This paper however argues that the state and local elites can in fact join forces to achieve developmental goals instead of contending with one another as they have often been portrayed. Looking at recent evidence of state-local elite relations, the paper attempts to provide a counterpoint to the dominant view that local elites have sought to advance primarily their own interest to the detriment of state capacity to foster development.

This paper is as structured as follows. The first section shall present a review of the relevant literature on state-local elite relations in the Philippines with emphasis on the most prominent type of elite that exist in the Philippine political system, that of the political family. It is argued here that the existing literature had highlighted the obstructionist tendencies of local political elite vis-à-vis the Philippine nation state. As such, there is a need to explore the other side of the political equation that looks at the supporting role of local elites to various state policies. The third section shall analyze two major state initiatives that have generated consensus among the state and local elites namely the Clean Air Act and the National Energy Conservation Program. These short

case studies how the central state has formulated initiatives that draws the support of prominent political elites at the local level. The third section shall contain a background of the political family in question and their role in the development of counterpart local initiatives that support state initiatives. It is suggested here that while often depicted as trying to capture the state for its own benefit, local elites especially in Makati City have in fact collaborated with the central state in bringing about desirable social policies.

Among the different types of political elites that exert influence upon state politics in the Philippines, it is the political family that has been the most resilient and had been the focus of considerable scholarly attention. Research into Philippine political families can be classified into three interrelated areas: 1) The political family seen as part of a beneficial symbiotic relationship; 2) The political family as an organization that undergoes transformation; 3) The political family seen as an impersonal and coercive mechanism.

First, on the perspective that the political family is a beneficial partner in political dynamics, Hollsteiner (1963), Lande (1964) argue that Philippine politics is not shaped by organized interest groups or political parties. Rather, it is the existence of mutual aid relationships that impinges on the political life of the nation. This relationship is characterized by its being asymmetrical and dyadic. The idea is that wealthy patrons provide material goods and services to dependent clients, who in return give their support and loyalty. Furthermore under this framework, political contests are decided by family linkages. Roces (2000) tries to elaborate on this particular model by attempting to map out the causal mechanisms underlying the behavior of a political family vis-à-vis organizations such as the central state. She points to traditional values that while are supportive of familial interest are in turn damaging to state interests.

Second, on the political family's transformation, research has been done by Machado (1974) and Magno (1989). The central argument of this research is that societal changes brought about by economic modernization have allowed the rise of professional politicians that do not come from traditional political families. The implication of such a phenomenon points to a decrease in the significance of family ties in consolidating political power. Among the most significant societal change that impinges upon the influence of the political family is the expansion of the influence of the central state. In addition, some scholars like Nowak and Snyder (1974) have pointed to increasing economic disparities as the reason for the diminution of the patron-client relationship that dominated local political dynamics.

Third, there is a large body of literature on the perspective that the political family is an impersonal and coercive mechanism. Much of this research has been based on criticisms of the patron-client framework. While the patron-client relationship was seen as a beneficial symbiotic relationship between political families and their dependent constituency, this line of research saw a more predatory role for political families instead. Anderson (1988) argues that exploitative behavior of political leaders was very much evident from the lower levels to the higher levels of government. Bentley (1993), Gutierrez (1995), Lacaba (1995), Sidel (1989), Sidel (1997), and Hutchcroft (2000)

presented different case studies of the “boss” type of leadership in local political dynamics. A clear dominant theme emerges from among these varying perspectives. This is the depiction of political families as a political actor that has sought to advance their own interest before the interest of the nation-state. While to some degree this is accurate, the picture that we are left with is rather incomplete and largely ignores the efforts of certain political families to support state led initiatives towards development. It is in this light that succeeding discussion shall focus on the efforts the local political elite in Makati in their efforts to support state initiatives in environmental protection and energy conservation.

Barriers to a healthy State-Local political elite relationship

In some cases, political families fall into the opposition camp while the central state is dominated by the ruling party. In such a highly politicized policy environment, neither group would have sufficient trust in the other to be able to work together nor would they desire to do so. The political family would not seek to visibly lend support to state initiatives if by doing so it would increase the popularity of ruling state elites. Conversely, the ruling state elites would likewise not lend support to a group which it views as political opponents. The state may not want to foster a healthier political family for fear of bolstering the opposition.

State and local elite relations may also be strained when issues of corruption are rife. During the height of the ZTE scandal, collaboration between state and local elites in Makati would have been impossible to achieve. The controversy in which state elites were embroiled particular those in charge with the transport bureaucracy had been vigorously articulated by opposing local politics elites.

Local political elites may represent narrow political interests. In such situations, the central state may consider the political family as too selective since it must consider the common good. The local political family could afford to focus on local issues that still resonates with their constituencies

The Challenge of Implementing a Central State initiative: the Clean Air Act

In June 23, 1999, President Joseph Estrada signed Republic Act 8749 otherwise known as the Clean Air Act into law. Along the way its implementation has been marked by difficulty. This is particularly true in the area of controlling smoke belching among vehicles.

The legislators who supported the enactment of the Clean Air Act had attempted concretized a central state initiated policy to ensure that Filipinos would be able to benefit from healthy living conditions. Despite of this positive intentions, the implementation of the law leaves much to be desired as the stringent regulations included in the law itself as well as its concomitant penalties had not been fully implemented (Danao 2007)

At the time of the passage of the law there was already recognition on the part of legislators that motor vehicles, especially diesel powered vehicles, are the main cause of air pollution in urban centers. To minimize the emission of toxic fumes on the streets, the Clean Air Act directed that no motor vehicle shall be registered unless it passes the emission-testing standards. The law also limits the use of benzene and aromatics for unleaded gasoline to further lessen air pollution (Danao 2007).

The state initiative known as the The Clean Air Act has put together significant penalties for violating pollution laws. In it states that smoke belchers “will be impounded, their license plates removed pending compliance with standards, and fined. A third offense is punishable by one-year suspension of the motor vehicle registration and fined up to P6,000. If the smoke emission test is zealously applied, then there should be no smoke belchers to impound or to fine” (Danao 2007). Despite of all this Metro Manila remains one of the most polluted metropolitan areas in the world. Efforts towards curbing vehicle pollution had been largely unsupported by a lot of sectors.

Aside from the lack of support, Danao also believes the pervasiveness of highly polluting vehicles despite the enactment of the Clean Air Act is indicative of the strong political force of the transportation sector. This muscle is definitely stronger than the political will of the regulators. The transportation sector flexed this muscle when regulators tried to enforce a provision of the Clean Air Act phasing out vehicle that have been used for more than seven years. Using the threat of a transport holiday, the transport sector forced the government to surrender to their demands (Danao 2007).

The difficulty faced by the central state in realizing this worthwhile objective is a validation of Joel Migdal’s typology regarding strong societies and weak states. According to Migdal, “state capability includes the capacity to penetrate society, regulate social relationships, extract resources, and appropriate or use resources in a determined way. However, states like the Philippines are characterized by a certain duality – their unmistakable strength in penetrating societies is accompanied by their surprising weakness in effecting goal-oriented social changes” (Migdal, 1988)

It is clear from the preceding discussion that the central state is unable to realize its positive social agenda due to a variety of factors. In order to counteract these forces that debilitate its capacity to fulfill its mandate, the central state has to elicit the support of key sectors in society to advance its positive social agenda. There are indications in recent years that the central state had decided to adopt this particular strategy. The strategy emphasizes the collaboration of central and local institutions as partners in achieving developmental goals.

The national government had envisioned that local governments could support state initiatives especially the implementation of the Clean Air Act. Among the actions initiated by the central state in this regard was for the Department of Interior and Local Government, with support from the DENR-EMB, initiated the launching of the *Linis Hangin sa Siyudad/Munisipyo* Program as part of the nationwide enforcement and implementation of Republic Act No. 8749 or the Philippine Clean Air Act of 1999.

The Department of Interior and Local Government (DILG) claims that under the program, “local chief executives are encouraged to issue resolutions or enact ordinances on air pollution control and include clean air policies in their local development plan, conduct information campaigns on the value of smoke-free communities, and encourage community leaders, civic and religious organizations, and school institutions to actively support the campaign against air pollution in their localities.”

Recognizing the limitations of its own capacity as well as the potential of greater political collaboration with local government units, the central state has taken the lead in harnessing the support of this frontline sector to achieve the objectives of its own initiated policy. Instead of just merely staying at the sidelines, the local government units now are seen as active partners in the quest for cleaner air.

The Local Government Code clearly provides that local executives are mandated to implement environmental laws. Besides they are at the forefront of local environmental governance and are therefore accountable to their constituents on what they do to address environmental issues and concerns affecting their constituents.

In fairness, several local government units have initiated programs under the Clean Air Act, but much still need to be done. The LGUs still have to do something about smoke belching vehicles, about providing bikeways which are meant to provide and environment-friendly transport mode to resident, regulating smoking in public places, and the shift from two-stroke to four-stroke tricycles. The Linis Hangin Program which was launched by DENR-EMB in November 2004, has three sub-programs: Bantay Tambutso, Bantay Tsiminea, and Bantay Sunog-Basura. In 2004, the Bantay Tambutso sa Malls was launched, and the Bantay Tambutso sa Eskwela in 2005

Profile of the Local Political Elite: The Binay Political Clan

Against this policy backdrop, one distinctive feature of local government in the Philippines is the dominance of political clans. When the new government of President Corazon C. Aquino was inaugurated, Jejomar “Jojo” Binay was the first appointee in local government. He was appointed Officer-In-Charge of the Municipality of Makati effective 27 February 1986. This jumpstarted the establishment of the Binay political clan in Makati. Jojo Binay has been served as mayor for all but three years since the EDSA revolution in 1986.

Binay is married to the former Elenita Gabriel Sombillo of Angat, Bulacan, a Doctor of Medicine by profession. Elenita herself would succeed her husband when he reached the three term limit imposed by the constitution. They live at Caong St., San Antonio Village, Makati with their four children. One of which, as argued in this paper would play a surprising role in supporting a vital state initiative considering the history of the family as staunch oppositionists.

Representative Mar-Len Abigail S. Binay is said to have been socialized about the ins and outs of politics firsthand as a child. Her website claims that “with public service in her blood, she witnessed how Makati transformed from being a debt-ridden city into the financial center of the Philippines.” She graduated with a degree in Human Ecology at the University of the Philippines Los Baños. She would proceed to take up Law at the Ateneo de Manila University. After passing the Bar exams, Rep. Abby “immediately applied her legal knowledge to defend the underprivileged, a trait she shares with her father the incumbent Mayor Jejomar Binay” (Abby Binay Website).

Local Elite Support for the Clean Air Act

Recognizing the need to contribute to the drastic reduction of pollution levels as well as support the overall energy conservation program, the city government under the leadership of Mayor Binay recently unveiled its groundbreaking electric jeepney program designed not only to address the problem of rising fuel costs but more importantly help solve the high levels of pollution that besets an urban setting.

Electric Jeepney (E-Jeepneys) the first public transport of its kind in Southeast Asia were launched in July 4, 2007 in a historic drive along Ayala Avenue in the Financial District of Makati by GRIPP (Green Renewable Independent Power Producer), Greenpeace, and the Makati City Government. The Electric Jeepneys, part of an innovative project led by GRIPP, to help mitigate climate change, even as it addresses urban problems such as air pollution and solid waste (GRIPP Website).

There were some delays in the full implementation of the program. For the one the Department of Transportation and Communication a central state institution in charge with giving permission to operate these innovation in public transportation only issued the guidelines for the e-jeepneys last April 30, 2008. Almost nine months since it was first tested in Makati’s Central Business District, the electric jeepney has been classified in the guidelines as “a utility vehicle for private or public use, for non-commercial or commercial purposes or be hired to transport goods and passengers, subject to all applicable rules and regulations governing public-transport vehicles” (Mayuga, Business Mirror).

Mayor Binay saw the delay as a blessing in disguise. While it may have taken almost a year before the electric jeepneys were allowed to operate on major roads, the changes in environment had made the utility of electric jeepneys more viable. Binay articulated that “With the country reeling from almost weekly increases in the price of oil, the electric jeepneys are now more cost-efficient, not to mention environment-friendly, alternative modes of public transport. If we had officially introduced the e-jeepneys a year ago, we would hardly feel the need for it. But because of the rising cost of fuel, and the problem of air pollution, these vehicles are now very timely options,” he said.

According to the GRIPP website, Binay led city officials and officers of its partners Green Renewable Independent Power Producer (GRIPP) and Greenpeace in introducing

the e-jeepneys to the country's financial district Tuesday. Six e-jeepneys will service office employees in both Legazpi and Salcedo Villages in Makati. For the first week of operation, the e-jeepneys will ferry passengers for free. The city government will operate the vehicles for the time being. Binay said two of the six e-jeepneys were manufactured by the Motor Vehicle Parts Manufacturers Association of the Philippines (MVPMAP), using 90 per cent local materials. The first four units were made in China. Presented to the public in July of 2007, the e-jeepneys were given permission by the Land Transportation Office (LTO) to ply commercial routes last month. Binay said Makati will consider fielding 50 e-jeepneys in the city's streets, and is encouraging jeepney drivers and operators in the city to form cooperatives for the purpose of operating the vehicles. The city government is prepared to provide financial assistance to these cooperatives, he added (GRIPP Website).

The mayor's position is also echoed by his daughter the congresswoman who claimed that The E-Jeep costs an estimated PhP 500,000 while a normal jeepney is only within the range of PhP 300,000. This is why Rep. Abby is conducting dialogues with environmental groups and interested private companies to help make the price of the E-Jeep affordable for both jeepney operators and their passengers. Her own environmental advocacy is reflected in the following statement:

"The Earth is alive and in one way or another it will strike back against our excesses, as we have seen from the recent spate of calamities in our country. Let's not hold back on investing for our environment,"

National Energy Conservation Program and Local Elite Support

In July 16, 2008, the national government launched the SWITCH movement. According to the Department of Energy, SWITCH is a "social mobilization movement that seeks to demonstrate how ordinary Filipinos and specific sectors of Philippine society can contribute substantively—through fundamental changes in lifestyle, behavior or standard practices - to the massive effort needed to address the dire consequences of skyrocketing oil prices and climate change."

SWITCH evolved as a result of the 2008 Energy Summit, which itself was a social mobilization activity. Held last January, the Summit drew over 2,500 stakeholders from various sectors and employed social mobilization and performance monitoring as key strategies for sustaining program interventions that would be recommended. SWITCH crystallizes all the proposed social mobilization plans and activities arising from the Summit under a single "umbrella" campaign to maximize impact.

The DOE also argues that the program is not meant to duplicate the existing programs of government but it aims to supplement it. SWITCH culls from regular DOE programs and from private sector/civil society initiatives specific aspects with vital social mobilization components. From these regular programs and initiatives that require a high level of involvement from sectors and/or communities, it selects those program aspects that can

be termed “low-hanging fruit” in terms of the following criteria that was mentioned in the DOE website:

- It is strategic: it will help build the critical mass needed to realize impact in terms of significant energy savings and reductions in greenhouse gas emissions.
- It is immediately replicable and/or scalable in a cost-effective manner.
- It will promote multi-stakeholder consensus and united action.

As a social mobilization initiative, SWITCH is designed to:

- Make energy programs of both the government and the private sector more participative for better appreciation, acceptance and involvement among key stakeholders
- Accelerate and scale up the adoption of best energy practices that are simple but strategic
- Lay the institutional foundation to sustain best energy practices on the ground

To accelerate social mobilization among priority programs identified during the Energy Summit, SWITCH is working along two tracks. One involves scaling up mobilization of key stakeholders in mature programs that have ready resources for this purpose. The other track involves identifying promising concepts of best energy practices that have been proven to work on a pilot basis—and devising a way to replicate these initiatives systematically in other areas.

According to the DOE website, the first phase of SWITCH is planned for July-December 2008. During this phase, the campaign will focus on five calls to action:

- Switch from inefficient to efficient energy practices—starting with lighting—in workplaces, buildings, homes and public places.
- Switch from petroleum-based fuels to alternative fuels and cleaner technologies in the transport sector
- Switch from kerosene to renewable energy sources for lighting and basic electricity in remote rural areas
- Switch from fossil fuel-based technologies to renewable energy technologies in power generation, where feasible at the local level
- Switch from vestiges of centralized energy planning to more participative, bottom-up energy planning at the local level.

The Department of Energy spearheaded the creation of the SWITCH program with the advocacy greater energy efficiency. SWITCH started off with an initiative called “*Palit-Ilaw*”. Individuals and institutions had been called upon to switch from incandescent bulbs to compact fluorescent lamps (CFLs) and other energy-efficient lighting technologies. The state is convinced of the tremendous strategic benefit that such action would generate. According to the DOE, “It is estimated that replacing one million 60-watt incandescent bulbs with equivalent 13-watt compact fluorescent lamps (CFLs) would mean savings of at least 50 MW in equivalent power generation. This means that for \$1.5 million worth of CFLs, we can forego the installation of a power

station worth at least \$50 million. At the same time, this spells significant energy savings for households, offices, schools, hospitals, factories and other establishments. It will also lead to a marked reduction in greenhouse gas emissions that have been identified as a major cause of global warming.”

It is argued here that state elites have tried to rally the citizenry to support the program. Both political and bureaucratic elites have articulated the central state’s agenda to deliver positive social change with regard to the energy issue. In a statement Energy Secretary Angelo Reyes enunciated the benefits that could be derived from this program in the following lines:

“This program—which is supported by the Asian Development Bank with counterpart government funding from proceeds of the value-added tax—will feature, among others, the replacement of nine million incandescent bulbs with CFLs. Along with the other components of the program, this will result in savings of about 90 million US dollars per annum from avoided fuel cost. More significantly, this means that our country can defer 1.3 billion US dollars in investments in power generation and associated network capacity of 320 megawatts, which represents about two percent of the Philippines’ total generation capacity.”

The head of the Philippine government likewise had thrown her all out support for this initiative and has likewise acknowledged the emerging partnership with local political elites to realize a positive social agenda. In a statement the President had underscored the importance of the SWITCH program. President Arroyo stated that:

“National Fuel Conservation is now entrenched as a first principle of state craft. All government agencies have to reduce their energy bills by 10 percent. At gaya ng sabi ko, para sa proyektong Palit Ilaw, kalahating bilyong piso mula sa dagdag na kinita ng VAT ang inilaan sa tulong ninyong lahat upang himukin ang lahat ng Pilipino na palitan ang ginagamit an incandescent bulbs ng fluorescent lights. Sinisimulan natin sa pagpalit ng mga bombilya sa mga kalsada, opisina ng pamahalaan, ospital at iba pang pampublikong lugar. At ako ay nasisiyahan na narito ngayon ang mga mayor ng Metro Manila, pati na rin si Congressman Binay ng Makati na nagpakita ng suporta sa programang SWITCH” (DOE website).

Such comments from the chief executive underscored the importance of state local elite collaboration. For her part, Representative Binay is said to be currently organizing her constituent barangays to implement the switch from incandescent bulbs to compact fluorescent lamps (CFLs).

“The SWITCH movement extends beyond politics. If we really want to unite as a people, then this project is one of the best ways to start. My district will make the switch to CFLs now; it may be a small step in itself but if everyone cooperates in a symphonic matter, I am sure we will save not only the environment but also our expenses on energy,” according to Rep. Binay.

Rep. Binay had stated that she will “bring the CFL advocacy in all thirteen barangays of Makati City’s 2nd District by providing free CFLs to each of the barangay halls. Each barangay will be tasked to inform the people about the benefits of CFL and thereby encouraging them to make the switch (Abby Binay website).” To establish the benefits of CFLs, Rep. Binay will be consistently monitoring the power consumption of each barangay.

“Makati City has always been at the forefront of energy and environmental conservation. Pioneer projects which Makati has started such as the Electronic Jeepney (E-Jeep) and the No Smoking campaign are testaments to our commitment to give our constituents a sound environment to live in, Compact fluorescent lamps (CFL) provides the same amount of visible light as incandescent light bulbs but utilizes lesser energy and is estimated to have a longer life span. More importantly, it can save 2000 times of its own weight in greenhouse gases.

The support of Makati’s local elites for state initiatives did not end with the need to protect the environment. This time a scion of the established political clan contributed her own political support by bridging the political divide between state elites and local elites. Such efforts dovetail the earlier counterpart initiative of the patriarch of the Binay clan with regard to pollution control. The support of Abby Binay for an advocacy similar to programs initiated by his father is not surprising. During her campaign for the congressional seat in Makati, Abby Binay stressed that:

"I constantly try to emulate him and stand for what I think is right and just for the majority of the Filipino people. And it is my dream that someday soon, I too, will have the opportunity to make a tangible improvement in the quality of life of Filipinos, most especially the citizens of Makati.

The degree to which the Binay political clan’s potential as a partner in attaining national goals is realized depends on a number of factors including their commitment to a social agenda that benefits their constituency, the level of financial resources available to them and the interest of state elites to form de-facto partnerships with them. A paramount factor is the relation between the state and the political family. Inclusive state policies can pave the way for adoption of stronger ties with entrenched political families.

Conclusions

A healthy state-political family relationship can happen if both parties share common objectives. What has been observed here is that when the central state has a positive social agenda and when the political family has a history of advancing similar initiatives at the local level there is the potential for a strong collaborative relationship. Such relations between the state and the political family are rare. Conventional knowledge tells us that political families do not form genuine partnerships with the central state to advance social reform agenda. However case of Makati City, provides an interesting counterpoint to mainstream thinking regarding state and local elite relations in the Philippines.

When both the state and the local political elite look to complementary rather than competing contributions, collaborations become possible, even though the political family has had a history of opposing other state initiatives. As has been observed here, the state may desire to harness the capacity of the political family to mobilize resources that support of the state initiatives. The political family on the other hand may seek to reorient their parochial policies to policies that have broader implications.

ABSTRACT

The three pillars of sustainable development are social development, environmental protection, and economic development. One of the strategies for sustainable social development and democratic governance is political empowerment of women. In Malaysia, women are generally not excluded from the public sphere and are given the opportunity to play active roles in politics. Their involvement in politics has become apparent since 1945. Even so, previous studies show that the political roles of majority of Malaysian women are limited to campaigning and voting. The number of women competing as candidates for parliamentary and state assembly seats is also considerably small compared to men. This paper focuses on women political participation in Penang. It is an exploratory study of women involvement in politics using survey method. The objectives of this study are to: 1) to examine the forms of women political participation and 2) to compare the extent of political participation among women from different ethnic background, educational background, job sectors, and income levels. The findings indicate some extent of women involvement in different participatory forms such as voting, contacting their members of state assembly and parliament, contacting committee members of political parties, participating in political parties' activities, campaigning, attending political parties' talk, and contributing financially to political parties.

Keywords: political participation, women and politics, political participatory forms

Introduction

Among the determinants of sustainable development are social development, environmental protection, and economic development. One of the strategies for sustainable social development and democratic governance is political empowerment of women. In other words, women's political participation has been used as one of the measures in assessing their development in society. Specifically, indicators for women's political development are the existence of political rights similar to men to participate in politics, the rights to vote, the rights to become electoral candidates at all levels of political structure, and to become members of any political parties.

For many years, participation in political activities has dominated discussions of political research. McCloski's definition of political participation is "activities by which members of a society share in the selection of leaders and directly or indirectly in the formation of public policy" (Lovenduski & Hills, 1981: 3). Cross-national research done in several countries shows that the better educated and higher social status individuals are more likely to use various opportunities for political participation. There is a tendency for these individuals to develop attitudes such as feelings of efficacy and a sense of civic duty that encourage political participation. They also possess the personal resources and skills that are easily converted into political involvement when the need arises (Verba, Nie, & Kim, 1978). Previous studies on situational factors and political attitudes have identified socioeconomic factors such as education, occupation, and income that shape variety of attitudes. Education has also been one of the predictors of women's participation in politics (Tedin, Bradley & Vedlitz, 1977; Klein, 1984). Recent evidence suggests that skill and confidence are important factors in activities which are considered to be complicated such as organizing new groups or becoming a leader in an organisation as compared to voting and personal contacting. In some societies such as the United States, there is an evidence of the better-educated and higher social status group of individuals to dominate the arenas of participation compared to the lower class (Almond, Powell, Strom, & Dalton, 2004)

This paper focuses on women political participation in Penang, Malaysia. In general, Malaysian women are not excluded from the public sphere and are given the opportunity to play active roles in politics. Their involvement in politics has become apparent since 1945. Even so, the number of women competing as candidates for parliamentary and state assembly seats is considerably small compared to men. After the 2008 general election, the total number of seats held by women in the Lower House and Senate of Parliament is 24 (10.8%) and 20 (31.35%) respectively (<http://www.ipu.org/wmn-e/classif.htm>).

Previous studies show that the political roles of majority of Malaysian women are limited to campaigning and voting. They are either directly involved in the general election campaigns as political party workers or as members of various groups and associations which give supports to political parties (Ramli, 2003). Some of these groups act as pressure groups which persuade political parties to accommodate their concerns into their election campaign. Women comprised about 50% of the country's population and this percentage is significance that political parties generally accord considerable importance to women issues in their manifestos and political campaign.

Objectives of the Study

The objectives of this research are:

- 1) to examine the forms of women political participation
- 2) to compare the extent of political participation among women from different ethnic background, educational background, job sectors, and income levels.

Methodology

This paper is an exploratory study of women political participation using survey method. The sample consisted of 314 women in Penang, Malaysia. The questionnaire used a 5-point Likert scale for each item. Data management and analysis was performed using SPSS 17.0.

Results and Discussion

The respondents in this study comprised of women aged from 21 to above 51 years old as indicated in Table 1. Eligible age to vote for Malaysians is 21 years old. The respondents were distributed across all age groups as shown in Table 1.

Table 1. Age of Respondents

Age (yrs)	Percent
21-30	34.3
31-40	23.2
41-50	24.8
51 above	17.8
Total	100.0

Internal consistency of all the items in the questionnaire was quite high, with a reliability coefficient (Cronbach's Alpha) of 0.872.

Table 2. Participate and Responsible to Participate in Politics

	Disagree & Strongly Disagree (%)	Somewhat Agree (%)	Agree & Strongly Agree (%)	Mean	Standard Deviation
I participate actively in politics	81.9	12.4	5.4	1.80	.921
I am responsible to participate in politics	57.8	27.9	13.3	2.25	1.097

Table 2 shows that more than three-quarters (81.9%) of women in the study “disagreed and strongly disagreed” that they participated actively in politics. Only 5.4% “agreed and strongly agreed” that they participated actively in politics. However, the percentage of women who “agreed and strongly agreed” to the statement that they were responsible to

Table 3. Types of Political Participation

	Disagree & Strongly Disagree (%)	Somewhat Agree (%)	Agree & Strongly Agree (%)	Mean	Standard Deviation
I vote in every general election	16.5	12.7	70.2	3.91	1.301
I contact Member of State Assembly when necessary	69.2	13.7	16.5	2.41	1.176
I contact Member of Parliament when necessary	74.2	14.0	11.1	2.00	1.055
I contact Committee Member of any political parties when necessary	66.4	20.0	13.0	2.20	1.106
I participate in political groups' activities	83.2	10.5	6.0	1.75	.926
I participate in general election campaign	74.4	14.3	11.0	1.95	.981
I pay attention to politics of this country	18.1	34.3	47.0	3.29	1.068
I attend political parties' talk	74.3	15.9	9.5	1.93	1.074
I contribute money to political parties	84.7	27.9	4.7	1.60	.879

participate in politics is slightly higher (13.3%) than those who “agreed and strongly agreed” that they participated actively in politics (5.4%). It is apparent from this table that the percentages of women who participated actively in politics and felt responsible to do

so were small compared to percentages of those who did not participate and did not feel responsible to do so.

Table 3 presents the types of political participation the women involved in. The data from the table show that the only two forms of activities which score mean value more than 3. The highest mean value for the types of political participation was voting in every general election which was 3.91 followed by paying attention to politics of this country which was 3.29. The types of political participation which score the mean values between 2 and 3 were contacting members of State Assembly and Parliament, and Committee Member of any political parties when necessary. The other types of political participation score less than 2. The mean value lower than 2 indicates that majority of the women “disagreed and strongly disagreed” that they were involved in political groups’ activities, general election campaign, attending political parties’ talk, and contributing money to political parties. Most of the women in the study voted in every general election as compared to other types of political activities. The percentage of women who “agreed and strongly agreed” that they participated in voting in every general election was 70.2% as compared to those who “disagreed and strongly disagreed” which was 16.5%. The data also indicates that 47% of the women “agreed and strongly agreed” that they paid attention to politics of this country as compared to only 18.1% who “disagreed and strongly disagreed” of doing so.

Table 4. Participate actively in politics and ethnic background

	Malay	Chinese	Indian & others	Total
Disagree and strongly disagree	101	102	55	258
Somewhat agree	18	14	7	39
Agree and strongly agree	13	2	2	17
				314

Table 4 shows that women who “disagreed and strongly disagreed” that they participated actively in politics comprised of 101 Malays, 102 Chinese, and 55 Indians and others. There were only 17 women who “agreed and strongly agreed” that they participated actively in politics. The numbers were smaller for all three ethnic groups who “agreed and strongly agreed” to they participated actively in politics: 13 Malays, 2 Chinese, and 2 Indians and others.

Data in Table 5 indicates that women who “disagreed and strongly disagreed” that they participated actively in politics constitute of 42 with primary school level and below, 127 with secondary school education, and 89 with college/university education. The number of women who “agreed and strongly agreed” that they participated actively in politics decreased for every levels of education.

Table 5. Participate actively in politics and education levels

	primary school level and below	Secondary school	College/ University	Total
Disagree and strongly disagree	42	127	89	258
Somewhat agree	1	22	16	39
Agree and strongly agree	6	9	2	17
				314

Table 6. Participate actively in politics and job sectors

	Public sector	Private sector & NGO	Student	Total
Disagree and strongly disagree	49	140	66	255
Somewhat agree	9	27	3	39
Agree and strongly agree	3	7	7	17

As can be seen from Table 6, there were 49 women who worked in public sector, 140 in private sector and 66 students “disagreed and strongly disagreed” that they participated actively in politics. The number of women from each sector of employment who “agreed

and strongly agreed” that they participated actively in politics decreased to 3 women in public sector, 7 in private sector, and 7 students.

Table 7. Participate actively in politics and income levels

	RM 660 below	RM 661- RM 1999	RM 2000 above	Total
Disagree and strongly disagree	68	100	57	225
Somewhat agree	6	23	10	39
Agree and strongly agree	7	6	1	14

Table 7 shows that 68 women whose income was below RM660, 100 women whose income was between RM661-RM1999, and 57 women whose income was above RM2000 “disagreed and strongly disagreed” that they participated actively in politics. Only 7 women in the income bracket of below RM660, 6 women in the bracket of RM661-RM1999, and 1 woman in the bracket above RM2000 who “agreed and strongly agreed” that they participate actively in politics.

The results in this study are inconsistent with previous research since they suggest that levels of education and income are not significant indicators for women’s political participation. The results also do not show that ethnic background and job sectors as significant determinants for women to be involved in politics.

Conclusion

The findings in this study suggest that in general, the majority of women “disagreed and strongly disagreed” that they participated actively in politics. Most of them also did not feel responsible to participate in politics. Contrary to previous studies, these findings indicate that factors such as ethnic background, educational levels, job sectors, and income levels are not significant in determining the levels of women’s political participation.

Finally, even though the majority of women considered themselves as not actively involved in politics, the findings show that the majority of them admitted to voting in every general election. This rather contradictory results may be due to the women’s

general understanding of voting in general election as not part of being actively involved in politics. In addition, the results show that most of the women were reasonably well-informed voters who followed politics of the country. Considerably more work need to be done to investigate women's political participation and attitudes in developing countries.

University of Singapore**

April 15, 2010

The Microfinance Sector in India: Contrasting the Self Help Group Bank Linkage Model and the Grameen Bank Model

Savita Shankar, PhD Candidate, Lee Kuan Yew School of Public Policy, National University of Singapore

Microfinance refers to the provision of a broad range of financial services such as deposits, loans, payment services, money transfers and insurance, to poor and low income households and their microenterprises (ADB, 2009). Microcredit, namely the provision of loans, has been the mainstay of microfinance.

Globally, microfinance has grown in popularity as a possible means to address poverty in a sustainable manner. The high repayment rates on collateral free, microfinance loans are attracting the attention of not only socially oriented but also commercially oriented investors. Microfinance is emerging as a noteworthy asset class, whose earnings have low correlation with global business cycles and with potential to provide investors high returns with relatively low risk.

India, being home to around 300 million poor people is witnessing rapid growth in microfinance activities. Two important models have emerged. One is the “Self Help Group Bank Linkage Program (SBLP)” which was developed by the country’s apex bank for rural credit, the National Bank for Agriculture and Rural Development (NABARD), a public sector organisation. The other model, the “MFI (microfinance institution) model” largely replicates Bangladesh’s Grameen Bank Model and grew mainly through private sector and NGO (non government organization) initiatives.

This paper enquires into the dynamics of these two models in the context of one state in India, Tamil Nadu. The purpose is to describe, analyze and explain them from the perspective of sustainable development drawing on a study of two microfinance providers and in-depth interviews of mature microfinance users.

The first section is about the challenges in assessing the impact of microfinance and its contribution to sustainable development. The second section provides an overview of microfinance in India. The third section describes the research study undertaken. The fourth section discusses the findings of the study. Finally, there is a section on conclusions.

1. Sustainable Development and Microfinance

One of the earliest definitions of sustainable development was provided by the Brundtland Report (1987), which defines it as “development that meets the needs of the present without compromising the ability of future generations to meet their own needs”. The first part of the definition implies the importance of meeting the basic needs of the poor. The report of the world summit on sustainable development states clearly that eradicating poverty is an indispensable part of sustainable development (UN, 2002).

The millennium development goals (MDGs) integrate most of the aspects of sustainable development in the areas of nutrition, education, health, gender equity and environment. Microfinance which focuses on providing financial services to low income women could potentially be an important enabling factor in achieving the MDGs. The specific possible impacts of microfinance with regard to the MDGs are identified by Littlefield et.al. (2003). These include eradicating poverty, promoting children's education, improving health outcomes for women and children and empowering women.

However assessing the impact of microfinance on these criteria is not an easy task due to a number of factors. While anecdotal evidence on the benefits of microfinance are many, the number of careful impact studies by independent researchers is far fewer. This has led to skepticism on whether the enthusiasm for microfinance has been misplaced (Adams and Raymond, 2008).

Rigorous evaluations need to address the issue of what would have happened if the microfinance program had not existed. However, in the context of microfinance, this aspect is complicated by the fact that microfinance members usually join the programs on a voluntary basis leading to a "self selection" problem that makes direct comparisons between members and non members invalid. Similarly, direct comparisons between older members and new members also poses problems as earlier members are likely to have been significantly different (such as having greater initiative and risk taking ability) from later ones.

There is therefore a need for a comparable control group so that differences in income prior to providing microfinance and at a point in time subsequent to providing it can be compared. Two recent impact studies have used a randomized evaluation research design in order to address these issues. The first was by Karlan and Zinman (2009) who carried out a randomized evaluation in a microfinance bank in the Philippines. They found that businesses of borrowers shrank though profits at the household level increased through productivity increases. The measurement of impact was after a period of between eleven and twenty two months. They concluded that microcredit works through risk management and investment at the household level than by expansion of the micro enterprises financed. The other study was by Banerjee et.al. (2009) who carried out a randomized evaluation of the impact of introducing microcredit in a new market in the slums of Hyderabad, India. Fifteen to eighteen months after lending began in treated areas, they found no impact on average monthly expenditure per capita or on measures of health, education or women's education. However expenditure on durable goods increased in treated areas and the number of new businesses increased by one third.

The microfinance programs studied in both cases were very different, the first used an individual lending model to lend to existing business owners both male and female. The second, used the classical group lending model to lend to women. However the results were similar in that microcredit impact was not dramatic.

A group of six large microfinance practitioners based in the USA have pointed out that the results of these widely cited studies are greatly limited by their short time frames and small sample sizes (Accion et.al., 2010). They also make the point that "quantitative studies may not capture everything". Moreover, many of the impacts of microfinance may be indirect rather than direct.

Another study which specifically aimed to assess the contribution of microfinance to MDGs was conducted by the ADB with respect to the microfinance program of Khushhali Bank in Pakistan. It found that while there was a significant impact on income generation of the members, contribution to other MDGs was not significant (Setboonsarng and Parpiev, 2008).

The present paper will examine microfinance in India by using qualitative methods. The emphasis is not on the magnitude of possible impacts but on whether the process is geared to promote MDG goals.

2. Microfinance in India

Microfinance loans in India are defined as loans below Rs.50,000 in value. Broadly speaking, estimates on the extent of microfinance in India should also include operations of post offices and banks to the extent that they provide services to low income groups. However, challenges in estimating the extent to which they do so, have resulted in a more narrow definition of microfinance in the country as being comprised of the SBLP and MFIs (Srinivasan, 2009). The two models are described below.

2.1 The SBLP Model

A self help group (SHG) is usually a voluntary group that comes together with the objective of mutual aid. In the Indian microfinance context, it refers to groups of 12 to 20 low income women who come together for the purpose of creating a pool of savings that can be used for lending to members when the need arises. The women are between the ages of 20 years and 60 years and are residents of the same neighbourhood. The number of members of an SHG is capped at 20 to avoid the need for formal registration. Usually an NGO acts as a catalyst in the group formation process and also provides some basic training.

A group leader (called “animator”) and deputy leader are elected by the group. The animator has to undergo a compulsory awareness program within the first three months of the group’s formation. The group meets regularly (weekly or monthly) in the same neighborhood and starts saving. The monthly saving ranges between Rs. 20 and Rs. 100 depending on the capacity of the members. The pooled amount is initially kept in a box or in a post office account. Thereafter, a savings account is opened in a nearby bank branch. When the kitty grows, the group starts giving small amounts (between Rs. 2000 to Rs. 3000) as interest bearing loans to individual members. The process continues and a record is maintained by the animator, giving the members experience in assessing individual credit worthiness, monitoring and record keeping. The members also build up credit histories and acquire experience in keeping accounts and adhering to terms and conditions. After a few cycles of mutual savings and credit have been successfully completed, the group approaches an external financial agency, usually a commercial bank for funding. Usually the group gets two or three times the pooled amount as a loan. A grading system is followed according to which banks assign grades to SHGs based on various parameters. SHGs which achieve the minimum score are advanced credit. The borrowing entity is the SHG and not the individual member. The loan taken by the SHG is distributed among the members in a proportion decided by the group, taking into account need and repayment capacity.

Financial incentives are usually provided by the Government to NGOs for group formation and training. Over a period of time, the NGO reduces its involvement with the group though some NGOs continue to meet them at least once a month, to monitor their performance and

also provide inputs on other matters they consider important for the socio-economic progress of the women. SHGs are at times used to channel resources of poverty alleviation programs. At the national level, the Swarna Jayanti Swarojgar Yojana (SGSY)¹, a program launched in 1999, which provides credit and capital subsidy is implemented through SHGs. SGSY groups accounted for 20% of the SHGs financed during 2008-09 and 21% of the loans disbursed in the same period. However, studies have found that the SGSY groups had repayment problems with non performing assets being double the average rate². Moreover, the groups also are found to last for a shorter duration (Srinivasan, 2009). Perhaps the reason could be that SGSY may attract certain undesirable elements who may join the group solely to take advantage of the program. At times, state level programs are also introduced through SHGs.

2.2 MFI model

MFIs also mostly use group based models of lending. Either the joint liability group or an adaptation of the SHG model (explained above) is commonly used.

Joint Liability Group (JLG) Model (replication of Grameen Bank model)

In this case, the MFI raises funds from various sources (such as donors, equity investors and lenders) and then on lends them directly to groups of low income women living in the same neighbourhood. The groups are usually composed of 5 members, with 6 to 8 groups forming a centre.

The MFI has a team of field officers who form groups and train them. While there is a group leader, she is not required to maintain records for the group as these are maintained by the field officers themselves. Hence no special training for the leader is necessary. After training of members, there is an assessment of the group by the MFI branch manager which involves visits to the residences of the members. This process is called as “group recognition test (GRT)”. Thereafter, the groups meet regularly on a weekly basis in the neighbourhood where the members reside. Loans are disbursed soon after the GRT. Savings are not usually insisted upon. In fact most MFIs (other than those registered as banks or cooperatives) in India are not permitted to collect savings of members.

Loans are given to individual members, though the group as a whole is responsible for repayment. All disbursements and repayments are made in the weekly centre meetings over 50 weeks, which typically take place in the early hours of the morning. The meetings are conducted by the MFI field officers. Strict discipline is enforced at the meetings so that they take place on time and are concluded within a fixed time frame. This is because the field officer usually has a tight schedule of centre meetings in the morning. All records of transactions of the group are maintained by the field officer. Progressively higher loan amounts are considered by the MFI on successful repayment of loans. All group members are usually given equal amounts of loan.

Adaptation of SHG Model

¹ Translates as “Golden Jubilee Self Employment Scheme”

² 5.72% as compared to 2.9%

MFIs, primarily those that evolved from NGOs who had been closely involved with the SHG model, use a hybrid of SHG and MFI models, by raising funds and directly lending to SHGs. In this case instead of commercial banks, MFIs themselves lend to SHGs. These MFIs make use of the SHG base built up by them as NGOs and superimpose the MFI model of lending to groups by raising funds.

2.3 Growth of the sector³

In March 2009, there were 76.6 million microfinance accounts in India as compared to 61.2 million in the previous year. Of these, 54.0 million accounts were served by the SHG model while 22.6 million were served by the MFI model. After adjusting for overlaps between the two models, the net microfinance customer base is estimated at 70 million.

While the SBLP accounted for 70.5% of the total outreach, the rate of growth of its outreach was 14.6% in 2008-09, far lower than the growth rate of the MFI model which grew by 60%. Moreover, for the first time, the number of incremental customers added by MFIs during the year was more than that added by the SHG Model. This could be because MFIs attract funding from a wider range of sources including from equity investors.

Outstanding loans of MFIs increased from Rs.59.50 billion in 2007-08 to Rs. 117.34 billion in 2008-09, a growth rate of 97%. In the case of SBLP, loans outstanding in the books of banks, increased from Rs. 170 billion to Rs. 241.96 billion (provisional figures) indicating a growth rate of 42% during the same period.

Some studies such as the Intellecap⁴ study entitled “Inverting the Pyramid” (2007) estimate that the potential market may be 245 million individuals, suggesting that there is still a lot of scope for the sector to grow.

2.4 Differences between the SBLP model and the MFI model

There are important differences between the two predominant models, the SBLP and the MFI model, as summarized in **Table 1** at **Annexure**.

Both the SBLP and the MFI model have over a period of time developed their own strengths and weaknesses. The strengths of the SBLP include its wider social agenda, the training provided to group members and its emphasis on savings. Its primary weakness is that as groups manage themselves after a point, there is wide variation in quality observed between groups (EDA-APMAS, 2006). The MFI model on the other hand has strengths in the greater uniformity of services provided across groups of a single MFI and the standardized record keeping by MFI employees. However the sole emphasis on microcredit and the lack of savings services due to regulatory constraints are significant weaknesses.

3. Research Study

³ Figures in this section obtained from Srinivasan (2009).

⁴ Intellecap is a social sector advisory firm based in India.

As described in **Section 1** of the paper, it is difficult to assess precisely the direct and indirect impacts of microfinance on achievement of MDGs. Using qualitative research, this study attempts to assess if the way microfinance is made available in India, warrants expectation that it could contribute to the MDGs. An understanding of this aspect could be useful to donors and policymakers in determining how much emphasis microfinance should receive in their actions to promote achievement of MDG objectives. The study could also point to ways in which the practice of microfinance in India could be improved in order to contribute more to these objectives.

The above research question implies that the study is a kind of an “evaluation” research, as it is in essence trying to evaluate the role of micro finance in promoting achievement of MDGs. Case studies are said to have an important role in evaluation research, when there is a need to explain the link between program implementation and program effects (US General Accounting office, 1990, quoted in Yin, 2002) when the causal links are too complex for a survey to analyze.

The case study has multiple units of analysis, as both micro finance providers (MFPs) and microfinance members are studied resulting in an “embedded case study design” (Yin, 2002). Multiple case studies are proposed to be used at both levels making it a multiple holistic-multiple embedded case study design.

As there are two main models for micro finance in the state, namely the SBLP and the MFI model, one typical case of each one was studied, making it a multiple case study design at the level of microfinance providers. Within each MFP, individual MFP members who are at least in the third year of MFI membership were studied. So at this level also, a multiple case study design is used. A major objective was to ascertain the method in which the microfinance loans were utilized. The in-depth interviews trace the usage of microfinance loans from commencement of membership, providing an insight into the results that may be expected from the process. Members using one or both models of microfinance in the country were interviewed.

3.1 Selection of microfinance providers and members

The entire study was conducted in the context of one state in India, namely, Tamil Nadu. At the microfinance provider level “Hand in Hand (HIH)”, an NGO involved with the SBLP was selected while for the MFI model, “Grama Vidiyal Microfinance Limited (GVMFL)”, an MFI using the Grameen model was selected. While HIH is an NGO which has been involved with the SBLP since 2002, GVMFL is the largest MFI in Tamil Nadu on the basis of loans outstanding and the 9th largest in the country (Crisil, 2009).

For selection of members, a stratified random sampling technique was adopted at GVMFL as it was decided to cover members in rural, semi-urban and urban areas. In this manner, 5 rural members, 8 urban members and 10 semi-urban members were interviewed. As some members had been graduated to individual loans, in all the above three categories, graduates and non graduates were interviewed.

At HIH, as only monthly meetings are held, a neighborhood in which members reside was visited and 8 members who were at least in the third year of their membership were interviewed.

All members interviewed were women between the ages of 18 and 59 as this is the eligibility for HIH as well as GVMFL membership. In total, in-depth interviews of 31 microfinance members were carried out.

3.2 Research details

The research site was Tamil Nadu in India. In the case of the MFI (GVMFL), the researcher visited 12 branches of the MFI around Tiruchirapalli. The urban branches of Thennur, Srirangam, Kattur and Pudukkottai were visited. The semi-urban branches that were visited were Somarasampettai, Samayapuram, Mathur and Lalgudi. The rural branches which were visited were Annavasal, Keeranur, Thirukattupalli and Nanillam. In addition, the head office at Tiruchirapally and the administrative office at Chennai were visited.

In the case of the SBLP (HIH), the researcher visited Baluchetty in Kancheepuram District, Tamil Nadu. In addition, the head office at Chennai and the administrative office at Kancheepuram were visited.

4. Analysis of findings

A study of the microfinance providers of both models indicated clearly that the SBLP seems more suited for providing a more holistic development of the individual member as its focus is not lending alone but the social development of the members. Moreover, it offers savings services in addition to credit. Finally, the involvement of NGOs whose staff is attuned to addressing social issues, makes it more likely that matters relating to social aspects are discussed during group meetings. The focus in the MFI model is primarily on lending. As a result, MFI field workers often tend to come from commercial backgrounds such as finance companies or marketing companies. Even though the MFI management emphasizes social issues in its mission, at the ground level the emphasis is on disbursing and collecting loans.

The interviews with members indicate that both the SBLP and the MFI appear to be benefiting them by providing a means to bridge cash flow gaps. In fact, it turned out that fourteen interviewees had joined both MFI and SBLP programs. In response to questions on which model was superior, it was surprising to find that many of them viewed each model as serving different purposes. Instead of viewing the two models of microfinance as competing, they viewed them as being qualitatively different and used them in a complementary manner. Membership in the SBLP was essentially for members to be able to take advantage of Government initiatives and having a platform to participate in social and political issues. The fact that the groups were linked to large banks gave them a sense of pride and empowerment. The membership in the MFI on the other hand, was seen as the key to a reliable and predictable source of funding. The women valued this membership as well greatly, and were dependent on it for working capital as well as to meet lump sum expenses.

Looking at the aspect of poverty eradication, it was found that in both models, there were two distinct kinds of members.

The first kind of members included cases where the members or their husbands were engaged in an income generating activity. For them, access to micro finance provided working capital in the early stages. After each loan cycle, as the loan size typically gets larger investment for capacity expansion is enabled. In other cases, it enables the member to engage in greater

value added activities. For example, one member who had a photo studio was able to buy a video camera after a few loan cycles. In this manner, the member is able to gradually increase income levels substantially.

The second kind of members were those who did not have a stable and solid income generating activity but used the loans mainly to meet household expenses and bridge cash flow gaps. For instance, one member in a rural area used the loan to smoothen cash flows as her husband, the only earning member of the family, was erratic in giving her his income. For such members, there does not seem to be a clear path out of poverty. Micro finance providers need to clearly identify such members and put them on a different kind of program which enables them to attend skill development courses. To start a business in addition to attending courses, an opportunity for internship in a successful micro enterprise in the same line of business in another location may be helpful.

With regard to health outcomes, this was studied by examining if the microfinance members had health insurance coverage. It was found that none of those interviewed in both models enjoyed health insurance. Thus when there are health shocks, typically members continue repayment of microfinance loans by pawning their jewels or by availing loans from moneylenders. The higher interest rates that these usually entail, put a burden on the members. In the SBLP, NGOs often specifically provide information and advice on health aspects during their meetings with members.

With regard to empowerment of women, this was examined by an assessment of whether the microfinance loans were used by women for their own businesses as this would imply that they have their independent source of income. Aghion and Morduch (2005) point to the fact that microfinance can enhance the woman's intra-household bargaining power. As shown analytically by Browning and Chiappori (1998), a women's intra household bargaining power is obtained by her ability to credibly threaten to leave the household. Access to microfinance can enhance this ability.

Directly asking about whether women felt empowered by microfinance has the tendency to elicit a positive response due to conditioning by NGOs and MFIs in this regard. Hence this indirect approach was used. It was found that out of the 31 members interviewed; only 15 used the loans for their own business or for their joint business with their husband. Out of the remaining, 12 used the loan mainly for their husband or children's businesses. The other 4 used the loan to meet household expenses, fees for children or to repay moneylender's loans. Especially in urban areas, only 2 out of the 8 members interviewed used the loan for their own business. Out of the 9 interviewees who had graduated to individual loans, 4 used the loans for their own business. The other women had been graduated to individual loans based on household cash flow, which primarily emanated from husband's earnings.

Hence it cannot be assumed that microfinance leads to women developing their own enterprises and subsequently their independent sources of income, contributing to their intra-household bargaining power and empowerment. However, it was found that in both models, women mentioned that the microfinance groups enable them to develop bonds with a set of people outside the family to whom they can turn to in times of need.

On education, there were no specific questions as again these may illicit responses that may tend to be positive. However, it was found that in most cases, women mentioned that access to microfinance enables them to smoothen cash flows and make lumpy payments such as

children's school fees. Moreover, many members when asked about their future plans mentioned their desire to enable their children to study for vocational or professional courses. In at least a few cases, it was found that women used the loans for payment of fees for their children. However the rigid repayment schedules of microfinance loans puts a heavy strain on their finances as the loans are typically geared for repayment from income generation loans. There seems to be a need for MFIs to offer loans more specifically for addressing this need by providing longer repayment periods.

5. Conclusions

From the study of the two models of microfinance in India, it seems that both models appear to be playing useful roles in improving the lives of their members. More specifically, with regard to aspects relating to achievement of MDGs, it is found that the SBLP is better geared to address these aspects. However, it is the MFI model which is growing more rapidly and which more clearly appears to be financially sustainable, due to its better access to funding from various sources.

Interviews of members indicate that a differential approach needs to be adopted by both models with regard to members having a stable income generating activity and those not having this advantage. The latter need inputs on skill development so as to enable them to move out of poverty.

With regard to health outcomes, microfinance does not seem to help except through advice provided by NGOs in the SBLP. There is a need for health insurance in order to enable tangible benefits in this regard. In its absence, health shocks have the potential to undo any progress made through microcredit. In India, growth in microinsurance is clearly lagging behind that of microcredit. Even the product with the highest coverage (life insurance) has coverage of just 21% of that of micro credit. Health insurance coverage needs to be improved in order to help achieve better health outcomes for members.

To study potential for female empowerment, the utilization of microfinance loans was studied. In about the half the cases, microfinance loans were utilized by women for activities of male household members. It therefore cannot be assumed that microfinance leads to female empowerment by enabling women to have an independent source of income. To the extent that the loan is routed through the women, they may have a say in the utilization but the empowerment impact of that may be limited. However, bonding with the microfinance group who are in regular touch with the member, is found by women to be source of strength in times of need.

On the subject of access to education, microfinance helps bridge cash flow gaps enabling payment of fees for children's education. This could address an important barrier to continued access to education. However, for larger outflows associated with vocational training and professional courses, members felt the need for specific education loans with longer repayment periods. Provision of such loans could also enable a means for the household to progress out of poverty.

In conclusion, it is apparent that microfinance provides a good channel to reach large numbers of low income women for purposes of promoting sustainable development. However, the channel does not seem to be fully leveraged by policymakers and donors for this purpose. In order to play a more significant role in achieving these objectives,

microfinance providers need to be encouraged to incorporate greater focus on these outcomes
into their processes.

ANNEXURE

Table 1: SBLP Model and MFI Model

(Source: Author)

SBLP Model	MFI (Grameen) Model
Groups of 13- 20 members	5 member groups, with 5 to 7 groups forming a center
Group formation and monitoring for some time by NGO, but NGO eventually withdraws	Group formation and monitoring throughout by MFI
Loan advanced by Commercial Bank	Loan advanced by MFI
Group members trained to do record keeping and bank transactions	MFI staff do record keeping and bank transactions
Loans are given to SHGs which on lend to members	Loans are given to members individually though on joint liability basis
Savings for 6 to 12 months needs to precede borrowing	Loans are given without any prior savings period. In fact savings cannot be collected by MFIs due to regulatory reasons.
Delivery of microcredit viewed by some NGOs as secondary to goals of female empowerment and social transformation	Microcredit is the main focus
On an ad hoc basis, Government subsidies are given to SHGs by way of grants equivalent to a part of the loan	There is no subsidy element in MFIs

Institutions and Social Mobilization: The Chinese Education Movement in Malaysia

by

ANG Ming Chee

Department of Political Science, National University of Singapore

Introduction

Arguably Malaysia's longest-running social movement organization, *Dongjiaozong*, is a rare example in Asia, as an ethnic-based social movement organization and actively engaged in contentious politics for more than five decades. *Dongjiaozong* is known to the Chinese civil society in Malaysia as the combination of two national-level umbrella organizations and the two most significant elements of the Chinese school: the United Chinese School Committee Association of Malaya¹ (or *Dongzong*) and the United Chinese School Teachers' Association of Malaya (or *Jiaozong*). Together, they have been running the Chinese education movement in Malaysia since the 1950s. *Dongjiaozong* also represented the resistance of the Chinese minority groups, in their fought to preserve their cultural pride and identity from incursion by the Malay-dominated state of Malaysia.

Dongjiaozong has earned a reputation among the Chinese community as a worthy and legitimate defender of Chinese culture and rights in Malaysia. Over the years, the state has consistently striven to constrain the movement, its organizations, and supporters alike. A series of events have threatened to derail the movement, with some of these challenges being turned into opportunities and sources of motivation for the movement's activists. State officials like to paint *Dongjiaozong* as a chauvinist or extremist organization, a view supported by the plethora of restrictive regulations and policies imposed on it.

These restrictions have failed to result in the movement's demise, however. Over time, the movement's leadership and key supporters have repeatedly seized opportunities, generated and accumulated resources, and survived its dealings with the state. Nevertheless, why does this social movement organization continue to persist, if it has successfully achieved its objective? Has the five decades of experience begun to be a burden instead?

This led to increasing unrest in Malaysia between 1998 and 2008. Social movement groups and opposition political parties took advantage of the political opportunity to broach on a variety of issues ranging from human rights, grievances of minority groups and government policies, to demands for greater state reformation. These attest to the fact that the Malaysia society is expanding beyond itself as a contained pressure group and has begun to play a more significant role in domestic contentious politics.

In 2008, for the first time in Malaysia history, the Barisan National alliance lost control of five states and a promising two-third majority advantage in the federal parliament. This defeat and the political pressure that fell on Abdullah's successor, Najib Razak, saw the

¹ The name was changes into United Chinese School Committee' Association of Malaysia on April 26, 1979.

emergence of stronger and more demanding social mobilization among its citizens in 2009. For political survival, Najib's government began to open itself to compromises to its citizens' demands through collaboration and cooption. Among the various groups, *Dongjiaozong* was one of the few contentious groups the government engaged for negotiation. How did this social movement organization maximize the political opportunities presented to them to achieve their objectives?

There are comparatively little systematic studies made to understand the existence, prevalence, functionality, and operations of *Dongjiaozong* as a social movement organization. Non-institutional elements such as the internal organization, core issues of membership and identity, importance of networking and political participation in its mobilization process that have allowed the social movement organization to attain its objective in its operations and campaigns, remain potentially worth exploring. Therefore, this research is devoted to exploring and understanding the politics within and between the social movement organizations in Malaysia.

Research Questions and Observations

This research aim to explore the following primary research question:

How does a minority social movement organization persist in pushing its agenda despite facing ongoing constraints imposed by a majority-dominated state?

The understanding of the role of social movement organization (in this thesis, the case study of *Dongjiaozong*), will perhaps provide better validity of *Dongjiaozong* as a model of an organization in social movement analyses. The author will attempt to analyze the campaigns conducted by the same social movement organization separately, thus sorting out the conditions that induce different types of mobilization, process and achievements. The social movement political opportunity models will also provide a synthesis of the political struggles of the social movement organization and state actors to form a core understanding of the evolving dynamics of a non-violent, ethnicity-based, trans-social class social movement. Additionally, the research will examine the role of the social movement organization in sustaining the movement, the challenges it faces, the strategies it adopted, and the state's attempts to constrain and control the social movement organization.

Observations

Here, in order to answer the mentioned research question, the author argues the following three observations:

1. *Continuous external threats to dilute the minority's identity by the State have shaped a culture of resistance that has become important momentum for the social movement organisation.*

Cultural resources such as vernacular language and the culture it symbolizes have shaped the identity and “imagined”² territory of Chinese communities in Malaysia. Continuous external challenges, marginalization, lack of competent alternatives (especially in providing quality education), and the threat of Chinese identity dilution have sustained the movement’s actors and their activities, despite confined in a constrained political environment. In the process of struggle to sustain the continuation of Chinese education system, the social movement has created a temporary solution to sustain this identity by maximizing limited resources (mostly provided by the Chinese-speaking Chinese communities), and opportunities, thus shaping a culture of resistance against the state’s policies over time.

2. The combination of a formal bureaucracy institution at the national level with a loosely structured grassroots support system agency has provided significant mobilization powers to the social movement.

Although begun as a cultural preservation tactic, the movement has been sustained through the gradual maturation of its social movement organization through professionalization and division of work through a system of working committees. The chief strength of the social movement organization remains in its ability to collaborate with allies, while its extensive grassroots support demonstrates effective mobilization. Despite differences in social and political backgrounds, individual connections have been critical in brokering and bridging the divide between the movement's entrepreneurs and the authorities.

3. *A competitive political arena has provided channels for negotiation and limited violent expression by both the State authorities and the social movement activists.*

A multi-party coalition regime of a (semi) democratic country is more tolerant and provides more political space than a single-party dominated regime. Mutual dependency among various parties within the coalition has prevented the state from taking violent measures to counter the Chinese education movement. Instead, everyday resistance and tension had better encapsulate the challenger-state authority relations in Malaysia. Moreover, although tensions have waxed and waned over time, violent suppression has been rare, especially when compared to the fate of other ethnic (and religious) based movements in the country.

Literatures on Social Movements and Institutions

Collective behavior scholars of the 1940s and 1950s who studied riots, crowds, and mass hysteria considered the participants of these activities as irrational, dysfunctional, and abhorrent aberrations in the functioning of a modern social system. Contemporary social movement studies grew out of this research. In contrast to the previous studies that

² Anderson, 1991.

stressed the integration of and equilibrium inherent to social systems, these newer studies placed conflict and struggle as integral to such a social system.

Social movements differ from political parties or interest groups. They are a complex set of multiple actions by a mixture of actors oriented toward some general social change goal.³ Political parties nominate candidates in election and aim to win formal control of government to implement its programs, whereas interest groups and social movement organizations do not. Interest groups, as associations of individuals or organizations and usually formally organized, simply desire to influence public policy in their areas of concern.⁴

The definition of a social movement in this research will combine that of Tarrow (1994), Charles Tilly (1995, 2004) and Clive S. Thomas (2001). Here, a social movement is *a series of sustained interactions and collective political action, contentious performances, displays and campaigns by ordinary people outside established political institutions. These people share collective claims, common purposes, and solidarity to challenge authorities to change elements of the socioeconomic and political structure, or in the distribution or exercise of power in society.* Despite evident diversity, social movements share commonalities and principles that make comparative research and generalizations possible.

There are many distinctions where social movement groups and interest groups overlap, as some social movement groups may transform into interest groups or political parties when the need arises. Above all, social movement groups, interest groups, and states continuously influence each other. “Movements influence state actors by agenda-setting and suggesting new political strategies; states, in return, influence movements by proactive covert repression, and by setting the rules for counter movements as well as movement activities.”⁵

Social movements involve collective behavior and collective action, and need both to succeed. How or why rational individual join to act collectively has always puzzled scholars. In 1965, Olson (1965: 2) argued that, “unless the number of individuals in a group is quite small, or unless there is coercion or some other special device to make individuals act in their common interest, rational, self-interested individuals will not act to achieve their common or group interests”. Collective behavior entails costs and usually requires such stimulus as grievances or deprivation, although the latter do not automatically translate into movement activity.⁶ Grievances need to be mobilized. Any given society possesses external (i.e. money, time, media, material) as well as internal resources (i.e. members’ capacity, individual moral, support). These can be put into use by political entrepreneurs, movement leaders and organizations to coordinate, organize, mobilize, and ultimately agitate.⁷ A social movement’s leaders and entrepreneurs can be

³ Oliver and Marwell, 1993.

⁴ Key, 1964: 9-10, 155; Thomas, 2001: 5.

⁵ Goldstone, 2003: 24.

⁶ Zald, 1992.

⁷ Olson, 1965.

those running an organization, providing incentives or resources, or leading the movement's activities. McCarthy and Zald (1977) lay special emphasis on the role of professional social movement organizations in solving the collective action problems of the resource mobilization literature.

According to Meyer and Tarrow (1998: 19), the strength of movement-related organisations can be measured by their internal development following heightened mobilization, such as maturation of greater formalization, the move toward bureaucratization, professionalization, membership growth, and extension of networking. Others warn that organisational formalization can discourage mobilization, leading to the movement's ossification and alienation of grass-root support.⁸

Resource mobilization literature, however, have failed to explain why social movements do not happen across countries with grievances and sufficient resources. This gave rise to the political process approach, which looks more broadly at the political opportunities and threats in which movements mobilize their resources. A principal proponent of this school of thought, Doug McAdam (1982), argued that political opportunities, a heightened sense of political efficacy, and the development of institutions had played a central role in shaping the civil rights movement in the United States. The political process model places great emphasis on the structural constraints and opportunities that social movements face. These include political pluralism, internal fragmentation within political systems, receptivity of political systems to organized protest, as well as support and facilitation of political elites.

Power relationships between challengers and authorities are constantly changing and therefore present a constant change of opportunities for social movements to draw upon. "People join in social movement in response to political opportunities and then, through collective action, create new ones."⁹ Social movements result when expanding political opportunities are seized by people who are formally or informally organized, aggrieved, and optimistic that they can successfully redress their grievances.¹⁰

Political opportunity theorists are institution-oriented. McAdam, McCarthy, and Zald (1996) proposed that political opportunity should only include structural factors and not cultural processes: "the kinds of structural opportunities should not be confused with the collective processes by which these changes are interpreted and framed" (pp. 25-26). Sidney Tarrow (1994) used slightly different language to describe the same phenomena. Instead of discussing 'institutional constraints', Tarrow wrote about the need for 'political opportunity structures' (p.13) as dimensions of the political environment that provide incentives for people to undertake collective action by affecting their expectations for success or failure (p.85). For Tarrow (1989, 1994), Tilly (1978) and McAdam, Tarrow and Tilly (1997), the success of mobilization (or politicization) hinges on the opportunities afforded the group in question. The opportunities present themselves when

⁸ McAdam, 1982: 55-56.

⁹ Tarrow, 1994: 17-18.

¹⁰ McAdam, McCarthy, and Zald, 1996: 8.

there is a shift in the institutional structure or the ideological disposition of those in power.”¹¹

Non-institutional or structural factors such as strategy, agency, culture, cultural perception, ideology, and class variables have been neglected by most mainstream scholars. They are lumped into the category of “mobilizing structures” and “framing”, and lacked systematic analysis.¹² Despite the difficulties of scientifically and quantitatively categorizing and grouping these important variables, these restrictions should not hinder academic exploration on them.

Chinese Education Movement in Malaysia

The Chinese education movement is historically rooted in opposition to state attempts at control. Its origins can be plausibly dated to 1920 as a reaction against the passing of the Registration of Schools Ordinance,¹³ the colonial administration's earliest effort to exert “order” over Chinese vernacular schools in British Malaya.¹⁴

From 1925 to 1928, 315 Chinese schools’ registrations¹⁵ were revoked for failure to comply with curriculum, administration and management, or sanitary standards.¹⁶ In response, local Chinese organizations, such as the Penang Overseas Chinese Union,¹⁷ are the core cadre of pro-revolutionist Sun Yat Sun’s *Nanyang Tongmenghui* and Penang Philomatic Union,¹⁸ took up the cause. Chinese leaders at the forefront, such as Choong Thiam Poe, Song Mu Lin, Goh Say Eng, Yu Pei Gao, Tan Sin Kian, Khoo Beng Cheang, Ooi Kim Kheng, are mostly businessmen, and which also acted as Chinese school management committee, regarded the law as an infringement on their authority over the management of the schools.¹⁹

¹¹ Freedman, 2000: 37.

¹² Goodwin and Jasper, 1999: 29.

¹³ Registration of Schools Ordinance, Straits Settlements No. 21, October 27, 1920. A similar law was passed by the Federal Council of the Federated Malay States on November 20, 1920.

¹⁴ Under this education enactment, all school’ teachers, and school board of governors had to register with the Department of Education and comply with various regulations. Many believe that the regulation was imposed due to the increase in Chinese nationalism and anti-imperial sentiments in Chinese schools strongly influence by the 1919 May Fourth Movement in China. See MICSSWC, 1992: 76-77.

¹⁵ By 1920, the Malay State Federation had 181 Chinese schools, and 313 in the Straits Settlement. Choong WC, 2004: 182.

¹⁶ Choong WC, 2004: 183; Loh, 1975: 43, 94-95.

¹⁷ The Penang Overseas Chinese Union was part of the Overseas Chinese Union, formed by former members of *Nanyang Tongmenghui*, a secret organization that supported Sun Yat Sen revolution. The Penang *Tongmenghui* branch camouflaged as the Penang Philomatic Union, a reading club consisted of politically active Chinese businessman. *Tongmenghui* significantly contributed (especially in providing financial resources) to the successful of China 1911 revolution. The Overseas Chinese Union was formed after 1911 and was acknowledged by the new Nanking government. Teoh SK (2004)

¹⁸ In August 1910, Sun Yat Sen began to use Penang as a personal sanctuary as well as the revolutionaries secret headquarters of the *Nanyang Tongmenghui*. Goh Say Eng and twenty-one others had jointly called for a meeting to organise the Penang Philomatic Union. Tan, 2007: 133

¹⁹ Goodman, 1921.

They mobilize a public assembly on July 16, 1920 at Penang Chinese Assembly Hall in protest of this regulation. Although most straits-born, English-educated Chinese committees from the assembly hall refused to participate, however local Chinese educationalists and school representatives from seven other states (including Singapore) attended the assembly.

Accompanied with lawyer Goh Guan Ho, the movement representative Choong Thiam Poe travelled from Malaya to London in the mission to petition the British Home Government to repeal the law.²⁰ The law was approved by the British on the August 4, a month earlier before Choong arrival on September 6.²¹ Resistance failed, and some leaders, such as Choong Thiam Poe, Tan Sin Kian, Yu Pei Gao, Ooi Kim Kheng and Song Mu Lin, were either jailed or expelled from the Malaya federation.

At its outset, the movement concentrated its energies at the local level. Limited by geographical terrain, human resources and access to communication, movement during the pre-world war era were mainly confined to towns or districts. Headed by a politically active merchant class, the movement was loosely structured and lacked the capacity to respond uniformly or effectively to changing developments. Although activists had the support of the local Chinese population, most attempts at resistance--like the one described above--ended poorly. The British simply expelled the agitators. Not until after World War II did the movement coalesce into an organization-led entity with clearly defined aims and strategies.

The Chinese schoolteachers nationwide had built up a steadily growing number of teachers' and principals' associations in the country. In 1950, as a result of growing numbers of the local teachers and principals associations, these groups joined together under the umbrella of a national union. Despite linguistic and geographical differences, this collective approach and standardization of strategy promised gains in the advocating for improved welfare, which included an increase in grant-in-aids for Chinese schools.

Brewing optimism led to the formal establishment of the United Chinese School Teachers' Association (or *Jiaozong*). The decision was taken at the first national meeting, held at the Hokkien Association in Kuala Lumpur in August 1951. *Jiaozong* was officially inaugurated on Christmas Day in 1951. After the release of the controversial 1951 Barnes Report²², which recommended that all vernacular schools should be abolished and replaced by a single system of primary school teaching in English, these groups of Chinese schoolteachers sensed an impending crisis in Malayan Chinese society. It was through the efforts and intervention of Wen Tien Kuang,²³ founding member of

²⁰ Tan KH, 2007: 192; Teoh SK, 2005: 89.

²¹ Teoh SK, 2005: 89.

²² It triggered a strong reaction in the Chinese community and brought together 1,400 Chinese associations to discuss this government legislation. The discussion ended with the formation of the United Chinese Schools Teachers' Association and the United Chinese Schools Committees Association. See Palanca, 2004.

²³ Graduated from the Columbia University in America, he has been the Chinese-English translator of MCA during the 1950s. Almost all documents between *Dongzong*, *Jiaozong* with MCA were translated by him. He was the Selangor Chinese School Committee Association general secretary (1956- 1959) and

Malayan Chinese Association (MCA) -- the first Chinese-based political party, and an active leaders of Selangor Chinese School Board of Committee Association, in collaboration with *Jiaozong*, that drew on the collective power of MCA, led by Tan Cheng Lock²⁴ and the United Chinese School Committees' Association (*Dongzong*) to collaborate under the framework of the "Grand Three Associations of Chinese Education" (*Sandajigou*) in defending the status of Chinese education. This was one of the most important political collaboration of the Malayan Chinese, especially during Malaya's transition from a colony into a new nation-state.

However, the strength of the working relationship among *Jiaozong*, MCA and *Dongzong* was shaken when most sympathizers of Chinese educationalists and MCA leaders left the party after an internal crisis in December 1960.²⁵ Tan Siew Sin²⁶ who assumed leadership after 1960 were more submissive, pro-UMNO, and therefore dropped their uncritical support for the Chinese movement. In response, *Jiaozong* and *Dongzong* joined forces to form the working alliance of *Dongjiaozong*, and became popular and widely acknowledged by the Chinese community after the 1968 fundraising campaign and formation efforts to establish the first Chinese independent university-*Merdeka* University in Malaysia. *Dongjiaozong* has been acting as the formal organization of the Chinese education movement ever since.

Over this time, and to this day, *Dongjiaozong* has striven to solidify its organizational efforts, to strengthen its power of negotiation, to recruit and unify supporters, and, most importantly, to function as a platform to plan the movement's strategies.²⁷ During its five decades, *Dongjiaozong* has survived a host of challenges from many quarters. It has established itself as a major social movement organization and the player behind the dynamic Chinese education movement in Malaysia.

The title of *Dongjiaozong* became popular and widely acknowledged by the Chinese community during the *Merdeka* University Campaign in 1968. However, *Dongzong* began to lead the Chinese education movement in Malaysia from the 1970s with the *Duzhong* (Chinese Independent Secondary Schools) revival movement, and provided strong financial resources for its organization at the beginning of 1974. With more *Jiaozong* members now being constrained by their status as a civil servant, *Dongzong* staff and leaders formed the majority of *Dongjiaozong*.

deputy president (1960-1964). He was also appointed as *Sandajigou's* Chinese Education Central Committee's secretary. He also played the role as the middle man between Lim Lian Geok, and Tan Cheng Lock.

²⁴ Tan Cheng Lock was MCA first president. He was straits-born, English-educated, and a well connected Straits Chinese leader with British officials such as Malcolm MacDonald and Henry Gurney. Tan served as a nominated member of the Malacca Municipal Council and Straits Settlements Legislative Council. See Tan LY (1988: 50-51); Heng PK (1988: 67, 251).

²⁵ After the death of MCA charismatic leader Tan Cheng Lock (陈祯禄) in 1958, MCA has been divided into two factions, one of the pro-UCSTA leaders (lead by Lim Chong Eu, 林苍佑) and the others who prefer a closer cooperation with the Alliance and UMNO (lead by Tan Siew Sin, son of Tan Cheng Lock).

²⁶ Tan Siew Sin served as MCA President from 1961 to 1974 and held the powerful posts of Minister of Commerce and Industry and Minister of Finance from 1957 to 1974.

²⁷ Lee, 1957; Chen, 1992; Tan, 1997; Kua, 1999.

Collective identity of this movement has been exclusive and ethnicity-based since the very beginning. The focus of the movement has always been to fight for the right to equal status in accord the Chinese language, and this right to be manifested in the Constitution, and later, as an official language. However, with both attempts failed, the movement struggled to reinstate the status and importance of Chinese education, and promote its usage among ethnic Chinese in Malaya. After the release of the controversial 1951 Barnes Report,²⁸ which recommended that all vernacular schools to be abolished and replaced by a single system of primary school teaching in English, Chinese schoolteachers, in particular, sensed an impending crisis in Malaya's Chinese society.

Few social movements last long enough, however, for organizational formalization to be an issue. *Dongjiaozong* is a rare example in Asia that as an SMO has actively engaged in contentious politics for more than five decades. As a national-level umbrella organization, *Dongjiaozong* has adopted a traditional Chinese organizational management format. Prior to the mid 1970s, *Dongzong* and *Jiaozong* secretariats, for instance, had been organized simply. *Dongjiaozong* had adopted a traditional Chinese organizational management format. They had one or two general officers who worked closely under a ten-man executive committee.

The formalization and institutionalization process of *Dongzong* and *Jiaozong* started to evolve in the 1970s, when Lim Guang Seng took over the premiership as the new *Dongzong* Chairman. Working closely with *Jiaozong*, headed by Sim Mow Yu and Juang Di Jun, they formed a so-called dream team of the Chinese education movement, by successfully transformed *Dongjiaozong* into an active, professional, instituted social movement organization.

After the 1974 organizational reform, and the formation of the National Independent Chinese Secondary School Working Committee, *Dongzong's* secretariat expanded into a massive 140 paid staff institution. The organization was responsible for planning and operating various campaigns related to the Chinese education movement and provided liaison for the activities of sixty independent Chinese secondary schools. *Jiaozong's* secretariat was expanded into a thirty staff institution in the 1980, responsible for research and studies about the 1,284 Chinese primary schools in Malaysia. *Jiaozong* was responsible to coordinate more 100 ad-hoc committee at the local level after the formation of National Chinese Primary Schools Working Committee in 1994.

The social movement organization began to manifest internal strain during the term of Ong Chao Chuen as *Jiaozong's* chairman since 1994, and escalated into a full-blown battle when Yap Sin Tian became the new leader of *Dongzong* in 2004. The two new leaders faced challenges in terms of control and command of the executive division which ran the daily activities of the movement organization. Many in the executive community had developed a *laissez-faire* working relationship with the leaders during

²⁸ It triggered a strong reaction in the Chinese community and brought together 1,400 Chinese associations to discuss this government legislation. The discussion ended with the formation of *Jiaozong* in 1952, and *Dongzong* in 1955. See Palanca, 2004.

Lim Guang Seng's leadership. Issues ranging from dissatisfaction regarding the qualification of leaders, their selection process, and check and balance mechanisms subsequently led to the demand for reforms of the movement organization from the executive community and movement supporters.

Thus, as one of the most extensive Chinese organizations in Malaysia, *Dongjiaozong* and its leaders were implicitly acknowledged as the spokesperson for Chinese education and played a leading role in matters related to Chinese education, welfare and rights. Through working committees and independent institutions, for example, it accommodated support and enhanced social networking in the Chinese organizational community. Thus, the movement organization generated amiable social capital in the associations by inviting leaders and activists from other Chinese organizations to sit in the organization's various sub-committees.

The development of a social movement organization is not a linear process, but evolves through continual interactions between the movement and the larger political society. This is especially so of the relationship between a social movement organization's leaders and state authorities over time. Each learns to adapt from experience.

It is believed, for instance, that the ability of a social movement organization to learn from its earlier experience can assure a lower chance of failure in its future repertoire. Unlike other Chinese organizations, *Dongjiaozong* has managed to successfully resist co-option and circumvent the constraints imposed by the state.

Today, *Dongjiaozong* remains a legitimate organization, and conducts activities such as seminars and press conferences openly. At the forefront of dealing with changing cultural and political constraint (such as access to mass media, changes to Chinese demographical constraints, Islamization in the country, etc.), the social movement organization continues to shoulder the burden of preserving the culture and identity of the Chinese community in Malaysia.

Over the years, the ethnically Malay dominated state of Malaysia has consistently strove to constrain the movement--its organizations and its supporters alike. A series of events have threatened to derail the movement. *Dongjiaozong* shifted from a citizenship movement in the 1950s into a movement campaigning for Chinese to be adopted as an official language in the country in the early 1960s. Facing the heightened anti-communist agenda in the 1960s, and the termination of Chinese as the second official language movement in 1969 after the national communal riots, the organization, and its supporters suffered under the New Economic Policy since 1971. The growing Islamization of Malay state and the increasing suppression discrimination has led to the 1980s Chinese Civic Rights movement. *Dongjiaozong* participation in party politics since 1982 till 1990, however the strategy shift turned out to be not very successful, due to lack of effective mobilization and support from both Chinese and non-Chinese communities.

In present day, as globalization intrudes into Malaysia's ever changing political arena, the movement also faces a pressing need to adapt accordingly, by shifting its approaches,

strategies and changing its internal institutional structures to ensure continuous participation in the nation-building process of Malaysia. Adopting a non-violence approach, *Dongjiaozong* continue to facilitate influence and soft power from within and beyond the state institution to push for its ultimate agenda, especially in promoting the status of Chinese language and Chinese education in the mainstream national policy-making.

Conclusion

Social movement organizations are part of the state; they act and react with the state and other contentious bodies within the political arena. This thesis demonstrates that *Dongjiaozong* has consistently employed a non-violent stance in its resistance towards state suppression. Paradoxically, the social movement organization has also become dependent on external suppression and continuous discrimination by the state to sustain its ongoing struggle and to sustain its legitimacy.

Dongjiaozong remains the Chinese community's chief voice in Malaysia's Chinese vernacular education and to some extent, in the political arena. The movement successfully resisted language assimilation and prompted the formation of a unique integrated education system in Malaysia. Nevertheless, it is now facing a threat greater than its traditional enemy: pressure from its supporters over demands for structural reform, greater democratization and separation of power within the social movement organization.

This thesis concludes that professionalized social movement organizations are one of the interpreting factors for a successful movement. Political opportunities and the strength and effectiveness of mobilization remain the key variables that mediate the achievement of a social movement organization. The reopening of *Baixiao* and the replacement of English with the vernacular languages as the medium of instruction of Science and Mathematics in school, are among the positive responses of Malaysia's Barisan Nasional government towards pressures from mass-supported social movement in the post-2008 political arena.

The Ah Beng Subculture: A Popular View

CHAN Suet Kay

University of MALAYA

There is a trend among Malaysians in using the Hokkien term ‘Ah Beng’, in describing unsophisticated people. ‘Ah Beng’ means quite simply, a ‘country bumpkin’. However, there has not been any academic studies on the subject in Malaysia, whereas popular media tout it as a cultural icon. There are some issues related to the use of this term – for example, do people readily identify themselves as ‘Ah Beng/Ah Lian’ or is it a pejorative term? Furthermore, among Malaysian Chinese there is a divide between the English-speaking and Chinese-speaking groups. Do the English speaking groups deliberately conjure up a term to disassociate themselves from their Chinese-speaking counterparts, for fear of being seen as unmodernised? And why do the Chinese speaking Malaysian Chinese display these characteristics ‘mocked’ by the non-Chinese speaking Chinese – which include traits like the overt display of Western brand names, copying trends from East Asia, persistently sticking to their own mother tongue, and displaying a form of anti-intellectualism? In Singapore however, leading sociologist Chua Beng-Huat has spearheaded much of the academic literature on the ‘Ah Beng’, and charts its rise from ‘stereotype’ to a desirable subculture. This paper surveys the general public opinion in urban Malaysia of the concept of ‘Ah Beng’, using a total of 200 respondents from the urban youth in Kuala Lumpur.

The Ah Beng: Definitions

Singaporean sociologist Chua Beng-Huat, who has largely pioneered the study of youth subculture in Singapore, especially on the Ah Beng, has termed the Ah Beng as:

“In contrast to the English-educated middle-class young, with their skimpy tank tops, spaghetti straps, and basic blacks, the lesser-educated Chinese youth are influenced by different cultural flows. The latter are unlikely to have successfully completed the four years of secondary school. They have been pejoratively termed locally as ‘Ah Beng’ (for males) and ‘Ah Lian’ (for females).”¹

¹ Chua, Beng-Huat. 2003. Life is Not Complete Without Shopping.

*"As the 'other' to the English-educated, the figures of Ah Beng and Ah Lian are not simply lowly educated, they also have supposedly 'pre-modern' or 'sua-ku' (hill tortoise, metaphor for 'backward') modes of behaviour. Until recently, the English-educated used Singlish as a means of belittling this group."*²

Chua also describes the fashion of the Ah Beng in detail, taking care to demarcate it from the 'English-educated Chinese' and the latter's way of dress:

"In contrast to the black and muted pastel shades of the middle-class youth, the clothes of the Ah Beng and Ah Lian are filled with bright, or to the English-educated, 'gaudy', colours. For example, frilly lime green tops of polyester material may be matched with 'day-glo' yellow jeans or short skirts and white patent leather platform shoes. Generically, against the understatement of the middle-class youth, Ah Beng and Ah Lian go 'over the top' in every item of bodily adornment, including dyed bronze hair. All the colours on the body from hair to nails are big and bright, with every intention of drawing attention to themselves."

Some background on the origins of the Ah Beng are necessary. The Ah Beng emerged in an era of mass consumption in Singapore, which allowed bountiful access to brand names. Frank Michael Chua's doctoral thesis, 'Culture of Consumption: The Emergence of The Global Market Culture in Singapore, 1960-1990' (1999), describes the emergence of consumption culture in Singapore as a result of 'government policies, private business, and the advertising industry'. He explained that due to previous lack of material wealth (pre-1960), the public in Singapore were very receptive to channels of mass advertising, fuelled by the growing economy, which encouraged the purchase and ownership of brand names. This in turn had implications for the way society behaved and formed their values. One of the offshoots of this new consumption culture was a tendency to form identities based on purchasing power. Frank Michael Chua further argued that the entire process began with the upper classes emulating Western trends, which was then 'trickled down' towards the less affluent. This led to a culture of acquisition, which is epitomised by the overt display of brand names. Hence, this enabled the rise of a Chinese subculture called the 'Ah Beng'.

² Chua, Beng-Huat. 2003. *Life is Not Complete Without Shopping*.

Another definition is given by Singaporean political satire website TalkingCock.com, which is founded by Jocelyn Woo Yen Yen and Colin Goh. This website is famous for mocking Singaporean politicians using colloquialisms, one of which is a staple in a column dedicated to politicians. There is also a glossary describing these colloquialisms, titled the 'The Coxford Singlish Dictionary'. It defines 'Ah Beng' as the following:

“AH BENG[1]

An unsophisticated Chinese boy, usually Hokkien. Stereotypically, he speaks gutter hokkien and likes neon-coloured clothes, spiky, moussed hair and accessories such as handphones or pagers, all of which are conspicuously displayed. He also likes to squat, even when a seat is available.

"Wah lao eh, why you so chao ah beng one?" (Goodness, why are you such an ah beng?)

See also: Ah Huay Ah Kow Ah Lian Ah Seng Beng Chao Ah Beng/Ah Lian”³

Given that Ah Beng has become a trope for popular discourse in Singapore as early as in the 1990s, it is likely that Malaysia followed suit in adopting this trend. The term is also widely used in Malaysian media, for example in The Star, a mainstream English daily. From an article titled 'A Social Stereotype', we have a description of the Ah Beng:

“There are a few traits associated with the Ah Beng. Perhaps the most visible and readily identifiable is the dyed hair. Then there's the abovementioned souped-up car with a loud stereo blasting “feng tau” music.

He also has strange habits, such as squatting by the roadside, at the bus-stop, outside shops; and mixing his brandy, even wine, with soda.”⁴

Retrieved 6 Dec 2009.

In this study, the researcher sought to investigate whether the public opinion among the urban crowd, centering on the Klang Valley, matched that of both descriptions earlier – i.e. that of the Singaporean Ah Beng and the one mentioned in *The Star*. The intention was to see if there was a general consensus on the conception of the Ah Beng. This is to later form an introduction to an in-depth study of the Ah Beng subculture using ethnographic techniques.

Questions of Taste

Bourdieu defined taste as originating from the individual's habitus, which is "a set of dispositions which generate practices and perceptions"⁵. The socioeconomic background of a person determines their future conduct and choice of economic goods. This of course, extends to fashion, one of the hallmarks of identifiers for the Ah Beng. The Ah Beng has generally been associated with the working class. Studies of working class communities have shown that their offspring tend to reproduce the same culture as their forebearers⁶. The Ah Beng has been said to originate from Chinese New Villages in Malaysia as a result of British resettlement after the Japanese Occupation in Malaysia⁷. The children of the New Villages, when coming into the city, bring with them some of the traits associated with the Ah Beng such as the love of brand names, seemingly to make it seem like they have "made it big" in Malaysia. However, like most nouveau riche, they also bring with them a certain lack of refinement otherwise associated with wealth. It is as though they deliberately consume to the point of excess to differentiate themselves from the working class, of which they themselves came from originally. This echoes Veblen's theory of conspicuous consumption, where those who have accumulated wealth deliberately make waste of it to show they can afford it⁸. However, Bourdieu has also been said to argue that rather than being innate, taste is socially assigned, in that "objects of consumer choice reflect a symbolic hierarchy that is determined and maintained by the socially dominant in order to enforce their distance or distinction from other classes of society."⁹ It is also likely that Ah Bengs choose to consume certain goods which they perceive as equivalent to their standing in wider society.

Youth and subculture

⁸ Veblen, Thorstein. 1902. *The Theory of the Leisure Class: An Economic Study of Institutions*

⁹ Allen, Douglas E., and Anderson, Paul F. 1994. *Bourdieu's Theory of Consumer Taste Formation*, in *Advances in Consumer Research* Volume 21, pp.70-74.

In 'Subculture: the Meaning of Style', Dick Hebdige outlined the functions of subculture, mentioning Albert Cohen's theoretical contribution to the study of the juvenile gang, where "working-class adolescents who underachieved at school joined gangs in their leisure time in order to develop alternative sources of self-esteem"¹⁰. Hebdige argues that the post-World War II economic boom in the 1950s allowed for greater spending power in Britain, especially among the youth. This allowed for increased channels of expression through consumption of goods such as clothes and music – thus allowing for the creation of subculture. He wrote of how youth, in general, especially the 'consumer youth', was grouped together by researchers into a class of 'Teenage Consumers'.

*"The persistence of class as a meaningful category within youth culture was not, however, generally acknowledged until fairly recently and, as we shall see, the seemingly spontaneous eruption of spectacular youth styles has encouraged some writers to talk of youth as the new class – to see in youth a community of undifferentiated Teenage Consumers."*¹¹

This paper draws from this concept, applying it to an investigation of Malaysian urban youth culture, from the perspective of youth as 'Teenage Consumers'. The starting point is that Ah Bengs are primarily youth who express themselves through consumption, and that there are complexities within the ways in which they express themselves.

Visibility of Subculture to the Public Eye

Tolson¹² remarks that the public visibility of subcultures might have come about as a result of the birth of the 'sociological gaze'. He writes that Hebdige's theory of subculture as a post-war consumer boom, while contrasted to the work of Mayhew¹³, who posits that subculture was inherent even in the mid-1800s in London, could be used to affirm the above. In other words, while subcultures might have long been existent, it is the 'sociological gaze' which carries it out into the open and makes it visible to the public eye. From this, we might conclude that the existence of a subculture is largely based on its public visibility. Hence, this paper seeks to discover the visibility of the Ah Beng in the Malaysian public eye.

¹⁰ Hebdige, Dick. 1979. *Subculture: the meaning of style*.

¹¹ Hebdige, Dick. 1979. *Subculture: the meaning of style*.

¹² Tolson, Andrew. 1990. *Social Surveillance and Subjectification: The emergence of 'subculture' in the work of Henry Mayhew*. The Subcultures Reader (Gelder ed.)

¹³ As quoted by Tolson, Henry Mayhew was a journalist who conducted surveys of urban poverty and published them in the London Morning Chronicle during 1849-50.

The Methodology

A short opinion survey consisting of six general questions about the respondent's background and four open-ended questions about the lifestyle of the Ah Beng was designed. The survey was carried out in three main premises, the first being that of the researcher's own university, University of Malaya, a number of private colleges, and a few shopping malls.

The reason for having both close ended and open ended questions was due to the nature of the questions themselves. For the socioeconomic background of the respondents, close ended questions were used as response parameters were easily measured – such as age, income level, education level, occupation, and leisure activity. For the open ended questions, the respondents were queried about their perception of the Ah Beng – what they would wear, what type of music would they listen to, employment, and leisure activities. The intention was to allow the respondents to be more expressive, and printed on the survey questionnaire itself was an encouragement to use descriptive keywords.

The reason for using both University of Malaya (a public/government university) and private colleges was to balance out the distribution of students who responded to the survey. The researcher intended to allow for the differences in socioeconomic background, which might affect their worldviews. In the same vein, the use of the shopping mall survey was to balance out the education level of the respondents – as respondents in a shopping mall would not necessarily have university level education. This was the case, as some of the respondents were youth between the ages of 15 to 20 (the research was conducted during a school term holiday) and were only sitting for their high school exams.

For the University of Malaya survey, an online questionnaire was used, hosted on a website called eSurveysPro. This was because as a student of University of Malaya, the researcher had access to the full student mailing list, which included around 10 000 undergraduate students and 9000 postgraduate students. A link to the survey page was included in a mass email asking students to participate.

For the private colleges, the survey was conducted in HELP University College physically, while the researcher sought the help of a friend in Monash University Malaysia campus to publicise the survey on his Facebook account, where he had a student group.

As for the shopping mall surveys, the researcher conducted them in 6 shopping malls in total – all based in the Klang Valley. These were Mid Valley Megamall, Gardens Mid Valley, Sungei Wang, Berjaya Times Square, Pavilion KL, and Sunway Pyramid.

There was a slight difference in the online and offline survey – as the researcher wanted to primarily survey the opinions of the Malaysian Chinese (given that Ah Beng is a Chinese language term). Hence in the online survey, it was included an open-ended question asking the

respondent to list down their ethnicity. However, there was an interesting discovery in that respondents who listed down themselves as Malay, answered questions about the Ah Beng’s lifestyle in similar vein to those who listed themselves as Chinese. This showed that Ah Beng subculture transcended the linguistic and ethnic realm – and was something of a generational trend.

The breakdown of the respondents are as follows:

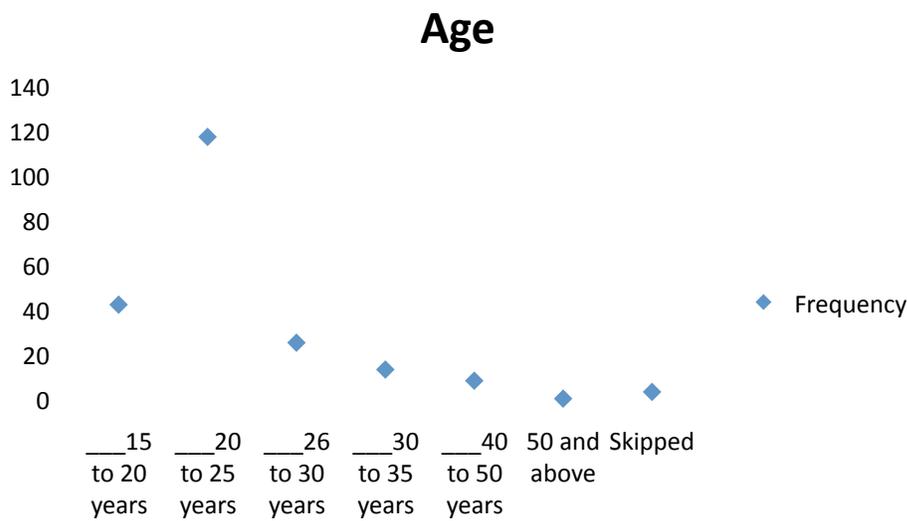

Table 1: Age of Respondents

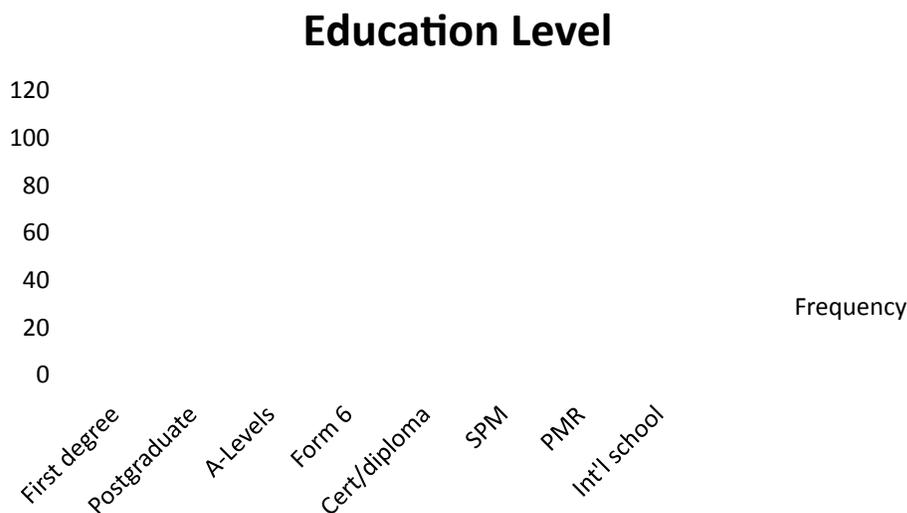

Table 2: Education Level of Respondents

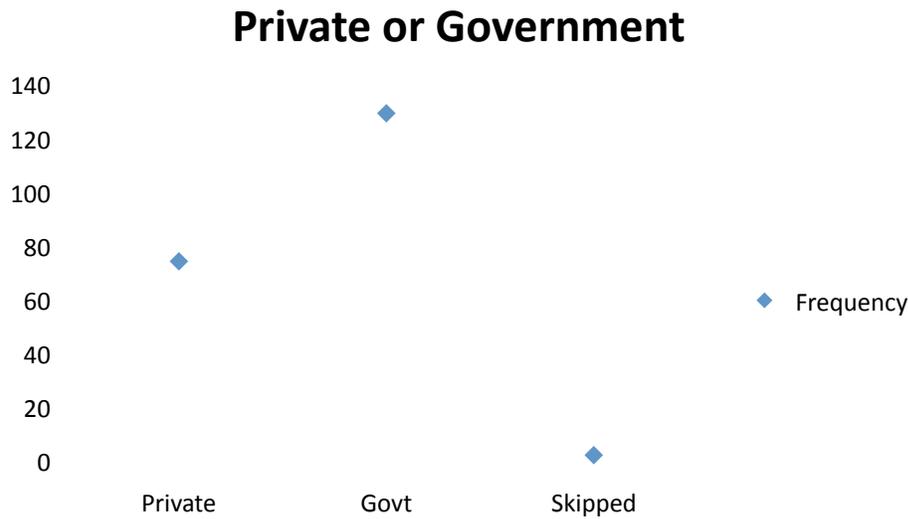

Table 3: Type of Higher Education of Respondents

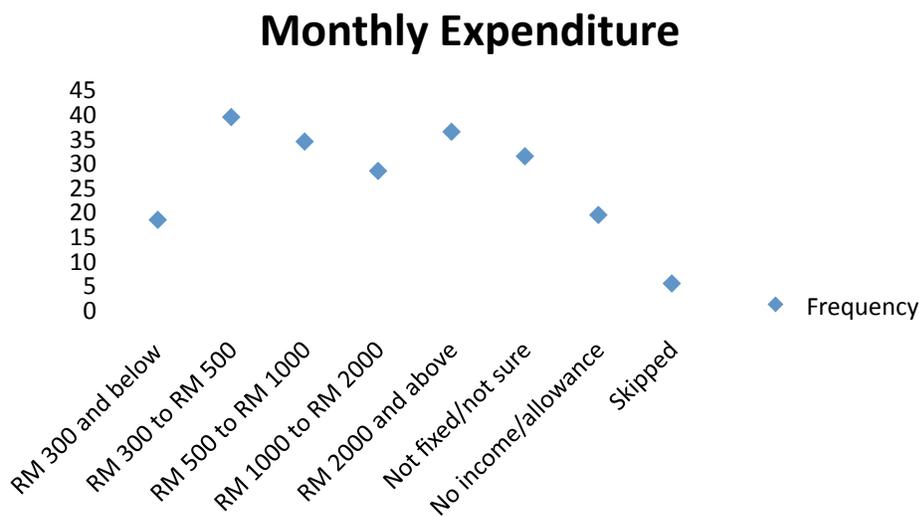

Table 4: Monthly Expenditure of Respondents

Tabulation of Scores from the Opinion Survey

The above charts show the background of the respondents, classifying them into two segments – online and offline. For the latter, there is no ethnicity profile as the majority was Malaysian Chinese. As earlier on, the researcher and an assistant noticed that some non-Malaysian Chinese

The responses which were used were that of questions 7c to 7f (provided in the actual survey sheet below). These were the open ended questions, which asked for descriptive keywords. The questions were:

c. What do you think Ah Bengs wear? Please describe their fashion/clothes.

d. What music do they listen to?

e. What kind of leisurely activities do they do?

f. What kinds of jobs do they usually have?

The following are the 5 most commonly used keywords from each category, as calculated by the RankWords counter.

c. What do you think Ah Bengs wear? Please describe their fashion/clothes.

Word	Frequency
tight	13
bright	7
colourful	8
weird	8
loud	4
sloppy	6
overly	4
mismatched	3
trendy	3
outdated	5

d. What music do they listen to?

Word	Frequency
Chinese	40
pop	33
techno	26
rock	29
Hokkien	8

hip hop	12
trance	5
loud	5
disco	5
Mandarin	5

e. What kind of leisurely activities do they do?

Word	Frequency
shopping	16
lepak (hanging out)	17
gaming	15
karaoke	10
clubbing	12
smoking	12
malls	12
girls (chasing, flirting with)	12
gambling	3
drinking	8

Question 7F: 'What kinds of employment do Ah Bengs usually have?'

Word	Frequency
sales	80
loan shark	7
mechanic	14
jobless	8
designer	3
waiter	3
pirate	27
labourer	2
IT	2
hairstylist	1

For clothes, the Ah Beng wears a lot of 'tight', 'bright', 'colourful', and 'loud', which matches the description given by that of Chua Beng-Huat's analysis as well as the popular media profiles by media channels such as The Star newspaper.

For music, popular culture always mentions Ah Bengs as prone to listening to loud techno music. This appears to be the case, with 'Chinese', 'techno', and 'pop' mentioned many times. The dialect of the songs is also mentioned, with 'Hokkien' emerging many times. 'Trance', another type of clubbing music is also included, which correlates with the mass media's linking of Ah Bengs with clubbing culture. This certainly affirms the belief that Ah Bengs are not connoisseurs of high art, but instead prefer to participate in mass manufactured entertainment.

Leisurely activities that seem unproductive are attributed to the Ah Beng. These include 'lepak' (which is Malay for 'hanging out'), 'smoking', 'malls' (which once again denote the place they are 'hanging out'), and 'looking at/chasing girls'. 'Clubbing is also included, as is 'karaoke' - an allusion to their love of loud music perhaps.

As for employment, it is clear that the respondents associate the Ah Bengs with retail employment and vocational skills, such as 'mechanics' and 'hairdressing', alongside a few jobs that do not specifically require a high level of formal education. 'Loan shark' and 'pirate' are also included, referring to another popular observation by Malaysians that Ah Bengs normally make their living by selling pirated DVDs and VCDs.

Avenues for Further Research

The intention of the survey was to primarily measure whether there was a fit between the public opinion of the Ah Beng, and those of the profiles described by newspapers. Once again, as the strength of a subculture relies on its visibility (for a subculture has nothing to differentiate itself from if it is not visible in the first place), the knowledge of the public about the Ah Beng subculture is important. Once the researcher is able to establish that the Ah Beng subculture does indeed, exist, then the study of the Ah Beng community itself can commence. It is clear that there is an understanding of the Ah Beng subculture from the public, and that it matches that of the profile in Singapore.

The Survey Questionnaire Itself

OPINION SURVEY

Dear respondent, the purpose of this survey is to study the perception of urban youth on subculture among the Malaysian Chinese. Please fill in the blanks where the answer matches your opinion. The survey is part of a postgraduate research project for a Masters programme. Names will not be collected.

1. Please tick your relevant age range.

15 to 20 years

20 to 25 years

26 to 30 years

30 to 35 years

36 years and above

2. Please state your ethnicity: _____

3. Please select your relevant level of education?

First degree

Postgraduate

Pre-university (please choose one from below)

A Levels

Form 6

Other - e.g. certificate, diploma

Secondary school (please choose one from below)

SPM

PMR

Primary school (please choose one from below)

Standard 6

Below Standard 6

Other (please state) _____

4. If you are/were in college/university, did you go to a private or government college/university?

Private

Government

5. What is your monthly allowance total (estimate)? If you are working, please select your relevant monthly budget.

RM 300 and below

RM 300 to RM 500

RM 500 to RM 1000

RM 1000 and above

RM 2000 and above

Not fixed/not sure

No income or allowance

6. Choose one main activity you do in your spare time/leisure:

Sports

Reading

Artistic activities - drawing, designing,

Watching TV or DVD

Gaming

Blogging/Social networking online

Shopping

7. This survey's objective is to find out "What is an Ah Beng?" Please select the answer you feel matches your opinion.

a. An Ah Beng is a

Culture

Subculture

Individual

Media stereotype

I don't know

b. How would you explain what is an Ah Beng? (You may tick more than one option here)

By his ethnicity

By his clothes/fashion

By his mannerisms/behaviour

By his education background

By his leisurely activities

By his choice of employment

c. What do you think Ah Bengs wear? Please describe their fashion/clothes.

d. What music do they listen to?

e. What kind of leisurely activities do they do?

f. What kinds of jobs do they usually have?

Thank you for your cooperation.

Abstract

The integration of motivation and achievement has been gaining attention throughout each of the prospective fields for more than a decade, particularly at the elementary and middle school level. However, little research has been conducted at the college level to analyze the effectiveness between two variables and using a valid strategy to promote college students' motivation. Drawing on this limitation, the purpose of this study was to use Keller's ARCS motivational model as a basis to develop and design the instruction in order to improve college students' motivation and achievement toward information technology and society courses. Participants were 220 technical and vocational college students from four information technology and society classes and two teachers who taught these classes in southern Taiwan. Each teacher had to teach two classes, and they were randomly assigned to one experimental group and one control group from two classes. Data was collected by learning motivation inventory (LMI) which was developed by the researchers. In addition, students' midterm and final exam scores were collected. As a result, we found there were no significant differences between students' motivation and achievement in the experimental group and the control group respectively. The results of the study not only could address the status quo of students' learning situation in this course, but also review the instructional design during courses.

Keywords: ARCS Motivational Model, Motivation, Technical and Vocational College Students

Introduction

In the practice of education, the importance of motivation is most certain in the past as well as the future (Maehr & Meyer, 1997). The issue of how motivation facilitates learning and how it enhances performance has attracted researchers' attention in educational research over the past decades (Bruinsma, 2004). In spite of the importance of motivation on classes, teachers' instruction is also an indispensable factor on classes which may influence students' motivation to learn (Covington, 2000; Eccles & Wigfield, 2002; Elliot, McGregor, & Gable, 1999; Wigfield, 1994; Wigfield & Eccles, 2000). Once teachers utilize appropriate instructional models to create a highly motivating learning environment, students are able to increase their engagement in class (Keller, 1983). In other words, teachers' instructional practices and interpersonal relationships with students are highlighted as potentially powerful factors influencing students' motivation and performance (Wentzel & Wigfield, 1998). Therefore, to design an effective instruction not only can improve students' achievement but can also enhance their motivation.

Theories of motivation have extensive definitions and offer different points of view, such as hierarchy of needs, theory of achievement motivation, expectancy-value theory (Weiler, 2004). However, few researchers have paid attention to students' learning motivation in relation to teaching strategies and teaching materials used in the classroom. Keller (1983) laid the foundation for integrating teachers' instructional designs into his theory. He was the first researcher to develop the ARCS model, in order to improve teachers' instructional design and teaching strategies.

Keller's ARCS model is a macro theory that incorporates cognitive and environmental variables in relation to effort, performance, and consequences (Keller, 1983). It is also a means to improve the motivational appeal of instructional materials (Keller, 1987a; Shellnut, Knowlton, & Savage, 1999). According to the ARCS model, there are four components to motivate learning, namely attention, relevance, confidence, and satisfaction, and there are practical strategies to use in achieving each of the four components (Keller, 1987b). Keller (1987b) defines the four components as follows: A (attention) is to capture the interest of students and stimulate the curiosity to learn; R (relevance) is to meet students' needs and goals to effect a positive attitude; C (confidence) is to help students believe and feel that they will succeed and control their success; and S (satisfaction) is to reinforce accomplishment with internal and external rewards.

For each of these components, Keller (1987b) designed three different teaching strategies within each component. In the attention component, the teaching strategies in this category are: A1. Perceptual arousal, A2. Inquiry arousal, and A3. Variability. In the relevance component, the teaching strategies are: R1. Goal orientation, R2. Motive matching, and R3. Familiarity. In the confidence component, the teaching strategies are: C1. Learning requirements, C2. Success opportunities, and C3. Personal control. As for the satisfaction component, the teaching strategies are: S1. Intrinsic reinforcement, S2. Extrinsic rewards, and S3. Equity.

In general, many researchers confirmed the positive relationship between motivation and achievement (Covington, 2000; Eccles & Wigfield, 2002; Elliot, McGregor, & Gable, 1999; Eccles & Wigfield, 2002; Wigfield, 1994; Wigfield & Eccles, 2000). Keller's ARCS model was also confirmed by its clinical validation. Many researchers use the ARCS model to improve students' motivation; the results showed that using the ARCS model could promote students' attention, and further improve their achievements (Ainley, 2006; Carson, 2006; ChanLin, 2009; Means, Jonassen, & Dweyer, 1997). In spite of the positive results based on the ARCS model, some researchers came to different results. Klein (1990) pointed out there was no significant correlation between the ARCS model and students' confidence and satisfaction. Price (1989) stated that the factor which may influence students' achievement is the way teachers present their teaching material, which is not influenced by students' attention or confidence (Means, Jonassen, & Dwyer, 1997). Huett, Kalinowski, Moller, & Huet (2008) were using online students as participants to compare the differences between courses which used the ARCS model and those that didn't, concluded that there were no significant differences between the two types of classes.

Opposite these conflicting results, this study found that participants could be a crucial factor. Most of the previous studies have been conducted in primary and secondary schools (Robbins, Lauver, Le, Langley, Davis, & Carlstrom, 2004). Research at the college level to inquire into students' motivation, and the correlation between motivation and achievement is still rare. As is the use of a valid strategy to promote college students' motivation. Fenollar, Roman, & Cuestas (2007) suggested that advanced students and college students' motivation and learning conception are different. However, there is little integration or research synthesis of the educational and psychological literatures when looking at college students' achievements. This lack of integration impedes a full understanding of the relative predictive validity across achievement, psychosocial, and motivational models (Robbins et al., 2004). In

order to understand the effectiveness of the ARCS model in a college classroom, the present study is trying to apply the ARCS model to design a curriculum to assess technical and vocational college students' motivation and achievement.

Research questions

Based on the purpose of the present study as stated above, this study was guided by the following three research questions:

1. Were there any significant differences in motivation to learn between students who took the courses which were designed employing the ARCS model and the ones which weren't?
2. Were there any significant differences in achievement between students who took the courses which were designed using the ARCS model and the ones which weren't?
3. What was the relationship between students' motivation to learn and their achievements?

Methodology

Participants

A total of 220 technical and vocational college students and two teachers from one college in Taiwan participated in information technology and society courses in the present study. Students were between 18 to 25 years of age. There were four classes and each class had 55 participants. Each teacher taught two classes. They were randomly assigned to one experimental group and one control group. The instructional experiment was conducted over 14 weeks for two hours per week.

Course Design

The instructional goals of the study were to enhance students' cognitive, psychomotor, and affective domain of information technology, as well as to obtain information technology literacy and information ethics. The instructional material consisted of ten chapters: What Is Information Technology?, The Character of Information Society, How Does Information Technology Influence the World?, Information Technology Literacy, Licenses Related to Information Technology and Society, Information Technology Ethics, Information Technology Crimes, Laws of Information Technology, The Future of Information Technology, and Video Editing Software Skills.

This study was a quasi-experiment with two distinct instructional conditions. In the experimental group, teachers applied motivational instructional strategies of the ARCS model to teach. Teachers used multimedia instruction, such as PowerPoint which included video clips, pictures, news, and stories; designed games related to instructional materials; invited officers of the Internet police to lecture on Internet crimes; invited professionals to introduce the licenses related to information technology and society; maintained blogs where students could share their feelings and comments with classmates and teachers; walked around the classroom and checked students' learning situation; praised students when they performed well. Teachers also encouraged students to express their thoughts through giving them a bonus point as an incentive at the final grades in the end of semester.

In order to protect students' learning rights and experimental ethics, the study didn't use didactic instruction in the control group. Teachers used multimedia instruction by PowerPoint which included video clips, pictures, news, and stories. The content of PowerPoint was similar to that of the experimental group, but the number and degree of interest of the media used are slightly different from the experimental group. In addition, teachers utilized worksheets in all classes.

Procedures

The study adopted random assignment because the course was selected by students. In order to reduce experiment errors, the study used a careful matching method after the experiment was finished to test motivation to learn, achievement and the correlation between each factor.

The matching method can not only consider students' achievement but also take students' learning motivation into account. In the present study, we had three conditions when we used the matching method. First, researchers had to delete the data of participants who skipped the class more than five times. Second, the matching group was selected from one experimental group and one control group by the same teacher. Third, two rules were applied to construct the matching group. On the achievement scores, the difference between the experimental group and the control group needed to be less than four points. On the learning motivation inventory scores the difference between both groups needed to be less than six points. Based on these conditions, we were able to match forty-six pairs.

After the end of semester, we randomly chose 18 students from the 220 participants to be our interviewees. The interview questions were all concerned with their thoughts in

taking this course (e.g. Why did you select this course?), in order to let researchers further understand students' opinions about this course.

Measures

Achievement.

To assess students' achievement scores, teachers and researchers developed an achievement exam based on the instructional materials and a two-way specification table. The questions were examined by item analysis, including difficulty index and discrimination index. The exam contained 50 questions, all of which were multiple-choice questions. The pre-test was held before the experiment, and the post-test was split up into a midterm and a final exam.

Motivation to learn.

Motivation to learn was assessed using learning motivation inventory (LMI) which was developed by the researchers. The pre-test of LMI was held before the beginning of experiment, and the post-test of LMI was held after the completion of the experiment.

LMI was based on the ARCS Model, and made up of four subscales: attention (six items), relevance (six items), confidence (six items), and satisfaction (six items). Items were measured using a five-point Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree). The observation of CFI, RMSEA, and SRMR were simultaneously examined to evaluate the model fit. In general, the first-order baseline model of this research was moderate: CFI=.92, RMSEA=.07 and SRMR=.05.

The internal consistency of scores on the four factors was estimated by the Cronbach's coefficient alpha. The alpha coefficients obtained in this study were quite high for these four factors: $\alpha=.92$ for attention subscale, $\alpha=.89$ for relevance subscale, $\alpha=.92$ for confidence subscale, and $\alpha=.88$ for satisfaction subscale. And the total inventory's internal consistent alpha was .96, indicating that the LMI was reasonably reliable. The correlations between the LMI and Keller (1987b) Instructional Materials Motivational Survey was $r=.87, p<.01$. As for the motivation subscale of Motivated Strategies for Learning Questionnaire (MSLQ) developed by Pintrich, Smith, Garcia, and McKeachie (1993), its correlation between LMI was $r=.84, p<.01$.

Results and Discussion

Overview of Analyses

At the beginning, the study used *t*-test to examine the difference between pairs' achievement and the pretest scores of LMI. If the result showed no significant difference, it proved the matching method was successful. The result of pretest *t*-test analysis suggested that there were no significant differences between the experimental group and the control group in the result of LMI ($t_{(91)} = -.22, p = .93$). The result of pretest *t*-test analysis suggested that there were no significant differences between the experimental group and the control group in the result of achievement ($t_{(91)} = -.10, p = .27$). Hence, it was accepted to use the forty-six matched pairs in the present study. The means and standard deviations of the pretest and posttest of experimental group and control group are displayed in Table 1.

Table 1. Pretest and posttest scores of LMI and achievement in the experimental group and the control group.

	Pretest				Posttest			
	Experiment		Control		Experiment		Control	
	<i>Mean</i>	<i>SD</i>	<i>Mean</i>	<i>SD</i>	<i>Mean</i>	<i>SD</i>	<i>Mean</i>	<i>SD</i>
LMI	80.24	8.90	79.83	9.33	81.76	10.25	80.78	12.51
Achievement	60.39	7.60	60.22	8.49	63.70	8.46	65.30	7.41

Results of the research questions

1. *Was there any significant difference in motivation to learn between students who took the course which was designed using the ARCS model and the ones who received multimedia instruction?*

The result of the post-test one-way ANOVA suggested that there were no significant differences between the experimental group and the control group ($F_{(1,90)} = .17, p = .68$). Furthermore, the study examined the four subscales of LMI. There were no significant differences in any of the four subscales. This result ran contrary to our research questions, which lead researchers to re-examine the course design of the experimental group and the control group individually.

First, the study re-examined the attention component. To compare it with the multimedia instruction in the control group, the teacher used multimedia instruction with a large amount of video clips, pictures, news, and stories; played games; asked

more questions; walked around the classroom; had more interaction with students; invited special guests to give a lecture; used interesting instruction tools, such as a robot and a cell phone. The study used extensive and intense attention strategies in the experimental group.

Second, the study re-analyzed the relevance component. To contrast the teaching with the multimedia instruction in the control group, teachers designed assignments or thoughts-sharing articles on the blog weekly; invited the internet police to talk about internet crimes that happen and criminals that can be found at colleges; advertised activities which related to the topics in the experimental group. The instructors utilized many relevant strategies in the experimental group.

Third, the study reviewed the confidence component. To compare it with the multimedia instruction in control group, teachers told students that they had the abilities to achieve the goals of the course and praised students when they performed well or encouraged students when they felt frustrated. In fact, the teachers applied few confidence strategies in the experimental group.

Fourth, the study re-examined the satisfaction component. To contrast this with the multimedia instruction in the control group, teachers adopted a token economy. When students answered questions and shared their opinions, teachers would give them bonus points. Points were transferred to grades as an extrinsic reward at the end of the semester. Additionally, in one lecture course, the speaker gave away USB flash drives and MP3 players as presents to reward students who had answered questions. The instructors thus used some satisfaction strategies in the experimental group.

As the descriptions above demonstrate, there were many attention and relevance strategies used in the course design of the experimental group, but only a few confidence and satisfaction strategies. Besides the lack of sufficient confidence and satisfaction strategies, there were other reasons to explain this result. Huang, Huang, Diefes-Dux, and Imbrie (2006) found that an interaction between attention and satisfaction constructs exists, suggesting the need to adjust the theoretical constructs of the ARCS model. Moreover, Song and Keller (1999) indicated that appropriate amounts and levels of motivational instructional strategies used could promote students' motivation to learn. Too much or too little motivational instructional strategies, on the other hand, might decrease students' motivation. The results also might be influenced by differences in the course design between the experimental group and the control group. In the present study, the control group still was exposed

to some attention and relevance strategies, such as video clips, news, and worksheets. That might be the crucial factor which influenced the results of the two groups.

Apart from the abovementioned reasons, students' characteristics and properties of the course also played essential roles in the study. Bohlin, Milheim, and Viechnicki (1993) proved that the effect of using the ARCS model also depended on students' characteristics. Participants in this study were technical and vocational college students, their learning focus was on professional skills instead of scholastic material taught in general colleges in Taiwan. In addition, this course was a general course, not a required one. This might also have influenced students' learning attitude. The finding was consistent with Halawah (2006) and Clark and Schroth (2010)'s studies. Halawah (2006) found that there was a remarkably high correlation between the motivation to learn and students' characteristics. College students with different personality characteristics had different reasons for pursuing college degrees and different academic priorities (Clark & Schroth, 2010).

2. *Was there any significant difference in achievement between students who received the course which was designed using the ARCS model and the ones who received multimedia instruction?*

The result of the post-test one-way ANOVA indicated that there were no significant differences between two groups ($F_{(1,90)}=.94, p=.34$). This result ran contrary to our expectation. Comparing the pretest and post-test scores, both groups showed a slight increase in their grades, but there were no significant differences between the two. In other words, the grades increased neither because of the instruction, nor because of the experimental manipulation.

In order to come to a deeper understanding of the underlying reasons, researchers interviewed students to collect information about their learning situation. After interviewing students, we found that students didn't put much effort into this course. Because this course was not a required one, they thought they could pass the course and get the credits easily. For this reason, they didn't spend much time or energy on studying. Furthermore, they felt it was enough to pass the course and get the credits, rather than try to receive high grades. Therefore, it was reasonable to see this result in a selective course.

3. *What kind of correlation exists between motivation to learn and achievement?*

Bivariate correlation was computed to examine the relations between the motivation to learn and achievement (cf. Table 2). There was no statistically significant correlation between the two in the study. Further examination revealed that significant correlations between the four subscales of LMI existed. It meant that the components of attention, relevance, confidence, and satisfaction had positive effects on the motivation to learn. The statistical analysis revealed that students' motivation to learn and achievement bore no significant relation to the present study.

Several studies had shown that there were positive correlations between the motivation to learn and achievement (Covington, 2000; Elliot, McGregor, & Gable, 1999; Eccles & Wigfield, 2002; Wigfield, 1994; Wigfield & Eccles, 2000). Other studies had found little or no significant relationship between the two (Halawah, 2006). These contradictory findings drew the researchers' attention, so we examined the result from the angles of goal-setting and the importance of exams. Goals in general can be conceptualized as internal representations of desired outcomes (Karoly, 1999). Since the goals of learning were merely to pass the course and acquire credits, students regulated their motivation and did not study hard. Hence, goal-setting was one reason which leads to the present result.

The other reason was the importance of the exam which was the second critical factor. Students regulated their motivation and behaviors depending on their goal orientation and perceptions of task value beliefs (Pintrich, 2004). In the present study, students thought the exam was not as important as for a professional required course. This stance influenced their preparation for the exam. Consequently, there was no significant correlation between motivation and achievement in this study.

Conclusions and Future Directions

The main purpose of this study was to use the ARCS model to design a course in order to promote students' motivation to learn and achievement. Results of the study differed from the general theory of motivation and the ARCS model through the use of quantitative and qualitative data analysis.

There were two main aspects that lead to the results of the study. The first one was the participants. Researchers chose technical and vocational college students as the participants of the study for two reasons. Previously, there were few research studies which investigated the learning situation of technical and vocational college students in Taiwan. In addition, compared with general college students, this group of students generally has a low motivation to learn. Because of their low motivation, they don't learn easily, and their post-test scores for motivation to learn were not sensitive enough to change their level of motivation. To avoid this situation, researchers could either choose university students to become participants or enhance the extent of motivational instructional strategies according to technical and vocational college students' characteristics in the future.

The second main aspect was the properties of the course. To choose a selective course

proved a limitation in the present study. However, properties of the course actually affected students' learning goals and the importance place on the exams. It resulted in students not paying much effort on exams. This limitation was difficult to overcome in our teaching practice.

Although the results in the present study showed no significant differences between the two groups, the researchers would still like to revise the course design and their motivational instruction strategies. Not only is course instruction undergoing perpetual evolution and innovation, but we also hope that teachers acquire a repertoire of practical instructional strategies to promote technical and vocational college students' motivation to learn and become achievers.

A Structural Equation Model of Math Self-Concept and Mathematics Achievement:
A Longitudinal Study in Taiwan

Hsin-Yi Kung

National Changhua University of Education, Taiwan

hykung@cc.ncue.edu.tw

The TIMSS 2007 research of the IEA reported that Taiwanese fourth and eighth graders' math performance exceeded the international average; fourth graders ranked 3rd and eighth graders ranked 1st from among all the participating countries. However, the Index of Students' Self-Confidence in Learning Mathematics was below the international average for both these groups. This study, coming at the end of the second year of a three-year project, explored Taiwanese students' mathematics learning at the junior high school level from the social cognitive perspective. Utilizing structural equation modeling, it examined the relationships between math self-concept and mathematics achievement using a longitudinal data. Subjects included 1,211 eighth graders from Taiwan. Findings were addressed as followed; first, results identified good psychometric properties (e.g., high internal reliability) and a well-defined structure of math self-concept and mathematics achievement. Second, the longitudinal effects were all significant, including that (a) prior mathematics achievement significantly predicted subsequent math self-concept (skill development model); (b) prior math self-concept significantly predicted subsequent mathematics achievement (self-enhancement model); (c) the reciprocal effects model was supported and the effects of achievement tended to be stronger and more systematic. Third, latent mean analysis showed significant gender variation with respect to math self-concept and mathematics achievement. The implications of these findings were discussed from the viewpoint of cultivating the students' interest in learning mathematics, and suggestions were provided for further research.

Keywords: math self-concept, mathematics achievement, structural equation modeling, longitudinal study, latent mean analysis

A Structural Equation Model of Math Self-Concept and Mathematics Achievement:
A Longitudinal Study in Taiwan

Hsin-Yi Kung

National Changhua University of Education, Taiwan

It is a widely discussing agenda of how to provide a good mathematics learning environment and how to enhance students' mathematics achievement in the field of mathematical education. Recent research has consistently shown group differences in mathematics achievement among children from different cultural backgrounds, and this issue has piqued the interest of many educators and psychologists (House, 2006; Shen, 2002). Based on the results obtained from the Trends in International Mathematics and Science Study 2007 research of the International Association for the Evaluation of Educational Achievement, Foy and Olson (2009) reported that Taiwanese fourth and eighth graders' math performance exceeded the international average; fourth graders ranked 3rd and eighth graders ranked 1st from among all the participating countries. However, the Index of Students' Self-Confidence in Learning Mathematics (SCM) was below the international average on mathematics in both 4th and 8th grades in Taiwan.

In light of these results, studies have suggested that social cognitive factors act as critical factors influencing the students' mathematics achievement (Leung, 2002; Shen, 2002; Shen & Pedulla, 2000). Among the various social cognitive factors, a positive self-concept is frequently posited as a mediating variable that facilitates the attainment of certain desired outcomes such as academic achievement (Marsh, 1990; Marsh & O'Mara, 2008; Marsh, Trautwein, Lüdtke, Köller, & Baumert, 2005; Marsh & Yeung, 1997).

Math Self-Concept and Mathematics Achievement

A positive self-concept (i.e., the set of beliefs we hold about who we are) is valued as a desirable outcome in many educational settings and is frequently posited as a mediating variable that facilitates the attainment of other desired outcomes such as academic achievement (Marsh & Yeung, 1997; Marsh et al., 2005; Skaalvik & Valas, 1999). More recently, however, researchers have emphasized the need to separate the academic (e.g., the mathematics and English self-concept) and nonacademic components of the self-concept. Marsh (1993) has cited a considerable number of studies showing that while academic achievement is substantially related to the academic self-concept, it is almost unrelated to the global and nonacademic components of the self-concept (e.g., Byrne, 1996). Hence, it is necessary to

accurately measure the self-concept construct from a multidimensional perspective in order to identify the academic components that are most important for increasing academic achievement.

Researchers have consistently reported a positive relationship between the academic self-concept and academic achievement (Byrne, 1996; Kung, 2009; Marsh, Hau, & Kong, 2002; Marsh et al., 2005; Marsh & Yeung, 1997). In addition, Marsh et al. (2005) have argued in support of a reciprocal effects model in which prior self-concepts influence subsequent achievements, known as the self-enhancement model, and prior achievements affect subsequent self-concepts, known as the skill development model – both these models were originally proposed by Calsyn and Kenny in 1977. Support for the self-enhancement model would provide a strong justification for self-concept enhancement interventions that are explicitly or implicitly incorporated into many educational programs. In contrast, the skill development model suggests that the academic self-concept emerges principally as a consequence of academic achievement; therefore, the best way to enhance the academic self-concept is to develop stronger academic skills. Marsh and Yeung (1997) have also suggested that these issues need to be researched using longitudinal data in which both self-concept and achievement should be measured on at least two occasions. Although it is recognized that the reciprocal effects model describes the relationship between academic achievement and academic self-concept, researchers as yet do not know which exerts the stronger effect, and the results seem to reveal mixed findings. Moreover, few longitudinal studies have focused on specific subject areas (e.g., the math self-concept and mathematics achievement). Hence, more studies are needed to evaluate these effects and clarify the mixed findings.

Developmental Perspectives Regarding the Reciprocal Effects Model

Marsh et al. (2005) have indicated that younger children's understanding of academic self-concepts is minimally related to objective outcomes and changes with age. Such a developmental perspective may explain why longitudinal studies that have sought to establish the reciprocal effects model have yielded mixed results (e.g., Marsh, 1990; Marsh & Yeung, 1997; Skaalvik & Valas, 1999). Skaalvik & Valas (1999) proposed that in the early school years, students' academic self-concepts are not very well established and may undergo several processes of shaping and reshaping. When these academic self-concepts become better established and more stable, they may increasingly affect performance and study behavior, which in turn may affect academic achievement. Once self-perceptions are more firmly established, the relationships between self-concept and achievement are likely to become reciprocal (e.g., Marsh & Yeung, 1997). During late adolescence, the academic self-concept

may even have causal priority rephrase as self-enhancement model over skills development model. There is evidence indicating that the agreement between academic self-concept and academic achievement grows stronger with age at least through high school (Marsh, 1990). Therefore, it is possible that the reciprocal effects model of these variables varies with age.

Longitudinal studies have proposed reciprocal causality between mathematics self-concept and mathematics achievement in Western youth. However, few studies have examined the reciprocal effects model with non-Western samples. Moreover, the relationships between students' achievement and their self-perception in the within-country analyses as found in the 2003 TIMSS report remain controversial, and we need more longitudinal designs using a different sample and various methods, such as structural equation modeling, in order to clarify these relationships.

Research Questions

Utilizing the structural equation modeling approach, the present study uses a longitudinal data to examine the directional effects between math self-concept and mathematics achievement in Taiwan. The study also addresses the following questions: (1) What is the influence of social cognitive factors such as math self-concept on promoting students' mathematics achievement in Taiwan? (2) Is the reciprocal effects model with longitudinal design (math self-concept vs. mathematics achievement) that this study proposes for Taiwanese students acceptable, and does the model obtain a reasonable model fit? (3) Are gender mean differences significant with respect to math self-concept and mathematics achievement?

Method

Subjects

This study was based on a longitudinal project on junior high school students' mathematics achievement, in which data were collected from representative samples in Taiwan. In an attempt to obtain a representative sample, schools were selected from the northern, central and southern areas of Taiwan, and participants on the basis of their educational, economic, institutional and residential characteristics as well as recommendations from the respective educational authorities and researchers. The subjects included 1,256 seventh graders in the first wave and slightly decline to 1,211 eighth graders in the second wave of the study, coming at the end of the second year of a three-year project.

Measurements

Data were primarily collected by means of a questionnaire, with items designed to measure the math self-concept in the first and second year, while the math achievement levels were also measured on two-wave occasion. All the instruments were translated into Chinese by native speakers and then back-translated into English for translation verification. This process was repeated until the back-translation into English was deemed to be sufficiently accurate.

Math self-concept questionnaire. Self-Description Questionnaire II (SDQ II) developed by Marsh (1988, 1999 revision) were adapted for the present study, and were administered in the middle of the second semester of each academic year. There were two waves of math self-concept data (T1-2 and T2-2). In addition to 10 items from SDQ II that deal with the math self-concept, the present study added three more items to evaluate students' mathematics learning from the viewpoint of social comparison with their classmates. The students were asked to rate the bipolar statements on a six-point Likert scale. The reliability coefficient, arrived at by utilizing Cronbach's alpha, were .93 and .94 for T1-2 and T2-2, respectively.

Mathematics achievement. Mathematics achievement was based on students' school grades from the official records at the end of first semester of each academic year. In addition, teachers' ratings of student performance in mathematics subject were the other source to represent mathematics achievement. There were two times of mathematics scores (T1-1 and T2-1). The reliability coefficient, arrived at by utilizing Cronbach's alpha, were .90 and .89 for T1-1 and T2-1, respectively.

Statistical Analysis

A structural equation model-fitting program utilizing the Amos (analysis of moment structure) software package 7.0 was used to conduct the analyses. First of all, a confirmatory factor analysis was conducted to test the validity of each latent factor (i.e. mathematics self-concept and mathematics achievement). Second, structural equation modeling was utilized to examine the relationships among these factors. Third, latent mean analysis was conducted to compare gender mean differences in math self-concept. The hypothesized model is shown schematically in Figure 1.

Insert Figure 1 about here

The model evaluation criteria used to test the fit of the models included the chi-square statistic (χ^2), CFI (Comparative Fit Index), TLI (Tucker-Lewis Index), RMSEA (Root-Mean-Square Error of Approximation), and CN (Critical N). It should be noted that the χ^2 statistic is sensitive to sample size; therefore, alternative goodness-of-fit indices were used for the present study (Schumacker & Lomax, 2004). Values of .90 and above for CFI and TLI were regarded as indicating a reasonable fit

(Byrne, 2001), with the RMSEA value of 0.05 indicating a close fit and values in the vicinity of .08 indicating a fair fit (Browne & Cudeck, 1993). Hoelter (1983) have suggested that a critical N of 200 or better indicates a satisfactory fit. For the latent mean analysis, a non-significant $\Delta\chi^2$ statistic indicates that the compared models were equivalent across groups. In addition, alternative goodness-of-fit indices of CFI and RMSEA were used to complement the chi-square difference test in comparing the nested models.

Results

Preliminary analyses identified no multivariate outliers, and the assumption of normality was never severely violated for any variable, considering the guideline of normality (i.e., skewness < 2; kurtosis < 7) proposed by Curran, West, and Finch (1996). Confirmatory factor analysis was conducted to test the constructs of math self-concept and mathematics achievement. All corresponding factor loadings for the latent factors were significant, ranging from moderate to high magnitudes.

Structural Equation Modeling Analysis

The hypothesized model was then evaluated using structural equation modeling to test whether, and to what extent, the model fits the data. As indicated by the fit indices (e.g., χ^2 , CFI, TLI, RMSEA, and CN), goodness-of-fit for the initially hypothesized model was not fit well. A review of the MI (modification index) indicated that the incorporation into the model of correlated errors (i.e., the residual error variables from the same instruments in analyses of longitudinal data) would lead to a substantial improvement in model fit. Given that (a) the modification index associated with this initially unestimated parameter was distinctively higher ($\chi^2_{(1)} = 246.20$) than was the case for all remaining modification indices, and (b) such error covariances can typically represent a type of response set bias or redundancy in item content that is common in the testing of assessment measure (see e.g., Marsh & Yeung, 1997), the hypothesized model was respecified and then re-estimated. The respecified model is shown in Figure 2 and the fit index is shown in Table 1.

Insert Figure 2 about here

Insert Table 1 about here

As shown in Table 1, the respecified model fit the data well. Although the χ^2 was significant, it was sensitive to sample size, and CFI, TLI, RMSEA, and CN indicated good fit. The parameter estimates are presented in Table 2; all corresponding factor loadings for the all latent factors were significant, with moderate

to high magnitudes. The squared multiple correlations were .53 and .55 for math self-concept and mathematics achievement at T2-2 and T2-1, respectively. The combined reliability (ρ_c) of math self-concept T1-2, math self-concept T2-2, mathematics achievement T1-1, and mathematics achievement T2-1 were .87, .89, .901, and .80, respectively. The ρ_v of math self-concept T1-2, math self-concept T2-2, mathematics achievement T1-1, and mathematics achievement T2-1 were .69, .74, .81, and .89, respectively. The longitudinal effects were all significant. Prior mathematics achievement significantly predicted subsequent math self-concept at T1 and T2 ($\gamma=.68$ and $\beta=.49$, respectively). In addition, prior math self-concept (T1-2) significantly predicted subsequent mathematics achievement (T2-1) ($\beta=.19$). In other words, the reciprocal effects model was supported and the effects of mathematics achievement tended to be stronger and more systematic.

