empowerment, and MDG 5 on improved maternal health. Unquestionably, all of the 8 MDGs are important for the protection of women's rights and advancement of gender equality. Consequently, it is an oft-made criticism that MDG 3 has relegated gender concerns to this goal to the neglect of mainstreaming gender throughout all MDGs in line with UN policy (Barton, 2005: p. 103; Alston, 2005: p. 757).

MDG 3 aims at promoting gender equality and women's empowerment, with indicators 9, 10 and 11 respectively measuring the ratio of boys to girls in primary, secondary and tertiary education; the share of women in wage employment in the non-agricultural sector; and the proportion of seats held by women in national parliament. Reproductive rights include, *inter alia*, the right to attain the highest standard of sexual and reproductive health (ICPD, 1994: Chapter VII, para 7.2; Beijing Platform for Action, 1995: C.3, para 95). Reproductive health requires the ability to have a satisfying and safe sex life and the capability to reproduce together with the freedom to decide if, when and how often to do so (ICPD, 1994: Chapter VII, para 7.2; Beijing Platform for Action, 1995: C.3, para 94). Implicit in this last condition is the right of men and women to be informed and to have access to safe, effective, affordable and acceptable methods of family planning of their choice, and the right to access appropriate health-care services that enable women to go safely through pregnancy (ICPD, 1994: Chapter VII, para 7.2; Beijing Platform for Action, 1995: C.3, para 95, 97).

The political sensitivity of the issue of reproductive rights, which should otherwise be understood as encompassing a range of other inalienable human rights, is evident in the drafting of the MDGs. When the General Assembly adopted the Millennium Declaration in 2000 and, a year later, the MDGs, an explicit commitment to the reproductive rights of women was absent. Such a commitment was also absent in the allocation of specific indicators for measuring progress. Although MDG 6 addresses some important reproductive health issues, including condom prevalence and comprehensive correct knowledge of HIV/AIDS among young populations, opposition from the G-77 was pivotal in preventing inclusion of the language of the 1994 Cairo International Conference on Population and Development (ICPD) (Crossette, 2005: p. 72). With the addition of the reproductive health indicators in 2005, MDG 5 was expanded to include the achievement, by 2015, of universal access to reproductive health, with the contraceptive prevalence rate, adolescent birth rate, level of antenatal care coverage (at least one visit and at least four visits) and unmet need for family planning to be measured. I use these reproductive health indicators in this analysis of Vietnam's progress.

2. Placing the spotlight on Vietnam

In this section, I provide a brief overview of Vietnam's legislative framework in relation to gender equality and guarantees of the right to reproductive health. I then consider key examples where persistent gaps remain, particularly when data is disaggregated.

Vietnamese law provides a number of protections for reproductive health. Article 40 of the Constitution of Vietnam (1992) declares that men and women enjoy equal rights in all aspects and circumstances (Article 63), and places an obligation on the State, society, family and all citizens to protect mothers and implement the population and family planning program (Article 40). In 1960s, the Vietnamese National Assembly adopted the Law on Marriage and Family based on the four principles of freedom of marriage; monogamy; gender equality; and protection of women's and children's rights. In 1989, the Law on Protection of People's Health was approved, affirming the people's rights to choose contraceptive methods. Furthermore, the Law articulates women's rights to abortion, receive gynecological diagnosis and treatment, health check-ups during pregnancy and medical services during birth. Article 17 of the Law on Gender Equality of November 2006, although not yet implemented, provides for equality between men and women in the field of public health, with equality in choices and decision-making regarding contraceptives and safe sex, and with specific reference to poor women residing in remote and mountainous communities.

From a reproductive rights perspective, this set of laws is certainly progressive. However, implementation, government will, and resources remain major challenges. Moreover, as one respondent noted, there is a persistent shortage of gender experts in government (Anon., Management level, UNCT, pers. comm., 15 December 2008). Similarly, when interviewed, another gender specialist in the UNCT shared with me their view on the lack of gender expertise and leadership among government staff:

...capacity of Government here is very low. We have people working in the gender equality units that do not know anything about gender equality. They think that gender equality means getting people at the table. They think it means getting a woman represented in Parliament. In actual fact, even when the law was introduced, Vietnam only had one minister out of 26 ministries, *one*, but a lot of vice ministers. So there was a sense of recognizing that women are of high calibre but there is still a ceiling that women cannot break (Anon., Gender specialist, UNCT, pers. comm., 11 December 2008).

These shortcomings cannot be adequately reflected in the MDGs. In fact, one respondent remarked that the achievement of true gender equality lies far beyond the MDG deadline of 2015:

There are now two major pieces of legislation that at least say in rhetoric that women do have all these rights, that they should be protected. It is probably going to be 20 years before it filters through to the community and has any impact (Anonymous, gender specialist, UNCT, pers. comm., 11 December 2008).

Various challenges persist with regard to gender equality in Vietnam. I now consider several key reproductive health issues, including maternal mortality, access to a full range of family planning, access to abortion, the continued use of sex-selective abortion in response to son preference, and the experience of women living with HIV/AIDS in Vietnam.

Maternal mortality

Vietnam has achieved a sharp decline in maternal mortality, from 223 deaths per 100,000 births in 1990 to 75 deaths per 100,000 births in 2007. However, this trend has slowed in

recent times, as noted by the UN. There are significant challenges in reaching the national target of reducing the rate to 70 per 100,000 by 2010 and addressing the higher rates of maternal mortality in disadvantaged and ethnic minority areas (UN, 2009). In an interview with Bruce Campbell, the Country Representative of UNFPA, he noted how, when disaggregated, the maternal mortality ratio ranges from 40 deaths per 100,000 live births to as high as 500 deaths per 100,000 live births. He continued by noting that the role of the UN in Vietnam is to “go beyond the aggregate data” and look at the specific experiences of vulnerable groups such as migrants and at differentials between districts and provinces (Bruce Campbell, UNFPA Country Representative, pers. comm., 13 October 2009).

The situation of ethnic minority women is particularly stark. According to government data, the infant and child mortality rates in the mainly ethnic minority Northern Mountains region are twice the rates in the majority Kinh Red River Delta region (VDHS, 2002). Much higher discrepancies have been documented by the Ministry of Health (MOH, 2006). Bruce Campbell discussed with me the complexity of the issue of improving maternal mortality rates for ethnic minority women. In the high mountainous and other inaccessible regions where most ethnic minorities live, health care facilities, although fully staffed and equipped, recommend practices seen as a challenge to traditional ethnic minority lifestyles. Referring to the desire among some ethnic minority communities to bury the placenta of the new born child in a specific location following birth, Campbell observed:

We need to train ethnic midwives to deliver ethnic babies. This is something that you cannot scale-up. You have to scale down and design it more pragmatically around the cultural needs of the individual, the family and the community. We all strive for the MDG indicators and universal access and this is a good example of why it is not enough (Bruce Campbell, UNFPA Country Representative, pers. comm., 13 October 2009).

Beyond the scope of this paper is discussion of a range of other maternal health measures requiring monitoring, including maternal nutrition and births attended by skilled health personnel.

Access to a full range of family planning

Vietnam should be commended for its relatively high contraceptive prevalence rate (CPR, percentage calculated using contraception among women who are married or in a union). UNFPA’s Population Change and Family Planning Survey, conducted in April 2008, covered 378,000 households and 415,000 married women from all parts of the country. The survey revealed a CPR of 68.8%, although there was no significant increase from the 2007 survey (68.3%) (UNFPA, 2008: p. 9). According to WHO data from 2005, however, the CPR is even higher, around 78.5%, with the average for well-developed regions of 68.9%, and for less developed regions of 59.2%.

Access to contraceptives is of course most difficult for rural and ethnic minority women. The urban rate is higher than for rural areas, and ethnic minorities are disadvantaged by other barriers to utilization, including language (Bruce Campbell, UNFPA Country Representative, pers. comm., 13 October 2009). A further issue is the needs of adolescents engaging in pre-marital sex, a highly stigmatized subject. With many women

marrying later, an increase from an average age of 21 to 26 over the last decade, many women engage with contraceptives only after the first pregnancy. It is only at the stage that Vietnam reaches the 70% CPR (Bruce Campbell, UNFPA, Country Representative, pers. comm., 13 October 2009). This leaves unmarried Vietnamese women particularly exposed to unwanted pregnancy, HIV and STDs, violence and abortion. Despite attempts by the international community to create youth-friendly services, including anonymous and easily affordable or even no-cash services, the government's response to addressing this problem for adolescents has been slow (Bruce Campbell, UNFPA, Country Representative, pers. comm., 13 October 2009). The issue of contraception for adolescents goes beyond the question of social morals. Tine Gammeltoft's research provides evidence of how socio-political views of sexual activity and myths about the non-existence of pre-marital sex have in turn contributed to young people's non-acknowledgement of their own sexual activity and to an inhibited awareness by youth of their own need for sexual health services (Gammeltoft, 2002: 494).

Access to abortion

Vietnam has one of the highest abortion rates in the world. According to a 2003 estimate, the average Vietnamese woman has 1.3 abortions in her lifetime, although this figure did not include the many privately performed abortions (Haub and Phuong, 2003; see also Hoang et al., 2008). An earlier estimate from 1996 estimated the rate to be as high as 2.5 abortions per lifetime (Henshaw et al., 1999). More recent estimates are that there were approximately 500,000 abortions provided by the public sector in 2006 and at least the same number by the private health sector (Hoang et al., 2008: p. 145). The discrepancies between the estimates from the 1990s and more recent figures could be explained, in part by what seems to be a trend towards a reduction in the average number of lifetime abortions. However, reliable statistics on the prevalence of abortion are difficult to obtain and are unavailable for unmarried youth (Gammeltoft, 2002: p. 484), making comparisons and trends difficult to establish.

In spite of a liberal law and a high number of recorded abortions, unsafe abortion is still a common cause of maternal death in Vietnam, estimated at 11.5% of direct causes in 2002 (Hoang et al., 2008: p. 145). This illustrates a direct correlation between the lack of access for all women to safe abortion and MDG 5 on maternal health. A number of factors hinder access to safe abortion services. Although the Ministry of Health's National Reproductive Health Standards and Guidelines stipulate that abortion is legal up to 22 weeks, availability depends on the capacity at each level of hospital. At the central hospitals, abortions can be performed up to (and in a few cases above) 22 weeks, whereas the limits at the district and commune level are up to 12 weeks and up to 6 weeks respectively, mostly due to lack of skills and the instruments required (Hoang et al., 2008: p. 146).

There is also a high demand for second trimester abortion, especially for young unmarried women (Hoang et al., 2008: p.145). Delays in seeking an abortion have been partially blamed on inadequate sexuality education, which has resulted in fallacies about how one falls pregnant and lack of knowledge about access to contraception and abortions, as well as unfriendly attitudes of abortion providers when it comes to sex

before marriage, and a lack of confidentiality and privacy at public hospitals (Hoang et al., 2008: pp. 146-147). It should perhaps be noted, however, that in 1999, Danièle Bélanger and Khuat Thu Hong reported respect for anonymity in public hospitals (1999: 73). Sex selective abortion is also a key driver of abortion demand.

Sex selective abortion

The clash between a low demand for children and a high demand for sons in Vietnam is clear (Bélanger, 2002: p. 326; Wells, 2005: p. 6). Nearly 37% of adult respondents in the MOCST survey favoured sons, particularly women respondents and respondents in rural areas and in the Central Highlands (MOCST et al., 2008: p. 23). Vietnam has seen a sharp increase in the sex ratio at birth to 112 females for every 100 males, while the normal sex ratio at birth is 106/100. When interviewed, one UN staff member with expertise in population and development commented,

I think the fundamental thing that you get from the sex ratio at birth study is that stigma against girls remains a huge issue in this society. If you look back, son preference has a long history here, like in other countries, and has a long history agriculturally. Even as we put attention on more urban populations, we still see son preference as a very strong cultural belief and with that come incredibly strong preference to have a boy child (Anon., management level, UNCT. pers. comm., 13 October 2009).

The increase in the sex ratio at birth is actually one of the sharpest in history, “sharper than China, sharper than Korea and sharper than India... Vietnam has gained a point per year for the last four years so it is twice as fast as China” (Anon., management level, UNCT pers. comm., 13 October 2009).

According to the director of a local NGO, the enforcement of the two-child policy, with fines and threats against male employees working in the public sector, continues to contribute to the preference for sons (Anon., director, local NGO, pers. comm., 10 September 2009, translation). Until May 2009, there were daily reports in the newspapers of “someone receiving some sort of penalty, whether it is no bonus or demotion. Even at high levels, even in industry, people who have more than two children lose some privileges” (Anon., management level, UNCT pers. comm., 15 December 2008). However, some UN experts argue that progress is being made, with one informant noting that senior policy makers in Vietnam are moving towards the language of “small family norm” (Anon., Management level, UNCT, pers. comm., 13 October 2009). However, the shift in policy is not necessarily driven by the right of women to decide the number and spacing of their children. UNFPA has been quoted in the popular press as stating that the government should reconsider its population policies in light of the difficulties it will face if it attempts to increase the population in a few decades when faced with an aging population, and the consequences of an insufficient labour force if it enforces the policy (*Vietnam to enforce two-child rule*, 2008). One UN expert agreed:

The census indicated that total fertility is continuing to decline and it may decline to such a point, as was experienced in Malaysia and Singapore, that you build a huge economy but you do not have a big enough workforce to fill those jobs so you have no choice but to import labour. And frankly speaking, I do not think this country wants to import labour (Anon., management level, UNCT, pers. comm., 13 October 2009).

Sex-selective abortion is a clear reflection of gender inequality and a major obstacle to the advancement of women. It perpetuates and reproduces inequalities, “not only by male and senior (male and female) family members who put pressure on women, but also by women themselves needing to guarantee their status and position in their family and community” (Bélanger, 2002: p.195). Furthermore, the resulting demographic imbalance heightens inequality. Increased violence and a decline in women’s political power, with few women to vote, have been documented (Bélanger, 2002: p.195). With such an imbalance in the sex ratio, there is also a potential increase in demand for young brides, with Vietnam expecting to have 4 million unmarried men in 2025.

While there are “efforts to curb sex selective abortion” and some UN staff suggest that “the government is moving away from the two-child policy language” (Anonymous, management level, UNCT pers. comm., 13 October 2009), current practice in Vietnam remains a major obstacle to gender equality. Referring to the challenges that lie ahead in changing attitudes, one UN Gender Expert noted in an interview with me:

I understand that there is already change in the language. This is a big step. The state incentives can be changed, but the values within the family, how are you going to change that? Yes, I think the government is concerned. How much they can do, I do not know (Anon., UN Gender Expert, UNCT, 20 October 2009).

Women living with HIV/AIDS

As noted above, Vietnam is unlikely to achieve MDG 6 with regard to HIV. Although the prevalence of HIV/AIDS in Vietnam has not been high compared with many other developing countries, the situation is now changing rapidly. The first officially reported case of HIV/AIDS was in 1991. In 1999 there were about 22,816 people infected with HIV/AIDS, up from fewer than 4,000 in 1995. More troubling, however, is the increasing number of new cases reported each year. By 2001, this number had climbed to over 43,000, with about 3,560 people having died from the disease (Haub and Phuong, 2003).

Although the government is attempting to adopt a public health approach to drug use, HIV and sex work, the continued use of the language of “social evils” in relation to drug use, sex work and HIV/AIDS has served to stigmatise people living with HIV/AIDS and inhibit public health programming (see Vijayarasa, 2009). The merging of the National Aids Bureau with the “social evils” approach also creates fear of arrest among those possessing a condom (Knudsen, 2006: p. 157).

I have elsewhere critiqued the impact of the Government’s “social evils” approach on female sex workers and victims of trafficking for sexual exploitation in Vietnam (Vijayarasa, 2009). This approach has also served to create public perceptions associating HIV/AIDS with drug users and sex workers, with social marketing regarding condom use linked to these target groups. One UN expert noted, “It is clear is that the government has made some mistakes with the HIV response by targeting these individuals rather than targeting these behaviours” (Anon., management level, UNCT. pers. comm., 13 October 2009). Unprotected sex is common within marriage and the number of men with HIV/AIDS is continuing to rise, increasing the risk of transmission from husbands to

wives (Anon., management level, UNCT. pers. comm., 13 October 2009). Discussions concerning HIV on the ground have not adequately addressed the intersections between high rates of domestic violence and unwanted or forced sex increased vulnerability to HIV, nor the higher rates of violence that may be experienced by HIV positive Vietnamese women (see generally WHO, n.d.)

3. Next steps: Global and local

As I have discussed elsewhere, accountability at the national level for gender equality remains a problem in Vietnam (Vijayarasa, 2010). Institutions and bodies established to monitor accountability for women's rights in Vietnam lack "influence, resources and creativity" (World Bank, 2006: p. 118) and largely maintain the status quo (Vijayarasa, 2010: 94). The Vietnam Women's Union (VWU), although one of the largest women's mass organizations in the world, lacks the political influence to champion the rights of women (Vijayarasa, 2010: 95). A frequent partner in the implementation of projects with the international community, the VWU remains under-resourced, with a lack of avenues to coordinate policy at the government level (Goetz, 2003: p. 77).

National gender machinery: Who is monitoring and guaranteeing accountability?

At the ministerial level, responsibility for gender equality remains divided. Monitoring and implementation of the Law on Gender Equality is in the hands of Ministry of Labour, Invalids and Social Affairs (MOLISA), while the Law on Domestic Violence Prevention and Control is the responsibility of the Ministry of Culture, Sports and Tourism (MOCST). Ministerial capacity is also weak. When the former National Committee for the Advancement of Women was integrated into MOLISA, according to one UN gender expert, its most experienced staff did not accompany the move (Anon., UN Gender Expert, UNCT, pers. comm., 20 October 2009). With a large mandate, spanning the law on gender equality, the development of the national strategy for gender equality, CEDAW reporting, and responsibilities related to Beijing +15, the gender department of MOLISA faces "significant challenges, some of which are simply related to the quality of the government generally and the gap between policy and implementation as well as having too many sets of policies" (Anon., UN Gender Expert, UNCT, pers. comm., 20 October 2009).

The reliability of government data also remains an issue. For example, education and Vietnam's MDG achievements reflect an overall lack of gender disparities in education. However, as one UN gender expert noted:

The government likes to put a very positive spin on the education data and gender figures. When you look more closer, for some data, the government will sex-disaggregate and for others, they will not. And generally when things are bad, they will not disaggregate. So we need to take a critical eye (Anon., UN Gender Advisor, UNCT, 20 October 2009).

The same approach to all government data must be taken with regard not only to the education indicators but to all the MDGs.

Although progress has been made, Vietnam lacks a body at the domestic level, either

within an existing ministry, or a separate government body or independent entity, such as an ombudsman or commissioner, with sufficient political influence to champion women's rights beyond the status quo (see generally Vijeyarasa 2009). For such a body to successfully build greater accountability, a level of probing is required that surpasses the barriers created by the government's adverse reactions to criticism and its tight control over media and civil society more generally, and its reluctance to distribute sex-disaggregated data in all instances.

Monitoring of the MDGs by the international community

With five years until the 2015 deadline, it is essential that we reassess how best to use the MDGs in guaranteeing accountability for women's rights. Vietnam has ratified the CEDAW (although not the Optional Protocol), the International Covenant on Economic, Social and Cultural Rights, the Convention on the Rights of the Child and the Convention on the Elimination of All Forms of Discrimination, and in doing so has made a number of key international commitments not currently being met, as the example of sexual and reproductive health illustrates.

For example, in 2007, the CEDAW Committee recommended that Vietnam give priority attention to the sexual and reproductive health needs of adolescent and young women and men, and that it provide age-appropriate sex education, including in-school curricula, with particular attention to the prevention of early pregnancies and STDs, HIV and AIDS (CEDAW Committee Concluding Observations, Viet Nam, 2007: ¶25). The Committee on the Rights of the Child recommended in 2003 that Vietnam prevent stigmatization and discrimination against children living with HIV/AIDS (CRC Concluding Observations, Viet Nam, 2003: ¶46), while the CEDAW Committee expressed concern about the increasing number of HIV infections in women (CEDAW Concluding Observations, Viet Nam, 2007: ¶24), as well as the very high rates of abortions among adolescent and young women (CEDAW Concluding Observations, Viet Nam, 2007: ¶25).

Criticism from the international community, including the CEDAW Committee and the Universal Periodic Review (UPR) by the Human Rights Council in May 2009, is taken seriously by the Vietnamese government: "They do often talk about what the CEDAW Committee said, so it is definitely an awareness-raising tool, and possibly a way of prioritising issues" (Anon., UN Gender Expert, UNCT, 20 October 2009). Ceri Hayes advocates the use of human rights principles, and CEDAW in particular, to guide national-level monitoring of the MDGs in a way that addresses the root causes of gender inequality and discrimination (2005, 77).

The next five years are crucial, with the Beijing +15 review having been undertaken by the Commission on the Status of Women in 2010. There also exist further opportunities for highlighting the gender gaps in Vietnam's MDGs progress and the failure to implement the abovementioned recommendations in future reports of the government of Vietnam to the CEDAW Committee (Vietnam having last reported in January-February 2007 and previously July 2001) and the CESCR (Vietnam having only submitted on report in 1993, despite having acceded to the Covenant in 1981).] It is also essential that monitoring at the national level involves measuring progress against not only the MDGs but all of Vietnam's international commitments. The question remains, however, of how

to ensure national-level monitoring by government stakeholders, given a lack of adequate understanding, will, resources and voice in regard to gender equality.

Conclusion

Where to for reproductive health in Vietnam? Success in moving towards the MDGs, and beyond 2015, to ensure government accountability for women's reproductive and sexual health, requires continued advocacy and implementation from the grassroots level to the international stage. In the lead-up to 2015, significant and justifiable attention will be paid to the MDGs. While progress on the MDGs must be monitored globally, it is important that the MDGs are not considered in isolation, but that monitoring takes place at both the national and international level of Vietnam's global commitments. This will be complemented by stronger national-level gender machinery to champion women's rights and by monitoring the implementation of recommendations to guarantee Vietnamese women's right to sexual and reproductive health.

Acknowledgements

I want to thank all my interviewees in Vietnam for their time and contributions to my research. Thanks also to Dr Helen Pringle from the University of New South Wales and José-Miguel Bello y Villarino for their valuable comments on earlier drafts. I bear sole responsibility for the opinions expressed in this paper.

Abstract

A linear matrix model is constructed to predict Bosnians' cross-cultural adaptation over time. A conventional method to collect longitudinal data in social science is to conduct a panel study, studying the same set of subjects over time. Although researchers are able to develop methodologically sound panel study designs, it is difficult to execute a design in practice for many reasons. This study seeks to construct mathematically a predictive model, using two data sets collected at two time periods during the three-year project, in order to overcome such difficulties. From suitable sets of subjects, matrices are derived which map the data from the first time period to that from the second. Consistency of the matrices from set to set could suggest a universal law of adaptation for this population. In that case the matrices could be used to predict long-term adaptation trends. 'Spectral analysis' of the matrices---decomposition into eigenvalues and eigenvectors---could reveal hidden features of the subjects' long-term adaptation process. This approach, new to this area, is akin to one used by ecologists to study the evolution of biological populations. Construction of the adaptation matrices requires a number of *linearly independent* data vectors (subject responses) equal to the number of data variables collected for each subject. Understanding the significance of linear independence--mathematically, that no subject's data vector be a linear combination of the other subjects'-- could be an important contribution of this research to the field of Social and Behavioral Sciences.

Short Description: A linear matrix model is used to predict Bosnians' cross-cultural adaptation over time in place of a panel study.

Key Words Set: longitudinal study, a linear matrix model, ecological model, cross-cultural adaptation of Bosnian refugees

Background

Problems Associated with Longitudinal Data

There is an increasing number of studies which use a longitudinal approach in the past 20 years. Willett and Singer (2003) report that while many longitudinal studies in Social and Behavioral Sciences have collected data at two or more data points, data analysis techniques are not appropriate for longitudinal data sets. They argue that many studies use Repeated Measures ANOVA or wave-to-wave regression analysis, simplify analyses by setting waves aside, or ignore age-heterogeneity in their samples. They identify two types of questions to be addressed in longitudinal studies; questions about systemic change over time, and questions about whether and when events occur. The present paper addresses issues associated with the first question.

Individual Growth Model (IGM) and Frequency Domain Analysis (FDA) are appropriate data analysis techniques to explore systemic change over time. For example, Vinokurov, Trickett, and Birman (2002) used FDA in their longitudinal study of the impact of stress on refugee adaptation. IGM and FDA require data collection at multiple time points, which assumes a larger sample size in the wave one data collection than other time points due to attrition. Although Spectral Analysis is an alternative statistical technique, it requires symmetric matrices for calculation. This paper explores the possibility of the use of asymmetric matrices.

Adaptation of Immigrants

Socio-cultural adaptation of immigrants has been studied by many researchers. Vinokurov et al. (2002) studied impact of stress on Soviet Jewish refugee adaptation, using an ecological perspective of life domains of school, family, peers, and language. Schwarzer, Jerusalem, and Hahn, (1994) explored psychosocial changes (employment, social support and health) among refugees with a sample of 235 East Germans in West Berlin after 1989. They recruited 1,036 participants for the first wave data collection and reported a 78% attrition rate by the third wave data collection in two years. Lie (2002) conducted a 3 year follow up study of post traumatic stress disorder (psychosocial functioning) and general symptoms among refugees from Africa, Bosnia, and Kosovo who resettled in Southern Norway. They reported a 48% attrition rate in the second wave data collection. These studies report problems in data collection at different time points. This paper uses the sample of Bosnian refugees who resettled in Midwest region of the United States. The data were originally collected to explore socio-cultural adaptation process of this group.

Model development

The model obtained from the data consists of the mapping matrices obtained from each segment of the subject sample. Consistency of these matrices from group to group will itself indicate general laws of adaptation, a major advance in understanding in this area, regardless of the success or failure of the model's long term predictions. The matrices

can then be used to make longitudinal predictions, which may be tested by subsequent investigations. The mathematical features of the matrices may identify hitherto unknown but general characteristics of the long-term adaptive process. Although simple, this use of matrix algebra to analyze the adaptation process represents the application of techniques familiar in very different fields, e.g., physics, mathematics, and biology, to a social science problem in a novel way.

Method

Data vectors consist of the values of three variables, for each subject. From each of the segments emerging from the cluster analysis of the data collected during Wave 1, three sets of four people are drawn. In other words, if there are four segments, a total of 48 subjects ($4 \times 3 \times 4$) will be necessary for the Second Wave data collection. (The fourth person in each set allows for the removal of data vectors that prove to be unsuitable.) For each segment, there are 5775 ways to group 12 subjects into three sets of four; this should make it easy to identify sets of (three) linearly independent data vectors, and even to compare the 3×3 mapping matrices obtained from different groupings. The Second Wave cross-sectional data collection with 48 subjects was conducted using the mobile unit described above. Ultimately, the preliminary analysis is conducted with three continuous variables with 24 subjects. Dependent variables used for the analysis are 1) functional fitness, 2) psychological health, and 3) intercultural identity, which constitute the three-dimensional vectors of the linear analysis. The Wave 1 data set consists of 316 subjects, with 24 subjects randomly selected as the Wave 2 data set.

Results

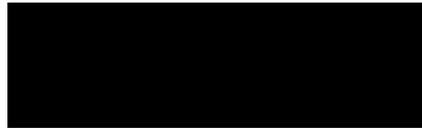

The values of the Socio-cultural Adaptation, Ethnic Identity, and Psychological Health variables were arranged in 3×1 column vectors for each subject, one vector for time T1, and a second vector for time T2. The subjects were collected in groups of three, essentially randomly in the first trial, by age in the second trial. (Of course larger numbers of variables and subjects in each group can be used; the choice of three here simplifies the algebra for this initial exploration.) The time-T1 vectors for each group formed a 3×3 matrix X , the time-T2 vectors for the same group a second matrix Y . The *transfer matrix* for each group, describing the adaptation process from T1 to T2, is given by

$$Z = YX^{-1}.$$

(Because of the nature of the data, it was occasionally necessary to change the subjects in a group to avoid duplicate columns, i.e., singular X matrices.) For example, for the first trio grouped by age, we have

giving transfer matrix

Note that this matrix does not appear to describe a Markov process: The columns do not sum to unity (the sum of the variable values for any subject is not fixed), and the matrix has negative entries. Since negative values of the variables at any time are not meaningful, some form of data conditioning may be necessary to exclude data vectors which ultimately evolve such values.

Because there is no principle governing the ordering of subjects within the groups, we should not expect to see entry-by-entry identical matrices for different groups. One possible signature of a "universal adaptation process" would be the appearance of identical eigenvalues for the transfer matrices of different groups. For four groups of subjects selected by age, we obtain the four sets of eigenvalues

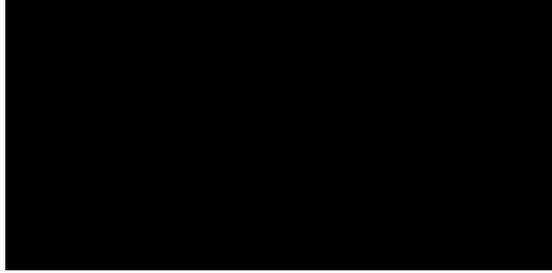

and ,

where $i = -1$ is the imaginary unit.

The second set appears to be anomalous, as the large first eigenvalue would quickly give rise to meaningless data values as the adaptation process proceeds. This suggests that the data for this group are "ill conditioned": The initial-value matrix X_2 is very nearly singular, i.e., the subjects used to construct this matrix are insufficiently independent of one another. The other three sets are different—given the preliminary nature of this analysis, finding a near-identical match would be a truly spectacular result—but share common features: a largest value near unity, with two other values of smaller magnitude.

For seven groups of subjects not selected by age or other demographic factors, we obtain the following sets of eigenvalues:

Of these, the seventh set again looks "ill conditioned," the very small second eigenvalue suggesting that the matrix Y_7 is nearly singular, i.e., again the subjects in this group are insufficiently independent. The fourth and sixth sets are also problematic, as the eigenvalue of largest magnitude in each is negative. This might again engender meaningless negative variable values in the course of the adaptation process, unless some unknown mathematical mechanism intervenes to prevent it. The remaining four sets (first, second, third, and fifth) are not identical, but they are intriguingly similar: Each has an eigenvalue of largest magnitude near unity, and other eigenvalue(s) of smaller magnitude. Sets one and three are conspicuously similar in this regard. Perhaps the examination of a large number of demographically heterogeneous groups of subjects might reveal a broader commonality among the transfer matrices.

These results suggest the possibility that a linear model of this sort could describe interesting aspects of the adaptation process over the long term. If the initial data vector for some subject is \mathbf{x}_0 and the relevant transfer matrix is A , then the expected data vector for this subject after n time intervals (years, say) would be $\mathbf{x}_n = A^n \mathbf{x}_0$. The nature of this evolution can be examined by considering the eigenvalues and eigenvectors of A . As long as the eigenvalues are distinct, it is guaranteed that the corresponding eigenvectors are linearly independent, hence, that any data vector can be written as a linear combination of the eigenvectors. Denoting the eigenvalues of a transfer matrix λ_1, λ_2 , and λ_3 , and the corresponding eigenvectors $\mathbf{v}_1, \mathbf{v}_2$, and \mathbf{v}_3 , the initial data vector can be written

$$\mathbf{x}_0 = \alpha_1 \mathbf{v}_1 + \alpha_2 \mathbf{v}_2 + \alpha_3 \mathbf{v}_3,$$

with suitable (fixed) coefficients α_1, α_2 , and α_3 . The evolved data vector after n years is then

$$\mathbf{x}_n = \alpha_1 \lambda_1^n \mathbf{v}_1 + \alpha_2 \lambda_2^n \mathbf{v}_2 + \alpha_3 \lambda_3^n \mathbf{v}_3.$$

If one of the eigenvalues is (essentially) unity and the others are of smaller magnitude, the data vector will approach the eigenvector corresponding to the first value as the adaptation process proceeds—as n becomes large—while the other terms diminish to insignificance. The appearance of complex eigenvalues does not by itself invalidate this description, but it does introduce a rather novel feature. Suppose λ_2 and λ_3 are (necessarily) complex conjugates of each other. If we write λ_2 in polar form,

$$\lambda_2 = r e^{i\theta},$$

then the evolved data vector takes the form

$$\mathbf{x}(t) = \mathbf{x}(0) e^{\lambda t} + \frac{1}{\lambda} (1 - e^{\lambda t}) \mathbf{b}.$$

The exponential factor in the second term introduces an oscillatory behavior: If λ is unity and ρ is less than unity, then the data vector asymptotically approaches (a multiple of) $\mathbf{x}(0)$ as the oscillating term diminishes. If such behavior is possible for a subject, a model of this sort is capable of describing it.

Note that for the second set of eigenvalues for the demographically heterogeneous groups given above, the complex eigenvalues have magnitude near unity while the real eigenvalue is substantially smaller. With this transfer matrix, the constant term in V_n would diminish away, while the oscillation persisted "forever." However, in this case again the appearance of negative data values would have to be excluded in some way.

Conclusion

Since the matrices are asymmetric, the features obtained here do not constitute a full spectral analysis. The linear matrix model, a conventional method in Natural Science, is still a novel way to study human behaviors in Social and Behavioral Sciences. The results demonstrate the potential for the use of such a model—an ecological perspective—in a study of human adaptation to a new environment.

Abstract

Over the last ten years, game-based learning (GBL) is one of the new technologies that are having on new learning and teaching practice in and out of formal educational environments. Reviews of the research, however, revealed that there has never been a comprehensive review of the research on the effectiveness of game-based learning used in schools. The purpose of this study is to examine the critical factors that influence students' game-based learning efficiency using meta-analysis. An extensive search for relevant published and unpublished studies found 40 studies from year 2001 to 2009 meeting the criteria that impact on game based learning efficiency, including 22 researches written in English and 18 in Chinese. Based on these researches, five major dimensions that contributed to the game-based learning efficiency of the students are identified as: learning environment, learner, pedagogy, context, and teacher. The learning efficiency was divided into three domains: affective, cognitive, and psychomotor. These studies yielded 140 independent effect sizes representing learning efficiency. The analysis results indicated that the design strategies of the learning environment is the most significant factor that affects the game-based learning effectiveness. The experience and play time of the learner are also important factors. Furthermore, the tasks and presentation strategy of pedagogy also affect the learning efficiency of the learners.

Keywords: game-based learning, critical success factors, meta-analysis

Introduction

Game-based learning has gathered great importance in recent years. Prensky (2001) has pointed out that motivation is a sine qua non for successful learning. Numerous studies (Eck, 2006; Papastergiou, 2008; Russell, 2008; Tuzun, 2009; Vogel, 2006) showed that GBL can promote learners' engagement and academic achievement, but not to mention the critical success factors for GBL comprehensively. The study we present in the present paper is an attempt to supplement the findings of these previous studies.

Definition of Learning Efficiency

Bloom (1956) designated that the learning objectives can be divided into three domains: affective, cognitive, and psychomotor. The learning efficiency can be defined by the changing in the knowledge base, skills, and attitude of the students

after receiving instructions (Piccoli, Ahmad, & Ives, 2001).

Critical Success Factor

Critical Success Factors (CSF's) refer to the vital elements which will ensure successful competitive performance for the individual, department, or organization. The term was widely used in the world of data and business analysis with various definitions (Martin, 1982; Kenichi, 1985). This study defines what the critical success factors are and how they affect the learning efficiency of the students.

CSF's for GBL efficiency

Freitas & Oliver (2006) proposed a framework for teacher to evaluate effective educational games that considered four main dimensions: context, learner, internal representational world and processes of learning. Killi (2005) addressed an experiential gaming model that is based on experiential learning theory, flow theory and game design. The model can be used to analyze educational computer game. In light of these concerns, this study presents a framework to address the factors influencing the GBL efficiency based on the following dimensions: learning environment, learner, pedagogy, context, and teacher.

Method

The method employed to carry out this study used meta-analysis, which derives and tests overall factors from the empirical results of individual studies, to obtain a quantitative estimate of the overall effect for the purpose of integrating the findings (Blimling, 1988; Chang, 2007; Glass, McGaw, & Smith, 1981; Ma, 2007; Tsai, 2006)

Data Sources

Multiple search criteria, e.g. learning achievement, learning effectiveness and learning performance, were used to collect literatures that are related to the GBL efficiency. Relevant studies were identified from the following databases: Science Direct Database, ERIC, ProQuest and Electronic Theses and Dissertations System from year 2001 to 2009. Forty treatment outcome studies (22 published journal articles and 18 theses/dissertations) were located. We derived a conceptual framework to guide this review. We identified 5 dimensions and 15 associated features (Table 1).

Data abstraction

The following details were coded for each outcome study: independent variables, dependent variables, sample size (N of effect sizes) and quantitative data on the means, standard deviation, F values, γ value, t values, to calculate the effect size. Microsoft's Excel spreadsheet program was used to assist in the coding of studies. From the 40 studies selected, we retrieved 140 original data records. Because each feature needs to contain more than two treatment condition, any feature with less than two treatment conditions was eliminated from the study. A total of 139 records were used in this study.

Coder reliability

Coder reliability was typically based on the consistency of a single coder from different occasions and the consistency between different coders. In this study, coder reliability was checked by applying double-coding on a sample study, the two sets of result are compared side by side.

Quantitative data synthesis

Statistical values were computed and analyzed by calculating each Meta quantitative values, including Fail safe N, Heterogeneity Q test, significant weighted average Zc value, True population effect size, 95% confidence interval, and explained variance.

Analysis

The meta-analysis was conducted using methods outlined by Rosenthal (1991) and Wolf (1986). A Fisher's r to z transformation was performed before analyses were undertaken. Meta-analysis, effect size is concerned with different studies and then combines all the studies into a single analysis. For all Stouffer's combined probability effect sizes Zc were reported as indicators of significance. The r's based on three or more correlation coefficients were interpreted as follows. The magnitude of r was interpreted using Cohen's (1988) guidelines: $r = .1$ (small effect), $r = .3$ (medium effect), and $r = .5$ (large effect). Cochran's Q was used to test for heterogeneity. The calculated Q (χ^2) value should be smaller than the degree of freedom: $K-1$ (K = numbers of the independent research) in the chi-squared distribution table. A significant Q statistic indicates heterogeneity of the individual study effect sizes, which poses a threat to a reliable interpretation of the results. 95% confidence interval (95% CI) was calculated based on the method defined by Hunter et al. (1982). If the confidence interval does not include zero, the effect is said to be statistically significant. Explained variance was used to account for the variation (apparent randomness) of a given data set. According to Hunter et al. (1982), a large amount of unexplained variance among studies suggests the presence of potential moderator variables.

Publication bias

To control for the possibility that some results are missing from the database, the fail-safe N (FSN) was calculated. Rosenthal (1991) offered a simple solution to the 'file drawer' problem, and offered the arbitrary guideline of $FSN \geq (5 \times \text{the number of research articles} + 10)$. A fail-safe number of studies estimates the number of non-significant, unpublished studies that would need to be added to a meta-analysis to reduce an overall statistically significant observed effect to non-significance. The FSN statistic permits estimation of the robustness of the results of a meta-analysis.

Results

Five dimensions of GBL efficiency

Learning Environment.

Table 2 shows the breakdowns of the effect sizes that were found for game environment, design strategies, learning of thematic, and technology. The design strategies have large effect size 0.92 (95% CI: 1.50, 1.75) with significant Zc value ($p < .001$) which indicated that design strategies have a significant effect on GBL efficiency. The game environment also has large effect size 0.56 (95% CI: 0.06, 1.06) with significant Zc value ($p < .001$), but is heterogeneous ($\chi^2(21) = 58.51, p < 0.05$). It revealed the importance of moderating and mediating effects. While the effect size on learning of thematic, technology was small with insignificant Zc value which implicated that learning of thematic, technology have no impact on GBL efficiency. The FSN of learning environment revealed only game environment and design strategies were higher than the tolerance ($5K+10$). It implicated that publication bias can be neglected, and there were no significant deviation. The rank of the explained variation was: design strategies (85.42%) > Game environment (31.21%) > technology (4.21 %) > learning of thematic (3.55%). The results showed that “design strategies factors” is a critical success factor of learning environment domain.

Learner.

The effect sizes for gender, play time, learning style, experience and playfulness are shown in Table 3. The experience and play time have two large effect size (0.90, 95% CI: 1.36, 1.66; 0.72, 95% CI: 0.12, 1.32), and are homogeneous indicating that the various studies were similar enough to be combined. The Zc values of all the variables were significant and indicated that learner factors have a significant effect on GBL. Further, the FSN of learner revealed play time and experience have no publication bias. While playfulness has medium effect size with significant Zc value ($p < .001$), but has a publication bias. Gender and learning style have no significant linear relationship existed with GBL efficiency. The rank of the explained variation was: experience (81.88%) > play time (52.11%) > playfulness (14.58 %) > gender (7.40%) > learning style (6.45%). The results showed that experience is the most crucial factor; followed by play time and playfulness, while gender and learning style are not critical success factors of GBL efficiency.

Pedagogy.

The results of pedagogy factors reflected in Table 4 that were found for presentation strategy, alternative goal structure, and tasks. The tasks have large effect size 0.73 (95% CI: 0.25, 1.21) while presentation strategy has medium effect size 0.42 (95% CI: 0.03, 0.81) with significant Zc value ($p < .001$). The heterogeneity of all pedagogy factors were significant which indicated that there were inconsistencies among studies, and need to further explore. The FSN of tasks and presentation

strategy revealed that publication bias can be neglected. As for the alternative goal structure, the confidence intervals include 0 which implicated that no significant linear relationship existed between alternative goal structure and GBL efficiency. The rank of the explained variation was: tasks (52.66%) > presentation strategy (17.49%) > alternative goal structure (0.02 %). The results showed that the tasks are the most crucial factor, follow by presentation strategy, while alternative goal structure have no impact on GBL efficiency.

Context and teacher.

The effect size on context factor was small 0.29 (95% CI: -0.01, 0.60) with significant Z_c value ($p < .001$). Due to the confidence intervals include 0, context factors have no impact on GBL efficiency (Table 5, row 1). The effect size of teacher's experience and gender were listed in row 2 and row 3 of Table 5 . As for teacher's experience and gender, due to various factors, such as small effect sizes, publication bias, and heterogeneous, exploration of potential moderating and mediating effects will be needed to determine the true effects of these two factors. The results showed that context, teacher's experience and gender factors are not critical success factors of GBL efficiency.

GBL efficiency

Cognitive domain.

Table 6 shows the numbers of studies on learning environment factors (23), learner factors (19) and pedagogy factors (24) which indicated that sufficient studies are available for cognitive analysis. The learner and learning environment have two large effect size (0.69, 95% CI: 0.09, 1.29; 0.56, 95% CI: 0.02, 1.10), but are heterogeneous which showed inconsistency among studies. The effect size of pedagogy factors are higher than medium effect size 0.39 (95% CI: 0.06, 0.71). The learner, learning environment and pedagogy have significant Z_c values ($p < 0.01$), and no publish bias. The rank of the explained variation was: learner factors (47.47%) > learning environment factors (31.51%) > pedagogy factors (14.87%). The results suggested that "pedagogy factors" is a critical success factor of cognitive domain.

Affective domain.

As shown in Table 7, separate analyses for affective domain were carried out for five dimensions: learning environment factors (10), learner factors (19), pedagogy factors (10), context factors (16) and teacher factors(7). The learner factors have small effect size (0.19, 95% CI: 0.03, 0.34), but have publish bias which indicated unpublished studies would need to be added. Furthermore, learning environment factors, pedagogy factors, context factors and teacher factors showed a statistically insignificant effect. The rank of the explained variation was: learning environment factors (31.99%) > context factors (8.63%) > pedagogy factors (8.30%) > teacher

factor (4.23%) > learner factor (3.51%). Results of the statistical analysis revealed that “learner factors” have influence on affective domain of GBL efficiency.

Psychomotor domain.

Table 8 presents the numbers of studies on learning environment factors (2) and pedagogy factors (8) in psychomotor domain. The learning environment factors have small effect size 0.29 (95% CI: 0.25, 0.34) with significant Z_c value ($p < .01$), while the FSN is lower than the tolerance which suggested that there were some publication bias. The pedagogy factor has insignificant effect. The rank of the explained variation was: learning environment factors (8.63%) > pedagogy factors (0.22%). The results showed that pedagogy factor was not a critical success factor of psychomotor domain.

Discussion

The results support the conclusion that design strategies of the learning environment is the most prominent CSF affecting the GBL proficiency. While learners' experience and play time also play a critical role in the success of the GBL efficiency of the students. We interpret this to mean that game design strategies should inspire the experiential learning to generate a positive affect in players, and students can be engaged and motivated through direct experiences with the game world. These findings are in accord with the results of the previous studies which Angyal (1993) identified that games satisfy the basic requirements of learning environments and can provide an engaging environment for learning. Kiili (2005) argued that facilitating experiences of students is important which can maximize the impact of educational games. The study will provide some contribution to the development of GBL. First, design strategies of the learning environment is the most prominent CSF affecting the GBL proficiency. Second, learners' experience and play time are the major factors that affects the learning efficiency of the students. Third, the tasks and presentation strategy of pedagogy also affect the learning efficiency of the learners. Fourth, pedagogy factor is a critical success factor of cognitive domain. Although the present study has yielded findings that both theoretical and pedagogical implications, it is not without flaws. Due to the inconsistency among the studies, publication bias, and insufficient numbers of studies, as the results may reflect in part the way in which the data were collected. The study points to new possibilities for future research. Design strategies of educational games should correspond better with students' “experience” and provide suitable “tasks”. Much remains to be done, but we anticipate that future research need to balance the published bias by adopting unpublished studies, and exploration of potential moderating and mediating effects to determine the true effects.

ABSTRACT

This paper seeks to investigate the role of matching concept applied by Western retailers during the international entry process to the Chinese market. Guanxi is a particularly special emerging theme which occurs in the Chinese market. The international entry strategy of IKEA entering to China is examined. In-depth face-to-face interviews with various managers and suppliers are collected in the local market. Data is also collected by store visits, suppliers visit, observation and secondary research. This qualitative research is analysed by N*Vivo software, which assisted in managing and encoding data. The finding of the research indicates the importance of matching and networking with different actors during the entry process. The local government is a crucial actor at the macro level as it has an impact on regulations and policies. At the micro level, the relationship with local suppliers assist companies in managing effective operations and achieving low cost production, which allow the retailer to enhance better relationships with local consumers as well as provide to local customers needs. Two ways relationships help retailers and suppliers to support each other in the business. The western firm learns the importance of guanxi when they do business in China.

Article type: Case study

Keywords: International Retailing, International Entry Process, Networking, Matching.

AN EXPLORATORY RESEARCH OF MATCHING AND NETWORKING IN INTERNATIONAL ENTRY PROCESS TO CHINA

1. INTRODUCTION

Retail is a rapidly growing industry and expands aggressively to the emerging markets. The retailing literature pays attention to how retailers expand into international markets and their methods and strategy (Alexander and Myers 2000; Dawson 1994; 2003; McGoldrick and Davies 1995; Whitehead 1992). Networking plays a crucial part in the retail industry because retailers do not produce anything themselves and rely on supplier network relationship. Bianchi and Ostale (2006) found that lack of strong social network could lead to unsuccessful international expansion. The previous matching concept studies have been focused on international expansion to Baltic States (Ghauri and Holstius 1996), and to Eastern European countries (Rogers et al. 2005). In the case of Eastern Europe, The retailer achieves market orientation and better performance in Slovakia and Hungary through using matching such as networking with suppliers to supply Tesco's own brand. *The existing gap in the literature on which this research aims to focus, is to study matching concept during the international expansion of the retail sector, mainly in China.* This paper takes the matching concept to apply further in the retail industry in the Chinese market context. The objective of this paper is to investigate the role of matching concept applied by Western retailers during the international entry process to the Chinese market. The main research question in this paper is "How western retailers apply matching and network concept during international entry process into Chinese market?"

2. LITERATURE REVIEW

2.1 MATCHING CONCEPT

When retail businesses enter foreign markets, they are faced with barriers in terms of differences in cultural, political, legal and economic environment. As a result, matching is seen as a way of reducing or eliminating those obstacles (Holstius 1991; Ghauri and Holstius 1996).

Ghauri and Holstius (1996) identify matching as “...a key concept for understanding how the development of successful business relationships can be facilitated – by means of appropriate adaptation – between two countries...” (Ghauri and Holstius 1996). Matching is even more crucial, as retail businesses’ problems are more pronounced during the earlier stages of the process. Consequently, it is necessary to study the role of matching in supporting the foreign market entry process (Ghauri et al. 2004). According to Ghauri and Holstius (1996), matching creates specific requirements prior to entering a new foreign market, as well as determining the process required to achieve a successful market entry, therefore, contributing positively to the performance of retail businesses.

Matching implies a high capacity of adaptation from the firm; for instance, the adjustment between Western and Asian countries, which have different environments (political, culture, legal and economic). It is important to build relationships with the right type of people, activities and resources in different market. Matching may be recognized as the processes that facilitate the development of business relationships between firms in dissimilar countries, at the global, macro and micro levels (Holstius 1991). *At the global level*, the company might benefit from the international trade organization such as World Trade Organization (WTO), European Union (EU), International Monetary Fund (IMF). The IMF and the World Bank provided assistance to the Baltic States in 1992, so their financial system illustrates matching at

the global level. The European Union giving economic aid to each of the Baltic countries is another example of matching at the global level. *At the macro level*, matching refers to activities of the firms and governments, where they try to match with each other to gain mutual benefits. Companies try to match governments (home and host) to get preferential treatment to facilitate their entry into the particular market. For instance, there might need to be an understanding between two countries to facilitate the business between firms from each one. For example, finance matching at the macro level could be in the form of measures such as financial help, export credits, soft loans, investment benefits, investment protection, and agreements avoiding double taxation. *At the micro level*, matching is about building relationship with the local customers, suppliers, associations and local stakeholders. This level of matching is thus quite similar to the network approach. The sharing of cultural knowledge could be achieved through personal contact, education, learning the language and the media (Meyer and Skak 2002). As a result, mutual respect and good relationships can emerge from matching at the micro level. Companies can gain ownership advantages by building a network in order to access understanding of the business environment.

Matching at the micro level is closely related to networking. Welch and Luostarinen (1988) mentioned the importance of personal contacts and networking in the field of market expansion. The buyer and seller network might initially face a lack of knowledge about each other, physical distance and cultural differences. These gaps could be reduced by a regular two-way communication and by learning from each other, which can lead to the development of strong relationships and commitment. The market-orientated companies are more active in gathering local market research in order to understand the market, including their customers, competitors and the

market environment (Rogers et al. 2005). Matching is one of the methods used to assist a company to access its customers' and competitors' information. Holstius (1991) suggested that matching could facilitate international market entry, and overcome the differences between market environments. In this research, the focus is on the matching at the macro and micro level.

2.2 NETWORK APPROACH

Johanson and Mattsson (1987) introduced a network approach to explain the international production process. The network approach looks at the inter-firm relationship, rather than the network itself. Also, it enhances the understanding of the strategies used in different markets. Different types of relationships exist between companies in the network; one is the member of a group or network. In contrast, a company also plays the role of the competitor to provide products to consumers. Companies in a network create competitive advantages by developing relationships with other companies. As long as each partner benefits from each other, the relationship will be pursued and grow stronger (Johanson and Vahlne 2006). This approach contrasts with the internalisation theory (Dunning 1993, 92). That is because companies in the network theory do not internalise their ownership advantages but become a part of the network or alliances. In effect, they will have access to external resources and benefit from a direct relationship with the customers and partners. Companies could use their network relationship to pursue their operations abroad and maintain a degree of control over their intangible resources (Johanson and Mattsson 1987, 47).

There is a high degree of risk and uncertainty during international expansion. Networking is a fundamental strategy used for managing the internationalisation of

markets (Elg and Johansson 1996, 61). It involves a combination of flexibility, independence, high degree of control, and efficiency achievement.

It is important to recognise that companies are involved in a broad network of relationships. Therefore, a specific relationship cannot be understood in isolation. Each relationship should be reviewed in the connected network relationship context. This also includes the activity of exchange, whereby each connected company shares trust and knowledge, and depends on each other through mutual commitment. A relationship can be viewed as an asset where each party benefits from each other. Also, the notions of learning, as well as building trust, emerge in a network relationship (Johanson and Vahlne 2006). However, the drawback is that those actors are dependent on each other.

Elg and Johansson (1996) suggested that a company in the network could reduce its risk and uncertainty and create a more efficient network. In the home market, a company initially has established relationships with the other actors in the network. However, when a firm expands abroad, the relationship will change and new actors will be involved. There are two dimensions of network activity (Elg and Johansson 1996, 62). In the first dimension, a company will create relationships with new suppliers, customers and competitors when it operates internationally. At the same time, the company will meet new competitors in its home market. Thus, it is important to maintain its home market position, as well as focus on international expansion. The second dimension is that the company should concentrate on managing both vertical relationships (with suppliers) as well as horizontal relationships (with other stakeholders, companies) because of the impact that the internationalisation process has on them. Bianchi and Ostale (2006) suggested that

lack of local adaptation to consumer's preferences and lack of local suppliers could lead to the failure of international expansion of retailers.

3. METHODOLOGY

Exploratory research intends to observe trends, ideas or hypotheses, rather than prove a hypothesis. Case studies and observation are often used to gather data (Ghauri and Grønhaug 2005; Yin 1989). The methodological approach is based on qualitative research, using single case study and in-depth interviews to allow an in depth study of the role of matching when retailer entering the Chinese markets. Conducting case studies with organizations allows the researcher to study the relationships, behavior and operations in the organizational context (Berg 2006). The case selection relies on the time, resources, and accessibility of the company and the suitability of the research questions. This research problem involves describing and analyzing the impact of matching and networking on the firm's international expansion. Case study is an appropriate technique for conducting research (Yin 1989, 18) in order to answer the research problems.

This research examines the furniture retailer in China because there is a trend towards modern living, influenced by Western culture. Therefore, there is a high growth in the sector of imported furniture in China. In addition, there is a heavy investment in property, including condominiums in Shanghai, leading to a rise in furniture demand. A case study of IKEA is appropriate to illustrate the retail internationalization process, expanding into China. The company focuses on its overseas expansion to Central Europe and Asia as it faces market saturation in Europe. Ingvar Kamprad was strongly interested in the Chinese market and willing to invest there, so it shows the commitment of the company to the market. The growth of local production has been extremely rapid in China because of the cheap labor there.

Twelve face-to-face semi structure interviews were conducted with senior, middle and frontline managers at IKEA subsidiary in China and its suppliers. The growing interest in semi-structured interviews may be explained by the fact that the interviewees' viewpoints are more likely to be expressed in a relatively openly designed interview situation rather than during a standardized interview or questionnaire (Flick 2002). Semi-structured interviews are used in this research because they provide the interviewee with the opportunity to express and discuss the topic widely. The expatriate managers, local managers, local employees are interviewed to gain opinions. Due to the rule of anonymity, the author avoids stating the name and specific position of respondents in this paper. All interviews were conducted in English. Follow up telephone interviews and emails are used. The company data, secondary data, store and supplier visits and observation (Miles and Huberman 1994) are also conducted in this research. The interviewer has the opportunity to observe non-verbal behavior and how the respondents react when answering the questions. It allows the interviewer to interpret and understand the interviews better. N*Vivo software is used in this qualitative research in order to assist in managing, encoding and data analysis (Sinkovics et al. 2005).

4. IKEA CASE STUDY

IKEA is a Swedish based furniture retailer, which was founded by Ingvar Kamprad. He started as an entrepreneur with "IKEA", which was a small business in 1943, and initially traded in matches, pencils and nylon. Ingvar Kamprad decided to be involved in the furniture industry in Sweden in 1947 and established the first IKEA furniture outlet in 1953 at Almhult (IKEA Corporate Website 2008). The global objective of the company is "*to provide well designed, solidly built furniture for working*

people”. The company wants to convey the message that IKEA products are of good quality, have trendy Swedish design and that the price is affordable to everyone.

4.1 MATCHING

Majority of the respondents agree about the importance of matching and network relationships when doing business, especially in China. There are many stakeholders who play important roles in retail operations, including the local authorities, local government, central government, suppliers and local employees. A senior manager expresses the importance of network relationships, and how these can assist in terms of laws and regulations. “I think after nearly two years now...I feel that I have a basic understanding of how things work and the importance of relationships compared to laws and regulations and the methods needed to secure, build up and establish contacts. That has been for me the biggest learning” (Senior manager, IKEA China)

Matching at the macro level plays a significant role in IKEA’s operations in China. The company needs to build up a relationship with the local authorities. The central government and district authority are considered as the most important actors. “We rely very heavily on the government in China when it comes to our retail operations. The district government, municipal government and obviously the central government.” (Senior manager, IKEA China) However, IKEA feel uncomfortable about using matching at the beginning. The manager feels that they do not manage their relationships strongly enough and that this is something that could be improved. “We made use of contacts and existing relationships, but, we did not work closely enough together and that is a very high priority because we really want to do it.” (Senior manager, IKEA China)

The purpose of matching is to get information and to discuss what might be of common concern. The team managers mostly build contacts and maintain a

relationship with the local government. For example, the President, expansion manager and property manager will network with the district government and local authority to find new store locations.

IKEA establish relationships and maintain these contacts. In Chinese culture, people need to get to know each other individually in order to build relationships and trust. The company learns and adapts itself to building relationships with its local partners. IKEA also use local managers to network. “You must have Chinese people; Western individuals never come in.” (Middle manager, IKEA China)

Managers feel that matching and building relationships are very time consuming but crucial tasks. Hence, they will probably dedicate a separate function for IKEA just to maintain those relationships. “I am learning and getting used it. It could be formal meetings... you have this row of officials down the side...I would sit and talk for forty-five minutes but would not have a clue about what really happened, if that was good or not; but now I really see the value of those types of meetings and I see how efficient it is as a system.” (Senior manager, IKEA China)

The company has a positive image and is seen as a retailer responsible for significant employment through its local supplier network and retail network. The company shows commitment and contributes clearly to the Chinese market, which enhances the relationship between the government and IKEA. “We have a good relationship, and I think we need to be part of the community here.”(Store manager, IKEA China)

“We make an enormous contribution in China today; there are hundreds of thousands of people who rely directly on IKEA for their employment in our supply network.” (Senior manager, IKEA China)

Matching at the micro level, IKEA has learnt the importance of the Chinese business network relationship - called “guanxi” - with external partners, such as the local authorities, and suppliers. Western and Chinese firms conduct business differently. Western firms, for instance, conduct business directly and follow procedures step by step. However, Chinese firms prefer to work with people whom they trust. Therefore, building a network relationship is a crucial factor when doing business in China. The relationship might be built on a regular basis, at the individual level and extended to the company level. It takes a lot of resources, time and experience to develop guanxi. “The most important concept to apply, when you have a relationship with Chinese people, is really the Guanxi. Numerous people failed here because they wanted everything straightaway, and thought they knew it all. In China, it is crucially important to learn how to deal and to talk to people, and it may mean people will say yes sometimes, just to be polite, but never intended to sign the contract. It is about personal feelings and relationships. Relationships are very important, so there are a lot of relationships that need to be built at IKEA.” (Middle manager, IKEA China)

From the interviews, some Western managers feel uncomfortable with guanxi. It is because the way business is done is different. The company, therefore, needs to adapt to the local business. IKEA’s senior managers network with the local stakeholders. The local property manager also deals with the local authorities and other stakeholders. IKEA is not familiar with the guanxi system but accepts that guanxi has an impact on doing business in China. Nevertheless, some managers feel uncomfortable with that, especially guanxi within the IKEA store. Some managers try to stop guanxi within the organisation and promote a system based on meritocracy. The store manager believes that the IKEA system and development should be based

on individual ability or achievement rather than using individual relationships (Store manager, IKEA China). IKEA choose to maintain the IKEA position rather than follow the guanxi concept, in terms of doing business.

Network relationship with the local retailers

IKEA has less corporate relationships with other retailers, compared with the relationship it has with its suppliers and the government. The contacts and collaboration are mainly about sharing views of the current situation, and discussing any government regulation issues (Senior manager, IKEA China). They often meet through government forums. Local retailers and entrepreneurs could be challenged for copying IKEA products and selling them at cheaper prices (Middle manager, IKEA China).

Network relationship with the suppliers

There is a strong focus on long-term relationships with the suppliers "The IKEA Group believes in long-term relationships with suppliers who share our commitment to promoting good practices, and who want to grow and develop with IKEA." (IKEA Corporate Website 2008).

IKEA uses micro matching and strong network relationships with the media, other retailers, and particularly suppliers. The IKEA group builds long-term relationships with their suppliers who share their commitment to be socially and environmentally responsible and who want to grow and develop with IKEA. IKEA has 43 trading service offices that work with approximately 1,500 suppliers in 55 countries. These offices develop relationships with the suppliers, monitor production, test new ideas, negotiate prices, check quality and work towards ensuring that the supplier lives up to IKEA's policies (IKEA Corporate Website, 2008). The advantage of network

relationships with the suppliers benefits IKEA in terms of purchasing products at a low price, therefore allowing IKEA to offer low priced goods to customers. Import taxes and duties add up to a higher price. Hence, the company switched to local production in order to reduce the import duties cost. Also, the main suppliers are located along the coast, due to the better transport access. IKEA uses the right networking approach with its suppliers which provides the right price. It could help to reduce the production costs, and resolve the high prices and copycat issues that IKEA currently faces. If you find the right supplier, you will find the right market price.” (Middle manager, IKEA China)

Suppliers can also transfer their knowledge on new product development back to IKEA, as they are more specialised. “Numerous products are developed in collaboration with the supplier...we are working very closely with the supplier, where you can use the supplier’s idea, also the supplier’s experience in making products more efficient, and to use the right material, helping in getting a low cost product and more efficiency in production.” (Senior manager, IKEA China)

Contacts with the local suppliers are managed through the trading office team in the Central, Southern and Northern part of China. IKEA gives considerable importance to the relationship with its suppliers. A good relationship with the suppliers assists IKEA to purchase merchandise at a lower price. The approach IKEA uses to build and maintain its relationships relies on the concept of keeping its word for what has been promised to be ordered. IKEA’s aim is to build a long-term relationship with the suppliers based on reliability, transferring IKEA’s knowledge to suppliers in order to improve performance and maintain relationships. The company provides assistance to its suppliers and helps them to achieve better performance. IKEA trains its suppliers to achieve minimum standards of health and safety,

corporate social responsibility, including no child labour, and standard working hours, as well as good working conditions.

IKEA also has invested in their suppliers in order to develop and educate them to meet the standard required by IKEA. It is called the “**IKEA investment programme**”. For example, IKEA educate their suppliers about their warehouse system. IKEA also provides financial assistance for high standard suppliers to help them with further investments. The author had the opportunity to visit one of IKEA’s supplier and its factory, which is located outside Shanghai. This supplier has provided sofas to IKEA for several years, but initially they did not meet their standards. IKEA helped them to improve their standards and develop their business. IKEA even helped them financially to build a second sofa factory.

“The investment programme helps suppliers do their best... helping and working with suppliers to invest in machines, more efficient ones... it can be machinery, it can be money, it can be raw materials.” (Middle Manager, IKEA China)

Network relationship with the local employees

Employees’ satisfaction could influence market orientation effectiveness. In order to work well, the staff and employees have to be well treated. The IKEA concept is to treat the staff well so they can deliver a good service to the customers. The company **recruits** people fitting the IKEA values; the new recruits should be willing to learn, willing to share knowledge, creative, motivated, humble and able to adapt quickly. The recruitment of the right people who fit with IKEA culture stimulates the degree of market orientation. This is because people in the organisation are willing to share information within the organisation.

“They should be hard working because I think IKEA always has some physical work to do...and I think they should be very humble, simple, and not too complicated.”

(Frontline manager, IKEA Shanghai)

Training and **motivating** people are seen as an important tool to encourage employees to work their hardest for the company. IKEA has a **training and development programme** for its employees, depending on their role. Each employee will have a training schedule, for instance in interior design training, or visual merchandising training. As it is costly to train people abroad, IKEA has created a training facility in Shanghai and hoped to set it up as the Asian training hub. It shows commitment towards investing in people.

“New employees receive around one week’s training, describing the IKEA concept, HR procedures, and customer behaviour, how to communicate with customers is reviewed with all co-workers, and product knowledge, as well as sales skills being provided. If you do not have that, you cannot serve customers well and you cannot answer questions very well.” (Frontline manager, IKEA China)

IKEA in China conducted “**employee opinion survey**” to determine whether employees are satisfied with their current work. 99% of employees participated at this survey. It showed that salary rate satisfaction was quite low. However, the co-worker feels positive and proud to work for IKEA because of the positive Western brand image, personal development opportunity and good employee treatment. Some people apply to the job because they like IKEA’s products. Staff turnover at IKEA is quite low, compared with other retailers, because the company treats its employees well and is honest with them. They provide a high standard working environment.

“When co-workers leave for another retailer, they soon phone up and say that they want to come back to IKEA, and that is a very positive thing as well. Of course you

can get more money somewhere else, with any position for another company, but I mean there is a lot of soft value in IKEA that you miss quite quickly.” (Store manager, IKEA China)

In China, the central and local government played a crucial role because they are the decision makers regarding policy and regulation. The local manager plays a crucial role in representing IKEA and communicating with the stakeholders, especially with the local government and suppliers. Matching at the macro and micro level supports IKEA in its operation and obtaining approval. The results confirm Ghauri and Holstius (1996) and Rogers et al (2005) studies that matching has been seen as facilitating factor during international entry process.

5. CONCLUSION

IKEA success comes from the ability of applying matching with the right actors while entering the Chinese market. It is crucial to build a relationship with the Chinese government when entering the market and maintaining this network. IKEA uses local employees to network with the government, together with the positive “create employment opportunity in China” image that are the keys to successful matching with the government. In 1998, IKEA was seen as an expensive Western brand. The brand image has changed to lower prices and affordable products. This is because the company has switched to producing locally and emphasizing their supplier network, resulting in a reduction of imported products and duties (China Daily 2004), and therefore providing cheaper products. Suppliers helped IKEA to gain low cost production and prepare for further expansion to other cities in China.

My study agrees with Ghauri and Holstius (1996) that matching and network relationship could facilitate the company activities to get the right location and to run

their retail operations. In these cases, the author found that the crucial network with the right actors, such as suppliers and associations allow the company to access the market and customer information which enhanced their market orientation. This research further confirms that the ability to understand customers, which can be done through market orientation and matching, are the main factors that influence performance in international operations.

This research also takes matching concept (Holstius 1991; Ghauri and Holstius 1996) further by applying them to the international retail context. This research contributes towards theory development in this field by providing a framework that could be a basis for future empirical investigations of international expansion. The findings also suggest how foreign market operations can be managed, thereby providing a way to improve our understanding of the internationalisation process.

The matching concept (Holstius 1991; Ghauri and Holstius 1996) can be applied to the international retail context. The crucial actors might be different in different countries, depending on the market environment. In this case, suppliers are important for IKEA China to bring the production costs down. Furthermore, different actors have an influence at different stages. For example, IKEA relies on the government heavily in the search and project phases for getting permission. The company later relies on suppliers during the establishment, when the company decides to increase local sourcing. Matching at the global level does not apply in this study. Retailers should devote more effort to macro and micro matching, rather than matching at the global level.

Guanxi shares a similarity with matching in terms of focusing on building and maintaining a business relationship. Guanxi has a major influence on the decision making process, as the Chinese do business and select partners based on personal

relationships and trust. Understanding guanxi is useful for Western managers who plan or currently conduct business with their Chinese partners.

As a recommendation, further research could explore the role of matching in other Asian markets. Moreover, it is interesting to conduct further in-depth study regarding the impact of guanxi on Chinese business and how Western companies cope with it.

State Weakness and Corruption: A Direct Test

**C. Simon Fan, Lingnan University

April 2010

Abstract

We directly test the argument made by Shleifer and Vishny (1993) that a weak state, defined as the state in which the ruler does not control government officials effectively, experiences a high level of corruption. By using a newly collected index to measure state weakness, we find that a greater conflict intensity, more political instability, and incidence of coups increase corruption. Even more gross human rights abuses tend to increase corruption, too. However, empirical results also suggest that more “portion of a country affected by fighting in ethnic and revolutionary wars” reduces corruption. This finding seems surprising, but reflects a classical thesis in the sociological literature that external threat increases internal solidarity, which in turn increases the strength of the state particularly in response to ethnic wars.

1. Introduction

In a seminal contribution, Shleifer and Vishny (1993) argue that a weak state, defined as the state in which the ruler does not control government officials effectively, experiences a high level of corruption. Their underlying logic is that centralized rent-seeking is more efficient than decentralized rent-seeking due to the tragedy of commons in uncoordinated rent seeking, and the weakness of a weak state likely leads to decentralized rent-seeking. This insightful argument, which fostered a fairly large theoretical literature, has a strong intuitive appeal in developing countries. For example, in an influential review article, Bardhan (1997) presents a detailed discussion on the role of state strength/weakness in determining corruption in relation to the theoretical framework of Shleifer and Vishny (1993). In particular, Bardhan (1997, p 1325) states: *“This may be relevant in a comparison of corruption in, say, Indonesia with that in India. Table 2 in the Appendix suggests that in the perception of foreign businessmen the two countries are about equally corrupt; and yet the economic performance by most accounts has been much better in Indonesia. Could it be that Indonesian corruption is more centralized (controlled largely by the first family and the top military leadership in cahoots with the ethnic Chinese-run conglomerates) and thus somewhat more predictable, whereas in India it is a more fragmented, often anarchic, system of bribery?”*

However, there appears to be little empirical literature that directly tests the insight of Shleifer and Vishny (1993). Such an empirical endeavor is challenging because, for example, it is hard to measure state weakness/strength, which may take the form of multiple dimensions. Recently, the Brookings Institution published a report of Index of State Weakness in the Developing World, which provides a rare opportunity to examine the relationship between state strength/weakness and corruption. In particular, this Index consists of five security indicators, Conflict Intensity, Political Stability and Absence of Violence, Incidence of Coups, Gross Human Rights Abuses, and Territory Affected by Conflict, which describes the strength or weakness of a state from different aspects. For example, the intensity of violent conflicts is an indication of the state’s ability to control local officials in maintaining basic rule of law; states

that have experienced extraconstitutional or violent overthrow are likely to have a weak ruler; widespread perceptions of political instability in a country are likely associated with a weak control of the central government over local governments. Moreover, the Index has a variable that measures “scaled portion of a country affected by fighting in ethnic and revolutionary wars” and “Revolutionary wars are defined as "episodes of violent conflict between governments and politically organized groups (political challengers) that seek to overthrow the central government, to replace its leaders, or to seize power in one region"; ethnic wars are defined as "episodes of violent conflict between governments and national, ethnic, religious, or other communal minorities (ethnic challengers) in which the challengers seek major changes in their status.”” Clearly, this indicator, named Territory Affected by Conflict, reflects well for a state’s ability to exercise its sovereignty.

In this paper, we will use the newly collected Index to measure state weakness and examine its impacts on corruption. Indeed, to our knowledge, this Index provides the first direct measure of state weakness/strength, which is hard to quantify. Moreover, this Index provides measures of state weakness/strength that are largely related to exogenous factors (e.g. Besley and Persson (2010)), which facilitates the empirical estimation of its impact on corruption.

The data of corruption used in this paper are obtained from the dataset of the World Business Environment Survey (WBES), which surveys responses of businessmen and citizens in particular countries about their own (or close associates’) concrete experiences with corrupt officials.¹ The World Business Environment Survey interviewed managers from more than 20,000 firms in 2006-2009. We focus on two questions. Respondents were asked: “Is it common for firms in your line of business to have to pay some irregular ‘additional payments’ to get things done?” and “On average, what percent of total annual sales do firms like yours typically pay in unofficial payments/gifts to public officials?” The first question provides an indicator of

¹ Triesman (2007) and Fan, Lin, and Triesman (2009) explain the advantages of using experience-based data of corruption such as WBES over perception-based data of corruption such as those collected by Transparency International.

the frequency of bribery, while the second aims to estimate its scale. Besides permitting us to focus on experience-based rather than subjective indicators of corruption, the WBES makes it possible to control better for individual characteristics of survey respondents (which may vary systematically across countries). Specifically, we can control for the size, ownership structure, investment level, and level of exports of firms in analyzing their managers' responses on corruption.

Our regression analysis yields the following findings. First, a greater conflict intensity, more political instability, and incidence of coups are all found to increase corruption. In addition, even more gross human rights abuses may tend to increase corruption. These findings are clearly in support of the insight of Shleifer and Vishny (1993). Second, it is consistently shown that more "portion of a country affected by fighting in ethnic and revolutionary wars" actually reduces corruption. This finding is somewhat surprising, and at first sight, appears to contradict the argument of Shleifer and Vishny (1993). However, a careful reflection indicates that this result is precisely consistent with Shleifer and Vishny (1993). Indeed, it is a classical thesis in the sociological literature that external threat increases internal solidarity, which in turn increases the strength of the state particularly in response to ethnic wars. In a series of theoretical analyses, Besley and Persson (2009, forthcoming 1, forthcoming 2) show that fighting external wars is conducive to building state capacities. For example, Besley and Persson (2009) states: "...political historians (see, e.g., Charles Tilly, 1990) holds that state capacity evolved historically over centuries in response to the exigencies of war. War placed a premium on sources of taxation and created incentives for governments to invest in revenue raising institutions" Also, it is a classical thesis in sociology and political science that an increase in external threat increases internal solidarity and state capacity (e.g. Coser (1964), Andrew (1975)). Thus, while an increase in political violence weakens state capacity and hence increases corruption, a grand scale of political violence that leads to large scale wars may in fact strengthens state capacity and hence decreases corruption.

Clearly, a civil war almost always brings disaster to the society (e.g. Easterly and Levine

(1997)), and we are definitely not claiming that an increase in internal wars will be beneficial to the country. However, it often does increase state capacity, for example, due to the increased centralization of power in response to the mounting military pressure. Consequently, in the single aspect of corruption, it may have the effect of reducing corruption by the logic of Shleifer and Vishny (1993). In other words, this empirical findings provides additional support for the insight of Shleifer and Vishny (1993) from an unusual angle.

Finally, we provide a number of robustness checks, including considering endogeneity and conducting instrumental variable (IV) estimations. In a series of papers, as described earlier, Besley and Persson note that political violence is often caused by exogenous and historical events, which suggests that endogeneity is not a serious problem in the current empirical study. To further mitigate this problem, we follow the literature in constructing ethnic fractionalization, the absolute value of a country's latitude, and the length of time it has been independent to predict cross-country variation as the instrumental variables. We obtain consistent empirical findings as reported above. The remaining of the paper is organized as follows. Section 2 presents the data and the empirical methodology and results described in Section 3. Section 4 discusses robustness checks and Section 5 concludes.

2. Data and Variables

2.1 The Sample

The dataset used in this study is compiled from two main sources: (1) the World Business Environment Survey (WBES) on firm-level corruption data; and (2) the Index of State Weakness in the Developing World published by Brookings Institution. The WBES survey is conducted in 2006-2009 by a team from the World Bank. Over 20,000 firms from over 80 countries answered a standard questionnaire, which covers a series of questions regarding firm ownership, regulation, institution environment and corporate corruption, etc. After we match the WBES dataset with the Index of State Weakness, we have a fairly large sample of over 13,000 firms from 62 countries

in the analysis. In addition to these two datasets, we also include the World Development Indicator (WDI, 2004) published by the World Bank and the World Governance Indicator (WGI, 2006) compiled by Kaufmann, Kraay and Massimo in our robustness checks to control more macroeconomic and institutional factors that could also affect the corporate corruption within a country.

Recently there are a number of organizations that have attempted to quantitatively rank and assess weak countries according to country level of performance (e.g. see the survey by Rice and Patrick (2008)). For the purpose of this paper, the Index of State Weakness in the Developing World most recently collected by Rice and Patrick (2008) are most suitable. First, this dataset has a wide coverage of virtually all developing countries (141 in total). Note that the theoretical argument for the correlation between state weakness and corruption by Shleifer and Vishny (1993) appears to have empirical relevance in developing countries only. Thus, Rice and Patrick (2008) provide us with the largest dataset available. Second and more importantly, The dataset of Rice and Patrick (2008) consists a category of index that are based on the assessment of a state's "security", which as explained in the introduction are largely determined by historical and exogenous reasons. Thus, the potential problem of double causality between the measure of corruption and the measure of state weakness/strength is a relatively less serious problem by using this "security index".

Specifically, as will be described in detail in Section 2.3, there are five security indicators measuring the occurrence and intensity of violent conflicts, political instability, human rights abuses and political violence ranging from civil war.

2.2 Measures of Corruption

The corporate corruption measure is the dependent variable in our analysis. We construct two different measures of corruption using data from WBES. The first measure is the amount of unofficial payment as a percentage of total sales (*Bribe Amount*) to government officials. The second measure is the incidence of unofficial payment with a dummy variable taking value of 1 if a firm claims it needs to pay unofficial payment to public officials and 0 otherwise. Overall, 31% of the firms in the sample report that they need to pay informal payments or gifts to public officials to get things done. The average size of the unofficial payment is about 2.37% of total sales. For firms reporting positive graft, the average size of the unofficial payment is about 7.67% of the total revenue sales. Table 1 presents incidence and magnitude of bribe payments across different countries in the sample. The pervasiveness of bribery payments also vary significantly across countries. For example, in Croatia, Madagascar and Tajikistan, firms report that on average over 10% of their revenue sales will have to be used for unofficial payments to get things done. In contrast, in Cape Verde and Nepal, the average firm that makes such unofficial payments is less than 0.5% of their annual sales. In addition, in Peru, Uganda, Turkey and Uruguay, less than 1% of firms reported that they actually need to make the unofficial payment, however, in Armenia, Azerbaijan, Belarus, Bosnia-Herzegovina, Brazil, Bulgaria, Croatia, Georgia, Hungary, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Moldova, Mongolia, Mongolia, Poland, Romania, Serbia, Tajikistan, Ukraine, and Uzbekistan, all the interviewed firms claim that the informal payment is necessary to get things done.

[Insert Table 1 Here]

One advantage of the corruption measurement in our study is that it is based on a survey question, “We’ve heard that establishments are sometimes required to make gifts or informal payments to public officials to ‘get things done’ with regard to customs, taxes, licenses,

regulations, services etc. On average, what percent of total annual sales, or estimated total annual value, do establishments like this one pay in informal payments or gifts to public officials for this purpose?" To encourage responses to this question, the WBES uses "establishments like this" rather than "your firm" to solicit honest answers. Furthermore, the interviewers have also assured the respondents that they will not distribute the information back to the company.

2.3 Measures of State Weakness

The key explanatory variables in our study are measures of **security** basket of state weakness. These five indicators are Territory Affected by Conflict, Conflict Intensity, Political Stability and the Absence of Conflict, Incidence of Coups and Gross Human Rights Abuses. They are standardized with scores ranging from 0.0 (worst) to 10.0 (best).

The following table, which is taken from Rice and Patrick (2008), provides an explanation about how these variables are measured.

Indicator	Description
Conflict Intensity	This variable measures the destructive magnitude of the violent episode during the period 1993-2007. It is based on such factors as interactive intensity (means and goals), area and scope of death and destruction, population displacement, and episode duration, which aims to be an indicator of all forms of major armed conflicts in a country.
Incidence of Coups	This indicator was obtained by tracking the "entry" and "exit" of political leaders for the period 1992-2006. A coup is defined as that a new leader assumed power through "regular means," "irregular means," or "was imposed by another state," and the incumbent leader was removed by domestic rebel

	forces, or by domestic military actors, or by other domestic government actors. But this indicator does not include cases where the leader was removed by foreign force or where the leader was removed through assassination.
Political Stability & Absence of Violence	Political Stability and Absence of Violence measures the “perceptions of the likelihood that the government will be destabilized or overthrown by unconstitutional or violent means, including domestic violence and terrorism.” This indicator draws on data from 12 different sources.
Territory Affected by Conflict	
Gross Human Rights Abuses	

The first measurement of the security indicator is the *Territory Affected by Conflicts (v3)*. It measures a state’s ability of maintaining peace and security across the entire territory when the state is affected by fighting in revolutionary wars or ethnic wars. The indicator ranges from 0.0 (worst) to 10.0 (best). Higher score indicates the state’s more monopoly power on the use of armed force across the entirety of the territory when the central government is threatened by the overthrown or replacement of its leaders.

The second measurement of the security indicator is *Conflict Intensity (v1)*. This indicator measures the presence of intense violent conflict. This indicator ranges from 0.0 (worst) to 10.0 (best). Higher score reflects the state’s more ability to provide physical and human security to

maintain peace within its borders. The difference of *Conflict Intensity* from *Intensity Affected by Conflict* is that the latter measures more intensified conflicts and contradictions between central government and the politically organized groups, national, ethnic, religious or other communal minorities, which are characterized by revolutionary wars or ethnic wars. Such intensified conflicts not only threaten the existence of the central government, but also threaten the safety of the entire human being within the country.

We hypothesize that the more small conflicts the state involves, the more corporate corruption the state may suffer. However, when the state experiences conflicts are so severe which could threaten the territory security, this state tends to have more central power to repel outside threats and also control corporate corruption.

The third measurement of the security indicator is *Incidence of Coops (v4)*. This variable measures how political leaders assume and lose powers. For example, it includes incidents whether the leader lost power by domestic rebel forces, domestic military actors, or by other domestic government actors. It also captures whether the leader assume power through regular, irregular means or was imposed by another state.

The fourth measurement of the security indicator is *Political Stability & Absence of Violence (v5)*. This indicator measures the “perceptions of the likelihood that the government will be destabilized or overthrown by unconstitutional or violent means, including domestic violence and terrorism.”²

The last measurement of the security indicator is *Gross Human Rights Abuses (v2)*. This indicator is defined based on the definition of “Level 4” and “Level 5” on the Political Terror Scales. “Level 4” is defined as “civil and political rights violations have expanded to large

² Source: World Bank, Governance Matters VI, 2007. Available at http://papers.ssrn.com/sol3/papers.cfm?abstract_id=999979

numbers of the population. Murders, disappearances, and torture are a common part of life. In spite of its generality, on this level terror affects those who interest themselves in politics or ideas.” “Level 5” is defined as the “terror has expanded to the whole population. The leaders of these societies place no limits on the means or thoroughness with which they pursue personal or ideological goals.”³

2.4 Firm Characteristics and Other Macro Controls

In our regressions, we include dummy variables to identify firm industry classification. The variable *Manufacturing* equals 1 if the firm belongs to manufacturing industry, 0 otherwise. The excluded category consists of firms in the service industry. We also include dummy variables for firm ownership. The variable *Government* equals 1 if any government or state body has a financial stake in the ownership of the firm, and 0 otherwise. *Foreign* ownership equals 1 if a foreign company or individual has a financial stake in the ownership of the firm, and 0 otherwise. The excluded category is *Domestic Private*, which consists of firms that are owned by domestic private businesses or individuals. We also control for the firm size, which equals the natural logarithm of firm annual sales. Finally, we control for whether the enterprise is an exporter (*Exporter* equals 1 if firm exports, and 0 otherwise).

Previous literature has found that certain aspects of country characteristics are significantly related to perceived corporate corruption (Ades and Di Tella, 1999; Fan, Lin and Treisman, 2009; La Porta et al., 1999; Svensson, 2005; Treisman, 2000). Following previous practice, we include the natural logarithm of a country’s GDP per capita (*GDP per capita*) and imports of goods and services as a share of GDP (*Openness*) as country level control variables. In our robustness checks, we also control for democracy of the country from 1950 to 2000

³ The definition is from www.politicalterroryscale.org. The data source is compiled from Mark Gibney, University of North Carolina at Asheville, Political Terror Scale, 2007. Also available at <http://www.politicalterroryscale.org>.

(*Democracy*), status as a British colony (*LegalOrigin_UK*), and proportion of protestants in the population (*Protestant*). In addition, we also include a proxy variable for court fairness (*Court Fairness*) to measure the institution environment of a court in resolving business disputes. This indicator ranges from 1 to 4, a higher values indicates more court fairness. Furthermore, Torgler and Schneider (2007) find that institutional quality such as regulation quality, government effectiveness, voice and accountability, and rule of law tend to reduce the shape of the shadow economy. We therefore further include the World Governance Index (Kaufmann et al., 2006) to capture more macro country level institutional environment. The World Governance Indices (WGI) are constructed from 276 individual indicators taken from 31 different resources and produced by 25 different organizations. These indices measure six different dimensions of governance, which are Government Effectiveness, Absence of Violence, Regulation Quality, Rule of Law, Control of Corruption and Political Stability.⁴

[Insert Table 2 Here]

The detailed data sources and summary statistics of key variables are presented in Table 2. The correlation matrix for the key dependent variable (*Bribe Amount*) and the five security indicators are presented in Table 3. The variable *Security* takes the average value of the five indicators. As shown in Table 3, all the security basket variables are negatively correlated with the unofficial payments except the *Territory Affected by Conflicts* indicator. This correlation matrix suggests that the worse of *Conflict Intensity*, *Gross Human Rights Abuses*, *Incidence of Coops* and *Political Stability & Absence of Violence*, the more perceived corporate corruption. However, the worse status of *Territory Affected by Conflicts*, the less perceived corporate corruption within the state.

[Insert Table 3 Here]

⁴ The detailed explanation for these six indicators can be found in Kaufmann et al., 2006.

3. Empirical Results

To explore the impact of state security on corporate corruption, we assume a firm's latent responses can be represented as follows:

$$DEPVAR_{i,j} = \alpha + \beta' Security\ Measures_j + \alpha_1 Manuf\ acturing_{i,j} + \alpha_3 Government_{i,j} + \alpha_4 Foreign_{i,j} + \alpha_5 FirmSize_{i,j} + \alpha_6 Exporter_{i,j} + \theta' Country\ Controls_j + \varepsilon_{i,j}$$

Where $DEPVAR_{i,j}$ is $\{Bribe\ Amount_{i,j}, Bribe_{i,j}\}$, where $Bribe\ Amount_{i,j}$ is the percentage of total annual sales and $Bribe_{i,j}$ is a binary variable equals to 1 if there the firm reports the unofficial payment and 0 otherwise. The i and j subscripts indicate firm and country, respectively. In the basic model, we use $Bribe\ Amount_{i,j}$ as our dependent variable. We first use OLS to estimate the regression coefficients. Since the $Bribe\ Amount_{i,j}$ is polychotomous variable with a nature order that ranges from 0 to 100. We therefore also use the tobit estimation. In both of the two models, we use the standard maximum likelihood estimation with heteroskedasticity-robust standard errors and cluster the standard errors by country. Specifically, the clustering allows the errors to be correlated across firms within the same country while still requiring them to be independent across countries.

We use stepwise regression that just includes *Territory Affected by Conflicts* as the key explanatory variable. We then run regressions by including other explanatory variables one by one associated with particular arguments discussed in Section 3. In all of these, we control for firm characteristics and country level variables. Finally, we show a model that combines all the variables using principal component methodology into the aggregate regression. More specifically, we choose four security indicators except for *Territory Affected by Conflicts* to calculate one principal component. *Territory Affected by Conflicts* was excluded because this variable is expected to affect perceived corruption in an opposite way. We present the OLS

regression results in Table 4 and tobit regression results in Table 5. Note that the number of observations falls slightly in the last two regressions for *Bribe Amount_{i,j}* because of the missing measurement for *Gross Human Rights Abuses* in Mauritius.

[Insert Table 4 Here]

Bearing in mind that the coefficients in the tobit model do not measure the marginal effects of a one-unit change in the explanatory variables on the dependent variable, although the signs and statistical significance of the coefficient can be interpreted in the same way as in linear regressions. To give a sense of the magnitude of the estimated effects, we compute the marginal impact of state security (from worst to best) in Table 5. Compared with the marginal effects shown in Table 4, those in the tobit model appear a much larger impact for almost all the explanatory variables.

[Insert Table 5 Here]

The most important finding concerns the impact of *Territory Affected by Conflicts* on corporate corruption. Among firms in this survey, those located in countries with more conflicts that suffers territory security report that they pay less bribery money than those in countries with less territory security concerns. The coefficient for *Territory Affected by Conflicts* is positive significant in almost all regressions. The magnitude of the impact is quite large. For example, a decrease of the score by one (more conflicts) decreases the amount of unofficial payments relative to sales (less corruption) by about 4 percentage points. This effect is substantial given that the average annual sales of the firms are over \$600 million dollars.

Consistent with our expectations, the coefficients for *Conflict Intensity*, *Incidence of Coops* and *Political Stability & Absence of Violence* are negative and statistically significant, which indicates that more intensified small conflicts, more incidence of coops, less political

stability and more presence of violence can increase the likelihood of bribery payment. This finding confirms the view that corporate corruption is less pervasive in a society in which business disputes are fairly settled in politically stronger states. The sign for *Gross Human Rights Abuses* is negative but not statistically significant, indicating that human rights abuses are less relevant in corporate corruption control.

The firm and country control variables also yield some interesting results. In all specifications, manufacturing firms pay less bribery money than firms in the service industry. Firms in countries with higher GDP per capita report less exposure to bribes. The other controls do not enter the models significantly.

4. Robustness Tests

4.1. Interaction Effects

We further look at the interaction effects between security indicator and more corrupted country dummies. We first calculate the average of the bribery amount in each country, and then we calculate the average of the average bribery amount for all the countries. We define a country is more corrupted (*Corrupt=1*) if its reported average bribery amount is larger than the whole country average. The results in column 1 Table 6 suggest that *Territory Affected by Conflicts* can reduce corruption more significantly in less corrupted countries. Furthermore, in column 2 Table 6, we explore the interaction effects between the rest of the security indicators by using principal component methodology and corrupted country dummies. The results suggest that more intensified small conflicts, more incidence of coops, less political stability and more presence of violence can increase the likelihood of bribery payment more if the country itself is more corrupted.

We also look at the interaction effects between security indicator and less open economies. More specifically, we use *Territory Affected by Conflicts* interacted with dummy variable indicating countries that are less open to trade. The negative and statistically significant coefficient suggests that the effect of *Territory Affected by Conflicts* in reducing corporate corruption is more pronounced in countries that are more open to trade.

[Insert Table 6 Here]

4.2. More Micro Control Variables

We further check the robustness of the findings by including more macro control variables. We first include the *Court_Fairness*. This variable takes the value of 1 (strongly disagree), 2 (tend to disagree), 3(tend to agree) and to 4 (strongly agree) from the survey question to the firm, “The court system is fair, impartial and uncorrupted?” Therefore, higher value of *Court_Fairness* indicates a more fair and uncorrupted court system. The negative and statistically significant coefficient as shown in Table 7 suggests that a fair court system has a positive impact on corruption reduction. Consistent with Treisman (2000) report, we also find that protestant religion is significantly linked to lower perceived corruption.

[Insert Table 7 Here]

We also include a series of institutional environment macroeconomic controls in our regressions. Including these variables do not change the signs of our important explanatory variables, although *Political Stability & Absence of Violence* becomes statistically insignificant.

4.3. Incidence of Unofficial Payments

For further robustness check, we produce a comparatively balanced sample of responses for the unofficial payment to the government officials and employ a probit estimator. More specifically, we designate the firm *Bribe_{i,j}* variable as equal to zero if the firm claims zero unofficial

payment amount and give $Bribe_{i,j}$ variable a one for all other responses. The results for probit estimation are shown in Table 8. Again, all our important explanatory variables stay at the same sign which reinforce our earlier argument.

[Insert Table 8 Here]

4.4 Endogeneity and Instrumental Variable (IV) Estimation

Because this paper employs firm level responses on bribery amount, it is less likely to be subject to the endogeneity issue than in a pure cross-country study, since it is unlikely that an individual firm's views about corruption will influence a country's security issues. Nonetheless, there may be a feedback effect from the private sector to government regulations that a high level of corporate corruption may induce political conflicts and violence. We use instrumental variable and maximum likelihood estimation to address this issue. Table 9 shows the instrumental variable Tobit analysis. We choose instrumental variables based on the theory and empirical work in Barth et al. (2004, 2006), and also used by Beck et al. (2006). In particular, we use ethnic fractionalization, the absolute value of a country's latitude, and the length of time it has been independent to predict cross-country variation in conflict intensity ($v1$), incidence of coups ($v4$) and political stability and absence of violence ($v5$). We also use these three variables to predict the principal component we construct in Section 3. Note that these three instrumental variables are used when studying the country differences in determining bank supervisory and regulatory policies. It is reasonable to use them for the security basket measurement because of the following reasons: (1) As Beck et al. (2006) have argued that European's tendency of extracting natural resources generates more powerful administrative structures which reinforce country security. Since Europeans usually do not settle in tropical climates, more temperate climates are usually associated with more European settlers and more egalitarian policies. Thus

we include the absolute value of a country's latitude; (2) Including ethnic fractionalization is necessary because there is evidence that more ethnically diverse economies tend to choose policies to expropriate resources from each other and generate more state's conflicts and violence; and (3) The basic idea to include the length of independence years is that countries that are independent earlier are less likely to have security threats. These three instruments are not necessarily the best exogenous explanations of the territory security basket. However, these variables are reasonably exogenous, and previous theoretical work has suggested that these instruments can partially explain the country policy today.

Be more specific, in Table 9 column 1-3, we use the Tobit model with IV to instrument for variation in conflict intensity (*v1*), incidence of coops (*v4*) and political stability and absence of violence (*v5*). In these three regressions, we control for firm level characteristics and country level GDP per capita and openness. In column 4-5, we further confirm the regressions by using the Tobit model with IV to instrument for the principal component (*p1*) we constructed earlier based on all the four security indicators except for the territory affected by conflict (*v3*). Note in column 5, we particularly include the country level control of democracy, legal origin, protestant and court fairness. In sum, even when we use instrument variables, and change model specifications, the results are still consistent with our previous findings.

[Insert Table 9 Here]

5. Conclusion

Former United Nations secretary-general Kofi Annan declares that “if states are fragile, the peoples of the world will not enjoy the security, development, and justice that are their right.”⁵

⁵ In 2005 report *In Larger Freedom: Towards Development, Security, and Human Rights for All*.

We use a newly collected index to measure the state weakness. In particular, we use five security indicators that measure occurrence and intensity of violent conflicts, political instability, human rights abuses and political violence ranging from civil war to gross human rights violations. These indicators focus not only on the present, but also capture recent historical trends of state responsibility. But using these indicators, we directly test the argument made by Shleifer and Vishny (1993) that a weak state, defined as the state in which the ruler does not control government officials effectively, experiences a high level of corruption. We find that a greater conflict intensity, more political instability, and incidence of coups increase corruption. Even more gross human rights abuses tend to increase corruption, too. However, empirical results also suggest that more “portion of a country affected by fighting in ethnic and revolutionary wars” reduces corruption. Although this finding seems surprising, it reflects a classical thesis in the sociological literature that external threat increases internal solidarity, which in turn increases the strength of the state particularly in response to ethnic wars.

Appendix

Var	Label	Rationale	Indicator Description	Data Coverage
v1	Conflict Intensity	The presence of intense violent conflict is an indication of the state's ability to maintain peace within its borders and provide basic physical and human security		
v2	Gross Human Rights Abuses	Regimes that rely on widespread oppression and terror to maintain power may, among other things, be susceptible to internal discontent and instability.	We define "gross human rights abuses" to include the definitions of "Level 4" and "Level 5" on the Political Terror Scale. "Level 4" is defined as practices of "imprisonment for political activity", "politically-motivated executions", "political murders, disappearances, and torture" that affect a "large portion of the population" and are a "common part of life"; unlimited detention, with or without trial, for political views is also commonplace. "Level 5" is defined as including all the terror characteristics of Level-4 countries and "encompass the entire population"; in addition, "the leaders of these countries place no limits on the means or thoroughness with which they pursue personal or ideological goals." The Political Terror Scale publishes a score based on State Department reports and a second score based on Amnesty International country reports, both score countries from 1 (rare) to 5 (widespread political terror). We average of the two scores to assign a score for this indicator.	
v3	Territory Affected by Conflict	In the absence of an authoritative measure of "ungoverned spaces" across countries, this is the best available indicator for a state's ability to exercise its sovereignty and maintain a monopoly on the use of armed force across the entirety of its territory.	The PITF's "MAGAREA" variable measures the "scaled portion of [a] country affected by fighting" in ethnic and revolutionary wars, ranging in score from 0 (less than one-tenth of the country and no significant cities directly or indirectly affected) to 4 (more than one-half the country directly or indirectly affected). Revolutionary wars are defined as "episodes of violent conflict between governments and politically organized groups (political challengers) that seek to overthrow the central government, to replace its leaders, or to seize power in one region"; ethnic wars are defined as "episodes of violent conflict between governments and national, ethnic, religious, or other communal minorities (ethnic challengers) in which the challengers seek major changes in their status." Both revolutionary and ethnic wars are included in the indicator. If there were multiple entries in a given year, we used the highest score available for each country.	1991-2005

v4	Incidence of Coups	States that have experienced extraconstitutional or violent overthrow are by definition highly unstable, and likely to lack the political mechanisms, characteristic of a strong state, that ensure peaceful transition of power.	1992-2006
v5	Political Stability & Absence of Violence	Widespread perceptions of political instability in a country are considered a good indication of a state's actual stability.	2006

“Shakespeare” Among Many Englishes¹

(Gabriel Fajar Sasmita Aji/
Sanata Dharma University, Yogyakarta, Indonesia)

Stuart Hall noted that identity is not about the past but the future, especially in how to negotiate position. Then, Don Mitchell emphasized that identity exists as a nexus, a meeting point, not as an unchanging “thing” rooted to place,... identity itself is radically transformed (2000: 276). Though this notion was firstly addressed to the existence of migrant societies, it eventually becomes the up-dated fact in the at-present globalized world within which “local identity” should adapt to the new paradigm of the kind of world. The way of adapting (to the global identity) is surely characteristic, and its aim is not to “self-suicide and surrender” but to open “the communication” that the global world would not destroy, or even ignore the locality as part of the changing world since it stands still to resist the consequent changes of the “new world”. The communication opens any opportunities for those wishing not to be controlled by the hegemonic global world, which may be under some influential powers, but to take part on controlling the harmonious new world. In other words, the rapid and complex changes of the new world need a great commitment of all countries to build world communication in order to control it not to be destructive.

The urgent question is about how to create “tools” available to provide occasions and opportunities for the new world communication. English is the obvious example. This fact is understood to unite the world that the communication between nations and societies is facilitated because the nature of an individual, represented by a nation or society, can not stand by itself but it needs the others to live with. Otherwise, each would be threatened or threatening, and the world is in danger. If the English language can stand as the global identity, can the English literature do the same?

The English Language as the Global Identity

We may be proud, considering the fact that English now stands as one of the semiotic icons of the new world communication. Though the language was also known as the imperialist, that the postcolonial societies always strive to resist the imperialist hegemony², the interesting phenomenon happens due to the “development” of the language’s diversities. Today many Englishes exist³, such as Singlish, Taglish. Interestingly, some of those having “new English” were under the control of British Empire. Meanwhile, some territories (such as China, Russia, Germany, Spain, Egypt, and Brazil)⁴ apply English as the foreign language taught in schools. Indonesia itself also suggests that English is an important language that should be learned by students, despite the previous fact of colonialism by the Dutch.

¹ Presented in Asian Conference on Arts and Humanities (ACAH) 2010, Osaka, June 18-21, 2010.

² Stephen Slemon wrote, “The foundational principle for this particular approach to the field of postcolonial criticism is at heart a simple binarism: the binarism of Europe and its Others, of colonizer and colonized, of the West and the Rest, of the vocal and the silent”, Bill Ashcroft et al., 2006:104.

³ David Cristal listed that there are more than 76 territories using the English language (*English as a Global Language*, Cambridge: Cambridge University Press, 2003: 62-65).

⁴ David Cristal, 5.

Especially related to the countries using the English language as the second language, they apply their own English, and those are usually the ex-colonized countries. For example, Singlish is from Singapore, Taglish from Philippines. For the kind of case, there are two approaches: postcoloniality and globalism. On the one hand, the spirit of postcolonialism flames them to establish identity which is not under the hegemony of the ex-colonizer. The English language of their own is the proof that their English is characteristic because those Englishes are different from the original stem, either British or American. During ESEA 2009 International Conference, Nov. 26—28, 2009, Poh Yi Foong, from National Institute of Education Nanyang Technological University, Singapore, uplifted the topic about “Singlish: Can or Not?”, and Marikit Tara Alto Uychoco, from Ateneo de Manila University, Philippines, about “Philippine Errors in English or Features of Philippine English?” Those speakers claimed that the Englishes are justified as the national identity. Therefore, there are also linguistic features which are “new”, such as vocabulary and grammar. Here, the idea of “father tongue”, given by Roland Barthes⁵, is transformed into the second language which may be finally the “mother tongue”.

However, on the other hand, globalism is another important aspect to consider due to their national identity. Since English is an icon of globalism, the fortunate cultural condition of having the English language, in spite of the fact of the historical accident of colonialism, is one step in advance in comparison with those having the language as the foreign language. To the latter societies, such as Indonesia, China, Russia, and Brazil, the need of the English language would be satisfied by different step, and perhaps they even may not establish their own English since the language is still foreign. Quoting Titone, Carola Suarez-Orozco wrote that bicultural and bilingual competence enables individuals to fluidly adapt themselves to evolving situations, and the ability to code-switch—to move fluidly between languages and cultures—has obvious social advantages⁶.

The English Literature as the Global Identity?

In the context of the world communication the position of the English language is surely different from that of the English literature. The nature of language is a tool to communicate, while the nature of literature is a “content” to be communicated. It means when Joseph Conrad’s *Heart of Darkness* is told to the world its language can be understood and accepted but perhaps its content can not. The problem lies on the fact of its perspective or world view, rather than on its media. Universality of the language as media is easily perceived but that of the literature is unfortunately limited to the author’s identity. For example, in *Heart of Darkness* the view about underestimating “the African native” is obvious, and it is surely related to the author’s perception of the view. Therefore, in comparison with the English language, it seems the English literature must undergo many difficult chasms to be accepted as the global identity.

However, there will be different phenomenon since the English “Shakespeare” takes part in the context of globalism. Similar to the nature of the English language, as previously mentioned, Shakespeare is also “universal” in which all traditions suggest the person as the

⁵ ... that tongue which comes to us from our fathers and which makes us, in our turn, fathers and proprietors of a culture which, precisely, history transforms into “nature.” (Roland Barthes, *Empire of Signs*, 1982: 6).

⁶ “Formulating Identity in a Globalized World” in *Globalization: Culture and Education in the new Millennium*, Marcelo M. Suarez-Orozco and Desiree Baolian Qin-Hilliard (eds.), Berkeley: University of California Press, 2004: 174

greatest artist who is not confined by a certain identity anymore. The fact that Shakespeare came from British is gradually not an important item to consider in the literary context. People tend to claim that he belongs to the world literature rather than to the English literature. The debate about whether this person is colonialist or postcolonialist may be the proof that his position is universally accepted as the spirit of the world literature. Here, some prejudices that Shakespeare's existence is merely to signify and to strengthen the superiority of Western Literature, because he becomes the icon, or canon, of the British literature, as Ania Loomba stated,

“Shakespeare was made to perform such ideological work both by interpreting his plays in highly conservative ways (so that they were seen as endorsing existing racial, gender and other hierarchies, ever as questioning or destabilizing them) and by constructing him as one of the best, if not ‘the best’, writer in the whole world. He became, during the colonial period, the quintessence of Englishness and a measure of humanity itself. Thus the meanings of Shakespeare's plays were both derived from and used to establish colonial authority.”⁷

However, Loomba also acknowledged that by the different angle critics may position him in the realm of postcolonial study because of his ideas concerning with the racial problems.

“In yet other instances, they appropriated Shakespeare as their comrade in anti-colonial arms by offering new interpretations and adaptations of his work. In recent years, both Shakespearean scholars and critics working within postcolonial studies have increasingly begun to scrutinize the ways in which the colonial and racial discourses of early modern England might have shaped Shakespeare's work...”⁸

Also, in the world of literature the name of Shakespeare is unavoidable. Even, in the ordinary talk many people put some Shakespeare's quotations to pass any comments. For examples, the tragic love which kills the lovers is like the love story of Romeo and Juliet, the importance of not mentioning name is quoted by “what is a name?”, and also about no one is an island is the very famous proverb from Shakespeare. Meanwhile, none would question the greatness of Shakespeare related to his talents in producing so many great works, such as Hamlet, Romeo dan Juliet, Macbeth, Othello, As You Like It, A Midsummer Night's Dream, The Merchant of Venice, etc. To this greatness, even, people have questioned whether this person really existed or not. However, the fact is that this person is eventually the icon of the world literature. Mentioning the name of Shakespeare people would not hastily refer to literary canon owned by the imperialist, but to the great artist of literature. It means the world has acknowledged the universal values brought by Shakespeare's ideas.

Due to the previous phenomena, the globalized world should consider to position him in the context of the world communication. Like the English language, there should be also the diversities of “Shakespeare. Therefore, if the question is whether it is applicable or not, the answer is yes. There are at least two methods of applying “Shakespeare” into local traditions: from the form, i.e. tragedy, and the content, i.e. humanism. It means there will be collaboration

⁷ Introduction of *Post-colonial Shakespeares*, Ania Loomba and Martin Ortin (eds.), Routledge, 1998: 1.

⁸ Ibid, p.2

between the two, and from this deed the scope of audience will be broadened because it especially addresses the global world. This can be applied not only to literary works but also to other genres of culture, such as entertaining performance. In Indonesia it may be applied to *ketoprak* (traditional play), *wayang kulit* (puppet show), or also *tarian* (traditional dance). Here, the dialogue between the local and the global happens, and the outcome is that the local has the opportunity to voice through its aspect of the global perspective while the global signifies its universality rather than individuality.

Shakespeare and Universality of Identity

As the English language can pierce socially, not culturally, that the language becomes the main concern of the new world, “Shakespeare” may do the same. The importance of the English language is eventually to provide opportunities for the world relationship, and analogically the importance of Shakespeare is to open the broad paradigm of world literature covering Shakespearean tragedy and humanism. Therefore, let’s view some Shakespearean characteristics which may be more or less appropriate to be the universality of the world identity.

Shakespearean tragedy is famous not because of its structure but of its “characters”, such as Romeo, Juliet, Macbeth, Othello, Hamlet, etc. In this case, the success of Shakespeare as a matter of fact is in creating the very characteristic human representations through his characters of the plays. It means each character surely brings a very special value of the world universality within which the characters of Romeo and Juliet would be appropriate as the human representations of bringing “love story”, and Hamlet bringing “revenge story”. In other words, those kind of characters are having the standard of the universal human story, and this can be the reference of the other traditional “performance” in delivering the similar stories.

Possibly the second characteristic of Shakespearean tragedy is the use of some utterances in his plays. Those utterances are often reproduced again in our daily expressions. The reproductions are sure not to revive the figure of Shakespeare, but perhaps to unconsciously repeat the similar condition with that when Shakespeare produced them. Even, in the reproductions the reproducer/s may be ignorant of the original creator, who s/he was or where s/he came from or from what culture/background s/he came, of those expressions. In other words, the famous utterances, created by Shakespeare, through the plays have pierced socially and universally in the human lives and they finally belong to the universality.

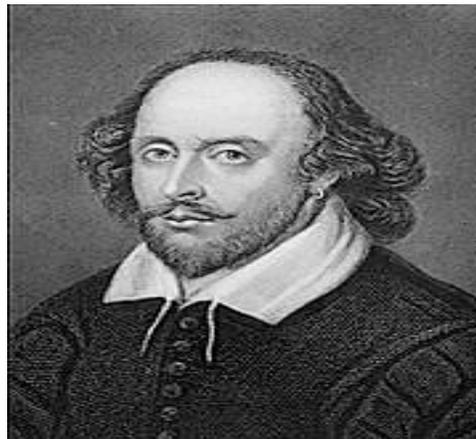

Besides those characteristics, “the content” of Shakespearean tradition may be viewed from his idea of humanism. This can be clearly seen by comparing Shakespeare’s works, which were in the spirit of Renaissance, with the tradition before him, i.e. Middle Ages. In the works Shakespeare treated man as the centre, while literature before the Renaissance had frequently offered ideal patterns for living which were dominated by the ethos of the church (Carter and McRae, 2001: 53). Thus, Shakespeare was the first figure who daringly put “man” as the focus of tradition, and not “man” as the complementation of living. Almost all his works discuss the problems of man as an individual, and because of this he could attract any kinds of audience, from the lower to the higher levels. Even, in the next generation the idea of treating “man’s problems” became common. And, it seems that finding the unique humanism characteristically owned by Shakespeare is not an easy task. There were many researches discussing this problem, but eventually those mounted on the outcome that Shakespearean humanism places or treats “man as the center”. Shortly, in Shakespearean tradition man is dignified, and it is the paradigm

that should be applied in the context of the globalized world. Man is not the complementation of technology, politics, economy, ideology, but is the center.

Closing Remarks

Quoting Kevin Robins, Kathryn Woodward noted the phenomenon of globalization as involving an extraordinary transformation, where the old structures of national states and communities have been broken up and there is an increasing ‘transnationalization of economic and cultural life’⁹. In the new paradigm it is an opportunity provided for all traditions to open the world communication in order to control the globalization together. However, to take part of controlling the “new world” there should be tools important to communicate. The English language has become one of the tools accepted as the global language, and it has spread into many traditions/societies socially through its diversities. Even, many societies also treat it as the important aspect of living that it becomes the compulsory subject for local students.

The appearance of the figure of Shakespeare seems important to consider as well as the tool of the world communication. It is not the idea of idolizing a foreign figure but adopting an identity for the new world. Shakespeare is nobody but a significant figure in the context of humanism. Shakespeare belongs to no tradition but the world tradition, because uplifting the person’s great talents is across local boundaries.

Bok Choy and Peanut Butter: Food and Generation Gap in Leslie Li's *Daughter of Heaven*.

Paula Torreiro Pazo

Food is the only element from the outside world that enters our body and turns into “ourselves” by the biological process of digestion. “Ingestion is the physical act that mediates between self and non-self, native essence and foreign matter, the inside and the outside. [...] Until eaten and absorbed into one’s bodily system, food is no more than a substance ‘out there’” (S. Wong 26). However, once eaten, its meanings multiply.

Owing to its myriad varieties of symbolisms, meanings and connotations, food has also awakened the interests of literary critics and scholars, who believe that the trope of food is fundamental for the formation of the “self,” the building of communal identity, as well as the preservation of collective memory. However, it is particularly in the pages of Asian American literature where food acquires a greater significance, due to the intimate connection between food and both ethnicity and identity. In fact, as Wenying Xu argues, this has historical and social reasons, because, “the racialization of Asian Americans has been achieved prominently through the mainstream’s representation and appropriation of Asian foodways” (8)

Therefore, for the purpose of this paper, I will explore the metaphors and symbolisms that food entails in Leslie Li’s memoir *Daughter of Heaven*. In this autobiographical work, Li describes her inner conflicts and difficulties as a second generation Chinese immigrant in the United States, where she always felt trapped between two cultures: Chinese and American. This cultural clash between East and West goes hand in hand with the “Generation Gap” between father and daughter. I will deal with several passages of the memoir where their conflicts are connected with their respective behaviors towards Chinese and/or American

foodways. It is my contention that, by focusing on the eating habits exhibited in her memoir, it is possible to understand her identity conflicts, as well as making inquiries about wife-husband, mother-daughter, or father-daughter relationships.

In the chapter entitled “Food-Shame and Sand-Wishes” Li describes her identity conflicts as a child and adolescent caused by peer rejection and stereotyping. As the narrator mentions, Leslie’s unpopularity among her schoolmates has to do with all those factors that make her stand out as different; that is, her physical appearance – having to stand the other schoolchildren “pulling at the corners of their eyes” (12) – and also the kind of food that she brings in her lunch box. What Leslie and her sisters eat during recess does not go unnoticed among their - mainly white - classmates, who pull a face at anything that emerges from their lunch boxes. This makes young Leslie feel that her family’s Chinese eating habits are preventing her from feeling belongingness and empathy among her friends. Therefore, she starts to try and hide all those signs that revealed her Chineseness, and one of them is food: “Even though we tried to imitate our peers and sometimes had in our lunches the chemical additives we so admired in theirs, this follow-the-leaderism soon stopped. Instead of the Sno Balls and Twinkies from the local Shopwell or Grand Union, our desserts often came from faraway Chinatown” (Li 11). Interpersonal relationships among children in recess have to do with the sharing of their lunch, however, Leslie is kept out of this mechanism because she cannot even share her food with her best friend, Laurie, who, after trying one of Leslie’s Chinese lunches, “spat it out onto the waxed paper it was wrapped in. Her face was red; her expression horrible, a kind of seizure. Finally, she gasped: ‘Oh, it’s awful. It tastes like turpentine!’” (14). Spitting the food Leslie has offered her means much more than the dislike of that particular kind of food; for Leslie it means contempt, incomprehension and even racism on the part of her best friend: “I blinked at her and wondered if our friendship [...] would remain intact” (14). Episodes like this one affect Leslie’s self-esteem and she blames

her grandmother's food for making her feel awkward among her peers: "Nai-nai, [...] among other unforgivable embarrassments she caused us, filled our lunch bags with 'icky-looking tree bark', 'disgusting animal turds', and turpentine-laced 'poisonous' fruits" (20). Leslie wants to be accepted as a member of the "cool" cold-lunch people, those who "carried a sandwich, thermos of milk, apple, and cookies in a lunchbox, with Lassie, Roy Rogers, Hopalong Cassidy, Betty Boop, or some other much loved character on the lid" (15). From this it can be inferred that Leslie wishes to follow "food-fashion" at school, in order to assimilate and look more Americanized. Her contempt towards Chinese foodways and idealization of American ones reflect the identity conflicts and fluctuations that she suffers as a American born Chinese girl, whose life consists in juggling two different sets of values and habits: Chinese culture at home, and American culture outside.

Teenagers start to explore and discover the social implications of eating habits and they begin to choose, not only in terms of taste, but also bearing in mind social acceptance and integration. Therefore, food can also become an element of conflict and clash between immigrant parents and children. As Sau-ling C. Wong argues, "the American-born children often have reservations about the parents' food choices (and by implication their life choices)" (37). The generation gap between parents and children becomes obvious when dealing with food. For first generation Asian immigrants, S. Wong adds, food means "necessity"; that is, the hardships they had to endure to make a living in the host country; but it also represents the need to preserve their culinary habits in order to feel that they still belong somewhere, constituting a way to shape their identity in the diaspora. In contrast, for the second generation, born in the US, food means "extravagance," the possibility of choosing, of consuming what is beyond mere survival. Sometimes the culinary tradition of their elders is rejected for being primitive, for making them look different from the rest, and for preventing them from assimilating to the mainstream culture.

Along these lines, Li focuses on the bad relationship between her parents, and on her own complicated relationship with her father. Leslie's mother is a second generation Chinese American, whereas her father is a first generation Chinese immigrant with a "near-military sense of discipline" (Li 49), obsessed with what he has left behind, with his work, and with "face: its maintenance, its gain, its loss" (49). Leslie's father has migrated to the US, but he has left his mind and his love in China, where he thinks everybody will judge how he fends for himself in America: "These distant relatives, these people he didn't even know, mattered more to him than his own family because of what they would say. What we, his immediate family, said or thought didn't matter, precisely because we were immediate family. And we were American" (50). Her father's "face" is at stake in America, not because of what her wife or children may think or feel, but because of the idle talk and judgments about him that may take place in his native Guanxi province. Obviously, this creates tensions and problems in the couple that also affect the children, and eventually end up in divorce.

Bearing in mind Leslie's father's obsession with his previous life and home culture in China, it is not surprising that he openly manifests his loathing towards American food, and his devotion of a "real Chinese meal" (51). However, on those nights that Li's mother arrives late from work, and he is in charge of the cooking, he prepares American food for his four daughters. Therefore, even though it may seem contradictory, cooking and feeding his children American food seems to reflect his resignation and his awareness that, though he does not want them to become Americans, there is no other way. Nevertheless, his American cooking is horrible, which – establishing a parallelism between feeding and educating - could be a symbol of his incapability of educating and instilling in his daughters other values that those of his native China which, he starts to realize, are beginning to be rejected by his American-born children.

I [Leslie] hated those Friday dinners and, despite my best intentions, despite the knowledge that my father was watching, silent and disapproving, I picked sullenly at my food. [...] I tried not to chew but simply swallowed, or tried to. Instead I gagged. Out came the fish stick, nearly intact, back onto my plate (51).

Likewise, the fact that Leslie regurgitates the food that her father cooks for her, might be read as an indicator of her difficulties in digesting the strict values and attitudes that her father instills in her in America. Consequently, it is also a metaphor of the generation gap and the lack of understanding that exists between Leslie and her Chinese-born father. Being sick after eating her father's dinner becomes something usual. The innumerable fights between Leslie's parents normally take place during dinner while the children are eating. The tension and shouting gets mixed with the taste of the food, which makes Leslie associate the food she eats at home with continuous problems and difficulties. This constitutes another reason for her to reject her parent's foodways in favor of the food she can eat outdoors. "Dinner that evening had consisted of the detested trio – fish sticks, buttered noodles, and string beans. Detested but consumed. Now it out came, not just a mouthful, but the full meal" (52).

As time goes by, Leslie starts to realize that one of the reasons why her father acts so aggressively and intolerantly is because he feels isolated; drowning in "a well of loneliness" (61). Thus, one night, when everyone is already in bed, Leslie finds her father alone in the kitchen cooking Chinese food. This image makes her realize that what is really ailing her father is that he feels he cannot share his Chinese culture – including his foodways - with anyone. In fact, contrary to what happened when he tried to cook American food, when preparing Chinese dishes, he moves around the kitchen "with a practiced efficiency, and automatic sense of ritual" (62). Her father feels a searing unbelongingness in America, and he is deeply homesick. Thus, the reproduction of the smells and flavors of the foods he used to

eat during his childhood in China transport him back to his birth place in Guillin and help him alleviate his sadness and nostalgia. Indeed, according to Anita Mannur, “food becomes both intellectual and emotional anchor” for the immigrant, far from the homeland and family. Leslie approaches him, offering company, and he invites her to eat the food he is cooking. Father and daughter share Chinese food for the first time – and also for the last. Food is plentiful, but words, again, are scarce: “Our silence was broken only by the ambient noise of our vigorous mastication, [...]. The food in my bowl was originally destined for my father’s, and I knew I was depriving him of half his Chinese midnight supper” (63). If food can also symbolize love, and repentance, this is the most obvious example. By sharing with his daughter the Chinese food he had prepared for himself, Leslie’s father is apologizing for not being able to understand her, for being so near and so distant at the same time. Since he is unable to show affection to his daughter, he uses food as an act of love. Leslie, in turn, lets her father feed her in order to create an atmosphere of trust, to make him understand that she accepts his apologies, and also to apologize herself for not being the daughter he would have desired. Everything is said “without words,” and for the first and last time, father and daughter connect with each other by means of food: “if not communion exactly, then [it was] a rare and precious accord” (64). In this context food functions as an apology and also as a bridge between father and daughter, for they momentarily leave their differences aside, and come to feel close to one another while they are consuming the same food. However, this union vanishes once the meal is over, indicating the instability of their relationship: “For most of my life, my father and I inhabited two different continents over which we had constructed, each from our opposite shores, a stone bridge, unstable and unfinished” (69).

As a conclusion, I would like to emphasize the evocative and metaphorical power that food displays in *Daughter of Heaven*. In the context of the Chinese American community described in this memoir, food functions as a fundamental ethnic and cultural marker that is

embraced by the first generation immigrants, but rejected and even loathed by the second generation. This becomes the reason for family conflict. In the case of Leslie, her rejection of Chinese food comes as a real shock for her father, who finds it really difficult to observe how his daughter is growing up into an American stranger.

Borrowing Roland Barthes's words, it seems that "food has a constant tendency to transform itself into situation" (26). What we eat, how, with whom, why, when and where are not superficial details, because food can only acquire its communicative power and its multiplicity of symbolic meanings, when all those questions are answered.

Abstract

The difference between the Eastern culture and the Western culture is not only reflected in how people from the two cultures view things differently, the difference can be seen in many different areas. The Eastern culture puts more emphasis on looking at an issue holistically while people from the Western culture tend to analyze different objects independently. This point could be clearly seen from the practices of the Eastern and Western medicine. The development of medicine in Western nations follows the way of hypothetical deduction and the Eastern approach uses the inductive method. The Western approach clearly divides the health from the disease, yet the Eastern approach considers health as a balanced state versus disease as an unbalanced state. The Western approach tends to change the environment and the Eastern way is to prefer to adapt to the environment. The same terminology may apply to entirely different facts, the teaching and learning methods are quite different, and the evaluation of the treatment is almost not comparable. The Eastern medicine puts emphasis on "adjusting," "supplementing", and "resting upon" the body of the patient while the Western medicine talks about "treating" the body. Both Western and Eastern systems have their place. Some believe that the greatest strength of Western Medicine is in its trauma care and therapies for acute problems, while Eastern medicine excels in the areas of chronic problems and preventive medicine.

The difference between Western and Eastern medicine is very much reflective of the difference in philosophies of the two cultures. In the West, we rush and conquer, and this is as true of our medical model as any other facet of our lives. Our relationship to disease process is adversarial. Frequently we do not take more than minimal care of ourselves until medical disaster has overtaken us.

In the East, the pace is slower. There is still time for, and celebration of, nature. Flowing with the energy of the moment is a high value in the East, and that moment provides the key to healing. The medical models are worlds apart. But they do share one process in common: diagnosis and treatment begin with observation of the patient.

In the West, however, that observation is increasingly mechanical. Temperature, pulse, respiration, blood chemistry, and digestive processes can all be sampled mechanically. All these tests in their varying technological complexities are designed to clarify the workings inside the ailing body. That body's environment, including how the patient is nourished (physically, but spiritually and emotionally as well) is rarely considered. It was seen as having little bearing on the problem at hand. The body's systems were seen as a complicated machine, susceptible to mechanical and chemical intervention.

In the East, a far gentler and more holistic process is used. The problem is observed - in the East as well as the West, what the patient is able to tell the physician may not be the entire story - and the patient's flow of chi, energy, is assessed. The symptoms are viewed as caused by imbalance in this energy flow, and correcting that imbalance seen as the route to resolving the issue. The solution is as apt to lie outside the body as in. It may be a problem of environment or temperament. It is in treatment that the philosophical difference between East and West is most explicit.

Eastern medicine is far gentler. No nostrum in the Chinese or Japanese cabinet of medicinal herbs will kill us. The healing techniques of Reiki and shiatsu are never painful when performed properly. The patient's mind is seen as contributing to his bodily woes, and he is helped to return to his own center. Our friend with the incipient heart attack would be told to take up tai chi, discouraged from eating quite as much meat, and given herbs to help strengthen the cardiac line of energy flow. He would be given this advice many years before the disease first manifested itself to Western eyes. The heart attack would be shunted aside, gently. While Eastern medicine does have processes for trauma treatment, it is in avoidance of that trauma that the East excels. Purely Eastern medicine is not for emergencies; it is for avoiding them.

In an ideal world, all of us would have access to both schools of medicine. If we get in a car crash, we will need the forceful interventions of Western medicine to save our lives in the minutes after the crash, and to mend our bones and keep us breathing while the healing process establishes itself. When we are recovered sufficiently to leave the hospital, the Eastern medical world can offer us the herbs to gently strengthen our healing body and perhaps modify the hasty temperament that got us into that car crash in the first place.

Both Western and Chinese systems have their place. Some believe that the greatest strength of Western Medicine is in its trauma care and therapies for acute problems, while Chinese medicine excels in the areas of chronic problems and preventive medicine.

Western medicine has developed through hypothetical deduction. Every statement in Western medicine is a result of a series of fact probing. The hypothesis is usually derived from general observations of a phenomenon and a research plan is carefully designed. When enough data are collected, conclusions are drawn as a result of critical statistical evaluations. In contrast, Eastern medicine uses the inductive method. Oriental medical literature in general is a record of practical experience accumulated from millions of practitioners throughout thousands of years.

As a part of the long-lasting traditional Chinese culture, Chinese medicine was quite advanced in ancient times. A doctor of Chinese medicine uses four methods to diagnose a patient, looking, smelling, asking questions and checking the pulse of the patient. Comparing to today's western medicine which relies heavily on performing laboratory analysis and tests, Chinese medicine can be practiced in an easier and more straight-forward manner, and is able to cure the illnesses at their roots.

The splendid historical accomplishments of Chinese medicine had everything to do with the divine culture of ancient China. Ancient Chinese science put emphasis on "heaven and humans becoming one" and following the rules of the nature. For a human being, all his major organs are interconnected and form one body. If his inner organs are not functioning properly, the problems are reflected in his surface pulse, and in his facial expressions, his voice, and even his behavior. It is truly like what one Chinese saying state, "from the falling of a single leaf, one can tell what has happened in the world all around him."

There is an ancient Chinese saying, "a practitioner of medicine is also a scholar of *Yi*." It means that the inner meaning of the Chinese medicine is as intricate and unfathomable as the ancient book of *Zhou Yi*. Therefore, someone who really understands Chinese medicine can easily find the root cause of a person's illness from his surface symptoms. For example, if one knows that the *Yang* and *Yin* sides of the patient's inner organs have become unbalanced; curing it is a very easy thing.

Yin and yang are two basic fundamentals of ancient Chinese philosophy. First described in the I Ching, Book of Changes, they are opposite terms representing the duality of positive and negative power. Normally they are equal in value, in balance with each other, and cannot exist one without the other. In the classical Chinese medical literature, yin and yang are used to

describe the state of equilibrium within and around the body, its organs and functions, and the relationship to the environment.

When speaking of yin and yang, the exterior is yang, the interior is yin; when speaking of yin and yang in the human body, the back is yang, the front is yin; when speaking of yin and yang of the organs in the body, the solid organs are yin, the hollow organs are yang. Therefore, the heaven is yang and the earth is yin; the part of the body above the waist is comparable to the heaven while the region of the body below the waist is comparable to the earth. Since the meridians, functional tracts of the body, running on the outer surface of the extremities are called yang meridians and the inner surface are called yin meridians, the outer surface is yang and the inner surface is yin.

Yang represents the active, strong, fast and positive aspects of the body. Yin, on the other hand, describes the passive, weak, slow and negative nature of the being. As a matter of fact, all of the visible organs and structures of the body are described as yin because of their passive nature when they are not functioning. The organs classified as yang are so named because they exist only by activity. Yang results in spirit, yin gives the shape. Yin in the interior is the guardian of yang; yang in the exterior is the activator of yin. In yang diseases, treat the yin; in yin diseases, treat the yang.

Western medicine doesn't take this path. It studies the function of each organ through dissecting it. It studies what the illness is through looking at the structures of different parts and different cells of the body. Now it has progressed to performing research on molecular and genetic levels. But a human being is, after all, not a machine made up of different parts. Therefore using such a dissecting method makes it difficult to identify the illness at its root and curing it effectively.

In addition, Chinese medicine puts emphasis on "adjusting," "supplementing", and "resting upon" the body of the patient while the western medicine talks about "treating" the body. Therefore even if doctors are able to offer a patient effective western medicine to treat his illness, the medicine often has side effects that cause damage to normal cells and lead to other problems down the road.

With the passage of the time, today's Chinese medicine is very different from what it used to be in the ancient times. The change is resulted from a variety of factors. One major factor is that today's people look at the materialistic world and the human body science differently. Many modern doctors of the Chinese medicine simply copy herbal prescriptions that have been passed down for centuries to treat patients. But in reality, even if two patients have identical symptoms, because they are different individuals, the cause of their illnesses could be very different. Since the technique of using the same old prescriptions based on the symptoms exhibited is practiced widely in today's Chinese medicine, it is very difficult to achieve good results. Sometimes it might even have negative results.

The good thing is that in recent years, along with the practice of Qigong, more and more people are looking at the traditional culture in a different light. According to many media reports,

more and more people are practicing medicine. It will definitely lead to people gaining new understandings of Chinese medicine and other elements of traditional Chinese culture.

The format of recording is a result of direct observation. This makes difficult to compare the results of the two different approaches to medicine. The Western approach to medicine clearly divides health from disease, and the main emphasis is on the individual body. The environment is considered as only one factor that affects the body. Responsibility for various phases of health and disease care is shared by professionals in several disciplines. Physicians are trained mainly for the care of acute phases of disease, that is, disease detection and therapy. The areas of health promotion, disease prevention and rehabilitation are taken care of largely by other trained professions. This team approach gives the impression of being more community-minded than individual-based, yet the objective is still individual well-being.

The Eastern idea of health and disease is looked upon as the two sides of a coin. In other words, every individual person is in a state of balance between external insults and internal defensive mechanisms. If the insults are greater than one's defenses, one is ill; if not, one maintains good health. Since the individual person is considered merely a microcosm existing in a macrocosm, there are changes every minute, with constant readjustments. The causes of diseases are almost equally divided into six physical aspects and seven emotional factors, or outer and inner insults. The former are the wind, cold, heat, dampness, dryness and fire. The latter are happiness, anger, sorrow, anxiety, sadness, fear and shock. For instance, The vicious energies of wind and cold attack the upper half of the body, while the vicious energy of dampness attacks the lower half. The duty of a physician is to strengthen the internal defensive power and power of adaptation of each individual person and enable him to fight the environmental insults, or to adapt to external changes so that he can live in peaceful balance within himself and with his environment, thereby maintaining good health.

The definition of good health means the state of equilibrium within one's body and with one's surroundings, the way of maintaining health and promoting health is eventually to keep the balance of all the body functions, the body and the mind, the person and his environment. Within the body, there are two systems of circulation described in the classical Chinese literature: chi (air) and hsieh (blood). Chi represents the invisible circulation of the vital energy and, therefore, is classified as yang. This energy circulates along definite pathways within definite periods of the day and ceases to circulate when the organism dies. These pathways are called hsieh, and include all the visible circulations of the body, such as cardiovascular, lymphatic and even cerebrospinal fluid. Only when these two circulation systems maintain a constant balance, a person can be kept in perfect equilibrium. In order to keep balance between man and his environment, the meridians are the communication routes. Since meridians are supposed to connect nearly a thousand acupuncture points (skin receptors of acupuncture stimuli) of the body, skin is really the reactor of the body to the surroundings.

The Western approach to health care involves, among other things, changing the environment in which we live. For example, if the weather is not ideal for the body, a shelter is built with temperature control; if the atmosphere and humidity are not comfortable, other controls are added. Antibiotics are developed to counteract bacteria harmful to the body. Sterilization techniques are practiced to shelter from the bacteria. In therapy, the same principles

apply. Artificial limbs and organs are used to replace diseased or injured body parts. Synthetic hormones and vitamins are used for impaired bodily functions. These achievements mark the victory of science and wisdom of mankind. However, in spite of the fact that human life is being prolonged, and the handicapped and retarded are functioning, the majority of people may be free from serious disease but not from discomfort or pain, either physical or mental. In other words, people are still suffering and unhappy.

The Eastern approach may be passive toward the idea of converting the environment. Its emphasis is from the "within" to strengthen the enormous defensive and adaptive powers of one's body so that the latter may accommodate physical or mental stress. It may work slowly and appear to be less effective; but, if successful, the result usually is a balanced, comfortable body and a happy person. With all the dichotomies mentioned above, it follows naturally that the learning systems and the terminologies used must be different. Even if the same terms are used, they may have quite different meanings. The system of the body is classified in a way quite different from that of Western medicine. So too, are the other aspects of medicine. For instance, the body is divided into 12 anatomical, physiological and psychological units. The causes of disease are divided into six environmental insults and seven internal insults. All the diseases are represented by symptom groups or syndromes. This approach may appear oversimplified in matter.

The Western approach looks into every aspect of a person with great detail, from a microscopic to a macroscopic view of biology, embryology, histology and microbiology, studies the cellular level of chemistry and physics, then looks to the basic anatomy and physiology, and finally moves to the clinical practical aspects of internal medicine, surgery, pediatrics, obstetrics and gynecology, psychiatry and public health. Eastern approach emphasizes knowledge in terms of environmental health, surface anatomy, functional physiology, neurophysiology and the psychosomatic aspects of medicine, although different terms are being used. After learning the differences, we may be able to make a fair judgment of the validity of either the Eastern or Western approach to medicine and take advantage of knowing both.

In Chinese medicine a human being is looked upon as a small universe. The anatomical structures and the physiological functions of the body are correlated with one another. They also correspond and react to the outside environment the large universe. When everything coexists in perfect harmony, a person is in excellent health. Since the physiological process is in continual change and balance, as are the environmental conditions, this delicate change and balance between the small and the large universe are constantly being readjusted in every respect. Once the balance is disturbed, illness sets in.

Eastern approach suggests the body can heal itself if the body, the mind and the spirit are working in sync or synergy with each other. If one part of the body is not working right, then a person will experience symptoms. These symptoms may manifest physically or emotionally. For example, someone experiencing chronic pain may actually suffer from depression, according to the Eastern model of medicine and healing. While treating the symptoms of pain may help alleviate the person's condition initially, an Eastern approach will dig deeper to find out what the emotional or underlying causes are for depression. Once the depression is treated fully, the body has the ability, according to Eastern beliefs, to heal itself.

Fortunately many Western doctors are realizing the benefits of adopting a well-rounded approach to healing. Because of this many recommend non-traditional approaches to healing diseases along with conventional therapy or medication treatments.

Nowadays many doctors practice both Western and Eastern medicine and they follow an open minded approach towards different diseases. By combining the two approaches, most people learn if nothing else, to live a healthier lifestyle. This lifestyle may involve changing one's diet and encouraging the practice of meditation or other relaxation techniques to relieve stress. Often a combination of traditional and holistic approaches results in the best possible outcome for patients looking to restore the quality of their life and inner joy.

ECONOMY AND REPRESENTATION: SABRİ ÜLGENER*

Dr. Türker Armaner, Assoc. Prof.

Galatasaray University

Department of Philosophy

Sabri F. Ülgener (1911-1983), descendent of a distinguished Ottoman family and a prominent economist, has published his major work in 1951, entitled as *İktisadi İnhitat Tarihimizin Ahlak ve Zihniyet Meseleleri* (literally translated: The Moral and Intellectual Problems of Our History of Economic Decline) in which he examined the interrelation between Orient's medieval morality and the feudal mode of production. In this book, as he mentions, Ülgener uses Max Weber's method found in *Economy and Society* as well as in *The Protestant Ethic and The Spirit of Capitalism*, and applies it to a content different from that of Weber. In this paper, restricting my scope to basically two works of these authors, I shall attempt to make a critical comparison between the outcomes of both authors' researches.

The transition from Ottoman Empire to Turkish Republic, which lasted for about two decades and officially was marked in 1923, can be observed in the sources of Ülgener. He mastered Arabic and Persian languages immediately through his father who was an eminent religious authority and a high-rank teacher, promoted to the private tutorship of Şehzade Şevket Efendi, the son of the empire's king Abdülaziz¹. Ülgener had knowledge of Western languages, chiefly German, during and after his secondary educations.²

Ülgener, graduating from the Faculty of Law of Istanbul University in 1935, became a research assistant at the same faculty. A year after, in December 1936, the Faculty of Economics was established at the university where Ülgener pursued his position of assistantship under the branch of General Economics and Theory of Economy chaired by Wilhelm Röpke.³ Ülgener acquired his Ph.D. from Faculty of Law by a dissertation entitled as "The Economic Morality and Mentality of Near East Turkish-Islamic World" ("Yakın Şark Türk-İslam Dünyasının İktisat Ahlakı ve Zihniyeti"). The acquaintance of Weber's and Sombart's thoughts had initiated in Ülgener's career during his academic research accompanied by the lectures of and conversations with the German scholars.

The book by Ülgener, the material that I included to this paper, was written following his research as a scholarship holder in Harvard University between 1947 and 1948, where he worked on "Weber's sociology of economics" under the supervision of J.A. Schumpeter and A.H. Hansen.

* This paper is part of a work supported by the Commission of Scientific Research Projects of Galatasaray University, Istanbul.

¹ King Abdülaziz, the 32. emperor of the Ottomans, reigned between 1861-1876 and succeeded by King Murad V.

² Biographical informations are extraited from Ahmed G. Sayar's extensive work on Ülgener: *Bir İktisatçının Entellektüel Portresi: Sabri F. Ülgener* (The Intellectual Portrait of An Economist: S. F. Ü.), Eren Publications, 1998, Istanbul.

³ Prof. Röpke was among the German academics whose positions were cancelled by Nazi régime in 1933 and came to Istanbul to teach at (and found) various departments. 1933 was the year of "University Reform" realized by Turkish Republic by abolishing Darülfünun and restructuring the institution under the name of "Istanbul University".

One of the main hypotheses of Ülgener can be formulated as follows: Occident and Orient are in an inverse proportion with respect to the “modern times” of the former and “decline” of the latter in the same period. The word “decline” implies the end of a glorious era of commerce and of the related mentality. In the forms of enterprise there was a dominant “guild spirit”, a rigidity was observed in the “value production”, as well as a traditionalism in labour, and lastly a consciousness of “mastership” which was propagated by feudalism. Thus, in this work, Weber’s method is applied to the medieval mentality instead of the morality of capitalism⁴.

Ülgener was well aware of the difficulty in demarcating a certain period as it is the case in “Middle Ages”. Nevertheless, admitting that it is conventional, according to him, it is not entirely impossible to mention the continuity and rupture in certain practices and in the transformation of the value systems. Hence this era depends upon the common economic and mental traits, not to the all-encompassing chronological order. Briefly, it is “Orient’s middle ages”, from 12.-13. centuries until the end of 18. century that Ülgener put under spot. As obvious, this historical indication is completely different from the meaning of the medieval period in the history of philosophy, which begins in 3. century and lasts about a thousand years; philosophy’s late middle ages is the beginning of Eastern medieval in economics.

In terms of geographical domain, Ülgener’s field comprises Anatoly, northern parts of Syria and Iraq and West Iran. The picture that Ülgener attempted to construct is to define the behavioural attitude of the “typical subject of economics” together with the function of religious groups in forming a morality throughout the eras and various phases.

To begin with, Ülgener’s object of research concerns the mentality and morality of the middle ages in this sense, and its representation in certain Turkish-Islamic canonical texts. This point can be indicated as an initial impact of Weber’s work on that of Ülgener: Ülgener, in agreement with his predecessor, asserts that the economic modes of production and the mental domain influence each other mutually, and he opposes the idea that considers a unilateral cause-effect relationship between the former and the latter; the representation and that which is represented stand on equal foot. However, Ülgener was keen on avoiding a determinist approach, that is to say, by no means he claims that there exists a unique mentality for a mode of production and vice versa. Rather, both domains are complementary for each other. Quoting from Ülgener; “In the spirit of Oriental personality, an apathetical and disinterested attitude, whatever its origin may be, is completed by religion and Islam Mysticism (Sufism). By the same token, as Weber emphasized, despite the fact that Calvinism is not the sole condition of the birth of capitalism, it is this Christian order which inserted the capitalist way of life to the individuals’ minds within the framework of a methodological and calculated manner of duty morality.”⁵

Max Weber, in *The Protestant Ethic*, strictly rejects the idea (and somehow finds it “foolish”), which asserts that the spirit of capitalism could only have arisen as the result of certain effects of the Reformation, or that capitalist mode of production is a creation of the Reformation. “On the contrary”, Weber says, “we only wish to ascertain whether to what extent religious forces have

⁴ Sabri Ülgener, *İktisadi İnhitat Tarihimiz*, Istanbul: Istanbul University Publications, 1951, p. 7.

⁵ Ibid., p. 6-fn 2.

taken part in the qualitative formation and the quantitative expansion of that spirit over the world”.⁶

The term “spirit”, *Geist* in German and *Ruh* in Turkish, might sound ambiguous. However, as indicated above, despite being an extra-economic domain, in the sense of both authors, the spiritual domain is nothing other than the textual context, i.e. the literary and linguistic expression of the domain of economics.

It should be stressed that none of these authors has an “essentialist” point of view since they both ascribe the term “spirit” to an individual as an outcome of certain historical, cultural and economic conditions. For Weber this historical individual “is a complex unity of elements associated in historical reality which we unite into a conceptual whole from the standpoint of their cultural significance”.⁷ Similarly, Ülgener always locates the eastern feudal personality in a historical framework; in short, the word “spirit” is not synonymous with “essence” but with “mentality”, there is no unhistorical eastern, western or anywhere else’s spirit.

Ülgener explains Oriental spirit in an allegorical way, using the metaphor of “surface”: Characteristics of this mentality over the surface are politically; “large-scale land ownership and sovereignty abiding to land”, “decentralized authority”, “land-based hierarchy of ranks”, and economically; “priority of exchange in kind and accidental situation of movable estates”, “agriculture as a basic form of enterprise in the roundabouts of the city”, “the artisan class and their guilds inside the city”.

Beneath the surface there lie “the dominance of the morality of the notables of the village”, “Essentialist claims and the overemphasis of genealogical origins” (Ülgener’s criticism in this kind of claim is a strong proof of his anti-essentialist position), “a stagnant and idle comprehension of wealth”, “guild morality”, and “traditional artisanship”.

The above mentioned characteristics, for Middle and West European (and a few Oriental) countries, according to Ülgener, are peculiar to 5.-15. centuries. From 13.-14. centuries onwards they began to fade away from Occident while in the Orient, especially in the Ottoman Empire, this mode of production, as well as the related mentality and morality were carried on, or from another angle, after a period of military occupations, there was a drastic return to the Middle Ages.

Rationality Principle

“The development of the spirit of capitalism is best understood as part of the development of rationalism as a whole, and could be deduced from the fundamental position of rationalism on the basic problems of life.”⁸

⁶ Max Weber, *The Protestant Ethic and the Spirit of Capitalism*, trans. By T. Parsons, New York: Scribner, 1958 [1905], p. 91.

⁷ Ibid., p. 47.

⁸ Ibid., p. 76.

Departing from Weber's indication, as far as I can see, in both authors, the definition of "rationality" is closely linked to three elements which are interrelated among themselves:

- 1- Market regulations,
- 2- Consciousness of time, and
- 3- Moral values.

All these elements are knotted in one notion: "Calculation". Currently, I shall attempt to display their intersection points around this notion.

1- Market regulations

I assume that in the context of Ülgener, market regulations, despite being a complex structure, comprise three basic elements:

- a) Production and Exchange
- b) Wealth
- c) Acquaintance of commercial knowledge.

1-a) Production and Exchange: Ülgener defines "economic development" as "having larger domains of production by rational means".⁹ With respect to this development, Ülgener classifies the means of gaining profit from "normal" to "abnormal": Agriculture, small-scale retailers and commerce take place in the closest domain to the normal way of acquiring profit. Then comes the "relatively normal" domain which includes political benefits and rents. The outermost two domains are entirely abnormal ways to profit, which are criminality and "fantasies" (treasure digging¹⁰, magic, etc.).

Ülgener, affirming Weber, claims that the feudal east has been deprived of a rationalistic economy, that is, acquiring profit by means of calculation resting inside the domain of economics.¹¹ As long as the constitutive element of the market is the exchange-value, a definition which firstly appeared in Aristotle's *Nicomachean Ethics*, redefined by political economists and criticized by Marx, there is a quantitative amount, a magnitude, a quanta, to be calculated. Whereas in the West, with the development of capitalism, this word signified a moral uprightness in work, in the East the notion of "profit" has been subject to debasement. Ülgener presents a striking example to this debasement: The word "*kârthane*", which originally meant "labour-ware", turned out to be the denotation of "brothel house" throughout the history.¹²

1-b) Wealth: Ülgener defines the level of welfare in eastern middle ages as has been measured up with the social status rather than labour, production and wealth. It has been a political category

⁹ *İktisadi İnhitat Tarihimiz*, pp. 128-131.

¹⁰ The film *Umut* (The Hope) by Ş. Gören and Y. Güney, released in 1970, depicts this deviation from normality in profit-gain in an appropriate way. Cabbar (acted by Y. Güney), a carriage owner, blocked in the urban transformation of Adana, one of the biggest cities in the eastern Turkey, loses all his means for income and becomes obsessed in finding an imaginary treasure.

¹¹ *Ibid.*, p. 164.

¹² *Ibid.*, p. 164.

rather than economic. And money, in the pointed time, was a means for maintaining and keeping, rather than being a means for payment and exchange.¹³

Exchange, according to Weber, is a compromise of interests on the part of the parties in the course of which goods or other advantages are passed as reciprocal compensation; the exchange may be traditional or conventional, which is not economically rational.¹⁴

For Ülgener as well, the origin of wealth is extra-economic, chiefly political, and used for glory and fancy. The mentality is consumptive and the economic regime adjusted to consumption was a result of a static and a traditional working manner.¹⁵ The role of money in feudal mode of production, according to this analysis, was being an instrument for socio-political rank and glory, rather than a means of economic-rational mentality.¹⁶

Ülgener excerpts two examples from literary texts of that time: Gülşehrî¹⁷ and Fuzuli¹⁸. In the verses of both poets wealth, specifically accumulation of gold and silver, is described not as an economical category but as a social symbol of glory.

1-c) Acquaintance of commercial knowledge: Despite the amendments over the “surface”, Ülgener claims, there lies an immovable reality beneath, which is “lordship consciousness” and folk literature is a representational outcome of this feudal mentality. Referring to *Diwan* poetry¹⁹ as an example, a literary genre, Ülgener mentions the hierarchical hailing (to God, prophet, kings, and so on) at the beginning of each text.²⁰

This “hierarchical order”, mentioned by Ülgener, is “traditional authority”, found among the classification of Weber: “The Three Pure Types of Authority”, according to Weber, obtain legitimate foundations on either rational grounds, or traditional grounds, or charismatic grounds. In relation to Ülgener, I shall quote Weber’s evaluations of the second one:

“Traditional grounds rest on an established belief in the sanctity of immemorial traditions and the legitimacy of those exercising authority under them... In the case of traditional authority, obedience is owed to the person of the chief who occupies the traditionally sanctioned position of authority and who is bound by tradition.”²¹

Ülgener’s expression, “traditional way of labour”, is immediately related to the “guild spirit”. In the medieval morality of artisanship, in Ülgener’s interpretation, going astray from the

¹³ Ibid., pp. 170-182. Ülgener mentions that the Turkish word *Kudret*, deriving its origin from Arabic language, means “effluence” alongside with “power” (which is common in the present usage).

¹⁴ Max Weber, *Economy and Society: An Outline of Interpretive Sociology*, ed. by G. Roth, C. Wittic, Berkeley: University of California Press, 1978 [1909], p. 72.

¹⁶ Ibid., pp. 118-119.

¹⁷ Gülşehrî is a 14. century Turkish poet.

¹⁸ Fuzuli, a *Diwan* poet, lived in 15.-16. centuries.

¹⁹ *Diwan* literature appeared in 13. century under the influence of Persian and Arabic literatures and lasted until the end of 19. century.

²⁰ Ibid., pp. 14-16.

²¹ *Economy and Society*, pp. 215-216.

commandments of a guild master was considered as heretical (*Bidat*), as a sort of blasphemy. Authority and hierarchy were two indispensable conditions of medieval life in Orient. Since, according to the sect morality, it is not possible to attain the truth without mediation of a religious master (*Şeyh, Mürşid*), it is equally impossible to be a mature artisan without the mediation of the guild master (*Pir, Usta*). Hence, the hierarchical stratification in the religious sects is observed in the artisans, guilds and crafts that are: Disciple (*Çırak*), Assistant-master (*Kalfa*) and Master (*Usta*). Or, as indicated in the canonical texts *Fütüvvetname*'s²², they correspond subsequently to Valiant/Courageous Person (*Yiğit/Heveskâr*-One who is inclined to the craft), *Ahi* (Junior Craftsman) and Sheikh (*Şeyh*-Senior).²³

This traditional hierarchical order is distinguished by other forms mostly by the fact that in this morality, there is found not the “autodidacts” (*Hüdai-Perver*), but the ones who are trained and raised by a master (*Pir-Perver*). Mastery is recognized only to ones who are capable of opening out the curtain of secrecy and thus participating the community. But once accepted to the community, possessing the knowledge of a mutual secret, this curtain should be closed down to the exterior world. Thus, rationalistic way of acquiring the knowledge of a craft and an artisanship is rejected by the medieval morality. In Ülgener's words, “The rationalistic way of acquiring the knowledge of a craft and an artisanship is rejected by the medieval morality.”²⁴

In Weber's account, this type of organized rule is based on personal loyalty which results from common upbringing. The person exercising authority is not a “superior”, but a personal master, his administrative staff does not consist mainly of officials but of personal retainers, and the ruled are not members of an “association” but are either his traditional “comrades” or his “subjects”. Personal loyalty, not the official's impersonal duty, determines the relations of the administrative staff to the master. In the pure type of traditional rule, a rationally based hierarchy and a technical training as a regular requirement are absent.²⁵

Şerif Mardin, a Turkish sociologist, in an article dated 1984, calls to mind a crucial distinction, that is between “literati” and “intellectuals.”²⁶ Mardin depicts “literati” as belonging to traditional societies and likens their way of conserving knowledge to a sort of “guild spirit.” Thus, the “*literatus*,” whose profession is “to know,” has the duty of both preserving and transferring the basic values of society to the future generations. In this sense, the acquisition of knowledge is supposed to be realized within the borders of a certain space and hidden from people who are foreign to that community. This definition of “*literatus*” can appropriately be attributed to Sufi orders, for example. According to Mardin, this situation of the “*literati*,” mastering the written material and controlling it for the stability of society's “essential culture,” is closely related to traditional societies' attitude of ignoring or never being aware of the “daimonic creative faculty” of the individual. Mardin, in his evaluation of Ülgener's account, asserts that this lack of

²² *Fütüvvet*, in Sufi literature, firstly signifies the virtue of an audacious young man (*fatâ*), that is basically courage, but then the virtues turned out to be generosity and abstinence from earthly pleasures. The struggle was first an inclination towards “fight and gain”, afterwards it began to signify “a combat with the necessities.” (*İktisadi İnhitat Tarihimiz*, p. 54).

²³ *İktisadi İnhitat Tarihimiz*, pp. 82-83.

²⁴ *Ibid.*, pp. 84-86.

²⁵ *Economy and Society*, pp. 227-241.

²⁶ Şerif Mardin, “Aydınlık Konusunda Ülgener ve Bir İzah Denemesi” [Professor Ülgener and Turkish Intellectuals], *Toplum ve Bilim*, vol. 24, 1984, pp. 9-16.

“daimonic cult,” grasping the “daimonic” only in its external form, and taking it as an equivalent of “Evil” (*Şer*) and “Satan” (*Şeytan*) have been among the chief features of the Ottoman mentality, which also explains the absence of works on Fichte and Schelling, who sought the riddle of the cosmos in the human being, while the “*literati*” and the thinkers of the “enlightenment” searched for it in the universal picture. Mardin concludes, “One of the most evident features of Islamic culture, apart from Sufism, is not admitting -and even vehemently denying- that the daimonic side of men might be a creative faculty. Despite all our ‘modernism,’ I suppose that this belief has been recorded to the official theses of modern Turkey. In this respect, the most leftist, the most ‘radical’ thinkers of Republican Turkey are by no means different from the Ottoman ‘*literati*.’”²⁷

Returning to Ülgener, alike to Mardin’s grounds for distinguishing between “*literatus*” and “intellectual”, he draws three fundamental dichotomies concerning Occidental and Oriental “*ethos*”:

Rational/Irrational commercial activities

Juridical framework/Lack of security

Calvinism-Puritanism/Islam-Sufism. (The former has directed the earthly activities to definite targets.)²⁸

2- Consciousness of Time

Ülgener’s subject of “feudal orient”, depicted formally alike to Weber’s “ideal type”, had a “distance consciousness” with respect to time as well as to space. Medieval morality, based upon a religious and theological account, according to Ülgener, had a “distance consciousness” as its basic characteristic.²⁹ “Distance consciousness”, peculiar to medieval morality, has spatio-temporal boundaries. Spatially, it is bound by the communitarian relationships; temporally merely by “today”, the present time, which lead the member of the community to an indifference to the future, to “tomorrow”: It is not only unnecessary to be anxious about the future, but it is also harmful.³⁰ On the other hand, for Ülgener, the “disinterested individual” of medieval life is not a reality but an ideal type. And thus the ideal of “distance consciousness” has worked on the privilege of the upper classes.³¹

The concept of “time” and the imagination of this concept in consciousness together with its literary representation entail, as far as I can see, the consequences of a) Regarding “time” as a physical, measurable and hence a calculable quantity; b) Being a physical entity, considering this concept earthly and attempting to avoid it by establishing an opposition between temporal and spiritual domains; while the former, in this viewpoint, is subject to calculation and formed of units, the latter is indivisible, unique, atemporal and exempted from calculation.

²⁷ Ibid., p. 16. (This paragraph concerning Mardin’s work appeared in another article of mine: “The Reception of Kierkegaard in Turkey”, *Kierkegaard’s International Reception*, vol. 3, ed. J. Stewart, Surrey: Ashgate Publications, 2009.)

²⁸ *İktisadi İnhitat Tarihimiz*, p. 126.

²⁹ Ibid., pp. 43-44.

³⁰ Ibid., pp. 58-59.

³¹ Ibid., p. 98.

This last point has a moral dimension which I shall argue below.

3- Moral Values

The basic characteristics of the “moral individual of the eastern middle ages” are depicted by Ülgener as the following:

Rational calculation, with respect to above-mentioned arguments, is regarded as a moral debasement and virtuous moral action is to abstain from it. On the other hand, as again mentioned above, because of the discrepancy between the real and ideal modes of living, and upper classes’ attitude of taking benefit from it, we encounter with this class’s glorification of earthly pleasures and an inclination to over-abundant consumption.³²

Weber, in *Economy and Society*, asserts that in the ethos and style of life of patrimonialism and feudalism, “luxury in the sense of rejecting purposive-rational control of consumption is for the dominant feudal strata nothing superfluous: it is a means of social self-assertion... Positively privileged feudal strata do not view their existence functionally, as a means for serving a mission, that is, an idea that should be realized purposively. Their typical myth is the value of their ‘existence’”³³.

Ülgener indicates that oriental mysticism, theoretically claiming and appraising the individual and the cosmic reality, practically was away from calculating the measurable elements of it.³⁴ And Weber enumerates the “typical measures of rational economic action” as:

- 1- The systematic allocation as between present and future of utilities, on the control of which the actor for whatever reason feels able to count.
- 2- The systematic allocation of available utilities to various potential uses in order of their estimated relative urgency, ranked according to the principle of marginal utility.
- 3- The systematic procurement through production or transportation of such utilities for which all the necessary means of production are controlled by the actor himself.
- 4- The systematic acquisition by agreement with the present possessors or with competing bidders, of assured powers of control and disposal over utilities.³⁵

³² Ibid., pp. 205-206.

³³ *Economy and Society*, p. 1106.

³⁴ *İktisadi İnhitat Tarihimiz*, pp. 196-197.

³⁵ *Economy and Society*, p. 71.

Conclusion

For both Weber and Ülgener, formation of a systematic economic structure and developing an ethos according to it is a typical sign of the occidental rationality. While Weber traces the relationship between the birth of capitalism and the protestant ethic, Ülgener, by using Weber's method, examines the relationship between the feudal mode of production and the morality of the oriental middle ages.

It should be noted that, in the research of Ülgener, there are three relationships which are different in kind:

- 1- Between the mode of production and the morality,
- 2- Between the morality and its representation in the literary texts, and
- 3- Between the mode of production and its representation in the same texts.

The first one, methodically alike to Weber's analysis, draws a parallelism between the two sides of the relationship, that is to say, as indicated above, there is a mutual relationship between the morality (mentality or even "ideology" in the narrow sense) of a certain spatio-temporal framework and the economic infrastructure.

The second one enables the author to display the ideal type of the moral individual in distinction from the real individual. It can be said that this distinction of Ülgener corresponds to the dichotomy of "is" and "ought to" in the terminology of ethics.

The third one differs from the second for at this point the level of economics in the texts is elucidated in an "interpretative" manner: The verses in the poetry, at times appearing as moral dictums, are interpreted as the sublimation of the economic activities of the historical individuals' everyday lives.

Assuming this issue, I would like to raise the following questions: What kind of a relation can be assigned to this representational account? Is it legitimate to claim that there exists a causal power between economics and literature? If this is the case, is it -using the terminology of Kant and of the German Idealism- a mechanical causality or a free causality, or can we consider a third kind other than these? If this is not the case, what relates both domains to one another?

Although an attempt to reply these questions can be a subject of an entirely different research, Erich Auerbach's³⁶ major work *Mimesis* provides us firm ground on the legitimacy of asking them. In my concluding remarks, trying not to go astray from the focus of this paper, I would like to mention some hypotheses of Auerbach briefly.

In *Mimesis*, subtitled as "The Representation of Reality in Western Literature", Auerbach examines each form of representation as fictions of various conceptions of "time". Each style of literature, each form of "time", represents a differing aspect of conceiving history. As indicated above, Ülgener mentions the "hierarchical hailing" in *Diwan* poetry. And Auerbach, when comparing Homer's characters with those in *Old Testament*, states that Homeric characters are

³⁶ E. Auerbach (1892-1957), another German scholar, lived and taught at Istanbul University between 1936-1947 where he has written *Mimesis*.

more static and life is enacted only among the ruling class, which is an outcome of patriarchal, feudal aristocracy.³⁷ In a further chapter, Auerbach analyses a passage from *Chanson de Roland*, and claims that in the style of the French heroic, the separation of the realm of the heroic and sublime from that of the practical and everyday is a matter of course. Strata other than at the top of the feudal system do not appear.³⁸

As obvious from Auerbach's method, despite that mechanical time is the same for all individuals; in each social class, historical phase, and dominant mode of production we encounter with diverse representations of time. Weber and Ülgener were both well aware of this fact.

What is the Function of Press Council in Civil Society? (An Evaluation: Turkish Case)

Prof.Dr. Halil Ibrahim Gurcan
Anadolu University, Eskisehir, TURKEY
higurcan@anadolu.edu.tr

1. Introduction

People mostly face a lot of problems when they have to protect their rights, which in turn gives way to more serious problems such as violation of certain rights and difficulty in taking part in decision making processes. This negative situation naturally results in the emergence of civil collaborative mechanisms to ensure a life in a more democratic and freer environment. Such mechanisms, which represent civil society, defend human rights and freedoms and have a well-principled stand towards the established practices and governmental actions. When these civil collaborative mechanisms develop into more organized structure, they are called Non-governmental Organizations (NGOs).

The current roles of NGOs in the development of democracy can be listed as follows: defending democratic values among citizens; representing the neglected groups; creating opportunities for participatory democracy; contributing economic reforms; and mediating negotiations between the government and citizens. The most important functions of NGOs in this respect are creating public spaces by establishing bridges between conflicting groups as well as creating a democracy culture through decision making processes and more democratic structures in their organizations.

Press Council is a civil organization which consists of media employees and the representatives of certain organizations. The council plays an important role in defending the rights of aggrieved individuals and media employees due to biased news and unfair treatments and also verbalizes the discomfort that occurred accordingly. In short, it has an important function in establishing an organized stand against media, government and human rights violations in general.

In this study, press council will be examined as an NGO defending the rights of individuals and media employees, and the content of the applications made to the council in 2009 will be analyzed accordingly.

2. Turkish Press Council

Turkish Press Council, founded by media employees, is an independent organization defending the freedom of communication, work ethics and the established media principles. In this regard, it is the authority to apply in case of the discomfort due to untrue or biased news violating human rights of individuals.

Press Council practices audits to determine whether media operates appropriately or not. The organization does not have the authority to impose sanctions on media institutions; however, it has the right to publish or broadcast statements to public in order to warn or

denounce journalists or media institutions violating already established media ethics and principles.

In 1986, a group of journalists, namely Oktay Ekşi, Hasan Cemal, Güneri Cıvaoğlu, Yalçın Doğan, Teoman Erel, Orhan Erinc, Yurdakul Fincancı, Güngör Mengi, Rauf Tamer, presented a draft model to media employees in which they claim to bring solutions to unprincipled publishing due to depolitization and to establish certain work ethics for media and a self-audit system. A group of journalists, namely Uğur Mumcu, İlhami Soysal and Nail Güreli disagreed with the idea of council and some associations and unions, namely Turkish Union of Journalists, Association for Modern Journalists and Association for Reporters, decided not to be involved in this process.

Following the necessary procedures, Press Council was established on February, 6th 1988 with the participation of 627 journalists. The chairman of the council is Oktay Ekşi since the establishment.

Not having a legal (judicial) entity, Press Council is a voluntary organization based on Press Council Charter and aims at representing media and practicing self-audits. Its supreme Board is composed of elected individuals from media employees, readers, as well as the representatives of media organizations cited in the Press Council Charter. It evaluates the complaints regarding the violation of 16-item “Code of Professional Ethics of the Press” and Press Council Charter and publishes its decisions and opinions to the public. The decisions concerning the complaints are in the form of “warning” or “denouncement” depending on the degree of violation.

As of May 2009, Press Council lost most of its members from local and national media, only members left being from mainly Doğan Media group and a few local media institutions. The reason for this situation is mostly due to the decisions taken and the problems at the administration level in the Council

3. Non-governmental Organizations and Their Characteristics

NGOs are non-profit organizations which aim at meeting the demands of the society regarding certain issues. Financed by donations and membership fees, NGOs carry out various practices independently to voice the discomforts in social, legal, cultural and environmental issues and suggest some solutions accordingly. These organizations operate under different forms such as chambers, unions, foundations or associations and all the actions and activities are carried out by volunteers (Wikipedia, November 10th, 2009).

One of the indispensable components of democracy, NGOs today are quite influential on setting the political agenda and shaping public opinion; and therefore contributing to a better democracy. They work for the welfare of the society independently based on common goals.

According to their activities, NGOs can be classified into two main categories, namely as “Development NGOs” and “Aid NGOs”. The former aims at supporting social, economic and cultural development, while the later one provides disadvantaged groups with necessary humanitarian aid. Based on this classification, Press council can be considered “Development NGO”.

The roles of today’s NGOs in improving the local democracy mostly center on the following issues: defending democratic values; voicing the problems of the groups which are not represented; creating opportunities for a participatory democracy; and contributing to economic welfare. In addition, NGOs sometimes function as negotiators between the government and the regular citizens; therefore, creating “public spaces” by establishing

bridges between those having different opinions and demands. Finally, NGOs are perfect examples of an ideal democracy culture due to their decision making processes and their own democratic structures and practices.

4. The Functions of Press Council

As an NGO, Press Council has the following functions in its activities carried out in order to ensure a civil society and a more effective democracy for everybody:

- Helping to voice individual demands and to increase social awareness by creating public opinion,
- Playing an effective role in creating pluralist social structure,
- Functioning as a balancing system against the practices imposed by the government or market economy
- Being an intermediate mechanism by undertaking certain functions of the government,
- Voicing the demands of individuals by creating a public opinion for the welfare of the society,
- Assuming alternative or parallel responsibilities for government policies in certain issues such as education, social welfare and employment by preparing new projects and finding financial support for them,
- Having a balancing function against dominant market values by helping to the establishment of pluralist and participatory social structure,
- Contributing to social welfare by cultivating their own staff in a pluralist and participatory organizational culture environment and by equipping them with management experience
- Encouraging voluntary contributions in the activities of NGOs

5. Code of Professional Ethics of The Press

Published by Press Council, Code of Professional Ethics of the Press lists the following principles suggested for media organizations to follow:

1. No person shall be denounced or ridiculed in publications on the account of his/her race, sex, age, health, disabled condition, social status or religious beliefs.
2. Nothing that restricts freedom of thought, conscience and expression or is damaging or offensive to public moral, religious sentiments or the foundations of the institution of family, shall be published.
3. Journalism being a public function, shall not be used as a vehicle of immoral private pursuits and interests.
4. Nothing that humiliates, ridicules or defames private or public persons beyond the limits of fair criticism shall be published.
5. Private lives of individuals shall not be reported except when made necessary by the public interest.

6. Every effort shall be made to ensure that news stories that can be verified through normal journalistic channels shall not be published before investigation or shall not be put in print (broadcast) before a thorough assessment of its validity.
7. Information given on condition of confidentiality shall not be published (broadcast), except when made urgently necessary by public interest.
8. A media product produced by a medium of communication shall not be presented to the public by another medium of communication as its own, until its distribution process finalized. Attention shall be paid to cite the source of media products received from news agencies.
9. No person shall be declared "guilty" until he/she has been tried and convicted by judicial authorities.
10. Those actions deemed criminal by laws shall not be attributed to individuals without reasonable and persuasive evidence to that effect.
11. Journalists shall protect the confidentiality of their sources, except in the circumstances where the source is deliberately trying to mislead the public for personal, political, economic etc. reasons.
12. Journalists shall refrain from doing their duty with methods and manners that may be detrimental to the good name of the profession.
13. Publication of material that is conducive to violence, offensive to human values and use of force shall be avoided.
14. Paid announcements and advertisements shall be presented in such a way that leaves no room for doubt their true nature.
15. Embargoes on publication dates shall be respected.
16. The press (media) shall respect the right to reply and correction arising from inaccurate information (Press Council, 10.11.2009)

6. Non-governmental Organizations in Turkey

As for their locations of the total 1793 NGOs in Turkey, 708 are located in İstanbul, 444 in Ankara, 189 in İzmir and 453 in other 78 provinces in various locations in the country. This distribution clearly reveals that NGOs in Turkey are mostly located in big cities, which shows that they are not evenly distributed across the country yet.

Of these organizations, 949 are associations, 538 foundations, 93 unions, 32 cooperatives and 30 by individual initiatives. Of the associations, 392 are located in İstanbul, 182 in Ankara, 55 in İzmir and 116 in other provinces. As for the dates of their establishment, 106 NGOs were established before 1950, 104 between 1951-1960, 159 between 1961-1970, 194 between 1971-1980, 488 between 1981-1990 and 659 between 1991 and the present. The fact that two-third of the NGOs in Turkey were founded in the last 15 years shows that the importance of NGOs in social life is understood well by the public.

Of 1726 NGOs in Turkey, 234 (14 %) carry out activities at local level, 537 (31 %) at province level, 182 (11%) at regional level, 764 (44 %) at national and 13 (1 %) at international level.

The general problems of NGOs in Turkey can be summarized as follows:

- Inadequate introduction
- Communication problems
- Need for cooperation
- Lack of governmental support
- Lack of public awareness
- The difficulties due to “Law on Associations”

7. The Place of Press Council among NGOs

The official website of Press Council (http://www.basinkonseyi.org.tr/lang_tr/) presents data about the applications and the decisions made between 2002 and today. The following table displays the distribution of the applications to the Council in Turkey after 2002 according to years:

Year	Application numbers
2002	68
2003	74
2004	78
2005	61
2006	60
2007	51
2008	26
2009	10

Table 2 shows the topic of the applications and the decision taken in 2009.

READERS COMPLAINTS	5
Lie news	3
Lacking news	3
False news	2
Condemnation of journalist	4
Condemnation of the medium	1
ORGANIZATIONS COMPLAINTS	3
Lacking news	2
False news	2
Condemnation of journalist	2
MEMBER OF PRESS COUNCIL COMPLAINTS	2
Lie news	2

Lacking news	1
Condemnation of the action	1
Unwarranted complaints	1

In 2009, a total of 10 applications were made to the council to express some complaints. Five of these were by the readers, 3 by the directors of various institutions and 2 by the members of the council. Of these ten applications, 4 were complaining about untrue news and 6 about biased news or news with missing information. As for the decisions regarding the applications, 8 stated that the journalist should be denounced and one decision was for the denunciation of the action. One of the applications was labeled as “ungrounded”.

It is observed that there is a considerable decrease in the number of the applications regarding biased and untrue news in recent years, especially in 2009 in which only 10 applications were discussed and decisions were made about them in the council’s last meeting on September 30th 2009. This number is very low compared to previous years’ figures. However, it is also possible that there might be some applications after this date until early December 2009 which have not been discussed yet.

The main reason for the decrease in the number of applications is that the council has started to lose its unifying characteristics in Turkish Media. As of 2005, many media organizations ended their membership in the council, namely Sabah Newspaper, ATV, Show TV, Akşam Newspaper, SKY Türk TV, Yeni Şafak Newspaper, Star Newspaper, Tercüman Newspaper, Kanal 7 and Zaman Newspaper. With these resignations, the only national media group left in the council today is Doğan Media Group.

The reasons leading to resignations in the council can be listed as follows:

- As of 1994, Doğan Media Group founded or bought many television channels or newspapers and monopolized the sector which changed ownership balance in the sector. Such monopolization was not on the agenda in the late 1980s when the council was established.
- The Supreme Board of the Council is predominately composed of Doğan Media Group employees, which shed some doubt on the objectivity of the council. In addition, Oktay Ekşi is criticized for being the chairman of the council more than 30 years since the establishment and for writing columns for one of the leading newspapers of Doğan Media Group.
- Today many journalists and readers believe that Press Council has lost its unifying power and importance.
- Press Council is believed to have had double standards in its decisions and practices. For example, the council was silent when a reporter were left alone in a snowy mountainous area by being rejected to get into a military helicopter; however it made press conferences and published denunciations for even simpler events. The silence of the council for the above mentioned event received a lot of criticisms by the media and related organizations. Zaman Newspaper announced that it ended its membership from the council as a reaction to this silence.
- The chairman Oktay Ekşi has been criticized for making the decisions on his will and giving his friends the privilege to be a member of the Supreme Board (Memurlar.net November 10th 2009).

- The administrative staff is believed to be reluctant to make self-criticisms and most of the decisions are considered biased by the member organizations. This situation resulted in resignations from the council.
- The council was not successful in having a powerful stand for professional rights of journalists. Moreover, the chairman and supreme board members often published criticisms against their colleagues which even contain insults.

8. Discussion

Press Councils have an important role in creating a civil society, especially due to its effective role in evaluating the complaints made by readers regarding news contents. NGOs should have a principled structure ready to deal with different interests and demands. However, Press Council decisions do not have sanction power, being just suggestions for the parties involved, which weakens the effectiveness of the Council. In addition, the fact that only one media group is represented in the council increased the doubts about it to a great extent. In short, as a result of these negative developments, the reputation of the council deteriorated and the number of the applications decreased considerably in recent years.

The institutions such as Press Council are necessary for healthy democracies and civil societies. However, Turkish Press Council has not achieved its mission since it could not improve itself and adapt to new developments in the world. Therefore, the structure of the council should be renewed immediately.

Abstract

Taking the multifoci perspective, the present study integrates social exchange and climate research to evaluate the effects of social exchange relationships (i.e., perceived organizational support [POS] and perceived team support [PTS]) on contact employees' prosocial service behaviors. A dyad data of 197 contact employees and supervisors in a large supermarket chain of Taiwan shows that POS and PTS are positively associated with the exhibition of extra-role customer service. However, only PTS contributes to role-prescribed customer service. This paper also demonstrates the relationship between POS and extra-role customer service is enhanced within a strong service climate. Through empirical examination, theoretical and managerial implications are discussed.

Key Words: perceived organizational support; perceived team support; role-prescribed customer service; extra-role customer service, service climate.

Introduction

Contact employees in service organizations often offer customers the first and the only impression of the service organization (Bowen & Schneider, 1985). As services are often intangible, customers will rely on employees' behavior to form opinions about the service offered (Clark, 1997). While role-prescribed behaviors are basic requirements for contact employees, extra-role customer service is an unexpected behavior that delights the customer through the provision of little extras and spontaneous exceptional service during the service encounter. Such service-related behaviors, which are going beyond simply meeting customer expectations, positively benefit the firm (Bettencourt & Brown, 1997). How employees behave in a service setting actually becomes part of the service and influences customer perceptions about a service

organization (Bitner, Booms, & Tetreault, 1990).

Since how employees treat customers is a reflection of how the organization treats its employees (Bowen, Gilliland, & Folger, 1999), internal social exchange within an organization must operate effectively and satisfactorily to have the organization achieve its goal of positive external exchange with customers (Yoon, Seo, & Yoon, 2004). Perceived organizational support (POS) (Eisenberger, Huntington, Hutchinson, & Sowa, 1986; Shore & Tetrick, 1991; Shore & Wayne, 1993) and perceived team support (PTS) are two essential components of the internal social exchange relationships associated with employee outcomes (Wayne, Shore, & Liden, 1997).

Despite the proximal difference between POS and PTS, employees are more sensitive to support from their teams than organizational support (Bishop, Scott, & Burroughs, 2000). The multifoci notion of social exchange suggests that employees can and do form multiple relationships at work with multiple parties (Cropanzano, Chrobot-Mason, Rupp, & Prehar, 2004). To advance understanding of this question, the current study examines the effects of POS and PTS on this prosocial service behavior by applying the multifoci perspective of social exchange.

Traditionally, service research has focused on identifying the individual attributes, such as personality or attitudes, that are associated with work behaviors in service settings (Bettencourt, Gwinner, & Meuter., 2001; Koys, 2001). There is a need to examine how service climate affects the relationship between multiple social exchanges and prosocial service behavior. As such, the other objective of this study is to examine the direct effect and the moderating effect of service climate when leveraging the impacts of POS and PTS.

Theoretical Background

Social Exchange Relationships

A pattern of mutually contingent social exchanges of gratification exists between two parties who support reciprocity under a generalized moral norm and two parties who conform to the norm of reciprocity to discharge their obligations in the future (Blau, 1964; Gouldner, 1960). Employees differentiate and react to the level of social exchange they perceive they have with the organization (as reflected in POS), their supervisors (as reflected in perceived supervisory support [PSS]), and their team (as reflected in PTS) (Bishop et al., 2000; Lavelle, Rupp, & Brockner, 2007; Rupp & Cropanzano, 2002).

From the multifoci perspective, an employee's perceived social exchange with a particular party should impact the behavior they direct toward that party (Masterson, Lewis, Goldman, & Taylor, 2000). POS and PTS are essential components of the social support associated with employee outcomes (Bishop et al., 2000; Wayne et al., 1997).

Prosocial Service Behaviors

Prosocial service behaviors includes both role-prescribed customer service and extra-role customer service (Bettencourt & Brown, 1997; Organ 1988). Role-prescribed customer service

refers to expected employee behaviors when serving a firm's customers (Brief & Motowildo, 1986). In contrast, recent marketing researchers stress the importance of contact employees "delighting" the customer by providing spontaneous and exceptional service that influences customer satisfaction and emotional responses in both internal and external service encounters (Bettencourt & Brown, 1997; Bitner et al. 1990).

POS and Prosocial Service Behaviors

According to the reciprocity rule, as employees perceive greater organizational support, their sense of obligation to the organization to reciprocate with helpful behaviors increases (Shore & Wayne, 1993). When a high-quality employment relationship exists, one way contact employees can reciprocate this social exchange is by performing the type of behavior valued in their work environment and extending that behavior beyond the normal role requirements (Coyle-Shapiro, Morrow, & Kessler, 2006). High-quality employment relationships will prompt contact employees to perform more prosocial service behaviors (Gakovic & Tetrick, 2003). Based on this discussion, the following hypotheses are thus proposed:

H₁: Contact employee perception of organizational support will positively relate to employee prosocial service behaviors.

H_{1a}: Contact employee perception of organizational support will positively relate to employee role-prescribed customer service.

H_{1b}: Contact employee perception of organizational support will positively relate to employee extra-role customer service.

PTS and Prosocial Service Behaviors

Team member exchange (TMX) is the quality of the exchange relationships that exist among coworkers in the work group (Seers, 1989). When individuals perceive team members as supportive and concerned for their welfare, they will reciprocate by carrying out activities that contribute to the effectiveness of their entire team (Griffin, Neal, & Parker, 2007). Although employees can distinguish between and reciprocate actions directed at co-workers versus those directed toward the organization, positive feelings about the team members can produce a spillover effect toward customers. As such, contact employees who feel supported by their team are likely to exhibit discretionary, extra-role service behaviors.

H₂: Contact employee perception of team support will positively relate to employee prosocial service behaviors.

H_{2a}: Contact employee perception of team support will positively relate to employee role-prescribed customer service.

H_{2b}: Contact employee perception of team support will positively relate to employee extra-role customer service.

Service Climate and Prosocial Service Behaviors

A service climate refers to a set of practices and procedures for service delivery and service quality that differentiates one organization from others. These practices and procedures influence the service-related behaviors of individuals in the organization (Kelley, 1992). Employees in these environments will receive stronger and more frequent demands related to the attainment of their goals for meeting customer expectations. As a result, employees in a stronger service climate are more likely to perform extra-role customer service behaviors. Based on this discussion, the following hypotheses are proposed:

H₃: Service climate will positively relate to contact employees' prosocial service behaviors.

H_{3a}: Service climate will positively relate to contact employees' role-prescribed customer service.

H_{3b}: Service climate will positively relate to contact employees' extra-role customer service.

Service Climate as Moderator

Social exchange theory predicts that if employees perceive that the organization is concerned with their well-being, employees will develop an implicit obligation to reciprocate by carrying out behaviors that benefit the organization (Blau, 1964). In particular, employees may reciprocate those positive experiences they have in the work environment by carrying out their core tasks to a high standard and performing citizenship activities (Tsui, Pearce, Porter, & Tripoli, 1997). In the service literature, Schneider and his colleagues (2005) argue that when employees work in an environment in which customer service is a concern and is a rewarded behavior, they are likely to follow suit and perform extra-role service behaviors as reciprocation for organizational support. Hence, the following hypotheses are proposed:

H₄: The positive relationship between POS and prosocial service behaviors will be moderated by service climate, such that this relationship is stronger when the service climate is strong.

H_{4a}: The positive relationship between POS and role-prescribed customer service will be moderated by service climate, such that this relationship is stronger when the service climate is strong.

H_{4b}: The positive relationship between POS and extra-role customer service will be moderated by service climate, such that this relationship is stronger when the service climate is strong.

Good social exchange relationships between team members does result in a positive effect on role-prescribed service behaviors as well as extra-role service behaviors. In addition, team support can enhance team cohesion and elicit more frequent interaction between coworkers (Dobbins & Zaccaro, 1986 ; Zaccaro & Lowe, 1988).When there is a strong service climate, contact employees who are supported by their team members are likely to understand the importance of customer service behaviors. Therefore, the following hypotheses are proposed:

H₅: The positive relationship between PTS and prosocial service behaviors will be

moderated by service climate, such that this relationship is stronger when the service climate is strong.

H_{5a}: The positive relationship between PTS and role-prescribed customer service will be moderated by service climate, such that this relationship is stronger when the service climate is strong.

H_{5b}: The positive relationship between PTS and extra-role customer service will be moderated by service climate, such that this relationship is stronger when the service climate is strong.

Methodology

Procedure

The current study drew its sample from a large supermarket chain in Taiwan. The supermarket chain has 36 branch stores around Taiwan. We contacted each store manager to by telephone and then sent questionnaires to those store managers who agreed to distribute the study to their employees and supervisors. This effort produced a pool of 14 branches and supervisor-contact employee dyads. Overall, the effective response rate of branches was 33 percent.

The data were collected through the use of two separate questionnaires and two survey instruments: One for contact employees and one for supervisors. The contact employee survey included measures of POS and PTS. Employees completed their forms in a room during working hours. Supervisor surveys included measures of service climate and each employee's prosocial service behavior.

Participants

The participants in this study consisted of employee-supervisor dyads at 14 branches of Taiwan's largest supermarket chain. A total of 280 employee-supervisor dyads were surveyed. The data from the remaining 197 fully completed survey packets were analyzed. The effective response rate was thus 70 percent. The final sample of contact employees averaged 28.41 years old ($SD = 5.81$), and had been employed by the supermarket chain for an average of 3.82 years ($SD = 3.26$). Males represented 60 percent of the contact employee sample and 30 percent of these were married. The final sample of supervisors averaged 31.56 years old ($SD = 4.12$), and had worked for the organization for an average of 6.35 years ($SD = 2.89$). Males represented 76 percent of the supervisor sample and 45 percent of these were married.

Measures

Perceived organizational support (POS). To assess contact employees' perception of the organizational value of their contributions and care for their well-being, this study selected six high-loading items from the SPOS (*Survey of Perceived Organizational Support*; Eisenberger et al., 1986) with factor loadings ranging from .71 to .82.

Perceived team support (PTS). To assess employees' perceptions that their team members provide assistance and share information, this study adapted four items developed by Zhou and George (2001) with factor loadings ranging from .69 to .83.

Prosocial service behaviors. Prosocial service behaviors were measured, using the 10-item customer service scale by Bettencourt and Brown (1997). The 10 items had 2 dimensions, including role-prescribed customer service and extra-role customer service. In the present study, supervisors were asked to assess their subordinates' prosocial service behaviors on a five-point Likert scale.

Service climate. The branch's service climate was measured, using the seven-item Global Service Climate Scale (Schneider, White, & Paul, 1998). The supervisors responded to a 5-point Likert scale from 1 (*poor*) to 5 (*excellent*) on the basis of their observations.

Control variables. Several control variables were included in our statistical analysis to reduce the possibility of spurious relationships based on unmeasured variables. Employee gender, age, tenure, and level of education are commonly specified control variables in studies of POS and job performance (Rhoades & Eisenberger, 2002; Hofmann, Morgeson, & Gerras, 2003). Participating contact employees reported gender (0 = female, 1 = male), age, level of education (0 = high school, 1 = college), and tenure (number of years).

Results

Table 1 shows the correlations between the major variables and their descriptive statistics. POS had statistically significant positive relationships with role-prescribed customer service and extra-role customer service ($r = .14, .18, p < .05$). PTS had a statistically significant positive relationship with both customer service behaviors ($r = .15, .16, p < .01$). Service climate was also correlated with role-prescribed customer service and extra-role customer service ($r = .28, .49, p < .01$)

Table 1. Means, Standard Deviations, and Intercorrelations for Study Variables

Variable	Mean	SD	1	2	3	4	5	6	7	8
1. Gender	0.60	0.48	-							
2. Age	28.41	5.81	-.03	-						
3. Tenure	3.82	3.26	-.07	.47**	-					
4. Level of education	0.64	0.47	-.07	-.03	-.07	-				
5. Perceived organizational support	2.97	0.61	.02	.09	.06	-.16*	-			
6. Perceived team support	3.49	0.60	.02	.07	.11	.01	.49**	-		
7. Role prescribed customer service	3.75	0.52	-.01	.27**	.17*	.15*	.14*	.15*	-	
8. Extra-role customer service	3.82	0.87	-.03	.34**	.17*	-.02	.18*	.16*	.52**	-
9. Service climate	3.70	0.60	.01	.22*	.11	-.03	.20*	.17**	.28**	.49**

* $p < .05$. ** $p < .01$.

The regression analysis results are presented in Table 2. Hypothesis 1 predicted effects of POS and PTS on role-prescribed customer service. The results show that only PTS was positively

related to role-prescribed customer service ($\beta = .277, p < .01$). Only H_{1b} was supported. Hypothesis 2 predicted effects of POS and PTS on extra-role customer service. In support of this hypothesis, both POS ($\beta = .120, p < .05$) and PTS ($\beta = .274, p < .01$) were positively related to extra-role customer service. H_2 was thus supported. Hypothesis 3 predicted an effect of service climate on both forms of prosocial service behaviors. In support of this hypothesis, service climate was positively related to both role-prescribed customer service ($\beta = .200, p < .01$) and extra-role customer service ($\beta = .716, p < .01$). H_3 was thus supported.

Hypothesis 4 predicted that service climate would positively moderate the effect of POS on both dependent variables. As shown in Table 2, the interaction between POS and service climate was significant for extra-role customer service ($\beta = .085, p < .05$), but not for role-prescribed customer service. Only H_{4b} was thus supported. Hypothesis 5 predicted that service climate would positively moderate the effect of PTS on both forms of prosocial service behaviors. The interaction between PTS and service climate was not significant for either extra-role customer service or role-prescribed customer service. H_5 was thus not supported.

Table 2. Results of Hierarchical Regression Analyses Predicting Prosocial Service Behaviors

Step	Variable	Role-prescribed Customer Service			Extra-role Customer Service		
		Step1	Step2	Step3	Step1	Step2	Step3
1.	Gender	.020	.005	.066	-.023	.010	.008
	Age	.021**	.018**	.018*	.028**	.029**	.014**
	Tenure	.001	.002	.002	.001	.001	.002
	Level of education	.164*	.193*	.135	-.012	.010	.020
2.	POS		.066	.067		.120*	.119*
	PTS		.277**	.278**		.274**	.234**
	Service climate		.200**	.196**		.716**	.710**
3.	POS × Service climate			.132			.085*
	PTS × Service climate			.050			.011
	R^2	.094	.211	.218	.084	.700	.722
	Adjusted R^2	.076	.178	.183	.065	.687	.698
	ΔR^2		.117	.124		.616	.638
	F value	5.009**	6.322**	8.881**	4.419**	46.930**	42.584**

Note. The displayed coefficients are standardized beta weights at each step. One-tailed tests of significance were used to evaluate the significance of the beta weights for the main and moderating effects of POS and PTS.

* $p < .05$. ** $p < .01$.

To explore the nature of the significant interaction noted above, this study conducted a simple slope analysis to graph the interaction and test differences between different levels of service climate (Cohen, Cohen, West, & Aiken, 2003). As shown in Figure 2, the simple slope for

the regression of extra-role customer service onto POS within high service climates was significant (simple slope = 0.45, $t=2.079$, $p<.05$). Within low service climates, the relationship between POS and extra-role customer service was non-significant (simple slope = 0.18, $t=1.15$).

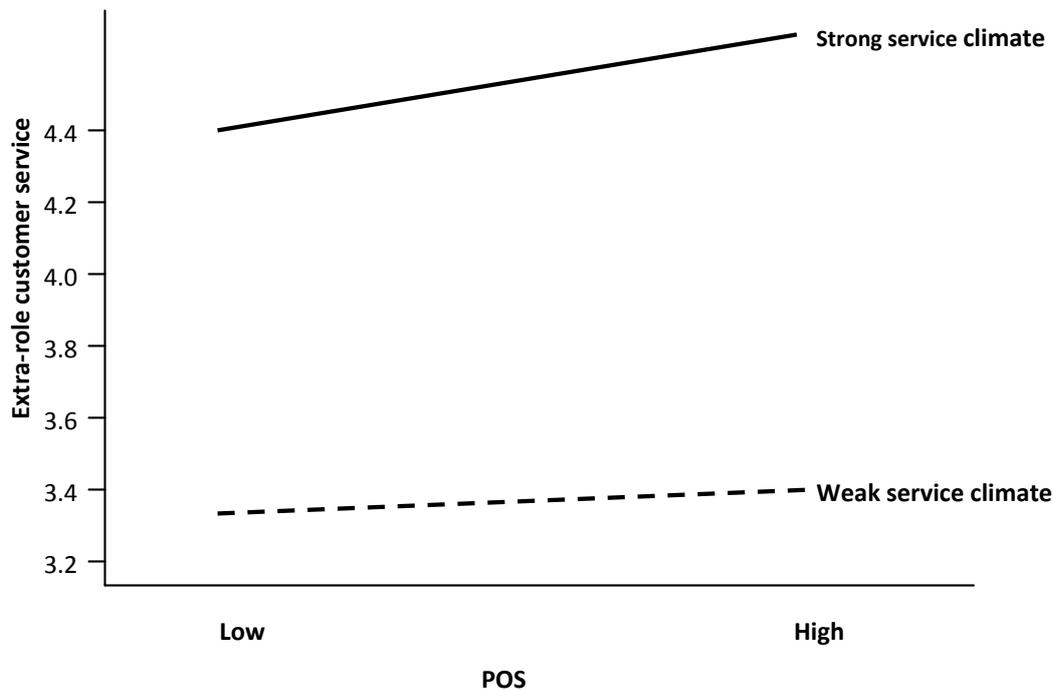

Figure 1. Plot of Simple Slopes of the Relation between POS and Extra-role Customer Service as a Function of High and Low Values of Service Climate

Discussion

Theoretical Implications

In this study, PTS was positively related to in-role customer service, whereas POS was not. These findings are consistent with a large body of prior research, indicating that social exchange with team members or supervisors are better predictors of in-role work behavior than social exchanges with an organizational focus. (Rupp & Cropanzano, 2002; Wayne et al., 1997). There may be an importance in taking a multifoci perspective of social exchange relationships at work when examining factors that contribute to in-role work behavior or in-role job performance. On the other hand, both POS and PTS were found to be positively associated with extra-role customer service. One possible explanation is that team member social exchange can predict organization- directed as well as individual-directed extra-role behavior.

As predicted, employees who belonged to groups with a strong service climate reported that they delivered more role-prescribed customer service and extra-role customer service. These findings are quite consistent with the literature. A growing number of service climate studies indeed show that employee perceptions regarding their organization's commitment to service excellence and delivery of clear service policies at the organizational level are linked to individual in-role service behavior (Schneider & Bowen, 1992; Schneider et al., 1998).

The most notable finding of the current investigation is that the organizational climate acts as a contextual moderator of the relationship between POS and extra-role customer service. In the study, the positive relationship between POS and extra-role customer service was strengthened by service climate. These findings are consistent with the view that organizational climate establishes a context that emphasizes certain extra-role behaviors as being important and that POS then predicts the degree to which contact employees integrate such extra-role behaviors within this domain into their prescribed work roles.

Managerial Implications

Given the importance of contact employee performance (both role-prescribed customer service and extra-role customer service) to service organizations, the results here can provide valuable feedback to managers and supervisors. In terms of role-prescribed customer service, the quality of the social exchange relationship between an employee and his or her work group is of critical importance, seemingly more so than the relationship with the organization. In contrast, both the social exchange relationship with the organization and co-workers positively relate to employee performance of extra-role customer service. These findings remind managers that the various sources of social exchange partners are not necessarily equivalent in their relation to prosocial service behavior. If the goal of management is to promote role-prescribed customer service, it will be necessary to foster social exchange with team members. If the goal is to promote extra-role customer service, it is necessary to foster social exchange relationship with the organization as well as team members.

This current study also highlights the importance of service climate. The climate can signal employees on the organization's expectations of certain prosocial service behaviors (Schneider et al., 1998). Organizational efforts to shape employee perceptions of the service climate – via detailed service codes, customer-related training programs, and strategic use of reward systems that signal to employees the importance of extra-role behaviors – can enhance the overall extent to which employees will deliver extra-role customer service (Schneider & Bowen, 1993).

Limitations and Directions for Future Research

Despite the above-mentioned implications, several limitations of this study should be recognized. First, some possibility exists for response biases to occur, for example, social desirability. While subordinates might have inflated the exchange relationship, supervisors were also likely to rate subordinates' service behaviors higher than they were in reality. Previous research has convincingly demonstrated that observed levels of socially desirable responses do vary with the level of anonymity (Randall & Fernandes, 1991). To deal with the effects of socially desirable responses, the researchers assured respondents that their names would never be associated with the findings. It is hoped that emphasizing both confidentiality and anonymity alleviated response bias among the respondents. Another limitation is related to the sample used in this study. Our sample included 197 employees who had been with the organization three years or more. Because of the complexity of the hypothesized model, it is important that the model be

tested using a larger and more diverse sample. Future research is needed to examine how POS and PTS develop over time with new employees. Finally, the design was cross-sectional, circumscribing our ability to make causal inferences; thus, longitudinal inquiries would be extremely valuable.

The results of this study have a number of implications for future research. First, the researchers take the multifoci perspective here to examine the relationship between multifoci social exchanges and prosocial service behavior. Although we use the spill-over effect to explain why PTS is positively related to extra-role customer service, there is a lack of evidence to prove that employees reciprocate team support by exhibiting cooperation behavior toward co-workers and extra-role customer service toward customers. We did not assess the helping or cooperation behavior of employees in this study. Future studies might investigate the cross-foci or spill-over effects in terms of multifoci social exchanges that predict multifoci work behaviors toward different beneficiaries (i.e., the organization, co-workers, and supervisors).

Second, the results of this research show that service climate is actually a more dominating factor for predicting prosocial service behavior than are POS and PTS. Service climate does not strengthen the relationship between PTS and both forms of prosocial service behavior. Borrowing from the multifoci perspective, we propose that team service climate may play a key role in moderating the relationship between PTS and prosocial service behavior. Future research is suggested to measure team member consensus for team service climate as well as organizational service climate so as to examine further the proposed notion of multifoci climate.

Abstract

This study was conducted to investigate elementary school teachers' attitudes and motivation toward web-based professional development. Also, the relationship between teachers' attitudes and motivation toward web-based professional development was explored. In this study, the teachers' attitudes and motivation toward web-based professional development were assessed with the Attitudes toward Web-based Professional Development Survey (AWPD) and the Motivation toward Web-based Professional Development Survey (MWPD) respectively. The AWPD was consisted of four scales, including "Perceived usefulness", "Perceived ease", "Affection", and "Behavior", while the MWPD was consisted of six scales, including "personal interest", "practical enhancement", "social stimulation", "social contact", "occupational promotion", and "external expectation". By gathering questionnaire data from 356 elementary school teachers, this study revealed that the teachers showed positive attitudes toward web-based professional development, and the teachers attained highest scores in the "personal interest" scale, followed by "practical enhancement", "social stimulation", "social contact", "occupational promotion", and "external expectation". No gender difference on teachers' attitudes and motivation was found in this study ($p>0.05$). However, the significant differences in age were found to be related to the motivation and attitude toward web-based professional development. More importantly, this study also showed that, in general, the teachers' attitudes and their motivation toward web-based professional development were significantly positively correlated with each other ($p<0.05$). It indicated that the higher motivation teachers have the more positive attitudes toward web-based professional development they may show.

Keywords: attitudes, motivation, web-based professional development

1. Introduction

In the past decade, the rapid diffusion of the Internet has not only generated a renewed interest in the role of new information and communication technologies (ICTs) in educational contexts, but it has also affected the ways people teach and learn (DeLacey & Leonard, 2002). With the rapid development of the Internet, teachers have more opportunities to employ the Internet and Web for their practices and advance their professional development (Park, Lee & Cheong, 2007). Recently, the advantages of web-based learning have been widely recognized and accepted. Research suggests that technology-mediated learning environment affords more study flexibility, broader accessibility and improves students' performance (Alavi, 1994; Lee, Cheung & Chen, 2005).

Moreover, the relevant studies about learner's acceptance and usage toward web-based learning have been highlighted (Liaw, Huang, & Chen, 2007; Kao & Tsai, 2009). Technology Acceptance Model (TAM) has been widely used to predict user acceptance and usage behavior (Davis, 1989). In TAM, an individual's belief determines the attitude toward using the system and, in turn, the attitude develops the intention to use. This intention influences the decision of actual technology usage. These causalities are broadly studied and accepted (Suh & Han, 2002; Morris & Dillon, 1997). The TAM has shown that motivation formulates the mechanism of human behavior and action. And, the motivational model was adapted by Davis et al. (1992) employs two key constructs: extrinsic and intrinsic motivation. Motivation theorists argue that the reason individuals perform actions is not only because of external interests but for their intrinsic needs (Agarwal & Karahanna, 2000; Davis, Bagozzi & Warshaw, 1992).

With the proliferation of the Internet and convergence technologies, researchers have modified TAM to demonstrate the empirical evidences of it in the web-based learning context (Shin, 2007). Some recent studies have empirically investigated learners' acceptance in the web-based learning environment (Lee, Cheung & Chen, 2005; Raaij & Schepers, 2006). In other words, teachers' motivation toward web-based professional development can be an important issue for investigating. Therefore, this study aimed to incorporate the extrinsic and intrinsic motivators to explore the explanation and prediction of teachers' acceptance and usage toward web-based learning.

Many pervious Internet technologies related behavioral studies have used the belief-attitude-intention-behavior chain represented by the TAM formulation to successfully predict learners' online acceptance behavior (Heijden, 2003; Saade & Bahli, 2005). In addition, past studies that have investigated the role of motivation in Internet use also confirm that motivation has a positive impact on new technology adoption and use (e.g., Lin, 1998; Stafford & Stern, 2002). Also, instrumental use of media and technology with greater motivation has been found to produce stronger attitudinal and behavioral effects on the use of media and technology (Rubin, 2002; Windahl, 1981). Hence, it is plausible to hypothesize that teachers' motivation toward web-based professional development may affect their attitude toward web-based professional development. To examine this perspective, this study aimed to examine the

relationship between teachers' motivation and attitude toward web-based professional development.

In sum, the major purpose of this study was to probe teachers' motivation and attitude toward web-based professional development. To this end, two questionnaires for assessing teachers' motivation and attitude toward web-based professional development were developed in this study. In addition, teachers' Internet self-efficacy was also examined. Then, the possibility of using teachers' Internet self-efficacy in predicting their motivation toward web-based professional development was examined. By gathering questionnaire responses from 356 elementary school teachers in Taiwan, this study addressed the following questions:

1. Will the teachers' background characteristics, such as gender and age, make any difference to their motivation and attitude toward web-based professional development?
2. What are the relationships between the teachers' motivation toward web-based professional development and their attitude toward web-based professional development?

2. Method

2.1 Sample

The participants of this study were randomly selected from 20 elementary schools in north region of Taiwan. The final sample included 356 Taiwanese elementary school teachers of which 151 (42.4%) were male and the remaining 205 (41.3%) were female. Among these teachers, 101 (28.4%) were less than 30-years-old, 147 (44.8%) were 31-40 years-old, 108 (30.3%) were more than 41-years-old.

2.2 Instruments

To assess the teachers' motivation and attitude toward web-based professional development, two instruments were implemented in this study.

The Motivation toward Web-based Professional Development Survey (MWPD) administered in this study was developed on the basis of some relevant studies (e.g., Boshier, 1991; Mulenga & Liang, 2008). As a result, the initial pool of items in the survey included a total of 36 items, which were presented by using a seven-point Likert mode (ranging from 1, "strongly disagree" to 7, "strongly agree"). Six scales were designed for MWPD. The details of the six scales are as follows:

1. Personal interest: People who score high on this scale participate in web-based professional development for its own interest. That is, they care about the inherent joy of web-based professional development that impels their participation. A sample item of this scale is "I learn for the joy of it while participating in web-based professional development".
2. Occupational promotion: People who score high on this scale participate in web-based professional development mainly because of maintaining current job or getting a new job.

That is, web-based professional development is a way to advance professionally. A sample item of this scale is “I participate in web-based professional development for getting a better job”.

3. External expectation: People who score high on this scale participate in web-based professional development because of the expectation from someone at work. A sample item of this scale is “I participate in web-based professional development to be influenced by colleagues’ encouragement”.
4. Practical enhancement: People who score high on this scale are committed to "doing good" in education. That is, they think web-based professional development helps them do good work in education. A sample item of this scale is “I participate in web-based professional development to help me acquire better instructional ways for students”.
5. Social contact: People who score high on this scale participate in web-based professional development because of the joy of interacting with others. A sample item of this scale is “I participate in web-based professional development to make more friends with the same interest”.
6. Social stimulation: People who score high on this scale are usually lonely or bored in regular life or teaching and they participate in web-based professional development to meet others and to grapple with problems in their social life. A sample item of this scale is “I participate in web-based professional development to take break from routines”.

The Attitudes toward Web-based Professional Development Survey (AWPD) implemented in this study was adapted from Kao and Tsai’s (2009). We modified some items from their questionnaire. As a result, the 24 items were presented by employing a seven-point Likert scale (from 1, “strongly disagree” to 7, “strongly agree”). The details of the four factors (scales) are as follows:

1. Perceived usefulness scale: assessing perceptions of the extent to which teachers perceive that the impact of web-based professional development are positive and useful.
2. Perceived ease of use scale: assessing perceptions of the extent to which teachers perceive that the web-based professional development are easy to use.
3. Anxiety scale: measuring perceptions of the extent to which teachers experience the anxiety about web-based professional development. The scale score is scored in reverse.
4. Behavior scale: measuring perceptions of the extent to which teachers perceive actual practice and willingness to use web-based professional development.

2.3 Data analysis

To fulfill the main purposes of this study, factor analysis, T test, ANOVA and correlation were conducted as the statistical methods in this study. The factor analysis was utilized to reveal the scales of the instruments on the teachers’ MWPD and AWPD. In addition, this study also gathered teachers’ information about gender and age. By t-tests, gender differences on teachers’

MWPD and AWPD were analyzed. Also, the scales were examined via analysis of variance (ANOVA) to analyze age differences. Moreover, correlation analysis was utilized to examine the relationship between teachers' motivation and attitude toward web-based professional development.

3. Results

3.1 Factor analysis

Through the factor analysis, the final version of the MWPD consisted of 29 items with six scales. The reliability coefficients for the scales respectively were 0.91 (personal interest, 5 items), 0.84 (occupational promotion, 4 items), 0.89 (external expectation, 6 items), 0.90 (practical enhancement, 5 items), 0.91 (social contact, 5 items) and 0.90 (social stimulation, 4 items). The factor loadings for the retained items are shown in Table 1. The alpha value of the whole MWPD questionnaire is 0.94 and these scales explained 75.39% of variance totally. Therefore, these scales were deemed to be sufficiently reliable for assessing teachers' motivation toward web-based professional development.

Table 1. Rotated factor loadings and Cronbach alpha values for MWPDP scales

Scale	Factor 1	Factor 2	Factor 3	Factor 4	Factor 5	Factor 6
Factor 1: External expectation, $\alpha=0.89$						
Expectation 1	0.820					
Expectation 2	0.821					
Expectation 3	0.611					
Expectation 4	0.852					
Expectation 5	0.682					
Expectation 6	0.682					
Factor 2: Personal interest, $\alpha=0.91$						
Personal 1		0.804				
Personal 2		0.896				
Personal 3		0.674				
Personal 4		0.847				
Personal 5		0.832				
Factor 3: Social contact, $\alpha=0.91$						
Social 1			0.771			
Social 2			0.814			
Social 3			0.767			
Social 4			0.649			
Social 5			0.666			
Factor 4: Practical enhancement, $\alpha=0.90$						
Practical 1				0.558		
Practical 2				0.613		
Practical 3				0.837		
Practical 4				0.770		
Practical 5				0.795		
Factor 5: Occupational promotion, $\alpha=0.84$						
Occupational 1					0.780	
Occupational 2					0.689	
Occupational 3					0.859	
Occupational 4					0.668	
Factor 6: Social Stimulation, $\alpha=0.90$						
Stimulation 1						0.696
Stimulation 2						0.782
Stimulation 3						0.678
Stimulation 4						0.617
Percentage of variance	41.22	10.69	8.73	7.13	4.01	3.61
Overall $\alpha=0.94$ Total variance explained is 75.39%						

In addition, the aforementioned method was adopted to clarify the structure of attitude toward web-based professional development (AWPD). The factor loadings for retained items are presented in Table 2. The latest version of the AWPD consisted of 18 questionnaire items with four scales and the reliability coefficients for each scales of the AWPD respectively were 0.92, 0.93, 0.93 and 0.87. The alpha value of the whole AWPD questionnaire is 0.90 and these factors explained 79.73% of variance totally. Therefore, these scales were deemed to be sufficiently

reliable for assessing teachers' attitudes toward web-based professional development.

Table 2. Rotated factor loadings and Cronbach alpha values for AWPDP scales

Item	Factor 1	Factor 2	Factor 3	Factor 4
Factor 1: Ease of use, $\alpha=0.92$				
EASE 1	0.718			
EASE 2	0.852			
EASE 3	0.732			
EASE 4	0.860			
EASE 5	0.822			
Factor 2: Behavior, $\alpha=0.93$				
Behavior 1		0.820		
Behavior 2		0.882		
Behavior 3		0.870		
Behavior 4		0.815		
Behavior 5		0.840		
Factor 3: Perceived usefulness, $\alpha=0.93$				
Perceived use 1			0.775	
Perceived use 2			0.857	
Perceived use 3			0.730	
Perceived use 4			0.691	
Perceived use 5			0.709	
Factor 4: Anxiety, $\alpha=0.87$				
Anxiety 1				0.879
Anxiety 2				0.889
Anxiety 3				0.866
Percentage of variance	47.14	16.93	9.77	5.89

Overall $\alpha=0.90$. Total variance explained is 79.73%

3.2 Background differences on MWPD & AWPDP scales

In this study, t-test and ANOVA tests were employed to examine the background differences such as gender and age on the MWPD and AWPDP scales. First, a series of t-tests were performed on the gender differences of teachers' mean scores for the MWPD and AWPDP. The result of this study indicated no significant differences were found on the scales of teachers' motivation and attitude of participating web-based professional development between two genders.

Moreover, in order to compare the possible differences derived from age, we categorized the teacher respondents into three major groups: <30 years, 31-40 years, and >41 years. The ANOVA tests, presented in Table 3, indicated that age differences played a statistically significant role in three of the MWPD scales ($p < 0.05$) and two of the AWPDP scales ($p < 0.05$). A series of Scheffe tests indicated that <30 year-old teachers tend to express stronger personal interest, external expectation and social stimulation of motivation toward professional development than 31-40 year-old and more 41 year-old teachers. Moreover, the Scheffe tests further indicated that <30 year-old teachers tend to express more positive attitude toward professional development than 31-40 year-old teachers. These comparisons indicated that younger teachers had higher

confidences such as personal interest, external expectation and social stimulation and more favorable attitudes such as usefulness and ease of use toward web-based professional development than elder teachers.

Table 3. Teachers' motivation and attitude toward web-based professional development among different age groups

Age Group	(1) Less than 30 years (mean, SD)	(2) 31-40 years (mean, SD)	(3) 41+ years (mean, SD)	F(ANOVA) Scheffe Test
Motivation toward web-based professional development				
Personal interest	6.06(0.74)	6.03(0.71)	5.72(0.97)	2.95*(1 > 3, 2 > 3)
Occupational promotion	5.42(1.02)	5.36(1.10)	5.31(1.30)	1.65(n.s.)
External expectation	5.08(1.23)	4.69(1.32)	4.75(1.21)	2.76* (1 > 2)
Practical enhancement	5.80(0.90)	5.74(0.93)	5.88(0.81)	1.06(n.s.)
Social contact	5.52(0.96)	5.40(1.13)	5.45(1.12)	0.82(n.s.)
Social stimulation	5.59(1.17)	5.38(1.33)	5.20(1.57)	3.48* (2 > 3)
Attitude toward web-based professional development				
Perceive usefulness	5.97(0.82)	5.82(1.00)	6.09(0.74)	2.63*(1 > 2)
Perceive ease of use	5.78(0.86)	5.55(1.13)	5.70(0.98)	2.85*(1 > 2)
Anxiety	4.39(1.56)	4.29(1.50)	4.41(1.38)	0.42(n.s.)
Behavior	5.02(1.11)	4.99(1.35)	5.05(1.34)	0.37(n.s.)

* $p < 0.05$

3.3 Correlation motivation toward web-based professional development and Internet self-efficacy

The Pearson correlation coefficients shown in Table 4 indicated that the scales of the MWPD and the AWPD were significantly positively correlated with each other ($r > 0.17$, $p < 0.001$), except the result that no statistical correlation was found between anxiety and external expectation and practical enhancement of MWPD. These results in general, supported that teachers expressing stronger motivation would display more positive perceptions, less anxiety, and frequent usage toward web-based professional development. In particular, teachers' responses on the social contact and social stimulation scales were relatively more highly correlated with those on the behavior scale ($r > 0.51$, $p < 0.001$). This implied that teachers with stronger motivation to learn for better social interaction may help they attain more positive attitude of web-based professional development particularly for promoting frequent usage.

Table 4. Correlation of the teachers' motivation toward web-based professional development and attitude toward web-based professional development

	Personal interest	Occupational promotion	External expectation	Practical enhancement	Social contact	Social stimulation
Perceive usefulness	0.44***	0.23***	0.32***	0.47***	0.44***	0.45***
Perceive ease of use	0.37***	0.22***	0.40***	0.38***	0.41***	0.44***
Anxiety	0.18***	-0.25***	-0.01	-0.04	-0.17***	-0.19***
Behavior	0.32***	0.37***	0.24***	0.45***	0.53***	0.51***

** $p < 0.01$. *** $p < 0.001$.

4. Discussion and Conclusion

This study aimed to explore the relationship between teachers' motivation and attitude toward web-based professional development. To this end, two questionnaires to assess teachers' motivation toward web-based professional development (i.e., the MWPD) and attitude toward web-based professional development (i.e., the AWPD) were used in this study. The results showed that the MWPD and AWPD implemented in this study were sufficiently reliable to assess elementary school teachers' motivation and attitude toward web-based professional development.

Gender and age differences in Internet related issues have always been highlighted by researchers (e.g., Colley & Comber, 2003; Kadijevich, 2000; Kao & Tsai, 2009). The previous research concerning gender differences in motivation and attitude, in general, has shown that male learners had stronger motivation or more positive attitude than female learners (Corpus & Lepper, 2007; Warburton & Spray, 2008; Wu & Tsai, 2006). However, in this study, with the MWPD and AWPD, no gender difference in teachers' motivation and attitude on web-based professional development were found. It seems that both male and female teachers perceived similar levels of motivation and attitude toward web-based professional development.

Besides, in this study the age differences were found on teachers' motivation and attitude toward web-based professional development. And the result is consistent with those of previous studies concerning age differences in technology and Internet related perceptions (Vandenbroeck, Verschelden & Boonaert, 2008; Wu & Tsai, 2006).

It seemed that younger teachers expressed more positive attitude and stronger motivation toward web-based professional development. Therefore, educators should pay more attention to enhancing senior teachers' motivation and attitudes toward web-based professional development.

In this study, teachers' motivation toward web-based professional development was positively correlated with their attitudes toward web-based professional development. Teachers with stronger motivation would express more positive attitude of better perceptions, less anxiety and frequent usage for web-based professional development. It suggests that, to improve

teachers' attitudes toward web-based professional development, teachers' motivation toward web-based professional development should be highlighted.

In addition, researchers have proposed that the positive effects of training programs on learners' belief regarding the Internet (e.g., Lagana, 2008; Markauskaite, 2007). The results probably suggest that educators should try to find some effective ways to improve teachers' Internet-related capabilities and learning confidences in the web-based environments. It may be practicable for educators to enhance teachers' motivation toward web-based professional development by utilizing useful training programs. This study is quite helpful to facilitate the understanding of teachers' motivation and attitudes toward web-based professional development. By using the MWPD and AWPD questionnaires, educators and researchers can assess and review teachers' motivation and attitudes toward web-based professional development in a more effective way, with possibly higher validity.

Abstract

The objectives of this study were to investigate moral behavior, and factors related to moral behavior of Ministry of Social Development and Human Security Officials in Songkhla Province. The subjects of 193 were selected using the simple proportional random method. The instrument was a questionnaire on personal factors, officials' attitudes towards working in social development and moral behavior. The statistics used in analyzing the data were frequency, percentage, average, standard deviation, and Person's coefficient.

The findings revealed that the overall moral behavior of officials of the Ministry of Social Development and Human Security in Songkhla Province was at a high level. The hypothesis testing revealed that personal factors had no relationship with government officials' moral behavior while their attitudes towards social development work had statistically significant positive relationship with moral behavior.

Keywords: moral behavior, officials' attitudes towards working in social development

Introduction

The Ministry of Social Development and Human Security was established in 2002 to promote social development and create public equity and social justice. Its operation aims to encourage and develop quality of life and social security, family and community institutes. These responsibilities are to meet the government policy on social development for all target groups, especially children, youth, women, the underprivileged, the disabled and the elderly so that they have security in their living and their rights are protected according to the Constitution of the Kingdom of Thailand. Therefore, government officials working in social and human development should develop themselves so that they are high-minded, kind-hearted, with virtue and morality leading them to be dedicated in helping people solve their problems employing good governance and equity.

Purposes of the study

This study aims to investigate:

1. ethical behavior of government officials working for the Ministry of Social Development and Human Security in Songkhla Province
2. factors related to moral behavior of Ministry of Social Development and Human Security officials in Songkhla Province

Hypotheses of the study

1. Personal factors are related to moral behavior of government officials
2. Attitudes towards social development are related to moral behavior of government officials

Research methodology

Population and subjects

The population for this study consisted of 231 government officials, permanent employees and government employees working for 9 agencies attached to the Ministry of Social Development and Human Security except for the head of each agency. Krejcie and Morgan table was used to determine the sample size of 193 persons.

Research instruments

The research instrument was a questionnaire consisting of 4 parts: part 1. Personal data, part 2. An attitude measurement form to measure attitudes towards social development, part 3. A moral behavior assessment form to assess government officials' moral behavior according to the 5 core values specified by the Office of Civil Service Commission (OCSC), part 4. An open-ended questions (3 items) asking opinions on moral behavior development, problem and obstacles to development, and suggested solutions to problems in developing moral behavior of government officials by their agency (organization).

Data collection

The researcher distributed the revised version of the questionnaire to the government officials who were the subjects to answer and collect the questionnaires back in 10 days. All the 193 or 100 percent copies of the questionnaire were returned.

Data analysis

The statistics employed in analyzing the data were as follows. The data on personal factors were analyzed using frequency and percentage. The data on attitudes towards social development work and moral behavior of the government officials were analyzed using average and standard deviation. The relationships between personal factors and attitudes towards social development work and moral behavior were analyzed using Pearson's product moment correlation.

Results of the study

Attitudes towards social development work

The results of the study on attitudes towards social development work revealed that the overall belief in the characteristics related to social development work of the subject group was high ($X=2.43$). Overall, the subject group's assessment on the characteristics related to social development work was at a

moderate level ($X=1.81$), as a result, their attitudes towards social development work were at a moderate level.

Levels of ethical moral behavior

From the study on ethical moral behavior according to the 5 core values, it was found that the overall level of the subject group in terms of ethical moral behavior was high ($X=4.09$). When considered by item, it was found that all items of the ethical moral behavior were at a high level with the highest average for Result orientation followed by Nondiscrimination. The lowest average was on Moral courage.

Results of hypothesis testing

1. Personal factors are related to moral behavior of government officials

The results of the study revealed that personal factors, namely, gender, education, length of service, work position and additional training related to moral did not have a statistically significant relationship with moral behavior.

2. Attitudes towards social development are related to moral behavior of government officials

The results of the study revealed that attitudes towards social development work had a positive relationship with the government officials' moral behavior and the relationship was statistically significant at 0.01 with a coefficient (r) of 0.331.

Discussions and conclusion

It was found that attitudes towards work had a positive relationship with moral behavior of the government officials and the relationship is statistically significant at .01 ($r = .331$). This indicates that government officials have good attitudes towards their work and they, therefore, have moral behavior in their work. This is in line with Ajzen and Fishbein (1980) who claim that attitude is a component of a belief. Generally, people who believe that performing the behavior will lead them to a positive consequence have positive attitude toward their performing of that behavior. Likewise, people who believe that performing the behavior will lead them to a negative consequence will have a negative attitude towards performing that behavior. This is also in accordance with the study by Amarit Sawatdikun (1998) which found that the work attitude of government officials of the Department of Customs, Ministry of Finance had a significantly positive relationship with their moral behavior, and also in accordance with that by Penprapa On-thong (2005: abstract) which found that attitude towards profession had a significantly positive relationship with moral behavior of professional nurses at 0.01 ($r= 0.235$).

In conclusion, the subjects made the following recommendations for officials' moral behavior development: activities to promote officials' moral behavior should be organized continuously and rewards should be provided to give moral support to officials who work on the basis of virtue and morality.

ABSTRACT

Confronting the sweeping impact of knowledge-intensive economy, most of industry structure needs to follow the global shift and economy structure to adjust the business operation for enhancing the competitive advantages in the market. For the manufacturing, purely mass production and low-priced operation cannot break the paradox of the market. Therefore, the industry's transformation becomes the crucial project for the manufacturing in the global market. Servitization is the perspective advocated by the economic researchers and experts. From the product to the service oriented operating and combine the high-quality products themselves, the manufacturing can create extra value-added business. Recently, Taiwan manufacturing positively transform their business to the servitized style, such as Giant, Asus etc. They make effort to develop their service to extend their business successfully. As the servitization performance of Giant Manufacturing Cooperation the example, the framework of the research will adapts documentary analysis and in-depth case study. It would help for the analysis the service innovation success and deeply realize how a purely bicycle manufacturing becoming a well-known global enterprise. The purpose of this research expects to diagnose the integrated operation strategies of the servitized manufacturing and find out the service innovation model as the suggestion to the other manufacturing or traditional industries.

Keyword: Servitization, service innovation

1. Introduction

Under the sweeping trend of globalization drift, service sector become the crucial element involved in the industry. The rapid growth of the service sector in the 1980s and 1990s was the main performance in the market (Luis, 2007). According to Luis mentioned, service represent around 70% of developed economies. For the competitiveness, the enterprises have to treat the service as the significant factor for winning strategies. Taiwanese orientation of economy structure worked in the past focused on the mass production with original equipment manufacturing style, and normally occupied the numerous market sharing. Karlsson indicated the companies nowadays rarely survive as purely manufacturing enterprises because of the era of the knowledge economy influence the industries structure movement. (Karlsson, 2007) Labour intensive advantage declined in the decade. Therefore, the industry orientation in Taiwan moved toward to the knowledge intensive development and service gradually turns into the mainstream of the developing perspective of the market. Therefore, except of the mass production and quality maintenance, the concept of servitization building and executing in the manufacturing is vital mission for creating adding value. In the generation of knowledge economy, customer demand has been driven. Manufacturing enterprise can blend service into the overall strategy and focus on two ends of “smile curve” toward to the high value chain.

Despite the literature and researches advocated the benefits of extended service business in the manufacturing, most manufacturing companies or traditional industry will still find it difficult to increase service revenues successfully. They may not ready to accept the changes in their business. How to implement the service efficiently and appropriately enough into the business and provide high-value solutions to their customers is crucial issue in the industry. Therefore, the research tries to adopt the case of famous bicycle manufacturing firm as the studying benchmark. A purely manufacturing makes an enormous shift to combine service into their product and become an international bicycle company. It attempts to provide a better understanding of servitization and the necessary changes in a firm's activities.

1.1. Research Purpose

The purpose would expect to discuss and observe the servitization situation operating in the manufacturing and the importance for the transformation. Different from the service industry, the marketing strategies for promoting servitization in the manufacturing need to discover how to apply the advantages of manufacturing to develop the service. The research will focus on the manufacturing enterprise which servitized successfully and analyze the marketing strategy. As the new service” Ride life, Ride Giant” cycling tour business promoted by the Giant Manufacturing Co. Ltd. in 2008 as the research target. It would be intensively related to the Giant manufacturing Co. Ltd’s business management.

Firstly, the research diagnoses the influence of the servitized operation in the manufacturing transformation. By analyzing the best practice, provide the perspective of the servitized marketing strategies and as the suggestion for the manufacturing enterprises or the goods-dominant companies in Taiwan which confront the transition performance.

1.2. Research Scope

Giant Manufacturing Co. Ltd. Divide their business structure into different sections. Cross-disciplinary business for the traditional manufacturing becomes new business trend in the market. The servitization of Giant includes four parts, brand management, athletic marketing, social marketing and the new business, cycling tour agent. Each part contains some factors which affecting the servitization performance. Therefore, the project of bicycle tour agent will become the focus of this research but will adopt the ideas and service value from the other three.

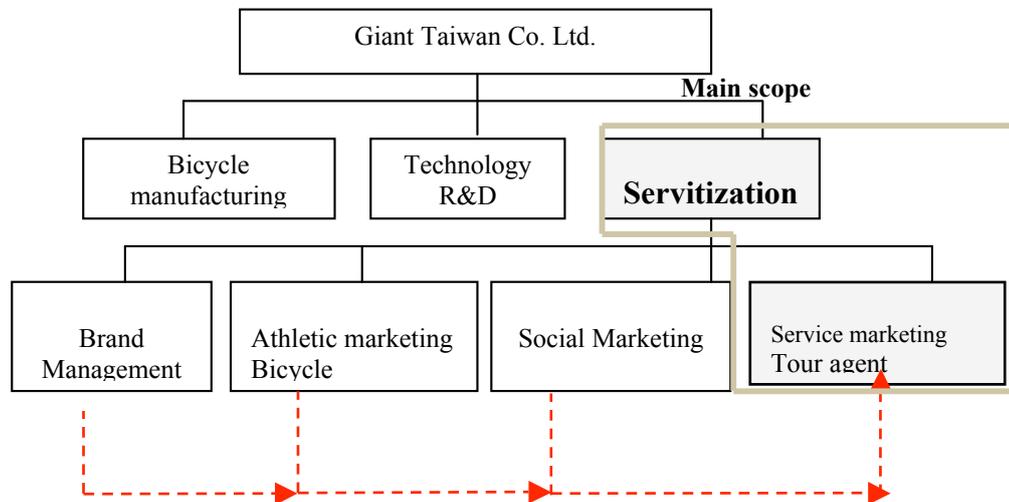

Figure 1. The research scope

2. Literature Review

2.1. Service-dominant logic

Kolter indicated the manufacturing produce the tangible products; however service be seen as offering something intangible (Kolter, 2003). The products become more complex with then generation movement, more service need to support them, pure manufacturing is difficult to survive.(Karlsson, 2007 and Neely, 2007) However, some findings indicated manufacturer becoming a service-focused business still existed some significant management challenges of the transferring process. The manufacturers can try to maintain the service logic while running the business. Products are usually accompanied by part of involved in service, and the services are facilitated by the products. Service activities have usually been customer-centric; nevertheless, customers would sometimes doubt about feasibility of the intangible service. The service looks to the manufacturing area for techniques support. Quality guaranty of products can enhance the service efficiency. (Grandall, 2008) The relationship between product and service gradually becomes closer. (Fitzsimmons, 2006, Ward & Graves, 2007)

2.2. Servitization in the manufacturing.

Servitization is the offer of integrated packages of product, service, support, self-service and knowledge to add value to the company's core business. (Vandermerwe & Rada, 1988) According to the mention from Vandermerwe and Rada about the idea of servitization, purely production gradually transformed. Service attached by the product such as basic post-sale

service was not enough satisfied the customers. Service needs to become the main support while promoting the products.

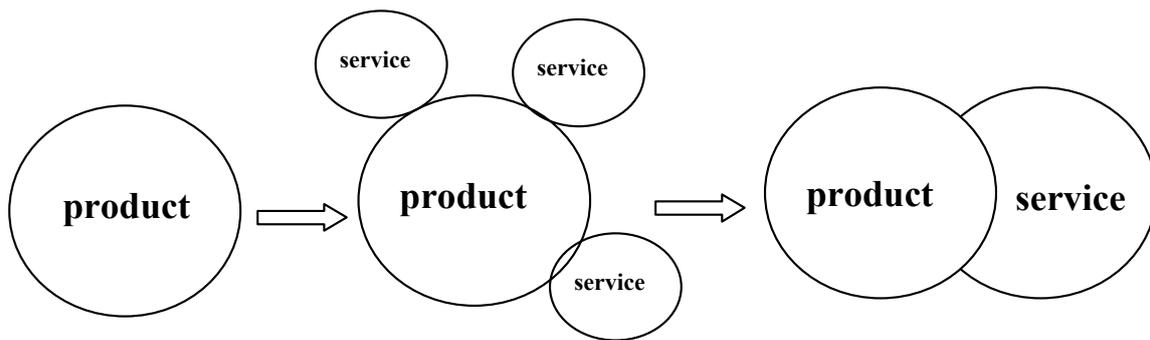

Figure 2. The relationship model between product and service

(Vandermerwe & Rada, 1988)

“Because of the economic impact, the manufacturing needed to think about how they add value to their customers’ outcome instead of merely focusing on the product transaction. They have to creating products that act like service systems. “(Morse, 2009) Different industries even the product-oriented manufacturing treat service appropriately as the customer-oriented strategy will create higher value in their business. Products represent only a small part of total creation, the main share of total value creation stems from services. However, because of the operation difference between manufacturing or traditional industry with the service industry, the company definitely need to the exploit the benefit of extend the service business with its own strategies. (Heiko, Thomas, and Elgar, 2006).

2.3. Boundary eliminated between manufacturing and service

Offering the appropriate service strategies is to satisfy the customer oriented market. For attracting the consumers’ attention, the service marketing definitely needs to be complete and emerge with its products. “A good manufacturer sees products sales as a single transaction, however, a service provider view and deals with a valued long-term relationship “(Morse, 2009) For promoting the service, the consideration should be multidimensional. For the customers’ diverse demand, the multidimensional service system can display the most effective function and outcome. Service design and offering is the action for creating the experience for the customers. Mange the service strategy well can create more impressive memory about the product to the customers. It will enhance the attention by recall the service touching (Audrey Gilmore & David Carson, 1996).

For the services supporting the core activities in the further business, integrating the manufacturing area with service can gain more advanced knowledge about customer's operations and demand.(Oliva & Kallenberg, 2003) As a successful service strategy, it needed to understand the market comprehensively for respect of the customer needs, market potential and future trends. The service position also needs to be defined because positioning is basic on the customers. The company must figure out what the perspective of product promotion and service operation to the customers and how to achieve the business goal (Young Zhu Lin, 2003). In the figure 3, Dr. Lin in his book, “Service Marketing “quoted Regis Mckenna’s positioning

model for explaining the service operation. From the model, it can extend and advance the Vandermerwe and Rada’s idea of servitization. Except the product quality and design, clear service position and operation will influence the enterprise, the market and crucial relationship with their customers.

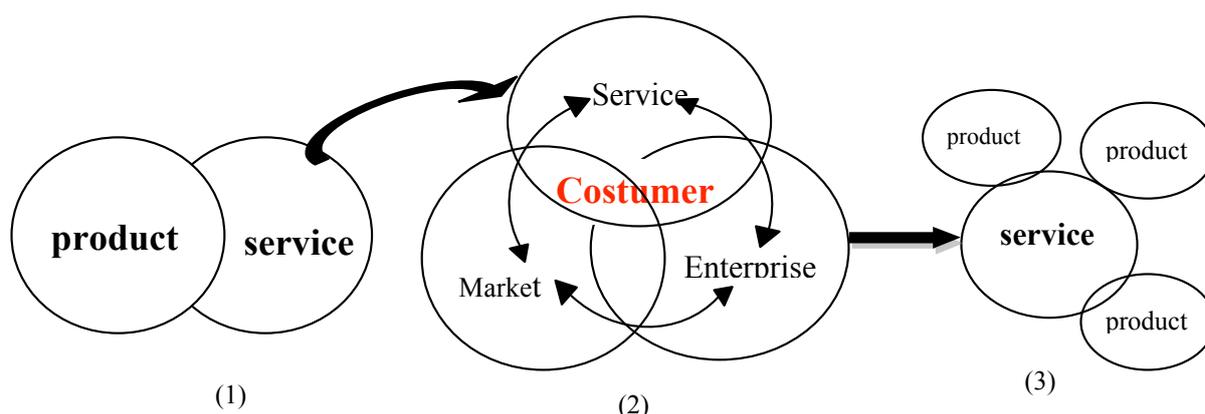

Figure 3. Service positioning(2) (Regis Mckenna, 1992)

Therefore, building up a network for sales, technical staff and external experts can systematically collect current and future customers’ needs. (Heiko, Thomas, and Elgar, 2006) The service mission is not just to make the product work, but to help the customer to maximize all different processes, actions and strategies that are able to associate with a supplier's product. (Heiko, Thomas, and Elgar, 2006)

3. Servitization-Giant tour agent

3.1. Giant Manufacturing Co. Ltd

Since 1972, Giant was an original bicycle-equipment manufacturing. During 1980s, Giant earned the brand and dedicated to build the reputation across other continents and countries. Till now, Giant bicycle company occupied fifty-odd countries cyclists with over ten thousand retail outlets still make efforts to work on the growth of cycling and cycling culture. The Giant headquarter is in Taiwan and the manufacturing factories is set up in both China and Netherland and produce around 5 million various bicycles per year. The business extends to the Europe, America, Japan, China, Canada, Australia and Taiwan. The Capital till now is around two billion eight hundred million dollars.

1986-1992	Own Branding & Manufacturing	<ul style="list-style-type: none"> *OEM management is hard to sustain the long-term management and survive for a company * strengthen the R&D skill and product quality for enhance the brand image. * Establish branch company in the Europe, America then to other countries to learn the know-how of local market.
1992-2002	Global Management&	*Expand the business to China and set up

	Globalization	global production station
2002~	Global Marketing and Expanding	*Create the value chain of GIANT: From R&D, S/Chain planning, procurement, manufacture, distribution, marketing, customer/dealers, service management, GIANT manage all the sections and integrate them to create more advantages.

Except of the technological innovation and design, the Servitization was another focus while running business. Giant notice the economic shift, they have to upgrade their business from purely mass production to the service-orientation till now total customer orientation.

It would be beneficial for winning the customers' attention. Jing-Yi Lin, the author of "Giant Legend-global brand management" (Jing-Yi Ln, 2008) indicated from the figure 4 that Giant places importance on creating the value with customers. Professional production and servitization enhance the highly potential business opportunities and positive customer experience.

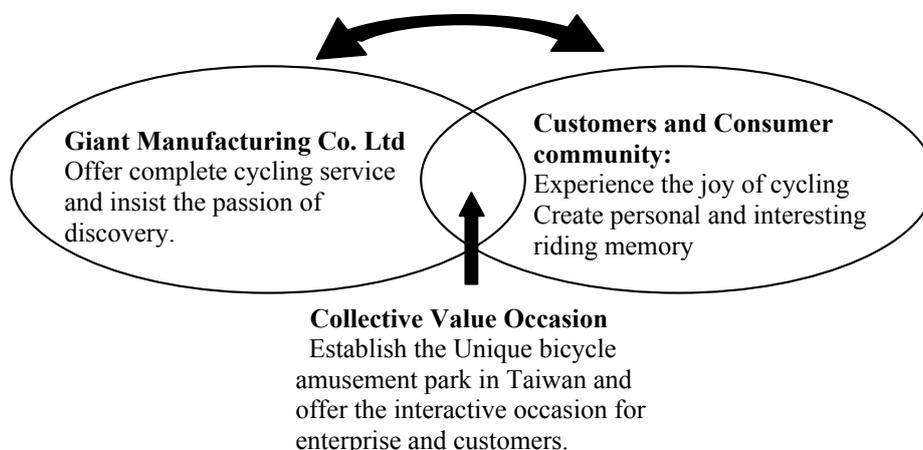

Figure 4. Collective Value Creation between Giant and Customers
 (Jing-Yi Lin,2008 and Giant Manufacturing Co. Ltd.)

GIANT not only develop their products and brand successfully, they do pay more attention on their customers. They have Industry art manufacturing skill and diverse product management system. The central faith they have is Total Customer Orientation (TCO) and be a total cycling solution provider. Merely a producer or manufacture would handle difficultly the diverse customers' demand and enormous market shift.

3.2. Bicycle Tour Agent-“Ride Life, Ride Giant”

Giant promoted the new business branch, Giant bicycle tour agent in 2008. It is brand new service for the manufacturing company. Because of the green issue springing up, people gradually pay attention on the environmental and health problems. Therefore, Giant manipulated their product advantages to offer more service and create more purchasing experience for the customers. Giant Bicycle Tour Agent will customize the route of bicycle travelling for different demand. Not only travelling round-the-Taiwan but Mainland China and

Japan customers can experience the complete tour service in anytime. Fifteen bicycle tourists will experience the Giant customized service including:

- Before the trip: Customized cycling tour design, professional cycling training and cycling tour class.
- During the trip: During the trip, The agent will assign a group of experts to maintain bicycle and offer repairing service, guiding the tour, and recording the tour processing for the customers.
- After the trip: Mailing the tour record and edited video to the customers, share more cycling tour information to the customers, build complete consumer network for sharing the information and experience etc.

The position of Tour agent operation just would be similar with service industry. As a manufacturing company is probably too risky to run a tour agent, GIANT however combines the tour, pre- technique service, and post-sale service with their product, a convenient transportation with environmental protection concept. With their high quality products, they service they offer will be easier attract customers' attention and trust. Even if this is a new business for GIANT, the cycling tour project attracts more and more customers. Not only the tour of Taiwan, but they keep promoting cycling tours to Japan and China for their clients.

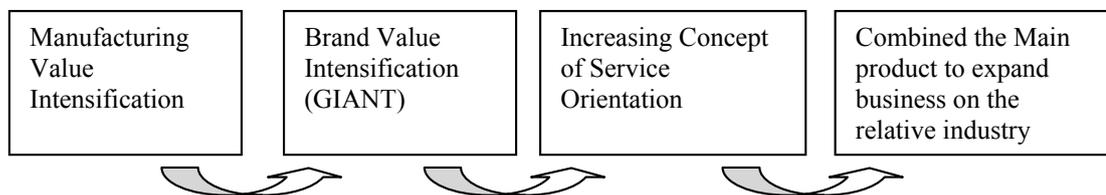

Figure 5: The servitization process of GIANT

GIANT establish their manufacturing value and brand image in the market. They add the service components into their physical object, the tangible products. Therefore, even they try to promote new business, the perspective of servitization apply well while running the business.

4. Concluding remarks

Servitization is the recognized concept that manufacturing business operation moved from purely producing and selling goods to extend integrated serviced-oriented or service-product operation. As the product-oriented business, manipulating the service strategy into the product is the challenge; however, if the manufacturing enterprise put effort to develop the new service strategy and service innovation for their customers, the value of the products will increase and be qualified to compete with the global market. Except delivering the core product, service supporting to the use of product and cooperate with the market trend would enhance the firms' industry value-adding. Manufacturing in Taiwan owns its advantage of quality and integrating production system. Combined the high-valued tangible product with customer-centric service design, it would be create more incredible business opportunities. The manufacturing, good-dominated company or traditional industry would still have chance to transform successfully.

Abstract

Performance appraisal (PA) system presents valuable performance information to a number of critical human resource activities, such as the allocation of rewards (Holland et. al., 2005; Boxall & Purcell, 2003; Allen & Meyer, 1990); feedback on the development and assessment of training needs (Taylor et. al. 1995); and credentials for legal purposes (Jordan, 1990). Due to the paradox facets of performance appraisal system, major issues in related to an intricate dynamic relationship between employee satisfaction and perception of fairness are raised (Allen & Meyer, 1990). This study explores the relationship of the perception of fairness of and satisfaction with performance appraisal process using Greenberg's (1987, 1990) hypothesized four-factor of organizational justice as a theoretical framework. This study seeks to understand the linkages between perceived fairness and employee satisfactions towards the system on organizational commitment. Better understanding of the perceptions of the fairness based on the concepts distributive justice, procedural justice, interpersonal justice and informational justice of performance appraisal process and related employee reactions to such systems should provide decision makers with more specific information needed to improve the effectiveness of the system in achieving organizational goals. Data collected from companies in Malaysia were used to test these relationships. By using a structural equation modeling, it was found that certain type of justice may influence satisfaction and specific dimensions of commitment.

Introduction

Perceptions of fairness are important to almost all human resource practices including performance appraisal process. Employees' perception on fairness of evaluation process, the procedures used to evaluate performance, the way in which performance-related information is communicated likely played an important role in shaping their reactions to critical elements of the appraisal process. In turn, these perceptions will also affect employees' satisfaction towards the whole system and their commitment to the organization.

Performance appraisal systems remain one of the most intricate human resource techniques (Holland, De Cieri, Teicher, & Gough, 2005; Roberts, 1992) and serve as great paradoxes of efficient human resource management (Taylor, Tracy, Renard, Harrison & Carroll, 1995; Gibbons & Kleiner, 1994). Nevertheless, individual performance appraisal presume a questionable of measurement accuracy (Roberts, 1992; Allen & Meyer, 1990; Jordan, 1990), stimulates employee conflict and competition (Boxall & Purcell, 2003; Gibbons & Kleiner, 1994; Allen & Meyer, 1990), dispense an immoderate responsibility to individual employees while underestimate the magnitude of the general work process (Holland, De Cieri, Teicher, & Gough, 2005; Boxall & Purcell, 2003).

Previous studies focused more on psychometric of performance appraisal process. We need to understand the perception of employees on the fairness of the appraisal process as it will affect the effectiveness of the system. For example, Murphy and Cleveland (1995) argued that the reaction criteria of performance appraisal are almost always relevant, and an unfavourable reaction may doom the most carefully constructed appraisal system.

Significance of studying perception on fairness of PA

Overall, this paper attempts to examine the constructs of the perceived fairness and satisfaction within the performance appraisal processes, focusing on its effect on employee satisfaction with the systems and their organizational commitment. Specifically, this paper will; (1) Explore the

relationship between fairness of performance appraisal and employee satisfaction with the performance appraisal, (2) Explore the relationship between employees reactions towards performance appraisal with organizational commitment, (3) Explore the relationship between fairness of performance appraisal and organizational commitment, and (4) Explore the relationship of employees satisfaction towards performance appraisal system as mediating variable between fairness of the performance appraisal system and organizational commitment.

Applying Organizational Justice Theory to Performance Appraisal

The perception of fairness on performance appraisal would be analyzed and discussed in the light of Greenberg's (1986a, 1986b, 1987) theory of organizational justice. Greenberg (1986b) was one of the first to apply organizational justice theory to performance evaluation. He posed the basic research question as to what makes a performance appraisal appear to be fair. Further he considered whether it is what one receives or how the decision is made, or both, that makes performance appraisals seem fair (Greenberg, 1986b).

Specifically, what people deem to be fair depends on their experience upon endorsed opinions regarding suitable ways to distributive outcomes and to treat others (Greenberg, 2001). Constant exposure to these standards produces expectations that serve as the basis for assessment of fairness (Greenberg, 2001). Behavior in compliance with these expectations is translated as of fairness, while breaches of these expectations are translated as acts of unfairness (Greenberg, 2001). Fairness has long been considered one of the key predictors of employees' affective states and behaviours. When the employees feel that they are being treated fairly, they reciprocate through satisfaction and commitment.

Fairness consists of three types of subjective perceptions, typically referred to as distributive justice, procedural justice and interactional justice (Adams, 1965; Leventhal, 1980; Bies & Moag, 1986).

Literally, **distributive justice** relates with the fairness of allocation of resources (Milkovich & Newman, 2005). In other words, distributive justice refers to the amount of resources or rewards that is distributed to employees (Milkovich & Newman, 2005). Folger and Greenberg (1985) suggest that distributive justice refers to the perceived fairness of the contents and the consequences. On the other perspective, Deutsch (1985) defines distributive justice as perceived fairness on the distribution of outcomes including conditions and goods that will affect individual wellbeing. Perception of fairness of distribution may lead to emotional feelings and emotional behaviors as it relates to individual's cognitive decision (Greenberg, 1987). According to Greenberg and Cropanzano (2001), unfair treatment of individuals tends to produce negative attitudes and behaviors than those who are treated fairly.

Distributive justice has been expansively studied over the past few decades since the equity theory was first developed by Adams (1963). Early research (Adams, 1965) paid attention to distributive justice based on social exchange theory, which suggests that employees perceive unfair treatment when they receive less returns than they expected (Greenberg, 1990).

According to Adams, people were not concerned about the absolute level of outcomes per se, but whether those outcomes were fair. Adams suggested that one way to determine whether an outcome was fair was to calculate the ratio of one's outcomes (e.g., compensation, promotions, and development) to their contributions or inputs (e.g., effort, time, education, intelligence, and experience) and then compare that ratio with that of a comparison other.

On the other hand, **procedural justice** refers to the process used to make pay decisions (Brockner, Leung & Skarlick, 2000), the fairness of the means that an organizations uses to determine outcomes (Milkovich & Newman, 2005), or the process of decision making for the distribution (Folger & Konovsky, 1989). Procedural justice proposes that the way a pay decision is made maybe as significant as the results of the decisions to the employees (Milkovich & Newman, 2005). Hence, procedural justice concentrates on employee attention in related to the procedures in making decisions (Milkovich and Newman, 2005; Folger and Konovsky, 1989). The employee is concerned about whether the decision process is fair and the process used to determine the outcome was just (Folger and Greenberg, 1985). These procedures should be constant, bias free and include the concerns of all groups and be morally acceptable (Leventhal, 1980).

The most recent studies in the justice literature focuses on the importance of the quality of the interpersonal treatment people receive when procedures are implemented or interactional justice. Feedback discussions which include a review of past performance, acknowledgements of strengths, and identification of areas for future development are crucial in performance appraisal process. Thus, perceptions of interactional justice are likely positively linked to satisfaction with performance appraisal feedback. **Interactional justice** is defines as the quality of interpersonal treatment received during the enactment of organizational procedures (Bies and Moag, 1986). Interactional justice is fostered when decision makers treat people with respect and sensitivity and explain the rationale for decision (Bies & Moag, 1986). More recently, interactional justice has come to be seen as consisting of two specific types of interpersonal treatment: interpersonal and informational justice (Greenberg, 1990).

Interpersonal justice refers to treatment with politeness, dignity, and respect by those who execute procedures or determine outcomes. Interpersonal treatment includes interpersonal communication (Folger and Cropanzano, 1998; Greenberg, 1990). Interpersonal justice reflects the degree of which people are treated with politeness, dignity, and respect by authorities. **Informational justice** refers to the explanations of why procedures were used in a certain way or outcomes were distributed in a certain fashion. Informational justice focuses on the enactment and explanation of decision making procedures (Greenberg, 1990)

Satisfaction with Performance Appraisal Systems

Depending on the perceived fairness in related to the organizational justice, there are many reactions towards the performance appraisal. Andrews, Witt and Kacmar (2003) argue that inappropriate distribution of organizational outcomes leads to jealousy and resentment. It creates a perception of unfair treatment and use of unauthorized behaviors in a manner that is negative to others (Andrews et. al., 2003). Greenberg and Tyler (1987) strongly suggest that when there is a perception that the procedures have been used unfairly or rewards and resource have been distributed is an unequal conduct, it establishes a perception of injustice, thereby leading to an erosion of trust in the organization. Additionally, the interpersonal treatment one receives also influences trust. Ironically, a negative interpersonal treatment can amend the perception of justice even though rules and procedures had been applied fairly (Saunders and Thornhill, 2003).

Many authors suggest that organizational fairness in decision-making processes may encourage employees' acceptance of and positive reactions to many types of organizational decisions. Tremblay, Sire and Balkin, (2000) add that procedural justice would affect in stronger attachment to the organization particularly for people who being respected by group or organization. Furthermore, constructive and positive working arrangements influence a greater

willingness to exert productive effort and to provide a high standard of customer service (Ichniowski 1986). Overall, the perception of fairness subsequently leads to an experience of higher organizational commitment, psychological well-being, and increased job performance (Samad, 2006; Tremblay et al. 2000; Ichniowski, 1986).

Organizational Commitment

A large number of previous research states that there is a significant relationship between work related factors (example; job satisfaction, fairness towards performance appraisal) with organizational commitment (Samad, 2006; Aycan & Kabasakal, 2006; Rivai, 2005; Samad, 2005; Roberts, Coulson & Chonko, 1999; Sweeney & McFarlin, 1993; Cropanzano & Folger, 1991; Alexander & Ruderman, 1987; Reichers, 1985). Generally, organizational commitment has varied explanations and measures in the academic literature. Many authors agreed that organizational commitment is acknowledged to be a bond or linking of the individual to the organization (Samad, 2006; Samad, 2005; Rivai, 2005; Cropanzano & Folger, 1991). Based on the literature, there are two major views of organizational commitment; behavioral approach (Allen & Meyer, 1990) and attitudinal approach (Mathieu & Zajac, 1990; Mowday, Porter & Steers, 1982). The attitudinal approach defines commitment as an approach in term of nature and quality in related to the linkage between an employee and an organization; a firm conviction in and recognition of the organization's goals and values; a willingness to exercise substantial effort on behalf of the organization; and a strong desire to maintain attachment to the organization (Mathieu & Zajac, 1990; Mowday et al., 1982).

On the other hand, the behavioral approach to organizational commitment is concerned mainly with the process by which individuals develop a sense of attachment not to an organization but to their own actions (Oliver, 1990). In describing the major constructs of this approach, Allen and Meyer (1990) proposed three components namely: affective, continuance and normative commitment. They state that the affective component of organizational commitment refers to employees' emotional attachment to, identification with and involvement in the organization (Allen & Meyer, 1990). The continuance component refers to commitment based on the costs that employees associate with leaving the organization (Allen & Meyer, 1990). Finally, normative commitment reflects an employee's feeling of obligation to remain with the organization (Allen & Meyer, 1990). To exemplify, persons with a strong sense of normative commitment remain in organizations because they feel they ought to remain with the organization (Allen & Meyer, 1990).

Meyer and Allen's three-component conceptualization of organizational commitment includes affective commitment, continuance commitment, and normative commitment (Meyer & Allen, 1991). **Affective commitment** is referring to employees remain because 'they want to'. Affective commitment develops due to personal involvement, identification with relevant target, and value congruence (Becker, 1992; Becker et al., 1996). **Continuance commitment** is referring to employees remain because 'they need to'. Continuance commitment develops as the result of accumulated investments, or side bets (Becker, 1960), that would be lost if the individual discontinued a course of action or chose an alternative to present course (Powell & Meyer, 2004). **Normative commitment** is referring to employees remain because 'they ought to'. Normative commitment develops as a function of cultural and organizational socialization and the receipt of benefits that activate a need to reciprocate (Scholl, 1981; Wiener, 1982).

Research shows that affective commitment has the strongest and most favourable correlations with job performance, organizational citizenship behaviours, attendance and turnover. Normative commitment had moderate correlations. Most interestingly, continuance commitment tends to be

unrelated, or negatively related, to these behaviors (Meyer, Paunonen, Gellatly, Goffin & Jackson, 1989).

In related to the organizational justice, many previous researches suggest that both procedural and distributive justice perceptions were positively related to organizational commitment (Samad, 2006; Pare & Tremblay, 2007; Fields, Pang & Chiu, 2000; Cropanzano & Folger, 1991; Loscocco, 1989). The authors agree that the level of organizational commitment and job satisfaction will increase if employees experience high level of procedural and distributive justice (Samad, 2006; Pare & Tremblay, 2007; Cropanzano & Folger, 1991; Loscocco, 1989). Both Samad (2006) and Martin (1981) report that the feelings of satisfaction and commitment are most likely to occur when there is a belief that the rewards employees received are equitable in comparison to others. Fields et al. (2000) add that procedural and distributive justice affected both job satisfaction and evaluation of supervision.

Additionally, some authors argue that distributive justice had more effects on both job satisfaction and organizational commitment than procedural justice (Samad, 2006; Roberts et al., 1999; Tang & Sarsfield-Baldwin, 1996; Alexander & Ruderman, 1987). It is reported that quitting intent or disloyal to organization exhibited a much stronger relationship with distributive justice than procedural justice (Alexander & Ruderman, 1987). Moreover, distributive justice has been an influence factor in determining variance in pay satisfaction and personal level evaluation than procedural justice (Tang & Sarsfield-Baldwin, 1996; Sweeney & McFarlin, 1993).

In another stream of opinions, some authors believe that procedural justice would be a better predictor of job satisfaction, satisfaction to the organization and loyal behavior than distributive justice (Sweeney and McFarlin, 1997; Scarpello & Jones, 1996; Yoon, 1996; Folger & Konovsky, 1989). A study by Sweeney and McFarlin (1993) conclude that distributive justice predicted pay satisfaction while procedural justice predicted organizational commitment. In another study by Cropanzano and Folger (1991), it is found that procedural justice influenced the evaluation of the organization and its authorities in related to trust in organization and organizational commitment. Consequently, if employees can be guaranteed of fair procedural treatment, they may likely to be loyal, which is a sign of organizational commitment (Tang & Sarsfield-Baldwin, 1996; Cropanzano & Folger', 1991). Interestingly, Yoon (1996) concludes that procedural justice and equity status had more effect on job satisfaction than distributive justice in the Asian context. In Asian collective societies, which value relational norms and social harmony, they would prefer the equality principle and need-based distribution rule of rewards while individualistic oriented societies prefer the contribution-based equity principle (Yoon, 1996; Rivai, 2005).

Based on the literature, this paper proposes a conceptual model of the relationship between organizational justice, employee satisfaction with the performance appraisal and organizational commitment as shown in Figure 1. Parallel to the objective of this paper and conceptual model, and consistent with the relevant literature, this paper proposes to test the following hypotheses:

Hypothesis 1: Organizational justice will be positively related to satisfaction towards to the performance appraisals.

Hypothesis 1a: Organizational justice which consists of procedural justice and distributive justice will be positively related to satisfaction towards the last PA and satisfaction to the PA system.

Hypothesis 1b: Organizational justice which consists of interpersonal justice and informational justice will be positively related to satisfaction towards the last PA and satisfaction to supervisor.

Hypothesis 2: Organizational justice will be positively related to organizational commitment.

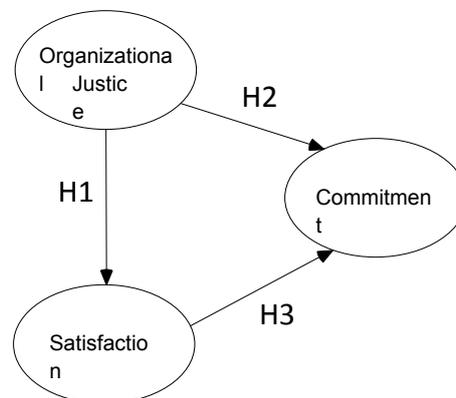

Hypothesis 2a: Organizational justice which consists of procedural justice and distributive justice will be positively related to organizational commitment.

Hypothesis 2b: Organizational justice which consists of interpersonal justice and informational justice will be positively related to organizational commitment.

Hypothesis 3: Satisfaction with performance appraisal will be positively related to organizational commitment.

Hypothesis 4: The relationship between organizational justice and organizational commitment will be mediated by satisfaction with performance appraisal.

Figure 1: Conceptual Model of relationship between organizational justice, employee satisfaction with the performance appraisal and organizational commitment.

Methodology

Data were obtained from full time employees of seven public listed companies in Klang Valley of Malaysia. A survey with non-probability sampling method was administered. 300 surveys were distributed and 229 employees returned completed questionnaires with response rate of 76%. The selection of the companies and respondents were based on convenience and willingness to participate. Survey questionnaire consisted of the demographic characteristics of the respondents and multiple-item (positively and negatively worded) survey instruments.

Measurements of Distributive justice, procedural justice, interpersonal justice, interactional justice, satisfaction with current appraisal, satisfaction with the supervisor, satisfaction with the appraisal system, affective commitment and normative commitment were adopted and developed on the basis of established existing variable from previous studies. All variable were measured with 7-point Likert-type scale with anchors of 1 = strongly disagree and 7 = strongly agree.

Data analysis was conducted in two stages. Firstly, checking for data entry includes validity and reliability of variables, identification outliers and normality of the data. Secondly, testing of a fit model was conducted using Structural Equation Modeling (SEM). AMOS 17.0 statistical package was utilized to run data from questionnaires. Goodness-of-fit model were assessed by

three criteria: absolute fit measure, incremental fit measure and parsimonious fit measure (Refer to Table 1).

Findings

The majority of the sample were middle management (39.2%), followed by lower management (35.4%), non-managerial employees (23.1%) and top management (2.2%). The educational level reported was 61.6% at baccalaureate or first degree, 28.8% at SPM/MCE/O level, 8.7% master level and 0.9% PhD level. The majority of respondents were female (51.1%). The average employment with the company is 7.12 years ranging from 1 to 32 years. While the average the processthehe respondents were in the age group of 30 – 39 years old (47.6%), followed by age group of 20 – 29 years old (35.4%), 40 – 49 years old (15.7%) and 50 years old and above (1.3%). Demographic data were summarized in Table 2.

The reliability of composite variables is presented in Table 3. Hair et al. (1998) suggested that usual lower limit for Cronbach alpha is .70, but in exploratory research, as being conducted in this study, this limit may decrease to 0.6. The Cronbach alpha of all the variables for this study is above 0.6.

The subsequent analysis for testing the overall model and developed hypotheses utilized SEM by operating AMOS program. The objective of the test is to assess the goodness of fit between the model and the sample data. Models 1 through 4 were used to test the hypothesized relationship between organizational justice, satisfaction with the performance appraisals, and organizational commitment. Based on justice theory and research, procedural and distributive justice should be related to satisfaction with appraisal systems, and interactional justice composed of interpersonal and informational components should be related to satisfaction with supervisor and satisfaction to the last appraisal.

To assess model fit, various fit indices were used. Chi-square is an index of absolute model fit. Incremental fit index (IFI) and the comparative fit index (CFI) compare the fit of a given model to a baseline model in which there is no covariance among the variables (Bentler 1990). The normed fit index (NFI) indexes the incremental fit of the tested model from a baseline model. The values of IFI, CFI and NFI range from 0 to 1. The closer the value to 1, the better the fit, and the value of 0.9 is regarded as good fit (Anderson and Gerbing, 1998; Williams and Anderson 1994). Root-mean-square error of approximation (RMSEA) is an index of the discrepancy between the observed covariance matrix and the population covariance matrix expressed relative to the degrees of freedom. According to Browne and Cudeck (1993), RMSEA values between 0 and 0.05 indicate good fit and value exceeding 0.10 indicate poor fit (Refer to Table 1).

Table 1: Evaluation of SEM with Goodness-of-fit Measures

Types of Measures	Goodness-of-fit Measures	Level of Acceptable
Absolute Fit Measure	Root mean square error of approximation (RMSEA)	0 – 0.05 – Good fit 0.05 – 0.08 Reasonable fit 0.08 – 0.1 Mediocre fit > 0.1 Poor fit
Incremental Fit Measure	Normed Fit Index (NFI) Incremental Fit Index (IFI) Comparative Fit Index (CFI) Tucker-Lewis Index (TLI)	Greater than 0.90 – Good fit Greater than 0.90 – Good fit Greater than 0.90 – Good fit Greater than 0.90 – Good fit
Parsimonious Fit Measure	Normed Chi-square (χ^2/df)	Lower limit 1.0 Upper limit 2.0/3.0 or 5.0

3	Satisfaction with performance appraisal will be positively related to organizational commitment.	Accepted
4	The relationship between organizational justice and organizational commitment will be mediated by satisfaction with performance appraisal.	Accepted

Results from Table 5 clearly indicate that Model 1 through Model 4 provide the fit to the data as indicated by the fit statistics; Model 1, $\chi^2=47.394$, $\chi^2/df= 4.309$, NFI=0.883, IFI=0.908, CFI=0.904, TLI=0.755 and RMSEA=0.095; for Model 2, $\chi^2=49.495$, $\chi^2/df=4.125$, NFI=0.878, IFI=0.905, CFI=0.901, TLI=0.769 and RMSEA= 0.092; Model 3, $\chi^2=32.334$, $\chi^2/df=2.939$, NFI=0.925, IFI=0.949, CFI=0.947, TLI=0.866 and RMSEA=0.073 and Model 4, $\chi^2=32.831$, $\chi^2/df=2.736$, NFI=0.924, IFI=0.950, CFI=0.949, TLI=0.880 and RMSEA=0.069.

Test of statistics for parameter estimates is assessed by critical ratio (c.r.). It represents the parameter estimate divided by its standard error. Critical ratio values which are larger than 1.96 prove the path coefficient to be statistically significant at level $p < 0.05$. The results support the hypotheses 1a that organizational justice which consists of procedural justice and distributive justice, will be positively related to satisfaction to performance appraisals. In Model 1, $\beta = 0.74$; significant at level $p \leq 0.01$, in Model 2, $\beta = 0.75$; significant at level $p \leq 0.01$, and in Model 4, $\beta = 0.94$; significant at level $p \leq 0.01$. The result also supports hypothesis 1b that organizational justice which consists of interpersonal and informational justice, will be positively related to satisfaction to performance appraisals. In Model 3, $\beta = 0.93$; significant at level $p \leq 0.01$ (Refer to result summary in Table 6)

However, the results do not support hypotheses 2a (Organizational justice which consists of procedural justice and distributive justice will be positively related to organizational commitment) and 2b (Organizational justice which consists of interpersonal justice and informational justice will be positively related to organizational commitment) as shown in Model 1 and Model 3 (Refer to Table 6).

The results clearly support hypothesis 3, satisfaction with performance appraisals will be positively related to organizational commitment. In Model 2, $\beta = 0.43$; significant at level $p \leq 0.01$ and Model 4, $\beta = 0.43$; significant at level $p \leq 0.01$ as well (Refer to Table 6).

The results also support hypothesis 4, the relationship between organizational justice and organizational commitment will be mediated by satisfaction with performance appraisal. In Model 1 and Model 3 there are no to show significant direct relationship between organizational justice and organizational commitment. Furthermore, β value increased significantly from 0.93 to 0.94 for justice \rightarrow satisfaction path (i.e. from Model 1 to Model 2) and -0.3 to 0.43 for satisfaction \rightarrow commitment path (i.e. from Model 3 to Model 4).

Discussion and Conclusion

Theory and research on justice perception and appraisal reaction as well as their relationship to organizational commitment were integrated to test specific hypotheses in this study. As predicted, organizational justice is significantly positively related to satisfaction to performance appraisals and in turn, satisfaction to performance appraisals is significantly positively related to organizational commitment. This study also found that the relationship between organizational justice and organizational commitment is mediated by satisfaction to performance appraisals.

Future research should investigate the relationship between specific organizational justice (distributive, procedural, interpersonal and informational) and specific satisfaction to performance appraisals and how they relate to specific organizational commitment (affective and normative). Perceptions of interactional justice might matter more when outcome (appraisals rating) are perceived as unfair and the procedures used to evaluate performance are perceived as unjust. Raters who doubt their ability to act in an informationally fair manner may be evaluating leniently to elicit favourable reactions from rates during their appraisals feedback session.

In conclusion, this paper has explored the literature detailing the linkage between perception of fairness, satisfaction in performance appraisals and organizational commitment. The reactions of the performance appraisal resulted from the perception of fairness have been also discussed. A review of theoretical and empirical research appears to indicate that an individual or group perception of fairness and reactions would normally have a spillover effect, which most likely to affect both organizational commitment. Hence, an in depth understanding in the dynamic relationship of the linkage is highly vital in facilitating and enabling performance appraisal to be a potent medium for both organizational and employees' goals.

ABSTRACT

Nowadays, plenty of products are in the market and lots of information blowing up on the Internet. Under this kind of keen competition, rational information can not touch people's heart anymore. What people want is not only a product, they also eager about concept, attitude, style, value, or life style related to the product. In addition, people are trying to purchase things that can represent themselves. To satisfy the potential needs of human, limited-edition strategy plays an important role. Limited-edition strategy is a kind of marketing strategy which takes scarcity's effect into practice. This research aimed to find out how scarcity effect of limited-edition strategy influences the consumers' purchasing intention. Besides, how scarcity effect influences consumers' purchasing intention through consumers' perceived symbolic benefits and loss-avoidance is also the object that this research trying to discover. Questionnaire and quantitative analysis were employed in this research. Before designing the questionnaire, a pretest was conducted to select a product suitable for the formal survey. The formal questionnaire would be designed to investigate the relationship between the different dimensions which this research refers to. The result of this research may help companies understand how limited-edition strategy

influence on consumers' purchasing intention and how customers feel and think toward the marketing strategy. And also help companies understand how customers evaluate their products when they use the limited-edition strategy.

Keywords: *limited-edition strategy, consumers' purchasing intention, scarcity effect, Perceived symbolic benefits, loss-avoidance*

1. INTRODUCTION

1.1 MOTIVES AND RESEARCH BACKGROUND

Nowadays, plenty of products are in the market and lots of information blowing up on the Internet. Under this kind of keen competition, rational information can not touch people's heart anymore. In traditional way of promoting products, companies just keep repeating how good their products are again and again. Or list out the advantages of their goods to catch people's attention. But this kind of marketing strategies can not arouse people's interest in this era. Useful functions and advantages are becoming basic things of goods. People are chasing things more than these. What they want is not only a product, they also eager about concept, attitude, style, value, or life style related to the product.

To make products into popular items, marketing strategy plays an important role. Good marketing strategy not only able to add extra value to the products, but also can arouse people's purchasing impulse. There is a marketing strategy has been widely used on the market, that is "limited edition" strategy.

Limited-edition strategy is a practice of scarcity's effect which many industries often use. (Lin, 2007) It can almost use on every kind of products. This strategy can apply on products from daily commodities to luxury goods. Remember that when Taiwanese baseball player—Chien-Ming Wang plays baseball in America and have very good performance, many companies start to release some limited-edition goods related to Chien-Ming Wang, such as Chien-Ming Wang limited-edition dolls, Chien-Ming Wang limited-edition EASYCARD. Take the Chien-Ming Wang limited-edition dolls as an example, the company only offer 1000 dolls to the consumer. After 4 minutes of releasing, the dolls had been sold out. It is not only because of Chien-Ming Wang's charisma, but also because of people's eager of

owning the product and worrying about unable to get it.

Besides, luxury brands such as LV, Gucci, Hermes also would release some limited-edition products. The Birkin bag of Hermes is a famous example of it. Because good materials of Birkin bag (skin of alligator or lizard) is hard to get and the work of making the bag is complicated, they only can offer a few bags on the market. Due to this, owning a Birkin bag is very hard and the price is extremely high.

Customers tried to purchase things that can represent themselves. And people also eager to make some difference between themselves and other people. Snyder and Fromkin (1977) had said that consumer's need for uniqueness "arises when individuals feel a threat to their identity, as occurs when they perceive that they are highly similar to others." When people are chasing uniqueness, they tend to purchasing something that different from others. They even willing to pay more money to buy it. Motorola discover this situation. Motorola cooperate with D&G and release a gold version of cell phone called V3i. They only release 1000 of it in the world. The price of limited-edition V3i (gold) is much higher than the regular version.

Although the limited-edition strategy had been widely used on the market, but the researches about it is seldom. Brock(1968) trying to discover the psychological effects of scarcity. And he also trying to find out the relationship between personality and scarcity effect. Fromkin (1968) and Lynn (1992) are trying to find out the unique perceived value created by the scarcity effect. Some researchers in Taiwan research about how limited edition effect on brand equity(Lin, 2007). And some discover from the psychological aspect of consumers who would like to purchasing limited-edition products. There are still other researchers trying to understand limited-edition strategy from information aspect (Lin, 2007), limited-edition strategy with internet auctions (Peng, 2007) and limited-edition strategy's extension effect and reciprocal effect (Chang, 2007).

LIMITED-EDITION STRATEGY AND CREATIVE INDUSTRY

Creative industry is a kind of industry that contains plenty of innovation, creativity, original idea, fresh design and etc. Compare to the mass production goods, products of creative industry offer people some more deep feelings and satisfy people's deep demand of their hearts, such as need of uniqueness. Take LIULIGONGFANG(琉璃工房) as an example, most of their works are limited-edition. They carve number on the bottom of every limited-edition products to ensure that they are exclusive works. In the process of making works, they use gypsum model to make their products. In order to make sure their works are limited-edition ones, they even destroy the gypsum model after producing the limited amount. No matter how popular the works are, they

insist to produce limited-edition of them. They said that producing limited-edition products can encourage them keep creating new works. This spirit applies on their motto: "To forever create that which is good for the human heart." Compare to the mass production products, producing limited-edition products is more related to the spirit of creative industries and can bring more profit to them.

1.2 OBJECTIVES

This research aimed to find out how scarcity effect influences the consumers' perceived symbolic benefits, and how it influences the loss-avoidance. Also, how consumers' perceived symbolic benefits and loss-avoidance impact on the consumers' purchasing intention. Besides, scarcity effect can straightly influence consumers' purchasing intention or not is also the object that this research trying to discover.

The result of this research may help companies understand how limited-edition strategy influence on consumers' purchasing intention and how customer feel and think toward the marketing strategy. And also help companies understand how consumer evaluates their product when they use the limited-edition strategy. Finally, according to the result of the research, some suggestions about the marketing strategy will be made to companies.

2. LITERATURE REVIEW

2.1 LIMITED-EDITION STRATEGY

To marketers, limited-edition strategy plays an important role of marketing. "Limited-edition strategy is a practice of scarcity's effect which many industries often use." (Lin, 2007) "Limited-edition strategy means that firms manipulate scarcity effect to let their products become hot product. Producing limited editions of products, having exclusive distribution outlets for products, prestige pricing of products and restricting maximum order size for products are all common practices that make products unavailable." (Chang, 2007)

In the traditional economic aspect, the definition of resources refers to land and some other visual resources. These are scarcity resource. In the 18th century, Adam Smith (1776) point out a kind of situation called "the paradox of water and diamond" in his book – "The Wealth of Nations". He said that "water" which is a useful

resource don't have the value to exchange goods with other people. But "diamond" which is not a useful resource contains the high value to exchange goods with other people. Smith (1776) thought that the value of diamonds is extremely high due to the scarcity of it. (Peng, 2007) Limited-edition strategy is a kind of strategy which trying to take the scarcity effect into practice and make the same effect of diamond.

Famous brands such as Nike, Apple, Swatch had designed and released some limited-edition products to enhance the unavailability of their products. They attract customer's attention and enhance the desire of owning the product. (Brannon & McCabe, 2001)

Products of Sony—Playstation 2 became a popular item soon in America when it just released. Everyone tried to have one during that period of time. Too many demands make the product hard to get. And the same situation happened when the Playstation 2 on sale in Japan. Many researchers think that this is Sony's marketing strategy. They create the unavailability to stimulate the demand. Similar situation happened on the game cartridge of Nintendo. The unavailability of the product make it became a hot product. These examples are how companies use limited-edition strategy on the market. (Stock & Balachander, 2005)

Brock (1968) also provides operational definitions of "unavailability" by presented several hypotheses in the "commodity theory". They are as "(a) limits on the supply, or the number of suppliers, of a commodity, (b) costs of acquiring, of keeping, or of providing a commodity, (c) restrictions limiting possession of a commodity, and/or (d) delays in providing a commodity." There are many marketing actions can make the effect of unavailability. For instance, producing exclusive distribution outlets for products, making or designing limited editions of products, limiting maximum order size for products, and prestige pricing of products are some common ways which companies often use to make products unavailable. (Brock, 1968) (Lynn M., 1991)

2.2 SCARCITY EFFECT

The meaning of scarcity in economics is that the existing resources can not satisfy human's desire (Bade & Parkin, 2004). Due to this, people have to make a suitable decision among lots of choices when facing the scarcity problems.

Brock (1968) takes psychological effect of scarcity into consideration. This is the famous "Commodity theory" (Brock, 1968) The principle of this theory claimed that "any commodity will be valued to the extent that it is unavailable". In order to understand the principle completely, extended definition of its three concepts – commodity, value, and unavailability are required. (Brock, 1968) (Lynn M., 1991)

“Commodities” means that any things (such as messages, experiences, or objects) that are useful, transferable and have the potential to be possessed. According to the definition, commodities have to be useful. Only if a thing has some utility to a person, it can be defined as commodity. Commodities also have to be transferable between people. If things cannot be transfer from one people to another, it is not commodities by definition. Commodities also need to have the potential to be possessed. The definition offers the commodity theory a broad domain. Almost all services and marketable products can be defined as commodities. (Brock, 1968) (Lynn M., 1991)

“Value” can see as a commodity’s “potency for affecting attitudes and behavior” (Brock, 1968, p.246) (Lynn M., 1991). Commodities must have some positive utilities. To increase a commodity’s value would enhance its perceived utility and would make people more desired to have the commodity. Due to this, “value” can be seen the same as “desirability” or “utility.” (Brock, 1968) (Lynn M., 1991)

“Unavailability” means that “scarcity and other limits on availability.” (Brock, 1968) (Lynn M., 1991) Brock (1968) also provides operational definitions of “unavailability” by presented several hypotheses in the “commodity theory”. They are as “(a) limits on the supply, or the number of suppliers, of a commodity, (b) costs of acquiring, of keeping, or of providing a commodity, (c) restrictions limiting possession of a commodity, and/or (d) delays in providing a commodity.” There are many marketing actions can make the effect of unavailability. For instance, producing exclusive distribution outlets for products, making or designing limited editions of products, limiting maximum order size for products, and prestige pricing of products are some common ways which companies often use to make products unavailable. (Lynn. M., 1991) (Brock, 1968)

One possibility that Brock (1968) suggested is – “that people may desire scarce commodities more than comparable available commodities because the possession of scarce commodities conveys feelings of personal distinctiveness or uniqueness.” (Brock, 1968) (Lynn M., 1991)

2.3 PERCEIVED SYMBOLIC BENEFITS

According to Holman and Keller’s research, symbolic product benefits can be seen as how a product helps consumers to develop his or her unique, visible, and personal representation. (Holman, 1980; Keller, 1993) There is scale developed by Bhat and Reddy (1998) can clearly measure symbolic concepts. And it also showed that symbolism has two dimensions which are personality expression and prestige. The personality expression dimension involves the symbolic conferring of status, and

other statements. The prestige dimension consists of uniqueness, prestige, distinction, and some other related qualities. Due to this, consumers may see the status-conferring powers of a product, self-expression, and uniqueness as meaningful symbolic benefits. (Wu & Hsing, 2006)

To see scarcity from the psychological aspect, scarcity intimates that only a few people can have the chance or access to own a product. And owning a scarce product gives symbolic benefits. When scarce products are referred to symbolic benefits, consumer would enhance more value to it.

2.4 LOSS-AVOIDANCE

“Loss-avoidance” is mentioned by Cachon and Camerer in 1996. They use a game called “coordination game” to make an experiment. They found that participants tend to choose the strategy which could avoid loss.

Dan Ariely (2008) had also do some interesting experiments about loss-avoidance. He used a computer program to do the experiments. And he took students study in Massachusetts Institute of Technology as participants. When the program starts, the screen would show 3 doors which are red, blue and green to the participants. They can click on each door to get into each room. After get into the room, participants can gain a certain amount of money of every click of your mouse. During the experiment, the screen would show them how much money they have already gain. (Dan, 2008)

Different doors have different range of the profit. Every time participants change the doors, they would waste one click (They can only click 100 times). The best way to earn the most money in this experiment is to find out the door which offers the most profit as soon as possible and stay there clicking. The result of the first experiment is that participants are doing so to gain the most money. (Dan, 2008)

In the second experiment, they change a little bit of the rule. This time, if the participants click 12 times continuously and didn't click on a door, the door will permanently vanish. Dan (2008) found that participants are working very hard to avoid the door vanished, even after they found out the door which profits the most. (Dan, 2008)

In the third time, they told the participants the exactly profits they can get in each door. In this situation, participants are still working very hard to keep the door open. In addition, Dan also allows some participants to practice hundred times before the main experiment. He supposes the participants would find out how good if they don't keep chasing the closing door. But Dan still found that students chasing the closing doors and keep them open. (Dan, 2008)

At last, they tried another rule in the experiment. If the participants click 12 times

continuously and didn't click on a door, the door will vanish, but not permanently. They just have to click on the vanished door once then the door will show up again. In other words, participants would not exact loss a door even they ignore the vanished door. Surprisingly, participants still keep wasting their click on chasing the vanishing doors, even the vanishing doors could easily show up again. Participants could not bear the current loss, so they try their best to avoid the door closed.(Dan, 2008)

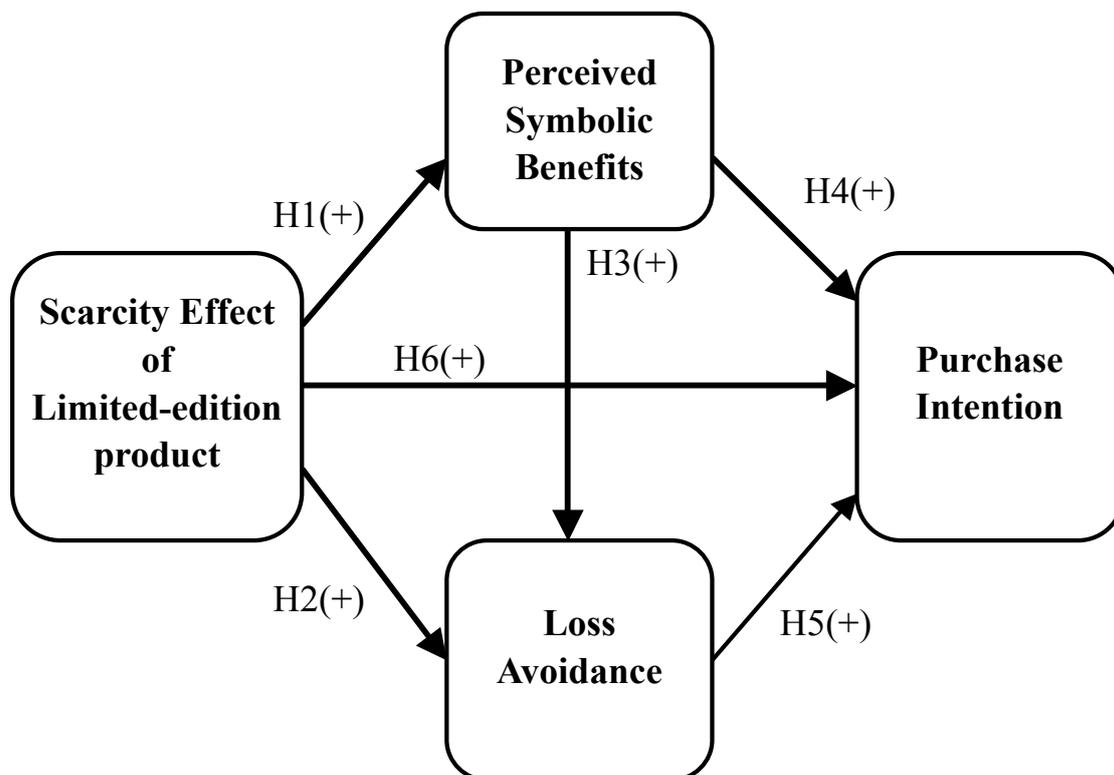

2.5 PURCHASE INTENTION

Purchase intention means that the possibility of consumers willing to purchase the product. External messages such as price, brand, and image of the store can affect consumers' purchasing intention. Usually price and purchasing intention have negative relationship. But about the popular brand or store, price and purchasing intention may have positive relationship. (Dodds, Monroe & Grewal, 1991) (Chang, 2007)

Customers' purchasing intention is also a personal subjective attitude toward the products. Such attitude may be affected by many external factors. (Chang, 2007)

3. RESEARCH CONCEPTUAL MODEL AND METHODOLOGY

3.1 THE CONCEPTUAL MODEL of THE RESEARCH

Hypothesis 1:

Scarcity effect of limited-edition product has a positive effect on perceived symbolic benefits.

Hypothesis 2:

Scarcity effect of limited-edition product has a positive effect on loss-avoidance.

Hypothesis 3:

Perceived symbolic benefits have a positive effect on loss-avoidance.

Hypothesis 4:

Perceived symbolic benefits have a positive effect on purchase intention.

Hypothesis 5:

Loss-avoidance has a positive effect on purchase intention.

Hypothesis 6:

Scarcity effect of limited-edition product has a positive effect on purchase intention.

3.2 METHODOLOGY

Questionnaire and quantitative analysis were employed in this research.

First, a pretest was conducted to select a product suitable for the formal survey. Prior studies suggested that scarcity effects are more readily discerned when the product is visible (Lynn, 1989)(Wu and Hsing, 2006) and appealing (Verhallen, 1982; Brannon & McCabe, 2001))(Wu and Hsing, 2006), and when there is significant uncertainty about its intrinsic quality. (Wu and Hsing, 2006) The pretest is trying to find out a product which can best evaluate the dimensions in this research.

According to the result of pretest, a suitable product would be found. This suitable product will be used to design the formal questionnaire of survey. The formal questionnaire would be designed to investigate the relationship between the different dimensions which this research refers to. In addition, one or a few scenario would suppose to be designed in it. After designing the questionnaire, a survey would be employed.

LISREL will be use to analysis the relationship between the dimensions which referred in this research. And also use it to test the hypotheses and the whole conceptual model.

4. Conclusion

Limited-edition information can successfully arouse people's purchasing intention. People tend to buy things that can represent themselves, such as things that can represent their social status, uniqueness, personality, image, characteristic, and so on. The scarcity effect of limited-edition products satisfies these deep needs. Due to this, people would choose the limited-edition products when seeking something special to represent them. The scarcity effect also makes people worry about not able to get it.

Because limited-edition products are scarce, they become precious and not easy to own. This situation would arouse people's purchasing impulse and push them to purchase the limited-edition products. And this situation sometimes would push people to make purchasing decision immediately. Because limited-edition products have limited amount of it, consumers would be afraid of being unable to get it. Due to this, people would decide to buy it immediately in order to avoid losing it. If companies could make good use of the limited-edition strategy, they can achieve the win-win situation--make profits for the company and make consumers happy and satisfied.