Insert Table 2 about here

Latent Mean Analysis

Test of configural invariance. Respecified model was tested between boys and girls. The results were supported a reasonable fit for gender groups (see Table 3). Similarly, all manifested items in the model were good indicators of their associated factors for each gender group.

Test of metric invariance. To test for metric invariance, the factor pattern coefficients were constrained to be equal. Thus, the next focus was on testing whether the factor loadings were invariant across the two groups. A χ^2 difference test was conducted for these nested model. These constraints increased the χ^2 value, 3.39 with gaining 6 degrees of freedom, and was not statistically significant at $\alpha=.05$. Table 3 presents indices of these nested models, and the values of CFI and RMSEA, generally, were very close for each group. The metric invariance was supported.

Test of scalar invariance. Since the metric invariance has been met, scalar invariance was tested by constraining a series of paths of structural paths and covariance. CFI and RMSEA were also used to evaluate the fit of the model (Hong, Malik, & Lee, 2003). The values of CLI and RMSEA were close for each group (see Table 3), and structural paths and covariance invariance was supported. The invariance tests for gender groups were shown in Table 4.

Insert Table 3 about here

Insert Table 4 about here

Group differences in the means of latent variables can be estimated only if the latent variables are on the same scale in all groups. Thus, the prerequisites for latent mean analysis are metric invariance and scalar invariance across the multiple groups. With respect to these indices, the invariance test was supported across gender groups for the Taiwanese sample. For identification purposes (Byrne, Shavelson, & Muthén, 1989), the girl group was used as the reference group with its latent mean parameters fixed to zero. Mean parameters for the boy group were free to differ from zero and comparison of the group differences on latent means is based on these differences from zero. Table 5 presents latent mean parameter estimates. Results of latent mean analysis showed significant gender variation with respect to math self-concept. Taiwanese boys exhibited higher mean values of math self-concept than the Taiwanese girls in 7th and 8th grade. Taiwanese boys exhibited lower mean values of mathematics achievement than the Taiwanese girls in 7th and 8th grade, however, the effect sizes were vary small (.01 and .01 for mathematics achievement of T1-1 and T2-1, respectively.)

Insert Table 5 about here

Discussion

The early schooling process is a complex network of effects, to which many variables contribute. Achievement is a significant topic in the field of children's schooling processes and therefore it is important to probe the multiple factors. These influences are particularly important in the early years of schooling, when students undergo rapid adaptational and psychological changes. These changes can be either positive and growth-enhancing or negative. When they are negative, academic success at the school level becomes more difficult to attain.

The Relationships between Math Self-Concept and Math Achievement

A positive academic self-concept is frequently posited as an important variable that facilitates academic achievement. With respect to the causal ordering of academic self-concept and academic achievement, growing support for the reciprocal effects model would have important implications in the field of education (Marsh, 1990). The present study extended the implications of the well-developed reciprocal effects model pertaining to academic self-concept and achievement to the specific subject of mathematics, with the use of longitudinal data. It examined whether the above reciprocal effects model was applicable to math self-concept and mathematics achievement in student samples from Taiwan. The results with respect to math self-concept were consistent with previous research findings that supported both the

skill-development model and self-enhancement model (Marsh et al., 2005; Marsh & Yeung, 1997). Therefore, in order to promote students' mathematics achievement, it is necessary to reveal how this process operates for school students. One approach would be to consider the possible intervening variables (e.g., increased effort, enhanced motivation, and persistence in the face of difficulties) that mediate the effect of prior math self-concept on subsequent mathematics achievement. Moreover, since the findings also supported the skill development model, improving students' math problem-solving skills or experience may be a good way to reinforce their math self-concept.

The Developmental Perspective and the Reciprocal Effects Model

The developmental perspective holds that the relationship between the academic self-concept and academic achievement changes as students pass through different school ages. This perspective might explain the reason why longitudinal studies in this area that sought to establish causal relations have yielded mixed results (e.g., Byrne, 1996; Marsh, 1990; Marsh & Yeung, 1997; Skaalvik & Valas, 1999). Skaalvik and Valas (1999) advocated a developmental perspective based on the achievement–self-concept relation. They proposed that in the early school years, students' academic self-concepts are not very well-established. During that period, the self-concept may undergo experience a process of shaping and reshaping that is controlled by the influence of academic experience. When the academic self-concept becomes better established and more stable, it may increasingly affect performance and study behavior, which in turn may affect academic achievement. Thus, after self-perceptions are more firmly established, the relationship between the self-concept and achievement is likely to become reciprocal (e.g., Marsh & Yeung, 1997). During late adolescence, the academic self-concept may even have causal priority rephrase as self-enhancement model over skills development model over academic achievement as found in Marsh's previous study (Marsh, 1990). Our findings generally supported both the skill-development model and the self-enhancement model. Since the samples were from the junior high school level, our study results are consistent with previous findings that supported the reciprocal effects model (Marsh & Yeung, 1997).

Conclusion and Implications

Findings of the present study were addressed as followed; first, results identified good psychometric properties (e.g., high internal reliability) and a well-defined structure of math self-concept and mathematics achievement. Second, the longitudinal effects were all significant, including that (a) prior mathematics

achievement significantly predicted subsequent math self-concept (skill development model); (b) prior math self-concept significantly predicted subsequent mathematics achievement (self-enhancement model); (c) the reciprocal effects model was supported and the effects of achievement tended to be stronger and more systematic. Third, latent mean analysis showed significant gender variation with respect to math self-concept and mathematics achievement.

To summarize, previous research contains surprisingly few non-Western studies employing structural equation models to deal with longitudinal data and social cognitive factors pertaining to mathematics learning. This study focused on the relationships between the math self-concept and math achievement; it is particularly noteworthy that the study demonstrated the construct validity and reliability of measurements pertaining to the math self-concept constructs in Taiwanese samples. Furthermore, the present study utilized a longitudinal design to more accurately examine the directional effects of math self-concept and mathematics achievement. The preliminary findings of the present study can be used to further our understanding of the relationships between students' attitudes and achievement and may help facilitate mathematics performance in students. In addition, these findings can be used to design experimental courses on increasing students' math self-concept with particular reference to the Taiwanese samples that are below the international average in the Index of Students' Self-Confidence in Learning Mathematics (SCM). Based on the present study, we suggest that it is important for researchers in this field to become "critical educators," and most importantly, be more aware of the social cognitive factors affecting mathematics learning.

Note. The latent mean values for girl group were set to zero.

* indicates that the estimate is significant at $\alpha=.05$.

The Effects of pay raises on career advancement and work exhaustion: a longitudinal study among IT professionals in Taiwan

Cheng-Shung Huang, Chang Gung University, Taiwan

Introduction

In recent years, there has been a growing interest in burnout research due to its substantially negative impacts on employees and the organizations (Halbesleben & Buckley, 2004). Burnout is a psychological response to a prolonged stress that consists of emotional exhaustion, depersonalization, and reduced perceptions of personal accomplishment (Maslach, 1982; Maslach, Schaufeli, & Leiter, 2001). Previous burnout research has provided empirical evidences of several negative impacts on either employer or employee such as reduced well-being, higher absenteeism and turnover rates and poorer performance (e.g., Hobfoll & Shirom, 1993; Maslach, Schaufeli, & Leiter, 2001; Moore, 2000). On the applied side, burnout could be a syndrome pervasive among employees across various units in a demanding work situation. Probst & Raisch's (2005) study indicates burnout syndrome is a leading predictor of corporate collapse for those once successful companies.

Although all three components of burnout are potentially important, a growing research consensus has concluded that emotional exhaustion is the key dimension of burnout (Cordes & Dougherty, 1993; Gaines & Jermier, 1983; Wright & Bonett, 1997; Zohar, 1997). For example, a wide range of topics focusing on emotional exhaustion including exploring its impact on organizational deviance (Mulki, Jaramillo, & Locander, 2006), turnover intention (Moore, 2000; Igarria & Baroudi, 1995), task performance (Witt, Andrews, & Carlson, 2004), and work attitudes (Mulki, et al., 2006). In emotional exhaustion research, many antecedents to emotional exhaustion receive consistent empirical support including work load, role ambiguity, lack of work autonomy, reward fairness (Moore, 2000). However, no studies, to my knowledge, have examined the role of pay increase in predicting emotional exhaustion has been ignored. As research has argued that managers in general underestimate the importance of pay in motivating employees (Rynes, Gerhart, and Minette, 2004), Shaw et al. (2003) notes that pay increase research is underdeveloped. In motivation theories, pay/pay

increase has profound impacts on employee career development, and work attitudes (Greene, 1973; Shaw, Duffy, Mitra, Lockhart, & Bowler, 2003). Does pay increase affect one's work exhaustion? Gardner, Dyne, and Pierce (2004) addressed that pay level can also signal one's worth (value) to the organization. Greller and Parson (1995) concluded pay increase communicate itself an employee's value to the organization. When one receives higher pay as compared to other colleagues, it implies s/he is more successful in career (Lawler & Jenkins, 1992; Wayne, Liden, Kraimer, & Graf (1999). As Lawler and Jenkins (1992) noted that employee reactions to merit pay systems are best described as mixed, pay, however, has its side effect on employee such as job stress (John & Weitz, 1989). Pines et al. (1981) reported when one confronts long-term involvements in demanding situations and receives too few positive features, s/he will develop tedium (or emotional exhaustion).

Among the antecedents of burnout research, little has explored it in term of career development angle. Career development research argues that organizational sponsorship such as training and skill opportunity and organizational resources provides special assistance to facilitate employees' career advancement (Tharenou, Latimer, & Conroy, 1994). In a highly global competitive work environment, those winners in contest-mobility model of career have better chances to be promoted (NG, Eby, Sorensen, and Feldman, 2005). Weiss, Ilgen, and Sharbaugh (1982) found low job performance appraisals are usually stressful to receive, and low performers may be more likely to engage in such information search activities as looking for alternative job opportunities as a possible way of avoiding a stressful job situation. Only did report one study from Kim & Wright (2007), to my knowledge, indicated that career advancement opportunity predicted negatively on emotional exhaustion.

Several recent studies indicate that support from supervisors affects employees' willingness to engage in development activities (Noe, 1996) and emotional exhaustion (e.g., Turnipspeed, 1994). This study includes pay increase, supervisor support and career advancement to examine their effects on emotional exhaustion. The reasons including the mentioned above antecedents in emotional exhaustion research are threefold: first, Less is known about the effects of pay raise on individual's career success as well as emotional exhaustion despite its popularity as a means to motivate employee. Secondly, leadership factor has been tested as a vital predictor of emotional exhaustion and career advancement (i.e., supervisor support). The third, despite some research that has explored the effects of supervisor support on career advancement and emotional exhaustion, is career advancement opportunity a mechanism to explain how supervisor affects emotional exhaustion.

Despite work exhaustion in various work environments, the research literature suggests that information technology professionals are particularly vulnerable (Schaufeli & van Dierendonck, 1993). This study is to explore the impacts of pay increase, supervisor support and career advancement on emotional exhaustion and whether career advancement opportunity plays a mediational role in the relationships between pay increase, supervisor support and emotional exhaustion.

Literature review and hypothesis development

The role of pay is widely explored in the domain of organizational behavior. Reinforcement theory takes various forms of pay as positive factor to reinforce employee's behaviors (Skinner, 1974). Past research revealed that pay raise impacts on many aspects at work including positive attitudinal reactions among workers (Mitra, Gupta, & Jenkins Jr, 1997), behavioral intentions (Shaw, Duffy, Mitra, Lockhart, & Bowler, 2003), turnover (Trevor, Gerhart, & Boudreau, 1997). Pay increase and pay level also function as delivering signals to employees (Shaw, Duffy, Jenkins, & Gupta, 1999). Researchers (Brief & Aldag, 1989; Gerhart & Milkovich, 1992) argue that the amount of pay increase reflecting one's career success signals one's value and contribution to the organizations (Shaw et al., 1999). Those who perform at an outstanding level will receive better rewards and are considered more potential to promote. The amount of pay increase signals one's contribution to the organization.

Pay raise has been part of pay-for-performance system to reflect employees' contributions to their organization. The amount of individual's salary increase, as compared to his/her colleagues, is often signaling who is a winner in an organization. In one's career advancement, both subjective and pay increase indicators are linked to contribute to one's promotability in an organization (Igbaria and Baroudi, 1995). This study expects if one who receives better pay raise based on his/her performance will attenuate the work pressure through career advancement opportunity because s/he gets more opportunity to attain or be closer to both work objective and career objective.

Beside pay raise, supervisor plays an important role in subordinate's career progress and work stress (Hilde Hetland, Sandal, & Johnsen, 2007). The relationship between employee and his/her supervisor will affect emotional exhaustion (Turnipspeed, 1994). Among

supervisor-related predictors of career success such as LMX, mentoring, and the like, supervisor support is undoubtedly considered one of the critical one. Now supervisors are increasingly required to support employees in their learning and career development (Kidd & Smewing, 2001). The role of the supervisor is broadening from an emphasis on performance management and control to include activities that facilitate learning and career development (Kidd & Smewing, 2001). Results from few studies (e.g., Leithwood, Menzies, Jantzi, & Leithwood, 1996; Mazur & Lynch, 1989; Stordeur, D'hoore, & Vandenberghe, 2001; Hetland, Sandal, and Johnsen, 2007) that have investigated links between transformational leadership and burnout have been equivocal (Hetland, Sandal, and Johnsen, 2007). On one hand, Maslach burnout model (Maslach & Schaufeli, 1993; Maslach, et al., 2001) addresses the intense and emotionally charged interactions between leader and subordinates are likely to be more demanding and therefore could result in higher levels of emotional exhaustion. On the other hand, considering the emotional needs of each employee, it may tactfully act to hinder overload work and stress. Recent research reveals such a negative link between transformational leadership and burnout (Corrigan, Diwan, Campion, & Rashid, 2002). Consistent with this assumption, Seltzer and Numerof 's (1988) study demonstrated an inverse relationship between consideration type of leadership and burnout. There is also abundant empirical evidence that perceived leader's social support is related to less perceived stress and burnout (Lee & Ashforth, 1996).

H1a-1b: pay raise is positively related to career advancement opportunity (a) and to emotional exhaustion (b).

H2a-2b: supervisor support is positively related to emotional exhaustion (a) and to career advancement opportunity (b).

H3: career development is negatively related to emotional exhaustion.

H4a-4b: career advancement opportunity has a mediation effect on the relationship (a) between supervisor support and emotional exhaustion and (b) between pay increase and emotional exhaustion.

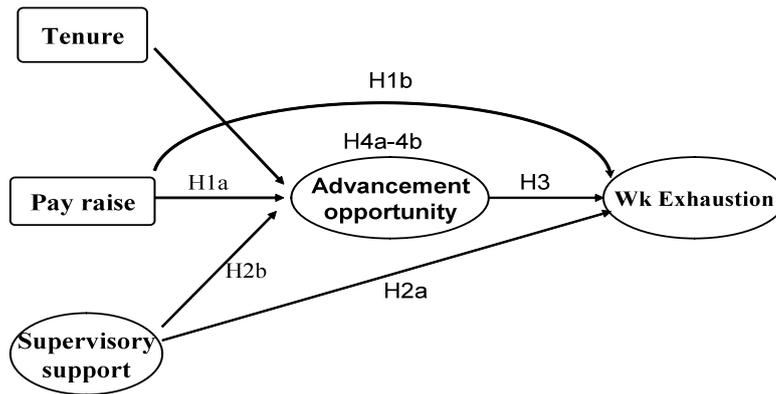

Fig. 1 framework of this study

Method

Organizational setting and procedure

Information technology (IT) manufacturers in Taiwan are facing a quick and constant change global competition. These companies are highly connected and most of them are doing business of OEM/ODM. It is common staffing policy that company will lay off those whose performance falls behind and ranks in the bottom at a work unit. The surveyed company is a DRAM (Dynamic Random Access Memory) manufacturer. There are three shifts a day for operating workers. When economy goes up and business orders keep coming, its IT professionals (assembly workers and engineers) have to accept overtime arrangement from the management and not a chance to take normal day off for several months. Due to rapid technology innovation, pressure of stable business order, and global competition, IT companies often response quickly by personnel cut to economic recession and order loss. The company of study has pay secrecy policy and conduct official performance appraisal two times a year. One for last-year annual bonus is done in January; the other for individual pay raise is done by the end of July. This study obtained the pay raise archives from the company, and then distributed questionnaire and collected data in one month later. Before the investigated year, this company has not given an overall raise for three years. Pay raise for employees was expected since good performance of the company was coming with stunning

profit.

Variable measure

Pay raise. Pay increase measure is collected from company’s archive. This measure is the ratio of the amount of one’s given pay raise to the average amount of pay raise at his/her rank.

Supervisor support. The four items of supervisor support measure were assessed using two of Wayne et al.’s (1999) scale. Example item “My supervisor gives me assignments that give me the opportunity to learn new skills.” The other two items were adopted from Jones-Johnson & Johnson (1992). For example, “I can get help from my immediate supervisor when I have difficulties at work.”

Career advancement opportunity. This measure adopted Balfour & Wechsler (1990) career advancement opportunity scale with minor modification. Item, for example, “this firm offers several channels to learn advanced technology and knowledge and a lot of training opportunities”; “experiencing plenty of opportunities to build a career, to grow within the organization”.

Emotional exhaustion. The measurement scale adopted Moore’s (2000) work exhaustion measure which slightly modifying Maslach and Jackson’s (1981) emotional exhaustion scale. Moore’s emotional exhaustion scale reported a good reliability ($\alpha = .88$). The scale ranges from 6 “strongly agree” to 1 “strongly disagree.” Cronbach’s alpha of the measure is 0.77.

Control variable. To avoid the possibility of the confounding effect, this study includes organizational tenure as control variable.

Results

Table 1 presents means, standard deviations of, and average variance extracted by the latent constructs. A look at the binary correlations among variables of study provides preliminary support for the hypotheses. As depicted in Table 1, the binary correlations also reveal significant relationships between performance, supervisor’s support, career development, and work exhaustion as expected. Moreover, the values of reliability of research variables are not above 0.9 partly because surveyed items were randomly distributed in the questionnaire.

Table 1 Descriptive Statistics, Correlations, and Reliability Coefficients

Variable	<i>M</i>	<i>SD</i>	1	2	3	4	5
----------	----------	-----------	---	---	---	---	---

1 Tenure	3.14	1.76					
2 Pay raise	1.09	.23	.258**				
3 Supervisor's support	3.79	.93	.046	.208*	(.85)		
4 Advancement opportunity	3.88	.85	.321**	.292**	.245**	(.75)	
5 Work exhaustion	3.89	.99	-.017	-.220*	-.224*	-.292**	(.77)

Note: $N = 130$. Value of Cronbach's alpha for each construct showed in the diagonal. * $p < 0.05$; ** $p < 0.01$.

To test our specific hypotheses of H1a, H1b, and a set of H2 hypotheses-H2a and H2b, and H3), we analyze using structural equation modelling technique to report the standardized path coefficients in Table 2 (direct model). Following Bentler's (2006) suggestion, Variables of study were treated as latent factors except pay raise measure as single variable. Hypothesis 1 is that performance is positively related to advancement opportunity and negatively related to emotional exhaustion; the analyses indicate, performance had positive, significant effect on career development ($\beta = .264, p < .01$) and had negative, significant effect on emotional exhaustion ($\beta = -.346, p < .01$). We posited Hypothesis 2a and H2b that supervisor support is related to advancement opportunity and emotional exhaustion. Supervisor support had positive, significant effect on advancement opportunity ($\beta = .183, p < 0.01$) and had negative, significant effect on emotional exhaustion ($\beta = -.191, p < 0.01$). Evidences for Hypothesis 1, H2a, and H2b therefore are fully supported.

Table 2. Standardized coefficients of Hypothesis 1-Hypothesis 3

Path	Standardized coefficients
Pay increase → career development	.26
Supervisor support → career development	.18
Supervisor support → emotional exhaustion	-.20
Career development → emotional exhaustion	-.19
Pay increase → emotional exhaustion	-.35

All coefficients are significant at $p < 0.05$.

To examine hypothesis 4 that career advancement opportunity mediates the relationships between latent independent variables (pay increase and supervisory) and emotional exhaustion, this study adopted some procedures as recommended by Cole and Maxwell (2003) to assess whether mediational effect is supported.

Table 3 presents the fit statistics for the tested model. The overall fit indices for this direct model, as Table 3 illustrates, suggested acceptable fit with the data (NNFI = .85, CFI = .88, GFI = .84, RMSEA = 0.097) (Browne & Cudeck, 1993). Consistent with the current practices (cf. Cole and Maxwell, 2003) in structural equation modeling, empirical support for the proposed model was determined by examining the magnitude of several fit indices. Table 3 displays information that all the fit indices showed an acceptable good match between sample data and the proposed model (namely, the direct and indirect model)--the values of NNFI, GFI and CFI are greater than 0.8; RMSEA is satisfactory acceptable with the value 0.096.

Table 3. Results of Structural Equation Models

Model Type	<i>df</i>	χ^2	NNFI	CFI	GFI	RMSEA
NULL	105	968.77	—	—	—	—
Direct model ^a	82	181.14	.85	.88	.84	.097
Mediation Model	83	197.18	.83	.87	.84	.103
Partially mediated Model	81	176.71	.86	.89	.84	.096

^aNo mediation

The analyses include comparing the proposed model with two alternative models. To test mediation, in general, the study compares the proposed model (partially mediated model) with a direct model in which advancement opportunity to emotional exhaustion was constrained to equal zero and the relationships between predictors (pay increase and supervisor support) and latent dependent factors (advancement opportunity and emotional exhaustion) were freely estimated. The results of a chi-square difference test comparing proposed model and direct models suggested they were significantly different, $\Delta\chi^2 (df = 1) = 4.43, p < .01$, and therefore provided preliminary support for mediation. The author then compared the proposed model to indirect model of which the direct paths between advancement opportunity, supervisor support, and emotional exhaustion were constrained to equal zero. The difference in chi-squares between the partially mediated model and the fully mediated model was not significantly different, $\Delta\chi^2 (df = 2) = 20.47, p > .10$, indicating the fully mediating effect did not provide a significantly superior fit over a partially mediated effect. Hypothesis 4 receives partial support. Truly, career advancement opportunity partially mediated the relationship between pay increase and supervisor support and emotional exhaustion. The paths and standardized coefficients of direct- and indirect-effect model reported in Figure 2.

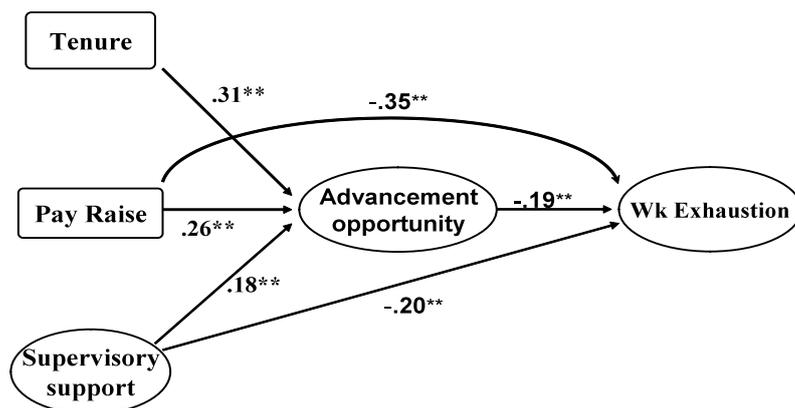

Fig. 2 all coefficients are standardized at $p < 0.01$

General Discussion

In spite of the popularity of pay or salary increase in human resource management practices, little research has explored the effects of pay increase on individual's personal development and burnout together. This study examined whether pay increase positively predicted career advancement and negatively emotional exhaustion. In this regard, the results are supportive. Even after taking account the effect of tenure and supervisor support, pay raise was found to predict career advancement and emotional exhaustion. The second objective of this study was to explore whether career advancement plays a mediational role in the relationships between pay raise, supervisor support and emotional exhaustion. Based on the comparison of original proposed model, direct model, partially mediated model, career advancement only partially mediated the relationships between pay raise, supervisor support and emotional exhaustion. On the contrary of pay increase-happiness research by Shaw, et al. (2003), the finding is very important, as it helps us a better understanding of potential negative impact of pay increase on employee in the context of theories of career. Moreover, the present study serves as an important contribution to the literature because it extends previous work on the effect of pay increase on burnout and, in particular, proposes a link to career advancement. This addresses two critical concerns in the burnout literature: first, the emphasis on a direct relationship between pay increase, career advancement opportunity and emotional exhaustion. Studies that explicitly incorporate pay increase, career development,

and emotional exhaustion are very sparse. Secondly, to explore how supervisor support affects emotional exhaustion through career advancement.

Limitations and directions for future research

To consider potential limitations of this study first is the one single organization surveyed to expose caution with regard to the generalizability of the findings. Second, despite data collected at a different point of time, self-reporting measures of variables studied inevitably confront common method problem. For instance, the assessments on opportunities of employee career development could be done by immediate superior. Third, including previous more longer pay (or pay increase) records could more precisely predict the accumulation effect of rewards over time due to the concept of burnout—a prolonged stress. In terms of limitations, the sample of employees included in the study was not randomly drawn from the population, and therefore representativeness and generalizability are a concern.

eCRM as a Postmodern Marketing Approach

Overview

When brand leads management thinkings, electronic customer relationship management (**eCRM**) is probably the **killer marketing approach** in the postmodern age. The future of marketing lies in eCRM that addresses customer lifetime value (**CLV**) via customer centricity from the perspectives of deep segmentation, customer profile, bottom-up marketing, one-to-one marketing, data warehousing, data mining and ongoing online dialogue.

The financial industry has popularized eCRM practice at a profit since the Internet proliferation at the dawn of the new millenium.¹ Interactive dialogue with customers, regulators and other stakeholders is now a must in wealth and fund management (e.g., financial planning and insurance).

Why this paper?

This is hard to find a comprehensive marketing text in eCRM.² Different authors tend to treat different parts of eCRM in different manners. Some are too general while some are too technical. They rarely address the **basic questions** like “What are the key differences between traditional marketing, relationship marketing and eCRM?” “What is the difference between CRM and eCRM?” “What is the linkage between eCRM and postmodernity?” “Why eCRM?” Some readers might then indiscriminately mix CRM up with buzzwords like electronic marketing, relationship marketing, data mining, social networking. This might give rise to a scenario of the blind men and the elephant. As a result, from an academic marketing perspective, it is necessary to clarify the uniqueness of eCRM to the general readers before being able to realize and capitalize on its full potentials. Though the difference is tiny, the impact is discernible and far-reaching. Mighty contests does rise from trivial things.³

What is eCRM?

eCRM is a marketing approach of managing customers in the postmodern age. Drucker

(1954)⁴ noted that “The purpose of business is not to make a sale, but to make and keep a customer.” This calls attention to customer lifetime value (CLV) and relationship marketing. “Marketing is the whole business seen from the customer's point of view.” The organization is the brand. A customer centric organization arises from customer centricity, which is more than customer orientation. Segmentation is no longer sufficient. We now use deep segmentation to develop customer profile for bottom-up marketing. All these are essentials of eCRM. The **industry** often manages **eCRM** as the **core** of customer service operation.

Hong Kong Broadband Ltd. (www.hkbn.net), for instance, continually monitors each of their some 400,000 clients online for service retention, recovery and up selling. They spot and approach every client online regularly. Those who spend less but demand more might be discouraged (e.g., longer waiting time, no promo discount) to continue. It is because every service call represents HK\$10-40 expense to the operator. All is done through data warehouse (e.g., analytical CRM and operational CRM). They develop positive dialogue with prospects and customers for market trends. This is collaborative CRM. Besides the typical CRM mindset (e.g., value every customer for good) and strategies, they also use traditional marketing (e.g., one-to-many, offensive, unspecific customers), relationship marketing (e.g., loyalty programme) and the 80-20 rule. They use direct mail (DM) and offer free download of pop start concert to preferred customer. Their HK\$99 for bb100 campaign comes with referral award scheme to promote brand loyalty via word of mouth and viral marketing.

CRM and eCRM are interchangeable terms

In this paper, customer relationship management (**CRM**) refers to the human and technology approaches of relationship marketing (**RM**). Examples of CRM are personal financial planning and personal travel planning. Having understood a specific customer’s profile (e.g., demographic, psychographic and preference details) via a continuous dialogue, the customer-centric supplier tries to explore business opportunities with individual customer.

Even in olden days, people without technology, could manage customer relationship and intimacy with a face-to-face mode. Technologies include writing, drawing, transportation vehicles, radio, telephone, television, fax, computer networking and then the Internet. Today’s CRM approaches primarily deal with the Internet (e.g., Intranet, Extranet) that could link to enterprise systems and supply chain management (SCM). Radio, phone, television and press can now transmit online. As a result, electronic Customer Relationship Management (eCRM) and CRM are **interchangeable** terms. **eCRM** highlights the role of technology in managing today’s human relationship. Examples of eCRM are automated selling systems of Amazon.com and social networking (e.g., facebook). They develop long-term relationship with specific individual customers for a profit in this electronic age. Social CRM (i.e., collaborative CRM), riding on social networking, is indeed the **true CRM**. It signals the emerging trend of social commerce and tagging culture.

Why eCRM?

It is because eCRM dictates the survival and growth of the modern business. Customers and competition are online. eCRM is the battlefield that no one can afford to miss. eCRM, as part of the enterprise system, is an indispensable part of the integrated world. eCRM is now part of our daily life. It is the norm of doing business in the new millennium. We are already

treading this eCRM world, virtual reality and postmodernity!

This **post-modern** age features rapid, parallel and profound changes. We now “sense” the virtual reality. Seeing and hearing is no longer fast enough to perceive. Then, all seem to be “unpredictable” and “nonsense”. Things might have changed before we can interpret and theorize it. **Phenomenon** experiencing rather than mere theory building might be more relevant nowadays. Scenario and symptoms become more critical. Traditional Chinese Medicine (TCM), for example, does work although its scientific meaning, structure and process remains unclear. That is why people talk about eCRM approach. This is not theory. This is the popular way to **survive** and **profit**. “If you cannot survive, why bother thinking?” someone said.

What is customer relationship?

All is about relationship. Relationship is the cornerstone of business success while the Internet realizes its magic potentials in the new horizon. Chinese people attach special importance to human relationship. In modern Chinese language, human relationship is translated as “**guanxi**”. Chinese people are well known for its profound proneness towards guanxi. Guanxi is emotional ties based on preferred long-term human interactions within Confucianism. **Face-to-face** interaction is the prerequisite for developing guanxi. No guanxi, money won't talk. With guanxi, we can talk, rather the other way round.

RM promotes a long-term customer relationship. It focuses on customer **retention** and satisfaction, rather than conclusive point-of-sale transactions. A preferred customer relationship derives its strength from repeated **service** encounter success, service quality beyond expectation and valid service recovery. As such, RM rides on service quality management.⁵

Why customer relationship?

It may **cost** 7-10 times more to recruit new customers than it would to retain current customers⁶. A 5% increase in the **retention** of your best customers can lead to 25-75% increase in profit.

To maximize a customer's lifetime value (**CLV**)⁷ marketers must think more in terms of what customers sense, think and act at all the touchpoints throughout the entire customer life cycle (**CLC**). They must look through the customers' eyes. This is customer centricity. When marketing concept suggests to offer whatever the customer wants, traditional marketer collects customer data and interprets the trend in their own eyes. Clearly, this is less relevant than customer centricity now. For instance, a smart mother will crawl on floor to examine every potentially dangerous spots to her baby. Looking from the adult view might miss the fatal moment. Dell enables the customer to configure the preferred system online. Then, it wins the market.

Friend is brand and **relationship** is brand equity

The one who plays fast and loose will receive no respect anywhere. Hence, **relationships**

first, profit next. Wise men always take the long-term view. They build human relationships first, and honor those over profits. Sales and profit will surely follow. Customers prefer to pay more for the brand. It saves them times and efforts in comparing every items for every purchase. Buying is winning, because relationship is harassment-free.

What is the role of eCRM in Marketing?

eCRM is the **approach** that derives itself from marketing theories, including direct marketing, database marketing, relationship marketing, Internet marketing and viral marketing.

A sluggish market together with rapid innovations and consumerism contributes to the continuing proliferation of marketing **thinking**. Examples include computer database-driven direct marketing (1967)⁸, database marketing (early 1980s)⁹, service marketing (1981)¹⁰, word-of-mouth marketing (mid-1980s)¹¹, relationship marketing (1990s)¹², internet marketing (1995)¹³, viral marketing (1996)¹⁴, affiliate marketing (1996)¹⁵, permission marketing (1999)¹⁶, one-to-one marketing (1996)¹⁷ and buzz marketing (2001)¹⁸.

Besides eCRM, other business approaches include segmentation, targeting, positioning, electronic commerce and enterprise systems. **Approach** explains the reasoning behind choosing your method. Example: His approach to any problem is to draft a plan first. He prefers a five-step approach in delivering the ball. **Method** is more specific than approach. Method is the way or steps that you apply these approaches. Example: There are three possible methods of repairing this computer. This is a simple method for making a cake. Mediation is a flexible method of solving disputes. **Techniques** are more specific than method. These are steps (e.g., tools and tasks) to achieve certain goals. We might use techniques for routine tasks (i.e., calculating multiple regressions). When the use of approach, method and technique involves planning, then all are **strategies**.

Marketing and marketing philosophies

Marketing gains momentum from economic development. Supply shortages in the old days let suppliers sell what they have. Demand surplus remained unsolved even after the Industrial Revolution in 1850s. Customers did not need to be consulted. This is **Product Concept** that continued to the 1920s. It holds that supplier knows its product better than anyone else does.

Consumer marketing started when sellers, using mass production, found it profitable to sell lower cost items to masses of customers. Henry Ford pioneered mass production of automobile to replace hand made cars for the very rich. The public for the first time can afford private cars. Demand surged. Henry Ford declared that his standardized low price Model T automobile was the best for the public in 1908. He dismissed the customers' demand for more colors that "you can have any color car you want as long as it is black." With increased competitive supply, Model T production ended in 1927.

During 1930s-1950s, suppliers could still sell whatever they offered by using advertising and personal selling. This is **Selling Concept**. Production Department was left to focus on the product.

Following greater productivity and supply competition, suppliers find it easier to sell what the

customers really want, rather than mere selling. This is **Marketing Concept** in around 1950s that started the marketing era.

Traditional marketing

Traditional marketing features selling to **mass market**. Before mass production of the industrial revolution, suppliers focused on the rich people with handmade items. The artisans and storekeepers, for example, produced and sold goods to specific individual customers. When new technologies of industrialization lowered mass production costs and lifted the society's general wealth and literacy rate, the suppliers began to sell standardized goods to a broad range of unspecific customers using advertising and direct mail. They targeted the public with generalized appeals.

Modern **advertising** traces back to 1836 when French newspaper *La Presse* first included paid advertising in its pages.¹⁹ N. W. Ayer & Son, the full-service advertisement agency, opened in 1869. Coca-Cola started extensive advertising in the 1890s.²⁰

Direct marketing

The popularity of systematic advertising spread to **mail order** advertising, a preceding form of modern direct marketing, when mail delivery became increasingly economical and reliable. Sears in 1887, for example, developed catalogs to sell to remote area households throughout the USA. In 1927, it sent out 75 million pieces of sale letters and catalogs by post.²¹

For better return, catalog companies started focusing on the more responsive and profitable **segments**. This is **segmentation**. Indeed, industrialization brought about a more affluent society (e.g., "The Affluent Society," Galbraith 1958) with more fragmented market. There are growing number of smaller distinct subsets (**segments**) of individual consumers, sharing similar needs, demand differentiated offers even at higher prices. Responding to this, marketers separate the whole market into different segments using demographic (e.g., sex), psychographic variables (e.g., lifestyle) and geographic variables (e.g., Hong Kong) in addition to income for analysis purpose. To profit, marketers offer customized sets of 4Ps to targeted segments. This is **targeting**. They estimate the attractiveness of the target segment and then design the right product, price, place and promotion. Improved market segmentation and targeting could lead to significantly improved marketing effectiveness. Less marketing dollars result in more sale and profit.

Targeting the appropriate segments, some marketers used the "12-month prune rule" in 1910 and the recency-frequency-monetary amount (RFM) model in the 1920s.²² They adopted compiled lists of prospect customers in the late 1940s (e.g., Polk and Donnelley).²³ For further cost reduction and better responses, they started to sell over the phone in the 1950s (e.g., DialAmerica Marketing). This is **telemarketing**.²⁴

In the late 1950s, direct marketing firms began to apply **computer** technology to their customer lists. This facilitates the rapid proliferation of data analysis, personalized communication, credit card and bar code scanning technologies.

It was **1967** before the computer-assisted **Direct Marketing** became a selling norm.²⁵

Reader's Digest, for example, was the first direct marketer to use **statistical** analysis, like **multiple regressions**, for targeting customers in 1967.²⁶ Other techniques include **SPSS** (1975), **SAS** (1976) and **CHAID** in 1980.

Direct response marketing

Direct marketing could include direct response marketing in addition to telemarketing. **Direct response** marketing involves the direct mailing of **direct response print ads** and the modern direct response television **infomercials**.²⁷ These both **solicit** customers' direct responses and purchases. Direct response marketing differs from direct marketing in that the customer **responds** to the marketer directly in direct response marketing whereas the marketer contacts the potential customer directly in direct marketing. Again, direct response marketing might involve the use of intermediary **broadcast media**, which direct marketing normally does not require.

Database marketing

Day (1980)²⁸ describes segmentation strategy as **top-down** approach in that marketer starts with the total population and divides it into segments. His **bottom-up** approach starts with existing customers and operates from its customers' point of view. This is **customer-centric**. For example, product and service should be available on demand. Dell's customers can configure the systems they want anywhere and anytime.²⁹

Using techniques like cluster analysis, marketers develop and analyze the **customer profile** (e.g., demographics and psychographics) and preferences for marketing purposes. This is database marketing. It appreciates the **long-term value** of customer.

The advances in **computer** and **database** technologies gave rise to the database marketing in the early 1980s.³⁰ This lets suppliers understand customers as **individuals** rather than a traditional broad consumer aggregate. Database marketing aims to communicate, promote and sell to customers by using a database management system (**DBMS**). The DBMS gathers and stores customer data to build their customer profiles for marketing planning. The advent of relationship database management system (**RDBMS**) added further strength to the rise of database marketing. In 1983, IBM released DB2 on its MVS mainframe platform. This SQL-based mainframe system offered greater flexibility and menu-driven capacity for marketers to analyze and plan better. The world entered **micro** end-user computing era in the late 1970s. All these make database marketing even more prevalent.

Relationship marketing (RM)

The terminology of relationship marketing was first described by Theodore Levitt in 1983.³¹ He wrote that "In a great and increasing proportion of transactions, the relationship actually intensifies subsequent to the sale. This becomes a central factor in the buyer's choice of the seller the next time."

In the 1990s, the practice of developing long-term relationships with individual customers has become popular.³² It emphasizes the use of customer **retention** and **satisfaction** to keep

and develop continuous customer relationship.³³

This concept has its root in direct marketing. In the late 1800s, suppliers started sending catalogs to specific customers directly. They did care about customer satisfaction and retention. During the 1940s, some direct marketers recognized the long-term value of customer.³⁴ Jain for the first time introduced the concept of customer lifetime value (**CLV**) in 1969.³⁵ In face of the stagnating demand growth and deteriorating brand loyalty, marketers find it more profitable to target their core customers (e.g., active and profitable segments). They combine numerous segmentation variables to get an in-depth understanding of the customer segment. This is **depth segmentation**.

To cultivate a preferred long-term relationship with customer, the supplier organizations require good internal coordination for smooth and cost-effective operation. eCRM under such enterprise systems must link with supply chain management (SCM) and enterprise resources planning (ERP). Every step throughout the value chains must be well structured and justified profitably.

Differences between traditional marketing, RM and eCRM

First, traditional mass marketing is aimed **anonymously** at the **whole** target market segment with the 4Ps (Product, Place, Price, Promotion), whereas RM and CRM target **specific individual** customers in the segment and communicate with them with the right databases. It is because in cases that exists a previous relation with the client the marketers intended to build business continuity, the response is often better.

Second, traditional marketers often associates with such **offensive marketing** concepts as intrusive marketing and interruption marketing. They aim to obtain new customers (e.g., dissatisfied customers from their competition) and increasing customers' purchase amount and frequency.

Traditional marketers employed intrusion-based communications to push the prospects to buy by surrounding them with messages from all sides and at all times without any invitation and approval for an indefinite period. Such unsolicited communication is **intrusive marketing**. For example, direct marketing without any prior permission and **relationship** is intrusive in the sense that it intrudes the customers' privacy.

Again, some traditional marketers attempt to stop the prospect customers with ads in certain media or scenarios where they are more likely to use frequently. Examples are TV prime time ads and outdoor ads. They wish to increase exposure to boost attention and finally purchase as the AIDA model suggests. This could however lead to clutter in the less related customers' mind. Advertisers are interrupting others' private life by filling everywhere (e.g., TV, toilet, walls and floors) with "unwanted" messages (e.g., sex, shock, violence). This involves free rider, overloading and privacy concerns. This is **interruption marketing**. Then Godin (1999)³⁶ argues that marketers have no right to sell to others without permission. They should build a mutually agreed **relationship** with the prospect before any selling.

RM and CRM, on the other hand, follow the "**defensive marketing**" approaches of increasing customer **satisfaction** (i.e., managing customer dissatisfaction) and switching **barriers** for customer-**retention**.³⁷ These relationship marketers attempt to reduce customer

turnover and increase customer **loyalty** by offering personalized care and service quality beyond expectations. They wish to move the customers up the “**relationship ladder of customer loyalty**” from prospect to customer, client³⁸, supporter, advocate and then partner.³⁹

Third, traditional marketing strives to create leads and **first-time** customers while RM focuses on maintaining the relationship with them **after the sale**.

Fourth, traditional marketers use extensive distribution **channels** and **promotional** mix to recruit customers. RM and CRM rely more on **viral marketing** to acquire further customers.

Using viral marketing, these relational marketers try to create certain viral messages (e.g., most-talked message, interesting advertising, unbelievable discounts and benefits, shocking news) for targeted individuals with high Social Networking Potential (SNP). When these "susceptible" users become "infected" (i.e., accept the idea), they go on to share the idea with others to "infect them" like virus. No one could stop such exponential infection process if the users find it so “compulsive” to infect the others. This might realize much greater explosive communication impact. The entire spreading process does not cost money for the marketers. They only need to create such viral messages.

The rapid growth of online **social networking** since 2007 grants viral marketing even greater spreading power than before. Then, eCRM enjoys much greater potential of generating new leads than RM.

Linkages between traditional marketing, RM and eCRM

RM and CRM are not completely different from traditional marketing. They are **parts of a continuum of marketing strategies** for developing the unique customer experience. By capitalizing on these relationships, the marketer can create edge over the competitors.

The approaches and methods used in traditional marketing, RM and CRM are similar in today's data-rich environment. They all involve segmentation, targeting, positioning and the marketing mix. An exception is that traditional marketing is weaker in addressing target customers in that the customers' names and contacts are usually unknown. TV advertising is an example. After all, traditional marketing is also using segmentation database techniques in media planning today. Example is Nielsen Ratings

Differences between RM and eCRM

First, RM focuses on core customer segments and eCRM respects every individual. Customer relationship building limited to big and frequent buyers in the old days. **RM** advocates positive relationship with customer by keeping customer satisfaction and retention. It recognizes the importance of developing old customers and promotes loyalty programmes (e.g., Cathay Pacific Airways' Asia Miles). It tends to focus on the core and **profitable customer segments**. It is because having dialogues with every individual customer for good is expensive.

The arrival of Yahoo!, Amazon, eBay, MSN and Google and the like broke the rule and exposed the world to the immense profit of eCRM. **eCRM** borrows the relationship building

concepts from RM and rides on the Internet technologies for implementing the individual customer-centric approach. Web 2.0 social networking makes one-to-one relationships with **every individual** customer profitable, no matter how small and inactive the customer is, for the first of its kind. Examples include Facebook and msn.

Second, **RM is a marketing theory** that advocates customer retention based using CLV concept and loyalty programmes. Although Asia Miles membership is free, membership might be suspended after 36 months of inactivity and be closed without notice when all remaining mileage credits have expired.

CRM refers to the customer-centric approaches for a life-long relationship based on RM. Example is personal financial planning. **eCRM**, as the **true CRM** since 1990s, derives strength from direct marketing, database marketing, relationship marketing, Internet marketing and viral marketing respectively. It consists of analytical CRM (e.g., data warehousing, data mining), operational CRM (e.g., call-center automation), and social CRM (e.g., web 2.0).

Third, RM follows a traditional top-down approach. It continues to sell to customers after initial sale. CRM starts specific individuals to build on the customer profile (e.g., depth segmentation). It is a bottom-up approach.

Fourth, RM mainly uses **price** and **promotion**, and eCRM concentrates on a sales-supporting **dialogue** without trying to close a sale in each contact but achieve long-term profitability in each relationship. RM attempts to **sell** more after the initial sale whereas eCRM is not selling. eCRM will not ask one to buy. CRM simply **suggests** alternatives only when a customer requests. Sale is a result of good relationship with the customer in eCRM. CRM **builds nest to attract phoenix** - builds infrastructure to attract visits, dialogue and development.

In the eyes of customers and potential customers, RM uses relationship for selling purpose and eCRM uses relationship to develop further relationship. RM goes for profit and eCRM wants more than mere profit. When RM keeps sending sales letters, brochures, flyers and messages that often become irritating junk mails for customers, eCRM empowers customers to design and control the communication and exchange modes. People use facebook, Skype, msn and twitter, because they feel less pressure of being “sold” or “manipulated”. They appreciate a friend who stays with you even you are idle.

True friendship comes when silence between two people is comfortable (Dave Tyson Gentry). No road is long with good company (Turkish Proverb). It follows that, RM targets apple while eCRM eyes apple tree and apple forest.

eCRM might profit by helping a friend in need. Such profitable exchange would further enhance the relationships for further exchanges. “Propriety suggests reciprocity. It is not propriety not to give out but to receive, or vice versa.” (Book of Rites)

eCRM cares more about a “true friendship” by giving benefits and rewards. Examples are Cathay Pacific Airline’s Marco Polo Club loyalty programme (LP) with travel benefits, and Asia Miles’ Mileage Credits travel reward programme.

Conclusion

As a result, eCRM is unique and significantly different from conventional marketing thinking. Riding on the established concepts of relationship marketing, service marketing, and database marketing, eCRM grows a new breed of marketing approach for the online markets that feature global interactions and a lack of unity.

A fragmented view of customer subjectivity that modernism suggests is no longer relevant and sufficient. Market is now short of substantial unity, coherence and meaning that theoretical development can promptly cope with. Sources of competition are drastically changing the ways we think and react with each other continuously. Responding to the observed phenomena is even more relevant than merely conceptualizing and operationalizing the scenarios. Then, eCRM profits organizations from such market changes with integrated management theories, approaches, methods and techniques. Indeed, marketing thinking must grow along such line of operation in the postmodern age. eCRM is creating new blood vessels for future marketing development.

¹ It might be a reflection of postmodernism with “nonsense” phenomena of consumer capitalism.

Chinese images in Europe in the 17th century

-----A study on Johan Nieuhof's images of China

Jing Sun

Leiden University

As the first illustrated book to describe China, Johan Nieuhof's account of his experiences as a member of the first embassy of the Dutch East India Company (VOC) to China in the years 1655 to 1657 greatly satisfied the seventeenth-century European longing for knowledge of China. The first edition was published in Amsterdam by the bookseller and art dealer Jacob van Meurs¹ (1619-1680) in 1665. Translations into French (1665), German (1666), Latin (1668) and English (1669), and additional editions in Dutch, appeared in rapid succession in the seventeenth and eighteenth centuries.² The entire publications were of vital importance to the European reconstruction of China.³

¹ Jacob van Meurs also published many other travel accounts, including Athanasius Kircher's *China Illustrata* in 1667 and Nieuhof's book on East India and Brazil in 1682.

² It was quickly translated and printed into many editions. Dutch: Amsterdam, 1665, 1669, 1670, 1680, 1693, and Antwerp, 1666 (an expurgated Roman Catholic edition); German: Amsterdam, 1666, 1669 and 1675; English: London, 1669 and 1673; French: Leyden, 1665; Latin: Amsterdam, 1668. Another, quite different French version, much of it a summary, was published in the Thèvenot collection. For the bibliography see P. A. Tiele, *Nederlandsche Bibliographie Van Land- En Volkenkunde*, Amsterdam, 1884, pp. 179-80.

³ Dawn Jacobson, *Chinoiserie*, Hong Kong, 1993. p.20.

Fig.1 Johan Nieuwhof, the title page of the first Dutch edition of *Het Gezantschap der Neerlandtsche Oost-Indische Compagnie...*, 1665

The title of this book is “*An Embassy of the Dutch East India Company to the Grand Cham of Tartary, the present Emperor of China: in which are treated the most remarkable Events which befell them during the journey through the Chinese Countryside (...) from the year 1655 to 1657 (...).Also, an Accurate Description of the Chinese Cities, Villages, Government, Sciences, Crafts, Customs, Religions, Buildings, Costumes, Ships, Mountains, Crops, Animals etc.. and the Wars against the Tartars. Embellished with more than 150 Illustrations, drawn after life in China*”⁴ (Fig.1). At least three aspects are indicated in this comprehensive title. The first aspect is that, besides the travel account of the Dutch embassy’s visit to China,⁵ it contains more than 150 copperplates. The second point is that the motifs of these illustrations contain comprehensive aspects of China, including Chinese cityscapes and architecture; Chinese people and their costumes; Chinese customs; Chinese plants and animals. Finally, all these illustrations of China are made after life (*na’t leven in Sina getekent*).

⁴ The title in the Dutch edition is “*Het Gezantschap der Neerlandtsche Oost-Indische Compagnie, aan den grooten Tartarischen Cham, den tegenwoordigen Keize van China: waar in de gedenkwaardigste Geschiedenissen, die onder het reizen door de Sineesche Landschappen(...) sedert den jare 1655 tot 1657 zijn voorgevallen (...) verhandelt worden. Beneffens Een Naukeurige Beschrijving der Sineesche Steden, Dorpen, Regeeing, Wetenschappen, Hantwerken, Zeden, Godsdiensten, Gebouwen, Drachten, Schepen, Bergen, Gewassen, Dieren, etc, en Oorlogen tegen de Tartars. Verciert met over de 150 Afbeeldsels, na’t leven in Sina getekent*”.

⁵ This book also contains information from the most important Jesuit sources. The general description of China is based primarily on the works of Trigault, Semedo and Martini. But this description is more detailed than in any of the preceding works.

Fig. 2 Martino Martini, the title cartouche in the map of Peking in *Novus Atlas Sinensis*, 1655

This title distinguishes Nieuhof's account and illustrations of China from the previous publications on China enormously. The latter often only recorded China in a general sense even though some of them had illustrations occasionally. For instance, the atlas *Novus Atlas Sinensis* by the Italian Jesuit Martino Martini (1614-1661) published in Amsterdam in 1655 offers people maps of China and representations of Chinese figures. The figures are often placed in the corner of the map showing the local costumes and custom, as can be seen in title cartouche (Fig.2), in the map of Beijing. Two exotic phoenixes, so-called Chinese *Fenghuang* stand atop of the cartouche, and a formally dressed Chinese couple (probably Chinese emperor and empress) sit on either side of the cartouche while their servants holding canopies standing behind them. This image does provide western readers a fanciful impression of China, but as there is neither background setting nor context for the individual components of the image, the idea of China still remains in an imaginative stage.

Fig.3 Huygen van Linschoten, Chinese figures in the book *Travel Accounts of Portuguese Navigation in the Orient*, 1595

Fig.3.1 Luo Yingping, Portrait of an Official in Ming dynasty, 1590

Illustrations of China can also be found in the book *Travel Accounts of Portuguese Navigation in the Orient* in 1595 by Jan Huygen van Linschoten (1595-1596). In contrast to the depiction in Martini's atlas, Chinese figures (Fig.3) shown in van Linschoten's book are often arranged in a cityscape setting, even though this cityscape is placed in a far distance and its specificity could not be recognized. In order to give a prominent effect, as most contemporary travel illustrations did, the Chinese figures are arranged in

the extreme foreground as if they stand in a stage. The costume, especially the long robe with wide sleeves wore by the official the second from the right, reflects some characters of Chinese costume in Ming dynasty (1368-1644) when van Linschoten visited China. But these characters are very general and many of them are inaccurate. For instance, it is true that the official's hat in Ming dynasty has two wings, but it should be on the left and right of the head (Fig.3.1) rather than on the front and back as shown in van Linschoten's image. It is even more fascinating that some details like the woman's hairstyle and collar decoration are represented in a European in style. Apparently, these figures depict an imaginary China rather than showing the real Chinese costume in late sixteenth century. Therefore, the illustrations in this book are limited in number and based on unreliable information.⁶ Compared with these previous publications about China in Europe, no wonder when Nieuhof's book of China was published, it was immediately fond of by the western readers as it not only presented the Western reader with the most substantial and detailed accounts of China of the day, but also visualized the notion of China in Europe with a great number of illustrations, which later became standard visual sources for images which defined China for Europeans for a long time.⁷

It is the purpose for this paper (1) to show the impact of Nieuhof's images of China in Europe in the 17th and 18th centuries, and (2) to further examine to what extent these images, including the engravings in the printed book and the drawings in Nieuhof's manuscript are reliable, and (3) to investigate how and why these images are complied in the so called "after life" manner.

The wide-ranging influence of Nieuhof's images of China and their relationship with the Chinoiserie style

As '*a touchstone for books of China*',⁸ the pictorial information contained in this book was eagerly seized and used by scholars as the primary source of visual information on China for about a century and a half. Its tremendous influence on the European conception of China was hardly superseded until the first few years of the nineteenth century when the watercolours of China made by English artist William Alexander (1767-1816) while his accompanying the British embassy to visit Chinese emperor Qian-long's court in 1792-1794⁹ were published. For a long time the *Travel* served as a key work for anyone interested in China.

⁸ Ibid. p. 13.

⁹ In 1792, William Alexander was appointed as one of the draughtsmen to the Macartney Embassy to China, he made the drawings for the plates which accompany Sir George Staunton's account of that embassy; and afterwards published the book, see Erasme Gower, *An Authentic Account of an Embassy from the King of Great Britain to the*

A generally accepted opinion on the impact of Nieuhof's images of China on European art is that they profoundly affected the evolution of Chinoiserie,¹⁰ which was rooted in Europe in the mid 17th century and reaching its peak when it was assimilated into the European Rococo ornamentation in the mid 18th century¹¹. The illustrations and the designs drawn from them were widely copied and used in part or in whole in the subsequent publications on China, in architecture, in various decorative arts from interior decoration to porcelain, from wallpaper to textiles, from furniture to lacquer ware, profoundly affecting the evolution of Chinoiserie. We can see some examples as the follows.

The detailed engravings of various Chinese structures in Nieuhof's book do provide usable prototypes for innumerable Chinoiserie designs¹² although Chinese architectural forms and principles were not well understood in Europe for a long time.

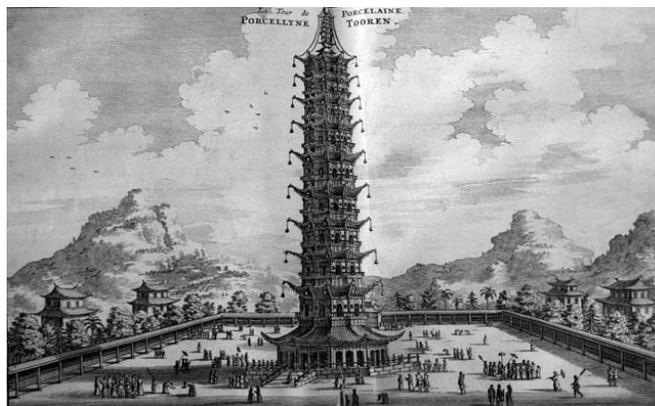

Fig.4 Johan Nieuhof, the plate of Porcelain Pagoda from the first Dutch edition of *Het Gezantschap der Neerlandtsche Oost-Indische Compagnie...*, 1665

The 'Porcelain Pagoda' in the city Nanjing first illustrated in Nieuhof's book (Fig.4) is 'the Chinese building best known in Europe'.¹³ It is a nine-storey pagoda, constructed of glazed and painted tiles and crowned with a golden pineapple. This exotic pagoda had been widely imitated, not only appearing in the publications¹⁴ and interior decorations,

Emperor of China, Including Cursory Observations Made, and Information Obtained, in Travelling through That Ancient Empire, London, 1797. The striking series of prints in this book came to be an important eighteenth century series on China.

¹⁴ The first appreciative account of Chinese architecture, *Entwurf einer historischen Architektur*, published in 1721 by Fischer von Erlach, relied for its illustrations principally on the engravings in Nieuhof's book. Honour,

but more frequently showing up in European gardens especially in the eighteenth century. For instance, the pagoda in Kew Gardens (Fig.5) built in 1761 by Sir William Chambers (1723-1796) follows Nieuhof's design¹⁵, the replicas of which were built in many European gardens, such as Munich's Englischer Garten, Sanssouci (1770) and Chanteloup (1775-1778).

Fig.5 The pagoda in Kew Gardens in London

In addition to the pagoda, Sanssouci Park¹⁶ further offers us another example of the garden pavilion, which is called the Dragon House (Fig.6). Compared with the illustration

Chinoiserie.p.21; also see Lothar Ledderose, "Chinese Influence on European Art, Sixteenth to Eighteenth Centuries", in Lee, ed. *China and Europe: Images and Influences in Sixteenth to Eighteenth Centuries*. p.232.

¹⁵ William Chamber had visited Canton and in 1757 was the first European to publish professionally accurate drawings of Chinese buildings in his *Designs of Chinese Buildings*, including the Chinese pagoda. But his own design was not adopted when he built the pagoda in Kew Gardens; by contrast, he used the design of the Nanjing porcelain pagoda which Nieuhof had made famous in Europe. See Lothar Ledderose, "Chinese Influence on European Art, Sixteenth to Eighteenth Centuries", in Lee, ed. *China and Europe: Images and Influences in Sixteenth to Eighteenth Centuries*., pp.233-234. But Hugh Honour probably did not compare the pagoda in Kew Gardens with the illustration of the porcelain pagoda in Nieuhof's book of *China* as he thought this pagoda was not modelled on any particular oriental prototype. However, in my opinion this is erroneous. See Honour, *Chinoiserie*. p.155.

¹⁶ Sanssouci is the former summer palace of Frederick the Great, King of Prussia, at Potsdam, near Berlin. It is often counted among the German rivals of Versailles. The palace was designed by Georg Wenzeslaus von Knobelsdorff between 1745 and 1747 to fulfil Frederick's need for a private residence where he could relax away from the pomp and ceremony of the Berlin court. While Sanssouci is in the more intimate Rococo style and is far smaller than its French Baroque counterpart, it too is notable for the numerous temples and follies in Sanssouci Park.

in Nieuhof's book(Fig.7), people may easily figure out how the European architects were influenced by the images of China in Nieuhof's book

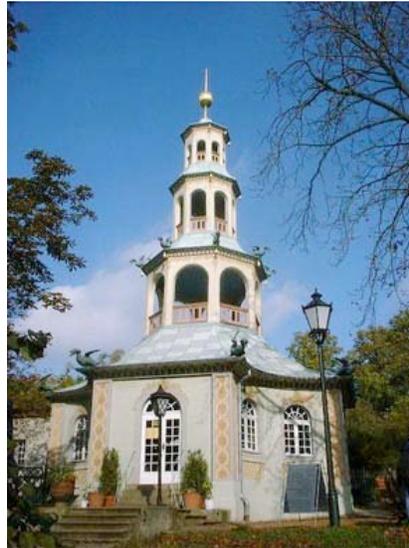

Fig.6 The Dragon House, constructed between 1770 and 1772 in the Chinoiserie style on the northern edge of Sanssouci Park, Berlin.

Fig.7 Johan Nieuhof, the plate of a Chinese pagoda from the first Dutch edition of *Het Gezantschap der Neerlandtsche Oost-Indische Compagnie...*, 1665

Designs inspired by Nieuhof's illustrations of China can also be found in the freely decorated Chinoiserie rooms which were greatly favoured by European monarchs, such as Louis XV of France and Frederik III of Denmark. In 1663-1665 Frederik III had a room in Slot Rosenborg, Copenhagen, decorated with Chinoiserie in lacquer set with turquoise and mother-of-pearl. It was executed by the Dutch artist Francis de Bray, and

many of its motifs were derived from the illustrations from Nieuhof's book of China.¹⁷ For instance, the dark green panel (Fig.8) has a design in gold representing a Chinese dragon boat; and this dragon boat is bedecked with pennants and steered by a youthful figure with long plumes nodding from his turban; he stands behind the dragon-headed prow. This is apparently copied after Nieuhof's representation of Chinese dragon boat, as shown in picture 9 (Fig.9).

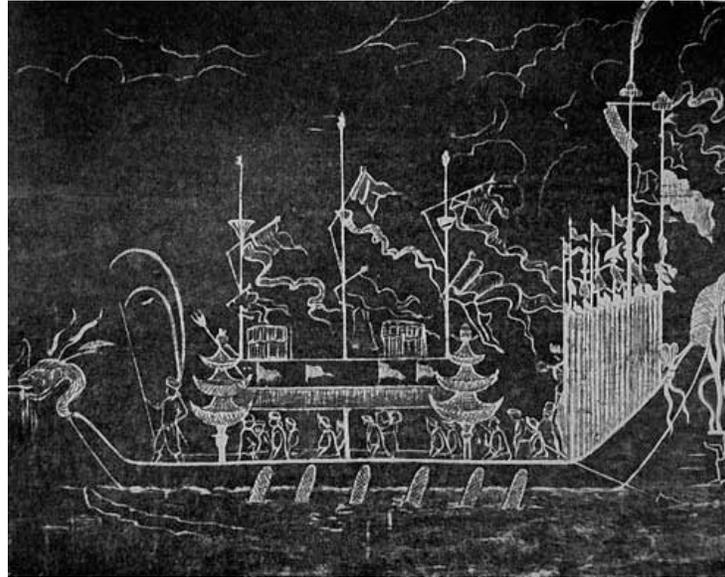

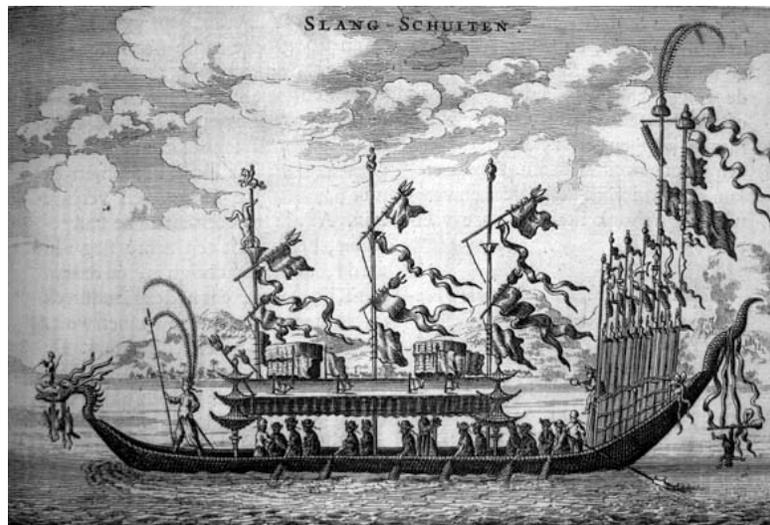

Fig.8 Chinese dragon boat in the lacquer room in Slot Rosenborg, Copenhagen, 1663-65

¹⁷ Frederik III used the chamber for informal audiences with foreign diplomats, and in 1663-1665 the decoration was executed by the Dutch artist Francis de Bray and based on illustrated travel accounts and novels about China, Japanese lacquered boxes and decorative art. Here Hugh Honour probably made a mistake about the date when the room was decorated with lacquer work. According to him, this room was furnished in around 1616; moreover, he did not point out the relationship between these junks and Nieuhof's illustrations. See Honour, *Chinoiserie*. p.45.

Fig.9 Johan Nieuhof, the plate of a Chinese dragon boat from the first Dutch edition of *Het Gezantschap der Neerlandtsche Oost-Indische Compagnie...*, 1665

An interesting example of Nieuhof's design applied to furniture is a clock case and stand made in Augsburg about 1725. The case itself is common and classical that it has four Corinthian columns at the corners; the exotic part is the stand, where a carved figure of a small Chinese man seated cross-legged on the stretcher (Fig.10).¹⁸ This odd Chinese man dresses a flowered robe and wears an extraordinary hat, which immediately reminds people the figure appears in Nieuhof's book (Fig.11). The figure in this image is supposed to be a monk, since he holds a *Muyu* (wooden fish), a wooden percussion instrument similar to the Western wood block, in his hands. His exotic hat must excite the draftsman's great interest, so he particularly made a replica in this clock.

Fig.10 A clock case and stand made at Augsburg, about 1725

¹⁸ Ibid. p. 114.

Fig. 11 Johan Nieuwhof, the plate of Chinese figures from the first Dutch edition of *Het Gezantschap der Neerlandtsche Oost-Indische Compagnie...*, 1665

It is quite often found that the European designers went far beyond Nieuwhof's original presentations of China: they extracted various Chinese elements from different sources and dealt with them in a western manner to invent imaginary scenes of the mysterious Far East. It often abounded in exotic 'foreign' figures set in ethereal landscapes filled with oversized flowers, craggy rocks, fretted fences, dwarf trees, temples, pleasure boats, and fanciful birds. The next example (Fig.12) shows how far the Dutch potters had gone to reinterpret the image of China on the basis of Nieuwhof's design and how he created an imaginary image of China.

Fig.12 Plaque with Chinoiserie decoration, 1680-1700, dimensions, 63 x 92 cm, Rijksmuseum, Amsterdam

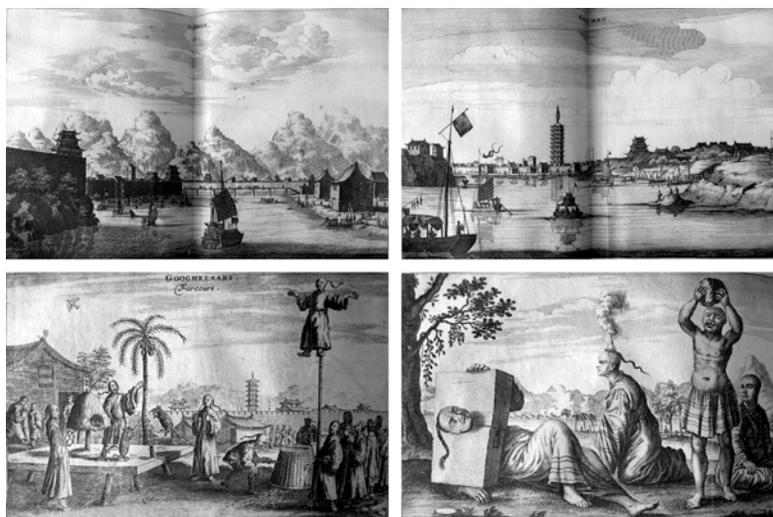

Fig.13 Johan Nieuhof, plates from the first Dutch edition of *Het Gezantschap der Neerlandtsche Oost-Indische Compagnie...*, 1665

It is a wall decoration, a plaque (a large tile) of Delftware pottery, painted by an unknown artist at the end of the 17th century. Decorated in blue and white, this plaque gives a festive view of life in China: a river full of pleasure boats, circus attractions on the riverbank and happy people everywhere. The potter must have been very familiar with the illustrations of Nieuhof's book, because the motifs such as the boats sailing on the water, the figure who strikes his bare head against a stone, the one who is supporting a long pole with another one standing on the top of this pole, the city wall and tower on the left side and the pagodas emerging here and there, are all obviously derived from Nieuhof's book [Fig.13]. But rather than simply copying one single print from Nieuhof's book, the potter extracted Chinese elements from different illustrations and mixed them into one image. Moreover, he added Japanese figures, a coconut tree from Indonesia and a pine tree from Scandinavia. It can also be seen that various flowers, plants and animals from unknown sources are displayed in the foreground framing the plaque in a typical Dutch pictorial convention.

A similar design can be discovered in one of the series of ten Beauvais tapestries known as *The Audience of the Emperor* (Fig.14), made in Beauvais from designs by François Boucher. Here the love of the fantastic has outstripped even the love of the exotic. This Chinoiserie tapestry is an attempt to achieve an Oriental style rather than a mere depiction of an Oriental subject. Here, the enthroned emperor is also closely related to the depiction on the title page of Nieuhof's volume, but in this image, the magnificent setting, the prostrate courtiers and exotic animals and flowers, all testify to the power and glory of the sovereign, be he the Emperor of China or King of France. As a matter of fact, it bears witness to the transformation from the Chinese imperial splendour of Nieuhof's prints to a theatrical stage-setting of Chinoiserie¹⁹ based on European baroque court models.

¹⁹ Chinoiserie entered the European repertory in the mid-to-late seventeenth century and became especially popular in the eighteenth century. Important studies about Chinoiserie, see Ibid.; Oliver Impey, *Chinoiserie*, London, 1977.

Fig.14 One of the series of ten Beauvais tapestries, *The Audience of the Emperor*, after the designs by François Boucher, 1725

Therefore, as we can see, Chinoiserie begins with direct imitation, later developing by drawing farther and farther away from its prototypes. By combining different elements, it assigned China the character of something ‘odd’ and with little regard for the original designs, pictorial themes, or subjects represented. These objects were in fact appreciated only when they were integrated into European surroundings, adding some exotic seasoning, which makes them all the more exotic.²⁰ In this sense, objects in Chinoiserie designs only produce a feeling of a likeness of China on the basis of Chinese pictorial elements and Western imagination.

When more and more Chinoiserie designs went far away from their origin and images of China came to be more and more fanciful, Nieuhof’s illustrations in turn were regarded as standard sources to define China for Europeans²¹ not only because they provided the prototypes for various Chinoiserie designs, but also because they were made on the basis of Nieuhof’s eyewitness observation.

The credibility of the engravings in Nieuhof’s book of China

The credibility of these illustrations of China had been specially emphasized by Nieuhof in his book on East India, as in the following:

“herein (without committing any breach of modesty) I dare boldly affirm that nothing considerable intruded into my observation relating to my design, and that making

²⁰ Danielle Elisseeff-Poisle, “Chinese Influence in France, sixteenth to Eighteenth Centuries”, in Reed, ed. *China on Paper : European and Chinese Works from the Late Sixteenth to the Early Nineteenth Century*. p.160.

²¹ Ibid., p.142.

accurate maps and sketches, not only of the countries and towns, but also of beast, birds, fishes, and plants, and other rarities never divulged (as I am informed) heretofore.”²²

This statement was lent extra emphasis by his brother Hendrik Nieuhof, who was in charge of the publication of his work on China. He echoed his brother in his introduction to the book on Johan Nieuhof’s voyages to the East and West Indies, claiming that Johan religiously adhered to the ‘*naekte waerheit*’ (naked truth) and never indulged in the telling of fables instead of history²³. This statement works so well as a selling point that it is frequently stressed in different editions of the translations. For instance, when the French publisher Melchisédech Thévenot (1620-1692) introduced Johan Nieuhof’s journey to China in his book *Relation* in 1665, he claimed that: “*The principal feature of this Relation is truth...I have checked that the instruction is trustworthy and the only ornament that I can offer is truth.*”²⁴

Apparently, the publishers’ claim generally offers people an impression that Nieuhof’s illustrations of China are different from the Chinoiserie objects and they are not an artificial hybrid of various elements but reliable representations on the basis of Nieuhof’s eyewitness observation.

²² Nieuhof, *An Embassy from the East India Company of the United Provinces to the Grand Tartar Cham, Emperor of China*. Amsterdam, 1665, p.3. And the Dutch text is as the follows: “En hier in, zonder roem gesproken, heb ik my ook zodanig gequeeten, dat ik niets on-aangemerkt heb laten voor-bygaan, zo in ‘t onderzoeken, van de zeden en manieren dezer volken, en den aart van ’t land, als ook, en dat voornamelijk, in ’t aftekenen van lantschappen, steden, dorpen, dieren, kruiden, en meer andere vreemdigheden; ’t welk tot noch toe, mijns wetens, niemand dus gedaan heeft.”

²³ Johan Nieuhof and Reid A.J.S. , *Voyages & Travels to the East Indies 1653-1670*, Singapore, 1988. p.2.

²⁴ Thomas Gages and Melchisédech Thévenot, *Relations De Divers Voyages Curieux, Qui N'ont Point Esté Publiés Ou Qui Ont Esté Traduites D'hacluyt, De Purchas, Et D'autres Voyageurs Anglois, Hollandais, Portugais, Allemands, Espagnols, Et*, Paris, 1663. p.i. The French text is as the follows: ‘Le principal merite de cette Relation est la verité. l’ay crû que sur tout la traduction en devoit estre fidele, que c’é toit la feul ornement qu’elle pût souffrir.’

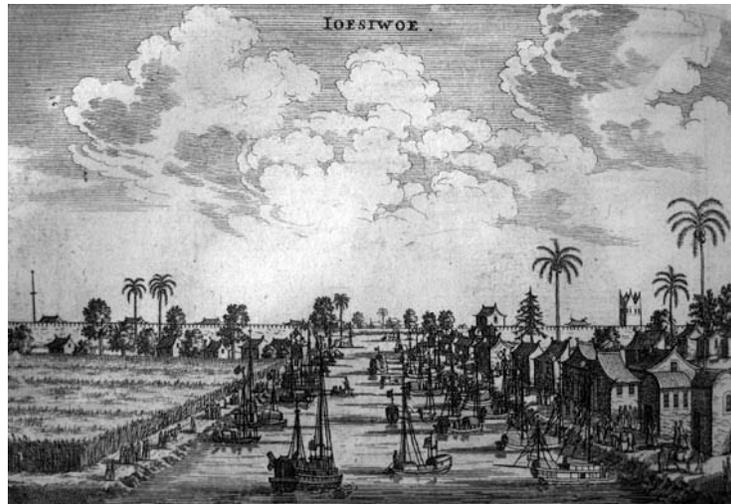

Fig.15 Johan Nieuhof, a plate of the town Joesiwoe from the first Dutch edition of *Het Gezantschap der Neerlandtsche Oost-Indische Compagnie...*, 1665

However, I doubt this judgment. In my opinion, the relationship between Nieuhof's illustrations of China and the Chinoiserie style is far more complicated. Here I want to show an example of a very common townscape illustrated in Nieuhof's book. This townscape (Fig.15) represents the countryside of Joesiwoe (Hexiwu, 河西务), a small town close to Beijing. In this engraving, a broad river flows towards the background where the city wall emerges; the left bank is occupied by a vast wheat field and several rows of native dwellings with exotic roofs stand on the right bank. All these representations offer people an impression that this townscape is taken from life. However, with closer look, people may find that the enormous coconut palms appearing on the banks do not grow in Northern China which is far too cold for them to survive, and meanwhile, they are not supposed to be planted at the same environment as the fir trees, which frequently appear in Everdingen's painting of Scandinavia²⁵ in the seventeenth century (Fig.16). Similarly, the Dutch ships should not be visible here as well, because the ships on which the Dutch embassy travelled from Canton to Beijing were actually Chinese ships²⁶. In this meaning, these decorative motifs do not improve the specific quality of this townscape but eliminate its credibility, since many of them are not supposed to appear in this location in the real life.

²⁵ See Wolfgang Stechow, *Dutch Landscape Painting of the Seventeenth Century*, London, 1968.

²⁶ Johan Nieuhof, *An Embassy from the East India Company of the United Provinces to the Grand Tartar Cham, Emperor of China*, London, 1669. p.46. The text is as the follows: "The ambassadors had hired a very brave vessel to themselves, having procured fifty more at the Emperor's charge, to carry their followers, presents, and goods. And in regard it was thought unadvisable to bring our great ships any higher up the river, we left them at Canton, under the command of Francis Lansman." Similar record can also be discovered in the manuscript: "Den 17e martij gingen Haar E.s van Canton met een vloot van omtrent vijftigh vaartuigen t'zeil om onze reyze na Pekin te vervorderen." See Blussé and Falkenburg, *Johan Nieuhofs Beelden Van Een Chinareis 1655-1657*. p.35.

Fig. 16 Allaert van Everdingen, *Mountainous River Landscape*, c. 1660

Considering the exoticism of both the coconut palm and the fir tree to a Dutch audience, it is not difficult to figure out the purpose of inserting these trees here, namely, to enhance the fantasy of this foreign country. And of course, the representation of Dutch ships sailing on the river will not only inculcate a sense of familiarity among the readers but also the sense of pride in Dutch activities in the Far East.

In this respect, if we say one of the essential features of Chinoiserie is to imitate and compose Chinese elements to create 'China-like' images, the illustrations of China in Nieuhof's book themselves should also be attributed to be part of the Chinoiserie. More precisely, these illustrations not only provide materials for the later Chinoiserie designs, themselves also evolved in Chinoiserie design. In this sense, we may say that they are both the origin and the precursor for Chinoiserie.

Moreover, in addition to revealing the close relationship between these illustrations and the Chinoiserie style, the analysis of this engraving also casts some doubts on the commonly accepted opinion that these illustrations were produced on the basis of eyewitness observation by Nieuhof during his journey in China. If they were really based on a traveller's trustworthy observation, how to explain the fanciful trees, boats and exotic houses?

The manuscript compiled by Nieuhof on spot

The study on a manuscript in Bibliothèque Nationale de France²⁷ which came to people's sight in 1984²⁸ may shed some light on this question. Leonard Blussé believed this

²⁷ The codex: BnF/Cartes et Plans/ Societe de Geographie/ Ms.in 8o/ 17/1271 Reserve. See also: Alfred Fierro, *Inventaire des manuscrits de la societe de geographie*, Paris. 1984. pp. 96-7, nt. 1271

²⁸ The value of Nieuhof's original manuscript and drawings had recognized and scholars had sought them for a long time. Their trace was first mentioned in the book *Mémoire sur la collection des Grands et Petits Voyages, et sur la collection des voyages de Melchisédech Thévenot* by the French scholar A.G. Camus (1740-1804) discussing Thévenot's work in 1802.

manuscript was the original report of the Dutch embassy visit to China between 1655-57 written by Nieuhof and delivered to the VOC in 1658, seven years earlier than the publication of the first Dutch edition. The manuscript is composed mainly of the text embellished by eighty-one drawings and around seventy engravings in the printed book match the design in the corresponding drawings. This suggests that either the drawings in the manuscript provide sources for the reproduction of the engravings or they share the same sources, namely, the original sketches compiled by Nieuhof on the spot.

When this manuscript was exhibited in Middelburg in 1987, Leonard Blussé and Reindt Falkenburg each wrote an essay for the catalogue *Johan Nieuhofs Beelden van en Chinareis 1655-1657*, and their research findings and investigations had a profound impact on the later study on Nieuhof's images of China. In Blussé's essay, he mainly concentrates on providing an introduction to the historical background and the process of the discovery of this manuscript but, without further examination on the reliability of the text and drawings in this manuscript, he rashly drew the conclusion that this manuscript was compiled by Nieuhof himself on the basis of his sketches made on spot.

However, the issues where Blussé failed to investigate were successfully pursued by Falkenburg. Falkenburg adopted a fairly strict attitude towards the drawings in the manuscript. On the basis of the comparison between drawings in the Paris manuscript and the engravings in the printed book, he proposed that the drawings and the engravings matched each other, especially in the perspective of the silhouettes of cities, but the great differences between them also suggest that both of them were made on the basis of the more than 150 'after life' rough sketches mentioned in Hendrik Nieuhof's preface.²⁹ On the basis of the analysis of the drawings, he found some problems with the drawings, which led him to postulate that Nieuhof was probably not the person who had executed the drawings in Paris manuscript.

However, Falkenburg's theory and investigation have not been continued with by the later researches on the images of Nieuhof. Most of the later researches often give a general judgment towards Nieuhof's images of China on the basis of Blussé and Falkenburg's theory³⁰. A deeper research on Nieuhof's images of China has not been made until in 2003 by Friederike Ulrichs. She holds a similar opinion as Blussé that the manuscript was produced by Nieuhof and the drawings were much more convincing. And the artificial and fanciful depictions should be attributed to the engravers or his brother Hendrik Nieuhof, since Johan Nieuhof himself did not involved in the publication and he only left the sketches to his brother Hendrik during his short stay in Holland. She further argues that, on the whole, the illustrations can be considered reliable representations of Nieuhof's observations, even though these were inevitably embellished to a certain extent.³¹

Nevertheless, I find it hard to agree with them completely on this point. It is true that the drawings in the manuscript are more convincing than the plates, but this is no reason to infer that the drawing itself is therefore trustworthy. To make my point clear, I would like to take the townscape of the town Fengcheng as example (Fig.19). Like the most contemporary townscape made by Dutch travellers, this Chinese town is also observed from water. The foreground is filled with water and an attractive Chinese ship which has two masts and sails. A number of small boats are anchored alongside the bank. On the bank there stand two extraordinary buildings which share some characteristics of Chinese traditional architecture, such as the up-turned eaves (although the eaves seem to be much exaggerated). Then people can see the main theme of this engraving, the city wall and various roofs emerging from the city wall, which shows a prosperous scene of the town. Moreover, the townscape is decorated by the exotic coconut trees and some other unknown trees appearing here and there in the town. All these elements bring the Dutch audience a quite different townscape from their own. But just as the engraving of the town Hexiwu I have analyzed above, this fanciful feeling is rather stimulated by the decorative components, including the exotic trees, the boats and the roofs.

Comparing this engraving with the corresponding drawing, people may find that these elements actually do not appear in the drawing (Fig.20). It is less decorative that only has the most fundamental components of the townscape, but may we therefore make a conclusion to say that the representation of Chinese town in this approach is trustworthy?

Fig.19 Johan Nieuwhof, the plate of the town FengCheng from the first Dutch edition of *Het Gezantschap der Neerlandtsche Oost-Indische Compagnie...*, 1665

Fig.20 The drawing of the town Fengcheng in the Paris manuscript

Before answering this question, I would like to take a closer look at this drawing. Just like the engraving, the town profile consists mainly of a vast bank in the middle ground and a city wall in the background. Embellished with a ‘specific’ Chinese boat on the water and a ‘typical’ Chinese city wall, this image does generally convey the feeling of a Chinese town until we take closer observation on the two oddly shaped buildings in front of the city wall. Their shape suggests that they may be Chinese city gates, but this speculation is contradicted by their location, because a Chinese city gate does not stand alone outside of the wall but is invariably attached to the city wall.

This doubt may be answered by the accompanying text which sheds some light on their identity: ‘on the north side of the city is a populous suburb, well and close built with buildings. There are also two great and high triumphal arches, which had been much defaced with the reset of the brave structures in the last bloody invasion’.³² Accordingly, these two buildings should be ‘Chinese great and high triumphal arches’ however they have been transposed into the city gates in the drawing. It turns out they neither have a form of Chinese arch (Fig.21) shows what a typical Chinese arch looked like, nor have a proper position as the city gate.

³² Johan Nieuhof, *An Embassy from the East-India Company of the United Provinces to the Grand Tartar Cham Emperor of China*, London, 1673, p.62

Fig.21 A photograph of a Chinese arch in Canton

Apparently, such confusion was not likely to have been made by Nieuhof himself, because he had made a great number of descriptions of Chinese city gates and arches which he had seen in China in his travel account, which means he must have been very familiar with the distinctions between these two buildings.

Moreover, another noteworthy detail is the building attached to the city wall. Its form does not resemble Chinese city gate tower but more reminds people the Dutch castle which often appears in the contemporary Dutch landscape pictures, for instance, the second building from the left in the engraving of *Egmont op de Hoeff*, by Jan van de Velde (Fig.22) . If it is the case, this townscape drawing is rather a kind of combination that whoever made it not only borrowed Chinese elements but also adopted Dutch components to invent a fanciful image of China.

Fig.22 Jan van de Velde, *Egmont op de Hoef*

In fact, this drawing is not the only example showing the unreasonable depictions of the scenes in China; similar problems can be discovered in many other drawings in the manuscript. These problems show that although the representation of China in drawings in the manuscript is less embellished than the engravings in the printed book, the drawings are not necessarily more reliable than the engravings; in contrast, due to the close relationship between the drawings and engravings, the fundamental construction problems in the engravings may be attributed to the unreasonable design in the drawings.

In this sense, it is noteworthy to further discuss two issues: how to understand the claim that these images of China are made after life? Under what kind of consideration the draftsman produced these images of China?

The ‘after life’ representation of China

Taking into account what ‘after life’ or ‘realistic’ depiction meant in Nieuwhof’s day and the modern interpretation which has been greatly influenced by the invention of photograph, inevitably there must a large discrepancy with the ideas entertained by people in the seventeenth century.

In the seventeenth-century the Dutch treatise on the art of painting, *Het Schilderboeck* by Karel van Mander’s was published in 1604; in this book, he discusses many important issues including the landscape as a subject for artists. He argues that young artists should go out of the city into the countryside to study and to extract the essence of nature and record it in drawings which will subsequently be translated into paint back to the studio. Moreover, he does not advise artists to represent the landscape just as they see it; the aim of the landscape images is rather to create the illusion of verisimilitude.³³ Namely, two points are addressed here: first, the representation of landscape should be rooted in the study of reality; second, the artist should take care to select the most beautiful aspects of nature.

In respect to the modern review on van Mander’s theory, Freedberg claims that ‘the phrase *naer het leven* implies that the work gives the impression of being lifelike and that natural phenomena are depicted as drawn from life’.³⁴ Partly, his dictum was a result of the invention of photography which appears to be the direct image of the reality. When the nineteenth-century concept of ‘photographic realism’ was reflected on the Dutch painting of the seventeenth century, it was believed that the old masters had portrayed the visible world as if they had seen it through a camera lens.³⁵ As Svetlana Alpers has argued that, in the seventeenth century, the Dutch paintings were considered a replacement of the eyes; the painter supposedly suppressed his personality when depicting nature, thereby allowing for its objective representation.³⁶ Therefore, under this context, the European viewers in the seventeenth century would like to accept the artist to add some imaginary elements or select and compose the elements for a ‘harmonious and natural-looking entity’, as long as the depictions are made on the basis on the direct observation.

The principal audience of the printed book on China would not have been the VOC directors but the general public, who would not have had any chance to go to China, but

³³ Kristina Hartzler Nguyen, *The Made Landscape and Country in Seventeenth-Century Dutch Prints*, Cambridge, 1992, p.9.

³⁴ David Freedberg, *Dutch landscape prints of the seventeenth century*, 1980, London, p.11.

³⁵ On the idea of realism, see Edwin Buijsen, *Tussen fantasie en werkelijkheid :17de eeuwse Hollandse landschapschilderkunst* Den Haag, 1993, pp.45-52.

³⁶ Svetlana Alpers, *The Art of Describing*, 1983, p.40.

were nevertheless full of curiosity about this country of myth and legend and would have hoped to learn about China without leaving home; leafing through this series of naturalistic landscape prints would have been like taking an imaginary walk in that country.³⁷ To satisfy people's curiosity about faraway wonders, it is understandable consequently care will have been taken to enhance the exotic and fanciful nature of this country.

This is exactly what the later Chinoiserie style did. On the basis of Nieuhof's images of China and other sources, Chinoiserie went on to develop more exotic images, mixing various elements to visualize the European idea of what Oriental things were like, or ought to be like.³⁸ When the draftsmen imitated the Chinese style, they were perfectly happy to mix together quite dissimilar ideas derived from quite distinct origins. Of course, mixtures of various Oriental styles which were mingled with Rococo, Baroque, Gothic or any other European styles were felt to be quite acceptable.

Therefore, although Nieuhof indeed brought images of China to Europe, these images visualized the ideology of the mysterious country rather than giving a faithful representation of what China really looked like. In this sense, China would always be an imaginary country, hovering beyond the experiences and surroundings of most Europeans.

The *Otherwise* of the Silk Road: the gap between photographic representation and artistic expression

Afsaneh Ardehali

University of Cincinnati

Historians have used photographs since the mid-nineteenth century as objects of analysis. They collect and document photographic images and categorize facts and figures in order to record, compare, or contrast various historical events. Architects, on the other hand, take photographs to document interesting details, the unique interplay of materials, colors, light, and textures. We aim to capture various spatial qualities or characteristics. Or, engulfed in a deep fascination with an outstanding work of architecture, architects may simply aim to hold on to the joy of their encounter.

This paper explores the difference between the above two divergent approaches in use of photography and based on the works of philosophers Martin Heidegger and Maurice Merleau-Ponty offers the resolution of these divergent viewpoints reach a point of fissure, a gap in space and time, we call the--“otherwise”-- a gap between knowing and not knowing that escapes all categorization. Like the Silk Road itself, a place that is neither East nor West, past or future, the “otherwise” persists in remaining unknown. In this space of the “otherwise,” visual representations offer fragmented narratives providing partial interpretations of this region’s complex layering of diverse histories, unfolding their depth and hidden qualities in contrast to referring to their facts and figures, and countless quantities. The “otherwise” of the Silk Road escapes all categorization, and belongs neither to the knowable nor unknowable, neither to the visible nor invisible. In this space of the “otherwise” all documentation and visual representation collapse into artistic interpretation and “disappear” in “usefulness,” simply melting in the shimmer of experiential unfolding (Heidegger 1971). Here the most critical value of the ancient Silk Road becomes apparent in connecting the labyrinth of languages, cultures, and ethnicities, ultimately merging people and places on the way.

One Silk Road Journey

Wonders of the ancient Silk Road goes back to 4th century BCE. Stretching from East to West from Japan and China all the way to Europe, traversing across India and Persia it spread the Kingdom of Silk halfway across the globe for centuries as its multiple trade routes facilitated exchange of goods among many cultures. The term Silk Road *Seidenstrassen*, however was introduced in 1877 by German geographer Ferdinand von Richthofen, while these days it has gained a new interest due to global economy and politics.

Our trip began in Xian, China, and followed through crisscrossing various branches of the ancient Silk Road in the Central Asia ending in Turkey. Physically, politically, and metaphorically Central Asia has been seen to span across an in-between space between the two poles of the East and the West. We traveled thousands of miles, attended various seminars and conferences in nine universities, and met many scholars from along the way.

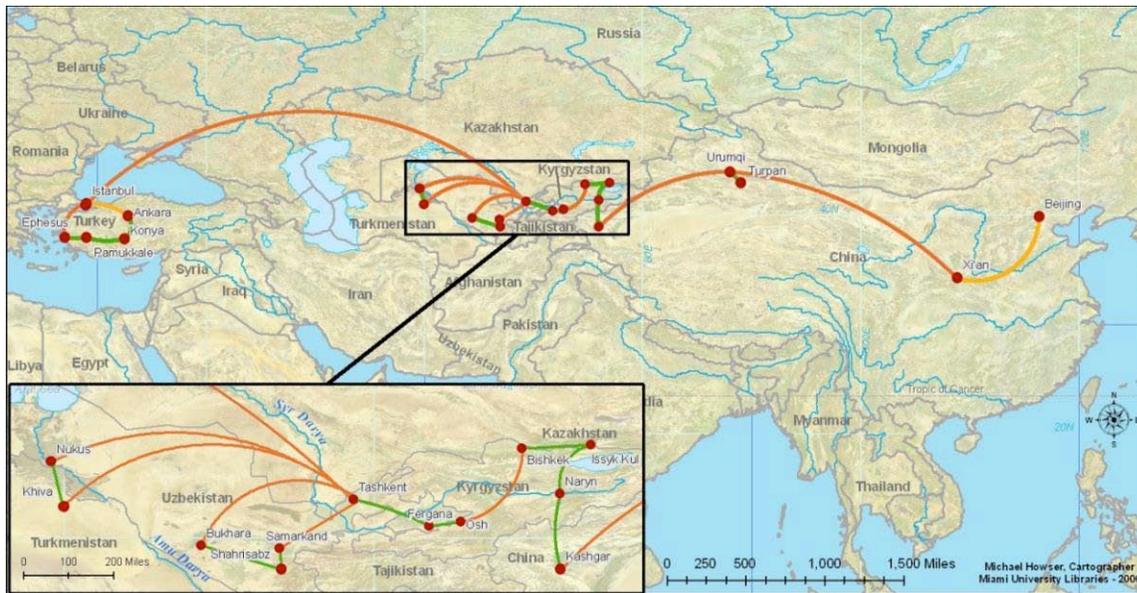

Figure 1: Silk Road Trip Map 2006, Michael Hewser, Cartographer. Reproduced courtesy of Miami University Libraries.

Being originally from Iran, the heart of the ancient Silk Road, I knew that a great expanse of the Silk Road traversed the ancient Persia, hence this trip on one hand held the secrets of a journey into a familiar past; on the other hand, the mysteries of unfamiliar people and places. I was going toward home and at the same time to completely new places. I watched many of my colleagues gather information, record facts and figures and document their finding while I found myself puzzled in the space in-between. As an architect I was acutely aware of the significance of the architectural riches on this journey. Observing diverse architectural forms and spaces, materials and expressions built across time, lands and cultures in this journey, yet for me the key to the unknown was held in the experience itself.

Determined to solve the multidimensional puzzle of the Silk Road, many of my colleagues, aimed to trace the actual routes traversed by Alexander the Great in fourth century BCE, Xuanzang, Buddhist pilgrim in the seventh century, Marco Polo and Ibn Battuta in the fourteenth century planning to record, analyze, and present their treasured findings on their return. Naturally, the vast array of historical and geographical sites, bazaars, and markets enticed all of us. Everywhere we traveled we learned about historical significance of ancient temples, mosques, or shrines we encountered, and met diverse scholars, curious children, friendly adults from all walks of life.

Figure 2. Grandfather with grandson, Northwestern China, May 2006.

In a small village in Northern China with our persistence against our tour guide's resistance, finally the bus stopped and we all rambled through the village, a pleasant place with a tree lined main street and full wide storm canal that made its way through on either side. Delightful cool canopies above the whispering stream, it was a joyous treasure in the burning summer heat, with the sound of water and contrasting shades and shadows. Local children, men and women greeted us kindly, offering us sour plums. Scattered through the village we each had our interactions and photo moments. I met an older man holding his approximately two years old grandson, in his arms. A deep smile through his wrinkled face and rugged teeth fully expressed the joy of his encounter with us. The child in his arms was more apprehensive. His extremely serious face, as thoughtful as seasoned diplomat, was not so trusting as his elder, as though he knew better. . . .

Photographic Encounter

I never enjoyed photography before. Waiting for the perfect moment, searching for the perfect frame, or aiming for the best focus used to frustrate me. The effort of concentrating on the perfect shot would usually succumb to the experience itself. One would assume photography comes naturally to architects, but photography used to make me tense. Until something amazing happened at a ceramic workshop on the way to Tashkent in Kirgizstan. I felt something unique about this particular place and decided not to focus on photography but simply on experiencing the site itself. Something was different for me here. Soon I found myself clicking away without prior contemplation. I was so intrigued by the scene, that for the first time, I felt as though photography was not an added event. My being present and taking the photographs were not two distinct activities-- somehow, they had merged. I knew this was a new beginning Without my conscious attempt, something had "cleared" something had "opened" by way of photography (Heidegger 1971, 145-161). Photography suddenly felt effortless and quite a joy.

Figure 3. The Ceramic Studio, outside Tashkent, Uzbekistan, June 2006.

I was once asked: *“How could you feel entirely immersed in the experience of the ceramics studio, if the camera was always there? The camera is always an “added event.”*

The camera would have been an *added event*, if there were never an *“unfolding.”* The *equipment*, in this case the camera *“disappears in usefulness,”* Heidegger has argued (Heidegger 1962, 224). In fact, *“the more handy a piece of equipment is, the more inconspicuous it remains... The more essentially the work opens itself, the more luminous becomes the uniqueness of the fact that it is rather than is not”* (Heidegger 1962, 65-66). In which, *“the whole existential constitution... get... laid bare”* (Heidegger 1962, 437). This state, Heidegger describes in terms of a certain *‘groundlessness’* (Heidegger 1962, 224). That we can associate with the life of a nomad, in terms of being everywhere yet, belonging nowhere, having an open, ambiguous, indeterminate, and interpretive qualities. It also in a way parallels the character of postmodern art and architecture vis-à-vis film and photography.

The ceramic workshop experience stayed with me. This union of the thought and action, process and product in photography was new to me--- from which many thousands of photos followed. Once this freedom encountered, the act of photography reaches beyond the realm of control. The joy and wonder arise out of allowing of the unexpected to take place. No more, you search for a preconceived idea; no more you allow judgment to shape the perfect frame; no more you regard a scene or subject matter correct or incorrect, not even you attempt for the perfect focus. Within this context, freedom rules, accidents are celebrated, imperfect focus is welcome, and blur is just fine. Strange, odd, or weird offer chances to open the ground for unexpected happenings (Heidegger 2003, 15-44). Now creativity happens freely and simply. Not much effort is required anymore that prevent one from the experience itself. The act of encountering, allowing, and creating happen effortlessly in the free experience. What a joy resides in this freedom from control in photography as well as life itself.

Conflicting approaches

In our travels we saw a broad range of historical sites. From the grand Forbidden City in China to Uygur houses on high mountain tops of Kergizestan, to Samargand and Bokhara two cities I recalled only through the ancient Persian poetic verses, until we arrived at Istanbul, a city on the edge. A city, which physically, historically, culturally, and artistically remains to be considered both of the East and the West. Thousands of ancient stories from these sites have intrigued the imagination of all in the literature of East and West. From the travels of Marco Polo, poems of Xanadu, tales from *The Arabian Nights* thousands of researchers and curious visitors reach to touch reminiscence of their histories or capture a taste of their ancient past, possibly collecting something for the future.

Alan Trachtenberg talks about photographs being unable to capture the "objective" reality, because they are interpretations, versions of reality that in documenting the facts they express "ideas and opinions" (History Matters 2007). This understanding of reality is plausible. It seems to assume that there is a 'fixed' objective reality out there that we can capture, which somehow is missed in a photograph. Today's worldview however would see this kind of thinking to be naïve and suggest there is no single reality out there whether objective or subjective. These days, everything is seen as interpretation and that is the best either we, or our photographs can do.

In my Digital Nomad- Pre-modern Mood/ Post-modern Space, presentation in our trip I talked about Heidegger's definition of 'downward plunge' (Heidegger 1962, 223), Merleau-ponty's 'inversion' (Merleau-Ponty 1968), Rashid Aitmatov's 'mankurt' (Aitmatov 1983). Digital Nomad characterized an attitude, that refers to the pre-Socratic mood--- and the nature of postmodern space, art, architecture, hence photography in which each of the above examples explicate. It is this general mood that also guides our main issue in photography in this discussion. What 'downward plunge', 'inversion,' and the character of the 'mankurt', have in common is a state that Heidegger refers to as, "the whole existential constitution of Dasein has been laid bare" (Heidegger 1962, 226). Merleau-Ponty describes this in terms of "*The reflection finds itself therefore in the strange situation of simultaneously requiring and excluding an inverse movement of constitution... it is to disengage,*" (Merleau-Ponty 1968, 45) and precisely this disengagement characterizes Aitmatov's "mankurt." This state is described in terms of certain "groundlessness" that we associate with the state of affairs of a nomad, on one hand, and today's open, ambiguous, indeterminate, and interpretive nature of postmodern art and architecture vis-à-vis photography. A fixed objective reality out there that we can aim to grasp and hold on to is an outdated illusion of the past.

Historian Tani E. Barlow calls each photograph a historical "catachresis" (Barlow 2006). As she argues that every picture records things but at the same time has been snapped out of context and hints of as many or more things unseen---things that we can sense but not witness. That, which can be used as a witness in a house of court, cannot always bring us to the hidden realities that

reside in the events themselves. Facts and figures only represent what we choose to see in them. On the other hand, both philosophers Heidegger and Merleau-Ponly would suggest it is only in this getting snapped of context that the real *existential constitution* of something can truly get *laid bare*. In other words, when things are “embedded” in their everyday context, their reality always remains hidden (Merleau-Ponly 1968).

One may be tempted to ask: Why Heidegger? Aren’t you aware of his reputation? I would simply respond: Yes, of course I am. However, regardless of the historical, social, or political agendas of the past, when it comes to discussing “*the nature of things*” or “*laying bare*” the “*existential constitution*” of beings, no one has come closer to resonate with what I already know.

Shifting Horizon

Our group was a metaphor for the Silk Road, extending from one discipline to the next, from one religion, ethnicity, and language to another. We included a Chinese historian who grew up in China, fluent in Chinese. Our geographer colleague lived in China and Kyrgyzstan for many years and was well versed in Chinese and Uygur. Among the three political scientists, all fluent in Russian, one also spoke Tajik. A geologist and interior designer, both originally from Turkey, naturally spoke Turkish. Our Italian scholar grew up in Italy, Italian his mother tongue. The classicist on the trip spoke Latin and Greek as well as Arabic. Arabic and Persian were the purview of the Islamist scholar on the trip, while another colleague in Comparative Religion specialized in Buddhism and Hinduism. In this representation of the various ethnicities and languages from across the ancient Silk Road in a sense we personified a contemporary construct, reflecting back to the original Silk Road.

One’s identity, whether classified in terms of language, ethnicity, citizenship, residence, or country of birth, determines the category into which we place them. Which one of these categories takes precedence over the others? Which is more important, more basic, more original, more primal, more governing? Of course, this has been and will be the topic of endless debates, however if we define identity as an essential character or aspect, what is my identity? Who am I? I was born in Iran, live in the United States. I speak Turkish with my mother, Farsi with my husband, and partially Farsi partially English with my daughter. If I knew Russian, I could have spoken Russian with my grandfather. So what am I? Do I have to be one, but not the other? In fact, what do we gain from categorizing me in any of these ways? I am all of these; I am none of . . . and we could even add a dozen more signifiers to this list; each of which would place me into smaller and smaller boxes. Of course, this is the way of science, but I choose to remain indefinable. I see these categories as “idealizations frozen in positivity of language,” (Tarabi 2005) and instead of clarifying, they confuse and blur the issues at hand. Being is not a

“genus,” Martin Heidegger argued in *Being and Time* in 1920’s, to free us from generalization, categorization, and referential-ism (Heidegger 1962, 22).

Before we left on the trip, I thought about the Silk Road in terms of connections beyond the significations of time and borders. My original proposal began: *“As the ‘wandering dervish’, we will wander in search of the unknown. In contrast to the Sufi; however, the course of our destiny will be predetermined by the places of our excursion on the Silk Road trip. What will not be predetermined for us, will be the nature of our encounter and each of our own interpretations. Each faculty member from a different vantage point will search to connect the bygone past, frail present, and unknown future. This proposal has to do with the nature of the connection itself, from past to future, East to West, and the gap in-between.”* However, in search of connections on the Silk Road, I encountered constant agitations. In every city, renowned Persian poets, scientists, and philosophers were claimed by others. My language was carved on ancient monuments, but for guides across the region the meaning that I could read was completely “lost in translation.” For me this became a source of great tension to have to sort out. Eventually, I confronted this in a presentation titled: “Referential-ism on the Silk Road.” as Keyvan Tabari describes this notion in his essay *“Claiming the Luminaries”* in *Luster of the Earth: Journey to Samarkand and Bukhara*. He writes, “Persian poetry, like that of Jami, has always been enjoyed by the Tajiks and all others who could understand it. Indeed, from the 10th century on, Persian was the literary language of not only the Tajiks but also the Turks and Mongols in Central Asia. It was the language of the court in Uzbekistan until Russian domination in the 20th century. The term Uzbek, which originally referred to the Arab invaders, by the 11th century, had come to mean the Islamicized, Persian-speaking people, as contrasted with the Turkic population of this area. Smael Samani was the founder of the Samanid dynasty that ruled in Bukhara for a hundred years. Both the Samanid’s and the luminaries who made that period Iran’s “golden century” were from Persian families and spoke Persian. Rudaki is considered to be “the founding father” of Persian poetry. However, the scientists Farabi and Avicenna [also known as Ibn Sina] and Beruni mostly wrote in Arabic.” Tarabii asks: “how does one resolve the dispute that follows when several nations assert an exclusive right to the legacy of these men?” The only solution may be to describe them as the ““heritage of (all) humanity”, to paraphrase the appellation that Unesco has given to so many monuments around the world and to many in Uzbekistan.” In a sense, this inversion into the essential core of humanity parallels the call away from referential-ism that we have been dealing with so far.

Cocoon Dehiscence: The Otherwise of the Silk Road

Aristotle’s discussion of Plato’s categorization of various modes of knowledge, Heidegger points out in description of *techne*, sometimes something weird happens, and a certain knowing arises by “accident.” This knowing, Aristotle could not explain or categorize, he referred to it simply in terms of the “otherwise” (Heidegger 2003, 5-21).

Figure 4. Afsaneh Ardehali and Mary Frederickson. Exhibit 'Cocoon Dehiscence: the *Otherwise* of the Silk Road.' Cage Gallery, Miami University, November 2006.

In our discussions about the exhibit format, I envisioned the photographs as 4 inch by 4 inch square representations as moments in the air, uncategorized specks of memory that in some way would connect those who walked through the gallery to the multiplicity of events that we had witnessed along the Silk Road within the larger context of its ongoing history. My historian colleague was initially appalled at this idea: "You are suggesting we cut every photo into small squares?" she asked, "that would destroy the original photograph and we would lose what we do know about the provenance of each photograph, where it was taken, when, the subject..." Apparently, historians save every scrap of evidence. She was not easily convinced.

"Yes, exactly," I answered, "isn't every photo only an interpretation, isn't every interpretation an incomplete representation itself? So we will have interpretations of interpretations of interpretations. We can even interpret the scraps. Let's keep them, if you wish, and have those who come to see the exhibit inscribe their own narratives as they negotiate through the opened space of the Silk Road cocoon in the Cage Gallery.

Our exhibit set out to celebrate the open, fluid "embodied" space of the Silk Road (Merleau-Ponty and Lefort 1968). In the long narrow space of the 50-foot long Cage Gallery, countless invisible strands of silk--fishing wire--loosely defined the indeterminate space of a split open fine white cocoon. From the open space of this finely suspended cocoon, expanded unquantifiable strands of the Silk Roads of the past, present, and future. The strands themselves had secondary significance in comparison to the invisible, untouchable space that they embodied. A natural, loosely defined, cocoon-like C opened toward the chain link entry gate, facing the library door across the hallway. Three feet from the back wall of the gallery, a long walk formed outside the open cocoon. This allowed people to walk inside and outside, interacting through the invisible suspended strands, facing each other, looking at square images suspended in the air, from either side. Throughout the weekend until the day of the exhibit opening many students, faculty, and friends were busy in the gallery cutting 8x10 prints into hundreds of four inch by four inch squares that were then suspended loosely back to back held by clips from hundreds of fishing wire strands suspended an inch and a half apart.

In the exhibit, an imaginary metaphoric cocoon split open and countless strands of silk expanded to suspend photographic moments that embodied the space of the Silk Road. As gallery visitors inhabited this ephemeral display of framed memories, they bore witness to our encounters in a place between that was neither East nor West, north or south, past or future. The otherwise could not be grasped and in a strange way it slipped through our fingers and defied categorization. The otherwise defied definition. The otherwise remained silent. But more than a hundred visitors who came to the exhibit spoke eloquently about what they saw unfolding there in the space between.

Understanding the range

Our research into the nature of current photographic experimentations clearly brought us face to face to an expanded range of contemporary photography. On one hand, sharply focused images from highly technical equipment, on the other hand imperfect, soft focused, blurry, and highly interpretive images obtained by “junk cameras.” In the border of these two extremes we found the works of Iranian born photographer and film maker Shirin Neshat, which offered “highly critical, social, political commentaries in gender and women in Islam” through use of extreme control (Neshat 1997).

Figure 5. Shirin Neshat. ‘Women of Allah’ 1997. [Permission pending].

Through her photographs we witness the tragedy in our “flesh” (Merleau-Ponty and Lefort 1968). In Neshat’s exquisitely choreographed images the “mechanical photograph collides with hand painted calligraphy.” This extreme juxtaposition of imagery between fiction--text of the poetry--and reality-- human flesh--instills an explosive response. Neshat’s Women of Allah, in their intense sense of control, contrast sharply with the earlier junk photographers’ blurring of the physical. Within this tension between celebrating the realm of the ‘free’ or sense of liberation, and strict sense of control, Neshat’s strict tangible physical imagery against intangible text, life and death, capture something other, something odd, something, something deeply primal, in other words something of the “otherwise.” Somewhere between the photograph as a “free” experimental artistic expression and a simple tool for recording and analysis, deeply

engaging a global audience, this work crosses the boundaries of time and space, objective and subjective, physical and phenomenal, going beyond the referential, and involving us in the emotional domain of the “otherwise”.

Neshat’s “Speechless” together with the works of 33 other contemporary artists in an exhibit titled: “Without Boundary: Seventeen Ways of Looking,” were displayed in The Museum of Modern Art in New York from February 26 to May 22, 2006. The author Michele Leight writes: *“Great art eludes confinement, compartmentalization - and boundaries. Art, for the most part, does not imitate life. Throughout history visionary artists have enabled us to escape life's obvious and discordant realities so that for a few, fleeting moments it is possible to imagine alternatives. It is these “imaginings” that have always contributed to change - life without visionaries would never reach beyond the conventional and the mundane.... This show does an excellent job of illustrating how art can blast through the clogged arteries of polarized thinking while still holding on to that which is cherished and valuable in any given cultural tradition or history - in this case “Islamic.” In these heavily politicized times, there is nothing remotely rigid in the worldview or the mind set of the artists whose work is exhibited at this show. Instead they demonstrate that the chaos, dislocation and exile initiated by violence, oppression and instability become the legacy of all those who hope for peace and harmony - regardless of religion, heritage or nationality.”* In an odd way, as we saw earlier, “the legacy of all those who hope for peace and harmony,” over and over show up to be “regardless of religion, heritage or nationality,” in other words, their inspiration seems to be drawn from a place of the otherwise that resonates from the “heritage of all humanity.”

Concrete Details of a Silk Road: through the eye of...

Toward the end of our trip, our group went for a boat ride on the Aegean at sunset. The following morning, our final day on the Silk Road, Mary and I rented the same boat for an hour from 6 to 7 am to take photographs of the sunrise at Kusadasi Harbor. For me, this one-hour was unworldly. Clear blue sky, glittering sea under the slowly emerging sun was beyond belief. I took several hundred pictures. My initial composed photography efforts of the beginning of this trip had fast given way to hundreds of point and shoot moments without predetermination, without prior contemplation. For me a new venue in photography had just opened that still continues. This sunrise on the boat held even a greater potential for my colleague-in one hour-careful premeditated documentation of countless treasures of the Silk Road, collected in the dark chamber only to be analyzed in a later date gave way to a new freedom of expression never encountered before.

Figure 6. Afsaneh Ardehali. Exhibit ‘Concrete Details of a Silk Road: through the eye of...’
Cage Gallery, Miami University, February 2007.

In February 2007 many of these images set the scene for “Concrete Details of a silk road: through the eye of...” my solo exhibit at the Cage Gallery at Miami University (Ardehali, 2007). Each image connected close to far, positive to negative, intimate to the infinite. Ordinary thirty-inch hollow core wood doors gently leaned at the gallery wall. Why water? Many people asked, four reasons came to my mind: 1. From hundreds of photographs of people and places, I had probably thousands of water. 2. In the process of selecting photographs, water just kept moving up on the list. 3. It was the shimmer of water that dazzled me. . . it just stayed with me. 4. Any photographs of children, women, buildings, or landscape that I selected, I found myself setting aside. They all pointed to differences in form, structure, skin or hair color leaving out what was real about them. From the beginning, for me the Silk Road had been about connections not separations. My hope was to bring about what is common to all of us, what touches us deep inside. In the end, I was left with water-- only water.

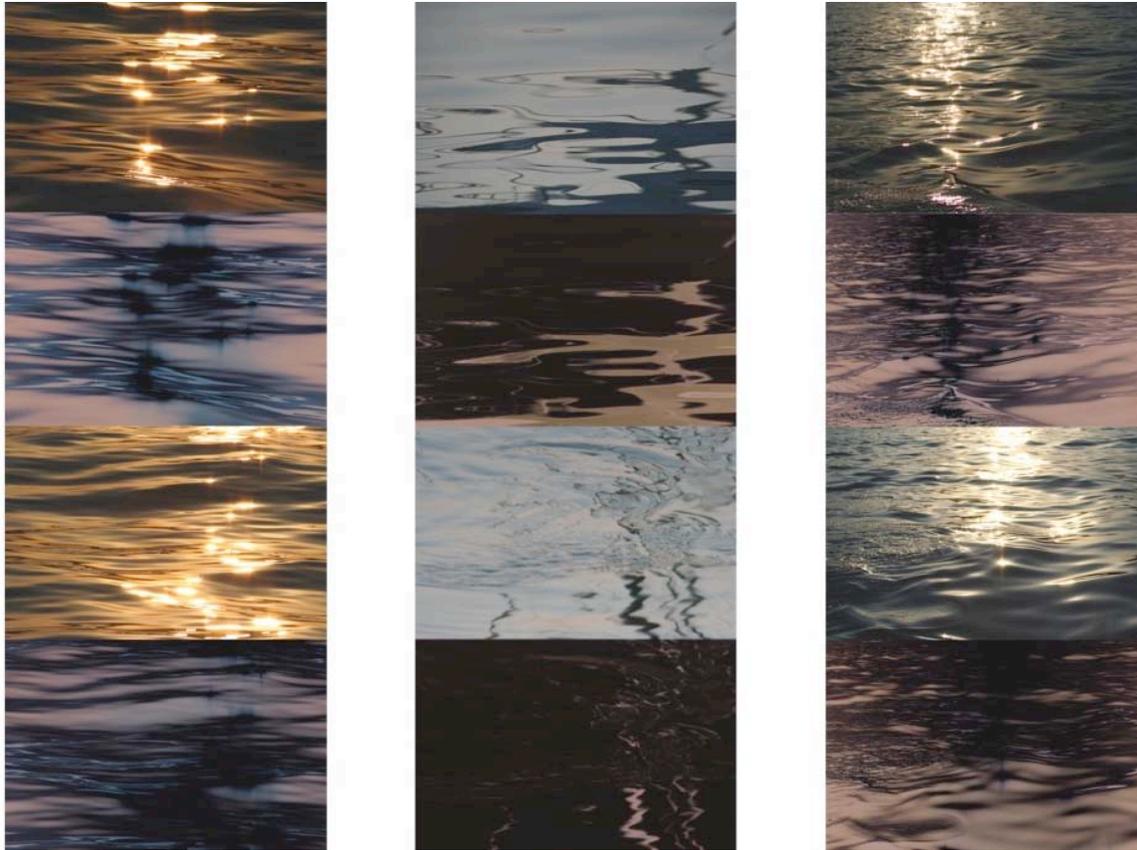

Figure 7. Three boards from ‘Concrete Details of a Silk Road: through the eye of...’ Exhibit. Afsaneh Ardehali. Cage Gallery, Miami University, February 2007.

Yet, the open fluid invisible strands of history, art, and architecture loosely framed our individual experiences and collective discourse at the Cage Gallery as they embodying the unfolding of our visitor’s encounters and ours. The vexing duality to the practice of photography came to a halt when the 8x11 documents were cut into 4x4 artistic expressions in the ‘Cocoon Dehiscence: the *Otherwise* of the Silk Road’ exhibit and the representation of people and places gave way to water in the “Concrete Details of a Silk Road: through the eye of...” photographic installations. The “otherwise” of the Silk Road, however, was left to be encountered through the 4x4 images and the gaps between the silky translucent strands as well as the shimmer of water on gently leaning boards, which James Cameron’s recent film *Avatar*, made visible what was invisible before.

Expanded Horizons New Definitions

Silk Road can be viewed as a Western cultural construction, a metaphor, a myth. Yet, Silk Road can also be discussed in terms of “equipment,” like the camera, which we encountered earlier,

Silk Road can be said to have “disappeared in its usefulness.” In connecting one side to the other, in facilitating the roads of exchange, in carrying on the cultures, languages, arts, music, people and products, the Silk Road itself can be said to belong to the space of the *otherwise*, which merged, *The Visible and the Invisible* (Merleau-Ponty 1968). Yet itself disappeared in “usefulness.” Silk Road disappeared in “usefulness,” as did the camera in the ceramic studio and water on the doors of the ‘Concrete Details of a Silk Road: through the eye of...’ exhibit. As the water below gave way to the luminance of the surface shimmer above, connecting near to far, positive to negative, intimate to the infinite, as well as me and YOU. Today, the ancient Silk Road remains as the luminous shimmer in the roads of dust. This NEW definition of the Silk Road dissolves all the boundaries and connects the inside of each county to out. In fact, as did Merleau-Ponty himself in aiming to redefine the relationship between inside and out, passed away in the process of writing *The Visible and the Invisible* (Merleau-Ponty 1968).

In the redefined space of digital images from the Silk Road, politics, history, art, architecture, vis-à-vis photography become expanded global conversations that transcend the limitations of specific disciplines, ethnicities, nationalities, or time and space. The visible and invisible boundaries between seen and unseen, objective and subjective, physical and emotional give way in the space of the ‘otherwise.’ The mediating silky strands of the in-between constantly negotiate our emotional realities and intellectual discourse through our photographic expressions. The Silk Road is not a distant place and it does not belong to an ancient world that has no connection to our own. The Silk Road expands all horizons and continues here and now in the spaces like the Cage gallery of Miami University. The Silk Road lives; and continues to live, be reinterpreted, and recreated through our conversations and photographs, allowing us to imagine its glorious past, live in its frail present, and explore its countless possibilities in the future.

The term *photography* literally means ‘drawing with light.’ Photography came to itself; when this very act of photography fulfilled its mission bringing to light the “otherwise” of the Silk Road in our experience. In this ‘drawing with light’ the vexing duality of the practice of photography on the Silk Road dissolved itself joining the divergent viewpoints. As we witnessed in this space of the “otherwise” all documentation and visual representation collapse into artistic interpretation and simply melt in the shimmer of the experiential *unfolding*. Hence, the Silk Road itself as any other objectified subject defied signification and by the “odd” way of *photography* continued to remain as “the heritage of all humanity...” (Heidegger 2003).

Studies on Shandong Bronze Decorations in Eastern Zhou Period *

By

Bi Jingwei

(School of History and Culture, Shaanxi Normal University, Xi'an, P. R. China)

ABSTRACT: The study on decorations is one of weak links of Chinese bronze study, particularly in regional bronze decorations. Up to now, there still isn't systematic study on Shandong 山東 bronze decorations. In view of the importance of Shandong bronzes in Chinese bronze culture, and in order to promote the studies in this field, this paper, mainly using archeological and statistical methods, carried out a detailed statistics and systematic analysis on Shandong bronze decorations in Eastern Zhou Period. And got the following findings: The bronze decorations in Shandong, in the early Spring and Autumn Period, followed the late Western Zhou Period, and had a sweeping change at mid-Spring and Autumn Period. Afterwards, the simple and unadorned decoration style was in vogue. The evolutions of bronze decorations in different regions of Shandong were not synchronized. The decorations in Lunan 魯南 evolved fastest, followed by Ludongnan 魯東南 and Lubei 魯北, and then Ludong 魯東. The regional characteristics of bronze decorations varied from slightly to distinctly with time. Compared with shapes and compositions, the bronze decorations in Shandong were more similar to Central Plains 中原. The social motivations that caused above phenomenon, likely were the following two: Firstly, the royal court's emigrant toward east (770.B.c.) led to the centripetal force reducing gradually while the region-based concepts of vassal states enhancing, therefore, the cultural differences gradually increased. Secondly, the corresponding visiting, alliance, marriage, human mobility, commerce and trade among vassal states accelerated the inter-regional exchange and integration, which promoted the multicultural convergence.

I . FOREWORD

Decoration is an important part of bronze, and also one of weak links of bronze study. At present, the studies on bronze decorations mostly concentrated on the individual one, such as Animal Mark 獸面紋¹, Bird 鳥紋², Ragged Curves 竊曲紋³ and so on. While the systematic study on regional decorations, especially on Shandong 山東 bronze decorations does not emerge yet. Therefore, it is necessary to carry out a systematic study on it. This paper will do it basing on the predecessors' achievements on bronze graves in Eastern

Zhou Period.

Since the early Spring and Autumn Period, the radial-type situation of bronze culture was broken, and the circle of regional bronze culture arose⁴. Besides, a larger cultural circle generally could be divided into several smaller ones, which is just as Su Bingqi described: “The regions in Shandong have the feature of conformity, as well as they have their special aspects respectively”⁵. At present, the bronze culture in Shandong in Eastern Zhou Period is usually divided into four regions: Lubei魯北, Lunan魯南, Ludong魯東 and Ludongnan魯東南.⁶ Basing on the four regions and according to the bronze decorations in 80 intact graves in Eastern Zhou Period, we analyze as following.

II .THE BRONZE DECORATIONS IN THE EARLY SPRING AND AUTUMN PERIOD

In the early Spring and Autumn Period, there are 24 intact graves⁷ with bronze vessels in Shandong, and 4 of them in Lubei, 11 in Lunan, 2 in Ludong and 7 in Ludongnan. The decorations were as Table 1 specifically.

In this stage, the undecorated bronzes were very few, and most of them were simple and rough. The Ragged Curves Pattern was dominant, and mainly decorated on the necks or the bodies of all kinds utensils. Regionally, it was most popular in Lunan and Ludongnan, followed by Lubei, and then in Ludong. The Double-ring Pattern重環紋 was also very popular, and mainly was seen on the necks, cover's edge, ring foot and handles of Ding鼎, Gui簋, Hu壺 and Pan盤. And it could be seen everywhere, especially in Ludongnan. The Bow-string Pattern弦紋 was fairly popular too, but it was only decorated on the abdomen of Ding. The Tile Pattern瓦楞紋 was usually seen on the abdomen of Gui, Yi匱 and Xu盥, and was mainly found in Lunan, for most of them in this phase were found there. The Fish Scale Pattern垂鱗紋 was mainly found on the ring foot of vessels in Lunan and Lubei, and occasionally on the necks of Hu. The Elephant's head Pattern was mainly seen on the abdomen of Li鬲 and Fu簋 in Lubei, Ludongnan and Lunan. The Wave Pattern波曲紋 was as few as Elephant's head Pattern象首紋, and mainly found on the abdomen of Fu, Hu and Yan甗, as well as on the shank of Pu鋪 in Lunan and Ludongnan. The Cloud and Thunder Pattern雲雷紋 was not popular yet, and mainly found on the abdomen of Hu, as well as on the neck of Ding in some places of Lunan. The others patterns such as Curly Cloud Pattern卷雲紋, Dot Pattern圓點紋, Animal Mark Pattern, Triangle Pattern三角紋, Dragon Pattern龍紋 and Nipple Pattern乳丁紋 were fewer found on bronzes. They were occasionally found on some bronzes.

Regionally, in this phase, the dominant pattern in Lunan was Ragged Curves Pattern, which could be seen on 50% bronzes of Lunan, and was followed by Double-ring Pattern, Kui-long Pattern夔龍紋, Tile Pattern, Fish Scale Pattern, Bow-string Pattern and so on in proper order. While the popular patterns in Lubei were Ragged Curves and Double-ring Pattern, and followed by Bow-string Pattern, Elephant's head Pattern, Kui-long Pattern and Fish Scale Pattern. However, the types of patterns in Ludong were few, but the

⁷ Because this article involved so many graves that it is difficult to note one by one here, please see Bi Jingwei畢經緯, “Studies on Unearthed Bronze Vessels in Shandong Province,” pp. 161-164.

undecorated bronzes were more relatively, and there were not dominant pattern in this region. Ragged Curves was also the dominant pattern in Ludongnan, and even more popular than any other regions, and followed by Double-ring Pattern, Bow-string Pattern, Cloud and Thunder Pattern and so on.

Overall, on the one hand, the frequencies of patterns in four regions were slightly different, the several popular decorations like Ragged Curves Pattern, Double-ring Pattern, Bow-string Pattern, Fish Scale Pattern etc. were all very popular in four regions. On the other hand, there were specifically differences in the patterns' frequencies and the types of patterns between them.

III. THE BRONZE DECORATIONS IN THE MID-SPRING AND AUTUMN PERIOD

In the mid-Spring and Autumn Period, there are totally 13 intact graves with bronze vessels in Shandong, and 7 of them in Lunan, 5 in Lunan and 1 in Ludongnan. The decorations were as Table 2 specifically.

Table 2: The Bronze Decorations in the Mid-Spring and Autumn Period

Annotation: IH = Interlaced Hydra Pattern; Cord = Cord pattern; S = S-shaped Pattern;

Xue State = Capital City Tengzhou of State of Xue; Penglai X. = Penglai Xinwangji Village; Yishui L. =

Yishui Liujiadianzi Village.

Compared with the previous phase, the decorations in this period had changed obviously. The popular traditional patterns in previous phases such as Ragged Curves, Double-ring Pattern, Bow-string Pattern etc. decreased sharply as Interlaced Hydra Pattern 蟠螭紋 emerged. The Interlaced Hydra Pattern was immediately popular in the period, and the proportion of undecorated bronzes declined, the reason of which likely is that the only grave in this region was a high-grade one, with numerous well decorated bronzes.

Interlaced Hydra Pattern was absolutely the dominant one in this stage, and usually was found on the cover's edge and abdomen of Ding, Li, Gui and Fu in the Capital city Tengzhou of State of Xue 滕州薛國故城 and Yishui Liujiadianzi 沂水劉家店子. The Bow-string Pattern stood the second place in this period, and still was only decorated on the abdomen of Ding. The Fish Scale Pattern was mainly seen on the ring foot of vessels in the Capital City Tengzhou of State of Xue and Yishui Liujiadianzi. The Tile Pattern was mostly found in the Capital city Tengzhou of State of Xue. The Dot Pattern and Animal Mark Pattern were more than previous phase, owing to numerous Ding decorated with Dot Pattern and Animal Mark Pattern in Yishui Liujiadianzi M1. The Dot Pattern was mainly found on the necks, cover's edge of Ding and on the abdomen of Fu. The Animal Mark Pattern was only found on the upper leg. While the other patterns such as Kui-long Pattern, Double-ring Pattern, Curly Cloud Pattern, Fish Scale Pattern, Wave Pattern and Dot Pattern were much fewer than before. The Cord Pattern 繩紋, S-shaped Pattern, Triangle Pattern etc. were occasionally found on some bronze vessels somewhere.

Regionally, in this phase, the dominant pattern in Lunan was Interlaced Hydra Pattern, which could be seen on 65% bronze vessels of Lunan, and was followed by Bow-string Pattern, Tile Pattern, Fish Scale Pattern, Ragged curves, Double-ring Pattern, Kui-long Pattern, and so on in proper order. While the undecorated bronze vessels were dominant in Ludong, and there were only three kinds of patterns such as Bow-string Pattern, Kui-long Pattern and Triangle pattern. The Interlaced Hydra Pattern was the dominant one in Yishui Liujiadianzi, and even more popular than in Lunan. The Animal Mark Pattern, Nipple Pattern and Kui-long Pattern were also fairly popular; however, the Triangle pattern and Fish Scale Pattern etc. could be seen only on some vessels.

Because the intact graves in this time are few, and different in size, therefore, the significance of statistics about regional patterns is fewer relatively. Nonetheless, there are still two conclusions can be drawn: Firstly, the decorations in this period had changed obviously, the dominant traditional patterns such as Ragged curves, Double-ring Pattern, etc. decreased sharply. Secondly, the decorations' regional characteristics began to increase; the differences between regions were bigger than before. This was synchronous with the evolution of bronzes' shape and combination.

IV. THE BRONZE DECORATIONS IN THE LATE SPRING AND AUTUMN PERIOD

There are 19 intact graves in the late Spring and Autumn Period, 4 of which in Lunan, 9 in Lubei and 3 in Ludong and Ludongnan. The decorations were as Table 3 specifically.

The most prominent change in the period was that the proportion of undecorated bronzes increased sharply. The Interlaced Hydra Pattern kept the highest frequency, but had fallen significantly contrast to previous phase, and its mainly endemic region was still Ludongnan. The Coiled Serpent Pattern 蟠虺紋 emerged in the period, and its frequency was almost as high as Interlaced Hydra Pattern, it appeared on the abdomen of all kinds of bronzes mainly in Ludongnan and Changqing Xianrentai 長清仙人臺. The Bow-string

Pattern was stable in this period and still as the only decoration on the abdomen of Ding. The Animal Mark Pattern was still only found on the upper leg of Ding in Ludongnan as before. The other decorations were found few, so it is not necessary to list them here.

Annotation: CS = Coiled Serpent Pattern; C = Cloud Pattern;

Xintai G. = Xintai Guojiaquan Village; Yanggu J. = Yanggu Jingyanggang Village; Zichuan C. M(4) = 4 graves in Zichuan Cicun Village; Zouping D. M(3) = 3 graves in Zouping Dasheng Village; Linqu Y. = Linqu Yangshan Village; Haiyang Z. = Haiyang Zuiziqian Village; Qixia X. = Qixia Xingjiazhuang Village; Juxian T. = Juxian Tianjingwang Village; Junan D. = Junan Dadian Village; Linyi F. = Linyi Fenghuangling Village.

Regionally, the undecorated bronze vessels were most prevalent in Lunan, and there were only four kinds of decorations found, of which the frequency of Coiled Serpent Pattern was highest. The region of Lubei and Ludong were generally the case, the undecorated bronzes also played an important role, but the decorations were more abundant than Lubei, and the frequency of them was not high. Ludongnan was obviously different from the other three regions; the undecorated bronze vessels were much fewer, for the three graves in this area were all high-grade ones with numerous well decorated bronzes. In this region, the Interlaced Hydra Pattern was most popular, and followed by

Coiled Serpent Pattern and some traditional patterns such as Bow-string Pattern and Animal Mark Pattern.

As can be seen, the bronze decorations in this period had the following features: Firstly, the proportion of undecorated bronzes increased significantly, and the simple style began to rise. Secondly, the traditional decorations such as Ragged Curves Pattern, Double-ring Pattern, Kui-long Pattern, Tile Pattern, Fish Scale Pattern etc. dominant in the early Spring and Autumn Period, almost disappeared. Thirdly, the Coiled Serpent Pattern was as popular as the Interlaced Hydra Pattern. Evidently, the change of style of decorations, started in the mid-Spring and Autumn Period, basically completed in this period. As a result, some of decorations turned petty and trial, while some turned simple and realistic.

V .THE BRONZE DECORATIONS IN THE EARLY WARRING STATES PERIOD

In the early Warring States period, there are only 9 intact graves, and 5 of which in Lunan, 2 in Lubei and Ludong. The decorations were as Table 4 specifically.

Table 4: The bronze Decorations in the Early Warring States Period

Region	Burial No.	NO B	Pattern											
			U	BS	RS	V	K	IH	CS	GF	H	C	Dot

Tengzhou Z.= Tengzhou Zhuanglixi Village; Jinan Z.= Jinan Zuojiawa Village; Laiwu D.= Laiwu Daiyuchi Village; Changdao W.= Changdao Wanggou Village.

Because the intact graves in this period are very few, the significance of statistics about decorations is fewer relatively. Judging from the available decorations in Table 4, the proportion of undecorated bronzes got a further increase, there were over half of them were undecorated. The simple style was dominant. As a result, the types and quantities of decorations further decreased. The traditional patterns such as Double-ring Pattern, Ragged Curves Pattern, and Fish Scale Pattern etc. disappeared thoroughly in this phase. The Coiled Serpent Pattern and Interlaced Hydra Pattern, dominant in the previous period, declined significantly. While the realistic patterns such as Gilt-fish Pattern 鑲金魚紋, Hunting Scene Pattern 狩獵紋, Combat Scene Pattern 戰爭紋 rose with the undecorated

and simple style. Nonetheless, some well decorated bronzes were unearthed occasionally in high-grade graves like Tengzhou Zhuanglixi 滕州莊裏西90M8. The realistic patterns, especially the Hunting Scene Pattern and Combat Scene Pattern were extremely important innovations just like a milestone in the history of bronze decoration. The regional characteristics of decorations, prevalent in the late Spring and Autumn Period, greatly declined in this phase, and showed much convergent.

VI. THE BRONZE DECORATIONS IN THE MEDIUM AND LATE WARRING STATES PERIOD

There are 11 intact graves in the mid-Warring States Period, 2 of which in Lunan, 5 in Lubei and 4 Ludong. While there are only 4 intact graves in the late Warring States Period, 1 of which in Lunan and 3 in Lubei. The bronze decorations were as Table 5 specifically.

Table 5: The Decorations in the Medium and Late Warring States Period

Period	Region	Burial No.	NOB	Pattern															
				U	BS	Ti le	K	Fi	C	P	Sna ke	D	CI

Lubei		Pingdu D.M14	1	1															
		Jinan Q.M	6	4	2														
		Zhucheng G.M	5	3	2														
		Sum	12	8	4														
		Frequency (%)		67	33														
Sum			19	12	7														
Frequency (%)			63	34															

Annotation: P = Portrait Pattern 人物畫像紋; Snake = Snake Pattern 蛇紋; CI = Copper-inlaid Pattern 錯紅銅紋.