The soul...never thinks without a picture.

Aristotle

Who we are and how we make sense of the world are the narratives played in our minds. It is the stories we are told and we tell ourselves through which we interrupt the world, and in this inner realm of sense making, our culture exists. In the modern era conscious and cultures are being challenged with globalization and instant messaging exchanges. As technology drives communications around the world instantaneously, we are increasingly more removed and oddly isolated. This paradox serves the application of a personal and very old communication strategy: a good story. It is a good story to which billions in all currencies are spent in advertizing. It is a good story from which leaders inspire (Denning, 2005; Spears, 1998; Tichy, 1990). And as a teaching tool, a good story has been used to motivate learning for eons. This paper will discuss the merits of a story genre, Japanese traditional folktales told as *kamishibai*, for learning and describe applications used for English as a Foreign Language (EFL) and international culture classes at a Japanese university.

There are thousands of stories about learning with tales of triumph and tribulations. Due to the variety of methods, measurements, results and accounting for individual differences, it is difficult if not impossible to predict how an individual learner will succeed. But one thing seems clear: it is the job of the teacher, *to create a learning environment in which more learners can be successful...* (Lightbrown & Spada, 2005, p. 75). In answering this challenge, storytelling is one way to provide a successful situation for learning.

Storytelling is an ancient art and is fundamental to all nations, societies, and cultures. Stories communicate and transmit knowledge, weaving threads of meaning from the imagination to the fabric being. And in this mechanism, stories are transformational. As Canilo Jose Cela said in his 1989 Nobel lecture, *storytelling has been a decisive tool in every era and in all circumstances*

(2007, p. 17). Stories can lead learners to knowledge, values, and understandings which are explicit or implicit: as it is the nature of narratives to allow the listener to internalize information. However meanings are derived, the journey is grounded in a medium fun and familiar to all. There are as many examples as there are cultures. From the parable tool used by religious teachers to the Aborigines of Australia whose entire culture was preserved through oral traditions, storytelling is a powerful communication.

It is fitting that there is a story behind this pedagogic path of Japanese traditional *kamishibai* in the EFL and international culture classrooms. The story of how I became fascinated by *kamishibai* began with a two woman team: a small Japanese lady and a tall redhead American who taught about Japanese culture in the U.S. at the Japanese Cultural Center and Museum, Mukogawa Fort Wright Institute. Central to my teaching tenure was storytelling (Pendell, 1999). Thousands of children and adults learned about Japanese culture framed by traditional *kamishibai* stories. An interactive dialogue prompted the audience to think about themselves as much as what they were watching. The audiences were so engaged that during call and response directed to children answers were often blurted out by adults. Although a compliment to my storytelling, what is far more relevant is the power of telling stories as *kamishibai*.

My story is also one of admiration of the Japanese and Japan with its layers of ancient and contemporary, archaic and ultramodern cultures. So when I had the opportunity to work in Japan, I did so with enthusiasm. As an EFL and culture instructor I seized the chance to explore a fresh slant to a very old tradition: Japanese traditional storytelling, *kamishibai* as the springboard to learning in EFL classes and cross-culture narratives.

Japanese storytelling has a long history. As early as the tenth century, Buddhist priests used picture scrolls and narration to teach their lessons. From this tradition, storytelling in the form of story-card theatre or *kamishibai*, developed in the late 1920s. Especially during World War II, driven by economic hardships, *kamishibai* offered a means by which the unemployed could earn a small income. *Kamishibai* was one of the most popular forms of entertainment for young and old. The tradition was largely replaced by television in the late 1950s but has recently enjoyed a revival in Japan as well as countries worldwide in libraries and schools (Clouet, 2009; Geier, 2006; Ko, Schallert & Walters, 2003; Lee, 2003, McGowan, 2009, Paatela-Nieminen, 2008; Tamaki, 2009). Even in a modern setting, Japanese remain very familiar with *kamishibai*.

Japanese *kamishibai* are fun, provocative, and in an educational setting, provide a tool to transport learners into an application of language acquisition or into another culture. This approach launches learners into a world of humor, irony and entertainment, which allowed risks including call and response to the stories, discussions, comparisons, creating their own stories, or just using a foreign language to convey a familiar story. Learners are motivated and actively contribute to their understandings.

Interestingly, a paradox again in-play, the primary goal of the class, EFL or culture, remains secondary to storytelling. Imaginations on fire, students use what they learned to communicate in English or convey cross-cultural comparisons. Storytelling as a means-to-an-end permits the primary goals of the class to become a skill-set put to use. Perhaps best of all, the exercise can transform learners into leaders who are able to share a new language and/or cultural perspectives.

What makes *kamishibai* particularly useful is the unique format. Large cards with colorful illustrations and the text written on the back allow the storyteller to present the visual component clearly to the audience. Additionally, how the cards are revealed, i.e., half a card at a time and the speed of the reveal adds to the drama. Although not required, the story is usually told in a wooden frame that resembles a theater. This further focuses the audience. There are numerous sources listed in the references of this paper for *kamishibai* making, teaching, and purchasing. In summary, *kamishibai* offers simple English, sound effects, humor and irony capable of transporting the viewer into another world and culture which can illuminate meanings whether familiar or foreign.

***Kamishibai* in the College EFL Classrooms**

Let's Learn English Through Kamishibai was the title of two EFL classes which are described. The classes were formatted into two workshops: I; II. Participants in both workshops were all female; who volunteered to participate; ranging in age from 19 to 20; university students; and were in training to become nursery and kindergarten teachers. In both classes the following format was applied. First a brief overview of *kamishibai* history and its application to Japanese educational contexts was explained. Students were then told the Japanese folktale, the *Marriage of the Mouse, Nezumi no Yomeiri*, as a *kamishibai*. The *kamishibai* was performed using the storyteller's voice to affect the audience's imagination as well as meaning. Students were encouraged to participate in the story and were asked questions about content and meanings. Because of the inherent interest of the students to this genre, we discussed some of the benefits to young learners and ideas to enhance learning with hands-on activities.

Workshop-I was a ninety-minute workshop offered with fifteen second-year students. The story was read several times and students provided the English dialogue including simple vocabulary and sentences. The students participated in discussions about the language, vocabulary and the story. Student responses were positive with comments like *I could understand English. I could really enjoy the story. I wish we had time to do more kamishibai.*

Workshop II was a two-and-a-half day retreat at the Karuizawa Kinjo University facility with nine third-year students attending. Students visited the Karuizawa Picture Book Museum and Children's Center Muse in the Forest Museum. The *kamishibai* lesson began like Workshop I. After hearing the story, we reviewed storytelling techniques and the students were asked to create their own *kamishibai* in groups of three. Students were asked to be creative, present and teach simple English, have a title page; employ storytelling voices and *kamishibai* techniques in narration; be able to discuss the story's meaning; and have a question ready to ask the audience. These activities gave students the opportunity to produce original written work, practice simple English sentence structure, and practice presentation skills. Because of the familiar format students were also able to experiment with word combinations and expand their vocabulary (Kistler, 2008).

The original *kamishibai* made by the students were remarkable and provide a variety of learning opportunities. Speaking and writing for expression, students produced imaginative content that was inventive and layered with plot, ideas, vocabulary and text structure. Students employed irony, moral lessons, moving parts, sliding cards, voice inflection and English in ways which had

the audience shouting out answers and participating in discussions. Each group had questions to further engage the audience. In preparing *kamishibai* students communicated through the visual medium and organized elements and forms into a creative work which was refined after presentations and feedback. The transformation of learner into teacher was palpable as the students commented: *I thought it was great to study English while having fun. I would like to perform kamishibai in English to children.*

The benefits of the workshops were multiple. First, students were able to interact with each other to build meanings. By focusing on the stories, it was possible to reach students in a personal way which was not confusing or offensive. *Kamishibai* also helped build relationships and motivate students in such a way to get around reluctant learners. Students were relaxed and happy-enjoying a story with friends and feeling somewhat nostalgic. The connection to Krashen's Affective Filter Hypothesis (Krashen and Terrell, 1983) is obvious. Second, students felt the workshop was good for their English studies. They commented that they understood English and became interested in learning more English. Because students could handle narrative both as a teller and listener, they became more proficient in English. Third, since the students were studying to become teachers, presentation skills and the interactive dialogue of the lessons were useful. The use of *kamishibai* has seen a revival in Japanese schools as teachers often perform a *kamishibai* on topics such as seasonal events, moral lessons and Japanese folktales at least as often as regular picture books (Mizuide, 2003). Finally, the experience gave students a renewed interest in their major. Since the study of English will be mandatory at the elementary level in all Japanese schools in 2011, there is greater interest even at the pre-school level to teach English. Students remarked that this experience motivated them to perform English *kamishibai* to children.

***Kamishibai* in the College International Culture Classrooms**

Many universities have active recruitment programs to attract international students. Motivations vary, but by nature, these students share an interest in cross-cultural learning. Arriving in Japan, one of the richest and most modern countries in the world, the international visitor soon recognizes the intimate links to seasons and traditions which mold Japanese culture into layers of old and new, ancient and modern, archaic and ultramodern. Rather than approach the topic head-on, the use of Japanese traditional folktales, *kamishibai*, provided a way for cross-cultural comparisons as students view a foreign story while examining their own narratives. *Kamishibai is a creative way to integrate reading, writing, speaking, listening, research, and art* (Paatela-Nieminen, 2008, p. 42).

Storytelling across cultures shares characteristics of entertainment, explanation for natural phenomena, and moral lessons. All of these elements have application to illuminate cross-cultural learning. Additionally, a good old fashion story creates a comfortable environment. Again, *kamishibai* establishes trust such that students were ready to look deeper into their own culture as well as the foreign one they found themselves in. From this the common ground, we shared traditional stories from their countries then examined Japanese traditional stories and some cultural elements.

A 90-minute class called *Japanese Culture and Traditional Storytelling* was taught in English to nine women students, ages ranged from 19 to 24 who were from Australia, France, Great Britain,

Japan, New Zealand, and the U.S. Students were asked to first think about and share a traditional story from their culture. From this personal narrative the class departed into traditional Japanese stories told as *kamishibai*.

A brief summary of the related content and discussions follows. Since the class was in December we began with *Sedge Hats for Jizo*, *Kasajizou* and a discussion of New Year traditions, including preparing a special meal, *osechi ryori*. *Urashima Taro* continued a discussion of the seasons as well as the concept of gratitude and obligations. In *Why the Sea is Salty*, *Umi no Mizu wa Naze Karai*, we discussed themes of kindness rewarded and the mysterious stranger or the powerful disguised as weak and dirty (Blacker, 1990). In the *Marriage of Mouse*, *Nezemi no Yomeiri* we discussed the theme of size and the power of the weak.

Culture, celebrations and related traditions were discussed after each story. Students were asked to write a one-to-two page comparison paper about a Japanese tradition and/or story contrasted with a tradition and/or story from their own culture. The student papers were a joy to read. Students based their discussions from their personal narratives. Meaning, relevance and the universal themes of folklore were elements in confident discussions, but moderated by an appreciation of the differences and similarities. Excerpts of some of their papers are as follows.

On *Sedge Hats for Jizo*:

I think folklore is a very important part of any culture for a number of reasons. It carries forward traditions and teaches children about their ancestors and heritage, as well as about cultures other than their own. On top of all of these benefits, folklore is also something that, from generation to generation, has been regarded as highly entertaining.

And,

Stories, although they appear simple, are quite complicated. Stories convey everything; history, beliefs, and culture. They provide the link to connect generations which allows this information to be re-taught and carried on to future generations.

On *Urashima Taro*:

Why is our curiosity even more triggered when we are told not to do something? There are many questions and I think the answer blanks don't necessarily have to be filled in.

And,

Although there are many factors which contribute to making a country unique, even in this day-and-age, folklore and tales which have been passed down through the generations contribute to making a country's culture even that more bewitching.

An Australian student compared the Aboriginal story *How the Water got to the Plains* which explains the origin of billabongs, waterholes in the desert, to the Japanese story *Why the Sea is Salty* from Japan saying,

It's natural for the people who regard something so important, to question its existence and how it came to be. Through these stories, it is easy to see how

human nature is ultimately the same, no matter what culture you come from. Our most simple ethics and values tend to be similar even though our ways of thinking and living may be different. These stories also show that the curious human mind had answers for things long before we had a scientific way of proving them.

On the *Marriage of the Mouse*:

I think that this story has the value of not being ashamed of who you are, and also to not judge people or things by their exterior.

Kamishibai lessons for the culture class involved the international students in comprehending, interpreting and critiquing imaginative narratives. From personal experience and knowledge to understand the story, students recognized the social, historical and cultural features of the stories. As cross-cultural narratives the class discussed the elements of character, point of view, and culture and compared these features to stories from their own lives in class and in their essays. Additionally, the cultural topics and examples which accompanied the stories were relevant as students gained a deeper understanding of Japanese culture.

Conclusion

Japanese folktales told as *kamishibai* provides a number of benefits to the EFL and international learners. First the format and subject are attractive. The colorful pictures augment the narrative such that all can understand. The large, illustrated cards (15 x 11) can be manipulated to produce a variety of dramatic effects. Second, *kamishibai* uses simple linguistic structures so that learners can *learn how to articulate characters and incidents* (Tirrell, 1990, p. 124) which provides EFL students the opportunity to develop proficiency as language learners. The lively dialogue adds to the drama and further engages students both emotionally and intellectually. Additionally because the Japanese students are familiar with the form and stories, they have confidence to create, practice and perform stories as a process in EFL learning. Third, the inherent cultural component of Japanese folktales provides an introduction for cross-cultural discussions which illuminate Japanese culture as well as the cultures represented in an international classroom. Additionally, Japanese folktales convey wisdom through humor and irony, which as Ziv (1976) comments provides *laughter, accepted and shared in the classroom can free less conventional forms of expression on the part of the students* (p. 321). Another feature is simple and obvious: a fun story builds trust so that students are confident in their learning environment and will venture into the unfamiliar. Transformations are possible as students make sense of the story and add the narrative to their world and beyond. Finally, *kamishibai* is meant for groups and makes it possible for an entire class to enjoy the story rather than individuals (Tamaki, 2009). Additionally, group assignments are easy to do whether it is presentations and/ or creating original stories.

Overall the application of Japanese traditional storytelling seemed successful. Students said they enjoyed the classes, learned English and learned about culture. A Japanese folktale may have been especially suitable for the students who were pre-service infant and kindergarten educators as well as the international exchange students, but I believe that students of all disciplines and children of all ages enjoy storytelling. Very affordable, versatile, easy to carry, and effective, *kamishibai* seems to have great potential in college level EFL and culture classes.

Storytelling can inspire and provide the frame upon which effective teaching environments can be created. A good story allows listeners to fill in the blanks, connect the dots: be it familiar or the mysterious. *Kamishibai* fires up the imagination to motivate students and their learning. In a *kamishibai* environment it is possible to simultaneously have students conceptualize purpose; develop ideas and techniques; organize forms and content into a creative work; reflect for self-evaluation and elaboration; refine their work based on feedback; and present it to others (Bassett, 2008; Nakatani, 2006; Tarvin, 1991).

The power of *kamishibai* is clear. *Kamishibai* applied to the EFL or culture classrooms can be transformational: in the moment as a revelation revealed, or in a classroom assignment, or as skills acquired and applied in new narratives. The potential to empower is plain and to participate a pleasure.

The use of paralinguistic cues in high and low context cultural communication.

An examination of the language of Japanese and English weblogs.

Barry Kavanagh

Tohoku University

b_kavanagh@auhw.ac.jp

Introduction

Hall's (1976) high context v low context cultural distinction places cultures in relation to each other through the ways they communicate. High context cultures are described as being more reliant on combining the verbal and non-verbal to convey the entire meaning of the message. In contrast low context cultures rely on the explicit, where words alone make up the majority if not the entire message. Countries on top of the high context list consist of countries such as Japan with America and Germany heading the low context culture ranking (Hall, E. and M. Hall (1990).

The paper will aim to examine these contrasting types of communication styles through online communication. As the internet is largely a low contextual form of communication how do high context cultures such as Japan communicate on the web that is high in text and content but low in context?

Using Hall's (1976) and Hofstede (1980, 1991) individualist V collectivist cultural framework this paper will attempt to examine high and low context cultural online communication through the language of Japanese and American weblogs looking specifically at representations of communication through paralinguistic cues such as the manipulation of grammatical markers, logographical depictions of laughter, vocal spellings and emoticons.

High context communication styles

Hall (1976) suggests that in a high context culture such as Japan, meanings are internalized and there is a large emphasis on non-verbal codes. Within this high context culture the internal meaning is embedded deeply within the context which results in not everything being explicitly stated in writing or within spoken speech. It is therefore expected that the listener is able to read between the lines or to read the context to grasp the unstated meaning.

The Japanese buzzword of recent years, KY or 空気が読めない *kuuki ga yomenai* (Lit: cannot read the air), points to a person that cannot read the context of a situation, someone who cannot adequately judge the atmosphere of a particular interaction. Such a person is likely to be accused of lacking discretion if this reading between the lines is not met. Lewis (2005) calls cultures such as Japan as 'listening cultures' that listen and react to the person's action verbal or physical. Yamada (1997:38) supports this notion by suggesting "For the Japanese, the responsibility of communication rests with the audience, making listener interpretation not only the key but the main mode of communication". Hall (1976;79) emphasizes that "a high context communication or

message is one in which most of the context is either in the physical context or internalized in the person, while very little is in the coded, explicit, or transmitted part of the message”.

According to the Hofstede Individual V Collectivist dimension (1980, 1991) collective cultures, paralleling high context cultural descriptions, take for granted that a lot of the information is latent in the structure of the message and assumes that the listener understands what the speaker wants to express without being told directly. He suggests collective cultures are more reliant on face to face communication in which the context can be read and understood.

Low context communication styles.

Low context communication suggests Fussel , Qiping & Setlock (2008) is explicit to the point that one’s true feelings are rarely masked and that such speakers are likely to disagree outright as opposed to their high context counterparts who may use indirect speech to express disagreement. America is an example of a low context culture and Yamada (1997:38) comments that “For the American responsibility of communication rests with the speaker”. Supporting this notion low context cultures are described as using more direct and explicit forms of communication to ensure the listener receives the message precisely as it was sent, hence placing the responsibility on the shoulders of the speaker rather than the listener as in high context cultures.

Within the online environment would CMC users from such backgrounds therefore rely on verbal language to express their opinions and thoughts and would their cultural opposites rely more so on non-verbal language to convey their message?

The language of CMC

Computer Mediated communication (CMC) is a process of human communication through the medium of connected computers over the internet. The modes of communication are generally divided into the two categories, asynchronous and synchronous communication. The former includes text based communication through weblogs, internet forums and e-mails where communication is not conducted in real time. Synchronous communication such as chat rooms and instant messaging is however carried out in real time. Both modes of communication can be transmitted from one user to many or a more personal one user to another as in e-mails. Common to all forms of CMC is that the expression of non-verbal communication is greatly limited in comparison to physical face to face communication.

Harris & Paradice (2007) suggest recipients of messages will interpret the senders’ emotional intentions using paralinguistic cues contained and sent within the message. Paralinguistic cues refer to message characteristics in text –based CMC used to convey meanings normally achieved via tone of voice, body gestures, and other non-verbal communicative behaviors in face to face communication. Paralinguistic cues used in text based CMC according to Harris & Paradice (2007) and Carey, (2001) can consist of vocal spellings, lexical surrogates, spatial arrays, and the manipulation of grammatical markers. Carrey (2001:67) suggests vocal spellings contain features that include

“non-standard spellings of words which bring attention to sound qualities. The spelling may serve to mark a regional accent or an idiosyncratic manner of speech”. Such examples can be found in vocal spellings such as Type back soon!!!! (Danet; 2001) and in Japanese 読みたいでう ~~~ ! ! ! *Yomitai desuu~~~!!!* ‘I really want to read it’ (Nishimura; 2003)

Harris & Paradice, 2007 suggest Lexical Surrogates such as ‘yuk yuk’ or lol (laugh out loud) or vocal spellings such as “weeeeeell” are intended to imitate vocal communication or provide a tone to the communication. Japanese examples include the use of logographical representations of laughter such as the Chinese character 笑 *warau* ‘to laugh’ at the end of messages.

Spatial arrays are techniques often employed by CMC users to draw pictures using the features available on the keyboard. Examples of this are emoticons such as :-) smile and :-(frown. The upright (^_^) is the basic smiley of Japan. Online emoticons, a phenomena going back over 25 years were also explicitly created with the goal of clarifying the writers intended meaning within their messages.

The manipulation of grammatical markers such as the use of capital letters and exclamation marks used by CMC users are intended to express emphasis and towards lexical items as well being a representation of tone of voice. Substitutions such as punctuation marks for emphasis (eg; ??? or !!!), the use of capital letters as in GREAT or AWESOME, bold or italicized parts of the message, the repetition of words for emphasis as in ‘*really really cool*’, and the deliberately use of different fonts within single online communication messages are often seen in online communication.

High and low context communication in CMC

Groups that communicate in a high communication style combine the verbal and non-verbal message to convey their entire meaning. How is this therefore transmitted within a low contextual CMC environment? Low context cultures in contrast rely on words to convey their message. Groups that adhere to this type of communication style do not need to include the subtleness of non-verbal communication. Would these traits therefore be transmitted into cyberspace communication?

A glance of the literature would suggest that cultural factors do indeed shape how people use CMC. Specifically, suggest Fussell et al (2008) auditory and visual cues appear to have more importance for members of collectivistic, high context, relationship-orientated cultures than they do for members of individualistic, low context, task orientated cultures. Pflug (2008) found that Indians (India is defined as a High context country) used more emoticons in internet forums than their German low context counterparts, reflecting the higher importance of non-verbal communication in high-context cultures. Kayan, Fussell, & Setlock, 2006 found that within instant messaging North Americans rated emoticons significantly lower in importance than did Indians and East Asians.

Würtz (2005) found that in her examination of McDonalds' websites, graphical design features and the visual effects offered by the internet are more likely to be adopted and used by high context cultures to convey their messages more effectively than their low context counterparts consistent with Hall's distinction between High Context (HC) and Low Context (LC) cultures.

In high context cultures communication places a strong emphasis on the personal relationship of the interlocutors. Therefore could we possibly see paralinguistic non-verbal and verbal communication used in an attempt to create a human presence in cyberspace? As the internet stemmed from low context cultures could we expect high context cultures to emphasize the use of these paralinguistic aids of communication to provide the context or physical atmosphere that online communication with words alone cannot possibly provide. Ironically the addition of these cues would paradoxically make the messages more explicit in an attempt to provide the reader with the paralinguistic cues required to read between the lines and discover the intended meaning of the message by providing a context. Is this more important in high or low context computer mediated communication?

Methods and data

Weblogs can be categorized as an asynchronous mode of CMC communication derived from usually one writer whose thoughts opinions and description of events are written in diary like entries to a broad audience that may result in a selective readership. Blog entries are usually posted in reverse chronological order and invite comments from their readership after each article or entry and the author of the blog can respond to and interact with those who leave comments by responding accordingly. Online personal blogs or online diaries will form the background and the analytical target for this study.

A total of 60 blogs (30 from American blogs, 30 from Japanese blogs) were taken from a variety of blog trackers (Tecnocrati, Yahoo Japan, Blogumura) that contained blog directories of personal blogs or online diaries ranked according to popularity through the number of hits or readers the blog received. The first top 5 male and female authored blogs from these ranked lists were selected from the blog trackers. Gender of the blog was determined by blog profiles that stated author sex, blogs that were not or could not be categorized into gender were rejected. An equal balance of female and male authored blogs were selected, 30 per gender (15 in English, 15 in Japanese).

Within each weblog topic 5 blogs were selected and 5 entries from each blog were taken for analysis. This gave a total of 300 blog entries, 150 from the Japanese corpus and 150 from the English corpus. As the counting of paralinguistic cues formed the basis of this research to create valid figures the number of sentences per corpus was counted and the frequency of these paralinguistic cues were tallied and put into their percentage form. Sentences were defined as full grammatical sentences as well as single word sentences restricted to the use of adjectives such as Great! and すごい *sugoi* meaning great in Japanese. Lists, quotations of text other than the authors words, stand alone conjunctions such as 'but', blog entry dates, titles and links were not counted as sentences.

In addition to the above blog entries, comments from these blog articles were also taken and examined for paralinguistic usage using the same methodology for the blog entries. However, comments could not be divided into gender as the blog entries were because the gender of the comment author could not always be determined. The tables below show how the data was divided and counted within the two sets of corpora.

Table 1. The Japanese data

Japanese corpus	Total number of sentences	Total number of male authored blog sentences	Total number of female authored blog sentences
Blog entries	2934	1420	1524
Blog comments	8243	N/A	N/A

Table 2. The English data

English corpus	Total number of sentences	Total number of male authored blog sentences	Total number of female authored blog sentences
Blog entries	3205	1545	1660
Blog comments	6539	N/A	N/A

The paralinguistic cues examined within these blog entries and their comments fell into three categories and the cues examined for this particular paper are featured in the table below.

Table 3. Targeted paralinguistic cues.

	Frequency of Emoticon use	Frequency of Logographic representations	Frequency of Vocal spelling
Japanese	Examples (^_^) (^o^;>) (^^;) (*^o^*)	Representations of laughter 笑 Chinese character meaning <i>warau</i> to laugh Manipulation of grammatical markers (exclamation marks !!!!)	Examples 行きまーす Ikima-su (Will go) ありがとう Arigato u (Thank you) Unconventional spelling mimicking vocal speech by extending consonant and vowel sounds..
English	Examples :-) :-(:-)) :-o	Representations of laughter Lol (abbreviation meaning lot of laughs) haha, hehe Manipulations of grammatical markers (exclamation marks, capitalization) That movie is COOL!	Examples Greeeeeat! Sooooo Cooooo! Awwesome! Unconventional spelling mimicking vocal speech by extending consonant and vowel sounds.

Results

If CMC is an extension of interpersonal informal speech the use of logographical or vocal representations of written out laughter set the tone of the message and gives hints to the reader in how the message is to be interpreted.

The tables below show representations of laughter as found within the English blog entries and comments section.

Table 4. Frequency of representations of laughter.: Blog entries

English corpus	Total number of sentences	Total number of male authored blog sentences	Total number of female authored blog sentences
Laughter	23 (0.7% of the total of all sentences)	20	3

Table 5. Frequency of representations of laughter.: Blog comments.

English corpus	Total number of sentences	Total number of male authored comment sentences	Total number of female authored comment sentences
Laughter	107 (1.6% of all sentences)	N/A	N/A

Examples of laughter within the English corpus were found to increase within the comments section and their usage.

Example from the English data's comments section:

I would agree that some of my fondest memories involve good food-dessert being the best ☺ lol. Have a blast!

Here the claiming of common ground, and the use of laughter to show agreement with the blog writer as illustrated here is an example of a positive politeness strategy that attends to the hearers desire to be appreciated thus reducing the social distance between commentator and blog writer and aiding in the cementing of solidarity.

Below shows the Japanese data divided into the frequency of representations of laughter found within the blog entries and comments section to these entries.

Table 6. Frequency of representations of laughter.: Blog entries

Japanese corpus	Total number of sentences	Total number of male authored blog sentences	Total number of female authored blog sentences
Laughter	15 (0.5% of the total of all sentences)	10	5

Table 7. Frequency of representations of laughter.: Blog comments.

Japanese corpus	Total number of sentences	Total number of male authored comment sentences	Total number of female authored comment sentences
Laughter	355 (4.3% of the total of all sentences)	N/A	N/A

*Gender of blog comments could not be determined with 100% accuracy and therefore should be treated as mixed in gender.

When comparing the two sets of data the use of these representations of laughter are used in greater percentage (4.3% compared to the English 1.6%) by Japanese blog commentators, a fact that can perhaps suggest that these auditory and visual cues appear to have more importance for members of collectivistic, high context cultures or within this sample of Japanese data

Like the English data representations of laughter within the Japanese blogs were to be found in the majority in the comments section. The comments section is usually reduced to communication between two people, the blog writer and the commentator.

In addition to the Chinese character representations of laughter (笑 *warau*) that were found and documented in tables 6 and 7 above, Japanese blog users also employ emoticons to express written out laughter in a variety of ways and levels of laughter as in:

すごく美味しそう～～*^^*

私もたらこの冷製パスタは作った事ないので作ってみたい！！

娘もたらコスパ大好きなので挑戦してみよっと^^

(*^^)/ポチ☆

Wow! Looks really delicious!

I too have never tried frozen cod egg pasta before, would like to give it a go!

My daughter loves cod egg pasta so I will try and cook it!

(Clicks masterpiece button)

Here the use of representations of laughter within the above example enforces a sense of solidarity and rapport within this social online interaction. The positive politeness strategy here shows a shared interest between the two interlocutors and the promoting of positive face is further supported by the use of compliments here. The ‘masterpiece’ button mentioned at the end of the interaction is a device used on these weblogs that allow the reader of the blog to press the button if they consider the blog to be interesting or funny and by doing this the blog can rise up the rankings depending on how many times the button is hit. This also acts as a notion of support and solidarity between the two CMC users.

Emoticons

Emoticons were divided into 2 parts, character based as in :-) or ^_^; and graphical emotions such as 😊 when the data was collected and analyzed.

Within the English blog articles both genders exhibited very few occurrences of emoticons (14 in all).

Table 8. English Data: Emoticon frequency within blog entries

Gender of blog author	Character based Emoticons (Article)	Graphic emotions (Article)
Male	0	0
Female	9 (0.5% of the total of all sentences)	5 (0.3% of the total of all sentences)

Table 9. English data: Emoticon frequency within blog comments

Character based Emoticons (Comments)	Graphic emotions (Comments)
347 (5% of the total of all sentences)	42 (0.6% of the total of all sentences)

Again with these representations of paralinguistic cues the frequency of use increases when CMC blog users speak directly to each other within the comments section.

Examples found include:

Awesome! I am very impressed that he (blog authors child) played in the nursery with you! :) All three of mine (commentator's children) are at different ages and do things at their own pace, which I guess what makes it so fun :)

Here two blog users are discussing their children and what they do at nursery school. A shared camaraderie is felt and the use of these emoticons aids in the support and bond that the writer wants to create.

Other users add a sense of humor to the message with the emoticon aiding in the messages intention as being funny. Talking about children, toilet training and the art of flushing the toilet, one commentator writes:

We've gotten lucky so far. Our son flushes like crazy, but has yet flushed anything but water. I'm sure our time is coming... 😊

The Japanese data provided much greater emoticon usage in both the blog articles and more significantly 25% of sentences within the comment corpus used character based emoticons which would suggest an importance is attached to these emoticons as visual aids in the promotion of the message and the creation of a context for Japanese blog users.

Table 10. Japanese Data: Emoticon frequency within blog entries

Gender of blog author	Character based Emoticons (Article)	Graphic emotions (Article)
Male	139 (9.7% of the total of all sentences)	89 (6.2% of the total of all sentences)
Female	161 (10.5% of the total of all sentences)	4 (0.2% of the total of all sentences)

Table11. Japanese data: Emoticon frequency within blog comments

Character based Emoticons (Comments)	Graphic emotions (Comments)
2074 (25% of the total of all sentences)	115 (1.3% of the total of all sentences)

長いも美味しい(○σ・ω・●・ω・○・ω・)σYO!!ね
 私も今回は長いもでチャレンジしてみましたw
 わーい♪ヽ(。ん`ヽ)(ノ`ん。ん)ノわーい♪
 ~(=^..^)。傑作 フチッ&TBさせてねw

Yam potatoes are delicious aren't they?
I will also give yam potato a go!
Wai wai (Onomatopoeic Expression of excitement)

The above example shows examples of positive politeness through the complimenting of the blog author, expressing an interest in the cooking and expressing a wish to try the recipe themselves. The example also includes vocal spelling わーい accompanied by emoticons to promote a sense of excitement and rapport with the blog writer.

Manipulation of grammatical markers: Exclamation marks.

When considered in relation to gender, exclamation points are often described as "markers of excitability," a phrase that implies instability and emotional randomness. Exclamation points are typically reported to be used by females significantly more than by males (Colley & Todd, 2002; Rubin & Greene, 1992; Scates, 1981; Winn & Rubin, 2001).

The table below shows the occurrences of exclamation marks within the English data.

Table 12.English data. Exclamation mark frequency within the blog entries.

Exclamation marks	Male	Female
Blog articles	770	155

Table 13.English data. Exclamation mark frequency within the comment entries.

Exclamation marks (Comments)
2901 (44% of the total of all sentences)

It was men who used more exclamation marks than women within the blog articles in contrast to studies in English written communication that states that women use such markers more.

Within the blog comments 44% of sentences had exclamation marks attached which as the comments are dialogues between 2 people could perhaps suggest an increased level of excitability or interest in their dialogues within the blog community that they are writing in. However a closer analysis will be required to breakdown how these exclamation marks are used and to divide these comments into gender as not all the comments could be categorized as such and should be treated as mixed in gender here.

English had multiple !!!! more than Japanese, usually followed by CAPITALIZED words

For emphasis as in (Examples from blog comments)

LOVE your newsletter...LOVE your blog...LOVE your kids...I would say I LOVE your handy husband, too...but that just seems WRONG!!!

Harper looks SOOO ADORABLE!!!

The Japanese data showed similar results albeit on a much smaller scale. This is perhaps not surprising as the exclamation mark is not usual used in written Japanese although in informal writing it can often be seen. In total it was men who used more exclamation marks than women.

Table 14. Japanese data. Exclamation mark frequency within the blog entries.

Exclamation marks	Male	Female
Blog articles	85	71

Table15. English data. Exclamation mark frequency within the comment entries.

Exclamation marks (Comments)
332 (4% of the total of all sentences)

Japanese users tended to use the more visual and friendly *kaomoji* instead of exclamation marks which can perhaps account for the differences in frequencies of occurrences with the English and Japanese blog data.

Example from blog comments section

1. す・すごい迫力(ノ°°)ノ 材材オオオオオ-
Gr Great force! Wow!

Example from blog comments section

2. 私も子供の頃にシマリスを飼ってたよお(*^ー^*)
I too had a chipmunk when I was a Kid!!

Vocal spelling

Vocal spelling definitions within the Japanese data were analyzed as those with deliberate vowel or consonant lengthening to duplicate the sounds of vocal speech. For example, the verb inflections まーす *ma-su*, as in ありがとうございまーす! *arigato gozaimas-su* (Thank yoou!) and words and expressions that had long vowel length with the inclusion of the smaller hiragana vowel font of え (e), あ (a), う (u), and い (i). as in 終わりましたかあ *owarimashitaa* I finished or やったあ! *yattaa* I

did it! which give emphasis to speech articulation, in which the phrase-final vowel is stressed.

The inclusion of these smaller sized fonts give the viewers a more vivid picture of how this expression / phrase might be pronounced in face to face communication and the readers of these interactions or monologues can interpret the atmosphere of the dialogue in the nature it was intended to be sent in. Nishimura (2003) implies that the writers intention is to convey the speakers' articulation as accurately as possible, and through this the writer or sender of the message can convey a high degree of affect and closeness, as if sharing the same physical space and time of conversation with the viewer. These assertions can be linked to the high context framework of trying to establish a context to be read within this low context medium. Nishimura (2003) continues that when the gap between pronunciation and conventional writing is highly noticeable, users seem to be more tempted to capture the spoken language in expressing their message, because they feel their voice can be more directly conveyed through such unconventional orthography.

Within the Japanese corpus 1392 or 17% of sentences within the comments section were found to have vocal spellings compared to 303 or 7% of sentences within the blog articles themselves. This it would seem, parallels high context cultures need or reliance on auditory or visual aids in the conveying of their message as if as already mentioned to share the same physical space with their reader.

The following are of some examples found in female written personal blog comments section.

1. わあ～！ ミニサイズっていいですねえ～！！

Wow! Mini size is good hey!

2. こんにちは！ 金メダル欲しい (>▽<) 種目出来ないかなあ...(^_^;)

Hello! I wanna gold medal! Wonder if I can do it???

Within the English data fewer examples of vocal spellings could be found. The same examination was applied where the lengthening of vowel and consonant sounds were looked for as in sooo, coolor, and greeeat. There were however relatively few instances of such cases. In total there were 34 (1% of the total of all sentences) within blog articles and an increased count of 241 (3.6%) found within the blog comments.

Examples from the comments section

1. Meagan said... Oh my goodness - she looks **sooo much** like your mom in the first picture.

2. I was laughing my ass off. faaaabulous film!!!

Conclusion

Across the paralinguistic categories examined within this sample of data here, there were more notable and frequent occurrences of emoticons, vocal spellings and logographical representations of laughter in comparison to the English data.

Only in exclamation mark frequencies did the English data rate higher occurrences and explanations have been give as to why this may be the case.

English Weblogs can perhaps be described as being more formal in tone than their Japanese counterparts with much fewer occurrences of paralinguistic cues. Cultural reasons and frameworks have been put forward to distinguish communication styles between high and low context communication styles, such as the ability to read between the lines to ensure smooth communication in high context cultures. This research has attempted to examine how these cultural frameworks and theories are applicable to communication online.

It has been shown that CMC users from High context cultures like Japan are more likely to adopt visual effects through emoticons and paralinguistic cues to convey their messages more effectively, than their low context American counterparts, especially within the comments section of these blogs where interaction was reduced to 2 people.

The American blogs here although employing the use of paralinguistic cues were more reliant on the spoken word to convey their messages within the data here. However across both cultural styles the use of these paralinguistic cues were similar in the way they were used as politeness strategies for promoting the positive face and acting as devices of solidarity and rapport within the social interaction which took place with the comments section of these blogs.

Japanese Novel Meets Western Genre

Dr Grzegorz Trębicki

The Jan Kochanowski University of Humanities and Sciences in Kielce

Even a cursory glance at *Brave Story*, the recent novel of the Japanese writer Miyuki Miyabe, reveals its affinity with *The Neverending Story*, a modern classic of fantasy for young readers.

The Neverending Story was originally published in 1979. It is the best known work of Michael Ende (1929-1995), a distinguished contemporary German author of books for children, translated into 40 languages. Over the next few years the novel achieved the already mentioned status of a modern classic. It has been published in several countries (it is worth noting that the Japanese publication preceded the American by one year¹ – 1982 and 1983 respectively).

Although the book's popularity owes much to its famous film adaptation², its literary merit seems to be unquestionable, which has been commented by several critics.³ Ende's novel is also archetypal in the way that it has introduced a certain set of motifs widely used by subsequent authors.

Miyuki Miyabe is an acclaimed Japanese author of, primarily, mystery novels, set in contemporary Japan and frequently undertaking crucial social issues. They also sometimes, but not as a rule, contain various fantastical elements. *Brave Story* is her recent venture into Secondary World Fantasy⁴. It conforms to all the defining conventions of this, so far predominantly Anglo-Saxon genre, and at the same time explores the essential motifs of Ende's novel which seems to have been the main source of its inspiration.

In the present article I will try to compare both novels with the emphasis laid on how Miyabe's novel reinterprets motifs introduced in *The Neverending Story* and adopts the conventions of Secondary World Fantasy (SWF) genre.

The main protagonist of Ende's book is a young, "ten or twelve" years' old boy, Bastian Balthazar Bux. Bastian is a rather unhappy, friendless child who faces problems both at school (other children constantly make fun of him) and at home (his father neglects him after the death of his wife).

Bastian's life changes after an accidental visit to an antique-shop, led by a Mr. Coreander, where he seeks refuge from the school-bullies pursuing him. He steals from the shop a curious-looking book entitled *The Neverending Story* and starts reading it.

The book tells the story of an alternative fairy-tale-like world called "Fantastica" inhabited by various creatures and races. This world is endangered by "Nothing", by which it is being gradually disintegrated. At the same time, the ruler of Fantastica (or more properly, the centre of its life), the Childlike Empress is suffering from an inexplicable illness. She chooses and sends on a quest a young warrior boy named Atreyu to find a cure for her, and simultaneously save the whole Fantastica. From now on, Bastian will follow Atreyu on his journey, witnessing his adventures and becoming more and more involved in the story.

Finally, Atreyu returns to the Childlike Empress feeling his mission has failed as almost whole land has been devoured by Nothing by now. The Empress reveals him, however, that

his real task was to bring to Fantastica a child from another world. This child is going to give her a new name and thus save both her and Fantastica. Reading this, Bastian realizes that he has actually himself become part of the Neverending Story. He transcends the border between the worlds, meets the Childlike Empress in person, gives her the new name “Moon Child” and begins the renewal of Fantastica. At this point ends the first part of the book.

The second part, describing Bastian’s adventures in Fantastica, is much more ambiguous. The boy is bestowed by the Moon Child a powerful artifact, Aurnyn, with whose help (and also by using his own imagination) he is supposed to rebuild Fantastica. Aurnyn gives the boy power to fulfill all his wishes, with each wish, however, one memory of his previous life is taken. In the meantime, Bastian meets and befriends Atreyu and his companion, dragon Falcor and is also joined by some other characters on his quest. As he loses more and more memories and gradually - his own self - he transforms into a sort of an anti-hero. He also becomes suspect to the plottings of the evil sorceress Xayida. As a result, he betrays the mission the Moon Child entrusted him and resolves to take the place of the Childlike Empress and himself become the ruler of Fantastica. After a bloody battle he is defeated by the rebels led by Atreyu and forced to escape, lonely and bereft of all his memories. At the end of the book, however, with the help of Atreyu and Falcor Bastian manages to find one true wish; he drinks the Water of Life and returns to his own world. Symbolically he also brings the Water of Life to his father and the relationship between those two can be restored.

As it can be easily observed, the literary formula invented by Ende creates unique opportunities for writing a modern novel of apprenticeship of highly metaphorical quality. Its core idea is the juxtaposition of the two worlds – the “real” (mimetic) or the primary one, where the protagonist experiences some serious problems of personal nature, and the secondary one, to which he is mysteriously transferred at some point of the narration. This alternate reality exhibits fantastical qualities and directly refers to human imaginative powers but, nevertheless, reflects the first one on several levels. Thus, protagonist’s adventures in the alternate world parallel the more mundane but very vital dilemmas he encounters in his everyday life – and – ultimately - lead him to a sort of maturity that enables facing them.

This formula has been efficiently executed and further developed by Miyuki Miyabe in *Brave Story*. The novel successfully explores its cognitive potential by depicting a highly convincing and suggestive presentations of both the contemporary life and the secondary world.

The title of Miyabe’s book already indicates Ende’s work as its principal source of inspiration. This suggestion is confirmed by further reading, on several layers of the text’s structure.

The main protagonist of the book, eleven years’ old Wataru Mitani resembles Bastian in the way that, from the very beginning of the book, his family problems are in the centre of the narration. They are also instrumental for the development of the plot of the novel.

The book has two distinctive parts (in which it is similar to many “translation” fantasy novels)⁵ – a mimetic introduction, and the main part, which takes place in the world of Vision. For the first 200 pages of the book, the mystery of the Daimatsu building, which hides a portal to another world, and the enigma surrounding a new student, Mitsuru Ashikawa, are carefully backgrounded against a typical routine of a Japanese schoolboy and a growing tension in Mitani’s home. During the course of the action, Wataru’s father abandons his wife and son to live with another woman. Ultimately, this is Wataru’s mother suicidal attempt that

makes him resolve to follow Mitsuru's advice and enter the world of Vision in order to change his destiny.

The main difference with *The Neverending Story* at this stage lies in the treatment of the "realistic" passages in the primary world. In Ende's text the mimetic introduction is very sketchy; it comprises, save for Bastian's reflections while reading the book, only a few pages and only two other characters appear in person (Mr. Correander and Bastian's father). In contradistinction, Miyabe delivers a detailed presentation of life in modern Japan from the perspective of a young boy. What is notable, unlike many fantasies for young readers, the text does not refrain from introducing difficult or even drastic situations (the split in Mitani family, the story of the murder of Ashikawa little sister and mother by his jealous father). As a result, Wataru with his average schoolboy's life, his typical interests and entertainments and, unfortunately, problems not uncommon in modern world, to a larger extent appears as a three-dimensional character, and, obviously, is easier to identify with. Although firmly rooted in Japanese reality, Wataru may be regarded as a figure of a really universal appeal, as his everyday life (school, friends), his passions (3D video games) and his problems (the impending divorce of his parents) could become a part of almost every contemporary boy's experience.

As the very names of the secondary worlds in both texts suggest – Fantastica and Vision respectively – their existence and condition is directly related to human imaginary powers, and they are subtly interlinked with our own world. As Mitsuru states while prompting Wataru to set out on his quest: "We created the Vision – us the people in this world – with our imaginations. Our thoughts create the energy that makes Vision what it is" (223).

However, even if Vision is an imaginary world by definition, it is also a very vast and complex one. Here again, major differences between the two novels in the construction of their secondary worlds are clearly visible. Describing Bastian's adventures in Fantastica, the text employs many of the conventions typical for the magical fairy tale.⁶ Time and space are not completely autonomous but similarly as in the traditional fairy tale seem to be subordinated to the movements of the protagonists. The descriptive names such as "the Desert of Colors", "The Land of the Dead Mountains" or "Childlike Empress" prevail in the narration. Characteristic for the fairy tale is also the role of the magical artifacts (the jewel Aurnyn, the magical sword Sikanda wielded by Bastian in the second part of the book) which on numerous occasions prove more instrumental for the development of the plot than the protagonist himself.⁷ Many of the characters, especially secondary ones, are typical stock characters or types rather than fully depicted individuals – here the hero Hynreck or Princess Oglamar could be mentioned. Thus, the reader is at all times made aware of the conventionality of the presented world and is hardly ever prompted to suspend his/her disbelief.

Unlike Ende's text, *Brave Story*, apart from using some fairy tale motifs, in the construction of its plot and the presented world relies primarily on the conventions of the contemporary Anglo-Saxon genre of Secondary World Fantasy. The Vision is a full-fledged alternate reality, a precisely defined spatial-temporal continuum with its specific geography (similarly as in a typical American fantasy novel, a map of Vision has been included in the volume), social and racial structure and a political system.

The world of Vision consists of two principal lands, occupying two respective continents separated by the sea: the multiracial and democratic United Southern Nations, and the

tyrannical Northern Empire. USN, where Wataru arrives first, is a loose federation of several cities and territories inhabited by humans (here called “ankha”) and non-human races (such as catkin, beastkin, intelligent giant birds - karulakin or resembling giant lizard waterkin). The harmony of this land is endangered by the racial prejudice spread by the refugees from the Northern Empire where humans have effectively exterminated “non-ankha” and by the religious turmoil caused by the rising followers of the Old God (the official doctrine of the Northern Empire sanctioning violence against non-ankha species) who oppose the traditional faith of the South in motherly and tolerant Goddess, the Creator. Almost immediately upon his arrival, Wataru is involved in the impending conflict and has to decide for himself what is right and wrong. He quickly makes friends with a young lizard-man Kee Keema and a cat-girl Meena who will accompany him on his quest, and also joins the ranks of Highlanders, the traditional peace-keepers of the South.

Contrarily to Bastian, whose adventures focused on his personal problems, ambitions and characterological failures, while most of the time safely remaining within the conventionality of a magical fairy tale, Wataru from the very beginning is confronted with the intricacy and ambiguity of the modern world (as it is metaphorically reflected in the construction of the world of Vision) and he is also made aware of the importance of ethical choices in social and personal life alike. Even if Vision is, partly, the emanation of himself, the way *Fantastica* was Bastian’s emanation, this is also the world of other beings; probably the most important lesson Wataru has to learn on his quest is that of empathy, the understanding of mutual interconnectedness of all living creatures and the world they inhabit.

Wataru’s primary purpose, when, acting on Mitsuru’s advice, he enters Vision, is to find the way to the mythical Tower of Destiny where the Goddess resides, and ask her to grant his one wish. Thus, both boys want to change their fate and miraculously undo misfortunes that befell to them in “real” life; Mitsuru is determined to save his little sister while Wataru wants to make his family reunite or, rather, to make the split never happen.

The boys set on their individual quests (although their ways will later cross on several occasions), each equipped with a “brave’s sword”, searching for five magical gemstones for sword’s hilt that would help to transform it into “demon’s blade” capable of opening the way to the Tower of Destiny.

Echoes of *The Neverending Story* surface continually in Miyabe’s book. Vision, similarly to *Fantastica* is affected and shaped by human dreams and feelings. The benevolent Goddess, creator and guardian of Vision ontologically resembles the Childlike Empress. Bastian’s successful temptation by Xayida is paralleled by Wataru’s encounter with Lady Onba who tries to coax him into destroying the Goddess and taking her place in order to fulfill an unlimited number of wishes. The Old Emperors of *Fantastica* - human visitors who could not find their way back to the real world- in *Brave Story* find their equivalent in failed Travelers who abandoned their quest and were subsequently confined in Dela Rubesi.

Yet, at the same time, those motifs are constantly reinterpreted and reworked. Bastian’s strength in the second part of *The Neverending Story* basically relied on the magical power of the already mentioned sword Sikanda, whereas Wataru’s Brave’s Sword grows together with its wielder, being only the expression of his inner ability and preparedness. Tempress Onba is not just another literary realization of the archetype of an evil sorceress like Xayida, but a manifestation of everything that is unwanted and rejected – including the negativity buried deep in Wataru’s own heart.

Brave Story's psychological complexity exceeds not only that of Ende's work, but also goes beyond what is generally expected from a fantasy book for children or teenagers. In this respect it again, once more, follows the tradition of Secondary World Fantasy. It offers several dark and disturbing scenes – for example the encounter at the Swamp of Grief when the revengeful side of Wataru literary separates from the boy and slays merchant Yacom and his pregnant lover Lily who seem to be Vision's alter-egos of Wataru's father and his friend Rikako for whom Akira Mitani has abandoned his family in the real world.⁸

The dilemmas of the protagonists are difficult and sometimes tragic. Wataru's friend Mitsuru, who has saved him on numerous occasions, ultimately becomes his rival, as it is revealed that only one of the two travelers can finish his quest while the other is doomed to become "the half" - part of the sacrifice, necessary in order to renew the universe of Vision. Mitsuru is also probably the most tragic and ambiguous character in the book. He is so determined to bring back to life his little sister that in order to reach the Tower of Destiny he is capable of committing several atrocities and of destroying everything and everyone that stands in his way. His dramatic end is one of the most moving and sad moments in the book.

Mitsuru's death is not the only loss Wataru has to suffer as the book draws towards its culmination. *Brave Story* consequently abstains from a conventional happy ending which prevails in the traditional magical fairy tale (and most of the fantasy for children stemming from it)⁹ and its messages are not simple. After helplessly witnessing his friend and rival's failure, overcoming his own hatred and evading temptress Onba, Wataru finally arrives before the Goddess of Destiny. However, as the whole world of Vision faces now complete annihilation, Wataru faces the most difficult of his dilemmas. Contrarily to Mitsuru, the boy abandons his personal cause for the sake of his friends and the world he has become involved in. At the end of book he returns to real life, aware of the fact that he will never be able to see again his friends and the world he has saved, and that the problems he has left behind will be still waiting for him. Yet, with a new maturity he also realizes that, ultimately, he is the only one who can change his own fate - now and in his future life as well.

Brave Story is an original, metaphorical and educational book that may be enjoyed by young and adult readers alike. Due to the already mentioned complexity of the presented world, the message of *Brave Story* moves far beyond a simple, fairy tale-like apotheosis of friendship and self-reliance into a more sophisticated morality on justice, empathy, loyalty, compassion, overcoming one's hatred and following "one's true path".

From the point of view of a more textual analysis, the novel's strength lies primarily in its ability to use various literary conventions and successfully combine them in its own specific way. This is a novel written by a Japanese author whose extensive parts describe Japanese reality, yet its primary sort of inspiration seems to have been a book by a German writer. The literary genre to which the text shows most affinity is contemporary Anglo-Saxon Secondary World Fantasy¹⁰ – all the defining elements of the genre – the motif of quest, the motif of initiation and spiritual transformation of the protagonist, the motif of the struggle between good and evil on the transcendental scale in which the fate of the whole world is to be determined – are present in Miyabe's book. At the same time, the book does not follow western conventions slavishly but uses them purposely to create its own textual paradigm. Originality can be seen, especially, in the creation of Vision, which does not simply imitate innumerable variations of feudal post-Arthurian or post-Tolkienesque worlds, so common in contemporary SWF sagas.

Such books as *Brave Story* illustrate also a very interesting and important literary and cultural phenomenon – the progressive process of the globalization of contemporary literature. This is especially visible in the case of the genres of popular literature, such as fantasy, in which texts, conventions and motifs quickly cross national, language or ethnic borders. Thus, the genre gradually becomes a cosmopolitan creation, continually enriched by various influences coming from the West and the East alike.

¹ Ende apparently maintained a special relationship with Japan, especially in the last 20 years of his life. His novels were warmly received in this country and sold in big numbers. He visited Japan on several occasions, and in 1989, four years after the death of his first wife, he married Mariko Sato, his Japanese translator.

² Ende highly disapproved of Wolfgang Petersen's 1984 movie, and even unsuccessfully sued the producers.

³ It is, however, worth noting that in the Anglo-Saxon world *The Neverending Story* remained much of a connoisseurs' book, whose popularity among average readers could never challenge that of American fantasy sagas. This, obviously, provokes a question whether a non-American (or non-English) writer can successfully enter the world's biggest and most influential popular literature market, or perhaps he/she is doomed to become, at best, a sort of niche literary curiosity. In this respect, the recent Miyabe's book might prove a very interesting case study.

⁴ As indulging in a theoretical-literary debate is not my present objective, let me just state that by "Secondary World Fantasy" I mean a popular contemporary genre which attempts to create an alternative, "secondary" world in the plot is set. The text focuses on making this world relatively concrete and complete, achieving this aim by the detailed description of spatial-temporal setting and the social and ontological order of the presented model as well as conferring to it a certain specific causality, unusual from the point of view of the empirical reality but logical and coherent within the created world. As a rule, the reader is initiated into the world gradually, together with the protagonist (who, in some peculiar cases, comes from "our" or "primary" world). The plot is shaped by the motifs of quest, the main character's initiation and spiritual transformation as well as the struggle between good and evil on a transcendental scale in which the protagonist is engaged and frequently plays a vital role. Thus described genre will include the exemplary works of J. R. R. Tolkien (*The Lord of the Rings*), Ursula Le Guin (*Earthsea cycle*) or such authors as Stephen Donaldson or Patricia McKillip, but not, by the way of example, the famous Harry Potter cycle, whose action takes place in the "primary" world or texts of the so called "urban fantasy" as represented by works of Neil Gaiman or Charles De Lint. See also Trębicki (2007).

⁵ By "translation fantasy" I mean the variation of SWF in which the main character or characters are, in some initially mysterious but ultimately explainable way, "translated" (transferred) to a secondary world, where they subsequently experience their adventures. They are usually appointed an important mission by some transcendental force, and after accomplishing it, they return to the primary world. The texts are usually divided into two distinct parts – the mimetic introduction, and the text proper. Among the most notable examples of this genre variation I will count such works as *The Chronicles of Thomas Covenant*, *Unbeliever* or *The Summer Tree* by Guy Gavriel Kay. It is also worth noting that a

similar convention can be found in the works of contemporary Japanese pop-culture, namely anime movies or manga books targeted at teenagers – here I mean such productions as *The Vision of Escaflowne* or *Fushigi Yûgi*.

⁶ On the genological differences between fairy tale and fantasy see: Lasoń (1990), Trębicki (2007) and Zgorzelski (1997).

⁷ See Lasoń (1990).

⁸ The motif of Wataru's double, the materialization of his hatred, the struggle that ensues between these two and its unexpected resolution is highly reminiscent of a classical fantasy novel *A Wizard of Earthsea* by Ursula K. Le Guin, whose protagonist, Ged, has to come to terms with the Shadow, symbolizing dark side of his own personality.

⁹ Once more, a close resemblance to many Secondary World Fantasy works manifests itself, especially those belonging to the epic fantasy subgenre. The endings are often marked with the pervasive feeling of sadness and personal loss, whereas the final victory over evil is often not complete and redeemed with sacrifice. Again, such titles as *The Farthest Shore* by Ursula K. Le Guin, *The Lord of the Rings* by J. R. R. Tolkien or *Chronicles of Thomas Covenant, Unbeliever* by Stephen Donaldson could be mentioned.

¹⁰ This is also what distinguishes *Brave Story* from many other Japanese novels that might be possibly labelled as “fantasy”. Two popular (and translated into English) texts will serve as an example: *Dragon Sword and Winter Child* by Noriko Ogiwara and *Moribito, Guardian of the Spirit* by Nahoko Uehashi. Plots of both books take place in imaginary realities but conventions characteristic for Anglo-Saxon fantasy are not used here, and the models of presented worlds are almost exclusively based on Japanese history and mythology.

National Taipei University, Taiwan

Living in an era of uncertainty, no one can escape from the state of constant anxiety about the dangers that could strike unannounced and at any moment. The dangers of uncertainty then brings to light the risk one has to take in dealing with unpalatable and undesirable consequences, of which one's capacity to calculate probability is very often tested or even diminished. The feeling of being unable to foresee probability jeopardizes one's configuration of the manageable and therefore evokes the most compelling feeling of human emotions, that is, fear. Fear is the name we give to our uncertainty in the face of dangers, and the fear of uncertainty, whether it is the fear of natural disasters, the fear of environmental catastrophes, or the fear of frantic terrorist attacks, characterizes what Zygmunt Bauman terms as the "liquid modern age," at which one's ignorance of what the threat is and one's incapacity to determine what can or cannot be done counter to the controlling forces of the socio-political world of the modern era. This paper aims to extend the discussion of the stranger to that of the liquid stranger implied in David Mitchell's debut novel *Ghostwritten* (London: Sceptre, 1999). To present a clearer picture of the "liquid stranger," I would begin with Zygmunt Bauman's elaboration on "liquid modernity" so as to explicate how "liquid" can a stranger be in a global cultural scenario. In *Ghostwritten*, David Mitchell creates a genre-bending collage of nine inter-linked short stories to unravel the frailty of human bounds and the "liquid fear" it generates. The story starts with the narrative of Quasar, a Japanese Aum *Shinrikyo* cult who has released poisonous Sarin gas on the Tokyo subway and is now a fugitive running around from Tokyo to Okinawa and later prompts liquid strangers to transmit fear globally from Hong Kong, Tibet, Mongolia, to Petersburg and, by the end of the story, London. The liquid fear spreads, thanks to the global migration of the liquid strangers, from East to West. How can the liquid strangers portrayed in *Ghostwritten* mediate and struggle against the "liquid fear" in the liquid modern time? To what extent can the liquid strangers confront and tackle the chaotic turbulence which they are themselves responsible for? Do they, as the compromising and chaotic situation eases off, remain as elusive figures in the landscape of the liquid modernity, or, one way or the other, reconcile with the frail human bounds so as to find a mind at ease in a world where all that is

solid melts into air?

In an interview conducted by Keith Tester, Bauman reiterates the essentiality of terming the time of uncertainty “liquid modernity.” He starts with an explication on how the word “postmodernity” hinders our understanding of the “discontinuity in continuity” (Bauman and Tester 97). Postmodernity, Bauman points out, is generally accepted as the end of modernity, “leaving modernity behind, being on the other shore.” But what we are encountering goes flagrantly counterclockwise. According to Bauman, we are “as modern as ever, obsessively ‘modernizing’ everything we can lay our hands on” (Bauman and Tester 97). We then have come to a dilemma: what seems the same turns out different, and what is supposed to continue as a whole is ruptured as discontinuous segments. Although Anthony Giddens has figured a way out of this predicament by suggesting the term ‘late modernity,’ Bauman finds it difficult to adopt. He bluntly tells Tester that:

I never understood how we know that this modernity here and now is ‘late,’ and how we would go about proving or refuting this. Besides, the idea of ‘late modernity’ implies the same as the concept of postmodernity: one cannot speak of a ‘late’ phase of a process unless one assumes that the process has fizzled out and that therefore you can eye the ‘whole of it.’ (Bauman and Tester 97)

In contrast, Ulrich Beck’s “second modernity” is considered a better term, but it says “nothing about the difference between the ‘second’ modernity and the ‘first,’” and therefore, the term itself is brandished as “an empty container inviting all sorts of contents” (Bauman and Tester 97). On the other hand, George Balandier’s “*surmodernité*” seems more acceptable to Bauman, though the English translation is not as solid as it is in its original French version. To such an extent, Bauman maintains that the term “liquid modernity” would cause less semantic confusion about the contemporary trends under the trope of “postmodernity” because liquid modernity “points to what is continuous (melting, disembedding) and discontinuous (no solidification of the melted, no re-embedding) alike,” which he finds “suitable and useful” for the time being (Bauman and Tester 97-98, emphasis original).

Bauman has tried to make explicit the idea of “liquid modernity” in the book under the same title *Liquid Modernity* (2000), so he says in the conversation with Tester. Bauman examines one by one some cardinal and topical social issues which have been widely attended to in modern times in order to “find out what has been changed and what has remained unscathed because of the advent of the ‘liquid’ phase”

(Bauman and Tester 98). The concept of liquid modernity, asserts Bauman blatantly, helps to “‘make sense’ of the changes as well as of the continuities” in a world that is inclined to be free of fences, barriers, fortified borders and checkpoints (Bauman and Tester 98), because what is happening at present is, Bauman emphasizes, “a redistribution and reallocation of modernity’s ‘melting powers.’” The solids bond individual choices in collective projects and actions, while the liquids, one variety of fluids, undergo a continuous change in melting the patterns of communication and co-ordination between individually conducted life principles as well as political actions of human collectivities. Likewise, while bonding signifies “the stability of solids,” melting indicates the changeability of solids which denies the solids to resist liquefaction. “Melting the solids” then casts off the “‘irrelevant’ obligations standing in the way of rational calculation of effects” and leaves the complex network of social relations “unstuck, . . . bare, unprotected, unarmed and exposed,” incapable of resisting the progressive untying of bonds from the traditional political, ethical and cultural entanglements. “Melting the solids” also precipitates a new order that is to be “more solid” than the orders it replaced, because the new order renders whatever might have happened in a world emphasizing the totality of human life “irrelevant and ineffective” as long as the “relentless and continuous” reproduction of that order is concerned (Bauman, *Liquid Modernity* 2-6).

The “melting of solids” has therefore been redirected to a new target. What is happening at the present time, the time of liquid modernity, is “a redistribution and reallocation of modernity’s ‘melting powers’” (Bauman, *Liquid Modernity* 6). “Configurations, constellations, patterns of dependency and interaction” are all thrown into the melting pot in order to be subsequently recast and relocated. The liquid modernity is the “breaking the mould” phase in the history of the inherently “transgressive, boundary-breaking, all-eroding modernity” (Bauman, *Liquid Modernity* 6). Undoubtedly, Bauman continues, when a mould is broken there will always be another one to replace it. By the same token, people are released from their old cages only to be cautioned “in case they fail to relocate themselves in the ready-made niches of the new order.” The task free individuals have to confront, therefore, is to utilize their new freedom to “find the appropriate niche and to settle there through conformity” by steadfastly following the rules and modes of conduct identified as “right and proper” for the location (*Liquid Modernity* 7).

Liquid modernity is an epoch of disengagement while solid modernity an era of mutual engagement and entanglement. It is its lightness of being that liquid modernity frees the individual from the cage of solidity and makes the most elusive

call the shots. While the most elusive rule the patterns of communication and co-ordination between individually conducted life principles and political actions of human collectivities, one would possibly fall prey to an endless facile escape and its pertaining hopeless chase. This free floating life strategy seems appealing to the liquid modern inhabitant for its flexibility and expansiveness, but it adversely causes his or her fear of dangers—the danger of uncertainty and the danger of insecurity. The dangers one is afraid of in a liquid modern society, Bauman points out, are of three kinds. Some put the body and the possessions in jeopardy, while others threaten “the durability and reliability of the social order on which security of livelihood (income, employment), or survival in the case of invalidity or old age, depend.” Then there are dangers that threaten one’s place in the world—“a position in the social hierarchy, identity (class, gender, ethnic, religious), and more generally an immunity to social degradation and exclusion” (*Liquid Fear* 3-4). One’s vulnerability to dangers in the liquid modern time haunts him or her with no visible reason when the dangers one should be afraid of can be detected everywhere but are nowhere to be found for sure. Life in the liquid modern time, therefore, is anything but “fear-free,” and the liquid modern setting in which it is bound to be conducted is “anything but free of dangers and threat.” The struggle against fears in the liquid modern setting has turned out to be “a lifelong task,” while fear-triggering dangers are widely believed to be “permanent, *undetachable* companions of human life” (Bauman, *Liquid Fear* 8, emphasis original). Succinctly put, life in the liquid modern society has become a long and intense struggle against the potentially devastating impact of fears, and against the dangers, whether they are genuine or suppositional, that make one fearful. Even so, Bauman suggests, one had better to see the struggle as a continuous search for maneuvers and expedients allowing one to delay or postpone, even if temporarily, the imminence of dangers. Or better yet, to “shift the worry about them onto a side burner where they might, hopefully, fizzle out or stay forgotten for the duration.” What one should delay is “*frustration*, not *gratification*” (*Liquid Fear* 8, emphasis original).

There is, however, a possibility that one cannot get what he wants and gets instead something “different and utterly unpleasant,” something he would rather stay clear of (Bauman, *Liquid Fear* 10). These undesirable consequences come “unanticipated,” and catch one unprepared. But it is precisely the consequences which one can predict that makes one worried, and it is those same consequences that one can struggle to escape. Likewise, it is exactly the undesirable consequences of such a “pre-visible” kind that can be filed in the category of ‘risks.’ Risks, according to Bauman, “are the dangers whose probability we *can* (or believe that we can) calculate:

risks are the *calculable* dangers. Once so defined, risks are the next best thing to . . . certainty” (*Liquid Fear* 10, emphasis original). That “calculability,” however, does not mean predictability. As Bauman reminds us:

What is being calculated is only the *probability* that things go wrong and disaster strikes. Calculations of probability say something reliable about the spread of effects of a large number of similar actions, but are almost worthless as a means of prediction when they are (rather illegitimately) used as a guide for one specific undertaking. Probability, even most earnestly calculated, offers no certainty that the dangers will or will not be avoided in *this* particular case here and now or *that* case there and then. But at least the very fact that we have done our computation of probabilities . . . can give us the courage to decide whether the game is or is not worth the candle, and offer a measure of reassurance, however unwarranted. Getting the probabilities right, we have done something reasonable and perhaps even helpful; now we “have reason” to consider the probability of bad luck too high to justify the risky measure, or too low to stop us taking our chances. (*Liquid Fear* 10-11, emphasis original)

Confronting the risks of dangers shares a similar line with living in the fog. Living in the fog, one targets and focuses precautional efforts on the discernable and imminent dangers—“dangers that *can* be anticipated and *can* have their probability computed.” Nevertheless, the most awesome and fearsome dangers by far are precisely those that are “*impossible*, or excruciatingly *difficult*, to anticipate: the *unpredicted*, and in all likelihood *unpredictable* ones” (Bauman, *Liquid Fear* 11, emphasis original). The most awesome and fearsome dangers hit blindly and indiscriminately and make everyone living in the liquid modern habitat fear of this kind of unprepared and defenseless dangers. There are, however, other fears even more “horrrifying”—the fears of being particularly singled out from the joyous crowd and “condemned to suffer *alone* while all the others go on with their revelries.” These fears, Bauman further exemplifies, are very much on par with the fears of falling out of a fast accelerating vehicle or being thrown overboard, while the rest of the passengers, with their seatbelts securely fastened, find the journey ever more entertaining. These fears are “horrrifying” not simply because they are unprepared and defenseless dangers but also fears of “a *personal* catastrophe,” of being “left behind,” of being excluded in the liquid modern scenario (Bauman, *Liquid Fear* 18).

The liquid modern fears of exclusion serendipitously characterize the traits of the liquid modern strangers. Exposed in the liquid modern milieu, everyone is a

stranger to most of the people he or she meets, Dennis Smith points out in his study of Zygmunt Bauman's exploration of the nature of modernity and postmodernity (161). Notwithstanding there are strangers described by Julia Kristeva as "strangers to ourselves" (182-83) and those depicted by Sara Ahmed as "bodies out of place" (39), which I have discussed elsewhere and termed the privileged homeless strangers portrayed in Kazuo Ishiguro's novels as "*stranger* strangers" (Wang 1-29),¹ the liquid modern strangers are neither neighbors nor aliens; instead, they have features of both (Bauman, *Life in Fragments* 88). They remain close by in space as neighbors, while remaining distant and unfamiliar as aliens. One way to respond to strangers, Bauman proposes, is to treat them as the "*flâneurs* or *strollers*," who roam along to enjoy human comedies. The *flâneur* is, as Smith observes in reading Bauman, a "stranger among *strangers*" who feels "no particular moral responsibility for those providing the entertainment" (161-62, emphasis original). The stroller in the liquid modern world has replaced the modern pilgrim, who strides purposefully towards a clear destination to fulfill a clearly defined mission, because the contemporary world is no longer "hospitable to pilgrims" (Bauman, *Life in Fragments* 88). Instead, we meet, together with the stroller, the tourist, the vagabond and the player in the liquid modern time.

The liquid modern tourist is chasing after new experiences in new places, while reducing the risks that new experiences bring on his way to enjoyment. He returns home after each excursion, although the sense of "home" becomes obscured by the feeling of being constantly on the move. His home sickness meets a strong challenge from "fear of *home-boundedness*" (*Life in Fragments* 97, emphasis original). In contrast to the tourist, the vagabond is a wanderer who has no home. He does not wander out of choice, although sometimes he may come to cherish his capacity to move on when necessary. Such a well-adept vagabond would become a tourist if he had no financial troubles. Finally, there is the player who regards life as a series of games, each with its own rules. To avoid being permanently disturbed by remorse, the player must be able to leave behind a game that is concluded, moving straight on to the next without grudges.

With their different strategies of living in the liquid modern time, these four characters do share something in common inasmuch as they all "tend to render human relations fragmentary . . . and discontinuous." They rebel against "'strings attached' and long-lasting consequences," and also militate against "the construction of lasting

¹ For an exhaustive analysis of the "*stranger* strangers," please consult my book-length study of the Ishiguroan strangers in *Homeless Strangers in the Novels of Kazuo Ishiguro* (2008).

networks of mutual duties and obligations.” What they all favor and promote is “a distance between the individual and the Other and cast the Other primarily as the object of aesthetic, not moral evaluation,” nor responsibility (Bauman, *Life in Fragments* 100).

The nine protagonists David Mitchell portrayed in *Ghostwritten* are liquid modern strangers who are intimidated by and tormented with liquid modern fears. In his “ambitious and weighty” first book, Mitchell creates an “intricately assembled Fabergé egg,” in which “a daisy chain of characters” wander through every time zone to go across “the gamut of individual experience” (Mendelsohn). When the Japanese fugitive desperately calls a secret number and says the encoded message, “*The dog needs to be fed*,” for “a wallet of crisp ten-thousand yen notes” from the treasury of the cult in the first chapter (Mitchell, *GW* 27),² it turns out in the second that he accidentally gets the line to the jazz-record store in Tokyo where eighteen-year-old Satoru works (*GW* 54). In the third part, an English financial scam, Neal Forbes, sits in a restaurant when a young couple asks to share the table. Although there is no more detail than a saxophone case the boy carries with him and the language they speak, the general description would suggest that they are Satoru and his girlfriend Tomoyo, a “half-Chinese” with a Japanese mother and a Hong Kong Chinese father (*GW* 55), reuniting in Hong Kong (*GW* 78). More complex and suggestive is that in chapter seven a womanizing Londoner, having an affair with Katy Forbes whose husband helps money laundry in the chapter titled “Hong Kong,” ghostwriting the autobiography of an artist who happens to be an old friend of the Petersburg forger in chapter six, saves an Irish female physicist named Mo Muntervary from being hit by a car after she has invented an all-powerful technology that can control all other technologies. The subtle connections between their narratives manifest “the cloaking devices of a system bent on keeping its elements present and foregrounded,” which forces the reader to “take on the role of the critical theoretician able to counter the illusionary masking of the text,” Philip Griffiths maintains as he relies on Jacques Derrida’s concept of *différance* and the trace structure of the sign to tackle the novel’s “numerous intratextual references” in order to examine “the postmodern world map and the plurality of postmodern voice” (Griffiths 84, 79). By referring to Zygmunt Bauman’s exploration of the nature of modernity and postmodernity, I would like to expand Griffiths’s observation and argue that a series of loosely interwoven individual experiences of the liquid strangers serendipitously put the liquid fear at large and bring to light the frailty of human bounds that is “present and foregrounded,” borrowing from Griffiths, in the postmodern world.

² The text *Ghostwritten* is referred to as *GW* with pagination in parentheses.

The main character in each episode seems to have found some kind of meaning in his or her life, but for a stranger inhabiting in the liquid modern world, “the casing of the human condition sometimes turns transparent, like a see-through Swatch.” One would “understand less” if one understands more, says David Mitchell when describing his experience of living in Japan as a *gaijin* (Mitchell, “Japan and My Writing”). Take the jazz aficionado Satoru for an instance. His experience in Tokyo melts the stability of the solids and leaves the complex network of social relations “unstuck, . . . , bare, unprotected, unarmed and exposed” (Bauman, *Liquid Modernity* 4). People he encounters with in Tokyo are figured as chameleons—changeable, fickle and inconstant—in order to conceal their fears of being singled out and left behind. An eighteen-year-old orphan adopted by a night-club Mama-san, whose Filipino mother was deported and Japanese father disappeared after he was born, Satoru is a liquid stranger who thinks he can determine what can be done or grasped, but in effect, his incapacity to foresee the probability of being excluded jeopardizes the theory of “seeing is believing.” “‘Seeing is believing’” means that ‘I’ll believe it when I see it,’ but it also means that ‘what I’ll see, I’ll believe.’ Nevertheless, in the liquid modern age, what we see is “*people trying to exclude other people to avoid being excluded by them*” (Bauman, *Liquid Fear* 19, emphasis original). The more Satoru sees through the dangers of being excluded implied in his ghost life, the less he understands the significance of his existence in Tokyo.

Tokyo is a city of uncertainty and insecurity because it “never stops rewriting itself.” By the time one street guide is printed out, “it’s already become out of date” (*GW* 37). For the days when Satoru immerses himself in piles of jazz records, he sometimes feels lonely, but mostly weird. Tokyo for him is a city beyond his grasp. In Tokyo, Satoru wanders as a tourist, a vagabond, and a player, because

Things are always moving below you, and above your head. All these people, flyovers, cars, walkways, subways, offices, tower blocks, power cables, pipes, apartments, it all adds up to a lot of weight. You have to do something to stop yourself caving in, or you just become a piece of flotsam or an ant in a tunnel. In smaller cities people can use the space around them to insulate themselves, to remind themselves of who they are. Not in Tokyo. You just don’t have the space, not unless you’re a company president, a gangster, a politician or the Emperor. . . .

No, in Tokyo you have to make your place *inside* your head. (*GW* 37, emphasis original)

What seems encouraging for Satoru is that his place “comes into existence through jazz” (*GW* 38). Jazz creates an appropriate place for him to, in words of Bauman,

“‘make sense’ of the changes as well as of the continuities” in a world that is prone to set itself free from solid bonds. The colors and feelings implied in jazz music “come not from the eye but from sounds. It’s like being blind but seeing more” (*GW* 38). The liquid modernity has melted the patterns of communication and co-ordination between individually conducted life principles and political action of human collectivities. Jazz, indebted to Bauman, has become Satoru’s “appropriate niche” where he can settle through conformity by following the modes of conduct seen as “right and proper” (*Liquid Modernity* 7) for his location in liquid Tokyo.

In the “Mongolia” chapter, the liquid stranger is transform into a disembodied entity that travels from one human host to another through touch. The unbearable lightness of being in the liquid modern world, as we can see in this episode, has made transparent fences, barriers, fortified borders and checkpoints to liquefy the traditional political, ethical and cultural entanglements. It is to this extent that the bodiless spirit in search of its origins identifies itself with trekkers like Caspar, a Swede businessman selling jewellery in Okinawa, and Sherry, an Australian girl working in a Hong Kong pub (*GW* 161), traveling from one spot to another to “understand the world”:

Backpackers are strange. I have a lot in common with them. We live nowhere, and we are strangers everywhere. We drift, often on a whim, searching for something to search for. We are both parasites: I live in my hosts’ minds, and sift through his or her memories to understand the world. . . . To the world at large we are both immaterial and invisible. We chew the secretions of solitude. My incredulous Chinese hosts who saw the first backpackers regarded them as quite alien entities. Which is exactly how humans would regard me. (*GW* 160)

The bodiless spirit, the ghost, spends its infancy “at the foot of the Holy Mountain” in China (*GW* 158) and finds for itself over a hundred hosts around the world, from East to West, possessing knowledge from those hosts but still “knowing nothing about my origins” until it inhabits the monks who live by the Holy Mountain side and finds companionship with an old Chinese woman who owns a tea shack and believes “I was a speaking tree” (*GW* 172). Thanks to the old woman that the ghost realizes how “alien” can a stranger be:

When I saw my first foreigner, I didn’t know what to feel! He—I guessed it was he—loomed big as an ogre, and his hair was yellow! . . . They had enslaved our people for hundreds of years until the communists, under the leadership of Mao Tse Dong, had freed us. They still enslave their own kind, and are always fighting each other. They believe evil is good.

They eat their own babies and love the taste of shit, and only wash every two months. Their language sounds like farting pigs. They rut each other on impulse, like dogs and bitches in season, even in alleyways.

Yet here was a real, living foreign devil, talking in real Chinese with a real Chinese man. He even complimented my green tea on its freshness. . . . After a few minutes my curiosity overcame my natural revulsion. “Are you from this world?” (*GW* 134-35)

For the old woman, to see is not to believe because it is beyond her imagination that a real entity can establish relationship with an “alien”:

While I was cooking the foreign devil and his guide carried on speaking. Here was another shock—they seemed to be friends! The way they were sharing their food and tea . . . How could a real person possibly be friends with a foreign devil? (*GW* 135)

In the liquid modern scenario, the liquid strangers are threatened by the fears of a personal catastrophe and of being excluded. Nevertheless, by struggling through their “strange” existence in a world rampant with liquid modern fears, the “alien entities” David Mitchell portrays eventually find themselves more secure and self-confident than they launch the journey to quest for the probability of making their ghost lives solid and sound.

***China's Propaganda in the Information Age: The 50 Cent Party
(Internet Commentators) with Chinese Characteristics***

Dr. Chin-fu Hung

bcfhung@mail.ncku.edu.tw

**Department of Political Science and Institute of Political Economy

Tainan, TAIWAN**

Abstract:

Propaganda has since the Mao's era been the primary vehicle for indoctrination and mass mobilization of the citizenry. With the deepening of the reform policies and opening to the outside, China has to some extent experienced an unprecedented boom and liberalization of the media sector. While the propaganda regime continues to attempt playing the role of guiding and shaping public opinion, the old "in your face" style of propaganda is not as effective as it was before. This has given rise to the new governing mechanism that employs Internet commentators to direct cyber discussions create favorable online opinion that is in the direction of the Party-state line. Accordingly, this paper addresses the rising cyber phenomenon of web commentary and argues that the setup and increased utilization of Internet commentators has provided the Chinese government in Beijing a sophisticated governing tool with which to disseminate and solidify Party ideology in the information age. A case study of the Weng'an incident is investigated to reflect on the China's propaganda in the information age.

Keywords: Propaganda, Online Public Opinion, Internet Commentators, Weng'an Incident, Agenda-Setting, Public Opinion Channeling

Paper prepared for the presentation at the Asian Conference on the Social Sciences 2010, Osaka, Japan, between June 18 and June 21 2010. Draft only; no quotation without permission.

Don't think that a little spiritual pollution doesn't matter much, that it's nothing to be alarmed at. Some of its ill effects may not be immediately apparent. But unless we take it seriously and adopt firm measures right now to prevent its spread, many people will fall prey to it and be led astray, with grave consequences. In the long run, this question will determine what kind of people will succeed us to carry on the cause and what the future of the Party and state will be. (Deng Xiaoping, October 12, 1983)¹

Introduction

The Chinese media since the 1990s has been the rising tension between the greater degree of market competition and the media's political role—the propaganda.² Propaganda, according to Olive Thomson, refers to “the use of communication skills of all kinds to achieve attitudinal or behavioral changes among one group by another.”³ Following the increasing commercialization of the Chinese media, it has carved newer spaces of public expression both for journalists and ordinary people. Absolute media controls have given way to economic policies seeking to stimulate market competition and revenues. Press subsidies have been cut down or suspended and the media governing structures have been streamlined in accordance with the market demands. These changes in the media sector have resulted in the processes of de-centralization of media governance, specialization of media contents, and multiplication of media production and distribution.

There is a growing speculation that the emergence of a commercialized media sector in China, in particular the Information and Communications Technologies (ICTs), has been challenging the CCP's dominated information environment in that

the modernization and globalized media sector will ultimately transform the propaganda apparatus into an enabling social force for a more democratic political regime to emerge. This article disapprove this assumption by suggesting that the Chinese communist has been very adaptive to strengthen its propaganda regime through incorporating Internet commentators to achieve regaining the commanding heights in discourse power. In way of enhancing the agenda-setting capability and public opinion channeling has made the traditional propaganda authority reinvigorate into attaining a more sophisticated governing tool with which to disseminate and solidify Party ideology in the information age. Specifically, the research question poses: how and to what extent China's propaganda regime has evolved and adapted itself in the information age. The politics of Internet commentators is also discussed. A case of Weng'an incident is investigated to reflect the theme of the theory and practice of China's Internet commentators.

This article begins with a brief review of the literature on the media and ICTs in China's propaganda state. Since the theme of this paper is closely related to the agenda-setting and public opinion channeling, exploration about the relationship between media and political system in transitional China is presented, paving the way for discussion about China's propaganda in the context of information age. The Internet commentators are introduced prior to the case study of Weng'an incident. Weng'an incident under review is the primary empirical evidence to reflect on how and to what extent China's propaganda regime is adapting to the information environment for political maneuvering. The politics and implications of Internet commentators is discussed with concluding remarks that although the Internet commentators have achieved some success in reinforcing the traditional propaganda apparatus, yet, whether the public opinion and discourses may effectively be guided or directed within the context of globalization of information technology is itself a

matter of debate that requires to be further studied in the mid- to long term.

Media and ICTs in China's Propaganda State

In western literature, discussion of the mass media, ICTs, propaganda, and democracy has become interwoven with one another. In general, there are two dominant approaches in the literature about the media's democratic potential: economism versus politicism, viz the radical-Marxist (focusing on critiques of the state) and liberal-pluralist (focusing on critiques of capital), with each one demonstrating rather different political images and normative expectations.⁴ The liberal-pluralist approach usually suggests that free media/press can only exist in a free democracy and true democracy is possible only with a free media/press. In this sense, a free media is to promote as well as preserve democracy by safeguarding its watchdog's role in checking governmental policies. Thereby "media" are attributed the status of the fourth estate of the State. Meanwhile, it is held by several scholars that most Third World and former Communist countries fit into the liberal-pluralist perspective because those late-developing states lead the country's modernization process.⁵ In this sense, as the media are capable of molding the minds of people and influencing their decisions in private and public life, they are likely to endanger full democracy if either the government or private individuals exercise monopoly control over the media.⁶

Yet in Asia there is a greater variety of views. The function of the media serving as an independent check on government is being de-emphasized by a number of Asian

governments. As a Singaporean scholar held, “In much of Asia, the justification for the media and for communications was instead to increase national unity and identity in nation-building.”⁷ In this view, unlike the western normative notion of the media checking the government, the media in Asia are instead supposed to “support” the incumbent government in fostering the grand vision of post-colonial process in nation-building or even consolidation of the political authority and regime. It is perhaps true that there are unique historical and political experiences in Asian countries. Such countries possess a longstanding tradition of developing political philosophy shaped by religious and social beliefs. This to a larger extent determines the process of democratization and in creating unique features of democracy whereby value loaded words like individual freedom, freedom of speech, freedom of expression and human rights including participation in political decision making are redefined.⁸

In contrast to its counterparts in the West, in many Asian countries there are “official” media. No matter whether they are state-run media or Party-controlled mouthpieces in nature, they chiefly act to monopolize news sources and serve the propaganda purposes of the state. The propaganda could be broadly viewed as disseminating what one (political Party leaders) believes to be true, with overtones of propagating an orthodoxy. This leads to further questions: what is propaganda and what are its relations with public opinion?

One view is that propaganda in the broadest sense is the technique of influencing human action by the manipulation of presentations.⁹ In Jowett and O’Donnell’s

⁷ Simon S.C. Tay, “Democracy and the Media in ASEAN and Asia,” *Media Asia* 27, no. 4 (2000): 226.

words, “Propaganda is a deliberate and systematic attempt to shape perceptions, manipulate cognitions, and direct behavior to achieve a response that furthers the desired intent of the propagandist.”¹⁰ As we may observe, such pre-war techniques of mass propaganda still persist in many Asian countries, albeit they may have been reworked.¹¹ Admittedly there has been a substantial tradition and political culture in Asian countries of managing information flows to ensure that the state is the primary if not sole provider of information. From this aspect, holding the comparative advantage to release exclusive news in ways that serve their own interests, those governments or political parties can seek to represent themselves in a more favorable light through using tame news reporters as their conduits to publish news information as the authorities wish.

In fact, Rawnsley has, for example, in an article cautioned us that, a factual based propaganda raises further questions of selection: who is deciding which facts to report? Which facts are hidden, and why?¹² His reminders touch upon what will be addressed in the later sections on the present-day issue of “agenda-setting”,¹³ with particular reference on the Internet commentators in the People Republic of China (PRC). Obviously, where the state occupies and controls press and mass media, it can utilize them either through denying access to information or distributing it selectively, for propaganda purposes, as was commonly argued in the cases of Nazi Germany and

¹⁰ Garth S. Jowett and Victoria O'Donnell, *Propaganda and Persuasion*, second edition (Newbury Park, CA. and London: Sage Publications, 1992), 4.

¹¹ Norris, Curtice, Sanders, Scammell and Semetko identify three main schools of thought which have developed to account for the influence of political communications: pre-war theories of mass propaganda, post-war theories of partisan reinforcement, and recent theories of cognitive, agenda-setting and persuasion effects. See, Pippa Norris, John Curtice, David Sanders, Margaret Scammell and Holli A. Semetko, *On Message: Communicating the Campaign* (London and Thousand Oaks, CA.: Sage Publications, 1999), 3-9.

former Soviet Union.¹⁴ In short, it was in the totalitarian regimes of Soviet Russia and Nazi Germany that propaganda was most visible as a weapon of the state for the purposes of political indoctrination and social control. Nonetheless this kind of technique does not distinctly differentiate between the communist system of communication/propaganda and the non-communist one. In practice, liberal western countries also do make use of propaganda for their own national interests. What makes the communist propaganda unique is probably that "...the principle of political intervention and co-ordination is accepted and proclaimed as a normal and central part of the day-to-day running of the mass media rather than as an exception to a more general rule of independence that would often be hotly contested and is usually justified by appeals to exceptional circumstances."¹⁵

In this sense, several Asian communications scholars demonstrate an ambition to construct "an Asian communication theory," in contrast to the western counterpart, based upon the supposed uniqueness of Asian culture, values and traditions that western models and theories fail to effectively apply.¹⁶ One of the shared beliefs among those proponents of the Asian-style communications theory is that while some of the western models and theories may be applied, there are unique factors that need to be considered for each culture.¹⁷ For example, Mary A. Kidd argues that Chinese communication practices are hugely influenced by centuries of interactions between

different philosophies such as Confucianism, Taoism and I-Ching.¹⁸ Such arguments are to some extent comprehensible in hindsight because the major concern of the move is that they wish to de-centralize the prevailing discourses led by the West, particularly by the US, by means of creating its own identity/discourse within a grand post-colonial/post-war state-building project.

However, the flip side is also evident that Asia has found itself swept along in the global twin tides: on the one hand, there is a growing influence of economic and sociopolitical globalization,¹⁹ and on the other hand, the communications revolution is being pushed towards ever-increasing degrees of information and freedom as evidenced by the blooming of ICT infrastructures and media consumption.²⁰ From the 1990s onwards, the Internet and ICTs have emerged as a “new media” that arguably serve as one of the driving forces that allow the general public more latitude in expressing opinions throughout Asia and across the globe.²¹ The substantive potential and the strategic impact of ICTs are also frequently addressed to significantly promote transparency and accountability in governmental affairs, despite government resistance and attempts to control flows of information.²² Some have further suggested that “the most profound significance of media commercialization in the Asian political and social context is an alternative or indirect way to achieve media democratization, which is the first step towards political and social

democratization.”²³ Whether this vision is in fact a reality or just a fantasy remains to be tested by more empirical evidence.

China’s Propaganda in the Information Age: Media Politics in Transition

In closed political systems like the PRC, propaganda could be seen unproblematic as the expression of an official ideology. Totalitarian and authoritarian regimes readily embraced official propaganda because they treated it as a positive and favorable force for mass persuasion as well as sociopolitical control. The expression of dissenting viewpoints through the Party and state-owned or controlled media was virtually unseen as a result of the stringent exercise of press and media censorship. The Chinese media have consequently never been the forum for serious public discussions or debates for decades mainly because of political and technological reasons.

By way of continuous use of classic media governing mechanism, the Chinese government has conventionally practiced a system of information control and censure, with an intricate grading process for whom at what level is allowed to see which kinds of information.²⁴ The media governing mechanism has also referred to informing (*xinxi*), guiding (*yindao*), harmonizing (*xietiao*), safeguarding (*baozhang*), and constraining (*yueshu*) in the media politics that can help effectively control the whole chain of news media from the news reporting to news production, and from product creation to product distribution. The Party-state has thereby long managed to channel information flows so that they are vertically linked, and in the meantime, has eluded any significant flow of horizontal information and mobilization as well as

organization.

Institutionally speaking, the Chinese propaganda system (*xi tong*) is headed by a member of the Politburo Standing Committee who is in charge of news media with subordinate media institutions under the State Council, including the Ministry of Culture, Ministry of Industry and Information Technology, Ministry of Public Security, State Administration of Radio, Film and Television, General Administration of Press and Publication, and the State Information Office, Xinhua News Agency. The Central Propaganda Department under the Central Party Committee has also supervised the propaganda institutions at different levels that guarantee the news organizations adhere ideologically to the Party line, propagate the Party messages, and obey CCP's regulations.²⁵

Overall, prior to the launching of the opening and reform policies in the late 1970s, Chinese people were overwhelmed by official information and interpretations of reality in the media, in the workplace and even at home.²⁶ Mao Zedong made the role of media unequivocally clear in 1942 that he demanded "a comrade thoroughly conversant with the Party's correct line should read the gallery proof to amend its incorrect views before publishing."²⁷ After the open-door policies, particularly after 1992 when Deng Xiaoping called for "more opening, deeper reform", China has been witnessing an unprecedented media boom and liberalization, and in the meantime, undergoing the tension between rapid commercialization and continued ideological control.²⁸ The media sector needs to respond to the increased market pressures and

competition when it is under-subsidized or even deprived of any governmental financial support.

In this context, the Chinese media have been argued to have transformed from being a mere tool of communist propaganda to a mixed agent of political stability, ideological control, economic growth and information provision.²⁹ Zhao puts that the significant shift of China's media's role is from propaganda instruments to an industry, from leading the masses to serving the consumers, and from tools to service providers.³⁰ In this sense, tight media controls seem have given way to policies seeking to stimulate competition, cut down subsidies, and streamline organizational structures. Through media marketization and commercialization, or in Chinese parlance, "media industrialization" (*meiti chanyehua*), the range of media issues under political control has been reduced. These changes have in turn resulted in the reinforcement of decentralization, specialization, and multiplication of production and distribution process in the media sector, which further weaken ideological control and increase operational autonomy.³¹ The Chinese mass media is thus argued to be "one head, many mouths," with a single head of the communist Party and many mouths and tongues of the media coverage.³²

Since the late 1970s, the Chinese media system has been steadily reorganized in order to integrate with a global communications system. Compounded by China's media integration in global communication systems, alternative and freer flow of

information have had a profound impact upon reforming China and its media governance. The arguably “spiritually polluting” communications, together with the increasing diversity of information carried by transnational media corporations (TNMCs), may act as a visible political weapon to undermine the capacity of CCP’s media governance and propaganda thought work as China enters into the information age.

Yet, with the rapid media commercialization and globalization, the media entrepreneurs may still find them in the dilemma of operational autonomy and political compliance.³³ In essence, the media sector is predominately constrained by the logic of China’s media politics and the general political climate. Media politics logic has also associated with the aspects of one-party rule, centralized power over the economy and society, and a bureaucratic hierarchy, which may be summarized as the vogue term “Chinese characteristics”. Thereby, some argue that China cannot have any press freedom under the ruling CCP for its iron fist control over information and media outlets. This highlights the intense struggles between the press freedom and media control that have been recurring among media politics in the present-day China. China’s propaganda department has constantly re-affirmed that one of the chief tasks for them is to vigorously disseminate the core values of socialist China.³⁴ While the forces of internationalization, commercialization and pluralization have far-reaching impact on China’s mass media in the past three decades, the propaganda organ is also adapting itself to the new media environments to strengthen its effective exercise of political and ideological indoctrination through the adept use of institutional resources

³³ The row between Google and the Chinese government is the most recent example that underscores the unease over mounting tension between (foreign) ICT entrepreneurs and the Chinese authorities.

³⁴ Yuezhi Zhao, “Neoliberal Strategies, Social Legacies: Communication and State Transformation in China,” in *Global Communications: Toward a Transcultural Political Economy*, eds. to manage media issues, affairs, activities and problems. In other words, the governing mechanism of propaganda is to set up an effective political framework in better and efficiently managing the mass media in the information age.

As a matter of fact, three decades of economic reform and dynamism have witnessed the official ideology continuously weakening.³⁵ A more pluralist and materialist value orientation is now emerging and increasingly shared among the general populace in Chinese society. By the same token, its liberalizing effect arising from economic reform was spilled over to the media sector that is observed by communication scholar Yuezhi Zhao, in which she argued, “Media commercialization [in China] from the 1980s onwards is part and parcel of the development of a market economy.”³⁶ However, the modernization and commercialization of media sector has not yet transformed China’s propaganda apparatus into an enabling social force for a more democratic political regime to emerge as this will be further explained in the later sections. The propaganda role in China’s media politics remains obvious and prominent despite China is now entering into information age. The Internet commentary is a carefully crafted mechanism geared towards achieving its steady propaganda purposes in the information age. The web commentator is further discussed in the ensuing section.

The Internet Commentator

In China the rising new cyber phenomenon is the mushrooming of the “Internet Commentators”, or in Chinese words, *wangluo pinglun yuan*, dubbed “Fifty Cent

³⁵ See, for example, Bruce J. Dickson, *Democratization in China and Taiwan: The Adaptability of Leninist Parties* (Oxford: Oxford University Press, 1997); Gordon White, *Riding the Tiger: The Politics of Economic Reform in Post-Mao China* (Stanford: Stanford University Press, 1993); and Kalpana Misra, *From Post-Maoism to Post-Marxism: The Erosion of Official Ideology in Deng’s China* (New York and London: Routledge, 1998).

³⁶ Yuezhi Zhao, *Media, Market, and Democracy in China: Between the Party Line and the Bottom Line* (Urbana and Chicago: University of Illinois Press, 1998), 52.

Party” (*wumao dang*) or “Fifty Cent Army”, that addresses the creative techniques adopted by the PRC authorities to employ paid astroturfing Internet commentators to away and influence public opinion online.³⁷ They are paid 50 Chinese cents, or 5 mao, as per message they post online. Allegedly it was in March of 2005 when the Ministry of Education was on a national mission to clean up college bulletin-board systems (BBS), where at Nanjing University, for example, the school’s BBS “Little Lily” was shut down for the preparation of the launch of a university-run online discussion forum. The university there hired a group of willing and capable students to work part-time as web commentators to uphold and advance communist Party’s ideological positions.³⁸ This appeared to be the prototype for what has since become an ongoing sophisticated propaganda technique for central and provincial level publicity organs to manage the cyberspace and blogosphere.

The globalization and commercialization of media that accompanied deepening economic market reform has increasingly highlighted the gap between the official/Party media and traditional propaganda agencies. Nowadays China’s propaganda may not be as obvious and blatant as it was during the Mao’s era, yet its current capacity and effectiveness remains contested. While some may argue that the overall power and efficacy of China’s propaganda state has deteriorated over time in the face of technological modernization, social pluralization, economic marketization

³⁷ The Chinese governments have rarely officially acknowledged that they organize the web commentary. Yet, recently China’s Xinhua news agency had announced that the Party in Gansu Province was planning to expand its “army” of Internet commentators. Although the notice was first posted on Gansu Daily Online, that web site, along with other websites that initially circulated it, including *Southern Weekend*, have been required to remove it, as the Chinese authorities claim the announcement constitutes an “internal affair.” See “Zhongguo Gansu Chengren Zujian Wumaodang Beipi Niuqu Minyi,” (China’s Gansu provincial government seeks to deploy a web commentary team, but is criticized to distorted public opinion), *Voice of America* (Chinese version), January 24, 2010, http://www1.voanews.com/chinese/news/china/China_20100124-82548812.html (accessed March 29, 2010).

³⁸ See David Bandurski, “China’s Guerrilla War for the Web,” *Far Eastern Economic Review* 171, no. 6 (July/August 2008): 41-44.

and globalization,³⁹ the Party-state's propaganda has instead attempted to revitalize such an apparatus through the set-up and utilization of the "Internet Commentators".

The establishment of the "Internet Commentators" is in part due to the growing concern of the CCP's recognition of the web's real power in empowering regular Chinese citizens with a more adaptive interactive communications tool to disseminate information, exchange opinions, and probably the most worrisome to the Party-state, the power to mobilize and organize them in the physical world. Rather than completely stifling critical cyber public opinion against the Party and government, the Chinese government tends to adopt an innovative scenario to shape and sway public discourses through the subtle use of the web-based spin doctors. Acting as normal Internet users, those designated Internet commentators register as many IDs as necessary, and work undercover and anonymously in the cyberspace as a full-time or part-time commentator.⁴⁰ The reason why they conceal their true identity is that "...by not revealing our identity we allow them to feel our mutual equality, and avoid creating a feeling of opposition. At the same time the work can be smoothly accompanied without revealing what goes on behind the scenes; this achieves very good results."⁴¹

According to "The Fifty Cents Party Training Manual," the principal duties for the Internet Commentators are to monitor China's cyberspace and blogosphere, such as popular discussion forums, blogs, and BBS, and to post comments so as to mold public opinion and spin bad or critical news/opinions into favorable (or at least,

³⁹ See, for example, David Shamble, China's Propaganda System: Institutions, Processes and Efficacy, *The China Journal*, no. 57 (January 2007): 25-58.

⁴⁰ Commentators either work full-time for the state-owned news portals, such as *Xinhua News Agency*, *People's Daily*, or work part-time as government employees for various government branches, mostly including Ministry of Public Security, Ministry of Information Industry, and academic institutions. See Zhang Lei, "Invisible Footprints of Online Commentators," *Global Times*, February 5, 2010, http://special.globaltimes.cn/2010-02/503820_2.html (accessed March 15, 2010).

⁴¹ "Zhokou yindao fuwu qingshaonian youle wangluo xin kongjian," (Zhokou city serves and guides the youth in creating a new Internet space) *China Youth Daily*, November 30, 2009, p. 8, http://www.cyol.net/zqb/content/2009-11/30/content_2959076.htm (accessed March 15, 2010).

neutral) praise of the Party and/or government.⁴² In this sense, these online commentators have also been referred to in other instances as the “red vest” or the “red vanguard” that they are innovatively incorporated in tandem with traditional propaganda agencies to safeguard and protect the interests of the communist Party by policing and infiltrating the ever-growing Chinese Internet. In principal, the Internet commentary is akin to what has been seen as astroturfing of PR tactic in some commercial activities in the western. Western astroturfing tactic and Chinese Internet commentary are accustomed to seeking the impression of being spontaneous and grassroots behaviors that ultimately satisfy their commercial and political ends and agendas.⁴³

In essence, Internet commentators are both a politically adept and proactive web-oriented approach that constitute as intertwined and interrelated sources of a new propaganda regime in the information age. It is politically adept in that Internet commentators are virtually far from regular cyber users; they are mostly well-trained spin doctors recruited from various police departments, propaganda and publicity agencies, and the Communist Youth League and Party, to follow the Party lines and orders in propagandizing certain political positions, censoring unexpected breaking events, and spinning online opinions into support for the government.⁴⁴ They are ready to espouse and rally to the political cause of a “harmonious society” in China’s cyberspace, a term directly derived from President Hu Jintao’s regular exhortations for Chinese citizens to help create a harmonious cyber community.⁴⁵

⁴² See *Zhonggong Hengyang Shiwei Dangxiao “Dangxiao Zhendi” Wangpingyuan Guanli Banfa* (Regulations governing Chinese communist party school’s web site “Dangxiao Zhendi” in Hengyang city), January 21, 2010, <http://www.cenews.eu/?p=21320> (accessed March 15, 2010).

In fact, the acts of web commentators usually involve an online surveillance that is captured in the Chinese words, *he-xie* (river crab). In spoken Chinese, “river crab” sounds similar to the word “harmony,” which has become a euphemism for the authorities’ justification on the Internet censorship in order to maintain a harmonious society. It is therefore a nuanced cyber strategy for the relevant propaganda departments to recruit Internet commentators to skillfully help release some of the unavoidable sociopolitical tension on the Net, and in the meanwhile, to help strengthen the CCP’s administration, and to reinforce the sense of Chinese patriotism in the Internet age through the adept use of eliminating, playing down the negative or harmful cyber discourses, and posts as well as online replies to comments.

In addition to traditional censoring web sites and blogs, the incorporation of the Internet Commentators into the management of China’s cyberspace is also a proactive initiative in the way that online spin doctors poise for political maneuvering to alleviate and/or neutralize unfavorable, pessimistic sentiments and critical opinions and possibly transform them into bolstering government views on the Net since many netizens tend to blindly follow what others remark online. In so doing, web commentators can usually alert dangerous or controversial content or information to the authorities to take necessary (precautious) action in the face of netizens’ initiatives and preparatory activities. As the director of the State Council Information Office Wang Chen reaffirmed the significance of swaying public opinion for the web company on the occasion of the Ninth Internet conference:⁴⁶

...the work to guide online public opinion is an innovative and bright spot for the

Wenhua Baozheng,” (Hu Jintao: Building the well-off society on the basis of better propaganda and thought work), <http://cpc.people.com.cn/GB/64093/64094/6808294.html> (accessed March 17, 2010).

⁴⁶ “Wang Chen zai Dijiujie Zhongguo Wangluo Meiti Luntan shang de Yanjiang,” (Wang Chen’s Speech at the Ninth Forum on China’s Internet Media) *Xinhua News Agency*, November 24, 2009, http://news.xinhuanet.com/newmedia/2009-11/24/content_12530246.htm (accessed March 17, 2010).

Party's propaganda and ideological work in the information age...key news web site is the principal driving force to channel public opinion...consciously strengthen the mainstream public opinion, actively lead cyber hot spots, divert public sentiment, resolve social conflicts, and promote public harmony...

In summary, Chinese government has learned that heavy-handed regulation on the Net may not as effective as they had initially envisaged. They are instead adjusting new governing tactics to elicit and gauge public opinion firstly, and later attempt to guide online opinion in a more instant and effective manner. The authorities are increasingly aware that ICTs may effectively serve as a pressure valve in China to wittily release those destabilizing and undesirable social and political conflicts that could critically undermine the capacity and authority of the top leaders and the image of the CCP, when particularly prominent economic, social, and political events took place and out of their control. As the extent of the liveliness of cyber discussions has reached a new high in Chinese cyberspace, it denotes that an enormous online public pressure to be frequently reckoned with by the authorities, let alone to dismiss or ignore it.

The practical aspects of directing Internet opinion, or Internet commentary, have thereby an integral part for China's Internet administration to systematically develop propaganda on the Net, to oppose cyber criticisms, and to develop the authorities' web leadership in the cyberspace. In a word, China's propaganda and thought work in the information age still uphold the important summary statement that was firstly addressed by former Chinese President, Jiang Zemin, in which he made a legal talk on July 11, 2001, as: *Jiji Fazhan, Jiaqiang Quanli, Quli Bihai, Weiwo Suoyong* (develop actively, increase control, accentuate the good and avoid the bad, use it to our advantage).⁴⁷ The enshrined sixteen words of key statement are still principally

⁴⁷ Jiang Zemin, "Tuidong Wguo Xinxi Wangluo Kuaisu Jiankang Fazhan," (Quickly promote healthy environment of Internet and information in China) *The Selected Works of Jiang Zemin, Vol. III* (Beijing: Renmin Chubanshe, 2006), <http://cpc.people.com.cn/GB/64184/64185/180139/10818587.html>

applied to its current Internet administration and commentary.

Case Study—Weng’An Incident, Propaganda and the Internet Commentator

In a nutshell, on June 28, 2008, over 30,000 people took to the streets and some attacked the Party committee headquarters and government buildings, setting fire to a local police station in Weng’an County, Guizhou province, because the demonstrators thought the victim of a female undergraduate student named Li Shufei did not die from drowning as the first two autopsy reports had revealed. Such an unusual death circumstance on June 22, 2008, was dismissed by the victim’s family as they felt the death of their daughter should be classified as a foul play instead of a suicide attempt. This case provoked backstreet gossip and rumors of raping and murdering into flying around. The family refused to collect her body as a sign of protest. Meanwhile, to prevent the local police from forcefully handling the victim’s body, the family began protesting on June 28, 2008, through public gathering and collecting signatures for a legal petition.

This incident soon became the hotspot news among SMS text messaging, blog and Internet forums, such as *Qiangguo Luntan*, *Tian Ya*, or Sina.com in which prevailing Internet sentiments seemed more supportive of the suffered family than the local authorities as it was evidenced in numerous angry comments containing official corruption, rape-murder and police inaction. Images, discussions and gossips with regard to the miscarriage of justice and sense of relative deprivation that attached to this incident had also spread far, wide and fast across the cyberspace and backstreets, albeit many critical posts had swiftly deleted and filtered by web site administrators that did not appear long on the Net. Official Xinhua news story could instead stay on discussion boards and got a record-setting number of visitors.

(accessed March 20, 2010).

While tens of thousands of Netizens and the general public utilized various communications means to distribute and download/upload videos and information from the scene in Weng'an, the emergency command center (*Yingji Zhihui Bu*) was established in Weng'an on June 29, 2008, one day after this mass incident. Directed by Shi Zongyuan, the Party secretary of Guizhou province, one of the main purposes for this center was to guide the (online) public opinion, when especially citizens were awakening to dispute the veracity of any official reports and government statements. On one occasion, Shi Zongyuan stressed that, "The most important thing in handling a suddenly breaking incident is whether we can release information immediately, accurately and factually and then we can guide public opinion properly."⁴⁸ This is basically because "Rumors stop as soon as information becomes publicly available. When a negative incident is made public and transparent, there will be positive reflections."⁴⁹ Local authorities were hence pressured to reflect on the incident of information openness. Yet the enhancing information transparency and accuracy might in the end for the political purpose of guiding public opinion through official information flow and authoritative news provision as it will be further explained in the later section.

In term of Chinese government's response to this contingency, the emergency command center composed of eight working groups, viz. groups of persuasion and guidance, incident investigation, traffic administration and control, information reporting, logistics guarantee, medical care, development after the event, and most importantly, the "group for policy discussion and law publicity" (*zhengce yulun fagui*

⁴⁸ "Shi Zongyuan Tan Weng'an Shijian: Chejiu Lingdao Zeren Gongbu Shishi Zhenxiang," (Shi Zongyuan talks about Weng'an incident: strictly investigates the leadership responsibility, and releases the true story), *Guizhou Ribao*, July 4, 2008, http://news.xinhuanet.com/local/2008-07/04/content_8488064.htm (accessed March 18, 2010).

⁴⁹ "Weng'an Shijian Beihou: Yixie Jiguan Ganbu xiang Heishili Tongfeng Baoxin," (Behind the Weng'an incident: some government leaders have provided gangsters with information), *China Central Television* (CCTV), July 12, 2008, <http://politics.people.com.cn/GB/14562/7503118.html> (accessed March 18, 2010).

xuanchuan zu) (abbreviated as “propaganda group” thereafter). The propaganda group was under the leadership of Zhou Xiaoyun, deputy publicity director of Guizhou provincial Party committee, with the general aims to mobilize Internet commentators to collect information and reports in relation to Weng’s disturbance and effectively lead and sway public opinion, and particularly to attempt to affect national opinion through proficient use of Guizhou media as a whole. The move for establishing this center was arguably in part derived from the high degree of attention paid both by the top CCP leaders and State Council to this riot,⁵⁰ in particular the prominent event of Beijing 2008 Olympic Games in August was just one month away.

Whereas the official media might be able to provide timely and politically “correct”⁵¹ coverage regarding this turbulence, government censors did move rapidly back and forth to delete online contributions that provided unofficial accounts and deactivate the accounts of those violated users. Admittedly, the propaganda group vigorously deployed Internet commentators from July 1, 2008, shortly after its establishment, to clarify rumored reports and comments and sway public opinion as there were many conflicting stories circulating in the cyberspace and blogosphere. For example, Zhou Shuguang, better known as “Zola”, was a famous independent blogger and citizen journalist who had posted his personal interview accounts with the victim’s family to his blog at <www.zuola.com/weblog/>. In addition to blogging, he also utilized social media like Twitter, QQ, and MSN to transmit live reports and on-the-scene information on this case, to draw Netizens’ attention to this largely

⁵⁰ For example, the Secretary General Hu Jintao reportedly asked about “why did such a small criminal case trigger such a large-scale mass incident? He had also demanded the local government to “calm down the demonstrators and protect social stability.” See “Guizhou Saoluan Hu Jintao Pishi Cuwu Fengsuo Xiaoxi.” (Hu Jintao demands not to block information about the Guizhou turbulence from going to the outside), *Min Pao* (Hong Kong), July 1, 2008.

⁵¹ Politically correct information usually means that Internet users are prohibited to create, replicate, retrieve, or transmit any information to incite to overthrow the Chinese government or the socialist system. Inciting division of the country or harming national unification is also considered politically incorrect information.

overlooked mass incident.

In fact, attached to the propaganda group, the Weng'an web commentary team was enlisted from a dozen school teachers and government personnel who were tech-savvy and adhered to the official lines to counterattack the "unhealthy" information and dispel rumors deemed by the authorities. In addition to calm Netizens down with positive comments on the Net, Internet commentators consulted the Xinhua news reports for politically "correct" viewpoints and information.⁵² The Internet commentary was *per se* an innovative and flexible method to sway online public opinions and discussions. In accordance with instructions directly released from the emergency command center and Guizhou Party and publicity departments, the Internet commentators had specifically received directives from the propaganda group and "online propaganda unit" (*wang xuan ban*) about how and what exactly the local Internet commentators need to respond to web sentiment and discourse. For example, the "online propaganda unit" had on July 4, 2008, issued important directives in line with demands from central propaganda department to downplay covering and calm people down concerning this turbulence, in which they stated:

Do not put relevant news report in the front page; simply treats it as normal, single news item. Do not operate this sort of news in the front page of web site or news center for long. Do not create a theme news section for this incident. Put the section in the latter page if it is already done;

Only relay or re-publish news reports from the People's Daily Online, Xinhua News,

⁵² For example, one day after the June 28 Weng'an incident, *Xinhua News Agency* released its first but short news report on June 29 with police station assaulted and torched by local people in southwest China county. This was unusually quick for a national media like Xinhua to cover mass incidents like this soon after it broke out. See "Guizhou Weng'an-xian Fasheng Yiqi Dazashao Shijian," (An incident of assault, vandalism and arson occurred in Weng'an county, Guizhou province) *Xinhua News Agency*, June 29, 2008, http://news.xinhuanet.com/newscenter/2008-06/29/content_8456598.htm (accessed March 20, 2010).

and the major provincial news websites of Guizhou;

Do not recommend any specific issue related to this incident in the discussion forums and blogs. Do not treat or recommend any relevant articles or posted comments to the front page. No more than three items of Weng'an related messages can be posted to the front page of a discussion board. Strictly monitor comments and contributions of the discussion forums. Delete any comments that assault the Party and government, provoke mass incidents, enrage furious sentiments, and disseminate rumored comments.

After receiving these instructions, the propaganda group had to completely follow and report to the authorities what they had achieved afterwards.

Moreover, Weng'an government and Guizhou authorities had jointly intensified their leadership in governing press media. On the one hand, the Guizhou provincial government information office held a press conference in the provincial capital Guiyang on July 1, 2008, clarifying that the teen girl was neither raped nor murdered, and the Weng'an Party secretary Wang Qin had no connection with any of the suspect.⁵³ The press conference was organized on June 29, 2008, two days after official *Xinhua News Agency* published their news report. This suggested the local government had tremendous political pressure from Beijing authorities to better tackle this riot. On the other hand, the Guizhou government had restricted traditional media in covering this incident one way or another. Journalists who intended to cover this case were required to register with the local authorities; they needed to apply a special press pass issued by the emergency command center in order to enter into Weng'an country to interview. When reporters interviewed local people, such as the family

⁵³ See "Guizhou Zhaokai Xinwen Fabuhui Jie Wengan Liu-er-ba Shijian Zhenxiang," (Guoizhou government holds a press conference, disclosing the true story of the Weng'an incident) *Guizhou Satellite Television*, July 2, 2008, http://news.xinhuanet.com/video/2008-07/02/content_8473735.htm (accessed March 21, 2010).

members of the deceased, militia police, or any other principals on the scene, they would be “fully accompanied” (*quancheng peiban*) by members of the local government and publicity, to ensure that the authorities kept track of who had been interviewed and what had been commented.⁵⁴

In the meantime, with the political mandate from President Hu Jintao, senior leaders in Guizhou province had learned lessons from previous (failure) experiences to evolve into more attentive to public outrage. In fact, they sprung quickly to action to dismiss local Party and government officials of Weng’an county on July 3 and 4, 2008, including the communist Party secretary, governor, and chief police and commissar, as they were deemed to have fatally failed in implementing strong and fair policies to tackle the conflict between the ordinary citizens and the local government, to better accommodate the public concerns, and eventually had led to the widening mutual mistrust and growing public resentment towards the Party and government. As a former chief of the state press and publication administration (*xinwen chubanzongshu*) regulator, Guizhou Party secretary Shi Zongyuan proactively allied Guizhou’s communist Party-run media—the *Guizhou Daily*, Guizhou Television, and the *Guizhou Metropolis Daily*—to have provided state media across the country with authoritative, timely and thoroughly point-to-point information that could clarify citizen’ suspicion and dispel rumors rampant on- and offline. In other words, the Guizhou authorities endeavored to restore their political images and trust in both governance and propaganda through active and nuanced use of propaganda and communications tools in the information age.⁵⁵

⁵⁴ Wang Weibo, “Weng’an Shaonu Zisha Shijian Dangshiren Shoufang, Wengan ‘Guanyuan Quanpei,’” (Weng’an officials provide ‘full company’ at interviews with the principals on the scene of Weng’an teen girl suicide) *Qingnian Zhoumo* (Youth Weekend), July 17, 2008, <http://news.163.com/08/0717/10/4H22C8G70001124J.html> (accessed March 21, 2010).

⁵⁵ Anne-Marie Brady has in an article held that current Chinese propaganda work has incorporated innovative approaches like the Internet to strengthen the work of preserving the positive images of the Party and government, and effectively “regiment the public mind.” See Anne-Marie Brady,

For publicity reasons, the command center in Guizhou further arranged several official interviews of the suspects and principals by outside media, lest individual news agency would conduct their own investigative journalism without the presence of local officials. In so doing, the Guizhou propaganda department could strengthen their publicity through its governing tactics and associated local media in a more authoritative and manipulative way because any media units outside Guizhou province could hardly cover the latest development and in-depth analysis without direct interviews of many of principal and relevant actors in the scene.

To sum up, the propaganda authorities both in Guizhou and central government had learned from previous experiences in tackling mass incidents to nowadays adeptly provide authoritative, professional, immediate and complete coverage of the riots, and accordingly exert continuous media control to prevent politically incorrect and unhealthy reports or rumors from extensively disseminated and communicated. Couple with the Internet commentators, the Chinese political system is evolving and adapting to a more Chinese information society as they are now becoming more confident in managing news as they are aware if the authorities have provided enough information and cyber venues for citizens to vent their sentiment, they can some how channel their access to information, and online opinion exchanging, discoursing and debating from a seemingly unfettered cyberspace and blogosphere to a more a government and Party-controlled medium to make the governance in the Internet age more manageable and governable.

The Politics of Internet Commentators in China

“Regimenting the Public Mind: The Modernization of Propaganda in the PRC,” *International Journal* 57, no. 4 (autumn 2002): 563-578.

In a Leninist Party-state like China, the truth of authority normally replaces the authority of truth.⁵⁶ That is partly why the Tiananmen Square protest of 1989, as suggested, highlights the most serious problem for the CCP that the Party-state was unable to successfully “communicate” with its own subject then.⁵⁷ Actually during the political storm period, China’s official media were somehow perplexed: they were firstly reticent to report this “political turmoil” but later covered it in a harsh and relentless manner after political climate became clear. Some people, the intelligentsia in particular, were dismayed at the official or Party’s controlled media coverage of this movement; they were impelled to switch to unofficial and underground channels for information and news reports since the mainstream media were deliberately biased and toed the Party line that extensively propagandized official accountants and perspectives. Arguably it is a herald that people from this incident onwards began not to consult news and information solely from official conduits because of the media’s credibility and authority had been frequently challenged and undermined.⁵⁸

The situation has become more obvious since the introduction of the ICTs for public use from the mid-1990s when the government in Beijing was determined to unleash the Internet’s economic potential.⁵⁹ The Party-state was fairly enthusiastic to achieve leapfrog development in informatization (*xin-xi-hua*) for the grand purpose of catching up with its western counterpart that had hoped for more than a century ago. To achieve this end, it is significant for the authorities there to assure its global economic competitiveness by bolstering the openness and development of the ICTs.

⁵⁷ Gu Zhibin, *China Beyond Deng: Reform in the PRC* (McFarland, 1991), 107-141.

⁵⁸ See, for example, He Qinglian, *The Fog of Censorship: Media Control in China* (New York: A Human Rights in China publication, 2008).

⁵⁹ See, for example, Yongnian Zheng, *Technological Empowerment: The Internet, State, and Society in China* (Stanford: Stanford University Press, 2008); and Junhua Zhang and Martin Woesler, eds., *China’s Digital Dream: The Impact of the Internet on Chinese Society* (Berlin and London: European University Press, 2003).

However, coupled with the potency of globalization and the transnational media corporation, the use of the Internet and mobile technologies have grown into the unexpected outcome that more citizens, mostly from the wealthy coastal areas, can now gain a higher degree of access to the alternative news sources. This simple but important fact bears the far-reaching political and policy implications in that it has the potential to undermine the long-lasting legitimacy foundation that the official media organs have fortified through an effective propaganda and thought work as well as information flow control.⁶⁰ In other words, the propaganda regime is now confronting the new challenge from the cyberspace.

To some extent, the Chinese authorities have also tied its success in Internet administration to the regime's survival, prosperity and sustainability. For instance, Hu Jintao, the general secretary of the CCP, warned at a study session of the Politburo on January 23, 2007, that "Whether we can cope with the Internet is a matter that affects the development of socialist culture, the security of information, and the stability of the state."⁶¹ He urged that "...the government should use advanced technologies to better guide public opinions voiced through the Internet."⁶² This may suggest that the Chinese government is becoming more aware that, although (cyber) public opinion may not be the final say on the general direction of national development, the change in public attitudes and sociopolitical behavior is making impact on the roles, institutions, and bureaucracies of the communist regime.

To the Chinese government, the propaganda departments and agencies need to be revamped and ought to adeptly use the ICT as a potent platform to spread "healthy"

⁶⁰ See, for example, Anne-Marie Brady, *Marketing Dictatorship: Propaganda and Thought Work in Contemporary China* (Lanham, Md. and Plymouth: Rowman & Littlefield, 2008); and Yuezhi Zhao, *Communication in China: Political Economy, Power, and Conflict* (Lanham, Md. and Plymouth: Rowman & Littlefield, 2008).

⁶² "Hu Urges Better Management of the Internet," *China's Daily*, January 25, 2007, http://www.chinadaily.com.cn/china/2007-01/25/content_792065.htm (accessed March 18, 2010).

and politically “correct” information as well as government polices in the Internet age. This is basically driven by the serious political concern that the Internet, or the so-called “new media”, is utterly becoming a hub of online activity for originating, discussing, and dispersing information. What is far-reaching is the increased cases of China’s based social and political movements are more relying on advanced forms of technology and mass communication as a political mobilizing tool and conduit to alternative forms of media than they were before. Despite that many regulatory organs such as the Public Information Internet Security Supervision Bureau, which is under the Ministry of Public Security, may achieve some success in monitoring and filtering “sensitive” information in the cyberspace as well as SMS text messages,⁶³ it is virtually improbably, if not impossible, to completely stifle online “unhealthy” information by those cyber-police or golden shield initiative (also known as “Great Fire Wall”) alone.

China’s Internet commentary teams are in this sense constructed to supplement China’s effective propaganda work, with their associated web commentators covertly enlisted from politically reliable Party members and/or public servants. They are trained and commissioned to embark on the task of “opinion police” that not only help administer and regulate the cyberspace, but play a leading role in guiding online public opinion as well. From orthodox propaganda viewpoint, this is a pioneering mechanism of national importance for Chinese government to better govern ICTs when their capability, credibility and authority of information/message management are growingly confronted by the opinions and discourses mediated online and many other Internet-facilitated mass incidents.⁶⁴ This has usually resulted in the fact that

⁶³ See, for example, Assafa Endeshaw, “Internet Regulation in China: The Never-Ending Cat and Mouse Game,” *Information & Communications Technology Law* 13, no. 1 (March 2004): 41-57; and Chase, Michael S. and James C. Mulvenon, *You’ve Got Dissent! Chinese Dissident Use of the Internet and Beijing’s Counter-Strategies* (Santa Monica, CA: RAND, 2002).

⁶⁴ See more discussions at Xiaoling Zhang and Yongnian Zheng, eds., *China’s Information and*

traditional propaganda measures can no longer take full effect as they originally envisaged. On the contrary, the propaganda personnel have increasingly found them struggling often to forcibly promote their agenda-setting (*yicheng shezhi*) capability and public opinion channeling (*yulun daoxiang*).⁶⁵ It means it is essentially a recognition that traditional mechanism for media/information governance, while largely remains crucial, is now withering and becoming ineffective in the face of modern (mobile) communications.

Interestingly, the Weng'an incident has highlighted the subtle transitions of China's propaganda authorities in the information age. As there usually lacks a decent level of real transparency and responsiveness at government institutions and agencies, when a mass incident like the one in Weng'an took place, the credibility crisis facing China's propaganda regime had in the first place sparked off worst turbulence, resulting in critical (online) public opinion tremendously against the local, provincial and central governments. Soon after the provincial and central governments stepped in, the situation began stabilized and the crisis management manifested its governing characterization of the remaking of traditional propaganda in the Internet age. Simply put, to repackage and streamline propaganda in the new communications environment, the Chinese propaganda regime had actively strengthened their efforts in reinvigorating its agenda-setting function and public opinion channeling.

In the aspect of agenda-setting, it is important to re-emphasize that China's

Communications Technology Revolution: Social Changes and State Responses (London: Routledge, 2009); and Guobin Yang, *The Power of the Internet in China: Citizen Activism Online* (New York: Columbia University Press, 2009).

⁶⁵ The concept of "public opinion channeling" is similar to the one "guidance of public opinion" which had been firstly appeared in CCP's criticisms of former Party secretary Zhao Ziyang following the crackdown on mass demonstrators in Beijing on June 4, 1989. Most importantly, the aspects of "guidance of public opinion" are two-fold: if public opinion differs from the Party on any matters, the media are responsible for sufficiently guiding the public so as to bring their opinions in line with the Party spirit; the media must ensure correct and unerring guidance of public opinion by thoroughly respecting the Party's discipline of propaganda. See Jiang Zemin, "Guanyu Dang de Xinwen Gongzuo de Jige Wenti," (Some questions regarding the Party's news work) *People's Daily Online*, November 28, 1989, http://news.xinhuanet.com/ziliao/2005-02/21/content_2600239.htm (accessed March 23, 2010).

traditional propaganda regime is now confronting a new informational environment, in which ICT industry grows faster and unofficial information becomes more available than before. Stringent information censorship and tightly-controlled media outlets cannot vouch for the fullest effect of modern-day propaganda and thought work in China. After all, to make propaganda at work, it depends perhaps more on “framing” than on mandatory “censorship”. To frame involves the agenda-setting that is not what we think, but what we think about.⁶⁶ It is also more about how the media manipulate and selectively report the news since the traditional media outlets act as gatekeepers of information in the Chinese context; news media or specifically, the propaganda authorities in the Weng’an incident, makes deliberative choices about what to report, what to play down, and what to simply disregard in dealing with the news and information. What the public know may be a by-product of media’s gatekeeping that ultimately serves the government’s agendas.

In this sense, the case of Weng’an under review highlights citizens are empowered by the new information technologies to begin to set their own agenda and organize themselves in a way that the government cannot easily overlook. This makes the propaganda regime is politically alert, attempting to remold its traditional governing techniques on to the thought work of ideological control to cater to digital generations through a more crafted Internet commentary. In this regard, we may suggest that Chinese Internet users are not only make their opinions and voices better heard but also to enforce the authorities, including the propaganda regime, to be more responsive and accountable.

Furthermore, the public opinion channeling is dynamically underway with the aim to overtake the political dogma and the boilerplate out of traditional propaganda

⁶⁶ See, for example, Maxwell E. McCombs and Donald L. Shaw, “The Agenda-Setting Function of Mass Media,” *Public Opinion Quarterly* 36, no. 2 (summer 1972): 176-187.

outlets. If it is successfully implemented, it may create a favorable public opinion environment for desirable sociopolitical stability (or “harmonious society” in the current political rhetoric), which is in turn the foundation and a necessary ingredient of deepening economic reform. Nevertheless this does not denote China’s propaganda out of news or loosening the Party’s grip on the (news) media; it is rather a political interest in boosting more effective media governance over the propaganda apparatus in the Internet age. In the Weng’an incident, the concept of Internet commentary was closely attached to the public opinion channeling that it practically directed at underlining positive news and comments and negating critical and opposing discourses on the Net. These cyber spin doctors were being incorporated into the current propaganda maneuvering in the government work, thought work, and the Party building in an all-round manner, making the Party-state’s voice more amplified and their viewpoints favorably presented in the cyberspace.

Undertaking the public opinion channeling is essentially toeing the Party and official line. This principle was clearly addressed when the President Hu Jintao made a special inspection visit during the 60th anniversary of the Party press *Renmin Ribao* on June 20, 2008. He firstly made an important speech on the significance of doing the news and propaganda work, with particular emphasis on the new patterns of robustly foster the Party’s ability to guide public opinion.⁶⁷ These new patterns can be characterized as grabbing the commanding heights in news coverage of

⁶⁷ Inside his speech, there are five essential points in the new patterns of public opinion guidance: (1) We must adhere to the principle of party spirit in journalism, holding firmly to correct guidance of public opinion; (2) We must adhere to people-based [journalism], increasing the affinity, attractiveness and appeal of news reports; (3) We must continue to reform and renew, enhancing the directedness and effectiveness of public opinion guidance; (4) We must strengthen the building of mainstream media and the building of new media, creating a new pattern of public opinion guidance; and (5) We must conscientiously take hold of the building of [propaganda/editorial] teams, enhancing our cohesiveness and fighting strength. See “Hu Jintao jiu Tigao Yulun Yindao Nengli Ti Wu Dian Yijian,” (Hu Jintao proposes five points to promote public opinion guidance) *Xinhua News Agency*, June 21, 2008, <http://news.sina.com.cn/c/2008-06-21/002515786464.shtml> (accessed March 24, 2010). English translations cited from David Bandurski from China Media Project, <http://cmp.hku.hk/2008/06/25/1079/>.

contingency and the suddenly breaking incidents in the information age. Web commentators represent the pivotal initiative of taking on the commanding heights to monitor public Internet speech: reinforcing the political effects of positive and favorable discourses while upsetting the influences of dissenting and critical voices.

In the case under review, after the strategic establishment of the emergency command center, particularly the propaganda group, the authority there had attempted to sway the public opinion and improve the public images of the Party and government through intensive crisis management measures. Supported by the central leaders in Beijing, the emergency command center boasted that the government would be more attentive and responsive to the public opinion, and meanwhile, seriously take public opinion into consideration when initiating and implementing public policies in the aftermath of handling future mass riots. In this respect, the Guizhou government had actively responded to the public demands by having the second and third autopsies on the deceased victim, holding several official press conferences to explain the situations and the latest developments regarding the incident handling,⁶⁸ and more importantly, by organizing persuasive commentary to extract doubts and give proper direction and guidance to the furious cyber community who were concerned about this mass incident. In doing so, the authorities walked a fine line in allowing or at least tolerating managed/controlled discussion that could help alleviate and release unstable sociopolitical forces/tensions on the one hand, and restore and strengthen the Party and government's images and prestige through the delicate deployment mechanism of Internet commentary on the other hand, which in turn may ultimately

⁶⁸ The setup of official press spokesperson systems are jointly to correctly and effectively channel public opinion as they step out more frequently and explain a situation as well as the government's position. See Zou Jianhua, *Tufa Shijian Yulu Yindao Celue—Zhengfu Meiti Weiji Gongguan Anli Huihang yu Dianping* (Strategies for guiding public opinion during sudden breaking incidents: Case reviews of government's media PR crisis) (Beijing: The Central Party School Publishing House, 2009), 7-11.

create a favorable dynamic between the citizen and the Chinese Party-state in the information age.

As such, the newly designated Web commentators are proactively enhancing the traditional propaganda regime via public opinion channeling to better adapt to this increasingly digitalized society that aims to regain the commanding heights of the CCP's agendas setting capability both in the "virtual" and physical Chinese societies. In the meantime, online e-government services and news provisions may weaken citizens' motivation of looking for online unofficial or alternative information, provided there is a decent quantity of timely, professional and authoritative news reporting on an event or issue. It means those vital conduits for alternative news and information, such as foreign or underground news websites, blogs, online chatting rooms and discussion boards, may be overshadowed or even replaced if the official press and media have a better, persuasive, timely, complete, and reliable news presentations and coverage in the cyberspace. In other words, the propaganda regime is being adapted to the rapidly evolving new information environment where the traditional political ideologies and thought work are frequently challenged. It endeavors to firstly channel public information sources from outside of the official domain to the officially manipulated realm, and later on channel their opinions to be more supportive or at least tolerant and sympathetic stance towards the Party and government.

Conclusion

When ICTs converge on the political environment in most authoritarian and developing countries, they allow the possibilities of the public gaining more latitude in expressing opinions. Communist China is a particularly significant country in this respect as the (mass) media was traditionally controlled and manipulated by the

authorities to serve as tools of propaganda and for purposes of agenda-setting. Entering the information age, the state is seen to assure its economic competitiveness in a globalized context where information and knowledge largely drives global and domestic economy. The government there keenly bolsters the development of information and network technology, but at the same time, it has been persistently trying to minimize the undesirable social and political effects that the ICTs have brought about since they were introduced in the mid-1990s. Because the political impact of the Internet has caused the Beijing government unease as it threatens its long-held monopoly over the flow of information, the regime has adopted a variety of strategies to harness it, limit the impact of the new technology to an acceptable degree, and hopefully to turn it to the government's benefit, particularly in the prospects of electronic commerce.

The explorations of the Weng'an incident reveal the political implications of Internet commentary for the subtle and adept transformations of China's propaganda apparatus in the information age. The case under review shows that the Chinese government is now taking serious action to improve and reinforce its governance in such a massive propaganda machine by attempting to sway public opinion via the ingenious utilization of Internet commentary characterized as their agenda-setting and public opinion channeling in an incident or issue. In other words, web commentators are integral part to the modern-day propaganda in the information age as the old "in your face" style of propaganda is quickly losing its credibility and effectiveness when a more efficient conduit for the horizontal exchange/dissemination of information among ICT users become more widely available in China. Such a horizontal communication has growingly given rise to sociopolitical unrests and mass incidents as citizens are being empowered to organize themselves in a more orchestrated

manner to defend their legal rights. The so-called “red vest” or the “red vanguard” of the CCP is in this regard becoming important to strengthen the propaganda regime in the digital age in which they work beyond outright/direct censorship but act to set the agenda and channel public opinion in a more nuanced and manipulated way. They have ultimately given the Party a foothold in the anonymous areas of the online world, therefore giving it quite substantial indirect government control.⁶⁹

The Weng’an incident under review provides episodic evidence that suggests in the short term, the Internet commentators have at least to some degree reinvigorated and reinforced the traditional propaganda apparatus. One aspect of this is the way the propaganda press outlets are providing freer, timely, professional and authoritative news coverage to compete against those foreign news channels or independent blogs and vying for dominance of commanding heights in discourse power and access. Whether the public opinion and discourses may effectively be guided or directed within the context of globalization of information technology is itself a matter of debate that requires to be further studied in the mid- to long term in the mid- to long term.

At last, it is worth quoting China’s ex-President Jiang Zemin when he was asked a critical question on China would be changed by the Internet, he interestingly replied:

“I’m getting old and sometimes I have trouble using a mouse. But my grandson is very good at navigating the Internet. I tell him that there is a positive side to the Internet, because it can help promote the spread of information and understanding. And there is negative side, which is when misinformation is spread. So I tell my grandson that he should use the Internet to enrich knowledge, and he should not use it to visit pornographic sites. But my grandson lives far away from me. I cannot tell him what to

⁶⁹ Evgeny Morozov, “Propaganda.com,” *The New York Times*, March 29, 2009, <http://www.nytimes.com/2009/03/30/opinion/30iht-edmorozov.html> (accessed March 28, 2010).

*do. I can only advise him what to do.*⁷⁰

By noting Jiang's words may we reaffirm that the Chinese leadership realizes that the Internet, unlike those official media, will be more difficult to administer despite its heavy-handed control from time to time. Regardless of the continuing waves of forward and backward movement in controlling the free flow of information on the Internet, one thing seems certain: the underlying tide in boosting the overall level of information freedom is moving forward in China. The authorities could perhaps "regulate" and "advise" but not compulsorily "direct" them how to use the ICTs. The Internet's probability to provide and disperse a flood of new ideas makes it the most formidable challenge yet to a key source of power, one practiced by Chinese government for centuries: the propaganda power to shape public opinion in a way that leads citizens to accept the regime's political legitimacy.

Abstract

The importance and influence of television cartoons on children's perceptions of the world has been recognized and discussed in the academy since the 1980's. The portrayal of gender and race in cartoons are crucial, because they convey the norm of behavior and values towards the children who watch them every day. This study examined the racial and gender representation of cartoons on Taiwanese children's television channels. With the low rate of children's domestic cartoon production (less than 1%); the content of cartoon on Taiwanese children's channels was embodied with the cultural values of foreign countries, such as the United States, and the United Kingdom, and Japan, rather than the Taiwanese society. Does this encounter illustrate the inconsistency between symbols and value from different societies and possibly confuse Taiwanese children with their own cultural system? Or do these cartoon characters in some extent represent a stereotype of gender and race from "the West"? This study explored this vital issue by applying content analysis approach. Because there was little literature on the issue of imported cartoon, this study aimed to bridge the academic gap by the example of the cartoons that on air in Taiwan.

Keywords: animation, stereotype, racial representation, children and animation

Introduction

The influence of television programs on children has been widely discussed for decades. With the increasing exposure to all kinds of media, plenty of research studies various effects of media on children, including increased aggression and violence (Hess, Hess, & Hess, 1999), the development of stereotyped beliefs and attitudes (Lavin & Cash, 2001; Ward, 2002), and other psychological problems, such as eating disorders (Thomsen, McCoy, & Williams, 2001). Among these, how television programs portray gender roles and different races and possibly influences the forming of stereotypes on children was widely discussed by academia (Klein & Shiffman, 2006). Many studies have found that television plays a significant role in the socialized process of children (Roberts & Maccoby, 1985; Signorielli, 2001), and many researchers even argued that television have socialize children and provide them with sexist and racist stereotypes, sexuality, violence and commercialism (Signorielli, 2001; Graves, 1996; Steyer, 2002). Numerous researchers have observed and conducted the research concerned the stereotyped images portrayed in children's programs and commercials (Larson, 2001; Dietz, 1998).

Before attending school, learning from parents and learning from television are the two main ways for children to know about the world. When children go to elementary school, they are often taught basic subjects, such as language¹, math, and science, but rarely discuss the outside world, foreigners, and the ideas of self and other. Also, usually it is often uncommon for young children to interact with people from other countries or races in daily life. Thus, the ideas they learned from television often become the main resource to connect with the outside/foreign world. Najjar (2007)'s study supports this point and suggests that cartoons are important sites for the construction of the identity of the self and other. Using techniques culled from social psychology, cognition, and anthropology, in conjunction with the cartoon code, he examined the way the cartoonist constructed Palestinian refugee and Arab identity. He argued that because cartoons provide a stream of social and political commentary and yet are artistic works, they demand a layered interpretation that gets at the symbolism that may lurk in the artistry of the image, in the captions, or in the relationship between the cartoonist and his or her interpretive community.

Meanwhile, the racial discourse presented by media does not often represent the real world situation. Much research about how the media portrays members of different racial groups and stereotypes them has been conducted in the past decade. Abercrombie, Hill, and Tumer (1988) defined stereotype as "a one-sided, exaggerated and normally prejudicial view of a

¹ The language here means the official language used in the country, such as Mandarin in Taiwan, and English in the United States.

group, tribe or class of people, [that] is usually associated with racism and sexism.” They suggested that stereotypes are difficult to be changed or corrected by the real world evidences, because they provide a sense of solidarity to a society. According to their assumption, when the representation of race is rigid in a certain pattern, it has become a racial stereotype and uneasy to alter. Signorielli (2001) also suggested that stereotypes are the “generalization or assumptions that are often based on misconceptions” (P.343). Based on the significance of the issue and the possible influences to children, several scholars have conducted studies on the potential of children’s television, particularly the animation, of how they maintain dominant ideologies of the society (Dines, 1995; Davies, 1995). One of the most famous and influential studies in this area is the social learning theory (Bandura, 1986). The assumption made by social learning theory is that children learn specific attitudes and behaviors from the content and characters they encounter in the media. Stereotypes on television are particularly suited for applying social learning theory (Signorielli, 2001), because they offer a over-simplistic image, model of behaviors to the unguarded audiences—children. Therefore, it is important to understand the representation represented in the media as well as the stereotypes showed.

Generally speaking, studies focusing on race-related content in the media have concluded that minority group members are underrepresented in the media (Eschholz, Bufkin, & Long, 2002; Larson, 2002). *Non-white* characters usually take minor roles in television drama, and often are marginalized when they show up (Klein & Shiffman, 2006). Nakayama and Krizek (1999) argued that through the process of “particularizing white experience,” critics explore the “rhetorical character” of whiteness. Media images of white characters, including those of animated characters, contribute to the centering of the white experience as normal and natural. To de-center whiteness, critics must interrogate those commonplace, taken-for-granted constructions of whiteness in media texts, especially those as ubiquitous as the Disney animated films.

At the same time, the phenomenon is more complicated in countries which do not have many self-produced programs. In Taiwan, where almost all programs are imported from foreign countries such as the United States and Japan, the roles that television plays for children to understand race are more intricate. Because of the buying relationship, the characters shown in cartoons are often constructed by US or Japanese companies, which sometimes represent the stereotypes of Asian or Taiwanese (or Chinese) people. With regard to Asians in the media, Taylor, Lee, and Stern (1995) claim that the magazine advertising research showed that Asian Americans were portrayed as being “work-oriented”. In a counterpart study examining television advertising, Taylor and Stern (1997) also found that Asian Americans were portrayed disproportionately often in business settings, and underrepresented in settings

involving family, friends, and social relationships. Based on the analysis of television and movie content, some scholars concluded that Asian characters are not shown to be as diverse as Asian people are in real life, and that these particular media tend to emphasize specific beauty standards for Asian Americans (Mok, 1998). Also, some researchers have described media portrayals of Asians as representing that of a “model minority”—that is, hard working, efficient, attractive, technologically savvy, well-educated, dependent, obedient, and so forth (Mastro & Stern, 2003; Taylor & Stern, 1997). Although this type of portrayal is not a negative concept, it is nonetheless based on social stereotypes of Asian Americans and its presence in the media does promulgate the continued existence of this type of racial stereotyping. This thorny situation is intensified in Taiwan and many other content importation-oriented countries, and makes children in these countries have to deal with the difficulties of distinguishing other from self on the screen.

This study proposes to examine the current racial representation of children's animations in Taiwan to answer the following research questions: how prevalent is race-related content in animated cartoons? How do the different personal traits link with different ethnic group? Does gender and ethnic representation connect to each other?

Method

A content analysis was conducted in order to obtain the basic information needed to analyze the current situation in children's animations. In order to assure objectivity and reliability of the research, this study followed Kassirjian's (1977) general guidelines for content analysis. According to Kolbe and Burnett (1991), benefits of content analysis consist of: the unobtrusiveness of the communication evaluation; the assessment of the environmental variables of the communication/message content; the empirical onset or starting point of new research evidence on the nature of the communication; and the ability to provide statistical information for multi-method studies.

A total of 126 characters from 42 episodes, including 11 children's cartoons that are on the air from four to seven o'clock in the evening on the Eastern Television Children Channel, were collected for one week in January 2010 and coded. YoYo TV is the most historical children's channel in Taiwan, and thus, has the most children audiences. The five programs during that time period that are not animations were excluded from the analysis. In Taiwan, elementary school students go back home after class is dismissed at four o'clock, and families usually have dinner at seven in the evening, so the interim is usually free time or television time for many children. Thus, studies of children's animations often choose this time period (Su, 1999), and it is appropriate for the current study as well. In each episode, the first three

characters to appear for more than thirty seconds were coded. If the same character showed up in more than one episode, they were skipped, and the next character that appeared for more than 30 seconds was coded. In other words, the researcher coded the first characters in the episode, but if the third character that showed up had already been coded, then the researcher would code whatever character showed up the next (i.e., the fourth).

Data Collection

For analysis, each character was assigned a coding unit. A two-page code sheet, developed in the research of Chu and McIntyre (1995), was used in this study. Following Levinson (1975), a character is operationalized as “anything or anyone who has a speaking role or appearance outside a crowd, a scene, [or an] audience.” Some background information was coded in the beginning, such as the country of production. The type of the character was coded according to the following categories: human, animal, monster or mythical character, plant or object, robot, and other. The ethnicity of the character was coded as Asian, Black, Latino, Middle Eastern, South Asian, Caucasian, or other. The general criteria for determining the race of the character is detailed in the code book. Other attributes that can be distinguished by the characters’ appearance, such as sex, age, body weight and attire, were also coded. In addition, we coded the characters’ occupational roles and relationships, including the occupation of the character and whether this character is an employee or an employer. Lastly, by watching the content of the animation, we coded other personal attributes, such as whether characters were aggressive, independent, emotional, objective to things, easily influenced, dominant or obedient.

Results and Discussion

Among a total of twelve cartoons on YoYo TV that were coded: six of them were imported from Japan, four of them were imported from the United States, and one of them was imported from France, and one was from China (see Table 1). A total of 126 characters were coded in this study. Among them, the gender rate between female and male is 1:1.34. 82(65.1%) characters are human characters; 35(27.8%) characters are animal; and 9(7.1%) characters are non-human or non-animal characters.

Table 1 The names and the production countries of the samples

	Japan	U.S.A	France	China	
	<i>Pokemon</i>	<i>Sponge Bob</i>	<i>SamSam</i>	<i>Flash and Dash</i>	
	<i>Case Closed</i>	<i>Dora the explorer</i>			
	<i>Digimon</i>	<i>Go Diego GO</i>			
	<i>Chibi</i>	<i>Jimmy Neutron: Boy</i>			
	<i>Maruko-chan</i>	<i>Genius</i>			
	<i>Jewelpet</i>				
	<i>We are Pretty</i>				
	<i>Cure</i>				
Total	6 (50%)	4 (33.33%)	1(8.33%)	1(8.33%)	12(100%)

Ethnicity of Characters

There are 82 (65.1%) human characters in the samples, with the total of 44 (34.9%) non-human characters, including animals, plants and objects. The ratio between human and non-human characters is 1:0.54. This suggests 65% of the characters can be recognized by ethnicity and racial discourse. Among the 82 human characters, there are only 16 (19.5%) characters with obvious Asian features, but as high as 52 (63.4%) characters are categorized as Caucasian, and 4 (4.9%) are categorized as Latin American. However, 10 (12.2%) human characters cannot be categorized into existing groups. These indistinguishable characters often have rare hair or eye colors, which cannot be categorized into a certain ethnicity (see Table 2).

Table 2 Distribution of ethnic characters

	Asian	Caucasian	Black	Latino	Middle Eastern	South Asian	Undistinguishable	Total
Japanese	11(13.4%)	30 (36.6%)	0	1(1.2%)	0	0	9(11%)	51(62.2%)
U.S.A	0	15(18.3%)	0	2(2.4%)	0	0	0	17(20.7%)
France	0	3(3.7%)	0	0	0	0	1(1.2%)	4(4.9%)
China	5(6.1%)	4(4.9%)	0	1(1.2%)	0	0	0	10(12.2%)
Total	16(19.5%)	52(63.4%)	0	4(4.9)	0	0	10(12.2%)	82

(100%)

Caucasian characters showed up the most, regardless of the country of production. Among the cartoons produced by Asian countries, the Japanese cartoons have 59% Caucasian characters, while the Chinese cartoon also has 40% Caucasian characters. The result revealed a similar tendency to the critics of early Disney cartoons discussed in the literature—children of other ethnicities had difficulty finding the images that represented themselves, but had to follow the Western look and even the beauty standards, which are not only dissimilar to their appearances, but also hard for them to pursue.

In most of the sampled cartoons, even though some characters were portrayed with different colors of skin or hair, they still share the similar big eyes, big noses and bone structures. To some extent, this phenomenon can be interpreted into blurring the racial difference and diminishing racial stereotype, but this over-simplified appearance seems to be another way of following the Western beauty standard. The portrayal of a different ethnicity was rough and embedded with Western styles. The low rate of the representation of other ethnicities in the cartoons made by the United States and France also revealed a danger that the non-white children in Western countries may have difficulty finding models for themselves in cartoons, and thus become marginalized.

The lack of non-Western attire is also noticeable. Only 5 (6.1%) of the characters were dressed in Asian customs, while 77 (93.9%) characters wore Western-style clothes. This rate is even lower than the percentage of Asian characters. Wearing T-shirts, shorts, or skirts, the characters looked alike no matter which the ethnicity of the character was. In other words, even though the characters had an Asian appearance, they still wore Western clothes and demonstrated a Western look. This result may also demonstrate the tendency of Westernization of apparel in real life. Due to the influence of Hollywood and the globalization of media, most people of a young generation prefer to wear Western garments and take this as a symbol of fashion. The absence of Chinese, Japanese or other Asian traditional attires may reflect this phenomenon.

Surprisingly, none of the personal traits is statistically significant in ethnicity (see Table 3). This finding suggested that these personal attributes are not directly related to ethnicity. The factors in this scale used by previous studies (e.g., Chu & McIntyre, 1995) may have changed over time. Also, this result cannot serve directly as evidence of the stereotypes declining in recent years, it showed that Caucasian characters may not be portrayed as more dominant or more independent in modern cartoons. This result may also be due to the fact that among the

12 cartoons sampled, three of them have Asian characters as the main characters, and thus, influenced the results.

Table 3 T-values of Personal traits and ethnicity

Personality Trait	T-value
1. Aggressive	0.355
2. Independent	0.127
3. Easy Influenced	0.839
4. Dominant	0.289
5. Obedient	-1.067

Gender and Ethnicity

The findings on gender are interesting. Judging by their voice, appearance, name, or interaction with other characters, among 82 human characters, only 31 (37.8%) characters are female, and as high as 51 (62.2%) characters are male (see Table 4). Among all the countries of production, the amount of male characters is twice that of the female characters in the United States and China, and the ratio is even higher in France’s characters, which have a 1:3 ratio of female to male. This unbalanced ratio reflects the tendency of having more male characters in cartoons in every country.

Table 4 Gender of characters

	Female	Male	Total
Japan	21(25.6%)	30(36.6%)	51(62.2%)
U.S.A	6(7.3%)	11(13.4%)	17(20.7%)
France	1(1.2%)	3(3.7%)	4(4.9%)
China	3(3.7%)	7(8.5%)	10(12.2%)
Total	31(37.8%)	51(62.2%)	82(100%)

More than 60% of Asian characters are portrayed as female roles, while more than 63% of Caucasian characters are portrayed as male (see Table 5). To some extent, this matches a part of the concept of “orientalism” by Said (1978), which posits that Europeans usually look at Eastern people as having more female characteristics. Asian characters were still portrayed as

having a feminine look, while Caucasian characters were more masculine. This separation provided a stereotype for the audiences, especially children in this case, to possibly model this pattern and categorize people with diverse ethnicities. Although the Latino male characters show up three times more than the female characters, conclusions can be made due to the small amount of samples.

Table 5 Gender of ethnic characters

	Female	Male	Total
Asian	10(12.2%)	6(7.3%)	16(19.5%)
Caucasian	19(23.2%)	33(40.2%)	52(63.4%)
Latino	1(1.2%)	3(3.7%)	4(4.9%)
Undistinguishable	1(1.2%)	9(11.0%)	10(12.2%)
Total	31(37.8%)	51(62.2%)	82(100%)

Conclusion

The findings of this study reflected the current situation of racial representation in cartoons. The percentage of human characters among all cartoons, which is 60 percent, is relatively high; thus, the possible influences that are suggested by social learning theory should be taken seriously. More Caucasian characters are showing up in the animations, while most Asian characters were depicted with Western-style apparel, and represented with an embedded Western appearance. When the children in Taiwan watch the cartoons, it is not only difficult for them to look for attributes similar to themselves, but they may also become permeated by the Westernized beauty standards.

There has been considerable social change since the previous studies, and thus, there were not statistically significant results between ethnicities and the personal traits tested in this study. However, more personal traits should be included in future research to further confirm if there are stereotyped attributes associated with certain ethnic group in animations. The link between gender and ethnic groups still exists, as it was assumed in previous studies. This finding reflected that Asian characters are still depicted as having a more feminine look or quality, while Caucasian characters played a more masculine role. Further qualitative studies are needed to see how Asian characters are portrayed in the content and storyline.

A NEW COMMUNICATION ENVIRONMENT FOR THE CITY GOVERNMENT: INTERNET. THE COMPARISON OF TWO DIFFERENT CITIES İSTANBUL-OSAKA

Asist. Prof. Ece Karadoğan Doruk

Istanbul University, Turkey

Phd. Murat Güreşci

Istanbul University, Turkey

The local governments; are the administrative, political and the social institutions providing public service to the local community and managed by the organs selected by the local people in order to meet the needs of the local people effectively; the reasons of their existence are providing service based on the participative, democratic, the wishes and the requests of the people and their recommendations by providing the confidence and the support of the people.

The “governance” understanding having principles like participation, transperence and accountability of the information age society shows itself in the reconstruction of the local governments just like almost in every field.

The local governments that are the institutes providing service intensely in Turkey and also the institutions where the people apply the most have entered into the search of healthy service production with a homogeneous structure where the citizen is participative and based on information by making investments to the information technology for the purpose of expanding the service fields, increasing the efficiency, raising the service quality. When considered in this point of view, internet is one of the most effective methods that can be used in establishing communication between the citizen and the local governments.

The local governments of two different cities Istanbul and Osaka, the way of internet usage of the different cultures and the way of management and at what fields their similarities and the differences will be evaluated by putting forward in this study.

INTRODUCTION

The world is rapidly urbanizing and becoming more and more dependant on advanced telecommunication, media and computer technologies. In parallel with global telecommunication and transportation networks, world cities are integrating more with each other in economic, cultural and infrastructure areas. In many estimates made within the last 20 to 30 years, developments in information systems were foreseen to create an alternative to the current urban infrastructure and accordingly the cities were expected to enter a phase of collapse. However, today cities still continue to play a dominant role in shaping the economic, cultural and social dynamics of modern societies.

The world has been experiencing a new process called “globalization” for the last few decades. One of the distinct characteristics of this new process is the internationalization of labor and capital, whereas on the other hand, the second one is the enormous developments in information technology. During this process, local administrations (cities) which face difficulties in meeting the societal demands and the community services they have undertaken, entered into an effort to create economic advantages for themselves by attracting capital towards their regions. Here, we can say that there is high competition between the cities in terms of attracting “capital”. It may well be said that the implementation of e-administration, being an indicator of information

technologies hardware infrastructure of cities, will function as a determinant in this competition. Furthermore, today a new management approach, driving social parties forward together with the actors, is being discussed: governance. "E-Government" (e-state) approach, which could be defined as "maintaining administrative relations through utilization of information technologies", can be functional in adapting to the globalization process and putting this new management approach into practice.

Municipalities and local administrations have great responsibilities in execution of planned and scheduled activities which facilitate the urban life required by the information era. Expectations of people and entities from local administrations are continuously increasing, effectiveness and efficiency in municipal services, an orderly and healthier environment come forth as basic requirements. Continuously developing information technologies open new horizons within the direction of the needs of local governments for rendering diversified services and can provide appropriate solutions for emerging problems.

Information technologies, having rapidly developed and spread within the last 50 years, change all areas in life radically, such as trade, production, business, education, home life, law, entertainment and forms of administration. This change causes administration forms directly concerning the public, such as the state and municipalities, also to be changed and renewed (Çoruh,2008:151). E-municipality, meaning interactive municipality, is the total of contemporary implementations in internet environment which enable municipalities to provide the urban citizens with continuous, faster and higher quality services through utilization of modern technological infrastructure and by going beyond the traditional municipality approach as well as informing the urban citizens and letting them participate in decision making processes within municipalities. In this sense, interactive municipality is not a mechanical system comprising of only a few keys, but a transparent and controlling structure. This is at the same time a way for local administrations to be more pluralistic. The most important advantage such systems introduce is the easy and free access to information. By exceeding the service type stuck within locations and going beyond the buildings, it aims to access the information on the date and time desired, over the fastest and shortest way.

Local Administration and Internet

Today, local administrations are considered as the leader of democratic organizations in almost all over the world. The main reason for this is that the local administrations, or local governments, are organizations which are able to let public to govern itself. The public can do this via bodies which are elected by the public. However, it is not sufficient for local governments to be qualified as democratic just because they are commissioned through elections. A genuine public participation is required, meaning to take a step forward from formal conditions. And this could be achieved by opening the ways of participation to various layers existing in the society (Keleş, 1991). To provide democratic public participation in local administration is among the most important tasks of local governments. The road to achieving such democratic participation passes through grounding the legitimacy of political administration on the public and furthermore convincing the public on this fact. And this can only be realized with a transparent local government assuming accountability.

Local governments are the closest ones among public administration units providing services to the public. Today, changes in the relations between central government and local governments gradually lead to the local, especially the urban administration to become more functional. When considered with a global perspective, urban administration vision becomes

more and more internationalized, and the cities proceed with consciousness for competition in terms of attracting resources and generating welfare. Administrative models are being tried to be turned into a transparent and accountable condition towards local public through participation mechanisms while urban administration structures are developed in a manner to be able to stand still. In recent years, mechanisms have been commissioned for integrating citizens with public administrations and cultivating the interrelations between these parties. Principals such as strengthening accountability mechanisms, transparency, right to obtain information, improvement of service quality, customer satisfaction, giving importance to participating in administration bear the objective of redefining by the citizens their status across public administration (Heden, 2005).

New communication technologies and specifically the internet are the ones mostly discussed about among technologies articulated in discussions of public participation. Internet is not only a tool for transferring news and information in shaping public opinion, but it attracts attention with the characteristic of actually constituting a platform itself on which public relations are realized. Determination of internet as the public communication environment, how it structures the relations between persons and the common location in which such relations are sustained are closely related with the quality of participants available on such common location and the distinctive feature of the discourse actualizing such participation (Timisi, 2003, 140). The ability of the feature of integrating multiple communication styles on a network environment to include and compress all cultural expressions is what qualifies new technologies and the internet (Timisi, 2003, 153).

Continuously developing information technologies open new horizons within the direction of the needs of local governments for rendering diversified services and can provide appropriate solutions for emerging problems. Especially, technological improvements in communication area facilitates the organization of life to a considerable extent, both for governments and for citizens (Heden,2005).

The most common type of local administrations are the municipalities, which are the administration types for urban settlements. Endeavors of municipalities to render services over the internet are much higher compared to other local administrative units in terms of the services they provide and their activities (Moon, 2002: 424-440). Municipalities are at the top among organizations which are designated with providing a civilized living to city citizens, use positional information efficiently, realize utmost data processing and are in a position to share the information they generate with the public. For issues related with utilities, construction, taxes and many more, municipalities are the places to refer for the individuals. Citizens always face municipalities at each stage of such mentioned services.

The universal network, namely internet is used to reach many people simultaneously and provide services without being dependent on location. Internet usage, which is quite useful for transactions such as giving and obtaining information and making applications etc., might as well introduce some sort of convenience for municipalities. For this reason, municipalities increasingly desire to establish their Internet Sites (Naralan, 2008: 64).

E-Municipality is the management of city related data through means supported by information technologies based on modern technology and production of various information from such data for the benefit of the city as well as the society and offering these for the service of citizens (TBD, 2004). Electronic Municipality (E-Municipality) consists of utilization of information technologies for municipal management as well as local administration services and activities, providing services to citizens and entities in an efficient manner over the internet, integration of internal units via internet networks and providing communication with relevant external units over the network.

Local governments in Turkey, having a heavy service load and taking the lead in terms of public application for issues, now invest in information technology to expanding their service areas, to increase efficiency and service quality. E-Municipality, meaning interactive municipality, is the total of contemporary implementations in internet environment which enable municipalities to provide the urban citizens with continuous, faster and higher quality services through utilization of modern technological infrastructure and by going beyond the traditional municipality approach as well as informing the urban citizens and letting them participate in decision making processes within municipalities. In this sense, interactive municipality is not a mechanical system comprising of only a few keys, but a transparent and controlling structure. This is at the same time a way for local administrations to be more pluralistic. The most important advantage such systems introduce is the easy and free access to information. By exceeding the service type stuck within locations and going beyond the buildings, it aims to access the information on the date and time desired, over the fastest and shortest way. E-Municipality not only changes the administration mechanism but also provides for environmental protection (Geymen ve Karaş, 2006).

E-Municipality is not only the activation of a website on the internet, but it is an integral transformation movement. At the center of this transformation movement, there exist the integration of all departments and directorates within the municipality with information technologies. Success of E-Municipality works depends on internalizing the “culture of technology” in every single unit of the municipality, as well as its adoption by the employees and departments. It is necessary to determine the content of such E-Municipality, including supply of hardware and software needs of the municipality, providing interaction with citizens and organizations over the internet, efficient utilization of public information technologies, adaptation of employees to the new conditions and covering their training needs, re-planning of legal and technical infrastructures, modifications of municipality laws and legislations, etc. (Erdal, 2002).

Municipal web sites in general have a characteristic of a “promotional leaflet”, and for the websites under updating, “e-advertisement” or “e-bulletin” image is prominent. Another characteristic of these websites is that they lack “humans”. The only element that could be perceived as human is the speeches of Mayors rising over the stand.

Targets are foreseen in relevance with E-Governments, yet it is important that the implementation takes place in an efficient manner, meaning that certain parameters should be checked to evaluate the success of the E-Government. In the first instance, it should be tested whether these local services are integrated in line with consumer needs, accessible, supported electronically, provided in common, continuous, transparent and accountable and used by the citizens. On the other hand, it is necessary to provide the services rendered through local E-Government to be currently more convenient compared to the past, services rendered to be faster and less costly, local citizen satisfaction and participation to be increased (www.coe.int/t/e, 2003).

In 21st century, being the communication age, Internet has become an infrastructure service just like water, electricity, garbage, drainage, natural gas, roads etc. and it should be managed and provided in this manner.

Osaka and Istanbul

Osaka is the third biggest city of Japan and the trade and industry center of the Western region. Osaka city is laid over an area of 222 km² with a population of 2.6 million people and it was founded in year 1889. It is the second most crowded region after Tokyo. On the other hand, the total of non-Japanese population of 15.6% lives in Osaka. The majority of this population is composed by Chinese and Koreans. Osaka, perfectly harmonizing modernity with traditionalism, is a city shaped up by the sea, the nature, culture and modernity. It is one of the most significant economic and business centers of Japan and has had the most vivid commercial life ever throughout its history. One of the most important reasons for this is its location being close to the former Japanese capitol cities Kyoto and Nara. Osaka is among the largest harbors of Japan together with Kobe. It used to be an important weaving center back in history. Today, it is known for shipbuilding, manufacturing machines, steel, electrical appliances, food, printing, textiles, chemical substances, cement and garment industries. The city is the center of a territory lying approximately 30 km along the north coast of Japan and covering an industrial region including Kyoto and Kobe. At the west end of this zone of industrial cities comes Kobe as the harbor city.

Istanbul is the most crowded and economically most important city in Turkey. One part of the territory covered by the city, founded on the two shores of the sea channel, stands on Asia and the other on Europe continents. According to the ranking made by taking municipal boundaries into account, it is the 5th largest city in the world and largest one in Europe with its 18.3 million population. One of the oldest cities of the world, Istanbul served as the capitol city for Roman, Byzantine and Ottoman Empires. In the city where a very small portion of its population lives in rural areas, people earn their livings in general from industrial, commercial and transportation activities besides other activities. The percentage of foreigners in Turkey is 0.14% and the majority of these people live in Istanbul and Antalya cities. The biggest industrial entities of Turkey are located in Istanbul.

When taken according to order of importance, the city industry is seen to be comprising of manufacturing of metal goods, machines, automobiles and ships, chemical substances, cotton and wool textile products, garments, food products, glassware, porcelain and cement. Furthermore, over 20% of small industrial entities are located in Istanbul city. Istanbul's geographical location caused this city to be an important commercial center since ancient times. Today, Istanbul is a center in which all types of goods and services are exchanged, with industrial products being the most significant. Moreover, 35% import and 25 of export transactions are executed within Istanbul.

Research Method

In our research, we tried to evaluate the ways of internet usage by local governments of two different cities – Istanbul and Osaka – , coming from different cultures, through presenting on what areas similarities and variations occur. In this study, the answers to the following questions will be sought: What kind of needs do the Municipal web pages meet for foreigners living in the city, investors thinking of making investments in the city, tourists, etc.? Are the Municipal websites organized just for city residents or are they also a platform to get information for people who want to visit these cities? Or are they platforms with information only appealing to people who plan to make a touristic travel to these cities or portals from where persons who desire to carry out commercial activities can obtain guiding information for such intentions? Are there communication channels available on these Municipal websites where the city citizens can tell about the problems they encounter with, criticize and give feedback and suggest solutions on the local government in relevance with their activities and performances? Is it possible to reach the highest authorized persons through such channels?

The Municipal websites of these two cities subject to the research are examined over their English versions between dates April 1, 2010 and April 7, 2010.

Objective of the Research

Osaka and Istanbul are two cities similar to each other in terms of population size and being commercial and industrial cities. Since both play an effective role in international trade, headquarters of many multinational corporations exist in these cities. Therefore, both cities are settlements in which there is a dense population of residing foreigners. Furthermore, both are attractive cities in terms of tourism, receiving a high level of touristic visits. For this reason, we tried to determine in this study on what level the implementations targeting foreigners are realized on the websites of these two cities; what kinds of implementations towards resident foreigners, investors and tourists exist on the English versions of these two Municipal websites? The E-Government implementations carried out by both city Municipalities in their native languages are not within the scope of our research. However, they might as well be an attractive subject for another research to be conducted. The objective of our research is to determine what kinds of services are offered to the foreigners living or to be living in the city by taking the English versions of the Municipal websites of these two cities.

Functionality of Municipal Websites

	OSAKA	ISTANBUL
Is there an English version of the Municipal website?	X	X
Are there different language options other than the native language for foreigners living in the city?	X	
Are each of the versions prepared for these language options the same with the native language version?	X	
Does the life guide provided on the website contain information about everything for the foreigners in the city, related to health services, accommodation facilities, childcare, education, health insurance, information about waste & garbage disposal, municipality taxes, retirement, nursing care insurance, pets, funeral services, bicycle – highway – river/sea etc. transportation, culture, sports, students, elderly, young, disabled, etc.?	X	
Are there sub-links available to explain all this information in detail?	X	
Is there a phone directory containing all emergency and important phone numbers for foreigners residing or to be residing in the city?	X	
Are hospital phone numbers and addresses available?	X	
Are there any instructions for emergent cases and/or cases such as burglary, snatching, fire, earthquake, tsunami, etc.?	X	
Is there any information as to which institutions should be called in such situations?	X	
Are there any links containing necessary information for business world?	X	
Any information on what kind of opportunities, novelties, incentives, technical possibilities, exhibition areas the city offers for business world?	X	

Are there detailed links with necessary information available for such opportunities?	X	
Are there any links & contact information of relevant municipal offices on finance, economic affairs, central wholesale markets, environment, labor & harbor services etc. for business world?	X	
When such links are clicked, is there detailed relevant information on the appearing pages?	X	
Are there any links for tourists?	X	X
Is there a city guide for tourists?	X	X
Is there any information about the history and culture of the city?	X	X
Is there a list of interesting places?	X	X
For such places, are there any relevant addresses, phone numbers and how-to-get-there information?	X	
Are there any links on municipal websites about city government?	X	X
Is there any information about Mayor?	X	X
Are there any press release news & information by the Mayor?	X	X
Is there a photo of Mayor?	X	X
Is there a list of Municipal administrative bodies?	X	X
Is there an e-mail address in the English version to contact administrative bodies?		X
Do phone numbers and addresses of all relevant municipal offices available?	X	X
Is there a unit in all of these offices to answer the incoming calls in English?	X	
Are all of the versions opening when clicked on the provided links in the English version of Municipal sites also in English?	X	
Is there a direct e-mail link for Mayor?	X	
Is there a direct phone number of Mayor?	X	

Both Osaka and Istanbul's Municipal websites have an optional English version other than the native language version. However, Osaka Municipal website also has versions in French, Spanish, Portuguese, Chinese, Korean, Indonesian and Thai language. These versions are identical with the English version. Entire information available in the English version also exists in these versions.

Different from Istanbul Municipality, Osaka Municipality provides a guide on its website for foreigners living or who will be living in the city. This guide contains very detailed information, ranging from what to do in the city to how to live in the city. Such that, it is possible to find detailed information such as health, medical, having children, education, how to dispose garbage, accommodation, infrastructural services, protection from disasters, life guide, municipal taxes, national health insurance, nursing care insurance, pets, funeral services, transportation, culture, sports, environment etc. also in the English version. This information contains everything for people who plan to live in that city. Thus, people get accustomed to the city. It is possible to obtain detailed information on every issue about the city system.

Osaka Municipality also provides a quite serious guide for investors who desire to deal with business in the city. All useful links are available under the button "for business" for investors. Here, detailed information about incentives for business and university education in Osaka, business incentive center, novelties for businesses, international exhibition areas,

technical institute etc. can be found. Moreover, links to all financial offices, economic affairs offices, central wholesale market offices, labor offices, harbor offices etc. are available, as well as English versions of such links, for investors planning to make investments in Osaka. Detailed information about the above mentioned issues is provided on these pages. Addresses and phone numbers of relevant offices are also available.

Both Osaka and Istanbul Municipal websites are used as an introductory platform in terms of tourism. City history and culture are explained on both websites. Information about interesting sites to visit is available. Both websites have a tourist guide of the city.

Also, information about the administration system of Municipalities exists on both Municipal websites. It is possible to find information on administrative bodies. However, website of Osaka Municipality contains detailed task definitions for administrative bodies as well as address and phone contact information. Moreover, such information is not summarized, provided in detail to serve as a guide for everyone living or planning to live in the city. When all pages are opened, the sub pages are not only in native language but one can find the version in the chosen language for them. In both websites, background information is available in relevance with the Mayors with a photograph displayed. With an exception of Istanbul Municipal website, which contains a direct e-mail account link to reach the Mayor.

CONCLUSION

The most important result we reached at the end of our research where we examined the Municipal websites of the two cities is that Osaka Municipality gives much more importance to foreigners living and planning to live in the city and provides significant information about the city to serve them as a guide. This indicates the fact that Osaka is an international city, trying to preserve and sustain such feature. All activities in the city are presented with details in order to avoid alienation of people from other nations living in Osaka. There is information about all problems possible to encounter with as well as addresses and phone numbers of relevant organizations to apply to and also the methods and procedures to be implemented by such organizations.

Osaka Municipality also has included all business related information about the city on its website to indicate that the city is an attractive place for investors and to invite external investments. Osaka Municipality emphasizes the commercial and industrial characteristics of the city and intends to develop and improve these features. Therefore, it explains all business opportunities in extended detail to the investors who might be planning to invest in the city. The internationality characteristics of Osaka city is very much emphasized by the Municipality.

However, there is no information about the city and country systems for foreigners living or planning to live in Istanbul not to feel as a complete stranger, especially when they initially arrive. This point is almost neglected. There is a serious number of foreigners from various nations residing in Istanbul. But there is no information on its Municipal website to facilitate their adaptation to the nation's system. As a matter of fact, Municipalities should carry out such services. Istanbul Municipality ignores the foreigners living in the city and is not rendering them any such relevant service.

Furthermore, despite Osaka Municipality, Istanbul Municipality does not provide any guide service for investors to facilitate their business. Although Istanbul is an important commercial and industrial city of Turkey along with the feature of being a center for many

international corporate headquarters, the Municipality does not provide any guides describing the appealing sides of the city for investors to attract new investments. So to speak, such feature of Istanbul is also ignored.

On the other hand, information useful for tourists is available on both Municipal websites. However, in Istanbul Municipal website, the pages introducing the touristic places in the city consist of carelessly arranged images and information lacking detail, whereas images and information of touristic places are presented in detail and glamorously on Osaka Municipal website.

Both websites contain information relevant to city administration, but information on English version of Osaka Municipal website is quite a lot, detailed and informative. An outsider, anyone not living in that city can obtain detailed information about the city administration. Such information on Istanbul Municipal website is summarized and short. It is not informative.

In short, the result we get after examining the Municipal websites of both cities is as follows: English version of the Municipal website of Istanbul, which is the largest city in Turkey, is insufficient and carelessly prepared. It is short and in a summarized form. However, Turkish version is quite detailed. Istanbul is a host city for many international company centers. Hundreds of foreigners work in those centers. English version of the Municipal website has not been prepared by taking the needs of foreigners living in the country into account. It is insufficient, simple and careless in overall appearance. Osaka Municipality, on the other hand, has prepared the English version of its website in quite detail and by considering the needs of foreign residents in the city. Not only foreigners, but also the characteristic of Osaka as being an international city was also kept in mind. To sustain the industrial characteristic of the city, the Municipal website also serves as a guide containing detailed information for foreign investors. Administrators of Osaka city provide the internet services in an appropriate manner, by taking all kinds of needs for further improvement of the city into account. Osaka Municipality has not limited the foreigners living in the country to only English speakers, and included various language versions in its website.

Foreigners seem to be as not such a precious and important factor for Istanbul Municipality, whereas every person living or planning to be living in the city is a precious component for Osaka Municipality and is being recognized and valued. Their needs are observed by the city administration and in order to provide a harmonized integration within the system and not to allow them to feel as a stranger in the city, the city system is explained to them totally in their own native languages. For this reason, it might well be said that implementations of Osaka city is reflected to the internet in a manner appropriate for the international dimension of the city.

Topic of Submission

Music; Australian art music; cultural exchange

Abstract

Recently-composed art music in Australia exists in a context where its composers are both the inheritors of a transplanted musical tradition and the beneficiaries of a multi-faceted cultural exchange. This convergence of musical styles and idioms, sometimes characterised as ‘East meets West’, enacted over many decades, is alternately praised as an example of a postmodern ‘rehabilitation of ethnic influence’ and lambasted as ‘cultural appropriation’ in Australian cultural and academic forums. While Australian composers in the early twenty-first century may lack the overt ‘moral certainty’ with regard to a particular style or tradition that characterised the attitudes of many art composers in the early twentieth century, divergence over issues of identity and cultural authority play a significant, and routinely misunderstood role in the production, reception and analysis of art music in Australia. This paper analyses a selection of Australian art music created in the first decade of the twenty-first century with the aim of showing how the idea of a multi-faceted cultural exchange continues to shape the diverse identity of Australian art music. The paper examines the circumstances surrounding the commissioning of each work; the compositional technique employed in each work, and evaluates the domestic public reception of the works. The paper concludes that post-colonial models of interpreting the compositional output that results from a cultural exchange needs to be re-examined in the light of recent compositional activity in Australia.

Word Count: 4679 (excluding cover page, works cited, footnotes and tables)

Introduction

Recently-composed Australian art music exists in a context where its composers are both the inheritors of a transplanted musical tradition and the beneficiaries of a multi-faceted cultural exchange. This paper will consider how recently-composed Australian art music is understood in recent academic literature; examine how this discourse understands the exchange; identify how the discourse has influenced composer behaviour, and posit new modes of understanding through an analysis of a selection of orchestral pieces created in the first decade of the twenty-first century. The paper concludes that prevailing post-Colonial models of understanding the music that has resulted from this multifaceted cultural exchange, referred to here as a 'diversity paradigm', need to be re-examined in the light of recent compositional activity in Australia. While the issues considered in this paper are pertinent to a range of art-music outputs, the orchestral repertoire has been used to focus the discussion. This is because the orchestral repertoire is large enough to identify meaningful patterns of composer behaviour and is in possession of a broad and detailed (but not all-encompassing) public record through the Australian Music Centre works registry.¹

Australian New-Music Discourse

The discourse surrounding Australian art music has, since the 1960s, been characterised by a fluid debate related to issues of authority and identity. Sometimes vitriolic, sometimes conciliatory, this debate has highlighted issues of an emerging Australian cultural identity firstly as a scion of a broader Western-European tradition, secondly as a dialogue with the music and culture of Indigenous Australia and, thirdly, as representing an interaction with the music of the wider Asia-Pacific region. The debate itself represents an effort to construct a sense of identity in the face of prevailing European and American music histories that either ignore Australian music making or classify it as being on the periphery of the 'central' Western tradition, and, by inference, derivative. Contributions to the debate often come in the form of polemics that deride or advocate particular music styles or techniques.

Issues of style and technique routinely work to frame this debate. Much of the discourse is characterised by the linking of these issues to the idea of an emerging Australian art-music identity: discussions of individual composers invariably attempt to position these practitioners in terms of pre-existing styles and techniques. The problem with this tendency is twofold. Firstly, the majority of Australian art music composed over the last fifty years rarely receives multiple performances and, with the exception of the work of a small selection of established composers, recordings of this repertoire are often not readily available. This means that the circumstance needed to engender a consistent style – multiple practitioners working along similar lines to the point where certain musical characteristics and processes are assumed – does not exist. Secondly, the development of Western art music through the twentieth century saw such a range of styles emerge that the notion of a single 'Australian' style emerging in the face of such diversity is untenable. As a result, the framing of the debate around the issue of Australian art-music identity through much of the second part of the twentieth century perversely worked to stymie the realisation of that identity. More recently, composers and musicologists have come to realise that issues of identity in the Australian context are not best defined in terms of traditional notions of style or a catalogue of musical techniques.

¹ Other repertoires such as opera and chamber music, while still in need of study, present the researcher with greater difficulties. For example, opera suffers from too small a sample concentrated over comparatively few practitioners, and chamber music possesses a less detailed public record of outputs and performances.

Recent Australian Art-Music Narratives

Over the course of the twentieth century, music making in Australia has consisted of a wide diversity of practice and, while the relationship of Australia to the European art-music tradition has dominated many narratives that seek to account for this diversity, most recent histories acknowledge a multiplicity of transplanted traditions as well as the music of traditional Indigenous cultures, and importantly, the interactions between these strands of music. For example, in the 1998 publication *Australia: Exploring the Musical Landscape*, one contributing author, the musicologist and composer Linda Kouvaras, seeks to understand Australia's contemporary classical music since 1970 through a diverse series of binaries such as Postmodernism and Modernism; Western and non-Western influence; tonal and atonal repertoires; and experimental and traditional practitioners.²

Musicologist David Bennett's 2008 publication, *Sounding Postmodernism: Sampling Australian Composers, Sound Artists and Music Critics*, seeks to rehabilitate the concept of Postmodernism in the face of a resurgent Modernist aesthetic and a community of Australian academics, composers and music critics who are increasingly ambivalent toward the concept. Bennett uses an Australian context to explore different approaches to Postmodernism and challenges the idea that it represents nothing more than an attempt catalogue the diverse out-workings of the post-1970 reaction against Modernism.³ Both Kouvaras and Bennett list numerous composers as evidence of the diverse music practices in Australia: Kouvaras mentions 81 composers, usually clustering them in groups of two to five as exemplars of particular music practices; Bennett interviews 36 personalities, asking each about their attitude towards Postmodernism – of the 36, 33 are creators of new music.⁴ While Kouvaras and Bennett are both formidable academics whose writing is lucid and insightful, their technique of listing numerous composers as de facto evidence of validity is problematic. Particularly with regard to Kouvaras' writing, the large number of composers mentioned takes on the appearance of a representative sample. However, Kouvaras does not attempt to explain the rationale behind the selection of these 81 composers and, like all arbitrary lists, the exclusion of some significant practitioners inevitably leads to a skewed perception of new music activity.⁵

Bennett and Kouvaras' work functions to deal with the themes and ideas behind Australian new music, rather than an in-depth analysis of the music itself. While both employ brief passages of prose-based music analysis, neither seeks to discuss a single work at length and neither features any score-based analysis. Composer and music critic Gordon Kerry's 2009 publication *New Classical Music: Composing Australia* takes a somewhat different approach. Kerry deliberately eschews issues of style and instead focuses his discussion of new Australian art music around various themes of Australian identity including musical responses to Australian landscape, Indigenous cultures, Asian cultures and the ongoing

² Linda Kouvaras, 'Australian Composition since 1970: Diverse, Daring, Multi-dimensional,' *Australia: Exploring the Musical Landscape*, ed. Caitlin Rowley (Sydney: Australian Music Centre, 1998) 52-57.

³ David Bennett, *Sounding Postmodernism: Sampling Australian Composers, Sound Artists and Music Critics* (Sydney: Australian Music Centre, 2008) 11-18.

⁴ Bennett distinguishes between 'composers' as creators of traditional music scores that go on to be realised by musicians, and 'sound artists' as music creators who work in electro-acoustic and other new-media settings.

⁵ Ironically the actual publication highlights this problem: a picture of the prominent Australian composer Elena Kats-Chernin accompanies the chapter, but no mention is made of her in the text.

influence of Europe. While acknowledging that his thematic scheme is arbitrary,⁶ Kerry goes on to use particular compositions, analysed in some detail, as case studies to illustrate his themes.

Kerry's interaction with the actual musical content of the repertoire he has identified is somewhat unusual in the prevailing discourse that surrounds new Australian art music. Musicologists have identified a reticence to engage in technical, discipline-specific analysis of new music: the musicologist Richard Toop, in a 2006 article titled *Discourse: Muffled, Muted, Muzzled?*, bemoans the lack of critical engagement with new music, suggesting that serious discussion of anything but the broadest trends in new music is "off-limits"⁷; in the same journal, musicologist Danielle Carey states that while the output of Australian new music is increasing, the discourse is not keeping pace: Carey states that "we aren't really talking much about what we are creating."⁸

Authority and Identity: the Diversity Paradigm

One reason for this growing disconnect between the discourse around, and the specific content of, the Australian new-music repertoire is the problematic issue of cultural authority. Kouvaras, Bennett and, to a lesser extent, Kerry all identify diversity in terms of style, technique and influence as the constant defining feature of new Australian art music. While this 'diversity paradigm' is undoubtedly a significant issue, the stressing of diversity affects the discourse on three levels: first, the histories that these musicologists construct primarily feature examples of composers and works that highlight diversity (making the diversity paradigm a self-fulfilling and self-perpetuating phenomenon); second, there is a danger that the diversity paradigm functions to release critics, composers and musicologists from any responsibility to make further attempts to understand trends in the emerging repertoire; and third, any attempt to identify a stylistic convergence within the Australian art-music repertoire is likely to be lambasted: the diversity paradigm undercuts the specific claim of cultural authority that accompanies such efforts. While Australian composers, critics and musicologists in the early twenty-first century may lack the overt 'moral certainty' with regard to a particular style or tradition that characterised the attitudes of many in the early twentieth century, the 'certainty' of diversity that characterises scholarship espousing the diversity paradigm is in danger of functioning in a similar manner.

Cultural Exchange: Lauded and Lambasted

While the diversity paradigm tends to undercut contemporary attempts to identify issues of convergence in Australian art music, it does not negate all issues of cultural authority. The identification of diversity as a defining feature of Australian art music has not been accompanied by an abrogation of issues of ethics; this diversity is not synonymous with a value-free environment. For example, there is a long tradition of criticism related to early attempts at forging a distinctly Australian musical identity through interaction with traditional Indigenous and non-Western music. From the 1960s onwards, mid-century Australian composers such as Clive Douglas (1903-1977) and Peggy Glanville Hicks (1912-1990) have been charged with cultural insensitivity and, more recently, Orientalism. In his seminal 1967 publication, *Australia's Music: Themes of a New Society*, Roger Covell conveys a "deep scepticism" as to the authenticity of what is purported to be an Aboriginal lullaby in Douglas'

1939 orchestral piece *Carwoola*;⁹ more recently, the Musicologist David Symons, in the context of research that places Douglas' output in a more positive light, has suggested that Douglas' attempts to forge an Australian national musical identity, by, amongst other things, appropriating Indigenous Australian melodic material is "naïve and illusory."¹⁰ Musicologist Victoria Rogers has undertaken an extensive analysis of Peggy Glanville Hicks' attempt to synthesise Indian and Western musical materials in her opera, *The Transposed Heads*. Rogers concludes that, contrary to the assertions of the composer that Indian and Western music could be combined without violating the character of either, Western musical practices predominate in the opera, with the Indian musical elements distorted or misrepresented.¹¹ Rogers goes on to state that Glanville-Hicks' Orientalism was symptomatic of a broader Western cultural imperialism that viewed non-Western music as a commodity to be exploited.¹²

Composer Peter Sculthorpe's use of both Indigenous Australian music and musical systems derived from Asian cultures has been a persistent strand of debate in the discourse surrounding Australian cultural identity. In Sculthorpe's 1999 autobiography the composer recounts a conversation he had with Percy Grainger in 1938. Even though Sculthorpe (born in 1929) was only nine or ten years old, he communicated to Grainger his desire to become a composer. Grainger's response was: "my boy, you must look north, to the islands!"¹³ In publishing this story, Sculthorpe has risked being seen as using Grainger's patriarch status in Australian music to create an imperative for engagement with Asia, and to justify his approach to interactions with other cultures. Responses to Sculthorpe's approach to cultural exchange have ranged from vitriolic to equivocal. In a 2008 article that examines issues of genre in contemporary Australian music, critic and musicologist Jonathon Marshall pillories Sculthorpe's interaction with non-Western music claiming that Sculthorpe draws "on elements from Indonesia, Sino-Japanese and Australian Aboriginal motifs in such a way that they become fundamentally interchangeable 'primitive' admixtures within the structures of Western tonality."¹⁴ In a 2006 article on cross-cultural appropriation, musicologist Steven Knopoff is somewhat less critical of Sculthorpe's practices but nevertheless suggests that his frequent use of what purports to be an Indigenous song from Arnhem Land, *Djilile*, is tokenistic and primarily the product of Western musical thinking, with any genuine musical connection to Indigenous culture lost in the transition to a Western-instrumental context.¹⁵

Composer Barry Conyngham (1944-), a student of Sculthorpe, has actively engaged with the music of Japan without being subject to the negative criticism received by his teacher. The more positive reception of Conyngham's work stems from two factors: firstly, he has eschewed the use of specific references to Indigenous Australian music¹⁶ (thus avoiding the

charge of cultural insensitivity levelled at Sculthorpe) and secondly, his interaction with Japan stems from his choosing to study with Toru Takemitsu,¹⁷ where, by first approaching Japanese musical culture as a student, with Takemitsu as intermediary, Conyngham largely avoids the charge of Orientalism. Conyngham has composed music that engages with Japanese culture on both a broad aesthetic level, and via the use of specific cultural objects such as Haiku poetry and the Koto. Conyngham's efforts have been widely lauded in the discourse surrounding Australian new music with his studies with Takemitsu being viewed as de facto 'permission' to interact with another culture. A recent example of this lauding can be found in *New Classical Music: Composing Australia*, where Kerry goes as far as asserting that Conyngham has achieved "a genuine fusion of traditional and contemporary sounds, of Asian and western aesthetics."¹⁸

Another student of Takemitsu, Chinese-born Australian composer Julian Yu, suggests that the end result of a cultural exchange, namely the exposing of an original compositional voice, is more important than the circumstance that led to the exchange. Yu qualifies this 'ends versus means' mindset by asserting that "one should try to identify with the inherent musical thinking of a tradition rather than sticking narrowly to certain pre-existing formulae such as modes or scales."¹⁹ Yu has perhaps identified why Sculthorpe's approach to cultural exchange, albeit as well-intentioned as Conyngham's, is subject to a greater level of criticism: in appropriating discernable musical artefacts such as scale forms, rhythmic modes and melodies, Sculthorpe's application of the exchange can seem tokenistic. However, regardless of any reading of the end result of Sculthorpe's efforts at engagement with non-Western music, his biography outlines the efforts he has made to understand other cultures on their own terms. From a respect for the sacred nature of certain Australian Indigenous instruments and repertoires²⁰ to his striving to understand Buddhist chant and Japanese court music in context,²¹ Sculthorpe has crafted a personal ethical framework that informs his interaction with other cultures.

Melbourne-born composer and academic, Liza Lim, has also interacted with both Asian and Australian Indigenous cultures. From basing a composition on the aesthetics of seventeenth-century Chinese poet Wang To, and incorporating the musical gestures of Chinese opera in her 2005 composition *Flying Banners*, to consulting and seeking permission from Indigenous custodians to use imagery of a sacred landscape in the creation of a collaborative sound installation of the same year²² (*glass house mountains*), Lim articulates an uncompromising ethical basis for the circumstances that surround her interaction with a variety of cultures. Particularly where two cultures are marked by a power imbalance, Lim's composition and scholarship illustrates the ethical concerns that need to be addressed to avoid charges of Orientalism or appropriation. These concerns include highlighting collaboration over Western notions of 'creativity in isolation;' a respect for differing world-views; a willingness to alter pre-existing practices that might compromise or disrespect another culture; and, importantly,

¹⁷ Conyngham's decision to study in Japan can be seen as part of a broader trend of Australia gradually turning away from Britain towards Asia. Only three years earlier in 1967, Japan replaced Britain as Australia's primary trading partner. Conyngham's decision to study in Japan was, at the time, controversial: his travel to Japan was made possible by a Churchill Fellowship – these were typically used to fund study in Britain and, in opting for a different path, Conyngham made front-page news in a major Sydney newspaper.

an abjuring of paternalism (a rejection of the idea that cultural exchanges with non-Western cultures represent a Western ‘advocacy’ of that culture).²³

Cultural Exchange, the Diversity Paradigm and the Australian Orchestral Repertoire

On the basis of demographics,²⁴ the continued emerging of India and China as economic superpowers (and the changing flow of cultural information that will inevitably stem from this), and the continued reality of mass communication, multicultural Australia will continue to be a hub of an ongoing multi-faceted cultural exchange. As this exchange unfolds, the diversity paradigm, along with the issues of authority and identity that have so far shaped the discourse surrounding new Australian art music will need to make way for more appropriate modes of understanding if the products of this exchange are to be more effectively understood. However, before new modes of understanding can be established, the implications of the prevailing modes must be more fully realised. A thoroughly under-researched issue is the effect the discourse surrounding Australian art music has had on the music itself. An analysis of the Australian orchestral repertoire since 1970 reveals that something akin to the ‘observer effect’ is at play with regard to the interaction between the discourse and the repertoire.

The following tables represent a possible avenue of research that stands apart from the processes employed by musicologists espousing the diversity paradigm. The Australian Music Centre (AMC) maintains a database of Australian compositions. It is a peer reviewed catalogue of compositions in the sense that an artist must be recognised as a functioning professional or semi-professional composer whose work is, at the very least, ‘published’ through performance: it is not a self-selecting mechanism. The database contains basic information about registered works including the title, the name of the composer, the type of ensemble employed by the piece, the length of the work (for the majority of entries), and a composer-determined level of difficulty (in a minority of entries only). A close analysis of the database reveals some problems with data collection: single works are occasionally listed under multiple titles and some composition durations do not match corroborating sources such as composers’ online work lists and the records of performing bodies and classical music broadcasters. In addition, the database does not represent a ‘census’ of all Australian art-music activity. However, the database is large enough that, after culling duplicate references, it can provide an over-view of Australian art music that is not filtered through the ‘list selection’ process of an individual academic and has the potential to form the basis of analysis that meaningfully tracks composer behaviour.

Table 1
 Australian Orchestral Compositions Registered with the AMC Since 1970 by Decade.²⁵

Decade	Number of Compositions
1970-1979	188
1980-1989	378
1990-1999	499
2000-2009	471
Total	1536

²³ Lim 17.

²⁴ Recent Australian government forecasts indicate that the population of Australia will grow primarily as a result of immigration. Much of this immigration will stem from the Sub-continent and South-East Asia. 2 April 2010, <<http://www.abs.gov.au/Ausstats/abs@.nsf/mf/3222.0>>.

²⁵ In calculating these figures, duplicate references to compositions have been culled.

Source: 20 March 2010 <http://www.australianmusiccentre.com.au>

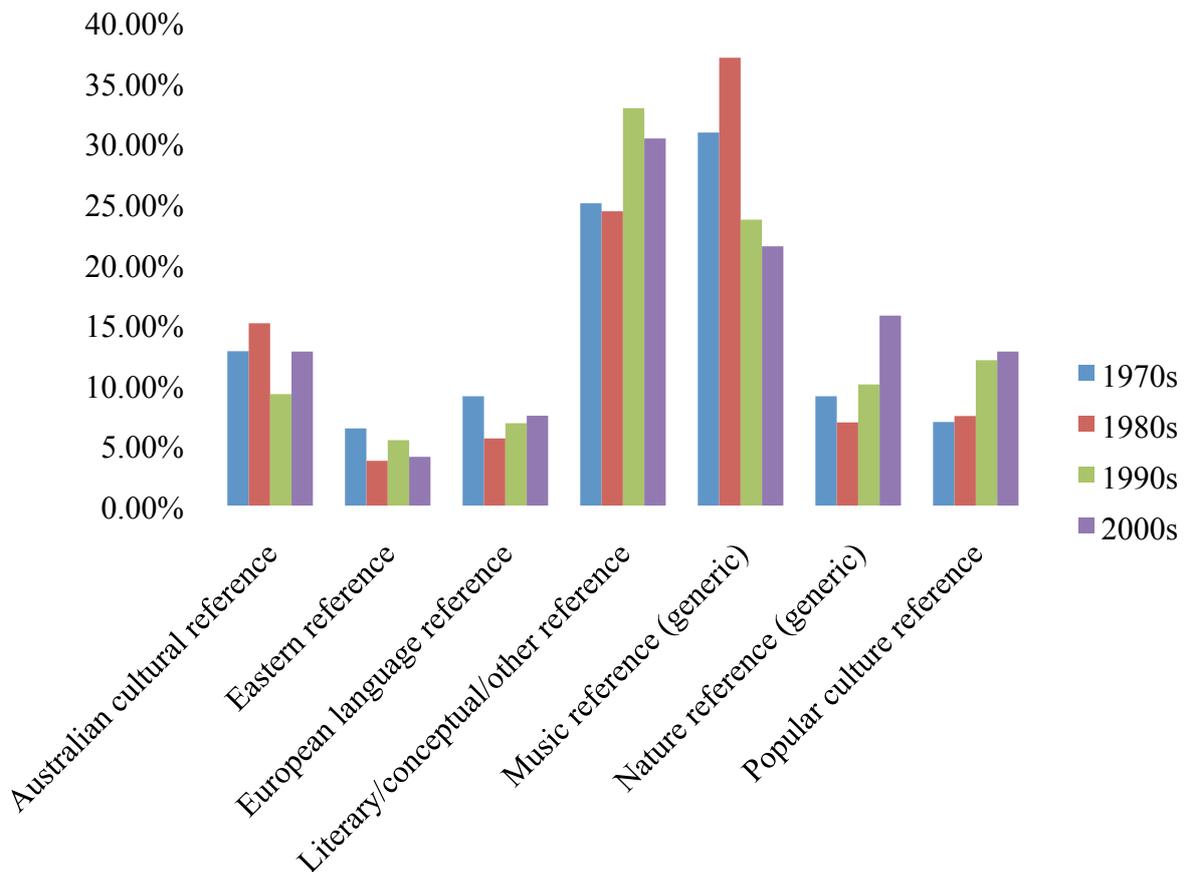

While a detailed consideration of the specific music of this repertoire is beyond the scope of this paper, an analysis of the titles that composers have selected for their compositions over this period reveals particular patterns of behaviour. The titles that composers give to their music are telling: they reveal how a composer seeks to position his or her work in a given tradition; they can indicate patterns of influence that inform the work; and changing tendencies in the choice of titles over a large, self-contained repertoire (such as the 1536 works indicated in Table 1) reveals how composers respond to the discourse that surrounds their work. Table 2 shows the divisions constructed for this paper to analyse the work titles contained in the orchestral repertoire.

Table 2
 Categorical Division of Composition Titles

Category	Definition	Examples
Australian cultural reference	Includes Australian geographical references; Indigenous language references; and unambiguous references to Australian history.	<i>Convict Dreams of England</i> by Katy Abbott (2000); <i>Kosciuszko</i> by Stuart Greenbaum (2006) (Australia's tallest mountain)
Eastern reference	Includes references to a variety of Eastern cultures such as Indian classical music, Chinese folk song, Balinese Gamelan etc.	<i>Concerto on Chinese Themes</i> by Julian Yu (2002); <i>Puppet play in Java</i> by Betty Beath (2009)
European language reference	Includes titles that employ languages other than English or Australian Indigenous languages; primarily Latin, French, German and Spanish.	<i>L'assaut sur la raison</i> by Andrián Pertout (2003); <i>A luta continua</i> by Martin Wesley-Smith (2005)
Literary/ Conceptual /other reference	Includes references to classical and other Western literature, broad philosophical concepts, and references to a composer's personal circumstances.	<i>Prometheus and Pandora</i> by Lee Bracegirdle (2004); <i>Parallel Universes</i> by Colin Bright (2005); <i>Iluka</i> by Tony Gould (2007) (the composer's daughter).
Music reference (generic)	Includes references to established music- genre titles.	<i>Romance for Flute and Orchestra</i> by Ann Carr-Boyd (2002); <i>Toccata for Orchestra</i> by Michael Knopf (2003)
Nature reference (generic)	Includes generic references to environments (landscapes, oceans, mountains, stars, moon) and animals etc. that are not related to a specific culture.	<i>Wild Swans Suite</i> by Elena Kats-Chernin (2004); <i>Storm Clouds</i> by Robert Allworth (2006)
Popular culture reference	Includes references to popular music and culture; references to contemporary events; and titles that contain ironic references to contemporary modes of communication.	<i>Headbanger</i> by Matthew Hindson (2001); <i>Rhythmania-groove-train</i> by Katy Abbott (2005)

These categories are merely one lens through which the orchestral repertoire can be examined: they can be further divided for an even more focussed examination of subtypes, or different categories could be constructed to reveal other patterns. Furthermore, some works can be placed in multiple categories.²⁶ These overlaps typically involve the generic music reference category and, as a general rule, where other another category is appropriate, it displaces the generic music category. Table 3 shows the results of an analysis undertaken for this paper as to how different title categories have been preferred by Australian composers between 1970 and 2009.

Table 3
 Changing Patterns of Title Selection in the Australian Orchestral Repertoire 1970-2009²⁷

While a variety of theories can be posited to account for these changes in composer behaviour, the data here can be meaningfully linked firstly to issues current in the discourse that surrounds Australian new music and secondly to broader social issues. These observations are ordered according to the size of the trend observed.

- 1) Music references (generic): The sizable reduction from the 1980s to the 2000s may be indicative of Australian composers trying to make their compositions stand out in a cultural environment where there are few performance opportunities for orchestral

²⁶ For example: Julian Yu's *Concerto on Chinese Themes*.

²⁷ Note that increments of a decade have been used in recognition of the fact that the dates listed for a composition are sometimes unreliable: the data does not make a clear distinction between the date of composition, the date of performance and the date the piece was listed with the AMC. Division by decade mitigates, but does not remove this problem.

music. It may also indicate the diminishing hold that traditional European genres have on new art music more broadly.

- 2) Popular culture references: This increasing trend is likely the result of aspects of Postmodernism, specifically the rehabilitation of popular music as 'legitimate' musical expression, filtering through to compositional practice.
- 3) Nature references (generic): The significant increase in generic nature references from the 1990s to the 2000s may be the result of a growing social awareness of issues related to climate change, environmental degradation and the Australian drought of 1997 to 2009.
- 4) Australian cultural references: while no reduction in the proportion of composers electing to use Australian cultural references can be detected from 1970s to the 2000s, the slight increase in the 1980s may be as a response to the Bicentennial celebrations of 1988 and the significant drop in the 1990s may be a response to a particularly vitriolic period of debate that academics, including Toop, have referred to as the 'style wars.'²⁸ The lambasting of repertoire that sought to establish an Australian cultural identity through reference to Indigenous Language and Australian flora and fauna possibly resulted in composers, at least for a time, shying away from such overt references.
- 5) Literary/conceptual/other reference: Being a mixed category that takes in a range of references that do not comfortably fit elsewhere, it is difficult to make a meaningful interpretation of the increasing trend present in this category. One possible explanation is that the increase has come about as a result of the vacuum created by composers eschewing generic music references in their titles.
- 6) Eastern references: the relatively small proportion of the cohort employing Eastern references makes the tracking of a trend in this category inappropriate. It should be noted that the relatively small proportion of the cohort making overt references to Eastern culture in composition titles is not indicative of low levels of cultural exchange. For example, the work of Julian Yu is indelibly linked to Chinese musical culture, yet many of his titles employ generic music references.
- 7) European language references: the sizable drop from the 1970s to the 1980s may be a displacement caused as a response to the increased number of Australian cultural references related to the Bicentennial.

Culture Exchange in 21st-Century Australian Art Music: New Modes of Understanding

In seeking to move beyond a diversity paradigm to an active engagement with the products of cultural exchange in Australian art music, this paper will posit two possible modes of understanding recent examples of cultural exchange.

- 1) Proliferation of cultural material as the instigator of exchange

As cultures interact, over time, musical materials find new contexts and inevitably develop along trajectories dislocated from their original setting. For example, in Timothy McKenry's²⁹ orchestral piece *Determined Seasons* (2000), the composer uses a melody from a nondescript music box found some years earlier in his grandfather's garage as the basis of an orchestral fantasia. His grandfather had just died and the melody became a signifier of grief for the composer. *Determined Seasons* is a musical essay in grief and won a composition competition run by the Palliative Care Association of Australia and was

²⁸ Toop 42.

²⁹ The author of this paper.

overtones that accompany the phenomenon of composers such as Sculthorpe and Conyngham ‘journeying’ to Asia to ‘discover’ eastern music. The work of composers such as Julian Yu, Liza Lim and Andrián Pertout represents a cultural exchange that is an organic part of multiculturalism, rather than merely a grafted adornment.

In Yu’s orchestral work *Chinatown* (2004),³² the composer employs a musical language that, while continually alluding to Chinese folk music, acts as a commentary on the presence of Chinese culture in Australia since the gold rush of the 1850s. The piece begins with simple diatonic structures that become increasingly florid; likely a metaphor for the blossoming of Chinese culture within Australia over the past 160 years. In addition to allusions to Chinese folk music, Yu employs a process of additive melodic development that is based on pedagogical methods associated with the learning of Chinese folk music.³³ These are highlighted in example 2.

'Cello, bars 1-7

'Cello, bars 78-80

Additive melodic development

- (a) Descending structural interval
- (b) Variation on ascending gesture
- (c) Filling in of melodic contour
- (d) Embellishment of descending line

Ex. 2. Julian Yu, *Chinatown*, additive melodic development.

The piece is ultimately a commentary on an aspect of Australian culture that represents a cultural exchange that has already occurred and continues to occur, not a contemporary appropriation of Eastern material.

Andrián Pertout, a composer who has lived in Melbourne from the age of nine, draws on a diverse range of cultural elements in his music including South-Indian ‘Carnatic’ classical music, Croatian folk music, models of intonation drawn from the Japanese ‘In’ scale and Iranian classical music.³⁴ All of these repertoires and practices are found in Melbourne – they are not the result of appropriation, they are simply an example of a composer interacting with the culture of his city. In Lim’s *Flying Banner* (2005),³⁵ the composer relates diverse

³² This work is the product of a commission by the Australian Pro Arte Orchestra with assistance from the national arts-funding organisation, The Australia Council. *Chinatown* went on to receive multiple performances, including a performance by the community group, Fishers Ghost Youth Orchestra in 2006.

Violin 1

f *mf* *f* *ff* *f* *ff*

Ex. 3. Liza Lim, *Flying Banner*, bars 131-133, Horn 1/2 and Violin 1.

The convergences that are revealed in these composers' works need to be understood not as isolated examples of a 'compositional Diaspora' operating within Australian borders, but as a product of Australian multicultural society. The diversity paradigm can too easily function to segment Australian musical culture and marginalise composers such as Yu, Pertout and Lim as the 'other' in Australian composition.

Conclusion

In examining the discourse surrounding Australian art music, it can be observed that the debate surrounding issues of authority and identity in Australian music has led to academics employing a 'diversity paradigm' to understand the products of cultural exchange. This paradigm becomes a self-sustaining mechanism as academics construct narratives that do not investigate large repertoires of music, but select isolated examples that act as evidence of diversity. This paper suggests an alternative mode of research that might better understand Australian music making and provides an exemplar of this through an analysis of composer behaviour in the selection of work titles. The paper also highlights how the debate surrounding issues of cultural exchange in Australian music has resulted in an emerging ethical framework that can work to inform how composers interact with other cultures. Finally, the paper identifies the limitations of the diversity paradigm in understanding the cultural and stylistic convergences that are occurring in twenty-first century Australian art music, and posits two alternative modes of understanding this phenomenon. The paper suggests opportunities for further research through a more detailed examination of various repertoires and the development of other targeted modes of understanding the products of cultural convergence and exchange.

This research will outline the experimental music in Asia during the past forty years. It will explore some important figures, works and techniques which have not previously been investigated or discussed, using existing examples and cases in the last four decades. There will be a review of the secondary literature that has informed this research project. Some contemporary musicians use computer to create and compose their music, which shows the variety of music can be performed or heard in a new way. This period has seen great exploration of the sonic capabilities of the music, and has increased demands on players faced with unfamiliar technical requirements. This research will consider:

- 1.1 Historical background, and
- 1.2 Literature review
- 1.3 Rationale of this research

1.1 Historical background

Current contemporary art music covers a rich variety of approaches styles and processes. These categories can be approximately classified under the following headings:

- conventional neo-Romantic writing
- minimalism
- modernism
- the integration of elements of non-western music, popular music
- indeterminism,
- computer music,
- computer music
- electronic music
- ambient music, and
- an ongoing development of an interface with modern technology.

Experimental or avant-garde music of the last four decades has vastly increased the range of techniques and possibilities for today's composers and also has expanded and/or modified the conventions of music notation. Composers to whose works I will refer are:

- Theodore Antoniou (b.1935)
- Luciano Berio (1925-2003)
- John Cage (1912-1992)
- Elliott Carter (b.1908)
- George Crumb (b.1929)

The use of new technology for violin after 1960

Ang-Cheng Kris Ho

UIC

- Pascal Dusapin (b.1955)
- Franco Donatoni (1927-2000)
- Brian Ferneyhough (b.1943)
- Philip Glass (b.1937)
- Aram Khachaturian (1903-1978)
- Helmut Lachemann (b.1935)
- Hans Ulrich Lehmann (b.1937)
- Luigi Nono (1924-1990)
- Krzysztof Penderecki (b.1933)
- Larry Polansky (b.1954)
- Gunther Schuller (b.1925)
- Toru Takemitsu (b. 1930), and
- Iannis Xenakis (1922-2001).

The relationship between the composer and performer of experimental music is often very close. Frequently, the composer is involved in directing or participating in the performance of his/her composition. Some composers, for example, Phillip Glass (b.1937) and Steve Reich (b.1936), have formed ensembles for the express purpose of performing their own works, perhaps implying the difficulties the contemporary composer may encounter in having new works performed.

Luciano Berio (1925-2003)

A great deal of the music written in the twentieth and twenty-first century was composed for and dedicated to outstanding performers, hopefully ensuring or at least providing for a premiere of a new work. Berio's *Sequenza* series provides an example of this. As indicated on the score, each *Sequenza* has been dedicated to a specific performer: *Sequenza III* for voice was written in 1965 for Cathy Berberian¹ and *Sequenza VII* for oboe was written in 1969 for Heinz Holliger.² Many contemporary composers of experimental music work closely with the intended performer during the period of composition. This collaboration is mutually beneficial, enabling the composer to refine his/her work based on feedback from the performer. At the same time, the composer can discuss with the performer the precise effects which he/she has in mind. Live or recorded performances approved or directed by the composer are more likely to give a much clearer indication of musical intention than the published score on its own. This also ensures a more direct line of communication between the composer and his/her audience.

Interface with Modern Technology

Since 1960 there has been an increase in the exploration and use of the violin's incredible ability to create and imitate an extensive variety of sounds. The innovative works from this period, such as George Crumb's *Black Angels: Thirteen Images from the Dark Land* (1970), make technical demands on the performer resulting in the production of sounds that

¹ Cathy Berberian (1925-1983), first wife of Berio, American mezzo soprano, specialist in modern music.

² Heinz Holliger (b.1939), Swiss composer, oboist, conductor, and pianist.

The use of new technology for violin after 1960

Ang-Cheng Kris Ho

UIC

would have been considered unmusical in earlier times. Nevertheless, there has been a continuity of technical development, built on knowledge of the violin's traditional capabilities. *Sequenza VIII* (1976) by Luciano Berio (1925-2003) was inspired by the Chaconne of the Partita in D minor (BWV1004) by Johann Sebastian Bach (1685-1750).³ Even though *Sequenza VIII* (1976) produces vastly different sounds from those of Bach's Chaconne, Berio has borrowed and expanded upon the musical ideas and intentions of Bach.⁴ A new translation of traditional ideas has been a major feature of the musical revolution of experimentalism which has evolved through the last quarter of the twentieth-century. The use of non-conventional instruments, the non-conventional use of traditional instruments, use of amplification and a range of modifications to the instrument have challenged the listener and have achieved a degree of acceptance of such avant-garde music.

New York School

The shift from conventional to non-conventional was sometimes dramatic, as Erik Satie (1866-1925) has demonstrated. Satie's landmark indeterminate piece *Vexations* (1893) has made a significant contribution to redefining the nature of musical communication. His twenty-four hour marathon work for piano was an historic precursor to the work of minimalist composers such as John Cage (1922-1992), Morton Feldman (1926-1987),⁵ and Cage's associates David Tudor (1926-1996), and Earle Brown (1926-2002).⁶ These composers have been strongly influenced by Satie's breaking of convention. Cage explored the possibilities of indeterminism using a very broad range of musical strategies⁷ including, for example, *I-Ching* charts,⁸ and random numbers.⁹ Feldman's piece *For John Cage* (1982),¹⁰ for example, distorts our expectation of musical duration. Like many of his works it has been written using an extended time scale, demanding at least one and a half hours for only one movement.¹¹

The use of new technology for violin after 1960
Ang-Cheng Kris Ho
UIC

L'Institut de Recherche et Coordination Acoustique/Musique (IRCAM)

L'IRCAM (*L'Institut de Recherche et Coordination Acoustique/Musique*) is the European counterpart to The New York School. This institution is possibly the most distinguished one specialising in electronic and computer music.¹² It was established in Paris under Boulez's directorship in 1974.¹³ Pierre Boulez (b.1925), Karlheinz Stockhausen (b.1928) and Iannis Xenakis (1922-2002) were leading musicians of electro-acoustic musical innovation from this institution.

Both Stockhausen and Boulez used indeterminate ideas to focus on electronic components or concepts which can be seen in their later works. Stockhausen and Boulez have composed only a few pieces of violin music, but these works clearly exemplify how they use computers, electro-acoustics, and the concept of chance, in their compositions. Examples of these compositional devices and performance approaches are illustrated in Stockhausen's *In Freundschaft* (1977)¹⁴ and Boulez's solo violin piece *Anthèmes 2: pour Violon et Dispositif Électronique* (1997).¹⁵

Minimalism

The use of electronic composition has been a formative component of the subsequent minimalist movement. La Monte Young's *Composition 1960 No.5* (1960)¹⁶ defined minimalism and influenced future composers such as Terry Riley (b.1935), Steve Reich (b.1936), and Philip Glass (b.1937).¹⁷ Riley's *In C* can be played by various combinations of instruments and the length of the piece is determined by performers.¹⁸ Reich's *Violin Phase* (1967) requires the performer to play with a pre-recorded tape with an assistant on the stage in the live performance.¹⁹ Glass indicates the performer has to walk along the "L" shape of the music exhibited while performing *Strung Out*.²⁰ All of these are

The use of new technology for violin after 1960

Ang-Cheng Kris Ho

UIC

examples of minimalism combined with aleatoric style.

1.2 Literature review

Although there have been a number of publications which address technical demands on violinists in avant-garde music, investigation has not been comprehensive. This literature survey will focus on music for violin composed between 1960 and 2006, and on publications which have analysed technical requirements for the performance of these compositions. During this period, compositional notation using symbols and specially devised terminology is not entirely standardised. Different composers create and define their ideas in different ways.

Patricia Strange and Allen Strange's *The Contemporary Violin: Extended Performance Techniques* published in 2001²¹ is an exploration of contemporary violin music, with numerous examples of recent music. The book discusses a number of bowing and fingering techniques including extended techniques such as percussive sound production and diverse *harmonics*. It also refers to alternative tuning systems, amplification and signal processing, and concludes with MIDI²² and computer techniques. The authors have included a list of Internet resources which provide the reader with a guide to current developments in performance practice and composition of contemporary music. Included in this publication are more than 475 explicit examples from published and private manuscripts, extensive scores, a very useful bibliography and a discography which lists more than 130 recordings. Although the publication gives a large number of musical examples, as well as notes on modifications of the violin and the application of technology to violin performance, it does not make reference to significant compositions by some well-known composers such as *Sonate-Monolog for Solo Violin* (1975) by Aram Khachaturian (1903-1978) and *Sequenza VIII* (1976) by Luciano Berio (1925-2003).

A useful reference for teachers and students is the 1992 edition of Jacques Ghestem's *Approche de la Musique Contemporaine au Violon*,²³ which comprises two separate documents. A three-page technical synopsis *inventaire et notations* constitutes the first half of the first volume of this guide. It illustrates symbols and their abbreviations as well as left and right hand techniques followed by brief explanations.²⁴ The second half of the first volume of *théorie et pratiques* documents the use of theoretical and practical ideas. It demonstrates several left and right hand techniques individually followed by effective exercises to assist

[%3Fq%3D%2522strung%2Bout...>](#) [25 March 2010].

UIC

the learning process.²⁵ The last page of volume one of *Approche de la Musique Contemporaine au Violon* contains *tableau synoptique*, which shows various technical applications as utilised by ten different composers in their compositions. The learner may focus on these technical requirements before attempting to learn any of the works comprised in the second volume. The second volume is *oeuvres*, which contains ten short violin pieces by ten different contemporary composers. These ten short pieces present different technical challenges to solo performers as well as to ensembles. Nevertheless, in this publication technical requirements, interpretation and musical expression only are addressed in a general way.²⁶

Anthony Thomas Adessa's dissertation "Contemporary Violin Technique: Its Nature and Difficulties" (1981)²⁷ examines selected twentieth-century works including Bartók's Violin Concerto No.2 (1937-8), Schönberg's Violin Concerto (1936), Henze's Violin Concerto No.2 (1951), Feldman's *Projection 4* (1951), Maderna's *Widmung* (1967), and Xenakis's *Mikka* (1971). It provides their cultural contexts and Adessa's viewpoints of musical interpretation and discussion of efficient practice and preparation. The last chapter of Adessa's thesis is a transcript of an interview with Paul Zukofsky,²⁸ who is well regarded for his insightful comments on performance practice of contemporary music. However, the previous discussion does not include Zukofsky's performance advice.

Kenneth Lee Sarch's dissertation "The Twentieth Century Violin: A Treatise on Contemporary Violin Technique" (1982)²⁹ can be considered as a handbook of contemporary violin techniques for string players (in particular violinists), as well as teachers, composers, conductors and students. It is divided into four broad categories which enable the student to easily comprehend specific techniques including the use of different types of mutes. Musical examples in this dissertation are derived from a wide range of exercises, concertos, chamber music and compositions for solo violin.

The use of new technology for violin after 1960

Ang-Cheng Kris Ho

UIC

Ernest Pereira's dissertation "Twentieth-Century Violin Technique" (1987)³⁰ provides an overview of the history of musical development from the nineteenth to the twentieth century with reference to the emergence of the first form of the violin in the ninth century. He discusses violin playing only from the time of Mozart with emphasis on twentieth-century violin playing techniques and on exponents such as Otakar Ševčík (1852-1934), Carl Flesch (1873-1944) and Ivan Galamian (1903-1981). It also includes discussions of twentieth-century violin compositions by well-known composers including Ravel, Debussy, Ysaÿe, Schönberg, Webern, Bozay, Prokofiev, Stravinsky and Bartók.³¹ The major research focus is on the left hand technique required to perform works by these composers. It also includes discussion on specific bowing requirements for twentieth-century violin music.³²

Barbara G. Jackson, Kenneth Sarch and Joel Berman compiled *Dictionary of Bowing and Pizzicato Terms*³³ published in 1999. It discusses most twentieth-century violin techniques and provides comprehensive explanations and musical examples. In *Standard Bowing Terms*, the three authors have catalogued diverse musical terms in different languages including French, German, Italian, Spanish and English. The authors have provided a brief historical background, definitions, explanations and some excerpts as examples. The chapter *Petite Dictionary of Pizzicato* written by Kenneth Sarch is the section of the publication which is most useful to performers. It includes several photographs of a violinist demonstrating specific techniques.³⁴

Kurt Stone's *Music Notation in the Twentieth Century*³⁵ gives a general overview of the new notation and techniques utilised in twentieth-century music for different instruments. It is divided into two comprehensive parts: Part I: Basic Procedures and Part II: Specific Notation. Each part contains definitions of symbols, plus explanations of the use of symbols in music for different instruments. It can be used as a manual for understanding and interpreting twentieth-century musical notation. However, this book was printed in 1980 and has not been updated thus far. Neither a number of newly invented symbols (for example, *finger percussive sounds*), nor compositions from the last twenty years have, as yet, been discussed.

The use of new technology for violin after 1960

Ang-Cheng Kris Ho

UIC

*Culture*³⁶ (2008) gives a brief outline of music technology history and important composers and their compositions, technological innovations and musical concepts from European to Asian studios; compositional skills used in various equipments; and *music concrete* to Tuntablism³⁷. The range of musical style is between modern music and popular music. It has four parts: Early History – Predecessors and Pioneers (1874 to 1960); Analog Synthesis and Instruments; Digital Synthesis and Computer Music; and The Music. This book has given comprehensive direction in the preface and related sources including diagrams, key points and examples of utilising equipments. It provides easy access to get knowledge of electronic and experimental music from 1874 to today. It also comprises a list of examples with a small number of notations. However, it might be complicated to use this book without fundamental understanding of utilising computer and softwares.

1.3 Rational of this research

The rationale for this research is based on the use of music technology on the violin. I intend to examine existing publications and musical works cited and written for the violin after 1960 including specific technical requirements, and interpretation and musical expression.

The tradition of violin music is expanded by the application of new technology in the last fifty years. This greatly increases possibilities for adventurous performance and presentation. The violinist may choose to accompany him/herself in a public performance or could choose to play in different types of venue. Minimalist composers and members of L'IRCAM employ computer and new technology in their works and require the performer to play in an unorthodox way or in an unusual venue. For example, *Toccatina* (1986) by Helmut Lachenmann (b.1935) requires the violinist to hit the strings with the screw of the bow. The application of new technology also gives the audience different audio-visual experiences. In *Ashes of the Glacial Crescent for Amplified Violin* (2004) by Dr Hing-Yan Chan, for example, the composer indicates that the violinist has to perform outside the concert hall, with the concert hall lights turned off and with the sound of the violin amplified. The new technology compels the violinist to focus on the sound production more because the sound will not be delivered directly from the violin. Because of the use of technology such as the amplification attached to the instrument, the violin sound will not be heard in its natural purity. The violinist also has to focus more on the quality of the final sound. Whether the violin is expensive or not, sound might lose some of its quality because of the use of this technology.

This outcome of this research will show an overview of violin techniques in the twentieth

³⁶ Thom Holmes, *Electronic and Experimental music: Technology, Music and Culture*, 4th ed. (New York: Routledge, 2008).

³⁷ is the art of manipulating sounds and creating music using phonograph turntables or digital turntables and a DJ mixer.

The use of new technology for violin after 1960

Ang-Cheng Kris Ho

UIC

and twenty-first centuries through an examination of a number of works for violin. It demonstrates that these works are not strange, incomprehensible or unplayable. Today's performer has to discover the meaning of these works and to solve performance problems without the benefit of having heard the works performed by anyone else. Therefore, every performance is very personal and unique. The violinist is called upon to demonstrate his/her ability to understand the music, to display his/her command of performance skills and to convey the expression of the music. The music of this period provides a great opportunity for the violinist to demonstrate his/her understanding of new works. This challenge is demanding, adventurous and exciting.

To sum up, violinists should appreciate the art of contemporary violin music at present. Violinists should aim to include contemporary compositions written by Asian composers in their performance repertoire and study. Inclusion of such works in the performance repertoire will make the concert program more interesting and exciting. The art of contemporary violin music gives greater liberty to performers and it may broaden the audience's horizon. There are still a number of solo violin works composed after 1960 that have not yet been explored, particularly in Asian countries. They deserve to be performed and to become the subject of future analysis.

Asian Music in Puccini's Operas: An analytical study of *Turandot's* and *Madama Butterfly's* music

ABSTRACT:

Puccini's music is a reflection of his powerful inner impulse. His numinous combination of fashionable romanticism, *diabolus in musica*, Asian folk and pentatonic inventions awakes both trust and beauty. Adhering more empathically to the musical phenomenon, the listener grasps the tale conveyed, believing in its characters. A foretaste of the tragic consciousness of the heroines is first expressed musically. *Mo-li-hua*, *Echigo-Jishi*, *Miyasan*, *Sakura*, *Kimigayo* are among the Asian songs embodied in the rich Puccinian architecture. As the scent reflects the feeling of the flower, Puccini's music reveals the sentiment of the human heart, which, in the end, discovers its inconceivable power. Twenty years after writing *Madama Butterfly*, "the most felt and suggestive opera I have ever conceived" Puccini breaks new artistic grounds leaving unfinished one of his most frequently performed works of our time: *Turandot*. It is not only Love and Death that form fundamental elements in both Puccini's plots, but the Ethical Power of the Spirit.

My presentation will convey audio -visually the Asian melodies used by the composer in his two operas showing how they shape the musical design, how they embody the characters and the text and ultimately how they contribute to the success of the two operas.

Dr. Mihaela Buhaiciuc

Asian Music in Puccini's operas:
An analytical study of *Turandot's* and *Madama Butterfly's* music

Among the twelve Puccini's operas, *Madama Butterfly* (1904) and *Turandot* (1924) hold a distinctive place. Despite its disastrous première, *Madama Butterfly* represents today one of the most successful artwork inspired by Japan while *Turandot* symbolizes the last Italian standard opera and the end of the Great Tradition. Premiered at *La Scala*, both operas depict Love and Death for Love as fundamental elements integrated in the Ethical Power of the Spirit.

The 15-year-old geisha, Cio-Cio-San sells herself to a foreigner, Pinkerton, from the US Naval Army, whose posting is only temporary in Nagasaki. Unexpectedly, she falls in love with him at first sight; she gives up her ancestral faith becoming a Christian, and follows Pinkerton blindly and faithfully as wife. Her uncle, a Buddhist priest, curses her at the wedding ceremonies. When his time expires in Nagasaki, Pinkerton abandons Cio-Cio-San and returns to the US. Immediately after his departure, Cio-Cio-San has his son. After waiting three years for Pinkerton's return, her hopes melt away. She learns the truth and her despaired consciousness forces her to commit seppuku. Without honor, her existence is no longer justified.

Puccini's opera is inspired by a play that the composer saw in London in 1900, by the American playwright David Belasco who dramatized the story of John Luther Long *Madame Butterfly* (1898). Puccini was also aware of *Madame Chrysanthème* (1887), a well-known autobiographical novel by French naval officer Pierre Loti, who unlike Belasco and Long had actually lived in Japan.

Twenty years after writing *Madama Butterfly*, "the most felt and suggestive opera I have ever conceived" Puccini breaks new artistic grounds leaving unfinished one of his most frequently performed works of our time: *Turandot*.

Turandot's libretto originates in Carlo Gozzi's play: *Turandot*. Published in 1761, the play incorporates characteristics of traditional *commedia dell'arte* (the masks) combined with fantastic elements. Based on an Oriental folk story, it is recognized as Gozzi's masterwork. The five-act structure of Gozzi's play offered the composer a complex set of actions, in which the spectator is kept in successive states of suspense.

The icy Oriental princess, Turandot, the daughter of Turan, enjoys the torture and elimination of her unsuccessful suitors who fail to answer her riddles until one day, when an unknown prince, Calaf, the son of Timur provides the answers. In trying to avoid keeping her promise to marry him, she will accept Prince's confrontation: by dawn, she must find out his name. On a secondary plan, Puccini develops another female character the Chinese slave, Liù, who kills herself to protect the name of her secret lover: Calaf. The forces of being and the reason of loving of the Imperial couple, Calaf-Turandot, may magnetize and repel us at the same time.

Gozzi's intention in his play is to portray an ultra-feminist heroine who becomes a threat to the society. The female insubordination allowed by a weak man, her father, will cause a social disorder

that is almost impossible to rectify. Despite her behavior, Gozzi's heroine is wise and indescribably beautiful. Yet, for Gozzi she is a negative female at the border between reality and fantasy. By answering the riddles Calaf re-establishes social order. Setting *Turandot* to music, Puccini creates an invincible woman whose cold heart discovers "love", through torture and fear.

Puccini's music is a reflection of his powerful inner impulse. His numinous combination of fashionable romanticism, *diabolus in musica*, Asian folk and pentatonic inventions awakes both trust and beauty. A foretaste of the tragic consciousness of the heroines is first expressed musically. The Asian tunes are framed in the rich Puccinian architecture-labeling characters, emotions or situations and ultimately conferring the *couleur locale* along with the composers' own pentatonic inventions.

Puccini searched for authentic sources for his two Asian representations. Three of his Chinese melodies are taken from Baron Fassini Camossi's music box, a former diplomat in China whom he visited in 1920 in Bagni di Lucca. Four other authentic tunes used in *Turandot* were taken from J. A. van Aalst's book *Chinese Music* (Shanghai, 1884) sent to him by Carlo Clausetti in June of 1921. Two of the significant Japanese sources are the collections of songs: *Japanese Popular Music, A Collection of the Popular Music of Japan Rendered in to the Staff Notation* by Nagai, Y. and Kobatake, K., (Osaka, 1892) and *Nippon Gakufu ("Six Japanese Popular Songs collected and arranged for the Pianoforte")* by Dittrich Rudolf, (Leipzig, 1894, 1895). Before starting his work on *Madama Butterfly* Puccini consulted Kawakami Sadayakko, a Japanese actress performing in Milan in 1902 and, later that year, Mrs. Ōyama Hisako, the Japanese Minister's wife in Rome, who sung for him several folk tunes. He heard Debussy's *Pellèas et Mélisande* and studied Sullivan's *The Mikado* (1885) found in the library at Torre del Lago.

The two charts illustrated in appendixes A and B explain the distribution of the musical language per each character trying to offer a visual comparison between *Chinoiserie* and *Japonaiserie* used in *Turandot* and *Madama Butterfly*. The percentage of use of different *tinte* in the two operas depends on the number of characters, their background and psychological development. Whether authentic or invented, Puccini's *Chinoiserie* is incorporated into a stronger dissonant harmonic spectrum than his *Japonaiserie*, (see Appendix 3) dissonant *tinta* being associated with *Turandot* and her cruelty.

As the scent reflects the feeling of the flower, Puccini's music reveals the sentiment of the human heart, which, in the end, discovers its inconceivable power. Adhering more empathically to the musical phenomenon, the listener grasps the tale conveyed, believing in its characters.

Cio-Cio-San's psychological journey in the opera takes place in the course of three years changing from a 15 year old geisha mind and happy bride to an 18 year old mother, betrayed wife, in search for her spiritual identity. Her withdrawal from this existential suffering is with honor- in Japanese manner- committing seppuku. *Turandot*'s psychology changes in less than 24 hours from an unrealistic, invincible, powerful beauty with super natural control into a beautiful in love humanized woman. Both, Cio-Cio-San and *Turandot* throughout the opera move from one emotional level to the extreme opposite one changing worlds, realities and believes. Although Cio-Cio-San's story in the opera is, outside of the musical context, perhaps more credible (at least to a non-Japanese audience), *Turandot*'s tale is definitely science fiction. It is Puccini's incredible talent for melody and his unequalled compositional skill and style that make us question: "How real is this story?" Subsequently, the composers' representations of the two Asian worlds become intriguing.

The night, a Romantic emblem of Europe of the 19th century, activates anxiety in both Cio-Cio-San and *Turandot*, keeping them awake. The psychological tension is not released but amplified. There's

no realistic turn toward the world until the dawn arrives, when reality shocks both characters. In both situations, Puccini consciously emerges the force of darkness from the tension between knowing the truth and believing the dream.

Both operas spread rapidly after their premières in most of the opera houses around the world except Japan and China. Due to symbolism that they may entail and despite the astonishing music, *Madama Butterfly* and *Turandot* had to wait decades before they were introduced to their respective audience. The first complete production of *Madama Butterfly* in Japan took place 32 years after its Milan première, in 1936 with Miura Tamaki as Cio-Cio-San at the Tokyo Kabukiza. The performance of *Turandot* was forbidden in China for more than 60 years (until the 1990's) considered being an unfavorable portrayal of the country and its people. In 1998 an international collaboration between director Zhang Yimou, conductor Zubin Mehta, producer Michael Ecker, the People's Liberation Army brought *Turandot* for eight nights to the Forbidden City. In the Olympic year of 2008, commemorating 150 years from Puccini's birth, Beijing puts on stage a Chinese *Turandot* with a different ending (than Alfano's) written at request by the young composer Hao Weiya. According to Andrew Moravcsik (Opera News) the new Finale music, irrelevant stylistically, sent out to the world Beijing's doctrine of a *harmonious world*, *Turandot* -the opera- becoming China's operatic symbol. According to Jan van Rij, -a former lawyer and European Union senior diplomat in Tokyo, the author of *Japonisme, Puccini and the search for the real Cho-Cho-San* "the original *Madama Butterfly* today still meets limited enthusiasm in Japan and continues to be deviated in various directions" mainly due to "lack of realism of the heroine and her lopsided logic". (Thus, how realistic is *Turandot's* logic? -one may ask.)

Even though the genesis of *Turandot* and *Madama Butterfly* may relate to a less congruent historical time in the encounter of the Western and Eastern cultures, their importance today lies purely in the value of their art: unequalled musical invention, dramatic intensity and character conveyor. Unlike Busoni's *Turandot*, Bazzini's *Turanda*, Mascagni's *Iris* or Messenger's *Madame Chrysanthème*, whose respective music died soon after its birth, Puccini's two Asian representations not only survived but became among top performed operas worldwide maintaining Puccini on his supreme and unique pedestal.

The Socio-Economic Impact of Liberal Reform and Political Corruption in Developing Countries

Eunjung Choi, University of South Florida
Jongseok Woo, University of West Florida

Abstract

How does economic liberalization—or a country’s integration into the global economy—affect its economic performance and the distribution of wealth? There have been heated debates on positive and negative sides of globalization. This article seeks to fill the existing gap in the study of globalization and its socio-economic outcomes by focusing on the mediating effect of political corruption. The authors suggest that countries with high levels of corruption achieve faster economic growth when they perform extensive economic liberalization. However, the economic growth does not improve the corrupt countries’ distributive justice, leaving levels of poverty and inequality rates intact after the economic development. On the other hand, economic liberalization in less corrupt countries does not generate fast economic growth, but the slow economic development significantly improves the countries’ poverty and inequality. This article studies 63 developing countries from Latin America, Eastern Europe, and Asia.

Introduction

How does economic liberalization—or a country’s integration into the global economy—affect its economic performance and the distribution of wealth? The heated debates have diverged into two competing arguments. One group of scholars suggests that globalization harms the economy of less developed countries by increasing poverty and inequality within and among countries. Another argument points to the positive effect of globalization, advocating that a country’s participation in the free market significantly improves its economic conditions and promotes faster economic growth as well as lower levels of poverty and inequality. In terms of the distributive effect of globalization, the so-called efficiency hypothesis maintains that the increasing exposure of a country’s economy to the international market competition will compel the government to scale back social expenditures; consequently, the country may end up having higher poverty rates and a widening inequality gap. Meanwhile, the “compensation hypothesis,” the parallel argument, implies that economic liberalization does not necessarily harm the distributive justice because the government will expand social welfare spending to compensate those who lose from the market competition (Kaufman and Segura-Ubiergo 2001: 556-7).

What could explain the discrepancy between the two arguments? This article suggests that the debate regarding the effect of economic liberalization has overlooked one significant element: the effect of political corruption on a country’s economic performance and the distribution of wealth. The authors demonstrate that the effects of economic liberalization on growth and the distribution of wealth are mediated by political corruption. More specifically, economic liberalization itself brings economic growth, yet a high level of political corruption results in the

inappropriate distribution of wealth by increasing poverty and inequality. Political corruption *per se* does not harm or benefit a country's economic growth. However, in a highly corrupt society, economic wealth is concentrated among a small segment of people who can and/or are willing to pay bribes. Corrupt transactions discriminate between people who pay for bribes and those who do not, with preferential services being provided for the former. Thus, in a society with a high level of political corruption, the positive distributive benefit of economic growth is limited to a small number of people, meaning that the socio-economic conditions of ordinary people do not significantly improve (Morris 1991). In short, the research argues that economic liberalization does not harm a country's socio-economic conditions when that country has a low level of political corruption whereas such liberalization of an economy with a high level of corruption significantly deteriorates its conditions.

The current research intends to bridge the gap between the two separate sets of research on the sources of distributive justice—namely, globalization and its consequence in a society on the one hand, and political corruption and its socio-economic impacts on the other. As such, this article sheds new light on the nature of the impact of economic globalization on domestic social conditions by incorporating political corruption into the equation.

The next section briefly overviews the competing arguments related to the effect of economic liberalization on a country's domestic socio-economic conditions. Section two discusses whether/how political corruption influences a country's economic growth and the distribution of wealth; based on this discussion, the main hypotheses will be generated to be tested against 63 developing countries from Latin America, Asia, and Eastern European countries and former Soviet republics for the period of 1995 to 2007. Section three spells out the composition of the data, variables, measurements, and methodologies used for the empirical analysis. After presenting the empirical results, the article concludes by discussing the theoretical and empirical implications of the findings for further research on economic liberalization, political corruption, and their socio-economic outcomes.

Economic Liberalization and Socio-Economic Impacts: Two arguments

The effect of globalization on developing countries' economies has been at the center of heated debates among scholars. One group of scholars suggests that a country's economic openness and integration into the global economy will boost economic growth (Dollar and Kraay 2002). According to this optimistic view on globalization, a country's adoption of an open economy leads to faster economic development. Although economic globalization may increase economic inequality for a short period during the early stage of industrial development, the inequality eventually diminishes when the industrialized economy produces a larger pie to share. This argument further states that underdevelopment, poverty, and inequality are more prevalent in less globalized and closed economies than more globalized and open ones.

Meanwhile, another group of scholars holds a more pessimistic view, maintaining that globalization may improve a country's overall wealth but it ultimately widens economic inequality within and among countries. According to this view, economic globalization aggravates the inequality gap as both winners and losers emerge from the economic competition, thereby creating concerns for the government's social welfare and safety net (Forsyth 2000). In particular, the foreign direct investment (FDI) and trade openness expand the inequality gap in both developed and developing countries. In industrialized societies, the FDI creates deindustrialization as industries move to developing countries offering abundant but cheap labor forces. In turn, deindustrialization leads to the movement of labor forces from the industrial sector with relatively equal income distribution to the service sector with higher income inequality (Alderson and Nielsen 2002). The same is true for developing countries where capitalists have stronger bargaining leverages vis-à-vis labor forces because the former have greater mobility with freer exit options than the labor forces (Rodrik 1997: 46).

The debate over socio-economic impacts of globalization has revolved around two competing hypotheses—efficiency versus compensation—over globalization and social spending. The efficiency hypothesis asserts that globalization undermines a government's ability to redistribute domestic wealth from winners to losers in the market competition. At the same time, economic globalization intensifies the labor market competition and reduces workers' wages (Rodrik 1997). Globalization forces the government to reduce social spending because it leads to higher taxation and hurts competitiveness in the market. Therefore, as a country becomes more open to the international market competition, the government faces strong incentives to curb social spending, leading economic inequality within society to grow.

Meanwhile, the compensation hypothesis draws attention to the positive side of economic globalization as it offsets the market competition through social safety nets. According to this hypothesis, a government with greater economic openness to the international market has both political and economic incentives to expand the social welfare spending and reduce the inequality gap (Kaufman and Segura-Ubiero 2001: 557). Politically, a government tries to make up for any grievances from market competition by expanding social welfare spending as the negative effects of globalization—namely, social dislocations, job uncertainty, and the expanding unequal distribution of income—create political instability and backlash against market-oriented and business-friendly policies. Economically, both the government and owners of industries have incentives to increase social welfare spending to reeducate and improve skills and productivity of labor forces. Therefore, the compensation thesis argues that a country's economic liberalization and integration into the world market competition do not necessarily make its socio-economic conditions worse.

The debate over the effect of economic globalization on economic growth, poverty, and inequality has produced extensive empirical evidence from both proponents and opponents of globalization. However, the theoretical and empirical debates have produced no conclusive evidence. Such inconclusiveness may stem from the ambiguous concepts related to globalization and different methods of measuring economic growth, poverty, and inequality rates (Ravallion

2003). The problem may also arise from the case selection, depending on whether OECD, Latin American, or East Asian countries are examined.

Yet one important element missing from the debate is what could intervene to make a difference in the effect of economic liberalization on socio-economic outcomes. One factor that could influence the allocation of the wealth within a society is political corruption. Political corruption occurs in the expectation that corrupt transactions will bring certain *preferential* benefits to the provider of bribes and, thus, has a certain distributive effect within society. Therefore, this article maintains that political corruption mediates the effects of economic liberalization on a country's socio-economic conditions. The following section discusses previous theoretical and empirical discussions examining the effect of political corruption on economic growth, poverty, and inequality, based on which the main hypotheses will be generated.

Political Corruption and Socio-Economic Outcomes

Corruption is not a contemporary social phenomenon, but rather has existed as long as human society has. Moreover, corruption is not limited to the political and public arena, but may be prevalent in virtually any human interaction (e.g., family and community relations and business interactions), adopting various forms (bribe, kickback, stealing, nepotism, misappropriation, etc.) (Nye 1989). However, the primary focus of this article is political corruption, commonly defined as “misuse of public office for private gain” (Anderson and Tverdova 2003; Sandholtz and Koetzle 2000; Amundsen 1999).

Concerning the effect of political corruption on governments' economic performance and the distribution of wealth, two competing arguments have been prominent. The first line of argument, dating back to the 1960s, has been presented primarily by political scientists who looked at the positive side of political corruption (Bayley 1967; Nye 1967; Huntington 1968; Leys 1989). According to this “grease-the-wheel” argument, bribery as one of the most common forms of political corruption can make society more efficient by avoiding “burdensome regulations and ineffective systems” (Kaufman 1997: 115). In other words, bribery enables people to bypass the unnecessary bureaucratic lethargy and reduce unnecessary time and tiresome paperwork to get things done faster. This is thought to be the case especially when a country has weak and ill-functioning political systems with highly inefficient bureaucratic regulations. As a result, “[B]oth the ends and the means served by government-constricted choices may be worse than those freely chosen and finding expression through corruption” (Bayley 1966: 726). Furthermore, political corruption may form a sort of market competition in which private firms compete for a procurement contract with the government. The corrupt government “awards the contract to the highest bidder in bribes” so that the mechanism of efficient allocation of resources succeeds, as “the lowest-cost firm can afford the largest bribe” (Bardhan 1997: 1322, see also Beck and Maher 1986; Lien 1986).

The positive effect of political corruption is expected to be more evident in the context of newly born, modernizing societies, where underdeveloped and weak political institutions have limited ability to exert a monopoly over bribes given that multiple agencies collect bribes. The weak political institution's lack of control over bribery results in an ever more inefficient allocation of resources in society. Huntington points out that, "in terms of the economic growth, the only thing worse than a society with a rigid, over-centralized, and *dishonest* bureaucracy is one with a rigid, over-centralized, *honest* bureaucracy" (Huntington 1968: 69). In a society with less-than-perfect political and bureaucratic systems, bribery serves as "speed money" that can circumvent the unnecessary bureaucratic hurdle. Furthermore, political corruption brings harmony between the corrupter and corruptee, while bribery makes government employees work harder to make things done faster (Leys 1989: 54; Mauro 1995: 681).

However, only a small number of scholars have pointed to the positive impact of political corruption on economic growth. Numerous economists and political scientists have presented that political corruption results in poor economic performance because it increases transaction costs, discourages investments, and distorts market competition (Seligson 2002; Della Porta 2000; Doig and Theobald 2000; Pharr 2000; Friedman, Johnson, Kaufman, and Zoido-Lobaton 2000; Gupta, Davoodi, and Alonso-Terme 1998; Kaufman 1997; Mauro 1997; World Bank 1997; Klitgaard 1991; Morris 1991; United Nations 1989; Etzioni-Halevy 1985; Gould and Amaro-Reyes 1983). According to Mauro's empirical research, a corrupt society turns out to have approximately 0.5 percent lower GDP growth per year and about 5 percent fewer aggregate investments than a relatively less corrupt society (Mauro 1997). In a similar study, the World Bank (1997) revealed that countries with undue corruption suffer from foreign investment amounting to about a half of what less corrupt countries gain. Overall, corruption harms economic growth, per capita income, infant mortality, and education service (Kaufmann et al. 1999; Perry 1998; Mauro 1995). Although most recent studies have demonstrated that political corruption harms a country's economic growth, the negative effect of corruption does not seem to be either robust or linear. Some countries with a high level of corruption show faster economic growth than less corrupt countries, as evidenced in studies involving East Asian countries (Kang 2003; Bardhan 1997; Shleifer and Vishny 1993).

The current article expects that a more direct effect of political corruption on the economy is less about growth than about the distribution of wealth in society. More specifically, political corruption negatively influences a society's distribution of wealth by increasing poverty rates and widening inequality gaps, even after a country achieves a substantial level of economic development. The insidious effect of political corruption on distributive justice is possible because corrupt transactions discriminate people who pay bribes from those who do not, resulting in preferential services being provided to the former. Therefore, the positive benefit of political corruption—if any—will be limited to a small number of people who can pay bribes (Morris 1991).

Political corruption harms a society's distributive justice by distorting governmental policies (Gerring and Thacker 2005). When a corrupt transaction occurs in the form of a kickback, it

significantly diminishes the governmental spending for public goods because corruption diverts resources from public purposes to private sectors that provide bribes (Bayley 1966: 724). Corrupt transactions give private benefits to those who pay bribes for the short term, but they harm the general public by fabricating larger public costs through higher taxation as well as reduced spending for general social welfare for the longer term. Consequently, political corruption generally harms the poor and “strengthens the hands of people seeking to protect advantage they already have” (Nice 1986: 288).

Political corruption tends to recreate and perpetuate the poverty and inequality gap within a society. When corrupt transactions are embedded in a society, the wealthy and powerful “have both greater motivation and more opportunity to engage in corruption” to keep their privileges intact (You and Khagram 2005: 136). Indeed, they have strong incentives to bypass fair political and legal processes to receive preferential services from the governmental agencies for which they provide bribes. Yet the poor do not have the resources to gain these private benefits from corruption. Although they have strong incentive to remove political corruption from society, they lack resources to do so or suffer from a collective action problem. Consequently, a high level of poverty and inequality is deeply entrenched in a society with undue corruption so that they perpetuate one another.

To summarize, as the two separate discussions on the impact of economic liberalization and political corruption on socio-economic conditions have indicated, the current debate about the effect of globalization overlooks whether/how political corruption harms a country’s distributive justice. Economic liberalization itself is not expected to have significant impacts on a country’s poverty and inequality; rather, the level of political corruption mediates the effect between globalization and a country’s socio-economic conditions. As such, countries with great economic openness to the international market competition likely have low poverty and inequality rates when political corruption is low. However, economic liberalization does not improve poverty and inequality when political corruption is high, even though the wealth from opening the market is bigger.

Research Design: Data, Variables, and Measurements

Data

This article examines the effect of liberal economic policies and political corruption on socio-economic conditions across 63 developing countries in Latin America, Eastern Europe, and Asia. The cases include 21 countries from Latin America, 17 from Asia, and 25 from Eastern Europe and the former Soviet republics. Although classified as developing countries, these cases vary in their economic, social, and political conditions. The average values of GDP per capita between 1995 and 2004 among the countries range from \$153.00 (Tajikistan) to \$22,306.00 (Singapore). Political corruption in these countries is perceived to be relatively higher than most western consolidated democracies. Except for Singapore, no country among the studied cases is listed in the top 20 of the Corruption Perception Index (CPI) from Transparency International (2008). A higher rank indicates less corruption perception. The CPI measurement is explained in the

variables and measurements section. According to the measure of freedom from Freedom House, the cases include 21 free, 31 partly free, and 11 non-free countries.

Variables and Measurements

To examine the varying effect of liberal economic policies on socio-economic conditions (economic growth, poverty rates, and inequality) in developing countries, the models herein include imports, foreign direct investment, corruption perception, political freedom, GDP, literacy rate, and female labor participation. All independent variables are computed as ten-year averages between 1995 and 2004. The dependent variables—namely, economic growth rate, poverty rate, and inequality (i.e., the GINI index)—were obtained from the World Development Indicators (WDI) and computed as an eleven-year average from 1997 to 2007. In order to investigate how corruption perception levels mediate the effects of liberal economic policies on socio-economic conditions, the models also include interaction terms between imports and corruption perception and between foreign direct investment and corruption perception. The interactive relationships between these variables imply that the impact of liberal policies on socio-economic conditions differs according to corruption perception levels.

The degree of economic openness is commonly measured by the share of the sum of imports and exports in GDP. However, total trade is influenced by the size of the economy. Export-oriented countries are considered economically open even though they are not (Kaufman and Segura-Ubiergo 2001; Gerring and Thacker 2005; Tavares 2005). In order to avoid the inherent problem this situation poses, the current study uses the share of imports in GDP as well as the fraction of foreign direct investments in GDP to measure economic liberalization (see Larrain and Tavares 2004). Countries with more open regulatory policies tend to attract more foreign direct investments (Gerring and Thacker 2005). WDI provides the data on imports and foreign direct investment.

The primary data on corruption is obtained from Transparency International's CPI and the World Bank Institute's Control of Corruption Index (CCI), which are the most comprehensive and reliable measures of corruption (Anderson and Tverdova 2003; Montinola and Jackman 2002; You and Khagram 2005). Both the CPI and CCI are based on survey data that measure perceptions of experts and other informed individuals. The CPI ranges from 0 (most corrupt) to 10 (least corrupt) whereas the CCI is a standardized score of corruption perception, indicating how many standard deviations below or above this score a country's corruption perception falls on. The correlation between the two measures of corruption is .94, which confirms the quite high level of data reliability. This study presents the results using the CPI. Replacing the CPI with the CCI does not make a significant difference in the outcomes. The mean score of corruption perception among the cases is 3.4. However, for the purposes of this study, the cases are grouped into four sets according to their corruption perception levels, where 0 indicates the least corrupt and 3 the most corrupt. In this manner, this study examines the different effects of economic liberalization on socio-economic conditions across countries at different levels of corruption perception. This is also necessary as it is possible for the effect of liberal policies to be

significant for particular values of corruption perception even though the coefficient of the interaction term is statistically insignificant (Brambor, Clark, and Golder 2006).

In addition to economic liberalization, the degree of political liberalization or democraticness influences socio-economic conditions in society. The relationship between regime types and economic growth has been hotly debated. Democratization could hinder economic development since the government cannot exclusively pursue such development at the expense of popular demands (Haggard 1990; Huntington 1968; Huntington and Dominguez 1975; Krueger 1974). In other words, it is easy to suppress demands for public welfare in authoritarian regimes. Indeed, the remarkable economic development of the Four Asian Tigers—Hong Kong, South Korea, Singapore, and Taiwan—tend to prove this argument. Yet supporters of democracy argue that economic freedom and less corruption bring more effective and stable economic growth (Rodrik 1999; Baum and Lake 2003; Lake and Baum 2001). Empirically, the most developed welfare states are democratic regimes, implying that democratic regimes lead small but stable economic growth and more economic justice whereas authoritarian regimes bring big but unstable economic growth and less economic justice. The level of democracy is measured using the freedom index from Freedom House. The measure from Freedom House is the average of political and civil rights ratings, ranging from 1 (free) to 7 (not free). For the purpose of the study, the scores are reversed: 1 for not free and 7 for free.

Meanwhile, GDP per capita measures the economic development of a country. More developed countries can afford more welfare spending, thereby reducing poverty and inequality. However, GDP per capita tends to slow economic growth when a country reaches a certain level of economic development. Therefore, GDP per capita is logged in order to obtain the appropriate curvature. The data on GDP per capita is obtained from the WDI.

Finally, two additional control variables known to explain socio-economic conditions are used—namely, literacy rate and the share of female labor population in the total labor population—which should contribute to increasing economic growth and decreasing poverty rates and inequality. These variables come from the WDI as well.

Empirical Analyses

Table 1 indicates the effects of liberal economic policies on socioeconomic conditions—economic growth, poverty, and inequality—across the cases under study by paying particular attention to how the levels of the corruption perception modified the effects. Therefore, the focus is the interactive relationships between imports and the corruption perception and between FDI and the corruption perception.

[Table 1 is here]

How do liberal economic policies influence economic growth? The results in the Growth model indicate that none of the constitutive terms of imports, FDI, or the corruption perception is statistically significant. However, the coefficients and significance of the constitutive terms themselves are not very meaningful as they are valid only when imports, FDI, or corruption is zero, which is rarely the case. The coefficients of the interaction terms identify the nature of interactive relationships. The significant coefficient of the interaction term between FDI and the corruption perception indicates that the corruption perception mediates the effect of FDI on economic growth. For example, if the corruption perception increases by one unit (from zero to one, from one to two, etc.), the effect of FDI on economic growth increases by .208. In other words, foreign direct investment brings a larger economic growth in more corrupt countries.

In addition, how do liberal economic policies influence poverty in the countries under study? The Poverty model shows that the coefficient of the import variable is the only significant constitutive term, indicating that a 1% increase in the share of imports in GDP decreases the poverty rate by .345 in countries with zero corruption perception. However, as previously mentioned, the interaction terms determine the nature of interactive relationships between economic policies and the corruption perception on poverty. The coefficient of the interaction term between imports and the corruption perception demonstrated a statistical significance, indicating that imports decreased poverty rates but the effect was .167 smaller in countries with a higher corruption perception level. The insignificant coefficient of the interaction term between FDI and the corruption perception implies that FDI did not have significant effect on poverty regardless of the corruption perception level.

Next, the data were examined to determine how imports and FDI influence inequality. The Inequality model demonstrates that none of the coefficients involving imports and FDI are statistically significant. However, the insignificant coefficients of the constitutive terms and the interaction terms do not suggest that no significant effect of imports and FDI existed on inequality. It is possible for the total effect of imports and FDI on inequality to be significant at particular values of the conditioning variable—namely, the corruption perception (Brambor, Clark, and Golder 2006).

[Table 2 is here]

Table 2 presents the effect of imports and FDI on economic growth, poverty, and inequality at the varying levels of the corruption perception, ranging from 0 (the least corrupt) to 3 (the most corrupt). Imports positively impact economic growth only when the corruption perception level is low (level 1), whereas FDI results in more economic growth in those countries with a higher corruption perception (levels 2 and 3). The positive effect of FDI becomes progressively larger for countries with a higher corruption and fails to show statistical significance when countries have less or the least corruption. As the significant interaction term between imports and the corruption perception indicates in Table 1, imports—not FDI—decrease poverty only when corruption is lower. The positive impact of a higher import share in GDP is greater in countries

with the lowest corruption perception. Meanwhile, in corrupt societies, neither imports nor FDI significantly reduces poverty rates. As the insignificant coefficients of the interaction terms between imports and the corruption perception and between FDI and the corruption perception indicate in Table 1, Table 2 also indicates that imports and FDI do not substantially affect inequality regardless of the corruption perception level, with only one exception. Imports lower inequality only when the corruption perception is the lowest.

The analyses of the effects of liberal economic policies, imports, and FDI on socio-economic conditions suggest that liberalization of the economy may bring different consequences in societies according to different corruption levels. In more corrupt countries, economic liberalization is more efficient in bringing economic growth. However, the benefit from such economic growth does not guarantee better living conditions for all of society as economic liberalization results in a lower poverty and inequality rate only when the level of corruption is low.

Conclusion

This article sought to fill the existing gap in the study of globalization and its socio-economic outcomes by focusing on the mediating effect of political corruption. The authors suggested that the debate on globalization has been incomplete and inconclusive because previous studies overlooked how political corruption mediates the effect of globalization on developing countries' poverty and inequality rates. Especially in terms of the competing hypotheses on the effect of economic globalization—namely, the efficiency hypothesis versus the compensation hypothesis—previous studies either support or nullify both hypotheses, but do not sufficiently explain when or under what circumstances a hypothesis is relevant.

The empirical analysis discussed in this article demonstrates that a country's economic openness and greater integration into world market competition do not improve its socio-economic conditions such as poverty and inequality when the country has a high level of political corruption, which is consistent with the efficiency hypothesis. On the contrary, economic liberalization does improve a country's socio-economic conditions when political corruption is low, thereby proving the compensation hypothesis. In this respect, it is not economic liberalization itself, but rather the level of political corruption that determines how the wealth of a country is allocated.

Political corruption does not necessarily benefit or harm a country's economic performance. As the empirical analysis demonstrated, countries with high levels of corruption achieve faster economic growth when they perform extensive economic liberalization. However, the economic growth does not improve the corrupt countries' distributive justice, leaving levels of poverty and inequality rates intact after the economic development. On the other hand, economic liberalization in less corrupt countries does not generate fast economic growth, but the slow economic development significantly improves the countries' poverty and inequality.

The empirical findings of this article raise interesting questions about previous scholarly discussions on how to reduce political corruption. Most scholars agree that liberalization and increasing competition reduce corruption (Gerring and Thacker 2005; Sandholtz & Koetzle 2000; Treisman 2000; Bliss and Di Tella, 1997; Ades and Di Tella 1994). These scholars suggest that market-oriented liberal policies reduce political corruption because they (1) bring competition through openness to foreign trade and FDI and (2) result in less government involvement in economic transactions. However, the current article pointed to the fact that, although economic liberalization reduces corruption in general, it is not a guarantee. Some countries with extensive economic openness show quite high levels of political corruption. Future studies may need to clarify how and specifically what kinds of liberal reforms give rise to reducing political corruption.

Note: 1. The dependent variable for each model is the average value of GDP growth rates, poverty rates, or GINI index between 1997 and 2007 in 63 developing countries in Latin America, Asia, and Eastern Europe. The data come from the World Development Indicators compiled by the World Bank. 2. The number of the cases for the poverty model is 62, excluding Singapore that does not provide the poverty rates. 3. The CPI is categorized into four groups as 0 for the least corrupt countries and 3 for the most corrupt countries.

Abstract:

Countries in the West extol the virtues of civility, culture and liberty. They are also market obsessed and in their quest to make profit have broadened their purview to all parts of the world. The seemingly benign term of “globalisation” belies a more sinister underbelly. Whether it is to find new and energised markets to sell its products and technology to or whether it is to exploit cheaper labour to maximise its profits or even to gain control of resources for production, they follow an almost revered mania to colonise, control and exploit. Their methodology, historically, has been neither civil nor egalitarian – they act like a bull in a china shop. Once masking their intent in religious rubric, they now openly rely upon the creed of consumerism. Any discussion about East meeting West requires an analysis of the divergent (and paradoxical) cultural imperatives that underpin new social democracy in the West and their potential impacts in Asia, including the need to homogenise public policy and culture worldwide; the need to contain dissent whilst remaining a bastion of freedom; the rhetoric of tolerance in the face of intolerance; the market mechanisms that direct trade agreements more favourably in a Eurocentric direction and the belief that its systems are fundamentally more appropriate. The numerical power of the Asian marketplace should encourage serious reflection on which parts of Asian character should be retained rather than militating acquiescence to the flawed and redundant systems offered by the West.

GLOBALISATION: THE BULL IN THE CHINA SHOP

DR CLIVE BEGG

Adjunct Lecturer: School of Social Sciences: The University of Queensland,
St. Lucia, Australia;

Executive Director: ACRO Australian Community Safety & Research Organisation
Incorporated, Brisbane, Australia.

Western “civilised” societies have an almost schizophrenic disposition. On the one hand they applaud their system of democracy as the epitome of civilisation; whilst on the other their history of colonisation and aggressive incursions belies a dark underbelly of despotism. They wage wars in the name of democracy and freedom – a conceptual oxymoron¹. But how much of their neo-colonialism is benevolent and designed to liberate and enlighten? Is the “cause” more about a genuine attempt to transport values that they truly believe are better, than it is about self-interest (as it was with their forebears)? Certainly history has shown that earlier religious-inspired colonialism financially advantaged the “liberators” and, simultaneously, did transmogrify other’s cultures and expand the fan-base of the oppressors. It could be reasonably argued that the more recent incursions into the Middle East have been more about securing oil reserves than neutralising mythical weapons of mass destruction – yet it was the mantra of liberation and democracy that “prevailed”² – a curious contradiction.

The evolved modern form of colonialism or imperialism is economic globalisation, which lifeblood is the need to create a sense of oneness – a mono-culture – shared by all citizens on earth for the purpose of financial gain. It is a mono-culture that demands compliance and which seduces citizens through consumerism and hedonism. Let’s not delude ourselves - globalisation is about money, wealth and power, in spite of its promise of intellectual and personal liberty. It is not a benign process and its implementation is just as aggressive as any *Crusade*, any war to stop the *domino* of communism, any *war on terror*. Much of Asia is already well advanced towards westernisation as the exemplar of this mono-culture and Japan is probably more advanced than most.

In this Paper I will promote globalisation as likened to a bull let loose in a china shop. In Western parlance, the expression “acting like a bull in a china shop” elicits an image of a mindless beast destroying beautiful and delicate china or porcelain as it randomly thrashes about. In my country the word “bull” (colloquial for bullshit) also connotes excrement, rubbish or nonsense. Unashamedly, the duality of meaning equally applies. Whether by force

¹ The Encarta dictionary cites the term “legal murder” as an example of an oxymoron, which in the case of war is particularly useful.

² This is a reference to the pronouncements of George W. Bush on the deck of the USS Abraham Lincoln on 2nd May 2003:”the United States and our allies have prevailed...The transition from dictatorship to democracy will take time but it is worth every effort. Our coalition will stay until our work is done.”

(the beast let loose) or by lies (the bullshit) or both, the expansion of Western globalisation (the bull) into the Asian marketplace (the china shop) is imposing a methodology that is decidedly uncivil and non-egalitarian to enliven an agenda that meets market need rather than societal needs. Whether it is to find new and energised markets to sell its products and technology to or whether it is to exploit cheaper labour to maximise profits or even to gain control of resources for production, globalists follow an almost revered mania to colonise, control and exploit. They are certainly not about benevolence, fairness, social justice and liberation. And Asia is a compelling numerical market. The true face of globalisation is hidden behind the mask of laudable principles enshrined in nineteenth century European rubric – much of which will probably be discussed as reasons *in favour of* globalisation at this Conference. The Paper will also explore the similarly schizophrenic progeny of democracy, “civil society”, which, in an ideal form, provides hope for global civilisation, but which, I propose, in its evolved current form, has become corrupted and is used as a valuable weapon by political masters hungry for their continuance and expansion of power.

Globalisation has a dominating financial underpinning. So beware. The tools of the capitalists are neither beneficial nor noble. Woe betides anyone who stands in the way of their deity of profit. Just as earlier oppressed peoples in Africa, South America and parts of Asia embraced the Western God (as their assets were stripped by profiteers), so too will profit and pleasure become saviours under the imposed mono-culture of consumerism. There is not so much a meeting of East and West under globalisation as there is about a suborning of culture and tradition in the name of product distribution and profit – the interests of the national *will* be sublimated to the financial interests of transnationals - traditional despots will be replaced by newer ones: those with corporate attire and calculators. This inaugural Asian Conference on Arts and Humanities which seeks to explore the cross-cultural interconnectedness of “East meet(ing the) west” is constrained by an imbalance of power that is irreconcilable – under the new world order of the mono-culture, world citizens are merely viewed as consumers; their cultural and societal needs are of no interest whatsoever to capitalists. The mantra of “democracy” is simply rhetoric. This Paper is intended to provide a cautionary voice to the changing tune of “democracy” (or new social democracy) as it has evolved in the West (and as it impacts upon Asia). It will also seek to illuminate the controlling nature of contemporary “civil society” which has morphed away from its literal meaning to become a weapon of social control by governments in the West - and is likely to find fertile soil here in Asia (as did western religion in times past). The recurring themes of this Paper will be globalisation in the context of a new financial imperialism; the potential sublimation of culture and language to accommodate the needs of the market; the emasculation of government by business; and, finally the misuse of civil society as a tool for social control of citizens in the Asian marketplace³. I am not of the view that the shop should

³ Capitalism acts like a malignant cancer that liquefies the organs of ethics and decency as both become subservient to profit. Ironically, the spreading cancer in certain Asian marketplaces is transposing economic and social power to the region – Asians are becoming (or have become) formidable capitalists. The recently discovered State Capitalism of the Obama administration in the United States, which would have once been considered unconscionable, appear similar in many respects to the State Capitalism of China. The debate therefore is not so much about who controls the assets (be it Western or Asian interests) but whether the

be closed on globalisation. Quite the contrary, an informed and intelligent international understanding of differing cultures will greatly advance international agreement on issues that perplex and diminish the quality of life for all citizens. If there was a true global village, there would be no dissent and positive consensus would be achieved on issues such as race, global warming, environmental protection, nuclear proliferation, civil and political rights and the like. As temporary caretakers of this earth we already share a common bond. But these are not issues that should be mediated by a process obsessed by profit. These are intuitive ideals that are born out of dialogue and cemented in trust. Neither is it the business of *Business*.

In seeking to come to terms with the idea of cross-cultural connectedness (and the dangers for the direct transposition of Western “culture” to the East) it is important to first understand what has occurred across the political landscape of Western nations, particularly over the past three decades. Up until the 1980s there was a clear distinction between what could loosely be defined as the left (interventionist for the purpose of social justice) and the right (non-interventionist free market) of policy within political parties across democratic societies. Up until this time, there was the *actuality* (substantially) of alternative political positions to guide voting intentions by citizens. Of course there were propaganda impediments and other mechanisms that coloured choice-points, but the ability of the people to endorse or remove governments electorally was the hallmark of the democratic process. For reasons that will be expanded upon later, there have been changes to the nature of choice-points for citizens that have radically altered the character of democracy, post 1980s. What all political parties subscribe to, however, is the concept of civil society as a focus for democracy, albeit from different perspectives and based upon ideological affiliations. So, what is this concept of “civil society” (and “global civil society”) and why is it pivotal to all systems of governance, particularly democratic systems? A brief overview will follow.

“Civil society” is a common theme that is weaved throughout Western literature as the exemplar of the democratic state. Its images span a history of almost three millennia starting with Plato’s *Republic*, progressing through Aristotle’s *Politics*, and onward to what I perceive to be a more controversial and exploitative persona that links it to social control in the contemporary setting. According to Tolbert et al (1998), the principle attribute of democratic society for de Tocqueville was the ability for the association of citizens and their preparedness for political participation through that association (de Tocqueville: 1862 in Tolbert et. Al.: 405). Others such as Goldhamer (1964) Putnam et.al (1993) and Etzioni (1997) view associations as imperative for integration and cohesion “... in an otherwise fragmented urban world” (Tolbert 1998). Luis Roniger (1998) provides a reasonable (and contemporary) working definition of civil society suggesting it “... alludes to the existence of organized public life and free associations beyond the tutelage of the state, yet oriented towards the public sphere and toward influencing public policies” (Roniger: 1998, 67). The arenas and sectors vary, according to Roniger, but should include social movements and

concentration of wealth that accompanies is in the best interests of the global community and whether regimes meet the needs of its people.

voluntary organizations. The scrutinising of government through citizenship, civil libertarianism and civil participation has historical roots and is predicated by a process of struggle and change from the late 18th Century (Calhoun: 1992; Habermas: 1989). The progression towards a discussion on *global* civil society flows from transnationalism or globalisation. It has been alluded to by many academics including those from within Asia. Yanaihara Tadao (1893-1961) in addressing *shokuminchi-ka* (turning the land into a colony) of pre-Taishō democracy - under the Meiji constitution (citizens as “subjects” rather than “citizens”) - defined *shokumin* as group settlement. Nakano Ryoko (2006) argues that this use demonstrates Yanaihara’s belief in a global civil society where “autonomous groups of different identity would voluntarily cooperate for the benefit of the whole” (Nakano Ryoko: 188). Unlike Chris Brown (2009:9) who argues against cross-national advocacy as a vehicle to construct universal values for humans - and in line with Yanaihara - I believe that an unfettered global civil society (one not constrained by oppressive governments) can indeed achieve this end. The issue is how to contain the unregulated economic imperialism of capitalism and to bring to heel their servants, the politicians, in order to breathe life into the concept. But what is the nexus between civil society (in its changing incarnations) and capitalism? And, if civil society is such a desirable and necessary thing, why should it be approached with caution by Asia? To find an answer to this question, we need to review its aetiology from a philosophical point of view and test its implementation.

Whilst affirming the need for the collective, Plato acknowledged the need for personal diversity amongst individual citizens outlining the difference between selling something in order to buy and selling something for the purpose of profit - pre-empting the debate by Marx and Engels by some 1000 years (Rubenstein: 2000 in Ehrenberg: 1999). It was Cicero and the Stoics, however, who affirmed civil society in political terms. Ehrenberg (1999) argues that the classic view of civil society was “the arena of public debate and moral action ... where reason and civilisation would be safe”. He notes that it was the “Fathers of the Church”, notably Augustine (413AD), who believed that civil society should act as a “coercive mechanism that serves God’s purpose by punishing error and, hopefully, restricting sin”. Ehrenberg concludes on the assent of the Church, as an early proponent of civil society, that the struggles between the papacy, other church people and rulers were based upon institutional or personal motivations and were resolved by way of political or military power rather than logic (ibid.). The emergence of thinkers such as Locke, Smith and Hobbes was to redefine civil society away from the skirt of the church and morality and back to the earlier principles of money. Their mantra was that civil society was framed by economic interests alone and that the market was the only arbiter of social relationships. In this context, the market replaced the Church and, again, personal (or corporate) interests were to be resolved by way of political or military power. The imbuing of a “moral” stream into a reenergised debate through the writings of Kant, Marx and Engels - who sought to create models to improve the lot of citizens and ameliorate conditions that led to poverty and social dislocation through government-led fiscal interventions – led to social democracy. The “welfare state” emerged and with it the creation of political interests that are broadly labelled “left” and “right”, the left advancing State intervention for the benefit of citizens on issues such as education, health, social welfare and civil rights; the right advocating a free market system

with minimal State intervention. Where the Church used its constituency to impose the moral agenda, political parties used its membership to construct the civil agenda.

The most significant influence on the rise of the welfare state can be found in the writings of John Maynard Keynes, a British economist, who developed his ideas during the Great Depression (the 1930s). Certainly not a Marxist, Keynes nonetheless emphasised an important element of social democracy, full employment, arguing capitalism would remain in a depressed condition (suffering sustained unemployment and low growth) without the intervention of government. Keynes argued that market ideology was indifferent to the concepts of high unemployment and poverty (Theophanous: 1994). The post World War 2 version of the welfare state finds its source from the writings of William Beveridge (Beveridge: 1942) The Liberal Beveridge, who advocated for a “free society” and a “market economy”, proposed a system of social rights that citizens had to unemployment, disability and retirement income as well as to health services.

The emergence of new wave marketeer thinkers such as Giddens (1998, 2000) in the United Kingdom and Etzioni (1997) in the United States led to the emergence of the “third way”⁴ (or *new* social democracy) amongst formerly left thinking political movements. In essence this approach saw an abrogation of concern for social justice for those less capable of economic independence in favour of free market forces. Third way approaches were embraced by devotees such as Clinton, Schroeder, Pordi and Blair. Under this approach, civil society became a *tool* of government and new caveats on the ability for citizens (and their free associations) to either influence government (or more particularly, criticise government), emerged (Begg 2003). The resultant homogenisation of political thinking under new social democracy, de facto, led to a new political order where the nuances of difference became almost non-existent between the left and the right. The margin between the parties has narrowed to the point where a contest for ideological supremacy resided with who could promise the greatest repression. In this environment the manifestation of civil society became consultative groups, neighbourhood organisations and church groups whose membership was substantially engineered by politicians with a conservative agenda of compliance to ensure that criticism of political policy was neutralised. The pulpit was replaced by the Committee. The weapon of choice for both the left and the right in this new contest (now the right and the far right or the far right and the extreme right – they just keep marching further in the same direction) - became fear – principally the fear of terrorism and its newest younger brothers, the effects of the global economic crisis and fear of pandemics.

The concept of fear in politics is neither novel nor unique. For the philosopher de Tocqueville, anxiety was an indispensable precondition for contemporary people but which was not one forced from above by leaders. Rather, he saw community, and the will of the collective, as the most compelling weapon for social conformity. It is the individual “sense” of fear that obliges us to conform; with the threat of alienation from our peers as sufficient

⁴ This third way purports to represent a median point between the left and the right and emerged in response to long periods out of government by left-leaning political parties in various western societies.

justification for the suppression of dissent. It took a while for our erstwhile leaders to recognise that it was levels of fear generated from *within* civil society that was the key to domination – but they did get there. If you whip up enough of a frenzy the masses will do what no amount of legislation can achieve. This may always have been the case but it is the formalisation of the process by Giddens and Etzioni that is of significance.

Under the new political schemata, the narrow margins that differentiate government from opposition usually reside to the religious right of the spectrum – hence the right sideways shuffle within all political parties across all democratic societies. The grab for power in accommodating the needs of these margins is what I refer to as the *political imperative* – get into government whatever it takes. This political imperative as the combination of inferred (to the extent that these are not publicly debated) political dictates of a fundamentally conservative nature designed to maintain political power by governments. The elemental features of this political imperative are: intolerance; social control (reflected in government policy for the purpose of containing political dissent) and, political parties courting the slim middle ground that separates government from opposition, which entails acquiescence to the mood of the religious right (“faith-based initiatives”). This process moves the intent of ‘third way’ government away from formerly social democratic principles to market forces and government “at all costs” (Begg: 2003)..

If the political imperative is the means to the end, the *moral imperative* is the driver that maintains political control. In the social democratic context I define the moral imperative as being a series of moral dictates of a broadly conservative nature involving the imposition of narrow understandings of “family”, “community” and “responsibility” upon citizens which may be threatening to cultural and lifestyle difference and/or political dissent. This moral imperative becomes a companion device to consolidate political control once the political imperative has been realised. By seeking to negate the mantra of profit implicit to capitalism and confining its argument (substantially) to the moral imperatives of “responsibilities”, “obligations” and “mutualism” and the need for individuals to redefine each of these imperatives in their own lives (and thereby create a sense of belonging and “community”), new social democracy captures the moral arguments of the Protestant work ethic, American progressivism, British social Christianity and Evangelical Protestantism – a potent amalgam. At its heart it is a movement that reaffirms that which is moral, not necessarily that which is good. The vehicle for the imposition of the moral agenda, civil society, has now synthesised Church and (selective) community views.

A significant difference between the approaches by Giddens and Etzioni lies in the simple proposition of who is beholden to whom – to Etzioni it is the State that is beholden to the community and to Giddens it is the community that is beholden to the State. In my opinion both are methods of control. Religion provides common ground for new social democratic thinking across both the United Kingdom and the United States in that it links a pre-existing social order of solidarity and conservatism to the political imperative of maintaining government.

This may be all well and good but what is the relevance of this discussion in the context of globalisation and cross-cultural connectedness (West to East)? The answer to this question lies in the machinations of Western governments as they manoeuvre for self-preservation (abrogating their historical responsibility for its citizens to the whim of corporate entities); the ability of capitalism to reinvent itself; its need to find larger markets; its need to continue to over-consume resources in a landscape that is becoming increasingly more hostile as resources deplete; the need to exploit cheaper labour resources; and, the need to control dissent and constrain civil society (at least to the extent that it promotes its own ends). Certainly the Global Economic Crisis has demonstrated the resilience of capitalism with the implementation of State Capitalism in the United States – once a “socialist” device considered anathema to capitalism. The mechanisms for globalisation or transnationalism are fundamentally no different to those employed by earlier colonialists and all pivot on fear and control. Now citizens need to fear its governments as well as (or instead of) the Church.

Fear is a terrible thing. It is common to all of us in one form or another. It is uncompromising, urgent and, dependent upon the severity of the reaction to the stimulus, debilitating in the extreme. It consumes logic like a fire to rice paper. It is a primal response to circumstances for which we have, or perceive to have, no control. We tend to have a graduated scale of fear based upon our perceived degree of control, i.e. we fear that over which we have no control whereas we hold less fear for those over which we do. As Corey Robin (2004) points out:

...we worry far more about the dangers of train crashes than we do about car accidents, even though we are far more likely to die on the roads; we obsess about BSE or Aids or other rare diseases more than we do about the prosaic killers, even though we would improve our life chances far more by giving up smoking, eating better diets and taking moderate amounts of exercise.

In simpler societies fear responses related to issues of survival in circumstances unmitigated by order. The power of nature, Hobbes would assert, is "nasty, brutish and short" - and that fear of this power is that which should persuade people in a collective state to allow a despotic (or democratically elected) leader to emerge in order to protect them from that state of nature - in other words, to create a state of order that diminished the state of fear. So, as we go about our everyday lives we expect an order that protects our individual rights without circumspection by others. We invoke laws that protect citizens from collectively defined dangers. We imprison those who circumvent those laws and we conform to the norm for the good of all. We have an agreed pluralistic agenda that defines the moral and a set of guiding beliefs that determine the mores of our everyday existence. We are comforted in our lives by participating in a civil society. We exist within our communities in the knowledge that if we don't like the decisions of our governments, that we can elect another – at least in democratic societies.

But what if that alternative is no different from the last and, as has been suggested, new social democracy removes a choice for change? What if our conception of civil society doesn't

match the new political reality and the freedoms that we believed were inalienable were illusory? In our more complex, globalised and moderated systems the range of fears we experience have exponentially increased with our population and the definition of fear itself has evolved to engage phobias that have little to do with survival and more often than not relate to irrationality or the imposition of power. Within some non-Western democracies the manipulation of fear to control has greater resonance; with the fear of imprisonment – or worse - for dissent being accepted as the norm. These are processes that are experiencing a renaissance in the “civilised” West. Governments correctly fear its citizens and seem prepared to misinform its people in order to sustain governance. Civil society evolves to a set of Committees oversighted by politically or self-appointed representatives who sing from the song sheet of the government. Major exemplars of civil society, NGOs (nongovernmental organisations), are constrained from criticism of government through contractual strictures that gag them under threat of losing government funding.

Some leaders within our societies have learnt to manipulate fear and massage their citizenry into believing that fears which have no basis in reality are *real*. This contrivance of fear applies methods of control that are harvested by those with a vested interest in ensuring that others are kept compliant and under control or which ensure the continuity of electoral or economic power bases. Terrorism, the War on Terror and other such populist sounding machinations fall into this basket. Without diminishing in any sense those horrific random and violent acts against ordinary citizens that flow from such actions, the application of even more brutal acts in retaliation, either actual or ideological, as justification is simply unsustainable. They become even more so when the weight of evidence suggests that the originating logic is simply wrong. People overestimate the dangers posed to them personally by terrorism (Robin) but this flawed risk assessment has been fuelled by our political masters who raced out to impose decidedly undemocratic strictures on freedom on all citizens via various legislative devices – the Patriot Act in the United States has equivalence in many places. So if you don't conform to the Committee endorsed (new civil society) political view, the law is there to get you.

The use of propaganda to instil a sense of panic can, and has, been used by our political masters within western “democratic” societies just as effectively as any alleged tyranny in non- “democratic” societies. During the 1950s and 1960s Australian governments touted the onslaught of the “yellow peril” and spoke of “reds under the bed” referring to the “threat” of Communism. The implementation of the “white Australia” policy during that period was repressive and racist. In the United States McCarthyism enlisted the popular media to purge those accused of being communists applying a methodology not dissimilar to the Cultural Revolution in China. There are countless examples in Western democratic societies where the Machiavellian view that it is better to be feared than loved and impose that fear directly (Robin) has been applied by so-called democratic societies. And don't assume these were aberrations of the past. Whilst admonishing the human rights abuses in other places, there has been apparent virtue in “rendition” and torture of alleged terrorists by democratic administrations without due process. It has always been convenient to blame a patsy for your own incompetence or to hide your real intent. But the landscape has changed and former

enemies are now required to be co-conspirators. How ironic. This is the true face of globalisation. It is not about the advancement of a culturally more appropriate political system (democracy) as it is about the exploitation of available resources to consolidate the wealth and power base of the rich. There is certain inevitability to globalisation. In a Marxian sense, it is merely a synthesis that itself will become a thesis that will be reacted against – and so on until there is nothing more to consume.

Civil Society may well have become the conduit for the elites, with fear at its heart. Certainly, a more liberal form of civil society has been replaced with one that is controlled and easily manipulated to meet political agendas. Maybe what is needed is a revolutionary society – one that is spontaneous and innovative, not one that is compliant and stale. This becomes difficult in an age when governments struggle to contain dissent. Like Ehrenberg, I believe that we all must acknowledge the impact of capitalism's structural inequalities in everyday life and that the only way to reinvigorate civil society is through political struggle over state policy – wherever that state policy is situated. The emergence of a new form of tyranny in the West with the loss of differentness between the left and the right and the corresponding loss of debate and reason, is reflected in the same communities that the West claim to be liberating. We, as global citizens, need to be vigilant that our collective aspirations are not corrupted for a sinister purpose. For differing reasons, citizens in both the East and the West understand despotism and perhaps this, of itself, is the point of intercultural connectivity that binds a common link to global humanity. If the notional borders that nationalism created for us are to be broken down and we are to truly become citizens of the global community, it behoves us all to become more tolerant with ideologies such as religion and language subservient to the needs of the people. History teaches us that the elites in all countries will appropriate that which they believe will benefit them, not promote that which will lead to enlightenment and true liberation of citizens. Globalisation offers nothing new to Asia other than product – ironically, product that is produced in Asia. A new wave of dialogue between all peoples should start with the acknowledgement that we are all bound by the constraints that our environment places upon us, not that which is imposed by political masters – neither materially nor ideologically. There is great fragility both within the East and the West and for too long the bull has been in the China shop – both the beast and the lies. We have a choice and it is neither compliance to the status quo, nor is it acquiescence to a median point between corrupted systems. The china that is our humanity is at stake.