Pingdu D. = Pingdu Dongyueshi Village; Zhangqiu N. = Zhangqiu Nvlangshan Village; Changqing G. =

Changqing Gangxi Village; Yangxin X. = Yangxin Xibeicun Village; Zhucheng Z. = Zhucheng Zhangjiazhuang Village; Yantai J. = Yantai Jinzhagou Village; Jinan Q. = Jinan Qianfoshan Village; Zhucheng G. = Zhucheng Gebukou Village.

The intact graves in this period are very few. From the available decorations in Table 5, we can see the simple style won a further development on the basis of early stage; the undecorated bronzes play a dominant role. The proportion of undecorated and decorated only with Bow-string Pattern bronzes stood 80% of all the bronzes. Correspondingly, the types and quantities of decorations became fewer again than before.

In the late Warring States, the intact graves were even fewer than the previous stage. Judging from the 4 graves in Table 5, the simple and unadorned style of decorations developed to the extreme and the proportion of undecorated and decorated only with Bow-string Pattern bronzes reached 100%. Therefore, the bronze decorations in Shandong basically achieved a situation with wide range unity.

VII. CONCLUSION

Firstly, the evolutions of Shandong bronze decorations during Eastern Zhou Period were nearly as same as Central Plains. The decorations in the early Spring and Autumn Period had not significant difference with the late Western Zhou Period. The mid-Spring and Autumn Period was the time when Shandong bronze decorations changed drastically and a large number of new decorations emerged and rose soon. At the same time, the regional characteristics of decorations were distinct. Up to the late Spring and Autumn Period, the decorations achieved unity for the third time⁸, on the one hand, they turned simple and realistic, on the other hand, they turned petty and trial. This reflected the ancients' self-consciousness awaking from primitive religion. During the Warring States Period, the simple style of decorations got a further development, and the types and quantities of decorations became fewer day by day. As a result, the regional differences fade away, and formed unity for the fourth time. In contrast with the shapes and combinations⁹, the bronze decorations in Shandong had more consistency with Central Plains.

Secondly, the evolution rates of decorations in 4 regions were different. The decorations in Lunan evolved fastest, followed by Ludongnan and Lubei, and Ludong was most lagged. This was manifested in two aspects: On the first place, the decorations updated in Lunan most rapidly, followed by Ludongnan and Lubei and then Ludong. On the second place, from Table 3, Table 4 and Table 5, we can see the rate of evolution from well decorated style to undecorated or simple style in Lunan was fastest, followed by Lubei, and then Ludong. There were only three graves found in Ludongnan, and they all were high-grade ones in the late Spring and Autumn Period, so the rate of evolution of bronze decorations in Ludongnan was not clear yet.

Thirdly, the regional difference and convergence of decorations in Shandong changed with time. In the early Spring and Autumn Period, the regional difference of decorations was slight, but it became evident increasingly in mid-Spring and Autumn. By the late Spring and Autumn, it began to turn slight again. Therefore, the convergence was dominant in the mid-Warring States, and the regional differences basically fade away in the late Warring States Period. The social motivations that caused above phenomenon

⁸ The first time happened in the late Shang Dynasty, while the second time was in the late Western Zhou Period.

⁹ Bi Jingwei 畢經緯, "Studies on Uneathed Bronze Vessels in Shandong Province" The master thesis of Shaanxi Normal University (2009), pp. 49-99.

probably lied in the following points: Firstly, the royal court's emigrant toward east (770.B.c.) led to the centripetal force declining gradually while the region-based concepts of vassal states enhancing markedly, therefore, the cultural differences gradually increased. Secondly, the mutual visit, alliance, marriage, commerce and trade among vassal states accelerated the inter-regional exchange and integration. Especially, in the mid-Warring States Period, the State of Qi basically dominated Shandong area. The political unity broke the old divide between countries, and facilitated the exchange and integration of material and culture inter-regionally. As a result, by the late Warring States Period, the decorations in Shandong showed a feature of multicultural convergence.

Virtual-Reality Hybrid, Urban Space Idea of Future Asian Cities

Huang, Sheng-Yang

Graduate Institute of Architecture (postgraduate student)

National Chiao Tung University, Taiwan

Abstract

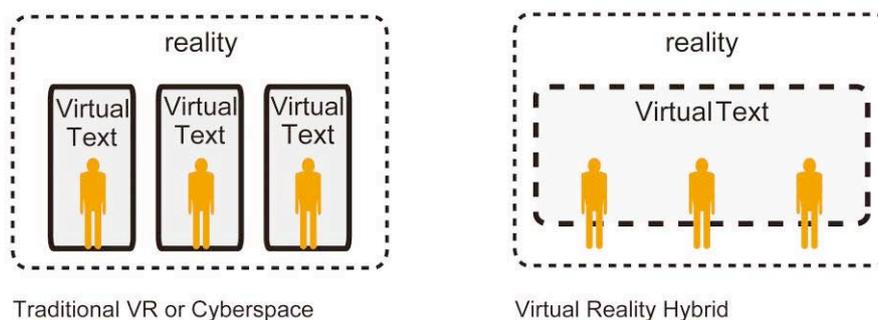

For discriminating Virtual Reality, Virtual-Reality Hybrid concept emphasized its character that Visual and Reality co-existed condition, this sort of spaces would not to be completely replaced by Visual Space because that user could switch the space backward to parallel reality with the body at any moment, dualism of scale and environmental perception. Information is taken as urban skin in Asian cities, Virtual -Reality Hybrid as architecture and urban design issue makes space hierarchy more synchronic, and it also would be interesting dialogue with western cities with diachronic appearance.

Keyword

Virtual -Reality Hybrid, Asian cities, urban space, lifestyle, message

Introduction

Virtual space intervene in the Environment can be divided into two kinds of attitudes do, one closed, such as VR or individual terminals, so that one is Virtual -Reality Hybrid open to the environment.

Virtual -Reality Hybrid is built on an artificial mechanism, the message interface, to visual technology, this interface provide limited virtual effects, and with the real text of coexistence of the living environment beyond virtual text. Therefore, the dual phenomena of the environment makes the body and essence connect virtual text and real text by synchronic way, to generate

an open channel that consciousness can back and forth free , and Feedback through the acts of environmental factors to the virtual text. By this interaction to the virtual text into an extension of reality, therefore, we can distinguish between it and the condition that virtual text and real text is the fracture in typical VR space.

Although the Internet and virtual technologies to overcome problems of distance and provide unprecedented efficiency and convenience, but the traditional space has remained as ever, it relies on is not only the spirit of the content, but also subject and interpersonal, experience of the state that reaction between environmental substances. According to description from "Message X Interface", lightness, real-time phenomenon, dialogue are three kinds of functions for digital messages revealed in the architecture. Such state virtual and reality interwoven for the information to spread on the surface of the Asian city has some design guidelines.

Virtual Temple

http://maj.family.nrt.tw/beatutide_hm/index_hm

However, the human dimension of virtual space technology is a very important issue, compared to distributed applications, We need to develop big attitude within environment context and live a more honest look at our place. Space technology applications in the virtual is still in global - in places over the occasion, we also expect through the view of spatial aesthetics, media, urban architecture of the integrated view of learning and to explore further the Asia Visual-Reality Hybrid concept the possibility of urban spatial development.

Framework and Viewpoint

Observe and find out urban scene which has potential of Virtual -Reality Hybrid as an example, then analysis their opportunity by comparative characteristics of the Asian community in these scenes.

Comparative characteristics including Asians pay more attention to interpersonal behavior patterns and lifestyle produced for maintaining social structure than westerners, and synchronic Urban texture generated by urban aesthetics, the discussion about include:

1. Through reading, based on Mcluhan's media theory to analysis media character in the urban space, to help define the virtual media in the oriental metropolitan environment

2 .Taking form of artificial environment respond lifestyle as a premise, then to think about the relationship between sense of place and urban form shows urban space face to the human conditions.

3. Buildings define two main environment condition of city life - outside / inside, therefore two examples are required, one outdoor scene, and one indoor scene for observation.

Result of Study

Nightscape and Façade

Among the world's three best nightscape, there are two in Asia - Hong Kong's Victoria Harbour and Hakodate. Appearance of the city are covered by messages, advertising billboard lights at night instead of building façade showing a different city scene with the daytime, building surface by the change that light-on from the light-through made to the information from being strengthened. People read the urban space that different from original state through the atmosphere of messages surrounding. Facade of the building by the superposition of the soft interface is liberated from architects will, then it extended to the open space, directly, meaning multiple to expand the city t, and does not avoid conflict between information at all.

Nightscape in Tokyo

Today, Messages flow all over the city rapidly; many occasional states become the norm in the city. Synchronic city makes people hold various identifications in the same space-time, in order to look for identity in various respects. Commercial vitality support the urban development does not only led to an efficient flow of the city, but also brings a variety of aesthetics to create virtual texts as group symbolic icons, and collage on urban surface.

Everyone has their own city images and experience, the experience is composed of physical cities –real texts and message perception - virtual texts, people experience physical spaces and establish contact with ethnic groups through such dynamic, sensitive and visible hierarchy. Immediately, follows collection of the changing texts to self-adjust. Instantly, re-constructed for the customized urban cognitive map constantly.

Black Model, Shi-Chieh Lu, MOCA Taipei

Internet café

Asia's Internet café is different from westerns. Western Internet café as a non-distance node is for the exchange of information between individual units. In Asia (especially far Eastern), Internet café in the late 20th century with the rise of online entertainment related. In this mode oriental society emphasis on collective is able to maintain accessible body in the virtual text, and additional communication outside of the visual text. Real conditions such as social status of participants and behavior patterns will affect the virtual process with the actual interaction.

In this way, an reactive and open state, human consciousness to the back and forth in a number of parallel space-time (including the real environment and virtual environment), virtual environment not only for the "extension of the will", and regardless of the number of visual texts, they begin to realize because of the impact from real environment, but also become "an extension of reality." Thus reality and will be integrated by the state of

A scene in Asian net café

this sort of space, and the virtual become visible from invisible in order to open to real environment as a platform for interactive activity. Empathy, communication opportunities and communication media by way of non-direct involvement in the crowd and around them makes the maintenance of interpersonal structure and entertained more diverse, increasing the hierarchy of urban space in order to fit the complexity of urban life in digital age.

Conclusion and Possibility

We find lightness, real-time, and communication in the observation, they are also the feature of Virtual -Reality Hybrid, the virtual context as a new materials of new generation urban space must be based on the actual relationship between people and place to decide between visual-reality combination state, form new pattern languages, strengthening the identity of the city. This sort of space is able to respond to speed and synchronicity of future lifestyle, to anchor existence of cultural root from dematerialization then we don't suffer nihilism.

Visual-Reality Hybrid is not only a space type, but also itself can be a design tool of method. Mind through the virtual media becomes visible, and also transform to a part of the body, to experience the environment with body, to involve in the environment, to change the environment. Therefore, design method can be re-established to fix the relationship between body and design process which was broken by the dematerialization of digital ages. It is a design system round-trip between the digital and analog, given the current media in the scale and design of user interface constraints on , Visual-Reality Hybrid concept has the ability to

liberate design activity back to the real building scale (by user perception), Body response to gravity and material loads, body controlling forming, and sensory experience of construct within review all will help spatial design and construction organized better and closer, such like medieval master craftsmen to design in the construction site.

But unlike then, we will never limited by body physical condition, time for production and cost constraints, the system maintained with CAM and other CAD platforms - the advantages of integration, and has opened a virtual space in the external environment, making the design discussion and business communication much more efficient.

An image of the design system: Application of Virtual Reality Hybrid

Title: Differences in Concepts of Friendship between Chinese and Japanese University
Students

Author: Naoko Oka

Affiliation: Kuno Intercultural Consulting Office

The research on concepts of friendship among Chinese people and concepts of friendship among Japanese people has not been examined well enough, although research on concepts of friendship among people of the United States has been done to the certain degree. Moreover, research has not been carried out on how cultural differences in friendship influence the development of friendship across cultures. The approach of the research was conducted to find out what influences cultural differences has on the formation of friendships between Chinese college students who have encountered a new culture, Japanese and formed friendships with Japanese students, who from the host culture. In this paper, two different formations of friendships by Chinese college students and by Japanese college students will be compared. This observational empirical study may help us to generate a first step toward some theory of intercultural communication in terms of cultural variability in the concepts of friendship between members of Chinese culture and Japanese culture.

This research will provide the findings of the interview research conducted to reveal concepts of friendship among Chinese college students who study in Japanese Universities, and concepts of friendship among Japanese college students who study in Japan. It reveals the different perceptions of friendship and different ideas of friendly behavior of two cultures among college students. In addition, it focuses on the differences of cultural points of views and the gap between the points of differences of two cultures in terms of friendship. In the first part, this paper clarifies the contents of ongoing research related to this area of research and some key points regarding the idea of friendship. In the second part of this paper, concepts of friendships of Chinese college students living in Japan and Japanese college students living in Japan, naturally highlight differences of cultural concepts of friendships between Chinese college students and Japanese college students through interviews will be explained in detail. In the third section, the limitation of this research in terms of cultural differences of the two cultures regarding the points of friendship will be discussed and proposal for future research in this field will be presented.

Before discussing the main themes, the research method will be explained here. In this research, in order to analyze the concepts of friendship which is the notion that a human being has in daily life and the college students conceptualize these concepts into their

awareness by encountering other people, the interview method was chosen as a research method and the whole notion was examined by looking at the data gathered through the interview research. The interviews were conducted with 30 Chinese college students studying in Japan and 30 Japanese college students living in Japan. The lengths of the interviews lasted from two to four hours for each interview. Also, in order to eliminate the researcher's bias, the findings from the data collected in the interviews was checked by one Chinese resident who had been living in Japan since her college life for 15 years, a Taiwanese student who studied in China and Japan, a Chinese Indonesian student who studied in Indonesia, China and Japan, and a Hong Kong student who studied in China and Japan. The varieties of the age range of interviewees were from 20 to 29 years old. Of the 30 Chinese subjects, five were from Shanghai City, five from Fujian Province, five were from Liaoning Province, and one interviewee was from each of the following districts and provinces: Zhekou Province, Nei-Menggu district, Guangdong Province, Gyuangxi Province, Henan Province, Jilin Province, Shandong Province, Xinjiaing district, Shanxi Province, Guizhou Province, Guangxi Province, Fujian Province, Heilongjiang Province, Zhejiang Province, Hunan Province. The universities the Chinese students attended were Osaka University, Kyoto University, Ryutsu Kagaku University, Hyogo Prefecture University, Kobe University of Foreign Studies, Doshisha University, Kansai University, Kobe university, and Kansei Gakuin University. In the interviews, the Japanese language was used. All of the Chinese interviewees had acquired level 1 of the Japanese language prophecy test, and had been living more than

8 months and had adjusted to Japanese home culture and college life well. Interviews were recorded with the interviewees' consent and transcribed. Afterwards, they were analyzed using the KJ method (Kawakita, 1970). In the interviews, the interviewees are questioned about their concepts of their idea of their closest friend and experiences with their closest friend in their entire life, and comments on the cultural difference of aspects they found in terms of friendship between Chinese and Japanese people. The sampling in this research is limited, and thus, the theory found through this research should be validated with research using a larger population. In a survey done by the Japan Student Services Organization in 2005, the population of Chinese college students living in Japan was 80,592 (Himeta, 2005). This interview research was conducted from 2000 to 2003. However, this research is useful from the point of view of cultural differences of friendship among Chinese and Japanese since such a category of cultural differences has not been revealed in past studies.

First of all, according to the past researches, there are three features of friendship.

One is the expected role as friend. The second one is rules which are formulated through communication between friends. And the third is dynamics in friendships which are constructed by interactions between two people, which develop step by step through the concept of ontological recognition.

The role as friend is varied and differs depending on ethnicity, age, generation, gender, and individual personality. Cultural groups and language groups each have unique concepts oriented to their own group (Cargile, 1998, Collier, 1996). Fahrlander (1980) mentions that friendship is different from culture to culture in terms of its extent, obligation, duration and mutual trust. Interview research of Japanese residents in the United States conducted by Cargile (1998) found the Japanese concept of friend has many notions and varieties and has a very complex of the concept of its role. Individualists Society which is North American and Germany has the differences when they are compared in the point of friendship (Gareis, 1995, 2000).

The rules between friends are different from culture to culture, and age and social background. Research conducted on Japanese college students in Australia revealed differences, and interview research done in Japan on foreign college students in Japan shows such differences (Kudo, 2003). When adults and children were compared, there were differences depending on ages in which adults valued the inner aspects more than children in relationships with friends (Wada, 1996). Also differences of individuals based on each of their characteristics, the relationships between friends and their rules were different and varied since they were defined based on subjective views.

Dynamics of friendship are constructed by each interaction by two individuals while playing the role of a friend to his/her friend. The conditions of formations of friendships consist of respect and understanding the identities of himself/herself and his/her partner as a friend and collective of symbols, and appropriate communication behaviors (Colliers, 1998). Friendship is considered as a dynamic relationship with a large subjective component, such as a little agreement that has been made as its definition of friends (Callan et al., 1991) Moreover, Laursen & Collins (1994) mention that friendship is classified as an open relationship that starts spontaneously, is fluctuating, and easily changeable. Therefore, the standing point of this paper is based on these principles, that each friendship is constructed through interaction and communication behavior between two persons, change, developed, and constructed and the roles and rules between friends are varied depending on culture, ethnicity and social status aspects.

Role expectation in friendship in Chinese college students is very different from Japanese students'. Hanazawa (2008) mentions that "*Gamen*" means a very close friend in Chinese, which formulates the "*quanxi*", or human relationship, in Chinese society. The human relationship in Chinese Society works as a strong network. Among the *quanxi*, two people have to do favors for each other, which is the main expected role in relationships in China. This system of helping each other is not limited to reciprocal physical and, spiritual aspects, but also it includes substantial and material

things. Moreover the continuity of this reciprocal status has to be maintained in order to maintain the relationship. These reciprocal behaviors are called “*huipao*” or, reciprocal returns, and can not be put aside (Hanazawa, 2008).

In this research, it was found that the closest friend for Chinese College students interviewed was considered to be the person who help him/her most after his/her parents. They expect to be helped by the closest friend if their parents can not help them. In the case of one man, he identified his closest friend as “*Gemen*” (Hanazawa, 2008) and in the case of a woman, is the closest friend was “*Jiemen*”. They explained the existence of the friend as similar to a brother or a sister and they consider the close friend to be the same as a real brother or sister. In the data of the interviews, often times participants found the closest friend from their childhood in their neighborhood, since the Chinese government’s one-child regulation meant that most has no siblings and the closest friend was from their childhoods in their neighborhood who came to be considered like a real brother or sister. By the time the interview was conducted, most of those closest friends were the ones who had the more than 10 year or 15 year long relationships as closest friends. They are expected to help each other, are called, “*huipao*” (Hanazawa, 2008) and also are expected to disclose everything each other fully. No spiritual boundary or distance can be seen between these two closest friends. They can talk about whatever they feel and think, and they are expected to disclose whatever they feel and think honestly. If one friend is in trouble, he or she will

disclose the seriousness of the situation to the other and the other will help the one in trouble by making strong efforts through any means. They help in all manners of spiritual things and material means. As a result, much money is borrowed from one another between closest friends, and the one who lends it does not expect to collect it, since helping the closest friend is the most important thing, and it is the most important role as the closest friend according to the data collected. The one who borrowed money or material things keeps is expected to continue remembering it forever and try to return it someday when the chance becomes available. This reciprocal helping behavior is unlimited and unconditioned as an expectation. Mutual benefits done reciprocally on endless terms is the key factor in order to maintain the friendship in the case of the Chinese students, and the reciprocal behavior does not limit affective support, but also in material ways and in actual actions to help the closest friend (Hanazawa, 2003). As a concrete example from the interviews, some interviewees responded that they lent from about 50,000 yen to 100,000 yen to their closest friend in Japan because some of them were facing financial problems in Japan as university students. Also paying for meals for eating out is a reciprocal Chinese way, which is conducted in Japan, too, between Chinese friends. Among Chinese customs, when eating out together, one pays all the bill one time and the next time the other person will pay the bill. As an example, the interviewee said that when a closest friend visited Japan from China, the one living in Japan paid for accommodation and meals for his/her closest friend coming from China. In a reciprocal way, when he/she visited China

from Japan, the friend living in China paid the accommodation and food for his/her friend coming from Japan. That is the expected role of the closest friend to show hospitality and help the closest friend. Of course, those two had chemistry, went together, did many things together, and had fun together. They visited each other's home and the parents treated the closest friend like a real child when he/she visited their home. In the social background of China, due to government regulations, the generation of interviewees had lived in one place since their birth until entering universities. Therefore, such physical situations helped to create good long-term friendships in their life because they did not move to other cities in their childhoods.

Assertiveness is also important between closest friends. They exchange true honest opinions in their arguments and discussions. The way of saying things is direct and honest without any hesitation. For example, when close friends go shopping for clothes, if a friend picks a certain article of clothing and the other friend thinks it does not suit his/her, the closest friend would directly point out its does not suit the friend and stop him/her from buying it without thinking how they feel about their opinion. In his/her mind, the true honest opinion helps the closest friend, and his/her role and that is the truly right action toward his/her closest friend as a good adviser. Also, in case of there is trouble, the one in trouble would explain the situation fully and ask the closest friend to help him/her directly and expect to be helped. There would be no hesitation to bother the friend when they ask for favors or help when he or she needs them. The

other one is also expected to be told that the closest friend is in a trouble and he/she is expected to know for sure what trouble happened as the closest friend. No secret can be expected to exist between the closest friends, especially when his/her closest friend is in trouble.

The value placed on the closest friend is very heavy for Chinese college students. Many interviewees answered that his/her closest friend is more important than his/her boy/girlfriend because relationships with the closest friend continues forever, but the relationship with a boy/girlfriend could end when they break up in the future.

Therefore, when the interest between the closest friend and his/her boy/girl friend are in conflict, Chinese college students take the side of the closest friend, not his/her boy/girl friend. One interviewee said that she would take the side of her closest friend, not her future husband's if they came into conflict because there was a possibility of divorce and would no longer have a relationship with her future husband, but as for her closest friend, the friendship continues during her entire life. The interests of her closest friend are more important than her possible future husband's interests. She said that the mutual assistance relationship between her and her closest friend continue forever as long as they live. This is the same notion explained by Hanazawa (2003) as "*Fuipao*," mutual assistance system between Chinese friends which includes affective support, substantial support, monetary support, and practical support such as introducing jobs, lending money, supplying goods, providing mediation, sharing time, offering manpower.

Some Chinese students in the interview explained that in Chinese college students' community, when moving to a new place to live, they ask friends to help move the belongings, and do not ask a moving company and pay money. Friends come on the moving day and all help move the things. In return, they would treat his friends at dinner on that day or another day.

In addition, there is more personal disclosure to the closest friend in the case of Chinese college students, than to the boy/girl friend, which is a commonly shared idea among Chinese college students. Therefore, when a girl/boy friend wants to know things about or gather information about his/her boy/girl friend, the Chinese college student goes to ask the closest friend of his/her boy/girl friend to get the information on the boy/girl friend, which was explained in one interview.

A favor asked by the closest friend is very important. Some Chinese college student interviewees answered that they found the part-time jobs for their closest friends in Japan using their networks of "*quanxi*" when they were told to help to find a part-time job by their closest friend since the friend needs to earn money.

The following paragraphs will explain about the results of the interviews with Japanese students. In the findings of the interview of Japanese college students, many made their closest friends during their high school days. They had chemistry, spent time together and had fun together during their high school days and that friendship matured in their college days. In their college days, they helped each other spiritually. Fukuoka & Hashimoto (1997) mention that in the case of the support among friends, emotional support is seen more often than material kinds unlike in the case of relationship between parents and children. In one example, many Japanese college students said that they talk about their worries over the phone or face to face to with their closest friends. They expect to be helped by having their worries listened to and having their troubles empathized with. But they do not ask favors to solve a problem. They are satisfied with being listened to and receiving comfort from their closest friend verbally. Research by Tanaka (2003) shows encouragement and consultation about worries by friends are the main reasons that Japanese students feel it is good that they have a friend, which was the internal support of the Japanese college students' expected roles and reciprocal support to each other between friends. In Tanaka's (2003) survey of Japanese college students, high scores show thoughtfulness is the biggest expectation of friends among college students.

Moreover, the way Japanese students showed their feelings or conveyed their opinion to their closest friends differ from the Chinese students. Japanese students said that they

guess the feelings of the closest friend and choose their words carefully, as they do not give their opinion to avoid hurting them. Okada (1995) explains that the characteristics of communication among friends of Japanese college students are carefulness not to hurt each other, carefulness not to step in each other's area in order to not deepen the relationship too much, and to pursue fun, and a desire to stick together as a group. College students want internal or emotional relationships with friends (Okada 1999). In the interviews conducted for this study, Japanese college students mentioned that they do not ask friends to talk to them about things they do not to disclose, and it is considered being sensitive to the friends' feelings.

In addition to differences in conveying feelings and opinions, the expected roles between Japanese friends are different from what Chinese college students expect. The closest friend is ready to help his/her closest friend in trouble and has a willingness to help him/her even in a material way. However, the one in trouble does not expect and does not want to bother his/her closest friend to help in a material way. The friend expects and do wants his or her closest friends to help in emotional ways, such as by using affective supports such as being a good listener to their troubles or worries and by giving encouragement or comfort to the one in trouble. The one in trouble does not ask for a favor of an actual action from his/her closest friend because the one in trouble does not want to bother his/her closest friend by asking for a substantial favor. For example, one interviewee said that he talked to his closest friend in Tokyo over the

phone about his problems in his love relationship with his girlfriend at the midnight and his closest friend gave him encouragement and advice about things that would go well and how to overcome his complex situation with his girlfriend. He thought his closest friend was the best person who could understand him and who gives good advice and comfort when he is in trouble. However, he never thought that his closest friend would go to talk to his girlfriend to solve the problem between him and his girlfriend.

In terms of differences between the concepts of friendship between Chinese college students and Japanese college students, differences in the mutual benefit system is the largest difference and it hinders the formation of friendship between Chinese college students and Japanese college students. Also, the differences in assertiveness in giving opinions are barriers to establishing friendships between Chinese and Japanese college students. Regarding the third point, the difference in the degree of self-disclosure between Chinese college students and Japanese college students hinders building close friendships between college students from the two cultures.

On the side of Chinese students, they confessed that there was no benefit to making friends with Japanese because Japanese students did not help them in terms of trouble. Many Chinese interviewees stated “such kinds of friendships are totally meaningless. Going out to eat and having fun is not enough as a true friend. Helping each other in

terms of trouble is the most important thing, and it has meaning and benefits for establishing a friendship.” Actually, Japanese college students explained in the interviews that Chinese students did not go with them when Japanese wanted to take Chinese college classmates out to eat out and drink, and Japanese students could not have a chance to be friends with Chinese students. From the view point of Chinese students, it is meaningless and does not provide enough benefits enough just to listen to worries have their problems listened while drinking with Japanese college students. Chinese students know that Japanese mutual benefit is limited to emotional support, and does not include material support. Chinese interviewees said that they do not ask favor of Japanese students, only to Chinese friends since Chinese friends helps them in substantial, material ways.

In addition, the way giving opinions by Japanese sounds vague to Chinese college students. From a point of view of Chinese college students, it feels like Japanese students do not have their own opinion since they do not argue or insist on their own opinion. When Chinese students are opposed to an opinion of a Japanese person, Japanese college students do not argue back anymore and the discussion is over. One Chinese student said, “Japanese do not express their opinions directly in a conversation when they have an opposing idea. Chinese friends exchange opinions even if each opinion is different. Exchanging different opinions and new ideas are inspired during discussions. When I was talking to Japanese at lunch, they talk about entertainment

information. I am not familiar with Japanese actors or actresses and can't enter the conversation. And, also I'm not interested in joining the conversation since they just exchange information that they know and they don't discuss their opinions which oppose each other. They agree with each other's opinion or information all the time."

Disclosure of feeling and ideas between close friends is also different in terms of its degree between Chinese college students and Japanese students. One Chinese student confessed in the interview,- "I still feel some distance between my Japanese friend and me since my Japanese friend does not share her own information completely. She hesitates to ask a favor of me so she hides the fact that she has problem from me. If we are real friends, I want her to share her situation in terms of trouble without hesitation and let me help her, so, I feel she and I are still not real true friends yet." On the Japanese student's side, she does not want to bother her Chinese friend with her own problem. The Japanese student wants to solve the trouble on her own. But from the viewpoint of the Chinese student, it sounds as if the Japanese friend does not come close enough to the idea of Chinese students, and therefore, there is still psychological space between the Japanese college student and Chinese college student.

One of the limitations of this research is that was done in only Japan, and interviews of Chinese students were conducted with only Chinese college students living in Japan.

Therefore, in order to pursue more accurate result, the interviews should be conducted in China as well. Furthermore, Japanese college students in China as well as Chinese college students in China should be interviewed. Another possible limitation is that interviews were conducted from 2000 to 2003 among college students. The new generation of 18 to 20 years old of Chinese college students, now may have different ways of thinking due to rapid economic growth in China. The younger generation of Chinese college students should be interviewed and analyzed in future research. Finally the sampling population was only 60 for both Chinese and Japanese college students. A larger volume of interviews in the research should be conducted in the future. To summarize, this research has limitations, and further research should be carried out for more accurate research results.

Developing Cultural Sensitivity: An Intercultural Simulation Plus

Scott Johnston
Osaka Jogakuin College

Abstract

“Do these people hate me? Why can’t they understand me?” These are feelings that a student overseas for the first time might experience. Cultural simulations along with other reflective activities can help learners develop the knowledge, skills, and awareness to better handle cultural uncertainty and miscommunication both within the country and while abroad. This paper examines a course in which simulations are utilized, describes one simulation and examines students’ reaction to the simulation.

Introduction

Cultural simulations are one tool for providing learners with opportunities to experience cross-cultural misunderstanding before they actually go abroad. Cultural simulations are types of games, usually involving at least two different cultures, in which participants take on new roles and interact with a purpose. During the simulation, the participants will face “behaviors” and “beliefs” which they are unfamiliar with, and thus are made to feel uncomfortable. Through this, the participants can reflect on their own culture and become aware of how to interact with people different than themselves.

Pederson (2000) suggests that simulations can increase people’s awareness of cultural differences while stimulating them to consider their own worldviews. Wurzel, Fischman, and Mayo (2002) use a simulation tied with videos to enhance toe intercultural competence of learners. There are numerous simulations available. Pederson (2000) includes many in his book. Lambert, Myers, and Simons (2000) describe numerous training activities, which include simulations. Such simulations as BAFA BAFA and Ecotonos are well known and used to help learners develop intercultural awareness. In Japanese, Yashiro, Machi, Koike, and Isogai (1998) have published a book that provides many useful simulations and cultural activities.

However, there are few cultural simulations that can be carried out within an hour, including the debriefing. I have simplified BAFA BAFA and Ecotonos for my Japanese classes, yet due to the formats of these simulations, they still take two hours to conclude.

Nohin is a simulation based on Outside Expert by Pederson (2000). I have reorganized it to fit my intercultural communication course at a Japanese women’s university and fit it in with a variety of other cultural activities. It can be conducted in an hour, including the debriefing, can be used with a variety of group sizes from 10 to 60, and can be organized by one person.

This paper will first describe the course in which this simulation is used, explain how to carry out this simulation, examine students’ responses to a questionnaire administered in February 2010, and consider the use of simulations in developing student cultural awareness.

Intercultural Communication Course

This course is taught to second, third, and fourth year students during the fall semester. In Fall 2009 there were 50 students. This course introduces students to intercultural

communication. Some topics include the meanings of culture, how values and beliefs shape behaviors, nonverbal and verbal communication strategies, and how different cultures “see” the world. The metaphor of culture as an iceberg is used. In this metaphor, the top of the iceberg represents things we see, hear, smell and touch such as clothes and food while the bottom includes the hidden aspects of culture such as attitudes toward time, dating, relationships between people. The hidden aspects include the values and beliefs that shape how we see the world. While this metaphor has limitations, it is useful for students to visualize the concept of culture as complex and interconnected.

In 2009 I used the text *Different Realities* by Shaules and Abe (1997). They define intercultural communication as communication between people with different cultural backgrounds in the same country or other countries. And culture is defined as, “the things that members of a group share in common” including language, customs, values and communication styles (Shaules & Abe, 1997, pp. 2-3). Thus, both concepts are broad and include life in a group’s home country, in this case Japan.

Lectures were held using Power Point presentations which students could download from a class Moodle before class. One of the key concepts presented used a video from Matsumoto (1994) on building cultural awareness. In the video, cases of miscommunication occurred and later the strategies were used to solve the problems. These were called strategies for cultural awareness and are:

1. Asking yourself questions. [Why do they speak so loud?]
2. Asking others questions. [Why do you speak so loud?]
3. Observing
4. Make your own attitudes known. [When you speak loud I feel uncomfortable.]
5. Presume good intentions when miscommunication occurs. [It might be culture!]

One case of miscommunication that we watched was about an African American student and a Korean student at a U.S. college and the African American student asking for change for a dollar to buy a coke. We watched this once, considered the miscommunication through brainstorming, and then watched again to consider how to improve the communication. The third time the video explained the cultural reasons for the miscommunication. In class we considered how the strategies presented above would work in this case and other situations.

This course was developed in order for students to be active in understanding intercultural communication. Thus, in addition to lectures there were numerous opportunities to think individually, in pairs, in groups and in class simulations.

Individual Level

Students kept an intercultural learning journal in which they made two entries a week. First, they wrote about something interesting they learned or experienced in class. Second, they had to observe the world around them and explain something they saw. At first this was difficult for students, but after providing my own examples, students began to be creative in their observations. Some topics included observing the differences between them and their siblings, observing what people did on the train in the morning, observing other students at school, writing about trips they took in Japan and the cultural differences they began to see within Japan.

The final assignment was a take home paper in which they were given situations to which they had to respond. They had to address three out of five situations. When answering the questions, students had to link their answers to concepts discussed in class. Some

questions included how to start a conversation with a foreigner in Japan, problems that might occur as an intern in the U.S. for a year, cultural concerns working for a tour organization in Spain, and how they have changed by taking this course.

Pairs

There were many handouts in the class involving critical incidents and applying new cultural concepts. Some of these included topics such as indirect/direct communication, individualism/collectivism and views of time. Many of these activities were from *Culture Matters*, the Peace Corps Cross-Cultural Workbook, which is online.

Groups

Groups gave presentations on different aspects of intercultural communication. While I considered letting students choose their own groups, in the end I put them in groups myself for several reasons. First, I did not want friends together. This course is about meeting other people and learning to interact with them. Also, I could arrange some groups more easily. For example, for one complex simulation I needed helpers for a group, so I handpicked these students. In addition, we had an exchange student from Taiwan and I put her in a specific group to make sure she was involved in a role play. Some groups showed videos and asked questions about the videos and how they connected to their classmates' lives. For example, one group showed a segment of a Japanese TV cartoon called *Sazaesan*, in which three generations live together. Other groups led role plays in which miscommunication occurred and they asked their classmates what the problems were. Then they reenacted the role play with a way to solve the problem. Some topics were: shopping in Hiroshima and Osaka, interacting with a Taiwanese student in Osaka, living in Spain and communication problems. These group activities gave students the opportunity to both work with other students and to deeply think about culture and why miscommunication occurs. Thus, it became both a cognitive and physical interaction with the cultural materials in class.

Simulations

Two simulations were carried out in this course: one called Paper and Clips and the other Nohin. Paper and clips is based on a simulation in *The Cross-Cultural Conference Room* (2002) by Wurzel, Fischman, and Mayo. In this simulation, two new cultures are created, participants study their new culture, and then visit the other culture and try to communicate. In both cultures, paper clips are exchanged, but they have different values: obtaining wealth versus building relationships. Nohin the focus of this paper is explained in more detail below. Both of these simulations involved all students as participants. The purpose was to have them "experience" cultural miscommunication and think deeply about it while drawing on the concepts learned in class.

Nohin Simulation

Nohin is a simulation based on *Outside Expert* by Pederson (2000). Two groups are formed: one is cultural experts and the other is a newly discovered indigenous group (the Nohin) in Japan. To develop interest in the simulation, I point out that the Nohin have lived deep underground under our school for hundreds of years. They have just come up to the surface. Unbelievable, but attention getting. I point out that the Nohin look like everyone else in the class, the experts, but they are quite different in their culture.

With a class of 30, there would be five groups with 25 experts and 5 Nohin. This way there will be 1 Nohin visiting each group of experts. Everyone is told that the Nohin have one specific rule: they can only answer Yes/No questions. Since the Nohin can only answer

questions with yes/no, groups of experts create some yes/no questions to ask the Nohin.

While the culture experts are making questions, I discuss with the Nohin their culture and how to answer questions. In fact, the Nohin have a unique way of responding to the yes/no Questions. If the expert smiles while asking the question, then the Nohin answers "yes." If the expert does not smile, then the Nohin answers "no." In addition, if there are boys and girls in a class, then the Nohin will ignore any questions from someone of the opposite sex, regardless of smiling or not. At my school with all girls, the Nohin and I take a look and choose some characteristic that seems to include at least one person in each group whose questions will be unanswered. In the past it has included long hair, wearing sneakers, and wearing glasses. In this class, it was anyone wearing a black top because there was at least one person in each group was wearing a black dress or blouse. The Nohin would ignore any questions from someone wearing a black top.

Then one Nohin is put with each group, and one expert at a time asks each Nohin her question. It is important that each expert ask at least one Yes/No question. After about a minute, I ask the Nohin to move to different groups. This is repeated three to four times. The Nohin have unique ways of responding, unknown to the experts, thus the experts become confused. Sometimes, the Nohin make mistakes too, and answer questions from anyone, so the experts can get quite confused.

The debriefing is when students actually have time to think about the miscommunication in the simulation. Without the debriefing, students would just have an experience, but little learning. Through the discussion students think and talk about what happened and use the cultural strategies learned. To start the debriefing, I point out that some of the experts were confused and might have felt bad. Now, we would talk about why.

In the debriefing, I ask each group what they felt about the other group. The experts say about the Nohin: "They are confusing" and "They tell lies because of different answers" and "They are nice."

When I ask the experts who were ignored how they felt, a variety of responses emerged: "I did not notice" and "I felt bad" and "I felt strange" and "I was a bit angry" and "I thought she did not like me." In fact some students did not notice that they were ignored. Others took it personally, with "She did not like me" as the most common comment. Then I would ask the Nohin if they disliked that expert and they would say No, which left the experts even more confused.

Next I asked the Nohin how they felt. In this class all but one felt uncomfortable ignoring people. They were fine with the Yes No part, but they felt uncomfortable ignoring people. The one student said it was fun to ignore people. This, of course, highlights that we are not all the same. To show why some were ignored, I asked a Nohin to ask me the same Yes/No question and I exaggerated my smile or frown. Even then, many students actually listened to the questions and did not look at my face until I asked them to look at me and not listen to the questions.

It is interesting that when involved with other cultures, we often try to solve problems by listening to what is being said rather than reading the nonverbal communication. In this class, though we had discussed how important nonverbal communication is in communicating,

students continued to focus on the verbal aspect of communication. It was only after the simulation and the discussion that students realized that during the simulation they were so involved in their roles that they did not use the cultural strategies that had been highlighted: ask yourself questions, ask the other questions, observe, make your attitude known and assume good intentions. Thus at the end, they realized that understanding cultures and “reading cultures” is very difficult and they need to ask themselves questions about what is happening and why. In addition, just studying about culture will not be enough to avoid cultural problems. Experience is important.

Finally, to bring the game back to their lives, I asked what Nohin is spelt backwards. It is Nihon, which is another way to say Japan. Then I pointed out that people, especially when meeting someone for the first time, may have attitudes similar to the Nohin. Many of us tend to want to make people like us at first meetings. One way to make friends is to be positive towards those who smile at us.

In addition, we also behave according to our cultural beliefs. Though we had chosen people wearing black tops as people we do not answer, in some cultures wearing black is the clothing for funerals. Then there may be a deep belief associating black clothing with funerals. When first meeting someone, you might hesitate to talk to people associated with funerals. By drawing on a possible cultural belief of the Nohin, students can see the link between beliefs and behavior.

Nohin and Questionnaire

This Nohin simulation was carried at the end of the semester, in order to tie together the ideas we had discussed and encountered during the semester. Of the 50 students, 34 answered parts of the questionnaire.

Two questions concerned whether the simulation was interesting and helpful for cultural learning. As Table 1 shows, it was viewed as both, with only 2 saying it was not interesting and none saying it was not helpful for cultural learning.

Table 1

Nohin and its interest and usefulness

	Strongly somewhat agree	&	Slightly & strongly disagree
Interesting	30		2
Helpful for cultural learning	31		0

When asked about what the simulation helped them learn there were a variety of answers. Asking questions had the most answers with five, and the Nohin’s belief about black had four answers. Among all these answers, the color black and smiling are two specific aspects that students felt they learned from the simulation. Responses included “They care about black”; “Care about beliefs (color); and “Smiling is important.” The other responses are related to general views of intercultural communication gaining wider views of the world.

Table 2

What did you learn?

What Students Learned	Number
------------------------------	---------------

Importance of asking questions	5
Beliefs: Nohin have strong belief about the color black	4
Smiling is important for the Nohin	2
Understanding cultural differences	2
Develop a wider view	2
Helping to imagine situations	1
Importance of observing in life	1
Review of stereotypes	1
Power of group thinking	1
Total	19

While the number of students who answered this question is limited, some interesting ideas emerged. Importantly, many of these ideas were ideas discussed and learned through activities in the course.

As indicated earlier, strategies for cultural awareness were presented in class and used to solve communication problems. Many of these were evident in the students' answers. These strategies were

1. Asking yourself questions.
2. Asking the other questions.
3. Observing
4. Make your own attitudes known.
5. Presume good intentions when miscommunication occurs.

Students seem to have learned from the strategies and using them in class, and students viewed them as helpful. Two of the answers, asking questions and observing, were part of the strategies learned.

In addition, as mentioned earlier, in this course students kept a journal and every week they were to write about something they observed in their world that was interesting or just a piece of their lives. Thus, observing was used both as one of the strategies and as another activity.

Thus, the simulation alongside the other cultural activities in this class, probably did increase students' awareness of culture differences and similarities. The responses of developing a wider view, power of group thinking, and understanding cultural differences suggest that they have learned that they need to hold a wider worldview and they need to be aware of themselves and cultural differences. Ward, Bochner, and Furnham (2001) are probably correct in suggesting that the participation and learning in simulations alone may not transfer to interactions in the real world. However, the first step to acting culturally sensitively and reflecting on our actions is cultural awareness. In this course, the grouping of activities at the individual, pair, group and class levels, it is hoped, helped students begin to develop deeper cultural sensitivities and some skills in interacting interculturally.

Conclusion

This course, with the variety of interactive activities that help students think about culture and themselves, is a step for students to begin learning about communicating in the world. Students were actively involved in their own learning through applying strategies for cultural awareness by writing a journal drawing on their observations, participating in pair

work, group presentations, and simulations.

The Nohin simulation at the end of the course was an opportunity to draw on the skills and knowledge learned through the semester. While students enjoyed participating in the simulation and felt it helped them gain cultural awareness, many did not draw on all these cultural skills while actually taking part in Nohin. However, in the real world as in simulations, we are so involved in life that we may forget to reflect on our actions and those of others. It is true for me. I have studied Japanese for many years and have recently once again decided to improve my polite Japanese. I think I have studied very hard. However, when I have a conversation with someone where polite Japanese is needed, I often forget to use the polite words and phrases that I have been reviewing. Thus, like learning to speak polite Japanese, this simulation does affect students' beliefs and gives them opportunities to be aware that they are not using all the skills they have learned. They are also aware, after taking part in the simulations and activities in the class, that they need more intensive experiences using these skills in real life to develop effective intercultural communication skills. But this is a first, and necessary, step.

Nohin Simulation: Directions to Participants

Interacting with people can be exciting and frightening. We will play a game. Some of you will be culture Experts and others will be a special group of people called Nohin. Experts will have to ask the Nohin questions about their culture.

- 1. Make groups of Experts (3-4).
- 2. Make one group of Nohin culture so that there is one for each expert group.
- 3. The experts will ask questions of Nohin people.
- 4. One rule-Nohin people can only answer YES or NO.

- 4. Experts talk and make questions to ask Nohin to learn about the culture. Some examples are:
 - Do you have leaders? Do you go to church?
 - Do you have schools? Do you hug?
 - Do you work hard? Do you use chopsticks?
- 5. Nohin go to a separate area and learn their cultural roles.
- 6. Nohin come back and 1 Nohin joins each Experts group to be asked question.
- 7. After 3 minutes Nohin change groups.
- 8. Repeat three times.

DEBRIEFING

- What did experts think of the Nohin?
- What did Nohin think of experts?
- What did you learn through playing this simulation?
- Ask experts what the rules of the Nohin culture were?

Nohin rules

- YES to a SMILE; NO to no SMILE
- Only talk to people with (sneakers)

Abstract

Banks that mobilized customers' deposits for higher returns, constantly in search of good leadership talents to be their directors. This leadership is attractively compensated because they are scarce and yet highly needed to chart the banks' future direction. This paper reports cross-country result on the determinants of Board Of Directors' compensation in four East Asia countries; Malaysia, Thailand, Indonesia and Philippines.

Keyword(s): Boards of Directors, Compensation, Bank

1.0 Introduction

Recent developments such as, the consolidation of the banking sector, the strengthened board and senior management over sighting functions within banks, and the more risk-sensitive capital and the stress-testing requirements have contributed towards reinforcing the core foundations for a more resilient banking system. High skill leadership with good foresight, innovative, competitive and people oriented qualities is one of the essential factors to

achieve sustainable success in the banking sector. Management team and Board of Director (BOD) are desired to have solid experiences and high managerial skills in order to ensure effective bank management and produce high returns in the future through profitable investments. BOD's remuneration is determined at levels which enable banks to attract and retain good directors to manage the bank effectively. There are several factors that banks consider in determining their BOD's compensation. Some of these factors have been identified in past studies (Smith and Watts, 1992; Lewellen and B. Huntsman, 1970; Chris, 2006) A positive relationship is found between pay and performance in Lewellen and B. Huntsman, 1970; Murphy, 1985). Most of the past studies (Mahmoud M. Nourayi, 2006; Chris, 2006 and Randy, 2003) focus on relation between internal determinants and Directors' compensation. Chris (2006) used variables consisting of performance variables (such as percentage change in stock market return and percentage change in return on equity) and size variables (such as sales, assets, and number of employees) and CEO specific characteristics (age, job tenure, education, and CEO stock ownership). From this survey of literature, we find there are no analyses done on internal and external factors affecting BOD's compensation. There were also some conflicting results in the past studies. Hence, the objective of this paper is to present the findings from the analysis done on the determinants of the BOD's compensation by covering both the internal and external factors. The findings provide fresh evidence on the determinants of BOD's compensation of banks in East Asia countries. These countries are Malaysia, Thailand, Indonesia and Philippines.

2.0 Past Studies

Chris, (2006) study finds that there is a weak relationship between both percentage of stock price return, percentage return on equity and the percentage change in CEO compensation. The study also find there is a weak relationship between age, CEO tenure in present position, education and CEO stock ownership and the dollar level of CEO compensation. Conversely, there is a strong relationship between sales, assets and number of employees and dollar level of CEO compensation. His result from the first Stepwise Regression analysis shows that the percentage change in return on equity was more important than the percentage change in stock market return in determining percentage change in CEO compensation. The results from the second Stepwise Regression analysis shows the determinants of BOD's compensation in order of importance are as follows: Assets, Sales, Number of Employees and Tenure of CEO in Present Position.

Randy (2003), study on community banks in the New York state from 1993 through 2001. His finding shows that there were significant variances in CEO compensation throughout the twenty-three community banks studied. However, the amounts of compensation do not affect BOD retention. This leads to the conclusion that compensation is not the major factor in the retention of community bank CEOs. His result is in contrast to past findings.

Mahmoud M. Nourayi (2006), study the relationship between CEO compensation and firm performance. The findings of this study show strong evidence that the relationship between executive compensation and firm performance is non-linear and asymmetric. Additionally, the structure of asymmetry is found to be dependent upon the

measure of performance. Convexity characterizes the asymmetry of the relationship between executive compensation and market returns, while concavity distinguishes the asymmetry of the relationship between executive compensation and accounting returns.

Firth, Tam and Tang (1999), find that UK and USA mandate disclosure of information influence significantly the directors and CEO pay. Raihan, Ravi and Pamela (2005), on the other hand use the Agency Theory approach to investigate how institutional ownership concentration and dispersion affect levels of CEO compensation, pay mix, and stock option pay sensitivity. The study finds that the largest owner's concentration is associated with lower levels of compensation, higher ratios of salary to total compensation and lower ratios of options to total compensation. But that the number of blockholders does not predict any aspects of CEO compensation. In addition, institutional ownership dispersion is associated with increased levels of compensation and greater use of incentive compensation. Finally, higher levels of CEO ownership lead to a significant reduction in the level of compensation options.

Greg N Gregoriou, (2003) study finds that compensation decreases with increasing net operating expenses (expressed as a percentage of average assets). This result indicating that the CEOs of institutions with high operating costs receive lower compensation as a penalty for this inefficiency. The study finds that compensation increases with the increase in price to assets ratio. This indicates a possible tendency for CEOs to exercise their options when the stock price reaches a certain level, thereby increasing their remuneration.

Hristos Doucouliagos, Janto Haman and Saeed Askary (2007) explores the relationship between directors' pay and performance within Australian banking using panel data for the 1992-2005 period. Several earnings models are estimated, using different dependent variables, alternate measures of performance and different estimation techniques. The results indicate an absence of a contemporaneous relationship between directors' pay and bank performance, and no association with prior year performance. However, there is a more distant pay-performance relationship, with total directors' pay having a robust positive association with earnings per share lagged two years, as well as with ROE lagged two years. The other key determinants of directors' pay in Australian banking are bank specific managerial policies, lags in the administration of pay, bank size, directors' age and directors' stock ownership. In contrast to total directors' pay, the evidence confirms a strong positive and direct association between CEO remuneration and prior year bank performance. The pay-performance association is stronger and more direct for CEO remuneration than it is for total directors' remuneration. The responsiveness of CEO pay with respect to bank performance appears to have increased over time.

Lucian A. Bebchuk and Jesse M Fried, (2005) find that a well-designed executive compensation can provide executives with cost-effective incentives to generate shareholders' value.

Meanwhile, James Ang, Beni Lauterbach and Ben Z. Schreiber, (2002) examine how a large sample of banks in the United State (US) compensates their top management teams. They find 166 US banks of various asset values compensated their top management teams during the 1993–

1996 periods. The compensation of top bank executives is shown to depend on executive rank, bank size, and bank performance. Another finding is that the weight of base salary in CEOs pay is significantly lower than in other senior managers' pay, and the pay performance elasticity of CEOs pay is significantly higher. CEOs receive not only greater pay in absolute dollar, but are also rewarded more in relation to performance, as manifested in having a larger portion of their pay in performance contingent compensation. Next to the CEO, the top executives have similar compensation structure and pay to performance elasticities. The results are robust to a size significantly affect the firm performance.

3.0 Methodology

The data for this study is obtained from secondary sources such as Banks Annual Report, Worldscope database, Lexis-Nexis, Mergers and Acquisitions magazine, newspaper articles, Bursa Malaysia Report, Bank Negara Malaysia Report, as well as individual bank websites. The sample countries in this study will be East Asia market which is Malaysia, Thailand, Indonesia, and Philippines. Total sample size in this study are 48 commercial banks consisting 9 commercial banks in Malaysia, 18 commercial banks in Indonesia, 12 commercial banks in Thailand, and 9 commercial banks in Philippines. The study covers period from 2000 to 2008 (9 years).

The dependent variable in this study is total compensation defined as the base cash compensation¹ plus the value of stock and options granted for directors. Mean while the independent variables are firm size, firm age, numbers of

¹ Salary and cash bonus include plus the value of autos, housing, retirement and health benefits as well as the value of stock options.

employee, inside directors, outside directors, tenure, education background, experience, pretax income, operating expenses and net income. Macroeconomic variables such as inflation, GDP, Balance of Payment are included. The determinants are analyzed using multiple regression analysis.

4.0 Finding

4.1 Descriptive Analysis

Table 1: Descriptive Analysis

Variables	Mean	Std. Dev.	Max	Min	Skewness
Total Compensation (USD million)	15.48	2.30	21.65	10.27	0.651
Net Income (USD million)	16.85	2.62	23.72	9.62	0.309
Operating Expenses (USD million)	19.00	3.60	26.11	7.52	-0.460
Pretax Income (USD million)	15.70	2.40	22.57	9.57	0.708
Total Assets (USD million)	19.96	2.20	26.11	14.23	0.765
Firm Age (no. of years)	6.75	2.47	13.38	0	-0.116
Employee (no. of employee)	85.18	49.87	219.67	4.24	0.644
Insider (no.)	1.53	0.34	3.46	1.00	0.389

Outsider (no.)	7.89	3.22	7.00	16.00	0.135
Tenure (no. of years)	2.52	0.93	6.48	1.00	1.035
Education (level)	2.61	0.58	4.00	2.00	0.325
Experiences (no. of years)	27.88	9.15	57.00	5.00	0.353
Inflation (%)	5.15	3.06	13.10	0.63	0.968
GDP (%)	3.36	8.31	26.05	-19.35	-0.008
BOP (%)	15.23	6.44	33.15	8.44	1.110

In Table 1, the mean for total compensation is US15.48million, with the maximum value for the total compensation is US21.65 million and the lowest value for the total compensation is US10.27 million. The standard deviation for total compensation is 2.30. This shows there is a wide variation between the banks BOD's compensation levels between the banks in the four sample countries.

Mean value for net income, operating expenses and pretax income is US16.85million, US19.00million and US15.70million respectively. The mean value for total assets and firm age is US19.96 million and 6.75 years respectively. We find that the banks on average maintain 85.18 numbers of employees per banks. The mean number of insider board and outsider board is 1.53 directors and 7.89 directors respectively. The standard deviation value for insider and outsider board is 0.34 and 3.22.

Tenure shows the mean value of 2.52 years and the average level of education is Degree to Master levels. The mean experience is 27.88 years. Meaning that most of the directors are highly experienced with almost 28 years of working experiences.

4.2 Regression Analysis

Table 2: Regression Analysis for Each Country

	Malaysia	Thailand	Indonesia	Philippine
R square	.906	.962	.970	.967
Adjusted R square	.895	.960	.967	.965
F value	81.703	514.584	384.939	375.182
Sig.	.000	.000	.000	.000

Table 2 shows the R square and the adjusted R square of each country under study. In the case of Malaysia the 14 independent variables explain 89.5% of the variation in its banks BOD's compensation. Mean while, in Thailand 96% variance in BOD compensation has been significantly explained by all the variables. In Indonesia 96.7% of the variance in BOD compensation has been significantly explained and in Philippines is 96.5%. In comparison, the result in Table 3 appears to capture most of the significant factors that influences directors' compensation of Indonesia banks.

4.3 Coefficients Analysis

Table 3: Coefficients Analysis for Each Country Model

	Malaysia	Thailand	Indonesia	Philippine
Variables	B (t)	B (t)	B (t)	B (t)
Pretax income	.384*** (6.279)	X	.106*** (3.791)	-.126** (-2.128)

No. of Significant Variables	7	5	10	3

Notes:

X: Not a significant variables

*** $p < .01$, ** $p < .05$, * $p < .1$

Table 3 shows a summary of significant coefficient variables of banks in Malaysia, Thailand, Indonesia, Philippines. For firm specific factors, pretax income in Malaysia and Indonesia show a positive significant relationship with BOD's compensation. However, Philippines show an inverse significant relationship. Meanwhile, coefficient estimation of operating expenses in Thailand is similar to the result of

Greg N Gregoriou (2003), where CEO compensation decreases with increasing net operating expenses. This indicates that the BODs of banks with high operating costs have to accept lower compensation due to cost management inefficiency. An interesting result is shown by the negative significant relationship of net income in the case of banks in Indonesia and Philippines. The result is in contrast with the result of past studies. The result suggests that despite an increase in net income, total boards' compensation decreases. The result implies that the banks management in the two countries might have reduced some of the perks in the BODs' compensation. Further more, total assets variable also shows a positively significant relationship with boards' compensation for all countries. This result shows that a total asset, which is a proxy for size are a major important determinant in determining boards' compensation in East Asia countries. This also suggests that the larger the size of the banks value the higher is BOD's compensation. Malaysia and Indonesia banks age have positive significant relationship with BOD Compensation. The result indicates that more establish banks (proxy by the number of years incorporated) pay higher board compensation. This result support Lerong He, (2007) where firm age is found to be positively associated with CEO total compensation and influence the level of CEO incentive compensation. In Finkelstein and Hambrick, (1989) and Tosi et al., (1997), firm age characteristics influence positively CEO compensation, incentives and performance. Mean while, number of employee variable in Indonesia shows a positive significant relationship but this variable is not significant for BODs' compensation in other countries.

Corporate governance factor shows that insider boards' coefficient estimation is similar to past studies result by

showing a negative significant relationship in Thailand and Indonesia banks. In the other side, outsider boards result shows a contradictory result with past studies where, in the case of Indonesia, it shows a negative and significant relationship. The result could probably be due to most of the boards of directors in Indonesia banks are family members. Beside that, tenure variable (measure as number of years the BOD has held his or her position) (in the case of Malaysian banks) has a significant but negative relationship with boards' compensation. In contrast, Indonesian banks BODs' compensation shows a positive significant relationship with education but in Thailand it is negative and significant. Experiences show a positive significant relationship with Malaysia but a negative significant relationship with Indonesia.

In term of economic factors, inflation is only significant in Malaysia as a determinant of BODs' compensation. Malaysia inflation is negatively significant related to boards' compensation. Balance of payment is positively and significantly related with banks boards' compensation in Thailand and Indonesia. GDP is not a significant determinant of BOD compensation of banks in four East Asia countries.

In summary, the regression result shows that seven variables are significant determinants to BOD Compensation of banks in Malaysia. They are pretax income, total assets, firm age, tenure, education, experiences and inflation. In Thailand, five significant variables are operating expenses, total assets, insider board, education and balance of payment. Meanwhile, Thailand has ten significant variables that will influence BOD compensation. They are pre tax income, net income, total assets, firm age, employee, insider board, outsider board, education, experiences and balance of

payment. In Philippines, three significant variables are pretax income, net income and total assets.

5.0 Conclusion

BODs' compensation is a dependent variable. Therefore, it is influenced by independent variables. As a conclusion this paper finds that bank size (total assets) has a strong influence on BODs' compensation. Bank's size is important in deciding directors' remuneration and banks with high earnings rely more on cash compensation to reward successful executive performance. These banks tend to be larger in size, and have larger earnings in East Asia countries. However, inflation is negatively significant past times in Malaysia banks and balance of payments positively significant in Thailand and Indonesia banks but GDP is not a significant factor in any sample countries. The findings of this paper hope to benefit both academic researchers as well as corporate officer who serve on compensation committees to structure boards' compensation.

Profits or Sales?

How state shareholders discipline their CEOs in China

Abstract

This study examines the determinants of CEO turnover in Chinese state-owned firms. Based on a sample of 1,555 turnover cases among listed firms in China during the period 1999 to 2003, we obtain three main results. First, CEO turnover is negatively related to the sales performance but not the profitability of the core business. Second, the negative relationship between CEO turnover and sales is stronger for firms with excessive employment and higher organizational slack. Third, there is a significant post-turnover increase in sales but a decline in profitability of the core business. Overall, our evidence is consistent with the hypothesis that state shareholders put a greater emphasis on sales generation than on profitability when they monitor their CEOs.

Key Words: state ownership, managerial monitoring, China's listed firms

JEL: G3, L2

1. Introduction

The way state owners run their companies has been a focal point of theoretical research. The general notion is that state owners have weak profit incentives due to the fact that they enjoy control rights without cash-flow rights. Moreover, state-owned firms typically benefit from generous transfers of government resources (Firth et al. 2008) and do not run the risk of bankruptcy (e.g., Shleifer and Vishny, 1994; Shleifer, 1998). Notwithstanding, state shareholders might still pursue sales maximization (hereafter referred to as the *sales motive*), as firms with a higher sales volume can generate more cash inflows, increasing the resources available to pursue political and personal objectives (Millward and Parker, 1983; Kornai, 1992). State shareholders are therefore assumed to have a strong incentive to maximize sales and a weak incentive to maximize profits.

Similar to owners of private companies, state shareholders develop monitoring mechanisms that help to align management performance with shareholder interests. As a result, the mechanisms of managerial turnover in state-controlled firms are expected to display distinct features that reflect the specific objectives of state shareholders. This has inspired a series of empirical studies exploring how turnover behavior in state-controlled companies responds to various performance measures. Prior studies have examined the sensitivity of turnover to three different performance measures, including labor productivity (Groves et al., 1995; Aviazian et al., 2005), sales-related measures (Aviazian et al., 2005; Firth et al., 2006; Kato and Long, 2006), and the accounting profitability measure of return on assets (ROA) (Firth et al., 2006; Kato and Long, 2006; Chang and Wong, 2008). As most of these studies find a negative relationship between turnover and

performance, the general conclusion is that state shareholders of corporatized firms, similar to private shareholders, discipline their managers on the basis of firm performance (Firth et al., 2006).

In spite of considerable empirical research, the underlying motives of state shareholders remain unclear because the performance measures previously employed could either reflect profit or sales maximization. Bai et al. (1997), for example, show that increasing labor productivity in state-owned firms (SOEs) can be associated both with profit maximization and output maximization. Additionally, the incentive to increase sales-related performance can help to maximize profits or could just be an end in itself. ROA, moreover, is analytically the product of profit margin (profit over sales) and asset turnover (sales over asset), which are measures of firm profitability and sales generation, respectively. Clearly, the question whether state shareholders act as profit or sales maximizers awaits more direct empirical testing strategies.

This study takes a first attempt to explicitly distinguish between the profit and sales motives and examine their relative importance in determining the forced turnover of Chief Executive Officers (CEOs) in listed firms in China. Managerial turnover in China's corporatized firms provides a useful testing venue because listed firms include both state-controlled and private firms that operate in different industries but in a similar institutional environment. This allows us to use private firms as a control group to isolate ownership-specific effects.

Based on a sample of 1,555 turnover cases in listed firms in China during the period 1999 to 2003, our analysis yields three main results. First, CEO turnover in state-controlled firms is negatively related to sales performance but not to profitability of the

core business. In contrast, turnover in private firms is negatively related to both sales performance and profitability of the core business. These results suggest that state shareholders place more weight on the sales motive than the profit motive when assessing CEO performance. Second, the negative relationship between CEO turnover and sales performance in state-controlled firms is stronger when firms have excessive employment and higher managerial expenses, whereas no such relationship is observed for private firms. These results suggest that state shareholders' emphasis on sales is closely associated with their desire to control large resource pools for the pursuit of political and personal objectives. Third, there is a significant post-turnover increase in sales performance but a decline in core business profitability. Overall, our study supports the hypothesis that state shareholders rely more on sales generation than on profitability as the basis of their CEO monitoring.

Our study makes at least two contributions to the literature on the corporate governance of state-controlled firms. First, we provide new evidence on managerial monitoring in state-controlled firms that shows that state shareholders actually place more emphasis on sales generation than profitability when monitoring their CEOs. To our knowledge, this is the first study to provide evidence that the inherent preference of state shareholders for sales maximization over profit maximization has material consequences for CEO monitoring. Despite massive waves of privatization in recent decades, state ownership remains globally important in many vital industries, such as telecommunications, energy, public utilities, and banking,¹ and the current global

¹ Bauer (2005) documents that 49.2% of fixed-access lines were still operated by either a fully or partially state-owned telecommunication operator at the end of 2004. Based on a study of the 10 largest banks in 92 countries, La Porta et al. (2003) document that 42% of their assets are controlled by state-owned entities.

financial crisis has led to the emergence of even more state-controlled firms. The quality of corporate control as exercised through CEO monitoring in wholly or partially state-owned firms is therefore of continued, and possibly increasing, relevance for policy makers and international investors.

Second, our study relates to the long-standing debate as to whether the privatization of state-owned firms is necessary to improve their financial performance. The property school regards privatization as a prerequisite to improve performance in traditional state-owned firms (Shleifer, 1998; Narjess et al. 2009), whereas the market approach claims that increasing competition and organizational changes in governance structures will be sufficient to improve performance (Yarrow, 1986; Vickers and Yarrow, 1991; Fang et al. 2009). Although listed firms in China operate under corporate governance structures that closely resemble the rules of the game in mature market economies, our evidence suggests that the inherently weak profit motive of state shareholders continues to influence company management through CEO monitoring.

The remainder of this paper is structured as follows. Section 2 provides a discussion of corporate governance mechanisms and the incentive structures of state shareholders in listed firms in China. Section 3 introduces the data and research method while section 4 presents the empirical results and robustness checks. Section 5 concludes.

2. Corporate governance: Between the profit motive and the sales motive

Formally, China's corporate organization resembles Western models of corporate governance, with the shareholder meeting being the highest decision-making organ that elects the Board of Directors to oversee and monitor the performance of CEOs.

Notwithstanding, China's corporate governance system also has distinct features that stem from its unique ownership structure and administrative control mechanisms. As recent as 2003 the state controlled about two-thirds of the total equity of the majority of listed companies through holdings of non-tradable state shares (Sun and Tong, 2003). Control rights over these shares are exercised through a two-tier administrative system similar to international state asset management systems such as the Italian IRI or the Singapore Development Bank (Wu et al., 1997). During our observation period, the National Administrative Bureau of State-owned Property (NABSOP) was at the top of China's asset administration system. NABSOP is entrusted by the State Council to perform all overseeing duties to protect the state's ownership interest. The actual execution of ownership rights, however, is delegated to local business groups, locally run asset administrations, or state-asset operating companies (SAOCs), which are formally registered as state-holdings or state investment companies. Although these three types of agents are not an integral part of the Chinese bureaucracy, they remain closely linked with the government through the oversight of the NABSOP and the State Council.

Despite official statements emphasizing the formal separation of government and firms, politicians and bureaucrats can still rely on vertical ties and personnel dependencies to pursue multiple interests in state-owned firms. Even in corporatized firms, state influence is not limited to the formal authority of state shareholders to vote at shareholder meetings. Equally importantly, the state retains the formal right to approve the decisions of the Board of Directors on appointments and dismissals of CEOs and other key personnel (Qian, 1995). This factual monopoly power over management recruitment provides a valuable opportunity to directly explore which objectives state

shareholders seek to maximize when exercising their authority over management turnover.

There is a rich abundance of literature on the nature of state-owned firms that emphasizes their weak profit motive. Governments operate state-owned firms not only to correct market failures, but to also win public support by providing additional employment opportunities, above market-rate wages, and social security (Shleifer and Vishny, 1994, 1997). Moreover, the political economy perspective on state-ownership suggests that, similar to managers in private firms, politicians and bureaucrats tend to abuse their office to utilize state-owned resources for personal interest and material gain (Shleifer and Vishny, 1994, 1997; Krueger, 1990). There is a general conflict between firm profitability and political and personal goals because the pursuit of the latter is often connected with higher costs and, thus, lower profits (Shleifer, 1998; Sikorsky, 2007).² The lack of cost minimization suggests that state shareholders are unlikely to be profit maximizing, but will rather respond to the government's non-profit goals. Empirical studies documenting an increase in the profitability of previously state-owned enterprises after privatization support the view that state-owned firms are less profitable than private firms (Megginson and Netter, 2001; Narjess et al. 2009). The link between managerial turnover and firm profitability is therefore likely to be weak.

In China, institutional arrangements guiding the corporate governance of state-owned firms further reinforce the weak profit motive of state shareholders. To begin with, entrusted local state asset administrative agents do not receive dividends, unlike private owners, as these are directly transferred to the state budget. Second, state shareholders are

² Sikorsky (2007) reviews more than 50 studies and finds that only three studies identify the cost-advantages of state-owned firms, whereas five studies do not detect a significant difference in the cost structure of state and private firms.

not allowed to sell their firm's stock, and are therefore unable to capitalize on potential increases in their firm's stock price that result from increases in firm profitability. Finally, the management and control activities of local asset administrators do not carry with them the risk of bankruptcy or an alternative sanctioning mechanism when performance is poor (World Bank, 2007). It is therefore likely that the profit motive will naturally carry a low weight in the objective function of state shareholders.

Despite of a weak profit motive, the literature on state-owned firms also suggests that state shareholders are likely to have an incentive to maximize output and sales performance, as a higher transaction volume generates broader opportunities for state shareholders to achieve political and personal objectives. As emphasized by Shleifer and Vishny (1994), politicians tend to maximize output because larger firms can provide more resources to buy out political supporters. Similarly, firms with a higher transaction volume also provide state shareholders with more resources to serve their private interests. Following this logic, Millward and Parker (1983) suggest that bureaucrats who run public enterprises tend to "raise the volume of co-operating resources beyond profit-maximizing levels" (p. 222) to increase the resources available for their personal use. Matsumura (1998) further indicates that public firms are typically given the objective of maximizing output subject to the condition of breaking even. Kato and Long (2006) find that the compensation of top executives in listed firms in China is more sensitive to sales performance than firm profitability, indicating that state shareholders have a greater incentive to tie managerial incentive to sales performance than firm profitability.

Consistent with SOE's general incentive structure, the regulations on the administration of state ownership in corporatized state-controlled firms have not

explicitly included any profit or profitability goals as a guiding principle of state asset management. Instead, state shareholders are requested to guarantee, protect, and further increase the controlling position of state-dominated companies in line with industrial policy guidelines (He, 1999). To this end, local asset administrators are required to oversee company activities and managerial performance based on the management's ability to maintain and increase the value of state assets (Preliminary Method for the Administration of State Shares in Listed Companies, Art. 17). Local agents, in turn, are reviewed by NABSOP based on the same guiding principle that they should "supervise and administer the preservation of and increase in the value of state-owned assets."³ Although these regulations do not explicitly specify how the value of state-owned assets is to be measured, the lack of explicit reference to profitability signals that the profit motive plays, at best, a subordinate role when it comes to the assessment of state asset management.

3 Data and research methods

We use a sample of firms listed on the Shenzhen and Shanghai Stock Exchanges in the period from 1999 to 2006 to empirically estimate the extent to which profit and sales objectives influence CEO turnover. The data on CEO turnover comes from the China Corporate Research Database (CCGRD) provided by the GTA Information Technology Co. For our analysis of CEO turnover, we focus on people who hold the formal title of General Manager or Chief Executive. We limit the turnover cases to those

³ "Interim Regulations on Supervision and Management of State-owned Enterprises" (May 27, 2003), Art. 14.

occurring during the period of 1999 to 2003 to retain three additional years of financial data for the investigation of post-turnover performance changes.

Table 1 provides an overview of recorded changes in CEO during our observation period. During this time 1,555 such changes were made, with at least one change in 879 out of the 1,255 firms listed on the Chinese stock exchanges at the end of 2003. Turnover activity declined slightly over time, with 29.74% of firms experiencing a CEO turnover in 1999 compared with 25.98% in 2003. With an average turnover rate of 27.99%, our sample clearly surpasses the figures reported in earlier studies that focus on the U.S. and Japanese stock markets.⁴ Of the 879 firms for which changes in CEO were made, 105 report multiple changes in a given year. In following the standard in the literature in consolidating multiple CEO changes and reporting only the final turnover, the number of valid CEO changes for our sample is reduced from 1,555 to 1,438. Correspondingly, the adjusted turnover rate falls from 27.99% to 25.89%.

[Insert table 1 about here]

Detailed reasons for officially recorded changes in CEO are provided by the CCGRD and include: (1) change of job, (2) retirement, (3) contract expiration, (4) change in controlling shareholder, (5) resignation, (6) dismissal, (7) health, (8) personal reasons, (9) corporate governance reform, (10) legal disputes, (11) no reason given, and (12) completion of acting duties. Table 2 summarizes the distribution of the reasons for turnover for the total and consolidated samples. Change of job is the most common reason given for CEO turnover, accounting for 427 (or 29.69%) of the consolidated

⁴ Denis and Denis (1995) report a turnover rate of 12.7% for the U.S. stock market. A more recent study by Huson et al. (2004) reports a lower turnover rate of 9.3%. Turnover rates for the Japanese stock market are comparable (Kang and Shivdasani, 1995).

sample. This is followed by change due to contract expiration with 319 turnover instances (22.18%) and turnover due to resignation with 265 (18.43%).

[Insert table 2 about here]

An assessment of the motives underlying shareholders' decisions to replace a CEO hinges on the adequate identification of instances of forced CEO turnover. The ability to distinguish forced turnover from non-forced turnover, however, is inherently difficult due to pronounced information asymmetry (Denis and Denis, 1995; Huson et al., 2004). The classification system provided by CCGRD suffers from a similar problem, as a change of job, for instance, may actually be the result of a forced turnover. Inferences on the true nature of a job change therefore need to build on additional information. A reliable indicator is the change in position experienced by the outgoing CEO. If the post-turnover position held by a CEO is less attractive in terms of salary, status, and authority than the previously held position, then the job change turnover is likely to have been involuntary.

Our identification strategy for forced turnover proceeds as follows. First, we exclude all turnover cases that are due to retirement, health (including death), corporate governance reform, and a change in controlling shareholder.⁵ As the focal point of our study is the corporate monitoring of state shareholders, we also exclude those cases of turnover resulting from legal lawsuits as such suits are not initiated by state shareholders as part of their normal monitoring activities. These exclusions leave us with 1,178 turnover cases with an unclear motivation. For these cases we retrieve additional information on the post-turnover position of the outgoing CEO to partition them into the categories of "voluntary" and "forced." We use multiple data sources to maximize the

⁵ The exclusion of CEO changes following corporate governance reform is consistent, as departing CEOs are typically recruited as chairpersons of the board of directors or move on to key management positions in the parent firm.

data availability and reliability, employing information from the annual reports of the firms, Infobank's China Economic News Database, Infobank's China Listed Firms Database, China's Listed Firms Database⁶, and online material retrieved through the internet search engine Baidu⁷. We define as voluntary all instances of turnover where the status of the CEO's post-turnover position is comparable or higher than the original position held, and label as forced turnover all cases where the status of the post-turnover position is significantly lower than the previously held position.

[Insert table 3 about here]

Table 3 summarizes the results of our sorting strategy. Out of 1,178 unclear turnover cases we identify 665 that can be classified as voluntary. These include 17 cases where the CEO took over a high-ranking government position at the municipal or provincial leadership level, 225 cases where the CEO retained the position of Board chair or vice-chair, 197 cases where the CEO was promoted to the position of board-chair or vice-chair, and 150 cases where the post-turnover position was a comparable management position in another listed company or within the firm's parent company. In 10 cases turnover was due to health reasons (these cases are additional to those officially registered by CCGRD in this category), in 34 cases turnover was associated with a change in controlling shareholder, in 24 cases it was due to legal investigations or criminal conviction, and in 8 cases the CEO left the position to enroll in an educational program outside of China.

The remaining 513 cases are categorized as forced turnover. In 198 cases, the post-turnover positions of the CEOs carried a weaker authority and status, in 27 cases the

⁶ <http://www.sina.com.cn>

⁷ <http://www.baidu.com>

CEOs were employed by small-scale, non-listed firms, and in 288 cases no post-turnover position could be traced before the end of the observation period. Given our comprehensive search strategy, this lack of traceable information indicates that a CEO's post-turnover career ceases to be of interest to the business media, and therefore the new position is likely to be connected with a decline in post-turnover status and authority.

From the 513 cases classified as forced changes, we exclude 62 cases with less than one year of CEO tenure, as it is unlikely that such turnover decisions would be due to performance assessments. Further, we transfer 19 cases involving retirement as the official turnover reason from the category of voluntary turnover to forced turnover, because the CEO's age was less than China's official retirement age of 55 years. In total, our sample of 1,555 instances of CEO turnover includes 470 instances (30.23%) of forced turnover.⁸

3.1 *Estimation models*

We apply the following Probit regression model to estimate the extent to which CEO turnover is sensitive to the profit and sales motives of state shareholders.

$$\text{Probability (forced CEO turnover)} = f(\text{performance, control variables}). \quad (1)$$

Our dependent variable is a binary variable that equals 1 if there was an instance of forced turnover in a given period. Rather than using the common measure of *ROA* as a measure of profitability, we use two performance measures to capture whether CEO turnover is sensitive to the profit motive or the sales motive. The first is the industry-adjusted profit margin (*PM*) of the core business, which is defined as profit over sales

⁸ Comparable figures in more advanced stock markets are considerably lower, at less than 20% in the United States [Denis and Denis (1995) report 13.3%; Huson et al. (2004) report 18%] and 24% in Japan (Kang and Shivdasani, 1995).

minus the corresponding ratio of the industry and is used to capture the profit motive. *PM* is a measure of the effectiveness of cost control, and is particularly useful for capturing the profit motive because state-controlled firms tend to operate at a higher cost.⁹

We also use the industry-adjusted asset turnover (*AT*), which is defined as sales over assets minus the corresponding ratio of the industry, to capture the sales motive. *AT* is a traditional financial ratio that measures the ability of management to efficiently employ assets to generate sales (Singh and Davidson, 2003). A decline in asset turnover or a generally low asset turnover rate compared with the industry average indicates that the management of the firm is not generating sufficient sales to justify its asset size. *AT* appears as a relevant measure used by state shareholders in China to evaluate their CEOs' sales performance. Given the Chinese government's emphasis on the increase and preservation of the value of state assets, state shareholders are likely to benchmark the sales performance of their CEOs on the basis of assets that they can utilize. From the government's perspective, the under-utilization of state assets in generating sales is likely to be regarded as inefficient management of the state's assets. We therefore expect forced turnover to be negatively related to *AT* if sales performance matters for state shareholders. We include *PM* and *AT* simultaneously into regressions in order to determine the relative importance of *PM* and *AT* to state shareholders.

⁹ Kato and Long (2006) use *PM* as a measure of financial performance, but only estimate a negative relationship between *PM* and managerial turnover if they exclude control variables for private and state ownership. If ownership and some corresponding interaction terms are included, then the negative relation between *PM* and turnover disappears. As this study estimates the performance-turnover links for both state-owned and privately owned firms in a single regression, rather than separately in different regressions, the estimation results are likely to suffer from specification errors given that state and private firms tend to have distinctly different incentive structures. Furthermore, this study uses *PM* and other sales measures as alternative measures of firm performance and does not include them simultaneously, and thus does not examine the relative importance of sales and profits in determining managerial turnover.

In order to separate out possible confounding influences we introduce a set of control variables. First, we introduce three variables to capture individual features of the departing CEO. We control for the CEO's age (*Age*) and tenure (*Tenure*), as older CEOs and CEOs with a longer tenure seem to be less frequently subject to forced turnover (Kang and Shivdasani, 1995). We also control whether CEOs are concurrently holding the position of board chair (*Duality*), as a more powerful CEO is naturally in a better position to resist the threat of dismissal. Further, we control for several firm characteristics. We control for the number of years a firm has been listed on the stock exchange (*Years*), as a longer listing may be correlated with greater shareholder monitoring. Firm size, as measured by the natural logarithm of the book value of total firm assets (*Size*), is included because managers seem to be more entrenched in larger firms (Dalton and Kesner, 1983). Also, larger firms seem to enjoy greater bargaining power vis-à-vis the government. As debtors may attract additional management monitoring (Jensen, 1986), we also include the capital structure as measured by the book value of debt over the total book value of assets (*DAR*). Finally, we include a dummy variable to indicate the year of CEO turnover to control for business cycle effects.

As there is naturally a certain time lag in turnover decisions, we use the previous year's measures for all variables except those associated with the personal qualities of a CEO in instances where a CEO change occurs in the first six months of a given year. Where the turnover date falls in the second half of the year, we include measures for the current year. This procedure is in line with Huson et al. (2001) and aims to alleviate potential endogeneity problems. Moreover, the use of half-year lags also suits the rather short average period of 2.8 years for CEO tenure in listed firms in China.

4. Empirical results

4.1. Sample selection and descriptive statistics

There are a total of 5,555 firm-year observations in the period from 1999 to 2003 after excluding those that involve firms listed only in the B-share market and firms in the finance industry.¹⁰ We also exclude firm-year observations that involve firms with negative equity and that involve firms listed for less than six months. Our *ROA*, *DAR*, *PM*, and *AT* data have some extreme values, and we therefore winsorize these variables at the 1% level. After further eliminating observations with missing values in the variables included in our regression analysis, our final sample includes 3,815 firm-year observations.

Data on the ownership identity of the controlling shareholder is obtained from the Ultimate Ownership of Listed Chinese Firms Dataset provided by Sinofin. To ensure that our information is accurate, we also crosscheck these data with information provided by the WIND Information Co.

Panel A of Table 4 shows the summary statistics for the variables used in the subsequent analyses. Our sample firms have, on average, been listed for 4.97 years, with the average age and length of tenure of the managers being 46.43 and 2.75 years, respectively. Overall, we have 3,110 firm-year observations (81.5%) where the state is the controlling shareholder and 705 firm-year observations (18.5%) where private shareholders are in a controlling position. Duality is not a common feature, with only 15.4% of CEOs also serving as board chair.

¹⁰ The B-share market was originally reserved for foreign investors, but was opened up to individual domestic investors in February 2001.

Panel B of Table 4 presents some univariate analyses of state and private firms for our two performance measures. Consistent with our hypothesis on the weak profit motive of state shareholders, the PM of state-controlled firms (mean = 0.007) is significantly lower than that of private firms (mean = 0.043). Additionally, the AT of state-controlled firms (mean = 0.087) is substantially higher than that of private firms (mean = 0.006), which indicates a relatively strong sales motive among state shareholders. Similar results are obtained when median tests are used.

[Insert Table 4 about here]

4.2 Regression results for the baseline models

Two estimation issues are worth noting before we discuss our results. First, there is a potential lack of independence across observations for a given CEO because of the existence of certain unobservable person-specific factors. We therefore estimate the model using the Huber/White/sandwich robust method with adjustment for within-cluster correlation for each CEO (Wooldridge, 2002).¹¹ Second, we conduct a Pearson correlation test and find that all of the correlations among the variables included in our models are lower than 0.5. We also calculate the variance inflation factors (VIF) for each independent variable. The VIFs never exceed 3, suggesting that our models are not plagued by serious multicollinearity problems.

Table 5 reports estimates of the sensitivity of turnover to *PM* and *AT* for state-controlled and private firms, respectively. To illustrate the importance of decomposing the profit and sales motives, we also report the results using the ratio of profit from the

¹¹ Consistent results are obtained if we adjust for within-cluster correlation for each firm.

core business over total assets (*ROA*) as an alternative explanatory variable. Although the coefficient for *ROA* is negative and significant at 5% for state owned firms, the breakdown of *ROA* into *PM* and *AT* indicates that the negative coefficient for *PM* is not statistically significant at conventional levels, while only the coefficient for *AT* is significant at 10%. The results indicate that state shareholders rely more on sales performance than firm profitability in monitoring their CEOs and the negative relationship between *ROA* and turnover is actually driven by sales component (*AT*) rather than profit component (*PM*). For the private firm sample, the coefficients for *PM*, and *AT* are significantly negative at 5%, which suggests that CEO turnover in private firms is sensitive to both profitability and sales performance.

An additional estimation confirms the existence of different performance measures employed by state and private shareholders to monitor their CEOs. We create a new dummy variable, *Private*, which is set to 1 if a firm is a privately-controlled firm. We interact this variable with our two performance measures and re-estimate the baseline model for the full sample of the listed firms. The last column of Table 5 reports the results. The coefficient on the interaction term of *Private* and *PM* is significantly negative, which indicates that private shareholders place a greater emphasis on profit margin than state shareholders. On the other hand, the coefficient on the interaction term of *Private* and *AT* is statistically insignificant, suggesting that private and state shareholders respond similarly to the performance measure of asset turnover.

Our control variables behave broadly as expected. Similar to the results obtained in previous studies, the coefficients of *Age* are significantly positive and the coefficients of *Tenure* are significantly negative, indicating that the probability of forced turnover is

lower for younger CEOs and for those with a longer tenure. The coefficient for a combined CEO and board chair position (*Duality*) is significantly negative, suggesting that the duality structure undermines CEO monitoring and reduces the possibility of forced turnover instances in state-controlled firms.

[Insert table 5 about here]

4.3 Additional Tests

Our baseline results are consistent with our hypotheses on the weak profit motive but strong sales incentive of state shareholders. In this section, we conduct two tests to provide additional evidence of the underlying monitoring motive of state shareholders. In the first test, we examine the changes in post-turnover performance. Performance changes after a change in CEO can provide information on the monitoring incentive of state shareholders because post-turnover performance will be affected by how the new CEO is selected and monitored. If sales performance rather than profitability is the major cause of managerial turnover, then the new manager is more likely to be selected and monitored on the basis of *AT* rather than *PM*. This, in turn, means that a post-turnover increase in *AT* is more likely than an increase in *PM*.

We follow Huson et al. (2004) for the post-turnover analysis and use a control group to isolate the component of performance change that is attributable to the mean reversion of accounting performance. The timing of performance comparisons is a crucial issue, as both outgoing and incoming CEOs have an incentive to manage company accounts. Outgoing managers tend to over-report company performance in an effort to secure their jobs, whereas incoming managers may under-report company performance to

facilitate chances to “realize” performance increases in the following years. To mitigate problems stemming from account management, we construct two control groups. For one group we use the performance reported in the turnover year (year 0) and for the other group we use the performance reported in the year before the turnover event (year -1).

We construct the control groups as follows. We first match each firm that experienced a change of CEO in a given year with a firm that is both in the same industry and had a similar recorded firm performance (both PM and AT) (+ / - 20% of the sample firm’s performance) in the corresponding year while not undergoing a change in CEO in either the event year or the three preceding years. If multiple firms fulfill these conditions, then we choose the firm with an asset size that is closest to that of the sample firm. If there are no firms from the same industry with a performance level within the specified band, then we loosen our restrictions and match our sample firm with a firm with similar performance but in a different industry. In total, our control group includes 325 (319) firms that match in terms of both industry and performance in year 0 (and year -1) and add 80 (78) firms that only match the sample firms in terms of performance in year 0 (year -1). Finally we exclude 31 (39) firms from our sample because we are not able to identify any firms with matching performance.

Table 6 presents the median post-turnover performance changes for the samples of state-owned and private firms. The table reports only the results when year 0 is used as the reference, as we obtain consistent results for year 0 and year -1 as the comparison benchmark. Panel A reports the performance changes for state-owned firms. There is a significant decline in the unadjusted profit margin of the core business in all years, but no significant change in the industry-adjusted profit margin, control group adjusted profit

margin (measured as PM minus the median of the corresponding ratio in the control group), or the industry and control group adjusted profit margin. However, there are significant increases in the unadjusted asset turnover and industry-adjusted asset turnover in the three years following a CEO change. Significant positive changes in control group adjusted asset turnover and industry and control group adjusted asset turnover can also be observed in all years except for year 3, in which the changes are still positive but not statistically significant. Overall, the results indicate a significant improvement in asset turnover but no significant improvement in profit margin in the post-turnover years among state-controlled firms. The results are consistent with our regression results, which suggest that sales performance carries more weight than profitability when state shareholders monitor their CEOs.

Panel B reports the performance changes for private firms. The control group adjusted profit margin and the industry and control group adjusted profit margin are positive and statistically significant at the 10% level except for year 1, which indicates that the control-group adjusted profit margin improved for these firms. The changes in unadjusted asset turnover, moreover, are positive and statistically significant at the 5% level except for year 1. There are no significant changes in the industry-adjusted, control group adjusted, and industry and control group adjusted asset turnover.

[Insert table 6 about here]

The second test aims to examine whether the emphasis of shareholders on sales performance is related to their desire to obtain more resources to serve their political and

personal objectives. We construct two variables to capture the importance of political and personal interests. First, we respond to the general notion that governments have a key interest in controlling excess labor, partly in response to voter and interest group pressure (Shleifer and Vishny, 1994), by including a dummy variable to indicate whether there is any over-employment in a firm (*Over*). Particularly, China's state-owned enterprises have a history of pervasive over-employment (Yin, 2001). To identify the phenomenon of over-employment, we use three outcome variables that capture a firm's employment situation: the total number of employees, the ratio between the total number of employees and the book value of total assets, and the ratio of the number of employees to the main operating income. Further, we assume that a firm's normal labor demand is determined by firm size, capital intensity, firm growth, industry (controlling for different technology and production characteristics), and year (controlling for macroeconomic variations). We then employ three median regressions to estimate the supposed normal employment conditions for our three outcome variables and compare them with real employment conditions.¹² We regard over-employment as robustly confirmed for observations where all three median regressions produce positive residuals. Based on these findings we use the binary variable *Over* as a means to capture the need to obtain resources to support over-employment and construct it to equal 1 if a firm has over-employment and 0 otherwise. Second, we introduce a second binary variable to indicate whether a firm's administration fee over the book value of total sales is larger than the year-industry adjusted median value (*Fee*). This variable is used to capture bureaucratic slack, which often signals the extent of firm consumption (Ang et al., 2000; Singh and Davidson III,

¹² We use median regressions to remove the confounding effects of outliers. Consistent results are obtained if we estimate the normal employment conditions by using other quantiles such as the 60th and the 70th quantile.

2003). We include these two dummy variables and their interaction terms with AT to capture the effects of political and personal interests on the sensitivity of turnover to sales performance. Table 7 reports the results.

[Insert Table 7]

Consistent with our expectation, the negative relationship between turnover and AT is stronger for firms with excessive employment and higher organizational slack. When interaction effects are included, AT also loses its independent effect on forced turnover.¹³ Overall, the findings suggest that the emphasis of state shareholders on AT is at least partly driven by political and personal interests.

4.4 Robustness Checks

We explore the robustness of our findings in several dimensions. In our baseline models, we have chosen AT as a measure of sales performance. To ensure that evidence of the sales motive is robust to alternative measures of sales performance we also use sales growth (*GROW*) to capture the sales motive.¹⁴ Compared with AT, annual sales growth has two limitations. First, it is closely related to changes in asset size in the corresponding year, and we therefore add the change in asset size as an additional control

¹³ As Powers (2005) discusses, interpreting the interaction terms in logit models can be problematic because of model non-linearity. We follow McNeil et al. (2004) in using the delta method to check the statistical significance of the predicted turnover probability and its sensitivity with respect to a change in AT. By assuming that all of the other variables are equal to the median values of each sample, we calculate the predicted probabilities and derivatives at the 25th, 50th, and 75th percentiles of AT for firms with different statuses of excessive employment and organizational slack. For the state-controlled sample, we find that the differences in the predicted performance-AT sensitivity between firms with and without an over-employment problem (firms with a high or low organizational slack) are all statistically significant at least at the 10% level. For the private sample, none of the interaction effects is significant regardless of which performance variable is used.

¹⁴ We follow Firth et al. (2006) in using $\ln(\text{sales}/\text{sales}(t-1))$ as the measure of annual sales growth.

variable (*Asset_change*). Second, annual sales growth often displays a great deal of variability. We employ two measures to deal with this problem. First, we restrict our sample by excluding the upper and lower 5% of the observations. The resulting new sample for the regression using annual sales growth as a performance measure has a total of 3,312 observations. We construct the three-year moving average sales growth rate (*MGROW*) as an alternative measure of sales growth performance, as this smoothes out annual fluctuations in sales growth and also allows us to explore whether CEO turnover is more sensitive to average than to annual sales performance. The results using the two sales growth performance measures are consistent with those obtained from our baseline model. As shown in Table 8, we estimate a significant relationship between turnover and annual sales growth rate at the 10% level, while the relationship between turnover and average sales growth rate is significant at the 5% level. This indicates that turnover is more sensitive to the average growth rate than the annual growth rate. When the sales growth variables are included, PM is insignificant in all cases. Overall, our results provide robust support for a strong sales motive but weak profit motive among state shareholders.

[Insert table 8 about here]

Another concern is the following: If, for instance, CEOs have only limited managerial tools to actually affect firm profitability (for instance due to persisting price regulations in state-controlled industries), then reliance on AT rather than PM may not signal a stronger sales motive but may rather be a convenience-driven choice for CEO monitoring in state-controlled industries. To address possible confounding effects

resulting from government regulations, we partition our sample firms into those that operate in a state-controlled industry and those that operate in a liberalized industry. In line with the transition literature (Brada, 1996), we use the percentage of private employment in different industries as the basis for the classification of liberalized industries. Accordingly, an industry is classified as liberalized if the share of private employment in that industry is above the countrywide median value for private employment. By following this classification, we place 720 firm-year observations into a state-controlled industry sub-sample and 3,095 firm-year observations into a liberalized industry sub-sample. We re-estimate our baseline model for the two types of firms and report the results in Table 9. For firms operating in liberalized industries, there is still a significant negative relationship between turnover and AT but no relationship between turnover and PM. This suggests that the insensitivity of turnover to PM is not simply a response to weakly liberalized firm operations. However, there is neither a significant relationship between turnover and AT nor between turnover and PM in state-controlled industries, which is consistent with our expectation that CEOs are unlikely to be evaluated on the basis of financial performance in weakly liberalized industries.

[Insert table 9 about here]

Critics could also question the reliability of our chosen performance measures. CEOs may be evaluated by their average performance rather than fluctuations in annual performance, and we therefore also use a three-year moving average of PM (MPM) and a three-year moving average of AT (MAT) over a CEO's tenure as alternative measures of

CEO performance. Consistently, we find a negative relationship between turnover and MAT but no such relationship between turnover and MPM.

We also respond to concerns that our results could also be caused by heterogeneity in the broader institutional environment, as China's transition economy is characterized by pronounced variability in the extent and scope of its marketization. To rule out unobserved variable bias due to institutional heterogeneity, we control for the degree of provincial-level market development by using the National Economic Research Institute of China (NERI) marketization index (Fan and Wong, 2006). The composite index covers the fields of government and market relations, development of the non-state economy, development of the product market, development of the factor markets, and the legal environment. The index values range from 1 to 10, with 10 indicating the highest level of marketization. Our results are not only confirmed with the inclusion of the comprehensive overall marketization index, but also hold with the inclusion of specialized marketization sub-indices that focus on private sector development, legal quality, and firm-government relations.¹⁵

Different industries tend to have different PM and AT values due to the specific conditions within which they operate. In our baseline models, we use industry-adjusted performance measures to filter out some of these industry effects. Nevertheless, to further ensure that our results are not driven by industry effects, we include a set of industry dummy variables into our models, but the findings remain unaltered.

Finally, we check the sensitivity of the results to our classification of turnover instances. We use both 60 and then 65 years of age as the benchmark for the

¹⁵ For brevity, the results of the remaining robustness checks are not reported. The regression results are available upon request from the corresponding author.

classification of forced retirement. We also include turnover instances that are associated with legal disputes in the forced turnover category. Finally, we exclude turnover cases in which we fail to identify the destinations of the departing CEOs from our forced turnover sample. We obtain consistent results with these alternative classification schemes.¹⁶

5. Conclusion

Previous studies have confirmed that managerial turnover in state-controlled firms is responsive to various financial performance measures, including profitability as measured by ROA and different sales-related measures. These findings seemingly contradict the common notion that a weak profit motive guides and shapes state shareholder behavior. The problem, however, is that none of these studies explicitly distinguishes between state shareholders' sales and profit motives nor examines their relative importance. Based on the common notion that state shareholders tend to have a weak profit motive but a strong sales motive, we distinguish between both objectives and estimate their relative impact on CEO turnover in a sample of listed firms in China.

We obtain three main results. First, CEO turnover is negatively related to the sales performance but not the profitability of the core business. Second, further tests on the interaction effects confirm that the sensitivity of CEO turnover to sales is stronger for firms with over-employment and excessive administrative expenses. This suggests that state shareholders do not treat sales maximization as a tool or means of efficient management. In contrast, a greater sales volume helps to realize social and political objectives such as personal rent-seeking behavior and the provision of excess employment. Third, there is a significant post-turnover increase in sales performance but

¹⁶ The estimation results are available upon request from the authors.

a decline in profitability of the core business. Overall, our study suggests that CEO monitoring is guided by the interest of state shareholders in maximizing sales rather than profitability.

From a broader perspective, our study contributes to the literature on the corporate governance of partially privatized firms. Our results indicate that CEO turnover, as one of the key mechanisms of corporate control, differs profoundly between state-controlled and privately controlled firms. In particular, profit motive plays an insignificant role in state shareholder monitoring, whereas the preference for large sales is a crucial determinants (Buchanan et al., 1980; Kornai, 1992). Our evidence from listed firms in China suggests that corporatization and public listing may be insufficient devices to turn state-owned firms into profit-oriented entities.

In an era of the global revitalization of state shareholdings, these findings may have critical implications for private investors in corporatized state-owned firms and will hopefully inspire further research to better understand the specific monitoring incentives of state shareholders in corporatized state-controlled firms. Notwithstanding, before prematurely generalizing our results, we advocate caution on two counts. First, our evidence is obtained from listed public firms in China only, and further evidence both from developing and developed economies is needed to rule out the impact of country-specific cultural or political effects that might influence state shareholder behavior. Second, as the specific social welfare functions are unknown, our results do not invite inferences on overall welfare effects. Theoretically, the dominance of the sales motive could yield positive short-term welfare effects if local employment rates and wage levels

were taken into account. Nevertheless, such potentially positive social effects would be partly financed by lower firm profitability.

Appendix A: Definitions of variables

Variable	Definition
Force	A binary variable that equals 1 if there was an instance of forced turnover in a given period.
Years	The number of years a firm has been listed on the stock exchange.
Age	The CEO's age
Tenure	The CEO's tenure
Duality	A dummy variable that equals 1 if a CEO is concurrently also holding the position of board chair
DAR	Capital structure as measured by the book value of debt over the total book value of assets.
Size	Firm size, as measured by the natural logarithm of the book value of total firm assets.
Private	A dummy variable that equals 1 if the private is in the position of the controlling shareholder
ROA	The ratio of profit from the core business over total assets
PM	The industry-adjusted profit margin of the core business, which is defined as profit over sales minus the corresponding ratio of the industry.
AT	Industry-adjusted asset turnover, which is defined as sales over assets minus the corresponding ratio of the industry.
Over	A dummy variable to indicate whether there is any over-employment in a firm, which equals 1 if a firm has over-employment and 0 otherwise.
Fee	A binary variable to indicate whether a firm's administration fee over the book value of total sales is larger than the year-industry adjusted median value
Over*AT	The interaction term of variable OVER and AT
Fee*AT	The interaction term of variable FEE and AT
Asset_change	Changes in asset size in the corresponding year
GROW	We follow Firth et al. (2006) in using $\ln(\text{sales}/\text{sales}(t-1))$ as the measure of annual sales growth.
MGROW	Three-year moving average sales growth rate.

Western Symbols of Power in Occupied Taiwan:
A study of the architectural 'Form' of the Governor General's Office in Taihoku

Western Symbols of Power in Occupied Taiwan: a study of the architectural 'Form' of the Governor General's Office in Taihoku¹

Hui-Ju Chang

University of Sheffield

Introduction

The Governor General's Office of Taiwan, built from 1912 to 1919, was a curiously authoritarian building and an interesting snapshot into the period that it was built in. It was necessary because, since the beginning of Japanese rule in Taiwan, the Japanese authority had been run from the traditional Chinese Yamen office from the Ching dynasty whose structure had severely declined. The government needed a building which showed their ambitions and the values that the colonial government held. As part of this the building project team decided to use a design from a public architecture competition. Competitions were a very popular method of attracting high quality yet this was the only competition used in Taiwan during the colonial period and attracted more than 50 designs, all from mainland Japan rather than Taiwan. The architect who later became the technical director of the project, Matsunosuke Moriyama, was a successful architect in Taiwan, building many of the principal town halls, but had failed to progress beyond the first stage of the competition. He was appointed by the Japanese authorities to execute the project from the winning design of architect, Nagano Ueiji (長野宇平治). Of the other competition entries, the archival data found has shown that all of the entrants designed using western architectural forms with few if any 'Japanese' features. For a country which is perceived to be so proud of its architectural traditions, this newly invented tradition is worthy of further exploration.

In Japan western countries initially came for trade and, after being refused, to force Japanese ports to be opened. The humiliation of the subsequent Treaties and the wish to be free from the western threat led to the desire to use western technologies to develop the nation and the restoration of the Emperor Meiji. Under this new regime Japanese architecture opened to the West and the new government soon established a western based education system, with western tastes in style and technology and new building types for the country, such as banks, mints, universities and government buildings such as law courts and town halls. (Watanabe, 1996: 22) It was far easier to imitate western building types than to integrate new functions into traditional Japanese architectural forms.

The desire to learn from abroad was shown in the significant oath: 'Knowledge shall be sought throughout the world so as to strengthen the foundation of imperial rule' in the "Five Charter Oath" in 1868. Much of these changes were therefore facilitated by government employed Western architects who became important translators of ideas from the west to Japan. As such the architecture of the period was representative of the government vision of taking outside influences to join the elite nations of the world and save itself through western learning.

Through this study of the architectural traces from Victorian Europe, through Japan to Taiwan in the form of the Governor General's office we can start to answer the questions of why the choices for the building's form were made, asking: "What is the effect of dominant groups – civil, military, ecclesiastical or, say, Freemasonic? Whose formal codes emerge? What explains exclusions – censored forms?" (Markus, 1993: 12) This paper will first explore the form development of National Government buildings through a study relationship between power and form of buildings and applying this to a short study of the history of national government buildings in Japan. The following part of the paper links these findings to an analysis of the form of Governor General's Office. After introducing the background of the building, this paper

¹ Taihoku is the old name of Taipei in the Japanese Colonial Period.

introduces of the spatial idea of form to explore form from the levels of space, decoration and style following the authority figure's route at the Office. The conclusion of the paper examines the effects that these invented traditions had on the Japanese architectural profession and how borrowing western forms represented the indirect domination of Japanese architectural identity.

Power and form in national government buildings

Buildings, particularly government buildings, possess a distinct quality of power in three main ways. First, by the *feelings* they transmit through their appearance. Buildings can inspire a sense of awe, respect, status and authority, or conversely, familiarity, banality and disrespect. Second, through their design, buildings can transmit *ideas and symbols* of power. Ideas of their importance and status can be shown by distinguishing them from other buildings in the general vicinity or functional group by their size, craftsmanship and expense, and, more particularly, through decorations. Third, buildings transmit power through the *organisation of space* and rooms within a building. "The articulation of space always embeds relationships of power, insofar as it governs interactions between users of a building, prescribes certain routines to them, and allows them to be subjected to particular forms of surveillance and control." (Markus and Cameron, 2002: 68-69)

One of the indications of these three aspects of power is how resources are distributed across the urban space and, at the building level, in certain rooms and areas. Since a building is split into component rooms, the way these resources are split can indicate a high or low degree of status and power. (Markus, 1993: 23) For example, in official buildings staff entrances are often practical whilst official entrances are ornate. Power can also be seen from the levels of hierarchical structures, control and surveillance, by placement or displacement from the axis and the floor a room is placed on. These criteria show that buildings are articulations of social meanings and, in particular, social power so that a decoration, style or articulation of space can be indicative of a level of power and authority.

Beyond the measurement of resource distribution as a crude gauge of power, there are certain symbolic characteristics which can be read in building forms; some of the most obvious examples of this are secular buildings such as banks resembling cathedrals and temples, and tall buildings such as skyscrapers using their height to create a powerful urban symbol. These are metaphors, easily interpretable, where the prestige of one type of building is borrowed for another or the height of a building is equated to its importance. (Markus and Cameron, 2002: 68.) More subtly, a decoration can have a deeper meaning which indicates the values and status that categories of forms are held in. Using the iconography of ancient Greece can denote something about the esteem and status that classical as opposed to national forms. The action of borrowing forms indicates the respect and power that the borrowed form is held in. When the country borrows forms from other cultures in its government buildings then the native culture has less faith in their own forms to show the power of the government.

The form will always reflect the public and hierarchy's understanding of what the building type represents so that forms are never strictly tied to functions. Taking governmental functions as an example, previous to the Meiji era castles were the main administrative buildings in Japan as in the early part of the Edo period the principle of 'one castle for one domain' was established which meant that each domain had to concentrate its military and administrative function in one castle town. (Sorenson, 2002: 15) Castles were therefore saturated with ideas of status and power with the building itself holding the functions of authority - legal, military and administrative - within it. The construction was necessarily large and the tall towers of the castle could be seen for miles. (Schmorleitz, 1974: 63) The urban environment was ordered around

these castles to the extent that an ideal emerged by the seventieth century that the distances of a samurai's residence should be in proportion to his status within the warrior hierarchy. (Sorenson, 2002: 15) This building form however was eclipsed in Meiji Japan with the establishment of new western based building types for national government buildings. This occurred after the restoration of the Emperor Meiji in the context of the threat of colonisation. The new building system became mature in its own way but bore no similarity in form to the previous indigenous government buildings.

These forms taken from the West were developed from the late twelfth century onwards and preserved from the early thirteenth. (Pevsner, 1976: 27) Until the end of the seventeenth century government buildings were nearly all town halls, which collected the functions of council meetings, administrative office and courts of justice in the same building. In the course of the eighteenth century this changed and the functions were re-housed into separate buildings. Differentiation of functions continued, so that by 1800 Houses of Parliament, buildings for Ministries, town halls and law courts all went their own way. (Pevsner, 1976: 34) After this time, any series of major town halls illustrated stylistic, not functional development. (Pevsner, 1976: 53) Therefore the Japanese government were borrowing stable governmental functions from the west, with uniformly separate functions for parliament, ministries, town halls and law courts. However the forms of these buildings were many and varied across Europe and America at a time of intense debate about the meaning and purpose of public architecture, a debate named the 'battle of the styles' which the Japanese were well aware of. The forms chosen were therefore indicative of both the self identity of the newly emerging government and the esteem which the Japanese government held western forms to impress and dominate the governed population. This was no where less the case than in Taiwan, Japan's first colony. The colonisation of the island made Japan the first non-western imperial power.

The Official "Form" of the Governor General's Office

"In Meiji Year 32, the fourth of Governor-General of Taiwan, Count Kodama Gentarō, was expected to be appointed. His first targets were to establish a 'Taiwan Shinto shrine' and 'Governor-General's Hall of Taiwan'. He believed the 'Taiwan Shinto shrine's purpose was to unify the people's consciousness. Yet, the 'Governor-General's Hall of Taiwan' was to show the prestige of Governor-General. Its purpose was to order the Taiwanese people to surrender and to threaten them; therefore, it should have an impressive style." 石川嘉太郎, the technician of the Department of Construction and Maintenance in the Governor-General's office. (Taiwan Architectural Association Magazine, 1936: 337.)

By the passage above it seems that demonstrating the prestige of Governor-General through an impressive style is most significant purpose of the Governor General's Office. As seen in the previous section, buildings, particularly government buildings, produce a powerful experience, and the building form of uses the mores and values of its society to great effect to influence the populace. (Markus, 1993: 27.) This is even more the case when the building is the seat of government and hence a symbol of the country in which it is based. The building process was long and complex with interventions by the central government on the building's form and style including a demand to increase the size of the central tower. The stylistic choices are analysed in order to draw out notions of authority and power in historical Taihoku and why such forms were chosen to influence the public at that time.

The Governor General's Office was a red brick and stone building, shown in figure 1, which used horizontal bands of red bricks and white pebbles on the outer walls. On the windows, keystones were arranged in a wheel shape to add diversity. The façade had sparsely-ornamented arcading along the fourth floor with the columns reaching down to the bottom of the first floor. This arcading gives the building a certain Italian squareness and regularity of outline. Although the façade of the first and second floors are simple with white square balconies which are separated by solid brick columns, the diversity of form from the third floor and ground floor make the front facade lively. This visual effect is very similar to the architecture of Tatsuno Kingo², Professor of Architecture at the Imperial College of Engineering where the architect Matsunosuke studied. There were echoes of the Queen Anne style in the building too, a style which was in vogue when Tatsuno Kingo worked in England in William Burges's office. This was a suitable style for much of the brick architecture constructed in the Meiji period, which Tatsuno recommended as "cheap and easy to produce". (Stewart, 1987: 38) The main traits of Queen Anne were "the use of plain red brick, English (and perforce Dutch) Renaissance details, a returning inclination towards symmetrical composition, and a quality of lightness and delicacy in treatment not associated with High Victorian architecture." (Macleod, 1971: 27) When used by Tatsuno, the lightness of the style was less evident than an emphasis on solidness and the use of white stone to add decoration to the red brick façade: so commonly did Tatsuno employ these features that it became known as "Tatsuno style" and therefore, to a certain extent, a Japanese architectural style.

Figure 1: the final design for the Governor General's Hall

Source: 黃俊銘, 2004: 113

The building's brick-tiled concrete construction, colonnades, gables, vaulted and oeil-de-boeuf windows, brackets, and composite columns reflect classic European elements common during the Japanese Occupation. Although we can say it's a "Tatsuno style" building with its elements of Queen Anne revival, the roots of the style found in Italian Renaissance revival, clear from its symmetrical layout around a vertical axis and classical features. Historically Renaissance architecture represented a return to Roman standards and motifs and this can be seen in the ornamentation in the Office as well as the use of Roman varieties of columns such as the Roman Ionic in the portico and a variation of the Roman composite order in the official entrance room. These features created a complex and imposing façade whilst the squareness and proportion of the building gave a feeling of permanence which was highly visible across the city as it was the tallest building in Taiwan for many years.

² Tatsuno Kingo was the best known of Conder's pupils, followed him as Professor of Architecture and Dean of the Faculty of Engineering at the University of Tokyo, and was responsible for the design and construction of some famous Japanese buildings. He could, perhaps, have been regarded as Conder's successor. (Checkland, 2003:78)

However, the impressive style of the building presents limited scope for understanding the building. In terms of communicating and directly influencing the building's inhabitants, perhaps the most direct effect was from the organisation of the building's space. The organisation of space "provides the material preconditions for the patterns of movement, encounter and avoidance which are the material realisation – as well as sometimes the generator – of social relations." (Hillier and Hanson, 1984: ix.) The spatial structure shows the practical purpose of the building as well as managing power relations. Therefore the circulation of the building connects all the spaces to show the borders of power and hierarchy.

This circulation can be shown by following the Governor General through the building which was his office. The route of the Governor General is logically the main hierarchy in this building which begins from the main official entrance. This entrance is the only one which rises from ground floor to the first floor - the other 8 entrances all lead to the ground floor. The official entrance in the middle of front of the building with a delicate façade surrounding it composed of an independent portico. This was only provided for the Governor or important visitors who would be driven from a private carriage from the left to right ramp (Figure 3). The portico (Figure 4), had a large, imposing Roman Ionic columns in octostyle with eight columns presented on approach and being roughly rectangular in shape. Between the middle columns there was a segmental arch with simple boxes hanging in the cornice below the front arch, which is repeated at either side. Under this arch is a large foliage based relief, which has since been removed, along with much else of the portico since the bomb damage of World War Two. However the original photographs show a classically inspired official entrance which is particularly decorative due to the Roman, rather than the simpler Greek, Ionic capitals.

Once through the portico, the Governor would have reached the lobby. In western National Government building the grand staircase of entrance lobby is one of the key points of the building. As with the foreign office in London, built in 1868, the three-dimensional sketch shows as much as dignity as the architect can muster: a delicate curved ceiling with some huge beautiful decorated pendant lamps though the most significant feature is the grand staircase which branches left and right. (Figure 5) The equivalent purpose and stairway form can be seen in the Governor General's Office. (Figure 6) It was a three story high Baroque style room which used the Composite order of columniation. There were openings divided into three equal parts on the walls along the hallway. Flanking each doorway are two-story high double-pillars with a pair of square-walled pillars directly behind them.

Source: Toplis, 1987: i

Figure 6: Lobby of Governor General's Office
Source: 李重耀建築師事務所 [C.Y.LI ARCHITECTURE & ENGINEERS]

The column stylobate (base) is tall, around the height of a person. The openings on the ground level are rectangular and each interrupted gable was originally decorated with flowers and mouldings. The openings at the upper level are arched and have a roaring lion's head at the top. A large mural by Japanese artist Okada Saburosuke, who was one of the founding members of the Paris-Pantheon art group in 1900, hung on the walls during the Japanese Occupation. The bull's skull in the fresco above these Composite columns, shown below (Figure 9), however, was unusual in its prominence and may betray either an erroneous understanding of the classical orders or defiance of the order. A bull's skull (Bucranium) was used in classical architecture and often garlanded but only used in the Doric order. (Parker, 1896: 156; Summerson, 1980: 123; Vitruvius, 1960) Therefore the presence of a Bucranium in the centre of a Composite order's frieze is puzzling in its symbolism given the importance of its position in the centre of the frieze above the official entrance lobby. (Figure 9) However the position did demand something to be there and, using the grammar of the classical orders, Matsunosuke may have thought that the bull's skull was eye catching, rather than imbued with meaning.

The columns in the lobby, shown below in figure 10, were in the giant order and the capitals roughly followed the Composite order with the key addition of a bird placed between the Roman Ionic volutes, likely to be an eagle. This use of a Roman Imperial symbol may have been used as its empire connotations were suitable to Japan's first overseas colony. The Composite frieze above the stairs is highly decorated as is usual in the order.

Figure 10 (right): Customised Composite capital in lobby
 Source: 薛 琴, 黃俊銘, 2003: iv-63

The top of the stairs of lobby (room 3 in figure 2) was an important place in the building as it was the exact point where the two halves of the building are back to back. It notable in the Japanese period there was a tree in this position or sometimes empty. (Figure 7, 8) Directly behind this point was a huge portrait of the Emperor on the second floor in the back of the main meeting room. This room was working in the centre of the vertical and horizontal axis and so it can be seen as the accumulation of the axis. Therefore in the Governor General's Office the most important person is at the end of the axis on the highest seat (although the emperor was not present in person, merely as a photograph).

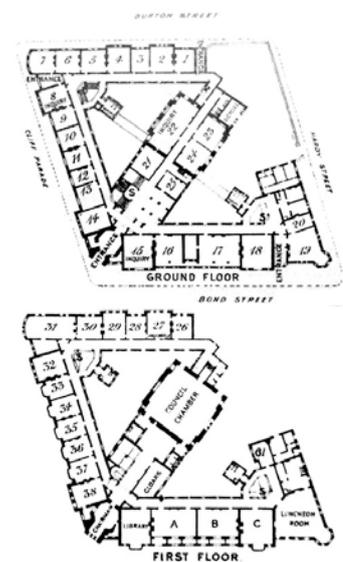

Figure 12: County hall floor plans
 Source: Barber, 1979:116

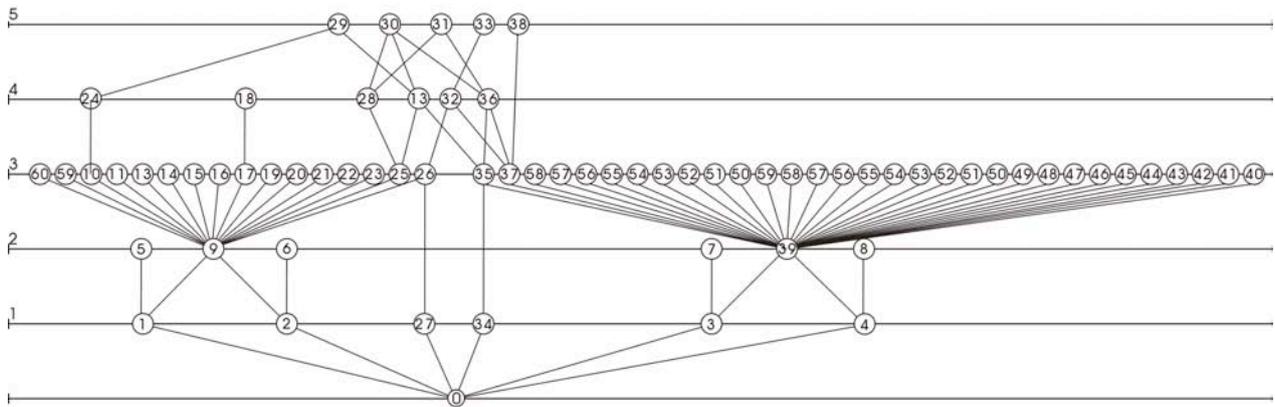

Figure 13: Space-syntax of Second Floor Plan of Governor General's Office

From this official entrance lobby, all the routes for the Governor were made easy by the spatial design; this is because of the high degree of centrality in the building, betraying the importance of the central axis. The rooms that the Governor might pass are all the important spaces to the building as seen the space analysis diagram (Figure 13) which shows the number of levels needed to go from the first to the second floor; the rooms 29, 30, 31, 33, and 38 are the deepest rooms (in red in Figure 11). As this figure above shows, the left and right U-shaped corridors (9 and 39) are almost symmetrically organised, providing easy access to the offices for most of the workforce, being only three levels from any point on the first floor. This suggests an emphasis on practicality and order for workers as well as showing the value of access and openness between colonial government departments. The official entrance is only a few short levels from the corridors too. However, this emphasis on easy access does not stretch to the Governor General's personal office. From any of the six sets of stairs on the first floor leading to the second floor, the Governor needs to go through a minimum of 5 levels, the maximum on the second floor's floor plan, to get to his office (33). This conforms to Markus' position that "depth indicates power... The person with the greatest power is at the tip of a tree, reached through corridors, stairs, outer and inner offices and waiting lobbies." (Markus, 1993: 16)

The Governor's personal office and his secretary's office are just to the right of the central axis (33 and 38 in figure 11) and facing the front of the building on the second floor. He also had his own private entrance so he did not necessarily need to parade. When necessary, the ceremonial entrance took place at the front entrance with the baroque lobby: such ceremonies were a very usual phenomenon for the period in Europe. The inaccessibility of the Governor General meant additional security for him as well as a prime position at the front of the building overlooking the front entrance which itself was guarded by soldiers. It is significant too that this axial system is strong in the centre of the building with the portrait of the emperor dead centre, and the position of the Governor's personal office at the front of the vertical axis, above the official entrance. This is similar to official buildings in the West: the chairman of Wakefield County Hall is also on the central axis and facing the front of the building on the top of entrance floor. (Figure 12) This vertical axis is very important: it is only by traversing the central axis and via a set of stairs that you can be taken through to the Governor General's personal office, often through the majestic two floor high committee hall and through past a portrait of the Emperor. This route is also for higher officers, the important honoured guests or any important ceremonial activity; the vertical axis is reserved for those of a high status.

The Governor General's personal office itself was embedded in western symbolism. It was a luxurious space with high standard, modern facilities. There was one of only three fireplaces in

the building in his personal office³: other heating facilities were not constructed until 1922. This was a feature imported from the west as fireplaces were very rare in Japanese houses where braziers were commonly used. In European countries such as England, heating was crucial. The traditional fireplace symbolised the heart of the home and formed a focal point around which people gathered. (Conway and Roenisch, 1994: 79) Architects in England at this time would always look at the impact of the fireplace on the room so it is a major focus and celebration. It is very interesting evidence to show that the fireplace is a strong western symbol and the architect saw need to have one in the Governor's personal office although it was functionally nearly redundant in the tropical weather of Taiwan.

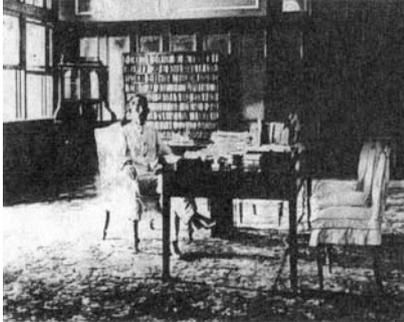

Figure 14: The Governor's personal office (fireplace right of bookcase)
Source: 黃俊銘, 2004: 133

The floor of his office was carpeted. In the near east, the carpet always had and still retains a practical function, as well as a symbolic function whose meaning is now obscured. It signified a magical space whose borders stood for the terrestrial, human sphere, erected as a protective barrier around the field, which symbolized the sphere of the heavens and the divine. (Milanesi and Hyams, 1999: 26) Unlike the consideration the carpet enjoyed in the Orient, it was deemed exclusively a luxury object in Europe, a symbol of authority and power, totally devoid of ties to practical everyday life. (Milanesi and Hyams, 1999: 184) It's usage in westernised Japan was almost certainly following contemporary western usage and symbolism rather than historical Chinese/Middle Eastern carpets.

An important decoration can be found in a room at the top of the main tower, far off the usual route of Governor General. A Taiwanese cypress tablet (figure 15, 16) was made with the date of the beam raising ceremony and the names of the government officials and workers responsible for the construction of the Office of the President. The variety of cypress trees in Japan and Taiwan were unique in the world and often used in traditional architecture in both countries. The use of a Taiwanese cypress tablet to mark the most important ceremony in the building process harked to the building traditions once shared between the two countries and their geographical bond. However the fact that this important symbol is so inaccessible being at the top of the tower reflects the withdrawn position of traditional symbolism in the building as a whole, hidden behind the dominant western architectural forms.

Figure 15, 16: Cypress tablet for beam raising ceremony
Source: 李重耀建築師事務所 [C.Y.LI ARCHITECTURE & ENGINEERS]

³ Besides the fireplace in his office, the other two were in the Governor's private reception and in the honoured guest lounge.

Conclusion

The work of linking the route of space with the appearance of the Governor General's Office discloses an unusual level of symbolism. Through analysing the form in an integrated way a more direct understanding of the effect that the environment has on the user can be found. The reflection of the power of the Governor General is not just in the way his building has been designed, it is also the way he and other bureaucrats perform for they are instruments for the power of the Japanese state. Yet the building shaped the building users behaviour in a new way, moving from the Ching period Yamen to a western style authority building and following a different historical trajectory. For example, the formal Roman Ionic portico entrance meant that the Governor would need to change his behaviour and parade to enter his office, following other European examples such as the Austrian Parliament (figure 17).

Figure 17: The Austrian Parliament building, Vienna.
Source: website

This behaviour change is related to the cultural power that Japan had in this period. Through hiring foreign architects, and following architectural education in the western mould, the only architects who were recognised by the state were those trained in western tradition at the College of Engineering. The traditional Japanese master builders' own qualifications and thus their status and recognition in their own culture (cultural capital) was reduced to near extinction by the advent of this new professional class of western trained architects. (Wendelken, 1996: 30) Yet although these architects had far greater cultural capital than the master builders they were not a dominant group but rather were dominated from afar. For Bourdieu (2001), professionals who have cultural capital but do not own the means of production (i.e. the things or ideas they use to make something) will be classed as the dominated group. The Japanese architect who built the Governor General's Office could never convincingly exercise the western building vocabulary due being dominated by a foreign tradition over which he had no ownership beyond familiarity. Through lending so completely from western architectural forms, the Japanese architects became a culturally dominated group. Indeed, by using culturally borrowed forms such as the Composite order in the Governor General's Office lobby, mistakes in using the vocabulary of the order were likely, as seen by the use of the Doric ox head on the frieze above the stairs.

To alter the position of the architects as a culturally dominated group the Japanese government attempted to change the status of the architectural vocabulary they employed by inventing traditions. According to Hobsbawm (1992) inventing traditions, "is essentially a process of formalisation and ritualisation, characterised by reference to the past, if only by imposing repetition." (Hobsbawm, 1992: 4) Invention of tradition through repetition appeared to be the strategy of the Japanese in the Governor General's Office and the city it was located in as all authority buildings in Taihoku, and important civic buildings such as hospitals and schools, were built in generic 'western style'. Indeed, by using such Roman inspired motifs as the eagle on the Composite columns in the lobby and Roman Ionic portico the Japanese forced visitors to

associate Imperial Rome with Imperial Japan. The route of authorities through the building would have gone through such symbolic and ornate rooms as the porch, lobby, staircase and the personal office of the governor, all rooms full of western motifs. This invention of tradition was not just through association but also through claiming historical commonality: the first architectural historical study by a Japanese architect showed how Horyuji temple's form had been influenced from Alexander the Great whose Greek architecture had spread across Asia to Japan and how echoes of this could be found in the 7th century Japanese temple. (Reynolds, 2002: 531)

Discussions focus on western symbols in the architecture of this period as they are so ubiquitous. Even without understanding the meaning of symbols on the building, the very fact that the Western symbols had become the formal Code which the Office was constructed in shows that the power of the west was already present and the western forms were labelled with a special meaning by the authority. By labelling western forms as suitable for authority buildings they were in turn seen as intrinsically powerful by the beholders. These unfamiliar symbols got their own status in the eastern world by plentiful media propagation through newspapers, postcards and events such as expositions. Ultimately, western symbols became a platform for the populace to obey and understand the new Japanese authority and this feeling transferred equally to respect and obey the West. This is reflected in that after the Kuomintang retook Taiwan from the Japanese all the buildings in Japanese form were destroyed whilst the western official buildings were kept: the Governor General's Office is now the Presidential Office.

Cambodian Animism: Bioregional Living in Practice

By Gregory McCann

The minority people of Ratanakiri and Mondulakiri provinces in Cambodia have almost certainly never heard of the term “bioregionalism.” However, their communities and lifestyles offer much to students and scholars of Ecocriticism; this is especially true for those interested in bioregionalism. The Tampuan, Brao, Kreung, and other minority groups are what Peter Berg and Raymond Dasmann (1977) refer to as “ecosystem cultures” who are adapted to and integrated with their local ecology in a way that ensures long-term prospects for both human and non-human life (Berg and Dasmann). Gary Snyder (1995) elaborates on this point: “Ecosystem cultures are those whose economic base of support is a natural region, a watershed, a plant zone, a natural territory, within which they have to make their whole living” (131). This is certainly true of the indigenous people who provide the source material for this paper, as will be demonstrated in the pages that follow. Special attention is drawn to Cambodia’s minority people because many of them still practice animism, which gives their relationship to the environment a religious underpinning that is composed of a nature-based spirituality. Furthermore, they are what French anthropologist Frederic Bourdier (2006) refers to as “vernacular people” whose societal structures and epistemology are largely shaped by their natural environments –not the other way around (p. 6). Remarkably on the Tampuan, Bourdier concludes “Thus, the manner in which native populations use their environment is directly dependent on the ideas they have regarding themselves, their physical environment and their intervention in the latter” (Ibid, 7). It is in this way that Cambodian animists have much to impart in the way of bioregional knowledge; they are infused with

the ecological milieu and their actions are largely governed by spirits that reside in nature. Without intimate knowledge of the flora, fauna, watersheds and spirit places of their region, their lives would literally come to a halt. Yet despite these attributes, the animistic, ecosystem cultures of Cambodia are on the brink of extinction due to outside forces that are not a part of their bioregion.

Indigenous people represent only 1.4 percent of the population of Cambodia, with the majority living in the northeast part of the Kingdom¹. While the Cambodian government often refers to its indigenous people generally as Khmer Loeu, there are at least eight different tribes living in these two provinces: the Tampuan, Brao, Kreung, and others. Additional minority groups live in small, scattered populations in distant provinces but their numbers are extremely small and virtually no ethnographic research has been done on them and it is believed that they are in the advanced stages of “Khmerization,” meaning that they are heavily integrated into mainstream Cambodian society (Ovesen and Trankell, 2004, 254). While some members of the tribes of Ratanakiri and Monduliri have converted to Christianity, a substantial portion of them still believe in what the West has termed “animism.” The word “animism” was coined by Sir Edward Burnett Tylor in his 1871 book *Primitive Culture* though the definition he established was described in David Hume’s 1757 *A Natural History of Religion* without actually using the word ‘animism’ (Graham, 2005). This definition held that indigenous people were child-like in that they had difficulty distinguishing between animate and inanimate objects, deifying natural phenomenon out of superstition and ignorance. New definitions of animism have surfaced in recent years, most notably from British scholar Harvey Graham, who posits that the “new animism names worldviews and lifeways in

which people seek to know how they might respectively and properly engage with other persons” (Ibid, xiv.). The other “persons” Graham refers to are not always human, but by that he does not necessarily mean spirits, but trees, rocks, thunderstorms, etc.

In some ways, Tylor’s emphasis on the belief in “spirits” per se existing in numerous places fits closer with the reality uncovered in this research; his observation about aborigines being “naïve” or “childlike”, however, has no place in this discussion. Graham’s notion of animism being about living respectfully and harmoniously with one’s surrounding was also, under the right circumstances, supported by my informants, and it is this approach to Cambodian animism which lends itself most clearly to concept of bioregionalism.

The term bioregionalism can be interpreted and explained in many different ways; there is, to date, no concrete definition of the word, and perhaps that is a significant advantage to researchers and students of Ecocriticism. In *Dwellers of the Land*, Kirkpatrick Sale (2000) defines bioregionalism as knowing and appreciating the place where you live in terms of its flora and fauna, its carrying capacity for human impact, and the history of man’s activities in that area (42). A bioregion can also be defined by natural boundaries such as mountain ranges, rivers, wetlands, vegetation types, or climate zones –natural lines of demarcation, as opposed to arbitrary lines drawn up by governments for the sake of convenience –lines that, for the most part, ignore natural landforms and biotic zones. Mitchell Thomashow (1995) asserts that, “The basic premise of bioregionalism is that ecological considerations should determine cultural, political and economic boundaries” (p. 61). Perhaps most apposite for this paper, however, is an approach postulated by Jim Dodge (2007, p.344):

“One of the more provocative ideas to delineate bioregions is in terms of “spirit places” or psyche-tuning power-presences, such as Mount Shasta or the Pacific Ocean. By this criterion, a bioregion is defined by the predominant psychological influence where you live. You have to live in its presence long enough to truly feel its force within you and that it’s not mere descriptive geography.”

This perception strikes closest to the way Cambodian minorities live in terms bioregionalism. Animists in Ratanakiri and Mondulkiri are in tune with spirit presences in their area and extreme care must be taken not to offend or disturb them for fear of incurring their revenge. Bourdier, who has spent considerable time among the Tampuan and other tribes of Ratanakiri, notes “One must also show allegiance to the spirits who dwell in the forest, at water points, rocks, hills, trails and village sites. Without certainty of the “agreement” of supernatural powers (through dreams, sacrifices, prayers), no human action can be undertaken” (p. 28). His findings reflect what my informants explained to me. Highlighting the importance of obtaining the acceptance of local spirits before engaging in activities in spirit-places, Do Yok, a Tampuan, related the story of a large tree stump near the sacred Yeak Lom Lake on the outskirts of Ban Lung:

“Do you see the cut tree there? That was done by minority people. This angered the spirits at the sacred lake, who then killed several people from the minority village where the loggers came from, and all the people from the village had to move out of the area. Even now, minority languages cannot be spoken in the park, or the people who speak it will fall ill and die very quickly.”

(Source: Do Yok, a Tampuan informant, January 2010 in conversation with the author)

Do Yok informed me that the Tampuan villagers who felled the tree did so at the urging of Vietnamese buyers –distant forces who do not live in nor understand this particular bioregion who nonetheless have a serious negative impact on it. Later we will discuss how the most serious threats to animistic cultures practicing what Ecocritics call “bioregionalism” are remote, powerful entities (corporations, governments, etc), as well as economic migrants, none of whom must be allowed to wield too heavy a hand in regions where they are not a part of the ecological milieu.

The villagers who cut the tree at Yeak Lom Lake either understood the risks involved in poaching timber from a sacred locale and decided to try their luck, or they were former animists who no longer believe in the spirits. The former, according to Do Yok, represent a small but growing number of Tampuan people whose actions put not only themselves but innocent villagers at risk from vengeful spirits. As stated by Bourdier, the spirits can communicate messages through dreams; they can also make their wishes known by making people ill, thus instigating the use of a local shaman or “magic man” to relay messages between the human and spirit world. Yet another method employed by spirits for transmitting information is the use of wildlife as mediums. Several species of animals are known messengers of the spirits, among them the muntjac (or barking deer), eagle, leech, chicken and several species of birds.

According to my informants across five tribes, the muntjac is the most feared of all forest animals, and its meat is not eaten. Whether joining a hunting expedition or simply leaving the house, if a muntjac is heard or encountered within two hours of a

journey, the party or individual must turn back and return home at once; the spirits disapprove of your plans. Leu, a 42-year old man from the Kreung minority group near the Da Lai community forest, told a story which was witnessed by numerous villagers:

“A man walked out of his house one morning and even before he reached the bottom of the stairs there was a muntjac crying out. The man stood there, listening to the deer, and shouted back to it defiantly: ‘Yes, I hear you, barking deer. Yes, I know that I will supposedly die within 24 hours if I do not return home. But I don’t believe you! Sure, I will die in one day. Ha ha ha!’ The man taunted the deer all the way to his motorbike and then went about his business. Within twelve hours he was hit by a truck and killed.”

(Source: Leu, a Kreung minority man, January 2010 in conversation with the author)

Anecdotes such as this are difficult for outsiders to verify, but their prevalence among indigenous people in Cambodia is a testament to the significance that signs attributed to local spirits play in their culture, signs which can only be read with special knowledge of the bioregion.

Birds also carry potent messages from the spirit world. In a Jan. 13 2010 piece in the *Guardian*, Margaret Atwood wrote, “Some of us once believed that birds could carry messages, and that if only we had the skill to decipher them.” Traditional people in Cambodia appear to have retained the skill. Leu explained that if an eagle is spotted making a pass in your direction, one must return home; if the eagle flies in a straight line, one may proceed; ignoring these signals may result in illness or misfortune. In the same *Guardian* article, Atwood explains that “We believed the birds knew things we didn’t,

and this made sense to us, because only they had access to the panoramic picture –the ground we walked on, but seen widely because seen from above, a vantage that became known as the “bird’s eye view.” Furthermore, birds play a vital role in determining the end of our lives. Do Yok told of how every person’s time of death is decided:

“For a person to die, three things have to agree on it: the birds, the trees and the earth. When a man or woman dies, a coffin has to be made, and for that a tree must be cut down; the coffin has to be buried in the ground, which means a hole must be dug in the earth. Birds have powerful eyes and can fly and they can see and know everything you do. The birds, the trees and the earth know all about your life and they will decide when it is time for you to go. If someday you get sick and you are lying in bed and a bird comes near your window and chirps –that’s it; you are finished. Nobody and nothing can save you.”