Email: kanda.j@psu.ac.th

Abstract

The purpose of this study was to investigate employees' mental health state, to identify factors related to employees' mental health, and to construct a predictive model. For the present investigation, a self-reported questionnaire was conducted on 173 employees of a manufacturing company located in Hat Yai district, Songkhla province, Thailand in October, 2008. A self-reported questionnaire consisted of Thai General Health Questionnaire version 28 items (Thai-GHQ 28) and work related variables were used for data gathering. Correlation was used to identify factors related to mental health, and to construct a predictive model logistic regression analysis was employed.

Results revealed that most of employees had a normal mental health state. Results from correlation analysis represented that work security, supervisor support, work advancement, and job satisfaction were related to mental health. In addition results from multiple regression analysis indicated that work-related variables explained of 31% of the variance in the mental health state. Between these variables only job satisfaction can significantly predict mental health state.

Keywords: work-related variables, job satisfaction, mental health, employee, manufactory

Introduction

Mental health has become one of the critical problems for Thai people. Based on the study conducted by the Department of Mental Health during August 2007 – February 2008, more than half of the sample group had mental health problems (Department of Mental Health, 2009) In addition, report of the National Health Development Plan (2007-2011) in 2008, indicated that people became stressed due to work problems which were considered as the most affecting factor. The findings were congruent with numerous studies conducted within the past decade, such as the studies by Arakida (2006) Danna & Giffin (1999) Kudielka et al, (2005) Faragher, Cass & Cooper (2005) Marklund et al. (2007). Therefore, a study to identify work factors related to mental health and factors used to predict mental health of employees can be further used as a data base for the prevention of mental health problems and the establishment of mental health development project for employees.

Methods

Subjects

The number of 266 employees of a beverage manufactory located in Hat-Yai district, Songkhla province, Thailand was selected via Simple Random Sampling.

Instruments

Data were collected by using a self-reported questionnaire which is composed of three main parts. Part I, mental health assessment was conducted by using GHQ 28. Part II, A self-constructed questionnaire of 33 items with five rating scales was employed in this study. The questions include work security, work autonomy, workload, supervisors support, co-employees support, and work advancement and job satisfaction. Part III, open-end questions which asking opinions on working problem, problem and obstacles to development, and suggested solutions to problems in developing working conditions.

Data collecting

The data were collected during October, 2008. The questionnaires were distributed to various departments. The appointed time for collecting the questionnaires was within one week after the distribution. There were 173 (65.79%) valid returned questionnaires which were used as the subjects of this study for further statistical data analysis.

Data analysis

Percentages, frequency, means and standard deviations were employed to analyze work factors, and state of mental health. Meanwhile, Pearson Product Moment correlation was used to analyze the relationship between work-related variables and mental health state, and Multiple regression analysis was employed to analyze factors predicting mental health.

Results

Level of mental health

Based on 173 subjects of this study, it was found that most employees (66.47%) have normal mental health. Every work-related variable shows fair mean scores. The support from supervisors has the highest mean scores of 3.09, while the mean scores of job satisfaction are 3.01 and the chance of work advancement shows the lowest mean scores of 2.57

The relationship between work factors and employees' mental health

It was found that work security, supervisors support, chance of work advancement and job satisfaction show negative relations with the mental health state. That is to say, employees who have low work security, low support from supervisors has less chance in advancement and less job satisfaction are more likely to have mental health problems than their counterparts who have higher scores in the above factors. Meanwhile, work autonomy, workload and co-worker support were not related to the employees' state of mental health.

Additionally, It was noted that work-related variables explained of 31% of the variance in the mental health state ($R^2 = .311$, $F=10.63$, $p<.01$.) Within these variables, only job satisfaction can predict mental health state with statistical significance at the level of 001 ($\beta=-.585$).

Discussion and conclusion

The results revealed that work security, supervisors support, chance of work advancement, and job satisfaction show negative relations with the state of mental health. It can be seen that a worker who has low work security, low support from supervisors, has less chance of advancement, and less job satisfaction are more likely to have mental problems than his counterparts who have high scores in the mentioned factors. These findings were consistent with the findings about the relations of employees' mental health with work security (Shankar & Famuyiwa, 1991); the support from supervisors (Danna & Giffin, 1999; Hagihara et al., 1997); chance of advancement (Hagihara et al., 1997; Goetzel et al, 2002; Murklund et al., 2007) and job satisfaction (Gaetzel et al, 2002; Danna & Giffin, 1999)

Moreover, results from Multiple Regression Analysis, only job satisfaction could be employed to predict the employees' state of mental health with statistical significance at the level of .01 which is consistent with the study by Prosser et al (1997) who stated that job satisfaction could be used to predict employees' mental health. In addition, the study by Faragher, Cass & Cooper (2005) identified that job satisfaction is highly related to mental health problems. It could impact exhaustion, self-esteem, despair and anxiety. The strong relationship between job satisfaction and the level of mental health of employees might derive from a person's satisfaction in working, which has been regarded as an important part of life. In fact, it is related to a person's general life satisfaction (Andrews & Withey, 1976, Campbell et al, 1976, Diener, 1984, Rice et al, 1980, Iverson & Maguire, 1999, Cimete, Gencalp, & Keski, 2003). Hence, the level of job satisfaction of employees is the major variables which can be employed to predict employees' mental health.

In conclusion, the results of the current study indicated the effected of work-related variables on employees' mental health. Therefore, the identification of employees with mental health problem and the improvement of their work-related variables should be considered as an important target in the prevention of mental health disorder. In addition we suggest the health promotion program implemented in the workplace improves employees' job satisfaction probably through the acquirement of the appropriate ways of coping with mental health disorder should be considered.

THE ENVIRONMENTALIST MOVEMENT IN OKINAWA AGAINST U.S. MILITARY BASES

EMMA MENDOZA MARTINEZ
Universidad de Colima

Introduction

Both the environmentalist and the pacifist movements in Okinawa have come about as a result of protests against US military bases stationed on the islands since 1945. This paper is focused on the environmentalist movement, which is intrinsically linked to pacifism and the quest for human rights. Two study cases will be discussed: 1) opposition to the construction of the facility that would substitute the Futenma air base in Henoko, and 2) the movement against the construction of six helipads in Takae. Various structural factors that play a part in the historical, cultural, political, economic, social and environmental issues taking place will be analyzed, as will be the organizational aspects of collective action.

Grosso modo, the first protest stage or wave, took place after 1952, when US Occupation of Japanese territory officially came to an end in Japan, yet the governments of both countries agreed to the permanence of military personnel on the Okinawa islands. In the process of expanding and strengthening their facilities, the US Armed Forces began to indiscriminately appropriate the land deemed necessary for their purposes, and in so doing, forcibly stripped peasants of their properties and land – which were, incidentally, their livelihood. The loss of their homes and the ensuing squalor and destitution they found themselves in leads to the death and sickness of both children and adults, which resulted in a group of peasants organizing a peaceful march from North to South of the main island to made their situation known.

The second wave of protest took place in the mid 1960s, with the reversion movement. After coexisting with US military base personnel for twenty years, Okinawa residents wanted the military occupation in the prefecture to end – or at very least, to be awarded a gradual decrease in the number of military bases – and for Okinawa to return to the Japanese administration. Okinawans expected the reversion to Japan would allow them to enjoy both the rights and prerogatives awarded by the Constitution as well as the standard of living prevalent in the rest of the country. Also, the Vietnam War helped to reinforce the population's anti-war sentiment, which called for observance to Article 9 of the Japanese Constitution: a renouncing of war.

The reversion of the islands in 1972, however, resulted in great disappointment for Okinawans, as military bases were to remain in place. Said disappointment led to the fragmentation of the protest movement throughout the island, which in turn resulted in the third protest stage, characterized by the grouping of activists according to their main interests. Some joined the landowners' Constitution-based anti-war movement, which argued their refusal to lease their lands to the US Armed Forces based on their opposition to

war and their desire for peace.¹ Others joined the environmentalist movement, which opposed the development projects postulated by the central government as per its Plan for Promotion and Development of Okinawa, and which was based on the economic policy model called ‘the three Ks’ in Japanese: namely, public works, military bases and tourism.

1995 marked the fourth moment or stage in which a generalized protest of military bases in Okinawa took place following the rape of a 12-year-old girl by a sailor and two US Armed Forces officers. This movement preceded the rising of the environmentalist movement, which was a direct result of the December 1996 announcement of the final report of the US and Japanese governments’ Special Action Committee on Okinawa (SACO). Its goal was that of reducing the burden on the people of Okinawa, thereby strengthening the Japan-US alliance.

The 1996 SACO Final Report² featured the dismantling of Futenma air station, located in the midst of the congested and highly populated city of Ginowan, under the condition that the Japanese government granted the US Armed Forces another site for its relocation. The place suggested by the latter was an area adjacent to the Henoko village.³ The Report also stated the return of an area in the Northern Training Camp, under the condition that the following be observed: “relocate helicopter landing zones from the areas to be returned to the remaining Northern Training Area.”⁴ It was at a later date announced this was to take place within Takae.

Henoko movement

When the Henoko movement started out in 1997, it was not an environmentalist movement, but rather a protest movement against the imposition of a new military base. However, it did from the outset feature pro-environmentalist arguments, which were manifest in slogans such as “Nature, Life and Health: Our Treasure”.⁵ At first, its priorities were the defense of the community’s life and lifestyle, and its specific natural values. Thus, it was the older generation, the elderly people who had witnessed the battle of Okinawa, who most fervently opposed the new base because they were aware of the importance of the ocean and its resources, which had allowed for them to survive during and after the war.

Despite the important first organizational advances in the struggle to protect the Henoko ocean area and valuable and rare species living there, it wasn’t until April 19, 2004 that collective action became fully manifest. The Naha Office for Defense Facilities attempted

to carry out preliminary perforation studies without prior public notification, which caused a fierce reaction in residents of Henoko and neighboring areas.⁶

The reason behind their opposition was the damage the construction of the new base would cause the ecosystem – the dugong and blue coral reefs in particular. Dugong are internationally protected marine mammals who feed off marine grass in waters close by to Cape Henoko and Oura Bay, and of which to date only 30 to 50 individuals remain. On their part, blue finger-shaped corals are endemic to the region.

Takae Movement

In 2006, in the village of Takae, to the north of Okinawa, people began protesting the construction of access roads and six helipads the US Armed Forces intend to use for their Osprey – vertical take-off and landing aircraft that are five times as fast and can carry up to three times the load of CH47 helicopters currently in use.

To oppose the construction of the helipads, Takae locals staged a protest on July 2, 2007, in front of the base's four doors, to stop workers from the Naha Defense Facilities Administration Agency from starting construction activities. Residents have complained that in informative meetings they have been briefed on the results of the environmental impact assessment, on the measures necessary to minimize impact on local wildlife and on the protection of endemic species, but nothing has been said on how any of this will affect the local population, or the community's lifestyle which has for centuries been in harmony with nature through fishing and vegetable bartering.⁷

The main concerns of the population of this village of a mere 150 inhabitants are to preserve their environment, conserve the forest and protect the area's water resources, which supply all of Okinawa, with the purpose of preserving the health and life of their children and of future generations. They also claim the illegal nature of the environmental impact assessment presented by authorities, the fact that their human rights have been ignored, and the shortage of information they are given.⁸

Key Factors in collective action

The Okinawa environmentalist movement in general and the Henoko and Takae cases in particular, are influenced by a series of factors that go beyond the protection of nature. Thus, their protest and opposition also seek to satisfy other types of demands such as the conservation of their calm and peaceful lifestyle in sync with nature, respect to their human rights, and an end to the segregation and discrimination they have historically been victims of and subject to.

The environment

The abundant biological diversity in the Okinawa islands has led to their being termed “Asian Galapagos”. It is said that when travelers in the 19th century arrived to *Loochoos* or Ryukyu, as Okinawa was then known, they marveled at the beauty of its scenery and the fertility of its lands.⁹ The Yanbaru region in particular, north of Okinawa, where Henoko and Takae are located, is known for its rich wildlife. Yanbaru is a 27,000-ha area of subtropical forest and mountain range home to over 4,000 wild species and 23 endemic species, 11 animal and 12 vegetation.¹⁰

Culture

The conservation of nature in Okinawa is closely linked to its culture. In its traditional culture, the Ryukyuan, before being conquered by Japan at the beginning of the 17th century and incorporated to the Japanese administration by the late 18th century, had a great respect for nature. Thus, the dugong, as a sea creature, has always been very important to the Ryukyu population. They have even been presented as mythical beings, a symbol of happiness and abundance, and messengers from the Sea God, who has as such warned people of impending tsunamis.

Just like the sea and its inhabitants are the main cause of the Henoko movement, for the people of Takae, its forests and the wildlife they harbor are their greatest treasure, because they have survived from generation to generation on the resources found therein. However, more to the point is that sea creatures live off the nutrients provided by the forest, which is why “when the forest is ruined, the sea will die”.¹¹

History

The history of Okinawa is filled with endless counts of submission, discrimination and segregation of its people and its culture, led by the government of Japan itself. Said actions are known among Okinawa historians as the *shobun* (処分 – disposal or dispensation).

The first took place in 1879, when Japan’s Meiji government, when commencing the reconfiguration of its policies and its borders, forcibly took the Ryukyu into their administration, granting them the name ‘Okinawa prefecture’ and conquering their people, culture and language.

The second *shobun* took place in 1945, with the bloody Battle of Okinawa, in which almost a third of the civil population died, because neither the army nor the civil population were prepared for the US military attack. However, not only did they endure the military attack

⁹ McCormack, Gavan, *Okinawan Dilemmas: Coral Islands or Concrete Islands*, paper originally published by the Japan Policy Research Institute, 1998, Working Paper No. 45: April 1998, <http://rspas.anu.edu.au/papers/pah/okinawan.html>

¹¹ Sakurai, Kunitoshi, *Development of Environment? – The Past and the Future of Okinawa –*, p. 2, paper presented in the Johannesburg Summit, August 2002.

perpetrated by the United States, but they were also subject to the psychological pressure the Imperial Japanese Army exerted on Okinawans, given their mistrust of them. As a result, many were tortured and executed as they were charged with being spies.¹² Also, Okinawans were brought up to believe it was better to die with honor than to fall into the hands of the enemy, which led to the suicide of many.¹³

The third *shobun* was registered in 1952, when after seven years of US Occupation Japan finally recovered its sovereignty – unlike Okinawa. April 28, 1952, when the Peace Treaty was signed by the United States and Japan, was known as the “Day of Humiliation” in Okinawa, as it was the date when the legal separation of Okinawa from Japan was to take place. Japan allowed the US to maintain indefinite control over the Ryukyus as a cornerstone of its strategy for regional security in the Pacific.

The fourth *shobun* dates back to 1972, when the Okinawa administration is returned to Japan, but the military bases remain, which result in Okinawans being forced to accept the perpetual presence and abuse of the US citizens living in their territory.

It is said the fifth *shobun* is the new Henoko base that is being imposed on Okinawans.

Economic dependency on the central government

Okinawa’s economic dependency on the central government is an influencing factor that limits the environmentalist fight against the Henoko base, and that stops it from turning into an all-island struggle. As a result, the flow of resources to Okinawa has depended on the model imposed by the central government, based on the *three K* system (public works, military bases and tourism) established since 1972, following the reversion of Okinawa to the Japanese administration. The economic dependence of Okinawans on the income created by the bases and on public works and subsidies granted by the central government to silence those who would pronounce themselves against the bases has created a new generation of Okinawans who say of themselves “we are Okinawans of a different kind.” However, Okinawans who make a living directly from the bases can also be grouped in this category, such as landowners who lease their land to the US Armed Forces, or service providers, or those who are after the economic effort-free benefits they receive from the government through subsidies and sympathy budgets.

The military base issue, the prefecture’s depressed financial situation and the lack of employment opportunities¹⁴ and income have caused tension and divided Okinawans.

Given these environmental, cultural, historical and economic circumstances, the movement’s participants have utilized various strategies to defend their fight. To begin, participants and movement partisans are differentiated.

¹³ Suzuki, David and Keibo Oiwa, “The legacy of war” in *The Japan we never knew*, Stoddart, Toronto, 1996, pp. 17, 26, 27.

¹⁴ In Okinawa, unemployment rate is 7.5%, and in Nago, 12.5%; these figures are much higher than the national mean of 5.2% by late 2009.

Participants in the environmentalist movement

The central actors who are taking part in the Henoko and Takae movements are locals from the areas where the new military base and helipads are to be constructed. These people are mainly farmers, fishermen, housewives, teachers, artisans, part-time workers, pensioners, writers and photographers.

In both movements, participating groups have different orientations. There are neighbors' associations, in which the parties directly affected by the construction participate, and there are highly specialized research groups that provide scientific, technical and organizational support. Some of the groups are: Henoko Life Protection Society, Save the Dugong Campaign Centre, the Association of the Ten Districts to the North of Futami That Do Not Want a Heliport, among others. The Takae movement is smaller and is made up mainly by residents' groups such as the Residents' Association that do not Want Helipad and Naha Brocoli, although they also receive the support of various groups.

Partisans

Support is manifested both at group and individual levels, and different interests converge; groups and associations have different orientations. Some which share a concern for the protection of nature are Awase Higata Association, Wild Birds Society of Okinawa, and the Fund to Protect Okumagawa River Basin. Those of a pacifist nature are Save Okinawa Center for Peace Movement, and Okinawa Citizens Liaison Committee for Peace; both share the hope of an Okinawa free from bellicose activities. Among feminist groups is the Women's Association to Make Movement to not Forgive Military Bases and Military Corps, whose goal is to put an end to military bases and military presence, given the abuse they have subjected women to. From the scientific groups stand out the Okinawa Reefcheck & Research Group and the Environmental Assessment Watch Group for the Dugongs in Okinawa, which monitor coral reefs and the dugong. There are even associations of an artistic and recreational nature such as Applause, which supports environmentalist groups through their enthusiasm, songs and music.

There are also organizations such as the Okinawa Environmental Network, which was created in 1997 by the renowned environmentalist scientist Ui Jun.¹⁵ OEN has a more professional personality, and is made up by specialists, researchers and activists with great experience in environmental issues, who study and discuss environmental issues in Okinawa in a comprehensive manner, and look for a consensual solution while looking to their national and international networks for support.

On the other hand, the Citizens' Network for Biological Diversity in Okinawa is an organization that was created in July 2009, with the aim of consensually defining within the different participating groups and individuals the stand this citizen network will present at

¹⁵ Personal electronic communication with Kaori Sunagawa, representative of the Okinawa Environmental Network, January 28, 2010.

the 10th Meeting of the Conference of the Parts for the Convention on Biological Diversity (COP10), to be held in Nagoya, Japan, in October 2010.

Partisans or people who support the movement as individuals are mainly pensioners, members of labor and teacher unions, students, members of the local and prefecture assemblies, as well as researchers and scientists from universities. They all contribute, inasmuch as they can, with their knowledge and expertise. They also provide simultaneous aid to several groups.

Formally, neither the Henoko nor the Takae movements have leaders, but in practice there are people who lead, participate in the communication and negotiation process with authorities, write petitions and decide what should or should not be done, usually in consensus with the local residents, although this is not always the case.¹⁶ These informal leaders are mainly people with previous experience in other social movements, and local, national and international academics and researchers familiar with the *know how*, both technical and organizational, of social movements.

Strategies of collective action

There is a strong heritage of the 1970s movements in mobilization strategies. In fact, the close to 40 years' added experience of some of the leaders of that time remains one of the pillars that guide the action of current movements. However, despite the refusal of some leaders or union members and of the Communist Party, who would maintain the old tactics – mass rallies, manifestations, violent confrontation – a new way of “doing” this movement has come up, and the options available in this new scheme have given the movement a fresh outlook. The most successful strategies have been networking with national and international environmentalist organizations, legal recourse and traditional practices.

National and international networks

This is one of the most commonly implemented strategies since the 1970s. At a national level, one of the organizations which have given the most support to environmentalist movements in Okinawa is the World Wildlife Fund-Japan. The networking strategy has been to work directly with the local residents of the affected areas. Among other actions they do research and publish scientific reports; write petitions and dispatches, which are then translated and sent to other NGOs in the United States; visit Ministries and Diet and local government representatives to persuade them to reject the construction of the new military facilities; and participate in the preparation of alternative Environmental Impact Assessment studies to those carried out by the government.¹⁷

The Nature Conservation Society of Japan has worked at close quarters with the Henoko movement by undertaking research and writing technical and scientific reports that are used

¹⁶ Conflict situations also take place, given that in Okinawa's social structure imposition from the male gender prevails, as does the dominant personality of the activists involved with left wing parties and labor unions.

¹⁷ Hanawa, Shinichi, WWF Japan, Conservation Division, personal communication Tokyo, Japan, October 27, 2009.

to uphold the requests or demands of the various citizen groups or to confront official reports. It has also supported dugong-related cultural-historical research.¹⁸

On its part, Greenpeace-Japan has supported the Henoko and Takae movements. In 2002-2003, it shared its *know how* with Henoko activists in terms of the use of kayaks and blocking, with the aim of stopping workers from the Naha Office for Defense Facilities from starting their activities at the site under dispute. In Takae, they have even made night shifts to support the manifestation.¹⁹

At an international level, the International Union for Conservation of Nature (IUCN) in its various Conferences – Amman, Jordania, 2001; Bangkok²⁰, Thailand, 2004; and Barcelona, Spain, 2008 – has issued its recommendations for the protection of the dugong, the Okinawa rail and the Okinawa woodpecker. IUCN's recommendations, although not obligatory in nature, have nonetheless exerted a strong influence on Diet members, who have created commissions and submitted petitions to the government.

Legal recourse

Legal trials have been one of the most effective resources the Henoko movement has used to oppose the project for the construction of the new base. After several limitations that were envisaged for starting a legal trial against the US Department of Defense (DoD), the Japan Environmental Lawyers Federation together with Henoko activists and some tenacious Okinawa activists, supported by Peter Galvin from the Center for Biological Diversity²¹ and represented by Earthjustice, a firm of US environmentalist lawyers, began a trial in 2003 against the Pentagon and its Secretary, Donald Rumsfeld. Their lawsuit was geared towards the violation of the National Historic Preservation Act (NHPA) Section 402, for failing to take into account the negative effects the military base construction plan would have on the dugong population.²² The lawsuit proceeded as the dugong is registered as a “natural monument” on the Japanese Register of Cultural Properties, a law equivalent to the US National Register, and the NHPA has an “International” clause which could allow a case in a foreign country to be tried in US courts.

After some interpositions, at long last, on January 2008, the San Francisco District Court gave the plaintiffs the summary trial which established that “the accused had failed to meet NHPA Section 402 criteria, and thus the case was suspended until new information was created that would make it possible to evaluate the effects the new facility that was to substitute Futenma would produce on the dugong, and until the defendants took this information into account to avoid or mitigate said adverse effects on the dugong.”²³

Traditional practices

Traditional beliefs and practices are strategies the movement resorts to, not in a fully rational manner, but as regular and spontaneous community practices, although at the end of the day they meet the goal of recruiting adherents and strengthening community links in Okinawa society. An example of this lies in the interest in rescuing old legends on dugong. These folk tales or legends are popular, so there is the possibility of having more people be attracted to the idea of playing a part in the fight against the new Henoko military base.

The Full Moon Festival is also an activity that is rescued from their traditional practices, and that contributes to spreading the environmentalist and pacifist movements. It is a time ripe for socializing, and making their culture and traditions manifest through rites, prayers, music, dance, songs and poetry, while also providing an opportunity for the exchange of information and opinions among members of the participating organizations, and for spreading information to the general public. Consequently, the movement wins adherents and partisans who will share the same interests and concerns.

Conclusions

The chapter was called “The Environmentalist Movement in Okinawa against United States Military Bases” because regardless of the existence of other environmentalist movements that are unrelated to US military presence, the two study cases discussed in this work rise from their opposition to the new military facilities the government of Japan and the US Armed Forces are planning on building.

Throughout the research, it was also explained why the environmentalist movement in Okinawa is not only geared towards the protection of nature and the conservation of biological diversity, but also why it is a movement that also fights for human rights, peace and the right to self-determination, in response to the lengthy US military presence following the defeat of Japan in World War II and the commitments established between Japan and the United States outlined in the 1960 Security Treaty. Counts of abuse and rape of US military personnel against the inhabitants and nature of Okinawa are numerous: sexual abuse of women, hit-and-run accidents, damages caused by the plummeting of aircraft and disturbance of people’s privacy in their own homes, plots and groves. Likewise, damage caused to nature is countless: felling of trees, clearing and leveling of lots, forest fires due to artillery practice activities, earth and water pollution from chemical substances, cartridges and waste that are left behind. Pollution can also be traced to US military

²³ Taira, Koji, “Okinawan environmentalists put Robert Gates and DOD on trial, the dugong and the fate of the Henoko air station”, *Japan Focus*, July 17, 2008, <http://www.japanfocus.org/-Koji-TAIRA/2822>.

personnel's unburied fecal matter.²⁴ Even, during survival drills military personnel can at times hunt birds or other endangered endemic species.

The slogans *nuchido takara* - "life is treasure" and *Furusato ha takara* - "our hometown is a treasure", contain and reflect the historical experience and aspirations of environmental movement participants and of many Okinawans who experienced the Battle of Okinawa. They know the resources offered them by nature were crucial to their survival. Also, after 65 years of living closely to with US military personnel, one of their greatest aspirations is that Okinawa be exempt from all and any bellicose activities. Okinawans are happy with their own calm, peaceful lifestyle, in which they can enjoy the sea, the forest and the opportunities for social interaction and its cultural and artistic expressions. Thus, in their struggle, the defense and rescue of local natural and cultural values is of utmost importance.

These features are a result of both their history and their culture, and are also present in the Henoko and Takae movements, which have been positioning themselves and gaining strength given the external conditions provided by the international environment. In both cases there is an immense struggle for peace and the defense of human rights, which are crucial issues in government and non-government organizations, and which affords these movements greater ease in terms of networking, feedback and receiving specific aid from different sources. However, the fact that the US is involved in these matters also plays a part, as this helps the media attract public notice.

Given the above, the environmental movement against military bases in Okinawa makes a contribution both within and outside. Within, because the movement claims elements of its own culture and identity, such as harmony with nature as was learnt from their ancestors' traditional practices; satisfaction with their calm and peaceful lifestyle; the freedom to choose their present and their future; and the desire to pass on to their children a healthy and safe environment. On the outside, the movement is a shared one; it is reinforced by and contributes to movements in different parts of the planet that seek to attain global aims.

The Full Moon Festival's slogan, "Round planet, round moon, round heart", more than a simple invitation or a mere slogan, can also be seen as a call to public participation and awareness in the sense that the problems faced in Okinawa are not only theirs, but those of the world, and that solving them will result in everyone's benefit.

Reflections on a Paradox: Seeking Peace in a Violent World

Marcus H. Martins, Ph.D.

Brigham Young University-Hawaii

In October of 2006 I spoke at the plenary session of a professional conference on families in Kuala Lumpur, Malaysia, and in my remarks I offered examples of religious beliefs conducive to positive relationships in families. Once the three keynote speeches were concluded, the chair opened the session for comments and questions from the audience. At one point a gentleman in the audience started criticizing one of the other speakers in a loud voice and angry tone. Then he turned to me specifically and started accusing religions in general for all the violence and extremism in the world.

About a month later, in England, an interview with British songwriter Sir Elton John was published, in which he stated: *“From my point of view I would ban religion completely, even though there are some wonderful things about it. I love the idea of the teachings of Jesus Christ and the beautiful stories about it ... But the reality is that organised religion doesn't seem to work. It turns people into hateful lemmings and it's not really compassionate.”*¹

In my opinion these two events reveal symptoms of a growing frustration that people everywhere may be feeling not just about the widespread violence and extremism in the world, but especially about the seemingly apathetic approach traditional religious denominations have undertaken to deal with this problem.

Elusive Peace, Pervasive Violence

Peace is defined in dictionaries as a state of security or order provided by law or custom, a state of being free from conflict, confusion, disturbance, or harassment. Peace may also be defined as a state of harmony, mutual concord, and esteem in human relations, and also as a mental condition free from disquieting or oppressive thoughts or emotions. In other words, we can describe peace as a state of general welfare and absence of conflict experienced when there is physical wholeness, emotional maturity, spiritual nourishment, generated by harmony and order, having obedience to laws as a necessary condition for the existence of harmony and order.

However, it seems that never in recorded history there has ever been worldwide, lasting peace. Whenever peaceful conditions were reported to exist, it has always been on a regional scope and for a relatively short period of time.

The yearning for permanent peace seems to be an universal aspiration, but we seem unable to reach it, for reasons apparently beyond our control. In fact, we live in a world so filled with violence that we take for granted that even our entertainment is often of a violent nature.

Several years ago at a college in the United States, before starting a class on a Monday morning, I asked my young students—almost all in their freshman year—if anyone had engaged in a great

¹ [The Observer Music Monthly](http://observer.guardian.co.uk/omm/story/0,,1942193,00.html), Sunday November 12, 2006 - <http://observer.guardian.co.uk/omm/story/0,,1942193,00.html>

activity during the previous weekend. Among the respondents was a young man who told us that he had had his “dream date” that weekend. He explained that he had been wishing to invite a certain young lady for three months, and that on that weekend he finally realized his dream, and then he proudly added: “We had a great dinner and after that we played paintball.” There were “oohs” and “aahs” from the other students, but perhaps betraying an ever-expanding generational gap, I was surprised by that last remark.

So I asked him: “Let me see if I got this straight: You waited three months to ask the girl out, and when you finally did, you shot her?” He smiled and answered: “Oh, it was just paint ...” I insisted: “Yes, but you pointed a paint gun and her and shot her, right?” He replied: “Yeah, but it was just for fun ...”

This is just a simple example of how desire for peace while accepting violence as normal seems to be an inevitable paradox. If that was restricted to entertainment, perhaps it would be a subject of interest, but possibly not one of grave concern on a global scale. However, violence in the current era is a problem so complex that it feels overwhelming to the average person, and challenging to even the most experienced political and military leaders. The interconnected nature of the contemporary world, with its complex networks of international trade and finance operating around the clock at mind-boggling speed and volume, has made violence a global affair regardless of where it takes place. A car bombing anywhere in the world takes place with explosives imported from thousands of miles away, financed by loosely-connected organizations operating in several other countries using electronic transactions to fund terroristic attacks. Nothing is entirely local anymore.

Science and philosophy alone have not been able to save us from violence, and because of the nature of contemporary threats caused by loosely-connected terrorist groups, military power will likely only beget more violence. Drug traffickers, terrorists, and other warmongers who will stop at nothing to shed blood, as long as it brings them some perceived advantage. The world has had plenty of scholars, plenty of philosophers, plenty of diplomats, plenty of poets and playwrights, plenty of peace activists—most brilliant and inspiring. Yet, in the end it is always the politicians and the generals who end up having their ideas implemented in the streets. All because violent attacks often come through those who no longer care about philosophy or diplomacy.

Global Interaction, Centuries-Old Feuds

For most of the recorded history of the world, existing technologies did not allow most of the world population to travel more than a few miles from their birthplaces during their lifetime. Today, international travel has reached proportions unimaginable just half a century ago. With this ability to travel comes closer interaction among nations and cultures, with the consequent clash of cultures, beliefs, and worldviews. When most of the world population lived in isolation, exclusivist discourses could be the norm, since most “outsiders” would never hear them anyway. But now that interaction with nations and cultures is a daily affair on the streets and in cyberspace, competing worldviews are readily available, and peaceful coexistence has become more difficult.

However, as people in a globalized era interact on a larger scale, they become exposed and to some extent affected by the postmodern predicaments described by Zygmunt Bauman (1992): institutionalized pluralism, variety, and ambivalence. Peter Berger (1967) suggested that the validity of a system of thought would be accepted without questioning (or taken for granted) until a problem arises that openly puts in question that validity. Despite political indoctrination and strong party affiliation, long-term interaction with other societies may create an awareness of inconsistent or ineffective traditional cultural practices and ways of life. Different forms of educational, political, and social structures and institutions (like religious denominations, families, and other forms of social relationships and associations) are then compared against foreign structures and institutions. These repeated evaluations and comparisons may force these structures and institutions to lose plausibility. And when people are confronted with challenges to their heartfelt beliefs, they often will defend those beliefs, even to the point of resorting to violent rebuttals.

Extremism then enters the picture as an attempt by ethnic, political, or even religion-related groups to advance their agendas through violent action fueled by radical discourse. Groups may resort to these tactics after efforts to advance their agendas through non-violent methods have been repeatedly unfruitful. Such agendas may include attempts to restore social or political orders from previous centuries, or to avenge wrongs perpetrated in earlier times.

In the first case, we see attempts to establish theocratic regimes, such as in the case of medieval Europe or in a few predominantly Islamic societies. All were or still are trying to establish the kingdom of God based on their own interpretation and understanding of what that kingdom should look like. The problem is that historical efforts to establish a theocracy always required geographical isolation and also then-living prophets or other powerful charismatic religious leaders who would claim contemporaneous, at-hand, divine guidance, not mere adherence to prescriptions found in religious texts from yonder eras. In the absence of those elements, modern-day efforts to establish theocracies will inevitably produce tensions and eventually irresolvable conflicts with the “outside” world.

The other case—those groups attempting to avenge wrongs of old times—are pursuing an effort that will likely only produce frustration due to its impracticality.

Let me illustrate that impracticality with a personal example. I was born in Brazil, a descendant of African slaves and Portuguese slaveholders. It is possible that my existence today may be the result of a Portuguese slaveholder’s sexual abuse of one of my African grandmothers at some point in the last 200 or 300 years. Should I, in the early 21st century, rant against Portugal and advocate war against that former colonial power for its sponsorship of slavery in centuries past? Most would consider that to be unintelligent. Or, taking another example, Spanish conquistadors some 500 years ago were responsible for the pillage of great pre-Columbian civilizations in Mexico, Peru, and other nations in Central and South America. Would it be reasonable for any Latin American nation to declare war against Spain today in order to avenge those wrongs of centuries ago?

Yes, mistakes were made by colonial and imperialist powers through the centuries, but there is not much anyone can do about them today. One cannot fight a medieval war in the 21st century.

We cannot change the past, and pursuing a violent agenda of revenge in the present will not correct anything.

Religious Traditions and the Peace Process

The pervasive influence of religion on the individual level has been discussed by many researchers. For theorists like Rudolf Otto (1923) the transcendent realm reached through religious experience provides a sense of ultimacy that has a powerful effect on the minds and dispositions of most religiously-oriented individuals. The major challenge, as far as possible practical implementations are concerned, is to find an effective way to bring the elements of this transcendent realm into the public secular discourse.

Yet, even in religious life we find the paradox of a search for peace amid violence. Sacred texts from many major world religious traditions contain narratives of divine accomplishments filled with metaphors and imagery related to war, battle, or conflict. Almost without exception these texts acknowledge the existence of evil and the need to battle and ultimately defeat it in order to forever consolidate the supremacy of good.

Of course, I disagree with the idea that religion is responsible for the violence and extremism we see in the world today. Extremists of all sorts in the world have often “hijacked” religion, that is, used it as an excuse, to try to legitimate their violent agendas. That misuse is plainly wrong and unacceptable. That is why I categorize such groups as “religion-related,” and not as “religious groups.”

Extremists have throughout history used terror as a tool to intimidate populations and prevent the exercise of human freedoms. Considering the worldwide impact of major terrorist attacks in recent years, let me clarify in the strongest way possible that this has nothing to do with Islam per se. One should keep in mind that even within Christianity one can find cases of extremist groups out of step with mainstream religious denominations or traditions. For example, the campaign of terror in Northern Ireland that lasted from the 1960’s until the late 1990’s, with bombings and political assassinations was perpetrated by Christians—some Catholic, others Protestant. No reasonable person in those decades would have blamed either the Catholic or the Anglican churches for the Irish paramilitary organizations’ acts of violence.

There are today in the United States of America white supremacist groups of all kinds who are in many cases practicing Protestants, and often they attempt to use the Bible to justify their racist views. No reasonable person would blame the Bible or Christian Protestantism as a whole for such misconstruction of the Christian message.

As a powerful force in shaping people’s lives, religious traditions must unite their efforts in addressing world problems. Traditionally most denominations have looked “inward,” that is, they seem to be primarily concerned with the welfare of their local congregations and not with the world at large—a “someone-else-will-take-care-of-that” approach to world predicaments. Therefore, while moderates take care of their respective flocks, who is minding the rest of the world? In the absence of anyone else, the extremists seem to have taken charge of that.

So, I am arguing that major religious traditions and their diverse denominations and communities—whether Christians, Muslims, Buddhists, Hindus, Sikhs, etc.—must unite their efforts and together address a matter of not just global importance, but also one that now threatens the continuation of human life on our planet. That will require on the part of each religious tradition an interesting balancing exercise in dialoguing with other traditions which also claim historical or divine approbation while at the same time holding fast to their faith's basic tenets and claims.

New Enemy, New Approaches

As we consider extremist groups that now resort to terror tactics to further their agendas, we find rampant hatred at the root of their actions. Therefore, we can say that the real enemy of peace in the early 21st century is the spread of ideologies founded on hatred.

This is no longer a matter of identifying terrorist organizations or extremist groups. For example, it may very well be said that Al-Qaeda has evolved into more of a “shared concept” than simply a loosely-connected network of terrorists. The expression we hear on newscasts “an operative with links to Al-Qaeda” may now be understood as someone who has adopted Al-Qaeda's rhetoric and/or its violent modus operandi without having any concrete connection with that organization. I suppose that people in a number of countries around the world cheer for Osama Bin Laden just because of his now almost legendary status—similar to how Fidel Castro is applauded in leftist circles in Latin America—as the proverbial underdog who stood up against a historical colonial or imperialist power and survived to laugh about it.

Fighting a “shared concept” is not as simple as fighting another nation. There are no traditional armies and no traditional battles, because attacks will be perpetrated by “lone wolves” acting without any centralized command and no direction. Incidentally, I am tired of seeing in newscasts the same video footage of one suspected Al-Qaeda training camp in Afghanistan. I don't know whether those camps might still exist, and I'm puzzled by the image of those militants engaged in fitness exercises prior to blowing themselves up. And yet, like Timothy McVeigh in the United States, bombings and other deadly violent attacks can be perpetrated by people with little more than an internet connection, a credit card, and an almost inconceivable level of hatred. The enemy of this new era is someone who can be virtually “invisible” among the multitudes of any major city in the world. No conventional army can be effective against this type of enemy.

Let me stress this point for a moment, since this is crucial: In previous eras of human history, it took the combined force of armies and military technology developed with the support of a national economic system to destroy another nation. Today, a single individual with little more than a credit card and a fast connection to the Internet has the potential of unleashing an attack that could bring a national economy to a standstill within hours.

The traditional approach has been to refuse negotiations with terrorists and to try to “root them out” using conventional armies with automatic weapons and “smart bombs.” But bombing entire neighborhoods in the hopes of destroying these “lone wolves” is inefficient and problematic. A permanent escalation of bloodshed is the only likely outcome, since many innocents are killed in such traditional attacks. And then, relatives and friends of those killed might attempt to avenge

those deaths, and when they themselves are killed, other relatives will take upon themselves the avenging duty, and so on. No traditional military operation can stop this escalation of hatred and violence. And the arbitrary killing of civilian populations in pre-emptive strikes is morally indefensible.

Unfortunately, the nature of the modern conflict—deadly attacks perpetrated by “lone wolves”—dictates that adherence to 20th century policies will leave no room for 21st century solutions.

A new approach would necessarily include more direct personal contact with peoples in regions of the world prone to such problems, more dialogue, more bridges of understanding, all leading to negotiated solutions that may bring a certain degree of general peace to the world. The only other alternative—a morally indefensible alternative, I should stress—would take us from retaliatory act to retaliatory act, in an ever increasing escalation of disproportional retaliatory acts until we would find ourselves destroying villages, cities, entire regions, and eventually entire nations—mindlessly committing unforgivable crimes against humanity in the name of national defense but with the conscience of a 15-year-old playing a violent video game.

The conflict in Northern Ireland seems to have been resolved through a negotiated solution. In the Middle East, Egypt and Jordan ceased decades-old hostilities against Israel by means of negotiated solutions. Likewise, I wonder whether negotiation may be the solution to many of the current predicaments.

But then difficult—and perhaps to some, unpleasant—questions arise: Would anyone support negotiation with known extremists? What if at some point in time they would agree to cease hostilities—would our societies be willing to accept the idea of exonerating them so that a lasting peace agreement might be reached? I confess that I am not competent to answer such divisive questions.

But given the impact and influence of religion in most societies, I still argue that major religious traditions and their diverse denominations and communities must unite their efforts and together address this matter. Although at the moment there is no global organization responsible for this, I wonder whether religious organizations might be able to come together in the realization that restrained responses have not produced any visible effect, and that they must find a way to rein in extremists and those who support them. This is more than just a matter of good public relations—it is a matter of survival for the entire world.

We cannot change the past; all we have is the power to determine how we are going to live in the present, and to teach our children and grandchildren to live in peace, and use whatever influence we have with others to invite them to live in peace. If we adopt a passive conduct, and do nothing, thus allowing things to continue to escalate continually, the world may eventually come to almost irredeemable desolation. If that would ever happen, future generations would not have much of a world left to enjoy.

Pseudo-positive discourses of ageing, Chin-Hui Chen, Cardiff University, Centre for Language and Communication Research

Introduction

The aim of this paper is to examine the ideologies behind advertising texts marketing over 50s life insurance products in terms of the representation of older age. This study falls in the research areas of ageing, mass media and discourse. To align with the theme of the ACAH conference “East Meets West”, this study uses data from the UK and Taiwan in a cross-cultural comparison.

Ideology, media communication and the social construction of ageing

Ideology is of special interest to this research because of the part it plays in the success of media communication. Ideologies, according to Fairclough and Wodak (1997: 275), are “particular ways of representing and constructing society which reproduce unequal relations of power, relations of dominance and exploitations”. They can be ideas, manipulated and reproduced in the interest of power-regulating agents (Blommaert 2005:163), such as the media. Ideologies are believed to activate the “hidden power” of media discourse (Fairclough 2001). The nature of mass media communication, like face-to-face interactions, is also interactive, involving negotiation between the message sender and receiver (Simpson 1994:121-2). Ideologies are devices through which such negotiations are enabled and “subject positions” (Fairclough 2001:41) are constructed for message receivers. That is why decoding the ideological presuppositions in advertising texts is important. As Coupland (2007:40) maintains, advertising texts are persuasive because they “tap into pre-existing ideologies and stimulate concerns and aspirations consistent with these ideologies”.

In this paper, I attempt to examine the discursive mechanisms through which certain ideological implicatures about older age are invited in the process of producing and interpreting advertisements for over 50s life insurance products. The purpose is to identify whether there are potentially ageist orientations taken for granted for marketing purposes. This concern is expressed in some of the literature on discourse, advertising and ageism (e.g. Ylänne-McEwen 2000; Coupland 2003 and 2007).

Ylänne-McEwen (2000) examined promotional brochures of holiday packages for older customers in the UK and found that the naming strategies of holidays convey youth-oriented metaphors. The consumption of holidays was positioned as a lifestyle choice, more specifically, the choice of an adventurous, fun, active and romantic lifestyle. Despite the promoted lifestyle, ageist ideological implicatures, however, can be inferred in the emphasis on communalism, and assurances of familiar activities such as the arrangements of afternoon tea. As argued by Ylänne-McEwen (2000),

Pseudo-positive discourses of ageing, Chin-Hui Chen, Cardiff University, Centre for Language and Communication Research

older customers are presumed to be dependent, feeling insecure and relying on daily rituals.

Coupland (2003 and 2007) also revealed ageist ideological presuppositions in UK print advertisements promoting anti-ageing skin products. Her findings suggest that ageing is ideologically positioned as a target to be repaired, remedied and corrected through the use of battle metaphors. The “unwatchability of old age” (Woodward 1991) is reinforced as a moral imperative normalizing body management for marketing purposes.

Both of the above studies have suggested that the problematising of older age is naturalised to legitimate the promoted products and it is rather indirectly conveyed. This study intends to explore whether this trend can be generalized in advertising texts for over 50s life insurance products, which also target the ‘grey market’. Following Yläne-McEwen (2000) and Coupland (2003 and 2007), a critical discourse analytical perspective is utilized to unravel ideological presuppositions about older age.

Methodology

Critical discourse analysis, according to Fairclough (2001), can be broken down into three inter-related stages: the stages of description, interpretation and explanation. Fairclough’s view on language is multi-functional. That is, language functions as text, discourse practice and social practice. Based on Fairclough’s perspective (Fairclough 1995 and 1995), certain linguistic features (such as overwording, metaphors, pronouns, modes, logical connectors between sentences, etc.) in a text are targeted by critical discourse analysts because certain ideological resources are evoked through them in a discourse practice (the process of producing and interpreting a text). Ultimately, the analyst should be dedicated to the explanatory function of discourse analysis by focusing on how the examined linguistic features reproduce or violate social structures (discourse as a social practice). This study is conducted accordingly.

Samples

The data selected for the analysis in this paper include three UK and three Taiwanese TV advertisements promoting over 50s life insurance products (examples 1-6).

Example 1: UK 1999 Sun life Over 50s Plan

Example 2: UK 1999 Cornhill Direct Senior Security Plan

Example 3: TW 2007 Alico

Pseudo-positive discourses of ageing, Chin-Hui Chen, Cardiff University, Centre for Language and Communication Research

Example 4: TW 2007 CIGNA

Example 5: TW 2007 CIGNA

Example 6: UK 2005 American Life

They were convenient samples obtained to compare the differences in the ways in which older people are represented in the advertising texts of interest. There is a longer history of TV promotion of the target product in the UK so the selected UK examples could date back to 1999, while the Taiwanese examples, as comparisons to the UK examples, are relatively recent. This is because the over 50s life insurance products were only recently introduced in Taiwan in late 2006.

Southern Min and Mandarin Chinese spoken in the Taiwanese examples are transcribed into the Taiwan Language Phonetic Alphabet system and the Han-yu Pinyin system. Southern Min is presented in bold and italic 10-size font in the transcripts.

Due to space limitations, only partial transcripts are provided in the paper but full drafts can be obtained from the author upon request.

Youth-oriented positions as legitimating devices

A youth-oriented subject position (Fairclough 2001:31) is often constructed for target customers in the marketing of over 50s life insurance products both in the UK and Taiwan.

For instance, the first example (UK, Sun Life Over 50s Plan, 1999) begins with an ideological frame that distances the target audience from their chronological age (lines 1-3). Through the voice of John Craven, an ingroup member of the target audience, the age denying stance in the first three lines is presented as if it should be shared by the target viewers (over 50s, line 6). Instead of one's chronological age (over 50s), a "younger" cognitive age is suggested to be not only possible but also preferable (line 3) along with a positive evaluation (line 5) of the status quo.

Example 1:

John Craven, a British media presenter and aged over 50, is portrayed presenting Sun Life over 50 plan. He is depicted walking his dog in the countryside. The following extract is what he says in the commercial.

1 they say you're only as old as you feel

2 so in that case

Pseudo-positive discourses of ageing, Chin-Hui Chen, Cardiff University, Centre for Language and Communication Research

3 I'm just a youngster

...

5 in fact life has never felt better

6 if you like me are over 50

7 then you've reached the age when you need to start thinking about the future

As suggested in lines 22-23 (see below), the consumption of the advertised life insurance product is presented as enabling the realisation of a youth-oriented ideology. In other words, the ideological frame of distancing older age actually prepares the transformation of the commodity into a consumerist solution for those consumers who want to transcend old age.

Example 1:

22 Staying young at heart is easy when you are taking care of the future

23 with the Sun Life over 50 plan

The second example (UK, Cornhill Direct Senior Security Plan 1999) shows a similar ideological focus by constructing a counter-stereotypical lifestyle as the consequence of the consumption of the advertised product.

Example 2:

An older woman is portrayed talking about Cornhill Direct Senior Security Plan.

1 mum she says (.) It must be great when you get to your age

2 you haven't got a care in the world

3 you're healthy (.) you can do whatever you want

4 I suppose she is right

5 for the first time in years I can take it easy

6 especially now I know the future is taken care of with Cornhill Senior Security Plan

...

11 so (1.0) how will I spend my (.) twilight years?

12 looking after my grandchildren? (.) baking cakes? (.) knitting (.)

13 all the things that grannies are supposed to do

Tango music is on in the background with the female presenter dancing with a sexy, young and handsome male partner

(Example 2, Cornhill Direct Senior Security Plan, UK, 1999)

The second example begins with a direct reference to a third person's voice (the presenter's daughter) about how older age is (traditionally) perceived and ends with a

Pseudo-positive discourses of ageing, Chin-Hui Chen, Cardiff University, Centre for Language and Communication Research

choice between playing the traditional role of a grandmother or leading a rather different lifestyle, embodied visually in the female presenter's dancing the tango with a young man. The contrast between an age-bounded tradition (being a grandmother, lines 11-12) and the violation of it is prepared to position the consumption of the advertised product as "a choice of lifestyle". The chosen (or proposed) way of ageing in this advertisement directs the audience to disassociate themselves with age-related norms (the perfect grandparent stereotype) and live as "individuals" following their interests ("do whatever you want" line 3). Such kind of lifestyle is implied as a consequence of the advertised product (as suggested in "so", line 11).

The emphasis on lifestyle choice as a legitimating device of the advertised products is not observed in the UK examples produced in more recent years (a point to be clarified later). However, this strategy is reproduced in two Taiwanese examples broadcast in 2007 (ex. 3 and 4).

Example 3 (Alico, 2007, Taiwan)

The presenter, Shi-ying is featured asking the question to some older men who are playing baseball and labelled as Male 1, 2, 3, and 4. The baseball players are depicted wearing their baseball caps back to front.

7 Shi-ying: *siann mih po hiam?*=

8 male 1&2: = rang wo men gen nian qing ren

9 male 1&2: xiang shou tong yiang de bao zhang

10 male 3: yi ding bao (the product name)

(A elderly man, labelled as Male 4, is featured running base successfully and facing to the camera)

11 male 4: nian qing ren ke yi wo men dang ran ye ke yi

English translation of Example 3:

7 Shi-ying: what is the life insurance policy?=
8 male 1&2: = which allows us like youngsters

9 male 1&2: to enjoy the same cover

10 male 3: yi ding bao (the product name)

11 male 4: youngsters can and of course so can we

The integration of the verbal and visual messages in the above extract informs the nature of the lifestyle the advertiser attempts to sell in relation to the product in example 3 (Taiwan, 2007).

Pseudo-positive discourses of ageing, Chin-Hui Chen, Cardiff University, Centre for Language and Communication Research

Arguably, a golden ager lifestyle is reinforced to justify the consumption of the product in example 3. This stereotype (Hummert et al. 1994) highlights attributes such as highly active, fun-loving, healthy and competent, which are reflected in the visual representations of the older male characters playing baseball. They are socially active (with friends), physically capable (running fast) and perhaps also acting young (wearing their baseball caps back to front).

Different from the UK examples 1 and 2, the link between the promoted lifestyle and the consumption of the advertised product in example 3 is not very clearly articulated, such as through textual properties, such as conjunctions to show cause-effect relations. However, the evoked ideological resources (the golden ager stereotype) do define the consumer community in a certain way. The subject position is offered to those who identify with the promoted picture of later life. In sum, people consuming the advertised product are made to feel “socially empowered” in the young-old contrasts (being equal to youngsters, lines 8-9 and 11) and perhaps “young at heart” (acting youngster-like).

Lifestyle choice positioned in relation to product consumption continues in example 4 but this time, the promoted lifestyle is leisure-oriented (“*huann ging tau tin lai iu lam a*”, meaning, “welcome to travel together” line 2). The consumption of a life insurance product is portrayed as a promise for an “independent” (“*kho lan ka ti*”, meaning, “on our own” in line 17) and well-travelled lifestyle (“*lan ma e tan lai khi iu tai wan*”, meaning, “we can travel around Taiwan” line 17). Again, a golden ager stereotype is reinforced to justify a product needed upon one’s death.

Example 4 (CIGNA, 2007, Taiwan):

1 Liao-jun: *o ji san o pa sang*

2 Liao-jun: *huann ging tau tin lai iu lam a*

...

13 Liao-jun: mei tian bu dao san shi qi yuan

14 Liao-jun: jiu you zhong shen bao zhang la

15 M3: *lan la koo ho ka ti*

16 M3: *si se to bian chau huan*

17 M3: *kho lan ka ti lan ma e tan lai khi iu tai uan*

(Someone says yes in the background and everyone laughs)

English translation of example 4:

1 Liao-jun: older men and women

Pseudo-positive discourses of ageing, Chin-Hui Chen, Cardiff University, Centre for Language and Communication Research

- 2 Liao-jun: welcome to travel together
...
13 Liao-jun: with less than 37 dollars a day
14 Liao-jun: then have life-long cover
15 M3: if we take care of ourselves well
16 M3: our children will not worry
17 M3: we can travel around Taiwan on our own

Discursive representations of death

The very thing for which life insurance products are created for is the (financial) preparation of death. Presumably, the justification for life insurance products is grounded on the uncertainty of when death may arrive. Nevertheless, the ideological focus of the first four examples seems to mitigate the association with impending death. As the denial of chronological age or violations of age-graded stereotypes are foregrounded, the inevitable consequence of ageing, namely, death, is treated as a taboo in the first four advertisements. Hence, death-related topics are expressed euphemistically (see the following extracts).

- 6 if you like me are over 50
→ 7 then you've reached the age when you need to start thinking about the future ...
9 If you'd like to leave something behind for your loved ones
(Example 1, UK, 1999)

- 5 For the first time in years I can take it easy
→ 6 especially now I know the future is taken care of with Cornhill Senior Security Plan
(Example 2, UK, 1999)

- 8 covers are made for the rest of my life for just eight pounds a month
→ 9 I can get my family a lump sum when they need it most
(Example 2, UK, 1999)

In examples 1 and 2, “the future” is a temporal phrase mentioned together with the reference to age-related expectation (lines 6-7, example 1) and the utility of the advertised product (line 6, example 2). What exactly “the future” signifies is not clearly stated and is left to be inferred by the audience on the basis of their pragmatic knowledge about what life insurance plans basically are (i.e. paying a lump sum upon the policy holder's death) and the stereotypical association between old age and impending death. Furthermore, the time one dies is indirectly referred to as “when

Pseudo-positive discourses of ageing, Chin-Hui Chen, Cardiff University, Centre for Language and Communication Research

they need it most” in example 2 (line 9). Pragmatically, the target audience is expected to be able to infer that it is the time when the presenter dies. This is because life insurance plans mainly function as a financial protection for those left behind. However, when the time of death is discursively represented in this way, there is literally a high degree of ambiguity, which indicates an intention to avoid explicit expressions regarding death.

As to examples 3 and 4 (TW examples, 2007), there is only the absence of topics related to death (hence, no extracts provided). There is no reference to funeral expenses and the point of time when a life insurance product is needed. The discursive strategy of “silencing” death in the two Taiwanese examples, arguably, shows the death-denial ideological stance, to a greater extent, as opposed to UK examples 1 and 2. Even though there is one Taiwanese example (example 5, see below) featuring the theme of bereavement (lines 16-18, example 5), euphemism can also be detected in the reference to death, for instance, “ren zou le” (Mandarin translated as “people went away” line 16), “hit kang kau” (Southern Min, translated as “that day comes”, line 19), and “li khui” (Southern Min, translated as “to leave”, line 20). Hence, Taiwanese examples either silence or euphemize the expressions related to death.

Example 5 (CIGNA, Taiwan, 2007)

An old lady, labelled as L2, is featured conversing with a guest, labelled as G, who intends to give her some money but is refused. Both of them are dressed in black. The old lady looks sad and sobs. The background is a dark and indoor setting, presumably the lady’s home.

16 G: ren zou le zong yao hua qian de

(trying to give L2 money)

17 L2: xie xie ni bu young le (refusing to take the money)

18 L2: zheng de bu young le (sobbing)

19 Liao-jun: *tioh sng hit kang kau*

20 Liao-jun: *lan ma e tang an sim li khui*

English translation of example 5

16 G: after people are gone, there is always a need to spend money

17 L2: thank you. There is no need (refusing the money)

18 L2: really there is no need for the money (sobbing)

19 Liao-jun: even if that day comes

20 Liao-jun: we can also leave with peace of mind

Pseudo-positive discourses of ageing, Chin-Hui Chen, Cardiff University, Centre for Language and Communication Research

However, in contrast to the above five examples, the next UK example (example 6), broadcast in 2005, begins to demonstrate relatively bolder strategies in discussing death. Furthermore, as compared to the UK examples produced much earlier (1999), the ideological focus has changed from constructing a ‘golden ager’ lifestyle to justifying the preparation for death

Example 6 (American Life, UK, 2005)

- 1 birthdays anniversaries
- 2 it always seems to be someone’s special day
- 3 when you get to our age
- 4 it’s important to think about giving something more to your loved ones
- 5 the guaranteed 50 plus plan from American Life helps you plan for the future
- 6 and ensures that your affairs will be looked after when you’re gone
- 7 It’s a simple and affordable type of life insurance that
- 8 pays out a cash lump sum when you die to leave for your family to
- 9 help pay towards funeral expenses
- ...
- 20 Act now and get the best gift of all (.) peace of mind

Impending death, in example 6, is conceptualized as a day which can be prepared for without fear but with anticipation. This ideological implicature invited through the theme of gift giving (line 1-2), as an analogy to the financial preparation of death for the family (line 3-4) ascribes positive attributes to death. Should coherence between lines be presumed, the theme of gift giving (lines 1-2) and the preparation of something (the product) for the family is considered relevant and hence there is an analogical relation (as both are about giving presents). Given this, the target audience is made to infer that the day one dies is simply like other lifespan milestones, for instance, birthdays or anniversaries. More importantly, they are “special” (line 2). One should prepare for those special days and confront them fearlessly. The ascribed nature of the exemplified special days is apparently positive and so is the nature ascribed to the day one dies.

In terms of lexicon, a more direct reference to death can be found in example 6, such as in the phrase “when you die” (line 8). Even though “the future” (line 5) is also mentioned in example 6 to indicate the time of death, there is no need to infer the meaning by drawing upon pragmatic knowledge about the commodity being sold. This is because what “the future” means is immediately clarified in a slightly

Pseudo-positive discourses of ageing, Chin-Hui Chen, Cardiff University, Centre for Language and Communication Research

euphemistic expression about death (“you’ve gone”, line 6). “Funeral expenses” in line 9 is clearly stated as the purpose of the consumption of the advertised product.

It is not rare to observe the repression of death topics in the media (Wernick 1995:281) or in daily conversations (Coupland and Coupland 1997). Earlier UK examples reflect this trend but more recent UK examples do not. Instead, the ideological shift regarding death in the examined UK advertising texts indicate that over the period of time between 1999 and 2005, the target customers are encouraged to take an altruistic attitude when considering what confronting impending death means in one’s later life or for one’s dependants (Peck 1968). As Coupland and Coupland (1997:118) argue, “how we orient to our own mortality is a crucial aspect of the experience of social ageing”. A positive trend evolved in the examined UK advertising texts while recent Taiwanese examples still take a rather ageist stance towards death.

More concerns regarding ageist representations of older age arise in the elaboration of the product messages. It is found that patronising communicative mechanisms are employed in the overt emphasis of aspects such as customer eligibility and affordability.

Patronizing communicative conventions

When cost is mentioned, it is conventionally specified in pounds and pence known as monthly or daily premiums (see extracts below). The presented amount of cost is addressed to enhance the affordability (assumed as a crucial concern) to the audience.

→ 12 for just six pounds a month (example 1)

→ 03 for just 8 pounds a month (example 2)

→ 14 shi-ying: mui kang m bian goo cap kho

English translation:

14 Shi-ying: less than fifty dollars per day

(Example 3)

→ zui di bu dao 50 yuan

English translation:

The minimum is less than 50 dollars

(Example 3)

Pseudo-positive discourses of ageing, Chin-Hui Chen, Cardiff University, Centre for Language and Communication Research

→ 13 Liao-jun: mei tian bu dao san shi qi yuan

14 Liao-jun: jiu you zhong shen bao zhang la

English translation:

13: Liao-jun: with less than 37 dollars a day

14: Liao-jun: then there is a life-long cover

(Example 4)

→ 22 mei tian bu dao yi bai yuan

23 jiu ke yi yong you zhong shen bao zhang

English translation:

22 with less than one hundred dollars a day

23 life-long cover can be possessed

(Example 5)

→ mei tian **98** yuan

English translation:

98 dollars per day

(Example 5)

→ 12 cover costs from just 23 pence a day (example 6)

It can be expected that cost is an important aspect to address in advertising texts. However, when cost is presented in the same way in all of the examples, we might need to consider what the advertisers attempt to provoke in the recipients' mind. As it seems that articulating cost in detail is a conventional discursive feature in advertising texts promoting life insurance products to older people in Taiwan and in the UK, it is likely that this communicative strategy works based on the presupposition that older people tend to have weaker financial power. Hence, addressing affordability and low cost is seen as an appeal to the target customers. However, whether the presumed customer need holds true or is just a stereotypical expectation deserves closer examination. Otherwise, it can appear to be patronizing and discriminatory based on age.

The concern of patronizing stances applies to the reference to the medical exemption in relation to the guarantee of eligibility in "all" examples (see the following extracts).

→ 18 you are guaranteed to be accepted without a medical (example 1)

Pseudo-positive discourses of ageing, Chin-Hui Chen, Cardiff University, Centre for Language and Communication Research

→ 10 I didn't even need a medical to qualify (example 2)

3 Shi-ying: *link am cai ngia cuan kok te it tng?* =

→ 4 Ladies in the park: = shen ti hao huai dou ke yi bao de

English translation:

3 shi-ying: do you know the first insurance policy in this country? =

4 Ladies in the park: = guarantees acceptance regardless of good or bad health

(Example 3)

→ 10 Liao-jun: bu yong shen ti jian cha

→ 11 Liao-jun: *a ma be kah li mng tang mng sai*

12 M2: *oh pi siau lian e be po hiam koh kha kan tan*

English translation:

10 Liao-jun: no medical

11 Liao-jun: no questions about this and that

(Example 4)

→ 13 bu young ti jian

→ 14 bu wun jian kang zhung kuan

15 jue bu ju bao

English translation:

13 no medical

14 no health questions

15 never refuse your application

(Example 5)

11 you are guaranteed to be accepted

→ 13 There is no medical and no hard sell (example 6)

In the emphasis of medical exemption, the target audience of all examples, arguably, is positioned to perceive themselves as individuals with deteriorating health. Medical examination as a condition for customer eligibility is presumably regarded as an offense. Hence guaranteed acceptance is taken for granted as an appeal but is possibly patronizing if the presupposition is not regarded as true for some target audience.

Naming strategies may also show ageist presuppositions. It can be argued that the above stated ideological presuppositions are reflected in the naming strategies of the advertised products in examples 2, 3, 4 and 6. Both “yi-ding-bao” (ex. 3) and

Pseudo-positive discourses of ageing, Chin-Hui Chen, Cardiff University, Centre for Language and Communication Research

“bao-zheng-bao” (ex. 4&5) literally convey “guaranteed acceptance”. The product name “Senior Security Plan” (example 2) might imply that older people are perceived to be “vulnerable” and hence in need of a certain type of protection (realised in the highlighted “security”). The theme of assured eligibility is reinforced again in the product name of the example as suggested in the word “guaranteed”. To make these arguments more robust, the product name of example 1 is more ideologically neutral as opposed to the other examples. This is because the product name is simply created to specify the target age range.

The product names of all examples:

Example 1: Sun Life over 50 plan

→ Example 2: Cornhill Direct Senior Security Plan

→ Example 3: yi-ding-bao

→ Example 4&5: bao-zheng-bao

→ Example 6: American Life, over 50s guaranteed plan

Final remarks

In conclusion, the findings presented so far in this chapter reveal that the positive construction of ageing can be commonly observed in the marketing of over 50s life insurance products in the UK and Taiwan. However, these constructions can be considered rather pseudo-positive because of the notion of gerontophobia that seems to be embedded in the examined advertising texts. The fear of growing old is realised in the attempt to disassociate the target audience from age-graded norms or to relate them to overtly youthful images. The highlighted ideological framework in earlier UK examples reflect the notion of “the mask of ageing” argued by Hepworth (1991). That is, older age is metaphorically likened to a guise of the hidden (eternally) young inner-self. The visual representations of “golden agers” in the advertising texts for over 50s life insurance products are consistent with “the myth of serenity” claimed by Butler (1975:10) as one aspect of ageist prejudice highly emphasized in advertising contexts. The represented positive ageing in the examined advertising texts can be problematic as agelessness cannot be perceived as an anti-ageist notion since “age”, the very thing which differentiates older persons from younger, is denied (Bytheway 2000:785).

Pseudo-positive attitudes towards older age can be further supported by unpacking the embedded ideological stance towards older age in the discursive representations of the

Pseudo-positive discourses of ageing, Chin-Hui Chen, Cardiff University, Centre for Language and Communication Research

promoted products. The findings reveal that the problematization of older age is commonly found in the UK and Taiwanese examples.

Furthermore, the repression of death-related topics further suggests an ideological stance which distances the target viewers from ageing. From a developmental point of view, death itself is considered to be a central event to be dealt with in later life. The failure to confront death can lead to a crisis of despair and a sense of integrity that cannot be achieved at one's last stage of life course (Erickson 1982). Given this, the topic is still treated as a forbidden subject (especially in the Taiwanese examples) when it should be highlighted as the main topic in advertising texts promoting life insurance products. The denial of death itself can be equivalent to the denial of ageing. The euphemistic discursive strategy used to present death in the examined advertising texts is seen as reflective of the ideological stance that problematises older age or ageing.

Finally, the analysis in this study, hopefully, can increase the awareness of the implicitly ageist messages in the examined and similar advertisements targeting the "grey market".

ABSTRACT:

In order to spur growth in small and medium enterprises the Malaysian government has established the National SME Development Council. One of the strategic thrusts identified by National SME Development Council is to build capacity and business capability among Malaysian SMEs. This paper aimed to interrogate the competitive advantage for globalisation sustainability among Malaysian SMEs. Exploratory research is used for this purpose by reviewing literature from other scholars and experiences personally received in banking industries. Additionally, the surveys also done through Bank Negara Malaysia, SME Annual Report, SME Corp Malaysia, and MIDA to support this paper. Malaysian SMEs and Ministries or agencies should realize the suitability of programme in order to develop their competitive advantage for globalisation. The finding of this study revealed that the competitive advantage is very importance for Malaysian SMEs to sustain in Globalisation. Therefore, the main contribution of this study is to enhance the knowledge of SMEs to effectively address the challenge for sustainable in global economic through a prioritizing the competitive advantage.

Keywords: Competitive advantage, Globalisation, sustainability, Small and Medium Sized Enterprises (SMEs)

1.0 INTRODUCTION

According to the Director-General of World Trade Organization globalisation is known as inter-dependency whereby the multi-layered involvement of intricate phenomenon which is intensive social, political and economic interaction whether nationally and internationally among nation across the border (**World Trade Report, 2008**). In Malaysia, globalisation affects three main groups of SMEs. The first group is known as SMEs that are internationally competitive or able to become internationally competitive which gains benefit from regionalisation. The second group is known as SMEs that are less adaptable as a result of globalisation pressure. This group is unlikely to survive in the present environment unless there are immediate steps to improve productivity by conforming to the international standards for training and employ professional and skilful staffs in management to adapt competition. The final group is SMEs that are protected by government aid from the globalisation effect. Basically, Malaysian SMEs should not escape from this phenomenon but take this opportunity to become more competitive and sustainable.

In 2006, Malaysia is ranked 23rd as the most competitive nation among 61 countries (**World Competitiveness Book**) and in 19th place of the largest trading nation in the world (**World Trade Organization Report**). Therefore, The Malaysian government continues to develop its policies and incentives to enhance Malaysia's investment environment and international competitiveness. Malaysia's services exports and imports rose by more than 20 per cent similarly with the China and Australia (**World Trade Report, 2008**). Hence, it is shown that Malaysian SMEs are capable of becoming competitive in the global market especially as services provider.

Various Malaysian Ministries & Agencies provide SME development programmes such as strengthening the enabling infrastructure, building the capacity and capability of domestic SMEs and enhancing access to financing by SMEs. Recently, Program MSC Malaysia Score Plus was organized by collaboration between SME Corp Malaysia and Multimedia Development Corporation (MdeC). This Programms are purposely for improving the competitiveness among Malaysian SMEs (**Harian Metro Newspaper, Dec 2009**).

At the theoretical level, the studies have identified Malaysian SMEs faced the pro long problems in the past 19 years. There are the same problems such as lack of access to information, difficulty in obtaining loans and financial assistance, lack of managerial capabilities, heavy regulatory burden, non-exposure to good management practices and low IT utilization to improve productivity, among others (**National SME Council, 2009, Wang S.D 2003**).

Competitive advantage refer to firms that are capable of offering value added product incomparison to their competitors in the same market (Kay, 1990). In order to become more competitive, SMEs should

perpetuate their core capabilities such as low cost production, innovative design, and high quality but maintained the indigenous of product (Rabino.S, Simoni.C & Zanni L, 2008). Based on the empirical assesment done by Ana C.S & Andyd.C (2008), the firms that inconsistent innovator in creating knowlegde or applied routines may facing the difficulty in developing competitive advantage. Hence the existing Multi National Corporation (MNC), somehow will contribute to the development of competitive advantage among SMEs such as China and Japan. In 1994, APEC Leaders and Ministers for developed countries agree to implement free and open trade investment before or until year 2010 and developing countries not later than year 2020 (Jin.H.Y, 2006).

This paper aims to investigate the importance of competitive advantage and strategis for SMEs to sustain in globalisation.

Despite the government concern toward Malaysian SMEs regarding the lack of transparency, limited acces to finance support, the suitability of developing programme, limited knowledge, low technology capability and others. Section 2.0 of this paper examines the current development of SMEs in Malaysia then followed by section 3.0 which analyze further the impact of globalisation on the current local SMEs. The challenges faced by SMEs in international trade are discussed in section 4.0 taking into account the experiences from other countries. Learning from the research, the authors came up with several recommendations in section 5.0 which hopefully could enhance better local SMEs in the future. Section 6.0 concludes the paper.

2.0 THE ESTABLISHMENT OF SMEs IN MALAYSIA

2.1 Background

In 2008, SMEs constitute 99.2 percent of total business establishment and providing employment around 56 percent of total workforce in Malaysia. It shown that SMEs become the backbone of Malaysian economy. Due to that achievement Malaysian government planned to increase the contribution of SMEs to Gross Domestic Product from 32 percent in 2005 until 37 percent in 2010 (**SME Annual Report, 2008**). The total of the list of establishments and entrepreneurs is 4.6 million but after eliminated the duplication of registration gained from various source. Finally, the finding by Malaysian Census in 2006 revealed that the total of 1,733,550 list of establishment entrepreneurs. Table 1 shown the distribution of establishment in manufacturing, services and algriculture (**Normah M.A, 2006**).

Bank Negara Malaysia established the case studies on SME more than 10 years and the findings revealed there are eight (8) key succes factors for Malaysian SMEs's. There are the management capability and integrity; business cultures and entrepreneurial spirit; prudent financial management; high quality products and services; effective programme for human resource development; strong support from financial institutions in terms of lending and advisory services; strong marketing strategies including good networking with the suppliers; and consistently looking for opportunity to expand the business (**Bank Negara Malaysia, 2003**).

Table 1: Distribution of establishments by sector

Sector	No. of Establishments	Percentage (%)
--------	-----------------------	----------------

Manufacturing	85,946	5.0
Services	1,523,8421	87.9
Agriculture	123,762	7.1
Total	1,733,550	100.0

Source: Department of Statistic, Malaysia Census; (2006)

2.2 Profile Of Malaysian SMEs

The definition of SMEs is based on two criteria 1) number of employees or 2) sales turnover. SMEs also divided to four (4) sectors such as Primary Agriculture, Manufacturing (including agro-based), Manufacturing-Related Services (MRS), and Services (including Information and Communications Technology)(**Bank Negara Malaysia, 2005**). Generally, SMEs in Malaysia are defined as companies with the annual sales turnover which does not exceed RM 25 million or having full time employees not exceeding 150 persons (**Bank Negara Malaysia, 2005, Small and Medium Industries Development Corporation, Malaysia: 2002**). Further information of Malaysian SMEs can be seen in Table 2.

Table 2: Definition of SMEs in Malaysia

Size/Turnover /Full Time Employees	Manufacturing (including Agro-Based) & Manufacturing-Related Services	Primary Agriculture	Services Sector (including ICT, mining & quarrying and construction sectors)
Micro	Less than RM250,000 or less than 5 employees	Less than RM200,000 or less than 5 employees	Less than RM200,000 or less than 5 employees
Small	Between RM250,000 and less than RM10million or between 5 to 50 employees	Between RM200,000 and less than RM1million or between 5 to 19 employees	Between RM200,000 and less than RM1million or between 5 o 19 employees
Medium	Between RM10million and RM25million or Between 51 to 150 employees	Between RM1million and RM5million or between 20 to 50 employees	Between RM1million and RM5million or between 20 to 50 employees

Source: Secretariat National SME Development Council, Bank Negara Malaysia,(2005),

The definition of SMEs in Malaysia as shown in Table 2 is introduced in September 2005 for the purpose to recognize the important role of SMEs to the economy. It is approved by a special board known as National SME Development Council which is formed in 2004 chaired by the sixth Prime Minister and attended by 15 ministries and more than 60 Government Agencies. The function of the board is to provide the policy direction for cohesive and comprehensive SME development. Meanwhile this is one of the alternative for Malaysian SMEs to stride in the economic meltdown with the external environment is extremely uncertain (**SME Annual Report, 2008**).

From this definition, the micro companies constitute of 79 percent (411,849 companies), followed by small-sized companies constitute of 18 percent (95,490 companies) and finally, medium-sized companies constitute only 3 percent (15,793 companies)(**SME Corp Malaysia, 2007**). Malaysian SMEs are encouraging to adopt this definition as to response to the robust changes of industry due to the globalization. With this number of companies Malaysian SMEs capable to become more competitive by pooling their resources and taking advantage on the globalisation opportunities.

Malaysian SMEs facing many problems whether local or international level which could hinder resilience and competitiveness, such as difficulty in obtaining loans and high interest charges, lack of human capital and involving high cost for professional and competent workforce, lack of access for latest technology, high level of bureaucracy in government agencies without revealed the secret of Malaysian SMEs' successfull, there is substantial orientation towards the domestic market and the involvement of research and development are little and lastly the impact Asean Free Trade Agreement (AFTA) and competition of Multinational Corporation (MNCs) or new competitors (Saleh & Ndubisi, 2006).

2.3 Globalisation Effect to Malaysian SMEs

2.3.1 The Benefit of Globalisation

Due to the globalisation, multilateral and bilateral trade agreements among countries in the Asian region are accelerating. The integration process and changing the nature of regional trade and capital flows. In 2005, estimated that 300 Free Trade Agreements (FTA) involving the Association of South East Asian Nations (ASEAN) member countries such as ASEAN-JAPAN Comprehensive Economic Partnership (AJCEP) agreements.

Levitt (1983) highlighted for operating in the international market, companies must be well prepared with ignoring the superficial regional and national difference. Many companies strengthen their resource through competencies strategic outsourcing due to lack of ability to perform or extraordinary perform needed for the global market (Murray J.Y, Kotabe.M & Westjohn S.A, 2009). Braithware (2003) stated the advantage of global sourcing such as low cost labour, logistics flexibility and less regulated operating environment and it provides the synergy for SMEs in the developing countries like Malaysia. Walmart Singapore applied global supply chain (GSC) which is 20 percent of their furniture manufacturers came from Malaysia. Instead, Walmart enjoyed the benefits like cost reducing and increasing buyers and suppliers networking in the Asian region but it assists Malaysian SMEs increase the sales up to 140 times in year 2004 until 2005 (Chiam, 2005).

Furthermore, the benefit gained from GSC such as Intel Penang introduced by SME-TNC linkages program. In 1972, Intel Penang involved with Free Trade Zone organized by Penang Development Corporation. Firstly, Intel choosed the suppliers who are willing to meets the requirements. Secondly, Intel provided the important training that suitable with it business needs and capabilities of the potential suppliers. Then, talks and contracts allocated based on the SMEs abilities. It continually refined the process until SME become mature, and capable to be independant supply to other parts of Intel's global supply chain; it is approved as a global supplier (Guerrero, 2005). Thus, the purpose Intel programme is developing its supplier's capabilities and competencies has indeed provided business opportunities to

the local SMEs. In addition to this, Intel becomes partner to the government and community. The partnership between the government, TNCs, SMEs and other supporting agencies lead to new economies. Between 1970 and 2002, industrial enterprises increased from 31 to 731 which have provided employment vacancies to 84,000 individuals; this has since then increased to 150,000 (Guerrero: 2005).

Globalization increased the interdependence of national economies and boundaries between domestic and international markets are becoming less relevant as businesses increase their profiles abroad (Knight.G, 2000). Hence, globalisation give a good impact among SMEs nonetheless promotes innovation, free movement of market as there is less government interventions and convergence across industries i.e. less trade barriers within the regions, constant arrival of new range of products, sharing new knowledge and liberalization opening up of new economies. It also creates unprecedented information and communication technologies.

2.3.2 Sustainable in The Globalisation

SME Corp Malaysia organized the Industrial Linkage Program (ILP) and the Global Supplier Program (GSP) purposely for SMEs' to be more innovative. These program is to enhance the SMEs' participation to be reliable and competitive suppliers i.e parts, components or services to MNCs (Jin. H.Y, 2006). Thus, existing MNCs is very important in order to create the opporunities in the global market (Hayase, 2004).

Anazawa (2004) stated in manufacturing sector Japan has 550,000 SMEs and Taiwan has 150,000 SMEs and Malaysia has 523,132 (SME Corp Malaysia 2007). SMEs. Thus, in terms of industrial structure, in Japan and Taiwan SMEs started as small enterprises than escalate their business into large companies. There are large number of SMEs assist the giant companies. Otherwise, in Malaysia it is different whereby government build up the large companies such as PROTON while SMEs are dependant to these companies as vendor or Original Equipment Manufactrurers (OEMs).

Japanese government provide full support to their MNCs whether in terms of technology like "US-styled SBIR", consultation or financial. In contrast MNCs support the frail SMEs for enduring especially financial viabilities (Jin.H.Y, 2006). SMEs have strong industrial linkages with the multinationals like Hitachi, Sony and Matsushita (Central Bank of Malaysia: 2003). Hence, they are able to utilise the multinationals' network to sell their products. Comparatively, Malaysian SMEs are largely domestic oriented companies and lack of indusrial linkage with MNCs and trading companies due to the existing gaps in quality standards.

The overall contribution of the local SMEs to the economic development is small compare to the developed countries. The reason behind this is that the local SMEs are still domestic oriented with export to be 20.8% output or 16.6% of total exports of manufactured goods (Small and Medium Industries Development Corporation, Malaysia: 2007). However, the Malaysian SMEs form the backbone of the local economic growth. During knowledge economy, the importance source of competitive advantage is using of global access in order to gouge out their innovation capabilities (UNCTAD, 2007)

Table 1 shows the importance of SMEs according to percentage of contribution in selected developed countries compared with developing country particularly Malaysia (Central Bank of Malaysia: 2003).

SMEs as a % of	Malaysia	Japan	Germany	Korea
Total Establishment	92.0%	99.7%	99.0%	99.2%
Total Employment	33.3%*	69.5%	69.7%	75.3%
GDP (GNP for Germany)	6.0%*	55.3%	57.0%	16.0%

*Based on SMEs in manufacturing sector only

Table 3: The Importance of SMEs according to Percentage of Contribution in Selected Developed Countries compared to Malaysia

Table 3 illustrates the SMEs account for Korea is 16.0 percent, Japan is 55.3 percent and Germany is 57.0 percent of gross domestic product (GDP) respectively. For the contribution of total employment, Japan account for 69.5 percent, Germany for 69.7 percent and Korea for 75.3 percent. Comparing those countries to Malaysia, SMEs account for 6.0 percent of the country's GDP and 33.3 percent for total employment. From this result, it showed that there is ample room for SMEs in Malaysia to improve in terms of contributions at the same level as the developed countries.

3.0 The Challenges Faced in International Trade

In order to achieve a significant competitive advantage and globalisation sustainability there are two main alternatives strategies can be implemented for SMEs when facing new global competition which is firm-centered brand strategy and outsourcing strategy such as supply alliance with co-branding possibilities with one or more MNCs (Rabino.S, Simoni.C & Zanni L, 2008).

The key challenges faced by Malaysian SMEs is the derogate of demand, formidable in payment collection, limitation of financial and the expense of raw materials. Due to this challenges Malaysian SMEs should be pro-active in handling the negative impact of globalisation (SME Annual Report, 2008).

3.1 Other Challenges

One of the problems facing the local SMEs is lacking knowledge on legal matters. Moreover, in Malaysia, there is neither body nor agency that advice matter pertaining legal specifically for the SMEs going to overseas. Thus, the local SMEs might find restricted access on legal knowledge either because the regulation published is outdated or it is inappropriate.

Another problem is regards to the registration and legal incorporation where the requirements vary amongst countries and often complex and expensive and may also take longer time than usual (APEC and SME Policy: 2005). This might defer the establishment of SMEs in foreign market.

The next issue is about the identification opportunities. Obtaining reliable information on market opportunities and relevant regulations are sometimes can be difficult when dealing with new products, services or techniques. There are certain requirements and controls imposed by foreign governments (APEC and SME Policy: 2005). Identification of suitable network partners and joint ventures are also a problem. Sometimes the SMEs need to be engaged in joint ventures, networks or alliances for internationalisations but finding the suitable partners is often difficult (APEC and SME Policy: 2005). For example in Indonesia (Pricewaterhouse Coopers, Indonesia: 2004), there is a specific requirement for shipping that is it must form a joint venture with local company. The foreign shareholding is maximum 95%; owns and operate vessel of 5,000GWT (minimum) under the Indonesian flag and protected by intellectual property in a cost effective way. Almost all economies in the region now have some form of recognition and registration of intellectual property namely brand names, patents, and copyrights. But is not economically suitable for the small entrepreneurial SMEs to enforce their rights through the existing legal system (APEC and SME Policy: 2005).

4.0 Recommendations to increase competitiveness among Malaysia SMEs Entrepreneurs

4.1 Improving Efficiency

SMEs need to compete and remain relevant in the emerging economies by strengthening domestic industry and to penetrate new market opportunities. One of good examples is branding. Local SMEs lack in branding their products because of poor attractiveness in packaging, design and product innovation especially for export market. As mentioned above, companies may achieve competitive advantage through the acts of consistent innovation which can be in the form of creative design, new product, new marketing approach or new way conducting suitable training (Porter: 1990, Ana C.S & Andyd.C, 2008). Alternatively, local SMEs may also go for strengthen their brand and distribute its own products through franchise.

A good example which illustrates this is Bonia, one of Malaysian brands for leather shoes and handbags. Now, there are 60 outlets and out of this numbers 41 outlets are in Japan, China, Indonesia, Taiwan, Thailand and Singapore where 30 are under franchise (Malaysia Franchise Association: 2005).

Outstanding services, pricing and customer relations can also command profitable niches (Dauphinais et al: 1999).

Fast growing internationalized companies always employ skill and professional staff. SMEs in Malaysia initially started from small business operated by family members need to engage more professionals in

running their business. This improvement is important to compete globally and having skilled labour will upgrade the ability to produce quality products.

The local SMEs need to improve networking and linkages with MNC and/or TNC through industrial cluster arrangement, export and processing zones. A research presented in United Nation Conference on Trade and Development (UNCTAD: 2003), business linkages call for partnership effort among all stakeholders namely the government, TNCs, SMEs and their supportive agencies (Guerrero: 2005). Need to be noted that linkages into the global supply chains requires high-tech manufacturers. Thus, human skills and technology need to be upgraded to sustain as supplier to TNCs.

As for distribution of network, there is a need to reach where the SMEs are including the sub-urban and country sides. A full collaboration from all parties are essential for instance by promoting the "Reaching out SMEs" nationwide like Megasale in Malaysia so that the spirit of entrepreneurship can be brought up!

4.2 Legal Awareness

There is lack of intellectual property protection in the local SMEs because the recognition and registration process is often not economical especially to enforce rights through the existing legal system. This can be a setback when gigantic companies take over their rights. Furthermore, most SMEs wish to protect their intellectual property rights in a cost effective way. It is recommended the SMEs are educated with the background and importance of intellectual property rights so that they could have options whether to register their products or not which depends on their preferences.

One of the key to a small business victory is target marketing (Susan.W, 2008).It is advisable that the SMEs study their target market, deliver as promised and differentiate themselves with the competitors to create the competitive advantage in order to help exporters in the global arena. Recommendation for this is to set up a one stop centre for advisory on legal issues to SMEs. In addition to this, the representatives' offices should also be set up in the countries where exports are being promoted so that offices are able to advise on the target country's law pertaining trade.

All SMEs should be advised about the importance of insurance and highly recommended if it can be made as mandatory since it is only an optional.

4.3 Aids from Government

Malaysian SMEs can take advantage by participating in the regional expansion and cluster. Higher value added activities in the line of design and development and research and development, improvement on real time business operation can be obtained. Multimedia Super Corridor (MSC) in Malaysia can be the example of cluster that has emerged largely through the government effort.

In supporting MSC, the government has established new infrastructure, passed special laws to woo investment followed by incentives like tax exemptions and grants for SMEs (Delios A et all: 2005). By participating in the regional cluster, SMEs can enhance the technical know-how and improve technology capabilities in meeting manufacturing standards by multinational corporations. Currently, the government has subsidized interest and gives guarantees to facilitate local SMEs. On the other hand,

for the SMEs to move forward, it is fundamentally important that SMEs need to become financially sustainable to reduce too much reliance on government incentives.

4.4 The Role of Malaysian SMEs

Many companies strengthen their resource through competencies strategic outsourcing due to lack of ability to perform or extraordinary perform needed for the global market (Murray J.Y, Kotabe.M & Westjohn S.A, 2009). Braithware (2003) stated the advantage of global sourcing such as low cost labour, logistics flexibility and less regulated operating environment and it provides the synergy for SMEs in the developing countries like Malaysia

The initiative to gain the victory should start from the SMEs itself. The role of SMEs in improving their performance is very important proportionate dependant to government helping them to outperform. Malaysian SMEs are counsel in practicing the long life learning. Continuously accumulating of knowledge and disseminating effectively the information throughout the organization. The successful SMEs recommended to share their tips with others SMEs in order to develop the MNC beside dependant to government. The reluctant of Malaysian SMEs to collaborate their resource is one of the limitation for them to expand their business. As mentioned above the global sourcing or via competencies strategic outsourcing is one is of the alternative to expand their business to the global market (Braithware, 2003, Murray J.Y, Kotabe.M & Westjohn S.A, 2009). Applying the mentor-mentee programm among the Malaysian SMEs is another alternative for SMEs go for advancement.

5.0 Conclusion

Liu.J & Huang. J, (2009) stated that entreprised competitive advantage and international enterprise competitive advantage is equal in the context of economic globalization. From the authors perspective, the most important competitive advantage criteria for SMEs is the willingness to gain knowledge. Knowledge is the most important source for long lasting competitive advantage. The continuous improvement of the product can also shape the competitive advantage among SMEs. Therefore, summarizations from this study states that there are two matters that needs to be emphasized among SMEs :-

- a) persistently seeking information and knowledge.
- b) Identify factors in forming a competitive advantage

Both efforts are needed for better business strategy, networking, leverage all resources available .

Abstract

Innovativeness has often been shown as one of the most important strategic orientations for firms to achieve long-term success, venture performance, and the avenues to gain a competitive advantage. While researchers have explored innovativeness of firms in different countries, few such studies exist on developing economies in South Asia. Sri Lanka is a small open economy, which lacks rural entrepreneurship development and any prior systematic studies particularly for small firms in southern Sri Lanka. Thus, this study investigated the degree of innovativeness and its interrelation between business performance of Small and Medium Scale Enterprises (SMEs) in the Southern Province of Sri Lanka. Interviews were used as a main instrument for data collection. Quantitative and qualitative techniques were applied for data analysis. A positive correlation was found between innovativeness and business performance. Also, the study identified obstacles to innovativeness of SMEs, which may be useful for enterprise development initiatives for the study area and more widely for other areas in Sri Lanka.

Key words: innovativeness, small business, Sri Lanka

1. Introduction

Innovativeness has often been shown as one of the most important strategic orientations for firms to achieve long-term success, venture performance, and the avenues to gain competitive advantage. Prominent entrepreneurship scholars argue that innovation is a constitutive element of entrepreneurship (Schumpeter, 1934; Lumpkin and Dess, 1996). Schumpeter (1934) was among the first who emphasized the role of innovation in the entrepreneurial process, outlining an economic process of “creative destruction”. Innovativeness reflects the

tendency of a firm to lend its support to new ideas, novelty experimentation and the creative processes that may result in new products, services or technological processes (Lumpkin and Dess, 1996).

Small and Medium-sized Enterprises (SMEs) give a strong boost to employment and economic growth precisely due to their innovation activities (Keizer et al., 2002). Among the most important aspects of success in small firms is innovativeness. These firms are able to capitalize on customer closeness and flexibility to satisfy rapidly changing customer demands, thereby creating valuable competitive advantages (Hausman & Fontenot, 1999). Encouraging innovation in small and medium sized enterprises remains at the heart of policy initiatives for stimulating economic development at the local, regional, national and international levels (Jones and Tilley, 2003).

Most published research studies, which deal with SME innovation come from developed economies (Radas and Božić, 2009). Also, most organizational innovation researchers have agreed that understanding innovative behavior in organizations has remained relatively undeveloped, inconclusive and inconsistent (Fiol, 1996; Gopalakrishnan, 2000). Also, empirical research on the innovation–performance relationship in SMEs shows controversial results (Rosenbusch et al., 2010). Thus, this paper aims to advance the knowledge on the innovativeness and business performance of established manufacturing SMEs in Hambantota District of Southern Sri Lanka (HDSL).

Small and Medium Enterprises (SMEs) play a vital role in the economy of Sri Lanka. SMEs have been recognized as an important strategic sector in Sri Lanka for generating high economic growth, reducing unemployment, inequality and poverty (Ministry of Enterprise Development, 2002). The Government, having recognized the importance of this sector in achieving a balanced economic growth, equitable regional distribution and increasing employment and productivity levels, has adopted various policies for the development of SMEs in Sri Lanka. The launch of the SME Bank and the establishment of the SME Authority as the apex body for the development of the SME sector, are expected to be the catalysts for SME led growth (Ministry of Enterprise Development, 2005).

The Southern Province of Sri Lanka consists of three administrative districts: the Galle, Matara and Hambantota. In the deep south of Sri Lanka, Hambantota District boasts a prosperous past civilization and is endowed with many natural resources. These resources offer opportunities for valuable income generation for the District and for the overall development of the country. Hambantota District has a population of 525,370 of whom 96% are considered rural residents. Some 13.4% of the labor force of 244,847 is unemployed - in comparison to the national average of 8.3%. Of those employed, 42.2% are in the agricultural sector, 23.3% in industry, with the remaining 34.5% working in the services sector (Department of Census and Statistics Sri Lanka [DCSSL], 2004). Hambantota District is clearly a gateway to profitable investment, playing a crucial role in the development of the southern region of Sri Lanka and presenting exciting opportunities for the responsible, visionary investor. Recently, the Sri Lankan government has recognized the southern region as an entrepreneurial hub and proposed to establish a new harbor and airport in the Hambantota District. These large scale projects, primarily aimed at developing the infrastructure of the area, indicate a move towards the development of the district into a hub of economic development.

Adaptation to shifting landscapes through aspects of entrepreneurship and innovation is of major concern for all enterprises, especially for small and medium-sized (SMEs) that are dominant in Sri Lanka. Innovation and R&D are recognized as a prime objective of poverty elevation and development of the country. Accordingly, Sri Lankan government has formulated its strategies as:

- Strengthening and modernizing science and technology organizations with targeted development strategies and policy directions;
- Identifying strategic technology development areas and preparing the science and technology institutions for the delivery and transfer of technology;
- Developing human resources for maximum productivity in science and technology, and for its effective management; and,
- Building a scientific culture, promoting its application in private and public sector activity (Amaradasa and Wickremasinghe, 2007).

At present, the focus of SMEs to promote innovation in Sri Lanka is recognized as vital. But, the empirical literature lacks evidence regarding the innovativeness of SMEs especially in the Southern Province of Sri Lanka. Thus, the present study could serve as a starting point to empirically study the SME innovativeness and its relationship with business performance in Hambantota District of Southern Sri Lanka. The research focuses on two key questions: (1) what is the degree of innovativeness of manufacturing SMEs in HDSL? (2) To what extent does innovativeness influence the business performance of these SMEs?

2. Literature Review and Hypothesis

2.1 Relationship between innovativeness and business performance

Innovativeness is defined here as the capacity to introduce some new process, product or idea in an organization (Damanpour, 1991; Hurley et al., 1998). An innovation can be a new product or service, a new production process, or a new structure or administrative system. Drucker (1985) described that innovation can be an economic or social, rather than a technical term. Innovation as changing the yield of resources as changing the value and satisfaction obtained resources from the consumer. Systematic innovation therefore comprises the purposeful and organized search for changes, and the systematic analysis of the opportunities such changes might offer for economic or social innovation.

Empirical studies investigating the innovation–performance relationship frequently present mixed findings. Some empirical studies report that innovation does not influence firm performance (Birley and Westhead, 1990; Heunks, 1998). Meanwhile, the positive relationship between innovation and business performance has been shown in a number of other empirical studies. Innovativeness is an important determinant of business performance. Firms' superior products have achieved higher market shares and similar performance outcomes particularly when compared to producers with less developed innovative practices. Innovativeness is also likely to be useful for allowing the firm to preempt competitors with new or improved products, diversify product lines, and generally expand the firm's scope of activities. All of these outcomes can help contribute to achieving a sustainable competitive advantage (Hult et al., 2004). Damanpour and Evan (1984) reported a positive relationship between organizational innovation and performance. Innovativeness is an important component of a firm's strategy, mainly because it constitutes one of the principal means

through which it can seek new business opportunities (Covin and Slevin, 1991; Lumpkin and Dess, 1996). Cho and Pucik (2005) found that companies which can balance innovativeness with quality improvement will create a virtuous circle of growth, profitability and premium market value. Their study further indicated that a firm's capability to balance innovativeness with quality is in itself an intangible resource critical for sustaining growth, improving profitability, and creating superior market values. A study by Deshpande et al., (1993) among Japanese firms indicated that innovativeness is positively related to organizational performance in terms of relative profitability, market share and growth rate. Using data from 206 US business services firms, Mansury and Love (2008) found that the presence of service innovation and its extent has a consistently positive effect on growth. In a study of determinants of innovation in micro-, small and medium enterprises in Sri Lanka, De Mel et al. (2009) found that firms which innovate earn higher profits than firms which do not innovate, and that innovation is strongly and significantly associated with higher profitability.

These previous studies provide empirical evidence of the positive relationship between innovativeness and firm performance. Thus, we hypothesize that:

H1: Innovativeness is positively related to business performance

3. Research Design and Methodology

3.1 Research Model

The research model of this study intending to determine the relationship between innovativeness and business performance of SMEs in HDSL is presented in Figure 1.

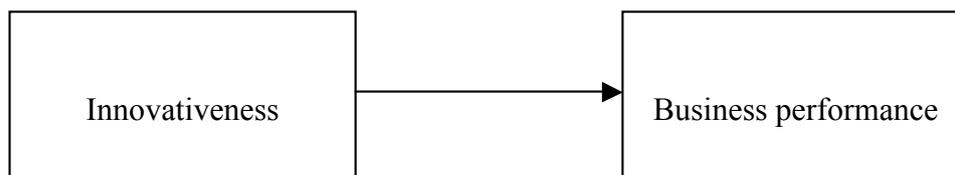

Figure 1: The research model

3.2 Survey Development and Sample Design

The survey for this study was carried out using interviews by contacting the respondents through the Hambantota District Chamber of Commerce (HDCC). At first, interviews were conducted with the economic development planner and the manager handling SMEs of HDCC to plan the study. Given this information from HDCC, a manufacturing sector was selected as a first step. There are in total 125 manufacturing SMEs listed in the HDCC directory and most of them concentrate around or closer to urban areas. Therefore, 25 manufacturing SMEs were selected to represent all the sub-geographic locations including city and rural areas within Hambantota District that were established more than five years. A sample of manufacturing SMEs were chosen with total fixed assets of 20 Million Sri Lankan Rupees (LKR) or less, excluding land and buildings, and the number of employees' ranging

from 5 to less than 150 in accordance with the definition of manufacturing SMEs by the National Development Bank of Sri Lanka.

Semi-structured interviews were chosen as a primary data collection method. The selection of this method was due to the unwillingness of respondents to provide information through other communication methods such as a mail survey. Swierczek and Ha (2003) also used this method to collect data from entrepreneurs in developing countries. Owners/managers of SMEs were target respondents. Prior to data collection, we conducted a pilot study with owner/managers of three manufacturing SMEs in the study area to confirm the understandability and content validity of the survey. Data were collected during October 2008 to April 2009 for all selected SMEs and interviews with each respondent lasted approximately one to two hours.

3.3 Research Instrument

Measures of innovativeness and business performance variables were drawn from previous research. *Innovativeness* is difficult to operationalize due to inconsistencies in the definition of innovativeness by various scholars (Li, Chen and Huang, 2006). The scale used for this study to measure *innovativeness* was adapted from Hurley and Hult (1998), as well as Covin and Slevin (1989), originally devised by Khandwalla (1977), with a total of eight items ranging from 1 (strongly disagree) to 5 (strongly agree).

Previous research suggests that performance is a multidimensional concept and it is not possible to choose a single performance measure because it likely to produce biased results (e.g. Wiklund and Shepherd, 2005). Business performance of SMEs can be measured by both objective and subjective measures (Murphy et al., 1996; Gupta and Govindarajan, 1984). In previous studies, growth is used as a proxy for business performance (Brush and Vanderwerf, 1992).

Based on the literature, this study concludes that in order to describe SMEs performance more fully, a combination of financial and non-financial measures is needed to provide a more meaningful picture of business performance. Therefore, we combined financial and non-financial performance measures. The scale for business performance was assessed by sales growth, employment growth, profit (pre-tax), market share growth and owner/managers' satisfaction. Sales, profit and employment information was obtained through interviews with respondents and the average growth rate from year 2006 to 2008 calculated. Becherer and Maurer (1999) also used the same method, perceived financial performance, by asking company presidents to indicate the change in annual sales and profits compared to three years ago. Market share growth was measured based on self-reported performance by the respondent from each SME. Self-reporting was appropriate and reliable when objective data was not available (Dess and Robinson, 1984). Owner/manager satisfaction was evaluated using a five point Likert -scale from 1 (highly dissatisfied) to 5 (highly satisfied).

3.4 Data Analysis

Both qualitative and quantitative methods were used to analyze data. Regression analysis was used to determine the relationship between the independent variable (innovativeness) and the dependent variable (business performance). Reliability analysis was carried out in order to

ensure the internal consistency and reliability of measures. Reliability of items measuring innovativeness and business performance were performed to evaluate Cronbach's alpha value which shows a value of 0.734. The alpha values of the measures used in this study exceed 0.70 as recommended by Nunnally (1978). This ensures that items grouping are reliable and acceptable.

4. Results

4.1 Respondent Profile

The background characteristics of respondents are given in Table 1. As shown, 68% of the respondents were both founders and owners of SMEs. Most of the respondents were between 30 and 35 years old. Levels of education among respondents indicate that only 04% have University degrees and 40% have advance level qualifications. Considering the experience of the entrepreneurs, approximately 56% of the entrepreneurs have less than two years of previous experience and 24% of them have more than ten years experience.

Table 2 presents the profile of manufacturing SMEs in HDSL. The manufacturing industries are varied and almost 56% of SMEs are from the food and beverage sector, 02% from machinery & equipment, 02% are jewelers, 04% in building & construction, and 3% from others such as furniture, herbal products and agriculture. In terms of ownership, 76% of the firms had sole proprietorship, 08% were partnerships, and 16% were limited liability companies. The age of the SMEs shows that the majority (44%) of them are more than 10 years old. In terms of firm size, 52% of firms had number of employees between 10 and 20.

Table 1: Background Characteristics of SME Owner/Managers in HDSL (n=25)

Characteristics	Frequency	Percentage (%)
Age of the owner/manager (in years)		
31-35	7	28
36-40	5	20
41-45	6	24
46-50	3	12
Above 50	4	16
Level of education		
Graduate	1	4
Advanced level	10	40
Ordinary level	7	28
Below ordinary level	7	28
Previous business experience		
More than 10 years	6	24
5-10 years	3	12
2-5 years	2	8
Less than two years	14	56
Current position of the respondents		
Founder and owner	17	68
Owner	5	20
Manager	3	12

Table 2: Characteristics of Manufacturing SMEs in HDSL (n==25)

Characteristics	Frequency	Percentage (%)
Type of business		
Food and beverages	14	56
Machinery & equipment	2	8
Jewelers	2	8
Building & construction	4	16
Others	3	12
Age of the firms		
6-10 years	6	24
11-15 years	11	44
16-20 years	6	24
21-25 years	1	4
26- 30 years	1	4

Sole proprietorship	19	76
Partnership	2	8
Company	4	16
Number of employees		
5-10	2	8
11-20	13	52
21-30	4	16
31-40	4	16
Above 40	2	8

4.2 Descriptive Statistics and Hypothesis Testing

The results indicated that the mean value of innovativeness of SMEs was slightly higher than the average level which is 3.19, whereas the mean value for business performance was 3.50. The summary of the descriptive statistics are presented in Table 3.

Table 3: Descriptive Statistics for Innovativeness and Business Performance Variables

Variables	Mean	Standard Deviation	Number of Items
Innovativeness	3.19	0.43	8
Business Performance	3.5	0.48	5

The results of the regression analyses in Table 4 indicated that innovativeness was positively and significantly correlated to the business performance of SMEs ($r = 0.392$, $p \leq 0.05$). This means that the higher the innovativeness, the better the performance of SMEs. Hence, the proposed hypothesis that innovativeness is positively related to business performance was supported.

Table 4: Results of Regression Analysis for Impact of Innovativeness on Business Performance of SMEs.

	R	R ²	Adjusted R ²	F-value	Significance
Innovativeness on Business Performance	0.392*	0.154	0.117	4.19	0.05

$p \leq 0.05$

5. Discussion and conclusion

This research focused on the degree of innovativeness and the impact of innovativeness on the business performance of SMEs in the Southern Province, particularly Hambantota District of Sri Lanka. First, the degree of innovativeness was slightly higher than the average level suggesting that generally SMEs have moderate innovative behavior. To gain a comprehensive understanding of innovativeness in SMEs, we further identified some obstacles that hamper innovativeness. Especially, HDSL is known as a rural district and currently accelerating progress through infrastructure development and other development activities. SMEs located

in rural areas still lack market access lowering the speed of small businesses competing against SMEs as well as large businesses in comfort areas. Inadequate resources, especially lack of financial capital, also hinder SMEs to introduce new products and expand new markets. Most SMEs have obtained initial capital from informal sources such as savings, family members and relatives. The lack of know-how for preparing proper business plans to obtain financing from formal sources has therefore also been found to be a barrier for access to the necessary financing. The majority of SMEs in HDSL were established with a very low level of skills and expertise, particularly lacking management and technical know-how. Innovativeness of SMEs also depends on the innovativeness of owner/managers. Creativity, technical skills, motivation for growth, flexibility and networking ability of owner/managers were identified as important factors that enhanced the innovativeness of SMEs.

Even though the SMEs have these barriers that may lower the innovativeness, they focused on gaining regional advantages such as available raw materials, labor-intensive techniques and crafting skills, cost reduction methods in order to introduce innovation to fulfill unmet customer needs. Furthermore, SMEs are likely to be introducing more incremental innovation rather than radical innovation as a result of these barriers and the lack of technology. In developing countries, incremental changes, acquisition of embodied technology, and applications or adaptations of existing products or processes are thought to be the most frequent forms of innovation (De Mel et al., 2009).

Secondly, this paper examined the relationship between innovativeness and business performance of SMEs in HDSL. Empirical findings confirmed that innovativeness was positively and significantly correlated to business performance of SMEs. This implies that innovativeness is an important variable that must be considered to improve the business performance of SMEs in HDSL. The findings of the present study were consistent with previous works which indicated innovativeness as an important determinant of business performance (Damanpour and Evan 1984, Hult, Hurley and Knight, 2004). Thus, it is important for policy makers to create an innovative atmosphere through understanding the barriers to promote SMEs in order to improve business performance.

SUSTAINABILITY MEASURES ADOPTED AT HOME AND ABROAD BY LARGE U.S. CORPORATIONS

Dr. M. Anaam Hashmi
Professor of International Business & Finance
Minnesota State University, Mankato, Minnesota 56001, USA

ABSTRACT

The United States' government has not ratified the Kyoto Protocol of greenhouse gas emissions reduction, but most of the large U.S. corporations are proactively involve in sustainability and environment friendly measures at home and abroad. The United States is still the largest polluter in the world, contributing one-fourth of global greenhouse gas emissions. These large U.S. corporations were slow to address the global environment challenges but a majority of them now have a clear understanding of their responsibility. Some of these corporations are actively trading carbon credits on global climate exchanges. About an hundred corporations are member of the Chicago Climate Exchange and the European Climate Exchange, the two large climate exchanges in the world. The questionnaire results also support these large corporations' increased involvement in sustainability measures.

1. INTRODUCTION

The purpose of this study is to identify sustainability measures adopted by large U.S. corporations in their domestic and international operations. Large U.S. and other global corporations have realized the importance of sustainability measures and related market-based mechanisms. Twenty-three of these large corporations came together in the Group of Eight Climate Change Roundtable (part of the World Economic Forum) and demanded world governments to establish clear, consistent, and transparent long-term economic incentives to reduce all greenhouse gases (GHG) emissions. Large U.S. corporations are the founding member of the North America's first voluntary climate exchange in Chicago. At the same time, the U.S. government has not ratified the Kyoto Protocol of GHG emissions reduction.

Large U.S. corporations are under pressure from sustainability advocates and institutional investors around the world. These large corporations along with the large European and Asian corporations have volunteered to share their sustainability efforts to the Carbon Disclosure Project (CDP). A positive development is the involvement of institutional investors in forcing large U.S. corporations to disclose their current GHG emissions and reduction strategies. The leader of these efforts is the Carbon Disclosure Project and their periodic surveys have encouraged large U.S. corporations to reduce their GHG emissions. (Truini 2004) The Carbon Disclosure Project is a coalition of about 385 institutional investors that manage \$57 trillions of global investment. The Carbon Disclosure Project has made requests to the largest multinationals to disclose their GHG emissions reduction programs. In early 2008, the group made its sixth request to 3,250 of the world's largest publicly traded corporations to release their investments in greenhouse gas reduction. The 2008 list includes largest 500 U.S. corporations, 500 largest global corporations, 350 largest British corporations, 150 largest Japanese corporations, and other large corporations from around the world. (Hashmi 2009) The survey results are available

to the public at large as well as to institutional investors. Such a request suggests that the large U.S. and global corporations are experiencing increased pressure from governments as well as investment groups to find a market-based solution to environmental problems and promote sustainability measures.

2. LITERATURE REVIEW

Snider, et al. (2003) studied socially responsible behavior of thirty largest U.S. corporations and fifty largest global corporations as listed by Forbes magazine. The authors studied the selected corporations' websites in context of the stakeholder's theory. Snider, et al. (2003) addresses the broader social responsibility issues but does not particularly deal with sustainability behavior. White (2006) suggests that going green is an economically beneficial decision for U.S. corporations. The growing market in carbon credits and other environment related incentives are impacting corporate income statements and balance sheets. White (2006) identified that the U.S. financial institutions are examining carbon-related legislations and corporate exposure to environmental risk in long term investment approval process. Hashmi (2009) looked into growth of carbon credits market in the U.S. and around the globe.

Launched in 1999, the Dow Jones Sustainability Indexes are the first global indexes tracking the financial performance of the leading sustainability-driven companies worldwide. (DJSI 2010) Currently more than 70 DJSI licenses are held by asset managers in 16 countries to manage a variety of financial products. For example, the Dow Jones Corporation has created the Dow Jones Sustainability United States Index (DJSI US) to evaluate market performance of the large U.S. corporations. DJSI US includes large corporations from all fifty-seven industry sectors. Market capitalization of these large U.S. corporations is US \$ 4.3 trillion. The top holding companies in the DJSI US are Microsoft Corporation, Procter & Gamble, Johnson & Johnson, General Electric, and IBM. (DJSI US 2010) One of the objectives of these indexes is to analyze sustainability policies of a corporation on their financial performance.

In August 2009, the Dow Jones Corporation has also introduced the Dow Jones Sustainability Japan 40 Index (DJSI Japan 40) measuring performance of the largest 40 sustainability leaders in Japan. The index is rebalanced each year in September and calculated in U.S. dollar and Japanese yen. (DJSI 2010)

Fleming (2005) discussed the shareholders' demand for more disclosure of climate risk exposure. Investors managing \$ 3.0 trillion assets released a ten-point action plan for U.S. corporations and Wall Street firms to help assess financial risk relating to environmental issues. Supporters of the action plan include state treasurers, comptrollers and pension fund leaders from California, Illinois, New York and the United Kingdom. It suggests that U.S. and European corporations are feeling pressure from the shareholders to be proactive in reducing the greenhouse gasses. In another study, Hancock (2005) foresee stringent requirement from the United State's Security and Exchange Commission, quoting Commissioner Richard Roberts, "era of responsibility free pollution for U.S. corporations was over." Truini (2004) summarize findings of a 2004 study of Financial Times 500 Global Index of companies by the realization of these companies that climate change can impact shareholder value both positively and negatively; thus, it is in the best interest of the corporations to be proactive.

An analysis of the web sites of the top 100 US corporations, as well as a survey mailed to the human resources executive of each of the top 250 US corporations (10% response rate) was completed by the Duke University researchers. (Rousseau 2009) A primary observation was the large variation among top US corporations when it comes to their commitment to sustainability and their commitment through the integration of sustainability practices into their corporate cultures. For example, companies such as Berkshire Hathaway Inc., exemplify a lack of integration of sustainability practices, while companies such as ATT, Inc. and IBM Corp., hope to develop and cultivate a sustainable corporate culture, and reap the benefits of the value this effort brings. In general, the research points to a lack of consensus and understanding of what sustainability means among the top US corporations, and perhaps a lack of prioritization of sustainability issues. (Rousseau, 2009) The website analysis by this study reveals that two-thirds of the top 100 US corporations report on sustainability issues, but only 43% chose to make sustainability immediately visible on their corporate website landing page. (Rousseau, 2009) Top U.S. corporations can facilitate the advancement of sustainability, starting with the modification of the company's mission statement and/or core values.

It is in the best interest of the U.S. corporations to design a long term strategy of reducing GHG emissions or risk being cannibalized by maintaining status quo or resisting the change. Editor (2006) argues that U.S. automobile industry's demise is attributed to their unwise lobbying to resist fuel efficiency. This resistance not only harming environment but they are losing customers to more fuel efficient automobiles. Sustainability corporations can also trade their carbon credits on global climate exchanges. Another encouraging trend for U.S. corporations is the tax incentives from several municipalities, states and U.S. federal government. U.S. treasury has announced to allow up to \$ 2 billion in tax-exempt bonds to be issued for selected industries. (Ferris 2004)

Davis (2005) reported that many U.S. corporations have implemented significant voluntary GHG emissions reduction. For example:

- BP America, Inc. reduced its GHG emissions 10 percent below 1990 levels, creating approximately \$650 million in value in the process, and has committed to maintain its reduced net emissions for at least a decade.
- Alcoa has reduced its direct GHG emissions 25 percent below 1990 levels through energy efficiency improvements, has captured over \$16 million per year in energy savings, and projects that technological improvements could lead to a 50 percent reduction by 2010.

Davis (2005) also reported encouraging and proactive strategies by U.S. corporations related to GHG emissions. For example:

- 228 companies and organizations reported 2,027 GHG reduction or sequestration projects to the Department of Energy's Voluntary Reporting of Greenhouse Gases Program in 2002. While 43 percent of the reports were from the electric power sector, a total of 29 industries or services were represented.
- Out of 50 entities participate in EPA's Climate Leaders Program, 20 of them have set reduction goals in addition to measuring emissions. Participants document emissions for

all six GHGs considered by the Kyoto Protocol and report on a company-wide, facility-level basis for all domestic facilities.

- Businesses with annual revenues over \$140 billion report their direct and indirect emissions to California’s Climate Action Registry, perhaps the most developed and influential GHG emissions registry in the United States.

For more than a year, the Newsweek worked with leading environmental researchers to rank the 500 largest U.S. companies based on their actual environmental performance, policies, and reputation. It was a huge challenge to rank companies based on sustainability. That's largely because comparing environmental performance across industries (power generation or service industries) is difficult to be compared. (McGinn 2009) More than half of companies' overall Green Scores in the Newsweek ranking are based on their environmental policies and reputation, industry-neutral metrics that help even the playing field for companies in carbon-intensive businesses. To overcome less than expected voluntary corporate emissions data, Newsweek used data from Trucost, which has created a widely acclaimed system for estimating. (McGinn 2009)

Table 1 is a summary of the top ten socially responsible corporations in the U.S. as compiled by Newsweek magazine. This is one of the most comprehensive ranking. U.S. corporations can find out their detailed rankings and use this information in their future operational decisions. At the same time, consumers can also make their buying behavior based on the social responsibility ranking scores.

Table 1
 Social Responsibility Score and Ranking of Large U.S. Corporations

Rank	Company	Industry	Overall Green	Envir. Impact	Green Policies/Performance	Reputation Survey
1	Hewlett-Packard <i>"Strong programs to reduce GHG and first one to report GHG data in the industry"</i>	Technology	100.00	64.80	97.90	88.44
2	Dell <i>"Forth user of renewable energy"</i>	Technology	98.87	67.70	100.00	70.80
3	Johnson & Johnson <i>"Its commitment to climate change is rare for its peer group"</i>	Pharmaceu - ticals	98.56	56.70	98.17	75.88
4	Intel <i>"Largest corporate purchaser of renewable energy- 46 % of total"</i>	Technology	95.12	46.70	87.87	81.86
5	IBM	Technology	94.08	76.90	84.20	77.56

	<i>"Had formal environmental policies since 1971"</i>					
6	State Street <i>"Leader in financial services industry"</i>	Financial Services	93.62	95.00	84.39	70.69
7	Nike <i>"Leads its industry in environmental management of suppliers"</i>	Consumer Products	93.28	77.10	78.31	89.90
8	Bristol-Myers Squibb <i>"Announced goal to reduce direct/indirect emissions by 10% by 2010, from 2001 levels"</i>	Pharmaceu - ticals	92.62	27.80	88.52	64.73
9	Applied Materials <i>"Semiconductor manufacturer designs its products to use less water/energy/GHG"</i>	Technology	91.79	50.90	89.51	44.51
10	Starbucks <i>"In 2008, announced to source products in environmentally and socially responsible ways"</i>	Leisure/ Food	91.63	30.50	82.01	75.42

Source: McGinn 2009

Nastu (2008) identified energy efficiency and investment in renewable energy as key steps taken by the U.S. corporations to reduce their GHGs emissions and operating cost. For example, Office Depot reported that it has reached a ten percent absolute reduction in carbon dioxide emissions from natural gas and electricity consumed in its North American retail stores, warehouses, and offices by installing more energy-efficient technology. Citigroup, with a real estate portfolio equaling 8.5 million square meters worldwide, has adopted such power-saving measures as turning off escalators in the lobbies of buildings and redesigning bank branches to include more natural lighting and recycled materials. Citigroup reported nearly \$100 million annually, by making its offices use less energy. Similarly, GE has pledged to invest \$1.5 billion annually on ecomagination research and development by 2010. One of four GE ecomagination commitments originally made in 2005, R&D investment has reached more than \$2.5 billion since the program's inception. In May 2007, GE announced that it had doubled sales from environmentally friendly products to \$12 billion over the previous two years. (Nastu 2008)

Wal-Mart Corporation has recently announced to put solar panels on their 22 stores in the United States. (Editors, 2007) BP Solar, SunEdison and PowerLight are the provider of this technology

and each of the 22 stored can generate up to 30 percent power from these solar energy. Wal-Mart also announced to generate up to 100 percent power from renewable sources. (Editors 2007)

Some of the questions in this study are inspired by Hoffman (2005), suggesting that if a company wishes to formulate a sustainability business model, they are advised to follow these steps:

1. Calculate the energy efficiency of the corporation and explore the ways to improve it.
2. Calculate the CO₂ and other GHG emissions of the corporation.
3. Explore carbon trading mechanism.
4. Conduct a cost benefit analysis of CO₂ and GHG emissions reduction by employing new processes and price of carbon credits.
5. Research new energy efficient technologies, particularly for future projects. The list includes solar power, wind power, hydro power and utilizing bio-fuels.
6. Assess GHG liability of new capital assets.
7. Formulate internal auditing system to comply with GHG regulations and forecast future greenhouse gas emissions.

3. RESEARCH METHODOLOGY

A questionnaire was mailed out to a sample of large U.S. corporations selected from the Fortune 500 list published in 2007. Certain industries which are exclusively domestic, e.g. home builders, saving institutions, and waste management were deleted from the sample. A total of 422 questionnaires were mailed out addressing by name to the CEO of the companies. The questionnaire includes questions related to corporation's environmental responsibilities, political risk and direct investment policies. The last section of the questionnaire covers corporation specific demographic information. A self addressed stamped envelop was enclosed to improve response rate. As an incentive, the respondents were promised summary data after conclusion of the project. A total of 66 responses were received (response rate 15.64 %); however, the environmental friendliness question was responded by only 53 corporations (13 %). The response rate of this study is within the acceptable range. There is a non-response bias; however, not addressed in this study. Secondary data sources are used to collect wind energy growth data and sustainability ranking of the U.S. corporations.

4. DATA ANALYSIS

Installed wind-power capacity data for the top four countries and the world are tabulated in Table 2. In four-year period, global capacity increased by 167 percent to 157,899 MW. The United States is the leading wind power producing country in the world, with an estimated installed capacity of 35,159 MW. The U.S. installed capacity grew at a staggering rate of 284 percent in four-year period. This result suggests that the U.S. corporations and utility companies have been aggressively investing in socially responsible wind-energy projects. Wind-energy investment in China is encouraging as Chinese increased their installed capacity from 1,266 MW (in 2005) to 25,104 MW (in 2009). China is about to become the second wind-power producing country surpassing Germany. Some of the questions in this study's questionnaire are related to the large U.S. corporations' investment/reliance on wind energy and other renewable sources.

Table 2
 Installed Wind-Power Capacity (MW) in the United States

Rank	Country	2005	2009	Growth
1	United States	9,149	35,159	284 %
2	Germany	18,428	25,777	40 %
3	China	1,266	25,104	1882 %
4	Spain	10,028	19,149	91 %
	World Total	59,024	157,899	167 %

Source: GWEC 2010

A careful analysis of Table 3 reveals that responding large U.S. corporations are making right investment decisions. In each category, U.S. corporations are involved in sustainability measures at home as well as their involvement abroad; however, these large U.S. corporations are more aggressive in their sustainability investment activities at home. This may sound contradictory to the fact that the United States has not ratified the Kyoto Protocol of environmental responsibility, but the United States environmental protection regulations and financial incentives in few U.S. states encourage U.S. corporations to be proactive in environmental issues.

The most widely used sustainability measure at home or abroad is ‘investing in energy efficient measures.’ A total of 38 corporations are focusing on energy efficiency at home and 31 in their international operation. The second and third widely adopted measures were getting part of the electrical power from solar and wind energy. Solar and wind energy is subsidized by several U.S. states and federal government, thus, encouraging U.S. corporations to generate solar and wind power or pay to the utilities for solar and wind energy generated electric power. Solar and wind energy power generation was also ranked second and third in their international operations; however, at a lower usage level. Bio-fuel was the fourth widely used sustainability measure at home and abroad. Perhaps the most surprising finding was the 42 percent of the responding large U.S. corporations are trading carbon credits in the U.S. This can be attributed to the voluntary reduction of greenhouse gases by many large U.S. corporations including Ford Motor Company, Dow Corning, DuPont, Motorola, Kodak, and Cargill. A small number of large U.S. corporations do support environmental organizations.

Table 3
 Number of U.S. Corporations Adopting Sustainability Measures
 (Total = 53)

Sustainability Measures	In USA	In International Operations
Electricity generated by solar power	36 (68 %)	27 (51 %)
Electricity generated by wind power	34 (64 %)	25 (47 %)
Electricity generated by hydro power	7 (13 %)	2 (4 %)
Electricity generated by biomass	9 (17 %)	7 (13%)

Using bio-fuels	31 (59 %)	10 (19 %)
Investing in energy efficient methods	38 (72 %)	31 (59 %)
Supporting environmental org.	11 (21 %)	5 (9 %)
Trading carbon credits	22 (42 %)	9 (17 %)

5. CONCLUSIONS

The United States has not ratified the Kyoto Protocol of mandatory reductions in GHGs, but the large U.S. corporations are making sustainability measures to be their top priority. These corporations are heavily relying on wind-power in the U.S. Based on a survey of these large corporations, it is concluded that the large U.S. corporations selected from Fortune 500 list are focusing on sustainability measures in their U.S. and international operations. Energy efficiency, solar and wind energy came out to be first, second and third widely used measures. It is also interesting to see that these corporations' involvement in sustainability activities is more aggressive in the U.S. compared with their international operations. This difference is attributed to better enforcement of U.S. voluntary and mandatory regulations. Also, U.S. corporations are pressurized by major investors and environmental groups to adopt sustainability measures at home. Also, the domestic operations of these U.S. corporations are in close observation of major investors and environmental groups. Financial incentives and carbon trading makes the above mentioned sustainability measures not only socially responsible behavior, but good business as well.

Factors Affecting the Practice and non-Practice of Filipino-American Families in the United States

Felinore Angelica Valera

De La Salle University-Dasmaringas, Philippines

Chapter 1

THE PROBLEM AND ITS BACKGROUND

Introduction

The word value comes from the Latin term “*valere*” which means “to be worth” (Merriam Webster’s Collegiate Dictionary). It reveals a corresponding utility. This may be translated into Filipino as “halaga” or “pakinabang.” Brian Hall (1994, p.21), on the other hand, defines values as “the ideals that give significance to our lives, that are reflected through the priorities that we choose, and that we act on consistently and repeatedly.” A person’s personality improves as he or she chooses alternatives and follows them up (Mercado, 2000). Hence, values have become an important part of a culture.

Value has been a concern of various studies, especially of social sciences, and it has a variety of meanings. In social sciences, it is linked to the acts, customs, institutions, and people’s positive ways (Mercado, 2000). In business or economics, it may refer to its usefulness or purchasing power. In behavioral sciences, it may denote any need, attitude, or desire.

If value is to be an object of science, there must be an obvious relationship between the object and the thoughts and actions of a certain person perceiving the same object. The person may find the object useful to himself and the share of viewpoint with other people becomes normative (Bauzon, 1994). Bauzon sees value as becoming a norm for judging behavior in a given culture. In Filipino culture, for instance, the people value group, hence, individualism is judged as bad. An individual can be called “walang pakisama,” or he can be called “pilosopo,” if he does not conform with the group’s thoughts and actions. Values, then, have a strong social dimension.

Mercado (2000, p. 88) mentions that “the Filipino identity is the result of his historical past.” Filipino identity is the fruit of the varied influences. Although the country has regional diversities, there is something common that covers all Filipino people. “The commonalities are more striking than the differences, and we can conclude there indeed a common culture and a common social structure that we can truthfully call Filipino” (CBCP, 1992, p.11, no.19).

The Filipino cannot be separated from the cultural values and attitudes where he has been brought up. These values have become a great part of his personality that makes him different from other people. Values, according to Andres (1996), give life to the individual’s spirit and uniqueness to his being. In this view, values can be a blessing or a curse

to a Filipino depending on how he manages these - positively or negatively.

As regards cultural values, we can say that every culture is distinct from each other and each has its own set of value systems (Andres, 1996). Although some cultures are closely related, there are still some unique factors which differentiate one from the others. People may only find the difference when they are already in a new cultural setting. This may result in a “culture shock.” This is usually the initial experience of people who migrated to a foreign country whose culture is far from theirs. However, a new cultural setting may either bring positive or negative influence on a person that may lead the practice or non-practice of one’s own cultural values.

The preceding ideas have inspired the researcher to find the different factors affecting the practice and non-practice of Filipino cultural values of Filipino-American (Fil-Am) families in a foreign land.

Review of Related Literature

This section presents the different articles or literature from different books and websites that are related to this present study.

The Filipino Culture

Filipino culture is “an integrated system of learned behavior patterns that are characteristic of the members of the Philippine society” (Andres, 1987, p. 4). This refers to the Filipinos’ total way of life that

includes Filipino customs, traditions, language, values, beliefs, attitudes, self-concept, morals, rituals, and manners.

The Filipino culture is a mixture of several ethnicities, mainly Malay ancestry, due to their trade and colonization history (<http://www.fasgi.org/cultural/cul0.html>). The Filipino values and ways of life were formed by several but sometimes conflicting cultures, thus making them uniquely Filipino. In the Filipino blood runs the rich Christian values of Europe, the pragmatic and democratic values of America, Islamic influence, and the spiritual values of Asia (<http://www.ci.glendale.ca.us/hrc/philp.htm>; see also <http://www.fasgi.org/cultural/cul0.html>). This fact makes a Filipino easily adapt to different cultures and live the values they provide.

There are seven distinct elements in Filipino culture. These are values, basic personality, basic social unit, politics, economics, technology and ecology (<http://www.ci.glendale.ca.us/hrc/philp.htm>).

According to Andres, (1987) Filipino cultural values are common beliefs that make some activities, relationships, goals and feelings important to the Filipino people's identity. The Filipino basic personality is established by the Filipino culture because of the selection of those similar types that are matched with the culture. The Filipino basic social unit is the family that supplies and maintains the Filipino values. The Filipino politics are the Filipino ideas and structures linked to the allocation and channeling of power within the Philippine society for its

welfare, order and regulation. The Filipino economics are the ideas that the Philippine society acquires and the structures which it creates for provision of food, clothing and shelter for its members. Filipino technology includes all that the Filipinos have invented to make their life easier, less demanding, and shifted from the edge of mere survival to a quality living thus changing their way of life and giving them more control of their physical environment. Finally, Filipino ecology is the link of the Filipino to the ecosystem such as temperature, type of soil, amount of moisture, types of crops that can be grown or types of animals present in the Philippines and other environmental features (cf. <http://www.ci.glendale.ca.us/hrc/philp.htm>).

Understanding the Filipino Character and Values

In the introductory part of this paper, it was mentioned that values may be translated into Filipino as “*halaga*” or “*pakinabang*.” But what could be the best translation that will better understand the Filipino character and values? Other authors have translated values as “*buti*,” “*pamantayan*,” “*ganda*,” and “*pagpapahalaga*” (Mercado, 2000). However, do these translations really fit the character and values of the Filipino?

Miranda (n.d) gives different translations to value, and he narrows them down to “*buti*,” which means good, and “*mahal*,” which means esteemed, loved, precious. Mercado (2000), however, disagrees with him on three counts: good differs from value; value is both objective and

subjective or intersubjective; and since value is ambivalent, it can also be evil.

Jocano (1997), on the other hand, suggests another translation as “*pamantayan*.” This term comes from the Filipino root word “*pantay*,” which indicates that “it stays in the middle between extremes, that is between ‘*labis*’ (more) and ‘*kulang*’ (less)” (Mercado, 2000, p. 96). Jocano (1997) refers “*pamantayan*” to “a code of meanings, as internal rules, as directive force, and as a system of relationships” (cf. Mercado, 2000, p. 96). This translation has three sub-groups: “*halaga*” (worth, value), “*asal*” (good manners), and “*diwa*” (spirit) (Jocano, 1997). Values are to be taken holistically because what a person values affects his thoughts, behavior, and outlook in life. This translation of value as “*pamantayan*” cannot be thought of by an ordinary Filipino in his everyday words although it can be taken philosophically (Mercado, 2000). Therefore, such translation will not be used as a basic standard in this study but can be considered in some ways.

Mercado (2000, p. 99) thinks that “although “*ganda*” (beautiful) may be philosophically approximate translation, it does not subscribe to the principle that the translation should be near to the language of the people.” He mentions that the Tagalog does not say “*mabuting umaga*” for ‘good morning’ but “*magandang umaga*.” Hence, “*pagpapahalaga*,” may be accepted as the best translation for the term value. If one only considers its root word “*halaga*,” which means price, value, worth,

importance, evaluation or assessment, it still lacks the aspect of intersubjectivity (Mercado, 2000). For this reason, an affix may be needed to supply the lacking elements. The word "*pagpapahalaga*" provides the shades of value as grasped philosophically.

Filipinos cannot get away from the influence of cultural values and attitudes (Andres, 1996). Values contribute life to one's spirit and to the uniqueness of his being. There are many strengths and weaknesses of the Filipino character. These could be the result of the blend of several cultures among the Filipinos.

Filipino values, according to Mercado (2000), are compound. Values can be universal but each country possesses its unique mark. Brian Hall (1994) suggests a total of 125 human values. His review of values has been validated cross-culturally. One may think that these values are like building blocks but they are bunches of more fundamental values. Mercado (2000) cites "*hiya*" as an example. This value can be a mixture of honesty, being liked, competition, care, order, confidence, competence, courtesy/hospitality, empathy, expressiveness, equilibrium, support/peer, tradition, risk, friendship/belongingness, health/healing, human dignity, intimacy, acceptance/limitation, prestige/image, right/respect, self-assertion, self-worth, social affirmation.

Licuanan (1994) presents several strengths of the Filipino character. These are "*pakikipagkapwa-tao*" (regard for others), family

orientation, joy and humor, flexibility, adaptability and creativity, hard work and industry, faith and religiosity, and ability to survive. However, these strengths of the Filipino character can also become negative depending on how the person manages to live these values. Hence, one can see the ambivalence of Filipino values.

“*Pakikipagkapwa-tao*” is very natural to the Filipinos. They are open to others and feel one with others (Licuanan, 1994). They easily empathize with others as they are helpful and generous in times of need. They are known for their practice of “*bayanihan*” or mutual assistance and for hospitality.

Because of “*pakikipagkapwa-tao*,” Filipinos develop a sensitivity to people’s feelings, trust, and a sense of gratitude or “*utang na loob*” (indebtedness). This results in camaraderie and a feeling of closeness to one another. It upholds unity and a sense of social justice (Licuanan, 1994). This value which is the same as “*pakikisama*” also means a cooperation with other people in order to reach the group’s or community’s goals or objectives in the shortest possible time (Andres, 1996).

The unity of the “self” with “other selves” gives emphasis on “kapwa” or others as the moral basis of relationships (Jocano, 1993). It is known that there are people who belong to a higher status compared to others but “they must treat each other equally. They are after all, *magkapwa tao* (fellow human beings)” (Jocano, 1993, p. 14).

“*Pakikipagkapwa-tao*” is very Filipino. This is being manifested even within the family, in the neighborhood, and in the larger community. It brings harmony to relationships.

On the other hand, “*pakikipagkapwa-tao*” may sometimes be negative. There are people who abuse other’s “*pakikipagkapwa-tao*” towards them. In this case, such value no longer brings harmony to relationships but destruction to the persons concerned.

Family orientation is very important for the Filipinos. They are known to be clannish (Andres, 1996). They have an authentic and deep love for the family that includes not only the spouses or children, parents and siblings, but also the extended family members or kin such as grandparents, uncles, aunts, cousins, godparents and other relatives by affinity. It is common for adult children to live with parents, and three generations living under one roof is typical among the Filipino families (<http://www.fasgi.org/cultural/cul0.html>). According to Licuanan (1994, p. 34), “to the Filipino, one’s family is the source of personal identity, the source of emotional and material support, and the person’s main commitment and responsibility.” This is the reason why the name of a Filipino family is given much respect and value.

Concern for the family is demonstrated in the honor and respect given to parents and elders, in the care given to children, generosity towards the needy relative, and in the great sacrifices one bears for the good of the family. This sense of family develops a feeling of

belongingness or rootedness and an essential sense of security (Licuanan, 1994). Andres (1996) mentions that this could develop a better and deeper relationship with relatives, and loyalty is strengthened.

Filipinos are known for their joy and humor. They have a joyful and fun-loving attitude towards life and its ups and downs. This sense of joy and humor is shown in the Filipino love for parties and celebrations, and in their capacity to laugh even in the hardest times of life (Licuanan, 1994).

Licuanan (1994, p. 32) writes that “Filipinos have a great capacity to adjust, and to adapt to circumstances and to the surrounding environment, both physical and social.” This creativity and resourcefulness enable them to accept change. This results in efficiency, novelty, entrepreneurship, composure, and survival.

Filipinos are known to be hardworking and industrious. The yearning to raise one’s standard of living and to possess the rudiments of an upright life for one’s family, mingled with the right opportunities and incentives, motivate the Filipino to work very hard (Licuanan, 1994).

A deep faith in God is one strong character of the Filipinos. Licuanan (1994) mentions that inherent religiosity allows the Filipinos to understand and truly accept reality in the context of God’s will and plan. This faith in God gives them courage, optimism, inner peace and even the capacity to accept tragedy and death.

Christianity is a minority religion in Asia (2.3%) but the majority religion in the Philippines is Catholicism (Gorospe, 1998). For ordinary Filipino Christians, God does exist. According to Gorospe (1998), there are different Filipino approaches to God. First, they are based on intuition rather than logic, on faith rather than reason. Secondly, one finds the “Filipino dimension,” tinted by the Filipino character and culture, of the common religious experience of humanity. Thirdly, whatever resembles the religious thought of the West is principally due the Christian influence.

The above strong characters of the Filipinos enable them to survive in life which is shown in their endurance in the midst of difficulty.

On the other hand, the different weak characters of the Filipinos are shown in their extreme personalism, extreme family-centeredness, lack of discipline, passivity and lack of initiative, colonial mentality, “kanya-kanya” syndrome, and lack of self-analysis and self-reflection (Licuanan, 1994).

Filipinos are person-oriented, and relationships with other people are very important in their lives. However, in the extreme, this person-orientation results in a lack of objectivity and an indifference towards universal rules and procedures so that everyone, despite these relationships, is treated equally (Licuanan, 1994).

Family-orientation may be a strength of the Filipinos but it becomes a serious defect in the extreme. Too much concern for the

family produces an in-group to which the Filipino is severely devoted, to the loss of concern for the larger community or the common good (Licuanan, 1994).

In the Filipino scale of values coming from the closed family kinship system, there are three traditional values given primacy such as authoritarianism, personalism, and small-group centeredness (Gorospe, 1998). It is very important for the Filipino to be approved by those in authority like the parents, teachers, and leaders who are in power. The individualism or personalism and small-group centeredness of the Filipino have hampered rather than helped towards nation-building and towards the growth of the Church in the Philippines (Gorospe, 1994). Unfortunately, Filipinos lack social consciousness of the common good.

Filipinos are known for their lack of discipline. This often results in “inefficient and wasteful work systems, the violation of rules leading to more serious transgressions, and a casual work ethic leading to carelessness and lack of follow-through” (Licuanan, 1994, p. 35). This character is linked to “*ningas cogon*.” By all standards, it becomes negative because it begins fervently and dies down as soon as it begins (Quito, 1994). This trait makes the individual inactive and unable to start things or to persevere. This is usually due to lack of discipline.

Filipinos are normally passive and lacking in initiative (Licuanan, 1994). They often wait to be told what has to be done. There is a fervent dependence on other people. Filipinos are inclined to be unworried, and

there seldom is a sense of pressure about any problem. In many ways, they are too patient and “*matiisin*,” too easily submissive to one’s fate. Therefore, Filipinos are easily oppressed and exploited.

Colonial mentality of the Filipinos has two dimensions: a lack of patriotism or love of the Philippines, and an actual preference for things foreign (Licuanan, 1994). It is often demonstrated in the hostility of the superior ones from their roots and from the masses, and in the essential feeling of national weakness that makes it difficult for Filipinos to interact as equals with the Westerners.

“Kanya-kanya” syndrome may be associated with the so-called “crab mentality.” Filipinos have a selfish, self-serving attitude that generates a feeling of envy and competitiveness towards others, particularly one’s peers, who seem to have gained some status or prestige (Licuanan, 1994). It is often manifested through “*tsismis*,” intrigues and unconstructive criticism to bring others down. One becomes self-centered; one has no regard for others (Quito, 1994). This results in the diminishing of cooperative and community spirit and in the refusal of the rights of others.

Filipinos tend to be superficial. In times of serious problems, they lack analysis and reflection. They seem to be satisfied with superficial solutions to problems. This lack of self-analysis and self-reflection is bolstered by an educational system that is frequently more

of form than substance and a legal system that tends to switch law for reality (Licuanan, 1994).

Roots of the Filipino Character

The strengths and weaknesses of the Filipino have been influenced by many factors. These include the home environment, the social environment, culture and language, history, the educational system, religion, the economic environment, the political environment, mass media, and leadership and role models (Licuanan, 1994).

Home Environment. The home environment consists of childbearing practices, family relations, and family attitudes and orientation (Licuanan, 1994). In a big family, the children are motivated to get along with their siblings and other relatives where “*pakikipagkapwa-tao*” is learned. In an authoritarian family atmosphere, children learn respect for the elderly. They also learn to become passive and reliant on authority. In the family, children are trained to value family and to provide it chief importance.

Social Environment. Social structures and social systems such as interpersonal religious and community interaction compose the social environment (Licuanan, 1994). The Filipinos are raised to be dependent on relationships with others in order to survive. This makes them in-group oriented.

Culture and Language. Filipino cultural values are characterized by warmth and person orientation, devotion to family, and a sense of joy

and humor which are strengthened by different forces such as family, school, and peer group (Licuanan, 1994). Filipino culture is characterized by an openness to the external factor that incorporates foreign elements without an essential consciousness of the heart of the culture. This could be linked with the Filipinos' colonial mentality and with the use of English as the medium of instruction in schools. The use of English may explain the Filipino's lack of reflection and analysis (Licuanan, 1994). This is the result of one's thinking in the native language but expressing oneself in English.

History. Filipinos are the product of colonial history which is generally considered as the perpetrator behind the lack of nationalism and colonial mentality (Licuanan, 1994). The American influence is more embedded in the Philippines because the Americans established a public school system where people learned English and the American way of life. These colonial influences are fortified by media and the Filipino elite by their western ways.

The Educational System. The Filipino students and teachers are forced to use school materials that are irrelevant to the Philippine setting due to the lack of suitable local textbooks and dependence on foreign textbooks. This results in a mind-set that things learned in school are not related to real life (Licuanan, 1994).

Religion. Filipino optimism and his capacity to accept life's difficulties are rooted in religion (Licuanan, 1994). This factor inculcates

in the Filipino attitudes of resignation and anxiety about life-after-death. Because of this, Filipinos are likely to become victims of opportunism, oppression, exploitation and superstition.

The Economic Environment. Many characteristics of the Filipinos are traced in poverty and hard life which most Filipinos experience. This drives them to take risks, to work hard, and to survive (Licuanan, 1994).

The Political Environment. The political power in the Philippines is depicted by a centralization of power (Licuanan, 1994). This power is concentrated in the hands of the few elite. The inefficiency of government structures yields a lack of integrity and accountability on the part of the public servants.

Mass Media. Mass media strengthens the Filipino's colonial mentality, passivity, and "*porma*" (Licuanan, 1994). They admire models who have "*mestizo*" or "*mestiza*" looks, and patronage imported goods that are seen or known through the mass media. They fantasize good life rather than confront poverty because of the escapist movies, television shows, comics, etc. that feed passivity.

Leadership and Role Models. Licuanan (1994) writes that Filipinos find their leaders as role models. Hence, when the leaders defy the law or manifest themselves as self-serving and drawn by personal interest, there is a negative bearing on the Filipino.

Assimilating the American Culture

Filipinos come from a nation where people of diverse descent are many and socially accepted. Filipinos do not have the cultural barriers against marrying outside their own racial group (Takaki, 1995). Filipino men, in particular, find it easier to meet and associate with white women compared to other Asian immigrants. They have been familiar with Western culture because their homeland had been under the Spanish and American regime for a very long time (Takaki, 1995). According to Takaki (1995), many early Filipinos in America saw themselves as Americans rather than foreigners because they had been educated in American schools and were able to speak English to some extent.

On the other hand, Coroner (1997) has presented his views about the failure of Filipinos to make a difference in American public life. According to him, Filipinos have been coming to the United States as immigrants for about a hundred years. However, they “have yet to build a community at par in clout with the other immigrant peoples who have come to compose this country’s mosaic of races” (Coroner, 1997, p. 107). Filipinos have found obscure the unity that binds a people into a unified community even within their own racial society. The Filipino Americans’ pursuit for power lacks this unrealized clasping of hands together.

Gendrano reviews the book of Nestor Mercado entitled “God bless America: A Discussion of Family Values” in Heritage Magazine (<http://home.earthlink.net/~vgendrano/heritage.html>). Mercado’s family, his wife and five children, immigrated to the United States in the mid-

70's to look for a better life for the children. In the book, Mercado narrates how he and his wife successfully raised their children and how they coped with the hardships of daily living, keeping the traditional Filipino values while they were sensibly embracing some American values that strengthened theirs. It is also claimed that parents' delicate balancing act of meshing both Filipino and American values helped the Mercados succeed in raising the children the right way.

The Filipino culture may not be very different from the American culture. The Americans, like the Filipinos, value family traditions. They teach their children the principles and values of free individuals in a free society (<http://www.americanfamilytraditions.com/values.htm>). They work hard to become men and women of integrity, self-discipline, productivity, humility and empathy. They believe in the principle of universal harmony that sustains their families by living harmoniously with the earth and the universe (<http://www.americanfamilytraditions.com/values.htm>).

There is part in the American culture whether spoken or unspoken that shows itself in everything that the people say, do, or think. One example is that they expect to compete in every aspect of their lives, and at the same time, they also expect to be given equal opportunity to realize their potential. They believe that everyone has equal rights under the law (http://www.americanfamilytraditions.com/american_culture.htm).

The Filipinos may adapt this part of the American culture but this would

not be very easy for them. Filipinos tend to be submissive. However, because of ability and determination, adapting to this culture may not be very hard for them.

Mercado (<http://home.earthlink.net/~vgendrano/heritage.html>) offers a plain model of the symbiotic relationships among the various institutions: the school, family, government, church, and the community. He explicates the interaction and effect of each other, and he compares the Filipino and other Asian values to the Americans'.

Anne Paulin (anne@pop.net.com) mentions in her e-mail write-up that "a sixth of the total immigrants in the United States are Filipinos and one million of the seven million foreign-born residents are from the Philippines." She is one of them. She asks herself, "How is immigration working for the Filipinos, their lifestyle, family values and their perception of our Homeland?" (anne@pop.net.com).

Paulin ran a survey in the Internet for a few days and there were one hundred fifty-five Filipinos who were willing to participate in her survey. Most of the respondents were petitioned by somebody in the family while others were either born in the U.S. or first generation Filipino immigrant in the family (anne@pop.net.com). Paulin's father, being the first member in their family who came to the U.S., shares the same difficult experience of other immigrants that they have gone through in assimilating the American culture, and at the same time, coping with the pain of leaving the family behind. For him, it was very

hard because he belongs to a closed-knit family. The same thing must be true for most of the immigrant Filipinos.

Coming to the United States, Filipinos are prepared with educational background and sound communication skills (anne@pop.net.com). With such ability and capacity, they can easily look for work as compared to other immigrants. The first generation Filipinos were working hard to immerse themselves in the American community as much as possible. Some have even gone to the extent of teaching only English to the children to facilitate their life and be liberated from discriminatory practices of the natives. However, while the Filipino-Americans may speak good English and know good grammar and usage and spelling, they have different way of pronouncing some English words (<http://www.filipinoweb.com>). Anne Paulin herself is a “product of the struggles of her parents to assimilate at the sacrifice of loss of language, custom, and overall Filipino culture” (anne@pop.net.com). She had “identity crisis” because she did not know how to ask her parents about her culture and her background.

Many young people from east to west have embarked on their personal quest for their Filipino identity. Unexpectedly assimilation is out and separate identity is stylish, and Filipino pride takes on a new meaning. Even children born and raised in the U.S. of Filipino parents have soared in the bandwagon expressing their bittersweet experiences

as minority students, as different and treated as such, in primarily white school (<http://www.home.earthlink.net/~vgendrano/identity.html>).

The children are very likely to take hold of and search for their roots and to identify themselves with the Filipino culture (anne@pop.net.com). Some respondents to Paulin's survey commented on their Filipino-hood. One mentioned that he was able to learn the importance of his Filipino-hood in college after going through a long period of trying to assimilate the American culture. He went through a period of anger and fervent root-searching. He is now in a period of synthesis. Another respondent found the Filipino culture so rich, so diverse, and so beautiful. He was aware of the strengths of the faith and values of the Filipinos as well as the qualities that keep the Filipino families together. Filipino customs and family values are still firmly enforced in most of the Filipino homes in the U.S. These include showing respect to elders and regular visit to parents. One respondent mentioned that Catholic upbringing is still sustained and practiced. Attending masses, novenas, prayer sessions and charismatic movements are very popular among the Filipinos in the U.S.

According to Anne Paulin (anne@pop.net.com), many Filipinos still find good life back home in the Philippines but what would one do if his or her father sacrificed over ten years of his life to offer the family the chance to fulfill their American Dream? She writes that she came to the U.S. because her loved ones have been there and her family is the most

important thing in her life. However, that does not stop her from being patriotic to her homeland and she will always look forward to coming back home to the Philippines.

In raising their children, the Filipino-American parents try to inculcate in their children's mindsets Filipino values such as respect for elders, good values, and good morals and right character. The children are taught to act like Filipinos and should not forget the good things about being Filipinos and their culture (<http://www.filipinoweb.com>). In other words, Filipino-American children are trained to live in two worlds: being Filipinos and being Americans.

Theoretical Framework

The vanishing Filipino cultural values among the Fil-Am families are observed nowadays. How can these Fil-Am families regain their Filipino identity and cultural values? In order to answer this inquiry, one has to find the different Filipino cultural values that those Fil-Am families either continuously practice or no longer practice today, and the factors affecting the practice or non-practice of such values.

Bauzon (1994) claims that there are two possible models that can be used in knowing and clarifying the Filipino values. These are the ***eclectic model*** and the ***holistic model***.

The eclectic model, Bauzon (1994, p. 93) states, "is similar to a shopper in a supermarket. The shopper picks out the grocery items he wants to buy and cooks the food according to his taste."

On the other hand, the holistic model, Bauzon (1994) continues, can be likened to the systems approach in which the person is seen as one totality. This model respects the nature of the person. As the person grows older, he becomes expert of things as he improves his thoughts and ways.

Statement of the Problem

The study tried to find the different factors that affect the practice and non-practice of the cultural values of Filipino-American families in a foreign land.

Specifically, this study aimed to answer the following questions:

1. What are the Filipino cultural values that the Fil-Am families in the US still consider/remember at present?
2. Which among these Filipino cultural values do they still cherish and practice today?
3. What factors contribute to the continuous practice of such cultural values?
4. What factors affect the non-practice of such values today?

Scope and Limitations

This study only tried to find the different factors affecting the continuous practice as well as the non-practice of Filipino cultural values

of Fil-Am families living in several states in the United States for at least three years.

This study had a limited number of respondents. The researcher sent survey questionnaire through e-mails with the help of her friends. Unfortunately, only one respondent replied through the e-mail. She learned from a friend in the US that it was difficult for the would-be respondents to reply back to the survey questionnaire through the e-mail. There was something wrong in the process. Due to such problem, she only received replies from 63 respondents from the US through the postal mails.

Significance of the Study

The results of this study will be significant to the following:

Filipino-American Parents. The Fil-Am parents can teach their children about their Philippine roots, the Filipino customs and traditions, in order for them to appreciate and still live their Filipino-hood.

Filipino-American Children. The Fil-Am children can search together for their own Filipino identity, and help each other to cherish and practice their Filipino cultural values.

Filipino-American Community in the United States. The Fil-Am community can strengthen their Filipino cultural values by celebrating and practicing their customs and traditions together.

Filipino Relatives in the Philippines. The relatives of the Fil-Am families in the Philippines may give support to their relatives in the

United States in their struggle to live the Filipino cultural values in a foreign land through regular communication and reminders.

Values Education. This study may be used as a guide or reference for Values Education Program that will help students or young people who have lived abroad, in the United States and other foreign countries, to be rooted in their Filipino culture, and appreciate and live the values that the Filipino culture provides.

Researchers. This study may serve as a reference for future researchers. This may influence a further analysis of a related topic.

Chapter 2

METHODOLOGY

This chapter presents the research design, respondents, the instrument/tools used in the study, the data-gathering procedure, the sources of data, and the data analysis plan of the study.

Research Design

This study used the descriptive-exploratory method of research, using survey questionnaire. It is descriptive because it identified and presented the different cultural values that the Fil-Am families still practice and no longer practice today. It is exploratory because it investigated the different factors that have been affecting their continuous practice as well as the non-practice of such cultural values.

A series of interviews was conducted with some Fil-Am students and visitors staying in the country in order to find the values that they either still practice or no longer practice today, and the factors that have been affecting these practices or their non-practice.

Respondents

There was a total of 78 respondents of the study. Among these 78 respondents, 12 are Fil-Am students from De La Salle University-

Dasmariñas, 3 are Balikbayan visitors, and the rest are staying in the US at present. The respondents staying in the US sent their responses through postal mails with the help of the researcher’s family members in the US. Only one among these respondents sent her reply through the e-mail.

The different tables below show the profile of the respondents of this study. **Table 1** presents the different states in the USA where the respondents come from. The 78 respondents come from 10 states in the US: 22 come from California, 2 from Connecticut, 1 from Guam, 12 from Maryland, 1 from Massachusetts, 26 from New Jersey, 9 from New York, 1 from Pennsylvania, 1 from Philadelphia, and 3 from Tennessee.

Table 1		
States Where the Respondents Come from		
State where they come from	No. of Respondents	Percentage (%)
California (Ca)	22	28.21
Connecticut (Ct)	2	2.56
Guam (Gu)	1	1.28
Maryland (Md)	12	15.38
Massachusetts (Ms)	1	1.28
New Jersey (NJ)	26	33.33
New York (NY)	9	11.54
Pennsylvania (Pa)	1	1.28
Philadelphia (Ph)	1	1.28
Tennessee (Tn)	3	3.85

Tables 2, 3 and **4** show the Religion to which the respondents belong, the status of their residency, and the length of their stay in the US, respectively. The respondents are composed of 75 Catholics and 3 Born-Again Christians. 54 are US citizens and 24 are permanent residents. Among them, 3 have lived in the US for 3 – 5 years, 18 for 6 –

8 years, 8 for 9 – 11 years, 10 for 12 – 14 years, and 39 for 15 and more years.

Table 2		
Religion of the Respondents		
Religion	No. of Respondents	Percentage (%)
Catholics	75	96.15
Born-Again Christians	3	3.85

Table 3		
Status of Residency of the Respondents in the US		
Status of Residency	No. of Respondents	Percentage (%)
Citizen	54	69.23
Permanent Resident	24	30.77

Table 4		
Length of Stay in the US		
No. of Years of Stay	No. of Respondents	Percentage (%)
3 – 5 years	3	3.85
6 – 8 years	18	23.08
9 – 11 years	8	10.26
12 – 14 years	10	12.82
15 years - above	39	50.00

Instruments/Tools

A survey questionnaire was primarily used in this study. An interview guide was also used in this study for some Fil-Am students and visitors. The questions used both in the survey questionnaire and interview guide were constructed in an open-ended form to allow the respondents to freely describe and explain their responses or ideas. Probing and follow-up questions were done during interviews.

The survey questionnaire and interview guide were composed of specific questions that helped generate insights and find answers to the study.

Data-Gathering Procedure

The procedure employed in this study consisted of three phases.

Phase I. The Preparation Stage. This stage was devoted to the preparation of survey questionnaire and interview-guide questions. The research instruments were validated by three DLSU-Dasmariñas faculty, one of them lived and studied in the U.S. for eight years.

The researcher, in this stage, tried to find possible contact-persons in some places in the US where she could possibly conduct her study through e-mails and letters. She started to send communication to those people as soon as the research proposal was approved.

Phase II. The Data-Gathering Stage. This phase was the period of sending survey questionnaire to possible Fil-Am family-respondents in the US through e-mails and postal mails. At the same time, this phase was also the actual interviews with Fil-Am students and visitors in the country for a period of about three months.

Phase III. The Data-Processing Stage. This stage involved processing of all data gathered in Phase II, and the actual writing of the results of the study.

Sources of Data

The data were gathered primarily from the responses of the family-respondents through e-mails and postal mails, as well as from interviews with some Fil-Am students and visitors in the country.

Data Analysis

Qualitative data analysis was used in this study whereby the researcher searched for patterns in the responses and for ideas that help explain the existence of those patterns (Bernard, 1994). Semantic and observational data were the main sources of insights in this study. As ideas about cultural values and practices were developed, the researcher tested them against her observations which have somehow modified such ideas.

The concept of theme was used in the presentation and discussion of the data that were gathered from the responses. The researcher analyzed the data and group them into some possible categories like family values, social values, religious values, etc.

To validate systematically the respondents' replies and the researcher's observations, she always bore in mind the following guidelines suggested by Bernard (1994: 361-362):

1. Look for consistencies and inconsistencies among knowledgeable informants and find out why informants disagree about important things.
2. Whenever possible, check informants' reports of behavior or of environmental conditions against more objective evidence.
3. Be open to negative evidence rather than annoyed when it pops up. When you encounter a case that doesn't fit your theory, ask yourself whether it's the result of : (a) normal intracultural variation, (b) your lack of knowledge about the range of appropriate behavior, or (c) a genuinely unusual case.

4. As you come to understand how something works, seek out alternative explanations from informants and from colleagues and listen to them carefully.

5. Try to fit extreme cases into your theory, and if cases won't fit, don't be too quick to throw them out. It is always easier to throw out cases than it is to reexamine one's ideas, and the easy way out is hardly ever the right way in research.

The emergent patterns in the replies of the family-respondents and interviewees to the specific questions that were asked in this study helped the researcher explain the respondents' insights about the Filipino cultural values either still practiced or no longer practiced by Fil-Am families today. To analyze the data, the study utilized frequency, percentage, and ranking.

Similarities, differences and common patterns with that of the reviewed literature were also noted.

Chapter 3

RESULTS AND DISCUSSION

This chapter contains the answers to the specific problems posed in the study, as well as some discussions about them.

Specific Problem No. 1 What are the Filipino cultural values that the Fil-Am families in the US still consider/remember at present?

Table 5 shows 6 different Filipino cultural values that were ranked no. 1 value that is still considered or remembered by Filipino-American families in the US, but these are not necessarily practiced by the respondents. These values are “utang na loob,” “pakikisama,” belief or faith in God, family gatherings or reunions, family ties and connections, and respect for elders.

Belief in God ranks first among the no. 1 Filipino cultural values that are still considered or remembered by Fil-Am families. There are 54 respondents or 69.23% who ranked this value as no. 1 Filipino cultural value that they still consider or remember.

Table 5			
Filipino Cultural Values Still Considered or Remembered by Fil-Am Families (Ranked No. 1)			
Values	No. of Respondents who Ranked such Values as No. 1	Percentage (%)	Percentile Rank
“Utang na Loob” (Indebtedness)	2	2.56	5.5.

“Pakikisama” (Getting along with others)	2	2.56	5.5
Belief / Faith in God	54	69.23	1
Family Gatherings / Reunions	4	5.13	3.5
Family Ties or Connections	4	5.13	3.5
Respect for Elders	12	15.38	2

Table 6 presents 7 different Filipino cultural values that were ranked no. 2 value that is still considered or remembered by Filipino-American families in the US, but these are not necessarily practiced by the respondents. These values are “amor propio,” “utang na loob,” “pakikisama,” “bayanihan,” family gatherings or reunions, family ties and connections, and respect for elders.

Family gatherings or reunions ranks first among the no. 2 Filipino cultural values that are still considered or remembered by Fil-Am families. There are 22 respondents or 28.21% who ranked this value as no. 2 Filipino cultural value that they still consider or remember.

Table 6			
Filipino Cultural Values Still Considered or Remembered by Fil-Am Families (Ranked No. 2)			
Values	No. of Respondents who Ranked such Values as No. 2	Percentage (%)	Percentile Rank
“Amor Propio” (Inner Strength)	4	5.13	6
“Utang na Loob” (Indebtedness)	2	2.56	7
“Pakikisama” (Getting along with others)	6	7.69	4
“Bayanihan” (Cooperation / Teamwork)	5	6.41	5
Family Gatherings / Reunions	22	28.21	1
Family Ties or Connections	20	25.64	2
Respect for Elders	19	24.36	3

Table 7 shows 9 different Filipino cultural values that were ranked no. 3 value that is still considered or remembered by Filipino-American

families in the US, but these are not necessarily practiced by the respondents. These values are “amor propio,” “pakikisama,” “pagkamatiisin,” “hiya” or “delicadeza,” faith or belief in God, family gatherings or reunions, family ties and connections, respect for elders, and superstitious beliefs.

Family ties or connections ranks first among the no. 3 Filipino cultural values that are still considered or remembered by Fil-Am families. There are 27 respondents or 34.62% who ranked this value as no. 3 Filipino cultural value that they still consider or remember.

Values	No. of Respondents who Ranked such Values as No. 3	Percentage (%)	Percentile Rank
“Amor Propio” (Inner Strength)	6	7.69	5
“Pakikisama” (Getting along with others)	6	7.69	5
“Pagkamatiisin (Endurance)	3	3.85	8
“Hiya”/ “Delicadeza”	6	7.69	5
Faith / Belief in God	3	3.85	8
Family Gatherings / Reunions	15	19.23	2
Family Ties or Connections	27	34.62	1
Respect for Elders	9	11.54	3
Superstitious Beliefs	3	3.85	8

Specific Problem No. 2 . Which among these Filipino cultural values do they still cherish and practice today?

Table 8 shows 6 different Filipino cultural values that were ranked no. 1 value that is still cherished and practiced by Filipino-American families in the US. These values are “pakikisama,” “pagkamatiisin,”

belief or faith in God, family gatherings or reunions, family ties and connections, and respect for elders.

Belief in God ranks first among the no. 1 Filipino cultural values that are still cherished and practiced by Fil-Am families. There are 44 respondents or 56.41% who ranked this value as no. 1 Filipino cultural value that they still cherish and practice.

Table 8			
Filipino Cultural Values Still Cherished and Practiced by Fil-Am Families (Ranked No. 1)			
Values	No. of Respondents who Ranked such Values as No. 1	Percentage (%)	Percentile Rank
“Pakikisama” (Getting along with others)	6	7.69	4
“Pagkamatiisin (Endurance)	2	2.56	6
Belief / Faith in God	44	56.41	1
Family Gatherings / Reunions	5	6.41	5
Family Ties or Connections	12	15.38	2
Respect for Elders	9	11.54	3

Table 9 presents 7 different Filipino cultural values that were ranked no. 2 value that is still cherished and practiced by Filipino-American families in the US. These values are “amor propio,” “utang na loob,” “pakikisama,” belief or faith in God, family gatherings or reunions, family ties and connections, and respect for elders.

Family gatherings and reunions ranks first among the no. 2 Filipino cultural values that are still cherished and practiced by Fil-Am families. There are 21 respondents or 26.92% who ranked this value as no. 2 Filipino cultural value that they still cherish and practice.

Table 9			
Filipino Cultural Values Still Cherished and Practiced by Fil-Am Families (Ranked No. 2)			
Values	No. of Respondents who Ranked such Values as No. 2	Percentage (%)	Percentile Rank
“Amor Propio”	2	2.56	7
“Utang na Loob” (Indebtedness)	4	5.13	6
“Pakikisama” (Getting along with others)	10	12.82	4
Faith / Belief in God	5	6.41	5
Family Gatherings / Reunions	21	26.92	1
Family Ties or Connections	18	23.08	2.5
Respect for Elders	18	23.08	2.5

Table 10 shows 8 different Filipino cultural values that have been ranked no. 3 value that is still cherished and practiced by Filipino-American families in the US. These values are “amor propio,” “utang na loob,” “pakikisama,” “hiya” or “delicadeza,” belief or faith in God, family gatherings or reunions, family ties and connections, and respect for elders.

Family ties or connections ranks first among the no. 3 Filipino cultural values that are still cherished and practiced by Fil-Am families. There are 19 respondents or 24.36% who ranked this value as no. 3 Filipino cultural value that they still cherish and practice.

Values	No. of Respondents who Ranked such Values as No. 3	Percentage (%)	Percentile Rank
“Amor Propio”	6	7.69	5
“Utang na Loob” (Indebtedness)	4	5.13	6.5
“Pakikisama” (Getting along with others)	4	5.13	6.5
“Hiya” / “Delicadeza”	3	3.85	8
Faith / Belief in God	15	19.23	3
Family Gatherings / Reunions	10	12.82	4
Family Ties or Connections	19	24.36	1
Respect for Elders	17	21.79	2

Specific Problem No. 3 What factors contribute to the continuous practice of such cultural values?

Table 11 shows the different factors that were ranked no. 1 factor that have been contributing to or affecting the continuous practice of Filipino cultural values by Filipino-American families. These factors are family, peers, religion or Church, work or studies, the presence of Fil-Am community in their vicinity, and rootedness in the Philippines or love of country.

Family ranks first as the no. 1 factor that has been affecting the continuous practice of Filipino cultural values by Fil-Am families. There are 54 respondents or 69.23% who ranked this factor as no. 1 in affecting the continuous practice of Filipino cultural values by Fil-Am families.

Table 11			
Factors Affecting the Continuous Practice of Filipino Cultural Values by Fil-Am Families (Ranked No. 1)			
Factors	No. of Respondents who Ranked such Factor as No. 1	Percentage (%)	Percentile Rank
Family	54	69.23	1
Peers	4	5.13	4
Religion / Church	9	11.54	2
Work / Studies	3	3.85	5
Presence of Fil-Am Community in the Vicinity	6	7.69	3

Rootedness in the Philippines / Love of Country	3	3.85	6.5
Filipino Traditions	21	26.92	1
Media	0	0	

Specific Problem No. 4 What factors affect the non-practice of such values today?

Table 14 presents the different factors that were ranked no. 1 factor that have been affecting the non-practice of Filipino cultural values by Filipino-American families.

There were only 68 respondents who ranked the enumerated factors since 10 respondents mentioned that there were no factors affecting the non-practice of Filipino cultural values. 10 factors were chosen by the respondents as no. 1 factor that have been affecting the non-practice of Filipino cultural values by Fil-Am families. These are family, peers, religion or Church, work or studies, non-presence of Fil-Am community in the vicinity, no sense of Filipino history, modern technology or industrialization, media, colonial mentality, and comfort or convenience in life.

Non-presence of Fil-Am community in the vicinity ranks first as the no. 1 factor that has been affecting the non-practice of Filipino cultural values by Fil-Am families. There were 14 or 17.95% who ranked this factor as no. 1 affecting the non-practice of Filipino cultural values.

Factors	No. of Respondents who Ranked such Factor as No. 1	Percentage (%)	Percentile Rank
Family	2	2.56	11
Peers	10	12.82	3.5
Religion / Church	3	3.85	8.5
Work / Studies	9	11.54	5
Non-Presence of Fil-Am Community in the Vicinity	14	17.95	1
No Sense of Filipino History	3	3.85	8.5
Modern Technology / Industrialization	3	3.85	8.5
Media	3	3.85	8.5
Colonial Mentality	12	15.38	2
Comfort / Convenience in Life	7	8.97	6
NONE (No factor affecting the non-practice of Filipino cultural values)	10	12.82	3.5

Table 15 shows the different factors that were ranked no. 2 factor that affects the non-practice of Filipino cultural values by Filipino-American families. There were only 68 respondents who gave no. 2 rank since there were 10 respondents who believed that there were no factors affecting the non-practice of Filipino cultural values by Fil-Am families (see Table 14).

There were only 6 factors preferred by the 68 respondents as no. 2 factor that have been affecting the non-practice of Filipino cultural values by Fil-Am families. These are peers, work or studies, non-

presence of Fil-Am community in the vicinity, no sense of Filipino history, modern technology or industrialization, and colonial mentality.

Work or studies ranks first as no. 2 factor that has been affecting the non-practice of Filipino cultural values by Fil-Am families. There were 21 respondents or 30.88% who ranked this factor as no. 2 affecting the non-practice of Filipino cultural values.

Factors	No. of Respondents who Ranked such Factor as No. 2	Percentage (%)	Percentile Rank
Family	0	0	
Peers	20	29.41	2
Religion / Church	0	0	
Work / Studies	21	30.88	1
Non-Presence of Fil-Am Community in the Vicinity	9	13.23	3
No Sense of Filipino History	8	11.76	4
Modern Technology / Industrialization	6	8.82	5
Media	0	0	
Colonial Mentality	3	4.41	6
Comfort / Convenience in Life	0	0	

Table 16 presents the different factors that were ranked no. 3 factor that have been affecting the non-practice of Filipino cultural values by Filipino-American families. There were only 68 respondents who gave no. 3 rank since 10 of them believed that there were no factors affecting the non-practice of Filipino cultural values by Fil-Am families (see Table 14).

There are 9 factors chosen by the 68 respondents as no. 3 factor that have been affecting the non-practice of Filipino cultural values by

Fil-Am families. These are peers, religion or Church, work or studies, non-presence of Fil-Am community in the vicinity, no sense of Filipino history, modern technology or industrialization, media, colonial mentality, and comfort or convenience in life.

No sense of Filipino history ranks first as no. 3 factor that has been affecting the non-practice of Filipino cultural values by Fil-Am families. There were 14 respondents or 20.59% who ranked this factor as no. 2 affecting the non-practice of Filipino cultural values.

Factors	No. of Respondents who Ranked such Factor as No. 3	Percentage (%)	Percentile Rank
Family	0	0	
Peers	6	8.82	6
Religion / Church	3	4.41	8
Work / Studies	12	17.68	2

Modern Technology / Industrialization	10	14.71	3
Media	2	2.94	9
Colonial Mentality	6	8.82	6
Comfort / Convenience in Life	6	8.82	6

Analysis and Synthesis

There are differences among the Filipino cultural values decided by the respondents as values that are still considered or remembered and still cherished and practiced by Fil-Am families. Some values that are still considered or remembered are not necessarily cherished or practiced. However, it could be noted that although there are

differences, the values that ranked no. 1, no. 2, and no. 3 among those that are still considered or remembered and among those still cherished and practiced by Fil-Am families are the same. *Faith or belief in God* ranked no. 1 Filipino cultural value that is still considered or remembered and still cherished and practiced by Fil-Am families. It is followed by *family gatherings and reunions*, and *family ties or connections* as no. 2 and no. 3 values respectively in both categories.

The *family* ranks as no. 1 factor that has been affecting the continuous practice of Filipino cultural values by Fil-Am families. It is followed by *religion or Church*, and *Filipino traditions* as no.2 and no. 3 factors, respectively, that have been affecting the continuous practice of Filipino cultural values.

Only 68 respondents ranked the enumerated factors as no. 1, no. 2, and no. 3 that have been affecting the non-practice of Filipino cultural values by Fil-Am families. 10 of the 78 total respondents believed that no factors have been affecting the non-practice of Filipino cultural values. Among the factors affecting the non-practice of Filipino cultural values chosen by only 68 respondents were *non-presence of Fil-Am community in the vicinity*, *work or studies*, and *no sense of Filipino history* that ranked 1, 2 and 3 factors, respectively.

The different Filipino cultural values chosen by the respondents could be categorized into the following: *religious values*, *family values*, and *socio-historical values*.

Religious Values

Being a Catholic-dominated country, the Philippines, it is no surprise that *faith or belief in God* would be the no. 1 value that the Filipino-American families still remember, cherish and practice even though they are already in a foreign country. Religion or the Church has become a great influence, being the no. 2 influential factor, on the development of such value. Most of the respondents, 96.15% of them, are Catholics, and the rest are Born-Again Christians. Most of the interviewees mentioned that their elders, especially their parents, have introduced to them their faith. The elders taught them about God and religion. They would even go to church together on Sundays to celebrate the Holy Mass with the Christian community.

Religious responsibility is familial rather than church-centered (<http://www.ci.glendale.ca.us/hrc/phlip.htm>). Every home has a family altar. This shows that family is really a great influence on the faith of the individual that even if he or she is in a foreign land, the family helps him or her to know God and have faith in Him.

Family Values

Based on no. 2 and no. 3 values, *family gatherings and reunions*, and *family ties or connections*, that the Filipino-American families still remember, cherish and practice in a foreign land, family is basically important in their lives. Family is even the no. 1 factor that influences the continuous practice of Filipino cultural values by those Fil-Am

families. It may be noted that both *family gatherings and reunions*, and *family ties or connections* are manifestations of family values. The value that was ranked no. 4 by the respondents as remembered, cherished, and practiced by Fil-Am families which is *respect for elders* (see Appendices D and E) is still an expression of family values.

In Philippine society, the interests of the family, not of the individual, are the priority. Because of close family ties, even among the adolescents, the Filipino's close friends do not replace the family. They merely widen their social circle (<http://www.filipinoweb.com>). The interests of the family or even just the family name are treasured much more than that of the individual. Many values unite the individual to the family, making him or her to consider how a decision will impact the family (<http://www.fasgi.org/cultural/cul0.html>).

Socio-Historical Values

Family is the basic unit of the society. Social values start with the family. The Filipino family is the nuclear unit around which social activities are structured (<http://www.ci.glendale.ca.us/hrc/philp.htm>).

The responses of the respondents and interviewees show that the presence of Filipino-American community in their vicinity helps a lot in developing their Filipino cultural values. As a community, they celebrate together their Filipino traditions. With the help of their families and the Filipino-American community, they can trace their Filipino history and culture.

On the other hand, without the presence of Filipino-American community, their sense of Filipino history and culture is affected especially if they are much occupied with their works or studies. Celebrating together the Filipino traditions enhances their Filipino cultural values. They do not practice it only within their respective family units but with the whole Filipino-American community in the vicinity. This is especially true among the respondents from California where there are more Filipino-American communities compared with those from other states. In fact, Los Angeles in the State of California has the largest concentration of Filipinos in the world outside the Philippines, with 223,276 Filipinos (1990 Census), making them the largest Asian group after the Chinese (<http://www.fasgi.org/cultural/cul0.htm>). Most of the respondents who mentioned that there was no factor that affected the non-practice of Filipino cultural values come from this state.

Those who come from a neighborhood where there are only few Filipino-American families or no Fil-Am families at all almost forget their Filipino cultural values and they are now very much “americanized.” This enhances their colonial mentality which is one factor that has been affecting the non-practice of Filipino cultural values.

In this study, one may see that the religious, family, and socio-historical values are important Filipino cultural values among most of the Filipino-American families living in the United States. The values

and the factors affecting such values always influence each other. As seen in family values, the family itself is a main factor that influences the continuous practice of such values. Likewise, the Fil-Am community is also a great influence in the continuous practice of socio-historical values. According to the respondents, there may be other factors that could affect the practice or the non-practice of Filipino cultural values. However, if the family and even the Fil-Am community support one another and share and practice those values together, their being Filipinos will always remain.

Based on the results of the study, the Filipino-Americans either use any of the eclectic model or the holistic model, or use both models in their practice or non-practice of Filipino cultural values in the United States. The parents and the elders in the family and in the community show, teach and practice the Filipino cultural values they still remember and cherish. The young ones pick the values they appreciate and feel good. Bauzon (1994) calls this eclectic model. On the other hand, there are some who first observe and respect the practice of the Filipino culture without necessarily appreciating it. As they grow older and mature they become appreciative and expert of the culture as they improve their thoughts and ways. This is called holistic model (Bauzon, 1994).

Both models may be used, one after the other. One may start with the eclectic model by simply picking the values that he appreciates, then

he becomes expert of such values as he grows older and matures, and improves his thoughts and ways.

Chapter 4

SUMMARY, CONCLUSION, AND RECOMMENDATIONS

Summary

This present study tried to find the different factors that have been affecting the practice and non-practice of the cultural values of Filipino-American families in a foreign land.

Specifically, the following questions were answered:

1. What are the Filipino cultural values that the Fil-Am families in the US still consider/remember at present?
2. Which among these Filipino cultural values do they still cherish and practice today?
3. What factors contribute to the continuous practice of such cultural values?
4. What factors affect the non-practice of such values today?

This study used the descriptive-exploratory method of research, using survey questionnaire. A series of interviews was conducted with some Fil-Am students and visitors staying in the country in order to find the values that they either still practice or no longer practice today, and the factors that have been affecting these practices or their non-practice.

There was a total of 78 respondents of the study. Among these 78 respondents, 12 are Fil-Am students from De La Salle University-Dasmariñas, 3 are Balikbayan visitors, and the rest are staying in the US at present.

The survey questionnaire and interview guide used in the study were composed of specific questions that helped generate insights and find answers to the problems specified in this study. The data were gathered primarily from the responses of the family-respondents through e-mails and postal mails as well as from interviews with some Fil-Am students and visitors in the country.

The procedure employed in this study consisted of three phases: the preparation stage, the data-gathering stage, and the data-processing stage. For data analysis, the study utilized frequency, percentage, and ranking.

After analyzing the data, the following results were gathered:

1. What are the Filipino cultural values that the Fil-Am families in the US still consider/remember at present?

Faith or belief in God was ranked as no. 1 Filipino cultural value that is still considered or remembered by Fil-Am families. It is followed by *family gatherings and reunions*, and *family ties or connections* as nos. 2 and 3 values respectively.

2. Which among these Filipino cultural values do they still cherish and practice today?

Similar to the answers to no. 1 problem, *faith or belief in God* ranked no. 1 Filipino cultural value that is still cherished and practiced by Fil-Am families. It is also followed by *family*

gatherings and reunions, and family ties or connections as nos. 2 and 3 values respectively.

3. What factors contribute to the continuous practice of such cultural values?

The *family* ranks as no. 1 factor that has been affecting the continuous practice of Filipino cultural values by Fil-Am families. It is followed by *religion or Church*, and *Filipino traditions* as no.2 and no. 3 factors, respectively, that have been affecting the continuous practice of Filipino cultural values.

4. What factors affect the non-practice of such values today?

10 of the 78 total respondents believed that there was no factor affecting the non-practice of Filipino cultural values. Among the factors affecting the non-practice of Filipino cultural values chosen by only 68 respondents, *non-presence of Fil-Am community in the vicinity* ranks no. 1, *work or studies* no. 2, and *no sense of Filipino history* no. 3.

The different cultural values have been classified as religious values, family values, and socio-historical values.

Conclusion

After analyzing the findings above, the following conclusions were drawn:

1. Religious values are of primary importance to the Filipino-Americans because of the influence of the family and

religion. The family itself is an influential factor in their lives so they also give importance to family values. The larger community of the Filipino-Americans help one another to cherish and practice their socio-historical values.

2. Filipino-Americans who live near one another or within a Filipino-American community, tend to cherish and practice the Filipino cultural values better than those who live far from a Fil-Am community. Living and celebrating their culture together drive them to cherish and practice their Filipino values better.

Recommendations

Based on the findings and conclusion above, this researcher recommends the following:

1. Regular gatherings of Filipino-Americans in their respective communities in the U.S. to celebrate Filipino traditions should be done.
2. More write-ups, newspapers and magazines should circulate among the Filipino-American communities about Filipino culture and values, as well as websites, that will allow the Fil-Americans especially the younger generations to know, appreciate and practice their culture.

3. Further studies may be undertaken to know and understand the effects of Filipino cultural values on the life of the present generation Filipino-Americans in the United States.

APPENDIX A

LETTER OF REQUEST FOR INSTRUMENT VALIDATION

COLLEGE OF EDUCATION
DE LA SALLE UNIVERSITY-DASMARIÑAS
Dasmariñas, Cavite

10 June, 2003

Dear _____:

Greetings!

I am presently working on a research entitled “Factors Affecting the Practice and Non-Practice of Filipino Cultural Values of Filipino-American Families in a Foreign Land.”

The idea of this research study has come out from the background that follows. The Filipino cannot be separated from the cultural values and attitudes where he has been brought up. These values have become a great part of his personality that makes him different from other people. Values, according to Andres (1996), give life to the individual’s spirit and uniqueness to his being. In this view, values can be a blessing or a curse to a Filipino depending on how he manages these values positively or negatively.

As regards cultural values, we can say that “every culture is unique and each has its own set of value systems” (Andres, 1996). Although there are some cultures that are closely related, there are some unique factors which differentiate one from the others. People may only find it when they are already in a new cultural setting. We may refer it to a “culture shock.” This is usually experienced by people having migrated to a foreign country whose culture is far from theirs. However, a new culture setting may either bring positive or negative influence to a person that may lead the practice or non-practice of one’s own cultural values.

With the abovementioned ideas, this researcher has been led to find the different factors affecting the practice and non-practice of Filipino cultural values of Filipino-American (Fil-Am) families in a foreign land.

This study uses two (2) data-gathering instruments: survey questionnaire (to be sent to family-respondents in the US through mails and/or e-mails), and interview guide (to be conducted with Fil-Am students/visitors in the Philippines. In this connection, I would like to request you to validate my survey questionnaire and interview guide as my data-gathering instruments.

Thank you very much.

In St. La Salle,

FELINORE ANGELICA H. VALERA, EdD

APPENDIX B

SURVEY QUESTIONNAIRE

Dear **RESPONDENT/S**,

I am a faculty-researcher of De La Salle University-Dasmariñas, Cavite, Philippines working on a paper entitled “**Factors Affecting the Practice and Non-Practice of Filipino Cultural Values of Filipino-American Families in a Foreign Land.**”

The idea of this research study has come out from the background that follows. The Filipino cannot be separated from the cultural values and attitudes where he has been brought up. These values have become a great part of his personality that makes him different from other people. Values, according to Andres (1996), give life to the individual’s spirit and uniqueness to his being. In this view, values can be a blessing or a curse to a Filipino depending on how he manages these values positively or negatively.

As regards cultural values, we can say that “every culture is unique and each has its own set of value systems” (Andres, 1996). Although there are some cultures that are closely related, there are some unique factors which differentiate one from the others. People may only find it when they are already in a new cultural setting. We may refer it to a “culture shock.” This is usually experienced by people having migrated to a foreign country whose culture is far from theirs. However, a new culture setting may either bring positive or negative influence to a person that may lead the practice or non-practice of one’s own cultural values.

With the abovementioned ideas, this researcher has been led to find the different factors affecting the practice and non-practice of Filipino cultural values of Filipino-American (Fil-Am) families in a foreign land.

In this connection, I would like to solicit a little of your time and effort to answer this **Survey Questionnaire** that will greatly help my research study. This survey questionnaire consists of two (2) parts: I. Profile of the Family-Respondent, and II. Survey Questionnaire. Kindly answer this questionnaire honestly and sincerely.

After answering this questionnaire, kindly send this back to this sender. I will appreciate it so much if you could forward this questionnaire to many of your Fil-Am family-friends.

Thank you very much! God bless your family!

Respectfully yours,

F.ANGELICA HORNILLA-VALERA, EdD

DLSU-Dasmariñas College Professor

Part I. PROFILE OF THE FAMILY

Name of the Family: _____ Religion: _____

E-Mail Address: _____

Permanent Address: _____

Nationality: Father _____ Mother _____

Occupation: Father _____ Mother _____

Number of Children in the Family: _____

___ No. of those in the Pre-school ___ No. of those in College

___ No. of those in the Grade school ___ No. of those Working

___ No. of those in High School ___ No. of those Married

Number of Years of Stay in the United States: _____

Status of Residency in the US: ___ Citizen ___ Permanent Resident

Part II. Questionnaire

Direction: A. Kindly check at least three (3) and rank from 1-3, 1-5, 1-8, etc. (1- the most, highest no. – the least) the different Filipino cultural values that you and your family still consider or remember at present as well as those that you still cherish and practice today in the United States.

B. Kindly check at least three (3) and rank from 1-3, 1-5, 1-8, etc. (1- the most, highest no. – the least) the different factors contributing to your practice of Filipino cultural values, and the factors affecting the non-practice of such values.

You may also give your comments/remarks at the end of each section of the questionnaire.

A. 1. What are the different Filipino cultural values that you and your family still consider or remember at present?

CHECK	RANK
___ “Amor Propio” (Inner strength to win)	_____
___ “Utang na Loob” (Indebtedness)	_____
___ “Pakikisama” (Getting along with others)	_____
___ “Bayanihan” (Cooperation/Teamwork)	_____
___ “Pagkamatiisin” (Endurance)	_____
___ “Pagkamasayahin” (Being cheerful and happy)	_____
___ “Hiya”/Delicadeza	_____
___ Belief / Faith in God	_____
___ Family gatherings / Reunions	_____
___ Family ties or connections	_____
___ Respect for elders	_____
___ Superstitious beliefs	_____
___ OTHERS (Pls.specify) _____	_____

REMARKS:

2. What are the different Filipino cultural values that you and your family still cherish and practice today?

INTERVIEW GUIDE

Dear **RESPONDENT**,

I am a faculty-researcher of De La Salle University-Dasmariñas, Cavite, Philippines working on a paper entitled “**Factors Affecting the Practice and Non-Practice of Filipino Cultural Values of Filipino-American Families in a Foreign Land.**”

The idea of this research study has come out from the background that follows. The Filipino cannot be separated from the cultural values and attitudes where he has been brought up. These values have become a great part of his personality that makes him different from other people. Values, according to Andres (1996), give life to the individual’s spirit and uniqueness to his being. In this view, values can be a blessing or a curse to a Filipino depending on how he manages these values positively or negatively.

As regards cultural values, we can say that “every culture is unique and each has its own set of value systems” (Andres, 1996). Although there are some cultures that are closely related, there are some unique factors which differentiate one from the others. People may only find it when they are already in a new cultural setting. We may refer it to a “culture shock.” This is usually experienced by people having migrated to a foreign country whose culture is far from theirs. However, a new culture setting may either bring positive or negative influence to a person that may lead the practice or non-practice of one’s own cultural values.

With the abovementioned ideas, this researcher has been led to find the different factors affecting the practice and non-practice of Filipino cultural values of Filipino-American (Fil-Am) families in a foreign land.

In this connection, I would like to solicit a little of your time and effort to answer this **Interview** that will greatly help my research study. This interview consists of two (2) parts: I. Profile of the Respondent, and II. Interview Proper. Kindly answer this interview honestly and sincerely. Thank you very much! God bless your family!

Respectfully yours,

F.ANGELICA HORNILLA-VALERA, EdD
DLSU-Dasmariñas College Professor

Role of the Family in the Cultural Overlaps of Half Japanese/Latin Americans

Forero Montoya Betsy

Tsukuba University, Graduate Program in International and Advanced Japanese Studies
Doctoral candidate

Introduction

The Japanese history of colonization and war and the most recent active patterns of migration have motivated the increase of Japanese/non-Japanese couples giving birth to offspring of mixed ancestry. Among this group of *haafu*¹, colloquial term derived from the English word 'half', there is an increasing number of individuals of Latin American and Japanese mixed parentage who have not been widely studied. This paper looks at Latin American-Japanese *half* individuals raised in Japan, focusing on the characteristics and practices of their family. It examines how every family lives with a mixture of elements that seem compatible, contributing to the creation of identifications that admit the mixture of cultures. Residing in Japan certainly signifies a powerful influence that supports the construction of more Japanized manners of socialization, but the culturally combined input at home not only maintains but also reinforces their overlapping being.

Theoretical Framework

Studies on mixed individuals around the world have discussed the possibilities and difficulties to deal with more than one cultural background. Benet-Martínez and Haritatos² referred to how bicultural individuals perceive their cultural identities as 'compatible' or 'oppositional', and argued that individuals construct and integrate their cultural identities in different manners depending on particular personality dispositions, contextual pressures, demographic variables and acculturation. These scholars support the claim that bicultural people depend on how they are motivated or allowed to be identified with the non-majority and the dominant culture. Bicultural individuals are assimilated; integrated; separated or marginalized into the dominant culture. Christian³ affirms that middle class children who interact with the ethnic majority or dominant group feel more affiliated to this majority even though they might live with people (family) belonging to the minority group. In relation to this, Tizard and Phoenix⁴ argue that if the racialized composition of the family is linked to social status, the latter influences the social position children take. Research by these scholars has shown differences between multicultural families from distinct social strata and has pointed out that the economic circumstances of working classes have contributed to their experience of racism in a manner that middle-class families have not. This has made difficult the plural identification of mixed individuals. Studies in the last two decades have demonstrated, in general, that identities are more dynamic. This paper follows the plural character of identity and the assumption that it is in constant construction, so it might be contradictory⁵. Multicultural identities are less problematic since children tend to comprehend

¹ Other terminology referring to half in the academia are: bicultural, biracial, of mixed ancestry, of mixed parentage, mixed race, mixed blood, multiethnic, multiracial, international and mixed among others.

the mixture of their identity and develop it in a context where both (or more) cultures are presented positively, and they do not favor one over the other. New approaches allow individuals to escape from choosing to be *one* or *the other* and accept the overlap of cultural influences. Although mixed people have in common the multiplicity, they differ in their identifications depending on their social and cultural experiences and the contexts that surround them. The particular case of Latin American-Japanese living in Tokyo and their families will be examined. Their case proves the family to be a site that has the faculty to promote the cultural overlap during the process of individuals' identification.

Methodology

This paper is based on the information obtained from ten in-depth interviews that were conducted to older adolescents and young adults of Japanese and Latin American⁶ mixed ancestry (hereafter LJs) in Tokyo. Several casual interviews also took place with relatives or closely related people such as religious leaders. In eight cases informants answered in Spanish, using a few single words in Japanese, and two people preferred English. The qualitative interview method was used, so an instrument was elaborated, but questions were not asked in a fixed order and depending on every case, other questions were added. There were also subsequent meetings to confirm or clarify the answers.

The Family as a Center of Cultural Overlaps

To begin with regarding general information, it is important to say that they all are nuclear families who have been in Japan at least 15 years, but in some cases their children (not necessarily the informant, but their brothers or sisters) were born in Latin America. Their parents met when their fathers were working in the country of origin of their mothers; eight mothers are Latin American, and two, Japanese. Three informants are married and live with their spouses outside their parents' household, and one of them has children. However, when talking about the family, they always referred to their parents, brothers and sisters, not to their own marriage.

The analysis clearly showed that the family is the social network where both cultures are more clearly combined and smoothly produce instances of cultural overlapping. Father and mother are the first and most determining keys for the understanding and attitude of the intersections of cultures that LJs may live. The kind of relationship with the culture of the foreign spouse directly influences the transmission, the mixture or the imposition of any or both cultures in the mixed offspring at home, according to what informants showed. From one parent there should be some varied cultural input, and from the other, there should be acceptance or cooperation. While school, friends and their Japanese parent usually allow LJs to interact in the Japanese society easily, the level of closeness to Latin America is directly proportional to the strength, constancy and variety of the Latino elements brought home, and to the level of support of the Japanese parent to the foreign culture. Data revealed specific elements that seem to characterize the cultural mixtures and overlaps that LJs develop: practices at home, religion and language.

Practices at home

Casual and simple everyday life activities inside the household were very recurrently mentioned by all informants. These were mainly related to their food habits and their access

⁶ One Argentinean, one Bolivian, three Colombian, three Mexican and two Peruvian.

to popular media, which evidenced what seems to be a smooth combination of cultural practices. Regarding food, there is a marked difference between families who usually have Latin American ingredients at home and those who do not. When the Japanese parent likes Latin American food, or when the Latin American parent insists on cooking their food, it is common to have traditional dishes at home or a combination of both elements even in the same meal, which is not a rare outcome for LJs. Mothers, who cook in all LJs families, may create new dishes to cope with the likes of the members of the family and to take advantage of the resources of both cultures. Some of the dishes LJs mentioned are: toasts with red beans and avocado, avocado with soy sauce, potato salads with *sashimi*, scrambled eggs with *nira*, Japanese rice with a few lentils and garbanzo beans, a lunch including *tsukemono* and rice, chicken with yellow chili sauce, radish and lotus root with *mole*, *tofu* with chili meat balls and with eggs, coke or juice at lunch time. Their interest in Latin American food has made them grow chili plants in their terraces, build *planchas* for tortillas or have their relatives in Latin America send them special ingredients.

“She (her Latina mother) cooks original things, well, such as Japanese food or Bolivian (food) mixed. One doesn’t know. She invents, no? Well yeah, she also cooks stuff that she knows, Japanese food...and Bolivian food too, no?”

“I’ve even put a slice of salmon or *maguro* inside my tortilla [Laughs] but well, neither of my parents like it.”

“Sometimes I don’t know if I’m eating *mole* or curry because we eat them both with rice, bread or *tortilla* and they both have the same, meat, vegetables..., and they’re both spicy.”

However, these instances do not account for all cases. There are three Latino mothers who learned to cook in Japan and do not know how to cook their own regional food. These LJs have only Japanese food at home, and do not even try Latin American food regularly when they eat out. Besides, the interest and knowledge about Latin America is more limited, and at least regarding food habits LJs are more Japanized.

“My dad only eats Japanese food at home (...) I barely eat Latin or Peruvian food because I don’t know any good place. There was one (...) and my mother said we should go, but she never made serious plans. (...) Maybe there are other restaurants (...), I think. Mmmm, well, but I haven’t looked for (...) If I am eating out, I prefer Thai, Korean or from the West, good, no? Yeah, that is good and easy to find.”

“She tried to make *frijoles*, but...they were just a red paste. She overcooked them, and didn’t add anything!!! Not even salt [Laughs]. I didn’t like them.”

Similarly to food, some entertainment forms at home reveal that what parents do may determine the posture of LJs towards both cultures and the relation between them. It was found that popular culture, mainly music and soap operas, tend to familiarize LJs with Latin American culture, and become the means parents use to contact their offspring with a culture that is geographically distant. In fact, the exposure to Latino culture originates a sense of closeness and more sensibility despite they are inside the Japanese society. Except for one LJ that prefers television and music in English, all other LJs watch Japanese television and listen

to Japanese music regularly, but they are also in contact with Latino popular culture. Some informants referred to the musical interests of their mothers and insinuated how this stimulated their sensitivity towards Latin America. In this manner, LJs associate Latin American music with positive feelings, from tranquility to happiness, and may even feel nostalgic. Despite the distance, the music means familiarity, too.

“Since I was a kid, she (her mother) has listened to this music (...). This music makes me feel good and think about the mountains in Peru, and the people there. And the birds, the condors. It’s part of the music at home”

“She had her project of a cultural center, and learned traditional dances. I was the oldest, so my dad told mum that I should help her with her project, and mum started teaching me the names of songs and rhythms...porro, cumbia, bambuco... even vallenato! And I was in charge of the tape recorder during the rehearsals (...) That was good because now when I am in Colombia, I feel like...wah!... good I didn’t lose this (music) while being there (in Japan).”

“The other day I was thinking why I like to listen to ballads in Spanish when I’m alone, when I...in moments of calm and self...self...in my time. I remember that was the music that my mum used to listen to when I was a kid...everyday.”

In a different way, since the media input at home is very frequently the unique and closest reference to Latin America, it may signify limited or ambiguous representations of their Latino parent’s country. When LJs access visual media and confront those images with what they know or have imagined, they may accept, doubt or reject those constructions. They may be aware that somehow those representations might be fiction.

“The other day, I was watching a telenovela, and I thought, ‘do all secretaries wear mini-skirts in Mexico?’ You know, there, they always wear mini-skirts and tight and small blouses. So well, I don’t know if that is true. All that make-up, and those girls flirting [Laughs]. And the bad ones, they always steal money. They only want money. Bad people are super bad and good people are exaggeratedly good. And the rich ones have those mansions with two long stairs and many maids, but you know 50% of the population is poor. (...) Anyway, the music at the beginning and at the end is good. *Mekishikan-poi!* [Smiles]”

Due to the geographic distance and the long time since their last visit to Latin America, their conceptions and images of Latin America come from old memories and specially from elements at home such as food and music, and are influenced by their circumstances in Japan. Having permanent contact and knowing about tastes, rhythms or kinds of TV productions and even knowing particular terms in Spanish means a cultural link that is part of daily life and constitutes what Latin America is for them and what makes them different from Japanese. In fact, the level and quality of Latino elements in daily life and their integration with Japanese elements varies among LJs. Most of them frequently cook Latino food, but the presence of other elements at home widely differs. Apart from music and television, LJs also mentioned reading newspapers, magazines and internet sites, and playing children’s games that they also taught to their friends. All LJs have a minimum degree of contact with Latino culture at home that allows them to understand and find a place for it everyday. The

introduction of elements at home is the first tool contributing to the interception of cultures because outside, in the Japanese world, this possibility is very limited.

Religious beliefs and customs

Religion was an element that came up in the interviews when talking about the family. This might be explained because it is tied to the most rooted customs and beliefs in Latin America and represents a level of commitment and rigidity that Latino parents might have brought. The significance of religion for the Latin American parent due to their traditional education makes them exert some influence, which is usually opposed to the Japanese parent, to whom religion implies more liberty and openness and does not require much rigidity. Out of ten marriage ceremonies, seven were Catholics, and one of the Japanese mothers affirmed to have seriously converted. In this way, LJs have at home the combination of both traditions. Most of them assign to Catholicism the freedom that religion has in Japan, so they do not feel compromise to be faithful only to the Catholic Church, but they can participate in it and in Shinto and Buddhist rituals. In fact, their parents do not seem to find inconvenient to exert the practice of both rituals. For instance, six LJs were baptized when they were children and two of these were also taken to a Shinto temple to be presented to the Gods as part of traditional Japanese rituals. Moreover, Japanese parents may accept celebrations at home such as Christmas, and allow their children to participate outside home in other Catholic activities although they may or may not accompany their partners and offspring. In either case, however, the sample and informal interviews show that LJs stopped accompanying their parents approximately in the adolescence, except for one college student that continues attending these events.

“When I was a kid, my father said no, I’m tired, and he wouldn’t go again with us to the church. Now, I know he doesn’t like it. (...) We are Buddhist, but she is Catholic. I (...) I also go [to the important celebrations]. I do go to Yotsuya [where there is a church], but well, I, I don’t pray... I almost don’t pray, but when my mother is sick, I pray “Our Lord”. [Do you know this prayer?] Yeah, when I was a little girl, I used to pray, and well, the body (I) remembers and prays.”

This feature was evident in the process of finding the interviewees when in religious activities the researcher met Latino Japanese couples with their young children and other parents, whose Japanese partners and/or 15 years old or older sons and daughters preferred to stay home, according to their parents. In the interview all LJs declared to acknowledge the importance of religion for their parents, and even though none of them expressed to follow these beliefs, they claimed to respect them.

The festivities LJs celebrate show their exposure to two cultures and could show cultural intersections that they seem to manage successfully. LJs often attend festivals in shrines of their cities although it is clear that they do not necessarily attach a strict religious meaning to these events as a Latin American would do with Catholic celebrations. Their perception of religion is very flexible, and they talk about Catholicism as they talk about Buddhism or Shinto. This is a posture that does not oppose to other religions and does not require constant practice or activity, so they make both kinds of celebrations part of their life in Japan as Latino-Japanese. Hence, Catholic rituals are only related to the family while Buddhist and Shinto celebrations might also include friends.

When they were asked about other important celebrations in their families, they mentioned

the O-bon festival and one person mentioned Easter Week, but she clarified that only her Latina mother goes to the church during those festivities. The traditions that were mentioned by all the informants and that most clearly evidence the integration of costumes that LJs do, are Christmas and New Year's. They all celebrate Christmas as Latin Americans traditionally do while New Year's is a Japanese celebration. In December, almost all of them make a Christmas tree and a Christmas crib, but they also have a traditional Japanese ornament on the door after December 25th. The night of December 24th, when Latin Americans usually celebrate Christmas, they have dinner together as a family and half of them have a short pray too; in fact, one family (except for the Japanese father) goes to the church. Regarding this day, seven LJs expressed that they began to slightly conflicting with their parents when they had their first boy/girlfriend. They had to "negotiate" this day with their parents, and as a result, they invited their partner to have dinner or they were allowed to spend the whole day before dinner outside home with their boy/girlfriend or friends.

"That day we have dinner together...mmm...I have my boyfriend and my younger sister too [Laughs], so we have to talk to my mother, and we do something...because...well, yeah, some time ago, I was so angry that I couldn't go into a date with my boyfriend while all my friends from school were planning their dates. (...) Now, I am older [Laughs] and understood the importance of this for my parents, for both of them. And now [mother, sister and the informant) make a Christmas cake, and at that time she (her mother) used to say that cakes were only for birthdays!!!"

For New Year's, as most Japanese, they have a Japanese meal by December 31st and visit their relatives and the temple during the first days of January. In the morning of January 1st, when it is midnight in Latin America, LJs usually also talk to their relatives since their parents call them to wish happiness and prosperity for the New Year. Therefore, LJs combine both cultures trying to maintain a balance between the significant rituals for their parents and also for themselves. They live both festivities, but the fact that they live in Japan strongly influences their behavior towards Japanese traditions. On the one side, from the Japanese context, they equal Latin American and Japanese religion, so they are just with both of them, and there is no conflict. However, they are not like all Japanese people who usually do not know about Catholicism. On the other side, they may participate in some rituals, but from a strict Latin American religious and cultural perspective they would not be considered Catholics since they are not committed with Catholic beliefs, and for instance, they worship other gods. Therefore, they mould customs of both traditions according to their cultural overlapping and situation.

Language

The language used by the members of the family is determined by the level of Japanese and Spanish of the parents, and it clearly influences the language level of the informants. Only one LJ does not speak Japanese, but English. The others are fluent in Japanese and can communicate in Spanish. In all cases the Japanese parents have a low or intermediate level of Spanish. None of them can speak perfectly according to all informants, but they can communicate with their extended family, and if their Latin American partners can not speak Japanese, they always speak in Spanish to them.

"When she came to Japan, yeah, there, she was trying at school. Yes, but then, she, yeah, she already has the idea of going back to her country, so she

thinks that learning Japanese is not necessary [smiles]. So, well, that's it. But, she understands the words, the easy words, no?" [This mother has been in Japan for 25 years]

The question "How do you feel more comfortable speaking in Spanish or in Japanese?" was asked, and it was evident that there are feelings associated to the use of Spanish and Japanese. A girl, who was born in Japan, but went to different Latin American countries during her elementary school years (kindergarten in Bolivia; first and second year in Paraguay, third year in Japan, fifth year in Costa Rica and afterwards Japan) answered: "Now, I feel...mmm...more Japanese. Japanese is better, but when I am at home or something like that, more tranquil, more Spanish. With Spanish I feel, I feel relaxed". Another LJ said: "Japanese for school or serious things, but when I want to be spoiled or feel affection, Spanish is better".

The language choice varies depending on the character of the family. If the Latin American parent does speak Japanese, they may alternate Spanish and Japanese with their offspring or speak only one of these languages. Four Latin American parents, all of them mothers, speak Japanese. One never uses Spanish with her offspring, the second one never uses Japanese and the other two alternate both languages. If the Latin American parent does not speak Japanese, Spanish is the language spoken at home. Nevertheless, in several cases the use of Spanish with the Latino parent was related to the proximity or (avoided) distance between parents and children. In addition, sometimes Japanese was associated with negative feelings.

"I wanted to have mum and dad. Once I came from school and talked to her in Japanese, and she got really angry...but wah! angry. I was just getting accustomed to Japan, no? Mmm...and I was speaking only Japanese outside home 'cause I was in a public school, and she was the only one who spoke to me in Spanish. She told me that I could never talk to her in Japanese again. (...) And my dad, he, the same. In Colombia, he was always saying '*supeingo hanasuna! supeingo hanasuna!*' so, see? If I wanted to have mom and dad I had to speak both languages."

"If I want to make her angry, I speak to her in Japanese. She understands what I say, but she would assume I am not talking to her."

"She used to get mad when I was in Secondary and my friends came home and they, or we talked too fast in Japanese, off course. She was always around but couldn't understand, so she was always saying 'Speak clear. You don't want me to understand, don't you?'"

The language(s) spoken by the LJs is determined by the conditions both at home and the school. While in most cases Spanish is the first language spoken and is later combined or replaced by Japanese, in one case English was the lingua franca at home. This family preferred to use English because after their two daughters entered an international school, English apparently became the most comfortable language for all of them. Nonetheless, the Japanese mother has recently felt that their adolescent daughters are losing their cultures and are being isolated in the society where they currently live, so she is intending to use Japanese as much as she can, and she insists her Latino husband to force their daughters to speak Spanish. Their older daughter, who was interviewed, does not seem enthusiastic about this. In fact, she prefers to continue speaking English, and mentions her interest in other languages

different from Spanish. She seems to be less connected to Latin America.

“When I was born, my first language was Spanish (...). When I came to the international school, I learned English and Japanese and forgot my Spanish (...) I plan to go to college to the US...maybe, or to the UK. And my mother, my father and my sister can speak English, so I think that we understand each other. I have studied French at school and would prefer to learn more French or Italian since my father is Italian by blood.”

The language used with the family influences the level of cultural overlapping. Several variations on the use of language were found among the mixed racial families; in all cases, better or more Spanish input definitely means more proximity to Latin American culture or more possibilities to include it in their Japanese surrounding. Their familiarization with sounds, words and expressions in Spanish while being immersed in another cultural environment, insinuates possible closeness to Latin America and facilitates their contact with it and the relationship between both cultures.

A glimpse of LJs outside home

It was expected that as other interracial people in Japan, LJs conformed a group or at least got along with interracial people like themselves, but there was no such evidence. One of the reasons explaining this might be the fact that most Latino-Japanese are younger than 17 years old, so there is not a visible quantity of adults or young adults who could promote the integration. In addition, until now, LJs do not manifest to feel close to other *half* Japanese, but some did express their interest in meeting other Latino-Japanese. School and work are the instances to meet friends, and since their interaction outside home is mainly in Japanese, their friends are Japanese too. Therefore, the ways of socialization are typical of Japanese people; for example, they go karaokeing, eating and drinking in *izakaya* or to game centers. In general outside home, LJs are surrounded by Japanese people and successfully interact with them. There are aspects that do favor or negatively affect these interactions, which might be discussed in other paper. This was the case of eight LJs, out of ten interviewed, and also the common pattern according to information by LJ parents and leaders of the Latin American community. The two exceptions correspond to an informant who attends an international school and mainly socializes with foreigners, and the other, to a LJ who moved to her mother's country several years ago, and interacts more closely with Spanish speaking people.

Conclusion

The analysis showed the family to be a site of negotiation and avid cultural intersections. This social group constitutes the base for half Japanese/Latin American to conserve a link with Latin America and also successfully integrate Japanese society, characteristics that do not describe all groups of *half* Japanese living in Japan. The negotiations and interactions inside the family group have been crucial for the development of LJs because they permanently prove the possibilities for these cultures to intercept and normalize situations of mixture. If the family does not provide this, Latino-Japanese *haafu* may have difficulties developing and conciliating their plural background, or even accepting only one of their cultures. Once LJs have left their home, their spouses bring with them cultural practices that may or may not reinforce their Latino-Japanese being. In fact, for married informants the site of mixtures and conciliations of differences was mainly their parent's home. They consider the negotiations in their marriage are more related to their personality than their Latino-Japanese character.

Respondents seem to be aware of two different cultural practices that occur almost simultaneously simply because they know both cultures, but they do not necessarily feel in a constant transition from culture to culture. LJs speak with their father in Japanese and with their mother in Spanish or eat *frijoles* and then *soba*, but they do not experience any conflict or have any sense of dualism. Their identification is a mixture of cultural practices that seem compatible and are particular to their overlapping being, not to only Japanese or Latin American individuals.

In addition to the mixed cultural input at home, other reasons may contribute to the non-conflicting mixture of Japanese and Latin American practices while living in Japan, which should be explored further. First, LJs belong to middle class families and access all services usually offered to Japanese people. LJs are not in the condition of Japanese descendents that have come back to Japan and usually become part of Japanese working class. Second, this is a group of *haafu* that is increasing but has not reached visibility; hence, Japanese people have not associated their identity with specific characteristics that may lead to stereotyping, but the situation may change as the number of Latino-Japanese grows. Indeed, LJs self identification is affected by several aspects that are not directly related to the family group. Subsequent studies of Latino-Japanese individuals could contribute to the understanding of what some scholar have called the multiculturalism of Japan⁷.

Contributions of Age Factors to L2 English Phonology

Jee Hae Lim

University of Pennsylvania

Abstract

The purpose of this study is to examine whether age factors contribute to L2 English Phonology. The participants in this study were 20 international students: 10 young learners and 10 adult learners. Participants read a paragraph and it was recorded in order to be graded by 3 native speakers of English. Close analyses revealed that if students start learning English after the age of 14, they were not able to reach a native-like accent. Implications for educators are discussed.

Many scholars have studied the relationship between age and eventual attainment in Second Language Acquisition. The issue of age in SLA is very controversial as some scholars support the critical period hypothesis, or CPH, while others refute it. As I am an adult language learner myself, this study started with my curiosity on CPH, which argues that children acquire languages most efficiently before puberty. According to Marinova-Todd *et al.*, with the first introduction by Penfield and Roberts (1959), CPH was further elaborated by Lenneberg (1967) (p.10). When applied to SLA, many scholars refute CPH, because Lenneberg's based his claim on the first language using the example of Genie, a feral child who did not have any linguistic input until the age of 13 and lacked linguistic ability even after seven years of support (p.11). However, many scholars such as Krashen and Long claim that CPH does apply to SLA as well.

Krashen, Long and Scarcella (1979) create three generalizations considering the contributions of age factors on eventual attainment in second language acquisition in their research. Krashen *et al.* suggested that for the matters of syntactic and morphological development, adults learn faster than younger children. However, in the matter of *eventual* attainment of second language acquisition, young learners do perform better than adult learners. For the purpose of this study, the last claim of eventual attainment was examined: "child second language acquirers will usually be superior in terms of ultimate attainment (younger-is-better in the long run" (Krashen *et al.* 1970, p. 573). In fact, these researchers found that those learners who come to English-speaking countries as children have higher eventual attainment and that the factor of length of residence does not play a role. Along with Krashen, Long (1990) also supports CPH: "while somewhat weaker than the claim for a critical period for FL learning, the claim for a sensitive period for SLA is still a strong and interesting one" (p. 253). Further, by observing psychologists and educators who maintain that maturation plays a significant role in "human development sequences," Oyama (1979) claimed that the factors of maturation plays as crucially on language learning as well (p. 254). Finally, Fathman (1975) conducted an experiment of 200 children between 6-15 years old who had lived in the United States from 1-3 years. From the study, Fathman found that even though the older group did better on morphology and syntax (which supports Krashen *et al.*'s three generalizations as well), the younger group was indeed superior at pronunciation (p. 261).

Based on this literature, the research hypothesizes that adult learners who started L2 English after the age of 14 will not reach a native-like accent while younger learners who started learning before the age of 14 are able to do so. The current research bases its main idea on a question: in the long run, does acquiring L2 English at an earlier age lead to having

a native-like accent, while learning L2 English as an adult learner place a cap on phonological ability?

Method

Participants

Twenty international students, ten female and ten male, participated in this study. A convenience sampling was used. All participants were from a social group called Korean Student Association from University of Pennsylvania. An email was sent out to the potential participants indicating that the participants would be asked to read a paragraph. The fact that the participants would be recorded was stated in the email as well. Forty people responded to the email out of fifty people. From those emails, twenty participants were selected who met the criteria of the study. Ten of them are students who started their L2 English after the age of fourteen while the other ten students started it before the age of fourteen. Every student has lived in the United States more than four years. The mean age for all participants was 22.65. Ethnically, 90% (18) of the participants reported as Korean and 10% (2) of the participants reported as Korean-American. Three native speakers of English participated as graders of 20 recordings. A convenience sampling used in the study somewhat hinders the generalization of the results. Thus, further research using broader participants is recommended. To maintain confidentiality in the study, each participant was asked to meet the researcher individually. As soon as the paragraph was distributed to the participants, the researcher started the recording in order to avoid time for practice.

The participants were limited to be the learners who had interacted with Native Speakers since receiving instruction from Non-Native Speakers is a whole different study. In addition, the experiment only concerned with the matter of phonology supporting Krashen *et al.* and Fathman's findings. The researcher agrees with these findings that older learners are better achievers of second languages in terms of morphology and syntax, but for the matter of phonology, the younger is better. Further, all of the participants are current university students who have been in the states more than 4 years. In other words, no matter when they started second language learning (either young or old), the amount of exposure to the target language is high. This limit was set to avoid Rasher's (1978) hypothesis relating length of residence (LOR).

Instrumentation

Each participant's pronunciation/accent was measured with a paragraph from "accent analysis archive." Participants were asked to read a paragraph and it was recorded by the researcher at the same time. The recordings were analyzed by native speakers of English. Three native speakers of English participated as graders of 20 recordings on a five-point scale from 1 (non-native accent) to 5 (native accent). The paragraph read by the participants is shown in Appendix A.

Results

The research question concerned the contribution of age factors in eventual attainment of L2 English phonology. Table 1 shows the raw scores as well as the means on young learner participants' recordings and Table 2 shows the same on adult learner participants' recordings. As shown in the two tables, the mean score for young learners of English was calculated as 4.31 and that of adult learners of English was calculated as 2.89. It was significant that none of the young learners received a grade

below 4 while 6 out of 10 adult learners received a grade either 2 or 3. Also, everyone from the group of young learners did receive a grade 5 at least once. There was one adult learner participant (A8) who did receive a grade 4 by two native speakers of English. Interestingly, A8 started his/her L2 English learning at the age of 15, which is as early as other young learners. However, considering the fact that A8 did not actually receive a grade 5 as other young learners, one can see that age factors do contribute to L2 phonology.

Table 1

* N refers to Native Speakers who gave the grade on a scale of 1(non-native accent)-5(native accent)

* Y refers to Young Learners who learned English before the age of 14

* A refers to Adult Learners who learned English after the age of 14

	Y1	Y2	Y3	Y4	Y5	Y6	Y7	Y8	Y9	Y10
N1	5	5	5	5	5	5	5	5	5	5
N2	5	5	5	5	4	4	5	5	4	4

N1	3	3	3	2	3	3	2	4	3	2
N2	3	4	3	3	3	3	3	4	3	3
N3	4	3	2	3	2	4	2	3	3	2
AVE.	3.3	3.3	2.6	2.6	2.6	3.3	2.3	3.6	3	2.3

AVE. $28.9/10 = 2.89$

Discussion

Showing the relatedness with Long's argument that age factors highly contribute to eventual phonological attainment of second language, the findings show the same results and support the hypothesis: adult learners who started L2 English after the age of 14 will not reach a native-like accent while younger learners who started the learning before the age of 14 are able to do so. In this particular study, where adult learner participants were all Korean, problems arose from the effect of their L1 Korean. According to Lee (2001), in Korean language, /ŋ:/ is pronounced "as a pure /o/" (p.326). Therefore, also acknowledged by native speakers who evaluated the recordings, adult learners were often recognized from the beginning where they had to pronounce "call [kŋ:ɪ]." Also, Koreans use English /r/ and /l/ as allophones of the same phoneme (p. 327). Thus, most of the adult learners pronounced "red" not as [red], but [led]. Finally, when pronouncing /ɹ/ and /ð/, Koreans often pronounce them as /s/ and /d/ respectively (p. 327). Indeed, this affected the adult learner participants' pronunciation of "these" as [diz] and "three" as somewhere between [sri:] and [tri:]. Indeed, unlike those younger learners who were able to pronounce the English words in a standard way, adult learners had problems affected by their L1.

The findings suggest several implications: 1) when teaching L2 English to adult learners, educators should be aware of the contribution of age factors and thus, be tolerant with

students' progress in pronunciation, and 2) rather than focusing on eventual attainment of phonology for L2 adult learners, it would be better to help them have gradual improvements focusing more on pragmatic issues: such as dealing with real problems in everyday life. The limitation of this study is that participants were all either Korean or Korean-American. In fact, learners from different countries have different phonological systems. Therefore, a study considering the different phonological systems using various participants from different countries might be a good addition to the current research.

Appendix A

The speech accent archive (Weinberger, 2009)

Please call Stella. Ask her to bring these things with her from the store: Six spoons of fresh snow peas, five thick slabs of blue cheese, and maybe a snack for her brother Bob. We also need a small plastic snake and a big toy frog for the kids. She can scoop these things into three red bags, and we will go meet her Wednesday at the train station.

Abstract

Writing is a very powerful tool when we want to communicate with other people either synchronously or asynchronously. With computer being used both as a research tool and as an instructional resource, it will make significant contributions beyond current conceptions of its utility for writing. Microsoft Word (WORD) installed in every computer could be a great helper for a writer at his or her initial stage of writing because it can provide a readability statistics when a writer finishes his or her writing in a computer. Taken this statistics as a reference, writers could revise their writings through their existed linguistic and cognitive knowledge individually or collaboratively. According to Freeman (1989), awareness is the capacity to recognize and monitor the attention one is giving or has given to something. Meanwhile, meaning of the text is found rather than imposed by the reader.

In this research, 18 texts were collected from one English writing classroom in a Chinese university. With these statistics, the author wants to look for whether WORD helps the revision of the writing from a reader's perspective as well as a teacher's. Secondly, from the interviews with these EFL writers, I wonder whether the interpretation of the readability on the texts has some hints in arousing EFL learners' linguistic and cognitive awareness and encouraging them in the improvement of their writing. At last, I hope that the EFL learners become critical and effective reader and writer with the aid of the technology.

1. Introduction

Writing is a very powerful tool when we want to communicate with other people either synchronously or asynchronously. Learning to write well is a necessity for young people because success in school and the world of work depend upon it. Writing abilities are not naturally acquired and automatically accompanies maturation (Lieberman and Lieberman 1990); they must be culturally transmitted in every generation, whether in schools or in other assisting environment (Grabe and Kaplan, 1996). With computer being used both as a research tool and as an instructional resource, it will make significant contributions beyond current conceptions of its utility for writing (Bruce et al. 1993; Bruce and Rubin, 1993; Tuman, 1992).

Despite the importance of writing in school, there is notably less research with this skill for the sake of College English¹ (CE) writers and readers on their own self and peer assessment with the aid of technology. Microsoft Word (*Word*) installed in every computer could be a great helper for a writer at his or her initial stage of writing because it can provide a readability statistics on the surface characteristics of language form, such as the word length, average length of the sentence and complication of language expression.

Nearly all the CE learners know how to use *Word* in proofreading but pay less attention to the readability statistics: *Flesch Reading Ease (Ease)* and *Flesch-Kincaid Grade Level (FK grade)*. Flesch Formula in *Word* is a simple approach to assess the grade-level of the reader which are designed to indicate comprehension difficulty when reading a passage of contemporary academic English (Flesch, 1948). The variables used in the readability formulas, such as average words per sentence, and average sentences per paragraph, show us the skeleton (form) of a text. It is up to us to substantiate that objective value of Ease and FK grade with our thoughts, ideas before reviewing or commenting on the design of the writing according to the principles or criteria of good writing.

With all these concerns, the author designed a formative writing test for CE learners in one Chinese university and 18 volunteers participated in May, 2008. It consists of 2 writing tasks based on listening and reading. Task 1 is the summary of listening and reading. This summary may either be a spring board or elicit writing Task 2. In this paper, the author focused 18 texts on task 2: “*why some people enjoy life while others don't?*” The analysis from the perspective of readability in word processor can only show part of their writing ability and demonstrate the weakness they presented in their writings. The author, from a researcher’s and CE teacher’s perspective, wants to find out:

1. In Readability statistics, which aspect should be weighed more, Flesch reading ease (*Ease*) or Flesch-Kincaid grade (*FK grade*) to CE writers?
2. What does the readability statistics mean to writers in their self or peer-assessment process?
3. What implications of *Ease and FK grade* could be drawn for CE instructor and learners?

To answer these questions, all the articles are typed into computer by the author. Via analysis of the texts and reflection on the readability from reader’s perspective, I hope this research can have a positive influence on College English teaching and learning of writing in China. Most importantly, I hope with the basic function of *Word* — readability statistics, CE learners can criticize and revise their writing on their own and exchanging perspectives between peers, and collaborate on the final version. The last and most important purpose is to help the learners learn how to monitor and assess their writing abilities and make more revisions autonomously beyond the surface level through *Word*.

¹ College English (CE) refers specifically to English taught to non-English-major undergraduates in China, who constitute the majority of English learners in the university.

2. Background

Writing is useful when the reader is removed and remote from the writer. No matter who the possible reader maybe, the writing itself should be clear, fluent, and develop effective communication of ideas. This section is trying to look for the characteristics of such writer-based writing, understand the meaning of readability statistics and importance of using self or peer-assessment to CE writers.

2.1 Seeking CE writers' self-awareness and accuracy in revision process

According to Freeman (1989), awareness is the capacity to recognize and monitor the attention one is giving or has given to something. Thus, one acts on or responds to the aspects of a situation of which one is aware. Meanwhile, meaning of the text is found rather than imposed by the reader. Readers must always integrate linguistic and contextual assumptions to recover relevance and meaning from utterances (Sperber and Wilson, 1995).

For much of the 1970s and 1980s, theories of the writing in L2 contexts (Carrell & Connor, 1991; Carson, 1993; Cumming, 1998; Kroll, 1990; Sasaki & Hirose, 1996; Silva, Leki, & Carson, 1997) followed closely on English L1 views of writing and theories of the writing process. Most recently, specific researches (Leki & Carson, 1994, 1997; Matsuda, 1998; Silva, 1997; Silva et al., 1997) that draws attention to the distinctions between L1 and L2 writing have been synthesized into a set of influencing factors.

To CE writers, their writing context is a totally different L2 context where they only practice their writing in classroom. Meanwhile, their potential reader is their teacher or examiner. Therefore, their writing and their writing often begin with writer-based prose and then revise it to make it easier for another reader to read, that is, to make it reader-based (Flower and Hayes, 1980; Richards and Schmidt, 2002) or reader-friendly.

As we know, there is no exact parallel form between two different languages and social contexts. The differences call for the need for writers to accommodate (Grabe, 2001) in their writing and make them understood in the process of writing. That is to say, a CE writer should bear in mind that his or her proposition in the writing is clarified and enhanced through the interpretation and interaction from the reader's perspective in an EFL² context. Whatever they have written should be easily understood by the reader who shares with the same implicit rules (Abraham, 1989).

² EFL stands for English as a Foreign Language.

2.2 Understanding construct of readability statistics

Flesch Reading Ease Formula is considered as one of the oldest and most accurate readability formulas that we can rely on without too much scrutiny (Farr et al. 1951; Kincaid et al. 1975; Rudolf, 1948). This formula is best used on school text. However, primarily, we use the formula to assess the difficulty of a reading passage written in English.

When *Word* finishes checking spelling and grammar, it can display information about the reading level of the document, including the following readability scores.

$$Ease = 206.835 - (1.015 \times ASL^3) - (84.6 \times ASW^4)$$

$$FK\ grade = (0.39 \times ASL) + (11.8 \times ASW) - 15.59$$

If we were to draw a conclusion from the Formula, then the best text should contain shorter sentences and words. For most standard documents, aim for *Ease* score is approximately 60 to 70. The *FK Grade* translates the 0–100 score to a U.S. grade level: 0-12, making it easier for teachers, parents, librarians, and others to judge the readability level of various books and texts. It can also mean the number of years of education generally required to understand this text.

The following table is also helpful to assess the *Ease* of readability in a document:

90-100	Very Easy
80-89	Easy
70-79	Fairly Easy
60-69	Standard
50-59	Fairly Difficult
30-49	Difficult
0-29	Very Confusing

Table 1: corresponding meaning of values of *EASE*

According to Webster dictionary, readable means able to be read easily and interesting to read. Although through readability statistics, one may get a rough measurement on the reading *Ease* and *FK grade* immediately after his or her writing on *Word*, it cannot show whether the reading is interesting or not. It is up to our readers to substantiate that formula with our thoughts, ideas and construct the design of the writing according to the principles or criteria of good writing. Therefore, if one can write an article to be read easily while keeping at his or her grade level, it could be of a good article for a reader to comprehend.

³ ASL = average sentence length (the number of words divided by the number of sentences)

⁴ ASW = average number of syllables per word (the number of syllables divided by the number of words)

2.3 Using self and peer assessment in CE writing

Since English is a foreign language in China, CE learners normally practice English writing in classroom context and under pressure: to finish a compulsory assignment which is set by their language teachers or for the test. Meanwhile, the time for their accomplishment is generally limited to 30 minutes in class or shorter if they are going to do after class.

What assessment for learning highlights is that this is far more than just a summative collection of information about learners' achievements: it is also a vital part in the learning process and impacts on the course of pupils' learning (Harlen and Winter, 2004). Self-assessment has the potential of putting the learner firmly in the centre of the picture as well as the possibility of adding valuable information to our total picture of how and why second languages are learned (Heilenman, 1990). The use of self-assessment and peer assessment aims to motivate CE students to take responsibility for the development of their own writing via involving them in the process of writing. A peer's responses can open up fresh avenues (Bolton, 2005) which could make assessment become a tool for learning rather than focuses on exclusively examination performance and standards.

With the widely adoption of computer in CE learners' daily life, the score of *Ease* and *FK grade* from the Microsoft Word be used by CE learners as the self and peer assessment before their final draft in writing. It can also encourage them to bring their own knowledge, cultural backgrounds, and personal histories into their writing. After sharing their existed knowledge, they can collaborate on their writings or provide meaningful comments on their peer's writing and reflect their own as well.

3. Data collection and Analysis

Data for the paper come from task 2 of one formative test in College English classroom and an overall analysis from a reader's and a teacher's perspective brief in the second part of this section.

3.1 Data collection

This formative writing assessment consists of 3 parts which integrates the listening, reading, and writing into two writing tasks and lasts for 45 minutes which is just one period of the normal teaching in the university. To eliminate the stress, all the participants are told that the test is formative and will only be used for diagnosis on their English proficiency anonymously. At last, 18 CE students volunteered to attend the test.

At the beginning, all the students will listen to a short episode on the topic of ‘*money and taste of wine*’ from VOA special English programmes for twice in 7 minutes. Then they will read a 500-words article on ‘*money can buy happiness?*’ written by a native speaker in 5 minutes. After that, they are asked to finish two tasks, the first one is writing a **100-words summary** on what they had listened and read in 15 minutes; the second task is to write **a 200-words essay** on a similar topic: “*why do some people enjoy life and others don’t?*” in 30 minutes. The data using in the analysis of this paper is the writing task 2 done by the students.

After their performance, all the writings are typed into the computer and saved in **Word** document separately in order to get the readability statistics (See appendix 1). To provide more evidence from the perspective of teacher, I also asked one of my experienced colleagues, who has been teaching CE for 14 years in the university, to grade these articles through the criteria in College English Test in China (See appendix 2, **15** is the full mark.).

3.2 Analysis

All the statistics are listed in the following table for an overview.

Text	words	Paragraphs	Sentences	ASL	ASW	Ease	FK Grade	Grader 1
1	36	1	3	10	4.8	69.7	6.0	4
2	73	2	6	12.1	4.3	80.9	4.9	6
3	110	1	5	22	3.8	70.6	8.8	8
4	117	4	5	23.4	4.7	63.7	10.1	8
5	140	3	9	15.5	4.5	75.0	6.6	10
6	158	3	14	11.2	4.4	69.5	6.3	8
7	162	6	10	16.2	4.2	76.5	6.6	11
8	163	1	9	18.1	4.2	69.5	8.0	13
9	173	2	14	12.3	4.2	84.2	4.5	12
10	177	3	16	11	4	92.8	3.0	11
11	179	3	10	17.9	4.4	65.7	8.5	12
12	180	3	11	16.3	4	79.3	6.2	8
13	181	3	12	15	4.4	70.4	7.1	12
14	205	2	16	12.8	3.8	91.8	3.6	10
15	207	1	12	17.2	4.5	72.0	7.4	10
16	217	6	18	12	4.7	68.6	6.6	12
17	217	4	12	18	4.3	69.9	7.9	13
18	228	4	11	20.7	4.3	69.2	8.7	12

Table 2: readability statistics of 18 articles

The accepted and normal readable text will have an **Ease** from 60 to 80 with an **FK grade** at 7 to 8. From the above table, we can easily locate that there are only 8 out of 18 texts reach this criteria. Five of them have 3 to 4 paragraphs, with a word limit from 117 to 228 while the rest has only 1 paragraph. The most outstanding

characteristic of these 8 texts is their score of *ASL*: all over 15 and 2 even over 20 which shows these CE writers use long and complicated sentence structures. From the teacher's grade in these 8 texts, 6 got a rather high score: 10 to 13. There will be a discount in score if the writer cannot reach the word limit. All these 8 texts have a teacher's grade over 8 which mean all of them have been effectively addressed and used some details to support or illustrate an idea. Although there are errors in usage and sentence structure, they are adequately organized as a coherent article and well developed as a whole.

Also from the above table, all the texts have reached an acceptable *Ease* over 60. According to the equation of *Ease* ($=206.835-84.6*ASW-1.015*ASL$), *ASW* weighs more than *ASL*. Since there are no significant differences in *ASW* and *Ease*, in the following analysis, I will focus more on the *ASL* and *FK grade* and their relation with the self or peer assessment from a reader's and a teacher's perspective.

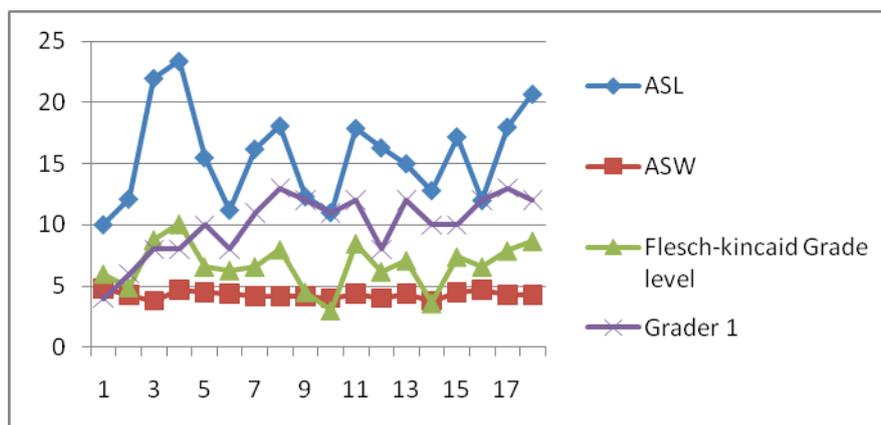

Figure 1: Relationships of *ASL*, *ASW*, *F-K Grade* and teacher's grade

From the above table and figure, we can find out that the trend of the grader and FK grade are alike except article 4, 10 and 14.

Text	words	paragraphs	sentences	ASL	ASW	Ease	FK grade	Grader
4	117	4	5	23.4	4.7	63.7	10.1	8
10	177	3	16	11	4	92.8	3	11
14	205	2	16	12.8	4.5	91.8	3.6	10

Table 3: Significant differences among 3 articles

If we compared these scores with Teacher's grade, Articles 10 and 14 have a teacher's grade of 11 and 10 while article 4 only has a teacher's grade of 8. Ignoring the difference in the numbers of words in the whole article, article 4's *ASL* score is nearly twice as that of article 10 and 14. From the equation of *FK grade* ($=0.39*ASL+11.8*ASW-15.59$), the strength of *ASL* plays an important role in the scoring if there is only slight difference in *ASW*. To the computer, the highest score in *Ease* does not necessarily match a higher *FK grade* and vice versa. These had been evidenced from the above explanation.

But to a grader or reader, clarification in content, style, and structure plays the decisive role in their understanding and assessment. Although texts 10 and 14 have a lower **FK grade**, they are rated over 10 by the grader. Part of the reasons may be their high reading ease. Short and simple sentence structure make the writing easy to be understood although there are flaws in grammar and coherence in organization. Meanwhile, small and short word will impress readers because it will cost them fewer efforts in comprehension and communication with the writing.

From a reader's perspective, **Word** could be a patient and untiring Grader. Take text 1 as an example:

Because different people have different valus on life. Someone knows how to get and also know where and when should devote. They can make themselves happy by help other people. They know what should and wether

After checking on spelling and grammar in **Word**, it was given **Ease** at 69.7 and **FK Grade** 6 with 2 spelling mistakes and one grammar mistake. When these surface mistakes are corrected with the help of the computer, the reading **Ease** becomes 64.7 and the **FK Grade** to 7.9. If we go further on the rules of grammar, such as the first two sentences can be combined into one and the following sentence with the correction of the verb form: *helping*. The statistics change again to 61.8 and 8.3. As a reader, this experience in assessment and revision is really positive and rewarding. Just by clicking and second thought, the figure could have a change which means the writer could revise and proofread as many times as he or she likes while practicing language at word or sentence level to demonstrate ideas.

More supporting details could be found in these 18 texts and because of the space limit, we cannot specify them one by one.

4. Discussion

Based on the analysis in the above section, I will have a detailed discussion on the application of readability statistics in the CE instruction and learning process from a reader's perspective as well as a CE teacher. Therefore, the research questions I proposed in the first section will be reviewed to find out how the statistics be used to arouse the CE writer's linguistic and cognitive awareness.

*Research Question 1: In Readability statistics, which aspect should be weighed more: Flesch reading **Ease** or **Flesch-Kincaid grade**?*

According to the test participants in this study, we do know that after having learned English for at least 6 to 7 years, the development of the whole testing group is at an appropriate level of their writing proficiency as their average **Ease** is 74.4 with an **FK**

grade of 6.71. But when we go to the reading of individual writing, there are great differences among them. The top two highest *Ease* articles with 3.8 to 4 *ASW* and their *FK grade* level is around 3 while others at 4.3 *ASW* or more. Their *ASL* (average sentence length) is only half of the highest *FK grade* article. Simple sentence structure, repetition of words, fragmentation, and misuse of pronoun are their commonalities. From a reader's perspective, high frequently used words and simple sentence structure is a good way to avoid big mistakes either in spelling or grammar. Accordingly, we can draw a conclusion that the length of the word will help improving the grade level.

Compared with CE learners learning history, *FK grade* around 3 is underdeveloped and unacceptable. From a teacher's view, I felt these statistics will help writers and readers to understand their proficiency level and provide assistance in their self or peer-assessment. Although participants have already had a basic knowledge on the conformity of language form and idea, they are intended to take fewer risks in achieving syntactic variety and appropriate word choice. After initiating CE learners' writing process, readability index can be used to arouse writer's awareness on their composition. With the high score in *ASW* or *ASL*, it is easy to ensure the *FK grade* which is more important than *Ease* to a CE learner who had learned English over 6 years.

Research Question 2: What does the readability statistics mean to readers or writers in their self-/ peer- assessment?

With acceptable *Ease*(60-80) *and FK grade*(7-8), further understanding of the readability statistics will help a writer or a reader to revise and perfect their writing on their own (See table 4).

Text	words	Paragraphs	Sentences	ASL	ASW	Ease	FK grade	Grader
3	110	1	5	22	3.8	70.6	8.8	8
4	117	4	5	23.4	4.7	63.7	10.1	8
8	163	1	9	18.1	4.2	69.5	8	13
11	179	3	10	17.9	4.4	65.7	8.5	12
13	181	3	12	15	4.4	70.4	7.1	12
15	207	1	12	17.2	4.5	72	7.4	10
17	217	4	12	18	4.3	69.9	7.9	13
18	228	4	11	20.7	4.3	69.2	8.7	12
Mean			9.5	19.0375	4.325		68.875	8.3125

Table 4: Acceptable Readability statistics and grader

We can also have a positive correlation between readability statistics and grader. In Chinese university, grading scale of the writing is from 0 to 15. Generally speaking, if one can get a score of 8, he/she can express his/her idea clearly with simple but sufficient naturalness of English and not many errors. All these 8 articles have the grades above the normal, 2 at 8, 1 at 10, 5 over 12. As structure, design, style and

content contribute to *Ease*, I will take Text 17 as an illustration of constructs of readability statistics for self or peer-assessment.

Firstly, from the structure and design of the article, it has four paragraphs which is the most popular structure adopted in writing because it states the opinion clearly at the very beginning and echoes at the last part with the supporting ideas in the main body from two contrastive perspectives. 12 sentences are distributed among 4 paragraphs. After first filter in surface language errors with checker in spelling and grammar in Word, both the writer and peer assessors can make improvements on the contents of the sentences rather than on the words form.

Then from the style part, the writer adopted many semantic and syntactic elements in his writing. He initiates his statement with a common shared idea: *different people have different lives. Some people like to help others, but some people just consider for their own.* In the body part, the writer demonstrates these ideas by means of coherent contents and by way of transitive cohesions, such as *at first, in addition and at last.* All these contribute a lot in the grader's grading and reader's echoing in understanding. In the end, he restates his opinion by *we can help each other and get more happiness.*

With impressive ideas, logical and effective organization, the writer shows his individual and appropriate voice from his own feeling which is very important when a reader could be involved in the reading by the usage of pronoun: *we.* Although there are many avoidable spelling mistakes, it is quite persuasive and fluent in clarifying idea which could impact the reader.

Of course, readability statistics cannot tell us so much. All the analyses are from a reader and a researcher's perspective with the values of statistics and grader. Local revision, at sentence level, is almost too easy on *Word.* Feedback from others can play an important part to gain overall improvement (Hedge, 2002:317).

Research Question 3: What implication of Ease and FK grade could be drawn for CE instructor and learners?

There are several implications learned from the above analysis on the readability statistics from a reader's and a researcher's perspective.

The first one is that *Word* allows a high degree of differentiation. Individual writer can write freely on the screen and get an objective value on their writing proficiency immediately. Meanwhile, with the support from their peers and instructors, they can review other's writing to test whether their understanding of the diction, sentence structure and representation are in a communicative way and take the readers into consideration.

Secondly, a high degree of learner motivation and involvement makes teaching more efficient, since the teacher can focus more on supporting learners rather than having to focus on providing content. Influenced by the Confucius teaching idea, Chinese students most often expect a teacher to answer his or her own questions and believe the authority of the teacher and they generally had no role to play other than to complete the assessment requirements under the conditions set for them (Boud, 1995). When students are asked to rate them on a marking scale, relatively able and mature students are able to do so in a way which is identical to the way in which they would be rated by teachers and some are quite critical in their assessments (Boud, D. and Falchikov, N. 1995).

5. Conclusion

In spite of the markedly positive tone of readability statistics in the revision stage for CE writers, a number of questions and problems still remain.

First and foremost, the small-scale exploratory study we reported here does not allow us to draw any firm conclusions with regard to long-term achievement in writing proficiency. Readability statistics can help the writer to know more about his or her development of writing proficiency without an extrovert grader. The advantages of *Word* are clear: learners who have previously struggled with handwriting in English are greatly assisted; *Word* enables sustained periods of composition, and the speed of processing can assist the generation of ideas and their rapid noting in any order as they come into the mind. Another advantage is that rapid drafting is possible, leaving error-correction until later, and this can be trained through techniques such as oral dictation (Hyland, 1993).

To the CE learners, writing process with *Word* could be of self-assessment in their own language development. Although CE learners' linguistic and cognitive awareness could have been aroused by the Readability statistics, it was really difficult to assess their proficiency or improve their weaknesses on their own. More training and practices will be done in the future instruction as well as understanding the criteria for good writing. Nevertheless, *Word* and computer are not an answer to all the problems in CE writing instruction and learning. *KF grade* can only be taken as a reference index in the development of CE learner's proficiency.

Undoubtedly, it needs more collaboration among computer, readers and writers. When I typed articles into the computer written by the CE learners, I had to ignore deletion, insertion, underline, and scrambling in their handwritings which may greatly influence the reader's assessment and interaction with the text. Readability statistics could play as guidance in writing, not only on the typical language errors, but also for the development of language proficiency. As a reader and teacher, I found that

collaboration between peers and instructor will play a different decisive role in the writing process. It needs further research and survey on these issues.

Appendix 1

18 texts for review

1. Because different people have different values on life. Someone knows how to get and also know where and when should devote. They can make themselves happy by help other people. They know what should and whether
2. Some people are happy everyday. This is nothing can make them sad, because they have a good move. They think about the good rather than the bad.

But some people don't enjoy life. The most important reason is that they don't feel full. Just like an old Chinese said: "poor people are tired of food and classes everyday, rich people always think they are not rich and think about how to become richer."

3. In my opinion, it is due to the element what people like to do. If some people have a good job, a warm family, a friendly scholar, he loves his work, enjoy his partime with his family and friends, everything is well to him. He certainly enjoy his life, but if he loses his job or he doesn't like his job, he may feel bored, senseless and have no patience to the family life. His motion is brown, everything is meaningless to him. Life is just a way to waste the time after a sequence of courses, he may have no idea about life, how to talk about enjoy life.
4. There are two kinds of people, one enjoy life, another don't, but why?

Many researchers have done a great number of experiments on different people, and they point out that whether people enjoy life or not largely because the income, job and their attitude to the surroundings.

They first asked the volunteers to write down their job, their income, and then write their thoughts about that. Through analysis, they find out that income and job surely can have effect on persons life, but the attitude to the surrounding play the biggest parts on people's life.

The people who treat life optimistic, they can more enjoy life than others though they have not good job and high income.

5. Our life is colourful and meaningful because we all live in this colourful world. But to each person, we may have different lifestyles and different thought about life. Some people enjoy their lives while other people may think life is meaningless.

The people who enjoy their lives should have some different look about their lives. They can enjoy themselves through giving or offering helps. For example, If they helped a blind people cross the street, they may feel happy because they think it is meaningful. But at the same time, if those people who don't enjoy their lives may do this thing, too, but they may regard it as a boring and meaningless thing.

In a word, different thought about life may lead people's view about life. If you want to live happier, you should take another look at life.

6. To most people, they could lead a plain as well as happy life. They could feel more comfortable everyday. Seldom will they encounter a huge hit in life. So this part of people often enjoy life.

Conversely, some others hate life. A host of negative impact, such as pressure from society, competition in daily life, and difficulties in social context, make up a wall in their heart. And a sense of hopelessness will up to their brain. Over time, it may destroy them and cause daily manner.

We can see from the root of these two perspectives that the different opinions different people holds all are the result of the surrounding of their life. And the environment can lead to different character. Also, character affects people largely. A person enjoys his life. He may be optimistic and happy. So we also can think that a person who hates life must be passive and lack of confidence in life.

7. When talking about this topic we should know what will make life enjoyable and what doesn't.

Money is an important part of this, it can meet our daily need and to make our matter life varieties, it's an important part but not the only.

Families and friends can not be deducted. They make our feeling world true and to share our happiness and unhappiness. This is the most important part of life.

Do some things to help others when they need.

When we make the above things clear we talk about the topic again. Those who enjoy life may have not much money, but they know how to use the limited money to make himself/herself and others get out of trouble and to do significant things. These people have many friends and often get well with people who around them.

The others don't enjoy life may have many reasons, but I think the most important is that they are greedy.

8. In a certain degree, people who enjoy life harbour an outgoing personality. Everything in daily life seems to be the original source of happiness in their eyes while it is opposite to others. For example, one receives an apple from a friend which has quarrelled with him before, the people who enjoy life may look on it as a gift while the other would think whether the apple can be eaten. For my own part, one who enjoys life or not depends on his way of thinking. It is impossible to own a life that no bitterness or pain. The key word is to keep on it as challenges that everyone must experience on it as challenges that everyone must experience if he wants to live a good life. Remember that complaining too much may disturb your good mood and make you nervous. Nothing is big if you really have a wide heart. So just enjoy life, you will never miss one happiness.

9. In our true life, people's attitude on life differ. Some people enjoy their life by many ways. Because they think that life to one person is so limit that they should do funs to make their lifes colourful and meanful. So they don't care of money and the attitude of people around them. they just to live on their own way. They like freedom and pursue it. In their eyes life means enjoying and enrich themselves.

But on the othe side, some people don't enjoy life. They think that enjoy means need more money so that they should work harder and harder to earn more money. Besides, they are afraid of falling so they put much of their time on jobs and familes. They live in press, noverous. In this condition result to they have no time to enjoy life. Because in their eye, work is the most important thing. They hardly feel happy, even feel that there is no happiness around them, and all around of them is just work and press.

10. As I see, when people just think of their own, they can't get happy, they never try to know about others and help otheirs. They don't understand that life is hard to us. Only if we help each other, we may get success. To the nature, only one is so small that one person can't do great things. And if you don't try to know and help others, others wouldn't.

Then when you come to the hard things, you won't succeed. At this moment, you certainly get pain. At last, you start to hate life.

But others know the life. They are helpful to contact with others. They try their best to help and know others. At this moment, when they get pain, they can talk with others and get help. So they aren't so painful. And whey they get success, they can own their feelings with others. At this moment, they will be happier, so they enjoy life. I remember one sentence that says "how you deal with the life, how the life deal with you".

11. In modern times, people who may easily get upset are becoming a large part of those who need help. Then, why do some people can enjoy life to its fullness when leading a life on the go whole others do not?

As to my eyesight, those who are happy now and then belong to the poor or the ones having a lower status in society. They are considering about the simplest thing of life, thus having little time risking his head to find ways to hurt others' benefits. They can easily feel content and comfortable with their incomes as long as there're great difficulties comeing to his family or job. In contrast, the ones who can be easily annoyed by simple thing are largely the white collars. High education and intelligence, rich profits and high and special tastes lead them to a habit of being careful with as many things as possible. They eat well, dress well..... If one of these won't satisfy them, they get unhappy.

In short, one's happiness are largely based on your expectations from life.

12. In my opinion, the attitude towards life is very important, when something happens, some of us may think it was really a bad day, he may think why the god always play tricks with him. He may feel life is dull. It is really unentrusting. On the other hand, the others have the ability to enjoy life, when the same thing happens, they don't feel sad, maybe they have another attitude towards the thing, this can help them get out of the trouble, and then lead a happy life.

Setting a goal is also a good way to enjoy life. But the goal setted shouldn't be too different. We should adjust our ability and then set a goal weither too easy nor too hard. Then we have energy to make our goal come true. When we reach the goal, we may think life is really so wonderful, and this would make you have more energy to make the next goal come true.

So this is life, with so many goals can you make it come true. It is really interesting.

13. Nowadays, some people enjoy life and others don't in the developed society. I think there are several reasons.

For the people which can enjoy life. The reasons of their enjoyment are different. Some people may be born in the old society where they didn't have enough food to eat, and they usually felt cold because they have no coats. However, they can eat enough food and make them warm because the society today has many better policies. That is, they are satisfied with today's life. Other people may have a comfortable family: a beautiful wife and a cute daughter or son, what's more, they have a steady income. On weekends, they can travel about with their family. Maybe they were not born in the old society, but they can enjoy today's fashion, they are happy too. As far as I'm concerned, if people are satisfied with today's life and can create their enjoyment, they may enjoy life.

For the people which can't the life, they maybe not satisfied with the life, and they usually feel tired with the burden of life.

14. As we know, there are many people who live a happy life, we can say they enjoy their life. But at the same time, we also find many people who work hard and is tired all the day. They have no time to relax and take themselves our from work. The reasons for that are diverse. In my view, the most important is money, just maybe. Suppose you have much money, do you want to work any more? I think the answer in your heart is No. of course, having so much money doesn't mean we can do nothing. I just mean we have no need to work as hard as those who live by the money they get from work. Their income is only from that.

In other side, I think the awareness is also the reason for that. It's not difficult for us to find some people who have much money still working hard. They just want to work, regardless of money. At the same time, some people know they have only one chance to live. They don't want to be tired all their life. So,

maybe they just have money to buy food, they are happy. They will smile all the time.

15. Naturally, many people don't enjoy their life, largely because they are under great stress, coming from family, friend, associate or themselves, while others may be in the same situation but they are good at adjusting themselves to adapt it. Many people don't enjoy themselves just because they don't have enough money, even though they are standing in the rich in other people's view, they don't think so. They have to drive themselves to higher and higher stair. So the life is like a bag full of sands, pressing them to death. Of course, they can't live their lives, let alone enjoy themselves. Money plays a prominent role in social life. But it isn't all, together with money, health is another element to limit people's life, who have a desire for enjoying life but they can't. That's objective. They struggle their life to great length and definite the life as their attitude towards life, that's respectful. Throughout the history, many people have no passion or no health or, even more, neither of them, but they also can enjoy their life to the minute. The point is, as far as I can see, the attitude. Just as the saying puts it "when you laugh, the life laughs to you!"
16. Every people regard their life with different attitude. So some people enjoy life and others don't. The following is the reasons.

People take different things seriously, such as money, time, emotion, friendship and so on. When they get or lose the most important things in their eyes. They will enjoy life or not.

People who live in different country and live through different experience may make themselves have different idea. Americans and Chinese are in the contrary. Every year, many people commit suicide which tell us that they can't adjust to the life.

People work on different job may have different spirit and belief. For example, a teacher maybe enjoy their life or not by the gains, students who study their preferable may be enjoy their life, others may don't.

The obvious difference is between people in different age. Usually, the young and the healthy elder will enjoy their life. While the adult must be busy on their job to take care of their children and parents. They are under pressure. Their life may lack of colour.

There are also some people enjoy life, though they are not rich and they have little knowledge, by devoting themselves. Such as the countryside teacher Xu Benyu, the more they do for the country or social, they will be happier.

17. Different people have different lives, some people like to help others, but some people just consider for their owns.

Some people enjoying life have several reasons. At first, life is very important for us, and everyone should take care of it. Whatever, it is poor or wealthy,

just do what you can do and satisfy yourself. In addition, they think everyone should be equal, and they should try their best to help others. When others get help, they feel happy, and they think money can buy happiness, only if you spend it on someone else, they like to devote themselves to make others happy. At last, enjoying life is good for our health, and everyone should put health first.

To the contrary, some people have enough money, but they don't enjoy life. To begin with, they have much desire, when they get some, they want to get a high one, so they are not happy. Furthermore, sometimes money is trouble, when someone has enough money, they are afraid others will steal the money. To worse, maybe others will kill them.

To my opinion, we should enjoy our life, whatever we are poor or wealthy, and everyone is in the earth, and we have a community house, so we can help others, and get more happiness.

18. Why do people enjoy life while others don't? wow, that's really a very interesting question. It just like "why you love me while I don't love you" or "why you love me while I like her?"

Yes, the point is different people have different situations or ideas, or we can say more clearly, the situation people experienced are different. In my opinion, some people enjoy their life because they have a good and beautiful experience, they love it and enjoy it, they feel happy and excited, while others may don't. It because they may have a bitter or unhappy experience, they hate it and want to forget it, but usually the fact is they feel more bitter and unhappy, they couldn't drop it, and on the other hand, they usually think of them.

Yet, there maybe some people couldn't understand their life, usually the wrong idea is to own enough money and power, while they may succeed, but they never satisfied with what they have got. So most of them spend lots of time and energy to get what they want, and never satisfied with what they have got. In fact, most of these people usually get nothing when they get time to remind of their experiences. So in the last, they feel regret and don't enjoy life.

So, above all, the point is the situations are different!

Appendix 2 Criteria for writing

Grade	Evaluation	Characteristics
0-3	Very poor	Serious disorganization or underdevelopment Little or no detail, or irrelevant specifics Serious and frequent errors in sentence structure or usage
4-6	weak	Addresses the writing topic adequately but may slight parts of the task Inappropriate or insufficient details to support or illustrate generations Inadequate organization or development Serious errors with focus
7-9	pass	May address some parts of the task more effectively than others Uses some details to support a thesis or illustrate an idea Is adequately organized An accumulation of errors in sentence structure and/or usage, with some serious errors
10-12	good	Effectively addresses the writing task Uses details to support a thesis or illustrate an idea Is generally well organized and developed May contain some errors that occasionally obscure meaning
13-15	Very good	Effectively addresses the writing task Uses details to support a thesis or illustrate an idea Displays facility in use of language Is well organized and well developed Demonstrates syntactic variety and appropriate word choice though it may have occasional errors

**“(HU)MAN-MADE” MONEY IN LINDA HOGAN’S *MEAN SPIRIT* AND
KAREN TEI YAMASHITA’S *THROUGH THE ARC OF THE RAIN FOREST***

ANA MARIA COTELO CANCELA
UNIVERSITY OF A CORUÑA, SPAIN
RESEARCH UNIT CLEU

The ecological age is a reality in a world dominated by consumerism and globalization. The destruction of the natural world is the other side of the coin that almost anybody seems to notice. However, ecologists, environmental philosophers and ecocritics try to emphasize the connections between money and nature, whether they are negative or positive.

The aim of this work is to analyze the economic and ecological factors in the novels *Mean Spirit* by Linda Hogan, and *Through the Arc of the Rain Forest* by Karen Tei Yamashita. An ecocritical perspective would highlight how these two texts are inevitably linked by main topics related to environmental conservation, ecological denunciation, or anti-globalization reports. Apart from this, the exploration through the settings and the characters would help me to establish clear similarities between the stories.

In both *Mean Spirit* and *Through the Arc of the Rain Forest* the new, burgeoning business is related to the exploitation of natural resources. To a large extent the exploitation of human beings is also present, given that people suffer the consequences as much as the environment. Ironically, this exploitation is also caused by “(hu)mans.” In both novels “corrupt” business is held by men, hence the parenthetical term “(hu)man” to intensify the fact that it is the human being who destroys nature in the novels, and not only this, they are men, not women. On the one hand, in *Mean Spirit* Hale is the ringleader of oil business and the instigator of the numerous murders. On the

other, Tweep is the representative without scruples of GGG, the absorbing American company that gets profits from the Matacão in *Through the Arc*. Male characters are in both cases the ones who perpetrate the cruelest attacks against the environment. Hale represents the villain in *Mean Spirit*; J.B. Tweep is the personification of fierce Western capitalism and greed in *Through the Arc of the Rain Forest*.

The murder of Grace Blanket is the first example of human greed involving money in *Mean Spirit*. Belle, the main protagonist in this novel, suspects that Grace's death is part of a plot, "since [her] land was worth so much in oil" (Hogan, *Mean* 29). Belle laments the discovery of oil in Osage territory because it smells "like death to her" (29). The speculation created around Watona, the setting of the novel, is likewise related to other businesses dealing with the tapping of natural resources. Hale's greed is behind all the destruction we witness in the novel. Apart from the devastating images of his oil derricks crushing the land of Watona, he is the obvious forerunner of the several mysterious murders related to the possession of oil. Hale "hire[s] Indian men to help him cut, burn, and clear their own land" strategically (54). With this trick he insures himself the support of the Natives who work for him, and at the same time he shows the world that not all the indigenous people care for the land, since they help to destroy it. According to Yonka Krasteva, this is a "stunning illustration of [the] self-deprecation and internal colonization" that helps "the intruders destroy their community and ultimately their way of life" (51). Hale's plot in Walker's death is also evident, as we know that he had "a life insurance policy on Walker" (Hogan, *Mean* 125). Later in the novel, it is discovered that "the man named Bird had been released from jail in order to commit the murder of Walker. The sheriff had been involved, but the idea was Hale's" (327). In the same way, Hale coerced China to marry John Stink to get his fortune, and when he discovers that John is dead he goes "to the courthouse and file[s] a lien on

Stink's money" (352). Hale's corrupted business is endless throughout the novel.

However, Watona depends on him economically: the cars and the fine clothes Natives buy come from oil income.

At this stage it is important to bring up the polemical dual ethics of biological conservation. As James D. Proctor puts it, there is a strong confrontation between what is ecologically correct and humanly convenient. In his article "Whose Nature? The Contested Moral Terrain of Ancient Forests," he exemplifies this dichotomy with a true story about the listing of the spotted owl as a threatened species in the Lane County Convention Center in Eugene, Oregon. On the one hand, and through the testimony of the director of Save Our Ecosystems, we know that the considerations of the meeting "are not really about owls, ... These hearings are about whether the timber industry shall be allowed to continue consuming our Northwest forests until there is nothing left..." (Proctor 269-270). On the other hand, another of the participants in the Convention implores them not to destroy the industry of 100 families that depend economically on this timber company (Proctor 271). The same situation can be found in *Mean Spirit*, since we see some Natives working for Hale's oil company and some others fighting against him to protect what he is destroying, that is, the natural and cultural heritage of Watona. A well-known Native proverb wisely tells us that "[o]nly when the last tree has been cut, the last river has been poisoned, and the last fish has been caught, you will realize that you cannot eat money" (Feest 12). Hale's greed gets to the point in which he does not hide his shady deals and he dares to expand the boundary lines, invading Belle's land to his profit and putting Belle's beehives in jeopardy: "Hale had no remorse," and even at the final trial he faces, he "smiled and shook hands with several of his friends [...] He looked, in an odd way, handsome and untouched by the weight of events" as if nothing could be done against him (325).

Towards the end of the novel the crimes against Native people are compared to the “clearing of the land for your farm, or hunting the food you eat” (327). Indigenous inhabitants put themselves on a similar level with the earth since they believe they are interrelated; however, the whites use this “idyllic” union to their own benefit, placing Natives under them. Whites do not have the same vision of the planet, whites think they are “superior” to the other inhabitants of the world, and this gives them the right to manipulate them, whether they are humans or non-humans.

Concentrating on the effects of money in local people, it is worthy of mention Eric Anderson’s study in “States of Being in the Dark: Removal and Survival in Linda Hogan’s *Mean Spirit*”. Anderson equals money and oil, and presents them as “dark presences in the novel,” generating conflicts between Indians and between Natives and Non-Natives (59). In view of the fact that the oil company has to pay the Natives for the use of their land, money enters their lives and transforms them into “the richest people in the world,” according to Eugene E. White (qtd. in T. Wilson 268). The oil businessmen “disliked the way Indian people displayed their wealth,” buying expensive cars, “wearing bright clothing, and joking back and forth about dollars and cents” (Hogan, *Mean* 56). As Krasteva openly claims, Native Americans “can be tolerated as long as they stay in the margins of society, as long as they remain poor,” (52) but once they become rich, they also become the centre of criticism. It is difficult for them “to take their wealth seriously” since the concept of richness is new for them (57). One of the most ironical scenes related to the inappropriate spending by an Osage citizen takes place when Jim Josh, “a man who loved plants, was said to have bought several useless claw-footed bathtubs even though he lived in a shack with no running water” (Hogan, *Mean* 56). This “ironic” scene links both novels inevitably, parodying “contemporary discourses regarding developing countries, technology and industry, and ecology”

(Wallace 147). When in Yamashita's novel Kazumasa starts to give his money to the people he realizes about the "ephemeral" use of wealth as he discovers that "a woman who received a washing machine had no plumbing to run water to it" (Yamashita, *Through* 148)¹. This explicitly shows the "stark contrast between extreme poverty and luxurious wealth" in the novel, and emphasizes the irony of introducing technology where it is virtually useless (Simal 210). Just like the Osage people Kazumasa does not know what to do with the money obtained in the lottery, and he starts to give it away to the people who ask for it, but as his donation system develops, he becomes aware of the fact that he cannot "perform miracles," as people ask for "health, a lost arm, vision, hearing, babies" (Yamashita, *Through* 61). Obviously, people take advantage of Kazumasa and lie to him in order to get his money, to an extent that Kazumasa's "altruism [becomes] corrupted by greed" (63). Thanks to Kazumasa's disinterested behavior, the main characters of Yamashita's novel start their own business. Mané and Batista DJapan become rich with feathers and pigeons. Hiroshi benefits from the karaoke business². Even Chico Paco takes advantage of "God's Will" and of the popularity of his pilgrimages, and sets up his own business with Kazumasa's money: Radio Chico, which turns out to be an overnight success (128). Kazumasa himself becomes a businessman as a "plastic hunter" once Tweep appears in the scene.

Jonathan B. Tweep and GGG go hand in hand throughout the novel. The former is the personification of the latter just like Hale personifies the entire oil extraction business in Hogan's novel. GGG is a company settled on a twenty-third floor in New

¹ This same fact is also mentioned in an interview with the author as she quotes her husband's words about a poor person in Brazil going to "a lot of trouble to buy a refrigerator" but not having "electricity to hook the damn thing up" (Yamashita "Interview" 50).

² According to Yamaguchi, Hiroshi represents the Japanese "snobbism" of the 1980s and the "models of consumerism and consumption" that the Japanese introduced in Brazil (27).

York³, and its presence in *Through the Arc* indicates the constant “intervention” of big companies from rich countries in poor countries. As Wallace convincingly argues, although the Brazilian government tries to keep the Matacão under its control, “it is the American transnational corporation, GGG, which exercises the greatest control over the new resource,” and turns the town into a “hyperactive money-making machine” (150; Chen 616). In fact, through the innocent eyes of the illiterate Mané Pena, Tweep is the representation of American/US progress and development, and Tweep’s third arm is the final indication for Mané to consider and say that “Americans certainly were more advanced!” (Yamashita, *Through* 74). The Matacão, the main setting for Yamashita’s novel, soon becomes the centre of speculation and business for many companies. Among others, “travel agencies [find] it lucrative to expand their activities to include the promotion and sponsoring of events on the Matacão” (101). This place turns into a tourist attraction like Watona, where “even before it began, the trail had turned into a kind of celebration for onlookers who gathered as if it were a holiday” (Hogan, *Mean* 323). Whereas in the Matacão acrobats perform their shows and the World Hockey play-offs take place there (Yamashita, *Through* 101), in Watona merchants start “making their profits by selling miniature stick derricks and hand-painted statuettes of Indians” (Hogan, *Mean* 324).

Very soon Tweep discovers Kazumasa’s ball’s attraction to the Matacão material, and his greed activates his thirst for power. Given that Kazumasa’s ball had felt the same attraction in Pará, Tweep concludes that “there [might] be other uncovered Matacões” awaiting him, there might be other waste dumps all over the world (Yamashita, *Through* 107). Tweep’s greed is different from Hale’s: murder does not

³ Oddly enough, there are thirty-two chapters in the novel, precisely the inverted number. This can be analyzed as a simple coincidence or as an indication for a possible inverted end and a consequent apocalyptic reading of the novel taking as a parallel the inversion of the Christian cross to indicate a satanic symbol, which is, at the same time, related to the number 666, resembling clearly the company name GGG.

come directly from his hand. However, “for precaution’s sake,” Tweep “had an assistant come in and velcro Kazumasa to his bed at night” (110). Kazumasa and his ball are “the key to this incredible source of wealth” (144). He is “oblivious to any obstacle in [his] path,” even “great government hydroelectric dam projects” that leave plants and animals “bulldozed under, rotting and stinking for miles in every direction,” or Native American homelands with “their populations decimated by influenza” (144). In the end, Tweep’s promising words in favor of “environmental conservation” and “ecologically responsible” promotions for people sink into oblivion, and leave instead devastating scenes such as those and others to follow (113)⁴. However, once again greed is involved, and as Susana Hecht states in *The Fate of the Forest*, “there was money to be made; survival to be sustained in cleaning forest” (193).

Disease is caused by overpopulation of pigeons in *Through the Arc*, and typhus spreads throughout the Matacão affecting people and animals, since DDT spraying is the measure taken to prevent the infected birds from spreading the plague. But this poison is not only a “birdicide”: in the long term, as Carson had already announced in her 1962 best-seller, the storage of this substance in the human body can cause “chronic poisoning and degenerative changes of the liver and other organs”(Yamashita, *Through* 199; Carson 21). Later, a furious bacteria eats the Matacão and disintegrates all that is made of this plastic, creating a collective hysteria in the novel (207). This “apocalyptic collapse” of the Matacão “symbolizes a moment of resistance by the colonized” (28), as Yamaguchi puts it, and, as I see it, this image of self-destruction is an invitation on the part of the writer to reflect on the consequences of our behavior toward this planet.

⁴ Apart from this negative vision of Tweep, Yamashita provides us with a humorous depiction as he tries to adapt to Brazil. For him “nothing seems to work in this country,” and the humidity interrupts his work and atrophies his third arm (74). Ironically, the fact that the one who complains the most about this country is a US citizen shows the American notion of the backward situation regarding developing countries, and at the same time he contradicts the Brazilian motto on order and progress in its national flag (Bang 133).

Corruption and business proliferation in *Mean Spirit* and *Through the Arc* have irrevocable consequences regarding environment and people. On the one hand, murder takes away human lives and business desolates the land. On the other hand, business culminates in disease and death, both human and non-human. Even if our examples here point to male greed, the inevitable truth is that, as Barbara Cook claims, “[h]uman actions have ecological consequences that in turn have effects on individuals and communities” (Cook 41), and all the money obtained from environmental exploitation is given back to the human being in a devastating form of payment by this same environment, which just as Tweep, is oblivious to any obstacle in its path.

Dani Cavallaro identifies Lewis Carroll's *Alice's Adventure in Wonderland* (1865)¹ as one of the most prominent sources of Hayao Miyazaki's *Spirited Away* (*Sen to Chihiro no Kamikakushi*) (2001), as he claims, '*Spirited Away* shares a taste for preposterous metamorphoses and for weird characters are driven by both benevolent and reprehensible intention'.² This 'taste of preposterous metamorphoses' refers to the sharing interest of Miyazaki and Carroll in illustrating a girl's growth in a fantasised world, which is specifically referencing to the cultures that the director and the author were experiencing during the production. The plot development of the two texts is similar, but, owing to the differences in cultural backgrounds, Miyazaki's Chihiro and Carroll's Alice are subjected to grow in opposite directions. This paper will then look into Chihiro and Alice's growing processes, which require them to 'de-create' their old selves by abandoning values acquired in reality; and 're-create' new selves by taking up the lessons that Chihiro and Alice have learned in the Japanese and British fantasised worlds respectively.

Passiveness and idleness of the girls are indicated in the beginning of the animation and text, reflecting their problematic characters and conceptions acquired in the real world. *Spirited Away* begins with Chihiro's annoyance at moving to a new environment. She lies on the backseat and complains about the loss of friends and school. To Miyazaki, Chihiro is dearth of passion and curiosity. Chihiro's skinny legs and her sulky face symbolise her enlarged fragile ego, for the reason that children of modern Japan, in Miyazaki's opinion, cannot feel that they have to work hard to survive in this world.³ In other words, it is because these children live in modern society safely, they do not see the difficulties of survival. Chihiro concerns her personal loss and unhappiness rather than accepting new environment and people. She has big disappointment towards the withering of her flower, a subject of fancy and impractical. In the early stage of the animation, Chihiro is probably, as Yubaba claims, a spoiled and lazy child. In Carroll's work, comparably, Alice shows her weariness towards life and challenges. The boredom of Alice, analysed by Ando Satoshi, is caused by her sister's book that suggests 'boredom and dullness of the adult world'. Alice gets tired of sitting with her sister by the bank and so she peeps into the book that her sister is reading. Alice is displeased as there are 'no pictures or conversation in it'.⁴ In the age of puberty, Alice perceives 'the sense of incongruity caused by acknowledging that she is approaching the boring world represented by the book'.⁵ Even though she should be prospecting adulthood, she still has the desire of pictures and conversation, symbols of children's tales. Satoshi reads Miyazaki's and Carroll's beginning as representing a 'girl's transition period'.

¹ In the original text, Cavallaro has mistaken the name of Lewis Carroll's book *Alice's Adventure in Wonderland* (1865) as *Alice in Wonderland*.

Accordingly, the two protagonists are not excited to their adulthood and changes in the future. The lack of energy presented in the beginning of the texts, therefore, will dramatize the changes that would be experienced by the two protagonists.

The fantasised worlds isolate Chihiro and Alice from the logic and reality that they used, forcing them to make changes to their problematic characters. They are required to de-create their original selves, so as to acclimate themselves to new environment. When the two girls first enter the fantasised worlds, they are isolated. When Chihiro finds out that her parents are turned into pigs and her body is vanishing, she hides herself in the corner of the river bank. Likewise, after losing the sight of the white rabbit, Alice sits in an empty hall that she cannot get out of, except through a door that is too small for her. She cries, 'I am so very tired being alone here'. Without much help from external agents, isolation forces them to change themselves. Starting with their physical bodies, Chihiro takes herbal remedy from Haku while Alice takes the mixed flavoured drinks from the bottle and the small cake in a little glass box. The food then effectively changes their bodies, as Chihiro's body stops vanishing and Alice starts changing her size until she is small enough to leave the empty hall. Taking in the food, therefore, symbolises the adjustment and submission that the protagonists have to succumb to before they can exist or enter the fantasised world. Still, after leaving the isolated corner, the girls are alienated because of their unfamiliarity to the logic and knowledge of the new worlds. Chihiro is the only human in *Yuya* (Yubaba's bathhouse), and she is despised by the workers of the bathhouse, as they claim that she has terrible human stink, which symbolises the dirt and impurity of human world. Alice's alienation is taking place when she loses control over the size of her body. She is misunderstood as a serpent, and she is treated like a monster when she is in White Rabbit's house. Also, James Suchan summarises the reasons of Alice's alienation in three points: her 'sadistic treatment of the Wonderland animals', 'her refusal to accept the nonsense and chaos which is a "given" in Wonderland, and finally, her 'persistence in interjecting rational, above ground vales into the Wonderland environment'.⁶ Both protagonists cry and get confused of their sudden misfortune and uncontrollable fate, and coincidentally, after their tears, they obtain some other food, rice balls for Chihiro and another cake for Alice.

However, in the case of alienation, more than physical bodies should be concerned. Rather than de-creating their physical bodies, one's spirit and soul should be de-created by abandoning the logic adopted from reality. Miyazaki disagrees with Chihiro's old self, which is created under the influences of modernized Japan. Mick Broderick comments that, 'The post-industrial age for Miyazaki is tempered by a sense of loss, not so much of innocence, but of origin where the importance of space, place and context need reinvigoration'.⁷ In *Spirited Away*, Miyazaki aims to show the depravity of Japanese cultural values in the new generation. Japanese culture, as presented in the bathhouse, is 'a culture that is constantly in danger of being soiled by both outside influences and internal corruption'.⁸ In the opinion of Susan Napier, the traditional culture presented in the animation should be 'seen in ghostly and occasionally demonic terms', which evokes that "'Old Japan" has faded into myth and folklore and can no longer be

approached in reality'.⁹ A mythical presentation of Japanese culture will therefore suggest the distanced and unrealistic values between the modern world and the traditional Japanese society. The cultural recovery is explicitly elucidated by Miyazaki, as he states, 'Surrounded by high technology and its filmish devices, children are more and more losing their roots. We must inform them of the richness of our traditions',¹⁰ and 'A man without history, or a people that forgot its past will have no choice but to disappear, like a shimmer of light or to lay eggs endlessly as a hen and consumed'.¹¹ With reference to Miyazaki's stress on the importance of national and personal history, Chihiro is deemed to develop her self regressively, or in other words, to look back to the Japanese traditional values and their relation with her self. Nevertheless, Miyazaki's disagreement as to modern society does not mean that he rejects value existing in other places. Shiro Yoshioka proposes that, even if the values of old Japan is essential, Miyazaki views a person's Japaneseness should also be included the diversity of Japanese cultures. In the opinion of Yoshioka, in the fantasized world of Miyazaki, 'Japaneseness is not absolute or objective.' His world is a "mosaic" that combines Asian and Western culture'.¹² The Japanese fantasized world of Miyazaki is constructed with 'both Japan's "historical" past and of Miyazaki's own personal past as extension of the contemporary "real" Japan in that belong to audience'.¹³ Accordingly, Chihiro is then surrounded by a mixed valued Japanese culture, her de-creation is seen as an adjustment of the values of reality and fantasised world.

In order to illustrate the loss and gain in a diverse Japanese culture, Chihiro's de-creation of old self happens through the loss and gain of her name. When Chihiro is signing a working contract with Yubaba, the sorceress takes away her name 'Chihiro Ogino', and renames her as 'Sen'. The transformed self of Chihiro is immediately shown when she walks up to the stairs next to the bridge in the morning. Compare to her hilarious and fearful walk to the Boiler Room in the night before, she is then much more confident and at ease to walk on the same stairs in the next morning. Additionally, she becomes courageous in dealing with supernatural characters. In the night before, she is shudder in fright when she sees Yubaba and *Kaonashi* (No-face), but in the next morning, she could bow to Kaonashi and talk to him face to face. She is also able to ask the foreman for token and to work well in the bathhouse. Apparently, the renewed Chihiro is formed when her old identity is forgotten, but Chihiro is specially placed when her old self is not totally left out by the director. In the scene which Haku comforts Chihiro under the flowery bushes, he gives her back the clothes that she used to wear, along with the card written with her real name 'Chihiro'. By remembering her real name as well as keeping the name 'Sen' in this magical world, she is a conglomeration of real and fantasised self. This echoes Yoshioka's analysis, in which Miyazaki does not intend to forget everything of the modern world as he understands that the children of Japan, at that moment, should acquire the modernized values and also be reminded with the traditional ones. The completion of the de-creation of Chihiro happens when she helps the River God (*Kawa no Kami*) to clear the rubbish and dirt that pollute him in human world. The god compasses her with water, signifying the purification of her soul and body. The

¹³ Ibid., p. 257-8

clearance of human dirt, therefore, ends the alienation and integrates the protagonist to the community of the bathhouse.

On the other hand, Alice's de-creation of soul is indicated along with the changes of her physical body. She correlates her physical changes to her identity, and thus she bewilders by her own identity. Alice tries to explain who she is by mathematics, geography and comparison to those she knows in the reality, but still she cannot assure her identity. As a result, in the early stage of the story, she cannot remember who she is. She could not answer the caterpillar, saying that, 'I can't explain myself... because I'm not myself.' For Carroll, a sense of loss is rendered by rapid industrialization and modernization of the nineteenth century. The Victorians, as Nicola Bown perceives, viewed themselves as 'makers and maters of the modern world', and 'they were most anxious to pass on to posterity. But they also felt oppressed by their responsibilities, fearful of the future and doubtful of the unalloyed benefits of progress'.¹⁴ When the Victorians were torn between their historical positions, nostalgia to childhood is resulted, providing an imaginative and romantic escape for the Victorians. In *Secret Garden: the Golden Age of Children's Literature*, Humphrey Carpenter claims that Carroll was living with social suppression and pressure. Different from Miyazaki's cherishment to tradition, Carroll's work replaces the nostalgia towards the past with the celebration of childhood. Alice is not an archive of old values, instead, she is the champion that represents the preciousness of childishness. For this reason, Alice's growth tends to be excessive in nature, so as to comfort those who lose their childish happiness. In the early parts of the book, the changes in her size baffle her greatly. Still, gradually she understands the logic of the Wonderland through these transformations of her bodies. After two transformations in the empty hall, Alice realizes that she has to drop the fan that she is using, before she stinks too rapidly and uncontrollably. After this, when Alice is in the White Rabbit's house, she expects that having cakes would trigger interesting changes in her body. And at last, her de-creation of the old self is completed when she gets into a 'right size'. She nibbles the two sides of the mushroom carefully, 'first at one and then at the other, and growing sometimes taller, and sometimes shorter, until she had succeeded in bringing herself down to her usual height'. More than getting into a right size of her body, Alice's de-creation happens when she adopts knowledge from her experience and adventures in Wonderland.

In these two materials, Chihiro forgets and regains her old self along with her new identity, while Alice is totally confused by who she is and de-creates her old self along with understanding the logic of Wonderland. Even though the girls are gaining knowledge from their experiences in the fantasised worlds, the de-creation of the two protagonists spark off with a series of losing control of their own bodies and identities. Reflectively, these deformations of self are written with the depravity of the society perceived by the director and the author in accordance to their cultural backgrounds. Miyazaki concerns the loss of values of a nation, and Carroll concerns the loss of self in each individual, their ideas are then coincidentally encapsulated in Kaonashi. He is a phantom like character that represents the loss of individuality under the influence of industrialization and materialism. He is effaced and alienated from the past and future. The absence of self is reflected in the physicality of Kaonashi, whose face is covered with a mask. He can hardly talk, unless he swallows someone and takes its voice for his use. Kaonashi is a pathetic figure as he does not know how to build up his self. When he sees that Chihiro is

¹⁴ Nicola Bown, *Fairies in Nineteenth-Century Art and Literature* (Cambridge: Cambridge University Press, 2001), p.1

asking for a token, he thinks that token is the medium of exchange for his friendship with the protagonist. Also, when he sees that workers of the bathhouse are thrilled to see the gold given by the River God, he thinks that gold is the means to gain respect and pleasure. Kaonashi represents those Japanese who follow materialism blindly. Materials become the only way for Kaonashi to communicate with others. At the same time, there are too many people and values in the bathhouse, and by this, Kaonashi, who is new to the environment and is dearth of self-consciousness, re-creates his self mistakenly and randomly. The incapability to select the values of Kaonashi, in addition, reflects the confusion of individuality; and this is similarly presented in Carroll's Alice when she first enters the Wonderland. Alice is bewildered by the uncanny characters and their logics, as they are all new to her. The variety and illogic in the fantasised worlds make both Kaonashi and Alice mess up in the beginning of the development of their selves. Kaonashi, therefore, is an interesting antithesis to the growth of the girls, who establish their individuality by selecting materials and values that suit them. Through Kaonashi, Miyazaki portrays the negative results of the economic bubbles of Japan. Kaonashi is not only mirroring the values of Miyazaki, but is also correspondingly echoing Carroll's work.

After the de-creation of the girls, their re-creations begin when they acquire the values of the fantasised worlds. The re-creation of Chihiro happens by integrating Japanese community and adopting the cultures and values. One of the ways to retrieve Japanese values is through labouring. Yubaba claims that if Chihiro does not work, she will turn from a child into a pig, indicating that only working can validate the values of a man. Same as Osmond's analyses, '*Spirited Away* has a similarly offbeat work regime with Chihiro tending Japanese gods and leaning responsibility and purpose. This is less to do with stereotypes of the industrious Japanese than with Miyazaki's own leftist leanings and beliefs in empowerment through labour'.¹⁵ Still, no matter this is a stereotypical image of Japanese or Miyazaki's leftist leanings and belief, labour is a great factor that transforms Chihiro. Within a very short time, she turns from the idle girl in the backseat to a worker in a bathhouse. Even if at the beginning, she feels uncomfortable to her new status, she learns the hardship of working when she cleans the bathhouse and the use of wisdom when she serves the River God. Labouring, subsequently, empowers Chihiro with strength and enhances her capability in integrating herself in a community. More than simply working, Japanese etiquette and ways of living is revived. For instance, the bathhouse is decorated with Japanese ornaments and workers are dressed in traditional uniforms. Throughout the film, Chihiro is taught to take up Japanese politeness. This starts when Lin requests Chihiro to answer her properly, and asks her to thanks Kamaji. 'Bowing', also, is insistently stressed throughout the film, in which Chihiro bows to Kamaji, Oshira-Sama, foreman, Kaonashi, Kawa no Kami, lamppost and Yubaba. The sorceress also, constantly reminds the etiquette towards customers. When Stink Spirit arrives, Yubaba requests Chihiro to show her respect to the spirit by not covering her nose. Yubaba welcomes the Stick Spirit herself, showing the politeness and veneration to every customer. Hence, the newly behaved Chihiro, indeed, is re-creating herself by looking back to Japanese practice and values that have long been forgotten by modern society. More than etiquette, Hiroshi Yamanaka attributes Chihiro's transformation also to her 'web of persona relationships'. He sees Chihiro as 'a joiner who quickly becomes socially integrated in her new workplaces, gaining admiration and respect from her colleague precisely because she

¹⁵Andrew Osmond, 'Gods and Monster: Film of the month: Spirited Away', *British Film Institute*, <http://www.bfi.org.uk/sightandsound/review/1237>

works so well in the group'.¹⁶ The integration of Chihiro indicates that Japaneseness presented in Miyazaki's animation also concerns a person's relation to community. Napier comments that *Spirited Away* is about 'cultural recovery' or 'cultural rehabilitation, in a corrupt postindustrial society'. This animation is 'a quest to rediscover the reincorporate element of purity, self-sacrifice, endurance, and team spirit, all of which have been historically regarded as quintessentially Japanese, and reintegrate them into a form that has resonance for the contemporary world'.¹⁷ Napier points out the stereotypical images of Japaneseness concern a person's development in endurance and purity, and simultaneously, a person's contribution and relation to community. By practicing Japanese etiquette and adopting values, Chihiro grows positively and regressively, as historical evidence is the main influence received by her. Miyazaki claims in an interview that, *Spirited Away* is 'not a story in which the characters grow up, but a story in which they draw on something already inside them, brought out by the particular circumstances'.¹⁸ Miyazaki sees that Chihiro is reviving some values that embedded in her self, yet, there is no contradiction of the past and growth if the revival of values are also be read as a way to grow with learning of the past. It is a form of 're-creation' of self that proceeds by applying useful and essential values of the past into future.