(Source: Do Yok, January 2010 in conversation with the author)

Being in tune with the spirits, therefore, requires careful attention to the fauna and flora of the area you live in, which is also one of the main tenets of bioregionalism. Frederic Bender (2003) notes that, “Crucial to becoming dwellers in the land is knowing the particular ecological relationships operating in the specific place where we live, understanding the cultures native to our place, and knowing the distinctive lore of those who have grown up there” (374). The central theme espoused by Cambodian animists and Ecocritics alike seems to be that the more one knows and understands his natural environment, the less likely one will be to engage in ecologically unsustainable or destructive practices; being clued-in by local spirits makes this relationship all the more

fecund. Man-nature rapport can become a positive feedback cycle as a healthy natural environment inherently offers man greater opportunities for healthier and more prosperous living. As the school principal on the fictional island of Pala notes, “Treat Nature well, and Nature will treat you well. Hurt or destroy Nature, and Nature will soon destroy you” (Huxley, 2002, 261).

Environmental writers provide an abundance of philosophical possibilities about what might constitute a bioregion and how one ought to live within its domain, but how do real “dwellers in the land” practicing animism in Cambodia live? Where exactly do they live and how do they go about life? Is it even a bioregion at all? And what is their current status?

The autochthonous populations of Ratanakiri had extremely limited contact with the outside world until the 1990s (Bourdier, 117). Furthermore, according to Cambodia scholar David Chandler (2007), rural lifestyles and attitudes have changed very little “since Angkorean times (from the ninth to the mid-fifteenth centuries) or even over the last few thousands years” (15). During this vast time span they have practiced swidden (slash-and-burn) agriculture, switching between two land plots approximately every fifteen years. “They have developed over the centuries an intimate relationship with their natural environment by experiencing its potential resources, evaluating appropriate periods of its exploitation, as well as discerning its limits,” explains Bourdier (103). Slash-and-burn or shifting agriculture is not, however, without controversy, and some government officials with strong ties to industry often overplay the ecological destruction wrought by this practice in order to evict indigenous people from their ancestral lands, settle them elsewhere, and establish hydropower projects or agricultural plantations on

these sites. Accusations of environmental destruction are faced by indigenous peoples throughout Southeast Asia, including Cambodia. In a well-documented case in the Malaysian state of Sarawak, James Wong, former Minister of the Environment and Tourism, accused the Penan people of ecological destruction, despite strong evidence to the contrary. “I will not bow to the experts. I am the expert. I was here before the experts were born,” insisted Wong, who supports the expansion of oil palm and logging on their land (Davis, 1995, 101). Astonishingly, Wong also added –contrary to numerous studies– that “logged over areas will return to normal after five years” (ibid, 103). Considering the fact that indigenous populations, including those of Cambodia, have practiced their form of agriculture for millennia without causing serious environmental impacts, accusations of ecological devastation do not coincide with reality.

“Swiddening is above all a long-term technique that stems from the knowledge of the stages of forest regeneration. Its aim is to domesticate without conquering or dominating nature,” explains Bourdier (94). Furthermore, new land plots are not opened up in primary forest, and ceremonial offerings and communication with the spirits always accompanies a new land clearing (Ibid). Therefore, large-scale, permanent, and indiscriminate destruction of forests does not, in general, take place at the hands of indigenous people who practice their traditional way of life.

Kam La, whose Brao village is located near the bank of the Sesan River across from Veun Sai district, explained that before the Khmer Rouge and before construction of an upriver dam in Vietnam, trading and travel was unnecessary; everything his village of one thousand families needed could be obtained from the forest, which to this day is

designated as a “community forest” by the local government, a forest that also doubles as a buffer zone for Virachey National Park, located to the north. He explained that:

“Before the Khmer Rouge, we could get all the food we needed within a short distance of the village. Wildlife was so abundant that elephants used to raid our crops and villagers dare not walk outside at night for fear of tigers. But after the Khmer Rouge, everyone owned a gun. Everyone had a gun because everyone was a soldier, and with those weapons local wildlife populations were basically wiped out, and the villagers then had no choice but to enter the national park, which is sacred [primary] forest; this made the spirits angry and sometimes our people became sick and died, but we had no choice.”

(Source: Kam La, January 2010 in conversation with the author)

The Brao people did in fact live within a specific geographic area, not traveling far, and were intimately familiar with the fauna and flora and the spirits therein; it appears that they qualify as bioregionalists who broke from tradition only when it was absolutely necessary. Similar stories were related by DoYok and Leu, whose tribes reside south of the Sesan River and in and around the community forests of O Chum district.

After the fall of the Khmer Rouge regime, the new Cambodian government offered fifty kilograms of rice for every gun turned in. Villagers, Kam La and Soukhon Thom explained, readily exchanged their arms for the ample food. This deal, which took effect in the early 1990s, was a boon to wildlife, which rebounded not only in Virachey National Park but in the multi-use community forests as well. For a time, ethnic minorities in Ratanakiri were able to return to what might resemble bioregional living,

hunting local animals, fishing locally, growing their own crops, making their own rice wine, and making offerings to the local spirits. This locally sustainable way of life, however, was soon disrupted by yet another outside force –construction of a major upriver hydropower project –the Yali Falls Damⁱⁱ- on the Sesan River in Vietnam.

Fish –as well as aquatic fauna and wild vegetables- from the Sesan River have provided a key source of food for indigenous people in the area for as far back as they can remember, explained Kam La, Soukhon and Do Yokⁱⁱⁱ. However, with the construction of the dam, water levels now fluctuate dramatically, with the result that fish have virtually stopped laying eggs; the Sesan today is nearly devoid of fish in many sections, particularly in the Veun Sai district and near the border with Vietnam. With few fish to catch, villagers once again have been forced to over-hunt in the community forests, depleting wildlife populations, and are compelled to poach in the national park. Additionally, explained Soukhon, many species of bird lay eggs on the banks of the river or in low-lying trees and shrubs and during large discharges their eggs and nests are washed away; many species have been rendered locally extinct as a result.

Yet another problem caused by the fluctuating water levels is flooding, which washes boats downstream, causing serious financial and practical losses to minority villagers. In a tragic event in October of 2009, dam authorities in Vietnam authorized a major discharge during the arrival of Typhoon Ketsana, resulting in a rapid 7-meter rise (in some places it was 13.3 meters high) of the river, a disaster which claimed the lives of two people, killed off large numbers of livestock, destroyed crops, washed away boats, destroyed homes and endangered the welfare of the villagers and other residents in the area^{iv}. Vietnam has yet to offer any reimbursement to those in Cambodia who suffered

losses. The dam also causes the Sesan River to dry up, and in a February 11, 2010 article in the *Phnom Penh Post*, it was reported that it is now sometimes possible to walk across the dry riverbed from one side to the other, and that in addition to fish depletion, villagers cannot wash and are developing rashes and sores when water is discharged because pollution levels have skyrocketed since the dam was constructed^v.

Another threat to minority people's ability to live sustainable and reasonably autonomous lives is the introduction of a cash trading system or "market economy."^{vi} With fish and game being scarce, villagers now have to buy some of their food in stores in Veun Sai and other towns. One way to make big money fast is to poach rare animals that are sold to Vietnam and China, such as the pangolin with its reputed traditional aphrodisiac properties, or the macaque -two species that are now extremely rare in Ratanakiri. Pangolins can be sold to middlemen in Ban Lung for US \$100 - \$300, depending on size; macaques sell for about \$100 on average. These sums represent a considerable amount of money for many village families, and if cash is now needed to purchase staple foods that were formerly available for free in or near the village, the temptation to engage in poaching activities is understandably difficult to resist. Traditional skills handed down through generations are then used to further deplete wildlife, threatening forest ecosystems. According to Do Yok, Leu, Kam La and Soukhon, the advent of a cash economy has also led to an increase in violence, theft, and cheating in the villages. Kam La related a chilling tale from 2004:

"There were two hunters who went into the forest to catch a pangolin. They spent two days to hunt a large animal that was valued at \$300. When they got back to the village,

one of the hunters agreed to go to Ban Lung to sell it while the other stayed in the village to rest. The man who went to Ban Lung returned empty-handed, claiming that his boat capsized in the Sesan River and that the pangolin was carried off downstream. Well, his partner knew he was lying and that he had kept the money for himself. When the thief went off hunting in the forest the next day, his partner entered his home, dismembered his wife and children limb by limb, and then decapitated them one by one. When the butchering was over he stole all of the man's money. The murderer is now serving a 20-year prison term and was ordered to pay 10 water buffalo to his hunting partner."

(Source: Kam La, January 2010 in conversation with the author)

Interactions with the market economy are set to increase as more Khmers and Sino-Khmers move to the region in search of business prospects. Bourdier notes that, "one observes in the villages near the capital the development of a market economy that tends to render previously autonomous villages increasingly dependent on external fluctuations and pressures from "new" populations" (128). Perhaps it is an axiom that migrations to the region, particularly in an age of globalization, are irreversible and futile to resist; it may also be said by some that minority people stand to gain from more outside investment in terms of education and healthcare. While there is some merit to these points (Vietnam built a school in Veun Sai that is free of charge specifically for minority children), this claim demands closer examination.

Many middle-aged and most elderly minority people in Ratanakiri cannot speak Khmer; they speak only their tribal language and perhaps another tribal language. Busy raising a family, farming, hunting, and making offerings to the spirits, they have little

time to learn Khmer; it goes without saying that they are also illiterate, as their languages are strictly oral. In addition, they do not have bank accounts, credit cards or telephones and many do not own vehicles. Many of these vernacular people have little or no formal education^{vii}. As such, they are not well positioned to compete in a cash economy against new settlers, particularly Chinese or Sino-Khmer, who arrive with enough money to buy land (land which in some cases is the minority people's ancestral lands) and set up businesses. Do Yok shared a popular Khmer idiom that sums up the situation: "The Chinese make the Khmer move, the Khmer make the minorities move, and minorities make the spirits move." This means that the minority populations are pushed so far out of their original zones by migrants that are forced to build homes in cemeteries. If cash-rich outsiders come to dominate all trade in Ratanakiri, then it is quite possible that the Tampuan, Brao and other minorities will meet a fate similar to that of the Penan of Malaysia –selling traditional jewelry and clothes and performing native dances and songs for camera-toting tourists where they are paid very little to make a spectacle of their extinguished culture^{viii}. This is hardly a lifestyle the knowledgeable, competent minority people of Ratanakiri would choose.

This situation is exacerbated by the arrival of Japanese, Malaysian and Vietnamese companies looking to set up rubber, oil palm, or other plantations. Unlike with swidden agriculture or selective logging, once plantations are established the native plants species are permanently extirpated and a once-biodiverse region is transformed into a biological desert of monoculture plantations. Worse still, indigenous knowledge systems that developed over millennia with these lost ecosystems are rendered almost useless. As Vandana Shiva notes (1993, pp.6-7):

“Monocultures are in fact a source of scarcity and poverty, both because they destroy diversity and alternatives and also because they destroy decentralized control on production and consumption systems. Diversity is an alternative to monoculture, homogeneity and uniformity. Living diversity in nature corresponds to a living diversity of cultures. The natural and cultural diversity is a source of wealth and a source of alternatives.”

Several benefits are therefore achieved by the establishment of large plantations: minority people are evicted from their traditional lands and thus brought a step closer to being in the fold of mainstream society, “unproductive” natural forests are converted into cash and tax revenue-earning crop lands, the hardwood trees standing on those lands are sold off to furniture companies in Vietnam, and the wildlife can be caught and sold into the pet trade, traditional medicine market, or consumed for food.

There seems to be little that minority people can do to stem this trend, particularly in a nation as notoriously corrupt as Cambodia. Bourdier (p.63) explains that:

“These investors, among whom notable Cambodians have insinuated themselves, come to a conquered territory with cash and in collusion with the highest level of Cambodian government; connivances that promoters of provincial rural development cannot resist, even less the local populations who have nothing to say in the matter.”

Compounding this problem is “land-grabbing” by powerful elites who can simply force minority people off their land under the threat of violence and other forms of retribution^{ix}.

Another direct threat to vernacular cultures grounded in animism in this region is the work of Christian missionaries, who make it plain that their mission is to extirpate animism^x. My informants described how villagers often profess faith in Christ in order to receive much-needed aid, such as medical help or assistance in finding jobs. In this sense, some Christian missionaries dangle a proverbial carrot before needy villagers who have few other alternatives but to accept Christianity and the rules that go along with it. This is not to say that all Christian missionaries are conspiring to overtly ruin traditional cultures in Ratanakiri; the free medical service they sometimes provide is of significant help to many minority people. Nonetheless the fact remains that conversion to Christianity means the end of animism for that individual, with a resulting disconnect from the community and its links to the environment.

Many villagers, however, coyly use the missionaries for help while secretly maintaining their animistic beliefs^{xi}. Leu explained that some people in his village “go to the church and pray to the God, but in their hearts, only animism. They go to the church because they need help, but deep inside, they are animists.” Do Yok said that his mother heard that the Christians could help young men get jobs, so she pressured him to join the faith. “I tried to be a Christian for one month,” he explained. “But then I got very sick, and my mother had to sacrifice a chicken, and after that I got better and went back to animism.” Nach Norb, of the Bunong tribe of Mondulkiri province, told of how the Christians “tried” talking to him:

“They wanted my family to get rid of our rice wine jars [when drinking rice wine, prayers are said to the spirits while stirring the brew], my spirit rice and my spirit things [ancestral shrines]. They told me to read the book about God and then my

life would be happy and I would not have problems, but I read the book and I still had problems; I did not see the God –I only read the book, and I still had my problems. How about my parents and grandparents? They cannot read and they don't understand the words when you explain it to them. And how about my great big forest? It cannot read either.”

(Source: Nach Norb, Mondulkiri province, February 2010 in conversation with the author)

Nach confided that he felt confused about why the Christians insisted that he dispose of his animistic paraphernalia, and that he was left feeling that the missionaries did not properly understand his culture or why these items were important to his family.

Kam La's wife converted to Christianity (there are approximately 30 converts in his village), and she has encouraged him to convert as well. However, Kam La related, “It is very difficult for me to believe in Jesus because I spend a lot of time in the forest and I know that there are many spirits there and I am afraid of them.” It seems probable that in seeing and experiencing nature, animists “see” the manifest forms of spirits and supernatural powers; a single, remote, omnipotent God is unfathomable to my informants, and they were skeptical of biblical claims^{xii}. Leu took an Israeli man trekking who told him about “God the Creator in Heaven.” Leu asked him: “have you seen this God for yourself, or did you only hear about Him on the news?” The Israeli admitted that he had only heard about Him on the news. Similarly, Den, a Bunong elder in Putang village outside Senmonorom, remarked “Every Christian just reads the book; they don't know God by their eyes. They just read the book.” Perhaps it should be taken into consideration the extent to which reading or “studying” about God in a book would seem

unduly abstract to a peoples who have always found spirituality in nature. Furthermore, missionaries should not underestimate the importance of ritual to minority people's daily lives and should understand that in demanding that they dismantle their traditional belief systems that they are, in effect, asking that they deconstruct their entire community and way of relating to the world.

Foreign religion is yet another threat from outside which arrives under a supposedly positive pretext but works all the while at undermining indigenous culture. Combined with the arrival of a market economy, economic migrants, agricultural corporations and large development projects such as hydroelectric dams^{xiii}, the future existence of what resembles bioregional living among the indigenous people of Ratanakiri appears increasingly uncertain. In *Dialectic of Enlightenment* Max Horkheimer and Theodor W. Adorno assert that, "Enlightenment's program was the disenchantment of the world. It wanted to dispel myths, to overthrow fantasy with knowledge" (Horkheimer and Adorno, 2002, 1). On the following page, they put forward, "The disenchantment of the world means the extirpation of animism" (Ibid, 2). Furthermore, they explain, "The local spirits and demons had been replaced by heaven and its hierarchy, the incantatory practices of the magician by the carefully graduated sacrifice and the labor of enslaved men mediated by command" (Ibid, 5). Originally published in 1944, this text is a prescient observation for the fate of indigenous people throughout the world and in particular for those of Cambodia. The world, Adorno and Horkheimer note, had to be "disenchanted" in order for "progress" and "development" to prosper under the auspice of "enlightenment."

Highlighting the ramifications of disenchantment and the importance of natural belief systems, Morris Berman (1981) writes in *The Reenchantment of the World* (p. 23):

“For more than 99 percent of human history, the world was enchanted and man saw himself as an integral part of it. The complete reversal of this perception in a mere four hundred years or so has destroyed the continuity of the human experience and the integrity of the human psyche. It has very nearly wrecked the planet as well. The only hope, or so it seems to me, lies in a reenchantment of the world.”

In this sense, Ratanakiri and Mondulakiri provinces represent two still-enchanted domains –ones that proponents of bioregionalism can learn from- and two of the last bastions of animism not only in Cambodia but in all of Southeast Asia. These are places where traditional culture makes a stand, where man still sees himself as belonging to the ecosystem, but it is an area that is coming under relentless threat from powerful outside forces who have little knowledge of and probably less interest in understanding the spiritual and cultural elements that allow for the indigenous people to live prosperously and sustainably within their bioregion.

Arguments may be put forth that the idea of “preserving” or “saving” indigenous people from modern society is a “romantic” notion. However, this is a clichéd and hollow observation. Emphasizing the active verbs “preserving” and “saving” is a blind reversal of logic. It is modern society that is “threatening” these cultures; therefore, if we did not try to “destroy” them, there would be no need to “save” them. This is not a case of a “damsel in distress” or a pair of warring tribes threatening genocide on one another

whom the international community must rush out to rescue; quite the opposite: these are highly knowledgeable, skilled people who have survived through the ages due to their intelligence and understanding of the natural world.

If the Cambodian government and affiliated investors can demonstrate some tolerance for diversity and some ecological and cultural foresight, there is no reason why indigenous people cannot share their province with Khmers, Sino-Khmers and foreign agro-businesses who operate in fair and sensitive ways. Indeed, both indigenes and outsiders have much to share with one another and both sides would almost certainly stand to benefit if the correct approach is taken. It is now impossible to prevent outsiders from penetrating these (once) remote areas where animist cultures survive, but instead of sidelining indigenous people when it comes to decision making, Cambodia should offer them an important role in regional planning or, better yet, let minorities take the lead; from this a healthy relationship might follow where local knowledge systems thrive and are shared with outsiders who can benefit from ecological insights that have been cultivated over thousands of years through bioregional living.

ABSTRACT:

The aim of this paper is to give a general outline of Sri Aurobindo's critique of modern Western culture. Since the turn of renaissance in Europe, it was found that Indian culture was deliberately misrepresented to the European mind. The critics like William Archer, A. H. Bowman, Claudius Buchanan, George Gogerley, Alexander Duff, Charles Grant, over the centuries made every effort to degenerate and debase Indian culture, which mainly stemmed from their ignorance about this culture of the world. Even in the twentieth century we find this practice still prevalent among the critics of Indian culture like the critique of William Archer. Sri Aurobindo took an enormous responsibility in enlightening the western mind about the true nature of Indian culture. He took firm cudgels against critics like William Archer, and not only disproved every of their arguments by exposing lopsided perspectives in them, but also rendered devastating critiques of western culture. However, it should be noted that Sri Aurobindo criticized only those aspects of modern western culture which really were worthy of criticism and which even the Europeans were coming to realize. Sri Aurobindo made them face the reality of their culture in its true form. This paper aims to give a gist of that critique of modern western culture by Aurobindo. What was said by him fifty years ago holds good even today, and the time it is not only to turn back from the influence of westernization, but strive hard also to understand and further our culture.

Sri Aurobindo's Critique of Modern Western Culture

I

Indian civilization from the very beginning has a great cultural heritage of its own. It has given more emphasis to the spiritual aspect of human life. It is unique in its own way of putting things. But most of us are not even aware of what this culture is. Why is it so?

Culture is embedded in our life and living. From the very beginning, human being starts living in a cultural environment. Thus, the word 'culture' has been defined in various ways by the historians, sociologists, anthropologists, philosophers, and psychologists. In the *Culture-Sociology*, Weber distinguishes culture from civilization. He restricts civilization to science and technology. He restricts culture to philosophy, religion and art. Civilization, according to Weber, is characterized by, "intellectual coherence than by struggles between groups, conjunctions ("elective affinities") of groups, forms of social organization, and ideologies..."¹

When we talk about culture or civilization we mean to say that there was a state of man's existence in his evolutionary history which was not civilized. Civilized here means the standards of living as acceptable by today's value systems. Nomadism is one such state. Myers define nomadism as, "that mode of life in which a human community is enabled, through its control of domestic animals, and also through its own dependence on them, to dispense with the cultivation or even the necessary collecting of plants or plant food, or any deliberate interference with the natural vegetation of a region. It also usually dispenses with any permanent abode, for such a nomad community can (and must) wander wherever its animals find pasture; and it maintains itself with the milk and other products of its cattle – wool, hair, and (occasionally) meat and skins."² Thus, before man became civilized he was a food-gatherer, moving from one place to the other in search of food. Even though he tamed some animals and birds they were moving along with them. It is only when man stopped moving and started growing his own food and built his permanent shelter that civilization took birth. The *Encyclopedia of Philosophy* finds the root of "Culture" in the word "Cultivate". Once a man became cultured he was no food-gatherer; he was a cultivator. So the origin of culture lies in cultivation. All great civilizations of the world like the Harappan, the Sumerian and the Egyptian exhibit settled life - the life, which is free from Nomadism. The Harppan civilization exhibits that India was ahead of the whole world in science and technology. But they ultimately came to prefer a spiritual life. The Vedic, the Buddhist and the Jain literature exemplify and reflect it. Alexander's invasion of India occurred when Buddhism and Jainism prevailed in India. Because of their religiosity and spirituality the Indians lost interest in wars and battles. More than leaving any impact on the Indian mind the Greek invaders carried the Indian thought to Greece.

A culture consists of the socially acquired ways of thinking, feeling and the activities of the member of a particular society. E. B. Tylor says that culture is "the complex whole which includes knowledge, beliefs, art, morals, law, custom and any other capabilities and habits acquired by man as a member of society"³. According to T.S. Elliot,

By culture then I mean first of all what the anthropologists mean, the way of life of a particular people living together in one place. The culture is visible in their arts, in heir social systems, in

their habits and customs, and their religion...but things are simply the parts into which culture can be anatomized, as a human body can... so culture is more than an assemblage of its arts, customs and beliefs.⁴

The western anthropologists and behaviorists view culture as a pattern of behaviour of a group of people. In other words culture is nothing but the way we lead our life. Thus both material and spiritual aspect of our life constitute the core of culture and it is that culture which unites us in a one room. As Sri Aurobindo says:

The culture of a people may be roughly described as the expression of a consciousness of life which formulates itself in the aspects. There is side of thought, of ideal, of upward will and the soul's, there is side of creative self expression and appreciative aesthesis, intelligence, and imagination; and there is side of practical and outward formulation. As people's philosophy and higher thinking give us its mind's purest, largest, and most general formulation of its consciousness of life and impulse. Its art, poetry and literature provide for us the creative intelligence. Its society and politics provide in their forms of and outward frame in which the more external life works out what it can of is inspiring ideal and of its special character and nature under the difficulties of the environment. We can see how much of it has taken the crude material of living, that it has done which it, how it as shaped as much of its as possible into some reflection of its guarding consciousness and deeper spirit. None of them express the whole spirit behind, but they derive from its their main idea and their cultural character. Together they make of its soul, mind and body.⁵

The traditional culture of India provides different dimension to human life, i.e., spiritual, religious, and moral. The spiritual and religious dimension presupposes the moral and social life and the moral and social sphere of life points to the religious spiritual goals. Indian culture basically emphasizes spiritual and religious aspects of life. That is, the Vedantic philosophy tells us what a human being is, does and should do in order to achieve the harmony of the spirit, mind and body. Human being is consists of spirit and matter. Here spirit is Atman or Self and matter is non-self.

A culture only consisting of economic necessity of life, social institution and political organizations cannot be called culture. Rather culture includes the most vital aspects of life, i.e. its spiritual aspect. As Sri Aurobindo says,

A mere intellectual, ethical and aesthetical culture does not go back to the inmost truth of the spirit; it is still ignorance, an incomplete, outward, and superficial knowledge. To have made the discovery of our deepest being and hidden spiritual nature is the first necessity and to have erected the living of an inmost spiritual life into the aim of existence is the characteristic sign of a spiritual culture.⁶

Human beings need freedom for his political, social, economic, religious life. But Aurobindo maintains that the highest freedom is spiritual freedom which is eternal also called *moksha* in Indian tradition. The harmony of spirit, mind body can be achieved only through the teaching of philosophy and religion. As Sri Aurobindo says:

The whole aim of great culture is to lift man up to something which at first he is not, to lead him to knowledge though he starts from an unfathomable ignorance, to teach him to live by his reason, though actually he lives much more by his unreason by the law of good and unity, though he is now full of evil and discord, by a law of beauty and harmony, though his actual life is a repulsive muddle of ugliness and jarring barbarism, by some high law of his spirit though at present he is egoistic, material, unspiritual, engrossed by the needs and desires of his physical being. If a civilization has not any of these aims, it can hardly at all be said to have culture and certainly in no sense a greater and noble culture. But the last of these aims as conceived by ancient India, is the highest of all because it included and suppresses all the others.⁷

Sri Aurobindo suggests degrees of transcendence from ignorance to knowledge, from unreason to reason, from obscure to unity, from ugliness to beauty, from material to spiritual. According to Sri Aurobindo:

A true happiness in this world is the right terrestrial aim of man, and true happiness lies in the finding and maintenance of a natural harmony of spirit, mind and body. A culture is to be valued to the extent to which it has discovered the right key of this harmony and organized its expressive motives and movements.⁸

Man always runs after material satisfaction. With the rise of modernization and technological advancement in the present day society this running-after has turned extreme. Being a social animal he always wants to fulfill his basic needs and wants to live in peace. Does he get peace out of his material satisfactions? Of course he cannot leave the material life and the advancement of the age. He is a seeker of peace and bliss. The mental peace springs only when there is a harmony between the inner and the outer. Man being the rational animal on the earth, has the capacity to maintain the balance between mind and body and keep them in harmony which brings for him the eternal peace. Thus happiness is the goal of all human beings and it can be achieved through this life only. Here happiness does not mean only the material comfort or the material progress, rather true happiness lies in the inner self. A human being can be taken into three levels of being such as physical, the mental and the spiritual. Thus true happiness will come only when there is happiness at these three levels. According to Sri Aurobindo:

India's central conception is that of the Eternal, the Spirit incased in matter, involved and immanent in it and evolving on the material plane by rebirth of the individual up the scale of being till in mental man it enters the world of ideas and the realm of conscious morality, dharma.⁹

II

A culture is characterized by the values it upholds as best for its people, values worth pursuing, and for it, forsaking everything else. Western culture is no exception to this generally accepted perspective of culture. It, geographically considered, belongs to that part of globe which lies on the western fringes of Europe, and includes in it along with those, American and South American countries. But, this is just its objective reality, and this is not criticized by Sri Aurobindo. It is 'modern' prefixed to Western culture that has come under severe censure of Aurobindo. The word 'modern' implies those aspects of culture that are products of this materialist epoch which started roughly with the advent of industrial revolutions throughout Europe. Emphasis on material production, wealth-hoarding, man-as-means, negligence to spiritual development, decline of ethical values are some of the aspects which characterize the modern culture, and give therefore, an altogether different coloring to Western culture. It is this aspect of Western culture that is criticized by Sri Aurobindo and that too, as a reply to attack on Indian culture from the West.

Modern Western culture is characterized by predominance of materialism in its ideology. With its emphasis on capitalism and globalization, condemnation of spiritual superfluity, comfortable relativity of societal norms and traditions, exaltation of reason, it has heralded its own decline in terms of decline of human values – ethical, and social. Compared to it, the Indian culture, characterized by its insistence on spiritual values, equality among races and creeds, emphasis on spirit over body, essence over existence, comes as a better choice for the future of turbulent chaos of today's life, i.e. in a global culture. Indian culture with all its pristine glory and humanitarian attitude has the better chance to survive than the materially reductionist attitude of modern western culture. And this is what emphasized by Sri Aurobindo, in his famous work, *The Foundations of Indian Culture*, written as a counter to the various deliberately sarcastic critiques of Indian culture by the Western scholars like John Woodroffe.

Before we proceed further, a little background, in terms of criticism of Indian culture by William Archer, would not be out of place. Because it is through a response to Archer that Aurobindo makes a strong defense of Indian culture. And it is highlighting its humanitarian characteristics that would be the foremost contributors in making Indian culture a part of global culture in future. In one line, William Archer rendered his hostile critique of Indian culture as,

“The plain truth concerning mass of the [Indian] population – and the poorer classes alone – is that they are not civilized people.”¹⁰

Drawing upon the work of John Woodroffe's *Is India Civilized* which was an answer to William Archers' sarcastic critique *India and the Future* wherein he had spewed nearly every bitter raisin of his brain when he “assailed the whole life and culture of India and even lumped together all her greatest achievements in philosophy, religion, poetry, painting, sculpture, Upanishads, Mahabharata, Ramayana in one wholesome condemnation as a repulsive mass of unspeakable barbarism”¹¹, Sri Aurobindo takes firm cudgels against the whole 'modern' western

culture. Aurobindo exposes the instability and hypocrisy of 'modern' western culture, and refurbishes the image of Indian culture.

But, first he examines what culture is, how India holds on to its central conception of spirit while western culture thrives on the baser shreds of materialism, and why in any global system Indian culture has a better chance to stand while the presence of western culture might spell doom for the entire humanity.

Every culture, according to Sri Aurobindo, is characterized by its central conception, which may be Body or the Spirit. Each nation is a *Shakti* in this sense. While the western culture vouches for body, Indian culture stands out because of its preference for spirit. The body-emphasis ties down a culture to the material wants and desires of earthly life. This can afford momentarily happiness, but not eternal pleasure. The momentariness was never an Indian ideal, although Buddha did talk about Momentariness, but that was to expose the flux of life, and its realization as an ideal to the higher truth of life, which is eternal *Nirvana*. Every little current of Indian culture is seeped with this ideal of eternity. In its every little nuance of cultural life, therefore, the ideal of eternity speaks for itself.

The values here are imbibed not for the sake of immediate gratification, but lifelong commitments, and it should, indeed, be the first prerogative of a culture, i.e. to give values that are eternal to its individuals so as to permeating in them the assurance of their life's worth as well, which gets lost in realization of life's futility to cover up which an individual is led to seek pleasures on here-and-now basis.

In the light of the aims and characteristics of "a great culture" as cited earlier, Aurobindo launches a comparative study of western and Indian culture. Western culture is characterized by the values like rationalism, emphasis on individual's freedom of thought and speech, worldly happiness, human rights, democracy, free market economies and so on. These are not criticized by Sri Aurobindo, however. He himself is enamored by the progress of western culture, but what disappoints him is the simultaneous progress hypocrisy in it, that has not only squeezed life's higher aims from it, but has become responsible also for the subsequent degeneration of it as well. As Nolini Kant Gupta says:

The godless and mechanistic civilization which is rampant today in Europe is a distemper of comparatively recent growth. Its furthest limit does not go beyond the sixteenth or the fifteenth century when the first seeds were sown by the Humanists of the Renaissance. It sprouted with the rationalists of the eighteenth century and the French Revolution cleared the ground for its free and untrammelled growth. But, only in the nineteenth and the twentieth centuries has it reached such vast and disconcerting proportions so as to swallow all Europe's other motives and velleities and to appear as the only form of her life-expression.¹²

Along with this superficial progress, we find the decadence of western culture as well in the form of its over-affection for materialism, open and disguised imperialism, tendency to dominate world's people, restlessness and killing monotony in day to day life, frequent disillusionments

etc. These ills have become such a prominent facet of western culture that these have nearly over-shadowed all its achievement. As notes Sri Aurobindo:

... the modern European civilization of the nineteenth century with all its triumphant and teeming production, its great developments of science, its achievements in the work of intellect we pass a certain condemnation, because it has turned all these things to commercialism, and to gross uses of vitalistic success.¹³

Any culture survives by being driven by its central conception. The central assumption of western culture is reason which is manifested in its other forms of expression which are of materialist nature. Whereas the central assumption of Indian culture is intuition and it is expressed in its spiritual tendency. Thus, when there is talk about the clash of Indian and western culture, it is not the matter about two cultures clashing with each other, but their basic philosophies. Wittgenstein views these phenomena as cultural perspectives and terms these two facets as culture of material development and culture of spiritual life. The first is the culture of progress, the scientific western culture, and the second is culture of liberation, the spiritual oriental cultures. As Wittgenstein says:

Our civilization is characterized by the word 'Progress'. Progress is its form rather than making progress being one of its features. Typically, it constructs. It is occupied with building more and more complicated structures.¹⁴

While such a culture emphasizes on quest of more and more knowledge and development of means to attain that, as is manifested in the spirit of scientific progress, the culture of liberation emphasizes on true understanding of cosmos and man's place in it. The spirit of the culture of liberation lies in 'striving after clarity and perspicuity in not matter what structure'¹⁵. In the words of R. C. Pradhan:

This typically brings in the idea of seeking liberation from the web of intellectual structures that are imposed on our understanding. It seeks freedom from the world-pictures that captivate the human mind. Here, the idea of liberation stands for clarity of understanding and the consequent sense of standing above scientific culture. The latter sense is the sense of transcending the scientific *weltanschauung* and its attendant value-systems. Scientific civilization creates its own value-system in the ideas of progress and progressive acquisition of the material resources. This model of progress thus makes man more and more inclined towards the gross products of our civilization, and contributes towards the impoverishment of the human spirit, especially towards 'separating man from his origins, from what is lofty and eternal'.¹⁶

Thus, culture of liberation is by its distinct characteristics towers high above the culture of progress which although aims, but aims too low, i.e. the conquest of material world instead of the eternal spirit. For the want of higher values like spiritual equanimity, western culture has become one big stinking bog of life that lives on number of sighs taken and given out without realizing the precious significance of that so much so that as a culture it lends its people not the comfort and bliss of life worth living, but a suffocating load of a burden that one has to carry on its shoulders. To entice its people in a perpetual illusion of being superior and civilized, its leading

figures talk about one humanity, one culture, one religion and so on, although, their own foundations of their religion and humanity are so unpredictably shaky that can give way, anytime unawares. As notes Sri Aurobindo:

The mentality of the West has long cherished the aggressive and quite illogical idea of a single religion for all mankind, a religion universal by the very force of its narrowness, one set of dogmas, one cult, one system of ceremonies, one array of prohibitions, one ecclesiastical ordinance. The narrow absurdity prances about as the one true. That narrow absurdity prances about as the one true religion which all must accept on peril of persecution by men here and spiritual rejection or fierce eternal punishment by God in other worlds.¹⁷

Whereas the Indian mind has always been for the comfortable co-existence of as many faiths and religions alongside each other, as long as, all these diverse paths lead to one Supreme Reality. That is the reason of the prevalence of so many faiths and religions in India, whereas the official religion of West comes out as Christianity. Their every critique of Indian culture is aimed at from the frontiers of Christianity, whereas to counter those, there are as many frontiers available as there are religions in India. Indian culture may be characterized by its different religions, so much distinct from each other at times so as to give an idea of hostility to the naïve mind of a westerner, but when the occasion of defending its hearth and home arises, all the different currents intermingle to make one great wave against the alien onslaught. The religious tolerance is proved by one more fact that nearly every major religion of the world is being practiced in India. As Aurobindo says,

“Indian religion has always felt that since the minds, the temperaments, the intellectual affinities of men are unlimited in their variety, a perfect liberty of thought and of worship must be allowed to the individual in his approach to the Infinite.”¹⁸

Aurobindo takes a serious note of William Archers’ warning that Indian culture is rapidly coming under the influence of western culture. How-so-much, the two cultures might seem to be poles apart, it is no denying the fact that a continuous co-existence for more than two millennia has led each of them exposed to the other, which at times have resulted in cultural clashes, but at others, a soft interaction between the two. Sri Aurobindo does not deny West’s rapidly increasing influence on Indian life and tradition, but he also does not forget to emphasize here the imperceptible invasion of Indian thought in the western arena. If West has influenced India, India too has infiltrated the mind of West with its thought. In various fields, this infiltration can be seen, right from religion to science. It has delimited the otherwise limited frontiers of science. Now science too admits occultism in their psychological researches. Theosophy now shows belief in

Karma, reincarnation, other planes of existence, the evolution of the embodied soul through intellect and psyche to spirit.¹⁹

Even Western art and poetry have not been able to escape from this influence from India. But, still, there are miles to go. As compared to West’s influence, Indian influence upon West is almost negligible, and that too, innocent, while West’s influence is not only rapid, but comprehensive and more devastating in the sense that it aims at obliterating the other’s cultural

identity altogether, assimilating the poor vanquished into its materialistic fold. Before this influence from outside assume momentous proportions, Aurobindo calls for an immediate and aggressive self-defense of home-frontiers, when he says:

There arises the necessity of a defense and a strong, even an aggressive defense; for not only an aggressive defense can be effective in the conditions of the modern struggle.... Aggressive defense implies a new creation from this inner and commanding vision and while it demands a bringing of what we have to a more expressive force of form, it must allow also an affective assimilation of whatever is useful to our new life and can be made harmonious with our spirit.... What we have to do is to front the attack with new and more powerful formations which will not only throw it back, but even, where that is possible and helpful to the race, carry the war into the assailant's country.²⁰

Thus, according to Sri Aurobindo, not only the positive defense of our own culture is necessary, but successful inroads into the assailing cultures of outside also is necessary, as this only would prevent further passive possession of our culture by them. Thus the Eternal Spirit, which is the breadth of body, is the real essence of a human being. And the aim of culture is the realization of the true and eternal spirit. Having spirit as its guiding force, a culture should aim at uplifting the human being to higher planes of existences, far above the mundane, worldly plane of material needs and wants. It should lead one to enlightenment, and not disillusionment. It should usher one into the realm of equanimity, and not hurl into the blind chaos of rushing from one desire to another.

Sufism as the Blooming Branch in Doris Lessing's *The Four-Gated City*

Sima Aghazadeh

University of Malaya

Since the 1960s, Doris Lessing has been persistently interested in Sufism, a kind of mysticism originated from the Eastern philosophy. She has been borrowing, embodying, and adapting Sufi ideas and using them openly in the western novel. It is difficult to define Sufism because it is much more than one "ism". Whatever the definition is, Sufism can provide for every person a revelatory means for spiritual life towards the transformation of being. According to Idris Shah, Lessing's Sufi mentor, it is "a certain kind of mental activity" that can produce "under special conditions and with particular efforts, what is termed as a high working of the mind, leading to special perceptions whose apparatus is latent in the ordinary man."⁽¹⁾ In the same manner, Sufism in Lessing's fiction is not a tradition of mystery or sensuality which has been associated with the East, nor should it be regarded as a specific religion. But rather it is a way of perception and a contemporary body of knowledge, rising up against any kind of prejudice and limitations.

Different critics in different works have offered a convincing demonstration of Lessing's Sufi commitment in her fiction.⁽²⁾ Lessing's *The Four-Gated City* (1969), the last volume of *The Children of Violence* series, is one of the early works inspired by and firmly established in Sufism.⁽³⁾ The series, consisting of five novels, traces the growth of the consciousness of its female protagonist-Martha Quest- from her adolescence in South Africa to her later life in England and until her death on an island. The last volume shows 15 years of Martha's life in England in the 50s and 60s, representing her change during the post-war era. The novel includes an apocalyptic Appendix which portrays a dystopian prophesy through some documents written between 1995-2000, describing events before and after "the Catastrophe". In order to make sense of her life and her "self", Martha experiences different ways-marriage, Communism, Color bar issues, World War encounter- but in the last book her experiences are more internal and psychological. Martha goes through extrasensory perceptions and recognizes the possibility of a higher understanding within her. What she finds out is beyond the rational and hierarchal mode of thought as the basis of the western civilization. Within such a scope, Lessing shifts her narrative towards prophesy of a dystopia in the form of "the catastrophe" which brings the western civilization to its end. The British Isles are depopulated by a nuclear disaster and a vast poison gas leak. Such prophesy expresses the author's most political, cultural, and yet spiritual concerns. It causes an end but paradoxically promises emancipation and transformation towards something new in an evolutionary form.

Martha's new Sufi knowledge she gains in the course of the novel is that humanity is in the process of evolution: "perhaps there'll be a mutation. That's why we are all so sick...something new is trying

to get born through our thick skin...everything's changed".⁽⁴⁾ Such knowledge brings Martha to new perceptions and intuitive power which help her to take over the responsibility of an active agent at the time of "the catastrophe". She becomes the nurturer of a new generation of children who are mix of all races and have no desire to hurt each other. The children have special talents: "they are grown-up-not physically of course, but mentally, emotionally. One talks to them as if they are adult...as if they are superior to us...They all carry with them a gentle strong authority. They don't have to be shielded from the knowledge of what the human race is in this century-they know it... we have no word for it. The nearest to it is that they are our guardians". (*Four-Gated City*, p. 662) In this way, the catastrophic ending promises something new in an evolutionary form, a sense of survival for human beings as Martha writes in a letter after the disaster: "we took heart and held on to our belief in a future for our race." (*Four-Gated City*, p. 658) It encourages the readers to break from the ordinary and habitual way of existence and to see themselves in a new way like Martha and the children survivors with extrasensory perceptions and ability to "hear" and "see" what ordinary people cannot. In fact, in the narrative of this novel it is Lessing's Sufi idea which offers her a significant process of reconstruction after deconstruction.

In the epigraph of the novel, Lessing writes a Sufi teaching story of a fool sent with a dish to get flour and salt for his master. In order to keep them separate, he turns over the plate after getting the flour. After getting the salt, he returns to his master and is asked where the flour is. He inverts the dish to show the flour thus losing both. Lessing's epigraph appropriately demonstrates the difficulty of rationality in capturing the two different realities separately. Through such story, Lessing emphasizes, as so do the Sufis, that the way of our perceptions must be examined afresh: "There is something in the human mind which makes it possible for one compartment to hold Fact A which matches Fact B in another compartment; but the two facts can exist side by side for years, decades, centuries, without coming together." (*Four-Gated City*, p.496) Her use of Sufi stories in this novel - and stories of Mulla Nasruddin in *Landlocked*- is her narrative strategy to criticize the one-dimensional mode of western thought and to find another level of meaning. It is a compensation for the rootlessness, discontinuity, and spiritual disintegration of the 1960s (the period of terror and decadence). Thus Sufism here does not advocate any religious or transcendental ideologies as always associated with the Eastern philosophy, but rather it is a trope, a vehicle, to criticize the limited present civilization and a reaction against the ideologies. For Martha, it becomes a higher form of understanding of her own hidden potentials that cannot be expressed by ordinary language. In Nancy Shields Hardin's words, it is a way "to shift in perspective from a more logical linear mode of thought process which we in the Western world have been taught to hold in the higher esteem, to a more intuitive perceptions".⁽⁵⁾ To put it in a nutshell, Lessing's use of Sufism in her writing is not a theistic voice to talk about any Absolute or Transcendentalism, but it is merely a possible alternative for the logical thinking and a warning against the Western sense of division and compartmentalization. Through Sufi ideas, Martha can combine the political with the personal and accept the contradictions and paradoxes as parts of life and to experience something new as Lessing herself says in an interview: "some new thing is happening. Maybe it will be marvelous...maybe out of destruction. There will be born some new creatures... What interests me more than anything is

how our minds are changing, how our ways of perceiving reality are changing.”⁽⁶⁾ In fact, Martha and her new generation of children are the embodiment of such change and transformation through Sufi thought.

Lessing’s Sufism in *The Four-Gated City* does not have any transcendental view; it is and remains in constant connection with politics and psychoanalysis. Martha’s childhood vision of an ideal city in which “There were splashing fountains, and the sound of the flute; and its citizens moved, grave and beautiful, black and white and brown together... the blue-eyed, fair-skinned children of the North playing hand in hand with the bronze-skinned, dark-eyed children of the south” (*Martha Quest*, p.21), and her later culmination of such experience have been a compensation for the violence of Imperialism, the war and post-war era, connected to the historical and political events of her time. Martha’s evolution “from that of a resentful, rebellious adolescent fighting against external forces” in the first volume of the series to “that of a mature woman who struggles against a more dangerous world” in the last volume has constantly been in relation with the external factors.⁽⁷⁾ Her vision of utopia but the achieved dystopia is the critique of her present ideologies. Even the post-apocalypse events documented in the appendix are set in a historical context with the exact time and place. Her realities, even the spiritual ones, are political, historical and psychological. So Lessing’s new Sufi ideas as a way to capture a sense of future of our culture include the framework of social and political realities on which her earlier works have been rested.

Martha’s intuitive power and higher understanding is associated with the psychological concept of madness and its root in social atmosphere. Much of Martha’s self-analysis grows in Coldridge’s house which is a kind of political-cultural microcosm of England of that time. The members of this house suffer from neurotic shabbiness under the pressure of the war and Cold war in the decayed London after the fall of the empire. Martha enters there as a secretary for Mark Coldridge, a political activist and a prominent writer, and stays as a mistress, surrogate mother, and servant. It is in her relationship with Lynda Coldridge, Mark’s wife who is suffering from neurotics, that Martha recognizes her extrasensory perceptions and power of telepathy. Martha shares madness with Lynda. The more she understands Lynda’s situation, the deeper she experiences many of Lynda’s horrors. She begins to realize that some people like Lynda, who can “hear voices” and are judged as mad, can in fact develop human mental potentials. Martha-Lynda bond provides an opportunity to criticize contemporary psychotherapy and its ineffectiveness to heal people like Lynda. They are diagnosed as insane because they cannot act according to the norms society/culture imposes on all people. The point the narrator/Lessing tries to emphasize is that a mad person is a victim and symptom of a mad and fragmented society. The character like Lynda is exactly the result of the pressures of the cultural engulfment that ordinary people cannot know or understand. Through Lynda, Martha gains the Sufi experience of the passage of insanity towards a greater understanding; she learns to read her dreams and to discover the hidden power of her psyche. They can hear each other’s thoughts and recognize each other in themselves. Hence Martha’s Sufi stage of awareness does not transcend but includes her social, political, and psychological factors. It makes her realize that her identity is determined by

both internal and external elements. She, like the Sufis, does not see the internal and external worlds as separate.

Lessing stands for the many-sidedness, complexity and sharpness of Sufism rather than its emotions. Mysticism in general and Sufism in particular embrace multiple opening paths which enable different people to operate in different contexts. Accordingly, Lessing writes: “In every part of the world, the forms of Sufism differ since they are shaped to fit the people living there. The way Sufism is being taught in Britain now differs from what happens in Morocco, Afghanistan, Greece...; the teachers and institutions containing Sufism for this time are different from those in the past, and always changing...”⁽⁸⁾ In the beginning of section four of *The Four-Gated City*, Lessing quotes from Rumi, the great 13th century Persian Sufi poet, which foreshadows the protagonist’s concern with consciousness growth and her effort to achieve an awakened state: “From realm to realm man went, reaching his present reasoning, knowledgeable, robust state- forgetting earlier form of intelligence. So too, shall he pass beyond the current forms of perception... There are a thousand other forms of Mind...” (p.461) This quality that one can participate in Sufi practices anywhere through various pathways towards that awakened state provides a model of pluralism. Lessing uses it as a narrative strategy in this novel to explain the pluralistic potential of Martha’s identity construction in an open process of becoming.

What constructs Martha’s identity is the process of her becoming through different roles that she performs in different contexts. *The Children of Violence* series is Martha’s life-long journey of self-quest. Through five successive novels, Martha performs different roles- a rebellious adolescent, a wife and mother, a Communist activist, a woman in love, a secretary, a surrogate mother- which stress the construction of her subjectivity in a discursive account of events with a sense of process in time and place. One novel continues the other, unfolding something new in a different setting and continuing what happens afterwards. Her quest includes her stage by stage awareness: sexual, social-political, psychological, and above all her awareness of gender roles as cultural constructs. She understands that her self-construction and definition is always bound to her gender identity as an individual woman on the basis of the roles she performs. So even in the last volume, in which Martha experiences her intuitive and mental power, she cannot transcend her gender roles. She remains gendered by caring and mothering the new children. In fact, her Sufi experience is another gender role which evolves her femininity/mothering role into a spiritual power but it is still bound to her time and place, giving her a distinctively social sense of identity. Martha’s Sufi knowledge becomes her author’s narrative technique to express the character’s awareness of her femininity as performance of plural roles. At the end of *The Four-Gated City*, Martha accepts the multiplicity of selves as “a mass of fragments, or facets, or bits of mirroring reflecting qualities”. (p.352) Accepting such multiplicity builds up hope for change, progress and transformation. Like the Sufi way which is fluid and multiple and changes from context to context, Martha changes role to role in the process of change and evolution through new modes of consciousness. What she offers is learning through experience.

Lessing's direct commitment to Eastern Sufism in the Western genre of novel offers a new view of her work as meeting of East and West by practicing syncretism through both-and rather than either/or process. Her use of Sufism should not make us categorize her under a certain circle or another "ism". It is meant to be a narrative strategy to express the multiplicity of meanings that cannot be grasped by ordinary consciousness because, based on Sufi knowledge, "for every ounce which is visible there must be a ton which is active, but not perceived by the ordinary man".⁽⁹⁾ Her use of Sufism is a creative vehicle to shake our minds loose from limited mode of thought and to express human and global evolution when war, natural calamity, and nuclear threats are bringing the civilization to its end. But she gives us hope for survival. Sufism in *The Four-Gated City* is not an ideology but an experience which cannot be "sold or taken: it could only be earned or accepted as a gift". (*Four-Gated City*, p.135) It is an immediate knowledge which encourages Martha along with the readers to enhance their own perceptions of humanity and take responsibility at the time of the growing global violence. It is required to hear the "screeching, wailing, howling bedlam of sounds as if all humanity begged for mercy and help". (*Four-Gated City*, p.657) Lessing's Sufism comes to rest as a tranquilizing solution for the Western nightmarish apocalypse and a blooming branch which she hopes to bend with fruit one day.⁽¹⁰⁾

Literary Texts in Cultural Contexts: Problems and Possibilities in Stage Adapting Prescribed Plays for College Students.

Rani Paul Ukkam M.Phil., Ph.D.
Reader and Head, Department of English,
St. Joseph's College, Irinjalakuda – 680121,
(University of Calicut)
Kerala, India.

Culture reflects and mirrors in many ways the times and the contexts it is produced in. Thus stage renderings of prescribed texts not only show-case them as classroom books, but also bring the spotlight on the ages and cultures that generated the texts and provided a platform for visualizing them. This paper is inspired by a project floated by the author and funded by the University Grants Commission, India, as an attempt to make a new and different exploration into a better understanding and appreciation of two literary texts in English- William Shakespeare's "The Merchant of Venice" and J. M. Synge's "Riders to the Sea", considered as classics from their respective eras- prescribed for the students of the University of Calicut, India. The paper endeavors to project how the above mentioned texts were subjected to a universal cultural transformation for a new generation. The 16th century English and the 20th century Irish plays were remixed with the cultural essence of the indigenous dance form of Kathakali and the theatrical innovations of Experimental drama respectively. The name and fame of Kathakali has crossed the geographical boundaries, but it is yet to take off among the students and the young generations. Theatre, though popular, needs to draw in more students and youth. Therefore, this project was also aimed to shift these performing arts from museum pieces to popular media of entertainment and knowledge. This remixing of old and modern literary texts with different cultural performance media has hopefully resulted in a transnational impact.

In recent times renewed and rigorous attempts have been made to make the stage more acceptable and accessible to the public and in particular to the students. The article "An Ancient World Comes Alive" by H. S. Shivaprakash, about the reviving and re-enactment of Sanskrit classics in refreshingly new and interesting ways, vouchsafes this turn of events (The Hindu, Sunday, Jan. 13, 2008). The first part of this paper focuses on the complexities involved in the rendition of a renowned Shakespeare text on stage in Kathakali form and hints at the hitherto Shakespeare theatre adaptations and their benefits and talks about the novelty in approaching a Shakespeare classic through a classical Indian dance form. In the introduction to "Beginning Shakespeare", Lisa Hawkins talks about the undergraduates of English Studies who would have had previous experience of studying Shakespeare and harbouring the fear that everything has already been said about the bard, and that nothing new can now be discovered (Hawkins, P.2). Discussing the Shakespearian films of Kenneth Branagh, Douglas Lanier writes that "they constitute an extended meditation into the cultural life of the common man" (Lanier, P.149). Commenting on the accusation that he was making 'an appropriation of Indian Culture' in his theatre adaptations of Indian Classics for the Western audiences, Peter Brooks replied in an interview by Ananda Lal, "We are approaching this as part of the common heritage of man, like Shakespeare; one could make the same comment on every part of the world where non English people do Shakespeare. Certain geniuses like Shakespeare make works that belong to mankind" (Lal, P.301).

In recent years the study of Shakespeare in performance has gained momentum, illustrating how a multitude of factors work to exude meanings for a particular audience, and at the same time

expressing certain fears about the reception of the productions and performances. The first stage performance of the project by the school of performing arts, Unnayi Warriar Smaraka Kalanilayam, Irinjalakuda, Kerala, India, was a Kathakali adaptation of the Shakespearian play “The Merchant of Venice” performed for the benefit of the general English Students of Arts, Science and Commerce streams. It broke down such fears and preconceptions and offered a novel critical and academic practice that brought the prescribed text closer and brighter to the students for whom it was staged. Textual scholarship is undoubtedly enhanced by such a closer and colorful viewing and is contributory to the vigorous debate in Shakespeare studies.

There were in all about 25 artists on stage and more in the green room during the performance. All the component elements required by the stage were brought in, with costumes specially made for the presentation. Though the critical garb of Kathakali gave a sense of anonymity to the artists, the melancholy of Antonio, the wisdom of Portia, the villainy of Shylock and the love-driven determination and helplessness of Bassanio were immediately and adequately conveyed. The typical makeshift curtain which is an integral ingredient of Kathakali was used in the shifting of scenes. The vocal music was heightened by the background score provided by the traditional drumming instruments of ‘Chenda’, ‘Maddhalam’ and ‘Chenghala’. This Kathakali production was meticulously preplanned to suit the academic requirements of the students. The traditional form of Kathakali could only be understood by the students who are amateurs in the classical dance form if they are familiar with the thread of the story or the sequence of the story parts and if necessary instructions are given to them on the intricacies involved in the highly complex art form. So, prior to the rising of the curtain, a 15 minute demonstration class was given to the student-audience, making them acclimatized with the various Kathakali gestures (Mudras) and other symbolic nuances. Explanations were given on the peculiar patterns of facial expressions, vigorous and complex eye movements, highly synchronized music that rises and falls and the mystifying curtain, all of which add to the intrigue of the story. The script was in Malayalam, the regional language, but adhered to the art form’s strict rules. The translated version was in keeping with the Kathakali norms. However, sneak previews of the scenes to follow were given in English at regular intervals to the students.

All the key plots of the story of the tragi-comedy were thus succinctly portrayed for the students through the Kathakali performance. The rich and popular merchant of Venice, Antonio, his offer to help his dear friend Bassanio, Bassanio’s falling in love with Portia, a rich heiress of Belmont, Antonio’s borrowing of money from Shylock, the wealthy Jewish money lender, Shylock’s demand that Antonio sign a bond that allows the Jew to cut off a pound of flesh from any part of the Christian’s body, the story of the caskets that determine Portia’s fate, her appearance in the trial scene as the shrewd and learned judge, the final resolution of all the twists and turns related the Ring episode, were all relayed to the student with sufficient conviction.

The next part of the paper attempts to analyze J. M. Synge’s “Riders to the Sea” as a play shifted from the page to the stage. The paper examines the drama as a genre of Literature meant to be performed and refers to Synge’s contributions to the stage briefly explaining the thematic significance of the play and its theatrical possibilities. “Plays are cultural events as well as literary ones”, says Edward Kopper, commenting on the dramatic vision of J.M. Synge (Kopper, P.124). This observation is in keeping with the definition of drama as a genre of literature that is meant to be staged. The culture of the audience also contributes to the meaningful appreciation of the drama. The emotions conveyed through the play may be universally applicable whether it is staged in Europe, America, Asia or elsewhere. However, certain cultural nuances of the dress code, spoken dialect, the mannerisms and gestures or even the materials used, may appear strange to the culturally different

viewers hailing from a different geographical and social milieu. As in Mukunda Upadhyaya's words, drama is the most peculiar, elusive and at the same time enthralling of all types of literature. "It is so deeply associated with and dependant upon the whole material work of the theatre with its thronging crowds and universal appeal that it is undoubtedly so social in its aims and in its appreciations (Upadhyaya, P.157).

The realization of J.M.Synge's "Riders to the Sea" on stage was a successful combination of the theme's universal appeal and theatre's wide possibilities to help a student audience understand the prescribed text through a medium that involved the modern techniques of drama to project the cultural peculiarities of the author, the characters as well as the spectators. Synge discovered the culture of his own land in his play. The setting of the play is a lonely cottage by the sea coast. The roar of the ocean plays havoc with the bitter memories of the central character, Maurya, as she remembers the generations of men in the family who perished in the sea. Only one son is now left to her who also wishes to go to the distant horse fair. The sea is a key character in the play, a demon claiming all who belonged to Maurya- her husband, husband's father and her sons. Four of her sons – Sheamus, Patch, Stephen and Shawn- are already lost to the sea even before the play opens. Michael's death is reported just as the curtain rises. Maurya anticipates the draining of life from her remaining son when the cottage sinks into darkness.

The stage adaptation was by CULT- Calicut University Little Theatre. The theatrical version was scripted in the regional language, Malayalam. Suffice to say that the presentation encapsulated the thematic and especially, the structural pattern of a typical play- the exposition which presented the situation, introduced the characters and acquainted the audience with the action that had already taken place before the play opened, the complication which showed the plot thickening with the conflict, the climax where emotions reached the highest point and the denouement where the plot unraveled. The performance of the play was supported by the meticulously prepared stage settings and props. The focal point was the basin of water on stage which symbolized the rumbling, vicious ocean that claimed so many lives. There was also a circular structure at one end of the stage on which were cast shadows that accentuated the tragic feeling. The clothes worn by the characters had a semblance of Irish costumes and helped transpose another world on to the stage. This was a stark contrast to the Shakespeare adaptation in Kathakali form. All the actors, particularly the actor in the role of Maurya, the mother, struck a chord in the minds of the viewers. The spirit and structure of the play was as that of a Greek tragedy. The conflict between the forces of Nature symbolized by the sea and man was pathetically put across. The stoic courage the old woman imparted won the admiration of the viewers. Though the play dealt with the poor people living on the fringes of the Irish society, its universal appeal was conveyed by the acting prowess of the players, the skill of the technicians and the capability of the director. Prior to the play the Director and the Principal Investigator separately addressed the students and briefed them on the proceedings. A short summary of the play was followed by the exposition of the technicalities involved.

The term inter-culturalism implies that some kind of exchange and interaction takes place between the cultures involved. One of the objectives intended by the project was an inter-cultural study. This was effected to some extent by the translation of the original text in English to one in Malayalam. The characters on stage in a resemblance of western costumes delivering their dialogues in the mother tongue of the students also helped them understand the universality of emotions portrayed. The settings on stage as props were not, strictly speaking, period pieces, but projected an expressionistic platform for the conveyance of the story from a different geographical area.

The concluding part of this paper enumerates the laudatory and derogatory aspects of combining academics with aesthetics. It is observed as though there are quite a few pitfalls, they are outnumbered by the possibilities which sanction the facilitation of similar studies in future. The predominant modes of research on literature are fixed on the printed text, with the scholar trained to focus on the printed word. Oral transmission of ideas through classroom lectures is considered fundamental to imparting knowledge about the text, and is the method followed invariably. In the case of a play the teacher tries to read the text as dramatically as possible. Often the drama is performed on an imaginary stage in the classroom itself, with the students memorizing lines, doing the prompting, making do with minimal settings and props, and with the teacher acting as the director or critic or reviewer. On rare occasions, the student performance is shifted from the classroom to the auditorium, with the larger section of the students forming the audience. It is not often that a play which is prescribed for study in the classroom is stage adapted by professional agencies or troupes. With the experience, training and exposure available to the professionals, there is no doubt that they could make a better job of the presentation and leave the students free to sit back and relax and enjoy, and at the same time sit up and take note and recollect.

The fundamental aspect of a play that cannot be disregarded is that it is written not to be read, but to be watched. There are many moments in a play that depend on and demand to be subjected to a purely audio visual effect, which contributes to the meaning of the text by highlighting these moments and making them linger in mind. The impact on the eye and the ear heightens the intellectual sensitivity and leaves a lasting impression. Live theatre presentations bring about an interactive response which is immediate and spontaneous. It provides more clarity and accessibility to the viewers, and at the same time inspires the performers to give their best. The artists can fine-tune their performance and make suitable alterations in their degree of expression and action by the reaction of the audience. And it must be kept in mind that a student audience is more honest and impulsively responsive than any other. The adaptations of the plays showed that rather than being displaced, the texts were endowed with a new life. The students after the performances began to view the texts differently. Their sense of attachment to the texts became far greater than before. One could sense them relating to the characters and recalling the tales from memory. The stage versions had taken over and almost possessed their reader's imagination.

The stage adaptations also succeeded in effecting an intercultural and international impact and understanding transcending the boundaries built by nations, languages and civilizations. An Elizabethan text and a modern Irish play were hereby translated onto the stage by means of a world renowned classical dance form hailing from the temple premises of Kerala and an expressionist drama practiced and perfected by scholars of theatre studies of the University of Calicut. The English play with the 16th century linguistic nuances and the Irish play with the slang typical of the region were re-scripted in the Kathakali language and the regional language respectively. This kind of a re-rendering of the English texts was a novel experience for the students and enabled them to look at world literature from a different linguistic and cultural perspective.

The project has also established inter disciplinary and inter institutional ties. The work was undertaken by the Department of English at St. Joseph's College, Irinjalakuda, Kerala, India. The Kathakali rendering was by Kalanilayam, Irinjalakuda, a school of performing arts. The original play by William Shakespeare was redone in the Kathakali language by Mr. K. Narendra Warriar for the Kalanilayam. The Calicut University Little Theatre (CULT) presented "Riders to the Sea" with the script in Malayalam. "The Merchant of Venice" in Kathakali form was staged for the benefit of students from two colleges. "Riders to the Sea" was staged in two venues for the students from five

colleges. With projects like these the involvement of academics in productions as advisors is also ensured. This would prevent the adaptations from straying too much from the required realms of the text and guarantee that student requirements are met with.

One of the deepest and most dangerous pitfalls encountered in the stage and performance adaptations is the inadequate knowledge of the chosen dance or art form by the spectators. The techniques involved in the Kathakali rendition, the complexities of make-up, 'bhavas'(expressions), 'mudras'(gestures), the stage conventions etc. pose much difficulty for the viewer. Another problem faced in the realization of the project was regarding the selection and omission of scenes from the text. Kathakali renditions usually require hours, and in this case if the entire Shakespeare text was staged in Kathakali form, it would require several hours which might not help in sustaining the attention span of the students. Hence the need arose for severe editing of the text. This was done in consultation with the Principal Investigator and after considering the interests of both the students as well as the performance troupe.

Another danger posed by such performance adaptations is the fact that it might just result in the misreading of the text by the presenters unless it is supervised closely by the subject experts. Also, the literary aspects of the text could take a back seat with priority being given to the performance media at the expense of the textual details. Apart from the very valid hindrance of the expenses involved and the difficulties of raising funds for such presentations by professional troupes, which in this case was successfully overtaken by the granting of funds from the UGC, there is also the stumbling block of the staging of the adaptations cutting into the regular schedule of teaching. Finally there is the risk of presenting a live performance which cannot be stored for the future. It is true that video tapes are obtained, CDs retained and still photographs taken, but these offer only a shadow of the real experience of seeing a production live on stage. Not even the CD can offer the 3-dimensional reception extended by a live performance on stage.

There was not any de-centering impulse to upset the supremacy of the literary text or the classroom teaching of it. Instead of undermining the text, the aim was to underline it. As texts prescribed for the University students, the presentations were of untold advantage to the students in that they hammered home for the first time in their life what a western play would look like on stage. In classrooms, plays usually are dealt with centering chiefly on their literary aspects and the drama is often lost to the students. The project enlivened the theatre in the play and taught the students how a play is to be assimilated. It was really an event of unmatched informative and entertaining value for the spectators. The presentations proved to them that no theme, eastern or western, is alien to the art form and that it is capable of enacting convincingly any shade of universal human emotion. On the whole, it was an enriching experience and quite a satisfying one, to combine academics and aesthetics.

Niklas Luhmann's Observations on Eastern Wisdom and Zen Buddhism

Abstract

While Niklas Luhmann might have inspired the academics in the social sciences, he has nevertheless discouraged Eastern readers by making two false premises in *European Rationality*. Luhmann criticizes Far Eastern “wisdom” as the “self-reference of knowledge,” developed on the level of first order observations. Also, Luhmann asserts that Far Eastern mysticism rejects the distinction in the communicative practice of the Kung-an in Zen Buddhism. This article attempts to rebut the two incorrect Eurocentric judgments on Eastern culture by pointing out Luhmann’s seeing the East as “Other” and inferior to the West is a typical Orientalism, and by pointing out his misunderstanding of Zen. Zen is not mysticism, not a systematic explanation of life, but a direct attack on formalism, like making distinctions. Zen is to come to direct grips with reality without the mediation of logical verbalizing. The modern epistemological situation is the result of “social differentiation,” the juxtaposition of and interaction between subsystems, according to Luhmann. Within our global society, the West and the East are both social subsystems. Only by the juxtaposition of both can “social differentiation” be possible. The interior of the system (Europe) is a zone of reduced complexity, and communication within a system operates by selecting only a limited amount of information available outside (Eastern wisdom and Zen). Gary Snyder’s understanding and practice of Eastern wisdom and Zen will also be applied to support this position.

Niklas Luhmann, a prominent German sociologist, has inspired the academics in the social sciences with numerous works, such as the influential *Risk: A Sociological Theory* and the monumental *Social Systems*. Recently, Luhmann has even caught the eyes of the researchers in literary studies in Taiwan by his *Ecological Communication, Love as Passion*, and especially his *Observations on Modernity*. The *Observations on Modernity* is a collection of five essays, in which Luhmann has tried to apply his systems theory to observe modernity and try to seek if there is anything modern in it. Luhmann has addressed several striking paradoxes and critically examined the common and prevailing concepts of modernity and rationality. The second essay *European Rationality* will be discussed in this article, whose thesis is that the distinction between European and non-European semantics can only be observed and described from the perspective of a distinctions-conscious rationality. Luhmann's discourses are rather creative indeed, but parts of them are too critical and cynical to be regarded justifiable. For example, Luhmann avers that "Psychoanalysis has never been recognized as a cognition theory but rather is known as a science of therapeutic practice." But actually, as first laid out by Sigmund Freud. Psychoanalytic theory has undergone many refinements through several theorist such as Jacques Lacan and Slovenj Žižek. Also, Luhmann thinks 'relativism' 'historicism,' and so forth are considered of little value, and the 'postmodern' (in reality: the modern) diversity of discussions, of deconstructionism, and of 'anything goes' can only cause a stir as 'happy sciences,' and they style themselves as such" (*Observations on Modernity* 29). Luhmann disapproves of relativism, historicism, and postmodernism. In his *The Ecology of Ignorance*, after outlining some research areas, Luhmann declares that the sponsors have yet to be identified. But in reality, we have great Ecological writers, such as Gary Snyder. What is more, he continues to criticize Eastern wisdom and Zen Buddhism. He has virtually discouraged Eastern readers by making the following two false suppositions in *European Rationality*. First, Luhmann criticizes Far Eastern "wisdom" as the "self-reference of knowledge," developed on the level of the first order observations. Secondly, Luhmann asserts that Far Eastern mysticism rejects the distinction in the communicative practice of the Kung-an in Zen Buddhism.

As a false supposition will lead to an incorrect conclusion, this article attempts to rebut the two incorrect Eurocentric judgments on Eastern culture by pointing out Luhmann's seeing the East as "Other" and inferior to the West is a typical Orientalism, and by pointing out his misunderstanding of Zen. Edward Said's *Orientalism* exposes the Eurocentric universalism which takes for granted the superiority of what is European or Western, and the inferiority of what is not. Without a second thought Luhmann writes, "However we may judge the cultural situation of contemporary world society, what is distinguishable as specifically modern has been formed by the European tradition" (22). Exactly as what Said says, Luhmann takes for granted the superiority of what is European without any hesitation or any doubt. Another

evidence is the clue of Luhmann's Eurocentric ideology unintentionally exposed in the sentence, "And the advantage of European rationality with regard to reflection would not necessarily mean that reflection leads to a self-verified superiority, to a self-assessing Eurocentrism" (23). According to psychoanalysis, Luhmann's denial of Eurocentric ideology only highlights his obvious ideology of Eurocentrism. "Even the Far Eastern tradition already recognizes the self-reference of knowledge, just as it knows self-referential signs, namely symbols. The forms of self-referential knowledge are communicated as 'wisdom.' Wisdom is precisely what is created when knowledge of knowledge, that is, self-referential knowledge, is developed on the level of observations of the first order, never to depart from that level" (37). What does Luhmann mean by self-reference? Luhmann makes a distinction between self-reference and external reference. He says, "With this it achieves that form of the distinction between self-reference and external reference. This ensures that reference to the difference between 'self-' and 'external' is clear for each system in its own way, namely, that that difference is itself... If necessary, the reentry can be repeated within the distinction of self-reference and external reference. The 'self-' then determines itself as a second-order observer that observes how it divides the world with the help of the schema of self-reference and external reference" (34). So in Luhmann's mind, the East with only self-referential knowledge is not able to observe how it divides the world with the help of both the schema of self-reference and external reference. What Luhmann tries to express is that the East does not have a constructive worldview and observes only things visible (the first order observation), instead of those invisible (the second order observation). Self-referential knowledge stays only at the phenomenological level, or the first order observation level, instead of that of cognition—the key to the second order observation. The so-called first order observation is the observed observation. Luhmann argues that the "naked eye does not recognize artistic quality," and Luhmann's first order observation is the naked eye observation and is certainly inferior to European second order observation, which is observing observation, or observation of observation. Edward Said identifies such kind of European cultural tradition as "Orientalism," which is a particular and long-standing way of identifying the East as "Other" and inferior to the West. Besides, Luhmann's using quotation marks on wisdom (that is "wisdom") exposes the fact that he does not regard Far Eastern (a remote "Other") wisdom as wisdom at all.

Actually, what does Luhmann mean by Eastern wisdom? How much does he know about Eastern culture? Luhmann believes "Origins might be sought in divinatory practices in the Near East as well as China, and also in their written textualization and in the reflection of failures in the semantic primary material" (37). Luhmann's knowledge about the Eastern wisdom seems to reside in his imagination with the ancient Chinese mystical divinatory practices prevailing in Zhou Dynasty 1045–256 BC. The East is seen by Luhmann as

homogeneous, the people there being anonymous masses, rather than individuals. They are superstitious and depend on the mystical divinatory practices to make decisions in daily life. In Eurocentric universalism, the actions of the East are determined by instinctive emotions rather than by conscious choices or decisions. Their emotions and reactions are always determined by racial considerations rather than by aspects of individual status or circumstance. Presumably, the *Book of 64 hexagrams* (周易六十四卦) is the hint of Luhmann's concept of the Eastern mystical divinatory practices. He has got his ideas from only the surface and therefore has derogated the profound implication in the *Book of 64 hexagrams*, or the *I Ching* (易經), a "reflection of the universe in miniature." Take *I Ching* (易經) as an example of a kind of Eastern wisdom to show how significant it is to our culture. The word "I" (易) has three meanings: ease and simplicity, change and transformation, and invariability. The three philosophical principles underlying *I Ching* are: First, simplicity, the root of the substance. It is the fundamental law of everything in the universe. Secondly, variability, the use of the substance. Everything in the universe is changing rapidly. Understanding the flexibility in life as something natural will cultivate the positive attitude to handle all the diverse situations. Thirdly, persistency, the essence of the substance. In the continually changing world, there is a persistent principle which does not vary with space and time. Such a principle is of absolute rationality as it deals with the essence of the substance. The 64 hexagrams are built from gradations of binary expressions based on yin and yang. The spirit of the *Book of 64 hexagrams* (周易六十四卦), or the *I Ching* (易經) has been alive in the Asia because of its approved wisdom.

For Luhmann, it seems that proverbs have made up a considerable part of Eastern wisdom. "In any case, as a result we have bodies of knowledge that are only practical in situational contexts (such as proverbs)" (37). Eastern proverbs are like Western ones which make only a small part of wisdom. Why can't proverbs be wisdom? There is a Japanese proverb that I particularly admire. That is "Fall down seven times, Get up eight," 七轉八起, "shichi ten hakki" or "nana korobi ya oki". If you fail seven times, you should be able to recover from those events and be prepared to rise an eighth time. If it is the world or circumstances that should knock you down seven times, you have one more chance to rise. Every one has the opportunity to conquer any kind of adversity. "Love is like a war: Easy to begin, Hard to end!" Isn't this Korean proverb true in reality? "A smile you send will always return." The proverb can be applied everywhere not just in India. The word "Meiji" in Japan's Meiji Restoration means "enlightened rule" whose goal was to combine "western advancements" with traditional "eastern" values. The Meiji Restoration is both self-referential and externally referential. There are various descriptions about Japanese wisdom. Here is one of them: The eight-point traditional Japanese wisdom, from the Japanese Association of Environment and Society for the 21st Century. (1) Mind over attachment to things, (2) Harmony with Nature, (3)

Learning to be Content, (4) Idea of Circulation, (5) Maintaining Harmony, (6) Freedom of Mind, (7) Living based on Respect for Ancestors and Predecessors, and (8) Caring for and Nurturing the Future Generations. Some of them sound spiritual, while some are considered rational, for example “Caring for and Nurturing the Future Generations.”

Luhmann’s ideas of knowledge in the East and the West contradict his observations on modernity. Luhmann regards our world as characterized by contingency and complexity and full of risk, and in such a world, rationality often becomes coextensive with imagination. Luhmann says, “...but also to a plethora of other distinctions that split rationality itself or distinguish it from other, equally valid world orientations of feeling or imagination.” (23) According to Spinoza, there are three kinds of knowledge. Spinoza’s knowledge of the first kind, or imagination, which is contingent, is the perception from the common order of nature. Knowledge of the second kind, or reason, which is necessary (the opposite of contingent), eternal and timeless, is our use of common notions. Knowledge of the third kind is the intuitive knowledge. According to Luhmann, Eastern knowledge is anything but reason, therefore it must be either the knowledge of imagination or that of intuition; while reason started in Europe during the Middle Age. “But only Europe has brought forth worldwide social descriptions that reflect the experience of radical structural transformation of society since the late Middle ages,” says Luhmann (22). “Coextensive” could be explained to mean that modern rationality embraces imagination and imagination penetrates into rationality. Thus, if Luhmann claims modern rationality, how can he despise the knowledge of imagination and intuition, no matter whether the knowledge belongs to the West or the East? Besides, Luhmann has mentioned about “pluralism” in the sentences: Another possibility, the laziest of all compromises, is to agree on “pluralism.” This both begins and avoids the deconstruction of the distinction between subject and object (27). The idea of pluralism, or parallelism, or juxtaposition will widen the visions visible or invisible.

Luhmann regards that “the dependence of the designation on distinctions is the problem that has guided the European development in the direction of a second-order observation” (42). Also, “When we formulate the problem this way, it becomes apparent that Far Eastern mysticism (if this European word is even appropriate) reacts differently, namely with a direct rejection of the distinction, in a particularly drastic manner with the communicative practice of the Kung-an in Zen Buddhism” (42). According to Luhmann, “there are countless explicit distinctions, such as those between mind and matter, state and society, society and community, individual and collective, or capital and labor, that serve as analytic instruments with open (or resulting open or hidden) options for one side or the other” (25). Also, he says that “rationality itself can also be made a component of a distinction whose other side must then be something irrational, for example, pleasure, fantasy, or imagination” (25). Luhmann might

have read a Kung-an story titled “Hsuen-Jei (玄覺) the monk who lodges over night” (一宿覺) But this is not the case designated by Luhmann as rejecting distinction. What is Kung-an anyway? And according to Professor John C. H. Wu (吳經熊) in his *The Golden Age of Zen*, Zen puts a special stress on kung-an (Japanese, *koan*) as a way to enlightenment, and this particular method has become one of the characteristic features of Zen. The Kung-an story goes like this. Hsuen-Jei visited Hwei-Neng (惠能), another monk, for studying Zen. When Hsuen-Jei intended to leave, Hwei-Neng asked, “Why are you in such a hurry?” Hsuen-Jei answered, “I have not even moved, how can you suppose that I am in a hurry?” Hwei-Neng continued, “Are you sure you did not move?” Hsuen-Jei replied, “That you feel that way is because of your sense of distinction (分別心).” Hsuen-Jei continued to say, “Inasmuch as there is no living (which actually signifies the transience of life 人生無常), there is no meaning. How can we recognize the nonexistence and make distinctions?” Hwei-Neng approved, “You are right. Distinction is meaningless.” But Luhmann seems to be seeing this story with his naked eyes, namely on the level of the first order observation. “Naked eye does not recognize artistic quality.” Zen is not this case at all. Luhmann’s idea is a very confused western idea of Zen Buddhism. To approach the subject with an intellectual or theological chip on the shoulder would end only in confusion. Zen can sound, at times, frankly and avowedly irreligious. And it is, in the sense that it makes a direct attack on formalism and myth and regards conventional religiosity as a hindrance to mature spiritual development. The idea to differentiate the East from the West is basically a matter of concern in formalism. To distinguish the external environment from social systems is what a formalist does. Luhmann will never realize and appreciate such a couplet found in a Chinese Zen temple: “剪一片白雲補納，邀半輪明月看經,” which is translated as “Cut a piece of white cloud to patch the monk garment, and invite the semi-round moon to read the sutra together.” That is a state of mind after Satori (enlightenment). Imagine such a picture that the monk himself has been merged into nature, is distinction necessary there? The whole aim of Zen is not to make foolproof statements about experience, but to come to direct grips with reality without the mediation of logical verbalizing, such as Luhmann’s criticism that Zen is a direct rejection of the distinction, in a particularly drastic manner with the communicative practice of the Kung-an in Zen Buddhism. The Zen experience is a direct grasp of the unity of the invisible and the visible, the noumenal and the phenomena, or if you prefer an experiential realization that any such division is bound to be pure imagination.

When we say Luhmann’s Europe is a system, the East is its environment. At the initial stage, indifference to environment is necessary because of building up its complexity. After the complexity reaches to some extent, the system selects some limited information from its environment so as to reduce its complexity. According to Luhmann, “A system excludes itself operatively from its environment and includes itself by observing. It does so by basing

the difference from the environment, a distinction between self-reference and external reference, on systems-internal observations” (35). He says that this means that the system, through exdifferentiation, becomes practically indifferent to what happens in the environment. But this indifference is used as a protective shield to build up the system’s own complexity, which can then be extremely sensitive to irritations from the environment as long as they can be internally perceived in the form of information (37). Luhmann regards that a system is defined by a boundary between itself and its environment, dividing it from an infinitely complex, or chaotic, exterior. The interior of the system (Europe) is a zone of reduced complexity, communication within a system operates by selecting only a limited amount of information available outside (Eastern wisdom and Zen). This process is called “reduction of complexity.” The criterion according to which information is selected and processed is “meaning.” Both social systems and psychical or personal systems operate by processing meaning. As Luhmann stays in his Eurocentric universalism, all the information from the East is meaningless to him. Therefore misunderstanding blocks the communication.

The East has meaning to a considerable number of the Westerners who admire Eastern culture. Allen Ginsberg, the American postmodern poet, claims that Kerouac’s “spontaneous bop prosody” required “an absolute, almost Zen-like complete absorption, attention to your own consciousness, to the act of writing.” (Ginsberg 147) Ginsberg is a lover of Eastern wisdom. In a *Paris Review* interview, he says, “They say intellect, like Saint Thomas Aquinas, will never do it, because it’s just like getting all hung up on whether I could remember what happened before I was born...Blake says something similar, like Energy, and Excess...leads to the palace of wisdom. The Hindu bhakti is like excess of devotion; you just, you know, give yourself all out to devotion” (Tyle 212). Bhakti Yoga denotes the spiritual practice of fostering loving devotion to a personal form of God. Gary Snyder, the American Ecological poet, won the 2008 Ruth Lilly Poetry Prize lifetime achievement award for *The Rabbit*. Ruth Lilly Poetry Prize, \$100,000, is one of the largest for poets. Please do notice the object à of Snyder in the last stanza, “Down arroyos and ditches by highways the water / The people to use it, the / mountains and juniper / Do it for men, / Said the rabbit.” I would like to associate Snyder’s second order observation in *The Rabbit* with a phrase in Chinese wisdom “飲水思源,” which means “think of its source when drinking water.” In *Spring Sesshin at Shokoku-ji* (相國寺), Snyder describes very vividly how severe the disciplines of Zen are. He says, “Zen aims at freedom but its practice is disciplined.” For example, “anyone showing signs of drowsiness will feel a light tap of the stick on the shoulder.” “While studying koans you should not relax even in the bath.” “When you understand Zen, you know that the tree is really there.” (92-101) Gary Snyder is a practitioner of Zen. He has written several poems on Zen, such as *How Zen Masters Are Like Mature Herring*. From his works we understand that he has been influenced greatly by Eastern culture, especially Japanese. Having read many of

Gary Snyder's poems and essays, I have come to the conclusion that although the "political tendency" in his works is completely western, his "literary quality" owes much to Eastern wisdom, especially Zen.

Many Westerners adore imagination, such as Baudelaire who believes that the imagination is the "queen of faculties." And he thinks the imagination must shape what nature makes available to it. Baudelaire's *Correspondences* generates a sort of occult wonder from both his imagination and intuition. De Quincey's imagination through the activation of drug is astonishing in *The Confessions of an English Opium Eater*. He blended and intertwined occasions of laughter and tears. Wordsworth's imagination is developed through spots of time and emits his particular dedicated spirit in *The Prelude*.

According to Luhmann, the modern epistemological situation is the result of "social differentiation," which designates the juxtaposition of and interaction between subsystems. This "social differentiation" is the natural consequence of the radical change in the Macro structure. Luhmann has mentioned that "We might question whether and to what extent the switch from primarily stratified to primarily functional differentiation of social systems has taken place in many regions on a structural level." Within our global society, the West and the East are both social subsystems, differentiated functionally instead of stratifiedly. Only by the juxtaposition of both can "social differentiation," the epistemological situation, be possible. In Luhmann's thought, human beings form part of the environment, while a social system consists only of communication. Our global society needs more communications between the West and the East in order to obtain resonances to solve or at least alleviate all the increasing global problems—population growth, nuclear crises, and global warming, and to achieve a sustainable way of life for all global citizens.

Gender Neutrality Discourses and the Subjectivity of Socialist Women
——Reading novel “*Nǚren*”(Woman) by Wei Junyi

Liu Xi

Dept.of Comparative Literature, The University of Hong Kong

This paper is one significant part of my dissertation, which will be one study on the multiple narratives surrounding the topic of “Chinese women’s liberation (Zhongguo Funü Jiefang)” in the post-liberation period after the establishment of People’s Republic of China in 1949. My thesis will target the historical and cultural texts that represented the complex interrelation between the state gender ideology/discourses and Chinese female subjectivities as its research objects. In this paper, I would like to touch upon the complexity of Chinese gender issues especially the female subject positions of Mao era during 1950s to 1970s by analyzing one literary text created by a Chinese female writer Wei Junyi.

This topic has great significance in rethinking of the gains and pains of Chinese women’s liberation movement——one of the essential Chinese socialist practices. They are critical particularly for the existing Chinese academia in the area of both cultural/literary studies and gender studies because it is closely related to the reappraisal of the so-called “top-down” mode of Chinese women’s liberation movement led by CCP. This description (“top-down”) becomes one generalization which is far from the highly complicated and polyhedral gender-panorama of socialist China, serving as the basis for the negative attitudes to women’s roles in the Mao era. The Marxist ideas on women’s emancipation were put into practice in the semi-colonial Chinese society since Yan’an period. After the founding of People’s Republic of China ,great achievements has been achieved in the improvement of Chinese women’s social status, the advocacy of equal gender relations and the protection of women’s economic, educational, legal and political rights. However, the masculinist order in the state gender ideology and the Party patriarchy in this women’s liberation movement has been identified by the existing scholarship. A popular argument was brought up of the subordination of Chinese feminist issues to socialist ones. However, is the moment of liberation also the moment of yielding one’s female subject position? I think the interaction of female subjects and the state socialization is more complicated that just a kind of one way direction. Or we can say both cooperation and resistance could be found in socialist women’s relations to hegemonic formation. In this process, there’re many kinds of possibilities of women’s gendered subjectivities in 1950s-1970s.

A big problem was found when I checked the existing criticism about the role of Chinese women in the Mao era among Chinese scholars is the appropriation of the theoretical terms “subject” /“subjectivity” underpinning their corresponding textual

interpretations. Most scholars centered on the idea that women lost their “subjectivity” and “femininity” and became androgynous or desexualized by Maoist culture. This kind of critique emphasized the subordination of Chinese women to the new socialist patriarchy by revealing the logic of the dominant narratives of the revolutionary novels. The critique from Chinese Scholar Meng Yue is a typical case for this angle of view when she contended that Lin Daojing, the heroine in *Song of Youth* “succeeds in becoming one of ‘us’, a comrade, facing ‘them’, the enemy, but never an ‘I’ or a ‘self’, nor a gendered individual, nor even an intellectual.” (Meng,1993). Other critics such as Liu Jianmei explored women’s writings of this period and found “traces of subjectivity” or maintenance of a self and gendered individuality which conflicted with the Party’s authority. What she called for is to avoid the risk of retotalizing the authoritarian voice in order to trace the changing, historically specific codes of the feminine.(Liu,2003) Although I agree with them in their detailed analyses of manifestations of patriarchal logic and its counter discourse in the dominant cultural texts, I by no means have in common with them the conceptualization of the interpretive use of the term “subjectivity”. The problem I found in both of the above two perspectives was their liberal view of the “subject” and their use of the concept “subjectivity” in a humanist, universalist and essentialist way. For the above two representative researchers, the legitimate “female subjectivity” can only be directed to individualism and the justified “female subject position” should always stand in opposite to all the aspects of state ideology. The fortunately survived “female subjectivity” which is against the Party’s authority is viewed as stable, unified instead of unstable, disunified or fluid. This standpoint will lead to the neglect of the multiple discursive formation of one’s subjectivity within concrete and complex social relations, institutions and practices in which a subject depends. The state power/ideology itself is not an integrated, unitary or unchangeless whole. The relationship between individuals and the state ideology is not always in a one-way direction. On the contrary, by adopting the poststructuralist way of viewing subject as socially constructed in multiple discursive practices, I will try to explore the complicated discursive formation of socialist female subject in a culturally and historically specific way.

Concurrently with that humanist perspective on the building of Chinese socialist subjects, one tendency showed from the existing Chinese scholarship in their treating of Chinese women’s emancipation is to depreciate its “from above to below” pattern under the influences of Western feminism theories which advocate an opposite “from bottom to top” way of liberating women. This point of view reflected a deep distrust in the state/Party ideology and the corresponding fear of the totalization of its dominating forces. However, aren’t any gaps in the seemingly all-encompassing embodiment of state’s political ideology? Or how do we view the state ideology if we put it into Foucault’s conceptualization of power as a network and of its asymmetries? One enlightening methodology I found from Joan W. Scott is that: “We need to replace the notion that social power is unified, coherent, and centralized with something like Michel Foucault’s concept of power as dispersed constellations of

unequal relationships, discursively constituted in social ‘fields of force’. Within these processes and structures, there is room for a concept of human agency as the attempt to construct an identity, a life, a set of relationships, a society within certain limits and with language—conceptual language that at once set boundaries and contains the possibilities for negation, resistance, reinterpretation, the play of metaphoric invention and imagination.” (Scott,1988). This encourages me to analyze the concrete policies, discourses and their corresponding functions under the title of state/Party ideologies especially the state’s gender politics. My aim is to probe into the extent to which the “from top to bottom” type of women’s liberation led by CCP has its emancipating and empowering force for Chinese women and also the extent to which this liberation is an incomplete one with its own pitfalls. The official sponsored discourses of women’s emancipation and its relationship to the construction of socialist female subjects will be my focus.

Rather than merely searching texts produced by men to find women’s subjective gender identities, I will use women’s own narratives and literary representations to explore the following questions: What’s the relationship between state ideology/discourse and the formation of female subjects in Mao era? What kind of gendered subjectivities did socialist new women own? How these subjectivities were constructed by different resources of gender discourses of this time? In this constructing process how were relationships of power signified? Is there any possible female agency within the power networks of socialist Chinese society? My research method will be based on the following viewpoint: “Although the subject in poststructuralism is socially constructed in discursive practices, she none the less exists as thinking, feeling subject and social agent, capable of resistance and innovations produced out of the clash between contradictory subject positions and practices. She is also a subject able to reflect upon the discursive relations which constitute her and the society in which she lives, and able to choose from the options available. ” (McLaren, 2002)

When CCP came into power in 1949, the emancipation of women and the gender equality policy was incorporated into the state ideology. Equal rights in the political, economic, educational and social domains were granted to the new category of “*funǔ*”(socialist women) , who would thereby enjoy higher social status and more opportunities to lead an economically independent life. Just like in May Fourth era when Chinese male New Culturalists identified women’s oppression as symptomatic of a Confucian culture built on patriarchy (Wang,1999), male intellectuals who adopted Marxism in socialist China ascribed the unsolving of women’s oppression in the past to the failure of the former liberal, bourgeois way to liberate broad Chinese masses without any radical social revolution. A simplified women’s history was then established in official history by just setting 1949 as the turning point for Chinese women’s transition from “the oppressed victims” to “the liberated modern subject”. By adopting gender equality policy and liberating women especially economically, Chinese CCP leaders took pride in the degree of Chinese women’s emancipation

which was viewed as the natural measure of the general emancipation of Chinese people since one of the Marxist principles guiding the official view on women (actually a quotation of French socialist Charles Fourier) is that “The degree of woman's emancipation is the natural measure of the general emancipation.” When there existed a Maoist Myth that the issue of women’s liberation was deemed as “already accomplished”, the social category of “gender” was no longer paid much attention to by the state ideology. Instead, “class” became the most significant perceptual, analytical and classification social term although the conceptualization of “class” mainly relied on gender for its articulation in the dominant narratives. Along with this was the emphasis on social, collective identities of the Chinese people instead of personal, individual ones.

There seemed to be a kind of nongendered image of socialist china since Chinese women were viewed the same as men. Along with the prevalent official discourses on gender equality, there emerged kinds of socialist identities which were gender neutral. These identities were embodied as diverse ways of naming citizens projected by official discourses. These diverse titles include “Qingnian” (youth), “Tongzhi”(comrade), “Shifu” (qualified worker). People were given these titles according to their ages[“Qingnian” (youth)] or professions [(“Shifu” (qualified worker)) Most of the time they were entitled as “Tongzhi”(comrade) which implies that they were viewed as a common member in the socialist society. Underlying all of these titles is the inclination to the social identities such as “socialist new person” and “socialist constructor”, but all of these naming themselves are without any gendered implications. Thus you have to add male or female before these title if you want to distinguish the named ones by their sex such as “female youth” and “male comrade”. But in most public situations, people were called “X Tongzhi” with their surname X.

What’s embedded in these naming strategies in terms of creating new titles and categories is to break the traditional gender boundaries as public/domestic to endow woman with a social identity/position and to include more of them into public labor sphere. When women were entitled with “Qingnian” (youth) or “Tongzhi”(comrade) instead of “funǚ”(socialist women), they were actually called for to direct their private life toward making a contribution to the public area rather than domesticity. Here naming could be seen as an important way of the operation of power by the state ideology. However, power does not operate just in a one-way direction. It is through the assimilation and internalization of these gender-connotation-free titles that a kind of empowerment is possible. Power works into the complex processes of the constitution of the subject. Wang Zheng argues in her article *“Call me Qingnian but not funǚ: A Maoist Youth in retrospect”* that “Coexisting with traditional gender expectations, the existence of a gender-neutral but hegemonic identity legitimates the crossing of gender boundaries for women and enabled personal development in girls.” CCP’s gender neutral and gender equal ideology with its plentiful discourses now serve to the breaking the gender hierarchies and the discursive construction of new subjectivities for women. In the eyes of scholar Wang Lihua who researched the life

of “Iron girls” from the perspective of sociology, the iron girl provided a new image for socialist females. Working hard for the society sometimes brought about social recognition. Although we admit that continuity of patriarchal power was passed on through the official creation of a male cadre system, we should not be blind to the possibility of state ideology in forming socialist women’s agency. A concrete case was brought up in Wang’s paper which is about how village women questioned about the unrealized of the “equal work with equal pay” policy using Mao’s language. “We applied Mao’s thoughts to our practice and asked the cadre ‘isn’t it true that Mao said that we should get equal pay?’ the women told me that even they knew the cadre had no answers, it was an opportunity to embarrass him in public.” (Wang, 1995) From this example we can see the interconnection of subject and power in a poststructuralist way—The subject is both an effect of power and a vehicle of power. Foucault explicitly rejects the idea that individuals are merely the inert or consenting target of power; as he says in his “Two lectures” that “The individual is an effect of power, and at the same time, or precisely to the extent to which it is that effect, it is the element of its articulation.” By seeing power has not only a negative but also a positive aspect, we can understand how it helps to produce subject and discourses in the context of Mao era. Socialist women’s individual interpretations of state ideology constituted subject positions which can question and challenge other subject position that was formed by others subculture in their lives and was trapped in the traditional gender boundaries.

Here I would like to use one novel named “nüren”(women) which was created in 1950s by a female writer Wei Junyi to further illustrate the constructive role of gender neutral discourses in its rejection of sex binary. The heroine in this novel is Lin Yun. She and her husband Song Cheng are both CCP members and cadres in their workplaces but Song Cheng’s position is much higher than hers. Consent to the request of Song Cheng, leaders in Lin Yun’s work unit has been ready to change her current work position into that of Song Cheng’s private life secretary (The real job under this title is do domesticity for Song). Another woman Ma Su who is an old revolutionary friend of Lin Yun also supports the translation of Lin’s job since she herself has already returned from public work place to private family life in the same way. Lin Yun refused to quit her job and was resistant to the job-translation order forced by her husband and the male authority in her workplace. Thus there are several disputes between Lin Yun, her husband Song Cheng and her friend Ma Su. Song Cheng justified his will to change Lin Yun’s twofold roles into a total domestic one as a housewife by arguing that he would like to get rid of Lin Yun’s double workload (public and domestic) in the name of loving and protecting her. “Whenever Song Cheng sees the wrinkles on Lin Yun’s canthus, thinking of her attrited youth time, he felt so indebted to her. Now he has conditions to care for and ease her by changing her job. She should understand him.” However, what Song wants is to draw Lin back to the “legitimate and most suitable” domestic role as a housewife. His idea just reinforced the traditional gender division of labor other than resisting or breaking down it. Meanwhile, what I found is that by debasing women’s participation in the

public work, Song Cheng wants to regain and re-strengthen his familial male authority which is weakened by the larger Party patriarchy which was embodied by appropriating of women's labor force. Harriet Evans maintained that when Chinese women were principally defined through 'class' and political' (communist) considerations and not through domestic, familial, bodily and sexual interests, it is because that the latter perceptive framework is oppressed which might suggest other axes of power and difference productive of social inequalities. (Evans,2007) Thus Song Cheng can resume his superior male position by rearticulating the propriety of the gender based division of labor and returning to gender hierarchy,

Both Song Cheng and Ma Su hold the ideas of the essential biological sexual differences and the inferior and weak female roles. "Nǚren!(woman), we are ultimately nǚren!" Ma Su argued, "We cannot compete with man just because we are nǚren." Then she expressed her dissatisfaction with the tendency of suppression of "femininity": "Why couldn't we pay much attention to our dressing up? Are you willing to be laughed at as bumpkins by those women from the groups of capitalist, merchants or Babbitts? I am most discontent to this! I can also be as fashionable as them!" It seems that this attitude is a rare female subject position which resisted to the degendered social atmosphere and maintained a gendered individual. However, this attitude is questionable if we explore the motives of Ma Su: "(Ma Su to Lin Yun) You'd better take care of Song Cheng such as preparing some invigorant soup for him. You should also pay much attention to your own appearances and dressing codes. We're growing older and older. Although Song Cheng is up to now self-disciplined and faithful to you, you should never lost your alertness to something possibly happen.....(marital disloyalty)". At last, what Ma Su means by "femininity" is mainly sexual appeal. This advocating of "femininity" is just out of her self-subjection to man and her acknowledging of the subordination and the sexual objectification of women.

What Lin Yun objected is this very notion of sex binary. In this fiction, her subject position was reflected by two articulations. In the dispute, Lin Yun rebuked her husband's role as that of Torvald Helmer by referring to Henrik Ibsen's famous play *A Doll's House*. When Song Cheng laughed at Lin Yun's resistance of his advice and order by saying that "well, you wish to become a leaving Nora?", Lin Yun recriminated that "I may not possibly become a leaving Nora, But you certainly resemble Torvald Helmer! ". The play "*A Doll's House*" gained much popularity in May Fourth period by providing a famous female protagonist Nora who seeks independence and challenges her objectification by the patriarchal world. "Grounded in a very different philosophical, political and cultural context, the Chinese enlightenment tells a story of male intellectuals' inclusion of women in their construction of the 'modern human being'".(Wang,1999) Thus May Fourth discourses on gaining an independent personhood(duli renge) played a significant role in forming new women's subjectivities. In this novel, Lin Yun used this very discourse on independence to resist her bestowed position of the sexed "other" with traditional

gender norms. What's more important, socialist gender neutral discourses also had its impact on bringing about women's agency. In her appeal letter to her leaders, Lin Yun argued that "I hope that leaders do not treat me as a housewife who should only attend her husband, but treat me as a Tongzhi(comrade)." Therefore for Lin Yun, the most important gender discourse in her subject position construction is a degendered, or a gender neutral concept "comrade" which signifies a new kind of socialist personal relationship. By treating herself as a Tongzhi(comrade) in both socialist construction cause and private familial relations, Lin Yun expressed her ideal on lovers' relationship basing on a neutral gendered identities. "I just discussed with him(Song Cheng) about the issue of my work, how did he treat this as an issue of love and conjugality?(Song Cheng said her refusal to his request means she did not love him.) Is my refusal to be his secretary due to the lost of my love to him? My words may have been sharp. He is not Torvald Helmer but my revolutionary lover from youth. We confirmed our love to each other through our common advancing steps. However, what our love will be if we share less and less common ground and understanding? This situation is sure to be changed! If not so there will emerge new problems." We can see that when Song Cheng builded the reasonable spouse relationship in his view on the male/female, subject/object sexist binary opposition, Lin Yun based hers on the comradeship which implies both gender equality and a kind of gender neutral identity. The ideal of gender equality between spouses was based on the notions of respecting and helping each other, was encouraged by the introduction of new language in the form of the term "comrade". "Comrade was a gender neural word, it could imply both male and female. As each spouse could be identified as equal partner in terms of comradeship, this relationship of the work place was meant to be carried over form the public to the private sphere."(Wang Lihua 173) From this perspective, we can understand the author Wei Junyi's own words about the motives of her writing this novel. In the postscript of this novel "About 'Nüren'", Wei Junyi contended that "Of course, when I was writing this novel I though I should express the idea that a woman is ought to have the same independent personhood, enterprise and career ideals as a man. However, this theme is not a dominating one. It is not the sexual differences between women and men, but the differences in mentality and morality (among people, either male or female) that really matters." We can see that the author has already presupposed the significant role played by "independent personhood/sense of independence" in the constitution of women's subject position. But more than that, what she emphasized here is a kind of significant "mentality and morality" which could surpass the sexual differences (either socially constructed or viewed as biologically exists which as also constructed/man-made). It is this special "mentality and morality" that weighs heavily in the constitution of socialist subject position, female subjectivity and agency. From the analysis above, we can see that this "mentality and morality" is out of a communist value system which highlights a new sort of personal relations as "socialist comradeship" with its ideals in equality, the devotion to the social cause as well as the belief in the common good.

Again, within this comradeship, like in the Chinese enlightenment movement,

Chinese women was not called on to become the other of man, but rather, were called on to be the same as man. Female intellectuals such as the author Wei Junyi who were influenced by the May Fourth “independent personhood” discourses, would find in the new socialist discourse such as “women are the same as man”, “comrade” and “gender equality” a forceful identity which serve to break the hierarchical gender boundaries and resist the sexual essentialism. “Modern human being”, “socialist constructor” and “comrades” are all discourses beneficial for Chinese women to fight against the positions as “objects” and “the other”. In this way, the state ideology and gender neutral discourse, together with the May Fourth liberal feminist legacy helped to construct women’s subject positions which can question both the male authorities and the essentialist sex binarism.

Of course, if we accept that gender is a primary way of signifying relations of power (Scott,1988), we should also see behind the socialist gender neutrality discourses the state power which always intend to utilize the liberation of women for its political, national ends. However, we should also see that individuals are not merely the inert or consenting target of power. Power has not only a negative but also a positive aspect; it produces subject, disciplines and discourses. The subject is both an effect of power and a vehicle of power. It is through power and its constitution of the subject that resistance is possible. Socialist state discourses on “gender neutrality”, “gender equality” can also be empowering ones in forming women’s sense of independence and agency. Thus we should not always treat socialist subjects as merely oppressed and restricted. This novel “Nüren” provides an example to us.

Meanwhile, there’re many kinds of possibilities of women’s gendered subjectivities in 1950s-1970s since at this time there coexisted the socialist state ideology on gender equality, the remaining gender based social division of labor as well as the scientific assumptions on women’s biological inferiority. Socialist female subjects were constituted discursively through complex social relations and institutions at that time. This led us to contextualize women’s experiences and analyze their constitution within asymmetries of power relations. The aim to reexamine and reevaluate the Chinese women’s liberation legacies will rely on the exploration of female subjectivities in a culturally and historically specific way. That’ll be the primary guiding principle for my future research devotions.

Evaluating the Universal Health Insurance Coverage (UC) scheme in Rural Thailand- Using a ‘Wellbeing Focused Evaluation (WFE) approach’¹

Assistant Prof. Farung Mee-Udon

This paper proposes a new approach to evaluation, ‘Wellbeing Focused Evaluation (WFE)’, to understand the impact of the UC scheme on the wellbeing of villagers in Northeast Thailand. This framework is adapted from the Wellbeing in Developing Countries (WeD)’s conceptual models, as proposed by Gough and McGregor (2007). According to WeD’s definition, wellbeing can be understood as: needs met (having), meaningful action (doing) and satisfaction (thinking) with life. Ethnographic research was conducted for eight months in one non-remote and one remote village using a multi-methods approach, including questionnaire surveys, focus groups, in-depth qualitative interviews, participant observation and some of the WeD’s research methods. By investigating the villagers’ experiences, it was found that the UC scheme has provided a sense of security and has lowered the cost of healthcare, thereby contributing to the wellbeing of the villagers. However, the study also found that not everyone with a UC card used it and the main reasons given for this were: trivial illness, opportunity cost, having alternative facilities, the poor quality of service on offer and cultural gender role. In addition, the UC continues to experience problems with regards to its implementation and has come in for criticism. Such criticism has included: restricted number of choices, low quality of service and discriminatory treatment. Although these problems have affected the villagers card usage, they have not adversely affected their wellbeing and having a UC card is viewed by the villagers as a form of life insurance, which can be used whenever they need to.

Keywords: The Universal Healthcare Insurance Coverage Scheme (UC), wellbeing

1. Rationale: Why ‘Wellbeing Focused Evaluation (WFE)’?

The justification for applying WFE to healthcare evaluation in Thailand can be attributed to two key factors. The first is the current economic, political and social transformation taking place in Thailand. Such changes have led to the Thai population broadening their aspirations from that of economic security to that of wellbeing as the main development goal. The importance of wellbeing has been emphasised in the nation development plan (2002-2006) as illustrated below:

‘The plan prioritised solutions to problems arising from the economic crisis in order to build an economy with strong internal foundations and resilience to external changes, while aiming for balanced development with respect to people, society, economy, and environment in order to achieve sustainable development and the wellbeing of the Thai people’

¹ This paper is a part of the PhD thesis entitled: ‘The contribution of Universal Healthcare Insurance Coverage scheme (UC) to the wellbeing of villagers in Northeast Thailand’. It was presented at the Samaggi Conference on 7-8 February 2009, University of Cambridge. However, it has not been accepted for publication in a journal.

(NESDB, 2009)

Increasing concern with the concept of wellbeing and attempts to incorporate it into the public developmental framework have also been witnessed. In 2007, the Public Policy Development Office (PPDO) organised an international conference to discuss the concept of wellbeing at the UN Conference Centre (UNCC) in Bangkok, at which many participants suggested that the notion of wellbeing should be understood as both objective and subjective, because both dimensions are essential for human beings and policy development (McGregor et al., 2008; Cummins 2008; Frijters and Mujcic 2008; Gray et al., 2008).

The second factor which supports the use of WFE relates to the reforms which have been taking place within the Thai health sector since 1992, in response to the increasing demand for better healthcare policy, i.e. an affordable and equitable one as set out for the first time in sections 52 and 82 of the 1997 constitution (Pannarunothai 2005; Wongkongkathep *et al.*, 2004). More recently, the growth of interest in wellbeing can be seen through the first national health assembly conference in Bangkok in December 2008, which placed wellbeing as a primary national development goal (National Health Commission Office -NHCO, 2009)

In this context, socio-economic change combined with increasing interest in wellbeing at the national level and in the Thai health sector itself have encouraged health policy makers to launch a new health scheme called the Universal Health Insurance Coverage scheme (UC) in 2001. Although the ultimate objective of this scheme is to enhance the wellbeing of the Thai people, the UC evaluation which is used by the National Health Security Office (NHSO) i.e. the public opinion poll, does not take into consideration the fact that the healthcare system and Thailand as a whole are constantly undergoing change. Thus in attempting to address this gap, this paper argues for a WFE approach as a broader tool for healthcare evaluation.

2. The problem: What has happened in Thailand with regards to the UC scheme?

The UC scheme is known in Thai as the ‘30-baht²scheme.’ This scheme has wider significance for health policy in developing countries, because Thailand is one of the first middle or low-income countries to introduce universal healthcare coverage for its population. It has been seen as an innovative and important policy for increasing access to health services in a rapidly developing society and it has been suggested by the World Health Organisation (WHO) that its success will be watched closely as a possible model for other countries (Towse 2003).

In Thailand, inequality and inefficiency in the distribution of healthcare services has been a major issue for those who use the healthcare system (Ministry of Public Health-MoPH, 2004). Although the government had been attempting to provide various health insurance schemes before 2001, these systems had proved problematic and were often criticised by academics and health administrators. The main criticisms included: the burden of high expenditure on healthcare and inequalities of access generated by the existing types of

² Under the scheme, there were two types of card. The first one was a free card and the second one was a co-payment card with which people paid 30 baht (approximately £0.50, \$ 0.86) for each visit or admission. Although all cards launched under the UC scheme were replaced by free medical treatment throughout the country from 31 October 2006, the term ‘30 baht scheme’ remains well known because it was used in a previous ruling party’s political campaign under the motto ‘30 baht treats all diseases’ to explain that all illnesses could be cured for only 30 baht .

healthcare systems, that is to say the poor could not afford similar quality to that of the rich. Moreover, it was reported that in 2001 around 30 percent of Thai people had no health insurance and thus had to pay for treatment (Tangcharoensathien, 1996 and Jirojjanakul, 2004).

These problems led to changes at the policy level regarding the organising and financing of the healthcare system so as to improve the situation in order to make the healthcare more equal and accessible to poor people. These changes were driven by governmental initiatives and advocates for civil society, such as: research institutions, NGOs, user groups and private sector representatives. Consequently, various policies have been introduced, particularly aimed at increasing access to healthcare for poorer people. This culminated in the UC scheme which was launched in 2001 driven by former Prime Minister Thaksin. It was very popular among poor people and contributed greatly to his electoral success, certainly amongst the poor. However, this led to the UC being criticised because of its populist nature and some scholars have argued that the UC was a tactic to get votes from the poor (Siamwalla 2003, Phongpaichit and Baker 2004, 2005, Warr 2005).

The implementation of the UC scheme began in April 2001 and subsequently was expanded all over the country in the same year. It was the most expansive single policy initiative, in terms of coverage of the population, and had the largest budget of all the major initiatives introduced in 2001 (Changson, P and Chaitrong, W. 2003). The UC scheme aims to decrease inequity in healthcare by providing the same quality of service to uninsured people as to those covered by other forms of insurance, such as the Social Security Scheme (SSS) and the Civil Servants Medical Benefit Scheme (CSMBS). The ultimate goal of the UC scheme is to promote the wellbeing of the Thai people (NHSO 2007).

Two lines of debate have emerged with regard to the impact of the UC scheme. On the one hand supporters have argued in favour of the UC and have perceived that it has improved access among uninsured people, by lowering user costs. The government has used public opinion polls to measure the success of the UC scheme and polls have repeatedly shown that since 2001 approximately 80-90 % of Thai people have expressed themselves to be satisfied with the scheme. On the other hand, opponents have argued that the scheme has created numerous problems, many of which have been reported in newspaper articles and research studies. These problems include: staff shortages caused by numerous resignations of doctors, a corresponding increase in workload among the remaining healthcare workers, and inequitable treatment of patients. In addition, the quality of the UC scheme as a whole has been affected by ambiguity and instability within its administration. Although several research studies have been undertaken to investigate this controversy, the government continues to rely on its high level of support in the public opinion polls to justify people's satisfaction to the scheme. Given the nature of public opinion polls, namely that it draws heavily on large-scale surveys focussing on general satisfaction, the government has been of the opinion that most people are satisfied with the UC scheme. With regard to the debate outlined above this paper aims to contribute to it by proposing an alternative way to approach the evaluation of the UC scheme, that of 'Wellbeing Focused Evaluation (WFE)'. Moreover, in this paper argues that, in order to gain a better understanding of the impact of the UC scheme on people's wellbeing, a more holistic way of understanding it is needed than simplistic public opinion polls. The WFE approach which incorporates: objective subjective and social aspects is considered as being one such holistic way of evaluating the UC scheme and an outline of a suitable methodology for applying this approach is discussed.

It must be noted that the WFE approach does not completely discount the current methods of evaluation that exist in research on contemporary health services. However, I am trying to look at aspects of health and healthcare from a different perspective, namely that of wellbeing.

3. What is a Wellbeing Focused Evaluation (WFE)?

A WFE builds on and extends conceptual and methodological insights of an international research programme into wellbeing in developing countries (WeD)³.

According to the WeD project, wellbeing is defined as ‘a state of being with others, where human needs are met, where one can act meaningfully to pursue one’s goals, and where one enjoys a satisfactory quality of life’ (Gough and McGregor 2007). From this definition, it becomes evident that wellbeing encompasses people’s objective circumstances and subjective perceptions of their condition. In addition, this definition of wellbeing highlights relationships with others, so the wellbeing of one person is related to the wellbeing of others. Moreover, wellbeing is not only an outcome, but a ‘condition of being’ that arises from the dynamic interplay of outcomes and processes. Lastly, the interplay between outcomes and processes is firmly located in society and is shaped by social, economic, political, cultural and psychological processes (Gough and McGregor 2007).

Similar to the WeD approach, a WFE can employ both objective and subjective measures and allows for more emphasis being put on subjective views and assessments of wellbeing. A WFE is used to assess the perceived wellbeing of villagers in the context of the UC scheme in Thailand. The research that has been carried out focused on villagers’ actual experiences of, access to and use of the scheme, by looking at whether people of different gender, age and class in two villages, one remote and one non-remote, had different access to and use of the UC scheme, and if so how this affected their wellbeing.

This study adopts WeD’s definition of wellbeing, which considers people’s objective circumstances, subjective perceptions of their conditions and relationships with others. This definition emphasises ‘conditions’ for the pursuit of wellbeing in two areas, as detailed by McGregor (2008): the significant role of the government in creating appropriate conditions; and the fact that these wellbeing conditions are different in each society as they are involved with different stages of development.

This hybrid notion of wellbeing could therefore be measured in different ways, for example, through subjective and objective dimensions, according to individual and social levels or as both processes and outcomes. The wellbeing of the villagers in both locations is also influenced by internal factors and external conditions. Internal factors are mainly related to the villagers’ own circumstances (i.e. whether they are remote or non-remote or their

³ Wellbeing in Developing Countries (WeD) is a project that aims to develop a conceptual and methodological framework for understanding the social and cultural aspects of wellbeing in developing countries. It is an ESRC funded research programme at The University of Bath. The research work has been on poverty, inequality and wellbeing in specific societies in Bangladesh, Ethiopia, Peru and Thailand (<http://www.welldev.org.uk/>).

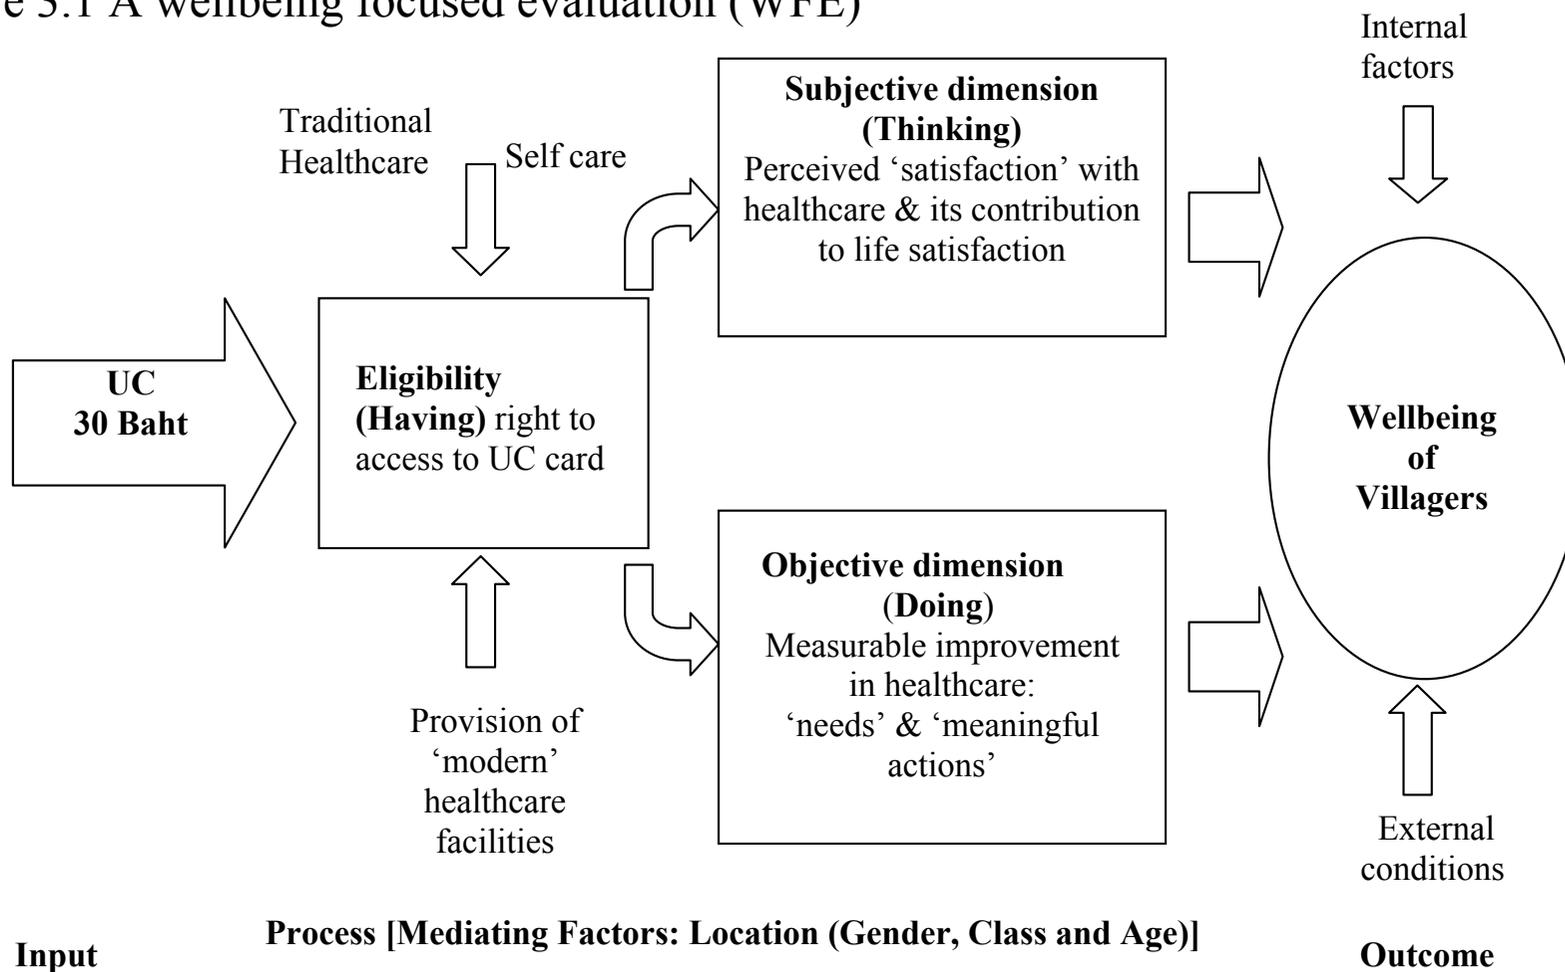

characteristics such as gender), while the external conditions are related to the state (government policies, i.e. the UC scheme), the market and the civil society.

In this study, objective and subjective dimensions are taken into account in the analysis of wellbeing. The objective dimensions are measured by investigating the level of uptake and utilisation of the UC card, and relevant data is compiled from questionnaires and the WeD Resources and Needs Questionnaire RANQ. The subjective dimensions are measured by the perceived satisfaction levels and the contribution of the scheme to villagers' lives as a whole, through in-depth interviews and other qualitative investigative processes such as participant observation and informal interviews. This part investigates villagers' feelings and their own explanations of how satisfied they are with the UC scheme and how the UC scheme has contributed to better living conditions.

The main focus of this study is to understand to what extent the UC has met its ultimate goal: 'to promote the wellbeing of Thai people'. As mentioned above, wellbeing is defined as 'a state of being with others, where human needs are met, where one can act meaningfully to pursue one's goals and where one enjoys a satisfactory quality of life. To evaluate the impact of the UC on villagers' wellbeing, three types of observations are used to understand the villagers' experiences of the UC scheme (i.e. their uptake and use of the UC scheme), namely, the processes of 'having, doing and thinking'. Thus, in this research, the following three aspects of villagers' lives are investigated: needs [HAVING], meaningful actions [DOING], and satisfaction with life [THINKING].

The WFE is summarised in Figure 3.1. The figure shows the relationship between the UC scheme and the wellbeing of villagers, both in the remote and non-remote villages, and according to different profiles of gender, class and age.

Figure 3.1 A wellbeing focused evaluation (WFE)

4. Methodology and techniques

As discussed in the previous section, wellbeing is defined as: needs met, meaningful actions and experience of satisfaction with life, it is necessary to consider a broader concept of evaluation. This paper argues for a broader concept of evaluation and proposes a new approach to evaluation, WFE. The WFE was developed from the WeD framework; thus some of its methods were applied for researching the villages.

An ethnographic research was conducted for eight months in one non-remote and one remote village in Northeast of Thailand using a multi- methods approach, including questionnaire surveys, focus groups, in-depth interviews, participant observation and some of the WeD's methods. The research conducted a detailed survey of 216 villagers, 24 in-depth interviews (12 men and 12 women), 6 focus group discussions and participant observation, and interviews with policy makers and healthcare workers, as well as data from the WeD project.

The samples for the research were selected with reference to: gender, social and economic status, age and location. Data was collected from questionnaire surveys and in-depth interviews with an equal number of women and men, with different economic status and age in both villages. The questionnaire surveys were carried out amongst 216 people in both villages, the in-depth interviews totaled 24 and there were also 6 focus group discussions. In addition, various stakeholders (healthcare workers and policy makers) were also interviewed, so as to obtain informed opinion regarding the healthcare provision to the villagers and their level of wellbeing.

In order to reduce some bias that may occur from relying only one method, this study is undertaken by a multi-method (Kanbur 2001). Using multi-method allowed the researcher to have a more holistic understanding of how the UC scheme has contributed to the villagers' wellbeing. In addition, it has helped to crosscheck the results generated from the different researchers and different research methods, which it is possible to triangulate results. For example, while a large-scale survey is helpful in outlining the characteristics of the non-remote and remote villages, participatory observation and in-depth-interview allow the researcher to understand the reasons behind their characteristics, having provided more 'thick description' as suggested in the work of Geertz (1973). In addition, the flexibly structured and open interviews allowed access to information such as their experiences of wellbeing as a result of the UC scheme in relation to their background, identities, culture and beliefs, which would have been difficult to pick up using only quantitative techniques or an opinion poll.

5. The extent of the UC scheme's contribution to villagers' wellbeing

The results showed that the UC scheme has created better conditions for villagers in both villages to achieve a greater degree of wellbeing, especially in relation to the terms that are set out in the WeD definition, which lists the three criteria as mentioned above: needs met, meaningful actions and satisfaction with lives.

5.1 The first aspect: need met

It was found more of the villagers' healthcare needs are being met. Firstly, the majority of villagers in both locations (83.2 %) who had the right to access the UC, held UC cards. In terms of the distribution of each card type (co-payment or free) it was found that the free cards were held by women and the poor in higher proportions than other economic groups and men (tables 5.1 and 5.2).

5.2 The second aspect: Acting meaningfully in pursuit of goals

Results show that the UC scheme has enabled the majority of the villagers (69.4%) who held the UC card to use it. In particular, it helped those who had limited access to healthcare before the UC scheme was introduced. This indicates by the fact that those with the greatest healthcare needs such as those living in remote community, women and the poor have had the highest percentage of card usage (tables 5.3, 5.4 and 5.5).

Nonetheless, it is worth exploring the reasons why nearly a third of all the villagers (approximately 31 %) had never used the UC card, even though it has been available in one form or another since 2001. Apart from trivial illness⁵, there are several reasons that discourage villagers from using the UC card.

The first reason is economic cost (Buchanan 1969). According to Buchanan, the actual cost can be measured in units or resource input in an objective way, opportunity cost is subjective and is related to choice. Using the UC card was seen by some as being time consuming and inconvenient. Some villagers preferred to pay for their care, because they believed that it was worth paying money more than being absent from their work. The villagers who had this preference included the rich who had the ability to pay whilst some others were the poor who could not afford to wait and waste their working time.

The second is a matter of geography. It was found that although the non-remote village had a slightly greater percentage of UC cardholders, the percentage of usage was lower than in its remote counterpart. This is because the availability of alternative healthcare systems has resulted in less use of the UC card by the non-remote villagers.

The third reason is the UC's low quality of services. Some villagers reported that they had had direct experience of poor service provision, whereas others anticipated low quality of service, owing to the belief that free and low cost products were usually not as good as something they paid for. Although better off villagers enjoyed a greater choice than villagers in other economic classes, it emerged that economic class was not the only factor and perceptions regarding service quality formed an even more important reason for non-use of the card.

The last reason for not using the card concerned cultural factor. It was found that both women and men were concerned about their cultural gender role more than the actual health

⁵ This refers to illnesses that the villagers consider to be curable through self-treatment methods. These methods range from no action to simple self-treatment such as resting, eating nutritious food, taking herbal medicines or to purchasing medicines (Researcher's field note 2005).

conditions that they experienced themselves. For example, some women expressed that they were too embarrassed to see a doctor to receive a cervical screening test, and some men said that if they frequently visited a doctor they could be thought of as weak and less manly. Understandably, such attitudes as these have had a negative effect on card usage.

5.3 The third aspect: experiencing satisfaction with life

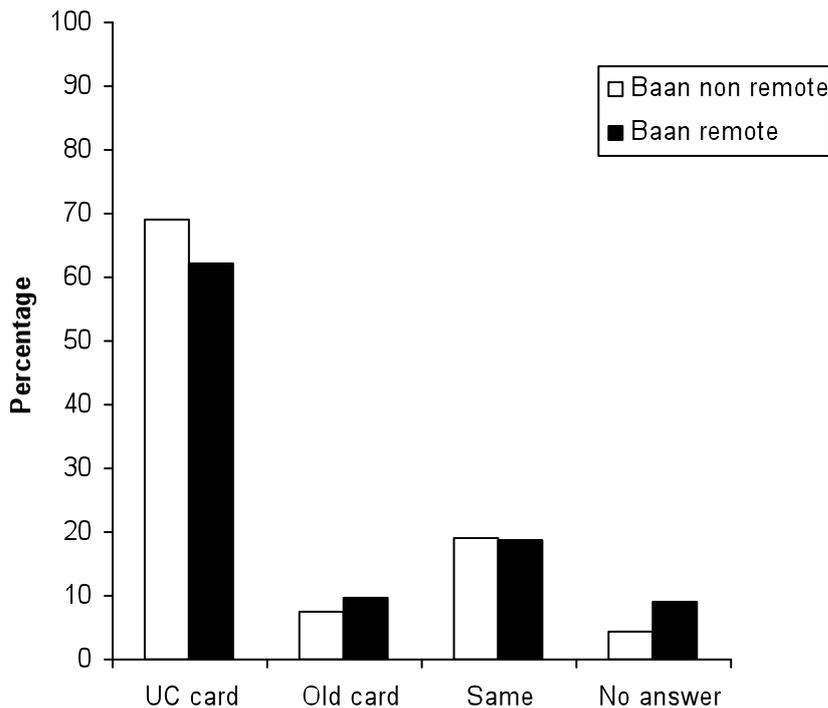

It emerged that in both locations, most of the villagers (76.4%) who used the card were satisfied with the scheme (see table 5.6) and 65.2% of villagers in both locations considered the UC scheme as being better than previous schemes (see chart 5.1)

Table 5.6 Percentage of villagers' satisfaction with the UC scheme

Source: Researcher's questionnaire surveys 2005

Chart 5.1 Percentage of villagers’ satisfaction with the UC card as compared with the previous card

Source: Researcher’s questionnaire surveys 2005

Explanations for the villagers’ satisfaction with the UC scheme can be attributed to these two main reasons. The first relates to the UC scheme itself and the second was down to the villagers’ health goal within their social and cultural context.

Firstly, the UC scheme had provided affordable healthcare and had increased villagers’ security more than any other previous scheme and thus relieved their anxiety about paying for healthcare should they fall ill. Most villagers in both village reported that their household expenditure decreased after using the UC card (80.9 % in *Baan non remote* and 69.7 % in *Baan remote*). Saving on medical expenses is an underlying reason for villagers’ satisfaction, regardless of location, gender, age or economic class. The following statements highlight the results from questionnaires.

Non-remote villagers

‘In the past, the card didn’t exist. I had to pay a lot.’
 (A better off female, 18 years old, 26 November 2005)

‘We don’t have to pay ourselves. They charge the government for the fees’
 (A worse off male 56 years old, 27 November 2005)

Remote villagers

‘Elsewhere the prices of medicine and hospital fees are high.’
(A better off male 55 years old, 17 November 2005)

‘The scheme helps us to save’
(A worse off female 22 years old, 17 November 2005)

Secondly, the UC scheme is proved to be a suitable choice for the villagers’ need and goal. For villagers, being good health was considered an important factor for their wellbeing as it helped them to be happy and content. Thai people believe in *‘Khwarm mai mee rok pen lap an prasert’*, which can be translated into English, as ‘lack of disease is precious luck’. When the UC scheme has enabled villagers to meet their health needs and they are able to act more meaningfully it could be expected that satisfaction with the UC scheme can be transferred to satisfaction with other aspects of villagers’ lives in terms of objective (having more options in life) and subjective (feel less fear of threats to their health and wellbeing) aspects.

In terms of differences among the different types of people, it was found that women and the poor were significantly more satisfied with the UC scheme than men and the other economic classes. The higher level of satisfaction among women can be explained in relation to their gender roles in households that women in a given role are the one taking care of the family’s health and manage household expenditure, when the scheme has benefited the family in terms of its accessibility at lower cost they feel the scheme is helpful. Similarly the poor recognised that they were spending less on healthcare than they had been before. This affordable healthcare scheme has created the sense of ‘more security’ among women and the poor, particularly when they need to see a doctor, and they live with less fear of threats to their health and wellbeing. This has encouraged more timely use of healthcare by people who were previously economically restricted from doing so and thus it has enhanced their wellbeing.

The relative high level of satisfaction brought about by the existence of the UC scheme has been shown to be linked to the Thai culture involving Buddhist teachings of being *‘Por Jai’* or being satisfied with what one has (Gray et al 2008) and the King’s philosophy of ‘sufficient living’. That is, people in rural areas are grateful for any provision of goods or services that improve their lives and those of their families and have a tendency not to be too critical. In addition, for the poor, in general poor people have low expectation than the other economic groups and therefore a high satisfaction on the UC scheme can be expected reasonable. This statement is supported by Cummins (2008) who suggests that optimistic responses from Thais are part of the national culture in which they were brought up.

However, it was also found that not everybody who used the card satisfies with it. A considerable number (approximately 22%) of respondents who used the card reported dissatisfactions with using it. The reasons for this are: restricted number of choices as villagers cannot use the UC card as wherever they preferred, low quality of services on offer and discriminatory treatment.

6. Conclusion

At the beginning of this paper, the research question was set out: to what extent has the existing UC scheme contributed to villagers' wellbeing in Northeast Thailand. This question was motivated by the controversial debates for and against the UC scheme. Based on eight months of ethnographic studies in one non-remote and one remote village in Northeast Thailand, this research has indicated that the UC scheme has made a contribution to conditions of the majority villagers' wellbeing in the two villages given that the needs of majority of them are actually met. The evidence is the finding that most of the people have the UC card, used the UC card and are satisfied with the scheme. Furthermore, villagers' satisfaction towards the UC card had exceeded that of previous cards. The satisfaction with the UC scheme has a positive effect to villagers' life satisfaction because the UC card is viewed by villagers as a form of their life insurance in which enabled them to access to healthcare services without having to worry about the cost that might exceed their ability to pay. The UC scheme has increased their economic and emotional security more than other previous schemes and thus relived their fear when facing with greater uncertainty when they fall ill.

Nevertheless, the study also found that there are many problems with regards to the UC scheme's implementation. These problems indicates by the fact that almost 31% of the villagers have never used the service offered by the UC scheme despite the fact that they have been entitled to it since 2001 and are in possession of the card. Furthermore, it was found that approximately 22 % people who used the card reported dissatisfactions. These problems require a great attention from policy makers to make the UC scheme perform better.

Although these problems have affected the villagers' UC card usage and their satisfaction, they have no adverse effects on their wellbeing. Villagers still reported being satisfied with having it. Having a UC card is viewed by the villagers as a form of life insurance, which they can use whenever they need to. Therefore it can be concluded that most villagers experienced a better sense of wellbeing as a result of the UC scheme.

**East meets West? Sustainable quality of life practices in Hong Kong and
the United Kingdom**

Dr Paul Higgins

City University of Hong Kong

Department of Public and Social Administration

*This is a working paper. Please do not quote or reproduce without the permission of the
author.*

Introduction

This paper conducts a comparison of sustainable development (SD) activity in Hong Kong (HK) and the United Kingdom (UK). It utilises a comparative public policy framework to explain ‘how, why and to what effect’ the UK and HK governments have pursued ‘a particular course of (SD) action or inaction’ (Heidenheimer, et al., 1990: 3). Attention is drawn to their commensurate quality of life (QOL) orientations and related adoption of a range of ‘performance’ indicator systems designed to monitor sustainability progress. However, as with many other economies of the world, doubts exist about the authenticity and credibility of their sustainability efforts. Hence, by illuminating the emergence and content of an East and West approach to SD while uncovering similarities and differences in their underlying mechanics this paper will be in a position to reconsider the broader meaning and politics of sustainability.

Sustainable Development

Although the terms SD and QOL are both alluring and popular (Costanza, *et al.*, 2007; Akranaviciute and Ruzevicius, 2007; Elliott, 2007, Unruh, 2007, United Nations, 2007) they remain a source of cultural and conceptual confusion (O’Riordan, 2004; Atkinson, *et al.*, 2007). This leaves them exposed to various forms of abuse and manipulation, with all sorts of policies and practices able to be legitimised in their good name. While international SD guidance exists – such as that available from the United Nations and from publications on best practice SD by relevant international organisations - there is no single prescribed formula for presenting a SD strategy. Many cities and countries have thus produced strategies, which vary in format and in content, reflecting the concerns and priorities of their respective societies. As Lucas explains (2000: 10) SD strategies may range from “*deep green* policy statements advancing the need to entirely rethink the extent to which human activity should be allowed to impinge upon the natural environment, through to use of the word simply as a catch-phrase meaning little in terms of policy adjustment and implying a *business as usual* approach. Accordingly, sceptics ponder whether SD has any practical meaning. As Myerson and Rydin (1994: 439 in Gibbs, 2000: 11) ask:

“Does the discourse around the concept of sustainable development represent a cultural oxymoron, a continuation of policy goals from the distinct economic and environmental policy arenas, or is it an innovative step forward in policy thinking which provides new opportunities for goal achievement?”