Chihiro is comparatively more passive in taking in the values of the fantasised world, as the re-creation of Alice refers to the retrieve of childishness as well as developing her character until she can overwhelm the values of the Wonderland. The sense of loss shown in *Alice's Adventure in Wonderland* was resulted by the nostalgia towards childhood in the nineteenth century Britain. It is a general feeling towards the loss of imagination that renders the triumphs of children protagonists in nineteenth-century children's literature. Pointing out by Cheshire Cat, the logic of Wonderland is chaotic. It claims that everyone in this fantasised world is mad. There are no specific reasons for such madness as it is the fact that only madness could lead a person to Wonderland. Thus, as Alice is also in the land, Alice is mad too. James Suchan analyses that the illogic of the inhabitants of Wonderland is caused when these characters lack a sense of self-consciousness and 'the anarchy of the kingdom constantly re-affirms the irrationality of their behaviour'.¹⁹ Hence, Alice is 'mad' when she lacks self-consciousness. Yet, Alice gradually affirms her identity, which is externalized by re-creating her physical body into a right size. It is obvious that, after she finishes nibbling the mushroom, she finds a sense of self-consciousness. Thus, when the Queen asks who she is, Alice could reply firmly that, 'My name is Alice, your majesty'. Suchan claims that 'if Alice could "accept" the "madness" of Wonderland, she could escape her alienated condition by becoming all child, a member of the Wonderland kingdom, and not a constant opponent or its nonsensical values'.²⁰ However, the re-creation of Alice is completed when she goes one step further than Suchan's suggestion. Therefore, it is essential for Alice to outlaw the magical context and the new logic of the Wonderland, so as to romanticize the triumph that children could possibility possess in fantasy. 'The romantic child could become a currency only too easily seized by the writer who had every good reason to seek its comfort in

ace of a sense of personal failure and shame'.²¹ Alice has to realise the illogic of Wonderland, and overthrow it. The new acknowledgment of Alice is shown when she said, 'it's no use going back to yesterday, because I was a different person then'.²²

In order to re-create a self, Miyazaki and Carroll put the female tyrants, Yubaba and the Queen of Hearts, to mirror the values for the girls to follow, even if these female tyrants could hardly be argued as maternal figures of the protagonists. Geographically, both tyrants are placed in the position of the ultimate power. Yubaba's chamber is placed at the top of the bathhouse, whose vertical structure echoes the traditional vertical class system of Japan. The Queen of Hearts is located in the 'beautiful garden' where Alice has a glimpse on it in the early stage of the story. Carroll's story is vertically structured, as shown with Alice's journey, she has to go to one place after the other until the garden. The ultimate positions of the tyrants are the destinations of the girls, symbolizing the female tyrants are goals to reach. Besides, Yubaba possesses magical power but still has to abide to the rules of her magical world, while the Queen has her absolute power on others, but not having any transformative or magical capability. The sense of integration of Yubaba to the natural law is highlighted, reflecting Japanese spirit in community and team building. This sense of Japaneseness happens to who ever in the community, regardless to their status and power. While in the case of The Queen of Hearts, her despotism shows that strong individuality is should be developed in a person's growth. Although the Queen does not have any magical power, her dominate character and authority make her the ruler of Wonderland. Hence, when Alice has to represent triumph of childishness, she has to be as stand out as the Queen.

According to Noriko T. Reider, Yubaba is one of the recalling images of *Yamauba* in Japanese folklore. Yubaba resembles *Yamauba* in her images and motherhood. In kabuki, *Yamauba* is often a white-hair lady accompanied by his son, *Kintaro*, a gigantic-sized boy who wears red *harakake* with the character 'Kin' on it. Similarly, Yubaba's son is enormous in size and strength, and is wearing a *harakake* with his name 'Boh'. Yet, even if Yubaba relates to a mythical character of Japan, the image of Yubaba outstands other characters of her bathhouse because she is the only character lives in a Westernized setting and wears Westernized costume. The hybrid cultural references inherited in Yubaba's images assimilate the transformed identity of Chihiro. Correspondingly, the girl re-creates herself with traditional Japanese cultures and customs, which include both Asian and Western values. It is just that Chihiro's re-creation transgresses the fantasised world as well as the modern world. Yet, both Yubaba and Chihiro emphasize the importance of following rules and regulations. Almost at the end of the animation, Yubaba posts a test for Chihiro, asking her to identify her parents among twelve pigs. This test is necessary, as Yubaba could not cancel it even if her son asks her to do so. Similar to Yubaba, Chihiro does not reject the test and regulations set in this Japanese fantasised world. With consideration of the obedience and politeness, the two stereotypical characters of Japanese, it seems that Chihiro and Yubaba both acknowledges rules are necessary to a person's development and to a community.

²² Carroll, p.91

While Yubaba is embedded with rich Japaneseness, the Queen of Hearts is then representing lawlessness. She is the ultimate despot of the Wonderland, and her authority exerts without regards to logic or situation. Unlike Yubaba, the Queen of Hearts does not possess any magical power. Yet, she would like to set all the rules of the fantasized world. In the croquet field, there is no regulation of the game except the Queen's rules. She even attempts to reverse the order of verdicts and sentences in the trial. However, the Cryphon says that the absolute power of the Queen is merely her fancy. Even if she frequently proclaims execution, 'they never execute nobody'. Considering Alice's growth with the influence of The Queen of Hearts, Alice does not simply follow the capriciousness and irrationality of the queen. Alice succeeds her re-creation of self because she realises the madness of Wonderland and overthrows the illogic of Wonderland. She attempts to demolish Wonderland by re-inserting the order, or by stating out the fact. Carpenter sees that *Alice's Adventures in Wonderland* is anti-fantasy, as when Alice realizes the characters and the world of Wonderland are merely fancy, and hence, the Wonderland is 'constantly uncreating itself'.²³ Throughout her adventure, Alice learns to 'uncreate' the fantasy in Wonderland. When she meets the characters of the playing cards, she understands that she does not need to be afraid of the queen and all other characters, as to her, they are simply a pack of cards. She builds up a sense of superiority by acknowledging the real faces of the characters in Wonderland as well as their nonsensical behaviour. This sense of authority is as significant as the Queen, who could only exert her power and reverse orders in Wonderland. Alice's superiority establishes when she can see the illogic of Wonderland by comparing the fantasised world to reality. The re-created self is once again externalized on her body. During the trial, Alice's body starts growing up till two miles high, even though she does not take in any food. This is a sign of her realization of facts, and so her power is overwhelming all the inhabitants of Wonderland. The re-creation of Alice is succeeded because of her excessive development of self-consciousness. She does not simply pick up values of Wonderland and apply them on herself but looks into the big pictures of Wonderland, which she interprets as a land of fancy. The characters are not fearful as they are not real. And therefore, with the individuality developed in Alice, her growth exceeds the knowledge and logic of Wonderland.

Still, it should be aware that the de-creation and re-creation of the two girls are limited in the fantasised worlds. There is no evidence that they will bring the lessons they have learned to reality. For Alice, Wonderland is a dream. When she wakes up, her adventure is followed by her compliance to her sister, who asks her to tell the adventures and to go back for tea. For Chihiro, at the end of the journey, she only gives a look to the tunnel. Although she brings along Zeniba's hair band to the reality, there is no sign that she remembers the adventures she had. Despite the difference or the oppositional directions of the two cultures, both Miyazaki and Carroll leave an open ending of the growth of the girls to readers.

The protagonists of Hayao Miyazaki's *Spirited Away* and Lewis Carroll's *Alice's Adventure in Wonderland*, Chihiro and Alice, respectively, have re-built their selves when they are in the fantastic worlds. They have left the old values that are taken up in reality and developed their way of knowledge and logic during their adventure. The stories have demonstrated that, in Miyazaki's word, the protagonist 'manages not because she has destroyed the "evil", but because she has acquired the ability to survive'.²⁴ While the de-creation is mirroring the destruction of

²³Humphrey Carpenter, *Secret Garden: The Golden Age of Children's Literature* (London: Unwin, 1985),p.67

²⁴ Miyazaki, p.15

corrupted social values, the re-creation shows to be more than just regaining the loss when a new self is established with reference to both cultures. Subsequently, it is because of this sense of loss, Chihiro rebuilds herself by picking up the traditional Japanese values, as the director intended. It is a regressive progress of growth. While Carroll's Alice re-establishes herself by demolishing the authority and logic of the new world. The growth of Alice is excessively progressed as she develops herself by understanding and realizing the truth of Wonderland. She could see the nonsensical issues in the fantastic world. Hence, she interjects rationality to correct the fantasy, and by which she crushes the Wonderland. The triumph of Alice, a figure of romanticised heroine, is successfully created with reference to the nostalgia to children memory of British readers in the Victorian period.

Japan's Basic Trust System toward East Asia in the Cold War Years: An Ontological Security Perspective

Hakan GÖNEN

Middle East Technical University

Faculty of Economics and Administrative Sciences

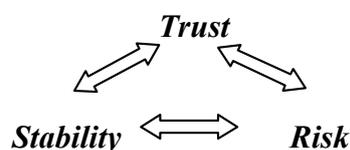

Department of International Relations

Introduction

Firstly used by Ronald David Laing (1960) in psychology and elaborated by Anthony Giddens (1991) in the field of sociology, the concept of 'ontological security' was recently brought to International Relations (IR) literature and applied to 'state level' by Brent J. Steele (2005) and Jennifer Mitzen (2006). Giddens (1991, p. 243) defines 'ontological security' in terms of sociology as follows: "a sense of *continuity* and *order* in events, including those not directly within the perceptual environment of the individual". In point of fact, Steele (2008, p. 68) here posits that all actors seek ontological security by emphasizing in particular the basic need of actors. Admittedly, as conceived by Steele's point of view, what makes ontological security a basic need is *a deep fear of uncertainty*, which constitutes a threat towards the actor's identity.

At the individual level, ontological security emerges with the conviction that the biographical narrative rests on a strong ground. On this account, Kinwall (2004, p. 747) asserts that, by making reference to Giddens' explanations, to be ontologically secure an individual needs a basic trust of other people. Obtaining such trust is required in order for an individual to maintain a sense of psychological well-being and to avoid existential anxiety. In a condition of ontological security, the individual will know how to behave and how to evaluate the possible threats and the means to realize his/her aims. Conversely, ontological insecurity points to a serious inability to discriminate between the dangers to be confronted and those to be ignored. In such a case, an individual will focus on immediate necessities and may not be able to choose the right means to be used to reach his/her goals.

In ontological security, I assume that an important place is occupied by the *trust-stability-risk triangle*. The relation among its three components is of direct as well as of inverse proportion. This concept can be illustrated with the formulation proposed here: trust can help maintaining a stable environment as well as increase potential risks. Very much in the same way, stability can foster trust but also pave the way for increased risks. Up to this point, the relation among these pairs of factors is of direct proportion: a raise in the level of one of the terms causes an increase of the other. On the other hand, when we come to "risk", the relationship is of inverse proportion: indeed, to a higher level of risk corresponds a lower level of stability as well as a lower level of trust.

According to Giddens (1991, pp. 39-40), the term 'trust' is "a protection against future threat and dangers which allows the individual to sustain hope and courage in the face of whatever debilitating circumstances she or he might later confront". He stresses that society should be conceived as social practices which are bound to time and space. These social practices are densely interwoven by relations of trust.

Trust in the systems brings a *stable cognitive environment* to the individual's life and fosters a feeling of security. In this respect, Mitzen (2006, p. 345) notes that this need for security implies a relatively stable understanding of the individual's self identity. Nevertheless, stability does not exclude change, which is indeed necessary for learning and self development. As a source of regularities in social relationships, trust is only created through routinization. Given that routines support the development of identity, the individual attaches to these routines, whether good or bad, regardless of their content (2006, p. 347). Individuals thus accomplish ontological security by routinizing their relations with 'significant others' (2006, p. 342).

It follows that the concept of trust is inextricably linked to the concept of risk although it maintains, to some extent, a stable environment. In the modern world, an individual continually assesses to what extent his/her actions involve risk and whether they can obtain positive results. In the occurrence of unexpected results, trust could cause an insecure environment (Kaspersen, 2000, p. 100). Risk here refers to hazards that are actively assessed in relation to future possibilities (Giddens, 2002, p. 22). Accordingly, the life of an individual is characterized by a dilemma between trust and uncertainty (Kaspersen, 2002, p. 102).

Ontological security lays at the basis of an individual's own identity and certainty about the social and material worlds appearing before him/her. It creates a shield protecting the self from strong anxiety. With a strong ontological security, an individual develops his/her self identity and thus the ability to recognize the others' identities. Moreover, an individual's self identity allows him/her to find answers and models to the problems to be tackled in modern life. If answers and models cannot be found to the existing puzzles, then anxiety will appear (Kaspersen, 2002, p. 103). At this point, with the term 'anxiety' is referred to a threat toward identity, causing a cognitive instability of the individual. On the assumption that an individual cannot find suitable answers to questions regarding acting and being, as argued by Roe (2008, p. 783), he/she will feel him/herself to be ontologically unguarded.

Mitzen (2006, pp. 351-353) contends that *states* also seek ontological security like *individuals*. As a justification for translating this concept from the level of individuals to that of states she offers three arguments. First of all, in IR theory states are commonly seen as seeking physical security, as if they were human beings in need to protect their bodies from harm. The body of state in this case is territory. However, while an animated being's body has parts that are essential for its functioning, like brain and heart, in the case of the state it is not clear which elements are essentials for the functioning of a state. Alternatively, the state's body can be seen as the sum of its members' bodies. In any case, considering the state as an individual has, for Mitzen, a heuristic value because it helps to explain the way states act in world politics.

Secondly, it can be assumed that states seek ontological security because of the need for ontological security of their members. In this respect, she argues that a society needs cognitive stability to secure the identities of individuals, thus fostering their attachment to stable group identities. In fact a critical element for any society is its distinctiveness with

respect to other societies. Such distinctiveness is maintained by routinizing relations with other groups. Such routines support identity coherence and give individuals some ontological security. In other words, by ensuring a sense of group distinctiveness the state protects the ontological security of its members.

Thirdly, considering states as ontological security seekers allows providing a sociological explanation of why different decision-makers, with distinct personalities and orientations, living in different times and conditions, can reproduce the same patterns of behavior. Likewise, most states tend to respect international law, mainly in a routinized or automatic manner, no matter the type or regime, the characteristics of its leader or its position in the balance of power.

Steele (2008, p. 68) also postulates four sets of factors playing an important role in ontological security-seeking behaviors for states: (1) reflexive and material capabilities; (2) crisis assessment; (3) biographical narratives; and (4) discursive framework by co-actors. Although the context in which such factors appear may vary, all states are confronted with these issues in their search for ontological security.

Contrary to what might seem obvious, he points out that states possessing more material capabilities, for example great powers, can in fact be “somewhat imprisoned by their ability to influence more outcomes in international politics”: as such, material capabilities reduce their level of freedom. Moreover, their reflexive capabilities make them aware that even unintended consequences may change in case they act differently, thus increasing anxiety. Less endowed states, instead, can have a higher level of emancipation in that the reduced number of choices available to them because of their lack of material capabilities lowers their level of anxiety and thus, in a sense, increases their freedom of action (Steele, 2008, p. 68).

Crisis assessment, according to Steele (2008, p. 72), refers to the evaluation and construction of events in terms of identity crises during the production and reproduction of identity. In this respect, it is important for actors to succeed in determining the identity costs of implementing or refusing a certain policy. In the modern world, states depend on the information provided by independent agents, such as the media or non-governmental organizations. Moreover, they rely on military intelligence to evaluate the material costs of any possible move. Such material costs entail political costs; hence have the potential to bound state leaders in their policy making.

The biographical narrative is fundamental because it is where agents build up their understandings of social settings and the position of their identities within those settings. Narrative is the kind of discursive consciousness agents utilize in order to give a meaning to their actions. A biographical narrative is composed by four interrelated processes dealing with the actor’s understanding of (1) what provokes or drives events; (2) the meaning of a given event for the actor’s identity; (3) the importance of those events to the actor’s interests; and (4) the policies to be pursued by the state in order to realize those interests. Narration, for Steele (2008, p. 72), is the most important political act of a state because it determines and explains what the state itself is.

The last factor points to the discourse strategies adopted by co-actors (states or other international entities) which can strategically build up the situation in order to force a state to take certain actions. For example, members of the international community can jeopardize the

ontological security of a state by utilizing a *language* constructed so as to remind its past failure. Here states assume that other states will refrain from committing the same mistakes in the future in order to avoid the anxiety produced by their outcomes (Steele, 2008, p. 74).

Like individuals, Steele (2008, p. 10) argues that states as actors in the international system also behave in terms of identity construction. A state's biographical narrative is composed by specific acts of narration connecting a policy with a description of a state "self". Thus, biographical narrative is the starting point to understand the way in which self identity limits and provides for states to perform certain acts instead of others.

The identities of states in the international system are built by state agents through biographical narratives. Such narratives are critical to go beyond the "spatial" level of existence of a state and create a sense of continuity. States have an ontological security since their biographical narratives have been continuously formed by agents in the past, the present and the future (Steele, 2008, p. 10).

Biographical narrative is studied through 'discourse analysis' to explain the meaning of states' acts of narration. Given that actors have to attribute a meaning to their actions in order to ensure consistency with their identities, state agents must explain and justify the meaning of any policy in relation to such identities. Steele (2008, pp. 11-12) posits that discourse analysis has three functions when applied to case studies. Firstly, it explains the way in which actors link a policy alternative to a particular narrative about identity. Secondly, it indicates when ideas about identity lead to a certain policy choices. Thirdly, it reveals how the actors build up meanings not only of their ideas of state identity but also of identity threats.

Clearly, for states physical security is significant; however, comparatively, ontological security is more significant. Steele (2008, pp. 2-3) makes this point because of the following reasons: First of all, with ontological security, it is confirmed that there is such a state in the international system, namely there is a confirmation of state's physical existence. Secondly, ontological security also affirms in which forms state perceives itself and wants to be perceived by others. Thus, the identity of states is built up and preserved by using biographical narrative vitalizing their routinized foreign policy activities. Routines in relations can be interrupted when a state's foreign policy activities reflecting its narrative do not relate any longer to its self perception. In such a case, state will search ways for re-establishing routines, which are compatible with its self identity.

In sum, applying the ontological security approach to state level allows to predict the way in which states with different levels of trust interact. On the one hand, actors having a high level of trust are able to take more rational decisions and to learn from the past while adapting to a changing environment. On the other hand, actors with a low level of trust tend to stick to rigid routines stabilizing their interactions, thus presenting a lesser ability to learn and to express creativity. Moreover, they do not involve in activities aimed at reflexive self-monitoring and updating of their biographical narratives (Krolikowski, 2008, p. 115).

Testing Ontological Security on Japanese State Identity

The end of the Second World War marked a critical turning point in Japanese foreign and security policy. In this sense, as many scholars highlight, in Japan the pre-war and post-war periods were completely different when compared to each other. In the pre-war period, Japan

had followed increasingly militarist and expansionist policies that, at their peak, started to threaten the international system. In the process following Japan's dramatic defeat in the Second World War, Japanese institutions and values, in other words, the political and military system that had taken Japan into war, were reshaped within the framework of the new vision of post-war international order (Pyle, 2007, p. 211).

Having a look at the general picture of the early post-war period, it is seen that Japan's role in the international system is mainly a product of the political order imposed on it by the victors. This order, aimed at demilitarization and democratization, rested on the notion that Japan would not menace again the peace of the world. The pragmatic acceptance of such impositions by ruling Japanese political leaders led the country to a condition of passivity in international politics. This passivity characterizing the early post-war years is ordinarily interpreted as a result of a number of factors, namely wartime trauma, unconditional surrender, nuclear allergy, the restraints imposed by the 1946 constitution and sometimes bureaucratic immobilism.

However, at the end of the 1940s, increasing Cold War tension in Asia Pacific brought about a change in the United States (US) foreign policy toward Japan's future. As a consequence, though being under occupation, Japan was given a crucial importance within the US Cold War strategy for East Asia because of its strategic location and potential role, thus turning into a key ally for the US (Miyashita, 2002, p. 146).

How could Japanese ruling authority respond to this rapidly evolving environment and to the expectations of the US? Doubtlessly, the Cold War would make Japan strategically important; however, on the other side, an early engagement in Cold War politics would construct an image of Japan as a rapidly remilitarized country and defer its economic rehabilitation and the social recovery of Japanese people. Nevertheless, the political authority in Japan thought that it was necessary to guarantee the country's national security and to revitalize its foreign policy capability in an environment characterized by rising tension (Pyle, 2007). In terms of trust, risk and stability triangle, this period can be seen as one of increasing risks and low trust, bringing forth an unstable environment in East Asia. At that time, trust among states was its lowest level, while the occupation of the Korean Peninsula and the breaking out a civil war in the Chinese continent were also jeopardizing stability.

Within this context, the so-called Yoshida Doctrine was a landmark in Japan's post-war foreign policy and security culture. The prime minister's pragmatic strategy was based on three major points: (1) Japan's economic rehabilitation should be the prime national goal. Political and economic cooperation with the US was necessary for this purpose. (2) Japan should remain lightly armed and avoid involvement in international political-strategic issues. (3) To gain a long-term guarantee for its own security, Japan should provide bases for the US army, navy and air forces. Yoshida's pragmatist approach to foreign and security policy had the potential to shake Japan's sense of self for the sake of more practical aim of economic reconstruction (Pyle, 2007, p. 239). As also argued by Pyle (2007, p. 240), his strategical outlook was initially focused on the timeframe necessary to achieve economic recovery. Nevertheless, this practical approach was adopted and embodied in a doctrine by political ruling elites succeeding him.

Reflecting on these facts, it is evident that a multitude of factors contributed to shaping Japan's new posture in world politics. Within this complex framework, Japanese political

leaders tried to construct the meaning of this period for themselves, thus opening the way to a change in Japanese state identity. Looking at these events from the perspective of ontological security, these new arrangements, such as the peace-based constitution of 1946 and the security treaty with the US, contributed to creating a trust mechanism and routinizing relations between the US and Japan, thus starting to provide a more stable environment in the region. This in turn reduced the risk of the rapid emergence of a conflict involving Japan.

In fact, the dramatic defeat suffered in the Second World War and the ensuing events forced Japan to build a new self-image to be projected both at domestic and regional/global level. This new identity rested on two main pillars, namely antimilitarism and a strong focus on economy (Berger, 1998). As a matter of fact, Japan aimed at reassuming a major role in world affairs by revitalizing its economy. Prime Minister Yoshida Shigeru strongly emphasized that a defeated nation could reconstruct itself and become a part of the peace. In other words, the national purpose of Japan, according to him, would be to contribute to the development of a peaceful environment and to abstain from getting involved into any armed conflict (Pyle, p. 227). These antimilitaristic sentiments were later translated into various restraining measures, such as the three non-nuclear principles (that Japan would not possess, manufacture or permit the introduction of nuclear weapons on its territory), and the prohibition on participating in collective defense activities (Miyashita, 2007, p. 104). Also from the 1970s on, despite having become one of the leading global market economies, Japan continued to abstain from policies that could negatively affect the country's growth and to pursue a foreign policy aimed at protecting its economic interests and emphasizing the antimilitarist posture.

However, the credibility of a self image depends on the creation of a boundary between self and other. This boundary creation is an active and ongoing part of identity formation (Neumann, 1996, p. 167). In other words, an actor's identity and values shall be recognized and endorsed by the others. In this sense, the US was doubtlessly a 'significant other' for Japan, one that served as an important counterpart for its identity building process. Other significant counterparts were East Asian countries: if so, how did East Asian countries perceive and respond to this new self image of Japan? This paper argues that, by concentrating on its economic rehabilitation, Japan brought forth a stable cognitive environment and fostered a feeling of security among states in the region. Its newly constructed antimilitarist identity led neighbor countries to progressively reduce their perception of Japan as a threat towards their identities and security. Furthermore, after regaining its economic capacity, Japan tried to foster trust by providing Official Development Assistance (ODA) to states in the region, and especially to China. As such, Japan's ODA supported the achievement of a number of foreign policy objectives and represented, at the same time, a confidence building measure, a solution for bilateral problems, a demonstration of economic power and global leadership and a way to acquire power and influence in different international organizations (Trinidad, 2007, p. 96).

In other words, also at regional level Japan tried to build a trust mechanism that would in turn guarantee stability, both in terms of foreign relations and ontological security. To this end, economic aid was conceived as a way to improve and routinize its relations with neighbor countries. By doing this, it managed to reconstruct a different and coherent self-image and to project it both inside and outside its borders, while maintaining a solid perspective. In fact, Japanese ruling leaders aimed at compensating for military weakness with economic power in order to enlarge the country's field of responsibility. In this sense, by increasing the degree of

influence on neighbor countries, Japan systematically tried to give, in a way, a kind of great power image to the international community.

Nevertheless, assuming the role of a great power implies a number of constraints and risks. In fact, while the alliance with the US and refraining from sharing the security burden at regional level gave Japan a relative security, both ontologically and physically, on the other side, it was bound to limit Japan's aspirations once it had rebuilt a solid economy. Actually, Japan could legitimately aspire to take on a more active role in East Asia given the comparative magnitude of its economic capabilities. In this sense, it could, at least in part, revive its pre-war regional strength. But this would mean taking a considerable responsibility within its area of influence. Such responsibility would in turn increase its level of anxiety, thus having the potential to jeopardize Japan's newly constructed state identity. In fact, in terms of ontological security, to a higher degree of material and reflexive capabilities corresponds a lower degree of freedom. As mentioned above, great powers are expected to actively engage in the international system in order to solve existing problems or to prevent possible ones. However, their vast material capabilities allow for a large number of choices, each possibly implying unwanted results or side effects. So a great power needs also high reflexive capabilities in order to discern, evaluate and choose among the available options. This comes at a high price in terms of ontological security because of the anxiety generated by such a heavy responsibility. On the contrary, choosing to remain a less powerful state as to material capability means being able to exert only a limited influence on other actors and not being expected to make a decisive contribution to the solution of major problems. Such a limited possibility of action contributes to fostering ontological security, as it reduces anxiety and potential threats to state identity. From this point of view, a state possessing less material capabilities can be said to enjoy a higher level of freedom. In the early post-war period, by renouncing to share the security burden in order to give precedence to economic growth, Japan plausibly enjoyed a high degree of freedom. From the 1970's instead, the accelerating pace of its economic involvement at regional level and the assumption of more responsibilities entailed also a limitation of its freedom.

Throughout the Cold War, East Asia was one of the most turbulent areas, characterized by sudden changes and conflicts. Generally speaking, the aim of Japan was to reduce the intensity of the existing security threats in East Asia. To this end, it chose to keep a relatively moderate military capability and a strong relation with the US (Kawasaki, 2001). On the assumption that taking extra security measures would increase risk in the region and bring a serious financial burden on Japan, the alliance with the US can be said to have had a deterrent effect, in that it maintained the probability of military campaign against Japan at a relatively low level. At the same time, it presumably boosted trust and stability in Japan's relations with its neighbor countries, as they could feel assured that Japan's potential military power would be limited within the framework of alliance relations. Conversely, it is generally argued that had Japan chosen to heavily remilitarize and to project a militarist image, an arms race could have ensued, resulting in a huge financial burden on Japan (Kawasaki, 2001). This situation could then both reduce the pace of economic development and create a state of ontological insecurity. As a matter of fact, a sudden remilitarization would cause a lack of coherence within the newly constructed Japanese state identity.

Nevertheless, although Japan maintained an antimilitarist identity, a closer look at actual data relating to Japan's military spending, especially from the 1970s, opens up a different perspective that highlights the existence of a quandary between identity and reality. In spite of

having a defensive posture towards the international community, Japan in fact is not a small country in military terms: actually, it was able to convert itself into a sophisticated military power. Lind (2004, pp. 93-95) strongly argues that analysts undervalue Japanese conventional military capacity because they are misled by just taking into account “defense spending as a percentage of gross domestic product (GDP)”. That around one percent is allotted from Japan’s GDP to its military spending apparently shows that Japan is a small-sized military power. Nevertheless, if a state with a huge economy allocates one percent of its GDP for defense spending it means that this state has a high level military capacity. On the contrary, countries having a relatively small economy with a huge military spending as a percentage of their GDP give the impression of having a high military capacity, while their actual spending is rather limited. In 1987, Japan ranked sixth in terms of actual military spending after the Soviet Union, the US, France, the Federal Republic of Germany and Britain. Thus, it is evident that the level of GDP allotted to military spending only tells part of the story.

This evidence indicates that identity is not necessarily a perfect reflection of reality; state identity building is a process developing within discourse and reflecting itself on biographical narrative. In other words, as individuals adopt different behaviors towards social and material environments to maintain a solid ground for their identity, states also try to maintain a reliable environment through their foreign and security policy discourses. To illustrate, foreign ministries of states play a leading role in identity building by presenting a specific narration connecting a policy with a description of state’s self identity. The aim of foreign and security policy discourse here is to constitute a stable connection between representations of identity and the proposed policy. In particular, in the case of Japan, the state identity building process is marked by major breaking points, by traumatic events that compelled state elites to pursue pragmatic policies and to reshape state identity accordingly. Within this framework, the language used by ruling authorities in order to construct the meaning of events plays a crucial role. At the same time, also the discourses elaborated by other states can strategically build up the situation in order to exert a pressure and compel a state to take certain decisions. To illustrate, after imposing disarmament and offering a security umbrella in the early post-war years, the US gradually pushed Japan toward taking the responsibility of its own security and hence remilitarizing. In particular, the Nixon doctrine developed at the end of the 1960s and urging Japan to share the security burden contributed to the emergence of a contrast between Japanese antimilitarist state identity and pressures coming from the international reality (Litwak, 1986, p. 134). Such pressures were particularly relevant as they came from a strategic ally and “significant other”. Moreover, other external factors were instrumental in bringing pressure to bear on Japan’s self image. For example, the oil crises of the 1970s exposed Japan’s vulnerability as an economic power (Yorke, 1981, pp. 434-435).

As a result, although continuing to preserve an antimilitarist self image, from the 1970s Japan actively sought to expand its military capacity again. This resulted not only in the adoption of the National Defense Program Outline and the creation of the US-Japan Defense Cooperation Subcommittee in 1976, but also in the drafting of the Guidelines for US-Japan Defense Cooperation in 1978. In fact, in parallel with its rapid economic growth, Japan increased its military spending from \$ 4.4 billion to \$ 14 billion between 1975 and 1985. This was possible in spite of the 1% GDP upper limit on military spending that was established by Prime Minister Takeo Miki in 1976 (Moses, 2009, p. 75).

Conclusion

In conclusion, the concept of ontological security can be used to explain some aspects of Japanese foreign and security policy toward East Asia. Japan systematically increased its influence capacity on the region especially by using economic means and emphasizing its antimilitarist posture. This posture allowed it to build up a new self image after the end of the Second World War and to improve its relations with East Asian nations. However, the sharp growth of Japan's influence and power in this area has brought forth some worries about its political consequences. At the same time, taking more responsibility, for example via Official Development Assistance, arguably increased the country's anxiety, thus reducing its ontological security.

All in all, in the period taken into account in this paper, Japan seems to have been able to take rational decisions and to learn from the past, thus transforming its identity and behaviors in order to adapt to a rapidly changing environment. It was able to modify its biographical narrative and routines and to reshape its relations with both the US and East Asian countries according to the new international order in a relatively short time. In this sense, Japan seems to present the peculiar characteristics of a state with a high level of trust.

His research interests are in trade and the environment, and climate policy. He can be reached at: armin_ibitz@mail.wtuc.edu.tw

Abstract:

Addressing global warming requires action from every nation in the world. However, the island nation of Taiwan maintains a unique and delicate political position since it is faced by exclusion from major international organisations, including UN affiliated environmental bodies. For some time, Taiwan ignored the issue of climate change, but under the new administration, efforts are being made to position Taiwan as a responsible climate partner. This study explores the developments and efforts of a non-Kyoto member seeking to upgrade its international profile through the field of climate policy. It not only discusses the domestic difficulties and prospects of unilateral actions, but also includes an international perspective.

Climate Change as a Catalyst for Internationalisation: The non-Kyoto Member Taiwan

Armin Ibitz

Wenzao Ursuline College of Languages, Kaohsiung, Taiwan

Introduction

Climate change has emerged as the agenda-setting issue of the new century. Its scale and trans-boundary nature make it a global matter. However, with so many nations involved in climate negotiations, and so many diverging interests being brought to the negotiation table, it seems to come as no surprise that international climate change policy efforts face severe difficulties. Historically, developed nations have been primarily responsible for the accumulation of greenhouse gases (GHG) in the atmosphere. However, developing and newly industrialising nations have raised increasing international concerns, since their aggregate emissions have already surpassed those of the developed countries, and are increasing rapidly. In order to stabilise atmospheric carbon dioxide emission concentration below 450 ppm by the end of the century, it seems to be inevitable that every nation needs to join global efforts to curb emissions output.

Taiwan's annual 294 million tonnes of CO₂ emissions represent about one percent of the total global emission output. However, due to its difficult political situation, it is denied participation in climate relevant international organisations, such as the United Nations Framework Convention on Climate Change (UNFCCC) or the Kyoto Protocol. Thus, it is also not bound to any carbon reduction targets, allowing the country to take the role of a free-rider and only make minimal efforts in order to avoid sanctions. Nonetheless, Taiwan is attempting to comply with international climate regimes and has increased its climate efforts. The new administration has stepped up its domestic climate mitigation efforts and aims to cut the annual CO₂ emissions to the 2005 levels of 257 million tonnes by 2020 – a remarkable 30 percent cut to the 2020 business-as-usual scenario – and half that by 2050.¹ With such an ambitious target, Taiwan has not only set the most stringent target throughout Asia, but has also

¹ Ralph Jennings, "Taiwan to use Africa as back door for carbon credits", *Reuters*, March 17, 2010, <http://www.reuters.com/article/idUSTRE62G18Y20100317> (accessed March 20, 2010).

received international attention. In the latest Climate Change Performance Index, Taiwan ranks poorly behind India, Indonesia, Thailand, Japan, Singapore and South Korea as 47th among 57 countries.² Surprisingly, in terms of climate policy, it takes 7th place. Furthermore, the government is actively using climate change in order to build up international links and also gain access to carbon reduction schemes.

Studies have focused on explaining why nations join or defect from climate regimes, but little research has been conducted on countries that are willing to contribute to international climate regimes but are limited in doing so. Taiwan represents an interesting case since it faces exclusion from major international climate relevant organisations and regimes but is voluntarily seeking compliance with international climate norms, even though it is not eligible to gain direct benefits in return, as it is also barred from participating in international carbon reduction schemes such as the Clean Development Mechanism (CDM).

This paper seeks to explore what is driving Taiwan's increasing ambitions for compliance with international climate norms. Climate policy might offer new opportunities to re-position the country within the international community. The paper analyses if and to what extent climate change can be seen as a catalyst for increasing international links, and considers how Taiwan's climate initiatives can be evaluated regarding the country's poor historical climate mitigation record.

The paper is divided into six parts. The following section frames the theoretical background of the work and introduces three models to explain a country's environmental policy choices. The third section explores developments in Taiwan's greenhouse gas emissions output and analyses its energy structure. The fourth section illustrates how climate issues have been elevated on the political agenda in Taiwan, and provides a historic account of the establishment of a climate legislation framework. Furthermore, this section provides insights into the domestic climate policy formation process. Section five draws a picture of the foreign policy elements within the climate issue, and part six draws conclusion based on the findings.

The Analytical Framework

Climate change mitigation represents a complex matter to be solved, since it is not only entangled with many policy areas, but also imposes high costs and involves

² Germanwatch, <http://www.germanwatch.org/klima/ccpi.htm> (accessed February 10, 2010).

uncertainties. Stabilisation of the atmospheric greenhouse gas concentration requires strong and concerted efforts from the international community, but efforts often interfere with national interests, such as energy security, national sovereignty and economic development. In order to explain a country's environmental policy choice, scholars have applied different models: the unitary rational actor model, the domestic policy model and the social learning model. Each individual approach sheds light on particular perspectives, but for the most comprehensive depth of understanding of Taiwan's climate policy choices, all three models should be applied simultaneously.

The Unitary Rational Actor model represents an interest-based model where the state is seen as the major actor, and domestic actors, internal policy processes and structures are ignored. International structures lead in certain directions and limit the number of policy options available. The state is assumed to be in full control of its society, ignoring the possibility that domestic sub-actors may have objectives differing from national interests. The state evaluates policy options in terms of costs-benefits-calculations regarding its sets of goals and objectives in order to maximise net national gains. Thus, the state's perception of its vulnerability and abatement costs plays a decisive role in its policy choice.³ Since a country will be reluctant to implement costly climate policies without benefits in return, policy makers may tend to adopt "no-regret" measures.⁴ Since climate policy measures compete with other issues on the political agenda, issue linkage is likely to enhance the probability of implementing new climate policies, as they serve several national targets.

Unlike the URA, the Domestic Policy Model sees the government not as the sole decision-maker, but also includes domestic constituents in the analysis. This model claims that besides national costs-benefits-calculations, the internal domestic distribution of costs and benefits also need to be considered for policy formation. Theoretically, a country's government is authorised to independently make policy decisions. However, with upcoming elections in mind, a government will also take domestic political circumstances into consideration. Climate change mitigation measures impose costs on certain sectors, whereas others gain benefits from cost

Simmons. London: Sage Publications, 2001; Rowlands, Ian, "Explaining National Climate Change Policies," *Global Environmental Change* 5, no. 3 (June 1995): 235-49.

⁴ "no-regret" measures gain benefits even if negative climate change effects do not occur.

reductions. Domestic actors are not primarily concerned with national welfare, but follow subjective goals. A new policy alters the internal distribution of costs and benefits among actors and thus influences their behaviour, and groups with common interests may jointly engage decision makers. Thus, the power and influence of domestic constituents may influence national policy formation. Diverging interests influence a country's climate policy and may even result in the inability of the government to build up a climate policy framework.

The constructivist social learning approach is more concerned about how normative factors shape the decision makers' interests.⁵ Actors engage in policy formation processes with a certain set of information and a will to learn. Policy formation seen as a learning process allows changes in decision makers' interest and preferences during the policy making process, since they are constantly confronted with new information which has an influence on their perception of the matter. Policies develop greatly through learning, and international actors with a high level of relevant competency take on the role of providers of ideas and knowledge. International institutions spread norms across countries that may also influence decision makers' behaviour as well as their perception of interests.⁶

While a change in an actor's behaviour without changing its preferences or re-evaluating its overarching targets will result in policy choices primarily focusing on reactive adaptation measures that satisfy international concerns, real commitment shows deeply rooted changes in policy makers' climate related preferences, ideas and also identities. Thus, if Taiwan has gone through such profound changes, we should be able to trace evidence of it in its policy formation processes.

Emission Development and Energy Structure

In the last decades, Taiwan's economy has undergone a tremendous industrialisation process, resulting in rapidly expanding economic activities accompanied by surging energy demands and rapidly growing greenhouse gas emissions.⁷ Carbon emissions

⁷ Taiwan Environmental Protection Agency, <http://www.epa.gov.tw> (accessed March 1, 2010).

increased by 138 percent over the past 16 years – an increase no other country in the world has experienced. In 2006, the International Energy Agency listed Taiwan 22nd in the world for fuel based carbon dioxide emissions, emitting some 270 million tonnes annually. Thus, the island is responsible for nearly one percent of the global greenhouse gas emissions. However, on a per-capita basis, Taiwan – with about 11 tonnes per person – ranks higher than for example Japan, South Korea and many Western countries. The manufacturing sector has been very important for economic development in Taiwan. Although Taiwan has seen the closure of thousands of carbon emitting factories or their relocation to the mainland, national greenhouse gases have continued to rise. Mounting economic difficulties and rising unemployment over the past few years have influenced climate policy formation, since the largest carbon intensive sectors – petrochemical, textile, steel, cement, electrical engineering and paper, employ about half a million workers and account for about one third of the manufacturing sector’s revenue. In Taiwan, about 70 percent of its GHG emissions stem from state owned enterprises. The three largest state companies alone – China Petroleum, Taipower, and China Steel – account for 30 percent of the carbon emissions. Thus, climate mitigation measures must be developed in a way that finds acceptance among state companies.

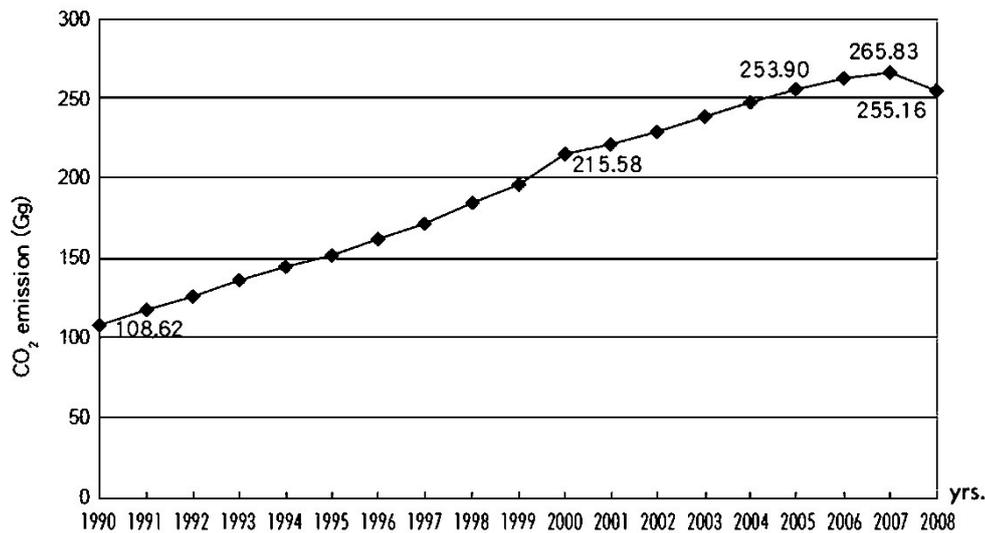

Figure 1: Taiwan’s CO2 emission from fossil fuel combustion (Taiwan Environmental Protection Agency)

The production of greenhouse gases is closely linked to energy issues, and Taiwan’s energy mix is heavily based on fossil fuels. Energy productivity in terms of GDP and energy usage is lower than in industrialised economies, thus Taiwan needs more energy for its economic growth. The industry takes the largest share of the total

energy consumption. Currently, the island imports about 99 percent of its energy needs and this makes the country vulnerable to changes in the world energy market. However, weak economic incentives are responsible for the slow development of alternatives. The energy market has been largely liberalised, but state enterprises still dominate the market by providing about 70 percent of the total supply. All of the previous administrations focused on keeping energy prices low. Although efforts have been made to phase out subsidies on electricity and oil, Taiwan still has very low energy prices compared with other countries in the region, and this represents a serious obstacle for the development of renewable energy sources.⁸ Costs for developing renewable energy as well as energy efficiency measures are higher in Taiwan, since it is not a member of international organisations that could help to lower transaction costs.⁹

Vulnerability and Abatement Costs

Taiwan is one of the leading climate victims for several reasons. By the time low-lying islands are submerged due to rising sea levels, parts of Taiwan will be underwater, including regions with major industrial facilities. Already now, the fishing industry is suffering from the relocation of fishing grounds which is increasingly leading to conflicts with neighbouring countries. Records have shown that the annual mean temperature on the island has risen by 1.4 degrees Celsius over the past century, and the island is increasingly confronted with weather extremes, water shortages and flooding.¹⁰ Only since typhoon Morakot hit the island in August 2009, causing severe damage in central and southern parts, has global warming started to attract public attention.

Climate change mitigation costs are high, as Taiwan lacks major domestic natural resources, and the industrial sector contributes the largest part to the national income. Moreover, the lack of comprehensive carbon reduction legislation has prevented substantial domestic and foreign investment in the island's green industries. As a consequence, domestic carbon mitigation measures are more costly than in other

countries.¹¹ Implementing strict domestic climate change mitigation measures is thus believed to negatively affect Taiwan's international competitiveness and also its overall national emission reductions.¹²

Climate Change on the Political Agenda

Internationally, climate change concerns were elevated to the global political arena following the UN Earth Summit in Rio de Janeiro in 1992, where the UNFCCC was adopted. While 154 countries signed the framework which went into force in 1994, Taiwan – due to its political status – was not able to join the convention. Nonetheless, Taiwan's President Lee Teng-hui articulated his willingness to comply with the climate convention. However, as history proved, Taiwan was neither able nor willing to take a proactive position in international climate negotiations.

In 1997, the Executive Yuan (the Cabinet) formed the National Sustainable Development Council as the responsible body for the evaluation and coordination of sustainable development strategies. The council is composed of ministers, but also includes representatives from academia and from non-governmental organisations (NGOs).

Responding to the formation of the Kyoto Protocol, Taiwan organised its First National Energy Conference in 1998, aiming to promote the development of renewable energy sources, review national energy and industrial policies and establish a greenhouse gas emissions reduction programme. Although Taiwan has been promoting alternative energy resources since the 1990s, domestic capacities have never reached significant levels. When President Chen Shui-bian took office in 2000, he vowed to transform Taiwan into a *Green Silicon Island* and to provide renewed support for the Kyoto Protocol. In 2000, the Environmental Protection Agency (EPA) drafted the Greenhouse Gas Control Act aiming at reducing emission levels, and in 2002, the Development Program of Renewable Energy Sources was adopted. Financial mechanisms were included to support the installation of wind or solar energy facilities. However, overall domestic climate mitigation measures were insufficient to reduce greenhouse gas emissions and, contrary to international

¹² Tser-yieth Chen, “The impact of mitigating CO2 emissions on Taiwan's economy,” *Energy Economics* 23, no. 2, (March 2001): 141-51.

developments, domestically, the climate drive lost its momentum. Climate policy remained a low-profile matter until Russia's ratification in 2004 initiated the Kyoto Protocol implementation process. The Cabinet established the supra-ministerial Climate Change and Kyoto Protocol Response Task Force to evaluate responding strategies, involving the EPA, the Ministry of Economic Affairs, the Council for Economic Planning and Development, as well as the National Science Council. The climate change issue returned to the island's political agenda when President Chen reiterated Taiwan's willingness to comply with the climate agreement. In 2005, the draft of the *Renewable Energy Act* passed the Executive Yuan, and the Chen administration called the Second National Energy Conference in order to formulate strategies responding to the mandatory reduction targets set under the Kyoto Protocol. However, the conference failed to reach a consensus on a national reduction goal. In 2006, the Ministry of Economic Affairs established the Taiwan Industrial Greenhouse Office to coordinate industrial GHGs' management, promote industrial emissions reduction and develop low-energy but high value-added industries. The EPA accelerated its efforts in drafting *The Greenhouse Gas Reduction Act*, which should serve as the legal foundation for the implementation and enforcement of domestic emission reduction measures. In February 2006, the EPA submitted the *Greenhouse Gas Reduction Act* to the Executive Yuan for review. The National Sustainable Development Conference which was held in April illustrated once again economic interests prevailing over environmental concerns. As a result, the draft bill submitted to the Legislative Yuan for deliberation in September 2006 did not include any reduction targets. While the Legislative Yuan completed the review in May 2007, the term of the legislators ended and the act had to be resubmitted by the new legislators. According to the Act, emission cuts would be enabled in three stages: voluntary reduction by the industry sector, enhancing efficiency standards and establishing a cap-and-trade scheme.¹³ The bill has drawn attention from the domestic industry sector since the EPA planned to include mandatory carbon emission reductions, and also a carbon tax was considered. The industry sector expressed its strong concerns, mobilised against the bill and as a consequence, those ministerial bodies closely involved with the economy also opposed the bill. The position of the EPA is too weak to withstand pressure from the industrial sector, the Ministry of Economic Affairs and also the Council for Economic Planning and Development. As a result, the deliberation of the Act has been delayed.

¹³ However, there is no clear schedule for the implementation.

Figure 2: Taiwan’s Step-Wise Emissions Reduction Strategy (Taiwan Environmental Protection Agency)

After President Ma Ying-jeou took office in 2008, the new administration has introduced *Guidelines for Sustainable Energy Policy* in order to renew impetus on the climate front and to re-orientate the national energy policy. On World Environment Day 2008, the EPA initiated the *Citizens’ No-Regret Carbon Reduction Action Plan* promoting ten steps for everybody to curb emission output and raise public awareness of energy conservation and carbon reduction. In addition, the government increased efforts to promulgate climate relevant regulations, such as the GHG Reduction Law, the Act for Renewable Energy, the Act for Energy Tax, and the Energy Management Act.

The Industry Involvement

The industrial sector has expressed its strong concerns about stringent GHG legislation including carbon reduction goals and suggested that incentives to encourage reduction through voluntary agreements should be extended. In recent years, some industry sectors have responded to governmental climate protection efforts, for instance the IT sector. In 2004 and 2005, the EPA was able to sign Memoranda of Understanding with Taiwan’s TFT-LCD Association and the Taiwan Semiconductor Industry Association for PFC emission cuts, resulting in the reduction of 38 million tonnes of CO₂e.¹⁴ Since many internationally operating high-tech suppliers are embedded in global supply chains, they are already confronted with the disclosure of information on emission levels. Thus, certain sectors are more

¹⁴ “Taiwan’s chip industry sign pact to cut PFCs emission,” *Taiwan Economic News*, July 26, 2005, http://news.cens.com/cens/html/en/news/news_inner_9703.html (accessed November 12, 2009).

responsive to stringent domestic climate measures than others. However, since Taiwanese companies are not eligible to obtain carbon credits for their reduction measures, such companies would gain benefits from increased international climate cooperation. These enterprises could play an important role in the build-up of a national climate framework.

In order to widen participation in voluntary reduction measures, a National Greenhouse Gas Registry was established by the EPA in 2007, where domestic entities can report their emission inventories and receive assistance for creating an inventory. As of December 2009, 192 entities from the power, cement, steel and iron, paper, petrochemical, and semiconductor sector reported their emissions, covering over 70 percent of the aggregate emissions. However, the divide between economy and environment could not be completely bridged.

The Non-government Sector

Environmental non-government organisations (ENGOS), such as the Taiwan Environmental Protection Union and the Taiwan Environmental Action Network, are actively involved in the climate change issue. Not only are they urging the government to set clear carbon reduction targets, but they have also established an important link to the international arena. Through their participation at international conferences on climate change, they have been able to represent the country and also improve knowledge transfer. Up to now, the influence of ENGOS on domestic decision makers on the climate issue has been limited. Nevertheless, a group of 33 environmental groups has urged President Ma to call a national convention on climate change and impose energy taxes and cut income tax to stimulate green sectors.

Improving International Visibility

For Taiwan, the climate issue involves important foreign policy elements. Since Taiwan is not part of the UN, it is not eligible to join the UNFCCC or the Kyoto Protocol. It can thus only participate in the Conferences of Parties (COP) as an observer and, up to now, the EPA has represented Taiwan in the status of an NGO. However, the delegation is only able to address the parties during the plenary meetings, and has no right to vote.

Under President Ma's "flexible diplomacy" initiative, ties between Taipei and Beijing have relaxed tremendously. With a softer approach, Ma is seeking to avoid China's

objection to Taiwan joining relevant UN sub-organisations in the fields of health, the environment and climate issues. The change in strategy has proven to be successful, with Taipei obtaining observer status at the World Health Association in 2009. Thus, Taiwan has new hope that it might be able to expand its participation in international organisations, including the UNFCCC, the World Meteorological Organization and the International Civil Aviation Organization. A recent resolution passed by the European Parliament in support of Taiwan's participation in the UN International Civil Aviation Organization and the UNFCCC can be attributed to this new diplomatic approach.¹⁵

However, already in the past, Taipei has shown its commitment to taking on responsibilities within the international community. The government has specifically focused on the field of environmental protection. For instance, Taiwan adheres to the *Vienna Convention for the Protection of the Ozone Layer* and the *Montreal Protocol on Substances That Deplete the Ozone Layer*, the *Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and Their Disposal* and the *Stockholm Convention on Persistent Organic Pollutants*. Even though Taiwan is not a signatory country, experiences with international conventions have shown that compliance is in Taiwan's best interest in order to avoid international sanctions. Although no country has applied carbon duties on imports from nations without a carbon reduction strategy, calls for such measures do exist within the European Union.

However, complying with international climate regimes not only ensures that Taiwan's export products can retain market access in developed nations, but also serves foreign policy ambitions. Taipei currently maintains official ties with 23 countries. Among them are six Pacific Island States¹⁶, which are directly affected by rising sea levels. Furthermore, some of its African allies¹⁷ are also threatened by global warming.¹⁸ Since the promotion of strategies to fight global warming will strengthen these ties, Taiwan vows to provide climate related assistance to its allies. Taipei aims to engage in international carbon trading by supporting its ally countries

in Africa and the Asia Pacific to develop clean energy projects.¹⁹ On President Ma's recent trip to the South Pacific, climate change was one of the top issues on the agenda. Some allies have already pledged their support for Taipei to join the international climate regime. Furthermore, international cooperation opens new opportunities for more cost-effective carbon reduction measures. Taiwan is also attempting to engage its allies in providing assistance for Taiwan to join international carbon emission trading mechanisms.

Clean Development Mechanisms

The Asia and Pacific region is the heartland of CDM projects, hosting about 75 percent of all registered projects. Countries in the region are engaged in developing CDM projects to sell carbon emission reduction credits (CERs). As of March 2010, there were 752 projects registered in China, 43 in Indonesia, 40 in the Philippines, 20 in Vietnam and 36 in South Korea.²⁰ However, Taiwanese enterprises are barred from participating in CDM activities, unless they have branches in signatory countries of the Convention, and Taiwan is not be eligible for the credits gained from such emission reductions. In recent attempts, Taipei has been seeking international partnerships among its diplomatic allies to obtain carbon credits for Taiwanese emitters by promoting green technology, including solar energy and bio-fuel power plants. The acquired CERs can then be used to offset emissions. There are also plans to open a climate registry with Germany in order to facilitate access to international carbon trading mechanisms.²¹ Through international cooperation, Taiwan hopes to meet its targets while supporting ally partners to cut carbon emissions with clean development.

Conclusion

This study reveals some interesting insights into Taiwan's climate policy setting. First, the government is still reluctant to impose carbon reduction costs on its major emitters, indicated by its preference for no-regret measures and voluntary reduction agreements.

Economic interests prevailing over environmental concerns suggests that there has been no substantial change in the overarching governmental development goal.

Second, unlike in European countries where climate initiatives are backed by its people, environmental groups and to some extent business actors, Taiwan's government faces massive obstacles in the domestic arena to building up a strong climate framework. As a consequence, climate policy follows a rather centralised top-down approach, mainly focusing on securing economic interests. Non-governmental actors are involved, but their influence on policy making is limited. The long debate about the inclusion of carbon reduction targets illustrates the big divide between economic and environmental concerns. Nonetheless, there are fragile signs of growing climate change awareness and increasing receptiveness of climate policy measures by industrial actors. However, low levels of climate awareness not only distort risk assessment but also constrain the unveiling of new opportunities. By 2020, clean energy will be one of the largest global industries. Since Taiwan has a technologically advanced economic base, it could gain benefits from the exploration of new technology markets. The government plans to create a climate friendly industry for the export of green technology, and substantially increase the production value of low-carbon industries, estimated to contribute about 6 percent to the total production value of the manufacturing industry.²² In 2009, Taiwan invested about 1 percent of its GDP in green technology.²³ This green sector would create some 110,000 jobs.²⁴ However, up to now, the potential is mainly untapped.

Third, although all former administrations stated their willingness to comply with the international climate regime, the policy outcomes were disappointing. While pre-Kyoto climate policy proved to be mere lip-service, the implementation of the Kyoto protocol triggered responses in Taiwan, but since it was only affected indirectly, climate change policies primarily aimed to avoid potential trade sanctions. Due to its difficult international political situation, Taipei mainly focused on developing national mitigation policies, with limited success, however, as absolute emission volume continued to rise rapidly until 2008. Recently, the Ma administration has expressed its

willingness to take carbon reduction seriously. However, it is still struggling to enact the legal foundation needed for implementing and enforcing mandatory reduction mechanisms. Without support from the private sector and the public, his ambitious reduction targets seem to be unobtainable. It is also yet to be seen whether the administration is committed enough to take action that might inflict short term welfare losses, despite the fact that a stringent climate policy framework would improve the international competitiveness of its industry and ensure access to developed nations' markets in the long run.

Fourth, climate change involves major foreign policy elements. The ambitious goal setting and increased climate protection efforts are part of the current administration's attempts to engage the international community and raise Taiwan's international profile as a responsible partner. This may lead to new cooperation and international exchanges, as the newly established channels for climate change cooperation between the EU and Taiwan has shown.²⁵ Taiwan hopes to be rewarded with increased international recognition and expanded participation in relevant climate organisations such as the UNFCCC. Since climate policy may also serve foreign policy goals, it may be supportive to domestic groups in favour of a rigid climate framework. Taipei seems to be standing at a crossroads, since internationally it is endeavouring to explore new opportunities by creating new international linkages, but domestically it is facing severe obstacles. As of now, Taiwan is not yet at the forefront of the climate change mitigation race, but important steps have been taken in the right direction. Only if Taiwan can overcome its domestic obstacles and escape from its dilemma of previous climate shortcomings will it be able to position itself as a proactive member of the international arena. Hopefully, Taiwan will soon emerge as an innovative participant and driver of international climate policy efforts.

What Makes You Happy? A Further Analysis on the Happiness Indicators of Malaysian and Indonesian Adults

Jas Laile Suzana Jaafar, Khairudin Che Tak, Yogi Suprayogi Sugandi

Abstract

Although there have been many studies investigating the happiness indicators in Western countries, relatively little is known about it in the Eastern societies. To determine what makes Malaysian and Indonesian adults happy, 40 respondents were interviewed. Qualitative analyses were conducted and the results indicated that, as predicted, the welfare of groups, especially family, takes precedence over personal achievements. The implications of the results are then discussed.

Introduction

The concept of happiness has been given a lot of attention since the beginning of the 20th century when psychologists realised there were more aspects to life than the negative aspects of behaviour such as mental illness, depression, and stress.

What is happiness or subjective well-being? There are many terms and definitions used by many psychologists, sociologists and economists but the most general definition is that it is an internal experience of a positive state of mind which can be induced through various means (Lu and Shih, 1997).

Among issues studied by psychologists is what constitutes happiness? So far, the majority of the studies which address happiness have been conducted in Western individualistic countries. In the east, there have been studies on the happiness of the Koreans (Kim, Kim, Cha, & Lim, 2007; Lee, Park, Uhleman, & Patsula, 1999), the quality of life and happiness of the Japanese (Inoguchi & Fujii, 2009; Kan, Karasawa, & Kitayama, 2009; Kitayama, Markus, & Kurokawa, 2000; Uchida & Kitayama, 2009), the happiness of high school students in Taiwan (Su & Lu, 2009), subjective well-being of migrants and older adults in China (Cheng & Chan, 2005; Knight & Gunatilaka, 2009; Ku, Fox & McKenna, 2008; Lam & Boey, 2005; Monk-Turner & Turner, 2009), the quality of life and life satisfaction of the Chinese in Hong Kong (Cheung & Leung, 2002; Sing, 2009; Wan & Lau, 2004), the quality of life in Singapore (Tambyah, Tan & Kau, 2009), the personal well-being of Thais (Ingersoll-Dayton, Saengtienchai, Kespichayawattana & Aunguroch, 2004; Yiengprugsawan, Seubsman, Khamman, Lim & Sleight, 2009), happiness of the Turks (Eryilmaz, 2010), and the Pakistanis (Suhail & Chaudhry, 2004). An impressive study was done by Lu and Shih (1997) on the sources of happiness and the study has been cited ever since. Obviously, all these studies show that there are some distinctive features of the happiness of the Eastern people (see also Nakamura, 1985). The people in the East usually belong to a collectivistic society. Apparently, collectivistic values have some significant influence on the things that makes them happy. In other words, the concept and definition of happiness have, up to this point, been based on a Western ideal that places great emphasis on individualism and liberalism which is in contrast to collectivistic cultures that place importance on a harmonious relationship with other members of the society (Lu & Gilmour, 2006; Lu & Shih, 1997). In collectivistic Confucian-based cultures and societies such as the Koreans, the Chinese and the Japanese, moderation rather than extremism is held in greater esteem. In other words, extreme happiness and satisfaction are not considered ideal in such collectivistic societies (Lu et al., 2001). Therefore, it remains to be seen whether the well-established concept of happiness of the Western societies are observed in the Eastern societies or do the Eastern societies do have some distinctive contributing factors of happiness.

In Malaysia and Indonesia, the number of studies on happiness is growing gradually but still only a small number is available. In Malaysia, Husain (2006) studied the happiness in marriages and Haslina (2010) conducted research on the relationship between personality and subjective well-being. Other studies include those on the well-being and the happiness of women (Ba'yah & Kamsiah, 2002, Noraini, 1999), the subjective well-being of the aged (Asnarulkhadi, 2006), the life satisfaction of the aborigines (Howell, Howell & Schwabe,

2006), the relationship between life satisfaction and general health (Swami et al., 2007), and more recently, the happiness of the Malaysians and Indonesians (Jaafar, Muhamad, Che Tak, Afiatin & Sugandi, 2009). Likewise in Indonesia, there are studies on the quality of life of the aged in Indonesia (Lamb, 1996; Wada et al., 2005), successful aging (Lamb & Myers, 1999), the relationship between gender and well-being (Ofstedal, Reidy, & Knodel, 2004) and the life satisfaction of adolescents in Indonesia (Diponegoro, 2004).

Not only that happiness of the Eastern societies are underrepresented, but the studies from this side of the world are also substantially on the Chinese, but some of them are also economically and management-based. Therefore, it would seem that the limitation of the current literature highlights the necessity of documenting the meaning of happiness in Eastern cultures which, in fact, comprise not only the Chinese but also the Vietnamese, Cambodian, Thai, the Philippines, Malaysians and Indonesians. There have been little or no studies have been done on the happiness of the Malaysians and Indonesians. Jaafar et al. (2009) found that the happiness of the Malaysians and Indonesians are based on group welfare. In our first study, the respondents were asked in a questionnaire to write the things that make them happy. One of the limitations of using a questionnaire is that it only gives little input on the aspects investigated.

Therefore, this present study attempts to go further by investigating the meaning of happiness of Malaysians and Indonesians. Specifically, our aim is to interview the respondents and examine deeper the things that make them happy. It is predicted that by using a qualitative method, the answers elicited from the respondents will be more profound. In 2009, it was found that Malaysians and Indonesians are generally happy and they interpret their happiness according to the collectivistic values and norms. Will these values be reflected again in an in-depth study?

Method

Respondents

Forty adults (20 Malaysians and 20 Indonesians; 20 males and 20 females), ranging from 21 to 66 years old, in Kuala Lumpur and Bandung respectively, were interviewed. They answered up to three questions voluntarily. Convenience sampling was used.

Measures and Procedures

Interviews were conducted at a convenience place for the respondents and no time limit is set. Three questions were asked, viz., “What makes you happy?”, “What do you need to make you happier?”, and “What are the characteristics of happy people?”. The responses were recorded and immediately transcribed.

Analysis

The data were transcribed and classified into meaningful categories. In other words, the data were sifted through to examine the significant statements which indicate the contributing factors of happiness.

Results and Discussion

We found that there are 12 themes in the sources of happiness for Malaysians but, only 10 themes in the Indonesians.

The Malaysians' sources of happiness are as follows:

1. Family

Example: "My family makes me happy"; "My children make me happy" ; "I'm happy watching my children growing up"

2. Health

Example: "I'm happy if I'm healthy"

3. Achievement at work

Example: "If my business is good, then I'm happy"

4. Absence of negative feelings

Example: "I'm happy when I'm not depressed or when I'm joyful"

5. Religion

Example: "Respect one's religion"

6. Education

Example: "Schools are easily available; there are many universities"

7. Harmonious interpersonal relationships

Example: "Having good relationships with all people from all walks of life"

8. National prosperity

Example: "It is a peaceful country"

9. Self autonomy and self actualisation

Example: "Achieving the goals in my life"

10. Wealth

Example: "If I have more money, I would be happy; I can do a lot of things with it"

11. Leisure activities

Example: "Going on holidays with my family"

12. Basic needs

Example: "I have enough to eat and drink"

The themes for the Indonesians are as follows:

1. Family

Example: "I'm happy when I'm with my family"

2. Harmonious interpersonal relationships

Example: "I'm happy with people whom I love and when nobody hurts me"

3. Health

Example: "I am happy when I'm healthy"

4. Free from negative feelings

Example: "I'm not depressed, I'm not alone and always happy"

5. Wealth

Example: "I'm happy when I have more money"

6. Self autonomy and self actualisation

Example: "Getting or achieving what I wish for"

7. Achievement at work

Example: "I'm successful in my career"

8. Education

Example: "I'm able to further my studies"

9. Religion

Example: "I'm happy being a Muslim"

10. Basic needs

Example: "I will be happy when I am able to fulfil my family basic needs, especially when my children are ill"

What are the similarities and differences between the things that make the Malaysians and Indonesians happy? Basically, they are the same except that the Indonesians do not consider national prosperity and recreation as their sources of happiness. It is possible that in a

developing nation of 226 million, there are other things which make them happy. In other words, these findings may have some connection with economic factors. According to the Gross National Income (GNI) report issued by the World Bank in 2006, Indonesia falls in the lower middle income (\$906—\$3,595) category while Malaysia is in the upper high income (\$3,596—\$11,115) bracket. The per capita income of Malaysia is \$11,300 whereas the per capita income of Indonesia is \$3,950 (<http://siteresources.worldbank.org>). Family, basic needs, achievement at work and the other factors have to be met first while national prosperity and recreation remain secondary. This may also explain why although wealth is important, it is on the lowest rank of the happiness indicators (Jaafar et al., 2009).

Apart from the two indicators above, both societies believe there are 10 things that make them happy. They are family, intergroup relationships, health, career or professional achievement, absence of negative feelings, religion, education, self-actualisation, wealth and basic needs. As with past studies on other Eastern societies, these findings demonstrate that the Malaysian and Indonesian societies which are collectivistic naturally uphold collectivistic values which put family and group welfare first. Earlier research has shown that happiness in Eastern societies is based on six dimensions, viz., relationships with other individuals, respect toward others, financial status, work achievements, less emphasis on social status but maintaining harmony (Lu et al., 2001), harmony and stability in life (Lee et al., 2001), wish to be respected, harmonious interpersonal relationships, career achievements, an easier life, *schadenfreude*, self-control and self-actualisation, positive feelings, joy and health (Lu & Shih, 1997), relationships with children, relationships with parents and siblings, marital relationship, life goals, relationships with others, finances, health, positive attitude, self-efficacy, self-acceptance, autonomy, self-growth, freedom and recreation, social status, kindness, appearance, social environment and relationships with loved ones. Similarly, Santos (2008) found 12 sources of happiness for the Filipinos, that is, family, friends, achievements, recreation and travelling, material possessions, emotional well-being, religion, good physical health, culture, peace and prosperity, pets and sexuality. Therefore, the present study findings are somewhat parallel with past studies on the Eastern society's happiness indicators.

What are the main themes in all the studies? All of them put family (children, husband, and wife, relatives) and harmonious relationships with others as first and foremost. The main difference in all these studies is that some researchers classify some aspects together under the same themes while others do not. For example, Lu and Shih (1997) categorise family under harmonious interrelationships. Lu and Shih do not have religion (which is a unique component in the Muslim and the Filipino Catholic societies) but discuss their findings according to Confucianism. However, one must understand that Confucianism is a philosophy of life of the Chinese.

What do all these tell us? Obviously, Eastern societies have some similarities with the Western societies in which both put great importance on families but at the same time both societies are different where interrelationships and group welfare are concerned. It seems that the people in the East believe more than the West do that these two factors determine their happiness. The results here (and in other studies mentioned earlier) have only one “individualistic” indicator of happiness which is self-actualisation. Even when the respondents mentioned achievement at work, this was mentioned within the context of the family; the individual hopes to be a success in his career for his family.

Are the present study findings more profound than those of the earlier study (Jaafar et al., 2009)? It seems that both studies reveal the same themes or indicators which includes family, social relationships, health, wealth, education, religion, basic needs, national safety, self-autonomy, emotional well-being, achievement at work, and recreation needs. However, when the data are closely examined, vital details of the indicators are provided in the present study. The respondents provide elaborate details of their happiness sources. For example,

“I’m happy looking at my children growing up. Watching them playing...
when they are successful in their lives, I’m happy.”

Male, 46 years old, Malaysian

“I’m happy when my family is happy; my children listen to what I say:
my children are successful at school, get excellent results in their exams”

Female, 50 years old, Malaysian

“I’m happy when my kids complete their studies at the universities; my family is healthy,
we can get by in our lives financially, God willing, and have long lives”

Male, 54 years old, Indonesian

“I’m happy if I can make my parents happy. To make my parents happy
is my wish now and in the future. Apart from that, I wish I can get a
good job, be successful in life and in marriage too.”

Female, 23 years old, Indonesian

Conclusion

The findings from the present study highlight the importance of considering people’s happiness within their own context. In this case, a collectivistic society emphasises some

distinctive values. The Western society's concept of happiness cannot be generalized totally onto other societies. Perhaps in the future, when these distinctive values are taken into consideration, a comprehensive method which will pick up all these treasured values can be formulated.

Malaysians and Indonesians have some similarities and differences where happiness indicators are concerned. Both societies also have a few distinctive values which separate them from the Chinese, Koreans and Japanese.

The present paper is an interim report of a bigger study which attempts to understand the happiness of the Malaysians and Indonesians.

“Imported Animal-Human Relationships in Japan: The sustainability of Friend and Food”

Paul Hansen

University of London (SOAS) and Japan’s National Museum of Ethnology (Minpaku)

Introduction

My doctoral research focused on industrial dairy farming in the north-central Tokachi region of Hokkaido, Japan. Staying true to classic notions of participant observation in anthropology, I worked for one year as a full-time employee on an industrial farm and then continued research in more bookish environs while based at Hokkaido University for an additional eight months. The original focus was on the lives of young dairy farmers (aged 18-35); locals, *furiita*- (free-timers), and foreign workers such as the growing number of Chinese, officially labelled ‘trainees’ but who are, in fact, exploited migrant labourers (Hansen 2010). What soon became clear in working on a dairy farm however was that the historical relationship in Hokkaido between bovine and human was an interesting and, as of yet, understudied one.

Currently, I am researching a topic that stemmed from these doctoral interests while based at Japan’s National Museum of Ethnology (Minpaku). The focus is on canine and human relationships in the Osaka area (2009-2010). This research also entails a great deal of participant observation; walking dogs, interviewing owners or pet store workers, and so on. And, while there is research in this area in Japanese, it would seem that the work of historian Arron Skabelund stands alone in Anglophone scholarship on the topic of modern domestic dog and human relationships in Japan (2005; 2009).

Japan’s modern relationship to both dairy cattle and pet dogs was, and continues to be, heavily influenced by ‘the West’ - notably America in the first instance and Europe in the latter. There are interesting and intersecting elements in both of these Japanese fieldwork areas and the following paper addresses some of these issues; not exhaustively, but more as an opening to research projects that are essentially still works in progress. I discuss the movement of cattle away from their mid-modern symbiotic and spatial nearness to humans and the movement of dogs from being distant, often distained, creatures in the mid-modern period to today sharing human foods, lives, and slowly but surely, graveyards with their ‘companion’ humans.

The outline for this paper is as follows: First, in historical terms, I address how relationships between humans, dogs, and cattle have changed. Second, in philosophical terms I address what these relationships mean and question if such meanings are shifting. And finally, in practical terms, I address how can or should these relationships be managed. Obviously perhaps, one cannot look at the entire history of these relationships in such a brief paper, thus I will start from the beginning of the Meiji Period (1868-1912) with an eye towards today. Thus the lion’s share of data is used to examine contemporary relationships. I will conclude the paper with questions regarding the shared future of humans and animals.

The (De)rangement of Hokkaido Dairy

The current popular image of Hokkaido dairy farming is pastoral and nostalgic. Tokachi tourist pamphlets have statements like... '*gaikoku ni kitamitai to omoudarou*' (you will think you came to a foreign country) as found in the *2006 tokachi de asobu: kurukuru hando bukku* (Have fun in Tokachi: a Tourist Handbook). Thus, the nostalgia in Hokkaido is interesting in that it often demarks Hokkaido as something 'not quite' Japanese; as a location that looks like pastoral Europe or North America. This history has been recently covered for the first time in English by Ann Irish (2009). From a historical perspective Hokkaido's colonisation is much like North America's, but I am going to avoid that controversial topic in what follows (Siddle 1996; Walker 2001).

The key point here is that dairy cattle were essential for *tondenhei* (samurai settlers) and *kaitakusha* (pioneers) to survive in Hokkaido. Tokachi is a region where in the early 20th Century rice would not grow, temperatures would frequently plunge below minus twenty degrees Celsius, and snow could cover the ground six months of the year. In such a climate, cattle could not survive without winter feed and settlers survived off a diet of milk, meat, and tuber vegetables such as potatoes, not rice and fish as the popular Japanese diet is imagined. Cattle worked in a variety of roles for humans, but generally in Hokkaido, and unlike on the Japanese mainland of Honshu, they were not used as traction. Horses were used for that purpose. Yet dairy cattle proved essential to the 'opening' of Hokkaido; they provided milk, their male offspring provided meat, their excrement provided fertiliser, and their bodies provided heat. Thus, the bovine and human relationship was more or less mutually dependant. Cows were treated like valued family members. And, often a single cow with a name lived near a family. Or a few cows lived in a human settlement like that of Yoda Benzo in the late 1800s on the southern shores of Tokachi. In Some cases livestock were offered funerary monuments and services upon their deaths.

In contemporary Hokkaido farmers are popularly depicted as parent-like in their care for cattle as this early modern image of cow and human relations still persists. Such images are carefully promoted in rural areas like Tokachi, where one can find advertisements playing off of these Meiji era themes of nature, purity, and communal animal-human bonds. Farms are shown in a pastoral and idyllic light; with verdant pasture, wood fences, rolling hills, and in the distance a time worn barn and farmer waiting patiently for milking time. Cartoons (*anime*) are everywhere in Japan and in rural areas popular depictions of animality are common; cartoon cows are shown as almost human, they are co-operative with smiling faces, happy to be milked.

While such images of pastoral nostalgia are used in the promotion of milk products and the promotion of areas such as rural Hokkaido, the actual contemporary production of milk is a very different story. Tokachi dairy farms no longer house one or two cows, as was the case during the Meiji era and the *kaitakusya* or *tondenhei* period, nor even the average of 40 cows a few decades ago (MAFF 2005). The farm I worked on had a milking herd of 1700 plus cattle with 30 full-time employees; a massive operation by any standard and far from a mixed family farm.

Modern dairy farming methods were introduced by 'the west' (Hansen 2006), and similarly today Japan is rapidly developing mega farm mono-culture industrialisation similar to that found

in Europe (Holloway 2001, 2003, 2005, 2007; Grasseni 2005, 2007) and North America (Grandin 2009; Harper 2001; Maclachlan 2001). This is rapidly changing the way humans relate to cattle, other forms of wildlife, and to the production of food (Pawlick 2006; Pollan 2006). On a modern rotary parlour dairy farm the notion of symbiosis is nearly gone. It has been replaced with a model of rational management. Much in the way that Foucault describes Jeremy Bentham's panopticon prison design, bovine bodies are progressively seen as docile equipment (Foucault 1977). Cattle are viewed as parts of a machine, often a rotary parlour capable of milking sixty cattle simultaneously. They are working components that can be manipulated, through Artificial insemination I and genomic technologies, repaired through feed, supplements, and antibiotics, and finally replaced. While the average life of a cow in pasture is twenty years, cattle in an industrial dairy regimen seldom live beyond six years of age.

In short, *we*, 'West' and progressively 'East', have distanced ourselves from cattle. Not just in Tokachi or Japan, but progressively in the 'developed' world. What was once part of our family, part of our home, part of our diet, part of or means of production has become removed from our daily experience beyond increasing consumption. Importantly for what follows, we no longer have face-to-face interactions with real cattle. Indeed, even farmers are having such interactions with less frequency. They too are part of what I call the Animal-Human-Machine, vamping of Maley's rather dark prophesy about the ends of Weberian rationalisation (Maley 2004). Cattle are being 'de-ranged' – taken out of families and farms and relocated in iron and concrete barns for the duration of their working lives. The result of such a de-rangement, as argued below, is a host of human derangements – failing family farms, food security issues, and poor human health for example (Hansen N.B).

Going to the Dogs

On the flip side, there is an interesting modern history with Japanese and dogs as well. Dogs were once working animals. If not used hunting, then they were distant guard dogs. They were, according to Skabelund, not regarded as house pets until the *Taisho* period (1912-1926) and then only by very wealthy urbanites seeking to copy European customs through purchasing lap dogs (Skabelund 1995: 231). Native Japanese dogs such as the *Akita* or *Shiba inu* were considered to be inferior to other breeds or even treated as pests.

However, Skabelund also notes this image changed with the rise of Hachi in public consciousness (2009). This was a dog in the right place at the right time. He resembled the perfect nationalist citizen. Hachi was admired for his qualities of honour and loyalty thought to well surpass those of humans and was popularised in the mass media. More to the point, these were desired traits for a population increasingly under military rule as Japan was from the 1930s on. This case is made in popular culture as well. The 1987 film *Hachikomonogatari* (Hachi's Story) can be compared with the newer, rather awful, Hollywood remake *Hachiko: A Dog's Story* (2009). While nationalist essentialism exists in both films, in the most recent version, Hachi is seen more favourably by all involved; the American assumption being that beyond dogs being an occasional nuisance, they are always loveable family members. In the earlier Japanese version it is clearly acceptable to be a good person who simply hates dogs. I suspect a recent shift here, but can only offer tentative fieldwork experience - events witness while walking and

comments made in passing - in contemporary urban Japan to hate a dog would seem as 'uncivil' as it would in North America.

Of course dogs are seldom used for hunting in Japan today. It would be hard to imagine one of the dogs I borrow for fieldwork, Ms. Koko a Chihuahua mix, stalking a deer or bear. Moreover, Ms. Koko, charming as she may be, is a useless guard dog; her wrath likely more comical than concerning to any potential criminal. But, she is not a pest. Like the family in cow in Hokkaido pet dogs they have become loved members of human families.

One must not go too far with this analogy. Cattle were clearly working animals in terms of product production, milk, meat, and through their excrement and occasional toil, potatoes. But as this form of production has changed in wider society, dogs have come to offer a form of affective labour that is perhaps indicative of social changes. People hold them like children, they are dressed like humans, and I am frequently told they do actually perform a valuable service for their owners. I have been told countless times that they offer *iyashi* (healing). Moreover, some, unlike Koko chan do work more tangible work as guide dogs, rescue animals and *etcetera*.

Recent statistics note that pets, dogs in particular, are displacing human children in Japan. (<http://www.petfood.or.jp/topics/0901.html> - Japan Pet Food Association, accessed via Google April 1 2010). And the domestic pet industry offers a stunning array of goods designed for dogs; specialty dog foods, dog clothing from boots to dog sunglasses, and dog prams. You can dress your dog up to be a dragon or strawberry or buy it a fancy dress to go out for dinner. Indeed there are dog restaurants, hotels, and spas (<http://www.rakuten.ne.jp/gold/pluxe1/index.html> - P and Luxe homepage accessed April 1 2010). One store called Mother Garden exclusively sells both children's AND dog's clothes in the same space divided only by the ends of the shelves. There are *manga* (graphic novels / comic books) devoted to dog human relationships. These are amongst many, along with children's books and how to manuals. If cattle have been drawn away from daily life with humans dogs have surely become closer to the majority of urbanites.

Becoming Human

What underlies this shift – dogs moving inside while cattle move further away? Many informants have told me it is because Japanese eat beef but not dog. First, in Japan this is historically inaccurate. Dogs were eaten in the south of Japan until the Meiji period, and before the Meiji period and western influence, eating beef was rare. Second, it would do a poor job of explaining case where both dog and cow are on the menu, or conditions in neighbouring Korea where one can have a pet dog and eat dog. Clearly, the story is not so simple.

With the work of scholars such as Donna Haraway (2008), Tim Ingold (2000), and Cary Wolfe's edited work (2003) to name a few, the study of human-animal relations has become a fertile a meeting ground for Philosophy, anthropology, and the sciences. The work of Jacques Derrida is famously complex, but below I focus on one concept building off of Lacanian psychoanalysis and notions of 'the other' and of 'face'.

Regarding...the question called that of the animal and of the limit between the animal and the human...*all* philosophers...[also Calarco (2008) on this point]...have judged that limit to be single and indivisible, considering that on the other side of that limit there is an immense group, a single and fundamentally homogeneous set that one has the right, the theoretical or philosophical right, to distinguish and mark as opposite...Interpretive decisions (in all their metaphysical, ethical, juridical, and political consequences) thus depend on what is presupposed by the general singular of this word *Animal* (Derrida 2002: 408-409 italics Derrida's).

Later in the article he asserts,

I would like to have the plural of animals heard in the singular. There is no animal in the general singular, separated from man by a single indivisible limit. We have to envisage the existence of “living creatures” whose plurality cannot be assembled within the singular figure of an animality that is simply opposed to humans...it is rather a matter of taking into account a multiplicity of heterogeneous structures and limits...there is an immense multiplicity of other living things that cannot in any way be homogenised, except by means of violence and wilful ignorance (Derrida 2002: 415-416).

In simple terms, our relationship with the other is based on that other having a face we can identify and empathise with. Thus, “East” or “West” we generally feel empathy with an injured cat but not as much with an injured tree. Derrida is also working with, or better against, Heideggerian philosophy – moving beyond the limit of *being* defined in strict Cartesian terms (Calarco 2008). Opening the above quoted article, Derrida asks the reader (borrowing from Montesquieu) if animals have a face, and outlining why they do, is the presence of it not something beyond our limit to fully understand? And further, this being the case, then why do we generalise animals (with so many different faces, not just dogs and cattle, but breeds of dog, even specific dogs) in opposition to humans when in fact we are in a series of complex individual relationships. For Derrida, both human and animal are linguistic categories that need to be deconstructed to see that at the core there exist inter-subjective relationships.

My point here is a simple one. The way we think about animality can be witnessed within these philosophical notions of otherness, limits, and face, whether in the East, West, or all the points between these fictional bookends. Before refrigeration, mechanised transportation, and the rotary or robotic parlour systems housed in distant mass holding centres, cattle were one part of human daily tactile experience. They had, simply, a face. To work with cattle was to have a particular embodied way of knowing in what Haraway has called “the contact zone” with their otherness (2008: 205). This otherness has been increased and also abstracted through modern technology and rationalisation – as cattle become numbers and not names, identified via coding equipment and not human contact and memory – they become part of a faceless bio-mechanical machine. Alienation is the net result; cattle removed from human handlers, consumers from producers, and wants from needs. Enter into this dark modernist tale the post-modern affective labour of the pet dog. Throughout my current research, and with alarming regularity and predictability, I have been told dogs are replacements for children, for friends, and even for the desire of a warm touch and protection ‘like a lover’ (*koibito mimitai yo*) from one young female

informant. While we are divorced from the productive labour of bovines, canines, it seems, are being seen as progressively familial – replacements for what is missing in alienated human lives.

Seeking Sustained Relationships

Are these relationships desirable – even sustainable – however? The limit of facelessness in regard to livestock has been reached. As noted above, they have become part of a panoptic apparatus; alienating human and bovine alike. While this is the case in the West and increasingly the East, Japanese agriculture has no future in this mode of production as philosopher Soda Osamu has warned (2006) and his conclusions are backed up by hard data that places Japanese dairy farms as the least sustainable in Asia (Beghin 2006). Moreover, with technologies that exist now developing further, cloning, robotic milking or synthetic meat, the likelihood that we will continue to farm animals the way we do is unlikely; not only in ethical but pragmatic terms. For example, robotic milking increases time farmers can spend with their cattle and their families. Why spend the money to produce the cow if the end game, cow flesh, can be produced for less cost and less bother? In the future I suspect that cattle will decrease in number and regain a face in Japan, perhaps they will remain on eco-farms, hobby farms, or be utilised to produce specialty products responsibly. Robotic milking on one end and hobby farming on the other are both increasing trends in the UK (Holloway 2001, 2005). I suggest that Japan will become ever-aware that it is dependent upon importation as industrial scale agriculture is unsustainable and hobby farming too limited to supply the nation with foodstuffs. While programs like Food Action Nippon have been directed at making the nation self-sufficient, I would argue, though not in detail in this conclusion, that this is undesirable but not so far as it is impossible given demographics and landscape alone (Hansen 2010).

Adam Miklosi notes that dogs are the most genetically varied mammals on earth and their face value, so-to-speak, has grown with an estimated one third of humanity sharing their life with canines (2009). This has much to do with our closeness to them genetically, physically, and our centuries of a shared history. For example, while pet dogs are only a century old phenomena in Japan, Japanese perform funeral rites for dogs today (Ambros: 2010). Indeed, one of my most interesting interviews recently was with a woman who works for a *butsudan* (a Buddhist altar to memorialise the dead) design company. While they do not specifically design fashionable apartment sized *butsudan* for pets, they are often asked if they make pet *butsudan*. In short, I was told that the company is aware that, though official company policy is in line with official Buddhist doctrine, people are definitely buying *butsudan* for their pets and so treating them as deceased family members. The Osaka neighbourhood where I conduct fieldwork has had the number of registered dogs double in ten years. Given these trends, a scenario whereby dogs would not become an increasing feature within Japanese society is hard to imagine.

This paper, as noted in the outset, only provides an outline of these issues. Yet while many questions arise in looking at these shifting relationships of human, bovine, and canine, one must, I think, return to Derrida and the central question of face, otherness and ethics. Beyond issues of sustainability related to economics, ecology, policy or politics; the question is, can we continue to exploit some animals for food and others as replacement family members or friends? The discussion that needs to be had in East or West alike is in regard to our ethical or socio-cultural decisions: Are these sustainable in our relation to friend or food? The answers to such questions

are only starting to be addressed, for example in the work of philosopher Martha Nussbaum or the edited works of Cary Wolfe (Nussbaum 2006, Wolfe et.al 2008), and it is in this area, fieldwork finished, that my own work will move.

Seeking Sustainable Cattle Production in Protected Forest Areas of Northern Thailand

Takashi MASUNO

Hayama Center for Advanced Studies, Sokendai University

Abstract

The objective of this paper is to outline some of the problems that arise from grazing cattle in the government established Protected Forest Areas (PFA) that surround a Thai hillside village. And further, to explain how local residents tackled problems through discussing the sustainability of cattle grazing in forested settings. In short, the results of the study are as follows. In 1992, the villagers kept twenty cattle but a decade later this number had increased radically to 130 cattle. However by 2005 the number had declined to only ten cattle. The reason for the sharp decline in the cattle population was directly related to problems of ecological and economic sustainability. One minor reason for the instability was that the increased foliage of the PFA did not allow sunlight to penetrate to the forest floor. And so, while the forests were beautiful, insufficient fodder was produced for the increased herd sizes. The key reason however was the expansion of maize croplands adjacent to the PFA. In the mid-1990s, alongside the steep increase in cattle herds there was a steep increase in lands opened for maize agriculture. There was no barrier between the PFA and the new croplands were destroyed by the excessive number of roaming and hungry cows. By the early 2000s most of villagers gave up keeping cattle. However the villagers are still seeking solutions in maintaining ecologically and economically sustainable forests, croplands, and cattle production.

Key words: animal-human relationship, feeding damage, maize, hill tribe, political ecology

Introduction

There is global concern about the sustainability of forests. Due to concern in regard to excessive deforestation, Protected Areas have been established all over the world. However, the establishment of Protected Areas has limited the land able to be utilized for agriculture by local residents. In Thailand, some of rural residents started forest grazing their cattle in Protected Area and watershed management area in order to make a profit. In this paper, forest conservation area and tree plantation area in watershed management area are called Protected Forest Area (PFA).

Smallholders in Southeast Asia not only conduct farming but also engage in multiple other subsistence and economic activities, for example livestock husbandry. They have raised various livestock such as cattle, buffalo, pig and chicken. Most of them do not treat livestock husbandry as their main subsistence activity but they have had a close relationship with livestock (Takai et al., 2008: 146). Those livestock are sold for cash income and harvested for household consumption as well as being utilized as sacrificial animals. The importance of livestock as a significant source of cash income for smallholders has been recognized in Thailand (Chantalakhana and Skunmun, 2002). And the shifting role of large livestock roles, for example as such as roles of draft animals was pointed out in northeast Thailand (Simarks et al., 2003).

The objective of this paper is to outline some of the problems that arise from grazing cattle in the government established PFA that surround a Thai hillside village. And further, to explain how local residents tackled problems through discussing the sustainability of cattle grazing in forested settings.

Materials and methods

Study village

The field research for this project was conducted at Pha Daeng village in Phayao Province, northern Thailand (Fig.1). This village is a hillside village, which is located at about 950 m above sea level (Photo 1). The population of the village is 21 households totaling about 130 people in 2009. At least 100 years have passed

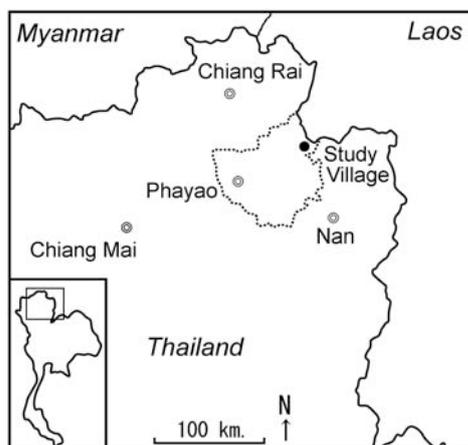

Fig. 1 Study site

Photo 1 Study village

since the foundation of the village. The main subsistence activity is agriculture. Villagers grow upland rice for subsistence and hybrid maize for cash income. Since mid 1990s, the villagers have switched from shifting cultivation to permanent farming (Masuno and Ikeya, 2008). Both crops are grown once a year during the

rainy season. The average cultivated area was 7.5 ha per household in 2005. Upland rice and hybrid maize accounted for 9% and 88% of the total area, respectively. All households used herbicide and chemical fertilizer for upland rice and hybrid maize cultivation in 2005.

The villagers are Mien (Yao) people, who are one of the ethnic minorities in Thailand and originated from south China. Each household cultivates their fields and also keeps several livestock such as chickens, pigs, dogs and cattle (Table 1). Most of households raise chickens and pigs. But raising cattle raising was not popular in 2007. The villagers frequently sacrifice chickens (Masuno 2008; Masuno and Ikeya 2010) and pigs (Masuno and Nakai 2009) for Mien rituals. But the Mien rituals which require cattle sacrifice are extremely-limited. They raise cattle in order to make a profit.

Table 1. Number of livestock raised in the study village (August 2007)

Types of livestock	Total number	Number of livestock per household			Household owning livestock	
		Average	Standard deviation	Range	Number	Percentage
Chickens*	257	12.2	6.92	4-30	21	100.0
Pigs	188	9.0	5.62	0-21	19	90.5
Dogs	22	1.1	0.84	0-3	15	71.4
Cats	7	0.3	0.56	0-2	6	28.6
Cattle	16	0.8	2.99	0-14	2	9.5
Ducks	2	0.1	0.43	0-2	1	4.8

Protected Areas in Thailand

Thailand's protected area system was inaugurated in the 1960s following enactment of the Wild Animals Reservation Act in 1960 and the National Parks Act in 1961 (ICEM, 2003). These acts established National parks, Wildlife sanctuaries and Non-hunting areas as protected areas and the total area of protected areas reached 96,160 square kilometers in 2007 (Table 2).

Table 2. Thailand's protected areas (2007)

Current protected areas	Number	Area (square km)	Percentage of Thailand's surface area (%)
National parks	108	54720	
Wildlife sanctuaries	57	36208	
Non-hunting areas	60	5232	
Total existing protected areas	225	96160	18.7
Preparing for gazettelement	58	21134	4.1
Grand total	283	117294	22.8

Source: The author modified Usher (2009: 174)

The RFD (Royal Forest Department) continues to establish protected areas so the area increases year after year. Usher (2009) reported that 21,134 square kilometers of protected area was under preparation in 2007.

In addition to the protected area noted above, the Royal Forest Department (RFD) has claimed watershed areas to manage forest of upland area since mid-1980s (Forsyth and Walker 2008:42). That is to say, a classification system using a range of classes, 1A, 1B, 2, 3, and 4 are found around the study area. These classes are used to enforce more strict governmental regulation on the use of lands by local people. For example Forsyth and Walker note that 18 to 30 percent of lands are classified under the strict code of 1A throughout Thailand (2008: 43). The RFD established the Dooi Phaamon watershed management area in the area discussed in this paper to protect the upland watershed. The RFD started to manage this area in 1991. This watershed management area covers 201 square kilometers in total.

Data collection

Statistical data regarding livestock are provided from the Department of Agriculture in Thailand. The author visited the study village in 2003 for the first time and has repeatedly visited there every year. Yearlong field research at Pha Daeng village was conducted in 2005 and direct observation and interview research with the villagers was also conducted. And the interview research with the officer of the RFD in Dooi Phaamon watershed management area was conducted in March 2007. In addition, a supplemental investigation was conducted in April 2009 and February 2010.

Results

Establishment of PFA by the Royal Forest Department

The RFD started to manage this area in 1991. They constructed a management office 2 km west of the study village. Inside this watershed management area, the RFD established a forest area in which cultivation was prohibited. This forest area consists of two parts, a forest conservation area and a tree plantation area (Fig. 2). After the trees were planted, the tree plantation area was treated in the same way as the forest conservation area. The RFD did not have a map showing the planning zone of the forest conservation area until the mid-1990s. RFD officers and local villagers therefore negotiated over setting the boundaries of the forest area. The upland area of the management area was established as the forest conservation area. Since the late 1990s, the RFD in this management area has used a six-class classification (Forsyth and Walker 2008: 44) to manage the watershed area. Classes

1A, 1B, 2, 3, 4 are found around the study village. In addition to the establishment of the forest area, the activities of the RFD in the watershed management area include road maintenance and management of the production of tree seedlings.

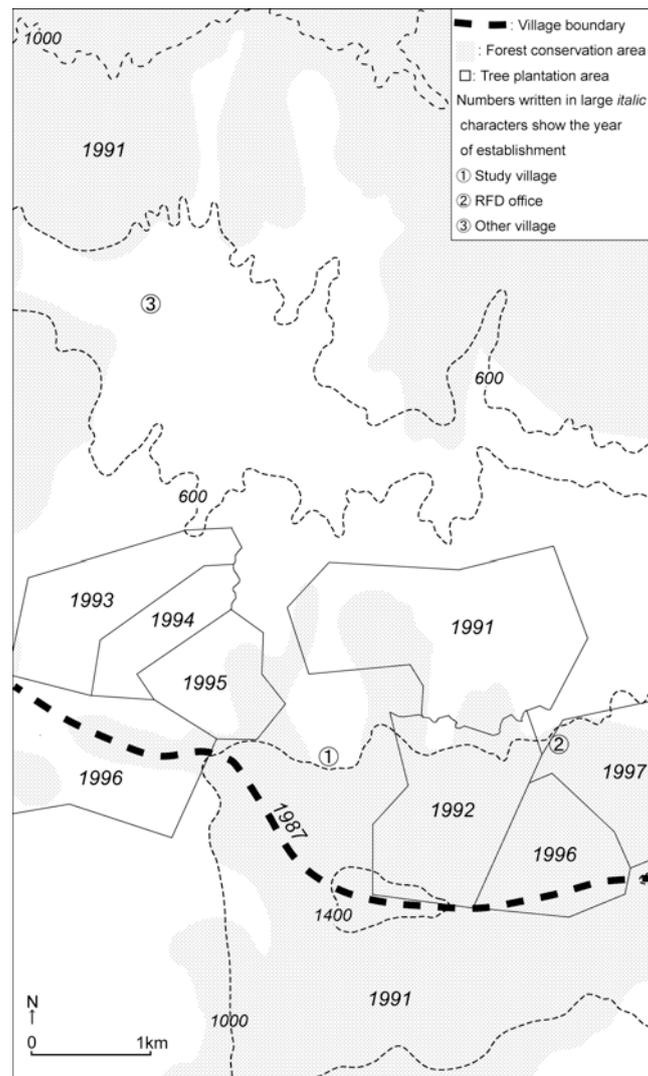

Fig. 2. Distribution of protected forest area (PFA)

Note: The PFA consists of forest conservation area and tree plantation area. RFD stands for Royal Forest Department. Numbers shows the year of establishment.

Historical changes of cattle raising

The villagers said that they started cattle grazing in PFA in 1992. The lowland Thai people, *kohn muang* in Thai language, offered cattle grazing in the forest area around

the village. Two villagers started to keep lowland Thai people's about 20 cattle. They sent their cattle to graze in the forest conservation area to the south of the study village (Photo 2). They left the cattle in the forest and went to see them two or three times in a week. No fence to enclose the PFA was made. The cattle could go anywhere. The villagers said that few villagers occasionally kept a small number of cattle and buffalo before 1991. Cattle raising in the 1990s was substantially successful and they made a profit by selling the cattle.

After this success, lowland Thai people quit cattle husbandry. And many villagers of Pha Daeng started to raise cattle in the PFA. At least nine households out of 20 households kept cattle and the total number of the cattle in the village was estimated to be nearly 130 cattle in 2002.

However in the same period, feeding damage by the cattle to maize occurred frequently (Photo 3). The cattle love to eat the young shoots of maize. The maize fields adjacent PFA were damaged. In 2003, the author observed several incidents of feeding damage to maize by the cattle in the study village. The cattle damaged not only the fields of Pha Daeng village but also the fields of lowland Thai people. The cattle owners must pay compensation to the owners of maize fields. Consequently, many of the villagers could not afford to pay the money and stopped raising cattle.

In 2007 only two households kept 17 cattle in total. These two households raised 30 cattle in 2010. The problem of the feeding damage was not overcome and their cattle still damage the maize fields. Thus the two households still suffer from the problem of paying compensation for feeding damage.

Photo 2. Cattle are grazing in forest

Photo 3. Maize fed by cattle

Discussion

The villagers started cattle husbandry in 1992. This was just after the RFD started

to manage the PFA. In that time, the villagers sought a way of effective utilization of the RFD. The villagers sacrifice chickens and pigs in their Mien rituals on a daily basis but they seldom use cattle as sacrifice animal. The villagers keep cattle for making money. During the early to mid-1990s Thailand was experiencing an economic boom. Thus, the author suspects that this lead to an increase in speculation within the livestock market and this leads to an increase in the number of cattle raised by local people.

In 1992, the villagers kept about twenty cattle but a decade later this number had increased radically to 130 cattle. The villagers kept more than 100 cattle in the early 2000s. However by 2007 the number had declined to only 17 cattle. The reason for the sharp decline in the cattle population was directly related to problems of ecological and economic sustainability. One minor reason for the instability was that the increased foliage of the PFA did not allow sunlight to penetrate to the forest floor. And so, while the forests were beautiful, insufficient fodder was produced for the increased herd sizes.

The key reason however was the expansion of maize croplands adjacent to the PFA. Since mid 1990s, the villagers have switched from shifting cultivation to permanent farming (Masuno and Ikeya, 2008). The villagers have depended on hybrid maize as their main source of cash income since the late 1990s. In the mid-1990s, alongside the steep increase in cattle herds there was a steep increase in lands opened for maize agriculture. There was no barrier between the PFA and the new croplands were destroyed by the excessive number of roaming and hungry cows. By the early 2000s most of villagers gave up keeping cattle. Many villagers did not want to make an effort to stop the feeding damage caused by the cattle, erecting fences for example. Thus they stopped keeping cattle and cultivated maize more intensively to get money.

Most of villagers chose maize cultivation rather than cattle husbandry in order to make a profit. But cattle husbandry is still one of the important choices to make efficient use of PFA around the village. The villagers are still seeking solutions in maintaining ecologically and economically sustainable forests, croplands, and cattle production.

Paper presented at ACAH/ACSS Conference, 18-21, June, 2010.

Why cattle is easier than water buffalo: lessons in sustainability from Nepal

Kazuyuki Watanabe

(Ritsmeikan University, Kyoto, Japan)

Introduction

This paper considers the sustainability of cattle farming for Nepalese farmers. Through analyzing field data, notably the composition of livestock and households, I discuss why cattle herds are increasing more rapidly than water buffalo herds.

Cattle have been raised in South Asia to compliment food supplies and to engage in other aspects of agriculture such as traction. In short, Cattle are benevolent creatures for farmers. While it is well known that the eating of beef is taboo in the Hindu religion, cattle are used for the production of milk. Moreover, they provide the means to easily plough fields and produce their own fertilizer. Cow dung is even used for cooking fuel and flooring inside the home.

In strict economic terms cattle are not more profitable to raise when compared water buffalo. Due to the introduction of high yield buffalo into the Indian Plains region, villagers can actually produce a greater income so as long as they are capable of producing the increased fodder needed to feed these animals (Nakazato 2004; Ikeya 2006; Nakatani 2008). “White revolution”, it is called in India, is limited among the mountain area of Nepal, local buffalo also produce more milk than local cows.

However, this tendency is not solely understood by economical profit. Relationships of the human and livestock must be considered social phenomena. Now some villagers insist “Cattle are easier than water buffalo”. What these relationships are and why they are seen as ultimately more sustainable? This paper aims to outline social change of animal husbandry.

Field research is carried out 1.5 months in 2009 and 2010. Interviews are conducted quantitatively and qualitatively including making of livestock census of all households. Livestock composition must be analyzed since it reflects difference of the caste, and household strategies.

The village and the livestock

The village, Rumjatar is located at 200km east of Kathmandu and 100km south of Mt. Everest. Topographically, altitude of the village is 1300m and it lies on the midlands mountain. The climate is effected by monsoon rain and annual precipitation is about 1800mm. Maize

and millet are cultivated in dry fields and there are also paddy fields where irrigation water are available. Administratively, the village is approximately equivalent for Rumjatar VDC (village development committee) of Okhaldhunga district. VDC consists of 9 Wards. Total household of the VDC is 566 and population is estimated more than 3000 (in 1998).

Table 1 shows caste composition of ward No.5. Dominant ethnic group of the villager is the Gurung and they occupied more than half of village household. They are middle caste and an ethnic group of Tibet-Barman language group, but they speak only Nepali as their mother language and can't speak the Gurung language even among old generations.

Rumjatar is known for the neighbors as the village of sheep herders(Watanabe 2005). But, in 1998, there are only 26 households (4.59%) among entire village and 6 households (6.98%) among Ward No. 5, where I lived in. As far as these days, only few households rear the sheep. According to the sheep herders, there were more herders in the past. I tried to ask some villagers if there was a herder in their household. Then, there were 2/3 of households among Ward No 5 had herders. However, this estimate must be deducted because there is a possibility of over counting the same persons in some households.

Today, selection of job is expanded among the villagers. There are many Gurkha soldiers in this village¹. Their income and pension have effected to village economy considerably. After their 18 years of duty, and retired from army, they get pension. This high standard property is invested to their houses and lands. Expired soldiers tend to hire agriculture laborers and care for their children's education. In case of Ward No. 5, all expired Gurkha soldiers below 40 yeas old live in Kathmandu. Employment of the Gurkha is decreasing since late 1980s. Nowadays it is said that only few people pass the examination of the Gurkha. Alternately, after 1990, labor migrations to Middle East or South East countries are increasing. Also, much of students go to university of Kathmandu and live there after the graduation. In such situation, village youth, including the sons of sheep herders, dislike the job of herders because of its physical hardness (*dukha*). This is same for herders themselves. They also wish their children go to school and get better jobs (Watanabe 2007; 2009).

Variety and use of livestock

What kind of livestock the villagers raise? Variety and use of livestock should be pointed out (Table 1). Here, cattle and water buffalo must be explained among them.

Cattle are raised widely. Bull (*gol*), castrated male, is used for cultivation. Agricultural mechanization as seen in Indian plain is limited in mountain region of Nepal. Tractor is not

1 The Gurkha is brigades of Nepali soldiers of British army. In World War 2, many solders fought in Burma fronts. After independence of India, their camp moved to Hong Kong, Singapore, Brunei, and UK.

introduced into the village, and a pair of bull still ploughs the fields as before. Cow (*gai*), female cattle, is used for reproduction and milking. Recently, “developed ox (*bikas gol*)”, higher yield ox, is tried to introduce by government veterinary office in order to increase income from milk. However the hybrid offspring has not matured to the stage of milking.

Water buffalo is also popular among the village. Female buffalo (*bhainsi*) produce more milk than cow, and male (*rago*) is fated for meat. Sale of meat is mediated by contractors. They collected a whole head of water buffalo from surrounded villages. They dissect and sell it at periodical market or cross roads. In case of the former, every parts of meat are available by buyer’s choice, however in case of later, all parts of meat are mixed and are divided equally by the weight. Higher yield type of water buffalo (*bikas bhainsi*), which is said to produce much more milk than local buffalo, is not introduced into the village.

Both cattle and water buffalo are kept on the shed usually. However, sometime cattle are grazed among the forest or open fields. Grazing grounds are situated on steep slope near the river, and the area has increased among last ten years because abandoned fields expanded considerably. Emergence of abandoned fields is reflected by globalization. Now so many village youth has gone to outside countries, and women, old men, children couldn’t afford to their agriculture by themselves. So, some households that have enough income from outside of agriculture, or that has enough lands, tend to stop cultivation near the forests.

Number of Livestock and Caste

Caste difference is also reflected among composition of livestock. Villagers select cattle or water buffalo according from both cultural and economical standard.

Cultural standard is reflected among caste taboo. Restriction of meat-eating is pointed out (Table 2) . In case of water buffalo, there is not difference. Every caste can eat meats of water buffalo. In case of cattle, there are some differences. The Hindu can’t eat the meats. Some ethnic groups of Tibet-Burman gropes, such as sub-groups of Tamang, Magar, or Tibetan ethnic group like Sherpa can eat meats of cattle. However, there are no such kinds of households among the village. In case of Sarki, low caste tanner who can eat meats of cattle traditionally, insist now they have stopped the practice. So, there is no person who eats meats of cattle among the village. Villagers say when cattle will die, the body is thrown from a cliff.

The numbers of livestock, cattle and water buffalo, is shown (Table 3). Difference of the caste is not clear. Number of the cattle is much more than water buffalo. However, seen from average number of rearing households, both animals are raised within 1-2 heads. This means cattle are more widely raised among the village. While cattle are preferred among almost all of the caste, and water buffalo tend to be raised by middle caste or low caste, there is not so considerable difference. Now every caste can sustain large animal even among low caste.

Seen from economical standard, water buffalo is more profitable than cattle. Water buffalo provides more milk. The amount is about 6 ℓ (12 *Mana*) a day. On the other hand, cattle provides only half, about 3 ℓ (6 *Mana*) a day. The price of milk is not different (0.5 ℓ =20Rs. US\$1=70Rs in 2009). In case of water buffalo, income from the meats will be added.

Yet in such a situation, however, why people raise more cattle than water buffalo? One of the reasons is related sustainability. Water buffalo needs more feed than that of Cattle (Table 4). Water buffalo eats double of cattle. It eats double grass, fodders, and maize mush (*khole*). So, the owners must be compelled more input of labor or money.

Which livestock the villagers select?

Case 1. Cattle are easier: a case of middle caste man.

Mr. O (50s) is Gurung. He is a retired sheep herder, and now he lives in house with his wife. His children live in outside of the village. His son works in UK as a mercenary of British Army, and his daughter lives in Kathmandu with her husband. He manages agriculture, and he has 3 heads of cow and a head of female water buffalo. While he milks a cow and makes butter (*ghiu*) as his daily work, hired laborers engage in agricultural works and collection of fodder. When I ask him why he doesn't manage more water buffalo, he replies cattle are easier than water buffalo. He explains cattle are sustainable because water buffalo needs more amounts of fodder.

Case 2. Only a head of cow is sustainable: a case of middle caste man.

Mr. KC is Gurung. He is also retired sheep herder. He has only one head of cow. While he has 10 heads of goat, he kept them to his related sheep herder. He can get all of infants of the goats because he shares a part of expenses of the herder. He lives in alone in his house. All of his family members live in Kathmandu. Now, he doesn't engage in agricultural works. He lent his fields to share croppers. While he must give a half of their products, it's enough food for living alone. He spends most of his time at Hindu temple for worship and service.

Case 3. Male stock is better for business: a case of low caste men.

Mr. BR is Damai. He has two heads of bull and one head of water buffalo. He raises the bull for cultivation. He ploughs for other farmers in order to earn money. He fats male water buffalo for sale. He engages in wholesales of livestock. He collects water buffalo or pigs from surrounding villages in order to sell on periodic market. He has three pigs and eight chickens. While pig bears four or five piglets, he can't sustain to fat more pigs because pig eats so much maize. He divided house with his brother, but he still share the shed of livestock. He gets food from his own fields and a half of products by share cropping.

Case 4. Water buffalo is profitable: a case of middle caste woman.

Mrs. M is Gurung. She has one head of water buffalo, one head of goat, and 12 chickens. She was gifted the water buffalo from her native home. The goat was brought from grazing camp by her husband who retired sheep herder. She hasn't her own field, so she get foods from share cropping. In addition, she works making rugs or home made liquors for sale. She insists water buffalo is profitable than cow. Her son works in Qatar, and she is assisted by her daughters the works such as agriculture or collecting of fodder.

Conclusion

Yet despite strict economic incentives villagers raise more cattle than buffalo. This relates to demographic changes in the mountainous Nepal region. Due to globalization, notably the economic draw of urban centers and other migration, rural regions mostly comprise of the elderly, women, and children. Thus, villagers find relationships with one or two cows more useful. This is seen as ultimately more sustainable.

On the other hands, we should not forget other type of choice. Now, caste or ethnic group is not sole index of livestock composition. Every castes hold large animals even among low caste. Pursuit of the economical profit is seen notably among poor households of low caste or middle caste. They must compensate their income even extend their labor impute. Family labor among the village is concentrated for collected of fodder or cutting of grasses for livestock. In addition, considering about recent shortage of male labor, almost of their works is sustained by women.

Topic:

Cultural issues that arise while using drama in a classroom with members of differing cultural backgrounds.

Title: Drama and Cultural Awareness

Author: Gerald Williams

Affiliation: Kansai University of International Studies

Culture is an important part of who we are. As Edward T. Hall has illustrated in his seminal works (Hall, 1959, 1989), we know who we are, but are unaware of the extent that our behaviour and thinking has been formed by our culture. Drama is an oft used tool in the language classroom. Many people are familiar with the most basic type of drama technique; the role-play. Our first introduction to language learning may well have included memorizing a brief scene in a restaurant, then acting it out in front of classmates. While not preparing us for a career on the stage, the language teacher was allowing us to use the role-play to experience the language in a 'natural' setting. By doing so, we should then be able to replicate the language outside the classroom.

When we teach in a culture not our own, we bring with us many preconceptions and ideas. As good teachers we not to devalue the host culture, while at the same time, we have to give proper due to the culture we represent. Adhering to local custom, while maintaining our own values and customs is healthy sign for living abroad. The old adage may be rephrased to something like, "*When in Rome, understand what the Romans do.*"

It is unnecessary, and I would suggest, impossible, to jettison the culture in which we were raised. Who we are has been formed by not only what we have consciously learned or studied, but by what we have absorbed. To remove these traits we would first have to identify them, then decide to erase them. The task moves into the realm of the impossible because of the sheer range of things we have absorbed. We learn when it is our turn to speak, when to make eye contact and when to make room on the seat beside us for another person. While it may be arduous to indentify these social graces, noting when they are broken is often quite simple.

If a woman in her seventies were to stand when a youthful twenty-year-old man walked into the room, this is clearly a breach of normal behaviour. It may not be inappropriate, but a further explanation would be required. If the genders were reversed, a common belief would be that the man was acting in some courteous fashion. In other words, breaches of norms are easily recognizable, and require an explanation. While taking public transit, a bus or train, we have a smaller personal space than when we are in a classroom. If we were to apply the rules of personal space for a train at rush hour to a classroom, it would be clear that social rules, customs, our cultural norms are being violated. Even if we could not specify what exactly the right amount of space in a classroom is, we know the wrong amount of space when we experience it. We learn the rules even if though we may not be able to explicitly express them nor if we have never taken implicit instruction in them.

Our culture is often implicit. It is integrated into our behaviour, and our belief system without our awareness or our control. This manifests itself into our daily life when we encounter an idea or behaviour that is in contrast to what we expect. Much like the

septuagenarian standing for the twenty-year-old man, it doesn't feel right and requires an explanation.

This is the situation our students are in when meeting a teacher from another culture. This foreigner standing in front of the class is going to exhibit different behaviour and have different expectations than a native teacher. As Li (Li, 1999) points out, this results in a number of problems for classrooms. What I would like to focus on here is not that problems exist, but that those involved miss that the problem is born from differing expectations of the others' behaviour. There will be a belief that the other side is being unreasonable. This is both common and understandable. I may be optimistic, but I believe that most teachers who enter positions in cultures foreign from their own are sensitive to other cultures and have an awareness of the potential problems and try and preempt problems before they arise.

For the drama teacher this is especially true. When selecting a play to use in the classroom, either to perform or to study as literature, there needs to be an understanding of the culture being taught. The good drama teacher will introduce cultural points for greater understanding. The Arthur Miller play *The Crucible*, for example, is the story of a witch trial that takes place in puritan America. Understanding the time it is set is important to understand the play. Equally important would be to know that witches were believed to be fictional. If a reader were to believe that witches were in fact an option of the play, then the questions play has a very different meaning. It is safe to assume that most teachers would not spend time discussing whether witches exist.

Fortunately, or unfortunately, examples like this are likely less common than the more mundane. The more mundane aspects of cultural difference include understanding of time, of space, of the right-wrong paradigm, non-verbal cues indicating the variety of positive and negative judgments. At this level we are into everything that controls our behaviour and judgment. Culture is so much a part of us, we are unaware of what is in the realm of opinion and what falls under predetermined cultural bias.

A play I use in my class for training purposes is a two-person play about someone being late for an unspecified appointment, and the late party claiming to have been detained by an Angel. The Angel (Nelson, 1999), apparently appears for the sole purpose of having a brief chat. From a cultural perspective, using this script would require that the learners understand a Christian concept of an angel. They would also have to have some reference about the role of Christianity in American society. What is less obvious are the cultural references that fill the opening few lines of the play:

A: You're late.
B: I know-
A: What time is it?
B: It's two o'clock.
A: It's two o'clock.
B: I know. I'm sorry.
A: I said twelve thirty.
B: I know-
A: I've been waiting for ninety minutes.

A common interpretation from a North American perspective is that B is late and A is angry. After a 90-minute wait it would be natural for A to be angry. The questions that is never posed is ‘why is A angry?’. In some cultures, 90 minutes is not along time to wait.

In my experience in both Thailand and Vietnam I have been given the excuse ‘thai-time’, or ‘local-time’ after being kept waiting all day for someone to show up for a meeting. Time, and adherence to an agreed upon time to meet, is a cultural viewpoint. However, it is possible that differing points of view on time are not introduced to learners. The fact that A has been kept waiting for 90-minutes is sufficient to move the action forward.

Another aspect of culture that may be overlooked is gender and communication. If A, the injured party, was played by a woman, and B by a man, how should A express her anger? Should she speak loudly, while directly facing her male companion with her legs apart? Should she avoid direct eye-contact, bring her arms close to her body to take as little space as possible and speak in a soft submissive tone trying to avoid any rebuke in her voice? These suggestions reflect different ways students have reacted to the use of this play in the classroom.

Students with no direction have reverted to the posture that is most comfortable, most familiar, when introducing this play for the first time. I’ve taught this play to students from Indonesia, Thailand, China, Vietnam, South Korea, Japan, America, and Australia. How students feel about being left for 90-minutes varies depending on gender and their perception of time. The most apparent difference seems to be that two boys will be much more aggressive than any other combination. When a male is playing the role of the waiting A and a female is playing the late B, it is not surprising when the boy is both stern and patronizing.

The most surprising reaction I’ve had to this play was in regard to the word ‘waiting’ in the last line of A’s above. A Vietnamese student questioned why A was *waiting*. The student introduced me to the idea that she wouldn’t have been waiting. Waiting itself is an activity. She would have been doing something. B would have showed up at some point, but A’s time should not have been spent “waiting.”

A teacher may provide students a model to follow. Believing that model to be the ‘correct’ form of expression. What would make the class fuller is to identify for students that they are being introduced to the culture of communication of the teacher and the playwright, rather than merely the story.

When a script is used in a class there are a number of obvious cultural points to be made. The less obvious ones are more difficult to identify, and are potentially more meaningful. It may be said that students chose to study a language knowing that culture is part of it. I don’t believe that students fully appreciate how many differences there are between cultures. I also am doubtful that many teachers, myself included, fully appreciate the limits that our own culture influences us.

BACKGROUND MUSIC AND THE ESL/EFL LEARNING ENVIRONMENT

Patrick Rates

Ritsumeikan University

ABSTRACT

Music is often used in the ESL/EFL classroom by teachers in many different ways to help second language learners acquire a second language. The use of background music in the ESL/EFL classroom can create an open atmosphere for learning that is enjoyable for students. By creating an open atmosphere for an ESL/EFL communication class, students are more relaxed, and therefore, more receptive to speaking. This paper will report research on the effects that background music can have on an ESL/ESL class and present student opinions from a survey of Japanese university students on their opinion of background music in an ESL/EFL conversation class.

INTRODUCTION

Creative teachers have often found various uses of music in class in the form of lesson activities to help ESL/EFL learners acquire a second language. This paper will provide an alternative use of music in the class, by looking at music in the classroom not as a lesson activity, but as a way of influencing the atmosphere of the ESL/EFL communication classroom. This paper will look at the efficacy of background music as a vehicle for first and second language acquisition by the creation of class atmosphere, making the entire learning process in an ESL/EFL communication class more enjoyable for students, creating an open atmosphere for communication in the classroom. The paper will then look at student who participated in an ESL/EFL communication class using background music opinions on background music in a communication ESL/EFL class from an in-class survey.

Recently, the effect of background music on the language skills of language learners has been gaining attention. Studies have shown that music can improve concentration, improve memory, bring a sense of community to a group, motivate learning, and relax people who are overwhelmed or stressed, make learning fun, and help people absorb

material (Saeki, 1994), These are but a few of the benefits associated with music use in the second language classroom. These benefits are not surprising, since the literature abounds with positive statements regarding the efficacy of music as a vehicle for first and second language acquisition.

Outside the classroom

Outside of the classroom, there has always been a significant use of music in different situations to bring about desired effects in people. Shopping malls use music to stimulate people to spend money, doctors rely on music to soothe nervous patients, and employers use music to relax employees. English as Second Language (ESL) teachers and foreign language teachers began exploring efficient methods for their use in language skill acquisition (Daniels, 2003; Gan & Chong, 1998; Hatasa, 2002; Hayashi, 1997).

The use of background music in the classroom is a relatively new concept. Although, the concept of using music while studying is not new to students. Students and music go hand-in-hand. Students often complete homework while listening to music. Cantril and Allport (1935) conducted a study on students and music. They found that sixty-eight percent of students do school work with the radio on. A similar study conducted later by Beentjes, Koolstra, and van der Voort (1996), showed that students regularly combined their homework with listening to the radio. With the introduction of MP3 players, many more radio stations, and expanded music technology; it would only make sense for that practice to continue. With this in mind, it becomes important for educators to understand the effect music has on the student's learning process and concentration. The majority of the evidence tends to support background music due to its positive implications. Cool, Yarbrough, Patton, Runde, and Keith (1994) conducted a study that proved radio noise generally was considered somewhat helpful to students while studying, allows sensory integration to take place, and improves concentration abilities.

Inside the Classroom

Using background music in the communicative ESL/EFL classroom makes sense. Background music can create a relaxed classroom atmosphere that encourages communication, providing an atmosphere in the classroom that promotes positive social interaction among students. Background music constructs atmospheres that can reduce student stress, relaxing students and motivate communication. Background music has been shown to have an effect on the mood of the classroom, by creating a more relaxed classroom, which is desired in an ESL/EFL conversation class. By calming students, certain types of music can be a powerful catalyst in creating a classroom atmosphere.

Eight teachers at Brookewood Elementary School in Grovetown, Georgia did a study on the use of background music. The study found that both teachers and students benefited from quieter, more orderly students. Brookewood kindergarten teachers used background music in their classes during thinking and working activities. Comments by the teachers were that students were:

- "Very effective in helping children settle down quietly."

- "During work time, the children were more attentive and quieter."
- "The students have to work quietly to hear the music, so the music helps to remind them to work and not talk."

Two teachers of Grade 3 classrooms at Brookewood used Thinking and Concentration CD's during independent work sessions. They reported:

- "Calming, students more focused, appears to be more concentration, room quieter."
- "Better focus. Seem to attend to task longer. The students ask for the music."

Three teachers of Grade 5 classrooms used background music reported:

- "Students like them, they ask for the music."
- "It appears that students are working more diligently and getting better grades."
- "Calms students, settles them down, has a soothing effect. Beautiful, relaxing music helps students focus more."

She also wrote that all the teachers in the school reported value in the music, and paraprofessionals who tend to be in a number of classrooms commented how much they liked being in a classroom that was playing music. She added, "I believe that background music has improved the learning environment for students."

Whether it is setting a mood, settling students, masking distracting noises, de-stressing the teacher or inspiring creativity for a writing assignment, music from background music has proven to be a welcome addition to the classroom.

Student Emotional State

Many students feel stress speaking a foreign language in class with their peers. Recently, the aspect of student stress in second language acquisition and a learner's emotional state was studied (Shiels, 2001; Takahashi, 2001). Shiels (2001) interviewed immigrant students about the factors of stress caused by second language acquisition and enculturation including school, the enculturation process, and prejudice. She described helpful teaching strategies for the students, including giving modified or alternative assignments and tests, and using cooperative learning techniques, both manipulative and visual. While Shiels (2001) focused on stress factors, Takahashi (2001) developed an exhilaration scale for learning Japanese as second language for college students based on interviews with Japanese learners, and he implemented the scale with college students learning Japanese. Then, he found that there was high correlation between motivation for learning and a cluster of positive emotional states encountered when learning Japanese as a second language.

Background music can have a relaxing effect on students, lowering student stress and anxiety. Relaxation is another factor that is mentioned by several authors that write about music in their works. Dubin & Olshtain (1977, p. 198) consider that the inclusion of music in English lessons is effective because "music is a pleasurable outlet...is a good way for students to relax and feel more at ease in using the new language". Coromina (1993, p. 27) says rock songs "provide a break from the textbook and workbook routine". Eken (1996, p. 47) says: "These activities provide a relaxed, friendly and cooperative classroom atmosphere".

In addition, it is interesting to see that Saeki (1994), working only with background music, found several similar reasons shared by other teachers working with music. Saeki (ibid. p. 30) says that music can be used for many purposes in language teaching: "BGM (background music) is important because I believe it can do the following: (1) relax students, (2) activate students, (3) get students to be attentive, (4)

let students have fun, (5) Change the classroom atmosphere, (6) create learning situations". Saeki also mentioned a very interesting fact dealing with the psychological aspects of the use of music, "Music may also engage the right hemisphere of the brains more, and make learning a more holistic experience". On the other hand, the use of songs is directly related to the identity of the people who listen to it, and the use of songs within the classroom can help the class to overcome indifference from the students due to the inclusion of their interests. Segura & Villalba (2005, p. 70) mention that using songs related to the students' interests can help the class to engage willingly and meaningfully in the activities involving things, they like.

According to Horwitz and Young (1991, p. 1), there are two general approaches to identifying language anxiety; 1) language anxiety can be viewed as a transfer of other general types of anxiety (e.g. test anxiety or stage flight); 2) language anxiety occurs in response to something unique to language learning experiences. These two approaches represent different perspectives of how language anxiety can be conceptualized, and they are not necessarily taking opposing stances with each other, but the efforts of both sides are considered complementary to the mutual goal of understanding the phenomenon more thoroughly. Such feelings of apprehension that second/foreign language communicative contexts induce are often accompanied by fear of negative evaluation from others. Watson and Friend (1969) characterize it as "apprehension about others' evaluations, avoidance of evaluative situations, and the expectations that others would evaluate oneself negatively" (p. 448-51). Even in small group class discussions, for instance, some of the learners might feel anxious for fear of negative evaluation from their peers, possibly ending up being quiet and reticent, contrary to their initial intention to participate. Such psychological dilemmas of L2 learners between willingness to speak up in the classroom and fear of losing their self-esteem in front of others, thus, seems to be a quite ubiquitous phenomenon in second/foreign language classroom settings (Bailey, 1983)

Application

The following framework was used while applying background music in the classroom:

1. Select music, to fit the activity students are engaged in doing.
2. Playing background music at an excessive volume can be a distraction. Keep the volume low. This means students should still have the ability to speak at a conversational level without raising their voice. The music should be in the background creating a filter for unwanted noise in the classroom throughout the day. This creates the body relaxed, mind alert state.

METHOD

An in-class survey was used to seek student's opinions on their experience with the use of background music in their classroom and whether the use of background music make the entire class atmosphere less stressful, more enjoyable and whether it created an open atmosphere for their communication class. The tool for data collection was a survey consisting of seven questions, which were open-ended and close-ended (See Appendix 1). The data collected was descriptive in nature and served as an initial step toward constructing their attitudes toward the use of background music in the

classroom. The close –ended questions directed the student’s attention toward a specific area of background music. Students were also encouraged to write their own opinion about the question topic under the question. The open-ended questions were more flexible and asked for the student’s opinion. The open-ended questions and student opinions were especially helpful in soliciting new topics of concern.

Background music Questioner:

1. Does music make the class more relaxed?

Yes

No

Comments:

2. Does background music reduce the stress of speaking?

Yes

No

Comments:

3. What kind of background music is best for class?

Rock

Pop

R and B

Slow

Classic

Any kind

Foreign Music

Comments:

4. Is background music good or bad? Why?

Good

Bad

Comments:

5. Is the mood of the class different?

Yes

No

Comments:

6. Does music distract from the class?

Yes

No

Comments:

7. Are there times that music is bad in class?

Yes

No

Comments:

Appendix 1.

Procedure

One hundred seventy five first and second year university students in Japan were played background music during a communication class for fourteen weeks during the semester. Students were played a variety of background music during communicative portions of English communication class. During the fifteenth week of the class, students were asked to anonymously complete the background music survey and to write any comments or opinions about the use of background music in class.

Results

The results of the student survey are as follows (Appendix 2). The survey reveals student answers to eight questions. The survey first reports the student's answers to the survey question and then reports frequent comments that students wrote in the comment section of the survey.

Background music Questioner:

1. Does music make the class more relaxed?

Yes	No
82%	18%

Common student comments:

- I do not like a silent class.
- Music helps people talk.
- Music changes the atmosphere of the class.
- Music makes the class friendlier.

2. Does background music reduce the stress of speaking?

Yes	No
65%	35%

Common student comments:

- I don't feel as much stress when music is played

3. What kind of background music is best for class?

Rock	Pop	R&B	Slow	Classical	Any Kind	Foreign Music
12%	12%	8%	16%	16%	16%	17%

4. Is background music good or bad? Why?

Yes	No
92%	8%

Common student comments:

- Sets a good mood for the class
- Lets the students relax
- Makes class feel fresh
- Makes the students feel closer
- Music is not used in reality

5. Is the mood of the class different?

Yes	No
88%	12%

Common student comments:

- Makes the mood of the class better
- More relaxed
- More fun

6. Does music distract from the class?

Yes	No
6%	94%

7. Are there times that music is bad in class?

Yes	No
8%	92%

Common student comments:

- When the teacher is talking
- During Tests
- During activity explanation

Considerations

For future, the effects and possibilities of active and passive types of learning should be further examined and explored more thoroughly. Common learning methods in the classroom and home often are passive learning; such as listening and watching, a teacher taking notes, watching TV or listening to music. Future studies should be carried out with and other types of students.

The research was framed in a qualitative research paradigm because it was my interest to explore, to describe and to analyze students opinion of background music in the, rather than to find any measure accounting for its effectiveness. The idea of using this kind of material was to motivate students to practice English outside classrooms and to help them relate their interests with learning a language. Future research should be done studying the learning effectiveness of background music in the classroom.

Discussion

In the frame of a case study, my intention was to see how background music could create a classroom atmosphere conducive to English conversation. Through an in class questionnaire, looking at student answers and opinions. The survey found that students felt that background music did help create an atmosphere conducive to an English conversation class. Students felt that the use of background music, brought a sense of community to the class, motivated learning, and relaxed students who are overwhelmed or stressed, make the class more relaxed and fun. Some students did express concerns that background music in the classroom could be distracting during tests or when the teacher was talking. Other students expressed concerns that background music was not providing a realistic conversation environment that music is not played outside of the classroom.

Introduction

Art is probably the most common language which is globally recognized, among all nations. Throughout history, many cultures received global recognition through their artistic heritage. Among the cultures renowned for their richness in art are the ancient civilizations that flourished in the Kingdom of Saudi Arabia. The artistic heritage of those cultures is characterized by its simplicity and richness with high flexibility. Such simplicity and flexibility made this heritage distinct in its adaptability for creative ideas and modernization while preserving its originality. This paper attempts to redesign parts of that heritage using a kind of art that reflects its beauty in a modern context. The ultimate goal of this research is to find new and creative methods for modernizing and redesigning some elements of the artistic heritage in KSA. This could be achieved by designing artistic innovative units which embrace the profundity of KSA's original heritage preserving the spirit of the era, and then, producing them through the use of the most modern materials. Thus, this artistic heritage would be more appreciated by the people of other nations.

The Artistic Heritage of the Ancient Civilizations in KSA

Contemporary scientific research in Saudi Arabia shows that the era of human settlement in the Arabian Peninsula dates back to the oldest prehistoric times, and signs of new discoveries of ancient stone settlement areas in the east and southeast of the Kingdom reflect the deep background of the past living stability on the land of the Arabian Peninsula. Eventually, it has become clear that some of these settlements are about 40,000 years old. It has been confirmed that the eastern part of the peninsula has effectively contributed to the existence of one of the earliest human civilizations, known as "Sumer" civilization which flourished in the land Ma Bain Alrafedain (to the south of Iraq) ^(Alagalany, 32). This fact is evident from the remains of the settlements, found in the eastern region of the Kingdom, which date back to more than a thousand years before the establishment of Sumer. Moreover, the belief of many prominent anthropologists that the peninsula was the cradle of the first Semitic people is another proof that the peninsula contributed much towards the formation of the civilization of those nations in various parts of the ancient Near East. The

monuments in the ancient villages: Ola, Taima, Faw, Najran, and the Eastern Region were the concern of the historians and archaeologist who searched for the origins of each civilization and decided on how old and how original they were. The civilizations of (Aldadanyen), (Allhyanin), (Nabataeans) and others were only a civilization built on other ones (Al – AlSaikh, 22)

Drawings found on Mount Prince in the Eastern Province of Saudi Arabia represent abstract forms of people dancing (Al – AlSaikh, 43)

**An exterior wall in the groove, on which Sabaa inscriptions are carved
Najran, south-western region** (Al – AlSaikh, 87)

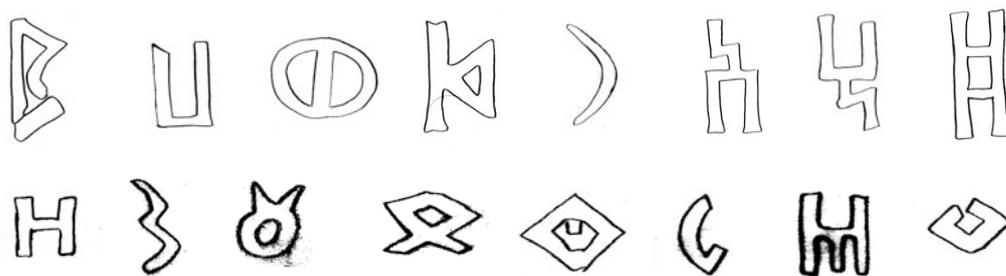

Designing Process:

Certain elements of the heritage have been selected for their simplicity and flexibility and drawn manually. Some changes in their shape have been made with a view to redesign. These changes are based on the different processes of design considering the idea of dealing with the element as a single unit because of its smallness, oldness and originality. When we focus on the element as an individual unit, we remind the beholder of its value. These changes are made by Coral Draw 12 program, a program that helps the designer to make lots of effects on one element. Certain tools have been selected such as “ripple”,

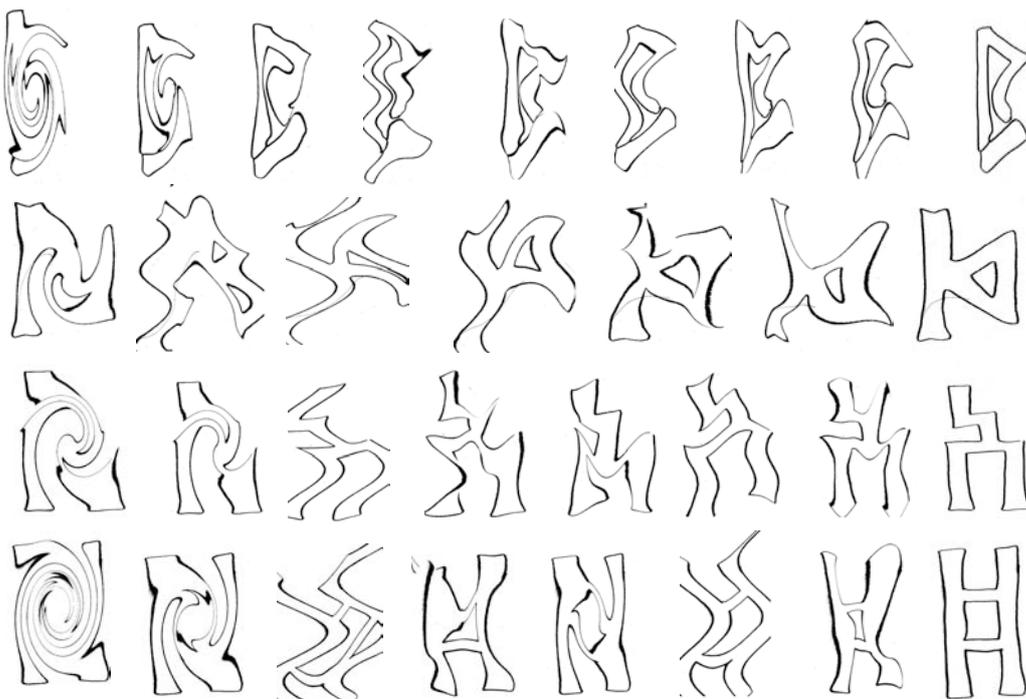

“swirl”, “mesh”, and “warp”. The researcher has moved gradually from the more simple to the more complicated processes while preserving the distinct nature of the element and maintaining its authenticity and historical characteristics.

The following are several examples of what the researcher has done to a set of written and human elements:

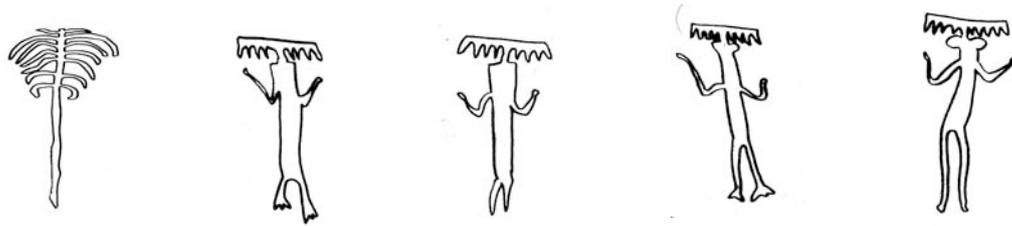

The written elements of the artistic heritage of the ancient civilizations in KSA before redesigning:

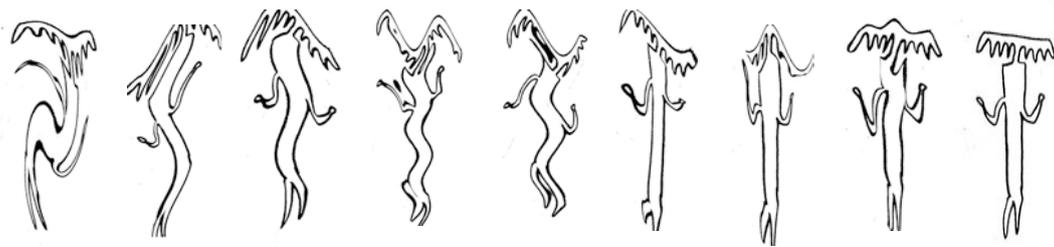

Changes made on the written elements:

The human elements of the artistic heritage of the ancient civilizations in KSA before redesigning:

Changes made on the human elements:

Designing techniques:

There is a close link between each of the raw material as used for formation and expression, and the technique as a means to represent the new shape that is based on the expression in the work of art. Thus the raw material and the technique are equally important factors for the creativity of work; the technique is part of the nature of the material. Having a role in presenting the final shape, both the material and technique contribute to the expression process.