Other commentators hold a more optimistic outlook arguing that the fluidity of the SD term does not imply that it is necessarily vacuous because as a unifying and visionary construct it provides a means to popularise environmental policy as an alternative strategy to pure economic growth. Thus, continuing criticism of the term’s elusiveness potentially deflects attention away from the political project that has to underpin the necessary shifts in human behaviour (Munton, 1997). In line with this latter position the implementation of SD was, in principle, given greater impetus at the United Nations conference on Environment and Development in June 1992 when officials from over 150 countries met to discuss how to achieve SD and agreed a plan of action for the 21st century, known as Agenda 21. This included a call on individual countries to prepare national strategies and action plans to implement the agreements (Whitby and Ward, 1994). The UK was one of the first countries to answer the Rio call and did so in 1994 when the then Conservative government published ‘Sustainable Development: The UK Strategy’ (HM Government, 1994).

This section provides an overview of SD activity in HK and the UK explaining how both produced SD strategies that have heralded sustainable QOL as a core focus. However, whereas the QOL direction in the UK emerged from the ruling Labour Party's stated desire to maintain social justice, in the Hong Kong case, it derived out of the Government's more pragmatic aim to ensure a sustainable urban living space while preserving economic opportunities.

Sustainable Development in England

Since the election of New Labour in 1997 a broad and strong sustainability approach to SD in the UK has been taken. This focuses on the meaning of development and formulates the SD agenda around a dual environmental and social justice approach (Heal and Kristrom, 2007; Ageyman, 2007) which heralds *sustainable* QOL as its core value (DETR, 1999; DEFRA, 2005). Labour's sustainability outlook moves beyond the goal of ensuring future generations have the necessary resources to progress sustainably towards one in which it becomes imperative that they also have the opportunities in their environment to enhance their level of well being.

At the same time, however, the magnitude of Labour's SD strategy can also be examined in terms of what it means politically. Here, it becomes insightful to view the strategy as a vehicle for New Labour to distinguish itself both from the consecutive 1992-1997 Conservative Government's approach to SD and, more profoundly, to demonstrate its principled separation from Old Labour values. New Labour's SD strategy managed to pursue this twin political objective by adopting a dual social and environmental justice stance that simultaneously targeted the former Conservative position on sustainability and the Old Labour position on the environment and rural affairs.

Regarding the former, New Labour broadened the meaning of SD beyond the Conservative's previous concern with inter-generational renewable resource availability (Scottish Parliament, 2001) to accommodate a social justice element too. It also embraced two issues that have been very controversial in the history of the Labour Party, the environment and rural affairs. To appreciate the magnitude of this latter repositioning effort one need only be reminded of Labour's previous stance towards the environmental or 'green' agenda which it had accused of being predicated on a manifest class bias which ignored the plight of the urban poor:

Its champions are often kindly and dedicated people. But they are affluent and fundamentally, though of course not consciously, they want to kick the ladder down behind them. They are highly selective in their concern, being militant mainly about threats to rural peace and wildlife and well loved beauty spots; they are little concerned with the far more desperate problem of the urban environment in which 80 per cent of our fellow citizens live (Anthony Crosland, 1971: 5 in Anderson, 1991).

Following the 1997 General election, however, 'New' Labour acted quickly to disown this former, 'outmoded,' position and did so on the principled and humane grounds that it shunned prevailing environmental injustices (Meacher in Boardman, *et al.*, 1999). This claim thus gave the impression that the Labour Party was about to ratchet up its longstanding preoccupation with social justice in order to tackle the environmental injustices of the modern era. Likewise, in revoking the Party's former hostility to the rural cause attention was drawn to the issues of agricultural demise, immigration and social exclusion (DETR/MAFF, 2000).

However, such headline redistributive claims did not manage to transpire into the implementation of SD which instead adopted an equality of opportunity-founded approach to sustainable communities formation (HMSO, 2007). In emphasising the revitalisation of each individual local community rather than addressing the prevailing inequities between them such a stance was largely alien to the Party's former commitment to spatial Keynesianism as built upon a strong national welfare state and the project of equalising the distribution of industry, population and infrastructure across national territories (Raco, 2007). Instead, responsibility and ownership for the rectification of prevailing QOL-deficits was to be mostly devolved directly to the communities and relevant authorities concerned.

Sustainable Development in Hong Kong

On a global scale, the SD discourse arrived comparatively late in HK (Mottershead, 2004a) and was first brought to the forefront of HK government policy in the 1999 Policy Address, when the Chief Executive maintained that: "*Every citizen, every business, every government department and bureau needs to start working in partnership*" to achieve SD. The roots of HK's SD strategy reside with environmental protection (Mottershead, 2004b) and a consultancy study undertaken by Environmental Resources Limited (now Environmental Resources Management, a global provider of environmental consulting services) which culminated in two reports: one surveying the state of HK's environment and the existing machinery for environmental protection (ERL, 1975), and the second (ERL, 1997), setting out priorities for environmental policy and an administrative framework for environmental protection.

Later in 1989 a White Paper entitled "*Pollution in Hong Kong – A time to act*¹" was released and led to the undertaking of a number of biannual reviews until 1999 (see Hills, 2004). Amidst this activity, a somewhat more enthusiastic commitment to SD emerged in September 1997 when the Government commissioned the "SD in the 21st Century Study" (SUSDEV 21), later concluding in August 2000. The study alluded to a definition of SD that, by stressing the need to *balance* economic, social and environmental considerations, drew criticism from major stakeholder groups for its lack of integration. According to Hills (2004) it also proved to be slightly at odds with the theme of SD developed by the Chief Executive in 1999 (Hills, 2004) which contained the following three principles:

1. Finding ways to increase prosperity and improve the quality of life while reducing overall pollution and waste
- 2 Meeting our own needs and aspirations without doing damage to the prospects of future generations and
- 3 Reducing the environmental burden we put on our neighbours and helping to preserve common resources.

¹ Pollution in HK and the surrounding industrial and urban centres of the Delta Region is a major problem. In HK it is estimated that 2000 people a year die prematurely from pollution-related illnesses and that the medical costs and reduction in productivity caused by pollution-related illnesses amounts to some HK\$4 billion per annum (GIS, 1999 in Cullinane and Cullinane, 2003). Individual pollutants frequently exceed World Health Organisation standards (Cullinane and Cullinane, 2003).

Following the recommendations of SUSDEV 21, a body called the Council for Sustainable Development (CSD) was established². Its remit was to advise and oversee the preparation of a SD strategy for HK, a process which began in December 2003 and concluded just over a year later following a five-stage engagement process and substantial campaign of community involvement³. The ensuing strategy, HK's first, contained the following mission:

“Our vision is for Hong Kong to be a healthy, economically vibrant and just society that respects the natural environment and values its cultural heritage. By engaging the community in the process of building a strategy for sustainable development, we aim to ensure that Hong Kong will be a city for all to share and enjoy, for this and future generations (SDU, 2005:7).”

In terms of structure, meanwhile, the SD strategy is divided into the three following ‘plot areas’ relevant to HK's long-term sustainability: *“Solid Waste Management: A Community Effort for Sustainability”*; *“Renewable Energy: Acting Locally on a Global Issue”* and *“Urban Living Space: Creating a Sustainable Built Environment”* and, of these, it is the third that expresses the need to enhance existing QOL conditions. Thus, as page ten of the SD strategy document (SDU, 2005: 10) explains:

“Creating a sustainable urban living environment involves a range of challenges. In seeking to improve the quality of life for people in Hong Kong, we need to consider how best to plan and to build so as to make our built environment attractive. We must also consider how best to maintain and enhance economic opportunities, whilst conserving a healthy and diverse natural environment and facilitating social and cultural development”.

However, rather than directly confronting its many social-economic tensions, as part of a strong sustainability outlook, the HK government instead turned attention to such urban design issues as height profile, waterfront development, cityscape, pedestrian environment and pollution mitigation. Consequently, the two major parties conducting urban redevelopment projects in the territory, the HK Government and the private developers, have mainly attempted to achieve various socio-economic objectives through urban renewal (Chan and Lee, 2009). Accordingly, one notable aim of HK's SD strategy is to consider “how to optimise the *economic value* of our scarce land resources for commercial and residential development whilst ensuring that we do not create an urban landscape that alienates citizens” (SDU, 2005:10 emphasis added).

It is not entirely clear from the above quote, however, what the term ‘alienate’ precisely means especially in a context where the HK government is regularly accused of colluding with developers to create a property market that maximises the economic value of the land to the detriment of flat buyers? At the same time, there is no sense in which HK's SD strategy

² The administrative arm of which was the Sustainable Development Unit (SDU), now called the Sustainable Development Division (SDD)

³ This included representatives of non-government organisations, District Councils, Chambers of Commerce and other business groups, as well as individuals all drawn together to engage with one another and decide on the choice of policy options and targets. The government also partnered with three major community groups, the Business Environmental Council, the Hong Kong Council of Social Service, and the Hong Kong People's Council for Sustainable Development, to facilitate the participation of diverse stakeholders with divergent views as well as grassroots and disadvantaged community groups.

recognises the ‘vulnerability⁴’ of its citizens with references to social justice and wealth redistribution notable for their absence. The word ‘just’ is mentioned only twice in the strategy and then somewhat ambiguously.

In summary, then, given the notable absence of social justice considerations in HK’s SD strategy, a more realistic and upfront position has been adopted compared to the UK. As such the relevant parties are not ashamed to proclaim that while SD matters the economy matters *more*. In the UK, in contrast, the combined principles of environmental and social justice have readily been bandied about without so much consideration for their practical achievement. Instead, their development seems to have more in common with Ageyman’s observation (2002) that they were deployed in order to avoid stoking up accusations of elitism and agenda control. Consequently, the ‘harder’ side of New Labour’s SD strategy is to be found in the ‘place shaping’ sustainable communities domain of implementation.

Quality of life indicators

It was explained earlier that the very ambiguity of the SD term permits a wide range of often contradictory social and political interests. This would suggest that its adoption as a purely technical term would be limited. However, despite vast differences in rationale, context and focus both the UK and HK SD strategies have been expressed in terms of a determined QOL focus that in one way or another has been operationalised via ‘performance’ indicator systems designed to monitor sustainability progress. However, given the vast differences in the nature of the sustainability trajectories taken what insights can be drawn from an examination of the various QOL-based indicator systems concerned? In this section, attention is drawn to the origins, variety and content of the two sets of performance indicators systems. It is explained that whereas in the UK context the *composition* of the indicators becomes particularly striking in the HK context it is the *origins* of the various systems that are more revealing.

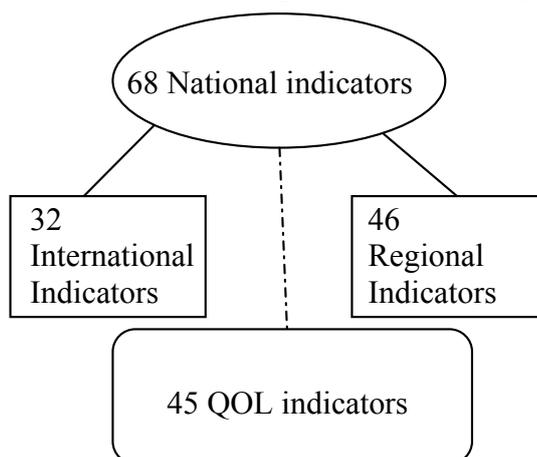

English QOL indicators

In the UK context, SD indicators are collected at four different, but integrated, geographical levels – International, National, Regional and Local. The overlapping and hierarchical nature of the UK SD indicators system (see <http://www.defra.gov.uk/sustainable/government/progress/>), compared to HK, is a reflection of the relatively larger geographical area concerned and the more integrated approach to SD taken. For example, the national indicators comprise a suite of 68 indicators, 32 of which double up as international indicators, to highlight the UK’s progress in an international context. Similarly, 46 of the national indicators have their regional equivalent, see Figure 1. However, in terms of the present focus of QOL, the relevant indicators derive from the audit and evaluation body the Audit Commission.

Compiled in 2005 from 45 core local government performance indicators, the local QOL dataset is designed to capture the key headline issues that local authorities should monitor to foster ‘sustainable communities’. The dataset forms, therefore, the basis of a sustainability reporting platform in local government (Ball and Grubnic, 2007) by capturing a range of objective and subjective indicators spread across ten QOL themes (see Table 1).

⁴ Rather than the dependency of their citizens given HK’s relatively limited social settlement.

Figure 1 United Kingdom’s sustainable development indicator system

Although the dataset contains a large number of environmentally and socially orientated indicators – see Table 3 and 7 – its dedicated commitment to justice-based considerations of these dimensions remains largely absent. For example, unlike HK’s social development index (see below) there is no such distributive consideration as ‘*household income received by the top 20 per cent of households divided by that received by the bottom 20 per cent*’. Instead, the social welfare measures tend to be concerned with key benefit claimant counts, deprivation levels amongst children and over 60’s and an all-encompassing measure of the ‘*proportion of population living in the most deprived super output areas in the country*’. These are absolute counts of deprivation rather than necessarily redistributive-orientated ones. This begs the question why, especially given the headline appeal to social and environmental justice outlined in the national strategy? Before answering this question it is useful to examine the HK equivalent.

Table 1 Audit Commission Local QOL indicators

Theme No.	Themes and QOL indices	Number of indicators
1	<i>People & Place</i>	1
2	<i>Community cohesion & involvement</i>	3
3	<i>Community safety</i>	4
4	<i>Culture & leisure</i>	2
5	<i>Economic well-being</i>	7
6	<i>Education & life-long learning</i>	4
7	<i>Environment</i>	9
8	<i>Health & social well-being</i>	5
9	<i>Housing</i>	6
10	<i>Transport & access</i>	4
	<i>Total</i>	45

HK QOL indicators

In HK numerous indicator systems have been developed to monitor sustainability and QOL progress and such diversity reflects the activities of diverse actors within the broader political arena jostling to exert an influence on government policy (see conclusion). Officially, HK’s formal approach to sustainability assessment is confined largely to an urban design and economic growth trajectory which provides little room for social considerations. The official

explanation for this (SDU, 2005:12) relates to technical/operationalisation concerns: “*unlike the areas of solid waste management and renewable energy, which lend themselves to clear objectives, quantifiable targets and clearly definable courses of action, the subject of urban living space is more difficult to link to specific measurable outcomes*”.

Thus, rather than devise a distinct set of social sustainable indicators *per se* the HK Government has chosen instead to integrate sustainability principles into its policy-making process via a sustainability assessment system⁵ through which all major initiatives - which may bring about noticeable or persistent implications on the economic, environmental and social conditions of Hong Kong - must undergo. Table 2 outlines the key principles of this eight-domain system.

Table 2 Sustainability principles

Domain	Guiding principles
<i>Economy</i>	Hong Kong should achieve a competitive and prosperous market-based economy which provides the resources to meet the needs and aspirations of the population, both now and in the future.
<i>Health and Hygiene</i>	Hong Kong should provide a living and working environment and pursue policies which promote and protect the physical and mental health and safety of the people of Hong Kong.
<i>Natural Resources</i>	Hong Kong should promote the sustainable use of natural resources to minimize its ecological footprint through improving consumption efficiency, minimizing the use of non-renewable resources and re-using, recycling waste and recovering energy from wastes.
<i>Society and Social Infrastructure</i>	Hong Kong should foster a stable, equitable, ethical and progressive society and enable present and future individuals to contribute to and fulfil their potential by providing universal access to adequate and appropriate educational opportunity and social infrastructure.
<i>Biodiversity</i>	To maintain the biodiversity of Hong Kong and to minimize any threat which consumption in Hong Kong may have on biodiversity elsewhere.
<i>Leisure and Cultural Vibrancy</i>	Protect and enhance the vibrancy of Hong Kong’s recreational opportunities, leisure activities, cultural diversity, archaeology, historical and architectural assets.
<i>Environment Quality</i>	Hong Kong should be pro-active in avoiding environmental problems for present and future generations, seek to find opportunities to enhance environmental quality, and minimize the unwanted side effects, locally, nationally and internationally, of development and inefficiencies such as air, noise and water pollution or land contamination.
<i>Mobility</i>	Hong Kong should provide safe, accessible, efficient and clean transport systems and pedestrian facilities along with an efficient transport network for the movement of goods and facilitation of services for the community.

What is particularly striking about the eight principles is the nature, and resulting treatment, of the two main social dimensions: ‘*society and social infrastructure*’ and ‘*health and hygiene*’, which in contrast to the other six domains stand alone in not being matched to associated performance indicators. Instead, they are subsumed under a list of ‘all social

⁵ Developed under the context of SUSDEV 21

checklist questions’ along with leisure and the additional dimensions of housing and education. It is also noticeable how the ‘*society and social infrastructure*’ domain stresses the importance of individuals to improve their situation via *access* to educational opportunity and social infrastructure, rather than say societal redistribution. In thus ignoring prevailing inequities of condition, this approach in ideological terms is akin to the UK’s sustainable communities initiative,⁶ albeit without being shrouded in the same degree of rhetoric.

Given the extent of social inequality that increasingly continues to pervade HK, however, alternative indicator systems have been launched to keep a track of its QOL conditions. While a number of the more notable initiatives have stemmed from University Departments such as “QOL in HK: the Chinese University of HK QOL index” (Chan, *et al.*, 2005) and City University of HK’s Sustainable Development Index Survey, the Hong Kong Council of Social Services⁷ (HKCSS) has been engaged in two social indicators projects. One is called ‘social indicators in HK’ and the other the ‘social development index’.

The first project derives from a conceptual framework developed by the Centre for Survey Research and Methodology European System of Social Indicators. Its stated purpose is to harness a theoretically and methodologically well-grounded framework and set of measurement dimensions and indicators for a continuous monitoring of the QOL and society in HK. As depicted in Table 3, the dataset centres upon three overlapping welfare concepts – QOL, Social Cohesion and Sustainability – together with three given social structures - demographic change, socio-economic development and changes in values and attitudes. However, the somewhat elaborate attempt to integrate the various dimensions and concepts into a coherent whole ironically results in a lack of clarity⁸.

Table 3 Social Indicators of HK (HK Council of Social Services)

Welfare Concept	Goal dimensions	Definition	Example
	Improvement of Objective Living conditions	Ascertainable living circumstances of individuals, such as working conditions	State of the environment, level of education

⁶ It is fair to note, however, that the economic domain of the sustainability assessment system contain two potentially socially-orientated criteria: “*Difference between percentage change in the upper quartile of after-tax household income and percentage change in the lower quartile of after-tax household income*” and a count of the *unemployment rate*. Minimum wage legislation is also currently being enacted.

⁷ In 1947, the HKCSS was formed to coordinate the service of various volunteer and non-government agencies which currently amount to over 370 Members via 3,000 service units all over HK. Although social welfare provision is one of the main responsibilities of the HK government it does not provide such services directly. Instead, over 90% of social welfare services are provided by non-government organizations, which are under the direct subvention of the HK government through the Social Welfare Department.

⁸ In fact, it seems that this approach has now been disbanded in favour of a more extensive social development index approach

Quality of life	Improvement of Objective Living conditions	or living standard.	State of the environment, level of education
	Enhancement of Subjective Well being	Perceptions, evaluations and appreciation of life and living conditions by individual citizens. Examples are measures of satisfaction or happiness.	Perception and evaluation of level of living
	Reduction of Disparities, Equal Opportunities, Social Exclusion	Concerns the current state as well as processes and measures that improve or deteriorate the base of natural resources.	e.g., equal opportunities for women and men, social discrimination, inequalities between women and men in political participation
Social Cohesion	Strengthening Social Connections and Ties, Social Capital	Focuses on processes and measures that affect people's skills, education and health.	e.g., availability of social relations, quality of social relations
Sustainability	Enhancement or Preservation of natural capitals	Concerns the current state as well as processes and measures that improve or deteriorate the base of natural resources.	e.g., resource use per unit of product or service or per unit of GDP, public expenditures on environmental protection and research
	Enhancement or Preservation of human capitals	Focuses on processes and measures that affect people's skills, education and health.	e.g., availability of health care facilities, health expenditures, health prevention measures
Remit	Structural Change	Definition	Examples
Individual structure	Values and Attitudes	Focuses on the general social change of values and attitudes	Effectiveness of education, perception and evaluation of personal employment situation, subjective importance of leisure and culture, subjective importance of work and job characteristics
Social Structure	Demographics	Addresses the general social change of demographic	e.g., Population size and growth, population structure (age, marital status), family structure
	Socio-economic Development	Addresses the general social change of socio-economic structures	e.g., employment status, occupational structure, sector structure

The second project, meanwhile, was initiated in 1999 when the HKSCC commissioned Professor Estes, from the University of Pennsylvania, to undertake work on HK's first comprehensive *Social Report*. The broad purpose of this task was to create an analytical tool, unique to HK, known as the social development index (SDI) for use in assessing the region's changing social, political and economic needs (Estes, 2002). The SDI is thus primarily a tool for assessing QOL indexed by official statistics in HK and to make an advance on the rather limited GDP per capita measure (Chua, *et al.*, 2009). Since the first report was published in 2000, the SDI has been updated bi-annually – SDI-2002, SDI-2004, SDI-2006 and SDI-2008.

The SDI consists of 47 indicators that are distributed across fourteen sectors of social development (see Table 4) and five disadvantaged population groups – women, low income, children, youth and the elderly. The low-income sub-index is particularly noticeable in social justice terms for containing the five following indicators: ‘*Number of people in low-income domestic households per 100,000 population*’, ‘*% of household expenditure on housing and food for the low-income households*’, ‘*Unemployment rate in low-income households*’, ‘*Real Wage Index of wage workers*’ and ‘*Homeless people per 100,000 population*’. In addition, the SDI uniquely contains a count of ‘*% of work force affiliated with trade unions.*’

Table 4 Social Development Index HK

Theme No.	Themes and QOL indices	Number of indicators
1	<i>Strength of civil society</i>	4
2	<i>Political participation</i>	3
3	<i>Internationalization</i>	3
4	<i>Economic</i>	3
5	<i>Environmental quality</i>	4
6	<i>Arts & entertainment</i>	4
7	<i>Sports and recreation</i>	3
8	<i>Science & technology</i>	2
9	<i>Education</i>	3
10	<i>Health</i>	6
11	<i>Personal safety</i>	3
12	<i>Housing</i>	2
13	<i>Crime & public safety</i>	4
14	<i>Family solidarity</i>	3
	<i>Total</i>	47

Indicator comparison

Given the distinct contexts in which sustainable QOL is being promoted in HK and the UK it is inevitable that in terms of capturing the most valued components of life quality there will be a number of dimensions unique to HK and others unique to the UK. For example in HK both the “strength of civil society,” and “family solidarity” (which is reported as being by far the worst performing dimension) are prominent in its SDI, see Table 5. The political participation theme is also more developed in HK compared to the UK equivalent (which measures election turnout only) and comprises three distinct items. In terms of ‘personal safety’ issues the HK index uniquely includes a food poisoning indicator, which is indicative of a number of HK food scares in recent time. It can also be seen that the SDI’s environmental quality theme differs greatly from the indicators listed by both the UK’s Audit Commission and HK’s sustainability assessment scheme (see Table 6) and includes data for ‘*per capita open space*’ and ‘*beach cleanliness*’, rather than more substantial environmental concerns.

Table 5 Social Development Index HK various themes

Strength of Civil Society

1. No. of charitable institutions and trusts qualifying for tax exemption
2. Private charitable donations as % of GDP
3. Ratio of private charitable donations to government subventions

4. % of work force affiliated with trade unions
Political participation
1. Turnout rate in most recent District Board elections
2. Ratio of District Board candidates to District Board offices
3. % of District Board candidates with political party affiliations
Environmental quality
1. % of gazetted beaches ranked as poor/very poor
2. Per capita square metres of public open space
3. Per capita cubic metres of annual fresh water consumption by domestic sector
4. % of municipal solid waste recycled
Family solidarity a hot topic, plus five vulnerable groups
1. Marriages per 100,000 people aged 15?
2. Divorces as % of marriages
3. Reported domestic violence cases per 100,000 households
Personal safety
1. No. of reported food poisoning cases per 100,000 population
2. No. of occupational fatalities per 100,000 workers
3. No. of traffic fatalities per 100,000 population

In further comparing the scope of *environmental* indicators contained within HK's sustainability assessment tool and the Audit Commission's QOL indicators attention is drawn to Table 6. It can be seen that both schemes contain data for carbon dioxide and other key air pollutants, water consumption, river water quality and sites of special interest. Yet, whereas the HK set also covers a noise exposure indicator, construction waste issues and land-fill, the Audit Commission dataset uniquely covers some indicators relating to household waste.

Table 6 Environmental indicators

HK sustainability assessment	UK Audit Commission QOL indicators
Environmental Quality	Environment
Quantity (tonnes) of carbon dioxide emitted per year.	The proportion of developed land that is derelict

Composite index for criteria air pollutants based on percentage of the Air Quality Objectives	The proportion of relevant land and highways that is assessed as having combined deposits of litter and detritus
Percentage of population exposed to excessive noise.	Levels of key air pollutants
Composite index for marine water quality pollutants based on percentage of the Water Quality Objectives	Carbon dioxide emissions by sector and per capita emissions: a) domestic b) total
Percentage of EPD's river monitoring stations ranked "Excellent" or "Good" using the EPD's Water Quality Index.	Average annual domestic consumption of a) gas b) electricity (kwh)
Composite index for toxic air pollutants based on percentage of acceptable risk.	Daily domestic water use (per capita consumption)
Natural resources	The percentage of river length assessed as a) good biological quality b) good chemical quality
Quantity of construction waste requiring final disposal per capita.	The volume of household waste a) collected per head b) the proportion recycled c) composted d) used to recover heat, power and other energy sources
Consumption of energy per unit of output (\$ GDP).	The percentage area of land designated as sites of special scientific interest (SSSI) within the local authority area in favourable condition b) the area of land designated as a local nature reserve per 1,000 population
Volume of freshwater supplied and consumed per capita.	
The total remaining landfill capacity (by volume).	
Percentage of demand met by locally-derived freshwater resources.	
Quantity of municipal solid waste requiring final disposal per capita.	
Total area of area-based significant landscape features.	
Total number of point-based significant landscape features and old and valuable trees.	

Table 7 finally singles out the three significant themes of crime (which according to some accounts such as the Gallup model is the most basic level of collective society that should be established) housing (HK's pressing topic) and education (New Labour's initial priority) for interest. It can be seen that, overall, the Audit Commission dataset is more extensive than its HK counterpart in relation to the issues of crime and housing. For example, differences in the types of reported crime are more explicitly detailed in the UK context which includes counts of perceptions of crime also, whereas HK uniquely captures corruption convictions. In terms of housing, meanwhile, the UK dataset is more concerned with the quality of housing and property prices as opposed to the HK dataset which is concerned with length of social waiting lists and housing expenditure as proportion of all household expenditure. The final dimension listed in Table 7 is education and it can be seen that both datasets share a concern with attainment and enrolment figures, and uniquely in the UK context, attendance.

Table 7 Comparison of crime, housing and education indicators

Hong Kong	United Kingdom
Crime	
No. of reported violent crimes per 100,000 population	The percentage of residents surveyed who said they feel 'fairly safe' or 'very safe' outside a) during the day b) after dark
No. of reported non-violent crimes per 100,000 population	Domestic burglaries per 1,000 households
% of population reporting victimized by violent crimes	Violent offences committed per 1,000 population
No. of corruption crime convictions per 100,000 population	Theft of a vehicle per 1,000 population
	Sexual offences per 1,000 population
	The percentage of residents who think that a) vandalism, graffiti and other deliberate damage to property or vehicles b) people using or dealing drugs c) people being rowdy or drunk in public places is a very big or fairly big problem in their local area
	The number of a) pedestrian b) cyclist road accident casualties per 100,000 population
Housing	
% of expenditure on housing as share of total household expenditure	The total number of new housing completions
No. of waiting list applicants for Housing Authority rental flats	Affordable dwellings completed as a percentage of all new housing completions
	Household accommodation without central heating
	The percentage of residents who think that people sleeping rough on the streets or in other public places is a very big or fairly big problem in their local area
	The percentage of all housing that is unfit
	House price to income ratio
Education	
% of people aged 20 with upper secondary educational attainment	The percentage of half days missed due to total absence in a) primary b) secondary schools maintained by the local education authority
% of people aged 15 with tertiary education attainment	The proportion of young people (16-24 year olds) in full-time education or employment
No. of adults registered in continuing education courses per 100,000 population aged 15	The proportion of working-age population qualified to a) NVQ2 or equivalent b) NVQ4 or equivalent
	The percentage of 15-year-old pupils in schools maintained by the local authority achieving five or more <i>GCSEs</i> at grades A*-C or equivalent

CONCLUSION

Despite the close historical association between the UK and HK, SD in the latter context is shrouded in a non-democratic milieu where economic growth provides legitimacy⁹. As Rabushka, (1979 in Cullinane and Cullinane, 2003) once stingingly commented: “*The purpose of Hong Kong is to make money. Hong Kong has no other public, moral, intellectual, artistic, cultural or ethical purpose as a society. It is just one big bazaar.*”

Accordingly, having long enjoyed the material rewards of economic growth, HK’s attention has, in recent years, had to become more sensitive to the need for better protection of the natural environment. Far less attention has been placed on viewing poverty and social inequality as leading to distrust and instability, and negatively impacting on HK’s reputation as a first class city (Boyer King, 2004). However, HK’s poor record on social justice, despite broader economic development, need not imply that such environmental concerns are a reflection of the widespread attainment amongst its population of the higher echelons of Maslow’s (1970) hierarchy of needs. Instead, environmental concern among low-income communities is very much likely to be encouraged by the fact that they also live in the most polluted and hazardous localities.

Hence, it is by virtue of HK’s failure to formally tackle the social dimensions of SD and to fully integrate social, economic and environmental factors – the strategy currently uses the pragmatic phrase ‘to balance and integrate’ - that a space has been created in its young civil society for alternative voices to be heard. As noted above, the HKCSS, along with the social science departments of several HK universities, have been particularly active in trying to fill this void. Thus, while the formal domain of sustainability of assessment has been rather limited in its overall coverage, other actors in the broader political arena have been keen to exert an influence on the agenda. However, it also seems to be the case that while SD progress in HK can broadly be seen to represent a form of ‘ecological modernisation’¹⁰ (Hills, 2004) through which something more meaningful could develop¹¹ its tempering of otherwise raw-capitalism has shown strong signs of creaking under the weight of heightened societal dissatisfaction with gross and manifest inequality.

In contrast, in the UK where party politics rules the rhetorical discourse appears stronger than in HK. For example, while both social and environmental justice concerns are raised as two key principles in the UK’s SD strategy this momentum is lost in terms of implementation. The question that has been on many people’s lips since is how prepared is the bottom half of the population for recession?

Consequently, taken for what they are, whereas the goal dimensions of HK’s social indicators system explicitly include a commitment to wealth redistribution the requisite efforts are found lacking in the UK’s corresponding system despite the more justice-orientated flavour of its headline strategy. This outcome reflects the way in which the two indicator systems have been fostered. In the UK, the QOL dataset forms part of a top-down hierarchical system

⁹ However, Ming’s (2008) study of QOL in HK suggests that the more emphasis people lay on materialistic concerns, the worse their QOL. Likewise, the more respondents feel satisfied with non-materialistic items, the higher their overall QOL.

¹⁰ Taken to mean a set of processes and perspectives whereby capitalism sets out to achieve its own version of SD, by replacing earlier phases of crude environmentally damaging industrial capitalism (Pepper, 1998).

¹¹ This has very much been the tone of HK’s first SD strategy which its authors described as a “living” document, subject to review, and if necessary, modification in the coming years.

of indicators which involves the co-operation of predetermined parties and stakeholders, such as the Audit Commission. Consequently, little if any public debate has been had about whether the Audit Commission's QOL indicators, drawn from existing local government performance indicators, adequately reflect the concerns of the general population and even the spirit of the SD strategy.

In HK, by contrast, the existence of the SDI reflects some broader societal dissatisfaction with the *status quo* and the recognition by the government that the SD agenda could be an evolving and inclusive one. Thus, as HK's SD strategy maintains (SDU, 2005:16) "*the Government is not the sole agent responsible for HK's sustainability. Without efforts from people in the community, whether as members of sectoral bodies or individually, no strategy will be effective in taking us towards sustainable development*".

This is an important statement and returns us once again to the HK government's reservations about the limits of measuring urban living. One of the major problems with the adoption of narrow performance measures is that by capturing only the partial, usually quantifiable, aspects of activity they often serve to hide genuine differences in ideology and political values such as redistribution, issues that have long been the stuff of political debate (Cutler and Waine, 1997). Thus, despite the best intentions of authors to force onto the agenda social development indicators their existence raises the ironic outcome that they could preclude the evolution of a more participatory politics by locking-in certain forms of taken-for-granted analysis.

Overall, then, HK's SD strategy appears to be more pragmatic and realistic in its aspirations, less rhetorical in tone and potentially more flexible in its overall progression. In contrast, New Labour's SD tone has remained committed to a discourse of strong sustainability even though this has since become strained under the weight of an economic recession, where all manner of efforts have been made to re-stimulate the economy and to get consumption back on track. Of course the one final twist in the tale, here, is that this is because the incumbent government could face eviction at the next election. Here the notion of sustainability seems to have become committed to the premise that it is the system of capitalism that must be sustained, something that HK takes rather more for granted¹². Let us only hope that the same efforts are made to save the planet and its citizens.

References

¹² This is not very surprising. Evidence from both HK and the United States suggests that in times of economic stress, the public would give initial priority to economic growth over the environment.

Abstract

Urban regime theory refers to the concept of an 'entrepreneurial city' in which a 'rentier class' or a coalition of powerful elites with a vision of a city's future can gain hegemonic power to advance their economic interests. The rentier class is usually posited as consisting of coalitions of developers, politicians and state planners who collude to implement pro-growth policies. In Australia, the interests of pro-growth coalitions have been challenged by community concerns over the environmental impact of sprawl, the unsustainable cost of providing infrastructure and services in expanding, low density cities, along with more general concerns over the impact of climate change. Australian State Governments have enacted urban boundary legislation to limit sprawl and encourage transit use, justifying these policies with reference to sustainable development. Such policies are in tension with neoliberal ideology, which permeates Australian public policy and demands minimal intervention by the state. It is argued that State Governments in Australia have responded to this tension with 'we can have it all' policies, ie both continuous urban growth and environmental sustainability. We argue that such policies rest on flawed assumptions that are antithetical to sustainable development. We offer a case study of the 30 Year Plan for Adelaide, the capital of South Australia. It is argued that the Plan claims to set limits to urban expansion whilst ensuring the interests of sectional interests are met at the expense of local communities.

Introduction

The dominant mode of urban regulation in western societies like Australia is changing, as governments respond to the continuing crisis of capitalism and more specifically to the recent meltdown of global financial markets. Traditionally urban regulation and planning has been concerned with the integration of social, economic and environmental considerations with land use to improve the built and social environments of communities. Local councils and local government authorities have been tasked with regulating land use in Australia. However regional State Governments are increasingly asserting a role in planning decisions. To shore up faltering regional economies Australian State Governments are shifting the focus of urban regulation from a concern with social and environmental outcomes to the facilitation of private investment and profit, and the augmentation of state revenues. This process seems likely to accelerate as governments seek to restore state revenue bases ravaged by the global economic crisis and facilitate private capital accumulation by investors damaged by failing financial markets.

Regulation of the urban environment

Brenner¹ notes that state regulation of the urban environment has been profoundly reconfigured over the past thirty years by the dominance of neoliberal economic planning in most western countries. The increasing globalisation of financial flows has affected the capacity of nation-states and regions to insulate themselves from the world economy. Intensified competition between states, cities and regions has caused state and local governments to assume direct roles in promoting capital accumulation on sub-national scales².

In Australia and other western countries, governments have pushed institutional transformation under the rubric of 'deregulation'. This has involved the dismantling of social and economic regulation at the national and regional levels in favour of weak governance regimes that focus on the rules of exchange rather than setting standards³. Indeed a study by Peck & Tickell⁴ suggests that we are witnessing a shift from 'roll-back' neoliberalism to 'roll-out neoliberalism'. The former involved dismantling state institutions to a point where deregulatory marketization began to produce adverse distributional consequences for the market economy. Realisation of the limits to deregulation has driven a new 'roll-out neoliberalism', which creates new modes of regulation to replace those dismantled. Roll-out neoliberalism favours state intervention and public spending provided it supports macro-economic management and the accumulation of capital.

The new, roll out neoliberal agenda is not about a return to a laissez faire free market model. It is now recognized that markets remain persistently vulnerable to failure and continue to depend critically on the non-market regulatory frameworks within which they are embedded. That is, while the market is positioned as the supreme coordinating mechanism in the roll out neoliberal project, actors in the market will seek protection from market failure within various institutional frameworks⁵.

Planning regulations inevitably place constraints on the operations of markets in relation to broadly defined community interests. For example, regulations on block sizes and urban density act to constrain increased residential densities in the inner areas of metropolitan regions. Such regulations might also influence the nature of housing construction in terms of the materials used, the height of buildings and other matters related to safety and amenity that have an impact on the cost of construction⁶. Urban and regional planners working in regional and local governments have a significant role in the framing of urban regulation, and discretion in mediating how regulation is interpreted in the field.

Hence planning and planners have been seen as arbiters of interests. As Sager⁷ notes

Compromise and conflict resolution are the everyday experience of the planner. What else are we doing but working out and advancing proposals, taking account of competing interests so that something may be done in practice which furthers the public interest.

The 'public interest' is of course an elastic concept. When there is unanimity about what is in the public interest decisions are straightforward but when there is disagreement some amalgamation of preferences has to take place before a choice can be made⁸.

While the collective choice should be consistent and fair this is difficult to achieve when interests conflict. How the arbitration process is mediated affects the benefits that will accrue to one interest group or another. It is evident that in the current context of global economic crisis there is an overt tendency by regulators to privilege capital accumulation and associated interests in considerations of what is the public interest over other concerns with reference to public fears of an economic recession.

Appeals to such fears provides cover for regulatory shifts from a concern with metropolitan planning to the facilitation of private investment and profit. Under this new regime the regulation of urban space moves its focus from urban density, the provision of infrastructure and social and environmental concerns to making space more valuable to developers and investors through urban renewal projects, improving 'quality of life' in the immediate environs of a development and a qualified ecological commitment to the sustainable management of environmental resources to secure economic survival⁹. The relative exclusion of the concerns of non-economic actors from the regulation of space opens room for tensions between developers, communities and layers of government responding to different constituencies.

Local Governments in Australia have traditionally acted as mediators between the activities of market actors and the community. Mediation requires a degree of acceptance of the legitimacy of the mediator by competing stakeholders. Planning for land use in Australia has derived its legitimacy from the election of local councillors by local communities. Councillors set policy directions in consultation with urban planners and other professionals who are also tasked with implementing planning decisions. Councillors are meant to represent the interests of their electors in regard to how land will be used in their communities. Hence planning for land use is anchored in the democratic legitimacy of elected members acting in concert with planning professionals. The latter bring functional legitimacy to the process by virtue of their qualifications and expertise. Land use planning in Australia has always required a degree of coordination with the private sector and between layers of government to improve the built and social environments of communities in accordance with community consultation, civic culture and everyday discourse¹⁰.

However, a study by Benz and Papadopoulos¹¹ suggests that an increasing interest in public-private partnerships by governments in developed countries such as Australia is linked to a fragmentation of institutional frameworks that place policies and actors in tension with each other across layers of government. Fragmentation is perhaps most evident where regional or

state governments seek to foster partnerships with private developers without meaningful consultation with local communities and local governments. Public-private partnerships require private actors associated with land development corporations to be brought into the central decision making process to a significantly greater extent. The inclusion of private actors associated with the development industry in the central decision making process changes the basis of legitimacy. Private actors have neither democratic legitimacy conferred through election to office, nor functional legitimacy through the possession of expertise, albeit individual actors may hold appropriate qualifications, employ urban planning professionals in their firms, or offer support to candidates seeking election to office. While such private actors might favour cooperation between local government and grass-root communities to address varying local issues, including those referring to social and environmental concerns, their principal concern must necessarily be with profit and the interests of their shareholders. As the Nobel Prize winning economist Milton Friedman said, the social responsibility of business is to increase its profits¹².

As many have noted the social responsibility of business to increase profits sometimes brings it into tension with the sustainability of communities, broadly defined by Chiu¹³ as 'maintenance and improvement of well-being of current and future generations'. Less well understood is the changing role of urban regulation in mediating this process at a regional and local level and the challenges new, neoliberal models of urban regulation present to the legitimacy of this process. This is particularly so in the context of federal systems of government as exist in countries like Australia and the United States where State Governments form an intermediate layer of governance between the national and local government authorities.

In a reprise of their influential study of the city as a growth machine, Logan and Molotch¹⁴ argue that this process can be conceived of as a tension between the use value attached to a place by the communities that interact with it as part of their daily lives and the exchange value of making money from the land. Use value in this sense refers to cultural ties, the sense of place that might be attached to iconic heritage buildings and organic ties to community and neighbourhood. Logan and Molotch refer to a 'growth machine' comprised of those for whom 'the city is their business', an interlocking collection of organizations that include pro-growth developers and investors but also politicians whose interests align with capitalists seeking a profit from changes to land use.

At its most basic level this process might be understood in the words of 'Big Jim' Folsom, a former governor of Alabama who is reported to have said 'Nothing just happens. Everything is arranged.'¹⁵ In Australia, political arrangements that support public-private partnerships for urban development are increasingly codified in long terms strategic planning documents. Sydney, Melbourne and Adelaide now have long term plans of up to 30 years that set out expected population and urban growth over coming decades and State Government plans to manage the process. The Plans represent an attempt by State Governments to assert greater control over local government authorities under the rubric of freeing the land market from constraints and allowing a more direct role for State Governments to promote capital accumulation on sub-national scales. Such attempts are allied with a new discourse that ties

such efforts to social concerns with saving the environment and reducing sprawl. A discourse on saving the environment by way of urban consolidation provides space for State Governments to address tensions between developers, communities and other constituencies by positioning a neoliberal policy on land use as in the interests of the environment. Adelaide's 30 year plan is the most recent of these long term plans for Australia's cities. A case study of this plan is illustrative of current focus of urban regulation by State Governments in Australia on the facilitation of private investment and profit, and the augmentation of state revenues.

Methodology

Our purpose in this paper is to illustrate the shifting the focus of urban regulation from a concern with social and environmental outcomes to the facilitation of private investment and profit, and the augmentation of state revenues through an examination of the 30 year plan for Adelaide in South Australia. Our aim is to offer a sharpened understanding of why the case has happened as it has. In this sense, the plan itself is offered as a critical case. Following Yin¹⁶, a critical case can be defined as having strategic importance in relation to a general problem or issue. In essence, the case is one that illustrates well the issues associated with changing models of urban regulation that place the state at the service of the private sector with a higher regard for private profit and the augmentation of state revenues and a diminished concern for social and environmental outcomes. What is valid for this case is likely to be valid for others, allowing a degree of generalizability.

State intervention in the land market in South Australia

South Australia has long been considered a 'rust bucket' state in Australia with an economy dominated by declining manufacturing industries and agriculture. As Gelber¹⁷ notes, South Australia's relative isolation and small market size forces a reliance on domestic demand from the rest of Australia for its manufacturing and agricultural products. As has been the case with most of the developed world, South Australia's economy has been battered by the global financial crisis over the past eighteen months albeit it has fared less poorly than other parts of the world because of the small size of the financial services sector¹⁸. Land and housing prices remained relatively buoyant throughout the global financial crisis and economic downturn that emerged after 2008. Moreover, the land market provides one of the few areas of significant domestic demand that the South Australian Government has control over.

In recent years the South Australian Government has signalled an increased willingness to override the planning authority of local government authorities to boost the land market and fast track development. The 30 year plan for 'Greater Adelaide' is the latest manifestation of this interest, which has been in evidence for some time. In 2006, the SA Government amended the Development Act to require local councils to appoint independent 'experts' to the Development Assessment Panels that review development applications in local government areas to replace the previous practice in which the panels were composed mainly

¹⁶ Yin, R. (2009). *Case Study Research: Design and Methods*. Fourth Edition. SAGE Publications. California.

¹⁷ Gelber, F. (2005), 'Economy' in *State of South Australia: trends and issues*, J. Spoehr Ed., Wakefield Press.

¹⁸ Gelber, F. and Circosta, M. (2009), 'South Australia: the economic outlook', in *State of South Australia: from crisis to prosperity?*, J. Spoehr Ed., Wakefield Press.

of elected council members. The intention was to take planning decisions out of the hands of elected members¹⁹.

Similar intentions seemed to underpin the State Planning and Development Review established by the SA Government in 2007 to review the state's planning laws. Half of the appointed members of the Review panel were representatives of the Economic Development Council, an advisory group dominated by business interests. The Review offered a number of recommendations to 'fast track' development proposals, which were endorsed by the SA Government. A key proposal was to exclude some types of development from the requirement of planning approval. A Residential Development Code has been introduced which allows for a 'tick box' assessment of development. If a proposal meets the requirements set out in the code planning approval must be issued by a planning authority within 10 days. This process significantly limits the capacity of individual residents or affected communities to address a development that might threaten their interests²⁰.

Moreover under section 46 of the SA Development Act 1993, the Minister for Planning and Local Government can declare a proposed development a 'Major Development' at the behest of a developer. Major development status removes the project from the authority of local councils. The development is instead assessed by the Minister and his/her department. The Minister can grant major development status if he/she believes it is necessary for the 'proper' assessment of the proposed development and where the proposal is considered to be of major economic, social or environmental importance.

Such developments might be expected to be in the order of magnitude of a major dam, a desalination plant a road or rail bridge or a similar, large scale project. However the Minister has declared a Buddhist temple, a local shopping centre and a local hotel development to be major projects. Such actions have fuelled a debate in South Australia over the extent to which the government has intervened in the land market in the interests of property developers. SA Progressive Business is a fund raising arm of the governing Australian Labor Party. Major development companies like Urban Construct and Baulderstone Hornibrook are among the firms that make up SA Progressive Business. Such firms have paid up to \$10,000 for access to South Australian Labor Government Ministers and the SA Premier to lobby for their projects. In 2009, thirteen companies involved in Adelaide development projects paid to host functions with the Premier and Ministers in 2009 compared with three mining companies, two retailers, seven financial-sector companies and three law firms²¹.

It is noteworthy that a recent report to the SA Minister for Planning and Development recommends giving the Minister the power to identify 'State Significant Developments' encompassing 'public infrastructure and Crown development, mines, minerals and energy, urban development, defence and aerospace, education, health and other services, water management and manufacturing and food processing'²². Indeed the report recommends

giving the Minister the power to declare entire regions ‘State Significant’ and take control of all planning and development issues in this area.

The 30 year plan for greater Adelaide

The 30Year Plan for Greater Adelaide (hereafter referred to as The Plan), was developed by the consultants KPMG Consortium and Connor Holmes for the South Australian Department of Planning and Local Government (DPLG) and released in draft form for consultation in 2009²³. More than 600 submissions (most of them critical of aspects of the plan) were made to the Department after its release. Only minor amendments were made in response to the submissions and The Plan was formally released in early 2010²⁴.

The Plan sets out a broad planning strategy for Adelaide’s expected growth over the next 30 years. It does not contain detailed plans but has the appearance of an advertising brochure or a coffee table magazine that offers pages of dot points on expected outcomes interspersed with attractive pictures and maps of Adelaide. It offers general statements on plans for mass transit, transit-oriented development and infill densification but it lacks any credible detail and specific targets for achieving the new objectives. The original draft of The Plan was accompanied on the DPLG website by a Background Technical Document, which contained the technical reasoning behind The Plan. The Background Technical Document was poorly drafted, contained numerous spelling errors and lacked accurate citations for many of the claims advanced in the document. The Background Technical Document attracted much criticism in submissions on The Plan and has since been removed from the DPLG website.

The central premise of The Plan is that Adelaide will grow from its population by 560,000 people to achieve a population of 1.8 million by the year 2036²⁵. How this population increase was estimated is not made clear in The Plan. A consideration of population projections should incorporate a discussion of the assumptions and address matters such as the rate of natural increase, inward migration, internal migration, outward migration from South Australia and assumptions about related economic and social matters. This discussion does not appear in the Plan.

According to the Australian Bureau of Statistics, Adelaide had a population of about 1.1 million in 2006 and might be expected using the most optimistic projections to grow to about a population of 1.8 million by 2056 (not 2036) (see ABS cat. 3222.0 Population Projections). The Australian Bureau of Statistics (ABS) uses the cohort-component method for producing population projections. In this method, assumptions made about future levels of fertility, mortality, overseas migration and internal migration are applied to a base population (split by sex and single year of age) to obtain a projected population for the following year. The assumptions are then applied to this new (projected) population to obtain a projected population for the next year. This process is repeated until the end of the projection period is reached. No similar discussion appears in The Plan or the associated Background Technical Document to justify the population projections that appear there. The apparent difference

²³ DPLG (2009), Planning the Adelaide we all want: progressing the 30 year plan for Adelaide, SA Department of Planning and Local Government, piii.

²⁴ DPLG (2010), The 30 year Plan for Greater Adelaide: a volume of the South Australian Planning Strategy, SA Department of Planning and Local Government, pi.

²⁵ DPLG (2010), The 30 year Plan for Greater Adelaide: a volume of the South Australian Planning Strategy, SA Department of Planning and Local Government, p3.

between the population projections offered by the ABS and those that are given in The Plan is explained on page 19 of the Background Technical Document:

The reason why Greater Adelaide's projections are higher than previous estimates is largely attributable to the Australian Bureau of Statistics' (ABS) revised population estimates, based on the results of the 2006 Census. Consequently, South Australia's June 2006 population estimates were revised up from 1.554 million to 1.568 million. This indicated that the ABS had underestimated South Australia's population growth between 2001 and 2006 by approximately 14,000 residents, or 25 per cent. Thus, this level of population growth and the demand for housing and employment in the Greater Adelaide region has been larger than that predicted in most intercensal estimates.

If the ABS revised its population estimates up from 1.554 million to 1.568 million or by just 14,000 residents for all of South Australia for 2006 this does not seem to represent a difference of 25% but a difference of less than 1%. Moreover Adelaide's population increased at a rate of only 0.7% between the 2001 and 2006 Australian Census, for which we have a count of the population for 2001 and 2006, not a projection. The Plan seems to exaggerate Adelaide's expected population growth. Moreover The Plan does not refer to Adelaide but rather to a place called 'Greater Adelaide' a term not used in planning documents before the release of the draft Plan in 2009.

Most of the planning for infrastructure and jobs discussed in The Plan refers to the current metropolitan Adelaide area ranging from the suburbs of Gawler to Willunga (an area of less than 2000 square kilometres, which the ABS refers to as the 'Adelaide Statistical District') as is evident in map D1 on page 73 of The Plan. However map D1 also shows the boundaries of 'Greater Adelaide' as extending much further to cover an area of 9000 square kilometres that will be subject to urban expansion. To put this into perspective, the area of 9000 square kilometres claimed for Greater Adelaide, containing 1.2 million people in 2010, is six times the area of Greater London (1500 square kilometres), a city of eight million people and more than twice the geographic area of Sydney, an Australian city with four times the population of Adelaide. If Greater Adelaide is considered to be a city then urban densities in 'Greater Adelaide' are incredibly low with vast areas of this 'city' being open farmland or vacant land. The Plan indicates that more than 14,200 hectares will be developed for low density housing on the city's fringes. Three large housing developments are flagged in The Plan for the iconic Barossa Valley wine growing district to the north of the current metropolitan area and major developments in the semi-rural Mt Barker district of the Adelaide Hills²⁶. Oddly such peri-urban development is framed in The Plan in terms of containing 'sprawl' and as being in the interest of 'sustainability'. These developments are of course within the 9000 square kilometres claimed as 'Greater Adelaide' and hence might be considered consolidation if one accepts the premise that the natural boundaries of Adelaide cover twice the land area of Sydney²⁷.

In a related matter The Plan also makes provision for the establishment of 'structure plans' for 800 metre high density growth zones on either side of major roads, train lines and tram lines in the existing Adelaide metropolitan area, which local councils will be compelled to

²⁶ DPLG (2010), The 30 year Plan for Greater Adelaide: a volume of the South Australian Planning Strategy, SA Department of Planning and Local Government, p73.

²⁷ DPLG (2010), The 30 year Plan for Greater Adelaide: a volume of the South Australian Planning Strategy, SA Department of Planning and Local Government, p73.

implement by state legislation²⁸. Developments within the zones will be at much higher densities than currently exist and there will be constrained capacity for local residents or communities to appeal a development to local planning authorities. This provision is also couched in terms of enhancing urban 'sustainability' with references to saving the environment by encouraging public transit use. Whilst there is a significant body of planning literature that supports higher density Transit Oriented Development (TOD) around transport nodes (usually discussed as major railway stations or tram stops associated with mixed use developments) as a means of reducing sprawl and car usage, there is little to recommend adhoc, ribbon development along congested main roads served by the slow and unreliable bus services that provide public transport on most of Adelaide's main roads. It is revealing that in a 226 page document only five pages discuss public transport and transit corridors and only in terms of general objectives²⁹, whilst many pages are given over to discussions of the need to find sustainable solutions to rapid population growth by increasing urban densities.

Conclusion

The new 30 year Plan for Greater Adelaide is illustrative of recent policies pursued by Australian State Governments to assert greater control over local government authorities. These policies empower State Governments with limited control over regional economies to promote capital accumulation on sub-national scales. The new agenda is not about a return to a laissez faire free market model. It is in part a response to fluctuations in the strength of globalised, international markets and recognition that local economies continue to depend critically on the non-market regulatory frameworks in which they are embedded. The Australian Government in Canberra has policy control over most aspects of the economy in Australia and State Governments are constrained in what they can do to protect local economies. However the land market remains an area where a difference can be made. Alignment with developers who profit from the land market is a logical outcome of these processes. But State Governments have to serve diverse communities and there remains a need to address the concerns of other actors, at least superficially. In essence, Adelaide's 30 year plan represents an attempt to address the fragmentation of institutional frameworks produced by globalised economies that place policies and actors in tension with each other across layers of government. Such actors might include developers, environmentalists, planners concerned with sprawl, local communities in the inner city affected by densification, and peri-urban or rural communities affected by urbanisation. Adelaide's Plan stakes an ambit claim that realigns the city's boundaries to incorporate a much greater region than the current metropolitan area. This claim allows the State Government to simultaneously argue that it is engaging in urban consolidation thus providing a fig leaf for the environmental lobby and for planners concerned about sprawl, whilst providing room for developers to continue to build on the fringe of the city. Such claims are allied to plans to free up more land in the inner city using similar justifications.

The Plan and others like it are likely to do little to address the concerns of communities in Adelaide affected by development, particularly those who may find themselves living in 'State Significant Areas' or higher density structure zones and who will find avenues for consultation and appeal against developments that affect their interests to be increasingly limited. The Plan is indicative of an emerging alignment of the interests of regional State

²⁸ DPLG (2010), The 30 year Plan for Greater Adelaide: a volume of the South Australian Planning Strategy, SA Department of Planning and Local Government, p72.

²⁹ Transport planning is discussed in dot point form on pages 114 and 116 of The Plan. Transit corridors are discussed in general terms on pages 71-73.

Governments with those local sectional interests that may still be rewarded and in turn provide reciprocal favours. Such governments can be expected to continue to privilege private capital accumulation and mount further appeals to public fears of recession and environmental degradation as a justification for reducing the role of local government authorities as mediators between the activities of market actors and the community. Mediation requires a degree of acceptance of the legitimacy of the mediator by competing stakeholders as well as avenues for consultation and appeal. Current State policy on urban planning in Australia, as set out in the 30 year Plan for Adelaide and similar plans for other cities, undermines the legitimacy of the planning process by overtly favouring some market actors over others. Appeals to public apprehension over the state of the economy and the environment might not be enough to paper over the tensions that must eventually emerge as the mediation system is dismantled.

Abstract

Oil wealth has provided Kuwait with the opportunity to become a player in contributing to the social sustainability of the world. Since Kuwait's independence in 1961, contributions to other nations' economic and social development are continuously being made. Many funding agencies were established to cater to the world's sustainability projects. This paper examines the case of Kuwait Fund for Arab Economic Development which has contributed 15 billion US Dollars to 101 countries since its establishment in 1961.

Introduction

Since the beginning of Kuwait as a social and political entity 300 years ago, Kuwaitis have realized that their existence and progress depends on their willingness and ability to fulfill a role in interacting cohesively with the rest of the world. Kuwait's limited resources in their pre-oil era made them dependent on pearl diving and trade by the process of buying and selling commodities. Such necessities carved in the Kuwaiti identity and culture the importance of precision in the decision-making process, and caring for others.

Over the past six decades, oil wealth has provided Kuwait with the opportunity to become a player in contributing to the social sustainability of the world. Since Kuwait's independence in 1961, contributions to other nations' economic and social development are continuously being made. Many funding agencies (governmental and non-governmental) were established to cater to the world's needs as well as to regional needs.

Some of the main motivators in contributing to world aid include becoming a responsible global citizen, enhancing Kuwait's position among nations, and encouraging other nations to act responsibly (Moubarak, 1987). As expected, there are a large number of projects from which a selection must be made, however, one realizes that most of Kuwait's efforts stems from the nation's historical and cultural heritage of reciprocal collaboration to sustain social benefits through communication, education, and health care.

This paper studies the Kuwaiti historical, social, and cultural elements that guide the decision-making process in various funding agencies, specifically in the Kuwait Fund for Arab Economic Development due to its particular attention in contributing approximately 15 billion US Dollars since its establishment to 101 countries, in the form of low interest,

long-term loans. These funds benefit projects that have a direct social impact on infrastructure, agriculture, education, and health care of the recipient nations.

Historical Context

The economy of pre-oil Kuwait was depended primarily on trade. Kuwait is located in the Arabian Peninsula in West Asia. It has well-established sea routes to East African countries and the Indian Malabar coast located on the West of the India subcontinent. Kuwaiti ships were known to reach as far as South-East Asian ports in Malaysia and Indonesia. Kuwait's geographical location served as a major trade post on the route between Europe and East Asia.

Kuwait's population was involved in ship-building as well as navigation. Months were spent at sea and in foreign lands for the sake of trade and commerce. This intermingling with a range of populations created deep-rooted ties between Kuwaitis and other nations.

Following the discovery of oil and reaping the wealth that it created for the citizens of Kuwait, these ties with other nations were not forgotten. Currently, all of the oil wealth is nationalized, meaning that the nation uses the income for the benefit of its citizens (Richmond, 1977). This is demonstrated by the establishment of a public education system which provides free education from kindergarten all the way to university level. Also, a public health system is available for all citizens as well as residents of Kuwait.

Kuwait has been geographically and culturally autonomous for more than 300 years with the same ruling family leading the country. However, it is in 1961 when official independence was declared and a new constitution was endorsed. Since that time, Kuwait has used its oil wealth to become a major contributor in helping other countries achieve progress and development. There are numerous philanthropic societies as well as well-established funding institutions. The focus of this paper will be to present a case for the government-run Kuwait Fund for Arab Economic Development.

Case Study

The Kuwait Fund for Arab Economic Development (KFAED) was established in the same year that Kuwait officially declared its independence, in 1961. Its initial mission was to provide assistance to other Arab countries. In 1974, it extended its mandate to all developing countries irrespective of geographical, ethnic, religious, caste, or cultural barriers. The countries whose economies are in transition are also eligible.

KFAED states its objectives as follows: "Assist Arab and other developing countries in developing their economies and to provide such countries with loans required for the implementation of their development programs."

Lending Conditions

The programs established by KFAED are low-interest and long-term loan programs issued to governments and public institutions in other countries. These include central and provincial governments, public utilities, and other public corporations. The loans are exempt from taxes and other duties.

The loan contract stipulates the rate of interest and the grace period before repayment starts. In past projects the interest rates were set at around 2.5% per year on average. The grace period averages around 4 years. For past programs, the average loan period was 22 years. In order to encourage the economy of the recipient country, preference is given to local suppliers based on competitive bids.

Types of Projects

KFAED provides loans for projects that have the purpose of sustaining a society and providing long-term benefits for the citizens of the countries awarded the funds. The projects are classified in the following categories (KFAED, 2009):

1. Transport and communication (35.3%)
2. Energy (23.9%)
3. Agricultural and irrigation (13.1%)
4. Water and sewage treatment (9.9%)
5. Industry (8.4%)
6. Development banks (3.3%)
7. Telecommunication (2.6%)
8. Social (2.5%)
9. Other (1%)

KFAED also contributes to financial institutions, including:

1. Arab Fund for Economic and Social Development
2. African Development Bank
3. Arab Bank for Economic Development in Africa
4. Inter-Arab Investment Guarantee Corporation
5. International Development Association
6. International Fund for Agricultural Development
7. Special Program for Sub-Saharan African Countries

Recipient Countries

Since 1961 till today, there are 101 countries that benefitted from the loan programs established by KFAED with 737 loans consisting of a total value of about 4,011,000,000 Kuwaiti Dinars (approximately US \$ 13 billion). To date, the beneficiary countries are distributed as follows:

1. Arab countries (16 countries) with a share of 53.5% of the total loans
2. African countries (40 countries) with a share of 17.7% of the total loans
3. Asia, Pacific, and European countries (34 countries) with a share of 26.2% of the total loans
4. Latin American and the Caribbean countries (11 countries) with a share of 2.6% of the total loans

Examples of Recent Projects

What follows are some examples of recent projects completed by KFAED:

1. *Nepal*: Praganna Irrigation Project, an agricultural project which is estimated to benefit 4,500 families.
2. *Viet Nam*: Irrigation project for rice and coffee cultivation and development of fishery. This project is estimated to benefit 60,000 people.

3. *Lebanon*: Hydro-agricultural development project which is estimated to benefit 400,000 people in the region over time.
5. *Ghana*: A water and sanitation project which involves the ecological restoration of Korle Lagoon in Accra by dredging the lagoon to remove contaminants and installation of wastewater treatment plant and pump stations (Grant, 2006).
6. *People's Republic of China*: A water and sanitation project in Shouzhou which aims at environmental rehabilitation by implementing flood protection works and construction of sewage treatment plants.
7. *Ukraine*: contributions were made to the Chernobyl disaster fund for the "new safe confinement" project.
8. *West African countries*: In the sector of health and social programs, funds were awarded to combating River Blindness in West African countries by contributing to the Onchocerciasis Control Program. This project will protect 100 million people in 19 West African countries.
9. *"Guinea Worm" Eradication Program*: A project aimed at eradicating a major public health problem that impedes socio-economic development. This project benefits people in 19 African countries.

Concluding Remarks

The government of Kuwait maintained a process of reciprocating the good-will with other nations by functioning through the United Nations and its institutions and at the same time communicating directly with other nations in a manner that is built on mutual understanding and cooperation.

An important element in the communication process is the exchange of ideas, goods and services among nations. Such a process strengthens relationships and directs nations toward a unified purpose. A relationship that is based on mutual respect over time is a relationship that has the designs necessary for longevity.

The KFAED represents the government of Kuwait and its citizens in international and regional developments. Over time it has gained a stellar international reputation as a reliable funding agency providing long-term low-interest loans to governmental institutions in developing and transitional countries. Through these interactions, the KFAED manages to promote cooperation and friendship among diverse nations and peoples.

Respectful dialogue among nations by utilizing the services of responsible financial institutions can be a cornerstone in advancing a sustainable future, concentrated on countering poverty, promoting education and health care, thus empowering nations to accelerate a comprehensive sustainable paradigm for all.

On the Western outskirts of the City of Johannesburg, traveling east along Main Reef Road one passes the Johannesburg Police Department.¹ Nestled at the confluence of Market Street and Main Reef Road with Main Road intersecting to make its western boundary, is a peculiar triangular space. Oddly enough the site has always been called Pigeon Square referencing an enormous feral pigeon population that occupies architectural cantilevers, window ledges, plaster moldings and a webbed array of telecommunication and power lines streaking over head. Pigeon Square is literally boxed in on the left by provincial government buildings including the Family Court Center and the Department of Home Affairs. The south boundary constitutes an enclosed parking lot and inner city residences and on the west side, along Main Road is the Madrasah Islaamia (an Islamic School) and a small hairdressing shop.

I have always known this inner city area for the kaleidoscopically colorful and diverse Diagonal Street not far from Pigeon Square and the vibrant Asian (predominately Chinese) trading community along Commissioner Street, with its almost inconspicuous noodle bars and fascinating general convenience stores filled from floor to brazier top with all things Asian, strange, exotic and other worldly. Also one should not over look the Oriental Plaza less than five kilometers to the west of the city. This is ironically second only to the prosaic Pigeon Square. A dead and banal space shared by jostling pedestrians (at peak foot traffic time) and a lively feral pigeon population. The two communities still eye each other with equal suspicion and at times contempt never quite at ease with each other's rightful passage through the space.²

In this paper I focus on the installation of three large origami-styled pigeon shapes by Gerhard and Maja Marx at Pigeon Square called *Paper Pigeons* (2009). I problematize the installation as a site-specific piece by drawing selectively on writings around public space and site-specificity. In doing this I want to bring attention to the discursive ways that public sculpture relates both purposefully, physically, spatially and culturally.³ My argument in this paper is limited to a study of the conceptual collapsing together and conflation of physical, spatial and thematic elements and in so doing draws attention to the many ways *Paper Pigeons* (2009) as a site-specific piece assists in our revision of public art installations as historical, sociopolitical and cultural markers.

In her book, *One Place After Another: Site-Specific Art and Locational Identity* (2002) Miwon Kwon plots out a comprehensive genealogy of 20th Century site-specific art. She begins with a contentious working definition of site-specificity as a traditional practice emerging in the 1960s and 1970s as involving, "...something grounded ...playing with gravity [and] ...obstinate about 'presence'..." Drawing on a reading of Deleuze and Quattari's notions of rhizomic nomadism and deterritorialization, Kwon calls for a revision of conventional views on the subject. She advocates rather for a site-specificity that moves "...beyond the inherited conception of site-specific art as a grounded, fixed (even ephemeral), singular event..." and advances rather an "...altogether different notion of site as predominantly an intertextually coordinated, multiply located, discursive field of

operation” (Kwon 2002:159). With reference to James Meyer’s term, “functional site” Kwon, underscores the significance of recent site-specific art to embrace an, “...idea of meaning as an open, unfixd constellation, porous to contingencies...” (Kwon 2002:160).

As a form of public expression, site-specific art should fit as a constituent part of the fluidity of the city. By this I don’t mean a complacent decorative feature but rather a form of visual expression that denotes a point at which interaction with different and discursive identities and situations are enabled through a certain critical momentum that agitates rather than dominates a place. Following Kwon, I am referring to creative interventions that articulate a “...prevalent description of contemporary life as a network of unanchored flows” (Kwon 2002:164). To further this point, Kwon drawing on Deutsche (1998) suggests that public art has as its social prerogative an operation within a cultural field of social contradictions, calling for an understanding of “...seeming oppositions as *sustaining* relations” (Kwon 2002:166, Kwon’s emphasis). Elsewhere Dirsuweit (in Farber 2008:52) refers to this as, “...unassimilated difference and a culture of agonistic disagreement.”

As part of this genealogy, Kwon identifies three paradigms of site-specific art practice. The first she categorizes as phenomenological or existential (Kwon in Gaiger 2009:47)⁴ referring to the “...inextricable, indivisible relationship between the work and its site...” to the extent that work and site became physically inseparable (Kwon 2002:12-13). Here, artists are essentially concerned with the relation between the viewer’s encounter with the work of art and the physical space in which it is located. In the second category, Kwon discusses examples of site-specific art, “...concerned with the social and political meanings of the site.” Here Kwon analyses examples of work in which attention is drawn to “...the hidden institutional conditions that sustain the supposedly ‘innocent’ space of the gallery... the wider institutional framework within which works of art are displayed, marketed and sold” (Kwon in Gaiger 2009:47-48).

Taking critical aim at Kwon’s third paradigm, Gaiger raises a series of objections to Kwon’s genealogy. In a critique of Kwon’s third paradigm, he alludes to forms of expression that move “...beyond the confines of the art world to address non-art spaces, institutions, and issues...” (Kwon in Gaiger 2009:48-49). For Gaiger the problem resides in the fact that the notion of site is dissolved entirely to the point that physical space is no longer relevant. He elaborates: “She terms this paradigm ‘discursive site-specificity’ to indicate that the site is now understood not as a physical place or as an institution but as a discourse of knowledge and ideas” (Kwon in Gaiger 2009:49).

Most importantly for this paper, is the purposefulness of site-specific public art to resonate beyond mere nostalgic yearning for a historical past. Rather as a form of public expression, site-specific art brings relevance and significance to ordinary everyday lived experience. Kwon (2002:166) explains this further when she writes: “Today’s site-orientated practices inherit the task of demarcating the *relational specificity* that can hold in dialectical tension the distant poles of spatial experience...” It is this concern with “relational specificity” that I seek to forward as a guiding principle in my analysis of *Paper Pigeons* (2009) at Pigeon Square by drawing selectively on Kwon’s ideas around site-specificity.

In March 2009, Gerhard and Maja Marx submitted a proposal for a site-specific sculpture in response to a sculpture commission administered by the Johannesburg Development Agency (JDA) and its commissioning agents, the Wits School of Arts (WSOA). The commission was publicized as part of the JDA’s inner city development and rejuvenation initiative which in part, has over the past few years seen a number of site-specific sculptural works installed in and around the city of

Johannesburg. Jeremy Wafer, a member of the selection panel from the WSOA, outlined some of the criteria for selection.⁵ In their consideration of the short listed proposals, the panelists considered the need for the successful work to above all *mark* the site as the Western “gate” of the City. It should also contribute to a rejuvenation of an area that has over the years slipped into a state of urban decay and in so doing respond to historical and cultural aspects of the site. In this sense the work should not merely decorate the site but respond and resonate meaningfully to everyday urban experiences (Wafer 2010).

The proposal to install three meter high pigeon shaped sculptures was (by the artists’s admission) a literal interpretation of the brief but in many ways not (Marx and Marx 2010). Their intention was to produce a site-specific work that addressed the problem of urban engagement. Rather than transform, refigure, mask or remake the site, their proposal sort to pull together aspects of the site that were already in place and highlight these in the way the sculpture relates to the site. I want to suggest here that Kwon’s revision of site-specific interventions and the epistemological conditions surrounding our understanding of this form of public expression can be applied to usefully situate *Paper Pigeons* (2009). In this sense, public art not only recalls more conventional definitions around the tricky locale of site but more importantly draws attention to the ontological significance of site-specificity as a social and cultural conduit synchronizing aspects of the city in an ephemeral and transient spatial locality. This kind of urban space demands creative forms that infiltrate, permeate, transgress and transcend geographical, spatial and cultural barriers thereby enabling a tangible and tactile social fluidity and mobility.

Pigeon Square is positioned precisely at an intersection of multifarious movement in and out of the city. It is a transitory space of coagulating but also dissipating and dispersing trajectories including the feral pigeon population, pedestrian and vehicular traffic, the buzz of a thriving localized retail culture as well as the scheduled timely arrival and departure of the Bus Rapid Transport (BRT) system. These methods of movement (historical, social, cultural, private/personal and public/collective) signal the conceptually discursive nature of the site. This is not a space of prolonged belonging.⁶ The nature of movement through the space underscores its fleeting-ness: a place whose physicality in time and space is fixed oddly enough, through its inherent transience.⁷

In many ways *Paper Pigeons* (2009) is essentially about interaction. It is in this we find its significance as a *public* work. The original proposal referred to one very large monumental pigeon form rather than three relatively smaller ones to effect a kind of care-giving aspect providing shelter from rain or shade from scorching sun. Interestingly, the artists draw attention to the way the pigeon structures function as “pedestals” for real pigeons in as much as they function as public sculptures. This doubling in structural purpose signals a shift in functionality – from aestheticized iconography to utilitarian object (Marx and Marx 2010).

The monumentality of the three pigeon forms problematically recalls the defensive armory of military combat vehicles - the rusty old war machines of long dead conflict on which children clamber to enact imaginary battles. In part this resolves the brief’s requirements for a sculptural installation that is robust, low maintenance and sustainable, in other words: a valued commodity; a fixed asset, but also defiantly references the impenetrability of the surrounding architecture.⁸

Too easily public sculpture *masks* rather than *marks* or *makes* social conditions enabling material cohesiveness that is conducive to social spatial production (Lefebvre 1991). Cultural resonance is displaced and camouflaged in guileful decorative beautification obliterating prescriptive symbolic

intentionality. Part of the conceptual and visual strength of *Paper Pigeons* (2009) is the many ways that this visual effect of militaristic defensiveness is undercut and contradicted through its physical and conceptual responsiveness to the site. I am reminded of Deutsche (1996:xxii) who alludes to what she calls "...the democratic possibilities of site-specific art..." when she disapprovingly discusses more established and conventional definitions of site-specificity that are, "...consistent with the concealment, rather than the questioning, of power in public art's urban sites." *Paper Pigeons* (2009) prompts social interaction and historical and cultural responsiveness in its visually and physically accessible apertures and appendages, exploding potentially prescient meaning.

The installation at Pigeon Square presents a public sculpture that integrates with the site in the way it osmotically absorbs physical and conceptual characteristics. The work invokes a spirit of and feeling for urban Johannesburg in the mixture of "harshness" and "lightness" inscribed in the site and its reciprocal relationship to the sculpture (Wafer 2010). It invigorates a cultural significance in the way it signals the milieu of Johannesburg City through a playful tension of delicacy and monumentality, heaviness and lightness thus signaling a space that Nuttall (in Mbembe and Nuttall 2008:195) argues is "...an intricate entanglement of *éclat* and somberness, lightness and darkness, comprehension and bewilderment, polis and necropolis, desegregation and resegregation."

In the three pigeon forms, formal elements are not imposed but rather radiate from the site recalling Kwon's (2002:26) assertion of a third site-specific category that an, "...art work's relationship to the actuality of the location (as site) and the social conditions of the institutional frame (as site) are both subordinate to a discursively determined site that is delineated as a field of knowledge, intellectual exchange, or cultural debate." For Gerhard and Maja Marx (2010) it was important that the idea for the installation emanates from the ideological significance of the site rather than a totalitarian imposition of ideological allusions or at worst a balsamic obscuring of its potential for social agglutination. In doing so it reestablishes a relationship with the current-ness of the site (and more broadly, Johannesburg the City) by re-emphasizing the lived experience of the place rather than a strictly ideological nostalgia for a historical (past/previous) significance. In this sense *Paper Pigeons* (2009) interpellates community ownership by emerging as a potent signifier of inner city identity.

Through powerfully centripetal cohesiveness, behaviour, ritual, trend and daily routine (in selected public art), signals *real* time as a product of the site's idiosyncratic multiplicity. Echoing Kwon's (2002:24) point that "...the guarantee of a specific relationship between an art work and its site is not based on a physical permanence of that relationship... but rather on the recognition of its unfixed *impermanence*, to be experienced as an unrepeatable and fleeting situation..." One could extend this point in a reading of *Paper Pigeons* (2009) as it recalls a potent reference to Mbembe's argument for the superfluity (Mbembe in Mbembe and Nuttall 2008:38) and mobility of everyday experience of the inner city intimating the everyday rather than the charged conceptual and cultural distance of traditional monumental public sculpture. The City as a backdrop defaults to a multi layered functional entity of shifting social dynamisms in the way social interaction is prompted publicly.

A number of devices further encode the work's conceptual rather than empirical relevance in its proximity to the site. In the short time that the work has been installed a significant contribution has been made through an ever growing inadvertent and inevitable defacement of the pigeon-shaped structures through a gentle but persistent avian vandalism; a *mark* of a more sympathetic kind: *poo*. Pigeon guano functions to assist in the assimilation with site and structure literally but this also prompts an alternative thematic reading. Aside from actualizing the anatomical bird, through colour and texture, pigeon guano signifies a recycling of urban matter as a process endemic to an

ontological experience of the city. One's sense of being in the city is brought to bear through a realisation of matter (fecal and otherwise) materialized in differing forms and recycled to affect a sense of things new, refigured or re-made.

A grey scale colour range in *Paper Pigeons* (2009) relates literally to the feral pigeon bird colouring injecting a sense of realism into the final solution. Yellow colour accents on the ends of the perching rods that protrude from the sides of the structures reference pigeon speckle. In addition to this, shadows cast by the rods further ebulate and enliven the surface. The artists note how this effect injects a second life into the work by animating the surface and transforming the visual totality through a play of light.⁹ Additionally, the choice of grey scale colouring enables a blending with the grey-ness of the site in the way it evokes the colouring of surrounding provincial buildings (Marx and Marx 2010). This has implications for how we understand site as "...not defined as a precondition. Rather, it is generated by the work (often as "content"), and then verified by its convergence with an existing discursive formation" (Kwon 2002:26).

The visual and structural language of origami is arguably the most significant sculptural consideration in the technical and structural visualization of *Paper Pigeons* (2009). In its conceptual resonance origami affords a sense of simplicity in the technical resolution of the sculpture. Formal considerations such as the shape and structure of the bird form proved technically problematic especially on this scale. The origami solution presented possibilities that were already in place and inviting application (Marx and Marx 2010). For the artists this was not necessarily directed at a need for cultural-specificity or referencing a cultural literalness in interpretation (Marx and Marx 2010). Beginning with paper as a starting point for experimenting with form, a planar structural language presented immediate aesthetic and technological solutions. *Paper Pigeons* (2009) is conceptually and spatially situated at the nodal visual play of thin-ness, flexibility, fragility and transience. The translation of form from a two dimensional (flat and ostensibly fragile) format into a three dimensional (spatial and structurally sound) format underpins a pulling together of conflicting spatial criteria exposing an optical dynamism. As a venerably antiquarian practice in structural engineering, origami enabled a shape-shifting of surface into an elevated three dimensionality appealing to the required sculptural outcome thereby feeding a structural purpose over and above a simply decorative outcome.

This tectonic play recalls a degree of humor in the quirky visual dance of binary opposites. The flimsy superficiality of the paper motif in the planar aspect of origami translates sculpturally into something structurally and visually powerful. Physical strength, permanence, foundational place-ness (synonymous with monumentality) is quickly undercut through an imposing visual significance that at the same time references transience, lightness and ephemerality. These subtle contradictions prompt curiosity and ultimately provoke, as integral to their design, concerted public interaction. The artists jokingly acknowledge this playfulness as a consideration in the engineering of the structures. The rods are engineered to easily accommodate climbing children or adequately facilitate eager tourists for that once in a life time 2010 FIFA World Cup photo opportunity (Marx and Marx 2010).

Conclusion

Relationally specific and responsive public art, particularly site-specific installations provide the necessary means to catheterize a flow of cultural information and knowledge that is otherwise invisible on the spectrum of everyday experience. I rather enjoy Hannah Le Roux's use of the acupuncture metaphor in her analysis of selected architectural design studios that collectively explore forgotten and discarded city spaces and places. She writes: "Acupuncture is a metaphor for a way of

working on the city through mapping the intensities of flows of people and processes, identifying nodes where obstacles – bureaucratic, legal, spatial, and social – block their realisation and create tension and malaise.” Through this inclusive approach, “the agency of everyday users can transform the city to a more socially fluid and multiple space” (Le Roux in Farber 2008:63). In my mind *Paper Pigeons* (2009) does exactly that. Not only does it activate a conceptual resonance to and presence on the site, but it becomes an important means through which we, the Johannesburgian public (and others), could begin to revisit and reclaim those parts of the City previously lost.

Notes

¹ This building was once home to the apartheid police headquarters: the notorious John Vorster Square, and negatively popularized by *known* incidents of police brutality and political suppression. It is now the headquarters of the Johannesburg Police Department.

² In their research for the project, Gerhard and Maja Marx found that according to a local Chinese shop owner the pigeons are fed daily by an Indian hairdresser who owns a small shop next to the Madrasah Islaamia on Main Road (on the west side of Pigeon Square). It is known that pigeon feeding in Pigeon Square has been active since the 1930s.

³ For reasons of scope, the content of this paper may only refer in passing to the significant political discussions and positions around public art, ownership and accountability. Also, there is enormous potential in my approach here to explore a reading of these works in relation to a discourse on the sublime.

⁴ For an excellent critique of Kwon's work, the reader is referred to Jason Gaiger's article, Dismantling the Frame: Site-Specific Art and Aesthetic Autonomy, *British Journal of Aesthetics*, 49(1), January 2009: 43-58.

⁵ I interviewed Jeremy Wafer to establish specific details governing the commissioning circumstances as well as the criteria for selection. The conversation also focused on the *Paper Pigeon* (2009) sculpture and its significance in relation to the Pigeon Square site.

⁶ The public are actually discouraged from loitering or pausing for too long in the space. Security officers are known to regularly chase dilatory individuals away, presumably to alleviate the threat of inner city crime (Wafer 2010).

⁷ This is reinforced literally through the reference to avian flight circulating notions of communal interactivity. Bird and human communities regard each other through fleeting interference and other usage of the space such as feeding.

⁸ It is also interesting to know that the Family Court Center for example, was built initially by the Apartheid government to house the much-hated department of Native Affairs (Marx and Marx 2010).

⁹ To a large extent this effect operates also as a means to undercut the visual implications of the rods as referencing a military or defensive structure (Marx and Marx 2010).

Japanese Abroad: Preparing Japanese students to study abroad
Jerrod Hansen, Ph.D.
Osaka Jogakuin College, Osaka
jhansen@wilmina.ac.jp

Abstract: This presentation examines best practices for ensuring maximum learning and benefit from study abroad for Japanese students in Canada and North America. Based on research examining the effects of study abroad among Japanese high school students in Canada and college students in the United States, various shortcomings in study abroad programs are identified. The value of better pre-departure training, oversight and instruction while abroad, and comprehensive debriefing upon returning to Japan are discussed. Since preparations based on descriptive notions of culture fail to sufficiently prepare students for understanding the host culture, cultural changes among students are rare. A new model of culture based on the cognitive theory of culture provides a better model for explaining not just how Western culture differs from Japan but why these differences exist at all. This functional appreciation of the process of culture better prepares students to understand the thoughts and behaviors of people in the host country and best prepares them for learning while abroad. Programs that incorporate these suggestions are expected to have fewer problems and participants are likely to learn more about both home and host cultures as well as develop greater cross-cultural awareness, improve their intercultural communication skills, and increase self-awareness.

Japanese Abroad: Preparing Japanese students to study abroad

Jerrod Hansen, Ph.D.

Osaka Jogakuin College, Osaka

jhansen@wilmina.ac.jp

Research examining the effects of studying abroad in North America (Hansen, 1999; Hansen, 2004) has identified ways in which culture learning can be enhanced or restricted. Different ways of preparing students for the sojourn, the structure of their environment abroad, and the manner of debriefing upon returning home are just some of the variables that administrators should consider when creating or reforming programs. Programs that fail to consider these variables risk squandering the unique opportunities for learning and personal development that study abroad provides.

Below I briefly introduce two study abroad programs that sent Japanese students to North America and discuss the different outcomes seen among students in those programs as well as factors influencing these outcomes. I distinguish two general types of change as learning and development. The lack of cultural change (a developmental change) among participants is understood as a consequence of the relatively short duration abroad and the fundamental nature of culture according to the cognitive theory of culture. The paper closes with a consideration of how the cognitive concept of culture may be used to prepare students to study abroad.

Two Programs: Introduction

An examination of study abroad programs is necessary to begin an analysis of best practices. As part of two independent research projects, I examined two different cohorts of Japanese students who studied in North America. The first was a group of college students studying at an American college in a 5 month program. The second group of high school students studied at Canadian high schools for one year. Although the author recognizes the differences between Canada and the USA, for the purposes of this analysis they are treated as equal.

The college group is characterized as the low immersion group. This designation is due to a combination of factors, starting with the comparatively shorter time spent abroad. In addition to spending less than half a year overseas, the college students traveled, lived, and studied in a group of over 100 students. There were no minimal English requirements for participation in the program and thus there were varied levels of ESL skill among the students. Because the group did not have sufficient skill to participate in standard classes (aside from Physical Education), they took classes that were designed solely for this program. There were no students from the host institution or other programs in any of their classes but the the classes were taught in English. Participants in this program were not considered as students of the hosting institution. Some students did have non-Japanese roommates in the dormitories but more often than not they shared a room with someone from the program.

The high school program is considered to be a high or deep immersion program. Participants in this program were abroad in Canada for one full calendar year. While abroad, they lived alone with a Canadian host family. At most, four students from the program attended the same high school with most students “sharing” their host high school with only one or two others from the program. They were enrolled in standard classes alongside Canadian students and essentially lived as a Canadian teenager for one year.

Two Programs: Effects

These two programs are representative of the ends of the spectrum of long-term study abroad programs (characterized in terms of months rather than weeks). At first glance, it would appear that participants in the high school program would exhibit greater changes in their awareness and personal development due to the apparent greater contact with the host culture. Surprisingly, the

opposite effect was found. The “low-immersion” college students returned to Japan significantly affected by the experience whereas the high school students, while not unaffected, flowed back into their pre-sojourn roles quite easily. There are several factors that explain this difference.

Although the college group had quantitatively lower levels of contact with the host culture, particular elements of the structure of that program combined to maximize the impact of the time abroad. The large group, low English level, and on-campus lodging structure contributed to a situation where many students were free to spend time on campus outside of classes and observe American college life, which they did intently. Surrounded by other Japanese students, they would often talk about what they had seen or any interactions they’d had. One student recalled being asked if he would share his cigarettes by an unknown American student. In and of itself this was a big event for him, but its impact grew as he shared the story with his friends and they all talked about how easy it is for Americans to do such things.

The high school students, in contrast, spent very little time with other Japanese speakers and in fact generally spent a majority of their time with their host families, either together at home or running errands or alone at home. The consistency of school and domestic life did not offer as many novel opportunities and experiences as the college students had, nor did they have as much opportunity to reflect on the experiences they were exposed to. Compared to the college students, the high school students did not spend as much time observing, discussing, or learning from their host culture.

This is not to say that the high school students were unchanged at all. On the contrary, their English skills developed dramatically. There was noticeable differences in many of the students regarding self-expression and many commented that the experience made them more confident and independent. They uniformly were dissatisfied with the schedule of their sojourn, as it had them arriving and departing in January. This meant they arrived in the middle of one academic year, then, just as they were making progress with language and social development, had a multi-month summer break before returning to school to start a new academic year. This schedule is also partly responsible for the counterintuitive effects of a one year sojourn. For many students, they met few Canadian friends during the 3 month summer vacation. Other factors including the long winter months in Canada and the lack of easy transportation or entertainment options reduced the amount of time that the high school students spent with other Canadian teenagers, contributing to an overall lower than expected degree of immersion, especially when compared to the college program.

Comparing these two programs highlights the unreliability of gross indicators such as time spent abroad. It is apparent that administrators have many options for influencing the impact of their programs. Prior to departing is an excellent opportunity to prepare students for the experience, above and beyond the essential safety instructions. Teaching students about the nature of culture as well as the specific differences between their home and host culture improves the likelihood that students will be able to make engaged observations immediately after arrival and reduces the stresses that, contrary to the intuitive U-curve hypothesis (Oberg, 1960), often mark the beginning of a foray into a foreign culture (Ward, Bochner, and Furnham, 2001).

Once students depart, there is still much that can be done to take full advantage of the experience. Official oversight of students’ experiences and progress ensures that any problems that may develop do not blossom into disasters. Additionally, regular contact with students can be used to inspire careful observation and reflection of the experience. Journals of daily experiences are very useful, especially after returning home, yet it is difficult for many students to keep a regular journal. Persistent (yet unobtrusive) reminders in this regard can reap tremendous benefits later during reflection and processing of the experience.

Students should be encouraged to continue using the observation, reflection, and documentation skills developed while abroad during the reentry process as well. Returning home often provides

a mirror to which participants can compare their overseas experiences. This can be the source of so-called reverse culture shock but can also be a method for identifying previously unrealized differences or changes in one's self.

All three phases of study abroad are important and deserve the full attention of students and administrators. To adopt an obvious travel metaphor, the pre-departure take-off, the in-flight sojourn, and the reentry landing are all part of studying abroad. Each is distinct in the opportunities for learning and development. Care must be taken to recognize these different opportunities and adapt one's posture accordingly to maximize the benefits to participants.

Types of Change

The effects of study abroad can be broadly divided into two categories, learning and development. Learning effects include language learning, new knowledge and awareness of local customs and ways of living, and improved communication and coping skills in intercultural contexts. Development effects are more psychological and include personal growth such as improved confidence in one's abilities, a greater sense of personal independence or responsibility, and unconscious cultural changes. Ward, Bochner, and Furnham (2001) reviewed different models of adaptation and reveal that adaptation is commonly conceived of as a skills set to be acquired or refined via various coping mechanisms and learning strategies. They also introduce a stress and coping model of acculturation that improves upon many of the shortcomings of other models, specifically by including a social identity element which I include under the Development category.

Within this framework, the two programs included in this analysis produced both learning and developmental effects, especially personal development. But neither had a significant impact on the underlying culture of the participants in the sense that they returned to Japan as hybrid cultured individuals. They were still thoroughly Japanese in a cultural sense even if they had developed personally and were armed with stronger skills for navigating multicultural environments.

The explanation for this lack of cultural change is simple. Study abroad excursions are not substantial enough to impart deep cultural concepts in a psychological sense. Participants are not abroad long enough or immersed enough to absorb enough of the host culture. While they may have learned a great deal about the host culture and developed skills and abilities that allow them to function in the host culture, psychologically they have not acculturated to the standards of the host culture. This sort of change may not be a goal of participants and the lack of this sort of change may even be preferred. An understanding of the psychological underpinnings of culture at a cognitive level nevertheless may aid students as they transition to the new cultural environment, enhancing their ability to learn and develop from the experience.

The Cognitive Theory of Culture

Essentially the cognitive model of culture describes how culture operates as a psychological phenomenon. The strength of this approach is its explanatory power. Where other models of culture are descriptive, the cultural psychology approach identifies the mechanism where culture is both created by yet responsible for the creation of collective cognitive trends and shared psychology. Nisbett (2004) provides the best explanation of the cognitive culture model. Others explore the concept of the self (Benson, 2001; Markus and Kitayama, 1991; Taylor, 2003), cultures of violence (Nisbett and Cohen, 1996) and the constitutive process of meaning making (Bruner, 1990; Tomasello, 1999). (See Schaller and Crandall (2004), Shweder (1991), Shweder and LeVine (1984), and Stigler, Shweder, and Herdt (1990) for general overviews of cultural psychology.)

Nisbett explains how culture is an emergent phenomenon subject to the way we process information, that is to say, subject to cognition. Broadly speaking, there are two divergent styles

of cognition. Analytic cognition tends to focus on salient objects and their attributes. Holistic cognition tends to organize the world according to relationships and as a result considers wholes, rather than parts. From this fundamental difference in how the mind interacts with the environment, a host of cultural differences emerge, including demonstrable differences relating to how we conceive of our selves, how we literally “see” the world, how we explain the behaviors of others, and our utilization of logic (or lack thereof).

One of the strongest elements of the cognitive model of culture is its acknowledgement that although culture is a product of cognition and thus human minds, human minds and cognition are in turn the product of culture. Other models of culture break down when subjected to a repetitive analysis of causation (“Yes, but why?”) but the cognitive model has broken through this conundrum by recognizing that culture is a product of psychology that is itself subject to influence from culture. This so mutually-constitutive process can appear tautological if considered simultaneously, but when the process is considered over time, the apparent contradiction disappears.

Understanding that culture is more than just beliefs and customs releases students from the burden of having to learn and understand those beliefs and customs before feeling comfortable. Culture is a process and culture is an effect. Knowing this helps to unlock awareness of not just differences between cultures, but the reasons for those differences. Armed with this explanatory tool, participants are capable of learning and understanding more about the cultural environment. This can only enhance what they learn and the degree of personal development and perhaps even cultural change in study abroad.

THE INFORMATIONAL SYSTEM MANAGEMENT

THE INFORMATIONAL SYSTEM MANAGEMENT

1. Introductory Notions

The informational society represents a new stage in the human civilization's development, a new, qualitatively superior way of life, implying the intensive use of information in all spheres of human activity and existence and having a major economic and social impact. „The informational society” can be defined as „*the society in which most of the active population works in the informational area, where information is created, processed, distributed and/or used.*”

The informational system includes the set of data, document included information, informational circuits, informational flows and means of processing the information, all of them involved in the fundamenting of administrative decisions, elaborated by institutions belonging to the public administration system and that contribute, due to their content, to satisfying the general needs of the population. (Androniceanu 2006).

The employment of information in the elaboration of norms and their transmission towards the local administrative authorities in order to be enforced implies an informational circuit and/or flow.

The informational circuit represents the route of the information from the transmitter to the beneficiary of information.

The informational flow is the quantity of information conveyed between the transmitter and the beneficiary of information.

In order to meet the social needs of the members of society, to provide public services in certain conditions, just the human, material and technical resources are not sufficient; it is also necessary to have a permanent contact with the social environment evidence, which the public management serves.

Within a local public administration, the informational system performs the following functions (Verboncu 2008):

a. The decisional function – means that the informational system must ensure the informational elements needed to fundament administrative documents and all categories of administrative decisions.

b. The operational function – is ensuring the enforcement of administrative documents: laws, decrees, resolutions and all types of administrative decisions.

c. The documentation function – expresses the system's purpose of registering information needed by the dedicated personnel, in order to create the basis of the objectives and subsequently of the deriving administrative decisions.

2. The Analysis of the Current Situation

Within a local public administration all official documents will enter the registry's office, being forbidden to pass them to the specialised departments without the resolution of the competent decision makers that decide over their solving.

Schematically, the circuit of official documents in the administration is presented in diagram 2.1.

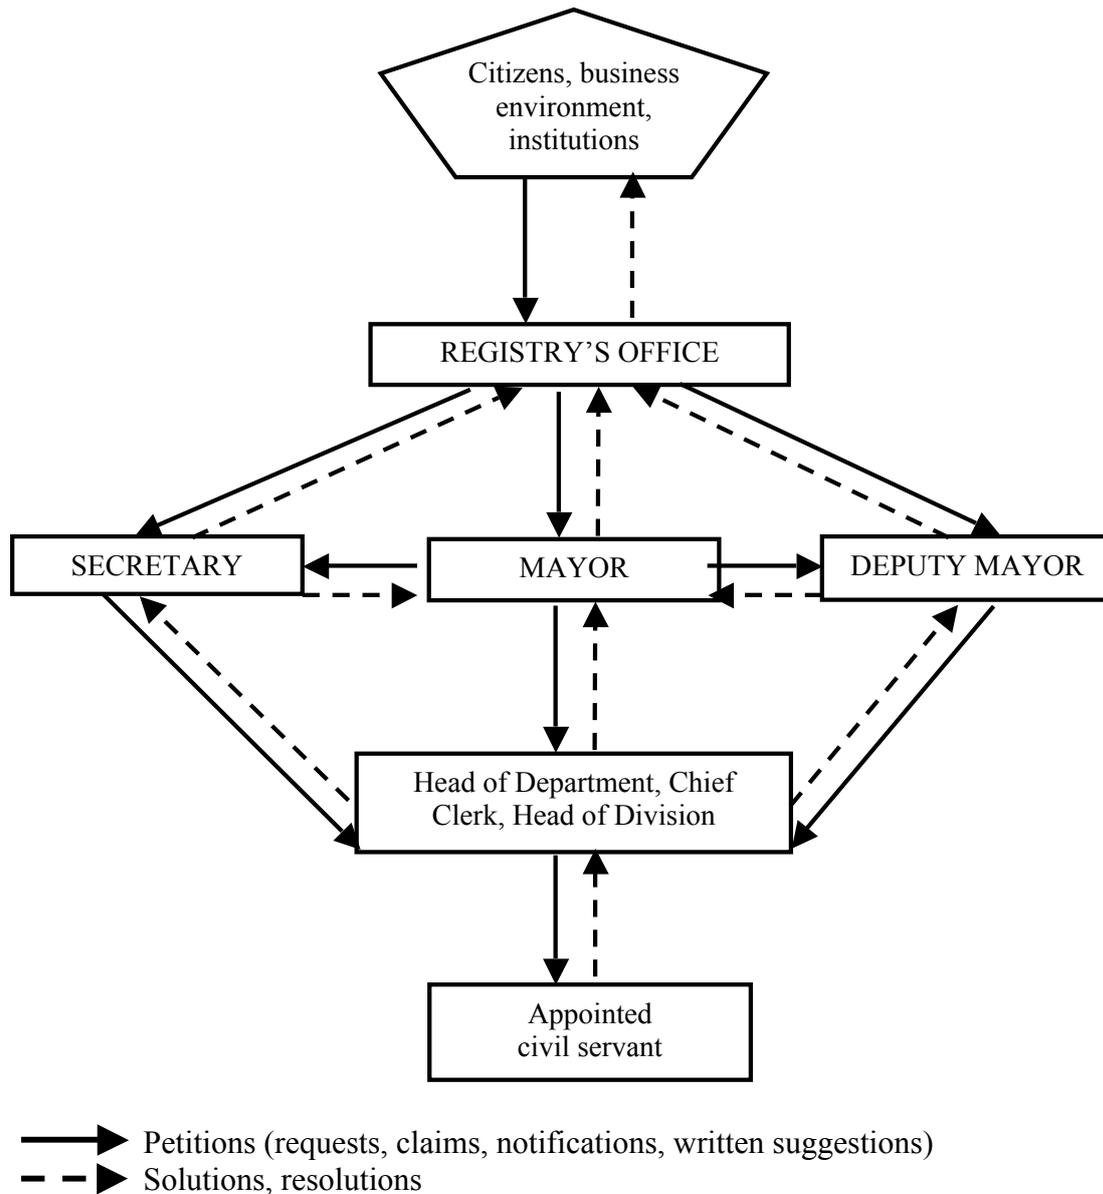

Diagram 2.1 – *The informational circuit in local public administration*

In the presented circuit, information goes as follows (OFR 2009):

- Duties are hierarchically established from the directly superior manager, a similar procedure applying to how duties are fulfilled.
- The directly responsible civil servant is asked by the management of the institution to offer information or to carry on specific works; he has the obligation to inform the hierarchically superior manager on the stage of works and the fulfillment of tasks.
- The access to public information is made from the official position or upon citizen's request, through the Public Relations department.
- Petitions addressed to the City Hall (requests, claims, notifications, written suggestions), would be solved and resolutions communicated to the petent within 30 days.
- The institution departments and office communicate between them by addresses.

Analysing this circuit we came upon a series of functional deficiencies that we are presenting in diagram 2.2.

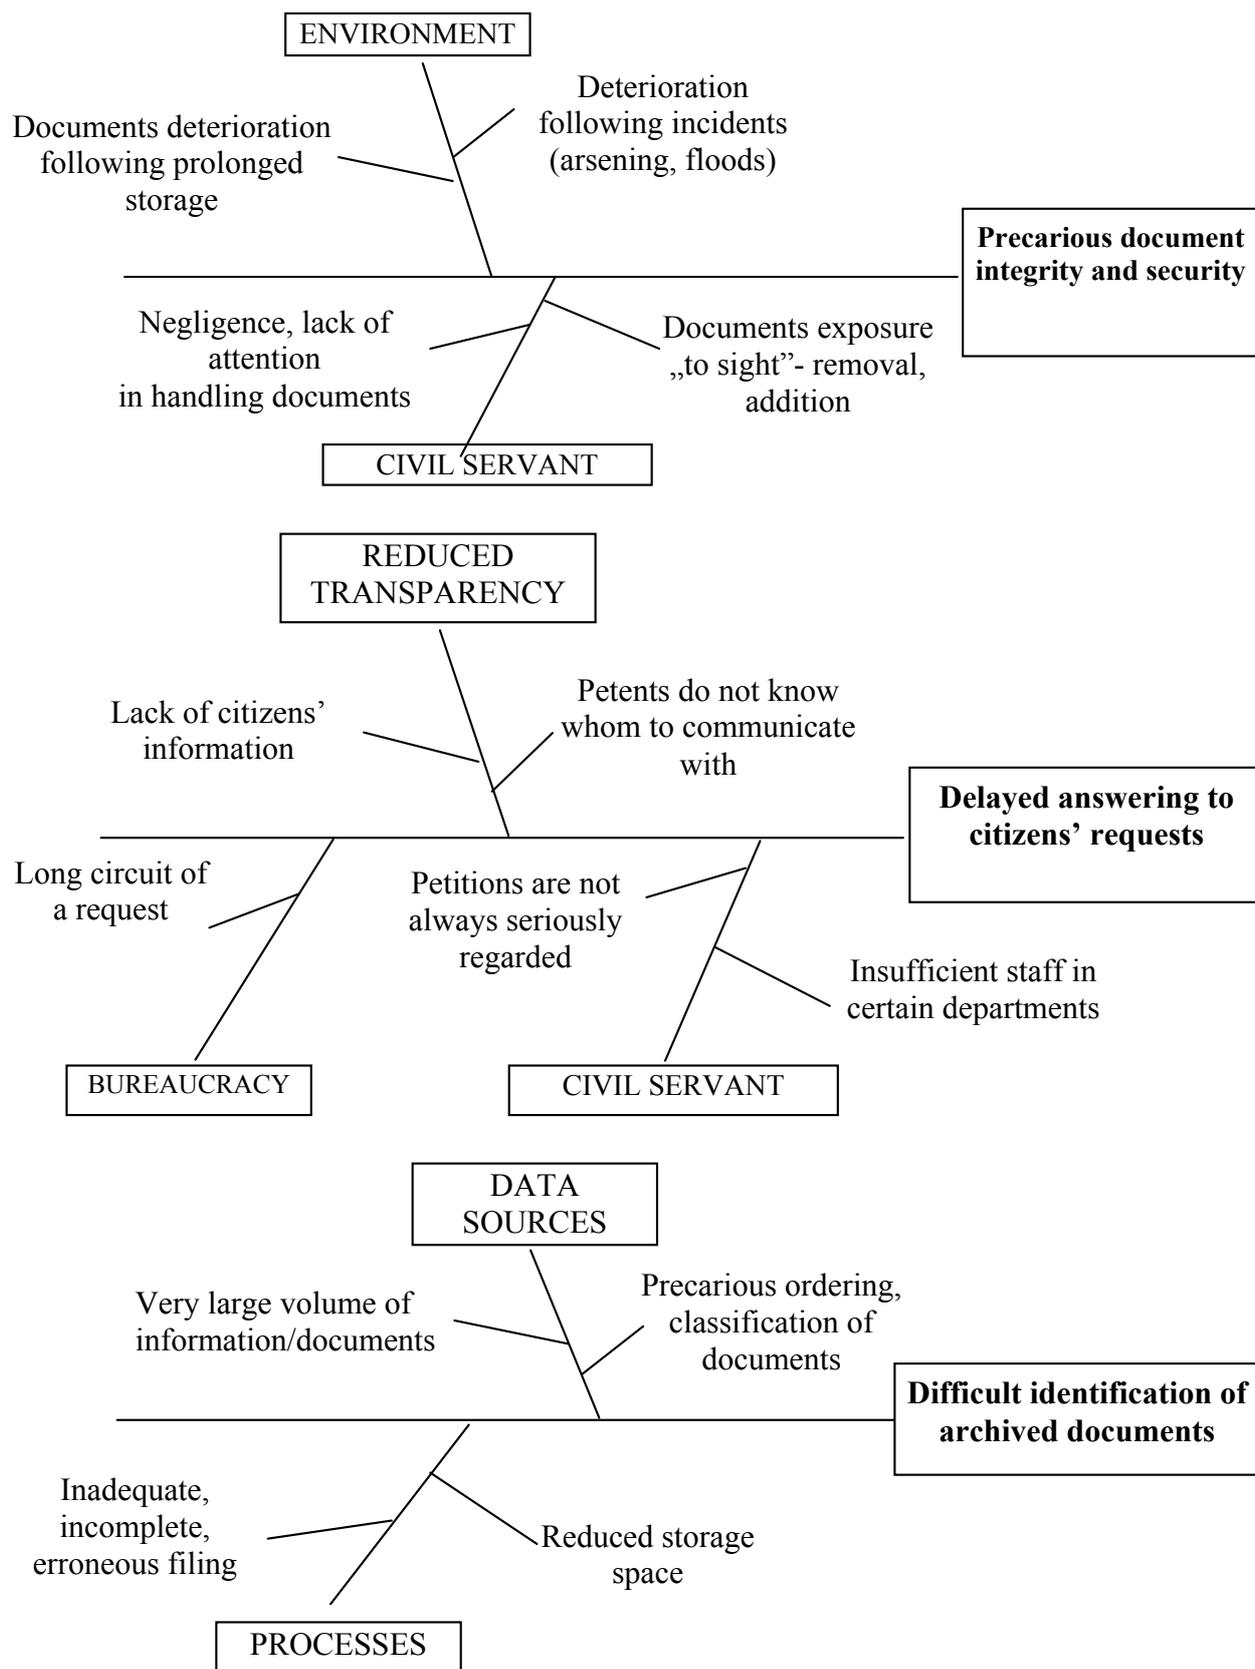

Diagram 2.2 – Deficiencies in the existing informational system in administration

3. The Optimization of the Informational System

One of the European Union's requirements in the context of Romania's integration views the modernisation of the working and structural system of local public administration, in the sense of modernization and employing informational technology.

In order to comply with these requirements, a modern informational system would have to provide (Tarbutaru 2009):

- A sole entrance for all current requests addressed to local public administration;
- Increase of speed in answering to citizen's requests;
- Improvement of data and information integrity, as well as in the quality of documents;
- Increase of the communication level between different departments in local public administration;
- Growth of cooperation between different public institutions, by means of extranet;
- Growth of data, information and public knowledge access;
- Integrated administration of the entire data, information and documents cycle;
- Data processing automatization, acceleration and safety;
- Diminution in the volume of archived papers;
- Diminution of documents copying costs;
- Complete and instantaneous identification of documents;
- Total data and information safety.

Taking into consideration the aforementioned requirements and the observed deficiencies, we have designed an information and communication technology system within a modern local public administration (Diagram 2 – *The Architecture of an Integrated System*) that would provide a maximum efficiency and optimal running of the entire administrative activity. The structure of this integrated system has the following components (Feasibility Study 2009):

- A) The Citizens Information and Communication Integrated Informational System:
 - A1) Unique registry's office ;
 - A2) Telephone switchboard;
 - A3) Infokiosks;
 - A4) Offices for the public access to information.
- B) The Hardware Integrated System (the infrastructure);
- C) The Communications Integrated System:
 - C1) Intranet;
 - C2) Extranet;
 - C3) City Hall private telephone network;
 - C4) City Hall private mobile phone network;
 - C5) Internet (optical fibre).
- D) Data and information archiving, saving and recovering
- E) The Integrated Software System:
 - E1) the Geographic Informational System (GIS)–digital map of the town;
 - E2) Modules of specific integrated applications for each department;
 - E3) Document Management (documents tracking application);
 - E4) Content Management (management of the entire informational cycle);
 - E5) Administrative Intelligent (Analysis and Reporting).

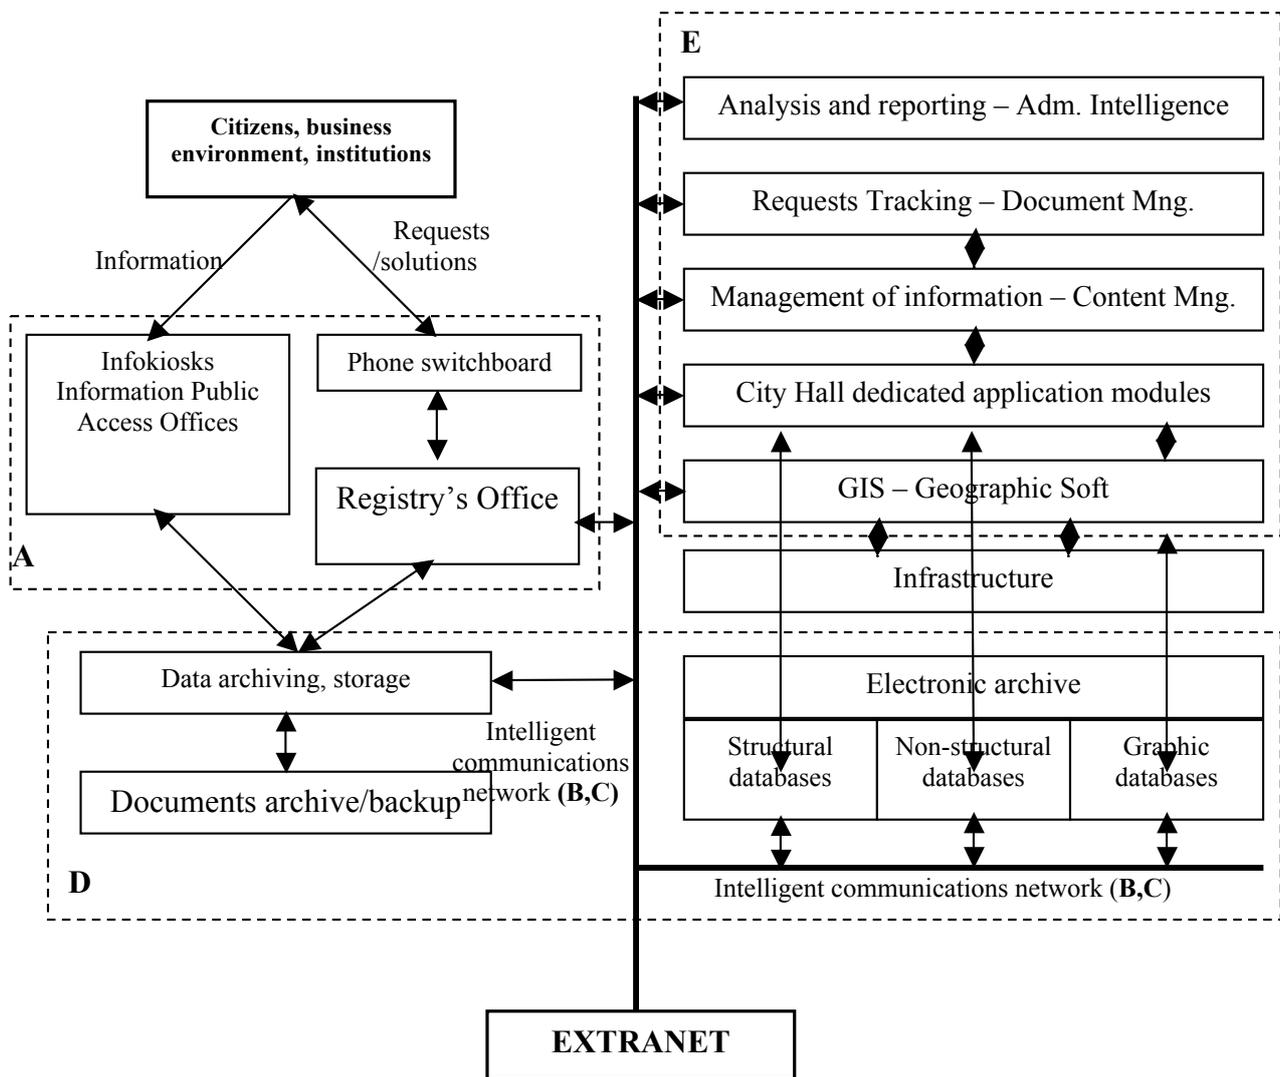

Diagram 3.1 – The Architecture of an Integrated System

A. The Citizens Information and Communication Integrated Informational System

The main perspective the entire body of civil servants and officials in local public activity of the municipality should regard their activity from is the perspective of the relation to the public. To this aim, modules should be integrated, such as the Unique Registry Office, Citizens Information Centres, Infokiosks, Telephone Switchboard, Public Access Offices, Portals (City Hall’s webpage), all of them connected online to the City Hall intranet, 24 hours a day, seven days a week.

The unique registry’s office becomes the sole place where citizens will directly contact civil servants. Thus, the chances of interrupting the civil servant from his/her current activity, the loss of time in repeatedly explaining as well as the possibility of corruption will disappear.

Infokiosks will be set up at all entrances in the building where the executive body of the City Hall carries on the activity, as well as in the main areas of pedestrian traffic, so that every citizen could access the needed information.

The telephone switchboard will provide an easy communication channel 24 hours a day, seven days a week, concerning all necessary information.

All necessary public information will be posted on the City Hall’s site, so that all patents should inquire on the legal procedures and norms to solve one’s request. A facility of this site would be the possibility to download the standard forms one needs to fill in.

B. The Hardware Integrated System (Intelligent computer network)

The City Hall's intelligent computer network will be the hardware support (the infrastructure), needed to implement the intranet (internal networks).

This intelligent computer network will be less expensive on an average length of time, taking into account that the necessary upgradings will be made on cheaper terminals. At first sight, the initial investment is high, but it will rapidly pay off by the efficiency and economy it will be running on.

C. The Communications Integrated System

In an information and communication integrated system, the communications infrastructure plays a determining role. The running parameters and quality of communications decisively influence the quality of public services performed by the local public administration.

The information and communication integrated system of the City Hall will be composed of the communications hardware-ul și software of:

- City Hall Intranet;
- City Hall Extranet;
- City Hall private telephone network;
- City Hall private mobile phone network;
- The access to the international communication network (Internet – optical fibre).

Through these three communication channels (telephone, mobile phone, optical fibre) a damage proof system will be provided, ensuring communication even if a certain channel will not function, by one reason or another.

The intranet represents the dedicated internet – type communication network of the City Hall. By means of this network, any civil servant would fulfill one's own job tasks from his office, without moving to another office, waiting for a colleague, searching for some data, information or documents, briefly, without losing time.

The extranet is a dedicated IP network (Internet Protocol) that allows restricted access to just a group of authorized users, that identify themselves when accessing the extranet. In other words, it can be seen as an extension of the City Hall's extranet, representing the connection to the dedicated networks of other public institutions that the local public administration enters into a relation: Police Department, Education, Culture, Environmental Protection, Hospitals and other subordinated institutions (Diagram 3.3).

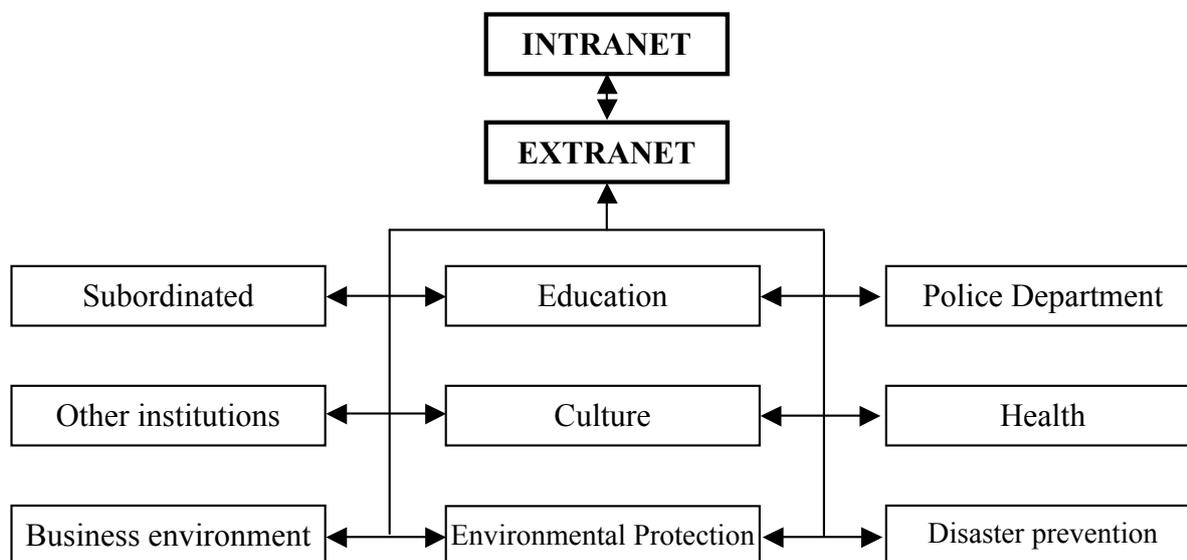

Diagram 3.3 – Architecture of the City Hall's Extranet

D. Data archiving, saving and recovery

Another area where important time resources are wasted is older data, information and documents identification. At present, this search is made by coming to the City Hall's Archive office, where, at best, the searched documents are classified, arranged, ordered, but the process takes too much time anyway, with searching, copying and restoring.

The implementation of the integrated system in the City Hall will eliminate this deficiency, by using the electronic archive or digital archive which presumes saving on a magnetic support all data, information and documents that are handled in the City Hall's current activities.

The methods of saving data, information and documents is very important, as long as the entire information is digitized. Within this system, data saving will be automatically done in three different locations, on breakdown tolerant systems with a high level of safety.

E. The Software Integrated System

The City Halls Software Integrated System will have several components:

- E.1 The Geographic Informational System (GIS – Electronic map of the city);
- E.2 Applications which are specific to certain areas of activity: economic, financial, investments, human resources, urban planning etc;
- E.3. Tracking documents (Document Management)
- E.4 Informational cycle (Content Management);
- E.5 Analyses, syntheses and reports (Administrative Intelligence)

E1. The Geographic Informational System is a collection of transparent drawing sheets of paper, electronically superposed, that allow any operator have a broad image on the territorial administrative unit. Each sheet of paper represents graphically an urban network (streets, buildings, parks – green areas, water distribution networks, gas supply networks, telephone lines, optical fibre networks, parcels etc). Their superposition give the overall graphical image on our city.

E.2 Applications which are specific to the City Hall.

There is a series of applications that local public administration employs:

- Taxes and duties application;
- Budget, budgeting, budget reports applications;
- Application for assets;
- Human resources application;
- Agriculture registry application;
- Urban planning and land register application;
- Civil office application – evidence of the population.

E3. The tracking documents informational system (Document Management)

The document management (the citizens' requests) is one of the most acute problems in city halls, because a defficient management, civil servants' lack of attention, excessive bureaucracy, temptation to corruption and various less or bigger interests.

The integrated informational system helps in solving this problem by implementing a software application of tracking documents and allowing to search the stage of solving the issues in a document according to registration number, petent, the object of petition, where did the document arrive to and how long did it stay in that office, where is it at present, which are the resolutions of different departments etc.

The implementation of Document Management is a first compulsory stage in making the city hall's activity more efficient and in easing the flow in the circuit of petitions.

E4. Management of Data Flow (Content Management)

In public administration, data, information and documents are the main tools helping in accomplishing objectives and job duties, according to the law.

A soft dedicated to manage in a centralized way all data and documents, to permanently check the inputs and outputs, as well as to provide a data, information and documents safety will surely lead to an improvement in data integrity, in raising the efficiency of administrative productivity, by an integrated management of the entire document flow.

E5. The Reporting Informational System (Administrative Intelligence)

Administrative Intelligence is a tool helping the management of a city hall to take decisions, to achieve planning and strategies, as well as in the periodical reportings to the hierarchically superior institutions.

It benefits from a report editor that allows configuring different statistical situations and reports the mayor wishes to find out, according to the information and databases existing in the integrated informational system.

Administrative Intelligence will be the top software tool that will integrate all managerial functions of the city hall's management and will run over all the other informational modules previously identified and detailed.

The information and communication technology system represents one of the component systems, which is vital in the context of integration, development level, reflecting at the same time the general level of technological, economic and social development of local community.

4. Conclusions

To use IT technologies in the governmental process and in public administration is an utmost necessity of our days. The advantages brought by the new technologies may lead to simplifying and dynamizing the governing processes.

From another perspective, taking into account the scope of e-government projects, the implied informational systems present a high complexity level and raise problems regarding their implementation. The citizen is at the core of the e-governing process, being the main beneficiary of integrating informational technologies in this area of activity.

The advantages of using the Internet in e-government processes are related not only to the widespread of this technology, but regard mostly the possibilities to interact with citizens by means of this type of communication. As such, the Internet and the digital technologies offer a high level of informational systems interactivity, as they are employed in administration, making the two-way communication easier.

The modernization of institutional communication, derived from using the informational technology, results in increasing the efficiency of public administration, eliminating bureaucracy and optimising the quality of public services. Therefore, the move from a directed, centralized administration towards a decentralized administration to the service of the citizen determines the redefinition of the „administration-citizen” and „administration – administration” types of relationship, using the means of information and communication technology.

The implementation of the public administration's informational update presumes changing the managerial approach in the public administration's activity. It is absolutely necessary to implement the ISO standards, programmes and projects such as strategic management, performance management, the management of changes, that will standardize the administrative activities and harmonize them with the European Union's regulations, making the whole activity more effective.

Abstract

This study aims to contribute to the discussion about the role of leadership in academic departments in research-intensive universities. The objective here is to understand how leadership and teaching are perceived in the context of an academic department of one elite US research-intensive university. Semi-structured interviews carried out in a dialogical manner aiming at grasping faculty perceptions of leadership in their academic department were the main data gathering method. Complexity theory which involves the investigation of how apparently random patterns of behaviour form complex dynamic systems, constitutes the theoretical framework of this study. The contribution of this school of thought is the emphasis on non-linearity as the main approach to understanding living systems. The main finding of this study is that participants identified self-organization as their main organizational strength. Dispersed, non-hierarchical leadership was described both as an outcome and as major factor contributing to what was perceived as organizational success. This study which has the initial ambition of contributing to the discussion about higher education reform in Europe, explores issues such as interdependence and sustainability which have been not emphasized in the debate about organizational change in higher education institutions worldwide.

Introduction

In most European countries, higher education policy reforms implemented as part of the Bologna process aimed at restructuring and unifying degree systems, promoting internationalization increasing commercialization of knowledge and, thereby transforming universities' relation with society. Policy makers claim that such reforms provide institutions with greater autonomy and increase accountability to different stakeholders and to society in general. It is also argued that in autonomous institutions, the quality of management and decision-making processes are decisive in a competitive environment. In official documents, competitiveness is expressed as a driving force in at least two ways. First, the contribution of European higher education to economical growth and national competitiveness is emphasized. Second, it is the need to compete in a global market which is expressed through the claim that European higher education institutions are "lagging behind": "the European university world is not trouble-free, and the European universities are not globally competitive with those of our major partners, even though they produce high quality scientific publications" (European Commission, 2003:2). The same policy documents present American research universities as Europe's major competitors usually implying that the US higher education is the result of the marketization of their system, high private investments in education coupled with low state intervention (Gornitzka, Maassen, Olsen & Stensaker, 2007:211).

The present study which aims at understanding perceptions of leadership and teaching in one academic department in one US elite research university, was designed and conducted based on the assumption that especially in large research-intensive universities with highly decentralized structures, academic departments are the key organisational units when it comes to understand organisational features such as leadership. This is due to the fact that for most academic staff, the department or its subunit is the main activity system. I followed a phenomenological research strategy aiming at understanding perceptions of leadership and quality teaching in their own work environment. However, rather than looking for generalizable practices in one US institution, this study applies new conceptions of complexity in organization theory to empirically investigate and discuss assumptions regarding the US system that seem to permeate some political discourses in Europe. I begin by presenting complexity theory which has its origin in the natural sciences and how it is perceived to contribute to the study of organizations.

Theoretical Framework

Complexity theory has been presented in the social sciences as a new set of conceptual tools to help to understand process change in contemporary societies (Walby, 2003:1). In the specific case of organizational studies, complexity theory assumes that organizations are characterized by non-linearity, generation of variation rather than uniformity and adaptiveness (Hatch, 2006:330). Historically the development of general theory in social sciences has involved a process of reducing complex phenomena to simpler ones (Walby, 2003). This has happened in two contrary ways. One movement has been downwards as a reduction to the level of smaller units of analysis rather than focusing in large scale processes. Another reduction which is usually associated with structuralism has taken place upwards mostly aiming at reaching casual explanations. Complexity theory overcomes this polarization as it aims at addressing different ontological concerns: “this facilitates the development of some of the concerns of classical sociology, such as combining an understanding of both individual and social structure, that does not deny the significance of the self-reflexivity of the human subject while yet theorising changes in the social totality” (Walby, 2003:2). This is due to a multidisciplinary process of re-thinking of the concept of systems.

Globalization itself urged a new re-thinking of the concept of systems in social sciences as its analysis requires a reflection of the notion of systemness in order to understand how events in one part of the world might impact those in another. Thus, in order to address social processes in the globalized world it is crucial to reflect upon potential systematic interconnections at a global level (Walby, 2003:4). Here the main shift in relation to much what had prevailed in terms of conceptions of systems in social sciences is the rejection of the notion of equilibrium that was perceived to limit our ability to understand diversity and change. This rejection reflects broader shifts in scientific concepts which pave the way for a theoretical linkage between different fields. Although not presenting a clear definition of complexity, Waddington (1977) states that the complexity of a system has to do with the number of components of a system and the number of ways through which they are related. If we follow Waddington’s claim, then the level of complexity of system varies according to how the observer identifies and understand these relations. Thus rather than being a fundamental characteristic of the system observed, complexity is associated with the different descriptions that the observer can produce: the more and different descriptions, the more complex the system will be regarded as. Rather than an inherent feature of the problem studied, complexity becomes then a mode of thought and even a worldview as described by Tôrres (2005). He presents the *Complex Worldview* which rises from global transformations and perceptions of intrinsic limitations of the *Mechanicist Worldview* and the *Economical Worldview* that had previously been hegemonic. A worldview here is understood as an individual’s set of fundamental beliefs and principles, sometimes not fully examined or questioned and often unconscious assumptions about the nature of reality.

Mechanistic which was the dominant worldview from the 17th century impacted all areas of knowledge by advocating for an objective reality as explicated by Newton’s law legitimation its main implications: linearity, monocausality, determinism, reductionism and immediatism (Tôrres, 2005:1). That was a worldview that was characterized by the rise of the positivist philosophy and the technological development that originated from the industrial revolution. Then, organizations were divided in different units according to specific tasks. With the exception of individuals in formal management positions who centralized power and control, people were seen as “human resources”. Strategy is formulated by following a principle of mechanical efficiency. During the late 1970s, when the *economical worldview* rose from new

developments in information technology, the metaphor of the market substituted to a great extent the metaphor of the machine (Tôrres, 2005). In this worldview the focus of organizations is the market and the customer. Structure and tasks are similar to the mechanistic worldview: the worker applies knowledge that already exists while managers try to implement procedures that have been associated with examples of success. Competitiveness is emphasized in different spheres of human life and a culture of quality control and benchmarking is imposed. From the *complex worldview*, reality is essentially defined by relationships and processes. Monocausality is seen as the exception and not as the rule as outcomes are seen as the effects of multiple interactions. Rather than searching for one single “right answer”, it is accepted that there might be many right answers sometimes paradoxical and sometimes even contradictory. Reality is seen as a web of relationships where non-linearity is the main feature (Capra, 1997). When it comes to understanding organizations, this worldview claims that more important than focusing on structures, it is necessary to observe the quality of relationships and processes. It also claims that rather than a management culture of command and control, it is necessary to encourage dialogue and shared leadership which will contribute to creativity. The language of complexity, non-linearity and systems analysis have been translated and applied to the field of organizational studies generating a way of seeing organization based on the following claims (Hatch, 2006:301; Tsoukas & Hatch, 2001:988):

- Complex systems are **non-linear** which means that there is no proportionality between effects and causes. Simple cause-effect relationships are rare. It becomes impossible to make precise predictions of how living systems behave.
- Systems become more complex as they evolve. **Emergence**, which is understood as the rise of new structures and patterns of behaviour from internal interrelations is a property of such systems.
- **Self-organization** as order can emerge from chaos or even contain order. Popularly the word “chaos” has the connotation of “anti-order” or “disorganization” but in the jargon of complexity theorists it means a state when small variations can send off a system in a completely different direction. It rejects the idea that big changes can only be produced by big causes. Instead small causes can produce large changes and vice-versa.
- **Non-equilibrium** as organizations are open-systems that import, accumulate and export energy. In the particular case of organizations, information and financial resources, for example, can be seen as forms of energy.

Sustainability is thus understood as not as the search for perfect equilibrium but in the capacity to respond, adapt and create. Stacey (1996) claims that today’s organizations should be seen as adaptive systems which are interacting with an environment of complexity and uncertainty and, that complex thinking enables organizational conditions that enhance creativity and adaptability. In other words, organizations should take benefit of internal complexity to face complexity. The main units of analysis of complexity science are complex adaptive systems (CAS) which are defined by Uhl-Bien, Marion & McKelvey (2007:299) as “neural-like networks of interacting, interdependent agents who are bonded in a cooperative dynamic by common goal, outlook, need, etc. They are changeable structures with multiple, overlapping hierarchies, and like the individuals that comprise them, CAS are linked with one

another in a dynamic, interactive network”. The adaptive leadership concept sees leadership as a process of mutual influence that is a property of social systems. It is that perspective that permeates the strategy adopted in this study.

Research Strategy

Faculty who agreed to participate represented 25% of the academic staff members of this department. The semi-structured interviews enquired teaching and learning were perceived and how leadership was experienced and if they identified any relation between these. In phenomenological studies, the researcher aims at identifying the essence of human experiences as described by participants in the study (Creswell, 2003:15). Among the interviewees, there were also the two faculty members that at this point were holding formal management positions. The interview with the Chair and the Associate Chair responsible for educational affairs were important not only as a way of learning about their personal experiences but also as sources of information regarding internal regulations, financial patterns, and access to documents, such as the department’s four-years strategic plan that were also analyzed. The contribution of analyzing strategic documents in this study is two-fold: first, it gives valuable information on how decision-making takes, and: second, it gives possibility of comparing more formally explicit organizational views of the department with individual perceptions. The sample of interviews was composed of recently appointed staff as well as professors who had been there for over two decades. Some had been students in this department before assuming academic posts. The fact of having interviewed people who had been at this department for a long time gave an interesting insight of what might have changed (or not) in a historical perspective.

I conducted a coding procedure that identified pieces of interviews that exemplified main ideas and concepts. These categories were provided by the data itself rather than being pre-determined by the literature. However, knowledge of main theoretical concepts regarding leadership in higher education and teaching influenced the construction of the interview guide and certainly influenced the categorization and analysis of the data. Nevertheless, the data categorization procedure used here was mostly data-driven. (Gibbs, 2002:59). There were identified over thirty categories describing either perceptions or personal experience, being the most present ones presented in this paper. In order to report the findings in a clearer and more structured manner, these were reduced to the seven that were both more recurrent and that more directly answers to the problem statement of this study:

Leadership	Teaching
<ul style="list-style-type: none"> - Flat, collegial organization - Consensual Decision making - Non-positional Leadership - Emergence 	<ul style="list-style-type: none"> - Internal discussions about teaching are content-driven - Little changes in terms of student background - Top Students as factor of motivation

Perceptions of Leadership

Different theoretical models have been presented to understand organizational changes in higher education. The model presented by McNay (1995) describes a process of shift in terms

of organizational culture in higher education in the west: from a collegial culture to a bureaucratic one and, then to corporate and finally to enterprise, involving first a tightening up on implementation, then a tightening up on goals and policy definition and, finally losing up on control of implementation while retaining clear goals.

This shift however cannot be witnessed in the same terms at the studied department. There were very few variations in terms of perceptions of leadership in the department as interviewees described organizational processes that are characteristics of the collegial culture model which is described by McNay (1995) as: decision-making is **consensual** and management style permissive. Leadership assumes here a “first among equals” style and authority of professional power is more present than authority based on positional power. In collegial culture, organizational change is expected to happen as a result of a process of discussion among institutional actors in professional networks (Miller, 1995). At this department, interviewees described a very **flat internal organization** characterized by consensual decision-making and little positional power. Here are some illustrations of this perception:

It's not a strongly hierarchical arrangement. It's a very weak hierarchy. There is a department chair that is more an organizer, a cheerleader than a boss. Each faculty member is their own boss and they do fundamentally what they want to do. There is not a strong leadership in the department in the sense of someone telling the others what to do (Interview 4, recently appointed).

They identified leadership with non-positional **power**. Some individuals were regarded as leaders either because of their professional expertise or, by gaining collective support in relation to that they suggest. They described processes change that were initiated and led by individual initiatives by faculty members that demonstrated a personal interest in a certain challenge faced by the department. Changes occurred when these individuals obtained collective support which was described as:

Professor Y is one of these people. She is not the director of this lab but in terms of her involvement in terms of pushing things like student research projects, pushing new programs, I would say that things that she's done from an educational perspective and research perspective have demonstrated a huge amount of leadership. I think she has demonstrated more leadership than some of the previous directors of the lab but she doesn't have the title of director of the lab (Associate Chair, one year in the department).

We are very consensus-driven but the consensus doesn't emerge out of vacuum. I think that the most successful academic leaders set consensus. It's not their own vision that they are putting forward. They articulate it and build consensus about it. I don't think that good consensus doesn't just happen. I think that leadership is about building that consensus (Department Chair, 11 years in the department).