The application:

After redesigning the selected elements, clay is used to implement these designs through the best technology with which the character of the element and the heritage fragrance carried in its lines are maintained taking advantage of all the possible ways of formation that exist in the clay. Therefore, Stoneware Paper clay is used for its high potential of formation.

The following steps have been followed in the implementation process:

- The shape is placed on a clay slab and is isolated from the background so that it tells the beholder that this element is trying to liberate itself from the background it is drawn upon. This process happens gradually so that the tiles altogether present the story the element liberation from the background. This technique presents a high sense of motion and an untraditional trend of ceramic tiles.
- The shape is then cut onto a clay slab trying to form the element by squeezing the clay inwards and outwards making cavities in both directions. These cavities are then used taking advantage of the resulted vacuum during the formation process.
- The shape is then cut off the thin clay slab embodying the element taking it from a two-dimensional surface to a three-dimensional environment through the squeezing process in which all the characteristics of raw material and the factors of vacuum and motion are used.

Here is the final result of that work of art:

Research findings:

- The creation of a new ceramic product whose design is characterized by authenticity and modernism.

Recommendations:

- To help researchers benefit from the artistic heritage of the KSA historical civilizations.

Asian States' Diplomatic Communications with Medieval China

Rachel Lung

Lingnan University, Hong Kong

Abstract

Language and communication issues in medieval Asia are inseparable from the impact of the Chinese cultural sphere (which denotes the learning and adoption of the Chinese language and cultural institutions from early imperial China). At a time when most Asian states had not yet developed their own written languages, the Chinese language was commonly used as the lingua franca in diplomatic communications not just with China, but among medieval Asian states as well. For those East Asian states with admirable proficiency in high-style Chinese, such as Paekche and Yamato (known as Japan since 700), communication with China is less of an issue. But how, precisely, did military empires such as the Hephthalites, whose civilization and literacy level were not highly developed, conduct direct linguistic contact with China? This paper investigates the efforts of the Hephthalites in approaching the Kumedhan and the Tuyuhun, sixth-century states from Central Asia, to bridge communications with imperial China in their tributary visit in 520. Based on pictorial and standard archival evidence produced in medieval China, I discuss the Asian states' practice of ghost-writing state letters to be presented to the Chinese throne and the use of relay interpreting to facilitate their diplomatic visits. I argue that China's documentation of foreign envoys' reliance on relay interpretation was not simply due to China's egocentric mindset, but was perhaps a true portrayal of a fact of diplomatic and commercial life in their China visits at the time.

Introduction

Ancient diplomatic contact between Asian states and China has been an intriguing subject given its relevance to historical politics and ideology in Asia. It is intriguing for two major reasons: first, the existence of a good number of small Asian states who spoke numerous vernacular; second, not many states developed their written languages before the early medieval times. How then did these states, with various level of writing and verbal progress, manage their oral and written communication? This article represents an initial attempt to examine such verbal communication from the perspective of translation history. This article will not deal with letters sent in medieval times by Yamato and the three Korean states (namely, Paekche, Silla, and Koguryō), which were generally confirmed to be written in Chinese, not translated, despite the fact that these countries did not usually speak Chinese in their home

countries at all. These Asian states, in fact, were the more active learners of the Chinese language and culture, and their Chinese proficiency can easily be explained.

Specifically, this article reports some of my findings in a historical study of translation in sixth-century Asia. It discusses the case of the Hephthalites (or the White Huns) regarding their ways to resolve their written and spoken communication problems in approaching China in 520. I conclude with conjectures pertaining to possible oral translation scenario and the related scripting strategies practiced in medieval times, based on China's archival and pictorial records. This article is structured into four sections: first, an introduction to the Chinese Cultural Sphere; second, a discussion of commercial interests involved in tributary journeys; and finally, an elaborate account of the Hephthalites' trip to visit Liang China (502–557) and the way in which they resolved their communication problems in the process.

Chinese Cultural Sphere

Since China is one of the earliest civilizations developed in Asia, written Chinese was often used for wider diplomatic communication across countries in Asia in medieval times.¹ This unique linguistic choice was rooted in the concept of the Chinese cultural sphere or the East Asian cultural sphere. The Chinese cultural sphere, roughly formed around medieval times (Gao, 2003), centered geographically round China, although it also covered the three Korean states, Yamato, and Vietnam. According to Han Sheng,

In the context of their shared background as agrarian societies, the country states in East Asia committed to reform themselves through learning from China. The East Asian cultural sphere was thus formed and characterized with the use of written Chinese as their common language of correspondence, the application of the Chinese ritual and legal institutions as their ethical norms, and the adoption of Confucianism as their cultural component. (Han, 2005, p.66; Lung's translation, 2009, p. 165)

Historically, China was well ahead of its Asian neighbors in the development of language and writing, institutions (ritual, political, and legal), and culture. China was thus looked up to as the Asian centre of learning in written Chinese (via standard histories and classics), Confucius learning, laws, and Buddhism, apart from other

¹ See Feng (2004, p.177-190) for state letters presented to China during the early eighth century from Central Asia.

technical and medical knowledge (Gao, 2003). Paekche, for example, actively “asked for collections of Chinese classics and Buddhist sutras [as means of learning] from China during the South dynasty [420–589]” (*Liangshu*, 54, p.805).

Apparently, learning the Chinese writing and language was an important tool to the Asian countries in their pursuit to learning from China in general. The Five Classics and other standard histories of China were therefore typically placed in the core curriculum in the schools set up in East Asian states at the time. In fact, Chinese characters were consciously introduced as early as the beginning of Christian era to Yamato, who had not yet, then, developed its own language.² By the third and fourth centuries, written Chinese was already quite well cultivated among the elite and in the ruling house of Yamato. It was commonplace in the imperial house of Yamato that princes were tutored by Buddhist monks from Paekche, who were masters of the Chinese language and culture. After all, Paekche received earlier and more direct cultural influence from China than Yamato, who was categorized merely as a remote people (*yuanyi*) in the political taxonomy of medieval China.

Communication with Medieval China

Eva Hung (2005) maintains that ‘relay interpreting’, literally the use of two or more interpreters, in the cross-linguistic and cross-cultural discourses archived in the Chinese history should not be understood simply as a pragmatic step to bridge the communication gap. The political significance of conscious and repeated references to ‘relay interpreting’, no doubt, suggest how much the Chinese thrones valued foreigners’ extra effort to come to China to pay tribute. This imperial mentality was closely tied in with the persistent ideology of China’s supremacy over others. The foreigners’ move to rely on translators or interpreters in their China-bound tribute missions, according to Hung, was honestly viewed by imperial China as an act of submission. Moreover, according to Hung, China “could not care less about the foreigners’ communication adequacy and concerned even less the way in which foreigners tackle their linguistic problems” (*ibid.*) when they approached China. However, Hung’s analysis of imperial China’s mindset is paradoxical. On the one hand, China was suggested to place premium on the levels of interpreting taken by foreign envoys to make the China visit possible. On the other hand, Hung maintained that China did not really concern itself to the linguistic barrier confronting the foreign visitors in those days. So ultimately did China care or did China not care?

² Niu Zhigong (2002, pp.422-3) says, “It was not until the eighth century that Japan developed its own written language, based on the Chinese writing system”.

Arthur Wright (1978) points out the practical eminence of written Chinese in sixth-century China despite its extended period of regional disunion before the Sui (581–618) unification. He made references to the instrumental value of written Chinese, which was likened to a common medium in exchanges with medieval China in general. Wright says:

The most obvious element in this common substratum is a written language that permitted communication across all manner of political and cultural barriers. A letter, a poem, a pronunciamento could be written in one corner of the Chinese subcontinent and be read and understood in the opposite corner. Written Chinese, thus described, would seem to resemble Esperanto—a language which indeed makes possible communication between men separated by distance and by culture. But the Chinese written by men of the sixth century communicated much, much more than the bare content of the message. By that time it had been continuously used and developed over a period of two millennia. And, as a result, almost every word and certainly every phrase carried with it from repeated historic use a rich freight of allusive meaning: echoes of men and events, references to places and times, to archetypal situations and much else. In all formal writing, specific historical allusions were omnipresent—used as argument to drive home a point or to refute one. Thus, tribal chiefs fresh from the steppe—once they had Chinese scribes to write communications for them—began to imbibe little by little the whole historic culture of China; and when their sons began to learn Chinese for themselves, the learning process was accelerated, and the moral and aesthetic appeal of the Chinese written heritage began to work upon them. (Wright, 1978, pp.43-4)

Three points are raised from Wright's foregoing observations about written Chinese as a language of power and prestige in medieval Asia. First, the stylistic sophistication of written Chinese in the political register, with embedded literary and historical allusions, would be challenging for foreign readership. Second, in pursuing communication with imperial China, foreign tribal chieftains often had "Chinese scribes" to compose (or translate?) letters for them. Third, as a measure to maintain communication with China, sometimes, sons of these tribal chieftains, in the form of "hostage princes" (zhizi 質子), would be arranged to learn Chinese, among other

knowledge, in China and therefore provide another source of Chinese experts for diplomatic exchange.

Commercial Interests and Translators' Roles in Tribute Journeys

Whether imperial China liked it or not, tributary visits made, through the assistance of interpreters, to China were not necessarily signs of submission in essence. Other commercial agenda was often behind such arduous tributary journeys. Tributary trips were originally conducted to forge ties in ancient diplomacy in Asia, either to lobby military support or to gain recognition for new regimes. As the system evolved, it was significantly blended with commercial interests (Lewis, 2008). In other words, tributary states would present regional products or rare items unique to their countries to curry China's favor. In return, these country states would expect to bring home precious items from China. In short, China's bestowal of gifts to visiting envoys was in principle a barter trade (Lattimore, 1940), although, not infrequently, envoys from strategically important states would be interviewed in the Court of Diplomatic Receptions (Lung, 2008), and possibly given imperial audience for purposes that went beyond commercial concerns.³

Translation is relevant in the discussion of such tributary journeys in the China context, because the act of translation or the level of relay interpreting was typically referred to in archival records documenting such encounters. Chinese archival records on foreign contacts often use the word "*translate*" to describe the way in which foreign envoys made their journeys to visit China. The number of translators employed for foreign embassies to communicate with Chinese officials was then taken as a reference point to indicate, symbolically, how keen they were to establish ties with it. It is totally understandable, then, why self-dramatizing statements about celebrating diplomatic encounters, with distant countries, are often used in China's ancient archives. For example, we have stock expressions "employing relay translators", "taking a treacherous journey and relying on three different interpreters", or "by means of nine interpreters" to pay tribute to China. It would be uncanny, no matter how remote these exotic countries were, that nine interpreters would be required to bridge language barriers concerned, but these inflated discourses should not cloud the plausible observation that relay translation was not necessarily an

³ Nicola Di Cosmo (2002, p.285) states that such gifts exchange between China and the foreign peoples existed as early as fourth-century BC China, as verified by a passage in *Mu Tianzi zhuan* 穆天子傳 (Biography of Prince Mu) composed around this time. It reads, "...the chief of western Mo (a tribe in the northwest of China) gave Prince Mu (of western Zhou China) 300 fine horses, 10000 cattle and sheep, and 1000 cartloads of millet. In exchange, Prince Mu gave him 29 golden necklaces, 30 belts of shells, 300 pouches of pearls, and 100 plants of cinnamon and ginger".

exaggerated expression, but perhaps a common contingent measure in inter-lingual communication in medieval Asia.

The Hephthalites

The Hephthalites was originally a nomadic horde of Turkish-Mongolian ethnic origin in the Altai Mountain. It later became a prominent military menace having expanded into a large swath of territories in the present-day Russian Turkestan. It rapidly acquired Samarkand and Bactria by about 440. In its hay days during the early sixth century, the sphere of influence once spanned over Afghanistan, Persia, the Punjab, Sassanid Persia, Kandahar, and Kabul. In 520 when the Hephthalites paid Liang China a visit, it was a dominant Central Asian empire. The Hephthalites paid a total of five visits to Liang China, and the frequent visits must have been motivated by China's material wealth. However, not having developed a written language, how did the Hephthalites produce a decent letter to assert China's 'superiority', which was a required protocol in Asian politics at the time?

Fortunately, and yet not unusually, many of the Central Asian states conquered by the Hephthalites were of more advanced civilizations with scripts developed. The Tokharian region that came under their control, for instance, was Bactrian-speaking and used a Bactrian script, which was linguistically affiliated to the ancient Iranian language (Ma, 2005). Chinese historians (Yu, 1986; Ma, 2005) conjecture that the Hephthalites might have transformed a conquered state in the Tokharian region into a puppet government to govern a swath of sedentary states there, using, probably, Bactrian as the language of administration. This observation is confirmed by the description of this empire in the *Liangshu*:

使旁國胡為胡書，……其言語待河南人譯然後通。(*Liangshu*, 54, p. 812)

[the Hephthalites] asked their neighbor state for a scripting service, using the language of the adjacent state, for written correspondence [...] their spoken language was only communicated [to us] through the interpretation of people from Henan (Tuyuhun).⁴ (Lung's translation, 2008, p. 189)

With the scripting service of their submitted state, the Hephthalites' lack of a script, therefore, would not hinder the China visit. This passage in the Chinese archive was

⁴ The Tuyuhun people was referred to as the Henan people 河南人 in Chinese sources because its leader was bestowed with the title of "king of Henan" by various regimes from the fourth through the sixth centuries (Shi, 2007). Its people lived in "the south of the Yellow River" (the literal meaning of "Henan"), and that was another reason why they were known as the Henan people.

initially perplexing precisely because the power hierarchy between the Hephthalites and their adjacent state was not explained. The scripting service was in effect instructed, not requested, by the Hephthalites.

According to the *Liangshu* (54, p. 812), envoys of three small states next to the Hephthalites, namely, Karghalik 周古柯 (Yarkand), Kabadiyan 柯跋檀, and Kumedhan 胡蜜丹 (regions closed to the frontier between N. Afghanistan and southern most Russia), tagged along the Hephthalites to China in 520. The fact that these three states asked to journey with the Hephthalite envoys may suggest that either they all faced similar language problems or they felt safe to travel in bigger group. As Richard Foltz suggests,

Inner Asia contains vast tracts of inhospitable land, often with little water and sparse human settlements, making them prime grounds for banditry... There is safety in numbers, and caravans could be made up of anywhere from several dozen to several thousand travellers at a time. (1999, p.9)

Which state helped the Hephthalites out with the literary assignment on their China visit? My conjecture is Kumedhan. First, Kumedhan, later known as Dharmasthiti in the seventh century, was in fact located in the Tokharian region in which a number of Bactrian-speaking states thrived under the Hephthalite influence (Xuanzang, 646). We cannot of course claim, with the existing evidence, that Kumedhan was Hephthalites' puppet state. But against this unique political background and considering the geographical and linguistic affiliations of Kumedhan, it is quite possible that Kumedhan was the state that offered the scripting, if not the oral translation, of the Hephthalite letter to China. Second, in the *Zhigongtu* 職貢圖 (tribute-paying painting) produced by emperor Yuan during Liang China around 539, letters from these three small states were actually inserted, at least in part, in the accounts placed next to their envoys' portraits.

Interestingly, it is only in Kumedhan's letter that the Hephthalite visit to China was awkwardly documented. It was awkward because they in fact came nominally as separate states, although they travelled together. The letter reads,

“...今滑使到聖國,用附函啟...” (*Zhigongtu*)

(...Now, the Hephthalite embassy came and visited this consecrated country, and its letter was attached here with utmost respect” [my translation].)

This letter makes no mention of Kumedhan having scripted the Hephthalite letter. Yet the delivering of this letter as an attachment in Kumedhan's letter to China was quite bizarre when obviously the Hephthalite envoys were there as well. I guess the Chinese translator of their letters, having noticed the Hephthalite letter written in the Kumedhan script and learnt of their ghost-writing arrangement, might have chosen to inform the court of this measured effort. Or alternatively, Kumedhan might have wanted to get the credit for being known as the linguistic mediator for the Hephthalites. Anyway, such a ghost-writing practice was not offensive to Liang China at the time because languages were not widely developed in most Asian states. Rather, the Hephthalites' indirect measure to compile a letter to China on its tributary visit was valued highly. Otherwise this practice would not be markedly documented in the account of the Hephthalites in the *Liangshu*. Unfortunately, the Hephthalite letter, somehow, was not documented either in the *Liangshu* or the *Zhigongtu* to throw further light on this subtle (oral) translation event known to have been conducted then.

It was not mentioned in the *Liangshu* if the three adjacent states had any communication problems in their journey to China. It would be a good guess that these states might also require language mediation, since the Hephthalite letter scripted, possibly, by a Kumedhan scribe, was in Bactrian, an Indo-European script, not Chinese. We can safely deduce that none of these three states would have any knowledge of written Chinese. This is confirmed when the Tuyuhun translator was asked to interpret the Hephthalite vernacular to the Liang Chinese court (to be discussed in the next section). However, their linguistic needs obviously were filtered out in the Liang chroniclers' brush, because, apparently, the rhetorical significance of the use of oral translation and interpreters to communicate with China would be more note-worthy with major states, like the Hephthalites, not minor states, in Liang China's diplomatic taxonomy and ideology.

The Tuyuhun

Historically, the Tuyuhun (329–663), originated from the Xianbei people from inner Mongolia, was a nomadic tribe living in northwestern China. In its expansion process, the Tuyuhun people had moved towards the south and the west ever since the fourth century to have exercised control over a stretch of areas around Gansu, Sichuan, and Qinghai, and absorbed sizeable population of different ethnic and language background. Subsequent to the downfall of Western Qin and Xia states, the Tuyuhun took over most of their territories, peoples, and properties. That explained its rise as a prominent state in the medieval times in a critical landmass encompassing the key juncture of China and Central Asia.

The incorporation of various regions in its territorial expansion naturally turned Tuyuhun into a multi-ethnic and multi-lingual existence, which became its edge as a linguistic and cultural mediator between East and Central Asia. In fact, the Tuyuhun people often, over centuries, served as travelling and linguistic gurus for generations of international traders or envoys coming from the remote western regions to visit China in medieval times. Tuyuhun's dynamic trading experience with surrounding regions also empowered its position as the guide to foreign merchants aspiring to transact business with China. For instance, it had commercial ties with peoples from the Mongolian steppe in the north, the western regions and Central Asia in the west, the Tibetan plateau and India in the south, and of course, China in the east.

If we examine the following text about the Hephthalite in the *Liangshu* further:

其言語待河南人譯然後通 (*Liangshu*, 54, p. 812)

their spoken language was only communicated [to us] through the interpretation of people from Henan (Tuyuhun).⁵ (Lung's translation, 2008, p. 189)

it is very likely that the Liang historian intended to relate that language mediation with the Hephthalite delegates was facilitated by the Tuyuhun interpreter(s) they hired to accompany them to China. If it was indeed the situation, the visiting states, in early sixth-century China, seemed to be expected to arrange translators on their own to facilitate the China visit. In this line of thought, the way in which the Hephthalites resolved their communication problems, as discussed here, might have been typical cases of this specific historical practice. In other words, the visiting envoys would consciously approach or hire 'exotic interpreters' during their China-bound journeys when there was no Chinese translator in their home countries. The fact that the Tuyuhun people actually thrived as entrepreneurial mediators on the Silk Road in medieval times serves to make this a convincing argument, if not a credible observation.

Conclusions

The examination of historical texts, verbal and visual, regarding the Hephthalites' China visit in 520 informs us about the peculiar nature of diplomatic interpreting in

⁵ The Tuyuhun people was referred to as the Henan people 河南人 in Chinese sources because its leader was bestowed with the title of "king of Henan" by various regimes from the fourth through the sixth centuries (Shi, 2007). Its people lived in "the south of the Yellow River" (the literal meaning of "Henan"), and that was another reason why they were known as the Henan people.

the sixth century. This case of linguistic mediation documents the practice of relay and oral translation as well as the classic mediating role of the entrepreneurial Tuyuhun people on the Silk Road that ranged from translators, scribes, travel guides, and providers of logistic support at the time. Similar means through which the Hephthalites resolved their communication problems are also documented in the *Liangshu* with reference to Silla's China visit. Seen from this perspective, the Hephthalite case of language mediation was not an isolated event, but probably a feature commonly found in the exchange between China and Asian states in medieval times. This observation, having been placed in proper historical perspectives, is all the more credible considering the language and political background of Kumehdan and the means of survival for the multilingual Tuyuhun people, which regrettably have not often been attended to in the historical study of translation in Asia.

Changes of Chinese Modernity Discourse: A Case Study of Chinese Cultural Conservatism

Yu Xuying the University of Hong Kong

By historicizing and contextualizing the discourse of Chinese modernity, my paper will delineate Chinese intellectuals' continued efforts to seek for an alternative modernity to the Western way from the semi-colonial and semi-feudal era to the globalization era. It will also explore how the "Chinese alternative modernity", as a discursive-political device, has been produced and packaged with different layers of contents and meanings under different historical, social, and cultural circumstances. It is a comparative study, including a diachronic study of Chinese intellectual currents in different eras, and a cross-cultural study on the interrelationship between Chinese and Western scholarships.

I will focus on an influential group of conservative intellectuals called the Xue Heng School in the 1920s who applied Western theories to defend Chinese traditional culture and criticize Western modernity. Since the voice of the Xue Heng School sounded contradictory to the keynote of Chinese modernity discourse established by the May Fourth Movement, it had been repressed for half a century. However, the long-neglected conservatives have been re-discovered since 1990s. The Xue Heng Study, which restarts promoting cultural conservatism of the Xue Heng School, has become a recent surge of Chinese modern history study. From the Xue Heng School to the Xue Heng Study, the shift epitomizes the continuity and transformation of Chinese modernity discourse. By comparing the historical controversy between the Xue Heng School and the New Cultural Movement camp with the contemporary Chinese modernity debate, I will argue that present Chinese modernity discourse reveals much more uncertainty, hybridity and paradoxicality.

The Xue Heng School: a Paradigm Shift of Modern Chinese Conservatism

The Xue Heng School is an influential group of intellectuals who graduated from Harvard University and founded a conservative journal *Xue Heng* (*Critical Review*)¹ (1922-1933) in China in order to defend Chinese traditional culture and oppose New Cultural Movement's modernization project. The emergence of the journal *Xue Heng* is a turning point in the modern Chinese history of thought, signifying the discourse of Chinese modernity opened a new phase. From late Qing to the early period of the New Cultural Movement, Chinese modernity discourse basically limited itself in the binary framework of "tradition/ modernization", which is embodied by a series of debates on "Chinese culture/Western culture" or "New Learning (*xinxue*) /Old Learning (*jiuxue*)". However, the journal *Xue Heng*, in a sense, marks that the focus of Chinese

¹ I use the journal's Chinese name "Xue Heng" instead of its English name "Critical Review" because the former implies the claim of the journal. Xue refers to "scholarship" and signifies the academic position of the journal, distinguishing it from other political conservative journal, like Jia Yin and Guo Cui. "Heng" means "impartial and unpartisan", which indicates that "the attitude of the *Critical Review* thus is one of moderation of the golden mean in intellectual and cultural matters". See Wu Mi. "A Statement by the *Critical Review*", Xue Heng, issue 13, 1923.

modernity discourse has changed from the dichotomy China/West or East/West into West/West, which means the question which Western modernity project should China adopt, instead of the question whether Chinese culture is available in the modern society, become the motif of Chinese modernity discourse. On the surface, the controversy between the Xue Heng School and the New Cultural Movement camp still lies in their attitudes toward traditional culture, similar to the difference between traditionalists and radicals, but according to the claims of the Xue Heng School, underlying the controversy are different intellectual resources—different Western theories.

"A Statement of the Critical Review" written by Wu Mi in English and published in issue No. 13 of the journal (January, 1923) clearly shows the stance of the Xue Heng School: They actually denied the label of "conservative", but on the contrary, considered they were "indirectly preserving Western tradition, learning and absorbing its spirit, rather than defending and preserving Chinese tradition" (Wu). Another leading member Hu Xiansu also defined the debate between *Xue Heng* and *New Youth* as the Chinese version of "New Humanism vs. Pragmatism", transplanting American controversy between Irving Babbitt and John Dewey (Hu et al. 14). Those claims reveals that the Xue Heng School's assertion of the importance of Chinese culture was no longer based on a nativist rejection of Western culture and modernity, but taking the discourse of critique of modernity to relocate Chinese culture in the map of global civilization to justify the tradition and see its potential contribution. From "China vs. the West" to "the West vs. the West", the debate between *Xue Heng* and *New Youth* epitomizes that after the First World War, China had been the cultural battleground for various Western thoughts and theories. Under the impact of global discourse of "decline of the West", Chinese intelligentsia began to re-examine the values of Chinese culture and Western culture in the framework of global civilization and reconsider the relation between Chinese tradition and modernity from the perspective of universalism. As Shu-Mei Shih pointed out, "modernity was a fact to be reckoned with, to be debated, to be better defined and delineated, all with an eye towards the native cultural tradition, so that modernity would no longer remain the sole property of the West, but would rather be hybridized, revised, and rewritten, and able to be claimed by the Chinese as well without their losing a fundamental sense of cultural confidence. The Chinese tradition was to be handled similarly, with an eye towards Western cultural traditions so that it would no longer remain the property of China but rather be hybridized, revised, and rewritten for larger purposes extending to the world." (Shi 159)

The journal *Xue Heng* also suggested a "paradigm shift" in the discourse of Chinese modernity—the focus changed from "the validity of modernity" to "the project of modernity"; the theoretic basis transformed from the evolutionary view and linear time-consciousness based on the binary opposition of "traditional/modern" into a seemingly dialectical and self-reflective structure. Applying Western modern theoretic tool (New Humanism) to revalidate the value of Chinese tradition, and compete with New Cultural intellectuals for the authority of introducing and importing Western culture, the Xue Heng School's cultural view reveals the self-contradictory quality and paradoxity of Chinese modernity discourse in the 1920s. On the one hand, the attempt to adapt tradition to contemporary needs is not the concern of the Xue Heng School. Instead, they tried to demonstrate that Chinese tradition could be an effective remedy for

the crisis of Western modernity. On the other hand, Irving Babbit's New Humanism, as a modern critical theory, was used by the Xue Heng School as the only criterion to judge the merits and vices of various cultures. Therefore, the Xue Heng School offers a critical but modernization-oriented cultural proposal, which makes modernity in Chinese context both irresistible and problematic category. It is true that the self-critique of modernity and the pessimism on Western culture were already prevalent in the West after the First World War, but Chinese modernity discourse had a distinctive and noticeable characteristic. The critique of Western modernity among conservatives in the 1920s partially rooted in cultural nationalism, and partially resulted from an anachronistic appropriation of Western anti-modernity discourse. Firstly, the relationship between the Chinese nationalism and the discourse of Chinese modernity exposed a dualistic quality: since China's modernization process was compelled by imperialism and colonialism which are outcomes of modernity, it began with a nativist antipathy towards the West. The critical stance toward modernity discourse was undoubtedly an expression of Chinese nationalism. Nevertheless, for a long time, modernization was regarded as the only effective means for self-strengthening China and rebuilding a strong and united nation-state. As a matter of fact, a series of movements, reforms, and revolutions from late Qing to the early 1910s, had more or less westernized and modernized the institutions and configuration of Chinese society in cultural, political and social realms. Therefore, Chinese modernization started and continued with a resistance to modernity itself. Secondly, while western self-reflection of modernity rose when the Western modernity had arrived at a late stage and showed its dark sides, as a victim of Western colonialism, except natural resistance to Western aggression, Chinese conservatives' impressions of crises and problematique of modernity basically formed under the impact of Western discourse of revolting against modernity. Besides the pessimism on their own culture, Western intellectuals began to pay attention to Eastern cultures, including Indian and Chinese culture that represent purely spiritual cultures in their opinions, and attempted to seek for an alternative model to Western modernity. Chinese intellectuals' cultural confidence, which had been lost for a long time, was suddenly encouraged by such "respect" and affirmation. The prevalence of Oswald Spengler's *The Decline of the West* and Bertrand Russell's *The Problem of China* are good examples illustrates how Chinese modernity discourse intertwined with the global modernity discourse.

However, the Xue Heng School and other conservative's anachronistic appropriation of Western anti-modernity discourse cannot be regarded as a theoretic naivety, but is a reflection of the struggle between the traditional culturalism² and the developing modern nationalism in the transitional period. The paradigm of "culturalism to nationalism"³ is widely used by scholars of China study to describe the changes of national identity from ancient China and modern China. According to Levenson, Culturalism and nationalism were competing for loyalty among intellectuals of turn-of-the century and the era was one in which "nationalism invades the Chinese scene as culturalism helplessly gives way." (Levenson) Yet the case of Xue Heng School demonstrates the coexistence and tension between modern national consciousness and cultural nostalgia. On the one hand, the former determines that the cultural proposal of the Xue Heng

² Culturalism, according to Prasenjit Duara, refers to a natural conviction of cultural superiority that sought no legitimation or defense outside of the culture itself. The term is widely used to refer to unique characteristic of pre-modern Chinese national identity. See Prasenjit Duara, "De-Constructing the Chinese Nation", *The Australian Journal of Chinese Affairs*, No.30, July 1993.

³ This paradigm was perhaps most eloquently formulated by Joseph Levenson in his first book *Liang Qichao and the Mind of Modern China*.

School is fundamentally modernization-oriented; on the other hand, the latter makes the Xue Heng School strategically appropriate Western critique of modernity to elevate the role of traditional culture in Chinese modernization.

The Xue Heng Study and Neo-conservatism

The long-term canonization of May Fourth discourse that characterized by iconoclasm and radical westernization has been challenged by the intellectual current of “comprehensive reflection on the May Fourth Movement” in the 1990s. In an effort to reappraise the legacy of radicalism and to find the alternative voice in the intellectual history, Chinese contemporary scholars and intellectuals in the 1990s revisited the May Fourth period and rediscovered the underestimated conservative component in the movement. As a spokesman of Chinese modern conservative, the Xue Heng School is definitely a good example for pro-conservatism scholars and intellectuals to break the May Fourth myth and further criticize the radicalism. The academic hotspot is triggered by Yue Daiyun’s influential paper “Reassess the Critical Review---also on the modern Conservatism” published in 1989. In this paper, Yue firstly labeled the Xue Heng School “cultural conservatives” in order to distinguish them from other political conservatives and traditionalists, and then applied the framework—the triad conservatism/liberalism/radicalism to divide the intelligentsia in the New Cultural Movements into three camps. By affirming the value and significance of the Xue Heng School’s cultural conservatism from the perspective of cross-cultural dialogue, this article aroused a trend of “revaluating the Xue Heng School” not only in mainland of China, but also in Taiwan and US academia. The claim of “revaluating” itself implies a subtle research motivation—by reassessing previous negative evaluations on the Xue Heng School and other conservative to deconstruct and de-canonize May Fourth discourse. The Xue Heng Study is an epitome of a “conservative turn” in both cultural and political domains in the 1990s.

The cultural conservatism in the 1990s, as the theoretic background of the Xue Heng Study, had two threads: the critique of radicalism and post-ism’s (後學*houxue*) reflection of modernity. The first intellectual current, the repudiation of “cultural radicalism” in the 20th century, was raised by historian Yu Yingshi’s talk entitled “Radicalism and Conservatism in Chinese Modern Thought History” in 1988 in the Chinese University of Hong Kong. Yu saw the whole modern Chinese history as a gradual process of radicalization, starting from the Qing Reform Movement, reaching the peak in the Cultural Revolution and reappearing in the 1980s. Yu accused radicalism for its destruction of Chinese cultural tradition and blind westernization. This repudiation triggered a hot controversy over “radicalism vs. conservatism” in the Hong Kong journal Ershiyi shiji(Twenty-first century), oversea journals Modern China, and Orient(dongfang), Literature Review(wenxue pinglun), ZhongShan and Shanghai Literature(shanghai wenxue) in China.

Obviously, Yu’s observation of Chinese modern history is problematic. For instances, as Zhu Xueqin pointed out, Yu’s view that attributes the disasters of modern China to the cultural radicalism actually simplified the complicated history of 20th century to a pure intellectual history that should be only a facet of changes of Chinese society, but ignores the historical

contingency and complexity. Ironically, Yu's argument shares the common ground with so-called cultural radicalism he criticized: the cultural determinism, which means a belief that regards cultural forces play the determining role in evolution of the society (Zhu 121). Though attempting to confine his discussion to cultural realm in order to show purely scholastic standpoint, Yu's critical review of radicalism in fact conveys his own politics, which combines cultural conservatism and liberalism as well as somewhat anti-communism incline. When Yu Yingshi denounced "radicalism", he especially singled out Chinese Communist Revolution, and regarded the Cultural Revolution as the most radical and destructive practice, which was opposite to preexisting cultures and orders at all times and in all over the world: not only Chinese traditional culture but also the Western modern culture, even including orthodox Marxism. However, Yu's cultural conservatism and political liberalism were widely used by Chinese neoliberals as intellectual and historical license against radicalism, idealism, and utopianism. It is worth noting that in the 1990s, the conservative voices have not all emanated from China, but also come from abroad. Both a large number of exile intellectuals resulting from the 1989 Tiananmen incident, and a number of rising scholars who studied in Europe, the United States and Japan, played important role in this conservatism wave. Therefore, as Liu Kang concluded "the conservative current spreading from the Hong Kong, Taiwan and oversea scholars to the mainland can hardly be seen as politically innocent, especially if it is understood within the context of the antirevolutionary wave in China studies in the West since 1970s that aims to delegitimize the revolutionary legacy." (Kang) In other words, underneath the critique of radicalism in the 1990s is a reflection on socialist practice. Compared to 1980s intellectuals' critique of socialism under the slogan of "anti-feudalism"⁴, the repudiators in the 1990s took the position of cultural conservatism and criticized Chinese socialist movement for its deconstruction of Chinese tradition. Considering the global theoretic context in the 1990s, such "conservative turn" can be regarded as an echo of two prevailing Western intellectual currents: one is the rise of global conservatism, especially American neo-conservatism (Panichas and Ryn); another is the influence of Post-Cold-War ideology— Fukuyama's "the end of history" and Samuel P. Huntington's "clash of civilization". In a word, the critique of radicalism that represents the reflection of Chinese socialist modernity actually belongs to global critique of "communism utopia" after the Cold War.

Another thread of cultural conservatism in the 1990s is the "post-ism", which is basically a transplantation of contemporary Western postmodern and postcolonial theories. As more and more postmodernism and "Orientalism" theories were applied to stress the alternative modernity to the Western model, the cultural conservatism in China evolves as "the Third World criticism" which is characterized by emphasizing the uniqueness of Chinese path and antagonizing Western cultural hegemony ("the First World Criticism") (Xu). Post-ism's simplified parallelism between Chinese status in quo and general post-colonial condition was widely criticized for its theoretical anachronism. Zhang Yiwu, the leading representative of "post-" scholars, insisted that their approach is different from western postcolonial and postmodern:

⁴ In the 1980s, the New Enlightenment criticized Chinese socialism for it follows the feudal tradition. Painting traditional socialism as a relic of feudal tradition was not merely a tactic on the part of the New Enlightenment intellectuals; it was also a means of self-identification. It allowed them to identify themselves with the antichurch and anti-aristocratic European bourgeois social movement. See Y. C. Wang, Chinese Intellectuals and the West, 1872-1949 (Chapel Hill: University of North Carolina Press, 1966).

This exploration tries, first, to find a new position: "the other of the other". While seeking to transcend the old condition of "Otherness" and refusing to take either side of the oppositions of universal/particular, classic/modern, it reflects on both in the context of contemporary culture and offers new insights. Second, it implies participation in contemporary culture --it implies the Gramscian role of the "organic intellectual". It neither stands apart from culture, nor tries to transcend culture, but seeks theoretical advances from within the dialectical thought of transformations in society and culture. It maintains a critique of Western cultural hegemony, but this critique does not imply a decisively nativist conservative perspective. This new perspective allows a new grasp on the "condition" of hybridity in contemporary China. This grasp was made possible by an appropriation of Western theories, but this appropriation does not imply the use of theory to advance interpretations of the Chinese context; rather, it recognizes that the transcendence of theoretical hegemony is dependent on reflection about and critique of theory. This requires the use of theory to critique theory, using contemporary Chinese conditions to reflect on theory, and using theory to match contemporary Chinese conditions, so as to produce a two-sided hermeneutic and gain a new cultural imagination and creativity(Zhang).

It should be noticed that when the post-ism statement attempted to use Chinese condition to examine the applicability of Western theories and further challenge Western theoretical hegemony, it actually lost the original critical position of those "*post-*" theories in Western context. Whether post-modernism or post-colonialism, they offer a challenge to the dominant Western modernity discourse, revealing the self-reflective and self-critical features of Western theories. However, in Chinese appropriation of those "post-" theories, scholars of "post-ism" only echoed Western reflections on the Western model of modernity, but turned a blind eye to the crisis of Chinese modernity caused by inner factors. Thus, those "post-" theories in Chinese context lose the critical thinking, and even on the contrary, cooperate with the official ideology, which are intentionally promoting the cultural nationalism and cynicism in post-1989 era.

Parallel to the cultural conservatism, there is also a neo-conservatism rising in the political realm. Neo-conservatism is loosely used to label a body of arguments calling for "political stability, central authority, tight social control, role of ideology and nationalism."(Chen)Political neo-conservatism continued the thread of neo-authoritarianism debate in the 1980s. Neo-authoritarianism debate, occurring between South School (Nanpai) and North School (Beipai), tried to deal with the conflict between central authority and democracy, and explore their respective roles in China's economic and political reform. The representative of the North School Wu Jiexiang held that China should transplant the existing Western market economy and modern enterprise system and through administrative means to rapidly change old system and achieve marketization; while the South School worried that directly replicating Western economy and political institutions without considering China's national condition would lead to economic, political and social disorder, hence, they insisted that government should rebuild and strengthen their authority first and then gradually reform economy and political system by means of tightening macro-economic control, anti-corruption and maintaining social stability.

Although both North and South scholars are reformists and stressed the importance of

central power and administrative means in boosting modernization and marketization, they had different opinions on the role of central authority: the former attempted to use central power to eradicate the obstacle to modernization and reform in their opinions; while the latter regarded the authority and legitimacy of the regime as the basis of social stability and reform. As the representative of South School Xiao Gongqin summarized, North neo-authoritarianism in nature is a packaged radical democratism and liberalism, while South neo-authoritarianism is a gradualism or belongs to the category of conservatism. This intellectual debate is interrupted because of Tiananmen incident. According to South neo-authoritarianism, Tiananmen incident, is "a bitter conflict between the political order required by the realistic logic of reform and political romanticism and idealism that had overstepped the historical phase,"(Xiao) and finally led to a failure of democratic and liberal radicalism.

Based on the thorough reflection on China's national condition and the momentous changes since 1989, Xiao Goingqin developed his neo-authoritarianism into a more "realistic" and empirically based theory called neo-conservatism. Neo-conservatism theory provides a more systematic and practical political project that can be regarded as a tactic response to emerging domestic and international difficulties and social problems CCP regime faced: a distrust in central authority and a repressed antagonism toward the state caused by the Tiananmeng incident in 1989; a crisis of faith in official ideology, Marxism or Communism, especially spurred by the Soviet upheaval; a cultural nihilism and a new cynicism toward belief systems brought by accelerated and radical marketization and Occidentalism in the 1980s. Confronted with those issues, neo-conservatism re-emphasizes the importance of traditional value system and central authority due to their positive agent roles in modernization and social transition. To neo-conservative scholars, tradition is indispensable to modernization, especially in late-developing countries for following reasons: firstly, social stability must base on people's respect for historical continuity. Secondly, since traditional politic institution is an authoritarian system, some traditional resource and ingredients could be transformed to benefit contemporary social or economic reform, especially effective in coordinating and mediating the relation between neonatal modernization force and existing social structure. Third, as collective memory of a nation, traditional culture is the original source of national identity that can help hold Chinese people together again, especially when official ideology is fading and losing its prestige due to Tiananmen incident and upheaval of Soviet Union. While promoting traditional values, including traditional political system and traditional culture, neo-conservatism is still a modernization-oriented theory in terms of its democratic and market-economy orientation. The fundamental difference between conventional conservatism and neo-conservatism is that the latter argue for traditional value and strong authority more as a means than as an end.

Another emphasis of neo-conservatism is criticizing democratic and liberal radicalism. According to Xiao, radicalism in China has three types: 1) mental radicalism, a mentality seeking to transform society by an immediate eradication of the old system without considering the feasibility and necessary conditions. 2) institutional determinism, which attributes all of China's problems to its bad institutions and thus can only be solved by a wholesale Westernization of Chinese society, viz. copying Western political and economic institutions. Such institutional determinism, similar to cultural determinism in New Cultural Movement, in fact is a kind of

Occidentalism; 3) rationalist radicalism, which roots in political romanticism or perfectionism and bases the social-economic-political programmes upon certain moral doctrines, seeking to construct social system in the light of some abstract and so-called self-evident principles. From the perspective of neo-conservatism, the immediate implementation of liberal democracy, radical and overall changes may break down central authority, cause social chaos and even lead to national disintegration. A series of political events, such as Tiananmen incident, breakdown of Communist regimes in the Soviet Union and Eastern Europe, to some extents, have shown that neo-conservatives' worries are not groundless. However, severe critique of liberal and democratic radicalism does not mean that neo-conservative thinkers were against democracy and market reform. For them, "a powerful central authority is always perceived as instrumental, rather than obstructive, to reform."(Feng) Replacing "utopian promise" with more practically "realistic gradualism", using traditional belief system and cultural nationalism as new sources for the legitimacy of socialist ideology to maintain social stability for the market-led reform, the core idea of neo-conservatism is gradualism.

Comparing the cultural conservatism with political neo-conservatism in the 1990s, the similarities, such as asserting traditional value, against radicalism and espousing gradualism, are obvious, yet they represent different positions. The political neo-conservatism basically explores the strategy of modernization from the position of government, while cultural conservatism actually is a projection of intellectual politics. It could be said that the difference reveals the ambiguous and even contradictory interrelationship between intellectual politics and state politics. On the one hand, as mentioned above, cultural conservatism's heightening the importance of traditional culture (especially the Confucianism) and repudiating revolution, to some extents, are delegitimizing the official ideology and socialist modernity. Moreover, the purely scholastic stance of cultural conservatism together with succedent scholastic turn and professionalization in Chinese academia symbolizes intellectuals' retreat from the public sphere and political realm in the post-1989 era. On the other hand, the popularity of conservatism in the 1990s, whether political or cultural, is related to the support of the regime. The most evident example is a document entitled "Realistic Responses and Strategic Choices for China after the Soviet Upheaval" written by several official secretaries and scholars in 1991 after Soviet Upheaval. This article suggested: first, the leaderships should stress the gradual reform under the guidance of realism and pragmatism instead of political romanticism and idealism; Second, since socialism or communism as the official ideology is no longer convincing in the context of post-cold war and post-1989, lofty and noble traditional culture should be incorporated into national ideology to re-establish a cultural bond Chinese people and to avoid social disorder and crisis of faith. This article implies that in order to stabilize the regime and legitimize official ideology, the government intentionally and implicitly promoted the political and cultural conservatism in the 1990s. The paradoxicality suggests that conservatism in the 1990s can be seen as a tactic consensus between the leadership and intellectual circles on how the Chinese modernization should be carried out.

Conclusion

The cultural conservatism of the Xue Heng School can be regarded as the beginning of a search for an alternative modernity when China was just involved in the modernization, while the Xue Heng study that restarts promoting the cultural conservatism, symbolizes another effort to seek for the Chinese alternative in the post-modern and globalization era. From the Xue Heng School to the Xue Heng Study, the shift epitomizes the continuity and transformation of Chinese modernity discourse. On the one hand, the debate on Chinese modernity that began in the New Cultural Movement at the turn of the twentieth century and was suspended in Mao era has restarted in the 1980s. Reviewing the contemporary cultural climates contributing to the rise of the Xue Heng Study, we can see that a set of issues, which were once the central themes of in the Xue Heng School era, have reappeared and revived in the Xue Heng Study. On the other hand, as social, cultural and political contexts have changed, those issues have been re-discussed and re-written in a new way.

In comparison with modern Chinese conservatives' perspectives on alternative modernity, contemporary conservatives' advocacy of "Chineseness" in the global system actually has been more and more explicitly separated from cultural nostalgia and national identity, and become a symbolic capital or a tactical response to the global market. Furthermore, modernity discourse in contemporary China reveals much more uncertainty, hybridity and paradoxicality, and is more deeply intertwined with post-modernity discourse and globalization discourse.

China, Africa and the “development” question: old wine in new bottles?

Ivan Evans (UC San Diego: ievans@ucsd.edu)¹
Sharon Grimm (UC San Diego: sharongrimm@gmail.com)
Fabrizio Farina (UC an Diego: ffarina@ucsd.edu)

Introduction

The ongoing malaise of global capitalism suggests to many that the neo-liberal “Washington Consensus” has irretrievably broken down and that a new model centered on China’s extraordinary growth over the past two decades is all but inevitable. For many, developments on the African continent offer compelling evidence of an ascending and insurgent “Beijing Consensus” in international affairs. The sudden explosion of Chinese OFDI (overseas foreign direct investment), personnel, trade and cultural contact with African countries is reflected in a surge of scholarship devoted to various aspects of “China in Africa”. Attention focuses mostly on the dramatic increase in China’s economic stakes in the continent and especially on the country’s near-frantic search for raw materials such as oil, timber and minerals to fuel its rapidly growing economy. However, comparatively little attention in this literature has been devoted to the unintended consequences of the accelerating ties between China and an ever-increasing number of African countries.

One of the developments that contemporary Chinese authorities do not seem to have prepared for is the emergence of an African presence in a small number of “Chocolate Cities” that have emerged within coastal cities on China’s coast. Without exaggerating the importance of this tiny African community, this paper argues that African communities in China serve as an optic for understanding the sort of cultural changes that global hegemony is likely to stoke in China. Small in themselves, these changes may well compel the Chinese to reassess aspects of their internal history as a necessary condition for acclimatizing China to the inconveniences that aspirant global hegemon inevitably have to deal with, both abroad and at home. Indeed, critical reassessments of Chinese identities in response to the African presence in China have already begun. It should be noted that Japan became a dominant economic player in the international economy but never aspired to political leadership in global world. Also, Japan developed rapidly in the shadow of and *cooperated with* the USA-led “West”. In contrast, China seeks to rewrite both the economic and political rules of the global world. Therefore, neither Japan’s “success story” nor its ability to remain ethnically “pure” for so long is likely to serve as a sort of guide for China’s global aspirations. As in so many things, China will have to discover for itself, and hopefully will embrace the global cultural forces that are already beginning to transform cities located in the Pearl River Delta (Hong Kong/Shenzhen/Guangzhou), on which this paper concentrates.

¹ Address correspondence to: Ivan Evans, Department of Sociology (ievans@ucsd.edu).

In general, this essay argues that China-Africa relations are ambivalent. China will soon be the continent's major trader and investor. Africans generally view China positively, but—at least in some quarters—also guardedly. Within China, there is clear evidence that diaspora Africans live in segregated ethnic enclaves and report high levels of isolation, although there is some debate to what degree these developments are straight-forwardly racist or also fuelled by structural, globalizing changes that have dramatically transformed globalizing cities such as Guangzhou.

China in Africa

For all intents and purposes, the period that we may consider the “early years” of China-Africa relations is a lengthy one, stretching from the era of the Ming dynasty in the 1400s to the Bandung Conference of 1955. Admiral Zheng He (the “Chinese Columbus”) led seven sea-faring expeditions between 1405-1433 and brought back from Africa ivory, gold, exotic animals and even “devil slaves” to serve in the imperial court. Shortly afterward, following Zheng He's seventh mission, the Ming rulers put an abrupt and mysterious end to all engagements with Africa, forbidding further missions, halting all shipbuilding and burning official documents of the voyages to prevent further interest in the matter. During the 15th and 16th centuries, however, Portuguese ships delivered African slaves to Macau, where the African influence lingers on in distinctive cuisines. (Hutchison 11).

The next formal meeting would not happen for another half millennium, when Premier Zhou Enlai met in 1955 with twenty-nine Asian and African countries at the Bandung Conference in Indonesia. Delegates from countries opposed to colonialism—including Egypt, Ethiopia, Liberia, Libya, Ghana and Sudan—attended the conference in Bandung, Indonesia. In the following years, the PRC undertook minor efforts to assist in the development of these nations, marking, for example, Guinea's independence from France in 1960 with a donation of 30,000 tons of rice (Wei 15; Snow 145).

In general, however, “though the official rhetoric of continuity speaks otherwise, the fact is that from the opening of official ties with Egypt in 1956, China's engagement with Africa has been episodic, shifting from periods of intense activity in the 1960s and early 1970s to outright neglect for much of the 1980s”. (Alden 2007, 9). One of the key developments in this period was China's celebrated construction of the TanZam railway in the early 1970s, linking Zambia to the Tanzanian coastal port of Dar-es-Salaam. This decision was apparently the outcome of a direct request to Mao that the Presidents Nyerere (Tanzania) and Kaunda (Zambia) made. The TanZam project is widely viewed as prefiguring key features of Sino-African relations today, viz. the Chinese sensitivity to African-defined needs and its readiness to accommodate them. Throughout the Cold War era, furthermore, a central goal of the Chinese government was to persuade countries to abandon their official recognition of Taiwan.² These goals—respecting the wishes of

² China proved successful in this strategy. In 1999, Taipei had diplomatic ties with only eight African countries (Burkina Faso, Chad, Gambia, Liberia, Malawi, Sao Tomé and

African states and ending recognition of Taiwan—are central to China’s dealings with Africa today. Some have argued that the unfavorable attention that the 1989 Tiananmen Square incident attracted to the PRC marked a turning point in China’s relations with Africa. To gain international political support and expand its influence in the post-Tiananmen era, Sutter speculates that the government upgraded its relations with Africa by forging what Chinese leaders call “trust-based relationships” between “South-South countries”. A “no strings attached” policy is a fundamental component of China’s “trust-based relationships” with African states. Pragmatic to the core, China expects no more than what it wants from Africa and categorically refuses to link cooperation or assistance to the sort of economic and political conditionalities that govern US relations with developing countries. China has therefore de-linked economic assistance from nettlesome questions about human rights, environmental degradation, developmental priorities and the persecution of regime opponents in Africa. Unsurprisingly, recent research indicates that a majority of African countries prefer to deal with China rather than the US and that more are likely to turn towards the much more indulgent partner in the East. (Sutter 2010, 312; Kitussou 2007, 21).

Rapid economic development is driving China’s fast-track, “non-ideological” rapprochement with Africa. But there is also seems little doubt that Africa finds itself at the end of a veritable bonanza, the beneficiary of China’s “display of “soft power” to secure badly-needed materials while isolating Taiwan diplomatically. For example, at the third meeting of the Forum on China-Africa Cooperation (FOCAC, which meets every three years), President Hu Jintao pledged to bring the volume of trade with Africa to \$100 billion by 2010; promised \$3 billion in preferential loans; wrote off part of the debt (\$1.3 billion) owed by countries that maintain or establish diplomatic relations with the PRC (and not Taiwan); established a \$5 billion fund to encourage Chinese enterprises to invest in Africa; widened the duty free access to the Chinese market -by increasing from 190 to 440 the number of tariff-free products to African countries that renounce diplomatic ties with Taiwan; and arranged for technical experts to provide extensive assistance wherever such countries required it. (Marks, in Melberg 2007, 46).

Are such developments “old wine in new bottles?”, a new form of “assistance and cooperation” that merely supersedes the regulatory regime that bodies such as the WTO, the IMF, the World Bank and USAID currently impose on developing countries? Do the animating policies of FOCAC merely place a Chinese face on the sort of exploitative and authoritarian outcomes that have long been associated with Western neo-imperialism and neo-liberalism? Moletsi Mbeki (deputy chairman of the South African Institute of International Affairs) has recently warned against continuities he perceives in American “aid models” and China’s rhetoric about “Development with Friendship, Peace, and Cooperation” with Africa: “Africa sells raw materials to China and China sells

Principe, Senegal, and Swaziland). In 2010, only four of those still recognize Taipei (Burkina Faso, Gambia, Sao Tomé and Principe, and Swaziland) (Sutter (2010), p 314). In 1996, Mandela suddenly announced its unique recognition of Beijing after the PRC pledged \$18 billion for the construction of a petrochemical complex. Alden (2007), pp33-34).

manufactured products to Africa. This is a dangerous equation that reproduces Africa's old relationship with colonial powers. [...] China's export strategy is contributing to the de-industrialization of some middle-income countries.” (Marks, in Kitussou 2007, 48) Without a strong tradition of element of public accountability, African leaders who negotiate deals with China are also free to engage in “bait and switch” policies, transferring the products of China’s investments from the public to strategic supporters. Chinese-built civilian homes in Ethiopia, for example, ended up in military officials' hands, eliciting from a Chinese functionary the telling opinion that “so long as Ethiopian officials are happy, our goal is fulfilled”. (Cited in Schiller (2005) in Bond (2006), p 74). China’s principle of non-interference in the affairs of other states not only props up oppressive regimes in Africa but actually undermines the moral conditionalities that Western democracies claim to value. Scholars note that China has aggressively counterbalanced and neutralized Western insistence on “humanitarian” policies in the Darfur region of southern Sudan. For example, in July 2004, Security Council Resolution 1556 “demanded” that Khartoum disarm the rampaging Janjaweed militia and bring its leaders to justice. China abstained on the resolution. Khartoum subsequently ignored it, correctly surmising that the international community would not back up its “demand” with any significant action.³ For many observers, such developments closely parallel the various atrocities and humanitarian violations that Western states and corporations have long either tolerated or even actively encouraged in Africa.

A recent report by Transparency International concludes that China’s impact on Sub-Saharan African countries is reflected in the correlation between the scale of FDI and scores for official corruption. An important finding is that the US invests in relatively less corrupt countries (which share an average level of corruption of 105). Countries that fall within the “Chinese sphere” sport levels of corruption that are 87.5% higher than in the countries in which the US is the major foreign investor.⁴ Although African leaders and media are generally welcoming of China’s growing presence as well as its policy of “non-interference”, they have also complained that Chinese businessmen, officials and workers rarely strike up cordial relations with local African communities, preferring to live in segregated compounds or to cluster in distinct sections of towns and cities.

How do Africans perceive the massive presence of China in their respective countries? In one of just a few systematic empirical studies that address this question, Loro Horto argues that the division of opinion amongst Africans is determined by socio-political status and the nature of China’s presence in different countries. A survey of 67 African officials in six countries revealed that fully 63 expressed positive views of what Ian Birrell describes as “the China invasion”. In contrast, ordinary citizens often pointed out that contemporary Africa has become “the new dumping ground” for cheap Chinese products and a repository for unemployed workers and technicians in China, despite high

³ (Reeves, “Partners in Genocide”, December 2007, retrieved from <http://www.tnr.com/article/politics/partners-genocide>, last access 05/08/2010).

⁴ Transparency International, www.transparency.org/policy_research/surveys_indices/cpi/2009/cpi_2009_table, (accessed 03/06/2010)

levels of local unemployment in all African countries? Supported by NGOs, ordinary citizens also complain about the significant environmental damage that Chinese projects cause. Local villagers in Mozambique, southern Sudan, Nigeria, and Equatorial Guinea have attacked and killed members of Chinese oil development teams. In Nigeria, rebels have warned Chinese companies not to enter the oil-rich Niger delta. In contrast:

African elites in general seem to welcome China's new-found enthusiasm for the continent. China provides many African governments with generous and large loans, allowing them to develop badly needed infrastructure, expand agriculture, and strengthen their security apparatus. Perhaps most attractive of all, Beijing asks no questions nor imposes any conditionality on such investments, at least for now.

... Moreover, China's model of a strong government and its focus on economic growth is looked upon by many African despots, and even some democratic leaders, as an example to follow.⁵

In the eyes of Dambisa Moyo, who welcomes the deluge of Chinese investment and the staggering array of ongoing and planned Africa projects, the West's "obsession with democracy" has hindered development in Africa's ethnically fractious countries. Only after a strong middle class has taken firm root will democracy become a reasonable and obtainable African goal—and the Chinese, as Horta's respondents observed, are doing precisely that.⁶ Furthermore, Western companies are attempting to re-enter the economy in response to China's meteoric rise on the continent. Looking beyond China's voracious appetite for the same African oil supplies that it also prizes, the US has not only stepped up its trading and humanitarian policies but has also created AFRICOM, a new command structure responsible for U.S. military operations and relations with all African nations (except Egypt).⁷ Horta concludes that only time will reveal whether elite or commoner sentiment towards China will prevail.

Adams Bodomo has recently taken issue with the standard assumption that China, with its population of 1.3 billion, is destined to remain the dominant partner in its "asymmetrical relationship" with Africa, a continent fragmented into 53 countries. For

Bodomo, Africa's saving grace is that African countries "often vote mostly *en bloc* on topical international issues"—which is how Africa delivered the Olympic Games to Beijing—and can muster a "massive voting clout at the UN and other international bodies like the IOC and the WTO". Moreover, the success of the South Africa Brewing Company in becoming the largest brewer by volume of beer in China suggests to him that other African enterprises might yet learn how to do business in and profit from China's enormous market. The future of the China-Africa, he concludes, might be more symbiotic than asymmetric.⁸

Africans in China

Whereas the "China in Africa" literature is quite extensive, interest in the reverse development—"Africans in China"—is still embryonic. This latter literature has essentially emerged in response to two related but distinct episodes, both of which strongly suggest a racist Chinese reaction against the presence of Africans within their communities. The first was the spate of anti-black protests and occasional violence by Chinese students against African students in the 1970s and '80s. The second event was the emergence of riots against Africans living in residential quarters in Guangzhou that have come to be known as "Chocolate City". Although these two events were driven by very different logics that should be carefully distinguished, their common effect was to debunk the official view that racism is "uniquely absent" from Chinese intellectual and political history. (Dikötter, 1994) Accordingly, China's ideological ambitions in Africa have much riding on skepticism on the continent about its claim to enlightened leadership over the developing world.⁹

Anti-African students protests

In contrast to the approximately 1 million Chinese on the African continent, fewer than one quarter of that number of Africans reside in a handful of Chinese cities; about 100,000 live in Guangzhou alone, the rest being dispersed across Hong Kong, Macau and a handful of other coastal cities.¹⁰ While traders account for the bulk of diaspora population today, students were the first to establish a something like a "African community" in China when they first arrived in 1960 as fully-funded participants in a program to bolster China's relations with friendly countries. The attempt to off-set US and USSR global hegemony by "winning hearts and minds" in Africa astutely targeted Africa's future leaders, who were all drawn from the ranks of their country's elite. The negative reactions amongst Chinese students that Africans students soon encountered

were not necessarily racist, however. Many Chinese students resented the relatively high stipends that African students enjoyed while African students themselves ranked race as the last of four complaints they lodged about their experiences at Chinese universities. In the 1970s, Chinese authorities championed the cause of various anti-colonial and revolutionary movements in the developing world and did not countenance attacks on African students. To the contrary, Red Brigades occasionally held rallies in which they appended pro-Third World slogans to the ongoing (and increasingly chaotic) Cultural Revolution.

China's ginger exploration of market-oriented reforms from the late 1970s onwards instigated a change in Chinese responses both to African students and the complaints they lodged. Chinese student hostilities increased while officials, under instruction to downplay "revolutionary"/Third World themes, either tolerated or even excused racially discriminatory behavior. Violent Chinese-African clashes erupted in Shanghai in 1979. In Tianjin in 1982 (where Africans accounted for 1,500 of 6,000 foreign students), Africans--but not white foreigners--were assaulted for having Chinese girlfriends. Inter-racial sexuality was a prominent theme in Chinese students' anger, suggesting that male rivalry sexualized, and perhaps provoked, inter-racial tensions.¹¹ Despite heated threats of violence, threatening public rallies and posse-like hunts for African (who had fled to Beijing), the Chinese authorities declined to act against the students and attributed the incidents to "cultural misunderstandings". Anti-African episodes erupted in Nanjing, Hangzhou, Beijing and Wuhan in 1988-'90, accompanied this time by charges that African "black devils" were spreading AIDS and "polluting Chinese society".¹²

Confronted with angry denunciations from African leaders, Chinese authorities rejected accusations of racism—as Zhao Ziyang (head of the Communist Party) claimed in 1988, racism occurred "everywhere in the world except China". (Sautman, 1994) A range of non-racist explanations arose to present the decade-long antagonism against African students as more complicated indications of deeper tensions in Chinese societies. Some argued that the events were not specifically "anti-African" but reflected a more "general xenophobia" amongst Chinese who bristled at the memory of their own debasement at the hands of foreigners; officials claimed that youthful students had cottoned on or developed "erroneous slogans"; others claimed that the events were confused with frustrations that arose from the mismatch between officialdom's emerging tolerance for market-based wealth and continuing poverty; and, finally, it was suggested that the events, coming as they did a few months before the massacre at Tiananmen Square in June 1989, were outlets for Chinese students' gathering antagonism against the leadership of the Chinese Community Party. None of these "frustration-aggression" explanations has been borne out by empirical evidence, however.¹³

¹¹ Sautman, "Anti-black racism," 414.

¹² Sautman, "Anti-black racism," 414.

¹³ Discussed in Sautman, 419-427. Also see Sullivan, Michael, The 1988-89 Nanjing Anti-African Protests: Racial Nationalism or National Racism, *The China Quarterly*, No 138 (June 1994), pp 438 – 457).

According to Barry Sautman (1994), but especially Frank Dikötter (1994), racism is the most likely and the most compelling explanation. Far from being uniquely inoculated against racism, China's deeply-lodged assumptions about the blood purity of the Han, the vitality in the first two decades of the 20th century of racist Social Darwinist creeds within the intelligentsia, and the latter's rigid, essentialist notions of "Chineseness" might actually have rendered the Chinese *vulnerable* to the more vulgar and virulent strains of racism. Extensive theorizing by Chinese intellectuals about the biological foundations of the racial hierarchy--which placed the "yellow" and "white races" at the top and (according to 1923 *Great Dictionary of Zoology*) ensured that the "black race" at the bottom had "a shameful and inferior way of thinking"—has a long pedigree that predates by several centuries any "hegemonic effects" that Western racial discourse exerted over Chinese thought.¹⁴ Responding to the suggestion that Chinese students' anti-African outbursts in the late 1980s had more to do with the swelling antagonism against the CCCP government, Dikötter writes: "Articulated in a distinct cultural site (university campuses) by a specific social group (university students) in the political context of the reforms initiated by Deng Xiaoping since 1978, campus racism demonstrates how contradictory discourses of 'race' and 'human rights' can be harnessed together in politicized oppositions to the state."

Anti-African sentiment against "Chocolate City"

According to official statistics, the number of Africans living in Guangzhou has grown by approximately 30-40% each year since 2003. Most of Guangzhou's 100,000 Africans come from Nigeria, Guinea, Cameroon, Liberia, and Mali. Nigerians constitute by far the single largest national group. Africans in the coastal cities in Pearl River Delta (Hong Kong/Shenzhen/Guangzhou) do not have to contend with the overt anti-African student mobilizations of the 1980s. Instead, their presence has solicited more subtle forms of prejudice that shed light on the massive structural changes that have transformed the cultural, economic and civil fabric of a rapidly globalizing city such as Guangzhou. "Chocolate City", and the ethnic politics in which this neighborhood is embroiled, therefore illuminates the interweaving of local and global forces that have yielded an "emblematic transnational space" in the PRD. **The discussion of ethnic enclaves follows Li Zhang...** If the racial tensions that have recently surfaced in Guangzhou underscore the persistence in Chinese society of deeply rooted anxieties about foreigners and ethnic differences, at the same time they also reveal how ethnic relations are also inscribed in the forces of globalization that continue to bring Africans to urban economies in the Pearl River Delta. It would be premature to apply the term "assimilation" to the Africans of Guangzhou. Yet the struggles they have begun to mount for more reasonable travel visas and greater respect from Chinese authorities for certain inalienable human rights represent the unprecedented emergence in China of a transnational community that originates from countries that are vital to China's own developmental goals. Nevertheless, an African ethnic enclave in Guangzhou was not

¹⁴ Dikötter, "Racial identities," 4089.

¹⁵ Li Zhang, "Ethnic congregation in a globalizing city; the case of Guangzhou, China," *Cities* 25 (2008), 383–395

created by discriminatory policies that imposed residential segregation on Africans. Instead, the ethnic enclave reflected market-based choices by Africans themselves.

Ethnic enclaves are simultaneously part of locally defined place and a global system of relations. The distinguishing feature of contemporary ethnic enclaves, setting them apart from the enclaves that emerged in Western cities in the early stages of industrialization, is their immediate insertion into a dynamic global system marked by a new international division of labor. Guangzhou's economy has undergone a dramatic transformation from a sluggish agricultural region into an increasingly export-oriented urban zone that attracted foreign entrepreneurs. What drew Africans to this city, at first in small numbers and later by the drove, was the opportunity to purchase cheaply produced internationally branded commodities such as electronic goods, cell phones, beauty supplies, garments, luggage and accessory bags and electrical appliances. The traders who flock to Guangzhou are therefore neither the transnational professionals who regularly criss-cross the international borders in the global economy; nor are they unskilled workers in search of minimum wages in the manufacturing or agricultural sectors of host countries. Instead, African "supply-driven petty traders" responded to a niche trading market specializing in inexpensive export commodities. This concentration facilitated the emergence of a distinctive "Chocolate City" composed of African nationals who are fully integrated into the Guangzhou metropolitan economy. Thus, in contrast to the generally isolated Chinese communities and minimal social contact that Chinese in Africa maintain with locals, Guangzhou's African traders lower costs by "cutting out the middle-man" and so deal directly and continuously with Chinese businessmen.

In part, "Chocolate City" emerged as the unanticipated by-product of economic and spatial reforms in Guangzhou. The area is centered on a neighborhood that was once a working class hub composed of production facilities and nearby, low-cost housing for workers and their families. The switch to a consumption-based economy took place in the 1980s, establishing an economic zone marked by rising land values and rent, commercial buildings, office towers and retail stores. The resultant over-supply of commercial space and under-occupancy of buildings created the incentive for apartments to be rented to incoming African migrants as a way of maintaining the vitality of the district. Indeed, city officials welcomed this development, especially once Chinese residents moved away and took their rents with them, and responded by infusing the district with an "African" flavor. For example, shopping malls were reorganized into "foreign trade towns" to enhance African traders' sense of place. Well-known global brand names were liberally advertized (often in English). These changes also pleased local Chinese entrepreneurs who benefited from increased sales—especially mobile card vendors, because Africans used their mobiles to call home. In the end, Chinese locals created a supportive system of networks that benefited both communities, providing visa applications facilities, local transport, packaging and mailing goods, etc. Africans moved into cheap, poorly serviced vacant housing units, creating a hub that attracted incoming streams of migrant traders and quickly culminated in a viable but effectively segregated neighborhood.

Li Zhang describes the result as something of a paradox: a more tolerant business

environment coupled to a virtually complete absence of ethnic interaction within the same neighborhood. In this sense, “Chocolate City” differs from the classic ethnic enclaves that were once ubiquitous in most large American cities. Whereas ethnic entrepreneurs generally employ co-ethnics, Africans own or manage very few stores within their enclave. Almost all enclave stores that sell goods to Africans are owned by local Chinese, a signal of ability of local Chinese to restrict the sale of stores to Africans who, in any case, invariably possess visitor visas that bar them from working in or purchasing stores. Short-term (15-,30- or 90-day) visas serve as perhaps the most important constraint on the formation of the sort of economically viable ethnic enclave that Alexandre Portes and others have described.¹⁶ In the absence of such pillars of the “classic” ethnic enclave, the strength of community in “Chocolate City” is unusually reliant on cultural networks built around churches and mosques.

The optimistic outlook of Guangzhou’s African community differs radically from the jaundiced view of the students in Chinese universities in the 1970s and 80s. Students in the 80s were reported to have deliberately vandalized public property so that they could be arrested and deported back to Africa. In Guangzhou, Africans have injected their cuisine, music and religion into their ethnic enclave. A small number have Chinese girlfriends. They look upon the opportunity to reside and trade in China as “a dream come true”. Perhaps their greatest desideratum is to modify visa restrictions to enable lengthier stays and obtain legal employment in China. Many would not mind remaining indefinitely.

Still, precisely because it is the embodiment of the global and the local, Guangzhou’s ethnic enclave has also attracted the prejudices of local Chinese. Like local citizens in all globalizing cities, Guangzhou’s Chinese are also struggling to comprehend the sudden appearance of a multicultural community in their once all-Chinese city. Morbid symptoms of an unfamiliar “glocalism” in contemporary Guangzhou combine old stereotypes that Chinese students entertained about Africans—that they are loud; uncivil; have designs on Chinese women; and take up valuable resources—now intermingle with complaints that are unique to the logic of ethnic enclaves. African traders are said to be unreliable contractual partners who fail to pay for the goods they order; haggle over even the smallest of prices, such as cab fare; fail to adequately maintain their cramped, often one-room abodes; and overstay their tourist visas and so readily become “criminals”. Despite increased intercultural knowledge in the digital age, many Chinese are startlingly ignorant about race. Reporting in 2006, an African American from Atlanta who is studying at the Beijing Language and Culture University, says he has learned to shrug off questions such as, “Do you take showers? Does the color of your skin rub off?” Online Chinese blog sites repeatedly debate questions such as, “Is it racist to call Serena Williams a black devil?”¹⁷

¹⁶ Portes, A (ed.) (1995) *The Economic Sociology of Immigration: Essay on Networks, Ethnicity, and Entrepreneurship*. Russell Sage Foundation, New York.

¹⁷ Evan Osnos, Letter from China, “The Promised Land,” *The New Yorker*, February 9, 2009, p. 50. A typical discussion about “Chinese racism?” may be found at <http://chinadigitaltimes.net/china/racism/>

250,000 Africans are much less than a drop in a bucket containing 1.3 billion Chinese. Yet Africans in China are significant for at least two reasons. Strategically, they are the visible face of interlocutors on a continent that is critical to China's development strategy and hence, to its bid for global hegemony. However, it is the second reason that is perhaps more interesting. The cultural significance of Africans in China is not confined to the psycho-spatial borders of China's ethnic enclaves. Instead, their minor cultural presence has gained significant symbolic importance in recent media discussions in China that raise questions such as, "In the age of globalization, what does it mean to be Chinese?" Two recent media debates illustrate the awkward discussions about race/racial difference that appear to await China.

2009 turned out to be an important year for racial discourse in China. Early in the year, Ding Hui, a young athlete from Hangzhou, was selected to China's national volleyball team. In August, 16-year old Lou Jing entered a talent-quest show, *Go Oriental Angel*, and became one of the five finalists from Shanghai. Neither success story would have been unremarkable were it not that both subjects were the bi-racial offspring of black fathers. Lou Jing attracted special attention. Immediately dubbed "Black Pearl" and "Chocolate Girl", Lou Jing became the object of often vitriolic condemnation in the Chinese blogosphere. Some of the kinder terms used to describe her included "Little black devil", "little mongrel", and, given the year of the historic presidential US election, perhaps predictably, "'Could Lou Jing's dad be Obama?" Comments such as the following filled blog sites: "Ugh. Yellow people and black people mixed together is very gross" and "One cannot be shameless to this kind of level!"¹⁸ Virulent racist screeds drowned out the support given the young theatre student, prompting a respected Chinese journalist, Raymond Zhou, to skewer "Chinese racism" in an essay, "Seeing red over black Angel".¹⁹ Zhou argues that rabid antipathy against Lou Jing "is outright racism, but on closer examination it's not totally race based." According to Zhou, "anyone who marries a foreigner is deemed a 'traitor' to his or her race." Chip Tsao, an esteemed Hong Kong-based cultural commentator and journalist, added that the mixed offspring of a Chinese woman and a black male was an "obnoxious novelty" that ignited the deepest fears and prejudices among Chinese: Lou Jing's public shredding symbolized "prejudice against people less well-off than themselves".²⁰ Zhou's admonition seems appropriate, to say the least. "China," he writes, badly needs "some sensitivity training on races and ethnicities if we are going to latch on to the orbit of globalization".

Ever since 1949, the CCCP government has governed on the assumption that China is essentially a monoethnic society and has been one for 5,000 years. This implausible claim has marginalized China's relatively small non-Han ethnic communities—Tibetans, Mongolians, Uighurs, Koreans and many other (often miniscule) ethnic groups. The

²⁰ "China's black pop idol exposes her nation's racism," <http://www.guardian.co.uk/world/2009/nov/01/lou-jing-chinese-talent-show/print>

myth of China's "blood purity" questions the "Chineseness" of the non-Han, pressuring them to disappear by assimilating with the Han majority. By opening up questions about such foundational questions as "What does it mean to be Chinese"?, the segregated presence of Africans in "Chocolate Cities" as well as in the mainstream life of China must surely alarm government officials.

Conclusion

China and Africa are now interpenetrated, perhaps inextricably. The Chinese presence in Africa has prompted governments and commoners alike to re-assess familiar Western shibboleths about the link between democracy and development and raised questions about China's motives for lavishing the continent with such irresistible largesse. To date, the majority of Africans are cautiously of the opinion that the Chinese presence differs from the West's "moralizing", neo-liberal approach to globalization. They suggest that the wine is indeed new; it is the bottle that needs to adapt.

In GZ, Adams Bodomu suggests that the bottle is already being refashioned to accommodate the infusion of African culture into the city. Based on his ethnographic research on Guangzhou, Bodomu cautions against conceiving of "Chocolate City" as either an "ethnic enclave" or an "outpost" that is isolated from the larger socio-economic and cultural space of the city. Instead, Guangzhou's Africans are better approached as "bridge builders". Time will tell whether the "bridge-building" adaptations in Guangzhou that Bodomu describes—the evolving pidgin admixture of Chinese, French and English; the spicing up of local cuisine; the ritual "calculator communication" that yields satisfactory accords over prices—are sufficient to substantially broaden China's racial discourse. His optimistic conclusion, however, is attractive: "The African trading community in Guangzhou serves as a salient emerging bridge between Africa and China that cannot continue to be ignored in efforts to effectively develop socio-economic relations between Africa and China."²¹ To this, one should add that Africans in Africa are also co-authors of the interpenetrated futures of China and Africa. Each will affect the other. Indeed, they already are.

Abstract

The purpose of this empirical study is to explore junior high school English teachers' perceptions of task-based language teaching (TBLT) in Taiwan. As an ETL method developed in western context, it is important to see how TBLT is perceived by local English teachers in Taiwan. Is there any adjustment made when TBLT is introduced. The learner-centred approaches are taken into consideration in terms of teaching English as a second language by the Taiwanese government during the education reform movement. Therefore, it is important to investigate English language teachers' perception of TBLT.

The research method for the study involved questionnaires from 136 teachers at about 30 different schools. The findings of the study show that most of the teachers did not have clear understandings of the principles and practices of TBLT and often regarded TBLT as CLT. While there are only a few studies in Taiwanese context addressing TBLT, this study has its importance in enriching the ELT research in Taiwan.

Key words: Task-based language teaching (TBLT), Taiwan, junior high school

Taiwanese Junior High School Teachers’ Perceptions of TBLT

(English teacher, Pei-Hsin Junior High School, Taichung, Taiwan)

I. Introduction

This paper aims to explore English teaching in Taiwan with a specific focus on the feasibility of the learner-centered language teaching method, Task-based language teaching (TBLT), in junior high school. Ellis (2003) mentions TBLT has become one of the most widely discussed approaches in the field of second language acquisition (SLA) today. This trend has exerted considerably influence on East Asian countries like Taiwan, Hong Kong as Nunan (2003, p. 606) indicates ‘TBLT is the central pillar of government rhetoric’ in terms of teaching English as a second language.

Carless (2007, pp. 595-596) points out, ‘there is a wide and expanding literature on TBLT’ but most of these are related to post-compulsory education. The lack of empirical studies in primary and secondary levels where English language teaching (ELT) mainly takes place is a weakness in the development of TBLT (Candlin, 2001). There are only a few studies about TBLT being practiced in East Asian primary and secondary contexts (see Carless, 2003, 2007; Kuo, 2006; Tseng, 2006). Van den Branden (2006, p. 1) also argues that most TBLT researches were ‘conducted under laboratory conditions or in tightly controlled settings’. Thus, the feasibility of TBLT in real ELT classrooms is still in question.

Moreover, TBLT has largely been developed within Western contexts and its suitability in the Asian context dominated by Confucian-heritage culture may be questioned because it is ‘in conflict with the traditional educational norms’ (Carless, 2007, p. 596). Cultural issues play an important role in English education in Taiwan. For example, the examination culture in Junior and Senior high schools in Taiwan clashes with the ideologies of various ELT approaches advocated in the West. The development of ELT in Taiwan is to some extent a passive process – merely following the teaching approaches developed by Western academics without much consideration for their suitability in Taiwan. With the rising popularity of TBLT, this paper aims to provide more insights as to whether this particular approach to ELT can be successfully implemented in Taiwanese classrooms.

Main objective of this study is to explore Taiwanese junior high school English teachers’ understanding of TBLT and the extent to which they think TBLT is implemented in their classrooms. The questions are as follows:

1. What understanding do junior high school English teachers have of TBLT in terms of its practices and implications for teaching and learning?

2. To what extent do the teachers claim to apply the principles and practices of TBLT in their teaching practices?

This paper starts with an explication of ELT in Taiwanese context that has been an ongoing concern of the Taiwanese public. After setting the context, a review of relevant literature will be provided with some discussions on the relationship between a western pedagogic approach and local pedagogic culture. Then, the third part of this paper will deal with the methodological issues. Data will be described in the fourth part and followed by the analysis of the data. In the ending section, a conclusion including implications, limitations and suggestions for further will be presented.

II English Language Education in Taiwan

1 A General Trend

According to Kachru's (1982) three concentric circles of the global spread of English, Taiwan is an "expanding circle" nation. This is because English has no historical roots or governmental role in Taiwan but is widely used in the country as a foreign language. However, English has a vital role in the Taiwanese education system. For example, the General English Proficiency Test (GEPT), which was created with the official support of the Taiwanese Ministry of Education (MOE), has been widely accepted by the nation and local universities as a requirement for employment and graduation since 2000. In 2007, more than 110 thousand people took the GEPT. It is argued that learning English is a national movement¹ in Taiwan.

2 ELT in Taiwanese Junior High Schools

2.1 Class size

Although the Ministry of Education (MOE) attempted to reduce the class size in junior high schools to 35 students in 2007 (Ministry of Education, 2000), it has only been achieved from year one to year four. The actual average class size is between 38 and 43 students in junior high school and it varies by region.

2.2 English Lessons

The English curriculum in junior high school plays an important role because it is viewed as a key subject. The other key subjects are Chinese, Maths, Science (Physics, Chemistry and Biology) and Social Science (History and Geography). Chinese, English and Maths are often given more attention than any other subjects in junior high school. A typical day in a Taiwanese junior high school comprises seven lessons including flexible hours. Each lesson lasts 45 minutes. Due to highly competitive entrance examinations and pressure from the school league tables in each county, most junior high schools require students to stay for one extra lesson daily – usually called coaching or a tutorial lesson. Therefore, an unofficial daily timetable of eight lessons is practised. There are usually three English lessons per week according to the Curriculum Guidelines. However, as mentioned, English is one of the key subjects given more attention. Many schools use flexible hours and/or coaching lessons for extra English teaching. Thus, in reality, there are 4 or 5 English lessons in a week in most Taiwanese junior high schools.

2.3 Textbooks and Entrance Examination

Within a school, teachers can decide which textbook they want to use and textbooks are designed to meet the requirement of the entrance examination of senior high school. There are no listening and speaking components in the entrance examination. Thus, the textbooks focus more on reading and writing. The ultimate aim of English teaching is to help students get high marks in the entrance examination that emphasizes accuracy and correctness of language use. Many drills

¹ <http://w3.nioerar.edu.tw/newtalk/1015%E4%B8%AD%E5%B8%AB/content/nea.pdf>

and mock tests are used in junior high school to help students prepare for the entrance examination. Although the four language skills mentioned in the curriculum guidelines are given equal importance, teachers remain focusing on reading and writing skills due to the highly competitive entrance examination.

3 The Rationale for TBLT

The move towards TBLT can be viewed as a backlash against the behaviorist ELT approach of Presentation, Practice, Production (PPP). A major criticism of the PPP approach is that it results in learners who are unable to communicate in English effectively. There has been a move towards more 'holistic approaches where meaning is central and where opportunities for language use abound' (Willis, 2005: 4-5). TBLT is a popular and prominent example of meaning-focused ELT approaches and can be viewed as the antithesis to 'teacher-centered' and 'form-oriented' second language teaching (Van den Branden, Bygate, & Norris, 2009: 1). TBLT, as a learner-centered approach, attempts to take learners' language needs into consideration and views them as the starting point of ELT practice (Van Avermaet & Gysen, 2006: 18). This learner-centered approach fits into one of the main themes in the education reform agenda in Taiwan. These rationales seem to portray TBLT as an ideal means of teaching English. However, it is crucial to bear in mind that these positive opinions of TBLT are formed in Western educational contexts. The feasibility of TBLT in Taiwanese educational setting has yet to be proven.

4 TBLT in East Asian Contexts

Although there is not much research related to the application of TBLT in actual classrooms (Carless, 2004), two case studies of TBLT implementation have been conducted in East Asia. In Carless' (2007) research, eleven secondary school teachers and ten teacher educators were interviewed to explore the suitability of task-based teaching in Hong Kong secondary schools. In 2006, Jeon & Hahn explored EFL teachers' perceptions of TBLT in a Korean secondary school.

Results of the studies indicated that although teachers understood TBLT well and regarded TBLT as a good teaching method, the approach was difficult to be fully implemented in their classrooms. Carless highlighted some factors affecting the use of TBLT in Hong Kong secondary schools and these include large class sizes, a highly competitive examination system and the lack of teaching expertise. Therefore, Carless proposed that TBLT should be adapted to suit the Hong Kong ELT context. He also suggested that 'a weak version of task-based teaching is likely to be most suitable for schooling' and reiterated the desirability of context-sensitive ELT approaches (for details, see Carless, 2007: 595).

In the Korean case study, it was found that many teachers did not have confidence in implementing TBLT due to disciplinary problems related to classroom management and large class sizes. In addition, many Korean teachers felt that they lack practical and theoretical knowledge that is required to successfully carry out TBLT. It was suggested that Korean 'teacher education programs, which aim at in-depth training about language teaching methodologies, should properly deal with both the strengths and weakness of TBLT as an instructional method ranging from basic principles to specific techniques' (Jeon & Hahn, 2006).

McDonough & Chaikitmongkol (2007) apply TBLT in ELT class in a Thai university. Unlike the previous two case studies, this is taking place in the university setting. Their findings are: 1. Both learners and teachers consider that TBLT is a good ELT approach, 2. TBLT can fulfil the learners' real world needs and 3. Adopting TBLT makes learners more independent in the learning process. However, they suggest that, in Asian context, TBLT needs to be properly adjusted and the learners need more support from teachers while developing more teaching materials in TBLT is necessary. There is a remark needed to be mentioned here. This research

has been conducted in university setting. The learners have certain level of English competence. Therefore, TBLT functions well.

The three case studies, suggest that despite teachers' positive attitude toward TBLT and official attempts to promote task-based teaching or learner-centred approaches, such teaching methodologies are not widely used by teachers in actual classrooms. This seems to be largely due to contextual constraints such as class size and educational cultures. It seems that adaptations are required to make TBLT function well in the East Asian context as Littlewood (2007) points out in his reflections. Five concerns of the implementation of TBLT in East Asian context are proposed by Littlewood (2007: 244-245): 1. The classroom management, 2. The avoidance of English, 3. The minimal demands on language competence, 4. The incompatibility with public assessment demands, and 5. The conflict with educational values and traditions. These concerns are mostly validated by the above three case studies. Further research is necessary in order to for educators and academics to suggest meaningful adaptations to make TBLT feasible in East Asian classrooms.

III Methodological Issues

1 Instruments for Collecting Data

The research applies quantitative methods of data collection. A questionnaire was employed for data collecting purpose. The questionnaire was semi-structured and consisted of both closed (rating scale and dichotomous questions) and open-ended questions. The rating scale employed was the Likert scale which provided 'a range of responses to a given question or statement' (Cohen, Manion & Morrison, 2007: 326).

The six-page questionnaire used for the survey was aimed at exploring Taiwanese English teachers' understanding of TBLT. The questionnaire, comprised of ten dichotomous questions (i.e. true or false), twenty-two Likert-type questions and two open-ended questions, was divided into five parts. The first part contained demographic questions in order to collect data about the teachers' gender, age, educational background and teaching experiences. The second part dealt with the teachers' knowledge of task and task-based language teaching. Ten TBLT-related questions required the teachers to choose an appropriate answer from two options, true or false. The third part was designed to gather the teachers' view on implementing TBLT in their classes. They were asked to answer individual questions by indicating a response on a five-point Likert scale (ranging from strongly agree to strongly disagree). The fourth part investigated possible problems affecting the use of TBLT in the Taiwanese context. It consisted of eleven five-point scale questions and an open-ended question. Finally, the teachers expressed their beliefs and attitudes towards TBLT in Taiwanese English language classrooms in the fifth part which was made up of four five-point scale questions and an open-ended question.

2 Participants and Data Collection

The detailed information of the participants is discussed in this section. The participants were all in-service junior high school English teachers working in the central part of Taiwan. A total of 200 questionnaires were disseminated in 30 junior high schools and 136 responses were returned. The high rate of return was mainly due to the dissemination method – the questionnaires were handed to English teachers while they were having their monthly English panel meeting. Basic information about the participants is shown in Table 1 and Table 2.

Table 3.1 Distribution of gender

Gender	Frequency	Percent
--------	-----------	---------

Male	24	17.6
Female	112	82.4
Total	136	100.0

82.4 % of participants were female which corresponded to the gender distribution of junior high school EL teachers. The majority of teachers teaching language subjects in Taiwanese junior high schools are female.

Table 3.2 ELT experience among participants

Experience (years)	Frequency	Percent
1-5	59	43.4
6-10	35	25.7
11-15	15	11.0
16-20	13	9.6
over 20	14	10.3
Total	136	100.0

Most of the participants were relatively young ELT teachers: 69.1% had less than ten-year ELT experience. Most of the teachers within this cohort were trained during the education reform movement in Taiwan, when CLT took the lead in the English teacher training programme. Some of them may even have learned about TBLT during their training courses.

3 Ethical Issues

According to the revised ethical guidelines (BERA, 2004), participants should be well-informed and voluntarily taking part in this research process. Therefore, following the guidelines, a consent form with a brief description of this research was attached to every single questionnaire. All the participants have signed the consent form. The consent form also provided my contact details so if the participants would like to know the results of the research, they may contact me.

IV Findings and discussion

1 Teachers' Understanding of Task and TBLT

Table 4.1 shows that about half of the teachers have heard about TBLT before, one-fourth of them had read something about TBLT while only 5.1 % had learnt about TBLT.

Table 4.1 Teachers' background knowledge of TBLT (n = 136)

Question Items	Teachers' Responses	
	Yes (%)	No (%)
1. Have you ever heard of Task-based Language Teaching?	47.1	52.9
2. Have you ever read any materials about TBLT?	23.5	76.5
3. Have you ever joined any course or workshop on TBLT?	5.1	94.9

Table 4.2 shows the results of teachers' responses to ten statements pertaining to the key concepts of task and TBLT. The first five items were designed to test teachers' understandings of the main concepts of task. The responses to item 1 indicate that 86% of the participants incorrectly thought

that a task is similar to an exercise. According to the responses to items 2 through 5, teachers had a certain level of knowledge about TBLT. 79.4% of teachers believed that a task involves a primary focus on meaning and 85.3% of them knew that a task involves real-world processes of language use. 91.9% of teachers were aware that a task involves any of the four language skills – reading, writing, listening and speaking and a task must have a clearly communicative outcome. Participants’ responses to items 6 to 10 suggest that most of the teachers had clear basic understanding of the concepts of TBLT. 79.4% of the teachers did not believe TBLT is based on the teacher-centred approach. 96.3% of the participants agreed that learners should be given enough opportunities to work on tasks in pairs or groups in TBLT. 93.4% of the teachers thought that practice, presentation and production (PPP) is used in TBLT. 80.9% of the teachers were aware that TBLT focuses more on meaningful communication than linguistic features. Finally, 91.9% of the teachers agreed that learners should take part in language tasks which are similar to those found in the real world in TBLT. This part implies that most of the teachers fairly understand what a task is and identify the relevant concept of TBLT.

Table 4.2 Teachers’ knowledge of task and TBLT (n = 136)

Questionnaire Items (Correct Answer)	Teachers’ Responses	
	True (%)	False (%)
1. A task is an exercise. (F)	86	14
2. A task involves a primary focus on meaning. (T)	79.4	20.6
3. A task does not involve real-world processes of language use. (F)	14.7	85.3
4. A task involves any of the four language skills – reading, writing, listening and speaking. (T)	91.9	8.1
5. A task does not have a clear communicative outcome. (F)	8.2	91.8
6. TBLT is based on the teacher-centred teaching approach instead of learner-centred teaching approach. (F)	20.6	79.4
7. TBLT should give learners enough opportunities to work on tasks in pairs or groups. (T)	96.3	3.7
8. TBLT focus on grammar/linguistic features rather than communication. (F)	19.1	80.9
9. Task-based learning uses the method of practice, presentation and production (PPP). (T)	93.4	6.6
10. Task-based learners should take part in language tasks which are similar to those found in the real world. (T)	91.9	8.1

2 Teachers’ Views on TBLT

In this section, seven questions exploring teachers’ views on implementing TBLT were asked. The responses to each question are described separately following their order in the questionnaire. Unlike the dichotomous questions in previous section, these Likert-scale questions gave the teachers 5 options to choose from (see Table 4.3).

Table 4.3 Teachers’ perceptions of the positive aspects of TBLT (n=136)

Questionnaire Items	Teachers’ Responses: Frequency (%)				
	SA	A	U	D	SD
1. I have interests in implementing	7(5.1)	82 (60.3)	46 (33.8)	1 (0.7)	0 (0)

1. I have interests in implementing TBLT in my classroom.	7(5.1)	82 (60.3)	46 (33.8)	1 (0.7)	0 (0)
2. TBLT provides a relaxed atmosphere to promote the use of English.	23 (16.9)	95 (69.9)	16 (11.8)	2 (1.5)	0 (0)
3. TBLT activates learners' needs and interests.	35 (25.7)	87 (64.0)	11 (8.1)	3 (2.2)	0 (0)
4. TBLT develops learners' four language skills in the classroom.	9 (6.6)	88 (64.7)	36 (26.5)	3 (2.2)	0 (0)
5. TBLT requires much more time to prepare the materials compared to other teaching approaches.	27 (19.9)	84 (61.8)	23 (16.9)	2 (1.5)	0 (0)
6. TBLT is suitable for the class with forty students.	0 (0)	32 (23.5)	29 (21.3)	61(44.9)	14 (10.3)
7. TBLT materials should be meaningful, purposeful and based	33 (24.3)	87 (64)	16 (11.8)	0 (0)	0 (0)

Note:
 SA=strongly agree,
 A=agree,
 U=undecided,
 D=disagree,
 SD=strongly disagree

ee, U=undecided, D=disagree, SD=strongly disagree

Item 1 shows that more than 65% of the teachers were positive towards the implementation of TBLT. Although 33.8% of the teachers expressed their attitude as undecided, only one teacher held negative view towards TBLT. While 86.8% of the teachers agreed that TBLT provides a relaxed atmosphere for target language usage, 1.5% of the teachers disagreed with the statement (see item 2). The data seems to imply that most teachers thought that through the use of TBLT, the learning environment could be made more conducive for English language learners.

Item 3 shows that 89.7% of the teachers thought TBLT could address learners' needs and arouse their interests in English learning. Only 2.2% of the teachers disagreed with the statement. Even when 8.1% of the undecided teachers are taken into account, the data still shows that the majority of participants considered TBLT as an effective ELT approach for triggering learners' interests and fulfilling their needs.

More than 70% of the teachers thought that TBLT was useful for developing learners' four language skills in the classroom (see item 4). However, 26.5% of the teachers were undecided. According to item 5, 81.6% of the teachers agreed that material preparation in TBLT would take them much more time compared to other teaching approaches. However, 16.9% of them were undecided.

Item 6 presents the result from question 6 in the questionnaire. While 23.5% of the teachers thought that TBLT was suitable for large classes with forty students each, significantly more teachers (55.2%) felt that the approach was not feasible for large classes. The last questionnaire item (item 7) of this part shows that a vast majority of the teachers (88.2%) believed that the material used in TBLT should be meaningful, purposeful and based on real-world context. No teacher disagreed with this statement.

In general, the findings from this part of the questionnaire suggest that most of the teachers held positive attitudes towards the practice of TBLT in their classrooms. To some extent, the results could imply that these teachers might be willing to try out TBLT in their teaching.

3 Teachers' concerns about the use of TBLT in the Taiwanese context

In part four of the questionnaire, the participants responded to eleven statements related to possible problems with implementing TBLT and an open-ended question that asked for other possible issues obstructing the adoption of TBLT in secondary ELT classrooms. These questions

invited the teachers to rate to what extent do they agree or disagree with the factors preventing the implementation of TBLT in their classrooms on a five-point scale (see Table 4.4).

Table 4.4 Teachers' perceptions of the problems with implementing TBLT (n=136)

Questionnaire Items	Teachers' Responses: Frequency (%)				
	SA	A	U	D	SD
1. Teachers do not understand what TBLT is.	7 (5.1)	88 (64.7)	33 (24.3)	8 (5.9)	0 (0)
2. Teachers are not familiar with TBLT because there is no relevant course in the teacher training programmes.	12 (8.8)	91 (66.9)	20 (14.7)	12 (8.8)	1 (0.7)
3. Students' English ability is low.	12 (8.8)	74 (54.4)	27 (19.9)	23 (16.9)	0 (0)
4. The class size is too large for group work.	41 (30.1)	77 (56.6)	10 (7.4)	7 (5.1)	1 (0.7)
5. The classroom setting does not allow students to work in groups.	25 (18.4)	79 (58.1)	19 (14.0)	12 (8.8)	1 (0.7)
6. The classroom management will be a problem if teachers use group work.	27 (19.9)	76 (55.9)	20 (14.7)	13 (9.6)	0 (0)
7. There is no available teaching material or resource for implementing TBLT.	6 (4.4)	70 (51.5)	38 (27.9)	21 (15.4)	1 (0.7)
8. Teacher's workload is heavy and does not have enough time to prepare tasks.	28 (20.6)	73 (53.7)	25 (18.4)	10 (7.4)	0 (0)
9. The current Taiwanese examination-led education system does not fit with TBLT.	48 (35.3)	71 (52.2)	11 (8.1)	6 (4.4)	0 (0)
10. Students prefer the grammar translation teaching approach.	13 (9.6)	29 (21.3)	61 (44.9)	32 (23.5)	1 (0.7)
11. Teachers need to follow the syllabus and the teaching time is limited.	27 (19.9)	96 (70.6)	10 (7.4)	3 (2.2)	0 (0)

Note: SA=strongly agree, A=agree, U=undecided, D=disagree, SD=strongly disagree

According to items 1 to 11, the key factors that hinder the implementation of TBLT are the need to follow a prescribed syllabus and limited teaching hours (90.5%, as shown in item 11). The second major obstacle to TBLT implementation is large class size and classroom management issues (see item 4 and 6). Over 80% of the teachers agreed or strongly agreed that the current Taiwanese examination-led education system hampers the practice of TBLT in their classes (see item 9), making this issue the third most pressing one to be addressed.

4 Teachers' Diverse Attitudes towards TBLT

In the last part of the questionnaire, teachers' beliefs and attitudes towards TBLT are explored (see Table 4.4). A vast majority of the teachers (82.5%) regarded TBLT as a good ELT approach. None of the participants thought otherwise (see item 1). It is a surprising result considering most of the teachers indicated that there are many problems and difficulties associated with TBLT implementation.

Table 4.4 Teachers' attitudes towards TBLT (n=136)

Questionnaire Items	Teachers' Responses: Frequency (%)				
	SA	A	U	D	SD
1. It is a good teaching method in itself.	17 (12.5)	101 (74.3)	18 (13.2)	0 (0)	0 (0)
2. It is feasible to use TBLT in Taiwanese language classroom.	1 (0.7)	61 (44.9)	63 (46.3)	11 (8.1)	0 (0)
3. The grammar translation teaching approach is more suitable than TBLT in my classes.	1 (0.7)	66 (48.5)	61 (44.9)	8 (5.9)	0 (0)
4. I would be willing to use a TBLT approach in my teaching.	10 (7.4)	70 (51.5)	53 (39.0)	3 (2.2)	0 (0)

Note: SA=strongly agree, A=agree, U=undecided, D=disagree, SD=strongly disagree

Although most of the teachers thought TBLT is a good method, less than half of them agreed that TBLT is feasible in Taiwanese language classroom (see item 2). More than 50% of the responses were undecided and disagreed. The result implies that the teachers held uncertain attitudes towards the practical application of this teaching method in their classes. According to item 3, almost half of the teachers preferred the grammar translation method to TBLT. Only a few teachers (5.9%) disagreed with the statement. 44.9% of the participants were undecided. The possible reasons for such uncertainty in the responses will be discussed in the following paper. The last question asked teachers about their willingness to implement TBLT in their teaching. About 60% of the teachers indicated that they would like to adopt TBLT. 39% of them were undecided and only 2.2% of them were reluctant to try out the approach (see item 4). Generally, it reveals that most of the teachers thought TBLT was a good ELT approach and they would like to use it as an alternative to GTM. However, it seems that TBLT presents too many difficulties in its actual implementation due to contextual and cultural constraints in Taiwanese junior high schools.

V Conclusions

Results of the study suggest that the vast majority of the teachers have a positive attitude towards TBLT. They agreed that TBLT is a good teaching method that can motivate learners and provide a relaxed atmosphere to promote the use of target language. Furthermore, they viewed TBLT as a potentially effective approach in developing learners' language skills with a specific focus on

meaningful communication. On the other hand, many teachers thought TBLT could not be easily implemented in the Taiwanese context because of the inflexible syllabus, limitation of teaching hours, large class size and examination-oriented education system. This probably led some teachers to think that GTM is more suitable than TBLT in their classrooms.

The Taiwanese government is taking learner-centered approach during the education reform and this approach also has influenced on language education in terms of policy level. The overall findings from this study reveal that most of the teachers have interests in applying TBLT but their understanding of TBLT is not sufficient. It is recommended that the government should provide more opportunities for teachers to learn about this specific approach. For example, the MOE can offer workshops about TBLT and encourage teacher trainers to provide more lessons on in-depth knowledge of TBLT. As a result, teachers may gradually build up their confidence and pedagogic ability in using TBLT in their classrooms.

In addition, the implementation of TBLT in Taiwanese junior high school classrooms relies on the change of system. For example, the national school syllabus needs to be more flexible, the number of students in a class has to be reduced and an alternative assessment system needs to be introduced. Otherwise, it would remain difficult for teachers to implement TBLT in Taiwanese ELT classrooms. Another issue discussed is the lack of teaching materials. Perhaps this specific issue can be addressed through communication between educators and textbook publishers so that more TBLT related teaching materials can be produced and made readily available in the market.

Due to the limitation of time and funding, data collection only took place in central Taiwan. The results of the study are thus not adequate to be generalized and cannot represent the ELT classrooms in the whole of Taiwan. Moreover, both classroom observation and learners' point of view which may affect the validity and reliability of the results are not addressed in this study. Further studies involving classroom observation and learners' viewpoints are necessary to investigate the situation in other areas of Taiwan in order to create a more holistic picture of the implementation of TBLT in the country.

Title: Social and Psychological Factors in Child Second Language Acquisition

By Wua Park

M.S. Ed. Candidate
Intercultural Communication
University of Pennsylvania
Graduate School of Education

The correlation between socio-psychological factors and second language acquisition is a subject that needs more extensive investigation in the field of applied linguistics. In particular, the study of children's Second Language Acquisition (SLA) is an important area in which to gain understanding of human capacity in language acquisition and childhood language development. This paper reports on research carried out to examine the influence of socio-psychological factors on the second language acquisition of two young English Language Learners.

From September 2009, two five-year-old Chinese kindergarten girls received English instruction from a bilingual tutor twice weekly for one hour. Both girls began their study of English with a combination of the Push-In and the Pull-Out instructional methods. One of the girls is outgoing and talkative, whereas the other is timid and reluctant to speak English. The girls' language skills seem to be differently influenced by their parents; the mother of the more ready speaker is a doctor, who is extremely involved in her daughter's schooling and has made several requests for her to be moved up to first grade. The strongly motivated girl has participated enthusiastically from beginning of the English-language lessons, which seems to have increased the frustration and reticence of the other girl.

Although both girls came to the United States in August 2009 and started their U.S. schooling in September, the more highly motivated girl performed much better on the Dynamic Indicators of Basic Early Literacy Skills (DIBELS) test, administered in early October.

In late October, the mother of the strongly motivated student requested that her child discontinue the Pull-Out tutoring, after which the other student continued to receive further assistance on her own. However, both girls' interactions with their teacher and peers were also observed in the classroom twice weekly for one hour.

At the beginning of January 2010, both of the girls took their second DIBELS test, and the strongly motivated girl again outperformed the other girl. Based on the DIBELS results, the strongly motivated girl was classified as a gifted student, along with a few of her classmates.

Gardener and Lambert (1959) suggested a link between motivation and language learning, which has greatly influenced the study of SLA. Schumann (1978) also proposed that social and psychological factors such as attitudes; motivation; imitation; and choice

of learning strategies can affect second language acquisition. In response to Gardner's social-psychological theory of second language (L2) learning, Au (1988) suggested five theories of the socioeducational model, including the Active Learner Hypothesis, which can also encounter for psychological factors in learning. Lakshmanan (2009) includes a learnability perspective to explore how child L2 learners can go beyond the input they receive. As previously noted, both Chinese girls started their U.S. schooling at the same and have learned within the same classroom, a significant environment in terms of their L2 acquisition. Nonetheless, the strongly motivated girl's English has improved at a much faster pace than that of the other girl, which may indicate the presence of other socio-psychological factors that influence children's capacity for successful L2 acquisition. Based primarily on Gardner and Lambert's theory, this research will also draw upon Schumann's social and psychological factors and Au's socioeducational model to explain successful child L2 acquisition and language development.

Follow-ups on the two Chinese kindergarteners' language learning differences and improvements will be made over the course of five months. The Assessing Comprehension and Communication in English State-to-State (ACCESS) exam for English Language Learners (ELLs) will be administered in February, and one more DIBELS will be administered at the end of the year. However, due to the proposed duration of this research, only the results from the first two DIBELS and the ACCESS will be presented. Finally, the implications for teaching with respect to individual learner differences in language learning will be presented for educators and researchers.

“Western references in Murakami Haruki's works: A literary reflection of today's Japan”

Benjamin Salagnon
Teacher of French language, University of Yamanashi, Japan
PhD student, Lyon 3 University, France

Introduction

Let's begin with a few references: cinematographical, musical and then literary ones:

The Magnificent Seven, Duck Soup, Casablanca, The 400 Blows, Easy Rider...

Ravel, The Beatles, The Bee Gees, Miles Davis...

Kant, Dostoyevsky, Fitzgerald, Stephen King...

It may seem so at first glance but these references are not taken from Western cinematographical, musical and literary dictionaries; they are references used by one single author, and a Japanese one: Murakami Haruki.

I assume that only few people interested in modern Japanese literature have never heard about Murakami Haruki and consequently I will not be exhaustive about introducing him. Born in 1949 in Kyoto, Murakami Haruki is a Japanese writer and translator. A voracious reader of mainly Western literature (despite the fact that his parents were high-school teachers of Japanese language and literature), Murakami was also deeply interested in American music, first in rock'n'roll then jazz. His interest in jazz went so far as owning a jazz bar, called Peter Cat, from 1974 to 1981.

His first novel, *Kaze no Uta o Kike* (Hear the Wind Sing), was awarded the Gunzo Prize for new writers in 1979. His new and refreshing style was praised by some critics, whereas others complained about his lack of “Japaneseness” and commitment. Many novels, short stories, essays, translations were to follow, with most of them being translated in many languages, allowing us to talk about a worldwide success for Murakami Haruki. If we focus on novels, we can mention here for example the 1982 Noma prize awarded for *Hitsuji o meguru bôken* (A wild sheep chase), the 1985 prestigious Tanizaki prize awarded for *Sekai no owari to hâdo boirudo wandârando* (Hard-Boiled Wonderland and the End of the World), the 1987 best seller *Noruvei no*

mori (Norwegian Wood), the 1997 laureate of the Yomiuri Shinbun's readers prize awarded for *Nejimakidori kuronikuru* (The Wind-up Bird Chronicle) or his 2002 Oedipian tale *Umibe no Kafuka* (Kafka on the Shore).

One of the points that has been continuously raised about Murakami's literature, and mainly by Japanese scholars, is the question of whether or not Murakami Haruki has to be considered as a "pure" Japanese writer, on account of his use of Western, in particular American, cultural references. For example, Ôe Kenzaburô, the author of *Man'en gan'nen no futtobôru* (The Silent Cry) and a major figure in contemporary Japanese literature, said that "Murakami Haruki writes in Japanese, but his writing is not really Japanese. If you translate it into American English, it can be read very naturally in New York".¹

If Oe's assertion seems questionable (and, indeed, it is disputed), the question of whether or not Murakami's works are japanized cannot be avoided, at least for those who would claim to analyze scientifically and meticulously the author's works. How, indeed, can one analyze the literary production of a writer characterized by the use of numerous Western references without thinking about whether this writer belongs or not to the literature of his country? This question becomes even more crucial if we think about the "pioneer" status granted in that matter by some critics to Murakami.

I began to be aware of it 5 years ago, when I was an exchange student in a Japanese university. We had a class held in English about modern Japanese Literature and one of the books we had to read was Murakami Haruki's *Nejimakidori kuronikuru* (The Wind-up Bird Chronicle).

On the one hand, the foreign exchange students were surprised by the fact that if you removed Japanese names from the text, it could easily have been thought that the story took place in any other capitalist country in the world and had been written by a Western author.

On the other hand, the Japanese students felt like it still seemed Japanese to them, but were somehow unable to say why.

I think that, if not the complete answer, at least a part of the answer can be found in the use of Western references in Murakami's works. Therefore, in order to have a general view on this subject, I propose to analyze the author's works through the prism of "intertextuality" and more specifically through intersemiotic (literary, musical and cinematographical) Western references which permeate Murakami Haruki's works.

Instead of quoting these references exhaustively, I will only chose the most relevant ones in the three artistic areas aforementioned and try to show how they allow us to speak about Murakami Haruki as a universal author, whose works are understandable by any human being, regardless of his nationality and culture.

I will then extend this literary analysis to the social and cultural background of today's Japan and in particular examine to what extent Murakami's westernized works reflect the cultural and social globalization of our times, which could explain why Murakami's world is at the same time familiar and exotic enough to appeal to readers all over the world.

A panorama of the references and a attempt at literary analysis

First, I want to discuss one key methodological point here, and this point is what I mean when I talk about intertextuality. The word, used for the first time by Julia Kristeva at the end of the 60'sⁱⁱ, has seen its definition largely debated since its creation, but I have chosen to use it in its broadest meaning: textual interactions between one text and others, including references, quotations, parody and pastiche. In my opinion, cultural foreign references, in Murakami's works, are intertexts because they modify the perception and the reading of the text quoting them. Of course, the question of whether or not musical and cinematographical references are texts can be debated. I personally refer to a French scholar, Anne-Claire Gagnoux, who considers that an intertextual allusion can refer to the different semiotic systems in the condition in which it is verbalized, and consequently incorporates these non-literary references as intertexts.ⁱⁱⁱ

Trying to make an inventory of cinematographical, literary and musical references in Murakami's books would be a hard task. Konishi Keita has listed all musical references in Murakami's novels or short stories, the result being a book of more than 300 pages.^{iv} What is interesting in this listing is, and it is the same for literary and cinematographical references, is that it reflects the diversity of artists and musical genres used by Murakami as references in his books. Let's have a look for example at *Dansu Dansu Dansu* (Dance, Dance, Dance), a novel where no less than 180 musical references appear. Their quasi-exclusive Western origin (with one single Japanese artist listed, Sakamoto Ryûichi) does not imply unity, as the various artists and songs enumerated go from The Doors, Abba, Donna Summer to Mozart, including Elvis Presley, Michael Jackson, Ray Charles, Gregorian chant, Iron Maiden, etc.

The same can be said for literary references where discussions about such different authors as Stendhal, Camus, Dostoyevsky, Kant, Carver, Fitzgerald, Conan Doyle or Lewis Carroll are common, as well as filmic references going from Star Trek, 2001: A Space Odyssey to Casablanca or The Marx Brothers.

As it is well known, these references are not only those of Murakami Haruki the writer, but also those of Murakami Haruki, the human being as he said himself to Larry McCaffery in an interview: "Up until that point, I had been so immersed in Western culture ever since I was about ten or twelve--not just jazz but also Elvis and Vonnegut (...) So when I was sixteen I stopped reading Japanese novels and began reading Russian and French novelists, such as Dostoyevsky, Stendhal, and Balzac, in translation. After studying English for four years in high school, I began reading American books at used-bookstores."^v It could be said then that the numerous Western references in his works are only a mirror of his own preferences.

We can also, as many critics before, point out the "Occidentalization" and, more particularly, the Americanization, as a main characteristic of Murakami's Works, its corollary being a lack of "Japaneseness". It can suggest a propensity to aim his works at foreign markets and broader his readership, that is to say writing for commercial and

financial reasons.

We can also see this trend as a representation of a generational gap. It is singularly Jay Rubin's interpretation: "If Murakami's copious pop references represent anything, it is his entire generation's rejection of their parents' culture."^{vi} It has been partially recognized by Murakami with him saying that:

"I think that my interest in these things was partly due to wanting to rebel against my father (he was a teacher of Japanese literature) (...)"^{vii}

If we position ourselves in literary criticism, it is possible to qualify his work as postmodern with regard to the use of abundant references. This analysis is possible if we consider the destruction of the frontier between high and popular culture in his works, which is a postmodern characteristic as Jameson pointed out.^{viii} What is interesting here is that for Jameson the apologia of popular culture implies the loss of critical distance which has been a characteristic of Art in the past. Another similar criticism can be found with Ôe Kenzaburô, this time directly addressed to Murakami Haruki, when Ôe reproaches him for not giving any model for present and future Japan in moving away from high culture.^{ix}

I think that this criticism is only partially true because if the use of popular culture doesn't allow critical distance in the traditional meaning of the word, the cultural and geographical distance induced by such use give these Western pop references a new meaning when written by a non-Western author. I believe that this cultural and literary gap is enough to give an artistic and therefore literary value to Murakami Haruki's writings.

Another possibility is to focus on the parodic dimension induced by such references. This is for example the theory of Rebecca Suter, who focuses on the parody of the hard-boiled genre, mainly Hammet's and Chandler's works, in Murakami's novels and short stories.^x

It is also possible to see a parody of modern Japanese Literature and in particular the so called "Watakushi shôsetsu" (I Novel) behind the use of Western references from his first novel, *Kaze no Uta o Kike* (Hear the Wind Sing). We can for example see the parodic use of dates (for example, Rebecca Suter notes that 1960, well known for being the year of the signing of the *Treaty of Mutual Cooperation and Security between the United States and Japan*, is mentioned by Murakami as the year when Ricky Nelson sang "Hello Mary Lou".^{xi})

I personally think that if all these views are valid, they are included in a more general one that is the lability of Murakami's world, a theory expressed by a French scholar, Anne Bayard-Sakai. It postulates that Murakami's works are linked together and that his entire literature is a sort of universe, structurally organized, that invites the reader to read across the different works of the author and go beyond the text frontiers.^{xii}

Using the same references in different works, for example *The Beatles'* songs (musical reference), Fitzgerald's *Great Gatsby* (literary reference) or *Casablanca* (filmic reference), gives a kind of similar atmosphere that makes the usual reader of Murakami feel like he's at home even when reading a new novel by the author. If we have to chose

a word to depict this phenomenon, I guess Intra-Intertextuality would be a meaningful one.

Abundant references and more precisely Western references appear then as a hallmark of Murakami, which is without a doubt one of the reasons that can explain his fabulous popularity across frontiers.

A Literary trend which denotes a cultural and social state

I think we can consider the use of Western references in Murakami's works not only in a literary view but also, and I guess it's the most important, in a social and cultural view as it functions as a mirror of our modern societies.

As Yomota Inuhiko rightly said, "Murakami's works are not being translated and consumed overseas as those of an author who represents Japanese culture (...) While it is true that Murakami is a Japanese writer who writes in Japanese, the cultural sensibility that he draws on, the music and films that appear in his works, and the urban way of life that he depicts are all of a nature that cannot be attributed to any single place or people, drifting and circulating as they do in this globalized world."^{xiii}

I think that is made possible by the fact that Murakami is conscious that these Western references and in particular pop references should be familiar enough not to scare the reader, but at the same time be exotic enough to allow him to stand back from his own culture. This is like talking about a "familiar exoticism", if you forgive me for this oxymoronic neologism. It is also a reason that can explain Murakami Haruki's success even in a country such as Korea, where "It is highly unusual for a Japanese author to enjoy the eager following of hundreds of thousands of South Korean readers" as Korean professor of Japanese literature and Murakami's translator Kim Choon Mie said. She explains that phenomenon with the capacity of Murakami to capture "the anguish of these youths, the loss of ideology in the course of late capitalist society's shift away from politics and history, the appetite for consumption that filled the void, and the ambience of a vain, if affluent, society".^{xiv}

In a more Japan-centred analysis, we join Glynne Walley when he says that abundant Western references in Murakami's works are more the reflection of a reality, the reality of contemporary Japan, than an allegiance of Murakami with occidental civilization.^{xv}

As a Conclusion

This short study is, without a doubt, too modest to embrace such a vast problematic as Murakami's use of Western references in his works and the meaning of such a trend. It can even be called useless as the author himself has said on several occasions that there was no real meaning in such use.

I think, however, that even if the author's initial will and aim has to be taken in account, the reader's reading should not be underestimated. In this view, I hope that my modest contribution may have given a short ray of leads about Murakami's phenomenon.

I should, however, apologize for not being able to resolve a key question about Murakami, that of whether or not his writings are filled with "Japaneseness", but I guess it depends on the way you see Japan or, more precisely, if Japan is still Japan, at least the image of Japan which prevails in the collective imagery. In other words, shouldn't we consider Murakami, with his use of so-called "low" popular and commercial culture, only as a witness of a mutating Japan? Answering in the affirmative should prevent people from criticizing Murakami for his virtual disconnection from social realities, his lack of literary commitment and, therefore, give him what certain commentators nostalgic of the *Junbungaku* or Japanese Pure Literature refuse him: the status of a major writer.

There is another thing I haven't really talked about but which is interesting in Murakami's works: his role as cultural mediator between Japan and the West. Rebecca Suter pointed out that not only being the most translated among contemporary Japanese writers, he is at the same time "very active in introducing American Literature to Japan, having translated writers such as F. Scott Fitzgerald, John Irving, Grace Paley, Tim O'Brien, J.D. Salinger, and Raymond Carver."^{xvi} In this view, Murakami can be seen not only as a vector of the "Westernization" of Japan being no more than only one of the expressions of Japanamerica's phenomenon (the word is from Roland Kelt), but both or, better, as a universal literary phenomenon and an invitation made to the reader to open his window to the world.

15 April 2010

Introduction

This essay will examine the figure of Emma Goldman (1869-1940) in the autobiographical fiction of the Japanese feminist and anarchist writer Itō Noe (1895-1923), focusing in particular on Noe’s autobiographical short story “Kojiki no meiyo” (The reputation of a beggar; 1918). In this story, a considerable portion of the text is devoted to a biographical introduction to Goldman.

“Kojiki no meiyo,” along with several other autobiographical pieces published during the same period, functions as a public defense of Noe’s decision to leave her marriage and then become the lover and partner in activism of Ōsugi Sakae, Japan’s most famous anarchist. At the same time, it presents Noe’s ideal of the anarchist lifestyle and her attempts (portrayed in the thoughts and actions of a fictional alter-ego) to break free from the restrictions of a conventional life and fight for an anarchist revolution. The figure of Goldman plays a fairly straightforward role in Noe’s narrative: her protagonist reads essays by Goldman and a biography of her, and is inspired by Goldman’s courage and uncompromising dedication to her cause to follow a similar path. In particular, this protagonist needs to summon the courage to leave her failing marriage and dedicate herself fully to self-education and social activism. Goldman’s example provides her with the courage to do so.

The reader is therefore invited to see Goldman as a role model for Noe, and more broadly to view the two as parallel figures. Certainly, Itō Noe would be the obvious candidate for the “Japanese Emma Goldman” if such a term had any meaning. Each was the most famous female anarchist in her country, and each wrote essays and other pieces promoting anarchism. Both were opponents of traditional marriage who were condemned by the press for their scandalous lifestyles, and both were in regular conflict with the police and other powers-that-be for their uncompromising rejection of all social authority. Noe unquestionably saw Goldman as her main role model.

However, an emphasis on these parallels can obscure the significant differences between the two women that are obvious even at the level of basic biographical facts. Goldman was a cosmopolitan, multi-lingual, Russian Jewish immigrant to the United States who during her 70-year life lived in Russia, England, Canada, France, and elsewhere working for the anarchist cause. She was especially known for her fiery public speaking. Among the highlights of her career were her support of her lover Alexander Berkman’s attempted assassination of industrialist Henry Clay Frick in 1892; her notoriety for allegedly inspiring Leon Frank Czolgosz to assassinate President McKinley in 1901; her publication of the journal *Mother Earth* (1906-1917); her opposition to military conscription in the United States during World War I, leading to her deportation; and her

residence in Russia after the Russian Revolution and subsequent denunciation of Russian Communist rule. Noe, by contrast, lived in Japan for her entire short life – she only lived to be 27 – prior to her brutal murder by military police in the chaotic aftermath of the Great Kantō Earthquake of 1923. Noe's activities were centered on writing. She began as one of the star members of the women's literary group *Seitō-sha* (The bluestocking society) and went on to write in mainstream as well as self-published periodicals. Unlike Goldman, who chose not to have children in order to fully devote herself to activism, Noe gave birth to seven children with her two long-term partners. Many other differences could be pointed out.

Although Goldman was tremendously well read in the European literature of the 19th century, and even lectured on such topics as the poetry of Walt Whitman and the modern theatre, one thing that she did not do was write fiction. Noe, however, did. Most of her fiction was autobiographical, and as I have argued elsewhere,¹ this fiction was one of her most significant accomplishments. Noe's choice to write in this mode followed naturally from the individualistic ethos of the Taishō period (1912-1926), when such fiction was commonly seen as an ideal format for self-expression and chronicling personal growth. And it is in her fictional narratives of the major struggles of her life that Noe, while expressing Goldman-like views and showing her protagonist emulating Goldman in various ways, articulates her distinctive view of struggle and personal growth.

This view is original to Noe and is not the result of borrowing from writings by and about Goldman. Although Noe viewed Goldman's battles with American society and the capitalist system as parallel to her own in Japan, at the personal level, Noe's fictional alter ego differed greatly from Goldman (as Noe saw her) in her sensitivity, vulnerability, indecisiveness, and constant self-questioning. In this essay, I will show how Noe's protagonist appropriates the perceived extraordinary qualities of Goldman as a tool for overcoming her weaknesses. In doing so, she becomes more liberated, and in a sense more like Goldman, but her self-exploring, vulnerable stance is retained.

Biographical Sketch: The Path to Anarchism

Itō Noe was born in 1895 in the fishing village of Imajuku (presently part of Fukuoka city) in Fukuoka Prefecture.² At age 15, she traveled to Tokyo to attend the Ueno Girls' School, assisted in tuition payments by her uncle. At school, she showed a particular love of and talent for literary studies, and became editor of the school newspaper.

In 1911, under heavy pressure from her parents and relatives, she became engaged to a young man in her hometown recently returned from the United States, Suematsu Fukutarō. The marriage took place in 1912, but just over a week later Noe ran away from home. She and her English teacher, Tsuji Jun, had fallen in love, and she now moved in with him and eventually married him. With Tsuji's encouragement, Noe became close to the renowned feminist Hiratsuka Raichō and other members of Raichō's *Seitō-sha* (The Bluestocking Society), a feminist literary group that published the famous journal *Seitō* between 1911 and 1916. Noe wrote a variety of essays and autobiographical pieces for *Seitō*, and towards the end of the journal's run took over as its editor.

Noe achieved mild notoriety as an outspoken and controversial writer and public figure. She expressed bold opinions on subjects such as prostitution and abortion, and defended the idea that romantic relationships and marriage should be based on ongoing mutual consent, citing her own negative experiences with an arranged marriage in support of this view.

Tsuji, a gifted translator and essayist, was Noe's intellectual mentor and spiritual partner, but the marriage soon began to show signs of strain. Tsuji had been fired from his teaching position for his relationship with Noe. Now, at home, he sank into a state of depressive inactivity, and despite the urgings of his mother, failed to obtain any steady work. Now raising a child, Noe found herself caught between Tsuji and his mother as the latter hectored her son to find a job and blamed Noe for his unemployment.

In her work for *Seitō*, Noe had been heavily influenced by progressive and Western thinkers from the West, from Bernard Shaw to Ellen Key. She had shown impatience with the moderate feminism and progressivism shown by some of her colleagues, expressed in articles such as one entitled "Arrogant, Narrow-Minded, Half-Baked Japanese Women's Public Service Activities,"³ where she described charitable women's groups as motivated by vanity and uninterested in the radical social change that would be needed to fully address problems like poverty and prostitution. In 1914 (Noe was still only 19 years old) there were clear signs that her thinking was taking a more radical turn.

One clear inspiration for this change in Noe's views was her discovery of Emma Goldman. In late 1913 she had read, and been highly moved by, Hippolyte Havel's "Biographic Sketch" of Goldman that appeared in Goldman's *Anarchism and Other Essays*.⁴ The impetus to read Goldman had come from Tsuji, who was interested in the anarchistic thought of Max Stirner, Goldman, Nietzsche, and others. Together with Noe, he translated the "Sketch" and four essays by Goldman, which were assembled with some other materials in the pamphlet *Fujin kaihō no higeki* (The tragedy of woman's emancipation [named after one of Goldman's essays]), published in 1914.⁵

Goldman denied that moderate reforms, such as granting the vote to women, or implementing laws limiting the working day to eight hours, could be adequate for achieving a truly just society. As an anarchist, she believed in the total abolition of government and all forms of authority based on force and coercion. Her views on the women's movement deeply affected Noe, who was already highly critical of the limitations of the Japanese women's movement. In "The Tragedy of Woman's Emancipation," Goldman wrote:

Emancipation should make it possible for woman to be human in the truest sense. Everything within her that craves assertion and activity should reach its fullest expression; all artificial barriers should be broken, and the road towards greater freedom cleared of every trace of centuries of submission and slavery.⁶

Salvation lies in an energetic march onward towards a brighter and clearer future. We are in need of unhampered growth out of old traditions and habits. The

movement for woman's emancipation has so far made but the first step in that direction. It is to be hoped that it will gather strength to make another. The right to vote, or equal civil rights, may be good demands, but true emancipation begins neither at the polls nor in courts. It begins in woman's soul.⁷

Noe's increasingly radical thought corresponded with ever-greater dissatisfaction with her marriage. Desperate to set aside some time to read and develop her political ideas, she was constantly thwarted by her mother-in-law, who demanded that she spend 24 hours a day watching her baby. Tsuji had become physically involved with Noe's cousin when the latter was staying at their home, which was a deep shock to Noe. Meanwhile, Noe had found an intellectual partner in the anarchist Ōsugi Sakae. Ōsugi, in his own magazine, had publicly praised Noe for her translations of Goldman. The two began a public correspondence through the pages of their respective magazines, which eventually developed into a love affair in real life.

Finally, Noe decided to leave Tsuji and their two children, following the agreement that they had always had that either party was free to leave the relationship if it ever came to impede his or her personal growth. Ōsugi, while with Noe, attempted to live out his philosophy of free love by maintaining, simultaneously, his relationship with his wife, Hori Yasuko, and the journalist Kamichika Ichiko. Kamichika, distraught over Ōsugi's treatment of her, stabbed and nearly killed him. All of this made Ōsugi and Noe the object of sensational stories in the popular press, and they were ostracized by many of their progressive and socialist colleagues.

When the dust cleared from all this chaos, Noe was still with Ōsugi. She bore five of his children (four of whom survived), and while caring for these children produced a copious number of writings, which were now explicitly anarchist. She and Ōsugi continued to publish and to work in the burgeoning labor movement of Japan, until September 1923, when the Great Kantō Earthquake put an untimely end to their careers. Noe, Ōsugi, and Ōsugi's six-year-old nephew were taken into custody by military police and summarily strangled to death. Although one military officer took responsibility for the incident, the incident remains clouded in uncertainty.⁸

“The reputation of a beggar”

“Kojiki no meiyo” (The reputation of a beggar)⁹ was published in 1918. Its first appearance was most likely in Noe and Ōsugi's *Bunmei hihyō* (Critique of civilization), and it was reprinted in a single volume, also entitled *Kojiki no meiyo*, combining works by both of them.¹⁰ The title of the story comes from a quotation by George Jacob Holyoake that precedes the biographical essay in Goldman's book. It makes clear Noe's intent to emphasize the ideal of the fearless “propagandist” or activist who devotes his or her entire life to the cause of social justice:

Propagandism is not, as some suppose, a “trade,” because nobody will follow a “trade” at which you may work with the industry of a slave and die with the reputation of a mendicant. The motives of any persons to pursue such a profession

must be different from those of trade, deeper than pride, and stronger than interest.¹¹

“Kojiki” opens with the main character, Toshiko, studying an English-language book at the home of an acquaintance who is running a study group. Toshiko is intended to represent Noe herself, and we know from other sources that she was studying Lester Ward’s *Pure Sociology* (1903).¹² Toshiko is so distracted by the problems in her home life that she is completely unable to concentrate. She broods over the terrible “miscalculation” she made in choosing to live with her husband and his family. After the meeting, she travels home on a snowy night, carrying her baby on her back. She desperately wants to escape from her present life, and is held back only by the thought of her baby.

Toshiko had escaped an inappropriate arranged marriage to be with her present husband, who is only referred to as “the man” (*otoko*). She has been cut off by her own family, and her mother- and sister-in-law blame her for her husband’s dismissal from his teaching job (although Toshiko knows that he himself had wanted to quit the job). The poverty that resulted has become nearly unendurable. Although she wants to escape the situation, she is held back by her love for the baby and by her knowledge that the present situation was something she chose of her own free will. She also takes a certain pride in her strength, which she believes gives her the ability to overcome the hardships of poverty and the subtle, constant harassment that comes from her mother-in-law.

Although Toshiko is devoted to her baby and does not begrudge the time and labor of caring for it, she wishes to be involved in activities outside the home, and in particular, she wants to educate herself on current social thinking, as represented in the opening scene. For this reason, she had accepted the opportunity to take over the editorship of a magazine known as *S* (i.e., *Seitō*). With the help of friends who volunteered to watch the child, this gave her the chance to do meaningful work outside of the home. However, her mother-in-law is unwilling to grant her even the smallest amount of time to herself, and insists that any spare time be filled doing things like making the child’s clothing fancier.

When [Toshiko] tried to open a book while putting the baby to sleep or nursing him, or sometimes while cooking something in the kitchen, the mother would glare at her as if she were indulging in frivolous pleasures.

“When I was raising children [said the mother-in-law], I didn’t relax even when I was eating.”¹³

After a detailed account of these hardships, the narrative cuts to a scene of Toshiko sitting outdoors in the shade of a tree on a hot summer day. She is fervently reading the biography of Emma Goldman. The story proceeds to give a summary, several pages in length, of Havel’s “Biographical Sketch” of Goldman, making use of many direct quotations, including the Holyoake passage from which the title is derived. What appeals to Toshiko is Goldman’s unyielding devotion to her cause. A single woman standing up

against the evils of capitalist society, Goldman succeeded in making her name known and in drawing numerous people to her cause:

[The biography] showed with utter clarity how the unjust oppression of all the varieties of authority had tried to kill her, and how even her friends, with their distorted understanding of her situation, tore away at her spirit. Triumphant over all that, with her unyielding spirit, indomitable vitality, and courage such as few can possess, she continued unceasingly in her difficult work as a famous propagandist.¹⁴

The narrative returns to Toshiko and the thoughts that the Goldman biography inspires in her. Several points in her reaction stand out. First, Toshiko begins to see that the epic struggles against injustice that Emma Goldman has conducted in her public life inevitably involve political opposition to the existing social system:

Toshiko had already understood, to some degree, the extent to which devoting oneself to saving that precious *justice* [Noe uses the English word] that most of the world had forgotten entailed resistance to the current social system. But for Toshiko, who was badly uninformed about the reality of society, it was almost baffling to learn the low, shameless methods that the government of a great republic would use against a single political agitator....

But what was even more gripping to Toshiko was Goldman's courage – and her burning passion. It was the freedom with which she moved ahead, not hesitating on any account, towards what she believed in. With each page she read, how splendidly [Goldman's] valiant stance in the face of the enemy's despicable tactics appeared to Toshiko! Quietly, she turned her thoughts to the world in which she and her comrades lived.

Here, too, every sort of *justice* was completely ignored. Everyone had been fast asleep in a false way of life, clouded by hundreds of years or more of tradition and superstition. Even if a small number of socialists tried to run a movement, they could accomplish nothing with their tiny amount of power, still in its fledgling stage. The same was true for her and her comrades, who, seeing a small slackening in the knots that tied them down, called for women to develop their self-awareness: they were not able to accomplish a single significant thing. One might be forced to conclude that it would be a long time before the inevitable clash between old and new ways of thinking would manifest itself clearly as a social reality.¹⁵

The story ends with Toshiko brooding over her frustration at feeling so powerless against the larger social system that oppresses Toshiko and so many people. She fears that she still carries within herself some of the harmful social customs that need to be fought and eradicated. Emma Goldman, she feels, was not like this. Goldman, unable to ignore systematic evils and lies, simply attacked them head on. Toshiko, too, would like to live this sort of life.

Goldman's Spirit as a Liberating Force

“Kojiki’s” inconclusive ending, with Toshiko as yet unresolved on any course of action, was meant to be understood in the context of Noe’s actual life; the story’s readers would have known that Toshiko was, in fact, going to leave her husband and his family. Noe’s artistic recreation of events that had taken place three or four years earlier in her own life, then, had a clear public purpose beyond that of advocating anarchism or introducing its readers to Emma Goldman. It served as an explanation and defense of Noe’s actions. To the many members of the public and fellow social activists who disapproved of the Noe/Ōsugi relationship, pieces like “Kojiki” were Noe’s response. Along with painting a detailed and persuasive picture of the unbearable nature of her life with Tsuji Jun, Noe linked her own personal liberation with the larger social struggle represented by Goldman’s tumultuous career.

To do this, Noe used the form of the autobiographical short story to create a narrative that, in contrast to the Goldman biography, had as its theatre the very private, walled-off space of her protagonist’s home and, more to the point, the internal world of her thoughts and struggles. As a persona, too, Toshiko is almost infinitesimally small in comparison to the epic warrior represented by Goldman. This small-scale, domestic, interior perspective is manifested in several ways.

First, Toshiko is extremely modest about her education and intellectual abilities. Her desire to “study” and her relative lack of learning and poor English ability are brought out in the story. Second, the conditions of Toshiko’s “oppression” are mainly social and psychological: she is not subject to overt abuse by her husband or in-laws, and she is always aware that she has the ability to leave her husband, and the knowledge that he will not try to stop her if she does so. In both these respects, the character of Toshiko is almost the diametrical opposite of the figure of Goldman as she appears in Havel’s sketch – and, we should add, contrasts considerably with Noe’s own public image. While Goldman, in her 1930 autobiography *Living My Life*¹⁶ (which Noe, of course, could not have read), did confess to emotions such as indecision and fear, the impression given by that narrative is in accord with Havel’s characterization of her: “There is no rest in the life of Emma Goldman. Ceaseless effort and continuous striving toward the conceived goal are the essentials of her nature.”¹⁷

Although Noe was genuinely concerned about the shortcomings in her own education, we should not assume that her purpose was, through the character of Toshiko, to elicit sympathy for herself or to express modesty. To the contrary, with her detailed depiction of Toshiko’s very ordinary trials, which one might imagine were quite typical for a young married woman of the time living with her husband’s parents, Noe endows Toshiko with a rhetorical credibility. Toshiko, modeled on the real-life Itō Noe, a radical woman with “dangerous” ideas, is shown to be a vulnerable woman who loves her baby and spares no effort to please her husband’s mother. And although Toshiko may be less typical in her unusual agreement with her spouse that the marriage is “free,” the reader is left feeling that she would probably be justified in breaking her relationship with this family.

Apart from this (retrospective) justification of her position, Noe has a more general purpose in this story of articulating a spiritual ideal of “self-growth” (*jiko seichō*) that combines self-education with an active involvement in the struggles for a just society. This theme appears frequently in Noe’s short stories as well as in essays like “Seichō ga unda watashi no ren’ai hatan” (How [personal] growth led to the breakdown of my love; 1921).¹⁸ It is a key component of Noe’s anarchism, since the ultimate purpose of destroying social authority and coercion is to enable the individual to flourish both materially and spiritually.

This emphasis on the individual was certainly present, and indeed absolutely central, to Goldman’s anarchism:

There is no conflict between the individual and the social instincts, any more than there is between the heart and the lungs: the one the receptacle of a precious life essence, the other the repository of the element that keeps the essence pure and strong. The individual is the heart of society, conserving the essence of social life; society is the lungs which are distributing the element to keep the life essence – that is, the individual – pure and strong.¹⁹

But Noe, in focusing on the vitality and growth of that “life essence” as embodied in the life of a single woman activist, endows her with the power and force of Havel’s Emma Goldman. Of the ideal of personal growth expressed in “Kojiki,” two important points should be made. First, this personal growth is inseparable from struggle and suffering. This is true whether one is being persecuted by one’s government through police harassment and imprisonment, or whether one is asserting one’s right to learn and work in the face of family opposition. One must commit oneself from the beginning to a life of working “with the industry of a slave” and dying “with the reputation of a mendicant.” Or, as Noe wrote in an early essay called “The Path of the New Woman,”

For the word “new” to express any meaning at all, it must remain the exclusive term for this small band of pioneers because only those who have lived in agony and died in agony—only those who have truly struggled to know the self, to believe in the self, and who have blazed the way to the self—deserve this word. Those carefree women who would follow after, who have done absolutely nothing of importance, should never be described with this word.²⁰

Second, this personal growth must take place in the context of social struggle. Here, Noe was criticizing the emphasis made by Hiratsuka Raichō and some other feminists at the time on a Zen-like quest for “self-perfection” (*jiko kansei*) performed in isolation from the larger society.

But Goldman’s attitude, as Toshiko had learned, was completely different. She was unable to ignore the systematic evils and the lies of society. She directed her feelings of hatred for those lies and evils directly against them. For her, there was no room for giving deference to anything. To put those true feelings of hers to

work, all she could do was to resist and oppose those lies and evils with body and soul, for the sake of all those who were oppressed. With this, her entire life became a flame that burned with a heat that would consume anything. The thought made Toshiko feel lightheaded. Something was driving her to throw everything away and plunge into a life with that kind of focus. She felt like she had to do something.²¹

The figure of Goldman, in short, plays more than one role in “Kojiki no meiyo.” It is not so much that Noe (in the guise of Toshiko) tries to imitate or compare herself to Goldman; rather, as the author, she uses the figure and “theme” of Goldman to emphasize the social significance of Toshiko’s struggles to pursue her activist career against the wishes of her husband’s family. The ironic contrast between the large scale of Goldman’s career and the small scale of Toshiko’s activities serves, not to reduce, but rather to magnify the importance of the latter. Finally, Goldman serves not only as an intellectual mentor but also as a spiritual force that can almost be physically felt by Toshiko. “Kojiki no meiyo” is more than a tribute to Goldman, and more than a convincing portrait of the life of a Japanese activist. In its skilled blending of the biography of an international anarchist “celebrity” with autobiographical and didactic elements, it is an excellent piece of propaganda.

Philippine National-Local Elite Collaboration and its implication for Sustainable
Development: The Case of Makati City

By

Raymund John P. Rosuelo
University of Makati
raymundjohn.rosuelo@gmail.com

Paper to be presented at the Asian Conference on the Social Sciences in Osaka, Japan, June 18-21, 2010.

In 1991, Republic Act 7160 otherwise known as the Local Government Code of 1991 was signed into law by then President Corazon Aquino. The law contained provisions that sought to empower local government units (LGUs) to accomplish certain functions that were previously the exclusive domain of the central government. The law was aimed at satisfying a constitutional provision included in the 1987 Philippine Constitution that required Congress to enact such piece of legislation. The law was also seen as a strategy of the Philippine State to harness the potential of LGUs as partners in development. Despite of this rather noble intention, there were some initial apprehensions regarding the implementation of the law. One of the more prominent criticisms is that the law had merely reinforced the dominance of elite politics at the local level. Such criticism was not without basis for in both journalistic as well as scholarly accounts, the local elites were seen as stumbling blocks to both political and economic development. This perspective as will be argued in this paper has generated a rather lopsided view of state-local relations in the Philippines (Coronel, 2007).

This paper can be seen as an attempt to shed light on the often ignored state-local elite partnership in achieving developmental goals. While it may be held true that local elites had in fact been obstructionist to several state reform initiatives, the picture that we are left with is rather incomplete. The case of land reform in the Philippines has often been cited as strong evidence regarding the capacity of local elites to obstruct state initiatives to achieve development (Borras, 2001). Local elites were seen as utilizing all the political and economic resources at their disposal to prevent the adoption of this vital piece of social legislation. Even at the point, when the passage of the land reform bill was inevitable, local elites through their capture of some of the institutions of the national government were able to insert provisions into the new law that can be adjudged as contrary to spirit of land reform.