Interviewees justified the flat organization of the department in two ways. First, by evocating the history of the department by claiming that since its foundation and consolidation process, the department was composed by highly capable and independent people who were leaders in their respective fields. Those who had been longer at the department reported not having witnessed internal changes in terms of leadership throughout the years. Another argument to justify this non-hierarchical leadership model supports some assumptions by the complexity theory: it gives space for personal initiative and creativity. Formal leaders are not seen as source of innovation when it comes to organizational challenges. Instead, innovation was enabled by **emergence**. This was described as:

Looking back over the years and taking a broad view, there is very little (change in leadership). The attitude which is similar to when I came here is: the department chair is that things get running and get money and get the professors to do what they want on their own (Interview 3, about 35 years in the department).

The role of the leadership is not to develop the good ideas, it's to recognize them. The reason is, I don't think good ideas can come from the top in a large organization because people in the top spend most of their time with management. They are too far away from details with which you discover the problems and the opportunities. So I think that in a great organization, being an university or a company, the way to structure is to allow these ideas from the bottom to find their way up to the top as quickly as possible. The leaders never come up with any good ideas. It's not that they are dumb people. They are just not in the position to do that (Interview 4, recently appointed).

This department has consolidated a central position in their research area in a technology-related field and has throughout the years established close links with industry. The department's strategic plan shows gradual shifts in previous years towards a more diverse funding base with both private and public resources. Interviews revealed a self-perception of success in the department which is sometimes expressed by the capacity that the department has historically demonstrated in raising funds from different external sources. It does not provide an entirely harmonic sight, as interviewees reported situations of internal conflicts which were mainly manifested in strategic discussions. However, a situation of economic stability and abundance flows of external financial resources was identified as a main enabler of this leadership model as there was little internal competition for resources as described by interviews:

And that's because individual faculty are good at raising money and not because the department is doing anything. What the department leadership tries to do is to position the department so that it will always be that way (Department Chair).

The formulation of the strategic plan is associated with internal vision of the department but also a mechanism to promote the department in the overall university structure with which the department has to interact in order to struggle for resources to hire new faculty and invest in new study programs. While the process that led to the formulation of the strategic plan was regarded as an interesting exercise in terms of discussion of a vision for the department, most interviewees also claimed that it had a more direct impact on the department relations with the university structure. When it was founded in the 1960s, this department was exclusively devoted to research with no undergraduate education which was only established after some years when the overall management of the university put that as a condition to hire new faculty. Still today, research is seen as the main priority in the department. For example, research excellence plays a much more decisive role in the appointment of new faculty than teaching. The same can be said in relation to decisions regarding tenure and internal promotion. That is why the shift in teaching paradigms is important to follow in research-intensive environments like this one as previous research shows that changes in approaches to teaching encounter much more resistance in such environments than on "teaching-focused" universities (Gibbs, Knapper & Picinin, 2007). The next section presents findings regarding perceptions of teaching in the studied department.

Perceptions of Teaching

Higher education institutions face the challenge of providing quality education for more students coming from more diverse social economic backgrounds. Promoting a learning-centred approach has been presented a way of facing this challenge. It is based on the

assumption that better learning is related to the behaviour of the lecturers and it is the way that they design courses which facilitates deep learning rather than some essential characteristics of individual students (Ramsden, 1994). According to Knight and Trowler (2000:71), university lecturers tend to adopt an approach to teaching which may be more, or less sophisticated: they can adopt a “surface” or “deep” approach to teaching. The claim that a shift from “teaching-centred” to “learning-centred” higher education observes that the expansion of the higher education sector has diversified student bodies in terms of previous abilities, motivation and socio-cultural background (Biggs 2007; Nygaard & Holtham, 2008). When university programs were targeted to highly selected students traditional methods of teaching were seen as appropriate. However, with the expansion of access, there is now the claim that a shift from syllabus-driven didactics towards learning-centred higher education will benefit students’ development of independent thinking and analytical skills. In the core of this argument is the recognition that students are now different and more diverse. Thus, I tried to investigate if and how faculty perceived changes in the student population over time. The strategic plan of the department gives initial signs that **changes cannot be witnessed** at this department as gender imbalance and under-representation of ethnic minorities remain as one of the main strategic challenges to be faced. According to this document, only 15% of the undergraduate population in 2006 was female, contrasting with the national figures in the same year which showed that 57% of all undergraduate students were female. The strategic plan also presents data suggesting under-representation of minority students in 2006: only 7% of the students were African-American, 6% were Hispanics and not a single student was Native American. This document described this situation as unacceptable and that the undergraduate program reform should develop ways of attracting more female and minority students and increase the success rate of these underrepresented groups on the department. Interviews with faculty reinforce the internal perception that little has changed in terms of student’s cultural background but give a blurred picture in terms of describing students’ previous skills and motivation. In terms of motivation some reported not witnessing changes at all while others noticed that students seemed to have become more pragmatic and more concerned with their professional future. One of them claimed that:

I don’t sense that students have a lot of expectations when they come to class. They come to be told things. They don’t come with particular plans or expectations about material. They are there to learn and today it’s similar to what it was before. And overall attitude doesn’t seem any different. College kids are still college kids. (Interview 4, one year at the department and a teaching award winner in his previous institution where he taught for about twenty years)

On the other hand, another interviewee claimed that:

The change in the perception of university education has changed dramatically. My childhood was in the tail end of a period of time when the university education was perceived as something you did to be a fully educated person. It was a finishing school for adulthood. They wouldn’t necessarily use it in your life but it would make you a better person. In the last thirty years, it has been much more about a career. It has been much more getting your first job. In a global scale, the value of higher education has gone up dramatically bringing very different expectations to someone who has college education and someone who doesn’t. And it means that college has been more important in people’s lives. There is a push to be more pragmatic (Interview 6, five years in the department).

In terms of previous skills, interviewees provided a general perception of students arriving at the department now better prepared and with more technical knowledge. They claimed that the university’s highly competitive selection procedure played a central role. The selection of top students was perceived by faculty as a factor that facilitated their task and made teaching often more enjoyable as they often could also learn from students. The overall argument for a

shift in terms of educational paradigms which has its roots in the expansion of the access to higher education to groups that previously did not have access (Biggs, 2003) cannot be found in this department. Here, the overall perception was that being part of a very selective private university enabled the department to work only with top students who taught themselves with very little help. Teaching **top students** are mentioned as source of motivation. When asked about what motivation they had to teaching and/if continuously improve their teaching, interviewees presented three sources of motivation: personal motivation (pride), peer pressure and internal competition for PhD students.

Discussions about reforms of study programs also gave signs that faculty had a “**content-centred**” **approach to learning**. Both the strategic plan and informal conversations with faculty showed that changes in study programs were mostly initiated by perceptions in the field that happen quite often in their research area. Most internal discussions about program reform and teaching in general are led by developments in their field of study. In other words, internal discussions about teaching are almost exclusively about what to teach and rarely about how to teach.

Discussion

The findings show striking differences between higher education in Europe and the context of the department that was studied here particularly in relation to change. While change in terms of both organizational structures and educational approaches is advocated not only in Europe but worldwide, the word “change” was hardly mentioned by interviewees and in strategic documents. While policy documents in Europe (European Commission 2003) present the US top universities as successful institutions by emphasizing competitiveness, participants of this study presented a self-perception of success that had its roots on their history and on internal interrelations that according to them, create an environment that enhances creativity and initiative. Rather than an obstacle, the collegial leadership model was presented by participants both as an underpinning and an outcome of what they regarded as organizational success. I discuss here how these findings can be interpreted in the light of complexity theory focusing particularly on leadership.

An analysis of how participants experienced decision-making and their own approach to teaching showed properties of emergence which are characteristic of self-organizing systems. Main strategic decisions were emergent of processes of interrelations rather than driven by positional power. The perceptions of teaching regarding what was defined as quality, as well as motivation to teaching seemed to emerge from personal experiences and from a horizontal process of relations which involved individual pride, peer pressure and internal competition for research students. Leadership was an emergence of these horizontal relations with different individuals assuming leadership roles in different moments by gaining support (Uhl-Bien et. al., 2007). Although participants demonstrated a positive view in relation to the collegial and distributed leadership model that they experience, their description of their work environment is far from one of equilibrium. By non-equilibrium, I do not refer here to existence of internal conflicts and personal disagreements which were actually also described by participants, but more to inherent dissipative characteristics of open systems. Open systems present dual dissipative properties: they import energy from the immediate environment that transform and enhance internal complexity, as well they export complexity (Harvey & Reed, 1994:377).

Thus organizational outcomes in this environment cannot be understood within the scope of linear models as a multiplicity of both internal and external factors interact and shape the organization. In the jargon of complexity, interaction does not refer only to the general sociological connotation as describing social interactions among individuals but also in the statistical sense where the relationship between two variables is affected by the value of other variables (Byrne, 1998:19). Organizational studies about knowledge-based organizations in which the theoretical framework is based on complexity science have suggested a leadership model that rather than being hierarchically based, emerges from complex interactive system dynamics. As mentioned earlier, from a complexity perspective, this model enables learning, innovation and creativity in complex adaptive systems. And it is also true they are in context where they do not have the same external pressure to change as in the case of public research-intensive universities in Europe that faced a much faster expansion of access to higher education based on the assumption that they should respond more directly to economical imperatives and system reforms driven by a principle of competitiveness together with fiscal austerity (Morley, 2003). Thus, the analysis of differences in terms and profile, financial patterns and historical perceptions of social role of higher education in different parts of the world makes the claim that European higher education institutions are lagging behind elite institutions abroad extremely questionable.

Conclusion

It was not the objective of this study to identify patterns of behaviour that could be generalized to other academic departments. The findings here regarding leadership and teaching cannot be generalizable even in the US context with a diverse system where management varies a lot according to many factors being among them the size and the wealth of the institution (Cohen & March 1986). Maybe these findings cannot be generalized even to other departments in the same university. The goal of this paper was to depart from a complexity theory perspective towards the study of organizations to investigate perceptions of leadership and teaching in one affluent academic department in one of the main research-intensive US higher education institutions. However, the investigation of perceptions of leadership and teaching in this department becomes relevant in a context when system reform proposals in Europe identify such institutions as those to which European are lagging behind. I share here Olsen and Maassen (2007:14) proposition that this claim is not the result of how American elite universities are organized and governed as well as it does not take into account the different economic, social and cultural environments surrounding higher education institutions in the US and in Europe. This study found evidences that in the specific context of a prosperous elite US university non-hierarchical leadership is present in a department that has largely contributed both in terms of technological transfer and provision of qualified labour force to economic development of the region where it is located. In order to understand changes (hopefully sustainable changes) in higher education institutions we need to focus on how patterns of behaviour and perceptions of leadership emerge rather than assuming a linear perspective.

ABSTRACT

In the basis of corporate social responsibility, as well as the apprehension of bringing back the brought one to the society, there lies the fulfillment of the responsibilities, by the institutions, for the society and certainly for the employees who are the internal target group, and by this way; to increase the organizational commitment via creating reputation.

The main objectives of the corporate social responsibility projects which are realized by the institutions include; providing facilities to the employees that they can improve themselves; providing their expectations and needs; and by creating a corporate structure and work environment, investing to the human capital.

In today's working conditions, the quality products and the services are not produced on the corporations where the employees are unhappy. The factors such as extended working hours, unsecured working areas, low wages and discrimination, are no more accepted by the new management systems.

The objective of the research in this context is to develop a theoretical model which will present the relations among work satisfaction, organizational commitment and employee-oriented social responsibility activities. Besides, by inspecting the relations among the aforementioned variables within the scope of a model, which will be developed with a field research for the employees of "The Most Popular Companies of Turkey", there will be a contribution for the generalizations that are made up to the present.

Keywords: employee-oriented social responsibility activities, job satisfaction, organizational commitment

1. INTRODUCTION

The developments, changes and the studies throughout the world have changed the way institutions view their employees. As institutions become aware of their responsibility towards the employees and the society, the job satisfaction and organizational commitment of their employees improve and thus, they feel as a part and a value of the organization.

In today's world, the efforts, expectations and demands of business managers are oriented towards realizing the corporate objectives and sustainability. Managers require many inputs in

order to reach the designated corporate objectives, and they employ or use such inputs in production of goods and services. Human factor is an important requirement for institutions, and also a factor of production that employs and gives meaning to other inputs during production stage (Mullins, 1999:177). Given these features, employees, who are well known by the institutions and are regarded as the most efficient means of reaching the designated corporate objectives and create a unique resource among factors of production, constitute the target group of institutions which could get the most direct influence.

The first signals of the acknowledgement of corporate social responsibility by institutions according to legal practices came when the employees in industrialized countries gained union rights, better wages, working conditions and social rights, and when anti-trust laws and more humanitarian rights were granted to employees as a result of the cultural and social changes in 1930s. And the institutions and corporations started to understand the importance of their employees with the WWII, and they began to fulfill their social responsibilities towards employees (Aydintan, 2010). And the number of initiatives, struggling to prove that the labor is managed within the scope of a healthy social responsibility both in public and private sector, is increasing day by day.

At this point, it is important that; the employee-oriented social responsibility activities of organizations, which rank among the most popular companies of Turkey with their social responsibility activities in business life, reveal the relationship between job satisfaction and organizational commitment of the employees.

With these findings in mind, this study, which is carried out on the employees of the most popular companies of Turkey, is considered to yield significant results about the analysis of the relationship between job satisfaction and organizational commitment created as a result of employee-oriented social responsibility activities. From this point forth, the related literature was analyzed and no study analyzing the relation among these three variables were found. Hence, the assumptions of the study were established in the first place regarding the measurement of employee-oriented social responsibility activities of organizations and the determination of the relation between the job satisfaction level and organizational commitment of employees.

1.1. JOB SATISFACTION

What makes an employee comfortable in business life and social life is working in the demanded position, getting the wage adequate to satisfy the needs, and fulfilling most of the needs with the acquisition of the preferred conditions. On the contrary, the employees who don't work in the desired position, who work in an environment where their demands are always ignored and can't fulfill their requirements take a negative attitude and this will negatively affects their business and social lives. Therefore, business managers are now showing deeper interest in job satisfaction measurement activities.

Moreover, the need to implement organizational change in institutions and the resistance against change and the necessity to establish changes have made job satisfaction an object of interest. With the invigoration of unionism in 1930s and the enactment of labor relations act of Wagner in 1937, collective bargaining has become a legal existence, and that brought along the interest towards job satisfaction in the country. The early systematic information about the business-related attitudes of employees were obtained with Hawthorne studies in 1930s (Baysal, 1997:30).

According to Wolf (1970 cited by Gülnar, 2007:162), the most significant variables drawing the attention of researchers in the last seven decades are researches about job satisfaction, its causes, results and evaluation. Besides, Wolf asserts that; the first studies are devoted to productivity and labor cycle while later studies focus on whether the earnings from job meet the psychological and physical needs of employees, i.e satisfying the needs of employees.

Later on, existing job forms and requirements also began to change in parallel with the social development and awareness of organizations. Beginning with the demand to improve performance at first, this interest has recently taken the form of social responsibility.

Due to its multidimensional nature, it is possible to come across different definitions of job satisfaction in literature. Some of these definitions are given below:

Job satisfaction is the sense of satisfaction and the positive attitude taken by the employee towards the job resulting from the harmony between the business life or the employee and the working conditions (Ugboro and Obeng, 2000: 254).

Job satisfaction, which is an important concept in determining the reactions of employees towards their job experience, is “the extent to which employees like their work” according to Agho et al., (Agho et al., 1993:1007). It is also considered that; the sense of belonging in the employees to their institution and their commitment may also be a product of their job satisfaction. In this context, job satisfaction can be defined in general terms as “an individual’s reaction to the working experience” (Berry, 1997).

Furthermore, job satisfaction covers the positive or negative feelings of the employee towards the job and the internal, external and general approaches (Odom et al., 1990:157). A similar definition is coined by Kutanis (2003 cited by Gülnar, 2007:163) who describes job satisfaction as “the general behaviors and attitudes of the employee towards his/her work”.

As clearly seen above, the concept of job satisfaction is generally regarded as a factor which increases productivity in terms of corporate behavior development throughout the studies. So, we can conclude that; the pleasure or the positive feelings the employee feels by means of evaluating the job or business life is effective in shaping corporate behaviors. On the other hand, variables like wage, job quality, promotion opportunities, working conditions, social rights, attitude and behavior of the management, occupational safety and communication facilities are also considerably influential elements that affect job satisfaction.

1.2. ORGANIZATIONAL COMMITMENT

As one of the most popular concepts among modern management terms, organizational commitment is a useful indicator of corporate effectiveness in adoption of corporate objectives by employees, sustaining the wish to remain in the company, the participation of employees in management activities, exhibition of a creative and innovative attitude for the company and the success of the company.

That being said, the rapidly changing environmental conditions, the stiff competition environment and the need of companies, that show a continuous trend towards becoming distinct, for educated and qualified labor in the total employment have brought this subject to a more significant point. Therefore, we can see many different commitment definitions in organizational commitment literature.

Nijhof et al., defines organizational commitment as “what the individual feels towards the organization”. From their point of view, the principal elements of organizational commitment are as follows: a) accepting the objectives and values of the organization and have a strong commitment to these values, b) endeavoring more than expected for the benefit of the organization, c) having a powerful desire for the continuation of organizational membership (Nijhof et al., 1998:243). Çöl defines organizational commitment in his studies related to organizational commitment as “the extent to which the employee adopts the organizational principles, objectives values, struggles for organizational achievements and wants to keep working in the organization by identifying with the said organization”.

And Schermerhorn et al., defines organizational commitment as “the extent to which the individual aligns himself/herself with the organization and the degree to which the person in question feels as part of the organization (Schermerhorn et al., 1994: 144), while Sims (1998: 388) describes organizational commitment as the sense of belonging and displaying loyalty according to attitudinal commitment approach, the wish to keep on with the organization according to affective commitment approach, and the necessity to stay in the organization due to lack of financial, security means and alternatives in terms of continuance commitment approach.

1.3. THE EFFECT OF EMPLOYEE-ORIENTED SOCIAL RESPONSIBILITY ACTIVITIES UPON JOB SATISFACTION AND ORGANIZATIONAL COMMITMENT

Some international organizations about employees have tried to bring some regulations related to the rights and freedoms of employees. According to the definition on the subject of maintaining health and security in business life, prepared by ILO (International Labor Organization) and WHO (World Health Organization) in 1950s and took its final shape in 1995, “Occupational safety and health aims at maximizing the physical, mental and social welfare employees from all work fields and keeping it at this level, preventing health problems caused by working conditions, protecting workers against occupational health risks, in short, tailoring the work experience for man, and vice versa. (Sungur, 2010:2)

And European Union created its own social policies in order to improve the living and working conditions of member states and to harmonize social policies of member countries. The steps to be taken by Turkey regarding social policies are given in the progress report drawn up by European Commission in 2003 about European Union Social Policy harmonization. The things to be done by Turkey are discussed in the official gazette published in July, 2003. Some of these are about child labor, equal wages, equal employment treatment, maternity leave, occupational health and safety, and extension of union rights. www.deltur.cec.eu.int/default.asp?pId=tree&lan=zero&fld=10&prnld=16&hnd=1&docId=326&fop=0, cited by, Bayraktaroğlu et al., 2009:13)

Considering this approach, all practices in Human Resources can be regarded as echoes of the social responsibility approach of organizations. Because, all Human Resources practices are based on the philosophy of bringing benefits to employees, organizations and the society at the same time. Business organizations are no more defined merely as economic and technical institutions, and they are forced to undertake or review their social responsibilities as the expectations of employees reach another dimension.

UN developed a set of CSR principles under the name “UN Global Compact”. Developed together with the voluntary cooperation of corporate leaders and other actors, UN Global Compact puts forward the principles that could be taken as basis in management processes and practices (United Nations, 2007). According to these principles, businesses should support and respect the protection of human rights and their association, eliminate all forms of compulsory labor, discrimination and develop working conditions to abolish child labor.

In addition, the protest movements of recently strengthened non-governmental organizations against corporations, which don't offer a healthy working environment to their employees, don't grant their social rights, and carry out their production in third world countries so as to reduce the costs and keep away from the laws, played a crucial role in establishing the SA 8000 standard. And with the more conscious approach of customers and society at large, the corporate social responsibilities of the producers are now questioned more than ever (Büyük, 2006).

As a consequence of these pressures, SAI (Social Accountability International), with its headquarters in New York, set forth in 1997 some conditions to be met in businesses which are typically about improvement of occupational working conditions.

2. 2. RESEARCH

2.1. Purpose and Method

The main purpose of this study is to determine the effects of employee-oriented social responsibility activities on job satisfaction and organizational commitment. The focal point of the study is to find out the relations between job satisfaction, organizational commitment and employee-oriented corporate social responsibility from the point of employees.

2.2. Universe and Sample

The theoretical scope of the study is set according to the gathered information and findings. Following this, an empirical research was planned in line with this theoretical scope. The field research was carried out on “The Most Popular Companies of Turkey” according to a 2009 survey of Capital Monthly Business and Finance Magazine. The questionnaires were sent to the general directorates of 10 companies, but only 3 companies responded. The number of employees in these general directorates is 600, and 240 of them responded to the questionnaire. The number of questionnaires can be regarded as positive since it equals to about 40% of the number of employees in these 3 companies, and is sufficient for statistical analyzes. Questionnaire was used as the instrument for gathering data, and 5-point Likert scale was used as balanced keying.

Social Responsibility Management System (SA 8000) scale was taken as an example and a scale consisting of 21 questions was developed in order to measure employee-oriented social responsibility activities. The validity and reliability analysis of the scale was conducted with a pilot study. Besides, 4 profile questions reflecting the demographic features and 2 questions giving place to occupational features were included in the questionnaire.

Organizational Commitment Scale, which is developed by Meyer and Allen (Meyer et al., 1991) and composed of 9 questions, was used in the study to measure Organizational Commitment. And the 20-question including Minnesota Job Satisfaction Scale was also utilized to measure job satisfaction. The aspects questioned in this scale are communication, satisfaction with job, satisfaction with supervisory approach, co-workers and wages.

Hence, the results of 50 questions prepared with 5-point Likert scale were evaluated with SPSS (Statistical Programme for Social Sciences) 11.5 statistical package.

Later, a correlation analysis was performed in order to figure out the relations between the independent variables. One-way Anova and Unrelated Group t tests were carried out between employee-oriented social responsibility activities, job satisfaction and organizational commitment points depending on the demographic characteristic of employees.

2.3. Research Hypotheses

H1 There is a positive relation between variables included in employee-oriented social responsibility activities and job satisfaction variables.

H2 There is a positive relation between variables included in employee-oriented social responsibility activities and organizational commitment variables.

H3 There is a significant difference between employee-oriented social responsibility activity points and organizational commitment points depending on the demographic characteristics of employees.

2.4. Demographic Properties of Participants

When we analyze the distribution of participants in terms of sex, 119 of them (49.6%) are female, and 121 (50.4%) are male. Regarding their distribution according to age groups, 18 (7.5%) of the employees are within 18-24 age group, 7 (29.2%) within 25-30 age group, 104 (43.3%) within 31-40 age group, 32 (13.3%) in 41-45 age group and 15 (6.3%) are 46 and above. When we come to the level of education, 10.8% of the participants (26) graduated from high school, 10.8% (26) graduated from a 2-year associate program, 54.2% (130) hold an undergraduate degree, 20% (48) hold a master's degree and 2.9% (7) did doctorate. Moreover, 52.9% (127) of the participants are married, 43.8% (105) of them are divorced or widows/widowers, and 4 people didn't state their marital status.

37.1% of the participants were working in their company for less than 1 year, 24.2% between 1-3 years, 27.2% between 4-6 years, and 10.4% served for over 7 years. And 1 person didn't answer this question. And when we look at the positions of the participants, 12 of them (5.0%) are senior managers, 68 (28.3%) are mid-level managers and 158 (65.8%) are personnel.

The following are coefficient values that could reveal whether the scale on employee-oriented social responsibility activities is valid and reliable.

TABLE 1. Internal Consistency Coefficients of Employee-Oriented Social Responsibility Scale

Internal Consistency Coefficients	Value
Cronbach α	0,8671
Spearman Brown	0.8387
Guttman Split Half	0.8385

As you can see in the table, the internal consistency coefficient of this scale is maximum 0.8671, and minimum 0.8385. And this proves the validity of the scale according to internal consistency criteria.

With a total of 25 questions, the Employee-Oriented Social Responsibility Scale was directed at 50 employee groups and the acquired data were subjected to factor analysis by principal components method. Kaiser-Meyer-Olkin and Barlett's Tests were carried out in the first place to see whether the sample was satisfactory and the scale had sub-dimensions.

TABLE 2. Results of Kaiser Meyer and Barlett's Tests on Employee-Oriented Social Responsibility Scale

Kaiser-Meyer-Olkin Sample Adequacy Test = 0.644
Bartlett's Test = 8, $p < 0.01$

According to the analysis, Kaisery-Meyer-Olkin value was found to be above 0.50 (0.644). That means, the number of samples taken are adequate for factor analysis in this scale. Bartlett's Test showed a maximum of 8 sub-dimensions explaining that; the total variance in universe parameter is 74.159%.

TABLE 3. Eigenvalues and Variances Obtained From Factor Analysis Results on Employee-Oriented Social Responsibility Scale

Factors	Eigenvalue (E)	Variance (%)	Total Variance (%)
1 st DIMENSION	6.688	26.751	26.751
2 nd DIMENSION	2.374	9.496	36.246
3 rd DIMENSION	2.146	8.583	44.829

According to Kaiser criterion, there are 3 factors with Eigenvalues over 1 and making for the 44,829% of total variance of the variable to be measured. The factor analysis table for all questions is given below:

TABLE 4. Factory Analysis Results on Employee-Oriented Social Responsibility Scale

FACTORS	ITEMS	FACTOR LOAD
Factor 1 E = 6.688 IMPROVEMENT OF HEALTH-SAFETY AND EMPLOYMENT	7. Women are given employment opportunities and such facilities are becoming improved.	0.666
	8. Disabled people are given employment opportunities and such facilities are becoming improved.	0.694
	11. Employees are offered sustainable employment opportunities.	0.459
	12. Management is conscious and effective about health and safety standards.	0.511
	14. Occupational safety culture is endeavored to be established in the working environment.	0.425
	15. Healthy working environments are created for employees.	0.546
	21. Private lives of employees are respected.	0.468
	22. Business processes are safe and sound.	0.647
Factor 2 E = 2.374 SUPPORT ON EDUCATION AND ENTREPRENEURSHIP	24. Employees get health and safety training.	0.717
	2. CSR practices for education and career development of employees are being carried out.	0.581
	3. Training programs to aid disabled are implemented.	0.496
	5. Activities related to social and personal development of children are organized.	0.460
	16. The organization is takes steps for raising CSR awareness.	0.767
Factor 3 E = 2.146 EGALITARIAN BUSINESS ENVIRONMENT	17. Voluntary participation of employees to CSR practices are encouraged.	0.762
	18. Incentives and tools for supporting the entrepreneurship projects are established.	0.816
	4. Fair performance evaluation.	0.582
	6. Suitable conditions provided for achieving new information.	0.488
	10. Flexible working hours given to female workers with children.	0.555
	20. Merit rating principle is adopted in the workplace.	0.714
	24. Good workers are awarded.	0.590
25. Employees give their opinion about the job.	0.606	

--	--	--

As a result of the statistical studies, this scale, which could measure employee-oriented social responsibility in three dimensions, was found to be highly reliable and valid. The number of items went down to 21 after omitting 4 items that violated the validity and reliability of the scale.

TABLE 5. The Number of Questions on Job Satisfaction and Reliability Analysis

Factors	Nr. of Quest.	Alpha Value
Communication	3	0.79
Satisfaction With Job	6	0.81
Satisfaction With Supervisory Approach	4	0.87
Satisfaction With Co-Workers	4	0.81
Satisfaction With Wage	3	0.81

TABLE 6. The Number of Questions on Organizational Commitment and Reliability Analysis

	Nr. of Quest.	Alpha Value
Organizational Commitment	9	0.76

The correlation relations and defining statistics between the grouped variables are given in Table 7.

TABLE 7. Pearson Correlation Coefficients Result on the Relation Between Job Satisfaction, Employee-Oriented Social Responsibility and Organizational Commitment

	Employee-Oriented Social Responsibility	Improvement of Health – Safety and Employment	Support on Education and Entrepreneurship	Egalitarian Business Environment	Job Satisfaction	Organizational Commitment
Employee-Oriented Social Responsibility	$\bar{x} = 68.108$	$t = 0.962$	$t = 0.932$	$t = 0.888$	$t = 0.765$	$t = 0.222$
Improvement of Health – Safety and Employment	$p < 0.01$	$\bar{x} = 34.737$	$t = 0.844$	$t = 0.775$	$t = 0.778$	$t = 0.233$
Support on Education and Entrepreneurship	$p < 0.01$	$p < 0.01$	$\bar{x} = 19.091$	$t = 0.775$	$t = 0.678$	$t = 0.226$
Egalitarian Business Environment	$p < 0.01$	$p < 0.01$	$p < 0.01$	$\bar{x} = 14.279$	$t = 0.643$	$t = 0.137$
Job Satisfaction	$p < 0.01$	$p < 0.01$	$p < 0.01$	$p < 0.01$	$\bar{x} = 69.670$	$t = 0.182$

Organizational Commitment	p < 0.01	p < 0.01	p < 0.01	p < 0.05	p < 0.01	$\bar{x} = 29.846$
---------------------------	----------	----------	----------	----------	----------	--------------------

According to the results of the correlation analysis between the sub-factors of employee-oriented social responsibility activities scale and job satisfaction and organizational commitment variables, there is a positive relation between the improvement of health-safety and employment and job satisfaction general variable ($t=0.778$). It is explained that; the components of improvement of health-safety and employment are influential in perception of job satisfaction variable components. There is also a positive relation between the support on education and entrepreneurship variables and job satisfaction general variables. ($t=0.678$) Support on education and entrepreneurship variable and job satisfaction components have a complementary and a positive relation. A positive relation was found between egalitarian business environmental variables and job satisfaction general variables ($t=0.643$). Egalitarian business environment positively affects job satisfaction. A positive relation exists between improvement of health-safety and employment and organizational commitment variable ($t=0.233$). It shows that; these components positively affect one another. There is positive relation between the support on education and entrepreneurship variables and organizational commitment values. ($t=0.226$) Activities that support education and entrepreneurship were shown to influence the organizational commitments of employees. There is also a positive relation between egalitarian business environment variables and organizational commitment variables ($t=0.182$).

In the light of these findings, the hypotheses (H1), (H2) which show that; there is a positive relation between employee-oriented social responsibility scale variables and job satisfaction and organizational commitment variables, are accepted.

One-Way Anova and Unrelated Group t tests were carried out between job satisfaction scores depending on the demographic properties of employees.

It is found that; there is no significant difference between job satisfaction and the positions of employees in the workplace, between job satisfaction and working hours, between sexes of the employees and job satisfaction, and between marital status of the employees and job satisfaction. However, there is a significant difference between the level of education and job satisfaction of the employees. In 0.01 significance level, 2-year associate program graduates ($\bar{x} = 63.423$) got the lowest score, while the employees who did doctorate got the highest score ($\bar{x} = 84.285$). Moreover, there is a significant difference between job satisfaction and age variables. In 0.01 significance level, 31 – 40 got the lowest score ($\bar{x} = 64.067$), while 46 and above reached the highest score ($\bar{x} = 79.730$).

One-Way Anova and Unrelated Group t tests were conducted between organizational commitment scores depending on the demographic properties of employees.

It was found that; there is a significant difference between organizational commitment and positions of the employees in the workplace depending on their demographic properties; and mid-level managers got the lowest score ($\bar{x} = 29,338$), while senior managers got the top score ($\bar{x} =$

31,750) in 0.05 significance level. Moreover, there is a significant difference between organizational commitment and age variables; and in 0.01 significance level, the ones within 31 – 40 age group scored highest ($\bar{x} = 30,558$), and 46 and above got the lowest score ($\bar{x} = 28,733$).

One-Way Anova and Unrelated Group t tests were conducted between employee-oriented social responsibility activity scores depending on the demographic properties of employees.

It is observed that; there is a significant difference between employee-oriented social responsibility activities and level of education and sex variables of employees depending on their demographic properties. High school graduates obtained the lowest score ($\bar{x} = 58,000$), and the ones with doctoral degree got the highest score ($\bar{x} = 70,966$) in 0.01 significance level between employee-oriented social responsibility and education. In addition, the employee-oriented social responsibility scores of men ($\bar{x} = 70,966$) are higher than women ($\bar{x} = 65,297$).

Following these findings, there is a significant difference in some variables between employee-oriented social responsibility activity scores and job satisfaction and organizational commitment scores depending on the demographic properties of employees, and some do not have a significant difference. And H3 hypothesis is accepted in some situations from this point of view.

3. CONCLUSION AND ASSESSMENT

It is seen that; the most important variable in the first factor of the scale developed for employee-oriented social responsibility activities, improvement of health-safety and employment, is provision of health and safety trainings to employees by the management. The importance given by businesses that participated in the survey to health, safety and employment is evident from the employment opportunities provided to disabled and women, development of safety in business processes, healthy working environments for employees, consciousness and effectiveness of management in health and safety standards and the endeavor to establish occupational health and safety culture in the workplaces.

The most important variable in the second factor of the employee-oriented social responsibility activities, the support on education and entrepreneurship, is to provide the desired incentives and tools to encourage corporate entrepreneurship projects. Moreover, Corporate Social Responsibility awareness initiatives are supported, employees voluntarily take part in CSR practices, CSR practices for employee training and career development are carried out, education programs to solve the problems of disabled people are applied and social and personal development activities are organized for working children.

And the most significant variable in egalitarian business environment, the third factor of the scale developed on employee-oriented social responsibility activities, is the implementation of merit rating principle in the workplace, and then respectively, receiving the opinions of employees about their jobs, providing the suitable conditions for acquiring new information, fair performance evaluation, flexible working hours for women with children and awarding the successful workers.

According to the satisfaction from job factor, which is included among the job satisfaction scale factors, the employees reported working in a position they desire, which is suited to their knowledge and abilities, contributes to their personal development and meeting other business expectations where they can use their creativity. They stated that; their powers and responsibilities were clearly designated and they also engaged in activities required by their jobs. When we collectively review the responses to the propositions about satisfaction from job, the employees generally presented positive opinions.

From the point of communication factor, the employees recognize the existence of a successful communication in their workplaces, and they expressed their ability to share their demands and problems with managers, which is thought to improve job satisfaction.

According to the opinions of employees regarding satisfaction from supervisory approach, the behaviors and the attitude of management play a crucial role in job satisfaction. Management should continuously stay in touch with employees while taking administrative decisions and making schedules.

The point where the most positive opinions were seen about job satisfaction was satisfaction from co-workers. The participants stated that; their co-workers are experts in their fields, they have good relations and they help one another when necessary. We can tell that the employees typically have positive thoughts about their co-workers and establish good relations.

However, the wage side of job satisfaction tells us that; the employees are not getting the wages they deserve and suffer from financial problems.

According to the results from One-Way Anova and Unrelated Group t tests between job satisfaction scores depending on level of education and age variable, the employees with the highest level of education and those at the age of 46 and over it are more satisfied with their jobs. Besides, the organizational commitment levels of senior managers are considerably high compared to other employees. The employees with the highest level of education think more positively about employee-oriented social responsibility activities than other employees. In addition, men hold more positive views towards employee-oriented social responsibility activities compared to women.

To make a general assessment, these results can be said to support theoretical assumptions. According to the sample mass designated as a result of the analyses, it is concluded that; there is a positive relation between employee-oriented social responsibility activities, job satisfaction and organizational commitment. Accordingly, the perceptions of employees about employee-oriented social responsibility activities in their workplaces are aimed at improving their job satisfaction and organizational commitment.

In conclusion, the measurement of the employee-oriented social responsibility activities, job satisfaction and organizational commitment of the employees of The Most Popular Companies of Turkey yield notable results and information to managers. Companies have the chance to evaluate and review their employee-oriented social responsibility activities thanks to these data. The vocational training to be provided by companies to their employees within the scope of their social responsibilities, new employment opportunities, measures for establishing a healthy and safe workplaces, investments supporting to the entrepreneurship of employees and egalitarian business environments will bring employees who embrace their jobs and workplaces as well as providing competitive advantage and contributing to a superior and productive production infrastructure. In addition to all the above points, these practices of businesses within the scope of responsible citizenship will bring along a high level of job satisfaction, and increase the sense of belonging in the employees besides helping the management sustain its activities as part of a management approach supporting organizational commitment.

Title: The Image of Russia and Great Britain in the Late Nineteenth Century Japan: A Comparative Analysis of “Kokumin Shimbun” Publications (April – June, 1895)

Author(s): Kovalchuk Marina

Professional Affiliation(s): Assistant Professor, Far Eastern National University (Russian Federation); Visiting Researcher, Osaka University (Japan)

The last decade of the nineteenth century marks the formation of a new balance of power in the Far East. Japan’s victory in the Sino-Japanese War (1894-1895) urged Europeans to revise their views on Japan and its role in world politics. Simultaneously, Japan’s victory prompted Japan to revise its perceptions of and interactions with the states of the West.

The analysis of the “Kokumin Shimbun” articles published in the spring of 1895 reveals that Japanese publicists of the late nineteenth century widely used some infant geopolitical theories in their attempts to analyse European nations’ states of affairs and international policies based on these countries’ geographical and climatic characteristics. In doing so, Japanese publicists tried to predict international policies of European states, specifically, the Far Eastern policies of Great Britain and Russia and to identify their potential as Japan’s future rivals or allies on land and at sea.

In May 1895 “Kokumin Shimbun” published several articles by its publicist Hisashi Hirata entitled “Russian Nature.” In his articles Hirata tried to provide a geopolitical analysis of the Russian Empire and its future potential by bringing attention to the peculiarities of Russia’s geographical characteristics. As a result, he came to a very interesting conclusion. According to Hirata, Russia was the only European nation, which could be considered the mainland power. This was due to the fact that Russia – a country with the largest territory in Eastern Europe – possessed a unique natural and climatic unity, despite its extensive territory. In addition, Russia almost completely lacked access to the navigable seas, which also made her more of a mainland power. By contrast, other European countries, in Hirata’s opinion, could be considered rather island civilizations rather than mainland civilizations, because of their cut landscape and small territories.

Drawing parallels between Greco-Roman and contemporary European civilizations, Hirata arrived at the conclusion that Japan should be far more concerned with Russia than with other European states, such as Great Britain, France, and Germany, despite the fact that the latter currently appeared more technologically advanced than Russia.¹

Based on the assumption that a so-called “island” civilization of ancient Greece reached the apogee of its cultural and technological advancement as it blended into the extensive territory of Roman Empire, Hirata concludes that modern Western European civilization will likewise continue its development on the boundless space of the Russian Empire, whose territory constantly continued to increase due the expansionistic policy of its government.

From the perspective of the geopolitical theory, which typically separates all states into sea powers and land powers and places them into contraposition as such, the characterization of Russia by “Kokumin Shimbun” as a boundless land giant could create a rather negative image of Russia in the eyes of Japanese who were typical representatives of sea civilization. During the period from the autumn of 1894 through the spring of 1895, in addition to “Kokumin Shimbun” publications, several other Japanese newspapers published numerous comparisons between Japan

and Great Britain based on their island nature. In this light, Hirata's characterization of Russia as the only mainland power of Europe once again emphasized the fact that there is almost nothing in common between Russia and Japan.

Regarding Great Britain, our analysis of "Kokumin Shimbun" publications during the period of the Sino-Japanese war (1894-1895) revealed that it was the "Sea Power" theory invented by the American navy officer Alfred Mahan in the early 1890's that had the greatest impact on the further geopolitical estimation of Great Britain as a possible ally or enemy of Japan.

Four years after the publication, namely in 1894, his work "*The Influence of Sea Power upon the History*" was examined in detail in the Japanese press. Moreover, according to "Kokumin Shimbun" in May 1894 the first chapter of that book was translated into Japanese and presented to the country's naval minister.²

Mahan's theory convinced the Japanese of the fact that it was Great Britain's insular character and other peculiar geographical characteristics that allowed her to reach her unprecedented sea power and made her into "the queen of seas and oceans" in the 19th century.

The tradition to emphasize the similarity between Great Britain and Japan as "island" civilizations, located on the opposite sides of the Eurasian continent, had existed long before the Japanese learnt about Mahan's theory.

Interestingly enough, it were the British who, as early as in 1850-s, began to emphasize that the insular nature of Japan is similar to that of Great Britain.

In his lectures on the Japanese Empire presented in December 1852 in the Newcastle Library and the London Philosophical Society (which, according to British historians³, were the first public lectures on Japan in Great Britain), Dr. S. T. Dauning described the special features of the Japanese nation and called the Japanese no less than "Englishmen of the East" or "Oriental Englishmen." And in the following years, the British often referred to Japan as the "Britain of the East."

It is hard to say to what extent the comparison of Japan with Great Britain convinced the Japanese government in the necessity to transform Japan into the strong naval state. However, it is well known that England was chosen as an example when Japanese fleet was created. This choice was naturally determined. Starting the modernization of the state, the Meiji government tried to cater for the best world examples and British authority on the sea was incontestable at that moment.

The naval victories of Japan in the Sino-Japanese war (1894-1895) revealed that Japan made a right choice. Victory in the war with China, which for a long time was considered as the strongest Asian nation in the Far East, gave to Japan confidence in its power. At the same time the acquaintance with the Mahan's theory of the "sea power" revealed that success of Japanese transformation into the strong naval power was predetermined by natural characteristics of Japanese islands.

Mahan pointed out the following six factors that, in his view, exert utmost influence on the formation of the naval power of a state:

1. The geographic position of a state: its access to the seas and the possibility to communicate with other countries via the sea; extensive land borders; capacity to control strategically important regions and trade routes, and to use its navy to threaten the territory of its adversary.

- 2.The physical conformation: the quality of the shoreline and the number of natural harbors where port facilities can be built.
- 3.The extent of the territory: i.e., the length of the coastline, not the total area.
- 4.The number of population: the capacity of the state to build and maintain a fleet of ship.
- 5.national character: the propensity of the populace to trade and enterprise.
- 6.The character of the government: the interest to develop as a maritime state.⁴

The analysis proposed by the Japanese naval officer Kikotsu Sei in “Kokumin Shimbun” in October 1894 revealed that Japan had all characteristics, necessary for the successful naval development. “The position of our country bears a strong resemblance to that of Great Britain,” said Kimotsuki in a conversation with the “Kokumin Shimbun” journalist. “Hence, we must pay special attention to the development of our navy as England... Because we do not have land borders with other states there is no need for us to build up land forces; conversely, we must capitalize on the rarely advantageous position that nature benefited us with, and direct all our efforts towards an acquisition of naval power.”⁵

In addition to the above six main factors, Mahan mentions many other geographical factors that might, in his opinion, encourage or slow down a country’s development as a naval power. For example, Mahan stressed the worth, or importance, of what he called the central position of a country at the crossroads of sea trading routes. If, in addition to facilitating its ability to defend itself, nature has placed a nation in a position where it has easy access to the main oceanic trading routes and, moreover, can exercise control over one of the major lines of world merchant traffic, such position has a great strategic importance, he wrote.

Britain occupied such a position during the era of the sailing vessels; by using its geographic advantage and the strategy of assailing the ships in its adversaries (the English called it “commerce-destroying”) it had assumed control over the English Channel, a passage used by the merchant vessels of the Netherlands, Russia, Denmark, Sweden and other countries.⁶

While agreeing to Mahan’s conclusions that the basis of Britain’s sea power was built by nature, the Japanese military and analysts stressed that the similarity between the geographical positions of Britain and Japan might hold a good promise for the naval development of their country. In the article “The Sea Power” Kimotsuki assumed that its geographic characteristics gave Japan a real opportunity to establish control over the most important trading routes in the Pacific and, hence, to occupy as important position in that part of the world ocean as Britain had in the Atlantic. “Even today, our country is at the crossroads of the principal marine routes linking the Chinese ports and the Pacific, and after the conclusion of the Trans-Siberian Railroad, the Tsushima (Korean, M.K.) and Tsugari (Sangar, M.K.) Straits will inevitably acquire not only mercantile but also strategic importance.”⁷

Thus, the analysis of Japan’s marine potential based on Mahan’s theory led to the conclusion that the Japanese islands had all the advantageous geographical and physical characteristics. With nature having done a very good job, it was now up to the Japanese people, according to the Japanese journalists and the military, to be wise enough to appreciate the importance of these conditions and embark on an appropriate course of political action. The conclusion that the geographical position of a state should be taken into account in determining the direction of its home and foreign policy indicated that the seeds sown by Mahan’s geopolitical theory resulted in new sprouts in the fertile soil of emerging Japanese imperialism.

The new awareness of its naval might, which relied on Mahan’s theoretical work and, in practical terms, on the victories scored in the war against China, played a major enough role in the

formulation in the Japanese press of an idea that an Anglo-Japanese union was not impossible in the near future. Contributing to this thinking was a new perspective that the Japanese had formed about Great Britain's marine potential.

Although the British navy continued to be the most powerful in the world in the 1890s, its positions no longer seemed as invincible after Britain's main opponents, Russia and France, signed a treaty of alliance in 1892. In March 1895, journalist Fukai Eigo, wrote a series of articles in the "Kokumin Shimbun" newspaper under the heading "England at the End of the 19th Century", in which he attempted to answer the question: how long would Britain be able to oppose the growing naval might of the Russo-French alliance.

With 200 warships flying the British flags in 1807 against 180 for the rest of the world, no navy could compete with the British one in the early 19th century. It was not fortuitous that the Japanese selected the British marine as a model for the building and modernization of its navy. The first 17 English instructors were invited to teach at the Japanese Kaigunshyo - Naval Academy by the Shogun's cabinet during the Keio period (1865-1868). After Meiji restoration, the Japanese again addressed the British for assistance. Between 1870 and 1900, naval officers were regularly sent to Britain for studies and training, while most of the Japanese warships were being built in the Britain's dockyards.⁸ As Fukai put it, the very word 'sea' was associated in the Japanese minds with the word 'England'.⁹

The scope of the British colonial possessions produced an equally strong impression on the Japanese. The best illustration of the Japanese admiration of the British Empire was, in our opinion, the following passage in the issue of the "Kokumin Shimbun" of December 1894: "Today, the area of the British colonial possessions scattered all over the globe equals 10 thousand square miles, and their population comes close to 300 million people. You may circumnavigate the globe by moving from one British colony to another without setting your foot even once on the territory of a foreign country."¹⁰

Three months after this publication, the idea of a round-the-globe trip via the territories under British rule came up again in the Fukai's article. His itinerary practically repeated that of his predecessor, but unlike the author of the article entitled "The State Might of England" Fukai was in no hurry to express his admiration at the sweeping scope of the British colonial system.

His task, he said, was not to sing the praise of the British Empire's past achievements, but to give an objective evaluation of its present potential to defend itself and preserve the territories that had proved the principal source of its power and riches. "In the good old days England would overpower Spain, got the upper hand in its confrontations with France, and built an empire that the world had not seen before. Britain's skills in sustaining its dominance over such vast lands, so different and so far apart bewildered and caused the admiration of the entire world. However, even a good swimmer may drown some day and a good rider may fall off his horse. What makes Britain's position weak is the need to defend such vast and scattered colonies. Today, the English are not concerned about aggrandizing their possessions, but about how to protect what they ceased earlier... Therefore, let us not look back at the glorious past of the British Empire, but try to evaluate objectively its present status."¹¹

The Japanese journalist stressed, that the Britain's greatest fear is to lose "the biggest gem in its crown"—India, because its passage to the hands of one of Britain's competitors would deprive Britain of its main source of wealth. "Who is Britain's chief opponent is an open secret", - went on Fukai. "The English readily admit that only one people will be able to compete with Britain in the future, and it is the Russians"¹². This passage belonged to Charles Dilke (1843–1911), the

author of a work, *Greater Britain* that made quite a sensation. The article quotes other well-known and influential Britons, such as the former deputy head of the British administration in India, George Curzon, the future viceroy of India and foreign secretary. Russia and France are expanding their colonial possessions and are approaching India. France had already swallowed Tonkin, Annam, Vietnam and Cambodia, and is setting its aims at Siam. Therefore, defense of our possessions should be the priority tasks of our policy”, - he wrote.¹³ These quotations indicate that the notion making its way to the Japanese press that Britain should change its course from expansion to defense came as a result of analysis of appropriate statements of Britain’s political and military elites. In fact, similar quotations are found in almost all twelve parts of Fukai’s article. The majority of the critical comments on the state of the British navy and the defensive potential of its colonies were excerpted from the British newspapers and reports prepared by various departments of the Ministry of the Navy of Japan for the general public.

One can imagine how shocked was the Japanese public, used as it was to defer to the might of Great Britain, when English historian and publicist Goldwin Smith (1823–1910), writing in his *Problems of the Present Day* (1894), virtually destroyed the illusion that an immense territory of a state was the basis of its power. One may threaten one’s enemy with a toy pistol only for as long as the enemy is not aware that the weapon is not real, he wrote. When the fraud is uncovered the counterfeit pistol becomes useless. If a state possessing immense colonies lacks sufficient military power to defend them, these possessions would weaken the state instead of strengthening it, he observed. For as long as an enemy of the state is not aware of this weak spot in its defenses, the state may be quite proud of its gains; but when the adversary finds out about it, you are in real danger, warned Smith and concluded that since the enemies of Britain are aware of its vulnerabilities it would better expect an attack at any time and any place.¹⁴

That Great Britain, which controlled one third of the globe, was unable to preserve its possessions might seem a figment of an English publicist’s imagination; yet, strange as it seemed, it was echoed by pronouncements of competent spokesmen of the Ministry of the Navy of Japan. It was such statements that induced Fukai to start his own investigation of Britain’s defensive capacity and to bring the result of his study to the attention of the Japanese reading public.

Convinced that only unquestionable naval superiority over all other countries could guarantee Britain full safety of its colonial possessions, Fukai equated Britain’s defensive capacity to the state of its navy.

The importance that he attached to Britain’s naval power stemmed from the formidable number of tasks it had to fulfill. The navy was not only the only means of communication between colonies and other possessions, vast and far away from the British Isles as they were, but also from the fact that the warships were their only protectors. In our opinion, Fukai conveyed the significance of the British navy clearly and succinctly by quoting British Admiral Crome’s statement: “If our warships are defeated it would mean the end of the British Empire because they are its only border-line.”¹⁵ Ch. Dilke was of the same opinion, which he conveyed by means of the following allegories in *his Theory of Imperial Defense*: just imagine, he wrote, that the entire surface of the world ocean is covered with ice, or that it suddenly turned into wilderness. What will become of Britain in this case? Or imagine that due to some unspecified chemical reaction sea water would no longer keep our ships afloat. What will happen to Britain then? Some people would probably consider these examples far-fetched, but should Britain lose its unquestionable marine supremacy it may well find itself in a situation very similar to what I have just described, he wrote.¹⁶

Judging by his text, Fukai agreed to the Englishmen absolutely. Relying on the 1894 data on the number and displacement of the British warships, which he compared to the corresponding data

dealing the navies of Russia and France, he sought an answer to what seemed to him the question of utmost importance: whether Great Britain had managed to preserve her status as the most powerful naval state in the world after the conclusion of the Russo-French treaty.

Fukai made use of the report of a commission that appraised the 1888 exercises of the British Navy that were to determine the level of its combat readiness. According the Japanese analyst, their outcome proved shocking to the British public. Members of the commission concluded that “at the present day, Great Britain does not possess sufficient resources in either personnel or materiel (shops, arms, ammunition, etc.) to maintain the necessary priority positions at sea,”¹⁷ he wrote.

What caused so negative an appraisal becomes evident when one examines the report that members of the committee presented to the Chamber of Commons later that year. In it they stressed that unless the number of British combat ships exceeds the numbers of its opponents, represented by one or several states, in the ratio of 5 to 3, Britain’s unquestionable supremacy in the sea is out of the question. Only such an advantage could enable the British navy, to quote Admiral Charles Beresford,¹⁸ to use, even in the age of ‘steam and steel,’ one of the most successful strategies of the sailing warships, namely to lock enemy ships in their ports. Meanwhile, in 1888, Britain possessed only 36 ships that could be rated as warships, while France had 30 such ships¹⁹ at the time. The conclusion was that even in 1888 Britain could not boast an unquestionable advantage. Taking these figures into account, Fukai concluded that the conclusion of the Russo-French treaty the position of Great Britain in this sense could only deteriorate.

It goes to his credit that Fukai went beyond mere six-year-old quotations from English statesmen; instead, he managed to uncover fresh data reflecting the ratio between the marine potentials of Britain and its two opponents during the time of the Sino-Japanese war. According to the information appearing in his article, the most marine powers of the day were in possessions of the following fleets: Great Britain, 46; France, 34; Germany, 22; Italy, 21; Russia, 17; and the United States, 6.²⁰ Fukai did not disclose the sources of his information, but, in any case, it appeared from his article that Great Britain not only had forfeited its indisputable supremacy in the sea, but, in effect, could no longer claim even a minimum superiority over the combined naval forces of Russia and France.

Let us adduce, for comparison’s sake, the figures published in January 1894 by one of Britain’s influential periodical magazines, “Edinburgh Review”, which claimed that it had received the information from the Admiralty. The magazine presented the comparative data relating to battleships of the 1st and 2nd classes of three countries: Great Britain, Russia and France (which is yet another proof that London held France and Russia to be its principal rivals at sea). According to the publication, as of December 31, 1893, Britain had 27, France 18, and Russia only seven vessels.²¹ Hence, the combined forces of France and Russia could only put forward 25 ships against Britain’s 27. Although the figures quoted by Fukai and the “Edinburgh Review” differ greatly it is clear from both publications that Britain failed to maintain supremacy in the 1st and 2nd class ships necessary to protect its colonies and external trade. Moreover, as the British sources stressed that Russia and France were actively increasing their marine spending, which is fraught with the possibility that might gain an advantage over Great Britain in the future. Unless the British government takes urgent steps to change the situation and come up with additional finances to strengthen the marine, the ration between the warships of Britain and the Russo-French alliance will be 34 to 49 in favor of the latter, maintained the “Edinburgh Review.”²²

In referring to Mahan’s *Influence of Sea Power upon History*, Fukai inferred that in addition to

losing its superiority in the mere numbers of warships, Britain could also no longer rely on a factor that used to provide it with considerable advantages over opponents: “After France had allowed its ally, Russia, to bring ships in the Mediterranean”, he wrote, “Britain virtually forfeited its control over this geographic area, which is a natural barrier on the way to its colonial possessions in India and Australia.”²³ According to the data published in the “Kokumin” by early 1894, the British fleet in the Mediterranean had only a minimum advantage over its opponents in the number of battleships—ten to nine—but had only 37 warships compared to 44 of the French-Russian alliance. Though this gap might seem insignificant at first glance, it somehow redoubled in comparison to Britain’s former unconditional dominance. “The shortest route from Britain to the East is via the Mediterranean”- Fukai wrote. “Well aware of it, Britain did everything in its power to be able to use this route. It established control of the Strait of Gibraltar, built a military base on Malta, established protectorate in Egypt, captured Cyprus, closed the Dardanelle and made itself one of the principal owners of the Suez Canal Company.”²⁴ But if an armed conflict (between Britain and the Russo-French alliance, M.K.), Britain will hardly have a chance to use this pathway because its fleet is inferior to that of the Russo-French alliance. Fukai went on that according to Charles Dilke, in such a situation Britain could only count on the alternative route round the Cape of Good Hope, which is three if not four times longer the passage via the Suez Canal. In practical terms, this deprives Britain of control over the Eastern seas, he concluded. India is not only a symbol of Britain’s might in the Orient, Fukai wrote, but also the cause of many concerns and problems that the British are faced up with, because Britain simply does not have enough resources to protect it... The English realize that they need a reliable ally in the East. But who can it be? The answer to this question may be tantamount to the resolution of all British problems, he wrote.²⁵

The conclusion that Britain is in need of a “reliable ally in the East” suggests that the “objective evaluation of the situation in which Britain found itself after the conclusion of the Russo-French alliance, was presented to the Japanese reader with the intention to convince him that Britain harbored not expansionist plans, at least not in the state it was in at the time, but that it had a strong desire to preserve intact what it had succeeded in conquer during the years of its unchallenged naval supremacy. Fighting capacity is probably the most basic indicator of the strength and health of a nation in our age, when the last word in the resolution of a conflict is the prerogative of the strongest in the military sense”, - Fukai wrote in the concluding portion of his article. “My studies indicate, however that the overly extended borders of the British Empire had a weakening effect, that it did lose the unquestioned naval supremacy, that its land forces had not a few shortcomings, and that its position in the East was no longer safe. Britain, in other words, had come to resemble an old man who had amassed a great wealth while being young, but had driven himself to psychiatric disorder in the old age by fearing he might lose it. Today, should the British government receive a message from some adventurer that he discovered some new lands, he would have been instructed without delay to forget about them and get back home.”²⁶

His comparative analysis of the naval forces of Britain and the Russo-French alliance convinced Fukai that Britain should enter into a coalition with a country that is strong on land and at sea and that could help Britain preserve its colonial empire. According to the Japanese analyst, such an ally should be looked for in the East. Bearing in mind that this article was to be published on the eve of the signing of the Sino-Japanese peaceful treaty, when the defeat of China was quite certain, it was just as certain that Fukai referred to Japan as an ally that Britain needed. It is difficult to say the least to assess, on the basis of newspaper publications, to what extent Japan’s political elite shared the views of the journalists and analysts. There are grounds to suppose, however, that because Britain’s stand on the Sino-Japanese war (1894-1895) was closely monitored by Tokyo from the very start of Sino-Japanese conflict²⁷, statements made by prominent English spokesmen on the problems confronting the British navy and the defense of

India were not unheeded by members of the Ito Hirobumi cabinet and were even taken into account during the drawing up of the Simonoseki Treaty.

In conclusion we can say that Alfred Mahan's notion that "sea power" was the principal instrument in the building of the great British Empire and remained the only potent weapon for its preservation—this notion was given a life of its own in the Japanese press. His theories played an important role in analysis of defensive capacity and naval potential and of Japan's allies and opponents, present and future, and it was not by accident that 20 years after the events described here, lectures on Mahan's theories were delivered to the young prince and future Emperor Shyova.

‘Germany’s Forgotten War’: German POW in Japanese POW camps 1914-1920

Dr Sandra Barkhof

University of Plymouth

Official relations between Japan and Germany date back to 1861 when the first bilateral treaty between Japan and Prussia was concluded, followed by the employment of the first German foreign experts by the Meiji government in 1872 (Spang and Wippich 2006:1). Although Japan, in her strive for modernisation during the Meiji period, had considered at first Britain, France and the US as ‘role models’, increasingly turned towards Germany in the 1880s and early 1890s, which has been described as a process of ‘Germanization’ (Akira 2006:80) and the high point of German-Japanese relations (Wippich 1986:17). For example, the Japanese Meiji Constitution was heavily influenced by the Imperial German Constitution (Dickinson 1999:23), just as the Meiji education system and military modernisation was inspired by the German system. The German government, including the Kaiser, as well as parts of the population, displayed pro-Japanese sentiments during the first Sino-Japanese War 1894-5 (Wippich 2006:66). Wippich (2006, 1986) also provides an interesting analysis of 214 congratulatory letters (161 of which came from Germany), which arrived in Japan after their victory in 1895. These letters, as well as the Kaiser himself, expressed a general admiration for the ‘plucky little Japs’ and benevolent sympathy for the ‘Prussians of the East’ (Wippich 1986:22).

This public sympathy for Japan during the war remained by and large without political consequences. Indeed, the turning point in German-Japanese relations came very shortly after the war when Germany joined the Triple Intervention. Although the German government acted largely for reasons relating to her European politics (especially with regards to Russia), the Intervention led to disillusionment and bitterness on the Japanese side, which was not helped by Wilhelm II’s subsequent increasing agitation against the ‘dangers of a unified yellow race’ and the German acquisition of Jiaozhou Bay in China in 1897, which threatened Japanese ambitions in China (Spang and Wippich 2006: 2-3). The Triple Intervention really marked the end of friendly relations between the German and Meiji governments (Akira 2006:82). Spang and Wippich (2006:6) note that several obstacles thereafter impeded closer relations between the two countries, including the above mentioned ‘Yellow Peril’ propaganda of the Kaiser and Germany’s inability to acknowledge and respect Japan as an equal power in world politics, which was a legacy of Japan’s former ‘unequal treaty’ status and the German-Japanese teacher-pupil relationship. Despite the admiration for Japan’s development and modernisation, when Japan asserted that they had entered the circle of European Great Powers as an equal power, the Kaiser sharply criticised what he called the ‘megalomania and arrogance’ of Japan (Wippich 1986:45). We can find similar sentiments in some POW letters, which will be discussed below. Unsurprisingly, the Japanese government harboured during the final years of the Meiji period, what Nish (1986:82) called ‘a strong sense of resentment’ against Germany as Germany was believed to be more racially conscious and thus more hostile towards Japan.

However, the Japanese decision to declare war on Germany on 23 August 1914 and enter Jiaozhou Bay, cannot be considered the result of these deteriorating Japanese-German relations, or simply as a result of the Anglo-Japanese alliance, but as an integral part of Japanese expansionism in Asia (Saaler 2006:26), which must be viewed in the context of

previous expansionist Japanese Asian policies and ambitions since the late nineteenth century. Thus, Japan was keen to possess the German sphere of influence in Shandong (and her industries and railway there) rather than simply driving the Germans out of China (Nish 1986:86). Japanese policy makers in 1914 greeted the Japanese entry into the war as an opportunity to obtain their long standing national goals in China and to redefine the nation (Dickinson 1999:36+80¹).

After the fall of Qingdao in November 1914, around 5000² German and Austro-Hungarian ‘defenders of Qingdao’ including the governor Captain Alfred Meyer-Waldeck were transported to Japan to spend the rest of the war (which was expected in the not so distant future) in fifteen hastily organised Prisoner-of-War camps³. The Japanese government created an ‘Information Bureau for POW questions’ [*Informationsbüro für Kriegsgefangenfragen*] within the Army Ministry whose remit included liaising with the Red Cross and the ‘protector nations’ [*Schutzmächte*] (Krebs 1999:196)⁴.

Although a considerable amount of research has been undertaken, especially by German scholars, into German Imperialism and the German colony in Qingdao, comparatively little research has been carried out concerning the direct aftermath of the fall of Qingdao, including the POW camps in Japan during WW1 (notable exceptions are for example Burdick and Moessner, and Krebs, all discussed in this paper). A wealth of primary source material can be found in the various locations of the German National Archive and the Foreign Office Archive in Berlin, but a great deal of surviving POW letters are locked up in private philatelic collections and are, as such, lost to academic research.

Once the POWs had been shipped to Japan, Krebs (1999), Burdick and Moessner (1984) as well as Dickinson (1999) describe the initial welcome by the Japanese population as generally curious and friendly since ‘no deep-seated animosity existed between the two countries’ (Burdick and Moessner 1984:7). Burdick and Moessner (1984:7) further note that the Japanese government had not engaged in an anti-German propaganda campaign since the outbreak of hostilities, but had described the German soldiers as ‘brave and daring’. The Japanese Emperor even sent a representative to greet the arriving POW. The Japanese government was keen to adhere to the Hague Conventions of 1907 regarding treatment of POW and allocated the same remuneration and food allowance to the German POW than to its own soldiers (R2/50306). As the Japan Times of 3.2.1915 stated ‘except for German beer and free outing, the German prisoners suffer no privation at all. The officers, in most cases, get European meals from restaurants at monthly rates, while non-commissioned officers and men cook their own food [...]’. (R9208/235). Reality, however, was somewhat different. The allocated remuneration provided for adequate Japanese meals for the POW, but European meals were more expensive and more difficult to come by (particularly if the individual POW did not have own funds), especially since Japan was suffering from an economic crisis and inflation. Subsequently, the food provision was an issue right from the start.

¹ We can see evidence of this in the 21 Demands issued to China in 1915 after the Japanese occupation of Shandong

² the actual number of POWs is very difficult to determine and varies from source to source. Burdick and Moessner (1984) give the overall number as 4592, a report from the Japanese Prisoner of War Bureau dated 1914 lists 5025 imprisoned German soldiers plus officers, medical officer and Austro-Hungarian prisoners

³ Note that the British, who had fought with around 2000 troops alongside the approx. 58,000 troops of their Japanese allies in Qingdao, also transported a number of wounded POW to Hong Kong and Australia (Burdick and Moessner 1984:xvi)

⁴⁴ At first the USA was the *Schutzmacht* in Japan, after the US entry into the war, the role was carried out by Switzerland

To give an example, initially, the POW were housed in provisional accommodation including temples, empty school buildings and other public buildings, many of which were, by and large, unsuitable for long-term habitation by such a large number of men. The first POW to arrive in Japan in October 1914 (before the final fall of Qingdao), some 55 men, were housed in the temple complex at Kurume. A series of reports dated October 1914, sent to the German Imperial General Consul Mr Knipping in Shanghai (R2/50306), describe the arrival of the first German troops in Kurume, initially indicating that ‘the Japanese military ministry undertakes every effort to make the stay for the POW as tolerable as possible’. They ‘delivered iron bedsteads with straw mats as well as meats, which the POW are cooking themselves’. The POW would be allowed to receive parcels and mail. The report also describes the creation of help committees among the German civilians of Tokyo, Kobe and Yokohama to care for the POW (in the form of for example regular deliveries of German bread, butter and tobacco), but indicates if the ‘number of POW reaches several hundred, larger sacrifices would be necessary’. Already three days after the initial report, the same source (not named, but seems to be a member of one of the help committees) reports that ‘the position of the POW is apparently not as good as initially indicated to me through the Japanese lens at the Japanese Ministry of War’. The food ‘leaves much to be desired’ and heating ovens were not permitted in the temple. A further report dated 29 October (R2/50306) explains that the insufficient food is down to the fact that the Japanese officials are ‘totally unclear about what a European [man] requires’. An investigation at Kurume instigated by the committee found that the POW had been ‘hungry for several weeks now and need first and foremost bread’. A note to the State Secretary of the Imperial Navy Ministry dated 15 January 1915 (R2/50306) also concludes, that although it is evident that the Japanese are trying to improve the conditions of the POW, ‘they [the Japanese] are completely unaware concerning the minimal requirements of a European due to the very different European standard of living’. Thus, if the food does not match the ‘taste and nutritional demands of the POW’, it is primarily due to this lack of knowledge since the Japanese are otherwise eager to treat their POW just as well as the European Powers theirs, especially considering the ‘general German-friendly attitudes in Japan’. However, the German Imperial Navy Ministry states on 30 January 1915 (R2/50306) that Japanese food is entirely insufficient for Europeans and would lead to illness and malnutrition. Some form of financial help to provide adequate foodstuffs was therefore recommended, although it was also agreed that any official offers of help to improve the care of and provisions for the POW are a ‘diplomatic minefield’, as a Japanese acceptance of such offers would equal a confession that they did not fulfil their commitments according to the international law⁵. It is obvious from various camp inspection tour report and letters that the food situation at least in some camps did not improve much for the remainder of the war. A 1917 tour (R2/50306) reported that in nearly all camps the food was described as ‘too scarce’, the POW wanted more meat, bread and fresh vegetables. The food situation was described as particularly bad in Narashino, Oita, Ninoshima and Kurume (where many POW complained of ‘malnutrition’). The health of the POW, however, was described for all camps as good or satisfactory.

Overall, the situation differed greatly from camp to camp and over time, but, as Krebs (1999:197) notes, the post-war myth of the “cosy imprisonment” [*gemütliche Gefangenschaft*] did not necessarily match reality and many former POW protested what they called “these

⁵ Interestingly, and in stark contrast to these early evaluations of the Japanese treatment of POW, in 1921 a report from the Siemens-Schukert Werke Japan to the Head of the German Navy (R2/50306) states that ‘the Japanese, eager to appear as a cultured nation [*Kulturvolk*] tried to follow the letter of the international treaties, but not their sense’

homegrown fairy tales” [*daheim entstandenen Märchen*]. The 1917 camp inspection tour (R2/50306) found that treatment in the camps differed significantly, much of which depended on the camp commanders. Some camp commanders were described as ‘soft-hearted and humane’, especially at Bando, while others were little more than ‘correct civil servants’, especially in Kurume and Ninoshima. Although all camps were inspected monthly by the division commanders (who report to the Ministry of War), they were usually ‘unaware of the real complaints’. Not surprisingly, letters from different camps can tell a very different story. In addition, some letters indicate that in some camps there were certain benefits in writing positive letters (while negative accounts, if read by the censor and passed on to the camp commander, may result in small retributions). This may have also led to some distortion in individual accounts.

Overall, we can note that some camps were consistently reported as ‘lacking’. They included Kurume, Fukuoka, Matsuyama and Marugame. The already mentioned camp of Kurume in particular often stands out as particularly unsuitable for the large number of POW housed there. Here, the inadequate facilities and the rather harsh attitude of the camp commander, who had given orders for a strict disciplinary approach, combined to create an atmosphere of ‘mental hostility’ between the POW and the guards (Burdick and Moessner 1984:11). A lengthy letter from a German officer POW named Wilhelm-Werner von Bobers, dated 19 October 1915 (R9208/236) and addressed to a German newspaper, described the conditions at Kurume as ‘hair raising’. He stated that the initially good treatment as well as the ‘so-called politeness and chivalrousness of the Japanese’ was nothing but a ‘mask’. Now, the treatment was ‘not worthy of humans’, the POW were treated not as POW but as ‘criminals’. He described the accommodation (‘worse than stable boxes at home’), the frequent beatings and punishments, the lack of beds, the plague of rats in winter, the destruction of incoming or outgoing mail and so on. A similar lengthy letter dated 1915, and again addressed to a national German newspaper, described the conditions at Shizuoka (R9208/236). Again, the letter stated that initially the conditions were good, but deteriorated quickly (according to the letter writer ‘once everyone had written an enthusiastic letter home and the Japanese had managed to create, with real Japanese cleverness, a good first impression’). His complaints included the incompetence of the resident doctor, the sanitary facilities (which were too close to the bedrooms and the kitchen), the unsuitable sleeping arrangements, the lack of heating, the abundance of fleas and rats as well as the punishments of prisoners. He also bemoaned the destruction of letters and the censor who was ‘either too lazy to read our letters or had a shamefully low disposition’.

On the other hand, the purpose built camp at Bando, which opened in April 1917 to take the POW from the camps at Marugame, Matsuyama and Tokushima, has often been called a ‘model camp’ led by Major Matsuye, which contributed much to the later arising romanticised accounts of POW imprisonment. Bando is often noted in letters and inspection tour reports as ‘commendable’ with better food supply (thanks to the pig farming allowed there), better exercise and educational facilities. Bando is also famous for the frequent interaction of the German POW with the Japanese population, which included concerts by the POW orchestra, building works carried out by the prisoners as well as the German ‘exhibitions’, which were open to the public. Burdick and Moessner (1984:78-82) provide a detailed description of this German-Japanese co-operation at Bando and the exhibitions, which, according to Burdick and Moessner (1984:79) provoked mutual interest in each other’s culture and skills. These ‘close encounters’ between German POW and the local Japanese inhabitants led to lasting friendships, which are now remembered at the German House and Museum in Bando (built in 1972). As Burdick and Moessner (1984:86) put it ‘perhaps the creation of affection between the European warriors and the Oriental villagers was Bando’s

finest legacy'⁶. The POW at Bando also published their own camp magazine [Die Baracke] which provides an interesting account of POW life at Bando.

On the other hand, and in stark contrast to the good relations at Bando, letters from camps with less good reputations, expressed a bitter and often racially-influenced attitude towards their Japanese captors. The already mentioned POW letter written by Lieutenant von Bobers at Kurume dated October 1915 (R9208/236) declared that 'everyone who traded with the Japanese in the past will know what wily, scrupulous rogues they are'. He goes on to call the guards 'yellow cultural bastards [*Kulturbastarde*]' who were still halfway 'the barbarians of old. In the past, they killed or tortured their POW, today they have to harass them and make them feel that they are POW'. He concluded his letter by stating that the POW would 'forever feel the bitter gall whenever the word Japan or Japanese is mentioned. The so-called cultured nation [*Kulturvolk*] has made sure of that with their chivalrous treatment of us, although otherwise, and given time, we might have eventually forgiven them their treacherous attack on Tsingtau, which they only undertook after being put up for it by England'.

Another letter from Shizuoka (R9208/236) expresses feelings of racial superiority. When describing the camp, a former girls school, the letter writer states 'what the Whites were meant to see [the school accommodation] is good and clean, but those parts which the Whites will hardly ever or never see is just as primitive as when the ancestors of Japan climbed down from their trees'. He also described 'Japanese customs' in a mocking manner designed to highlight the bad state of affairs at the camp. For example, he stated that the value of the hot Japanese bath is generally accepted and acknowledged, but 'once 60 people bathed in the tub, the bath water looks like pigs had been cooked in it, but I guess that is one of those "Japanese customs", which were mentioned on our arrival, and we dutifully have to get used to'. Furthermore, he stated that 'apparently it is also one of those "Japanese customs" that the living and sleeping quarters are full of rats and fleas'. Later in the letter he referred to the Japanese several times as the 'yellow ones' or with the condescending term 'Japse' (equal to the English usage of 'the Japs' but slightly even more demeaning). The letter writer also used the term 'monkey' for the Japanese. He concluded by explaining that 'even if we don't encounter the country and its people in the normal sense, we still gained a deep insight into the dark sides of the Japanese character. It is unbelievable, how much arrogance, brutality, impudence and dog-like cowardice can be found among the ranks of the military, officers and ordinary ranks alike. Rare exceptions confirm the rule. Imagine that this motley gang considers itself the strongest nation on earth! They won victory over the largest military powers on earth, Russia ten years ago, and Germany in Tsingtau. Japanese newspapers report of this daily and every Japanese person is whole puffed up with this truth. [...] There would be no better lesson for them to take part in a real war [the main theatre of war in Europe] where we would meet them in equal numbers. [...] Then the Yellows would learn with great fear who really is the strongest nation on earth [...] The Japanese have managed, with their arrogance and harassment, to plant an undying hatred for Japan in very POW [...] The hour of revenge will come, did you consider that, you blown up [arrogant] monkeys??'

Krebs (1999:197) notes that, in relation to punishments, many POW seemed to be under the impression that the Japanese guards (in some camps) could not help but try to 'pay back the Whites' for the so far endured racism (see discussion of the 'Yellow Peril' above). A letter from Fukuoka camp (1916) stated that the treatment is 'typically Asiatic, mean, revengeful, harassing and full of a petty desire to treat the officers the same as the ordinary ranks' (R9208/236). Interestingly, a report from an officer imprisoned at Marugame (1916) also

⁶ One cannot help but be reminded of early twentieth century cultural imperialism

bemoans that the POW officers' 'behaviour towards our hosts often leaves much to be desired for, so that we never managed to establish a good relationship with them' (R9208/236).

The repatriation of the German former POW commenced, with some delay, at the end of 1919 and early in 1920, although 171 former POW preferred to stay in Japan to build there a new existence, while 149 returned to Qingdao (Krebs 1999:201-202). But Germany did not return to East Asia after the war except for trade. The Qingdao leasehold was formally taken over by Japan, who eventually returned it to China. The other German colonies in the Pacific became League of Nation mandates.

Overall, and especially if we consider a comparison with WW2 Japanese POW camps, the German POW during WW1 seemed to live in good or at least improving conditions (Krebs 1999:197). The Japanese government was eager to adhere to the international laws concerning POWs and to present itself as a 'civilised nation in the Western sense and thus gain respect as an equal nation' (Krebs 1999:202). Letters and reports from the camps indicate that the conditions overall were at least bearable apart from widespread complaints about provisions and the treatment in some camps. Some camps, such as Kurume, stand out as particularly ill-run examples, which contributed to the above described ill-feelings and animosity of the POW towards their captor nation. The camp of Bando, on the other hand, contributed much to friendly local Japanese-German relations and to the above discussed post-war 'myth of the cosy imprisonment'. Overall, however, as Spang and Wippich (2006:7) note, the 'favourable treatment' of the German POW meant that post-war there was little ill-feeling between the two nations and diplomatic relations resumed in March 1920, albeit remaining low-key at first. In the immediate post-war years, the defeated Germany had little to offer to Japan, while German foreign policies remained firmly focussed on Europe and a revision of the Treaty of Versailles. Interwar relations between Germany and Japan amounted to little more than cultural exchanges until the renewed cooperation between Third Reich Germany and Japan, when, again the relationship between Germany and Japan was undermined by the Nazi 'Aryan' racial ideas, which resulted in similar (if more radical) notions of racial and cultural superiority that we found in some of the 'Yellow Peril' agitations of the Kaiser⁷.

⁷ Although the Nazi Party forbade the use of the term 'Yellow Peril' in 1935 (Akira 2006:94)

A study of the Core Value of Cultural Property as a Development Strategy for Creative & Cultural Parks in Taiwan

Su Ying-Ming

Associate professor

Department of Architecture, National Taipei University of Technology

1. Introduction:

The Council for Cultural Affairs began implementing Phase II of the Cultural & Creative Industries Development Plan two years ago(2007-2011)¹, but results have fallen somewhat short of expectations. Although an immense amount of resources was invested in cultural & creative industries, an “independent” approach and operations were adopted for development, not only lacking effective integration with other resources, but also overlooking the potential of sustainability that can be created by resource integration. The resource that has the most direct influence is cultural property. The development of creative & cultural parks, which is an ongoing effort of the Council of Cultural Affairs, plays a key role in the development of cultural & creative industries.

The five locations selected for creative & cultural parks are all old wineries and warehouses of Taiwan Tobacco & Liquor Company, in which many of the buildings are historic monuments or historic buildings because of their unique value. The current approach to planning creative & cultural parks is to retain the original appearance of buildings, however, not much attention is paid to the core value of cultural property, and there is a weak connection between the reutilization direction and the original building. Creative & cultural parks lack interaction with peripheral communities and industries; they are isolated islands in urban areas and develop apart from their surroundings. This not only makes the preservation of cultural property an empty shell, but also loses the opportunity of developing creative & cultural park features based on the core value of cultural property. Therefore, there is significant meaning attached to how the core value of cultural property is defined and redeveloped in coordination with regional development, and how it is used as a development strategy for creative & cultural parks.

2. Core Value and Reutilization of Cultural Property

(1) Core Value of Cultural Property

Different countries have somewhat different definitions of cultural property. Varied words and expressions are used to define different types of cultural heritage, showing the nature of each

individual type of cultural heritage. The Operational Guidelines for the Implementation of the World Heritage Convention establishes art, history and science as important indicators in “cultural monuments” and “groups of buildings”; historical sites emphasize on aesthetic, historical, ethnological and anthropological points of view. Taiwan’s Cultural Heritage Preservation Act states that cultural property must possess historical, cultural, aesthetic and scientific values.

Dr. Gerrit Fenenga² lists seven cultural property values: symbolic, aesthetic, economic, scientific research, educational, public interest and public relations. After analysis, Randall Mason³ generalized cultural property values into two categories: economic values and social culture values. Economic values can be divided into use value and non-use value; use value refers to the economic benefits generated by the use of cultural property for living, scientific research, cultural education and recreation; non-use value refers to the abstract and intangible value of cultural property, including options, legacy and existence value. Social culture values include historical value, cultural/symbolic value, social value, spiritual/religious and aesthetic values.

A clear description of the proper attitude towards objects of different eras appeared as early as 1964 in the Venice Charter. The International Charter on Cultural Tourism in 1999 when describing heritage pointed out that “It is a dynamic reference point and positive instrument for growth and change. The particular heritage and collective memory of each locality or community is irreplaceable and an important foundation for development, both now and into the future.” Norberg-Schulz⁴ indicated that “preservation and change are not relative, because change without reservation is destruction, whereas preservation without change is stubbornness...if we are to preserve objects of the past, we must do it with new methods.” The above passages clearly describe the significant meaning of the core value of cultural property and principles of how they should be expressed. This also means that reutilization targets should correspond to the present age, and not be confined to the original architecture.

Taiwan’s creative & cultural parks belong to a special category of cultural property that is closely related to industries because they are situated in old wineries of Taiwan Tobacco & Liquor Company. Fu Chao-Ching⁵ pointed out that industrial heritage refers to business facilities that used machinery for production after the industrial revolution and products that they produced, which is unlike products of the traditional handicraft industry. Therefore, factories where machinery operated often comprise the main content of industrial heritage. Besides tangible cultural property (buildings, space, production machinery, equipment and products), industrial heritage also includes other intangible values (production technology, employees and social composition), such as the factory’s history and social and historical transitions that induced by its operation, as well as its relationship with urban spatial structure. Industrial heritage possess historic, social, scientific and economic values, as well as a symbolic collective memory of its time. Combining the above, industrial heritage values can be divided into scientific (structure, production technology, products and machinery), aesthetic (architecture, space, details and

appreciation of beauty), social culture (social context, urban development structure and history), economic (cultural recreation, cultural tourism, cultural consumption and cultural marketing) and public interest (collective memories, mutual assets, community identification and community development).

(2) The Meaning of Cultural Property Reutilization

In terms of sustainable development, cultural property not only plays a major role in environment construction in the 21st century, but also comprises the historical traces in cities because of their cultural connotation; they are evidence of human history and also irreplaceable landmarks. Reutilization is the aspiration to practice a kind of life value; it adjusts and satisfies new demands of the society on living via the innovative utilization of space, and could create a new industry for the locality. The construction of a new cultural space itself is the concrete form of a new cultural experience. This is spatial culture, the cultural form reflected by the interaction between man and nature, or even the profound meaning of overlapping cultures within a certain space.

Fu Chao-Ching⁶ describes the theory of reutilization from four aspects: (1) The extension of a building's life cycle – the continued use of its functions. (2) A preservation method that gives consideration to both structural safety and modern functionality. (3) A preservation method that gives consideration to both history and modernity. (4) Financial sustainability of buildings. Whether it is a historic monument, historic building or abandoned space of an old building, reutilization shares a common theoretical foundation, which is that structurally safe old buildings can extend its life cycle while giving consideration to both history and modernity, and that its conditions allow it to survive financially.

The International Charter on Cultural Tourism, the Encyclopedia of Architecture, Design, Engineering & Construction, the United Nations Educational, Scientific and Cultural Organization, and Fu Chao-Ching all explained and defined the reutilization of cultural property. Besides emphasizing on the interpretation of the cultural value of building preservation, they also stress the use of appropriate, stimulating and contemporary forms of education, media, technology and personal explanation of historical, environmental and cultural information. Reutilization makes the continuity of cultural property feasible, because modern cities need the continuity of history, and the public needs to understand that the preservation of history is a necessity to their spiritual lives and urban development. Reutilization is a more positive preservation strategy that is closer to daily life, besides preserving a part or the whole of history, it injects new life into obsolete or abandoned buildings, discovers the potential of old buildings, and allows the building to become a part of the surrounding environment and daily lives of residents, creating new meaning for buildings, and allowing local and industrial cultures to achieve sustainable development. The concept of regional operation brings cultural property to life, the core value and meaning of cultural property preservation and reutilization lies in the close

interaction between people, land and daily life. Finding a permanent preservation mechanism that allows new and old to survive together will allow industrial heritage to achieve sustainable existence.

The design strategy of deindustrialization is to adjust or change the form, function and meaning of space, especially closed spaces used for industrial production in the past, making space more public so that it becomes a part of daily life to residents. This creates a spatial symbol that all urban residents are able to recognize, creates new space aesthetics and field for daily life, improves the living environment and benefits the redevelopment of urban space, which produces different collective memories that cause residents to identify future developments.

(3) Connection between Urban Development and Cultural Property

In the highly competitive age of globalization, culture is considered the most advanced and competitive factor for bringing harmony to the society, economy and life. Unique cultures are the most important asset to urban development, and the core resource for gaining a competitive advantage. Culture not only represents various cultural products, but also a way of life, expression, thinking and learning. Culture has become the core strategy of urban development, and is developing closer and closer relationships with the economy, society, technologies and education. Urban culture planning should pay close attention to both the culture of space and space of cultures, ponder upon the relationship between culture and the economy, and be concerned about how space and localities can become part of a cultural experience.

The preservation and reutilization of cultural property plays an significant role in the competitiveness of globalized cities, as well as their sustainable development. Juan I-San⁷ of Shanghai's Tongji University once indicated that "cities are the land where culture converge, the protection of historical and cultural appearances can enhance peoples' sense of belonging and identification to the city, and further increase their cohesiveness." Fu Chao-Ching⁸ believes that strengthening regional consciousness and implementing regional economic development are major issues of urban and rural development in the 21st century, and that more importance should be attached to the core value of cultural property in regional development. Ma Tzu-Hsiu⁹ also believes that the new trend of urban development is to mold regional and living culture styles, turning them into issues that will enhance competitiveness; future directions also include developing core values of cultural property into regional features, and integrating resources of peripheral communities.

City governments have shifted from a protective strategy, which emphasizes on social culture development and historic culture preservation, to utilizing urban culture strategies to boost economic development and competitiveness. With unique and symbolic cultures, urban culture strategies possess the ability to facilitate urban regeneration, remold the local economy, cohere community consciousness, attract tourists from around the world, create a globalized city and elevate the city's regional status. The fact that countries strive to become cultural cities or cities of

design serves as evidence of this transition. Charles Landry¹⁰ and Florida¹¹ both mentioned that the importance of creative cities is to create unique local cultures, in which the core value of cultural property best shows the uniqueness of local cultures.

Cultural resources are the foundation for developing cultural industries, but not all cultural resources can be industrialized, public acceptance of the attributes of a cultural resource is a prerequisite to industrialization. Cultural industries can improve national living quality, and high living quality is the key to creating a good image. Therefore, the importance of creative & cultural industries lies not only in its economic meaning, but also cultural enrichment. Cultural activities are the main force of commercial development, they are the infrastructure of cities, and enhance cultural tourism. Cultural industries are introduced via different marketing methods and diverse cultural activities, and enhance the effects of local marketing. The construction of cultural industrial parks is an important force driving economic and urban development, and a major part of urban culture strategies.

(4) Integration of Cultural Property with Communities

The vitalization of cultural property must be combined with regional development and involve public participation. Helping residents understand that the core value of cultural property benefits community development is to create an opportunity for redeveloping the community's historical environment. To achieve this goal, the core value of cultural property to a region must be shown via an appropriate and accurate interpretation. The International Charter on Cultural Tourism indicated that "Interpretation programs should present that significance in a relevant and accessible manner to the host community and the visitor, with appropriate, stimulating and contemporary forms of education, media, technology and personal explanation of historical, environmental and cultural information." The preservation and reutilization of Taiwan's cultural property should shift from individual, passive and rigid thoughts to utilizing the charm of core values to drive community development and aid new purposes.

Following the rise of public participation and consciousness, the preservation of cultural property is now seeing the participation of communities, and has transformed from construction technology into a public issue that involves social actions; actions by communities are able to boost cultural property vitalization and enhance local identification. It is a future trend to combine cultural property reutilization with cultural tourism and interact with community residents. The International Charter on Cultural Tourism states that "Tourism projects, activities and developments should achieve positive outcomes and minimize adverse impacts on the heritage and lifestyles of the host community." Therefore, in order to effectively achieve community redevelopment via cultural tourism, the core value of cultural property to a region must be appropriately and accurately interpreted. We must affirm the importance of community participation and identification to history preservation, and emphasize that history preservation should effectively give back to communities.

3. Developments of Cultural Property Reutilization in Taiwan and Status Quo

Before 1994, the Council for Cultural Affairs focused on hardware constructions of cultural facilities; it began implementing the preservation of Huashan Winery in 1997; it began implementing abandoned space reutilization in 1998; in 2000, it began implementing community empowerment and making comprehensive plans for the development of local cultures and industries. The Art Village and New Hometown Community Development Project in 2002 reutilized abandoned spaces for art performances and exhibitions, and invited artists to move in. In 2003 the Council began implementing its cultural & creative industries policy, and used abandoned wineries for creative & cultural parks, inspiring cultural creativity and producing economic benefits. Although contents of projects and plans over the years have some differences, they are all efforts that serve a common purpose. According to the Council's abandoned space reutilization principles, under the premise that buildings are structurally safe, buildings that serve the purpose of "promoting culture and art" can be reutilized, however, the area used for commercial purposes must not exceed 30% of the total area.

Issues faced by cultural property preservation and reutilization in Taiwan are as follows:

- (1) Complicated property rights and unclear long-term operation strategy: Most cultural property are public-owned, but ownership, administrative rights and right to use are often separated, causing difficulties in formulating long-term management strategies, and wasting long hours in negotiations.
- (2) Land use change lacks flexibility and affects the timetable and efficiency of abandoned space reutilization: Due to restrictions from Taiwan's urban planning laws and land use regulations, a long and complicated series of procedures for change in land use must be completed before cultural property can be reutilized; eight years after locations for the five creative & cultural parks were announced, procedures for change in land use still haven't been completed for all five locations.
- (3) Emphasis on only the preservation of a building's appearance: When it comes to the reutilization of cultural property, many people are only concerned about the preservation of a building's appearance, believing that building renovation equals cultural preservation. As a result, cultural property are only able to attract a small group of people who are interested in the architectural design, and can not become a common interest of the general public, even locals don't develop the identification they should.
- (4) The myth and predicament that cultural property can only be used for art and culture: Reutilization is limited to the promotion of culture and art, and although large volumes of space were released, the number of artists, art appreciating population and art managers has not showed corresponding growth. All redeveloped space should have diverse functions, e.g.

commerce, education and accommodations, and not be limited to art exhibitions and performances.

- (5) Inability to achieve financial sustainability: Cultural property lack long-term financial support after transforming into locations for art performances and exhibitions because their operation patterns are unclear, and the law stipulates that they must be non-profit, public-owned and for public interest, meaning that they must rely on government subsidies. Limited area for commercial use, designated for the purpose of art performances and exhibitions, the birth of collective elite consciousness, and difference with reality are all reasons why cultural property cannot achieve financial sustainability.
- (6) The elitist art and space have disconnected from communities: Art performance and exhibition space are used by only a few groups that target small audiences; contemporary art types and high priced foods and beverages are intimidating to surrounding residents. This abrupt space and exhibition system that is cut off from local life creates even more abandoned spaces; the contents of exhibitions and performances often feature foreign, exquisite and mainstream art types, forming the elitist artistic values.
- (7) Massively reproduced spatial culture has produced similar cultural properties: Swarming to implement cultural property reutilization has gradually turned into the reproduction of spatial functions; the industrial production of spatial culture has produced a great number of elite cultural properties. This pattern of producing “mass culture” has become the way the modern society views cultural property. Such stereotyped cultural property lack local features and cannot gain the identification of local residents.
- (8) Cultural property reutilization only focuses on the redevelopment of single locations: Most cultural property lack dynamic integration with its surrounding environment. They are often disconnected from transitions of the surrounding environment, urban activities and urban development, some are even ridiculed as the home of mosquitos. How to fully utilize the charm of cultural property and connect with developments of its surroundings are major issues of cultural property preservation and reutilization, especially large scale cultural property, e.g. historic villages or industrial heritage (wineries, residential military communities, etc.).

Developments and trends of cultural property reutilization in Taiwan: preservation and reutilization should be expanded from single buildings to the overall environment. The dynamic combination with urban development should be emphasized to prevent cultural property from being destroyed by inappropriate urban planning. Expand the definition of cultural landscapes that are worth preserving, including industrial heritage and abandoned spaces. Recognize the economic value of cultural property, promote cultural tourism, combine community industries with historic spaces, and allow cultural property to become a powerful instrument for urban marketing. Further interact with communities to boost community identification, and combine

with cultural tourism to effectively give back to communities.

4. Developments and Direction of Creative & Cultural Parks in Taiwan

(1) The Importance of Developing Creative & Cultural Parks

The United Nations Educational, Scientific and Cultural Organization in its report on “Cultural Industries and Enterprises” pointed out that “clusters and creativity are foundation stones of creative cities and complement each other. So an excellent creativity location naturally possesses the spatial qualities that cause creative people to gather together; creative people and creativity operators are mainly active in creative villages, creating, developing, cultivating talents, marketing and promoting.” Present day social development emphasizes on experience economy and innovation in aesthetics, creative energy is the core element to developing creative & cultural industries with high competitiveness. A creative village built in a urban area must possess attractions that will cause creative people to stay there, including creative activities and a creative atmosphere, which will further develop into cultural features and economic advantages characteristic of the area. These will create a high quality living environment for urban residents and further attract foreign tourists. Creative & cultural parks are a link of creative villages.

In this “creative economy” era under economic globalization, new human capital and creative & cultural capital have replaced conventional land capital and natural resources. With consideration to economic benefits and value-added, European and American countries at the end of the 20th century listed the creative & cultural industry as an emerging industry, and used it as a strategy for enhancing their international competitiveness. Therefore, they attached great importance to the implementation of cultural policies and construction of cultural facilities, and devoted to the maintenance and renovation of historic buildings, holding cultural activities and molding their urban image. These became major directions for preserving local cultures, regenerating traditional spaces, and revitalizing the economy. They also used creative & cultural parks to effectively gather creative and cultural resources; the parks merged and interacted with the urban commercial space and drove urban development. The great number of creative & cultural park that sprung up everywhere around were mostly transformed from industrial heritage sites or old urban areas that possess historic cultures; the rich connotation of cultural property became a advantage for developing creative & cultural industries. Florida¹², the American economist who proposed the creative capital theory, also indicated diverse cultural property that possess cultural and historic features are able to attract creative people, forming a unique attraction for localities, gathering creative communities, driving the accumulation of creative capital, and boosting local economic development.

In response to transitions of the global economy and social trends, developments of Taiwan’s cultural & creative industries in the past only emphasized on the economy itself, formulating

strategies for industrial transformation and upgrades, but neglecting the relationship with other industries, such as cultural tourism and cultural marketing. With “culture, economy and space already in a close codependent relationship,” using creative & cultural parks to drive development of cultural & creative industries is a new strategy that the government has been hoping to try in recent years. The role of creative & cultural parks is similar to that of science parks in which the government has placed great expectations, hoping that they will become a new base for developing creativity, driving regeneration and development of urban spaces, and revitalizing industrial economics.

(2) Status Quo of Creative & Cultural Parks in Taiwan

Taiwan’s government in 2002 began implementing the “Challenge 2008: National Development Plan,” in which it specified five creative & cultural parks around the country, using abandoned buildings of wineries in five cities as bases for implementing cultural & creative industries, including Taipei Winery, Taichung Winery, Chiayi Winery, Hualien Winery and Tainan Warehouses. All five locations were selected for being state-owned land and easy to acquire, and did not go through evaluations of culture and creativity and industrial clusters. The parks are in the state of isolated islands because no consideration was given to geographic relationships, connection with peripheral communities and urban development. Although these parks have reutilized precious industrial heritage sites, they have not been able to use the value of these cultural properties to benefit the cultural & creative industries.

Due to land acquisition, change in land use, and building renovation and maintenance, progress of the five creative & cultural parks has been slow; Huashan creative & cultural park (Taipei Winery) has the fastest progress, its operation was outsourced in 2008, and a winning team for phase III BOT¹³ was selected last year; operation and management of Hualien creative & cultural park has also been outsourced, and the county government provides several million NTD each year; Taichung creative & cultural park was closed for over a year for renovations and was reopened in November last year; Chiayi and Tainan creative & cultural parks have not been formally opened. The parks do not attract large crowds and are used as regular parks in the holidays for recreation. A brief description of developments of Huashan creative & cultural park is as follows:

Huashan creative & cultural park was formerly the Taipei Winery of Taiwan Tobacco & Liquor Company, which was founded in 1915. In 1987, the winery was relocated due to Taipei’s urban planning and environmental protection policy, leaving the original winery abandoned. In 1997, art workers from different fields formed a “Huashan association for the promotion of culture and art,” and appealed to Taiwan Tobacco & Liquor Company for the right to use the abandoned winery. After negotiations, Taiwan Provincial Government Cultural Affairs Department in 1999 outsourced operation and management to the “Taiwan Culture Environment Reform Association” (formerly the Huashan association for the promotion of culture and art), and

renamed it “Huashan Art District.” The Council for Cultural Affairs hoped that Huashan would become a center for culture and creativity in Taiwan, and possess six functions: video, market, education, performance, entertainment and sales. Implementation of creative & cultural parks began in 2002, and the Council for Cultural Affairs formulated a guidance plan in May 2004 for future developments of Huashan, pointing out that “the park’s operations and management must not rely on government subsidies,” and that the park should serve as a medium for “culture & creativity and industrial economics” and “living arts and commercial consumption”; meaning that the park should be based on characteristics of cultural consumption, while possessing the function of incubating creativity. The park’s space adopts dual-axis development, expanding space for performing arts, visual art and digital art, and space for sales channels of cultural & creative industries.

Huashan creative & cultural park was developed in three stages in accordance with the “Act for Promotion of Private Participation in Infrastructure Projects,” including the “film museum OT¹⁴ case” (signed a contract with Taiwan Film & Culture Association in February 2007) for historic monuments, the “cultural & creative industries space ROT¹⁵ case” (contract signed in November 2007, the Strategic Alliance in Taiwan's Cultural Creative Industries acquired the right for reconstruction and operation for 15 years, and operation right would be extended for another 10 years if good operational performance was achieved) for historic buildings, and the “Taiwan Cultural & Creative Industries flagship Center BOT Case” (the Strategic Alliance in Taiwan's Cultural Creative Industries was selected in August 2009 and awarded with a 30 year contract for the center’s construction and operation; upon expiration of the initial contract, the alliance would be given priority for 10 year contract extensions, but limited to two extensions, after which the alliance would no longer have priority). At present, Huashan creative & cultural park is a recreational location favored by Taipei City residents for the holidays, temporary food stands are surrounded by people on the grass square as if it were a festival. However, if you go further into the exhibition halls, the crowd will suddenly diminish, and very few people pay a visit to the art park at the end; the park resembles a large amusement park. Products displayed in the creative art markets during the holidays are mainly industrial products, and are unable attract many people to stop and take a closer look. Exhibitions are discontinuous and the doors are often locked. The park is rarely visited during weekdays.

From the reutilization process of Huashan creative & cultural park after being abandoned for 20 years we can reach the following conclusions:

1. Teams had low investment willingness due to extremely limited time during early stages, and operations still relied on government subsidies. Now, the government’s ROT and BOT time limit gives consideration to the risk and return of investors, but there is still dispute over considerations of public interest, content positioning, decision transparency and calculation of time limit. If the government’s zero budget policy causes mass volume of building BOT project high rental and product prices, which is the result of investors

seeking financial balance, it will damage the government's original intentions of nurturing the cultural & creative industries as well as public interest.

2. The role definition of the Council for Cultural Affairs is unclear, is it the landlord (collects rent), or does it need to supervise the entire process of project implementation? Private operators are entirely responsible for park operation and management and the examination of firms that hope to enter and be stationed in the parks, easily resulting in high prices or commercialization of spaces to make up for losses, which is against public interest. The Council for Cultural Affairs should not be the only project supervisor, specialists and scholars (especially members of the Huashan association for the promotion of culture and art) should also be a part of the supervisory mechanism, strengthening a supervision and interaction model between the government, private organizations and scholars.
3. The Huashan operation team comprises 2 different firms; there is no way to learn their role definition and division of labor; the rights and obligations of the two firms and the Council for Cultural Affairs should be clarified. The effective integration of public and private efforts is the key and challenge to Huashan's sustainable operation, and to its role as a base for the cultural & creative industries. Government departments should be integrated, including tourism, marketing and education departments.
4. Among the rich cultural property values of Huashan creative & cultural park, there is relatively weak connection between scientific, social culture, economic and public interest values; its cultural property values have yet to be transformed into its core competitiveness. This is why the park does not have any distinguishing features, and visitors are mainly there for its recreational functions and to enjoy its open spaces, few understand the park's true cultural connotation. Commercialization, inclination to please the general public, and bureaucratic atmosphere have driven art spaces towards embracing the masses, but has suppressed the originality and autonomy of art.
5. Huashan creative & cultural park is mainly used to provide cultural services and promulgate policies, but has not been able to connect with peripheral industries and communities. The government's cultural policies emphasize on large activities, but cannot shape urban aesthetics, cultural consumption and industrial core. Lack of social connection, e.g. interaction with communities, participation of residents, and connection between other educational institutions with cultural consumption and product market, has turned the park into a product of specific operations.
6. Surroundings of Huashan creative & cultural park include the Guanhua electronic commercial district, which is a famous location in Taipei for selling electronics, and many colleges and research institutes, but we still have not seen Huashan integrate peripheral industries and research institutes, as well as provide creative & cultural

industries with a location for research, development and incubation. To focus on cultural consumption while overlooking the incubation of creativity is to concentrate on details but forget the main purpose; this will turn the park into a large commercial area while providing no help to the development of the cultural & creative industries.

7. Creative & cultural parks provide services to urban development, but if its operation cannot become a part of urban life, residents will not identify the parks, and the parks will become isolated islands or areas near abandonment.

5. The Core Value of Cultural Property as a Development Strategy for Creative & Cultural Park in Taiwan

In terms of policy, the regeneration and development plan for creative & cultural parks starts with the reutilization of old buildings owned by government agencies, redeveloping the urban environment and enhancing industrial development opportunities, while emphasizing on the mixed usage of “cultural industries parks” and the concept of urban clusters; the goal is to bring local economy revitalization effects, redevelop damaged environments, and quality improvement.

Therefore, besides the preservation and maintenance of physical space, we need to utilize instruments and methods of intangible aspects, such as technology and economy, to more accurately integrate goals of sustainable development. Future development strategies are proposed according to four aspects: social culture, economy, environment and public interest.

(1) Social Culture:

1. Emphasize on the consensus of a locality’s collective memory so that it fits in with the cultural space concept of community eco-museums. Combine spatial development with cultural concepts, introduce cultural property values with new functions, and blend them into daily life via education, aesthetics and marketing. Taiwan’s creative & cultural park redevelopment should not be limited to hardware preservation and performance and exhibition purposes; spatial reconstruction should give consideration to the possibility of introducing new functions, such as education, residences and work, and allow more people to use and experience cultural property, extending their memories of living together.
2. Emphasis on cultural development and encouraging creativity, distinctiveness, rareness and uniqueness of cultural industries can create a symbolic economy and local identification of spaces, as well as unique and unwavering symbolic value. Mere duplication will cause creative & cultural parks to lose their uniqueness. In order to gain regional economic and local identification benefits, the core value of cultural property should be reexamined, and local cultures should be combined with peripheral industries

to create new creative industries.

3. Continue to develop cultural traditions, and establish connections between art, local history and cultural heritage. Furthermore, value the connection between local cultures and global cultures, and sculpt regional cultural landscapes.

(2) Economy:

1. Emphasize on economic development, utilize core values of cultural property to enhance the connection between cultural industries and other industries, create employment opportunities, and integrate cultural recreation, cultural tourism and cultural marketing to maximize economic benefits. Taiwan's cultural policies should not overlook economic benefits, or it will be like caviar to the general and limit developments instead. Mass cultures should be industrialized to an appropriate extent and integrated with education, tourism, industrial, recreation, and marketing policies.
2. Take advantage of the charm and values of cultural property, e.g. educational values, cultural identification, social culture values, and aesthetic values, and propose operation, management and marketing strategies. The government should reutilize intangible values of cultural property, and not just redevelop the environment from a commercial point of view or to make a profit; the government should not stoop to duplicating or collage culture.
3. The government should help build an industrial cluster development model to stimulate the redevelopment of local industries and cultural activities. Outsourced operation of creative & cultural parks emphasizes on sales and overlooks industrial cultivation and clustering. Only the government's cultural & creative industries policy can gain industrial cluster benefits. Therefore, in terms of development strategy, creative & cultural parks can not entirely depend on outsourcing.
4. The Guanhua electronics Commercial District, which is close to Huashan creative & cultural park, has a strong foundation in the 3C consumer electronics industry and multimedia industry. Development of Huashan creative & cultural park should be integrated with the industrial chain of Guanhua Commercial District, utilizing advantages of the creative & cultural park to boost industrial upgrade in Guanhua Commercial District.

(3) Environment:

1. Treasure the uniqueness of cultural property values, and help surrounding communities maintain a sense of identification and belonging. Emphasize on regional image and identity, and construct local features and spatial styles. Preservation and reutilization of park areas must be coordinated with urban development, and connote the nature of urban

cultures, historical context, and the lives of urban residents.

2. Integrate regional development resources to support the operation of the cultural & creative industries network. Peripheral developments and connection should also be considered when establishing creative & cultural parks; Location selection and planning should be carried out from the perspective of integrated regional development.
3. Subject orientation of creative & cultural parks should first engage in analysis, coordination with peripheral industries, and finding local potential features, completing development plans before the parks are established. Creative & cultural parks are not just exhibition and performance space, but places that combine cultural consumption with cultural production, in which culture is the origin and consumption is the substance.

(4) Public Interest:

1. A mechanism that effectively integrates public and private efforts is the key and a challenge to creative & cultural parks for achieving sustainable operation, as well as fulfilling its role as a base for cultural & creative industries. At present, operations of creative & cultural parks in Taiwan are completely outsourced; cultural policies are not carried through and lack continuity. It is recommended that the public sector collaborate with a third party in the implementation of cultural exhibition and industrial incubation policies, providing space and equipment to nurture creative & cultural industries, while the private sector engages in commercial operations and marketing. This way both public interest and economic benefits are given consideration to.
2. Creative & cultural park developments should maintain the openness of spaces. Cultural properties are the people's common asset, and should be locations where all residents can take part in and share common memories. Entrance fees of creative & cultural parks should give consideration to openness, different time periods and accessibility by different classes to prevent privatization caused by high expenses.
3. Respect the public, expand public participation, and approve of diversified developments in coordination with daily life. Exhibition themes in creative & cultural parks should be original and for the general public, attract participation and identification of community residents via diverse methods, and avoid targeting small masses.

6. Conclusion

The sustainable preservation of cultural property must strengthen the reutilization of core values, creative & cultural parks should fully utilize the core value of cultural property, discover the diversity and artistic value of local art and cultures, form a creative atmosphere, induce creativity and industrial cluster demands of creative & cultural industries, promote integration of

the local economy with local cultures, and implement creative economic development. These measures will allow creative & cultural parks to possess unique styles and industrial competitiveness that can be further utilized for developing cultural tourism. Reutilizing industrial heritage as creative & cultural parks in creative cities will not only recreate the spatial modernity that results from technologies and cultures contained in industrial heritage, but also extend the context of urban development to mold a new cultural landscape.

WESTERN INFLUENCES ON PLANNING PROBLEMS IN TURKEY

Guler KOCA, PhD

After the declaration of the republic, as Turkey has become one of the European Countries as a nation-state, the modernization Project simultaneously started to experience change in its qualifications. Following the end of the World War II, Turkey went into a transition period through which it aimed to take a respected place among other countries and to adapt itself to the newly established institutions of the world, both economically and politically. In this period, the modernization Project of Turkey has become sensitive to up to date tendencies, abandoning radical approaches. Again, with the changes related to domestic market, Turkey started a new orientation to the world markets and more attention was paid to modernization in agriculture. Taking the understanding of liberalization to the fore, private sector started to gain more significance, and the construction of public high ways was given more importance rather than the construction of railways. As the technological developments in agriculture increased and again as transportation facilities became more available thanks to the newly constructed roads, the opportunities for people to find a job got harder and harder in the cities, and as a consequence of the rapid increase in the population of the cities, they started to be densely populated. As a consequence of the rapid urbanization, it was not possible for the city administrators to come up with solutions so that they can catch up with these rapid changes using the already available facilities in their hands. As cities were not ready for this unexpectedly appearing transition, and as they did not have enough infrastructures, the people immigrating from countryside to big cities attempted to meet their accommodation needs primitively by themselves. As a consequence of that, the suburbs of the big cities were sieged by squatters which lacked of some of the most basic transportation services. All of the cities which lacked of basic infrastructure services, even metropolitan cities adapted a dual structure understanding as the naturally developing parts of these cities and those developing with an urbanization planning fell into a sharp separation.

Turkey faced many significant changes after the World War II as in every part of the world. Whereas the most significant change happened in the cities struggling with the problems appearing as a consequence of rapid urbanization, governments of countries tried to come up with various policies to meet the rapidly increasing needs for houses and urban planning. With the first development plan law passed in the parliament in 1956, it was aimed to adapt the country to the newly appeared urbanization understanding in the world. It is also possible to see the western influences on the other regulations related to urbanizations passed in that period. In that period, houses used to only be available for individuals. That used to be put into practice only if somebody who wanted to own a house apply a project prepared by a relevant technical expert on a land which had urbanization plan. As this process required a long time and also as it is very costly, it was not possible to meet the rapidly increasing housing needs. The people with limited and irregular income who immigrated to cities attempted to solve their housing needs constructing illegal squatters on the lands most of which were public land. Because of the reasons, such as the need of the industry for work force, and not able to meet the need for housing in legal platform, it became harder to struggle

with squatters, the number of which had been increasing dramatically. Consequently, the owners of these squatters used their right to vote as a means of gaining power to negotiate with the governments to preserve their illegally constructed buildings. As the increasing need for building land could not be met as a consequence of rapid urbanization led an increase in the prices of the building lands in all cities, which then made the possibility for the people with average income hard to own their houses at a single parcel. This then led people to construct western like multi-storeyed buildings with which they could have one flat after the legal regulations passed in the parliament. As a consequence of both the increase in the demand for multi-storeyed buildings and the legal regulations related to the construction of multi-storeyed buildings, the construction of buildings gained speed both with the help of builders and the housing cooperatives. Following the year 1950 when the construction of buildings gained speed, the experts brought from western countries performed field related studies and new institutions related to urbanization planning were established.

Traditional settlement

The new constitution coming into effect in 1961 included some regulations related to helping the people with low income to own their houses. The understanding which suggests that economical and social planning country-wide should be institutionalized and urbanization planning cannot be considered as separate from this planning. As Turkey went into a rationalist planning practice, this strict planning understanding which required long research was found not to be relevant to the rapid urbanization practice of that time. The fact that the urbanization planning replicated from western countries was not relevant to the realities of the country, and that a new urbanization planning which was quick and flexible in decision making made it compulsory for new understandings in urbanization.

Whereas the speed of urbanization decreased a little bit in that period as a consequence of the workforce transfer to western European countries from Turkey, it still kept going down. With the spread of the car manufacture in 1970s in Turkey, personal car ownership became common and the people with high income started to lead their lives in suburbs in western like isolated houses with large yards for personal use. At the same time, the production of automobiles led density in city traffic; consequently traffic related problems arose to be solved by city administrators. The ban for traffic on some regions where trade was very common and the conversion of these places into those just for pedestrians happened in that period.

Gecekondu

The cities in Turkey kept growing as an oil stain does till mid 1970s. The city centers lost most of their historically, culturally and naturally valuable assets during the period when old buildings were replaced with new and modern ones, and they experienced a continuous increase in population, which then led to insufficiency in social infrastructure of the cities. The growth and density of cities and the decrease in the quality of life in cities experienced a parallel development. As a solution to the housing problem resulted from rapid urbanization, none of the building areas succeeded in offering opportunities to city dwellers to increase their life standards. Neither the multi-storeyed buildings constructed by builders, the uniform buildings constructed by cooperatives nor the squatters around the cities could meet the expectations. The rapid continuous growth of the cities led to the decrease in the life quality of the dwellers.

Mass housing

Beginning from 1980s, Turkey underwent a new transformation period together with the world and the urbanization in that period reached a certain level. Three different effects are monitored in the transformation related to human settlement. One of these is the changes in their functions. Transition to a city based on industry from a city based on agriculture can be given here as an example. The second one is the changes in the presentation of the buildings and in the transportation organizations within the cities. The third one is the enlargement of the cities in size. The production functions of the city centers were replaced with banking and finance services. When the changes related to the distribution of the central business and

industrial fields were combined with those related to the enlargement of the cities in sizes and to transportation organizations within the cities, they also led many other changes around the buildings. With the rapid spread of personal car ownership, many new suburban settlements appeared for the people with average and high income as transportation had become easier for these people thanks to private cars. In the rest of the building areas, new buildings with lower standards were constructed and also new construction projects with high standards for the people with higher income were constructed on the building lands close to where rich people lived. The transformation that Turkey experienced with the Word in 1980s was not comprehended very quickly, it happened step by step in time.

It is possible to see causes of the physical deterioration in cities resulted from the rapid growth of the cities in the rapid change period in the technical, legal, social and administrative insufficiencies. As the causes of this above mentioned deterioration in cities, inappropriate urban planning policies, the abuse of the authority by regional and central administration organs, the fact that the self-interest of some groups in cities was kept fore rather than that of the state and economical insufficiencies can be given.

When we count the fact that cities grew out of control because of the dense migration and the city culture was kept under pressure by countryside culture as a consequence of that, we can easily observe that cities have experienced significant changes, physically, culturally, socially and economically.

Settlement of high income groups surrounded with walls

The rapid increase in the population in the country, the urbanization problems resulted from the dense migration from country side to cities have increased the gap among the regions more, and the problems experienced in urban planning have also snowballed. As the opportunities to find a job have increased in industrialized cities, they had to accept much immigration and they have become densely populated ones. It was not possible to overcome the problems related to the rapid increase in the demand for housing using the available facilities. As the available building land was not enough for constructing new settlements, and also as the replacements of two storeyed buildings in city center were rantabl, it encouraged both land owners and builders to construct and earn more. Whereas the city centers with insufficient infrastructure and dense population could not meet the needs related to transportation and other infrastructural services, cities went on growing out of control. In one side, the rapidly rising buildings in city centers for more rantabl purposes, in other side, the illegal squatters constructed by the immigrants with limited income around cities to meet their

housing needs have made it harder for city administrators to cope with these problems. This brought many issues to the agenda, such as establishing housing cooperatives led by local administrators following the making of new laws, state-led house construction. After a while, these mass of uniform buildings, most of which were constructed for those with limited income by housing cooperatives and with the loans taken from state banks had low standards with regards to construction quality, and thus they caused cities to lose their traditional texture.

As a consequence of the attempts to adapt to western like life styles and produce social housing lands, uniform social areas which are known that they are of low quality in life standards and construction have risen in many parts of the cities. It can be suggested here that the single storey and unplanned squatters built in large yards are luckier than those areas. Another type of housing construction built specifically for those with higher income is the detached houses built in the areas far from the city center and they have all kind of socialites required for higher life standards. Their infrastructural problems are solved within themselves. Most of those settlements provide social and cultural centers, shopping centers, sometimes preschools and primary schools. They are fewer storeyed and detached ones. These areas which are designed for a life within the site without having the residents leave the site for most of the needs tend to cause some social break-ups among people as it seems to be detached from the rest of the city.

Mass housing

The spread of the multi-storeyed modern buildings which are called as “residence” in western countries in the country has become common just recently. The spread of such housing types seem to hinder the traditional and social relationships among people in neighborhoods, but replaced that of western type. It did not take long for the urbanization understanding which neglects the traditional and cultural values gained after long years to show its negative effects.

Findings and suggestions for solutions:

- Whereas buildings consist of the indispensable part of traditional city life, they reflect an identity with uniformity and unique planning. The modern building of our age has uniform city texture and they do not reflect a unity.
- Whereas the deterioration which was caused by the rapid urbanization as well as modernization, accordingly, they have problems related to the changes in identity

- Whereas the decision makers aim to speed up to attracts the capital owners with their regional planning, they seem not to have paid enough attention to some most basic principles, such as plan discipline, consistency, determination and sustainability
- The inappropriate urbanization policies of the local and national policy owners, the abuse of the authorization, taking the self-interest of some capital owners to the fore rather than that of the state are some of the basic causes of deterioration in cities.

The western like housing style does not carry the characteristics that we see in traditional type of housing, physically and socially, and it also spoils the already existing texture.

Some positive features of traditional housing type, like the consciousness of being a city dweller, social relationships should be examined and they should be reflected on the new housing areas.

Rather than replicating the urbanization plans from western countries, a new understanding of urbanization should be adapted and it should take local and cultural assets to the fore. In addition to that, the local administrations should be manipulated to take the state interests to the fore rather than that of some other sides.

Industrial areas should be distributed equally within the region, thus immigration from countryside to the cities should be minimized.

The modernity Project which first appeared in Europe has caused many transformational acts in the world, has also led some transformations in the structure of the people in the Republic of Turkey as well as spatial organizations. The problems faced in last 50 years are consequences of this fact. However, it is appropriate here to suggest that Turkey has the potential to overcome these problems.

Empowerment among farmers in Nepal: are we all talking about the same thing?

and Rural Livelihoods, contact at: Annemarie.westendorp@wur.nl

4/14/2010

Empowerment among farmers in Nepal: are we all talking about the same thing?

Empowerment is an often debated concept in the academic world. However in development practice it seems to be used without discussion, assuming that it is always a 'good' thing and having a positive impact on farmers. However, empowerment is a very personal concept, therefore I asked farmers in Nepal what they understood by empowerment. Initially I expected that farmers would be unfamiliar with the word, since it is a word mostly used by well educated Nepali. Also it sounds quite 'formal' in Sanskrit: sanrakshan, too sophisticated in my view for farmers. But how wrong my assumption, how prejudiced I proved to be.... 95% of the farmers interviewed were familiar with the word and had clear ideas about its meaning. Interestingly the view of agriculture extension workers on empowerment is not in line with the view of male and female farmers. Additionally there is a clear distinction between men and women concerning their view on empowerment in Nepal. This gender difference reflects the roles of men and women and the opportunities they face in the household and society. It also implies the difficulties men and women face in achieving real changes in their lives. All these differentiations have implications to be considered in development interventions that aim to achieve empowerment of farmers in Nepal.

Empowerment among farmers in Nepal: are we all talking about the same thing? **A.M.B. Westendorp**

The Farmer Field School (hereafter FFS) is an agricultural extension approach in Nepal in which farmers learn about agriculture, and gain skills to improve their farming. The programme started in 1998 and is still on-going. On a weekly basis a group of 25-30 farmers meet to discuss problems in their crop, and determine which agronomic practices to take to solve these problems. Discovery-learning in a participatory way is a key element of the FFS. The entire process is facilitated by agricultural technicians from the government or local NGOs. One of the objectives of this programme is farmer's empowerment. *Farmer field schools are being considered vehicles for empowerment of farmers* (a.o. Ooi, 1998; Pontius et al, 2002; Bartlett 2004; Hounkonnou et al., 2006). Empowerment is an often debated concept in the academic world. However in development practice it seems to be used without discussion, assuming that it is always a 'good' thing and having a positive impact on farmers.

In this paper I like to explore how FFS developers have defined empowerment, what farmers themselves and FFS facilitators actually understand by empowerment. First I will look at different definitions of the word empowerment, and then I will look at the different views of farmers and agricultural technicians. Because farmers are not a homogenous group and because women and men have different roles in agriculture in Nepal, I will look at the views on empowerment from a gender perspective.

Empowerment is a word one does not come across in a Basic English course at High School. It is a word that I only became familiar with when I started working in international development. It is a term that I feel a bit awkward about when I explain my PhD study to friends and relatives who are working in different sectors. Searching the internet, www.empowerment.com is not very helpful: this site shows a picture of someone serving a meat dish. The word empowerment seems pretentious, and has a connotation of 'knowing what is best for others'. Still empowerment is an interesting concept that is worth debating, and a concept that has for most a positive thought behind it: to gain strength, to get power, to become independent, and so on.

Bartlett (2004) compares empowerment with the taste of mango or the feeling of snow, suggesting that: Empowerment is something almost everybody will recognize, but almost nobody can describe. There is no universal agreement, the experience is contextual. The experience of empowerment is unique for each individual; it entails a very personal interpretation.

There is a growing literature on empowerment but no single definition has been widely accepted. This complexity and different interpretations has led to various conceptualisations of empowerment.

Empowerment is a concept, which was introduced in the development scene in the 1980s and became popular in the 1990s. It is possible to observe trends in the conceptualisation of empowerment together with wider approaches to development. The early explanations are associated with the basic needs approach to development and a shift from a top-down technocratic approach to a call for popular involvement.

The World Bank links empowerment to poverty reduction and better service delivery: Empowerment is the expansion of assets and capabilities of poor people to participate in, negotiate with, influence, control, and hold accountable institutions that affect their lives (World Bank 2002a). *Empowerment of the poor* became a popular slogan, replacing the earlier top-down and material well-being approach. Now the word is found documented in over 1800 WB aided projects (Alsop and Heinsohn, 2005).

In brief the concept of empowerment emphasises three issues: 1) increased access and control over resources 2) individual's agency and own potential to achieve change and 3) in a transformation of power relations. Some examples are given below:

IFAD relates empowerment to an increase in access and control over resources: Access to productive resources and the capacity to participate in decisions that affect the least privileged (IFAD, 1995).

Others consider control over resources combined with capabilities, individual agency as an important aspect of empowerment, such as Sen and Chambers:

“Empowerment is the process of gaining power, both control over external resources, and growth in inner self-confidence and capability” (Sen 1997).
“Empowerment means that people, especially poorer people, are enabled to take more control over their lives, and secure a better livelihood with ownership and control of productive assets as one key element” (Chambers 1993).

The individual strength or ability is stressed by several, sometimes linked to the right based approach, for instance DFID, Kabeer and others:

“Empowerment means individuals acquiring the power to think and act freely, exercise choice, and to fulfil their potential as full and equal members of society” (DFID 2000).
Empowerment should lead to the liberation of both men and women where each can become whole beings irrespective of gender and collectively use their potential to construct a more humane society for all (Akhtar 1992).
“Empowerment ... refers to the expansion in people's ability to make strategic life choices in a context where this ability was previously denied to them”. (Kabeer 2001).
True empowerment is not a condition which can be bestowed by one group on another but is, rather, an ongoing process by which the disempowered seek to fulfil their own needs and preserve their own rights (Swift and Levin 1987).

Some academics and development practitioners believe that empowerment is about gaining control or changing structures in the context individuals live. For instance:

“The development of the ability and capacity to cope constructively with the forces that undermine and hinder coping; the achievement of some reasonable control over one's destiny (Pinderhughes, 1983).

Empowerment is about the creation of political, legal, socio-cultural and economic environment that would facilitate, encourage and enable the powerless (i.e., the poor) to influence policies, decisions, actions on their behalf (Sharma, 2003).

“Empowerment expresses the idea that disadvantaged and poor people increase their ‘freedom of choice and bargaining power in relation to ... more powerful groups’” (Adnan et al, 1992, in Neefjes 2000, p.100).

Batliwala and others emphasise that real empowerment can only take place when there is a change in the structure, a transformation in unequal power relations:

Empowerment is the process of challenging existing power relations and of gaining greater control over the sources of power (Batliwala 1994).

Empowerment is the process of awareness and capacity-building leading to greater decision-making power and control, and to transformative action (Karl, 1995).

Empowerment is about freedom to choose and achieve different outcomes (Sen 1999).

“Empowerment is the process of awareness and capacity-building, which increases the participation and decision-making power of citizens and may potentially lead to transformative action which will change opportunity structures to an inclusive and equalising direction” (Andersen and Siim, 2004)

All these different definitions reflect different positions and objectives of individuals and organisations and they might change over time, following new insights. This is illustrated by UNDP's changed definition of empowerment. In 1998 the organisation defined empowerment as: “full participation of people in the decisions and processes that shape their lives”. It is viewed in the context of policies and programmes designed to strengthen people's capacity to respond to their needs and priorities and civil society organisations are seen as mediators for people's empowerment and focus on strengthening these mediating structures (UNDP 1998PAGE). Then in 2004 UNDP defines empowerment “as the process of transforming existing power relations and of gaining greater control over the sources of power.” This interpretation is also very similar with UNDP's approach to human development which is defined as ‘creating an environment where people can develop their full potential and lead productive, creative lives in accord with their needs and interest ... to be able to participate in the life of the community’ (UNDP 2004). In 1998 UNDP focuses on empowerment as a process facilitated by ‘outsiders’ related to capacity-building, enhancing participation in decision-making. In 2004 the organisation considers changes in power relations, thus transformation, and people's own role as a key to

empowerment.

From above, it is clear that there are a lot of definitions and that there is no agreement on the concept. Batliwala regards this vagueness of the word empowerment as an advantage “*so it gives us breathing space to work it out in action terms before we have to pin ourselves down to what it means*” (1993:48). But Rowland (1997, 2007, 1995:105) correctly suggests: “*The concept of ‘empowerment’, if it is used precisely and deliberately, can help to focus thought, planning, and action in development. However, when its use is careless, deliberately vague, or sloganising, it risks becoming degraded and valueless...*”

Given the difference of opinion it is important to clarify from the start how I will use the concept in this writing. Because I relate ‘empowerment’ to the farmer field school, I use here the definition of the persons who designed the FFS programme. John Pontius et al, (2002) wrote in an overview of the history and status of FFS activities in Asia, that “empowerment reflects the developmental process whereby farmers become able to identify factors that inhibit their control over their lives and the means to resolve those issues”. Experiential learning introduced in the FFS facilitates this process. FFS practitioners (a.o. Ooi, 1998; Pontius et al., 2002; Bartlett, 2004) assume that this process of discovery or experiential learning continues after FFS and that farmers practice this in other crops than the one practice in the FFS, and even take it further in their daily existence, and solve problems in their community or social life.

This made me curious: is empowerment in FFS project documents or the way project policy-makers define it actually in line with farmer’s views (and implicitly reflect their needs)? How do the junior technicians (JTs) or FFS trainers see empowerment? In the same way as farmers they work with? How do farmers themselves actually define empowerment? *And: is there is difference between men and women?*

As De Jager in his PhD thesis states: ‘ a comprehensive impact assessment still needs to be done on broader development impacts of FFS such as on empowerment (2007:147), however, he did not elaborate on empowerment, so I will. Because empowerment reflects very much a personal experience or feeling I asked farmers themselves to define empowerment. I talked with men and women who did not participate in FFS and men and women, who did participate, to see if participation in FFS had an impact on their view on empowerment. Then I compared this with the way it is defined by the farmer field school trainers, junior technicians or agricultural extension workers who facilitate FFS.

Why are gender issues important in looking at empowerment and farmer field schools?

In most farmer field school project documents farmers are depicted as a homogenous group. However, in practice men and women in Nepal have separate tasks and responsibilities in farming. Women and men have unequal access to resources and are affected by policies and measures in different ways (Joshi, 2000). These differences are well described in an early study by Bennett and Acharya (1981), and still confirmed by later authors such as Indra Majupuria (2007). Individuals face differences in access and control of resources such as land and capital, whereby men

traditionally dominate women. Joshi (2000: 250) found: “Nepal’s patriarchal culture restricts women so much that they have few decision-making roles inside or outside the household”. The low status of women, systems of patrilineal descent, patri-local residence and rules of inheritance interact to isolate and subordinate women throughout the country.

Gender issues are thus interwoven systematically into the basic social structure of Nepalese society, as are other traditional values. (UNDP HDR 2004 p31, 32). Not only gender but also caste and ethnicity are part of a complex, interlinked, deeply hierarchical social structure that forms the basis for social exclusion and poverty in Nepal (Bennett and Gajurel et al., 2006). Among the interviewees, only 5 were from dalit¹ caste. Dalits hardly participate in the FFS, due to several reasons (not being invited to the FFS training, no farm land, no education, no time, situated far from training site). However, considering all these issues was beyond the scope of this research. Because gender is at the basis of all forms of discrimination and a fundamental ordering principle I have considered gender in this study.

Methodology

In the summer of 2008 and 2009 I² have conducted semi-structured interviews (SSI) with 79 farmers (42 women, 37 men) who have not taken part in FFS (later referred to as non-FFS farmers). These farmers came from places where they did not have a farmer field school.

I used the same SSI key words in interviews with 74 (54 women, 20 men) farmers who had completed FFS training (later referred to as: FFS farmers). I compare these two groups to get an insight of the difference FFS participation makes in farmers’ view on empowerment. Additionally I conducted 5 focus group discussions with respectively (twice) district agricultural office staff, (three times) with junior technicians. I had two focus group discussions with NGO FFS trainers. They are all men, because the DADO³ and local NGO office is dominated by men and there was no female staff present. They all have been involved in FFS. Furthermore I have consulted FFS project documents.

Findings

Initially I expected that farmers would be unfamiliar with the word ‘empowerment’, since it is a word mostly used by well educated Nepali. Also it sounds quite ‘formal’ in Sanskrit: *sanrakshan*, too sophisticated in my view for farmers. But how wrong my assumption, how prejudiced I proved to be.... 95% of the farmers interviewed were familiar with the word and had clear ideas about its meaning.

1) Women with/without farmer field school: their definition of empowerment

In the table below (1) the data collected from women who had taken part in FFS and women who had never attended FFS are presented.

¹ Dalit means lower caste or untouchable in Nepalese society.

² With thanks to Master students: Ramesh Humagain, Nalini Lamichhane, Rabindra Sapkota

³ District Agriculture Development Office

Table 1 empowerment according women farmers with/without FFS

Empowerment is...	Non-FFS Women n=42	%	Empowerment is...	FFS women n=54	%
Awareness	17	46%	Awareness through education	4	7%
Self reliant, strong	7	19%	Self-confidence, ability	13	23%
Women development	5	14%	Speak	4	7%
All in household in good condition	4	11%	Take part in decision-making	2	4%
Express own feeling	3	8%	To involve in groups and development work	22	39%
Free, can move from home	1	3%	Give women strength, ability and freedom	2	4%
			enable those who are unable	2	4%
			Unite all	3	3%
			Do not know	5	9%
Total	42	100%		57	100%

For women who never took part in FFS, empowerment means mostly awareness or being self-reliant. With awareness they mean: becoming aware of gender inequalities. Some added: empowerment means women development and self-reliance. Ten out of 42 women specifically emphasised ‘women’: “women awareness, women development, give women freedom”. Generally speaking, women without FFS experience see empowerment as increasing individual strength, personal growing. Women who took part in FFS mainly consider self-confidence and involvement in work and group activities as empowerment.

“My husband encouraged me to participate in FFS, now I have no hesitation to attending training, tours and community meeting” (Neelam Shrestha 38 yr)

2) Men with/without farmer field school: their definition of empowerment

In interviews with men (37 without FFS, 22 with FFS experience) the answers were different than women’s responses. See in the table below a summary.

Table 2 ideas of men without and with FFS regarding empowerment

Empowerment is...	Non-FFS	%	Empowerment is...	FFS men n=20	%
-------------------	---------	---	-------------------	--------------	---

	Men n=37				
Group action for society, active in social work	20	54%	Group action for society, active in social work	8	40%
Self-development, Self-confidence and decision-making power	9	24%	Self development	3	15%
To use power and knowledge for positive change	4	11%	Realise people's needs; enable those who are unable	4	20%
Awareness of development	2	5%	Full awareness thru education	2	10%
Do not know	2	5%	Put balance between men and women	1	5%
			Unite all	1	5%
			Speak	1	5%
Total	42	100%		20	100%

Men who did not take part in FFS consider empowerment mainly as being active in social work or as one said: 'group action in society', or even stronger: 'to move the group with unity'. From the answers of men in rural areas it is clear that their idea of empowerment is much more focused on improvement for the society, on action outside the household. There is not much difference between men with or without FFS experience. The view of women on empowerment seems to shift after FFS participation in the direction of the view of men on empowerment. Their focus on group work and social activities for development has increased.

More than men, women look at personal development when they talk about empowerment: involve in decision-making, become self-sufficient and able, become self-confident, and take initiative.

3) How have non FFS men and women experienced empowerment in FFS?

When we asked, how women and men had experienced or achieved empowerment, their answers were almost unanimously: due to education. See table 3 below.

Table 3: how do non-FFS men and women achieve empowerment?

	Women	Men
Education	22	30
Training	3	
Experience	3	

Involvement in group	5	
Doing social work		5
Participate in VDC		2
Support of organisations such as NGOs		2

Both men and women acknowledge that education is important for empowerment. For the interviewees with education they mean: school attendance and being educated is more than just literate. Men have mentioned: doing social work has led to empowerment or participation in village development committee, or through support from organisations such as NGOs. None of the women have mentioned these possibilities. Seventy percent of the women said that family support is a pre-condition for their empowerment. Men obviously have more links with the world outside their home or village; their circle is bigger, their mobility is larger than women's.

But how does their view differ from men and women who took part in FFS?

3) How have non-FFS men and women experienced empowerment in FFS?

How do women and men experience empowerment as a result of participation in FFS? The responses to this question are given in table 4.

Table 4: How did men and women achieve empowerment through FFS?

	FFS Women n=54	FFS Men n=20
Involvement in group	6	4
Learn to present	9	1
Singing and speaking in front of others	18	5
Improved technology, seeds, information	6	4
Contact with important people and organisations	3	2
Income generation	3	-
Planning skills	3	1
Able to lead and teach others	4	-
Through learning	4	
Able to solve problems	1	-
Give opportunity to all	-	3

Women achieved empowerment through singing and speaking in front of others and learning to present. For men speaking and group involvement was also important, but less explicit than for women. One dalit man said: "FFS gives chance to unknown people", this implies that he has felt excluded before.

Empowerment has taken place as a result of FFS, probably contributing also to a change in relations among men and women. As some of the interviewees concluded: *In the time before FFS my father and mother in-law treated me as domestic helper these days that is changed and husband the relationship is good, he do not deny what I do.* (Devi, 28)

These days the relationship with father and mother in-law is improved. I equally treat my son and daughter in food, education and others (Yam, 32)

The relationship with all family members has changed these days, my husband help me in household work, I treat my son and daughter equally (Laxmi 36)

Relation has been changed with husband and father and mother in-law, get freedom, free to participate in group and social activities. (Srijana, 45).

Yes, previously the permission should be taken from husband to do something but these days I could do in my own. I equal treat son and daughter. I live in different family than my father and mother in-law. The relationship is good (Ritu, 42).

Yes, previously my husband was deciding everything in farm, these days he takes my idea to make a decision. I also got land right from my husband. (Sunita, 39)

Some women interviewees also said that nowadays they have more access to resources such as land: *I also got land rights from my husband and mother and father in law* (Juna, 38). It is hard to tell if this is a result from FFS participation only, but it is clear that FFS has contributed to women gaining access to important resources such as land.

A few women said that their husbands took advice from them. This was a new experience for them, and it meant that their newly acquired skills in FFS were valued. *"Yes, my husband always takes advice from me"* (Anju, 34).

Many FFS trainees stressed that these days (in contrast to the recent past!) they send both boy and girls to school. This is a break with tradition when mostly boys got preference to be allowed to attend school. *We equally treat son and daughter in education and health* (Yam, 42).

5) Empowerment according to farmer field school trainers and extension staff

Interviews with FFS facilitators showed a gap between them and farmers in respect to their view on empowerment. In focus group discussion with respectively 8 and 13 JTs (junior technicians) from the District Agricultural Development Office, they mainly talked about empowerment as an achievement or outcome when: "women dare to speak or raise their voice" or "when women are not afraid to say their name". They

also often express empowerment in terms of ‘doing what they have been told or taught’ or “when farmers follow what they have learnt from us”, “when they adapt the technology introduced to them”.

According to the FFS facilitators FFS leads to empowerment, through the field experiments, the trials. The FFS trainers and extension staff considers empowerment of something that they facilitate for others. They suppose that they enable farmers to improve their lives. Unlike farmers who mainly see it as a process that affects their own lives, or that occurs when they are involved in social work, or in groups interact with others. FFS trainers talk about empowerment in terms of a result of technology transfer or a change in behaviour that they have observed among farmers (they talk more e.g.). Among the farmers only a few women mentioned that improved access to seeds and technology has contributed to their empowerment.

All FFS facilitators have observed a change among farmers who participated in FFS, especially among women. This is illustrated with the following remark:

"When I meet women who have participated in FFS they approach me with a lot of questions related to farming, they are not shy to ask for advice or seeds or other information. This is not the case when I visit women farmers who have not been in FFS. They are more shy and do not talk about agriculture at all with me (district officer DADO, interview July 2008)

Discussion

If we compare the different views of empowerment of men and women with and without FFS experience we see that women without FFS are much focused on awareness, and self-confidence and FFS women on group activities as well as individual growing.

Among the men there is not much difference between FFS participants and non-FFS participants.

Men’s definition of empowerment is more related to involvement in improvement of the society, on action outside the household. These answers reflect the traditional role of men and women in Nepal, which is for women mainly centred around the household, but it is also a sign of traditional women empowerment or gender activities in Nepal that apparently concentrate on ‘awareness’ raising. (See also Acharya et al. 2005). Women's answers (after taking part in FFS) are similar to men. This seems logical: one first needs to become aware of inequity or own possibilities. After awareness one can gain confidence to address inequities and also to join a group or get involved in community activities. This is line with Mosedale who confirms that “ One needs first Power within: self-esteem and self confidence. In a sense all power starts from here, such assets are necessary before anything else can be achieved (Mosedale, 2005:250)

The women have experienced a change in their lives as a result of FFS. This change is empowerment according to the women, but not in the same way as written in the project documents on FFS, which emphasises discovering factors that inhibit the control over their lives and the means to address these problems.

Although the FFS participants all liked going to the field, observing problems in the crop, doing the trials on fertiliser management and crop varieties, nobody mentioned this as contributing to empowerment. In discussions with farmers, in particular with women, singing and games were mentioned as giving confidence to the women. Also learning to give a presentation contributes to empowerment according to the women. The trainers dismissed the songs and games, as contributing to empowerment. In fact, observing the different FFS over the last ten years, the songs and games are the first to disappear from the curriculum when trainers are facing time constraints, or simply when they have no interest in singing or playing games. Also it is frequently observed that presentations of field data are rushed and mostly undertaken by young educated leaders in the FFS groups, who leave the village after they got an opportunity to work or study elsewhere. Thereby the programme is missing an opportunity to empower the other (female, often older, illiterate) farmers who usually remain in charge of agriculture and stay in the village. The empowering effect of presentation is not acknowledged or emphasised and could be encouraged by presenting on a rotational basis by all FFS participants. This requires a change of focus on process rather than content in FFS.

Many FFS programme officers or experts see empowerment as a way to mobilise groups and establish a forum for collective action. As is illustrated with the statement from an international NGO programme officer below: *“We consider FFS as an important mean to empowerment, in the way that the FFS provides a solid and necessary basis (through the processes of discussion and the need to come to consensus) for the later group formation. We see that some groups have matured into actual community development groups that can take responsibility for actual community development activities e.g. infrastructure, education, health etc. However by far the most of the groups just continue with the income-generating activities.* (e-mail communication Oct 2009 with ADDA⁴, an international NGO)

His view that FFS can be a vehicle for empowerment with collective action was confirmed by some of the local NGOs view in Nepal. This is illustrated with the following quote:

To provide Skill, to uplift the lower community is empowerment . We do this with self mobilization of saving and conducting regular meeting by a dalit women group. (Oct 2009, RIMS⁵)

Conclusion

The farmer field school is developed around the concept of empowerment of farmers. There is the assumption that everybody has the same understanding of the concept of empowerment. Yet emerging evidence from the field shows that this is not the case. The academic or policymakers definitions of empowerment are not in line with women and men farmers view.

It is clear that, neither male and female farmers, nor FFS trainers see empowerment in terms of *strategic life choices, increased decision-making, in identifying and*

⁴ ADDA: Agricultural Development Denmark Asia, an international NGO

⁵ RIMS: Resource Identification Management Systems, a local NGO

addressing factors that restrain their lives as it is indicated in the FFS documents by the project designers. None of the FFS facilitators seemed aware of the wider objective of ‘discovery learning’, its link with addressing problems felt in the lives of male and female farmers in Nepal. None of the farmers talked about solving problems they face, perhaps *becoming self-reliant* comes closest to the definition that FFS policy makers defined. In short, empowerment defined by FFS project designers is not based on male and female farmers’ realities and perceptions in Nepal.

Still, farmers do experience empowerment as a result of FFS. In particular women have experienced empowerment. Women in Nepal are disempowered relative to men, and have gained confidence and access to resources such as knowledge and skills from FFS. Although not due to discovery learning as assumed by policy-makers, but due to group participation, singing and presenting, speaking in a group.

If we compare all the views with the definitions listed in the beginning of this article, we see that women's view on empowerment is mostly related to agency, self esteem and personal growth; after FFS they also consider collective action or group work, but self-confidence remains important. Also access to resources, in particular knowledge, is mentioned to be important for the empowerment of women. Whereby women all said that family support is a prerequisite for empowerment, men do not mention this at all. The men seem unaware of this fact, or take family support for granted. The men interviewed see empowerment more in terms of ‘doing something good for society’ in a group.

In order to be more effective and sustainable with development programmes such as FFS, the interests, needs, background and context of the clients or beneficiaries ought to be considered. And when FFS is serious about empowerment the wider structures that shape disempowerment of men and women and inequality between men and women need to get addressed.

In practice it means emphasising participation of all and not just a few selected educated, young confident men or women, not just the leaders of the group. It means consciously involving shy, older, uneducated, unconfident women. Plus this implies attention to the importance of singing, speaking in front of the group and presenting findings rather than just the technical content or crop trials that FFS trainers seem to focus on.

Emotional Intelligence of trainee teachers in relation to their gender and method subject

Mrs. Santwana G. Mishra
Assistant Professor, Department of Education,
Dr. Babasaheb Ambedkar Marathwada University, Aurangabad,
Maharashtra, India.
Email: santwana21@gmail.com

Abstract

The present study is aimed to study the emotional intelligence of pre-service trainee teachers in relation to their gender and method subjects. A sample of 215 pre-service trainee teachers was selected. The tool used for the study was Emotional Intelligence Test developed by Prof. N. K. Chadha and Dr. Dalip Singh. The data was analyzed statistically using one-way ANNOVA. It was concluded that gender and method subjects had no significant role in determining the emotional intelligence. It was recommended that emotional intelligence of trainee teachers should not be judged on the basis of gender or their Method subjects.

Introduction & Literature Review

It was believed that a person's general intelligence measured as intelligence quotient is the greatest predictor of success in any walks of life – academic, social, vocational or professional. However researches and experiments conducted in the 90's onwards have tried to challenge such over dominance of intelligence and its measure intelligence quotient (IQ) by replacing it with the concept of emotional intelligence and its measure emotional quotient. The term emotional intelligence was introduced in 1990 by two American University professors Dr. John Mayer and Dr. Peter Salovey. According to them, "Emotional intelligence is an ability to monitor one's own and others feeling and emotions, to discriminate among them and to use this information to guide one's thinking and others." (1997). Today emotional intelligence is considered to be important for success in all walks of life. According to Hein (2000) : "Emotional intelligence is the mental ability underlying the emotional sensitivity, awareness and management skills which help us maximize our long term health, happiness and survival". Daniel Goleman (1996) of "The New York Times", adopted the term "emotional Intelligence" and introduced it in his best seller '*Emotional Intelligence-Why it can matter more than IQ*'. He gave the world a new meaning of emotional intelligence. According to Goleman, IQ accounts for only about 20% of a person's success in life. The balance can be attributed to "emotional intelligence" or EQ.

In 1997, Salovey and Mayer refined their definition as "the ability to process emotional information, more specifically, as ability to recognize the meanings of emotions and their relationships, as well as being able to reason and to solve problems on the basis of them. In particular, it involves one's capacity to perceive and assimilate emotional feelings, to understand the information of these emotions and lastly, the management of them." More recently, Mayer and Cobb further developed the definition of emotional intelligence, into the following four branches (2000): (i)Emotional Understanding, (ii)Emotional facilitation of thought, (iii)Emotional management, (iv)Emotional identification, perception and expression.

Teachers deal with young students who are the future leaders of current society. It is therefore very important for teachers to have a high level of emotional intelligence so that they can bring about desirable changes in the students. Emotionally intelligent teachers bring about desirable changes in their students easily. The researcher wanted to study the emotional intelligence of the trainee teachers in relationship with two important variables of the trainee teacher viz. gender and method subjects.

The researcher reviewed various researches in the field of emotional intelligence to gain an insight into the problem. K.V. Petrides and Adrian Furnham (2000) in their study titled, "Gender Differences in Measured and Self-Estimated Trait Emotional Intelligence", studied emotional intelligence (EI) wherein a regression analysis of the data indicated that gender was a significant predictor of self-estimated Emotional Intelligence. A.B. Patil (2006), in his study titled, "Emotional Intelligence among student teachers in relation to sex, faculty and academic achievement" used tools like Emotional Intelligence Test (E.I.T) based on Goleman's Emotional Competency Model, gave some interesting results about the relationship. The study indicated that though gender and faculty plays no significant role in determination of emotional intelligence, the academic achievement is significantly related to emotional intelligence. A study titled, "The Relation of LD and Gender with Emotional Intelligence in College Students" by Henry B. Reiff (2001) indicated that gender plays no significant role in determination of Emotional Intelligence.

The study by Uma Devi L and Mayuri K (2005) titled, "Relationship between Emotional Intelligence and Academic Achievement of Adolescents" suggested that some dimensions of the emotional intelligence were positively and significantly related to the academic achievement of adolescents. Paloma Gil-Olarte Márquez, Raquel Palomera Martín and Marc A. Brackett(2006) in their study, "Relating emotional intelligence to social competence and academic achievement in high school students" found that academic grades were significantly related to emotional intelligence.

Problem of the Study

Nowadays emotional intelligence is considered to be more important than general intelligence, for success in any field. Since teachers deal with students of all kinds, it is important for them to be patient and emotionally stable. They should have the ability to deal with emotions. They should not vent out their frustration and anger on the students. Teachers who are not able to control and regulate their own feelings and emotions will not be able to understand the student's feelings.

The teacher training colleges in India impart training to future teachers. Compared to the past, at present the number of teacher training colleges in India has increased, and every year huge number of student (both male and female) are enrolled in these colleges. These trainees are admitted to the training college after completion of graduation which is either in science subjects or humanities and is known as the method subject. Though the skill imparted to the trainee teachers during training are the same; however the practice sessions of teaching are method specific as the students are divided in their respective method groups during these sessions.

In the present study, the researcher wanted to study whether the female trainee teachers are more emotionally intelligent than their male counterparts and whether the choice of method subjects has any relation with the emotional intelligence of the trainee teachers. The researcher was curious to know whether the trainee teachers from science and humanities background have different emotional intelligence.

The study was designed to test the following hypothesis:

- Female trainee teachers have high emotional intelligence than male trainee teachers.
- Science method trainee teachers are more emotionally intelligent than humanities.

Methodology

The study is essentially a survey, and the instrument of data collection is the standardized Emotional Intelligence Test by Prof. N.K. Chadha and Dr. Dalip Singh. This test consists of 15 multiple choice questions which measures an individual's emotional reactions to different situations. The answer is to be given on the basis of how you feel and not what you think. This EQ scale has high reliability (0.89 - 0.91) and a high validity of 0.78. This test has been designed to measure the basic three dimensions of the emotional intelligence viz., emotional competency, emotional maturity and emotional sensitivity. This test was personally administered to the trainee teachers.

For this study, the researcher had selected the 215 trainee teachers from four colleges of education affiliated to Dr. Babasaheb Ambedkar Marathwada University, Aurangabad using stratified random sampling technique.

The statistical analysis technique used in testing the hypotheses was one-way analysis of variance (ANNOVA). All the hypotheses were tested at 0.05 level of significance.

Data Analysis and Results:

The data was tabulated and was analyzed using one-way ANNOVA. The testing of the hypothesis is presented one by one. All the analysis was done using well-known statistical software Minitab15.

Hypothesis one: Female trainee teachers have high emotional intelligence than male trainee teachers.

The data regarding the gender was collected though the preliminary information column of the answer sheet provided during administering the emotional intelligence test. The Emotional intelligence score was calculated by the response received from the trainee teachers against the multiple choice questionnaire given to them.

To test the hypothesis, one-way analysis of variance (ANNOVA) method is used, as one variable (gender of trainee teacher) is dichotomous. The result of one-way ANNOVA is shown in table below:

Source	DF	SS	MS	F	P
Gender	1	572	572	0.72	0.395
Error	214	168969	790		
Total	215	169542			

Table 1: One way ANOVA- Gender wise

Notations: DF is for degree of freedom, SS is for Sum of square, and MS is for Mean of Square

The P- Value obtained in the above table is 0.395. This P-value is more than 0.05 which indicates that there is no significant relationship between independent and dependent variable. This implies that there is no significant relationship between gender and Emotional Intelligence.

Hence Hypothesis one is rejected.

Hypothesis two: Science method trainee teachers are more emotionally intelligent than humanities.

The respective method subjects opted by the trainee teachers were also collected though the preliminary information column of the answer sheet provided during administering the emotional intelligence test. This data was sorted and tabulated along with the emotional intelligence score of the trainee teachers.

To test this hypothesis, one-way analysis of variance (ANNOVA) is used. The result of one-way ANNOVA of Emotional Intelligence score and method subject is shown in table below:

Source	DF	SS	MS	F	P
Method 2	1	8	8	0.01	0.92
Error	214	169534	792		
Total	215	169542			

Table 2: One way ANOVA: EQ score versus Method subject

Notations: DF is for degree of freedom, SS is for Sum of square, and MS is for Mean of Square

From the table no. 2, the P value associated with method subject is 0.92 which is more than 0.05. It implies that emotional intelligence of trainee teachers is not affected by method subject. In other words, there is no significant relationship between emotional intelligence of trainee teachers and method subjects.

Hence Hypothesis two is rejected.

Findings & Recommendations

The present study concludes that Emotional Intelligence is not significantly related to the gender of the trainee teachers. As there is no significant difference between the emotional intelligence of

trainee teachers with science or humanities as method subjects, it can be concluded that, the subject of basic graduation degree plays no significant role in determining the emotional intelligence. The study also recommended that gender and method subject should not be criteria for judging the level of Emotional intelligence of trainee teachers at the time of recruitment.

C.S. Lewis's *The Voyage of the Dawn Treader* and Christian Postmodernism:
East and West, and Beyond

The Irish author C.S. Lewis is popularly introduced as a writer of children's literature, although he does not write only for 'for juveniles,'¹ rather speaking to readers of all ages in our time. This paper will enable the reader to understand Lewis as a Christian author who employs Postmodernist strategy to reach contemporary minds² and to rehabilitate a longing for the other world beyond visible reality. The other world lies in neither in the East or in the West but Lewis suggests that it transcends the limits of human language. Lewis advocates understanding reality through both realism ("looking at," or the description of the activity) and supernatural experience ("looking along," or the actual object of the activity). He believes that the human construction of language is so limited that the two experiences can never happen at the same time.³ Christian Postmodernism,⁴ in this paper, is defined as a rhetorical strategy in which realism (Word as logical language) and supernatural perspective (Image as imaginative narrative) are synthesized in meaning.⁵

The discussion will begin by examining Lewis's multiple approaches to the Kingdom of God in his novel *The Voyage of the Dawn Treader* (*VDT*) (1952): firstly exploring the intertwined illustrations of each of the main characters' own journeys in time and space; secondly considering the value of the Medieval period in *VDT* as a modern version of the immram⁶ (an old Irish voyage tale) literature of *The Navigation of Brendan* (circa

¹ Lewis says he writes to overcome the inhibitions not only 'in a child's mind' but also 'in a grown-up's mind' in his essay, "Sometimes Fairy Stories May Say Best What's to Be Said" in *On Stories*. 48

² (16) Lucy finds herself comfortable on the *Dawn Treader*, rather than worried about the motion of the ship. She did a lot of voyaging as a queen in Narnia. The voyage includes the days of rolling, pitching and swelling as well as the lulled wind.

³ In his essay *God in the Dock*, Lewis gives an account of the incompatibility of these completely different human experiences, describing hyper-realism as "looking at" and supernaturalism as "looking along."

⁴ Nowhere in his writings is the term "Postmodernism" mentioned. However, although Lewis expressed his uncomfortable stance toward the modern mind-set, he advocates understanding reality through both realism and supernatural experience. Lewis is aware that the human construction of language is so limited that the two experiences can never happen at the same time. The writer Lewis enters into his readers' cultural domain by using their discourse.

⁵ Crystal Downing mentions the conceptualization of the transcendent Other in her 2004 publication. In my interview with June Senaha (Feb., 2009), he refers to the term "Christian Postmodernism." Through reading Christian Postmodernism literature, reader undergoes the process of the re-conceptualization of the transcendent Other through the accepting of language as the limited human construction, and of multiple interpretations exchanged within the community, and ultimately the reaching of an understanding that transcends binary selections of the interpretations.

⁶ 'Immram' is spelt as 'Imram' in *A Dictionary of Celtic Mythology* on *Oxford Reference Online*. "Imram" is the conventional first word, usually translated as 'voyage', in the titles of a class of Old and Middle Irish narrative in which travelers reach an Otherworld supposedly in the islands of the Western ocean. *A Dictionary of Celtic Mythology*. James McKillop. Oxford University Press, 1998. *Oxford Reference Online*. Oxford University Press. Accessed at Hokkaido University on 18 January 2010 <http://www.oxfordreference.com/views/ENTRY.html?subview=Main&entry=t70_e2763>

A.D. 800); and finally, highlighting the attention that Lewis gives to immediacy in terms of the relationship between humans and nature.

Introduction

In *VDT*, the immediacy of God's Kingdom is reflected by the voyage of the *Dawn Treader*⁷ in three ways⁸: King Caspian's vision of the Narnians to be "sea-faring folk," his intention of looking for friends missing in the Eastern Seas, and his knight Reepicheep's dream to find Aslan's country at the very Eastern end of the world. The future of the Kingdom of God operating toward perfection is represented by the three latecomers from the reader's world.

The life of Brendan, a monk historically active around the 6th century, whose story is collectively known as *The Voyage of Saint Brendan (VSB)* (circa the 9th century)⁹ is renowned for his legendary journey to 'The Isle of the Blessed,' the text being one of the most influential of the Middle Ages in Europe. The narrative of Brendan's setting out in a coracle for seven years was passed down orally and later scribed by Irish monks around the 9th century. The story is formed out of both the Christian tradition and pre-Christian sea travel mythology.¹⁰

Walter Hooper speculates that Lewis had *The Voyage of Saint Brendan* in mind when he wrote a rough sketch of *VDT*.¹¹ David C. Downing elaborates on literary influences on *the Chronicles of Narnia* from Saint Brendan and the biblical book of Revelation in addition to other literary sources.¹² Salwa Khoddam likewise discovers the same motif as *VDT* in the story of Saint Brendan,¹³ while Charles Huttar finds a parallel between Tolkien and Lewis in the way of using inherited myths with *VSB* being one of them. All of these scholars suggest a possible link between *VDT* and *VSB*, but have not made a

⁷ Lewis does not italicize the definite article 'the' when it is used for the name of the ship, for example, "the *Dawn Treader* was the finest ship he had built yet" (30).

⁸ According to *A Dictionary of the Bible*, "The kingdom of God" is not to be equated with a human Utopia nor the rule of a political sovereignty, but the dominion of God's superiority over His creation in two dimensions. The Kingdom is actually present in Jesus Christ's own ministry (Luke 11:20), and the Kingdom is still future in the sense that the Rule of God is not yet fully operative in the world (Mark 4: 26-9). "kingdom of God" *A Dictionary of the Bible*, by W. R. F. Browning. Oxford University Press Inc. *Oxford Reference Online*. Oxford University Press. Accessed at Hokkaido University on 15 April 2010 <<http://www.oxfordreference.com/views/ENTRY.html?subview=Main&entry=t94.e1069>>

⁹ 'Naomh Breandan (Navigator Brendan)' in Irish.

¹⁰ The journey metaphor of *VSB*, is likely modeled after what is classified as pre-Christian immrama¹⁰: *The Voyage of Bran* (possibly written in the 8th century) and *The Voyage of Mael Duin's Boat* (composed around the 8th century and written in Irish around the 10th century).

¹¹ Walter Hooper. *C.S. Lewis: A Companion and Guide*. 403.

¹² David C. Downing. *Into the Wardrobe: C. S. Lewis and the Narnia Chronicles* (Jossey-Bass, 2005) 48.

¹³ Salwa Khoddam. "The Enclosed Garden in Narnia" *The Bulletin of The New York C.S. Lewis Society*. January / February 2006 Vol. 37, No. 1 Whole No. 411. Kohoddam suggests seeing the unpublished paper by David C. read at Oxbridge 2005 on The Life of Saint Brendan as a source for *VDT*.

detailed analysis of literary elements connecting the two tales. Here, a comparison of *VDT* and *VSB* will demonstrate C.S. Lewis's Postmodernist approaches to the Kingdom of God and his wish to rehabilitate a longing for the other world beyond imperfect humanity.

I. The Immediacy and Future of 'The Kingdom of God'

In *VDT*, C.S. Lewis gives a full perspective on the trails of five characters travelling in multiple directions, as the reader is reminded of an intricate liaison which may stir a sense of awe and eternity leading to an understanding of the Kingdom of God. The track of each protagonist's movement is not visibly discernable, but the interlaced image of their different trails arouse a numinous sensation on the reader, as if the presence of a divinity were felt from the intricate patterns of Celtic spirals. The network of the characters' paths causes the reader an indescribable perception which Lucy feels at the World's End. The female protagonist of *VDT* is so filled with a mysterious sense that she can not explain it in words, but instead paraphrases it in an image, "the scent of lavender."

The five protagonists include the personified ship, the *Dawn Treader* that circles between the East and the West; the British children as a collective unit, Lucy, Eustace and Edmund who infiltrate into the other world; Reepicheep, who makes a bee-line advance to the Utter East; the two *VDT* story-tellers who unpredictably jump between fact and fiction; and lastly Aslan who makes an epiphanic manifestation in multiple media.

1) The *Dawn Treader* and Visions

In the old Brendan's immram, the ship sails for the paradise of Tir na n'Og,¹⁴ traditionally westwards, while the Narnian ship¹⁵ navigates in the Easterly direction where the country of Aslan, the Son of the Great Emperor, exists. The *Dawn Treader* shifts in a circle: heading for the East but turning just before the Utter East; returning westward; and finally sailing back to Narnia.

The Easterly direction in *VDT* is considered as one of Lewis's Postmodernist approaches to stir a longing for another world by navigating in a different direction from the traditional. As Medieval Literature scholar, C.S. Lewis must have adapted the

¹⁴ The land of youth in Irish

¹⁵ In the Kingdom of God, social hierarchies and class discriminations are irrelevant (Matt. 22: 9–10)

colliding-factors to make a desire for another world beyond reality. Thomas Cahill states that the Europeans of the Middle Ages had a desire for 'antipodes' through various cultural contacts with the Eastern World.¹⁶

Regarding the 'East' in *VDT* opposite of the West, Charles Huttar connects the imagery of sunrise in the East with the resurrection.¹⁷ The 'easterly' direction in *VDT* is biblically associated with Christ who is symbolically represented as 'the sun' of righteousness (Malachi 4:2)¹⁸ and the true light (John 1:9).¹⁹ The East also reminds the reader of the Magi (Matthew 2:1-12), the Wise Men from the East who are guided by the special Star to the infant Jesus in Bethlehem. *The Dawn Treader* likewise navigates with guidance from not one star but the multiple Stars including Coriakin, Ramandu and his daughter, -the multiplicity- suggestive of ambiguous values in pagan myths as well as in our contemporary times.

2) Three Latecomers from the Reader's World

Three latecomers, Edmund, Lucy and their cousin Eustace join the voyage from halfway beyond the modern world, but disembark the ship before the Utter East, returning to the reader's world. Their movement proceeds in a circular shape like the *Dawn Treader*, but in different way. From the rationalist' perspective, their sudden visit to the ship must appeared like a late embarkation and early disembarkation,²⁰ but from Aslan's point of view as Divine Being, the outsiders' arrival at the time of navigation should be considered neither too late or too early.²¹ In their individual encounter with Aslan, each of them undergoes spiritual metamorphosis. A product of Modernism Eustace is transformed from a monster into a boy,²² while the immature romanticist Lucy is able to release herself from her inferiority complex towards her sister and her classmates.²³ Her brother Edmund's trust in Aslan is strengthened after being tested by

¹⁶ Thomas Cahill. *Mysteries of the Middle Ages: the Rise of Feminism, Science, and Art from the Cults of Catholic Europe*. (New York: Nan, 2006, 2008) 264. Cahill evaluates Brendan's voyage as the literary fruition of Ireland in the Middle Ages, although the Vikings may have earlier arrived the Northern America. He exemplifies, as antipodes, the Islam (7-15 the century), the Tatar (the Mongol) (the 13th century), and *The Travels of Marco Polo* (the 14th century).

¹⁷ Charles Huttar. "Deep lies the sea-longing": inklings of home (1)" 2007 Mythopoeic Society

¹⁸ Malachi 4:2." But unto you that fear my name shall the Sun of righteousness arise with healing in his wings; and ye shall go forth, and grow up as calves of the stall."

¹⁹ John calls Jesus Christ the true Light: "That was the true Light, which lighteth every man that cometh into the world." (John 1:9)

Paul compares the dawn with immediacy of the Kingdom of God: "The hour has come for you to wake up from your slumber,Rather, clothe yourselves with the Lord Jesus Christ." (Roman 13:11-14)

²⁰ Lewis, *Reflections on the Psalms*. 160. Their sudden appearance reminds us of Melchizedek, who is mentioned as the King of Salem, and priest of God Most High, in the time of the biblical patriarch Abram, and who has "no beginning of days nor end of life." (Heb.7:3)

²¹ The three outsiders are involved in seemingly boundless visits to different islands, but cannot help disembarking the ship at the last minute.

²² *VDT*: Chapter 6-7

²³ *VDT*: Chapter 9-11: Lucy's journey of her self-discovery reveals the trauma of our modern time in which the opposites of male and female are disintegrated. The opposites, in Jung's terms, are called the anima (the female aspect present in the collective unconscious of men) and the animus (the male aspect present in the collective unconscious of women). Lucy undergoes a

the repetitive memory of his treachery.²⁴

3) Reepicheep: the True Dawn Treader

The valiant talking mouse, Reepicheep, disappears out of this world, moving not in the way as he expects that this visible world would fall at the end. He is seen paddling his coracle, and being lifted up the sides of the waves. Reepicheep advances in a rising line as he unhesitatingly devotes his whole life to finding Aslan's Country at the Utter East.²⁵ The mysterious end of Reepicheep whose final destiny is not described in the story, reminds us of Christ's Ascension²⁶ as well as the transferences of Elijah and Enoch in the Bible.²⁷ The *VDT* narrator makes the reader feel convinced of Reepicheep as 'the true dawn treader' in Narnia²⁸ by expressing his strong belief that the courageous knight must be alive at Aslan's Country.²⁹

4) Two Story-Tellers in the Story within the Story

The two story-tellers of *VDT* are not directly involved in each other as fact but their lives seem to be blessed with reciting the same story of the modern immram as truth. Their paradoxical roles reflect C.S. Lewis's understanding of the Gospel in which Myth tells the truth of the Incarnation. Lewis affirms that the myths of pagan gods, dead but risen, became historical fact when God was incarnated in the flesh of Jesus Christ.³⁰ One story-teller is the persona "I" who acts both as narrator and character.³¹ His ambiguous roles, travelling between fact and fiction, is the embodiment of Lewis's

metamorphosis of her self in her 'alchemical' process from the separation of opposites to the union of opposite principles and finally discovers her true self, which can be understood as the process of (what Jung terms) 'Individuation.'²³ In Jung's view, the alchemical attempt to transmute base metals into gold is actually a psychological process which is unconsciously projected onto the various material substances used in the process. The symbols (gold, the philosopher's stone, and the elixir) used by the alchemists are representative of the process of 'Individuation.' The path to Individuation is characterized by the constant conflict of opposites, which produces psychic energy.

²⁴ Contrary to the allegorical role of the characters, the male-oriented protagonists, and the negative image of mythological creatures in old immrama, the modern immram of *VTD* depicts the complex human nature in light of both humanity and mythological creature: the perplexity of the female protagonist who has an inferiority complex about her appearance and also the ambiguous values of the Monopod-dwarves who are dissatisfied with their appearance.

²⁵ Downing, David. *Into the Region of Awe*. Downing associates Reepicheep with "the Arthurian Legend for the Holy Grail" 137.

²⁶ Lewis associates the image of 'the waterfall' with 'the Cross in Chapter Six of *The Great Divorce* (1946).

²⁷ "After he said this, he was taken up before their very eyes, and a cloud hid him from their sight" (Act 1:9); "Elijah took his cloak, rolled it up and struck the water with it. The water divided to the right and to the left, and the two of them crossed over on dry ground" (II King 2:8); "Enoch walked with God; then he was no more, because God took him away" (Genesis 5:24). David C. Downing also associates Reepicheep with Elijah and Enoch "who are translated directly into God's presence without having to suffer death." (*Into the Region of Awe*, 137)

²⁸ Reepicheep are enchanted by a female voice of a dryad and propelled into a life-long voyage. For the hero of the pre-Christian immram, Bran, the woman's country 'Emain' is the last destination, whereas for Reepicheep, it is Aslan's Country. All his life, the talking mouse is guided by the prophetic lyric sung by a fairy lady and finally lifted up the waves, possibly to Aslan's Country: "Where sky and water meet/ Where the waves grow sweet,/ Doubt not, Reepicheep, / To find all you seek, / There is the utter East" (*VDT* 22).

²⁹ *VDT*, 266. "But my belief is that he came safe to Aslan's country and is alive there to his day."

³⁰ C.S. Lewis. "Myth Became Fact" in *God in the Dock*. 78

³¹ The narrator is involved as a character in the story on one occasion. The interaction between the three Children and the narrator is only once mentioned in the last chapter: "Edmund and Eustace would never talk about it (a breeze from the east) afterward. Lucy could only say, 'Why,' said I, 'was it so sad?' 'Sad!! No,' said Lucy" (265) (underlined by the author).

notion of the Gospel in which Myth is beyond reason and thought.³²

The other storyteller is the sailor Pittencream.³³ The minor character deserts the ship at the Lone Islands, goes to live in Calormen,³⁴ and tells the tales of the voyage until he believes them himself. The coward man should deserve criticism for his “inability to deal with reality,”³⁵ but he should be worthy of telling the truth of the voyage as the representation of ‘the Kingdom of God.’ With the exception of the fake story of his courageous role, he conveys the truth of the *Dawn Treader* which successfully fulfills the triple missions of living as the sea-faring folk, looking for missing souls and reaching the World’s End. His tales seems to be like mythology, which is orally passed down as a tool of the truth while its roots are unknown in our age.

II. Medieval Values in the *Voyage of Saint Brendan*: the Spiritual Rudder

In *VS*B, repetitive motion is a feature of Brendan’s journey³⁶: one characteristic of the monk’s voyage is his visiting of the same islands, encountering the same people at the same seasons and circling around the same islands. Brendan’s repeated movements remind us again of the Celtic triple spiral which, Philip Sheldrake asserts,³⁷ represents the link between reality and the other world: “the cyclical quality of Brendan’s ‘voyage’ reminds the reader that “the journey is an internal, spiritual one.”³⁸

The voyages, in both *VDT* and *VS*B, head for the Land of Promise, visiting mysteriously attractive islands but overcoming damage from severe sea weather. Unlike the monastic and ascetic life³⁹ valued in Medieval immrama, the quivering motion of the *Dawn Treader* suggests contradictory elements which are not only indicated by Lucy’s blissfulness of the sensations of sea life⁴⁰ but also by Eustace’s uncertain values as a product of Modernism. The quivering waves may be considered as Lewis’s Postmodern form of expression⁴¹ in which opposing factors combine to serve as a catalyst for

³² Lewis, 78

³³ Paul Ford. *Companion to Narnia*. 315. Ford associates ‘Pittencream’ with someone who is pitiful or a pittance and also introduces Thomas W. Craik’s parallels drawn between Pittencream and Pittenweem (a fishing village in Fife) and with Macbeth’s cream-fac’d loon (Act V, Scene 3) as Pittencream hangs back from volunteering for the adventure.

³⁴ Ford. 92. Calormen is the empire to the south of Archanland and Narnia. The term means men from a warm land: from the Latin ‘calor’, meaning heat and the English ‘men.’

³⁵ Ford. 315.

³⁶ Especially the repetition is emphasized in and after Chapter 15 “The Island of Sheep, Jasconius and the Paradise of Birds Again”

³⁷ Philip Sheldrake. *Living Between Worlds*. (London: Darton, 1995) 53.

³⁸ John Anderson regards the cyclical quality of the voyage as a spiritual one, “Brendan’s course is a circle. It is repetitive, inevitable, preordained, but nevertheless salvific. The ineluctable rise and fall of human existence is rendered salutary when Brendan achieves his goal and arrives at the Promised Land of the Saints.” “The Voyage of Brendan, an Irish Monastic expedition to Discover the wonders of God’s World”, from *American Benedictine Review*, 43:3 (September 1992) 273-274.

³⁹ Four saints appear in *VS*B: St. Enda, St. Ailbe, St. Paul the Hermit and St. Peter.

⁴⁰ *VDT*, 16. “Lucy found herself as much as at home as if she had been in Caspian’s cabin for weeks, and the motion of the ship did not worry her, for in the old days when she had been a queen in Narnia she had done a good deal of voyaging.”

⁴¹ Lewis confesses his two cultural roots, not only “the spokesman of the old Western culture” but also “a kind of people of the mist” “pagan, romantic and polytheistic in grain” in his foreword to Joy Davidman’s book *Smoke on the Mountain* (1953). Lewis

producing the possible harmony of pagan mythology and Christianity.⁴²

In *VDT*, the Old Star of Ramandu is down on the island to rejuvenate his spiritual and physical strength until the day when he returns for 'the Great Dance' in the cosmos.⁴³ This man, clad in long garments with a Druidic appearance is reminiscent of a celestial object incorporated in a mythological figure, such as Venus, in which the same entity is created both in astronomy and in mythology. On this island, Aslan's Knife⁴⁴ is on a table with a rich crimson table cloth, kept in honor of the great Lion Aslan's blood sacrifice of the earlier story *The Lion, the Witch and the Wardrobe* (1950). The relic is considered as further evidence of incorporation of Myth with Fact in the Gospel. The Knife originally belonged to the White Witch who had used it to slay the Great Lion⁴⁵ who sacrificed Himself for Edmund. This historical object reminds the voyagers of the great Lion's redemption, but it is not described as the final goal for their navigation. The protection of the stone knife instead serves to encourage the former-betrayers but the Saved, like Edmund, in advancing their pilgrimage into the Kingdom of God.

None of the travelers can characterize in logical words the enchanting song sung by Ramandu and his daughter, but the song is described simply in images. It seems to Edmund to be like the most exciting moment in his life, and to Lucy like "a cold kind of song, an early morning kind of song" (222). This mysterious scene may be considered as another embodiment of Lewis's concept of the Myth incorporated with the Fact in the Gospel. When the Mythological Star and his daughter sing the song, they face east (the direction where Aslan lives) from which the sun's rays (suggestive of the Righteousness of God) shine on the Stone Knife (the Gospel).

At the end of *VS*, Brendan discovers precious gifts - visible but spiritual,- stone and fruit, which are individually associated with Jesus Christ as the stone of stumbling (Psalm 118:22 and Luke 20: 17-18)⁴⁶ and the fruit of the Holy Spirit as the qualities of

wrote "I suppose we Northerners pagan, romantic and polytheistic in grain, are a kind of people of the mist when seen from the dreadfully unambiguous standpoint of Israel."

⁴² Lewis accepted God when he understood that the Gospel, the greatest story of God's words, is the completion of pagan myths. Lewis recognizes "Christianity as the completion". ("Religion Without Dogma" 163). David Barratt states that Lewis saw "Christianity as the fulfillment of paganism." (41) Lewis' conversion had a profound effect on his work. His wartime radio broadcasts on the subject of Christianity brought him wide acclaim.

⁴³ In Chapter 13 and 14 of *VDT*,

⁴⁴ The Knife is a relic rather like 'the Spear of Longinus' mentioned in the Gospel of John (19:31-37), though the name is not given in the Bible.

⁴⁵ He is a talking lion, King of the Beasts, son of the Emperor-Over-the-Sea; a wise, compassionate, magical authority (both temporal and spiritual); mysterious and beloved guide to the human children who visit; guardian and savior of Narnia. The author, C. S. Lewis, described Aslan as an alternate version of Christ—that is, as the form that Christ might have appeared in a fantasy world.

⁴⁶ "The stone the builders rejected /has become the capstone." (Psalm 118:22) "Everyone who falls on that stone will be broken to pieces, but he on whom it falls will be crushed." (Luke 20: 18)

character God grows inside the believers in Christ (Galatians 5:22).⁴⁷ Caspian also receives gifts, both visible and spiritual, -a magic sea chart- from the Magician Coriakin, and two other gifts on Ramandu's island: one is the knowledge of the way to break the spells on the sleeping lords and the other is Caspian's promise of his reunion with the Star's daughter.⁴⁸ Just as a rudder serves as a pilot guide for the Early Middle Age voyagers to gather navigational information,⁴⁹ informing them of the nautical facts and inspiring them to fulfill their mission, so the magical chart functions as a both practical and spiritual 'rudder.' Contemporary theologian Alister McGrath uses a related picture of the spiritual rudder which checks our faith, renovates ourselves with visions, and enables us to head for the final goal.⁵⁰

III. The Natural World and Beyond the Human Construction of Language

Both *VSB* and *VDT* emphasize the sensitive associations of divinity within the natural world, like the monastic poets who sought and found "the natural world as the image of the creator-God."⁵¹ The famous Irish hymn, "St. Patrick's Breastplate" (circa 8th century)⁵² connects the power and presence of God to the world of creation.⁵³

As the closeness of God to nature is found in both *VSB* and *VDT*, the explorers are gifted by God with the benefaction of nature from the Promised Land. Saint Brendan and his brothers receive fruit, suggestive of fruit of the Holy Spirit (Galatians: 5:22) and precious stones, reminding of the glory of God (Revelation: 21:11).⁵⁴ In *VDT*, the spiritual world is visually guided by a bird as the divine messenger, and also indicated by the fog through which Brendan's boat has to travel between this world and the other world. To the contemporary readers, however, Lewis emphasizes the importance of spiritual wealth not by displaying material fortune but by demonstrating his inability to

⁴⁷ "But the fruit of the Spirit is love, joy, peace, patience, kindness, goodness, faithfulness" (Galatians 5:22)

⁴⁸ Just like the Land of Woman, full of fruit and water in the pre-Christain immram, Caspian X and his companions are welcomed by the Star's daughter and guided by a bird whose gender is indicated by female "she," and served with a feast by a flock of birds every evening. Unlike the traditional fairy tale where a sleeping lady in a fairy tale is awakened by the prince's kiss, in *VDT* neither the beautiful lady, the three missing lords who sleep, or Caspian will receive a kiss. Instead Caspian will not be kissed by her unless he breaks the magic on the three sleepers, and also he will have to sail to the World's End and come back, having left at least one of his company behind in order to break the enchantment. In *VDT*, the beautiful lady plays a more active role than the traditional immram by encouraging Caspian to complete his mission, and by guarding the three sleepers until the prince breaks the enchantment of sleeping curse on them.

⁴⁹ J.B.Hewson, *A History of The Practice of Navigation*. The word "rudder" is likely derived from the French word "routier," meaning "something that finds a way."

⁵⁰ Alister McGrath. *The Journey: A Pilgrim in the Lands of the Spirit* (1999, Hodder) 47.

⁵¹ Philip Sheldrake. 73.

⁵² "Saint Patrick's Breastplate." The Prayer Foundation. January 22, 2010.

http://www.prayerfoundation.org/st_patricks_breastplate_prayer.htm

⁵³ Patrick's Breastplate : "I gird myself today with the might of heaven: The rays of the sun, the beams of the moon, The glory of fire, The speed of wind, The depth of sea, The stability of earth, The hardness of rock."

⁵⁴ (Galatians 5:22) "But the fruit of the Spirit is love, joy, peace, patience, kindness, goodness, faithfulness," ; (Revelation 21:11) "It shone with the glory of God, and its brilliance was like that of a very precious jewel, like a jasper, clear as crystal."

describe the sublimity of the invisible gift from nature: the enchanting sound of Ramandu and his daughter's singing voices,⁵⁵ the mysterious taste of light integrated with water, and the indescribable blend of music and fragrance of the heavenly wind.⁵⁶

In *VDT*, God's revelation is indicated in the detail of nature, but to Heaven Lewis ultimately applies no metaphor from nature, though he previously attempts to compare it to 'the smell' and 'the musical sound' of "a breeze." The whiteness of the lilies of the Last Sea is described as shining like the brightness of the Arctic,⁵⁷ but Aslan's country is literally and figuratively indescribable beyond the human construction of language, just as all Lucy can say is 'it would break your heart.'⁵⁸

Conclusion

Analysis of each of the main voyagers' experiences in *VDT* leads the reader to an understanding of the double aspects of the Kingdom of God, immediacy and future orientation (eschatological): the voyagers undergo spiritual metamorphosis in their immediate encounter with Aslan in the process of the navigation, and the imaginary trails of all of the travelers stir the reader to a sense of awe into realizing the future of the Kingdom of God. The present experience of swaying motion on the ship is a means of evoking both the happiness in dancing for the future and the pain in regretting the past. Lewis applies such his Postmodern approach to invoke the communication between the reader's reaction and the author's intention by laboring to clearly speak to the reader, who embraces multiple values in our time.

Comparison of *VDT* and *VSB* shows Lewis as a Christian writer who adapts seemingly ambiguous expressions as his literary approaches to the Kingdom of God. Unlike the Medieval explorer Brendan who was aware of the purpose of his journey from the beginning, in the modern Immram *VDT*, the three latecomers from the modern world would not have known the ultimate purpose of their lives if they had not joined the uncharted pilgrimage. Through their adventure, the visitors come to realize the real quest of the voyage: the importance of their life as the 'dawn traders' is not in the direction of their voyage, but it is meeting Aslan. Their encounter with the Son of the

⁵⁵ *VDT*, 222. I wish I could write down the song, but no one who was present could remember it. Lucy said afterward that it was high, almost shrill, but very beautiful.

⁵⁶ *VDT*, 265. It lasted only a second or so but what it brought them in that second none of those three children will ever forget. It brought both a smell and a sound, a musical sound. Edmund and Eustice would never talk about it afterward. Lucy could only say, "It would break your heart." "Why," said I, "Was it so sad?" "Sad!! No," said Lucy.

⁵⁷ Colin Duriez remarks the final part of *VDT* as the embodiment of the quality of the numinous where its appeal is first to the imagination, and it belongs to the area of meaning that we cannot easily conceptualize. *The C.S. Lewis Encyclopedia*.149

⁵⁸ See footnote 52.

Great Emperor is not geographically limited to Narnia, but is possible through every dimension of any world.

While Brendan lives close to nature and sees the image of God in the natural world, Lewis further uses the mysticism of the natural world to incorporate the two paradoxical concepts of Mythology and Christianity. He demonstrates not only his belief in the Gospel as the Myth which becomes the Fact, but also his religious conclusion that Aslan's country is indescribable in human words. Beyond this, Lewis narrates the story of both the adventure of the *Dawn Treader* and the beauty of 'the smell' and 'the musical sound' of 'a breeze': the story of East, West and Beyond.

**East is East and West is West: A reading of Jhumpa
Lahiri's *The Namesake***

Dr. Binod Mishra
Assistant Professor
HSS, IIT Roorkee

mishra.binod@gmail.com

Jhumpa Lahiri's debut novel *The Namesake* (2003) is a story of a Bengali couple who leaves their native country and settles in America. Spanning over a period of thirty two years, the novel describes the diasporic experience of two generations of Indians who progress remarkably in terms of material value but lose many other values. The novel makes various sojourns from India to America and vice versa to unfold the various happenings that construct and deconstruct numerous faiths humans often carry as a part of their individual and societal needs and expectations. The various characters namely, Ashoke, Ashima, Gogol and Sonia come into contact with many other characters and incidents, which prompt them to explore new knowledge and create in them a global outlook. Most of the characters of the novel witness encounter and interfaces that enable them to understand that the assimilation of various cultures ensures in strengthening ties by helping them distinguish between good and evil. This provides individuals an upper hand over the obsolete notion that east is east and west is west and never the twain shall meet. The meeting of the east and the west is a global need that cannot simply be forbidden but respected.

Ashima, the wife of Ashoke and mother of Gogol and Sonia is every inch an Indian woman stuck in her native culture and tradition. She faces the cultural clash because of her rigidity or resistance to change. She feels alienated because she is unable to adjust herself to the changed environment. Even in a country where no one except her husband could understand her problems, she clings to the traditional customs which do not allow wives to call their husbands by their names. It appears quite paradoxical that the man she lives with and whose children she is going to beget, cannot be called by his name. Jhumpa Lahiri seems to be ironical too when she says: "When she calls out to Ashoke, she does not say his name. Ashima never thinks of her husband's name when she thinks of her husband, even though she knows perfectly well what it is. She has adopted his surname but refuses, for propriety's sake, to utter his first. It's not the type of things Bengali wives do."¹

Customary though yet it appears quite ironical that despite the rise of Hindi movies, Ashima is unable to imitate the fanciful trait of couples treating each other as friend and darling. Ashima gets piquant to hear the word 'sweetheart' called by a man to his wife in the hospital. What embarrasses her is the cotton gown that reaches her knees. She finds everything around her too humiliating. One has to adjust oneself to the changed situation but for Ashima, these are offending. The novelist with an implicit hint at Indian parents' protective nature and children's parasitic habit writes: "It is the first time in her life she has slept alone, surrounded by strangers; all her life she has slept either in a room with her parents, or with Ashoke at his side. She wishes the curtains were open so that she could talk to American women." (P-3)

Ashima's urge to talk with other women is also devoid of American's idea of their privacy. Lahiri very subtly takes a dig at the reserved nature of Americans and sympathizes with Ashima's ignorance. Lahiri adds: "But she has gathered that Americans in spite of public declarations of affection, in spite of their miniskirts and bikinis, in spite of their hand holding on the street and lying on top of each other on the Cambridge Common, prefer their privacy." (P-3)

Ashima develops a sort of hatred for all that is hostile to her Indian anchorage. She is reminded of Indian women going home to their parents 'to give birth away from husbands and in-laws and household cares, retreating briefly to childhood when the baby arrives'. The hospital in Cambridge, despite all modern amenities, seems to her a confinement and even the prospect of motherhood does not gladden her. She is aggrieved so much that her labour pain seems somehow lesser than motherhood in a foreign land.' Lahiri writes: "That it was happening so far from home, unmonitored and unobserved by those she loved, had made it more miraculous still. But she is terrified to raise a child in a country where she is related to no one, where she knows so little, where life seems so tentative and spare." (6)

Ashima feels empty and banal most of the time. Even after the childbirth, she considers even Indian acquaintances as substitutes of her own people. She rather faces the cultural shock and feels deprived and dejected. Lahiri mentions Ashima's alienation in the following lines: "Without a single grandparent or parent

or uncle or Aunt at her side, the baby's birth like most everything else in America, feels somehow haphazard, only half true. As she strokes and suckles and studies her son, she can't help but pity him. She has never known of a person entering the world so alone so deprived." (24-25)

Ashima sticks to her faith and waits for her grandmother's letter that would bring the new child's name. She doesn't want to dispense with the proud practice of pet names that remind her of old time intimacies. A good name, according to the set belief was nothing but identification in the outside world. She grows furious with the clerk who emphasizes on the child's name to be mentioned on hospital's birth certificate. The way she attaches importance to the name being decided after the arrival of the letter reveals her blindness to her confined native as well as community culture. Ashoke understands the gravity of the situation and listens patiently to Wilcox's suggestion disapprovingly. Ashima approves of Ashoke's suggestion of naming the child as Gogol till the grandma's letter came. But as they start living in their apartment, Ashima returns to her own cocoon. Biased as she is, she does not appreciate the simplicity and graciousness of Montgomerys, the landlord. The landlady Judy, too, behaves cordially with Gangulys. She grudges their decision to seek the help of medical establishment for delivery. Ashima's problem is her inability to be cohesive, to be reticent and to cavil at everything that is unfamiliar. The novelist depicts Ashima's alienation saying:

She has kept her disappointment to herself, not wanting to offend Ashoke, or worry her parents. Instead she writes in her letters home, of her powerful cooking gas that flares up at any time of day or night from four burners on the stove, and the hot tap water fierce enough to scald her skin, and the cold water safe enough to drink. (30)

Ashima is so much obsessed with the native influence that even a little discomfort makes her cry. She seems to lack the fighting spirit which Ashoke has, but the exigency of the situation prompts her to move out for rice. She feels proud to discover a routine for herself. She is flanked by Americans' smile on showing their appreciation for the child in the pram. Though Ashima doesn't return their candid gestures yet she realizes for the first time that it's not the foreign country but her own isolation and closed nature that troubles her. Ashima's alienation thins as Gogol grows in months and years. She finds little relieved on Gogol's annaprasan ceremony in the ambience of Bengali couples discussing issues having a native flavour. But all these still are less compared to her family members' reminiscences. Lahiri makes a close observation of Ashima's helplessness saying; "She cannot help wishing her own brother were here to feed him, her own parents to bless him with their hands on his head. And then the grand finale, the moment they have all been waiting for." (40)

Ashima lacks in the qualities of adjustment. Ashoke, on the contrary is a forward looking character attracted towards foreignness. He is not the typical Indian stuck to traditional beliefs rather he loves making adventures. We are reminded how he was reading the Russian author

Nikolai Gogol's story 'The Overcoat' even on that fateful night in the train when a major accident took place. He had found much substance in the co-passenger Ghosh's advice to see and experience the outside world. Ghosh's instruction may be considered as a link to connect the east and the west. Ghosh advises Ashoke in the following lines: "Do yourself a favor. Before it's too late, without thinking too much about it first, pack a pillow and a blanket and see much of the world as you can. You will not regret it. One day it will be too late." (16)

Admirably, Ashoke, despite facing lots of hardships after the train accident, had applied for his engineering studies abroad even without fellowship initially. He is a post-modern, a post-colonial person who understands that the boundaries that exist in our thoughts hamper our growth and authentic existence. He braves all emotional chords that pull him homewards and packs up for his studies. The novelist records the incident lucidly: 'His siblings had pleaded and wept. His mother, speechless, had refused food for three days. In spite of all that, he had gone.' (20)

Ashoke knows well that knowledge and exposure of the outside world adds lustre to one's personality. Readers realize Ashoke's precocious nature when in annaprasan ceremony he wants his son to hold the pen and not money. When someone points out that an American boy must be rich, Ashoke retorts immediately. He is above the petty considerations of narrow ethnicity. He rather believes in world citizenship which can be realized not through money but by pen. Ashoke's gesture symbolizes his concern for education that alone can encourage

worldly ties and bonds. Ashoke has a global outlook and he feels proud to be appointed an assistant professor (of electrical engineering) who teaches American students. His birth and parentage in the east had filled in him a desire to prove his mettle in the west and he achieves that by being a professor in Boston. The novelist describes Ashoke's satisfaction in the following lines:

What a thrill, he thinks, to stand lecturing before a roomful of American students. What a sense of accomplishment it gives him to see his name printed under "faculty" in the university directory. What joy each time Mrs. Jones says to him, "Prof. Ganguly, your wife is on the phone." (49)

Ashoke believes more in reasoning than in emotional outpourings. He keeps himself updated by reading international news and tries to associate himself with the happenings around. As Ashoke grows in stature, Ashima's anguish also increases. Ashoke is open to new challenges which Ashima often dodges and invites unnecessary worries. The feeling of being in a foreign land is so deep in her psyche that she considers it a 'lifelong pregnancy.'

Ashima's prejudiced opinion towards America melts when she finds her lost bags recovered. She had left her bags while boarding a subway train after shopping. The thought of going to her hometown had gripped her mind so much that she left all the bags before boarding the train. She regretted her mistake but Ashoke called the MBTA lost and found and all the lost bags were returned. This not only melted Ashima's frozen evaluation of America but also bred in her an admiration for the country she detested too much. Ashima was under the

impression that things once lost are never recovered. But this small incident opens her eyes and she undertakes a journey towards knowing the merits of other countries and cultures. The novelist observes this change in Ashima: 'Somehow, this small miracle causes Ashima to feel connected to Cambridge in a way she has not previously thought possible, affiliated with its exceptions as well as its rules.'(43)

Ashima's real problem is her loneliness and she feels upset at Ashoke's shifting to university –subsidized apartment. She grows more finicky over Ashoke's refusal to a position at the North-eastern, which could have enabled them to stay in the city. Ashima's retreat to past often intimidates her present. She loves to accompany Gogol to school but as he grows, Ashima again clings to the loss of his past time habit of holding on to her. Ashima always wants to recline to something, to live a life protected and permeated with the core of belonging. Though good at English, she prefers reading Bengali books or writing letters to her mother than reading English books and journals in public library. She also emphasizes on Gogol's memorizing children's poems by Tagore and names of deities adoring goddess Durga. This amply hints at her closed and nostalgic nature.

Ashima loves both her children very much but she reacts when she feels her own cultural beliefs hurt. She disapproves of Gogol's visit to cemeteries and rubbings brought by him. She grows superstitious and considers it a bad omen. The novelist records Ashima's helplessness in the following lines: "Never before has she rejected a

piece of her son's art. The guilt she feels in Gogol's deflated expression is leavened by common sense. How can she be expected to cook dinner for her family with the names of dead people on the walls?" (71)

Ashoke is indubitably a practical person and though he is not averse to his Indian roots and connections, he tries his best to adjust himself with changing times and place. Though Ashima feels uneasy at times, she yields to Ashoke's insistence. The novelist shows the couple's admiration for celebrating the birth of Christ as their children Gogol and Sonia love to do so. It is the result of Ashoke's persuasion that Ashima sometimes makes American dinner and also cooks for Gogol sandwiches with bologna or roast beef, Ashoke knows well that their children might be the victims of not only their rigidity but also the problems of those children who oscillate between the rigours of two cultures and stifle because of their identities at stake. Ashoke tries his best to counterbalance these conflicts of children, keeping himself on the margin to allow the progeny more space. The novelist writes:

Though he is now a tenured full professor, he stops wearing jackets and ties to the university. Given that there is a clock everywhere he turns, at the side of his bed, over the stove where he prepares tea, in the car he drives to work, on the wall opposite his desk, he stops wearing a wrist watch, resigning his Favre Leuba to the depths of his sock drawer. In the super market they let Gogol fill the cart with items that he and Sonia, but not they consume: individually wrapped slices of cheese, mayonnaise, tuna fish, hot dogs. For Gogol's lunches they stand at the Deli to buy cold cuts, and in

The Namesake delineates the east-west theme as enriching and recreating. The novel named after Gogol shows the chief protagonist as a blend of two cultures that at times creates fissures in his identity. Unaware of the trauma that his name hid behind, he often cursed the moment he was born and also hated the inconsistencies and impediments of his namesake, Nikolai Gogol, the Russian writer's life comprised. His name becomes a butt of laughter and a mystery for everyone. As he grows up, he develops distaste for his own name. When his English teacher throws more light on the Russian writer's life, Gogol's hatred for his name worsens. He feels himself devoid of his identity when his father presented a book on his fourteenth birthday. It is now that he realizes that he has been named after the last name of an author. An impenetrable sorrow strikes him and Lahiri says rightly: "Not only does Gogol Ganguly have a pet name turned good name, but a last name turned first name. And so it occurs to him that no one he knows in the world, in Russia or India or America or anywhere, shares his name. Not even the source of his namesake." (78)

Gogol feels himself insignificant because he does not date any girl like his American friends do. His Indian atmosphere at home doesn't encourage such moves and he feels his identity at stake. At times he's pooh-poohed by his friends and suffers from an inferiority complex. He often wishes if he could change his name and he does that too. The change of his name from Gogol to Nikhil invites again a sea of troubles for him. His new name brings him some new acquaintances but relegates his identity to the margin. This new identity prompts him to

a thorny path where Gogol feels embittered, undecided and threatened. He is caught in a new dilemma and the shadows of the Russian writer's predicaments often cast their imprint on his life. He feels divided within and Lahiri embalms his wounds dexterously in the following lines:

Part of the problem is that the people who now know him as Nikhil have no idea that he used to be Gogol. They know him only in the present, not at all in the past. But after eighteen years of Gogol, two months of Nikhil feel scant, inconsequential. At times he feels as if he's cast himself in a play, acting the part of twins, indistinguishable to the naked eye yet fundamentally different. (105)

Gogol alias Nikhil starts realizing the cultural differences once he befriends Ruth, an American girl whom he felt to be in love with. Blinded by initial romantic heat and dust, he marks cultural gaps in the thought processes of his parents and Ruth's. He makes romantic forays with Ruth but always with a lurking fear of his parents' disapproval if they ever came to know. Ruth's fearless advances towards him and then their rendezvous at times make him skeptical about the future of their bond. He knows for certain that it would be indigestible for his parents to accept Ruth. Lahiri observes: "Ruth tells him she doesn't mind his parents' disapproval that she finds it romantic. But Gogol knows it is not right. He wishes his parents could simply accept her, as her family accepts him, without pressure of any kind." (117)

Gogol feels himself quite low to find Maxine's, (his next girlfriend) parents not minding her boyfriend coming to her home. Gogol's thought processes undergo a cataclysm to discover the mystery of his name. It is during Ashima and Sonia's India tour that Ashoke lives alone on Pemberton road. It is during those days that Ashoke unravels the train trauma giving him a limp. Gogol's name was another limp though it had saved Ashoke's life. Gogol is suddenly filled with remorse of how his father suffered all these years alone with this secret. The mere imagination of all that Ashoke suffered 28 years ago drenches his heart and Gogol laments miserably. Lahiri too sympathizes with Gogol:

He imagines his father in his twenties as Gogol is now, sitting on a train as Gogol had just been reading a story, and then suddenly nearly killed. He struggles to picture the West Bengal countryside he has seen on only a few occasions, his father's mangled body, among hundreds of dead ones being carried on a stretcher, past a twisted length of maroon compartments. Against instinct he tries to imagine life without his father, a world in which his father does not exist. (123)

Encounter and interface despite unfolding certain differences between two cultures, make people observe various things minutely. In this respect Gogol gets to know and learn many new things as compared to his parents. We are reminded of how after his break up with Ruth, Gogol falls in love with Maxine. Here too he finds the least interference of parents in children's affairs. He finds to his great surprise, Maxine's parents warm and affectionate towards him. Gogol learns some new mannerisms and develops interest in their food habits. He

finds too much difference in his home atmosphere where no stranger can get the privilege of being 'effortlessly incorporated' (136) as he has been into Maxine and her parents' lives. During the days he spends in their house, he has been able to make a comparative analysis of two cultures. The new culture allows more room to children's wishes and parents-children relationship moves on amity and is not tightened by stringent rules. Lahiri too throws much light on this cultural difference: 'She has the gift of accepting her life; as he comes to know her, he realizes that she has never wished she were anyone other than herself, raised in any other place, in any other way.' (138)

Gogol is also surprised how despite heated and repeated arguments at dinner table, Maxine lives a happy life. Maxine is flabbergasted to know that Gogol's parents cannot display their love before their children. As Gogol gets more and more familiar with Maxine's parents and their home, he feels startled also at times. Understanding the difference, he tries to be rational and feels betraying himself too. He often feels guilty and remorseful: "He cannot imagine his parents sitting at Lydia and Gerald's table, enjoying Lydia's cooking, appreciating Gerald's selection of wine. He cannot imagine them contributing to one of their dinner party conversations. And yet here he is, night after night a welcome addition to the Ratliffs universe, doing just that."(141)

Gogol comes to meet his parents and to keep her mother's request. Ashima has prepared all Indian dishes on Gogol's birthday. While the mother does everything

very carefully, Ashoke, who has known much about American life by now, doesn't show any protest. Ashima, too, doesn't show any reaction when Maxine addresses her by her name. Ashima's Indian upbringing and her cultural orientation could never have tolerated such an effrontery yet her exposure to a new culture prepares her for such occasions. Moreover, she maintains her Indian ethos of calling Ashoke as 'Nikhil's father' while telling Maxine. Not revealing her intent at that hour yet Ashima had resolved never to think of Maxine as her daughter-in-law. Maxine is also querulous about Ashoke's use of 'Baba' for Gogol. Gogol understands the exigency of the situation and assures her of explaining these things later.

East and West not only meet in Gogol rather it also creates a sort of conflict in him. After he adopts a new name 'Nikhil', he seems to have a passport to his freedom and his fulfilment of his desires, which his friends often did. But at times, he feels that this new identity has given him a placement, which on occasions, prompt him to feel guilty. The idea of celebrating his 27th birthday with Ruth and her parents of course entices him but he grows dispassionate soon. He hears an inner voice that makes him realize his lapses. Jhumpa Lahiri rightly records:

It is in the midst of the laughter of these drunken adults, and the cries of their children running barefoot, chasing fireflies on the lawn, that he remembers that his father left for Cleaveland a week ago, that by now he is there, in the new apartment, alone. That his mother is alone on Pemberton road. He knows he should call to make sure his father has arrived safely, and to find out how his

mother is faring on her own. But such concerns make no sense here among Maxine and her family. (158)

Gogol transforms after his father's sudden demise in a hospital. The news shatters him and generates in him a sense of responsibility. He moves to Cleveland to see the mortal remains of his father. He takes stock of his father's apartment at Cleveland and settles the accessories Ashoke had taken on lease. He sympathizes with his mother and is grieved to see her bare wrists. He seems more responsible and decides to go to Calcutta to scatter his father's ashes in the Ganges. His wilful exclusion of Maxine to Calcutta trip reflects his maturity and dawning of reality though this leads to his stepping out of his beloved's life. Gogol seems to have wakened from a dream which was romantic not yet real. He soon gets to discover that Maxine got engaged to another man. This new knowledge makes him wonder how relations matter less to girls like Maxine.

Gogol was only half aware of his cultural roots as long as his father was alive. But his father's death not only devastated him but also made him more responsible. He bids adieu to his life of sensations in America and agrees to marry Moushumi just to keep his mother's wish. He attaches less importance to Moushumi's zig-zag relations with others and in stead marries her in the most traditional ways. Gogol perhaps has forgotten that Moushumi has only a Bengali name and Bengali parents. She was rather more influenced by the glitters of Western ways of life. She was a new woman who cared for her space more than anything else. The notion of adopting Ganguly surname appeared like an appendage which Gogol understood yet he didn't reveal. He had sacrificed

himself on the altar of tradition his parents were so proud of. His east-west blend had made him absorb everything but his silences were not meaningless. The novelist draws Gogol's condition very minutely.

From the beginning he feels useless Moushumi makes all the decisions, does all the talking he is mute in the brasseries where they eat their lunches, mute in the shops where he gazes at beautiful belts, ties, paper,, pens; mute on the rainy afternoon they spend together at the d'Orsay. He is particularly mute when he and Moushumi together get together for dinners with groups of her French friends, drinking Pernods and feasting on couscous or choucroute, smoking and arguing around paper-covered tables. (231)

Gogol has to pay heavily for his allegiance to his parents' wish. He blindly submits to her mother's wish and marries Moushumi , who valued her personal wish more than anything else. Gogol's liberal attitude allows her more room for Moushumi's choices, which at times, prompt her husband to doubt his own capabilities. The novelist seems to be on Gogol's side when she says: 'They didn't argue, they still had sex, and yet he wondered. Did he still make her happy? She accused him of nothing, but more and more he sensed her distance, her dissatisfaction, her distraction.' (271)

Gogol ultimately becomes a scapegoat who bears all blows. Since he assimilates both the East the West in him, he doesn't behave rudely with Moushumi who has been infidel to him. Gogol rather allows Moushumi to go

her way but he suffers humiliations and defeat. He appears to grow more fatalistic and realistic at the same time. His fatalism reflects the way he remains witness to the topsy-turvy life he has shown. As regards his realism, he doesn't find fault in Moushumi who has seen more life than him, more in the sense that she was born to Indian parents, brought up in America and had brandished herself in a new language i.e. French. Gogol seems to derive some satisfaction from the fact that his mother will divide her time between India and America. He is relieved to see Sonia getting united with Ben, a boy of her choice. As regards his own, he would consolidate himself in solitude that he had longed for all these years. The novelist also records:

Gogol knows now that his parents had lived their lives in America in spite of what was missing, with a stamina he fears he does not possess himself. He had spent years maintaining distance from his origins; his parents, in bridging that distance as best they could. And yet, for all his aloofness towards his family in the past, his years at college and then in New York, he has always hovered close to this quiet, ordinary town that had remained, for his mother and father, stubbornly exotic. (281)

Jhumpa Lahiri, thus through her novel, has been able to establish the fact that east-west encounter is a reality. It seems only a misnomer to say that they cannot meet. One has to look forward to fresher possibilities and accept the differences. In fact, we need to negotiate with the differences. Lahiri's characters strive "to reconcile themselves to their shifting and evolving identities that are a result of their migratory experience." The

Gangulys, though skeptic at times, try to merge in the new world albeit the pull of their native culture often appears heavy. The much critical Ashima seems to develop love for the new country, which gave her husband, hearth and happiness. She loses her husband yet her decision to stay both in India and America shows her acceptability of two homes. We, as readers, find Ashima celebrating Christmas and 'Thanksgiving' besides reminiscing Durga Puja with other Bengali couples. Ashima's approval of Sonia's marriage with Ben again is her acceptance of multicultural characteristic of postcolonial, third world reality. Gogol runs to the tune of his adopted culture but gets disillusioned soon and decides to live a solitary life in order to reclaim his native as well as of his parents' culture. He determines to suffer a penance for his deviations of the past and does not stop Moushumi to suffer the tedium of traditional ties. The east-west interface is a cementing force that solidifies Lahiri's characters, who transcend space and time. In fact, humans are migrant by nature since new knowledge cannot emanate without migration. The observation of Antonia Navarzo Tejero about Jhumpa Lahiri in this regard is very perspicuous:

Lahiri writes with sensibility about her family's ethnic heritage and the lives of South American immigrants in the United States. She is an interpreter of conflict between humans, sometimes between immigrants and natives, some other times among natives, or immigrants only. So from my point of view, Lahiri transcends narrow nationalism and evokes universality.

*Abstract:

Merger is usually associated with strengthening of the firm's financial position, efficiency through reduction of production and distribution costs resulting in economic efficiencies. However, on the other hand, some mergers may cause harm to the consumers and give adverse effects to economy society. Thus, the study starts with the concept of consumer welfare by taking into account various jurisdictions' experiences on practicing merger control with Competition Law elements which highly recognise consumer welfare and it further discusses how the consumer welfare brings impact to economic sustainability. By limiting its scope to Malaysia, this study examines its merger control and whether it provides protection to the consumer welfare. The paper ends up with several recommendations that may be adopted by Malaysia to improve its merger control for consumer welfare towards economic sustainability.

1. Introduction

Observing from the advanced corporate behaviour in major industries, the financial market has become more vigorous in accelerating economic growth. In economic context, sustainable development means the ‘development that meets the needs of the present without compromising the ability of the future to meet their own’¹ thus constitutes a normative judgment for the future welfare rather than for present time. The concept of sustainability will not only look into the economic efficiency per se but also the ‘ethical commitment to the welfare of future generations’ giving importance to the ‘access to resources and the distribution of costs and benefits’². It has been accepted that economic sustainability means the ‘maintenance of capital, or keeping capital intact’³. This correlates with the definition of income being the amount individual can consume for a period and yet still be well off at the end of it⁴.

Significantly, mergers and acquisitions ‘form [of] inter-firm cooperation and coping mechanism utilized by firms in the face of the new competition’⁵. This may ironically increase in the near future despite the global financial crises since many corporations aim to

be the ‘survival of the fittest’⁶ either due to the desire to increase market power or market for corporate control⁷.

Even though mergers are usually associated with strengthening of the firm’s financial position by economic efficiencies through reduction of production and distribution costs, however, it may bring harm to the consumers and give adverse effects to economic society. Thus, it is appropriate to consider whether merger control imposed has considered consumer welfare in determining the best possible ways towards attaining economic sustainability.

Amongst the ultimate aim when assessing the competitive effects of any mergers is to ensure that the said mergers will maximise consumer welfare⁸. In general, the idea behind competition policy is to not only protect producers and consumers from anti-competitive practices⁹, but it also promotes transparency and attracts foreign investors which in turn, will reinforce and maximize the benefits of such investment¹⁰.

In merger control particularly, the concern is whether it will give a negative impact or the possibility of the market being less competitive¹¹. To have the balance between concentration¹² and competition is pertinent to ensure any cooperation will not lead to anticompetitive behaviour. Thus, it demands;

‘...increased vigilance and sophistication on the part of competition policy enforcement authorities¹³ ...care being taken at the same time not to stifle innovation and, in so doing, competition and competitiveness’¹⁴.

Due to the notion that competition forbids abuse of market power and at the same time promotes new market entry, its policy has been used as a means to reward efficient firms and sanction inefficient firms. A theory suggested by a UNCTAD¹⁵ secretariat is that in any merger situation, ideally, firms are usually quick to adapt to the changing markets and to the unyielding entry of new entities. Factors such as flexibility, fast-paced and ability to adjust would indicate its effectiveness, thus creating some form of competitiveness¹⁶ wherein

⁶ UNCTAD (n 5): wherein the author also noted that ‘it can therefore be said that competition kills competition’

⁷ Richard Whish, *Competition Law*, (6th Ed, Oxford University Press 2009)

⁸ Ibid

⁹ such as raising costs and prices and reducing production

¹⁰ Richard Whish (n 7)

¹¹ UNCTAD (n 5)

¹² The EC Merger Regulation (ECMR) has sometimes referred to mergers in EC system as ‘concentration’.

¹³ UNCTAD (n 5): In this respect, UNCTAD as a competition agent should be also mentioned among the institutions that devote resources to the promotion of uniformity in international antitrust. The approach of this organization tends to follow the view that developing countries should have an articulated competition policy with merger control in place, which ultimately promotes creation of new competition agencies.

¹⁴ UNCTAD (n 5)

¹⁵ UNCTAD (n 5)

¹⁶ UNCTAD (n 5)

competition may become a fierce struggle for any monopolist to be¹⁷. It has been recognised that the most affected by market failures is the developing markets¹⁸. As such failure may not only dilute competition but more significantly, may impede the competitive force on the whole, thus, a framework on competition policy is necessary¹⁹.

2. Consumer Welfare under Merger Control

The term *consumer welfare* has created major debates among scholars especially when used as complementary to competition law and policy. Generally, consumer welfare means the welfare of individuals 'who are confronted by actual or threatened exercises of seller market power in the output market'²⁰. In other words, it refers to whose benefits derived from the consumption of goods and services²¹. In anticipation of competition law and policy, *consumer welfare* serves as an operational principle where it refers to the direct and explicit economic benefits received by the consumers of a particular product as measured by its price and quality²². Precisely, the economist termed it as *consumer surplus* which also uses the notion to measure consumer welfare as the welfare of consumers as a whole that can only be maximized when the total surplus is maximized²³.

According to the economist, consumer surplus is maximized when marginal utility is made equal with price (MU=P) i.e. the marginal benefit from consumption is equal to the marginal cost of consumption²⁴. The fact that no economy is static as conditions of demand and supply is constantly changing, including fashions and technologies, the patterns of consumption and production will cease *Pareto optimality*²⁵. Hence, without the government intervention²⁶ and only relying on the *invisible hand*²⁷; *Pareto optimality* could be restored. In order to have an effective active flow of *invisible hand* the law plays an important role by

¹⁷ UNCTAD (n 5)

¹⁸ Sometimes be referred as 'emerging markets'.

²⁴ John Sloman, *Economics*, (4th edn, Prentice Hall 2000)

²⁵ Ibid: Pareto optimality achieved where all possible improvements have been made and as a results it is impossible to make anyone better off without making someone else worse off i.e. social optimality.

²⁶ J. Sloman (n24): Government intervention under the economics refers to the forms of intervention that can change the way the markets operate.

²⁷ J. Sloman (n24): Invisible hand refers to individual actions of producers, consumers and factor owners all seeking their own self interest.

encouraging the parties involved in the *invisible hand* especially producers and factor owners;

*‘...to achieve success in ways that benefit consumers, such as by adding new features or entirely new products, lowering the prices they charge for their products, expanding the markets for those products, and identifying and implementing better or more efficient ways of making those products or distributing them to consumers’*²⁸.

By guiding the *invisible hand* through antitrust laws, it could partly help the economic to be sustainable.

It is generally accepted that *consumer welfare* plays its role in the application of competition law and policy especially as the ‘*criterion for judging legality*’²⁹. What matters under competition law and policy is to decide whether the undertakings’ conducts are pro-competitive or anti-competitive. *Consumer welfare* acts as a yard-stick where one would ask whether such conducts maximizing or reducing the consumer welfare.

Additionally, the goal of merger control is understood to promote social welfare³⁰. Thus, the same yard-stick applies and since this is the case, it is also fundamentally important to specify which consumers that the law cares about. Werden agreed that ‘buyers are *consumers* because they are people in the standard textbook treatment,’³¹ while Rosch opined that *consumer* whose welfare the Merger Control are concerned about are consumers in the output market³². Specifying the sorts of *consumer* that the merger control cares about is important for the application of welfare standard taken from economics point of view. This welfare standard³³ measures the performance of an industry by defining how the welfare of different groups³⁴ in the economy is taken into account³⁵.

²⁸ David L. Meyer, “Section 2 Standards and Consumer Welfare: Some Lessons from the World of Merger Enforcement”, 2007 Colum. Bus. L. Rev. 371

²⁹ Gregory J. Werden (n22)

³⁰ Gregory J. Werden (n22); An Renckens, “Welfare Standards, Substantive Tests, and Efficiency Considerations in Merger Policy: Defining the Efficiency Defense”, June 2007 3 J. Competition L. & Econ. 149: Social welfare is used because ‘merger will affect the welfare of different groups in society--possibly in opposite directions (positive for merging parties, but negative for consumers)--so that these welfare effects should be balanced against each other to make a decision about the appropriateness of the merger. In general the welfare standard consists of a balancing of consumer and producer surplus and no other social objectives (such as the effect of the merger on employment) are considered’.

³¹ Gregory J. Werden (n22)

³² J. Thomas Rosch (n20)

³³ An Renckens (n30): The welfare standard can be in many forms and the generally accepted by most scholars are price standard, consumer surplus standard, Hillsdown standard, weighted surplus standard, and total surplus standard.

³⁴ An Renckens (n30): Groups here restricted to producer and consumer. Therefore, if a merger control holds to maximize consumer welfare goal, it is significantly important to define who are those consumers’ welfare being cared.

³⁵ An Renckens (n30)

As mergers will more often than not be open to competition issues, ICN³⁶ have raised a question; ‘should the focus of merger policy be on preserving competition, protecting consumers or preserving economic efficiency?’³⁷ Whatever roles does the consumer welfare plays in merger control, different merger control law may suggest a different meaning for consumer welfare³⁸. From the above discussions, it is pertinent to look into several other jurisdictions and their experiences in their merger control practice having the element of competition law with high regards to consumer welfare. The characteristic of effective merger control within a jurisdiction is a result not only from its interaction of competition within the economy but also its advocacy thereof. This culture, combined with consumer welfare element will increase greater observance of competition principles and consecutively encourage self-discipline³⁹.

2.1 U.S’ Merger Control

The primary competition law governing mergers and acquisitions in the US would be the Sherman Act, the Federal Trade Commission Act and the Clayton Act. Pursuant to section 7 of the Clayton Act of 1914, ‘...No corporation...shall acquire ... the whole or any part of the stock or other share capital ... [or] ... the whole or any part of the assets of another corporation [having] ... the effect of such acquisition may be substantially to lessen competition, or to tend to create a monopoly’⁴⁰. This shows recognition on the role of efficiencies in merger control.⁴¹

Additionally, the Horizontal Merger Guidelines⁴² provides its analytical framework. Section 4, dealing with efficiencies state that consideration will only be made to merger-specific efficiencies.⁴³ No challenge can be made if ‘*cognizable efficiencies is not likely to be anticompetitive in any relevant market*’⁴⁴, that may cause potential harm to the consumer.⁴⁵

⁴¹ Refer to Kolasky, William (2008), ‘The Justice Department’s Section 2 Report: A Mixed Review’, *Antitrust Source*, 8(1), 1–4., pp. 23135 and *Federal Trade Commission v. H.J. Heinz Co.*, 246 F.3d 708 (D.C. Cir. 2001), p. 720 cited in Gregory J. Werden (n22)

⁴² Refer to the revised section 4 Horizontal Merger Guidelines issued by the U.S. Department of Justice and the Federal Trade Commission in April 8, 1997. (Ref: U.S. Department of Justice and Federal Trade Commission, HORIZONTAL MERGER GUIDELINES (1992, revised 1997).

⁴³ Merger specific efficiencies is when the efficiencies are likely to be accomplished with the proposed merger and unlikely to be accomplished in the absence of either the proposed merger or another means having comparable anticompetitive effects.

⁴⁴ <http://www.justice.gov/atr/public/guidelines/horiz_book/hmg1.html> <accessed 24th February 2010>

⁴⁵ Gregory J. Werden (n22)

This analytical approach of *evaluating the likely net effect of a transaction on price and output to mergers*⁴⁶ indicate that US has taken the consumer welfare approach by recognising consumer benefits via the market forces⁴⁷.

It has been observed that the Guidelines are leaning towards the price or consumer surplus test⁴⁸. Baker⁴⁹ referred to the Guidelines to resolve the standard of welfare and Kolasky and Dick on the other hand have both viewed the Guideline as having a *'hybrid consumer welfare or total welfare model'*⁵⁰. US has also note that *'over the last half century, [US] merger analysis has become increasingly well-grounded in economics and 'has become more clearly focused solely on protection of consumer welfare'*⁵¹, thus refuting views that it seeks to protect competitors rather than competition. It reiterates that, *'[t]oday, [US] merger analysis is focused squarely on 'whether the merger is likely to create or enhance market power or to facilitate its exercise.'*⁵²

2.2 EC Merger Regulations

For European Union, the EC Merger Regulations 2004, wherein Article 2(3) provides the substantive test for merger control in determining whether a merger would significantly impede effective competition taking into account the interest of the consumers (intermediate and ultimate), the progress of which must be for the advantage of the consumers⁵³. By using substantive test, the Commission take note *'any substantiated and likely efficiencies'*⁵⁴ that translated as consumer welfare and not producer welfare⁵⁵ as the Commissions in both its Regulation⁵⁶ and guidelines⁵⁷ indicates that, the test made must ensure the customers will not be *worse off as a result of the merger*.

⁵⁶ Recital 29

⁵⁷ (2004a, paras 7778) in Gregory J. Werden (n22)

Further, the Commission's flexibility in applying the test shows that it place high importance on consumer benefits. The Commission have considers 'alternatives that are reasonably practical in the business situation faced by the merging parties'. Price test was used if all customer benefits derived from merger efficiencies would come from short-term price effects whilst to 'benefit from new or improved products or services, for instance resulting from efficiency gains in the sphere of R&D and innovation'⁵⁸, price test was not used. Efficiency effect will be considered in cases that 'benefit consumers in those relevant markets where it is otherwise likely that competition concerns would occur.'⁵⁹

2.3 UK – Enterprise Act 2002

In the United Kingdom, the use of substantive test⁶⁰ is not absolute, this test is used in determining whether any merger would result in a substantial lessening of competition but regards can also be made to mergers that produces 'relevant customer benefit' even if it fails the test. But, the benefit must be 'low[er] prices [with] higher quality or greater choice of goods or services' or 'greater innovation in relation to such goods or services' and that the *relevant customers* includes those incumbent competitors in relevant market, in a chain of customers and also future customers⁶¹.

The Competition Commission and Office of Fair Trading issued Guidelines (2009, ss. 4.201, 4.223) with the first consideration on whether merger generate efficiencies would prevent the merger from *driving up prices* and *decreasing output, innovation, productivity or product quality*. Then, thereafter it will be decided whether, even if not, merger-generated efficiencies *outweigh* any anti-competitive effects in terms of effects on customers⁶².

Thus, the U.K Guidelines only make considerations on merger specific efficiencies⁶³ and consecutively emphasis on 'efficiencies that arise in other markets provided that they benefit consumers'⁶⁴. It should be noted, that when a merger harm the customers, it 'will be presumed to lead to detriment to final consumers as well and that they do not consider it necessary to trace the path of adverse effects down the supply chain'⁶⁵. Hence, one can see that UK put high regards on consumer welfare as when it comes to mergers leading to the buyer's market power; it is the 'harms to customers and consumers at the end of the distribution chain' that matters⁶⁶.

2.4 Japan - Domestic Concentration for International Competition

Recently, it has been suggested that, 'international competitiveness can be achieved in the presence of domestic market concentration'⁶⁷ particularly in the newly industrialised Asian economies especially when the entry of foreign direct investment bring with it restraint of trade and also abuses of market power. Thus, regard should not only be made to its policies but also relevant legislations to govern it.⁶⁸ Japan in its government's procurement policies has made an investment barrier to protect its domestic industries from foreign direct investment. Other than setting rigorous standards and testing procedures limit the foreign investment and manufactured imports from flooding its market, one of the measures used by Japan is by imposing cross-holdings for foreign investors to gain entry in the domestic market which may impede hostile takeovers by foreign investors and consequently restricts foreign control.

This can be seen in their foreign direct investment as at January 2008 which represented just three percent of gross domestic product compared to US which represented fourteen percent. The effect of which not only it will allow profits but also the transfer of technological secrets to foreign owners. In US, many of the key jobs (in research and development, for instance) go to foreign workers, while the profits go to foreign holding companies that boost the tax revenues of foreign governments⁶⁹. Looking at this phenomenon, question arose as to whether by not actively participating in global arena and by putting restrictions on foreign investment under the then FIC Guidelines locally⁷⁰, does that entails that Malaysia is in fact considering the consumer welfare in its domestic region?

3. Malaysia's 'Merger Control'

Looking at the essence of competition policy, the capital control practised by Malaysia back in 1997 may be viewed as a method to protect the domestic market competition. Though there is no statutory competition law, but Malaysia has been practising the competition policy via its government's policies and indirect supervisions of financial markets. Other than that, the imposition of controls, have helped towards a financial market and by the implementation of corporate governance, it helps restructuring and strengthening the financial markets⁷¹. This can be seen in the commentary made by the High-Level Finance Committee on the newly reformed Corporate Governance Code wherein it was noted that,

'...the need for a code also results from economic forces and to re-invent the corporate enterprise, so as to efficiently meet emerging global competition... in market-oriented

⁶⁷ UNCTAD (n5)

⁶⁸ UNCTAD (n5)

⁶⁹ Dustin Ensinger, April 30, 2009 – 10.25am, America is Unilaterally Disarming Itself, Economy In Crisis – America Economic report daily, <http://www.economyincrisis.org/content/america-unilaterally-disarming-itself> (Accessed 10 Februari 2010); The writer further note that, 'This is certainly not a recipe for success. America should follow the lead of the Chinese and Japanese and begin taking steps to protect its vital industries, companies and assets from hostile takeover. China and Japan operate their economies as one big business fighting an economic war, it is time the U.S. joined the fight'.

⁷⁰ Note the recent changes made by the Prime Minister in respect of foreign equity ownership in Malaysia.

⁷¹ Shalendra D. Sharma, *The Malaysian Capital Control Regime of 1998*, p. 101-102

*economies, companies are less protected by traditional and prescriptive legal rules and regulations*⁷².

As aptly put by Wan Liza Md Amin, Malaysia need to enact its competition law, only then would uniformity and transparency can be implemented. However, the essence of competition in Malaysia's distributive implementation on issuing license, permit and approval in the Communication and Multimedia Act 1998 and also the Energy Commission Act 2001 indicates observance of competition policy at some level. But, like the corporate governance system, it will be pertinent in catering the needs and demands of the international level '...to cope with the advent of globalization and liberalization of trade'⁷³.

In this respect, one may find that, in enacting the regulatory framework on merger control, corporate and the competition laws should go hand in hand. As highlighted by Erlina Carletti, Philipp Hartmann and Steven Ongena, only when the regulation is competition-friendly then, it will give a positive impact on the economy efficiency⁷⁴. This is because; competition's merger control aim to prevent 'excessive market concentration'⁷⁵ whereas the corporate law aim to regulate the merger transactions and to protect the rights of the parties involved. The main problem of occurrences of mergers is the fear of excessive concentration which may lead to either substantial lessening of competition or strengthening of a dominant position in which case will create further problems, such as, increase of prices or reduction of consumer welfare⁷⁶.

The requirement to give prior notification to the merger transaction is designed for the ex ante control of the level of the concentration on the relevant market preventing the elimination of competition that might follow⁷⁷. As merger control under the competition law is usually made based on future prediction of the market structure and behaviour when (or, if) the merger takes place by using substantive test, this may require the burden of proof from the merging parties to prove that there will not be any negative effects on competition⁷⁸. This is different from the ex post competition control.

In Malaysia, the only reference made to 'merger control' is the laws governing mergers and acquisitions in Part IV Division 2 of the Securities Commission Act 1993 (hereinafter referred to as "the Act") and the Malaysian Code on Take-overs and Mergers 1998 (hereinafter referred to as "the Code"). The objective behind the Code is amongst others to ensure that minority shareholders have a fair opportunity to consider the merits and demerits of a takeover offer. It also imposes criminal liability for any false or misleading information

⁷⁸ Ibid

made⁷⁹. Another form of so-called ‘merger control’ measure includes the Guidelines for Regulation for Acquisition of Assets, Mergers and Takeovers issued by the Foreign Investment Committee (FIC)⁸⁰ which now have been repealed by the recent deregulation announcement made by the Prime Minister YAB Dato’ Seri Mohd Najib Tun Abdul Razak on 30th June 2009.⁸¹

Section 12 of the Code, provide amongst others, the announcement requirement under the pre-merger steps at the inception of any intended or proposed takeover offer.⁸² The provision also requires the offeror to notify the board of directors, its advisers, the relevant stock exchange and the Securities Commission certain necessary information and made application to the Securities Commission being the regulator. Additional protection includes, 35 days offer documents requirement, opinion by the board of directors to shareholders and independent advice circular.⁸³

These procedural requirements indicate that the Act and the Code are primarily enacted to protect the interest of the investors in general, particularly shareholders privy to the transaction. There is no indication whatsoever on the impact of the mergers on competition. Thus, from the above discussion it can be observed that, the ‘*merger control*’ in Malaysia does not make any reference to the *merger control* that is advocated by the Competition lawyers.

4. Conclusion

As highlighted above, any merger no matter how large and/or small the acquiring and/or acquired company will give an impact on the economy as a whole. Thus, mergers that are left unregulated may give an adverse effect on the economic sustainability because, in essence, an effective merger control is one that is able to balance between concentration and competition.

This is the reason why it is important to not only ensure the procedural law as a mode of control but also its substantive law to protect the investors (as accorded under corporate law) and also the consumer welfare (provided under competition law). Only then would mergers and acquisitions be beneficial to the economy as a whole.

⁷⁹ < www.secp.gov.pk/rc/CorpGovIntTrends/malaysia.pdf > assessed on 6.2.2010

⁸⁰ FIC is a committee within the Economic Planning Unit of the Prime Minister’s Office which implements government policies on the acquisition of assets or interests, and mergers or takeovers of companies and businesses, as well as on foreign investment in Malaysia. However, take note the recent announcement made by the Prime Minister Najib Razak on 30th June 2009.

⁸¹ Refer to the announcement made in the < <http://www.epu.gov.my/236> >

⁸² Section 12 of the Code requires that any intention or proposal of takeover offer must be formally announced vide a press notice to be given to at least three daily newspapers circulating throughout Malaysia, one of which shall be in the national language, and one in English. The Board of Directors of the target company must also make a press announcement within 24 hours of receiving the offer.

⁸³ Pre-Merger Notification, Lex Mundi Publication, Lex Mundi Ltd Aug 2006; The paper also provides that Securities Commission and the FIC, being the national regulatory agency may pursuant to Section 33E(3) of the SCA 1993 prescribes a fine not exceeding RM3 million or imprisonment for a term not exceeding 10 years, or both – the sanctions for not filing or filing an incorrect/incomplete notification. But, the Code does not provide for the procedures if the agency wants to challenge the transaction. Further, should there be an implementation of a merger before clearance or of a prohibited merger, the same as penalties for non-compliance will apply.

In analysing possible reason for this, we have argued that, it is consumer welfare that will bring impact on the economic sustainability. We have shown this, via stance taken by different jurisdictions which all in all place consumers as important stakeholders. As all nature of commercial and/or business transactions, mergers too will give an impact on the consumers, thus, anything that may harm the consumers may harm the economy as a whole.

However, we do observe that, merger control may also be regulated via soft laws (Code) and policies as applied in Malaysia. But, it has been suggested that, for an effective competition law and policy for any developing markets such as Malaysia, any policy adopted requires constant checks; periodic amendments and improvements⁸⁴.

To achieve a systemic competitiveness in a globalizing world economy⁸⁵, particularly in liberalisation of the economy, the approach undertaken by any jurisdiction should be comprehensive. Thus, to warrant a healthy competition and to take the benefits out of liberalisation, any new government policy must come with a corresponding competition policy⁸⁶.

Therefore, a stronger focus on competition law in merger control and how it will give impact on economic sustainability will definitely serve the market growth in Malaysia. More importantly, it will ensure the welfare of the consumers and even more broadly, it will keep Malaysia in control despite its rapid development.

The Precautionary Principle and the Controversy of GM Crops and Foods in Taiwan

Mei-Fang Fan *

Abstract

In a condition of scientific uncertainty, the precautionary principle has become an increasingly important theme in technological and environmental controversies about GM crops and foods. This paper examines some ways in which the Taiwanese public perceives the uncertainty of genetically modified (GM) crops and foods, and how precaution has played out in Taiwan. The research uses critical discourse analysis to examine a citizen report and expert opinions from the consensus conference on GM foods held in June 2008. It utilizes data gathered from in-depth interviews of environmental and consumer groups. The paper highlights the multiple knowledge claims of citizens and stakeholders, strong and weak interpretations of precaution, and the implications for GM crops and foods governance. It argues for the need to integrate the precautionary principle and democratic deliberation into the decision-making processes in Taiwan and elsewhere.

Keywords: The precautionary principle; scientific uncertainty; public participation; risk governance; GM crops and foods

* Associate professor, Institute of Science, Technology and Society, National Yang-Ming University, Taiwan

Introduction

In a condition of scientific uncertainty, the precautionary principle has become an increasingly important theme in technological and environmental controversies about GM crops and foods. It has become an important guide to protect human health and the environment. The precautionary principle was originally proposed in the Rio Declaration on Environment and Development during the Earth Summit in 1992. Principle 15 of the Rio Declaration states: “in order to protect the environment, the precautionary approach shall be widely applied by States according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation (UNCEC, 1992).” The 1998 Wingspring Statements also emphasized that: “When an activity raises threats of harm to human health or the environment, precautionary measures should be taken even if some cause and effect relationships are not fully established scientifically.” The precautionary principle has flourished. It is now found in many international statements of policy and in the texts of international conventions and protocols, such as the application of Sanitary and Phytosanitary of WTO in 1995 and the Cartagena Protocol on Biosafety in 2000 (Myers, 2006 a: 11-14). The United Nations Educational, Scientific and Cultural Organization (2005) published a report on the precautionary principle; it regards the principle as important for moral responsibility and legal norms.

The precautionary principle has been regarded as a deliberative principle in policy areas. It fosters moral deliberation of controversial public issues. It puts emphasis on an open, informed and democratic process. Affected parties are enjoined to deliberate and examine the full range of alternatives. The precautionary principle enables interactions and linkages between the scientific community and

the society (Schomberg, 2006).

However, there are many definitions of the precautionary principle. The interpretation of the precautionary principle can vary between weak and stronger versions; they range from calls for more research, asking for moratoriums, and embracing of ideas of justice, human rights, and even the inherent values of the environment (Throne-Holst and St ϕ , 2008: 101). The weakest formulations tend to be relatively protective of the status quo. In the words of O’Riordan and Jordan, (1995: 197), they “advocate a role for biased cost-benefit analysis, incorporate some concern for technical feasibility and economic efficiency arguments and tend to emphasise the importance of basing judgments on ‘sound science’.” The stronger formulations have more in common with the deep green worldview and ecologism. The lack of an unambiguous and fixed definition shows the need for a contextual interpretation (Throne-Holst and St ϕ , 2008: 101).

The issue of GM foods has become one of the most popular topics for deliberative exercises that involve the participation of ordinary citizens (Dryzek, et al., 2009). The rapid expansion of agricultural biotechnology reflects confidence on the part of some growers, the agriculture industry, and governments that the benefits of GM technology would outweigh negative effects. However, restrictions on GM commercialization and planting in the European Union, resistance from environmental groups, an increasing body of research, and the “no GMO” (genetically modified organism) of several major food producers show that GM crops and foods remain highly contested (Barrett, 2006: 242-243). Since the 1980s, the Executive Yuan of Taiwan has regarded GMOs research and development as an important to economic development (Chou, 2000). Since the regulatory institutions lag behind the development of GM technologies, the Science and Technology Advisory Group of the Executive Yuan has set up an inter-departmental Committee

on Gene Technology in 2006. The committee consists of representatives from several government departments, including the National Science Council, the Council of Agriculture, the Ministry of Economic Affairs, the Department of Health, and the Environmental Protection Administration. The committee is responsible for developing policies and integrative regulatory frameworks and establishing mechanisms for coordination.

The future development of GM technology and products will be influenced by how they are perceived by members of society (Napier et al., 2004: 70). This paper aims to examine how the Taiwanese public perceives the uncertainty of GM crops and foods, and how the concept of precaution has played out in the particular context of Taiwan. It employs critical discourse analysis to examine a citizen report and expert opinions from the consensus conference on GM foods held in June 2008. It utilizes data gathered from in-depth interviews of environmental and consumer groups. The paper highlights the multiple knowledge claims of citizens and stakeholders, strong and weak interpretations of precaution, and the implications for GM crops and foods governance. It argues for the need to integrate the precautionary principle and democratic deliberation into the decision-making processes in Taiwan and elsewhere.

The controversy of GM crops and foods in the Taiwanese context

The environmental and health risks of GM crops and foods have been discussed in recent scientific research. Topics include gene flow from GM crops to non-GM crops or related wild plants, the development of antibiotic-resistance, long-term impacts on biodiversity or ecosystems, and allergenic effects. The Starklink incident, in which corn approved only for animal rations ended up in human foodstuffs, shows that scientific uncertainties are inextricable from broader social and political

factors that shape the way technologies are developed, interpreted, and used (Barrett, 2006: 245-246). Wynne (1992) argues that it is useful to see the risks posed by a particular technology as a combination of the properties of that technology and the way it is used by people in a particular context and to place scientific knowledge within social, cultural, and moral perspectives.

The importation ratio of GM products from the USA to Taiwan is high, particularly GM soybeans and corn. At least 50% of soybeans in the Taiwanese market are GM soybeans (Chou, 2007: 153). The government's national biotechnology strategy is dominated by experts and technocracies; it defines the role of biotechnology for economic development in Taiwan, and it takes advantage of the new opportunities to promote Taiwan's scientific and industrial capacity (Chou, 2000). For Chou (2007), Taiwanese society seems less aware of global technological GMO risks. It continues to ensure GMO safety, and it has established related GMO labeling policies in 2002. The current decision-making process reflects the dominant technical and economic frame, the pursuit of a strongly expert-ruled policy, and the neglect of potential socio-economic impacts and public concerns.

In September 2003, the government confirmed that GM papaya had been illegally grown in Taiwan and sold on the market. The Agriculture Council has engaged in research into the development of papaya resistant to the papaya ring spot virus since 1998. While the papaya ringspot virus coat protein is seen as a potential allergen, the papaya seeds are being field tested (UDN News, 2003). This incident highlights the problem of risk governance and the potential negative impacts of GM foods on human health, the environment, and the agricultural export industry. It raises important questions of the problem of risk governance and who should take responsibility (Fan, 2009).

The National Science and Technology Development Fund sponsored the Science and Technology Law Centre of Institute of Information Industry to foster the development of GMO regulatory policy and the establishment of communication mechanisms. In response to a perceived need for greater public involvement in decision-making on the part of policymakers, academics, and the public, the Institute of Information Industry sponsored the Department of Sociology of National Taiwan University to conduct a citizen conference on GM foods to facilitate wider social discussions and to reflect a broader range of values of lay views on GM foods.

Citizens were selected on the basis of socio-demographic criteria. Volunteers were recruited through advertisements (e.g. newspaper and the internet), and they made applications by e-mail or post. With consideration given to age, gender, education, profession, and geography, there were 20 citizens randomly selected from 82 ordinary citizens who self-enrolled after public recruitment. The steering committee ensured that the readings on GM were clear and balanced. A two-day pre-conference was held on June 14, 15 2008 to inform the citizens about the GM controversies. The citizens listened to the presentations and had opportunities to query experts. The organizers made every effort to ensure that balanced views would be heard. The experts were consulted on four primary issues: (1) the impacts on public health; (2) the development of the industry and economy; (3) the impacts on the environment; (4) the regulatory framework and rights of consumers. The citizens took three days (2008 June 28, 29 and July 5) to study the problems, discuss issues, converse with experts, debate alternatives, and reach a conclusion. The first part of the consensus conference was devoted to a dialogue with experts. Experts from different disciplines offered short talks, and the citizens had an opportunity to ask individual experts for elaboration and clarification of their

presentations and to discuss further the issues. A total of 15 experts who hold various positions participated in the conference. During the second part, a citizen report was written that revealed that the citizens could not reach a consensus. The report was sent to the relevant governmental agencies (e.g. Science and Technology Advisory Group of Executive Yuan, Department of Health, Council of Agriculture).

Discourses on scientific uncertainty and active measures

The greatest concern of the citizen panel was whether GM foods have any negative impacts on human health and safety. The potential health risks of GM foods thus far discovered include the development of antibiotic-resistance, allergenic effects, the possibility of toxic effects, and the safety of transgenes. In the dialogue between the citizen panel and experts, one agricultural biotechnology expert emphasized that “no scientific proofs has proven that GM foods harm human health.” He held that GM foods are “not less safe than existing foodstuffs” and that “existing foodstuffs are not safe either.” The expert from the government and its research institutions adopted the standards of the WHO and the USA, which emphasize scientific proofs and that GM foods are taken to be substantially equivalent in regard to consumer safety if they are compositionally equivalent to existing foodstuffs (Yearley, 2008: 932). These experts did not highlight the differences between GM and ordinary foods, scientific uncertainty and unknowns; they did not represent the precautionary worldviews. Instead, experts from environmental NGOs put emphasis on the uncertainty of GM technology, and they indicated that there were experiments and research to show that GM feedings have had negative impact on rats.

According to the citizen panel, GM foods sold on the market have passed safety testing, and scientific research does not show any negative impacts on human health.

However, GM foods have been regarded as “novel products,” and they might cause and unknown negative effects in the future. Long-term experiments, research, and monitoring were judged as necessary for the health of future generations. They pointed out that the Council of Agriculture Council and Department of Health are the institutions in charge of the regulation and management of GM crops and foods, and they asked these agencies to cooperate and take responsibility. The citizen report contained some precautionary caveats that correspond to the elements of pro-action. They suggested:

The government should spend more money on the improvement of testing and technology and promote strict legislation for complete safety assessment. (The Conference Report, 2008)

The second topic concerns whether Taiwan should invest in the development of GM technology. The citizens were divided. In the dialogue between the citizen panel and the experts, one expert from an environmental NGO emphasized that GM technology cannot increase yields and reduce the use of pesticide. One interviewee from another environmental NGO adopted a precautionary position and indicated: “Now the risks of GM technology are still very controversial. Taiwanese did not totally understand them, but they accept them. It is unnecessary to let the public bear the unneeded risks (interview E1).” One agronomy expert said that it is not easy to develop GM technology in Taiwan because of the shortage of arable land, the small-scale of the farm system, and the wide variety of crops. He emphasized that the “traditional farm is even more advanced, not falling behind. What the public can do is to insist on supporting local agriculture.” The expert in commerce put emphasis on the benefits of GM crops. The agricultural biotechnology expert

indicated that GM technology will be continually enhanced and GM crops can be grown in harmony with the environment. Most citizens on the panel argued for the need to develop GM technology and that it is global trend, which Taiwan must follow:

The advance of technology is irresistible, so Taiwan cannot be absent from the trend of new technology in a new era. We cannot give up making renovations for fear of a little trouble... If we do not develop this technology, Taiwan will become an importer country of the technology, and will lose autonomy of relevant technology, even though do not have the capacity of GM crops and foods testing. Therefore, we need to develop this technology on order to protect our rights. (The citizen report, 2008)

However, a few citizens expressed their worry about the long-term potential risks of GM technology development and the high costs of research and development. Finally, the citizen panel made a compromise and agreed on “the development of testing and GM technology in the field medicine rather than foods.” The citizen panel also expressed their concerns about traditional agriculture, and they emphasized that the government could help farmers to develop agricultural products with particularity and added value.

The discourse of the citizen panel tended to emphasize the benefits that the advanced technology will bring. Technology was seen as a tool that can strengthen economic development. Their report reflects anthropocentric thought and an utilitarian view. It seemed to adhere to technological optimism. By this view, human beings only need to change their choice of technology rather than changing their ways of life (Throne-Holst and St ϕ , 2008: 105). To consider whether Taiwan

should invest in the development of GM technology and the economy necessarily involves consideration of values and the imagination of Taiwan. Although some citizens mentioned the potential impacts on the environment, the citizen panel did not have further debate on values, ethical positions, and their arguments and reasoning. They tended to seek the acceptable and pragmatic program in the practice. The characteristics of a consensus conference that asks the citizen panel to seek common ground might engender this position.

The third topic concerned the potential impacts on the environment, which mainly involves the risks of hybridization, impacts on the non-targeted species, and harm to eco-system and biodiversity. In the dialogue between the citizen panel and experts, one agricultural expert adopted a very positive position on GM technology. She emphasized that GM technology has positive functions, including an increase yields, the reduction in the use of pesticides, and an improve in environmental pollution. She indicated that “the technology of deletion of maker genes (gene-deletor) can solve the problem of gene flow completely”. The talk of the expert had some influence on the citizen. One citizen adopted the position that advanced technology can solve environmental problems and proposed to develop this technique. However, another citizen expressed his doubt about this proposal: “Even if we invest in the research and the development of this technique, GM crops could still have impact on the ecology. This technique alone cannot move us toward environmental sustainability.” Considering the GM papaya incident, they argued for the need to enforce testing and monitoring in the final report. They expressed their concerns of ecological impacts and sustainability, and they suggested “the needs for transnational cooperation of long-term monitoring, quarantine, and native species conservation, and efforts to ease the negative impacts.” Also, the citizen panel put emphasis on the transparency of GM crops and foods management. They

asked the government to consider the problems of smuggling GM seeds and plants into Taiwan, of providing farmers and the public complete relevant information, and of encouraging the consumers to purchase non-GM products.

The citizen panel did not discuss much the environmental and social issues. One possible reason might be that the experts on this topic tended to communicate the positive message of GM crops and to provide limited information. On the other hand, it might not be easy for the citizens to grasp the more complex, indistinct and invisible risks. because Taiwan has not allowed the commercial cultivation of t GM corps, and the information of the impacts on the environment comes from abroad, not from domestic experiences. According to Wynne (1980: 186), people cannot in any significant sense assess the ‘factual’ impacts of technology, and need to ‘assess the institutions which appear to control technology.’ Grove-White et al. (2000: 27) argue that any previous experience of the information provider (e.g. government regulator, manufacturer, and company, the non-governmental organizations) are crucial to people’s judgments on multiple sources of information. Such experiences can be treated as a basic feature of the information itself. The citizen panel had a short discussion on the impacts on the environment, and they shifted their focus to regulatory institutions. Whether or not the government can take responsibility crucially affect perceptions of the impacts on the environment.

The rights of consumers and regulation controversies

In discussion of consumer rights and regulatory frameworks, both experts and citizens put emphasis on the importance of transparent information, the “right to know,” and “right to choose.” Several agricultural biotechnology academics and one expert from the consumer association indicated that “it is necessary to inform the public and to let them choose when there is insufficient scientific proof that GM

foods harm human health.” One expert from the official research institution pointed out that “The public should have an opportunity to choose as long as they are safe foods. There is no need to become involved in arguments about religion and values.” However, the above expert seems to divide the scientific controversies from the social and ethical dimensions, which reflects the position of market-oriented model of supply and demand. These views might have influenced the citizen panel. They also emphasized the right to know of consumers. For them, only when the consumers are fully informed of the benefits and risks of GM foods could consumers make appropriate choices.

The citizen panel suggested that “the government should provide complete information for the public, and it is important to raise public awareness about the GM issues.” Also, they pointed out the need to let Buddhists and other vegetarians access to more information because vegetarian foods are made from GM soybeans. Moreover, the government needs to hold several public meetings and let the public have the opportunity to have a say in a civic society with the power to affect decision-making. The following quote from the environmental groups and consumer association points out that the public cannot acquire asymmetric information:

The government seems to play a role of lobbyist; as a lobbyist it tells them that GM foods are not that awful and greatly contribute to yields.... The media does not inform the public, and it is hard for the lay public to grasp those technical terms. There seems to be a circle of light around the things of professionalism. They might believe what the professionals have said.
(Interviewee E3)

The citizen panel also was also concerned with how to strengthen regulations and institutional power. Although some manufacturers and suppliers tend to use GM ingredients for lower costs, one expert from a manufacturer expressed concern about the uncertainty of GM crops. He pointed out that he does not use GM soya beans on the basis of “business ideals and corporate responsibility.”

Different from the general existing foodstuffs, the development process of GM foods is too short, and it might have negative impacts on health that might only be confirmed in several generations and hundreds of years. The public could not know which genes have been changed among the tens of thousands genes. The government does not do their best to let the inform farmers. I would rather not use GM stuffs.

The citizen panel also put emphasis on the social responsibility of corporations to improve public access to information. The GMO labeling policies were established in 2002. Labeling is required when products contain more than 5 % GM ingredients. The citizen panel emphasized that those foods on the market should obey the rules of compulsory labeling. For the majority of the citizen panel, the current labeling regulations are acceptable. A few citizens thought that it would be better to tighten the rules. One citizen concluded that the regulatory standards might be results of compromises among various interest groups and that labeling of very low percentages might involve the problem of technical feasibility. They all suggested that the government should resume a tractability system.

The citizen panel’s emphasis on the right to choose put the risks on the individual; this reflects the idea that the individual consumer needs to be precautionary. Only one citizen mentioned the need to enhance the responsibility of

professional researchers. He mentioned: “There should be a comprehensive planning about the management of innovation and experimental design in the early stages of GM development. There might have less opportunity to cause harm after complete and appropriate planning.” This claim tends to correspond to Rip’s (2006) idea of “responsible innovation.” Those who engage in the research and development of GM technology and their governmental regulators need to consider the social and ethical issues in the early stages of research and development and take action in advance. This highlights the problem of GM technology management. And it begs the question: “ Who should be precautionary?”

The EU countries adopted the precautionary idea, which suggests that the burden of proof should shift onto those who advocate GM technology. The corporations need to prove the safety of GM foods instead of regulatory institutions or the third parties which are enjoined to prove harm (Schomber, 2006: 26). However, in the discussion of the question “how to protect the rights of consumers and to compensate for losses,” the citizen panel tend to think that it would be hard to show the relation of cause and effect in GM foods and that the existing food regulations are sufficient. In the report, they emphasize “the need to let consumers have free choice and self-protection.” The report does not reflect the notion of “shifting the onus of proof” to the producers. The majority of the citizens adopt the position of status quo of the current food regulations, which does not highlight the priority of their welfare.

One important elements of the precautionary principle is the “paying for ecological debt” (O’Riordan & Jordan, 1995). The citizen panel raised the question: “how to compensate the possible loss of the consumers in order to protect the rights of the consumers?” The expert from the consumer association expressed similar viewpoints and considered a burden-sharing responsibility for the industry. He

suggested that building an insurance system has the function of risk diversification and that consumers could get compensation once unexpected hazard happened. The citizen panel also suggested: “GM corporations could have joint insurance, and the consumers will have more indemnification. A foundation and insurance system could be established while not disobeying international regulations.” Although the citizens suggested more measures to protect consumer rights, they were aware that the priority of consumer rights faces the challenge of international trade and business interests.

The government’s capability will affect the potential impacts caused by the development of GM technology. The citizen panel raised the question: “whether it is needed to establish responsible authority solely in charge of GM foods management, evaluation and monitoring?” One expert who used to work in the Agricultural Department pointed out the problem of incomplete regulation: “the Food Sanitation Agency is only a small unit of the Department of Public Health. The Agency and its research institutions did not have capability to undertake safety testing of GM foods sufficiently. The Food Sanitation Control Act was amended to include the regulations of GM foods, but it is not complete.”

The citizens have diverse views on setting up responsible authority. Those who support setting up responsible authorities tend to think that this could prevent the problem of shirking responsibility, and they suggest the responsible authorities be upgraded to the level of cabinet rather than the level of department. Others citizens thought that “the current regulations frameworks are sufficient. We can see GM foods as normal foods and the Department of Public Health could be in charge of regulations.” Moreover, considering the financial difficulties, they do not think it is necessary to increase budgets. Finally, the citizen panel reached the consensus that the government needs to “ensure accountability and offer one-stop services” in

order to solve the GM controversy efficiently. The different views on the necessity of setting up responsible authority show the various perceptions of GM foods and precautionary measures.

Conclusion

Risk governance and regulations need to take account of public deliberation and moral discussions; the risks and morality or values cannot be divided (Levidow and Carr, 1997). The citizen panel and the experts from the NGOs, industry, academia and the government have different views on the potential impacts of GM technology and its development. The citizen panel was aware that the controversy of GM crops and foods involves scientific uncertainty. Considering the potential impacts on health and the ecology, they argue for long-term evaluations of GM technology. However, the majority of the citizens tend to hold optimism toward GM technology and regard the development of GM technology as a global trend. Those experts who support the innovation and development of GM technology might influence citizen viewpoints. On the other hand, political culture and technology policy dominated by the government and experts might have a close relationship to the technology. As Cheng (2002) puts it:

The government's technology policy tends to regard the "upgrade of the level of technological development, industry infrastructure, and international competitiveness" as primary goals. In the face of global and transnational risks, the strategy the government has adopted tends to invest more in the research and development of technology rather than giving up the development of relevant industries to avoid dangers. This cannot reduce risk effectively. (Cheng, 2002)

The expert and the citizen panels put emphasis on the ' "right to know" and the "right to choose". Several experts tend to be market-oriented, which argues for the need to let the consumers get relevant information and to make choice individually. However, the need to empower citizens to participate in the front-end and decision-making (e.g. whether to develop GM technology and the possible direction, field trial and the approval of GM foods on the market) has been under represented. The citizen not only has right to know but also the right to participate in decision of technology development. The controversy of GM technology involves plural viewpoints of what kinds of society we want. The precautionary principle allows us to reflect on further questions, such as how precautionary should it be? How much scientific uncertainty is acceptable? According to whose values? We should move toward reflective governance, which considers the uncertainty and unknowns of new technology, the assumptions of the problems and accountability, and in the benefits of democratic deliberation. Institutional change is needed to integrate the precautionary principle and democratic deliberation into the decision-making processes. The participatory assessment of technology should be adopted in the early stages of technological development. More public dialogue needs to be conducted. It could help to respond to various perceptions and knowledge claims of GM technology and the particularities of social and cultural context.

Introduction

Recent years have witnessed a growing emphasis on developing a creative combination of mechanisms to conserve endangered species and wildlife biodiversity. Since conservation usually involves restrictions on land use, the tenure regimes and property rights rules are deemed the major task to be managed. Natural systems rarely conform to arbitrary human boundaries, nor do the targeted species care about the ownership of the land they harbor. When the suitable refuges of these species locate on the private lands and thus conservation would in odd with the interests of landowners, there will be a need to reconcile the conflicts. Take the US for example, conservation on private land matters a lot given the fact that more than half of the listed endangered species have at least 80 percent of their habitat on private land (U.S. Fish and Wildlife Service, 1997; Innes, Polasky and Tschirhart, 1998: 35). This fact has created a strong need to develop a feasible way to manage the rampant conflicts between public interests of conservation and dispositional rights of private land owners.

While either voluntary or regulatory approach might work on overcoming the obstacles, each has respective limits. A corollary is that combining tools in both approaches could be the ideal strategy. Increasing pieces of legislation in different countries actually vindicates such a trend of “mosaic” approach. Conservation policies in different countries no longer clearly separate conservation (mainly public) from production (mainly private) lands and values. Instead, the importance of better integrating these two value sets within the same landscape is widely recognized (Norton, 2000). Collaboration between government, non-profit organizations, and even local residents has in recent years emphasized. Observing in the context of the US, Endicott (1993: 3) argues that it is almost the exception if significant land acquisition is accomplished without partnership between private and public sectors.

Much has been written on the potential of collaboration. Not enough attention, however, has been paid to the fact that different policy tools or efforts from different sectors might actually conflict with each other. This paper aims at filling this blank by the case in Taiwan. Although the contingency of institutions and socio-political conditions might vary, the case is in many ways

a microcosm of what has happened in acquisition of lands for conservation in past decades. Some preliminary generalizations might be proposed for further scholarly examination.

Prospects and Challenges of the Mosaic Approach

According to the economic principles, if the real estate market has failed to manage the positive externality of environmental values associated with the private land uses, governmental intervention seems legitimate. Public acquisition as a compulsory strategy, however, has encountered both theoretical and practical challenges. First, from a broader perspective, regulatory takings of private lands for public use confront a constant tension with property rights security. Since the security has been the cornerstone of market system, infringement of it for whatever reasons is to harm the public interest in maintaining the institutional credibility of prevailing transaction system, and the overall efficiency would be at stake (Epstein, 1985). In addition to the principle of efficiency, fairness is also a concern for regulatory takings. In a democratic regime, compulsory takings might involve majoritarian exploitation of property owners. The will of the majority or of the winning policy coalition might be exercised through state mechanisms without sound consideration on the conditions of the minority land owners (Fischel, 1995). There is always a concern of justice in compulsory acquisition.

Second, public acquisition in real-life practices involve political obstacles hard to be overcome. On the one hand, compensation for acquisition usually demands for huge government budget and thus would inevitably crowd out other public services and goods. It is usually asymmetric structure of public choice that involves deprivation of vested interests for the sake of an ideology in a high abstract level. Public support and engagement in such a post-modern value would be less possible until some socio-economic conditions are met. On the other hand, compulsory acquisition encounters an imbalanced mobilization structure that tends to result in political gridlocks. Locally well connected property holders would use up all means to boycott the policy. Once forcefully deployed, the conservation policy would be hard to survive the sabotage of victimized stakeholders who usually have superior local knowledge to fight a guerrilla battle.

Alternatively, conservation can be done by a voluntary approach, in which the spatial need of conservation is solved by a market deal with the landowner, to acquire either full or partial property rights on the land, i.e., an easement deal. The buyers can be governmental agencies, or more often non-profit organizations, or both in some rare occasions. The major problem of voluntary transaction is that the sellers' priorities are often more controlling, as suggested by Fairfax et al. (2005: 10). Although more favorable incentive structure (such as tax reduction) might be constructed to promote the transaction (Gustanski, 2000), the profit-oriented principle underpinned this approach render great uncertainty to the conservation goal. Regarding the easement, its success requires a tandem task of persuading the society (including existing property holders and the judges making effective rulings) to accept this new property right regime

(Freyfogle, 1996; Wiebe and Meinzen-Dick, 1998).

Since neither voluntary nor regulatory approach alone sufficient in managing overcoming the obstacles of conservation on private lands, a creative of them combination of them seems more workable. As Norton (2000: 1222) has convincingly stressed, the best approach for biodiversity conservation on private land should involve a mix of mechanisms targeted to the local situation, including motivational, voluntary, property-based, price-based, and regulatory instruments (also Gunningham and Young 1997). The problem is, however, how to create a synergic effect in combining these instruments with different incentive bases. If the underpinning incentives of different instruments conflict with each, efforts of different policy partners would be offset rather than mutually enforced.

Some earlier researches have pointed out the crowding-out effect of different incentives. In a comparative research on blood donation, Thimus (1974) indicates that intrinsic incentive such as the altruism or moral appeals might be weakened or even replaced by external, materialistic rewards. In the wildlife conservation scenario, compulsory acquisition usually appeals to public interests in a moral tone, but to the regulated party, it usually implies external intervention that will ruin intrinsic moral sentiment. When the landowners rely on the land for their living, it is actually a life-and-death struggle for them and thus highly abstract moral principle usually has lower priority, according to Maslow's hierarchy of needs. For those who can afford losing the land, regulatory takings will antagonize and victimize the landowners, and thus deprive their altruism or willing to give, if any. Since compulsory acquisition turns the incentive structure to a mere calculation of interests, it works when the landowners feel the tremendous costs of fighting against the state mechanisms with legitimacy in using force.

In contrast, the voluntary approach renders a role for both intrinsic incentives and external rewards. If the landowners share the environmental values, they can donate the parcels of land to satisfy their moral needs in the meantime get materialistic rewards from tax reduction. For those who do not appreciate the value of wildlife, they still may reach a deal if the compensation is satisfactory. Nevertheless, when the landowners rely on the land for a living, the compensation tends to be too high for the buyers to reach. It is more possible to have an easement deal if trust base for transaction remains.

It is logically convincible to predict a disastrous result if both voluntary and compulsory instruments are apply in a wrong sequence. When the compulsory acquisition is deployed, the moral appeals will crowded out, the political struggles will ensue, and trust base for transaction with the conservation camp will be ruined. Once it fails and the policy turn to a voluntary approach, the deal would be very hard to reach. Oppositely, if such voluntary instruments as trust funds and easement are implement first to take care the landowners with intrinsic incentives, compulsory means might work as a credible threat in the negotiation with landowners pursuing material rewards.

The Case

Locating in the mountain area of northeastern Taiwan, Twin-Lake has long been famous for its distinctive ecological value. It is a small source lake sounded by mountains. Serving as a relay station for migrating birds, the lake area received all kinds of seeds of exotic species carried by the birds. Many of these exotic plants adapted to indigenous ecological conditions to evolve into a unique ecosystem. More than 70 kinds of aquatic plants (about one third of total species that can be found in Taiwan), including many rare species, makes this place a treasury for botanists. The once-extinct species, Medaka (Japanese Rice Fish), and several conservation-deserved animals also amazed the zoologists. The most distinguishing ecological feature, however, is the floating island on the lake. Many aquatic plants flock together by grasping humus materials in the water, while ferns interweave them into vegetal mats that can float on the lake once the water level rises. The mats further serve as nourishing bases for a wide variety of creatures, constituting a very unique wetland ecosystem. All these have made the lake a shining gem in the eyes of scholars and conservationists.

Failure of Regulatory Approach in Conservation

This precious ecosystem, however, landed on private property. Immigrants encouraged by Japanese colonial governor settled in this area about a century ago and gradually acquired arable land by draining part of the lake. Although the lake had shrunk substantially, the ecosystem was able to sustain as long as the lake still served as a major source of water supply. The threats of human settlement loomed large in 1990s when this place became famous after several movies took shooting there and travel programs introduced it. Adapting a green development strategy, the local government (Yiland County) intended to develop this place into a recreational resort with both conservational and educational functions. Ironically, this intention, once revealed, attracted investors to acquire the lands to seek possible policy rents and created difficulty for the pursuance of conservation goals in the following decades.

Several urban investors eventually gained the ownership of large parcels of land in this area. Among the new owners, the most hostile one was an engineer of the Power Company who once amazed by the scene on his duty of field work. He purchased 17 hectares of lake area, including the waterbody and surrounded lakeshore wetland. After several years of idleness until his retirement, the new owner started to engage in some economic activities that could be detrimental to the ecology. As an “investor”, the new owner kept having new ideas to gain profits from this property that challenged the conservation policy in the following years. As urban new rich and well-educated professional, he had a great ability in defending his rights by legal, administrative, and political means and thus forced the conservationist camp to change policy schemes to meet the challenges.

The first challenging event was the intention of the lake owner to turn it into a fish farm in

early 1990s. To extend its capacity in nourishing fish, the owner hired an excavator to remove the silt of the lake and had some consolidating works on the bank. Since this lake and surround area had been specified as a catchment zone and thus under the protection of germane laws, the local government imposed a fine on him for changing the natural conditions without official permission in advance. Such public intervention, however, irritated the owner who asserted an unfringeable disposal right on his property. In the following administrative petitions he successfully forced the government to recant the sanction. This victory reinforced his confidence in fighting against governmental regulations. This confidence also encouraged him to initiate a series of environmentally unfriendly projects in the following years.

The lake owner noticed that the main obstacle for his development plans was that the land-use specification of this property was for water conservation and thus subject to restrictions against any construction. Therefore he vigorously sought to change the status of land category to aquaculture land, but in vein. Partly to impose credible threat in the course of negotiation with the regulating agencies, and partly to plumb the boundary of his disposable rights, the owner bluntly drained the lake water in 1993. This outright challenge to public authority upset the county magistrate who accused the owner for violating the Water Act. Nevertheless, the public prosecutor dropped the case and endorsed the owners' arguments that draining water was the discretion left to the property owner, while irrigation water for nearby farms could be accessed by alternative sources.

Such unfavorable ruling, together with others in the consecutive lawsuits indicated the limit of command-and-control approach in a property regime with a less benign judicial branch to the conservation ideas. Although germane laws were largely enacted and administrators were willing to comply with the intension of the legislation, the relatively conservative judicial branch seemed to drag the progress. Taking advantage of this feature, the lake owner also launched several counteracting legal actions against in-charge officers personally and successfully intimidated the public servants from taking any aggressive actions in this matter. As the strategy of litigation paralyzed the administrative efforts in conservation, actors in the no-profit sector succeeded to initiate some efforts in a soft, voluntary manner in the beginning of new century.

Failure of Voluntary Approach by Non-profit Organizations

The lake owner continued to deploy other development projects once he felt the substantiated support from the courts. Starting on 2001 he built up a floating dock on which the excavator could operate to eradicate the vegetal mats and aquatic plants on the lake. He also used herbicide to clean the "weeds" on the wetland around the lake shore. Such mass destructing was witnessed by a botanist who had long engaged in local wetland conservation. Trying to stop this catastrophe-inducing behavior, the botanist tried to persuade the lake owner to change mind but was bluntly rejected. He then turned to implore the operator of the excavator to do his job in a more delicate manner—i.e., digging out the plants from deep roots so that they

could be saved and transplanted in other places. Many local environmentalists were convoked for the rescue mission. They stood in the chilly water to sort out the plants, packed each carefully, and sent these them to several shelters for restoration.

The rescue action attracted further public attention. Conservationists, led by the Society of Wildness headquartered in Taipei, quickly launched a fundraising campaign, called “one dollar for an aquatic plant”, for the lake. Following the mode of Environmental Trust prevailing in western countries, they intended to solicit petty donation from students and the public either to buy out the property or to reach an easement deal with the owner. Nevertheless, this was merely a wishful thinking at best. Several mutually enforced conditions thwarted ahead to prevent this campaign from be successful. First, the owner did not share the environmental values and meanings of conservation. In his book delineating his struggles with the governmental agencies and environmental organizations, he vehemently criticized the craziness of the concept to turn arable land to wildness (Wenge, 2004). Such lack of sympathy on environmental concerns drove the lake owner to make decision or judgment purely on the base of materialistic interests.

Second, since the environmentalists were dealing with an “investor” with economic thinking, they faced a simple truth that the Environmental Trust campaign just created the demand on the targeted property and lifted its market value. Before this campaign, nobody was sure about the exact “price” of the property. When the uniqueness of the property as the habitat for valuable creatures was identified, the value of property raise accordingly. It was surely a seller’s market in which the lake owner had incentive to wait for best price if he did not reject the idea of selling the property. In other words, the more successful the fundraising campaign became, the greater ability the Society of Wildness could pay, and the greater profit the lake owner could make. To the lake owner’s disappointment, the campaign was not very successful in terms of offering a satisfactory bid in this deal. Nevertheless, it was ok because there was another potential buyer, the government. As long as there is a public demand for conservation, the government will face political pressure to reach a deal with the owner.

Third, ironically, governmental policy to develop this place into a recreational resort had offered a lucrative prospect and thus lifted the expectation as well as the opportunity cost for the lake owner to reach a deal with the conservationists. The most profitable businesses after the deployment of recreational resort policy would be home-states and restaurants, both require intensive construction work which was prohibited under present land-use specification. It was therefore the lake owner’s best interests that the government could have conducted an eminent domain policy that allowed the lake owner to trade a larger parcel of wetland (including the lake) for a smaller dry land with wider range of use. Such agenda had prevented the lake owner from reaching a deal with the conservationists.

The lake owner did not hide the agenda. Instead, he openly urged the government to accept his proposal. The government refused because such arrangement would further attract

developmental demand and violate principle of low-density development. To pursue his best interests, the lake owner had incentive to put pressure on the government by threatening to destroy the ecosystem, which seemed to be a credible threat after a series of favorable judicial rulings. Nevertheless, the lake owner should have no intention to ruin the ecosystem to a degree that would reduce the value of this property to mere a normal fish pond. The rare species in the lake were just like the hostages in a kidnap. Once the hostages are known to be killed, the ransom is gone too. This explains why the destructive project stopped automatically even though the deal was not reached, and resumed every once in a while.

Collaborative Governance and Community Politics

Ever since the futile efforts of the voluntary sector in reaching either a transaction or an easement deal with the lake owner, the environmentalists turn to government to intervene aggressively by establishing a Wildlife Refuge. It was believed that once the Wildlife Refuge could be established any development projects would be banned in one shot, and thus the ecosystem would be safe. The problem was, however, that this area had long been settled by farmers and the ownership of the properties was in private hands. The requisition process inevitably involves huge budgets, strong resistance, and intensive political confrontation.

The policy turning from a recreation resort to a Wildlife Refuge was fermented after these confrontational events though which environmental value of the lake was widely recognized by the public and political supports quickly accumulated. A new policy was formally initiated when the county government eventually worked out a seemingly more feasible alternative under the title of “protection area”. Rather than rezoning a whole chunk of land to wildlife refuge, the new policy divided the habitat into a core and a buffer zone with a hybrid property rights arrangement. Since the public budget was very tight, only the core area, the lake together with the surrounding wetland, would be compulsorily acquired from the private owner. A huge area adjacent to the core, including both the public-owned forest and private-owned farms, would be the buffer zone without public acquisition, but the activities harmful to the wildlife would be listed and prohibited. It was a concept of “compulsory easement”: without changing the ownership status, the goal of conservation could be served by limiting a part of bundled-rights of the property.

It is more politically sophisticated in terms of managing the interest conflicts of the policy. The conservation efforts had confronted with opposition from two kinds of property owners with different interests, urban investors and local farm owners. Local farmers were more concerning with maintaining original farming life although they might be interested in lifting the land-use constraints on their properties. The urban investors, however, were overwhelmingly interested in the value of their property. Earlier policy trying to acquire lands from both kinds of landowners to establish a recreation resort antagonized both and forced them to ally together to fight against the government. Since the lake owner had experiences in beating the public officers

in judicial actions, he naturally assumed the leadership in the anti-conservation movement. With local supports, the lake owner in return gained greater odd of winning in litigation cases and more confidence in fighting back every governmental action.

The new policy that divided the habitat into the core and the periphery was supposed to be able to divide the leader from its followers in opposition camp. Since the lake area was the only target for acquisition, the government stopped negotiating with the lake owner but just exercised its condemnation power to acquire the lake. As to the farmers, the government assured them that no acquisition would be made. While some restrictions would be imposed on the farming activities, they were expected be acceptable because property right in Taiwan has never been in full scale. Landlords in the prevailing tenure regime have been used to all kinds of restrictions associated with zoning and other regulations. While the agricultural landlords were all used to such major restrictions as conducting construction projects, such other restrictions as the use of pesticide herbicide and killing of invading wildlife were only minor issues that would not hurt the property values. In return, the government would help the farmers to develop eco-farms in which organic produces could be grown and incomes of the farmers improved.

To save the quickly vanishing ecology by soliciting supports and cooperation from the community, the government had the second policy turn and conceded by excluding the private lands from the protection area in 2004. In other words, the core would be surrounded by a non-protected zone consisting of private farms, about 115 hectars, and this interim cycle would further be surrounded by public-owned forest as the periphery, about 617 hectars. It was considered by some environmentalists a substantial loophole. Some others, however, was not so pessimistic and believed that the vacuum left by the public sector could be made up by their vigorous engagement. The lack of formal regulations on local farming activities might be corrected if voluntary cooperation from local farmers could be gained. The most effective way to gain such cooperation seemed to help the farmers developing lucrative yet environmental friendly agricultural activities.

In previous experiences of rescuing the aqua-plants destroyed by the lake owner, one conservationist from local charter of SOW learned how to nourish one of special species, *Brasenia*, that had high economic value. It was considered a delicacy in Japanese restaurants, and had been growing well in this area. It occurred to the conservationist that if local farmer could make a living by growing this plant, then they would have a strong incentive to maintain an environment suitable for it, and thus would be supposedly suitable for other rare species. As the *Brasenia* was restored in the back yard of one of farmer in the community, and his restaurant was making lucrative profits by severing special dishes of this plant, the antagonism of local residents toward environmentalists and conservation ideas gradually reduced. As more community members were able to run businesses to gain benefits from increasing tourists, they realized that conserving the special ecology feature of floating island and many rare species of aqua-plants

meets their best interest.

Discussion

The case illustrates the predicament of wildlife conservation on private lands and the potential of public-private collaboration in solving it. Fast accumulated studies have explored the strength and limits of different public policy tools in solving the predicament. It is widely recognized that a combination of different policy measures and collaboration of public and private (including non-profit) sectors would be ideal to cope with complicate contingency. This study, however, points out some a caveat on such joint efforts. Although there could be synergic effect in a joint effort by public and private actors, it is also very possible that contributions of policy partners might be offset owing to the lack coordination.

As demonstrated in the case, earlier efforts of the government and the non-profit organizations were offering contradicting incentives for the private land owners. When local government tried to exercise its condemnation power to acquire private land for a recreation resort, every landlord was upset. A closer scrutiny, however, indicates different concerns and thus different responding agenda might be identified. On the one side, the farmers overwhelmingly worried about the deprivation of their production means and the threats to their living. They therefore tended to be diehard opponents to the policy. On the other side, the urban investors were mostly considering the possibility of maximizing their property values. It was less a life-and-dead struggle and was more negotiable.

Since the government failed to distinguish such important difference in offering compensational arrangements, it encountered strong and united confrontation from the regulated and thus reduced the political feasibility of this policy. A series of adversary rulings from the courts put the public administrators in quandary and triggered the anxiety of the environmentalists. Being pessimistic about governmental action, they launched a land trust campaign when the government seemed idle in rescuing the endangered aqua-plants. The campaign was successful in terms of promoting public awareness of the valuable ecosystem. It was destructive, however, in terms of getting cooperation from the landlords. To the farmers, the campaign enforced their sense of crisis and antagonism toward the policy. To the urban investors (especially the lake owner), the campaign bitted up the market price of the wetland and up-lifted the expectation on the compensation deal. When the fundraising result turned out to be less satisfactory, neither voluntary nor compulsory means were workable.

In contrast to this offsetting effect in the earlier stage of conservation policy, a synergy actually happened later on. When a policy turn took place that exempted private farms from compulsory requisition, the lake owner lost his alliance and the exercise of condemnation power became more politically feasible. While public acquisition was an effective policy tool in managing non-cooperative opportunism at the costs of ecological value and public will, it left the

problems on the part of private farms intact. The voluntary sector filled in the vacuum by offering profitable alternatives of farming activities that in the meantime could pursue environmental goals. Without antagonistic policy that threatened their familiar ways of earning a living, the farmers gradually changed their defensive attitude toward conservation values and would like to keep an eye on the possibility of a win-win situation.

Conclusion

In conserving a refuge for wildlife, it is inevitable to deal with landowners of different type. Among the most troublesome are those rely on the land for their living. It is true that, as argued by Innes et al. (1998: 37), the simplest way is to find a creative way to align private land-use incentives with social economic interests, as have been done in our case. It is important for policy maker to ask if the structure of property rights allow the reserves to organize themselves in such a way that they can develop viable revenue streams whilst fulfilling their broader conservation remit (Goeschl and Iglori, 2006) ? Nevertheless, this case study indicates possible conflicts among different policy tools to fill the blank of popular theory of mosaics in conservation. By analyzing the incentives of landowners, this research suggests that instruments of voluntary approach should precede that of compulsory one to avoid possible incentive crowding-out effects among these tools.

The Gaze Construction of Nordic Cross-cultural Consumption:

From the “Nordic Trend” to IKEA in Taiwan¹

Bruce/ Shih-Piao Chao

Prelude

In 1994, IKEA entered Taiwan, successfully establishing massive markets and consumption groups. After the rise of The “Nordic Trend”, IKEA’s catalog has become an important medium to gaze the Nordic lifestyle. It’s no longer a cheap, disposable advertisement; instead, it has turned into a collectable, which some people would use as a notebook to write down ideas concerning their ideal homes. Therefore, in my perspectives, the concept of Gaze Construction plays not only an indispensable role in IKEA and the Nordic consumption culture, but an important subjective activity to ferment “wandering imagination”. IKEA’s substantive shop evokes people’s imagination towards the Nordic life and real visiting/wanderings.

The purpose of this paper is to investigate not on its successful multinational business cases, but on the representation and interaction of consumption culture between IKEA and Taiwan society. I think the consumption and representation of the Nordic lifestyle has created pulls and co-construction with the historical context of the consuming society of Taiwan. Apart from being famous because of its affordable Nordic furniture, IKEA becomes the medium for Taiwan to gaze and aspire for the Nordic/ Scandinavian Europe.

American and Japanese Consumerism in Taiwan

Because of Cold War history and Japanese colonization, Taiwan’s emergence of modernity is “inserted” by American and Japan. Mainly, by using the Western (actually American) modernity as models, along with the design of consuming spaces of shopping malls, Taiwan considerably duplicates the Western/American consuming spaces when designing its own citted space construction to respond to the national developing goal as the Asian Regional Center.

Chiu Y. T. (2005: 26-29) expounded that what really constructs Taipei’s consuming space is imagination, which forms into real construction, like Taipei 101 as the tallest building, “Miramar Ferris Wheel” as the second biggest one in Asia, and Core Pacific City as the biggest ball construction in Asia. These buildings, all regarding the imagination and construction of globalization, increase the visibility of Taipei all over the world, making Taiwan connect to any kind of Western fancies. She viewed it as the hybrid and montage style under the process of postcoloniality of Taiwan Society; I regard it as the imagination of “the West” and gaze of we’ve been used to in Taiwan Society. All of those spaces refer to an unknown west. Moreover, the

¹ This is only the draft paper for ACSS conference. If you need to cite, please contact first.

home images from those shopping spaces are mostly the picture that belongs to rich, upper class level in society (Chiu, 32).

Under globalization, the anxiety resulting from the worries and anticipation of gearing to the world makes Taiwan keep gazing and desiring possible modern model. As a result, Taiwan places a great number of focuses on the opening of IKEA and the Nordic lifestyle intermediated by the cross-cultural mediascape as Arjun Appadurai (1996) defines. Appadurai emphasizes that “imagination” is the new power to re-arrange the global world. Through the imagination of movies, TV, media and cross-cultural texts, people have the ability to think about different lives. He treats this as a positive power of “multiple modernities”.

Contemporary cities are in the intermingled state of culture, every kind of heterogeneous culture flees and constitutes new citted visual experiences. Under the context of transformation of consuming society, Taiwan eagerly seeks for the position between Asian and Chinese culture; on the other hand, facing the influence of globalization, Taiwan always possesses higher, more delicate “upper class” imagination for the West. Chen K. X. (2002: 243-248) pointed out that,

“Aside from Austronesian aborigine, the composition of subjectivity of the culture of Taiwan has accumulatively mixed pre-modern Chinese culture, Japanese modernization and its westernized imagination in the period of colonization, the Right-wing Nationalism brought by KMT regime after WWII, and thinking coordinates based on America. These all reflect/locate on consuming contents and forms among different groups in daily lives.”

Moreover, according to Huang S.C. (2007), the establisher of famous Nordic furniture shop in Taiwan, he claims that Japan became the most prevalent place of the Nordic Trend, having much higher acceptance of the Nordic Style. After 2006, Many Taiwan publishing companies start to translate many Japanese books about Scandinavia. According to the calculation, there are only 3 translate books (from Japanese) about Scandinavia, however from 1992 to 2005,² there are only 3 books in the market, however, from 2006 to 2009, there are 14 translate books from Japan. It shows that Taiwan also gazes at Japanese modernity as Lee T.D. and Ho H.W. claims (2003). Lee and Ho claim (2003: 24) that no matter the American products in 1970s or Japanese products in 1990s, they are all the emotion of desiring modernity. Hence, from this point, Japan also mediates the imagination of Nordic modern life to Taiwan Society.

Based on the tangled history and identification combined with the support of America and the colony of Japan, and synergistic desires of modernity, Taiwan nowadays is in the situation of consuming-society scenery mixed with a great deal of the American and Japanese consuming culture. Under the inner regional integration of Asian cultures and the anxiety of globalization,

² 1992 is the earliest record that I could search on the biggest online bookstore, “Boooks” in Taiwan. I use “Scandinavia”, “Nordic”, the country names of Scandinavian area (Sweden, Norway, Iceland, Denmark and Finland) and the capital name of those countries. (<http://www.books.com.tw/>)

despite the fact that the combination of Japan consuming culture and American Capitalism characterize daily lives of Taiwanese people, hybrid identity consumption, which co-constructed with Japan and American culture, arise to contend with Hollywood and fast-food consumption.

What the space of consumption represents among cities all over Taiwan is consuming spaces capably, necessarily connecting to the world. These spaces are referred to an unidentified Western imagination, as most theorists discuss that placeless caused by Glocalization. Mike Crang (1998) discusses that American-style shopping malls destroy the sense of place by duplicating anonymous, universal mode, and that create sense of elsewhere by fragment images from different places and producing simulacrum of spaces. Such as LA Street in the Breeze Center, the Hollywood images at the Warner Vie Show Cinemas area, and any American lifestyle imagination carries by Starbucks, these cultural merchandise not only expand with the Imperialist attitude to erode original local culture, but attribute to the Homogeneity all over the globe. However, I think under the context of cross-cultural consumption, those cross-cultural products also bring the different imagination of the West. Therefore, the “Nordic Trend” introduces a different cultural imagination. It is not homogeneity, a dominant influence from the global to the local, but also an influence between the global to the global that provides the “differences” for the local.

IKEA as a Cross-Cultural Mediascape

IKEA is the most important “mediascape” of Nordic cultural imagination in cities of Taiwan with the appearance of a free museum/leisure center/huge demo center, which becomes a heterogeneous space with its prominent and special look. What’s more, this heterogeneous space not only provides media resources to experience the Nordic lifestyle which would be visited by people stably at anytime over a long period of time, but also enables the public to practice every detail of the Nordic family life realistically and penetrates into every corner of the home imagination in Taiwan with a gazing way—“to imagine here, to practice there”. As Lee M.T. (2005) pointed in his article, “Imagine Here, Practice there: The Reception and Representation of Japanese Television Dramas in Taiwan”, that what makes Japanese culture so powerful is the Japanese cultural products, such as TV drama, depicts every detail of Japanese lifestyle to Taiwan society. This is also why IKEA matters in the Nordic cultural imagination. IKEA provides a special place and text of Scandinavian cultural imagination.

However, other cross-cultural products in Taiwan cannot make the public have desires and imagination broadly as the Nordic life. Those elite and fashionable items from France and Italy are far away and expensive life fancies belonging to few rich people. And cultural goods from the U.K. are mainly sub-cultural music ones of the demassified markets; whereas what America brings to the public in Taiwan is too standardized, spreading far and wide, inexpensive and lack of creativity. And Japanese consumption is not only the reproduction of American capitalism but also the entanglement with the colonial and post-colonial historic context of Taiwan, showing a

sensitively contradictory desire of modernity.

IKEA, a multinational chain enterprise as well, expands to everywhere in the world with the type of American capitalism like methods of shopping malls; nevertheless, it's no longer a hodgepodge of each luxury brand. In IKEA, there are the Nordic living room, kitchen, bedroom, kid's room, personal working area, key diagram in Swedish greeting, restaurant and supermarket selling the Nordic food, not to mention those photos portraying the Nordic life and nature hung on the dining area; it's just like a modern museum presenting the Nordic lives, spirits, and details.

When we drive to Sin-Jhuang, which is located in Taipei County, it's hard to ignore a huge building in blue and yellow, hanging Swedish flag at the entrance. Whenever a new branch is open, it's unavoidable to have people streaming in and traffic paralyzed. This obviously shows that after operating in Taiwan for over decade, IKEA has pervaded household space and consumption in Taiwan. Despite the flag erected as a part of the city view, IKEA used another way, which differed from post-colonial American Empire selling style and Japanese identification consumption to represent on Taiwan's media.

A Mystery, the Nordic Europe is like for Taiwan. Because of the geographical and historical distance, what Taiwan society is concerned with is not only traveling and local lives but describing it as Utopia under the context of globalization by China Times. From the report, it says that "Scandinavia" is not on the same way with America and UK. It is a new Utopia for the world. Taiwan should learn from them.

As Max (2009) pointed out in his book that the democratic design of Sweden is not for the upper classes, but for everyone in the society. These Nordic imaginations reveal that distinct from fantasies of modernity of the West and Japan, the Nordic one is a wholly new, different, another option for modernity. I would like to take a broader view to reflect on the Nordic Trend behind IKEA, the relationship between the Nordic consumption and Taiwan society, and to bring up the possibility of "IKEA-ization" in the context of everyday aesthetics instead of discussing the meanings of symbols used by IKEA and the consumer's identification. Having strong character as Japanese consumption, the Nordic consuming type provides Taiwan a distinguishing image differing from the Western imagination. IKEA is a mixture of architecture, a museum and a leisure center, and its cultural imagination expressed by painting the building with the eye-catching color of its flag is much more obvious than any other cross-cultural brands.

IKEA's catalog is not only a business one but a Bible—a Bible regarding lifestyles. It's a medium representation of Swedish household to offer us inspirations for people to do our own design and decorations in all kinds of Nordic, Swedish, wonderful imaginations. In short, apart from a business catalog to seduce consumers to go shopping, this Bible itself is a historic material deeply connected to the history of Sweden and the national image of the Nordic countries, and that shapes IKEA into a brand full of highly cultural nationality. It seems that IKEA struggles between traditional dualism—design equates high price, and low price means lack of design, and tries to establish a new consuming feature: design=low price=good life. Meanwhile, IKEA keeps

constructing non-elite, non-high-price dreams, which can be imagined here and carried out here.

The Modernity of Home

IKEA's catalog is used the paintings of Carl and Karin Larsson, the Swedish painters, as the model to shape the style of Swedish household decorations. The best way to sketch styles of Swedish furniture is from nature, full of lights, fresh air, and simplicity. And in the late 18 centuries, Carl and Karin Larsson combined Warm Swedish Folk Style and this became a well-known the prototype of Swedish Household Design. Carl and Karin Larsson's Swedish living ideology integrated with Modernism in 1950's, along with the establishment and development of equal society under Swedish Socialism. This becomes distinguished with IKEA's multinational development and cross-culture consumption, making Taiwan society casts a great deal of gaze at it. It is different from what Chiu Y.T. points that Taiwan's consuming spaces create the rich pictures of people's home and room.

As a museum to demonstrate in different places, IKEA prints out the catalog on a large scale to construct the Nordic Swedish living imaginations and national identification, which is what Benedit Anderson talked about the possibility of the shaping of national identification. As he mentioned in his book, one of the main reasons is the rise of printing, the cognitive process of media communication and constructing imagination. Besides, novels and newspaper, languages along with the rise of capitalism make people share the common time and space, and form an imaginative community. The Nordic gaze and imagination of Taiwan society is an interesting combination and proof that IKEA is a living space to represent details of the Swedish life.

Picture 1(Left): Carl Larsson's [Mother's and Little Girls Room](1899)

Picture 2(Right): IKEA 2010 Catalog, Taiwan. P.34-35

Therefore, the Nordic consuming construction and gaze in Taiwan, a formation of “design” and “life style” not only have a close connection to the Nordic and Swedish regions but present the modern meanings of consumption, containing its own cultural and social meaning. The Nordic consuming type creates a frame, in which symbols are full of the imaginations towards the Nordic modernity and democratic design, transmitting in the social gaze and consumption and

contributing to the possibility of social reorder and construct through these symbolic imaginations and gaze consumption.

From the comparison of Picture I and II, we could sense the obvious cultural imagination behind the catalog. IKEA uses Carl Larsson's painting as the medium to express the ideal home. Carl Larsson is famous Swedish painter who produces many images of home and life in his series works, "Ett Hem" around 1900s. Later, in 1930~40 as Claes Britton (2006) demonstrates in, *Sweden and Swedes*, that after 1930, Swedish government starts to build up the ideology of "People's home" (Folkhem). The center idea is to create a country with the class difference and make the blue-collar level in society to entitle the happiness with all the middle-class level. Later, established in 1953, IKEA employs Carl Larsson's idea of home and popularizes the affordable design to every family in Nordic countries. This could show how the ideology of government influences the discourse of home.

In Taiwan's case, in 1950~80s, Taiwan's family discourse is basically conducted by the national party's policies,³ such as "Wife Works" (妻工), "Building a Strong Nation through Virtuous Wives and Good Mothers Movement" (賢妻良母運動) and "Happy Family Plan" (幸福家庭計劃) and these represent that the government controls how the family, home image should be like. It also reflects that at that time, Taiwan government tries to absorb wife for laboring (Yang, 2008:66-69). I think this builds up the "Home as Factory" ideology and those female laboring actually the basement for helping small enterprise to create the world-known "Taiwan Economic Miracle" (Ho, 1994). Here I think in this time government sharpens the home discourse and this makes the ideology of "home as labor". However, 2001, Taiwan starts to learn from the western countries by employing "two days off per week" policy. The image and discourse of home starts to transfer from "Home as labor" to "Home as leisure". Since here, the government's influence of the discourse of home gradually vanishes and is replaced by the consumerism. I think it also reflects that the Taiwan society gradually transforms from working society to consuming society as Paul Ransome (2005) illustrates. Later, IKEA comes to Taiwan and basically gives the new idea of what the home and family life should be by combining with consumerism context.

Carl and Karin Larsson used visual elements, including simple, bright lines and colors as axes, log furniture, and children-centered ideology not only to represent the concept of freshness of the Nordic Europe, and getting along with nature, but also to integrate modernist design elements. These all create a tight and close relation between IKEA and the Nordic design, becoming a wonderful, modern life imagination only from the Nordic regions. Traditionally, when it comes to the western cultural merchandise, we tend to place focus on western hegemony, or the cultural imperialism; however, what we could sense behind IKEA is far different from the capitalist pursuit of wealth and showoff. Instead, IKEA takes a plain and low-price image to

³ Here, the national party means KMT. During that time, KMT actually also governs Taiwan. It is the only party at that time.

penetrate into our lives. Identity Politics behind this consumption places emphasis on the connotation of democratic design, and reflects the consuming cultures among generations—nowadays a generation's ways of life are decided by lifestyles and aesthetic consumption.

Therefore, national culture hiding in the Nordic consumption spreads to everywhere all over the world with the real expenditure in IKEA, creating a social change in the new age. As Max (2009) claims that the idea of the Swedish democratic design is the Home of People, and in 1960s the Swedish and Scandinavian design has become the pronoun for high quality, advancement and modern style.

In the consuming society, Jean Baudrillard (1968/ Tans Lin, 1997: 13) says that home not merely serves as the harbor and offers basic daily lives, meanwhile but also reflects the society's expectation and construction of home. Household consumption becomes the domain of fashion shows and competition, and a practice for the public to shape individual styles and demonstrate wonderful living imagination. As Baudrillard said that the images and gazes of household consumption reflect the values of a consuming society and the change with times.

Strictly speaking, IKEA's consuming type is a constructive representation of consuming aesthetics in different ages. In other words, IKEA makes the public have access to design symbols. This expansion can be found in IKEA's catalog, which uses a great deal of Swedish Folk style and Modernity to present its democratic furniture ideology. Folk culture hiding in the catalog integrates into middle-class culture, and responds to what Mike Featherstone said: "the aestheticization of everyday life", which means the aesthetic taste has released into the public lives, no longer belonging to elites in the society, in which cultural economics is a crucial constructive factor producing aesthetic-quality products and service through continuous design.

DIY as a Cultural and an New Frame

IKEA places the production part on its advertisement, not just informing the consumption. That is, we consumers are responsible for the accomplishment of each product, paying not just money but labor to finish the production line. As what IKEA's catalog says: create low-price, we make these efforts---welcome you to join us, the spirit of DIY(Do It Yourself) widely penetrates into our lives. In other words, consumers have to spend their own private time with a view to fulfilling consuming behavior containing design, aesthetic, and the Nordic culture in their own personal areas. The pictures above shows that IKEA has made DIY culturalize and become the new age's consuming aesthetic. Because of IKEA's accessibility, IKEA with its Nordic blood, high identification, taste of bourgeois design, and the characteristic of DIY broadly penetrates into Taiwan, and successfully becomes the major medium to demonstrate the Swedish life and the Nordic imagination, and to perform the modern cultural consumption of the Swedish democracy.

Picture 3: DIY Process I (Catalog 2010, p.154-155)

Picture 4: DIY Process II (Catalog 2010, p.363)

Through IKEA's catalog and the clear process (ex. picture 3 &4) of DIY, I think it is not only "acculturated" but also "standardized". DIY in IKEA represents the new mode of modernity between Fordism and post-Fordism. It shows a different imagination of modernity as McDonald brings in 1980s in Taiwan. IKEA creates the new imagination of consuming-based modernity. This is comparatively more fluid with McDonald's working-based modernity.

Combination of I and We; Producer and Consumer

The display of Room Setting makes consumers enjoy the possibilities to buy everything at a time. What IKEA sells is not only furniture and appliances, but the whole set of imagination and concept of the IKEA/Nordic home. Examples as follow:

24 square meter. Welcome to my home. I live by myself, and it's enjoyable to have work, entertainment and leisure together.

50 square meter. Welcome to our home. We like our friends and family to see the home accomplished by ourselves.

IKEA uses “I” and “WE” in the slogans to arouse emotions of different subjects’ space imagination. In the exhibition area, we can find out that there are all kinds of novels and design books in the book shelves or fashion magazines like Elle on the table in the living room, making the virtual household place more realistic, have some connection with the outside society, and provide consumers to practice in this show room to make themselves become the ones who live inside. Hiding behind these slogans, IKEA tells its own story with a position of consumers to get close the visiting consumers. Also, under the cross-culture consuming context, it seems the distance between the Nordic Sweden and Taiwan has diminished, and the Nordic lifestyle is so real that can be carried out right here in Taiwan.

Moreover, producers and consumers share the imagination and gaze of wonderful lives. This share makes me consider the waning and waxing when both of the producers and consumers decide on consumption may differ from traditional culture industry. In other words, the slogans make producers invisible or even transform into consumers to carry out the spirit of enterprise that place consumers on the priority . Producers and consumers co-construct the imagination and desire for the beautiful lives, but they don’t have to buy in IKEA.

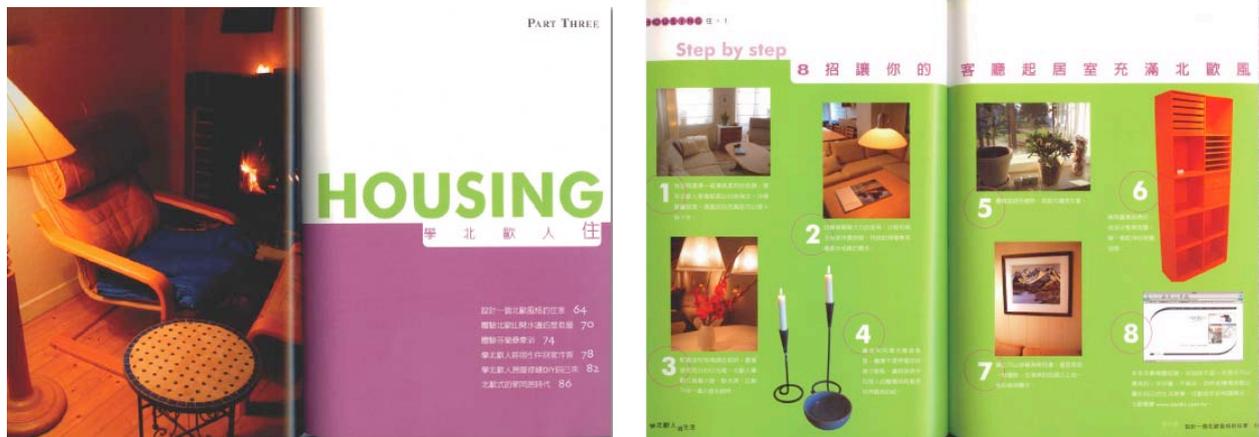

Consumers can wander around and touch without limitations in IKEA to experience all exhibitions there. Furthermore, if they like, they can stay there whole day long without any disturbance. Acting as a tourist wandering and gazing in IKEA, consumers turn the life imagination into real aesthetic experiences and bring them home. I can’t help but ask: for those consumers who don’t buy anything and go back home, do they really gain nothing? Of course, the space of IKEA unconsciously teaches and educates the consumers in this space by its show rooms and catalogs.

This is not a department store, nor any fast food restaurant. It’s a representation of the Nordic life. If you like, you can regard it as home temporarily. The faraway Nordic life now infiltrates into our desks, cups, coasters, carpets, living rooms, aprons, lighting device or bookshelves in fathers’ study in various representative ways through cross-cultural consuming space and multinational enterprises. Due to this penetrating gaze construction, IKEA establishes a gaze that I come here because I don’t have money. Inside this place, the exhibition area like a kaleidoscope co-construct a massive image of consuming culture production with the visiting consumers (or tourists).

There’s a special phenomenon in IKEA that most of the consumers have a mindset of “sense of price satisfaction”. When being asked concerning the quality of IKEA, most people have “post-purchase IKEA rationale” like Elen Lewis stated. Lewis pointed out that it’s a feeling of incredibility; that is, IKEA means it costs 800 US dollars for you to finish your interior decoration, in spite of the fact that the quality is different, it still looks the same as the one costs 20 thousand US dollars. In this free Swedish life place, IKEA offers the gaze process that “I don’t have money but I don consume”, and welcomes people to this amusement park/ life museum to experience, to learn how to decorate their own homes, to bring IKEA’s inspirations back home

without spending any penny.

Traveling Texts with IKEA-ization

Picture 5: 學北歐人住 (Learning How Scandinavian Live) p. 62-62.

Picture 6: Process of how to live like Nordic people in Learning How Scandinavian Lives p.68-69.

John Urry, the famous tourism sociologist illustrates in his book, *The Tourist Gaze* that “we gaze at what we encounter And this gaze is socially organized and systematized as is the gaze of the medic⁴” (Urry, 1990:1) John Urry defines that “Tourist Gaze” is “an anticipation...Such anticipation is constructed and sustained through a variety of non-touist practices, such as film, TV, literature, magazines, records and videos, which constructs and reinfore that gaze” (Urry, 1990:3). Tourist gaze doesn’t naturally happen. It should involve authorities /power undergoing when the tourists are doing the sightseeing. It is the expectation that society constructs.

The traveling guidebooks about Scandinavia are not as many as the other traditional traveling countries such as France, Italy, England, Japan. Scandinavia is a new area for Taiwan people to desire and imagine. However, there are many books about sojourning, and depicting the daily life in Scandinavian countries in Taiwan, and those books are placed in the “Traveling guide” area in many of the bookstores. Those texts become the new traveling guidebook for people to imagine and desire “Scandinavian Europe.” Those books always show how different the life is in Nordic area, and how it could be the best modern place for human beings, differing from American way of living.

Liu C.W. (2008) illustrates in her studies that Scandinavian texts focus on their beautiful natural sceneries and happy city life (105). However, those are still the early construction on the Scandinavian imagines. She uses the earlier texts. I find that in recent years that the Scandinavian books are more about “daily life design” or their home-centered life.

⁴ As to the medical gaze, please see the books of Michel Foucault.

In 2007, *Common Wealth* increasingly reports a series topic about North Europe many times in a year such as ‘Small But Smart Countries Achieve Excellence II: Sweden with Original Creativity’ (Common Wealth Vol. 386, 2007), ‘Green North Europe: Future City, Malmo’ (Common Wealth Vol.387, 2007) and ‘Multiple North Europe: The North Europe City With Talents, Oresund Living Area ’ (Common Wealth Vol.387, 2007). Those articles are mainly about how North European live in the smart and happy way, how they create their own competitive ability in their unique social democratic way.

Not only on the magazine, there are several books contributes to constructs what that Taiwanese have to gaze at. *Finland, Amazing Experience* (2005) was considered as the turning point that makes North Europe a “hit” in Taiwan. Later on, *Learning How Scandinavian Live* (2006) depicts North European countries life in details. *Design Perspective from Stockholm* (2008) treats Stockholm is where God of design lives in. Moreover, in 2007, Common Wealth Magazine Co. hold a series seminar discussing about North Europe’s competitive power and even set up the website named “Smart Country, the Secrets of North Europe with Happiness⁵.”

For example, in “*Learning How Scandinavian Live*”, the Picture 5 & 6 show how those texts could be treated as an IKEA catalog with the design items and the beautiful “home pictures”. This means the gaze construction of Scandinavia/ Nordic Europe is a kind of transforming, form traditional natural sceneries and magnificent buildings as John Urry (1990) claims to the images of normal life. Later, most importantly, these images of “normal” life become “unusual” spectacle in gaze construction of Scandinavia.

Conclusion:

In Taiwan, the gaze construction of Scandinavia relies on the traveling texts and IKEA space as a cross-cultural mediascape. IKEA’s cultural imagination in its space and catalog also influences how Taiwan society focus, gaze at Scandinavia. Moreover, this mediascape, combining with texts and IKEA space provides “textual travel” (Howes, 1996) and the process of “pre-travel” (Urry, 1990) imagination. After 2005, Taiwan has a lot of Scandinavian books and reports. The common point in those texts is that they all construct “Scandinavia” as a new cultural imagination of modernity. However, I think this cultural imagination might cause the project of multiple-modernities as Lee M.T. (2005) defines through consumerism. However, the Nordic trend eventually is a “mediated” cultural imagination. It is highly possible to only become one option of the many shopping symbols.

THE GEOGRAPHY OF AUCKLAND'S DESIGN CREATIVE INDUSTRIES

Lydia Kiroff

MDesMgmt (Hons), MSc (Arch) (Hons), PhD Candidate (UNSW) Sydney, Australia, Reg.Architect, ANZIA, Faculty of Technology and Built Environment, UNITEC, Carrington Rd, Mt.Albert, Private Bag 92025, Auckland, New Zealand, ph. + 64 9 815 4321 ext.7366, E-mail: lkiroff@unitec.ac.nz

1. INTRODUCTION

In this creativity age, abundant with relentless branding campaigns, bombastic slogans, breathtaking landmarks, inspiring cultural icons and heart-touching identity crises, the global competition for recognition is taken to new heights. Auckland has a magnificent natural setting between two large harbours – the Waitemata Harbour and the Manukau Harbour, a setting that can be rivalled only by few cities in the world. Some of the distinct characteristics that Auckland has are: remote geographical location in the South Pacific, unique identity reflecting the diverse nature of the New Zealand's society, strong presence of landscape features, such as the city's harbour, genuine Kiwi love of the outdoors and rich cultural heritage and tradition. Considering this diverse range of factors, the ultimate challenge would be to create prosperous and memorable urban places as a vital component of the city's vision and growth.

The aim of this paper is to examine the intersection between the concept of creative industries and urban design and planning focusing, in particular, on the relationship between the design sector of the creative industries and their impact on urban life in Auckland.

This paper focuses on Auckland-based creative professionals employed in small, medium and large-sized architecture firms, representing the largest creative sub-sector. Mapping techniques are employed to plot the exact locations of these design sub-sector firms in Auckland's CBD (Central Business District) and CBD fringe areas in order to identify possible patterns and trends. The resulting 2009 snapshot maps illustrate well defined areas of creative clusters in the fabric of the city. Further to the mapping techniques, a temporal study of the evolution of the architectural creative clusters in Auckland over a period of 15 years illustrates location choices and preferences. The generated charts are then compared with current economic trends in an attempt to establish relationships.

2. NEW ZEALAND'S CREATIVE INDUSTRIES: DEFINITION, CLASSIFICATION MODEL AND MAIN CHARACTERISTICS

The New Zealand Government "has identified the creative industries as a business sector that is capable of generating a transformational change in New Zealand's economic performance as part of the Growth and Innovation Framework" (Auckland City Council, 2005, p.4). The report acknowledges the economic potential of the creative industries admitting that this concept is relatively new and has not been fully explored in the context of the knowledge economy. The *Snapshot: Auckland's creative industries* document (Auckland City Council, 2005) defines the creative industries as "those industries that have their origin in individual creativity, skill and talent and which have a potential for wealth and job creation through the

generation and exploitation of intellectual property” (p.5). This definition is largely based on the one produced by the UK Department for Culture, Media and Sport in their *Creative Industries Mapping Document* from 2001. The New Zealand creative industries fall into six sub-sectors:

- **Design** (architecture, graphic design and advertising). It is the largest source of employment in the creative industries with 5 400 jobs in Auckland City.
- **Screen Production and Radio** (film, television, video and radio). This is the second largest sub-sector with 3 480 jobs in Auckland City.
- **Publishing** (newspaper, book and periodical publishing). It is the smallest of the three sub-sectors with 2 785 jobs in Auckland City.
- **Visual Arts, Crafts and Photography** – 893 jobs in Auckland City.
- **Performing Arts** – 806 jobs in Auckland City.
- **Music** – 252 jobs in Auckland City.

The creative sector employment is concentrated in the first three sub-sectors and the total creative sector employment is 13 616 (Auckland City Council, 2005, p.18). This classification is based on industry groupings from the *Australia and New Zealand Standard Industrial Classification* (ANZSIC) system. Design makes up 40 per cent of employment in the creative sector in Auckland city. The breakdown within the design sub-sector shows that out of a total of 5 400 employees in Auckland City the largest number of employees is in advertising services – 2 510, followed by architectural services – 1 590 and graphic design – 1 300 (Auckland City Council, 2005, p.25).

The majority of the creative industries in New Zealand are concentrated in the Auckland region with 18 730 full-time employees out of the estimated 36 540 creative sector full-time employees in New Zealand (Auckland City Council, 2005). Auckland is undoubtedly the centre of television and radio, music, performing and visual arts, publishing, advertising and architecture industries. The main attraction to Auckland is due to a number of related factors, such as great business opportunities, enjoyable lifestyle, cosmopolitan environment, cultural diversity, local networks and the size of the city’s market as well as proximity to key industries and clients. As Auckland is the largest city in New Zealand with a population of 1.4 million, it has a large talent pool that is professionally and culturally diverse. In terms of a location, most of the creative industries in the Auckland region are concentrated in Auckland City (there are 6 other Councils in the Auckland region), which provides 73 per cent of the region’s jobs and 37 per cent of the nation’s jobs in the creative industries (Auckland City Council, 2005).

In terms of location choices, the highest concentration of the creative industries is in Auckland’s CBD (31 per cent) and CBD fringe areas (36 per cent), which represent approximately two-thirds of Auckland City’s creative sector employment. The CBD fringe areas include: Ponsonby, Newton, Grafton, Newmarket and Parnell. The design sub-sector is located primarily in the following areas: Northern part of Parnell, CBD (Upper Queen Street, west and waterfront, particularly Albert Street and High Street areas), Newton (mainly architectural services) and Ponsonby (Auckland City Council, 2005, p.34). The share of design employment per area, equivalent to 5 400 employees in Auckland City, is as follows:

- CBD – 27.8 per cent
- Grafton/Eden Terrace – 16.9 per cent
- Ponsonby – 11.3 per cent

- Parnell/Newmarket – 17.8 per cent
- The rest of Auckland City – 13.8 per cent

The share of design employment is 39.6 per cent of total creative employment, representing the largest sub-sector of the creative industries in Auckland City (Auckland City Council, 2005, p.38). As CBD problems seem to deepen at an alarming rate in terms of high and unaffordable rents, lack of spaces suitable for creative businesses at the expense of traditional office buildings, and traffic congestion contributing to poor access for clients and customers, the CBD fringe areas seem to grow in popularity (Auckland City Council, 2005). A mix of factors contribute to the appeal of these areas, such as the availability of relatively affordable spaces, suitable for creative businesses, less intense traffic offering parking possibilities and easier access for clients, and a variety of local cafes and restaurants that can be used for business meetings in a less formal environment. Often establishing such creative businesses in the CBD fringe areas involves the conversion of light commercial buildings and warehouses into artistic spaces and reviving the surrounding areas.

Auckland City has the highest number of creative industries employees in New Zealand or approximately 14 000 (18 730 in the Auckland region), which equates to 5.1 per cent of the city's total employment. Wellington has 4 540 creative sector employees and Christchurch – 3 003. In comparison, on a national level, the creative sector employment stands at 2.4 per cent of total national employment. Auckland City is also the fastest growing centre of the creative industries in New Zealand. Creative industries employment in Auckland City increased by 16.5 per cent for a period of six years, between 1997 and 2003, outperforming any other city in New Zealand and creating 1 933 jobs. The sub-sectors of the creative industries that are well established and have a strong presence in the city are: advertising, screen production, design, music and fashion.

3. CREATIVITY AND THE CITY

The pure existence of flourishing creative industries in a city contributes to its vibrancy and attractiveness, which can lead to increasing numbers of creative professionals immigrating from overseas. The creative sector becomes an integral part of the creative city, which offers a great lifestyle and exciting business opportunities within a rich cultural and social setting. The *Snapshot: Auckland's creative industries* document (Auckland City Council, 2005) emphasizes the importance of a quality urban environment, which creates a “buzzy, magnet city” (Handy, 1999, November 24). “A vibrant urban environment is seen to attract creative thinkers, innovators and knowledge-economy entrepreneurs across the whole of the economy, catering to their lifestyles and providing them with stimulation and enrichment” (Auckland City Council, 2005, p.7). Furthermore such exciting environments create the premise for the formation and development of the creative class, which in turn transforms everyday life and contributes to regional economic growth through the attraction of new investment (Florida, 2002).

In New Zealand traditionally the tourism industry has been at the forefront of the marketing campaign attracting visitors to the country and capitalizing on cultural assets as part of the strategy. The associated branding has always been in the same context targeting the tourist sector of the market: “100 % Pure New Zealand”. In recent times a shift in thinking places the creative industries in a more central position with the realization of their potential to attract overseas talent. So far Auckland's current city brand “City of Sails” has failed to

reflect the emerging power of the creative industries, which can be encapsulated in catchphrases constructed around exciting business opportunities and an attractive lifestyle. Another major shift in thinking links the creative industries with economic growth, which is a different approach to the common perceptions of the predominant cultural and social values. This economic aspect of the creative industries manifests itself in increased export activities, significant expansions and growing investments.

Starkwhite's report for the Auckland City Council (2002) emphasizes the important role of creativity and innovation in the global knowledge economy. "Industries of the mind" (Starkwhite, 2002, p.4) whose main commodity are ideas are the ones having a central place and leading the way in a thriving economy. The report recognizes the value of the arts whose nature is anchored in the concepts of creativity and innovation and realizes the contribution they can potentially make to create a culturally vibrant environment in Auckland. The potential impact of art and culture and the associated creative industries on the economy is discussed in the context of creative Auckland: "governments are seeing the social, cultural and economic value of the creative industries" (Starkwhite, 2002, p.9).

Starkwhite's report (2002) identifies the key ingredients of a creative city and argues that Auckland has a substantial portfolio of arts and cultural assets: a big concentration of artists, a variety of performing and visual arts, a number of literary organizations, an evolving sense of identity and a range of cultural practices. The analysis of these main factors from the viewpoint of creativity and innovation is seen as crucial in shaping Auckland as a creative city. Although the main focus of the report is on "Rethinking Auckland as a creative city" the context that is considered is of the knowledge economy, where knowledge and technology become the main drivers for economic growth substituting capital and labour. The report introduces a third component, ideas, that are becoming increasingly important while knowledge and technology continue to play a key role in the economy.

4. AUCKLAND'S URBAN CHARACTERISTICS

Auckland has a strong sense of place, perhaps as a result of the city's dramatic physical setting located between two large harbours – Waitemata Harbour and Manukau Harbour and featuring the iconic One Tree Hill Domain - the largest and most intact volcanic cone in the southern hemisphere. The 182 meter volcanic peak, which is centrally located on the Tamaki isthmus, provides breathtaking views across the Auckland area and the two harbours. Taken together these powerful natural features give Auckland much of its distinctiveness and contribute strongly to its physical identity.

The city's designed or built environment that consists of the network of streets, formal places and buildings, collectively representing the essence of urban life, is also an important contributor to defining the sense of place. There are some notable urban characteristics that contribute to Auckland's unique sense of place. Auckland's physical setting, surrounded by water, has resulted in a significant portion of the city's public realm being located along the waterfront. In the past ten-fifteen years light industrial buildings and car parks have given way to modern urban developments, which are waterfront-related, such as the Britomart precinct and especially the Viaduct Basin, improving significantly public access and maintaining the relationship of city and sea.

The Mayoral Taskforce on Urban Design was set up in early 2005 to improve the quality of urban design and to identify “all possible impediments to good urban design in Auckland” (The Mayoral Taskforce on Urban Design, 2005, p.i). The report concludes that many of the recommendations require a “mindset change” and a “cultural change” (p.i) first and foremost, setting the ambitious goal of turning Auckland not just into “a world-class city but also a world-leading city in bold and imaginative urban design” (The Mayoral Taskforce on Urban Design, 2005, p.i). The report acknowledges the mismatch between aspirations and reality, substantiating its arguments with inadequate planning and Building Act controls. “Auckland’s role as the nation’s economic engine cannot be compromised by urban development that does not function well, nor inspire creativity and well-being in its people and businesses” (The Mayoral Taskforce on Urban Design, 2005, p.4).

5. AUCKLAND’S ARCHITECTURAL FIRMS: A SNAPSHOT OF 2009

The study of the architectural creative industries in New Zealand as a whole and in Auckland in particular, is based on data gathered through the Directories of NZIA (New Zealand Institute of Architects) Practices. These Directories are published annually in the March/April issue (No2) of Architecture New Zealand.

The practices are listed alphabetically according to geographic regions: ten in the North Island - Northland & Rodney, Auckland, Waikato/Bay of Plenty, Gisborne, Hawkes Bay, Taranaki, Wanganui & Rangitikei, Manawatu, Wairarapa and Wellington; and five in the South Island - Marlborough, West Coast, Canterbury, Otago and Southland. The list of practices includes architectural firms whose principals or partners are registered architects and architect members of NZIA. The Directories provide not only the practice names, but also their addresses and contact details. Most of them have also a brief description of their core areas of specialization. This information proved valuable for producing location maps through plotting the firms on Auckland’s CBD and CBD fringe maps.

The Directories do not provide any numerical data, such as a total number of firms in New Zealand, a breakdown of the North and South Islands, and the number of firms in the three main cities – Auckland, Wellington and Christchurch. The only way I could generate such data was through counting individual firms and categorizing them. The overall number of architectural firms in New Zealand in 2009 was 634. Based on the ten geographic regions in the North Island and the five regions in the South Island, I arrived at a figure of 500 architectural firms in the North Island or 78.9 percent and 134 in the South Island or 21.1percent.

The three main centres in New Zealand - Auckland, Wellington and Christchurch, feature separately in the Directories with their own lists of firms. Out of the three, Auckland proves to be the leader with 264 firms, or 41.6% of all architectural firms in New Zealand, followed by Wellington with 123 firms, or 19.4% and Christchurch with 69 firms or 10.8% of all NZ architectural firms.

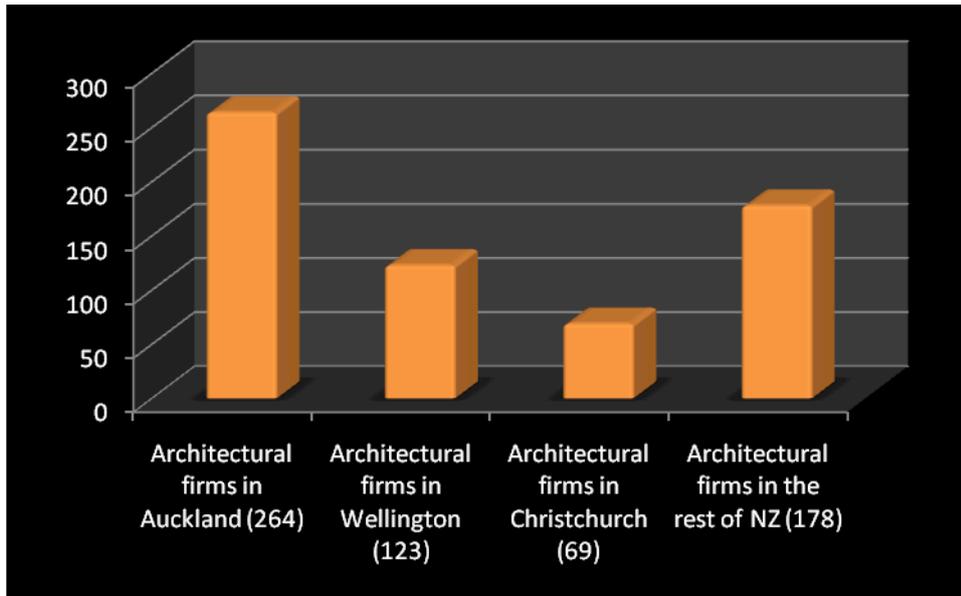

Figure 1: Architectural firms in Auckland, Wellington and Christchurch (Kiroff, L., 2010)

The physical addresses provided in the Directories of NZIA Practices helped in the accurate plotting of the firms on Auckland's CBD and CBD fringe maps (Fig 2 & 3). The aim of these architectural location maps is to establish whether there are any concentrations and clusters of practices within the fabric of the city and mostly in the central parts of Auckland. To be able to successfully categorize 264 firms in Auckland, I introduced a coding system depending on their physical addresses. The first broad filter that I applied to all the 264 Auckland firms was to exclude the firms that were outside the CBD and CBD fringe areas - 122. For the remaining 142 firms located in the CBD and CBD fringe areas, I applied the following nine location codes in alphabetical order:

- CBD – Central Business District
- ET – Eden Terrace
- FB&SMB – Freemans Bay & St Mary's Bay
- GR – Grafton
- GL – Grey Lynn
- N – Newmarket
- NTON – Newton
- PAR – Parnell
- PO – Ponsonby

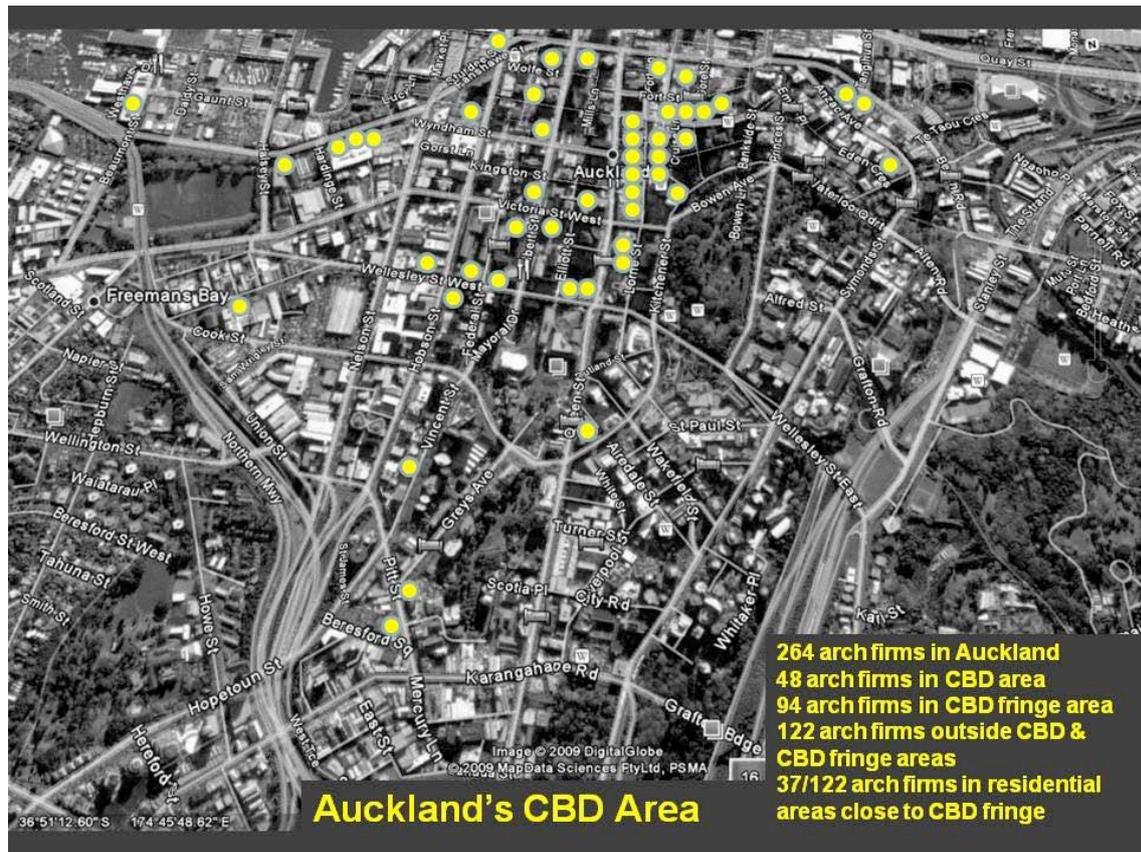

Figure 2: Distribution of architectural firms in Auckland's CBD area (Kiroff, L., 2010)

After assigning a location code to each one of the 142 centrally located firms, I got the following breakdown:

- CBD – Central Business District – 48 firms
- ET – Eden Terrace – 7 firms
- FB&SMB – Freemans Bay & St Mary's Bay – 10 firms
- GR – Grafton – 10 firms
- GL – Grey Lynn – 17 firms
- N – Newmarket – 16 firms
- NTON – Newton – 5 firms
- PAR – Parnell – 20 firms
- PO – Ponsonby – 9 firms

Based on the eight identified CBD fringe areas, the total number of firms located in these areas is 94 and the number of firms in the CBD - 48. I then plotted these firms on the two Auckland maps using the exact street addresses (Fig 2 & 3). As the figures above show, there are two distinct architectural clusters in the CBD fringe, one in Parnell with 20 firms and the other one in Grey Lynn with 17 firms (Fig 3).

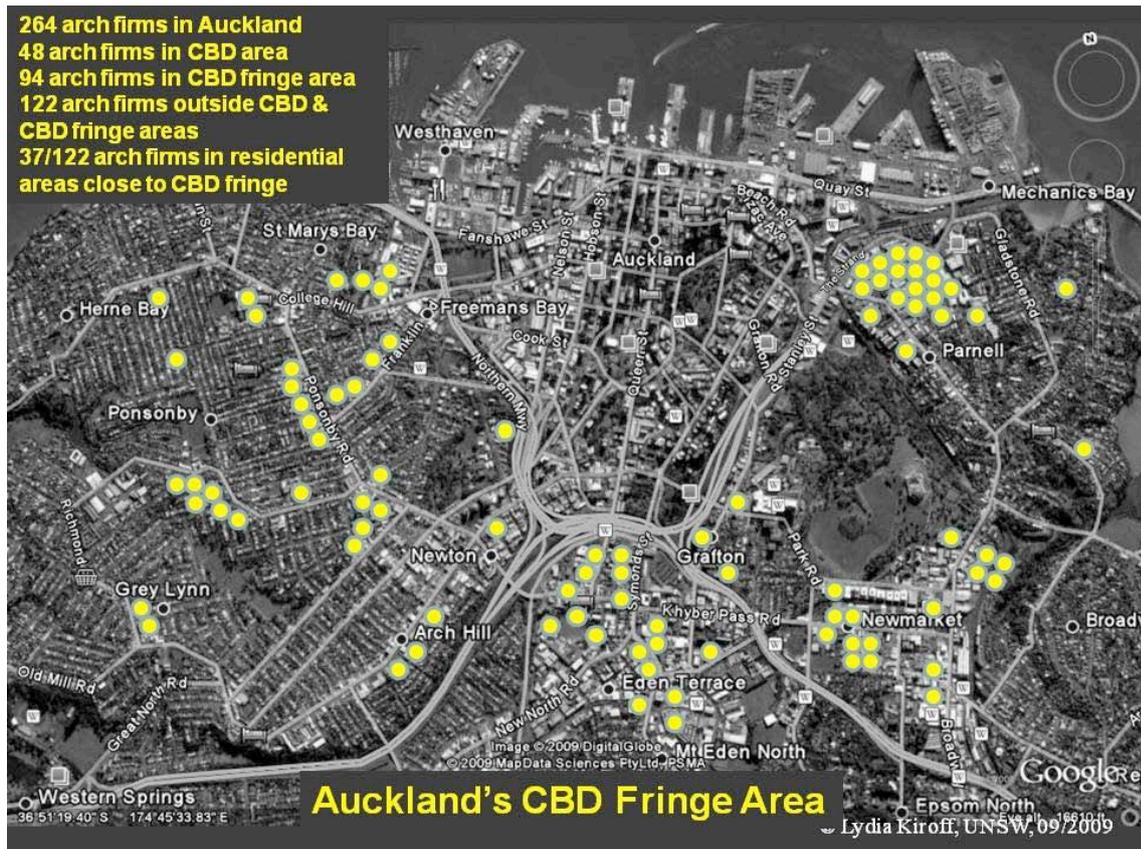

Figure 3: Distribution of architectural firms in Auckland's CBD fringe area (Kiroff, L., 2010)

Parnell is considered as one of Auckland's creative quarters located on the CBD fringe between the harbour and Auckland Domain. It is one of Auckland's oldest suburbs rich with history that dates back to 1841 when blocks of 3-5 acres were sold and quickly subdivided into thirty-six allotments thus establishing the suburb of Parnell. The profile of the early settlers living in Parnell at the time, mechanics and tradesmen, is quite different from the profile of the professionals inhabiting today's modern Parnell. These early settlers established themselves primarily in Mechanics Bay, where the first European suburban and industrial development took place. From the 1870s large industrial, railway and port developments took place in Mechanics Bay and St Georges Bay.

Tamaki Drive, which has direct contact with the open harbour, was formed in 1919 as a result of cutting off land from Parnell. The once thriving suburb lost some of its attractiveness and charm due to the lost connection to the harbour. New office and industrial developments as well as temporary housing stock took place until a local property developer Les Harvey started revitalising many of the old buildings along Parnell Road. The new iconic Parnell Village that was created was considered as the catalyst for regeneration of Parnell, a process that turned it into a desirable business location and also a prime residential area. Nowadays around 1000 businesses in retailing, jewellery, law, accountancy, finance, health, engineering, architecture and design, ranging in size from small to large, have chosen Parnell as a preferred location for their business activities. Parnell has unique ambience due to the successful blend of old traditions from the early settlement years with the commercial realities of modern life.

I considered the use of the official Directories of NZIA Practices as the most reliable source of data upon which I based my study of the architectural creative industries in New Zealand. This choice limits the sample to registered architectural practices only and excludes, for example, architectural designers, holding a Diploma in Architectural Technology or a Certificate in Architectural Drafting. Most of them belong to a professional organization, ADNZ, Architectural Designers New Zealand. The majority of professionals in this group either work for themselves from home as sole practitioners or employ between 1 and 3 draftsmen in their offices.

In comparison, the Auckland Yellow Pages from 2009 provide four different sections, all concerned with architectural design in its broad definition: Architects, Architectural Designers, Building Plans & Specifications and Draughting Services. These four broad sections include professionals at a Degree, Diploma and Certificate level. There are significant discrepancies between the data provided through the official Directories of NZIA Practices and the data contained in the Yellow Pages. While the 2009 Directory of NZIA Practices lists 264 firms in Auckland, the 2009 Yellow Pages list 309 in the “Architects” category only. A large number of these 309 firms do not have NZIA endorsement and do not fall under the registered practices category. This is due to the fact that the Yellow Pages are less concerned with the stringent registration requirements that govern the architectural profession. In summary, the data provided by the 2009 Yellow Pages per category are:

Architects – 309; Architectural Designers – 210; Draughting Services – 63; Building Plans & Specifications – 2; Grand Total - 584

This grand total of 584 is more than twice the number of architectural firms listed in the 2009 Directory of NZIA Practices, which are 264. Another problem with the listings in the Yellow Pages, which jeopardizes the reliability of data obtained from them, is the numerous duplications of entries. For example, Predefine Ltd appears in three out of the four categories: Architects, Draughting Services and Building Plans & Specifications. Similarly, Visual Designs and Concepts Ltd appear also in three out of the four categories: Architectural Designers, Draughting Services and Building Plans & Specifications. The multiple entries of some firms in more than one category make the figure of 584 highly unrealistic and unsuitable for a research to be based upon. As a consequence the potential sample derived from such a figure has the potential to be skewed and unrepresentative of the current market situation.

6. TEMPORAL STUDY OF THE EVOLUTION OF THE ARCHITECTURAL CREATIVE INDUSTRIES

The temporal study of the architectural firms in the North and South Islands of New Zealand, as well as in the three major urban centres - Auckland, Wellington and Christchurch, covers a period of fifteen years, from 1996 when the first Directory of NZIA Practices was published, to 2010. I gathered the data for these five categories for each year through counting the individual practices listed and assigning them to the relevant category. I then produced the charts showing evolution trends over a period of fifteen years.

	1996	1997	1998	1999	2000	2001	2002	2003	2004
NZ	608	393	403	486	470	488	544	556	596

	2005	2006	2007	2008	2009
NZ	604	622	604	645	634

Table 1: New Zealand temporal study of architectural firms (1996-2009) (Kiroff, L., 2010)

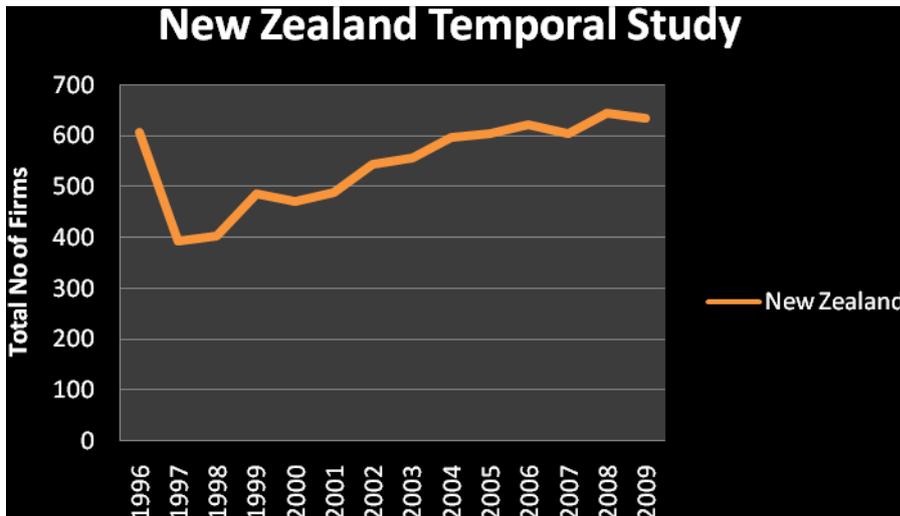

Figure 4: New Zealand temporal study of architectural firms (1996-2009) (Kiroff, L., 2010)

	1996	1997	1998	1999	2000	2001	2002	2003	2004
North	483	311	320	384	373	395	428	438	475
South	125	82	83	102	97	93	116	118	121

	2005	2006	2007	2008	2009
North	481	495	482	508	500
South	123	127	122	137	134

Table 2: North & South Island temporal study of architectural firms (1996-2009) (Kiroff, L., 2010)

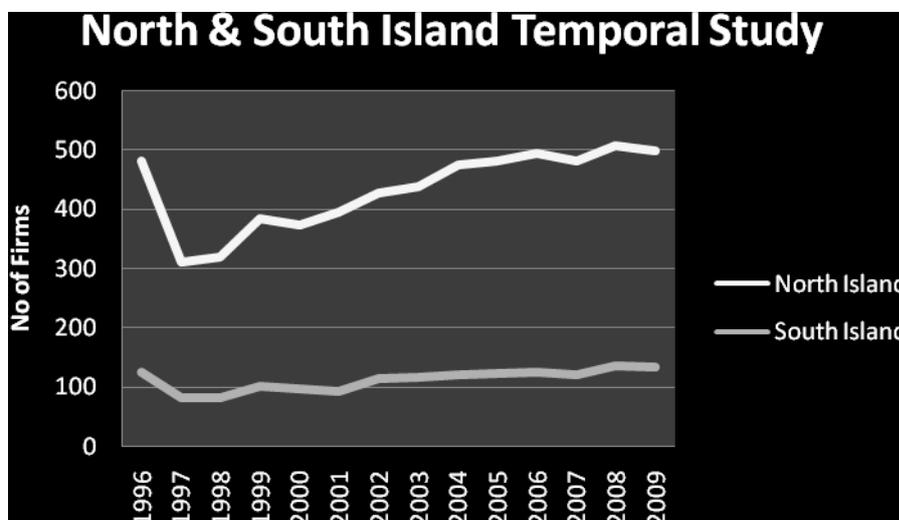

Figure 5: North & South Island temporal study of architectural firms (1996-2009) (Kiroff, L., 2010)

Once I produced the New Zealand overall chart and the North & South Island charts, I noticed a striking similarity between the overall New Zealand trend and the North Island one for the set period of fifteen years. The data series for New Zealand and the one for the North Island are virtually identical with the only difference being the greater number of firms in the New Zealand series as opposed to the North Island one. The South Island data series remains almost flat throughout the fifteen year period only with a slight fall in 1997 and a slight rise in 2008 and 2009 but has virtually no impact on the overall New Zealand trend. Based on this chart it can be speculated that the North Island plays a determining role in the country's architectural market.

	1996	1997	1998	1999	2000	2001	2002	2003	2004
Auck	237	152	167	207	208	208	228	234	259
Wngtn	138	81	76	87	85	94	100	108	114
Chch	64	43	47	52	54	57	64	63	64

	2005	2006	2007	2008	2009
Auck	262	273	262	280	264
Wngtn	115	119	120	116	123
Chch	64	64	64	67	69

Table 3: Auckland, Wellington & Christchurch temporal study of architectural firms (1996-2009) (Kiroff, L., 2010)

I used the data above to generate the fifteen-year trends for the three major cities in New Zealand – Auckland, Wellington and Christchurch. Being the largest city in the country, Auckland's number of architectural practices exceeds significantly the numbers in the other two cities, positioning the Auckland data series at a much higher place in the chart. The lows and the highs in the same series are also much more pronounced than the other two data series for Wellington and Christchurch.

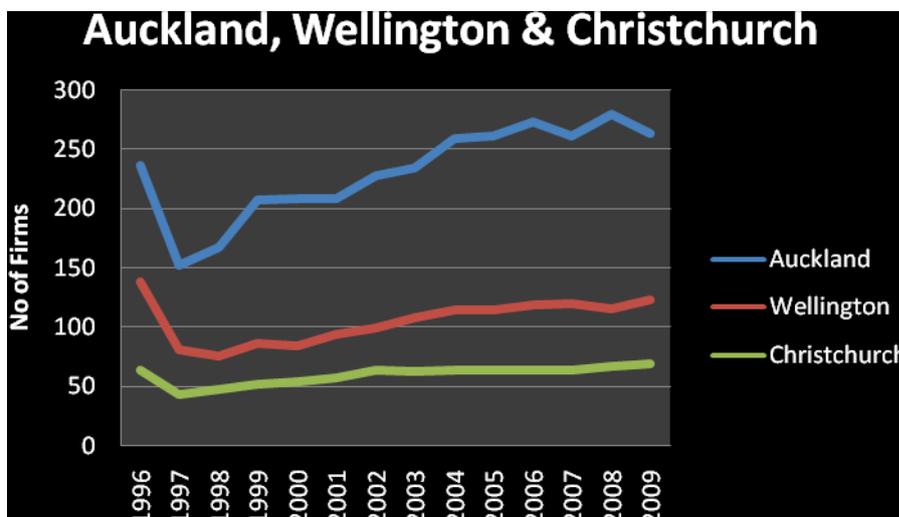

Figure 6: Auckland, Wellington & Christchurch temporal study of architectural firms (1996-2009) (Kiroff, L., 2010)

As the three data series in the chart above (Fig. 6) appear distinctly different and do not suggest similarity of trends, I compared the Auckland data series with the ones for New

Zealand and the North & South Islands. This comparison illustrates similarities in temporal trends between Auckland and the North Island & New Zealand as a whole. In addition, this comparison demonstrates Auckland's dominance on the architectural market far exceeding the whole of the South Island in terms of a number of architectural firms throughout the whole period of 15 years.

7. AUCKLAND'S ARCHITECTURAL FIRMS AND NEW ZEALAND'S FIFTEEN-YEAR ECONOMIC BACKDROP

An attempt has been made to compare the architectural firms' trend in New Zealand and the state of the economy as a whole, measured through the Real Gross Domestic Product for a period of 15 years, from 1996 to 2009. I was trying to establish whether the fluctuations in the number of firms throughout the country could be related in any way to the overall performance of the economy with all its ups and downs. The two line charts behave very similarly in 1996 starting high and going through a marked fall in 1998, which is then followed by a steep segment to reach a peak around 2000. After this year the similarities are less obvious as the GDP falls in 2001, which is not present in the architectural firms' trend as it remains relatively steady. After 2001 the GDP line chart fluctuates greatly with a well pronounced fall in 2009, while the architectural firms' one exhibits a slow but steady rise with occasional minor falls in 2007 and 2009.

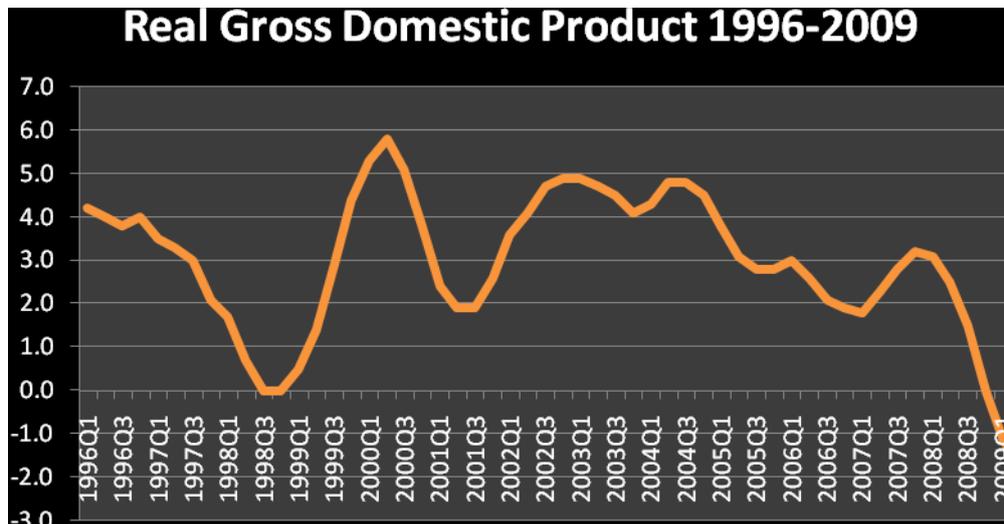

Figure 7: Real Gross Domestic Product in New Zealand (1996-2009) (Kiroff, L., 2010)

The comparison between the Real Gross Domestic Product chart and the New Zealand Temporal Study one shows in general that fluctuations in the national economic performance represented through the GDP do not necessarily get reflected in the number of architectural firms in the country over the same period of time. In reality, in tough economic times architectural firms tend to downsize rather than disestablish themselves. This trend is common in the architectural market, which is highly volatile, depending on the amount of work at any given time. The size of the firms fluctuates greatly even in the space of a single year as the office workflow fluctuates. The Directories of NZIA Practices used to publish information on their size in the period 1996 – 2006 inclusive. Since 2007 NZIA ceased to

supply this information in the published directories of the architectural practices. A meeting that I had with the current President of the New Zealand Institute of Architects on 15 September 2009 confirmed that publishing the size of architectural firms in New Zealand has ceased due to the unreliability of such data. For the first eleven years of the fifteen year period there were four sizes of architectural firms:

- 1-4 persons
- 5-9 persons
- 10-19 persons
- 20 plus persons

As the construction market in New Zealand is relatively small, the majority of the architectural firms are in the small to medium range with just a few large practices, located predominantly in Auckland City.

8. CONCLUSION

As a result of the plotting of the architectural firms on Auckland's CBD and CBD fringe area maps, it became apparent that certain areas around the CBD have well defined creative industries clusters. Parnell had the highest number of architectural firms, 20 in comparison with the other seven CBD fringe areas. Parnell's urban renewal that was started in the 70s by the local property developer Les Harvey is continuing at present turning Auckland's oldest suburb into a desirable business location and a prime residential area. The potential impact of such regeneration is on a micro level – transforming live-work-leisure spaces and on a macro level – transforming the urban environment and ultimately changing the city's image.

SUPERFLAT WORLDS: CROSS-CULTURAL STRATEGIES IN ART

Dr Kristen Sharp, RMIT University

Abstract

This paper maps Takashi Murakami's *Theory of Superflat Art* in conjunction with his associated artistic practices and works in the context of globalizing culture, particularly within the historical, social, and cultural contexts of their production-consumption in Japan, the United States and Europe. As an important contemporary artist, Murakami's Superflat work actively participates in and expresses the tensions between local, national and global cultural identity associated with contemporary globalization processes. While the term Superflat implies a world in which cultural difference is increasingly flattened and thus eliminated, Superflat art is anything but homogenous. This paper demonstrates that Murakami strategically presents Superflat art as an expression of Japanese identity, which paradoxically also expresses the fluid imaginings of cultural identity and value available through historic and contemporary global exchanges. This deliberate demarcation and multiplicity does not resolve the contentions of globalization but rather amplifies them as such exposing the key debates on the formation of cultural identity as an oppositional expression and as a commodity in global markets. Murakami's self-conscious activation of these global processes is the overriding framework in which to understand Superflat. *Superflat Worlds* contributes a valuable case study to the understanding of cultural production as a strategic negotiation and expression of the flows of capital and culture in globalization.

KEYWORDS: Takashi Murakami, Superflat, globalization, Japanese identity, art, popular culture.

Bio

Dr Kristen Sharp is a researcher working in the area of cultural studies and art history, with a specific focus on globalization and cultural identity. Her PhD, *Superflat Worlds: a topography of Takashi Murakami and the cultures of Superflat art*, examined the contemporary Japanese artist Takashi Murakami as an example of a contemporary art practice that is strategically located within the processes of contemporary globalization. Forthcoming publications include a co-edited publication on transnational public art projects with McCulloch and McCulloch publishing, Melbourne and a chapter 'Global Fissures: intercultural dialogues in contemporary art' in *Cultures and/of Globalization*, Cambridge Scholars Press. Kristen is currently lecturing in Art History and Theory in the School of Art at RMIT University and conducting research on art and the urban experience in association with the RMIT Global Cities Research Institute. SUPERFLAT WORLDS: CROSS-CULTURAL STRATEGIES IN ART

Dr Kristen Sharp, RMIT University

Global flows

Artists, such as contemporary Japanese artist Takashi Murakami, actively participate in many of the core debates and issues that have accompanied processes of globalization. Artworks and practices act as both expressive ideas and commodities in these globalised spaces. As a cultural text, art production-consumption, is intricately enmeshed in three key political issues regarding cultural identity and globalization. Firstly, the problem of how to retain the concept of local/national cultural particularity *and* to concurrently recognise the convergences and overlaps between cultures in a global context (Robertson, 1995); secondly, how to recognise the value in cultural difference as a tool of critical (oppositional) agency (Fisher, 2003) and acknowledge that difference can also become a commodity in the global market place (Hall, 1991); and thirdly, to acknowledge the dominance of Western cultural, political and economic imperatives in global processes (Hardt and Negri, 2000), while also recognising that it should not be reduced to this condition (Held et al., 1999). Murakami's concept of Superflat art and his art practice demonstrate how cultural identities facilitated by global processes are open to re-articulation by both global and local forces, which allow new strategic identities to emerge. These identities, while proffering resistance through the assertion of difference, are also formed as part of the processes of globalization rather than in strict opposition to it.

The spaces created by global interaction are dynamic and filled with tension. In response to what is felt as the increasing fragmentation of national and cultural identities (Morley and Robins, 1995), impulses arise to reclaim local and national identities in a form of resistance (Hall, 1995). A resistance that is complicated because it is formed in relation to the transnational imaginings of cultural identity stimulated by the constant circulation of people and mediated images through globalization (Appadurai, 1996). Geo-cultural mobility of people, ideas and objects draws attention to the unfixing of categories and values and their constant reformation. This not only includes cultural ideas of national identity, but also how the values behind separating and defining particular objects as "art" and as "commercial design" are constantly shifting in these spaces shaped by mobility, interaction and change.

Andreas Huyssen (2002) argues for critical research into the cultural spaces of globalization. He highlights the need to investigate and re-evaluate the cultural debates categorising high and low culture, which were such a dominant feature of (post)modernist debates in the 1980s and 1990s. Huyssen argues that many of the discourses around high/low culture at this time focussed largely on examples from Western culture.¹ The study of non-Western geo-cultural sites can establish ways to move beyond such a binary categorisation, and to reveal the multiple and horizontal relations between objects and values evident in contemporary culture and how these are realised in the spaces of globalization. In the following analysis of Murakami's practices and concepts, it becomes evident that distinctions between art and popular

¹ "Western" is used here to denote a discursive construct, rather than an actual geo-political territory.

culture have not disappeared. Rather, these categories have entered into new sets of relations strategically mobilised *in* and *between* local, national and global levels.

Superflat art

Superflat is a concept and theory of contemporary Japanese art developed by Takashi Murakami. Superflat was launched in 2000, in an exhibition of the same name, in Tokyo, which subsequently traveled to Los Angeles. By taking the exhibition to Los Angeles and producing a bi-bilingual catalogue with his manifesto of Superflat art (Murakami, 2000), Murakami strategically brought his concept into a globalised milieu of critical thought. The exhibition, curated by Murakami, featured the work of a range of established and emerging artists drawn from art and commercial practices in Japan. In the manifesto Murakami affirmed that the Superflat exhibitions were created to provide a cultural-historical context for the new form of art that he was proposing, and which was specifically exported for Western audiences. This new form of art emerges from the creative expressions in Japanese contemporary art, *anime* (Japanese animation), *manga* (graphic novels), video games, fashion and graphic design.

The underpinning ideology of Superflat is a flattening of hierarchical distinctions between fine art and commercial art forms such as graphic design, animation and fashion. Murakami extends this dialogue between the value and meaning of the concepts of “art” and “commodity” into his own practice by simultaneously exhibiting his paintings and sculptures within conventional art world institutions (galleries and auction houses) and distributing them as part of popular media culture (from creating a series of snack-toy figurines in *Superflat Museum* (2003) to being commissioned to design a range of accessories by Marc Jacobs for Louis Vuitton (2003).

The type of citation and crossover between contemporary art and the commercial world that is evident in Murakami’s practice and *Kaikai Kiki* is not new; what makes Murakami’s actions innovative are the playful interaction between these values, across geo-cultural territories. His intention was to establish his art work in international art markets, with the aim to utilise this profile in order to “revolutionise” Japanese art by connecting it to popular culture. The establishment of an epistemological context for Superflat was an explicit part of this process.

Murakami is self-consciously constructing relatively discrete identities for his practice in Japan and in the West. In the West he is associated with conventional artworld discourses and institutions. In Japan his agenda is different. Superflat is presented as a circumnavigation of the institutions and practices of modern fine art (*kindai bijutsu*), which Murakami contentiously and simplistically argues are an incomplete import of Western concepts adopted during the Meiji period (1868–1912) as a part of Japan’s process of modernisation and Westernisation.²

Murakami’s additional contention is that Western distinctions between art as “high” culture and mass-produced commercial forms as “low” or “popular culture” do not operate according to the same value structures in Japan (Clammer, 2000, 2001). It was

² Murakami is specifically referring to the practices of *yōga* (Western-style painting) and *nihonga* (Japanese-style painting).

not until after the importation of the concept of *bijutsu* in the Meiji period that the aesthetic value of art and the everyday use and commodity value of craft (*kōgei*) were categorically distinguished (Moeran, 1997; Yanagi, 1958; Guth, 1996). Nevertheless, there were ideological divisions between high/low cultures, such as art/craft. However, the objects and practices afforded the distinction of high/low were not the same as those in modern Western discourse. Prior to this, the development of technical skill and the concept of copying were not hierarchically devalued in Japan, nor was there the same historical ideology of art being privileged as an expression of originality, and many artists created both art and craft objects. Even then, however, the emphasis in Western modernism on autonomy was not applied in the same way in post-Meiji Japanese art.

Murakami extends his position further by contentiously arguing that while fine art (*bijutsu*) may occupy a privileged position within Japan in relation to established cultural institutions and state support it lacks conceptual and aesthetic relevance for young consumers (2000).³ He argues that in contrast, popular commercial media forms such as *manga* and *anime* demonstrate the qualities of originality and creativity that young consumers desire. For Murakami, these forms also express his idea of “creativity” that is tied to his desire for a peculiar Japanese form of expression and that are rooted in the importation issues of *bijutsu*.

According to Murakami, a new generation of “Superflat” artists source their ideas from these post-war commercial media forms (ibid). Murakami’s particular focus has not simply involved appropriating the imagery of *anime* and *manga* but with engaging the practices and aesthetic value of *otaku* (avid fans and artists of *manga* and *anime*). connoisseurship. Murakami is not alone in considering the politics of this dynamic. He is part of a particular group of artists who have been particularly concerned with the international circulation of their work and the formation and articulation of a post-war national identity for Japan based around *otaku* culture. Sawaragi Noi (2000) identified this new generation of artists in the 1990s as “Neo-Pop,” because they engaged with the popular imagery and products of *anime*, *manga* and game culture.

Murakami acknowledges that this Japanese sensibility emerges from the transformations arising from the influences of Euro-American culture; he simultaneously reaffirms the originality of Superflat as uniquely Japanese.⁴ This demarcation proposes Superflat as a specifically Japanese post-Pop Art aesthetic that is distinct from Western art and from imported ideas of art in Japan (Murakami, 2005, p. 152–3). The essential Japanese identity of Superflat constructed by Murakami is reinforced by the ways in which it connects (visually and ideologically) the *kawaii* (cute) forms of *anime* and *manga* with the playful aesthetic of Edo period artists and the two-dimensional formal properties of Japanese screen painting.⁷ This aesthetic lineage concept draws significantly on Japanese art historian Tsuji Nobuo’s *Kisō no Keifu* (Lineage of Eccentrics) (1970). To Murakami, the innovation and originality of

³ The status of contemporary art (*gendai bijutsu*) in Japan is particularly ambiguous because its existence is largely independent of established *kindai bijutsu* institutions. *Gendai bijutsu* is used here and by Murakami to refer to art that would be considered relevant to international contemporary art practice and emerged after World War II in direct opposition to the art establishment (*kindai bijutsu*).

⁴ There are precedents for *anime* and *manga* in earlier Japanese illustrative forms (Schodt, 1986), and while there are identifiable influences from Western comic forms these have been assimilated and transformed (Kinsella, 2000, p. 45–51).

post-1945 forms of commercial culture represent a continuation of the innovations of the Edo (1600–1867) visual culture. This foundation is then used to propose Superflat as an alternate lineage of Japanese visual culture, one that breaks away from the canon of *kindai bijutsu* and Western art history.

The reference to Edo functions in Superflat as the determinant of its cultural authenticity – that is, as the DNA of Superflat (Murakami 2000, p. 25). Edo is presented as the site of Japan’s cultural tradition and subsequently as a symbol of its Japaneseness. This echoes modern Japanese discourses in which Edo becomes the repository of nostalgic yearnings for a pre-modern, “traditional” Japan (Ivy 1995). In the late 1980s and early 1990s Edo was a common trope in debating Japan’s (post)modernity (Kojève, 1980). Contemporary Japanese culture, particularly popular culture, was considered to be a revival of Edo concepts and practices and thus particularly “indigenous” to Japan and distinct from a Western defined (post)modernism (Karatani, 1997). This was then used to propose Japan as the unique leader in a (post)modern future. However, as Gluck (1998) points out, the definition of authentic and traditional Japanese expression in relation to a fixed point of origin in Edo culture has been heavily challenged. Therefore, Murakami’s use of Edo to mark the culturally unique and authentic transmission of the Superflat aesthetic transcending Japanese and Western modernism, which is supposedly demonstrating the future of art, should be treated with caution.

Murakami has also been criticised for synthesising Edo with contemporary popular culture and emphasising Edo as the critical point of origin for Superflat. At least initially, Azuma Hiroki (2001) emphasises more than Murakami the important influence of American popular culture after the war on *anime* and *manga*. Azuma argues that critics in the 1980s (such as Kojève and Karatani) who sought to identify links between contemporary Japan and Edo culture betray a “historical amnesia” towards the trauma of defeat experienced by Japan at the end of the Second World War and the influence Western forms on Japanese popular culture. He rejects the construction of “authentic” Japanese art and culture outside of the post-1945 influences of Western culture, and theorises *otaku* culture as an expression of postmodernity, ruptured from Japan’s modernity.

Azuma’s argument is that *otaku* culture expresses the hybrid process of Japanising, or localising, imported commodity forms, like 7-11’s, comics and McDonalds. These expressions are not without tensions. For Azuma, this new identity is asserted to transcend Japan’s post-war feelings of inferiority, supported by the successful export of *anime* and *manga* to the West. However, Azuma potentially over-states the importance of the post-war influence of the United States, thereby replacing the centrality of Edo (in Karatani and Murakami’s discourses) with the United States. Furthermore, Azuma’s emphasis on hybridity is contradicted by his demarcation of this *otaku* identity as an expression of a contemporary national identity, albeit in a new form. Even in the subtitle of his essay, *Otaku Nationalism*, Azuma betrays his tendency to identify *otaku* as Japanese and distinct from other fan cultures. Therefore, Azuma still ends up reterritorialising *otaku* identity as form of Japanese expression (Lamarre 2004).⁵

⁵ Lamarre argues that Azuma’s emphasis on *otaku* as a rupture with the Enlightenment concept of subjectivity and as a new form of non-hierarchical subjectivity, results in the substitution of the individual and whole subject with a

Self-Orientalism

The affirmation of a national-cultural aesthetic in Murakami's theory of Superflat can be considered as a form of self-Orientalism: an identity formation that is constructed in relation to the Western Oriental gaze (Said, 1995). While self-Orientalism has been considered as an empowered strategy of re-appropriation, there is always the danger that it can become collusive to Orientalism. Particularly in relation to Japan self-Orientalist discourses can be considered a continuation of the Japan/West binary construction, which obscures the connections and power relations underpinning this structure (Iwabuchi, 1994).

Superflat does tend to follow the self-Orientalist path by echoing discursive constructions of a Japan/West binary. It also tends to follow aspects of the assertive discourses of Japanese identity, *nihonjinron*, in the post-1970s (Befu, 2001). Both of these tend to emphasise Japan's national identity as unique and different from the West and the East. Secondly, as previously stated, while Murakami acknowledges the Western influences on the Superflat aesthetic, his simultaneous transposing of this hybrid identity into a reinforcement of a Japanese identity, characterised by cultural assimilation and hybridisation, reinforces a unified national-cultural identity. One of the common criticisms of Murakami is that he is offering a futuristic Orientalist spectacle for Western audiences (Shimada, 2002: 188–189). This is not dissimilar to the creation of Japanese “export” art for foreign markets in the late nineteenth century at the height of the fashion for *japonisme*.

In some ways, the self-Orientalism of Superflat can be understood as a post-colonial defensive reaction. Superflat is presented by Murakami as a localised expression of cultural uniqueness resisting the global hegemony of Western art and transcending the imported colonialist history of *bijutsu* by presenting “icons of excessive otherness” (Matsui, 2001: 48).¹¹ Yet it is also evident that Superflat and Murakami do not erode but rather tend to reinforce the dominant art markets of the United States and Europe and that the Japanese identity of Superflat is used as a commodity, even though Murakami continues to emphasise Superflat as a “post-Japonisme” gesture (Kelmachter, 2002: 103–104).

However, to reduce Superflat to a collusive Orientalism, or to see it as *just* a commodification of identity in a pejorative sense, misinterprets the dynamics in play. Murakami is both proffering resistance as well as marketing his work strategically. Firstly, Murakami articulates his identity through the exhibition structures of the West as well as through conventional signifiers of Japanese aesthetics in order to establish his profile and to sell his work. Yet he also acknowledges the ambivalences of his own position and the playfulness of this global positioning of identity:

In the worldview that holds delicate flavouring as the only concept of ‘beauty’ with any value, heavy flavouring is taboo, and too much stimulation is definitely problematic ... In order to create something that is understandable both to the West and Japan, what is needed is an ambivalent flavor and presentation (Kaikaikiki Co. Ltd & Museum of Contemporary Art Tokyo, 2001: 131)

new form of unified (postmodern) subjectivity (pp. 177-8).

Furthermore, research into the popular consumption of *anime* and *manga* outside Japan argue that these forms express plural cultural identities and, as Allison (2000) shows, are detached from specific representations of space and place. They are instead marked by a particularly form of flexibility which can express both highly localised coding and fluid signifiers (Yoda 2000). This suggests that the consumption of Superflat, like that of *anime* and *manga*, is not simply based on a desire for reflected images of Japaneseness as a cultural Other; rather, it offers audiences a flexibility of alternate identities, free from specific geo-cultural connections (Sharp, 2007). Furthermore, the increasing familiarity of *anime* and *manga* suggests that Superflat is not consumed as an exotic Other but rather as part of an existing aesthetic identity for Western consumers.

Konbini Art: Superflat Museum

Murakami's engagement with *anime*, manga and otaku culture is most readily apparent in the series of figures made in collaboration with Okada Toshio, Kaiyōdō (a commercial company involved with figurine production), and Bome, a revered figurine modeller in the *otaku* community. Together they have created a series of figure sculptures, including, *Second Mission Project KO²* (S.M.PK02) (1999), *Miss KO²* (1997), *Hiropon* (1997), *My Lonesome Cowboy* (1998), and more recently, *Inochi* (2004). The almost life-size scale of the figures was an unusual departure from the typical *bishojo* (beautiful girl) scale-model figurines, called garage-kits, collected by fans.

The association with Kaiyōdō continued with the release of *Superflat Museum*, a series of limited edition (30,000) miniature figurines or *shokugan* (snack toys), based on the figure sculptures and other characters in Murakami's oeuvre sold through *konbini* (convenience stores) in Japan. *Shokugan* are ubiquitous snack toys that are highly detailed, intricately crafted, hand painted and mass-produced objects. They are usually based on popular *anime* and *manga* series characters, though they are not strictly limited to these sources.

Murakami's intention with *Superflat Museum* was to experiment with the meanings of art and commodity in response to the high-profile auction sale of *KO²* at Christie's New York auction. He states:

... in principle [with *Shokugan*] you are paying for the snacks and the figures enclosed in the packages are essentially free. ... One of my works, a life-size sculpture 'Miss KO²,' fetched over a half million dollars at a Christie's auction in New York City in 2003. ... The same figure, 'Miss KO²,' is also included in 'Takashi Murakami's SUPERFLAT MUSEUM.' To generate a great confusion of values by juxtaposing a half million dollars and 'free,' that is the purpose of creating the artistic *shokugan* figures. What is art in the first place? Is it about quality? Concept? Or monetary value? The standards vacillate throughout history. My definition of art is the moment that an artist or a work appears with the power to instigate the overturn of values. Therefore the crucial point for the presentation of 'free' artwork in the current artistic *shokugan* project is the moment it can provide the opportunity for people to rethink the sense of values itself (Murakami and Kaikai Kiki Co. 2003, n.p.).

Superflat Museum is a self-conscious engagement, on a mass-produced scale, with commercial commodity forms. The serialised production of the figurines replicates and references the “sculptures,” which have been exhibited in both art and *otaku* contexts. While the figurines reference the art world profile of Murakami they simultaneously exist as commodities to be sold and exchanged within the world of collectable figurines. It is the similarities, rather than differences, of connoisseurship between art and commercial commodities that Murakami is drawing attention to. There are interesting juxtapositions between the two items that support Murakami’s claims. The *shokugan* version uses similar manufacturing techniques, both the figurine and the full-scale figure are based on scale models created by Bome, and, just like the life-size version, each *shokugan* is individually hand-painted and coming with its own certificate of authenticity and an edition number.

Murakami argues that the figurines in *Superflat Museum* are valueless because the commodity transaction is based on the snack and the toy is free, which is the common value transaction of *shokugan*. However, the gestures of signing and editioning each figurine reinforce the author-ity (the branding) of the work as a “Murakami”. *Superflat Museum* is also distinguished from other types of *shokugan* because it was released in a limited edition that sold out immediately, the figurines were miniature versions of his artworks, the packaging clearly reinforced Murakami’s identification as an artist, and it received press coverage as a special edition promoting the “artist” Murakami. Each figurine also comes with its own historical background in relation to Murakami’s oeuvre. Murakami’s identity as an artist is thus centralised and *Superflat Museum* is given an existence within the social institution of art. It is arguable, however, that while it may question the meanings underpinning the value of the art market object and the mass-produced object, *Superflat Museum* does not erode the distinction and market value of works such as *Miss KO2*². What he ends up doing is simultaneously reinforcing and eroding the cultural distinctions constructed around the concepts of art and popular culture by strategically utilising the cultural capital (Bourdieu, 1993) of “art” and “popular culture.” For example, within Murakami’s pluralistic production range, aesthetic value does not operate solely in relation to the art works but is also attached to his design commodities.

Murakami uses the platform of *Superflat Museum* to cultivate and educate what he refers to as “art fans” (Nakamura, 2001, p. 24). Again, it can be argued that while Murakami may be engaging new consumers for his work outside of conventional gallery structures, this is not so much challenging the value of art as reinforcing the cultural capital of the identification of himself as an artist and his own artistic reputation within the art institution by producing commercial goods based on his artworks – similar to other art gallery store merchandise. The intertextual references between Murakami’s works support is the identity of *Superflat Museum* as a form of commercial consumption in Japan related to Murakami’s profile as an artist internationally, through the sale of *Miss KO2* at a Christie’s auction.

Murakami is not just representing the specialist fan culture of *otaku* but rather the mass consumption practices of *anime* and *manga* in Japan and presenting these for a Western audience, while also carving out a space for Superflat art in Japan amongst these consumers. Sawaragi Noi (2000, p. 166) reinforces the concept that *manga* and *anime* are not oppositional cultural expressions in Japan, but are highly valued by the wider public and are consumed with the same degree of discrimination and aesthetic

judgement that has been ascribed to art connoisseurship in the West. When *manga* and *anime* are exhibited in a gallery, Sawaragi argues, they are not presented as a challenge to high/low cultural distinctions but instead demonstrate their already wide popularity and esteemed value. If, as Murakami argues, art in Japan is consumed in a manner similar to other commercial products (such as music and fashion), and if Japanese consumers do not necessarily privilege contemporary art above these products, then Murakami is not so much challenging the distinctions between art and commercial culture, but rather reinforcing the status quo.

It can be argued that *Superflat Museum* is also part of a long history of art/commercial culture relationship in Japan, particularly in relationship to the “high” cultural values associated with *depāto* (department stores). Since the Meiji period *depāto* have been a key avenue for introducing and educating the Japanese public about Western consumer goods and art (Creighton, 1992) and in the early days of Superflat many of the large department stores had high-profile contemporary art galleries, including the Parco gallery where *Superflat* was originally presented.

Murakami’s conflation of art with the forms and practices of commercial culture can also be conceived as an expression of late capital cultural conditions (Jameson 1991) and a challenge to the hierarchical dichotomy of high art and popular culture which was a key part of modernist discourses (Foster, 1998; Huyssen, 1986).⁶ However, the pointed emphasis on the identity of Murakami as an artist suggests that these distinctions have not entirely disappeared in the way that Jameson and Baudrillard (1983) propose. Murakami is not necessarily subverting the commodity form or the status of art according to the terms of those discourses. In his own discussion regarding his practice, Murakami reinforces his identification as an “artist” (although this category has its own contentions) and distinguishing his “design work” productions such as *Superflat Museum* from the “pure art” of his paintings and sculptures (Frederick, 2003). Yet, the intertextual references between his figurine sculptures and *Superflat Museum* makes any distinction difficult to sustain.

Murakami’s status within conventional art discourses also appears to be reliant on his identity as an artist who blurs the distinction between art and commercial culture. Murakami has established himself as a brand – with a range of outputs and activities not limited to the conventional forms of painting or sculpture – under the banners of “Takashi Murakami” and “Superflat.” Murakami thus utilises the economic and cultural environment of late capitalism in which aesthetic value becomes part of the commodity value of mass-produced goods (Harvey, 1990). Murakami’s explicit emphasis on art production as a business (see Wakasa, 2000) renders a value distinction based on the meaning of art as an autonomous aesthetic expression, and commodity production as standardised and repetitive, equally problematic and permeable.

Superflat Museum also demonstrates the affirmation of the aesthetic value of commercial products by consumers. The seriality of Murakami’s work directly borrows from the processes of fragmentation, assembly and transformation which

⁶ While there is not the scope in this paper to fully enter into the intricacies of the modernism/postmodernism debates and particularly the definition of high/low culture within modernism, the paper follows Huyssen’s (1984) position that the distinction between high/low culture was insisted upon in dominant modernist discourse even while in practice many modernists violated this distinction.

characterise *otaku* communities and their relationships to *anime* and *manga* characters (Steinberg, 2004). In particular, the productive role of consumption, such as the expression of desire or attachment towards characters in *otaku* culture, which is facilitated by the processes of reproduction and deconstruction, provides a valuable framework through which to consider how aesthetic value operates at all levels of production. Murakami's serialised work and production practices, where he draws from a computer database of created characters and which his assistants continually re-deploy into paintings or sculptures, asserts the value of the copy and of seriality which is a key form in commercial character production. Yet the singular value of the work produced, even though its content or form may be reproduced, it still strongly reinforced: the techniques of signature, numbering and hand-painting are used to signify authenticity and to produce variation. Murakami has strict methods of quality control and the production of work is still highly manualised, with an emphasis on technique (Kaikai Kiki, 2001). Therefore, despite Murakami's claims, *Superflat Museum* is not so much a post-Duchampian challenge to the values of the art object; rather, it reinforces the sustained importance of singularity and brand signature even in its serialised production.

Murakami often gets criticised for his post-Warholian merger of art and business (see Searle, 2002; Saltz, 1999). Arguably, Murakami can demonstrate his own lack of regard for the criticisms aimed at his merging of art and business from within the art world, because he had potentially generated sufficient cultural capital in North American and European art markets and institutions by this time to establish his reputation as a "serious" artist. This establishes a platform from where he can safely engage with commercial forms. Furthermore, his supposed disregard of (Japanese) art critics is perhaps a safe position given that the majority of Murakami's art sales occur within Western art markets – a success he is keen to stress.⁷ Yet, Murakami must maintain a balance between establishing an art context, namely, his reputation as an artist for collectors and investors, while at the same time establishing his accessibility for the wider public.

Another important point to note is that Murakami's activities are not completely exclusive or always in conflict. The pieces in *Superflat Museum* are neither art nor entirely commercial products – their ontological status is not absolute. They demonstrate the mutability of art/commodity relations, while at the same time retaining the concept and institution of art and the brand identity of the artist. They celebrate the potential of penetrating different markets, rather than offering a critical position against commodification. This is not to say that there are no dominant values present in Murakami's work; all his activities still reinforce the institution of art and centralise his identity as an artist. Murakami is creating niche and customised products that build on his own signature brand of Murakami the artist. This "artist" identity is a key component of his work and strategy that can be projected onto his various activities. Therefore, at the same time that Murakami blurs the distinctions between his art and commercial works, there are still identifiable points of differentiation between them. In some sense, Murakami is merely capitalising on the merchandising potential of his artwork. However, the ways in which he utilises the cultural site of the *konbini* demonstrate potential for generating new audiences and

⁷ Approximately 70 percent of Murakami's paintings and sculptures are sold in these markets (Koyama, 2001, p. 119).

consumptive patterns for his work, beyond art world institutions.

What Murakami really offers is an understanding of how the cultural capital of *otaku* culture and art can be used to strategically position a practice in an international context. What becomes evident in this entire process is the way that Murakami strategically plays with the meaning dependent on geo-cultural context: the more commercialised access the public has to his work in Japan in contrast to the Western art gallery context. Murakami's "revolution" is thus a clever exploitation of the status of art and commercial culture in Japan and his status in Western art worlds.

Murakami's promotion and appropriation of *otaku* culture is not always positively received by *otaku*; they maintain a certain distance from him, arguing that his appropriated *otaku* forms are of interest to the art world and not to *otaku* themselves. They argue that they do not recognise a cultural dominance of art, that he has not captured the essence of *otaku* connoisseurship and they remain sceptical of his parody of their character culture (Asano, 2001). It is therefore difficult not to understand this as a one-way utilisation of *otaku* culture for Western audiences. Yet Murakami also contends that he provides an alternative platform for *otaku* creators through the Superflat exhibitions.

Murakami's presentation of Superflat offers an alternative identity to Western art history by expressing and articulating the particularities of Japanese contemporary art and visual culture, while simultaneously constructing that identity in the familiar terms of Western art discourse. However, Murakami's position is also more complex than simply presenting *otaku* beauty as an opposition to Western art. Superflat is still embedded in the debates of Japanese identity in which Superflat is defined, particularly in relation to the West as the Other, even though the intention of Superflat is to assert a new identity for Japanese creative expression. In this way, the self-Orientalist impulses of Superflat do not resist or oppose the West or modern Japanese identity *directly*, but use existing discursive constructions in order to re-work the meaning of contemporary Japanese identity by exploiting global processes, in which in-between and hybrid identities are an ordinary state (Papastergiadis 2003).

To understand Superflat as just a commodity, or constructed only for Western art audiences, is too limiting. Superflat operates on multiple levels. The limited interpretation of Superflat as Orientalist spectacle is problematic because it assumes that the Western audience desires and exoticises the differences of Japan and constructs it as a cultural Other. In contrast, research on the consumption of *anime* and *manga* in the West suggests that these products are not just consumed because of a perceived Japaneseness, but also because of their "culturally odourless" translatability (Iwabuchi, 2002) and, I would argue, an increasingly familiar aesthetic. Therefore, if Murakami is strategically deploying a self-Orientalist image in order to sell his work in Western art markets, like the consumption of *anime* and *manga*, this does not have to determine its consumption as Orientalist spectacle. Furthermore, if the self-Orientalist lens is the only one used to consider Murakami's work it does ignore the impact of his work in Japan, amongst the consumers of *anime* and *manga* and in establishing the international careers of younger artists such as Aya Takano and Chiho Aoshima. He also promotes the work of "amateur" artists through large-scale art events like *Geisai*. This is an open entry art fair competition for artists who

have not been trained in conventional art institutions, which was established by Murakami in 2002.

This paper has analysed the relations involved in constructing, maintaining and deconstructing distinctions between the sets of values associated with art and commercial products. One of the characteristics of the production-consumption of Murakami's works, including *Superflat Museum*, is its engagement with the distinctions (and blurring) between "art" and "commodity," which is a strategic deployment of both his expression *and* the commercial success of his work. Murakami inscribes his work in the conventions of art while also engaging with popular culture form and practices. Superflat is not an attempt to reconcile these concepts, but rather mobilises their distinctions and reveals their complexities *across* and *in* different cultural contexts. The ontological status of these objects is not absolute and what is demonstrated is the mutability of art/commodity relations in geo-cultural territories. The cultural meaning of Murakami's works and practices can thus be located in Western *and* Japanese discourses, and the sites in which they overlap.

Murakami is thus simultaneously constructing an international dialogue with Superflat: referencing a history of cross-fertilisation of visual culture between Japan and the West and articulating Superflat as a response to a particular national experience in Japan, which also focuses on the values of art and popular culture in Japan. In producing Superflat as a negotiation between Western art markets, Japanese art worlds and Japanese popular culture, Superflat becomes part of the politics of commodification and expression of cultural difference generated in global consumption.

Topic of the Sub: Folklore

With scientific advancements and revolution in the field of communication technology, Globalisation has finally come to stay. This necessitated the emergence of dramatic and dynamic contrasts in the world. On one hand societies are becoming more and more plural, multicultural and global, adopting global patterns and norms, while on the other hand there are societies still struggling with the problem of identity crises. These crises are taking shape in the form of ethnic revolts, communal riots, naxalite movements, terror attacks and so on. Undoubtedly, all these expressions are the outcome of identity crises in one or the other form. For the past two decades the situation has become even shoddier.

The period following gulf war, the global culture and the mass media have got a symbiotic relationship. Former is transmitted by mass media such as films, television, satellite channels, large public gatherings and is usually not location-specific. But in the name of globalization, what has happened and still happening with the local ancient folk culture in particular is very disheartening. Folk culture is a form of popular culture, whose impact and significance is immense on the local people, but unfortunately it has become a victim in today's mass communication age. The overwhelming reach and impact of media has adversely influenced the traditional folk culture.

In view of these seemingly contrast cultures, the central question is how could these two extremes be avoided and brought together and integrated in such a way that both could enrich each other. That let people connect and exchange their knowledge. Folk culture is that precious art, where humanity exists in its original form. The present paper aims to explore all those opportunities, which could save and preserve these humanistic values.

Globalization and Cultural effects

Globalization has had an impact on different cultures around the world. Culture is defined as patterns of human activity and the symbols that give these activities significance. Culture is what people eat, how they dress, beliefs they hold, and activities they practice. Globalization has joined different cultures and made it into something different. When cultures receive outside influences, they ignore some and adopt others, and then almost immediately start to transform them.

Folk Culture

The word "Folk" comes from the German word "Volk" which means "people". Folk- people of the past, the people who are like the pioneers, the locals, the traditional people, the common people, the ones who emphasize the transmission of cultural heritage through oral transmission. The folk are the carriers of customs, beliefs, arts and thus culture.

Folk culture is traditional, relatively inflexible, resistant to change, local in orientation and non-commercial. Folklore, is largely comprised of oral tradition, including folktales, folksongs, folkdance, folklore, folk beliefs, superstitions, and customs. Folk culture is usually transmitted interpersonally within the relatively small, cohesive, homogeneous community. Folk culture is basically rural, conservative, and largely self-sufficient. There is often a strong

family or clan. Tradition is paramount. Change comes infrequently and slowly. Individualism is subordinate to traditional community standards and values. The identity of members of a folk society is usually fixed and inflexible, with clearly-defined role expectations.

Folk culture has continually expressed concern over popular cultures negative effects on issues that concern the morality and behaviours in society. These concerns have only heightened with the growth of the media, and popular entertainment.

Global or Popular Culture

In contrast the global culture is urban, individualistic, flexible as to identity, constantly-changing, broadly-spread, commercial in nature, and wide-ranging in both scope and appeal. Besides, Popular Culture is very complex as it is continuously evolving through different changes and influences like economic, political and social ones i.e. modernity, capitalism, globalization...

Folk Vs Global Culture: Challenges and Opportunities

Folk cultures have been worried for the future, especially with the rise and power that global culture has gained. Later is replacing traditional; food, dress, housing, ideas, and values. These are many good reasons for folk culture to be scared of their descending influence on cultures. Global culture is always changing, every year there are new fads in which people conform to, there is no individuality. The western world has become an almost monotonous society, where everyone dresses the same, eats the same, lives in the same manner.

If we decide to visit developing nations around the world we begin to see how their culture is changing and becoming more Americanized. People wear more popular culture clothing, such as jeans and t-shirts, and not so much their traditional clothing. They eat from fast food restaurants, like McDonald's, Burger King, and Pizza Hut. Popular cultures in these societies are glamorized as step forwards into the future, of dreams of becoming more like the western world.

Folk culture and Global culture, both are intensely connected to common people. Without people, their existence is not possible. But both are related with people in different manner. Folk culture originates among common people, where as Global culture dominates the people

on its conditions. Folk culture develops in a simple process and grows with the continuously changing life styles and circumstances of the masses. It reflects an uncomplicated world of daily experiences and day-to-day routine chores of the society. On the other hand, Global culture focuses on the business, profit, and market and intrigues the masses in its figment of the imagination. It disturbs and interferes with the continual flow of Folk culture and daily life of common people. Global culture is very much ruthless and business centric. And that is the main reason that, Global culture in its autocratic achievements has done a great loss to the Folk culture. It is an immediate need to understand and explain the false claims of Global culture, which is recurrently harming the basic rights of the masses.

After 1990, Global culture has enormously attacked the normal life of the people through emergence of various satellite channels. These channels have increased the speed of daily life to a great extent. Cities, towns and villages, all are traumatised by these TV channels. Globalisation, Liberalisation, Disinvestment, Privatisation and Market forces are optimising the minds of common peoples as per their strategies. Cut throat competitions are destroying human relations and emotions. Pepsi, Coke, Fast-food, Pizza, Noodles, Mc Donald etc are dominating Indian market and influencing people. These commodities are commonly manipulating the original commodities, which were used and consumed from many hundred years. Media also helps increasing the process of Global culture, as most of the media is owned by the Global Multinationals, which preset the strategies to increase their market and business.

Current status of Folk Culture in India

We have wealth of Folk reserves still available in India. Though these differ in terms of Language, style, method etc but they are connected and deep rooted in the hearts of the people of India. To understand the Global threats to the Folk culture, we have to first understand the present condition of Indian Culture. We have to understand in detail how much efforts are been on place for the preservation and conservation of Folk culture. Though, this is true that the entire gamut of Folk culture in its original form is neither acceptable nor necessary. Instead of continuing with the obsolete and irrelevant facets of Folk, what is needed indeed is to focus on the preservation and conservation of only those facets of folk culture which are relevant and in tune with the contemporary society. Imminent question before us is how to begin the program of preservation and conservation; and also to see if

there can be any role of Media in it? These are the questions which require the urgent attention. Otherwise it will be too late to get anything.

Media and Folk Culture

Media constitutes the fourth pillar of Democracy but the relation between Media and Folk Culture seems to be very undemocratic. If Media is to remain relevant to the democratisation of communications at local level, it must be open to local-specific ways of understanding and culture-specific ways of dealing with communication problems as well as their solutions. This concerns needs to be situated within a most substantive understanding of intra national communication realities, problems and their solutions. But in reality, what we are witnessing is the emergence of private media monopolies capable of competing with established Western trans-national media interests with little consequence to the democratisation of communications. They believe in quick profits, exploitation of markets of least resistance.

Communication Alternatives

Fortunately, at present, there are serious efforts in place for using media for alternative purposes. Which can play a positive role and at the same time preventing, accommodating, calming feelings of rootless ness and binding fishers in the community. There are for example the instances of the emergence of popular culture movement's networks and the variety of groups involved in using media for alternative purposes all across the world. Like popular theatre initiative, wemens video collectives, women's newsletter groups, critical approaches to media education for local communities, media documentation centres around the world and networking initiative are some of the different alternative approaches in existence today. This range of roles is the strength of traditional media and it is lack of it that has affected the sustainability of popular cultural struggles.

Ours is a complex era with complex histories, demand a sophisticated and relevant theoretical framework- one that is in tune with lived reality. Today's challenge include how can we use different media techniques to incorporate and understand the Global in the Local and Local in the Global. This understanding must flow from the recognition that there are communications root-metaphors other than those from a western origin and must create the space for the local-specific solutions to local-specific communication problems. In order to reconnect people, it is necessary that institutionalised alternatives, in theory and practice, be exercised and that

attempts are made to evolve new alternatives based on recognition of the plurality of local cultural identities, discourses, practices, and situations.

To sum up, today the challenges before the folk community are multidimensional that range from danger of extinction of their cultural resources, disappearance of traditional art and knowledge to feeling of insecurity and their survival. Global and folk cultures constitute the two extremes, true, but when two contrasts are brought together, they produce enormous energy- (here) opportunity. Opportunity that let people connect and exchange their knowledge. Folk culture is that precious art, where humanity exists in its original form. Therefore, every effort should be made to recognize, preserve and document these knowledge resources and explore all those opportunities to save and preserve these humanistic values.

East Meets West: Studying Abroad for the Sake of Music
By Mylen Yamamoto
California State University, Los Angeles

Introduction

On February 18th 2010, a music student from Japan made his debut performance at a local coffeehouse. It was an unusually sunny Saturday towards the end of a cold winter season. The aroma of freshly brewed Columbian beans from a nearby coffee shop engulfed the afternoon air of a cozy alleyway. It was a perfect day to enjoy the shop's open-air pavilion. Most days, patrons sipped their drinks on chairs turned to focus on a laptop, their circle of friends or a business partner. But along with the weather, this afternoon was different. Instead of typical conversing with the distant sound of elevator jazz faintly playing from the shop's speakers, all chairs were turned towards this particular alley now showcasing the Japanese jazz guitar student. The guitarist's music cascaded a trace on the captivated audience. Jazz ballad arrangements of fan favorites like "Time After Time" and "Human Nature" were among his set list. After the performance, audience members approached the student to praise his guitar skills and asked questions about his arrangements. One year ago, this student would not have been able to provide answers for his American audience. As I observed his cohort's musical pursuits at a small music college over the past four months, it became clear that music played a powerful role in motivating and encouraging the ability to communicate in English.

The world's recent economic deficit demonstrates once again how interconnected the world is. Despite this statistic, less than 1% of all American college students are studying abroad in an academic year (Goodman, 2009). Due to ubiquitous global issues across the map, the need for global exchange of knowledge is necessary to reach solutions. Studying abroad opportunities prepare students to "reach conclusions in different ways." Existing research focuses on the study abroad student who assimilates into an academic setting, where the student's purpose is to study at a university, college, or similar institution in post-secondary (tertiary) education. He or she is most always working towards an advanced degree. Most profound amongst these studies is that study abroad programs expand and transform student worldviews by increases cultural awareness. Can the same be said about the student who studies abroad vocationally for music?

Bakagiannis and Tarrant (2005) suggest that music is used to encourage the development of positive intergroup attitudes. In addition, Anthony Storr (1992) "stresses that in all societies, a primary function of music is collective and communal, to bring and bind people together." Since this is the case, study abroad experiences in vocational institutes with an emphasis in music should also be investigated as an additional outlet towards the promotion of global awareness.

Purpose and Justification

The purpose of this research is to ethnographically observe an international cohort of

students at a music college with hopes to gain an understanding of how music facilitates Intercultural Communication Competence (ICC). Although current literature expresses the impacts and benefits of students who study abroad in an academic setting, there is a limited amount of research that explores the study abroad experiences of students pursuing music. Music breaks language barriers and creates interconnectivity. To start, have you ever listened to a song in another language? Although you may not understand the lyrics, the melody could still transcend you to an emotional state similar to what the musician is conveying. Thus, the language barrier provided by the lyrics is broken due to an emotional connection to the music. In confluence, music and study abroad programs expand and transform student worldviews. Ethnography of cross-cultural communication can provide rich and critical sites for an understanding of “people's understandings” of each other (Toyosaki, 2004). Due to this notion, the research question posed, *how does music facilitate intercultural communication competence in a pedagogical environment*, will be answered through ethnographic analysis at a small Western music college.

Literature Review

The recent approval of study abroad opportunities promoted by congress and previous research of intercultural studies both encourage ICC through studying abroad. Separate from studying abroad, music is also looked upon as a motivating factor that can potentially break language barriers to also encourages high ICC levels. The following is a literature review that addresses both concepts. First I will explain studies that uncover the benefits of studying abroad. Next, I will provide an overview of the Intercultural Communication Competence theory and lastly, a case study that explores how music influences communication competence.

The Benefits of Studying Abroad

Being exposed to international environments is important. Lewis & Niesenbaum (2005) argue that students who study abroad will naturally become more aware of their host country's culture and improve their language skills amongst personal, career and academic settings. More profoundly, study abroad programs expand and transform student worldviews. The willingness to travel and share travelogues with others spark differences in cross-cultural communication studies (Toyosaki, 2004). Acquiring such willingness provides “globally situated humanity, challenging the socially, historically, economically, and culturally constructed hierarchy of racism and nationalism (Toyosaki, 2004). Due to this reason, studying abroad is now supported by congress.

The state department has enabled foreign students to work while in the US to make it more attractive. Senator Paul Simon's Study Abroad Foundation Act was recently approved by the House, which enables one million American college students to attend universities abroad (McMurtrie & Bollag, 2007). Because of programs like these, 2 million students attend colleges outside of their country (Bollag, 2005) and it's increasing.

The Theory of Intercultural Communication Competence (ICC)

To achieve high levels of intercultural communication competence, one could study abroad. Kim (2005) describes three dimensions of communication competence: cognitive (understanding the host culture), affective (able to experience and appreciate the culture), and operational or behavioral competence, in which newcomers gain a kind of fluency with the host culture and can express themselves as a native can. Further, ICC (Inter-Cultural Communication) defined as: “ICC competence involves the knowledge, motivation, and skills to interact effectively and appropriately with members of different cultures (Wiseman, 2002).” Kim compares the enculturation process into a culture of origin with adaptation to a new host country: “In many ways, entering a new culture is like starting an enculturation process all over again. Only this time, strangers are faced with situations that deviate from the familiar and internalized original cultural script”. Being forced into another enculturation process allows those who study abroad to view the world as a place where ideas need to be shared through other forms of communication. Music promotes higher ICC levels by being a motivational influence to start the enculturation process.

Music Influences ICC

Globalization emphasizes “difference, promotes pluralism, and increases diversity through the accelerating circulation of a multiplicity of cultural practices” (Irving, 2009). Globalization defined here is when cultures share their common artistic practices with another culture. This is one of the paradoxes of globalization, and it “seems that no one art form encapsulates it more singularly than music (Irving, 2009).” This research aims to explore the relationship between music and its effects in a contemporary music institute that amalgamates students from all over the world into various bands and artistic developments. To emphasize music and ICC’s interconnectivity, almost every form of art music or popular music cultivated or studied today relates in some way to the patterns of intercultural reciprocity (Irving, 2009). For example, of the content being shared and discussed by web users from all over the world, music videos are a specific genre popular worldwide (Schackman, 2008).

The American pop culture and English language have been dominant in music around the world (Schackman, 2008). Moreover, the US recording industry has a niche for “world music”—local popular music from outside the US. However, the hegemonic influence of American culture through pop continues in the international music recording business, so any notion of universality must take into account American cultural dominance (Schackman, 2008). Due to this notion, conducting an ethnographic study of music students in America is an appropriate location for this research.

Research Context

California College of Music

California College of Music mentors musicians and audio engineers careers in the commercial recording and music industry. The college is located in Pasadena, California near major music industry labels in Burbank and Hollywood. CCM

provides an intimate and nurturing environment, with courses taught by faculty of music industry professionals. At CCM, students have the opportunity to develop tangible skills, technical knowledge, and a well-rounded professional attitude of confidence and discipline that will give them the ability to succeed in the industry at large. Classes range from technical courses like music and theory, rhythm training and sight singing to more practicum courses like applied rhythm training, contemporary ensembles and vocal performance.

CCM offers custom designed certificate programs in music and audio engineering and music production. There is also a comprehensive artist development program, similar to artist development departments at major record labels that serve to develop and perfect the talents of artists who wish to begin their careers in the music business.

Besides the customary classes, CCM offers courses on a variety of subjects, such as, DJ and Turntable Technology, the History of American Commercial and Pop Music, and Educator Workshop. Also, students of all ages may take music lessons in the community outreach program. The Grammy Award winning faculty was spearheaded by Wayne Henderson, world-renowned music producer and trombonist, founder of the Jazz Crusaders in 2007-08, and has passed to the current music department chair - Uros Raskovski. The Engineering and Music Production department is led by the legendary recording engineer Reggie Dozier.

Demographics at this institute consist of 45% international students in a music, artist development or audio engineering program. Its environment is small and intimate (study body of 28) with courses taught by faculty of music industry professionals. Ages range between 17 and 45. Instrumentals range from vocals to drums to keyboard to bass and guitar. The institute is a self-proclaimed contemporary music academy that focuses on genres like jazz, pop, classic rock, funk, hip-hop and R&B. Students observed come from Japan, Italy, Tanzania, China, Indonesia, the Netherlands, South Korea, Morocco and the US. At the time of the study, there was no requirement for the Test of English as a Foreign Language (TOEFL) to attend CCM. CCM is also a Student and Exchange Visitor Information (SEVIS) approved college.

Method

Ethnography allows the understanding of processes and results of learning from individuals' perspectives and how they are situated in group contexts. It gives voice to individuals' viewpoints that may otherwise not be heard and reveal processes in which their subjectivities are negotiated and contested (Doerr and Lee, 2009). Ethnography of cross-cultural communication can also provide rich and critical sites for an understanding of "people's understandings" of each other (Toyosaki, 2004).

Having relations at CCM allowed the creation of a trusted identity at the music institution. I held an administrative position and participated in an a cappella ensemble prior to the start of the fieldwork. These positions are suspected to have gained the trust

of the participating students, faculty and staff, which made it easier to gain permission to conduct research than those not affiliated with the college. Throughout the study, I played an influential role with the students of CCM as their Job Placement Coordinator. It was my job to connect them with community leaders and music industry professionals in hopes to obtain internships and performance opportunities. Although this formed trust and access to this research, it is assumed that these positions also created some constraints on the research.

The data discussed in this paper was collected between January and April 2010, the first four months of a year long study. It is conducted entirely in association with California College of Music through ethnographic observation and interviews. The collected data is comprised of field notes from six 45-minute participant observations and the transcriptions from three in-depth interviews. The field-observations are conducted during contemporary ensemble rehearsals, one concert open to the public, one student forum meeting, one international student orientation and conversations examined during break time. Written consent was obtained from the interviewees and observations with confidentiality being part of the agreement. There were a total of 3 interviews that were conducted. The first is of a 20-year-old female Indonesian vocalist studying in the Artist Development program and is a vocalist in the contemporary ensemble. The second is of a 26-year-old Japanese guitarist studying in the music program and a participant in the contemporary ensemble. The final interview is of a 22-year-old female admissions representative who conducts the international student orientation and open forum student meeting. The number of the participants in each observation will vary from one to twelve, depending on the class size and/or nature of the event.

The interviews lasted for 30 minutes on average. Interviews were conducted in a conversational and extemporaneous format. Questions addressed included (extracted directly from transcriptions):

- (1) How your life was before you came to America, your perception of music and any language difficulties or cultural differences you had and if music played any part in, breaking them.
- (2) What was your English level before you came to America?
- (3) How does music play a role in your life now and in the past?
- (4) What do, what do you think connected all of you (in contemporary ensemble) despite your language differences? How did you communicate?
- (5) Do you think learning music breaks language barriers? If so, explain how?
- (6) Do you feel more connected to your classmates when you play (perform/practice) music together compared to when you socialize together?
- (7) What types of topics do you discuss outside of class? Does it have to do with music or different worldviews? How do you communicate this to each other?

A discussion of the observations and transcribed interviews follows to answer the research question, how does music facilitate ICC in a pedagogical music environment?

Perceptions of how music influences ICC

In order to depict the ways in which music motivates ICC levels amongst an international

cohort of students at CCM, I will first provide a discussion of my observations in a specific context followed by examples supporting the discussion extracted from the three in-depth interviews.

Assumptions of America

As previously mentioned in the literature review, America's hegemonic influence in music continues in the international music recording business. Popular American artists like Michael Jackson, Elvis Presley, Frank Sinatra and the up and coming Lady Gaga are infiltrating the radios outside of American borders and continue to impact the direction of music all over the world. During an international orientation hosted at the beginning of the quarter at CCM, students were individually asked about their perceptions of America. Some students answered that America was an aggressive-in-nature country, but the majority of the students expressed that America was a country of opportunity—especially in music. One student from Japan mentioned that he studied music at a college in Japan but wanted to continue in America to bring its “higher level curriculum” back to Japan and teach it at the institute he was originally a student at. The admissions representative conducting the orientation expressed how enthusiastic the students appeared when they spoke of their dreams of pursuing music in America in the orientation. It was the same type of enthusiasm expressed in her e-mail correspondence with the same students during the admissions process.

Interviewees were asked of their perceptions of the US upon arrival to CCM. Responses focused on the influence of American music such as, “music (has a) great history. Musicians should learn here because of its deep roots (in music)” and “You know, it's really a good place to embrace a whole new set of opportunities, be it music, be it business, be it fashion, be it lifestyle. This a place where creativity is blended together.”

January 2010: Communication Apprehension in a Foreign Language

CCM is a small knit community where everyone seems to know each other. However, integrating into this community occurs over time. When a new cohort of student arrives, it becomes very apparent. My desk at work has a clear view of the lobby students congregate and socialize in. I've seen fresh incoming classes from all over the world sit on the lobby's leather couches, twiddle their thumbs and stare blankly at the white washed walls. In January, two new students from Japan joined the quarter. Although the students sit in groups, language barriers prevent on-going communication. The three engaged in nervous conversation on a leather sofa in the lobby—speaking only Japanese. One of the former English students from Indonesia attempted to approach the small group:

Julie: Hello! When did you arrive?

Hisami: Hai. Mm? Sorie, I don't undastand.

Yumi: Come yestaday.

It was apparent that communicating in English would be difficult for them. Since CCM

requires no TOEFL score, students may enter the institute with no ability to communicate in English. This is the case for nearly a fourth of CCM's students. Kazuto, one the interviewees was asked, "Could you speak English upon your arrival to the US?" and replied with a quaint, "Actually nothing."

Referring back to the two new Japanese students, it became even more evident that communicating in English was a language barrier for them in the student open forum meeting held later that week. An English-speaking native conducted the student open forum. This meeting occurred in the second week of instruction. Open-ended questions about how students felt about the institute were raised. Three students, two mentioned above, from Japan remained grouped in a corner disengaged to the conversation. Due to their limited English-speaking abilities, communication apprehension combined with the difficulty to understand, most likely played a factor in their inability to communicate. There appeared to be no desire to find a mode of translation. Students from the other countries who were able to speak a conversational form of English spoke only when directly addressed. Mainly students from the US voiced their opinions openly.

First ensemble rehearsal, first broken language barrier

The ensemble room is outfitted with soundproof paneling and is large enough to hold a capacity of thirty students. A drum set is located on a platform against the wall. Positioned in front of the drum set is a Yamaha keyboard and stool. Adjacent to the keyboards right are three microphones set up for the vocalists and on the left are a set of Fender amplifiers for the guitar and bass students to plug in. Speakers and mixers decorate the room's floor and walls. The equipment is positioned to form a lopsided circle, which creates on-going communication between the players. The instructor conducts class in the middle.

The first day of ensemble rehearsal occurred approximately one week after the open forum meeting. Student participants included three Americans, three Japanese, one Norwegian and one Moroccan. An English-speaking native conducted the contemporary ensemble. All students involved had an active role ranging from vocalist to drummer to keyboardist to guitarist. After the syllabus is read, sheet music is passed around. Students then sight-read, as conducted by the instructor. The song being rehearsed is in the classic rock genre. Students who were unable to communicate in the student forum meeting were actively listening to the English-speaking instructor. At one point, one of the same Japanese students from the student forum meeting took initiative to look up a word she couldn't understand in an electronic dictionary. Non-verbal gestures used to cue music were mutually understood. Eye contact was consistently on going and a sense of mutual respect for each other was sensed through active listening, participation and feedback amongst the group. Having students positioned in circle increased these traits.

As days go on and ensemble rehearsals echo through the hallway, the lobby becomes a chatterbox of thick Japanese, Norwegian, Italian, Chinese, Moroccan and Tanzanian accents mixed with perfect English from domestic students.

Midterm Progress Report: Higher levels of ICC in contemporary ensemble rehearsal

On March 9th, I conducted my second observation of the contemporary ensemble's rehearsal. I arrived at 4:10 p.m. when the ensemble began at 3:00. I stood outside of the doorway, hesitant to interrupt—although I could hear shouts of jubilee during the climax of a rock song. When the music stopped, I entered. It was the same mix of students from the first observation: three Americans, three Japanese, and one Norwegian. However, no instructor was present. At 4:25, the instructor walks in with the student from Morocco. I later learn that the song, "Anger Management" is being rehearsed.

"Do it now!" the instructor demands to his students. Immediately, students respond by either getting their instruments in ready or positions or by standing close to their microphones. "It sounds angry. That's how it's suppose to sound." The instructor cues the students to begin. The heads of the guitarists start to rock to the beat. The drummer keeps eye contact with the instructor at all times. The vocalists begin to tap their feet and one of them begins to start swaying to the beat. The keyboardist closes his eyes with what seems like an intention to listen to the other instruments to catch his cue on beat. As the song plays, I notice consistent eye contact. Twice, the vocalist would smile in my direction and I would smile back. The same type of non-verbal exchange occurred between the group consistently. Finally, the instructor cued the band to stop playing by positioning his guitar in a largely visible up then down motion. All students responded by ending on time.

"How do we want to end?" the instructor addresses to all members. A Japanese vocalist takes out her translation dictionary and begins to type in it. "Like a chill ending?" he suggests. "What about ending it how we started it?" suggests a US guitar player. The Japanese and Norwegian student nod in agreement.

In relation to the contemporary ensemble rehearsals, interviewees were asked how they felt about the experience.

Julie: You know, uh, we all inspire each other to become better performers and individuals. That's really what matters the most-

Author: : -I love how you're talking about individuality. It's, so, when you see people in the room, you don't really see them for their language and instead, you see their music and personality.

Julie: Yeah, it's sorta like that. We get to learn from each other.

Another example:

Kazuto: Lecture class was difficult. But in playing class, I didn't feel language barrier so much because we could communicate to each other through playing music.

The Finale: Performance Night

The students of the contemporary ensemble had their final performance at a local music/lounge venue a few blocks from CCM. The concert started approximately at 8:30 but I managed to observe the show as the ensemble was setting up their equipment. The crowd had a low turn out rate of about 30-40 people but that didn't stop the ensemble from remaining in high spirits. After months of attending regular classes, the two Japanese students who could not understand English were now able to form choppy sentences with their classmates and instructors and could follow directions. For example, I heard the instructor ask one of them to "grab the mic" and she replied, "Sure", then grabbed a microphone from the stage and handed it over.

Once the performance began and audience members congregated around the stage, it was evident through smiles and dance movements that all members enjoyed performing on stage. Similar behaviors from contemporary ensemble rehearsals were repeated that night. Thus, similar communication patterns and increased motivations to communicate well now that an audience was watching them.

Although I did not attend CCM's informal after celebration, I must note here that a need and/or desire to celebrate together after a performance demonstrates high levels of ICC due to having a motivation to communicate with others from different cultures—now extracted from a controlled pedagogic setting to a more free and social setting where attendance is optional.

End of the quarter celebration

In late March, the quarter came to a close. CCM usually organizes an in-house celebration to acknowledge the students who are graduating. Approximately 30 faculty, staff and students showed up for this party. The diverse setting of attendees included all of the students and instructor from the contemporary ensemble.

With refreshments present, students and staff socialized in pairs or groups. I overheard talk of how much fun the performance of the ensemble was. On the same leather couch mentioned earlier, students from Norway, Japan, and the US were exchanging thoughts on nerves felt during the performance. Occasional laughter could be heard. Twenty minutes into the party, I called for attention. Due to my administration position, I gave a short speech that addressed the accomplishments of the graduating students. I mentioned how much they improved as musicians throughout the quarter. I also emphasized on their passion and happiness expressed on stage and how it reflected back to the audience. This brought tears to a few students.

Overall, the cohort of students came a long way from staring silently at blank walls in the beginning of the quarter. Since their first contemporary ensemble, they learned to express their feelings and engage in laughter with each other. Bonds were created and e-mail addresses and Facebook accounts were exchanged with the intent of keeping in

touch with one another.

Discussion

Ethnographically analyzing the students of CCM over a four-month period answers the question, “does music facilitate intercultural communication competence in a vocational institution?” with a straightforward “yes”. ICC levels are cognitive, affective and operational and the actions of the student who studied abroad at CCM fall into each category. In this final discussion, I will reflect on how music motivated ICC levels amongst the students in each attribute. First, cognitive ICC levels demonstrate an understanding of the host culture. Having an initial exposure to American music prior to studying abroad sparked a general interest in learning more about the American culture. Through listening to the music and creating an emotional liking to it, I hypothesize that these students conducted further research to understand American music culture. When defining “conducted”, this could mean looking up background information on a favorite American artist or exploring the cities that’s considered to be America’s Mecca for music. Understanding the American culture from afar, even if it is in a specific area like music, takes the student to the next attribute. Being affective, or rather experiencing and appreciating the culture involves the student to physically be in the country. The students in the international orientation and from the interviews expressed that it was their desire to study music in America where they considered it to have “ a higher level curriculum” in music or that it consisted of a plethora of opportunity for musicians. The enthusiasm of the students expressed by the admissions representative indicates an appreciation for the American music culture and by studying abroad, students will obviously experience American culture firsthand. Interacting and breaking language barriers in contemporary ensemble was observed to be where higher levels of ICC first took place due to the messages being sent, received and interpreted while sight reading through music. Finally, obtaining operational or behavioral competence was demonstrated further in the second contemporary ensemble rehearsal where students were holding a discussion on how to end a piece. Another example was during the concert when a student who originally did not know how to speak English at the beginning of the quarter was asked by an instructor to hand over a microphone. She responded quickly and followed through with the instructor’s request. Music sparked a general interest in pursuing study abroad in America and continued to motivate and encourage affective and operational competence throughout the duration of their stay. After observing the positive relationships formed at the end of quarter party, I will note here that music facilitates higher levels of intercultural communication competence by breaking language barriers upon first emotionally connected listen. I hope this study can advance and be used as a case study of how music can play a powerful role in promoting higher ICC levels through study abroad.

Conclusion

ICC increases diversity through the accelerating circulation of a multiplicity of cultural practices (Irving, 2009). Most cultures share common artistic practices and it “seems that no one art form encapsulates it more singularly than music. This study continues to look

towards music as another form of promoting studying abroad to further intercultural competence. It explores the relationship between music and ICC levels in a contemporary music institute that amalgamates students from all over the world into various artistic and communicative developments.

Ottoman culture was used to be a part of Eastern world throughout history. It was the “other” and an important symbol of the “Orient” for the “West” for centuries. On the other hand, it was an ideal for Turks moving westwards for over a thousand years. When the nomads of Central Asian steppes migrated towards the West, to Anatolia in the 11th Century as Seljuk Turks, it wasn’t difficult for them to create a new cultural synthesis because of their being mobile, spreading on large areas and interacting with various cultures throughout history. The new synthesis was the combination of nomadic and semi-nomadic, Persian, Islamic and Anatolian cultures. This synthesis had spread to all areas of culture including architecture. The process of reaching an architectural synthesis took few centuries and the “classical Ottoman architecture” was formed in the 15th Century.

The First Meeting with the West in 18th Century

As the Ottoman Empire integrated with various cultures on its own land, it was not affected by Western culture until 18th Century. European influences would be seen on Ottoman social life, clothing and architecture as a result of increasing diplomatic and commercial relations with Europe. In fact, it was an interactive influence concurrent with the Turquerie trend in Europe. The meeting of Ottoman culture with Western lifestyle was first occurred during “Tulip Period” of the Ottoman Empire between the years of 1718 and 1730. It was a period of peace, entertainment, art and renovations imitated from the western civilization. The Ottoman envoys were sent to Western European capital cities by Sultan Ahmet III and his grand vizier Ibrahim Pasha to see the Western civilization and life style that was gradually getting strong. Yirmisekiz Mehmet Celebi who was sent to Paris was the one who had great effects on Sultan and the grand vizier. He was back with the plans of French palaces, mansions and gardens. In addition to this, two ships full of French furniture, clocks, weapons and industrial products were sent to the Sultan as a gift by the French King Louis XV. All these reasons aroused the will of dominating European life style on Ottoman Empire by Sultan Ahmet III and his grand vizier Ibrahim Pasha. The movement of renovation and reorganization in the state administrations were begun. The army was rearranged and the fire-brigade was organized, in Istanbul. The first Turkish printing-house was opened. A cellulose factory was established, in Yalova. Textile industry and porcelain manufacturing had increased. Arts and science had developed and, the artists and the scientists were protected by the sultan. Beginning with this period, the upper class and the elite people of Istanbul started to practice Western life style while others in Istanbul and people outside Istanbul were still going on their traditional life styles. Within this situation, the traditional, introverted manner of the society began to change and people started to use the open and public areas frequently in Istanbul. New palaces,

kiosks and tulip gardens had been built. The pleasures and prodigality of the Sultan and the Grand Vizier, their favoritism and the imposition of new taxes ruined the social life of the empire. People from the religious class incited a janissary named Patrona Halil to revolt against the sultanate and a widespread mutiny called “the revolt of Patrona Halil” was begun. The rebels dethroned Sultan Ahmed and they ended the Tulip Period. The tulip gardens and most of the buildings built at that period had been destroyed, but Tulip Period became a model for attitudes of westernization.

An urban revival and renovation began in Istanbul during Tulip Period. Western style buildings and gardens had been built in the content of broad building activity. Instead of monumental and classical works, villas, pavilions, mansions and fountains were built in Istanbul with Baroque and Rococo styles which were popular in Europe at that time. These styles had been slowly adapted to the existent classical Ottoman architecture which is called “Ottoman Baroque”. This style became popular firstly in Istanbul and than in Balkan provinces of the Empire. This was the first time that Western influences had come into Ottoman architecture. Baroque style architecture continued until the influence of the latter European styles. Its practices were limited with some buildings and gardens. An urban planning with radial schema had never been applied. Ahmet III Fountain, Nuruosmaniye Mosque and Laleli Mosque are the main examples of Ottoman Baroque in Istanbul.

Fig.1. Ahmet III Fountain

Westernization in 19th Century

The Ottoman Empire was out of Enlightenment Period and Industrial Revolution but it had the effects of French Revolution in 18th and 19th Centuries during Modernity process of Europe. Europe was a model of progress and success and the institutions and forms of it should be imported. As Western lifestyle used to be practiced since 18th Century among upper class families, official beginning of westernization in Ottoman Empire was in 19th Century with Tanzimat period (1839–76) which included a series of reforms centered on the concept of justice and equality for all Ottoman citizens. They constituted the first far-reaching and coherent program of adopting European institutions as models. The Tanzimat reforms included founding of secondary professional schools with European curricula and culminated in the constitution of parliament of 1876. 19th Century Istanbul was both the capital city of an empire to collapse and the dominant city of it by the centralization of the government, high

income of transit trade and its increasing population. The high bureaucracy, Levantines, non-Muslim minority groups and the elite Turkish families had the financial and social conditions of the European capital cities while the traditional layers of the society had weakened. The life style and the gusto of the non-Muslim and Levantine inhabitants of Istanbul, were slowly recognized and adapted by the others. This life style arose as the new cultural symbol and preference of the elite group as well. Although the effects of Westernization were seen as a cultural movement primarily exclusive to the administrative / elite group, it slowly involved other groups, the general public, the urban population and the family.

Institutional Changes and Effects on Urban Structure

The institutions parallel to their European models founded in Istanbul had great effects on urban structure. The most important institutional changes were the formation of the institution of aldermanship in the traditional organization of town quarters (1826), the founding of the Directorate of the Enbiye-i Hassa (buildings belonging to the Sultan) (1838), the Committee for the Intizam-i Sehir (the order of the town), and the municipal organization (Sehremaneti) (1855); the first appearance of municipal activity in Beyoglu; the preparation of the first city plans and maps during the century; the formation of groups and institutions to deal with construction, development, roads, water supplies, fires; the application of the regulations and other principles of dispositions put forward thereof; applications related to the widening of roads and the arrangement of facades; the modernization and the institutionalization of inter-urban transport; and abandoning of the traditional system concerning construction services and the initiation of a new institutionalized educated staff. Thus, especially the self-created religious and ethnic community type of organization in the city quarters and the semi-autonomous structures built on the traditional structures were beginning to disintegrate and a central arrangement and control was being established in every aspect of urban life. The social topography of the city started to take shape according to characteristics pertaining to social class instead of traditional ethnic / religious community system. The completion of this structure towards the end of the century prepared the basis for the realization of new housing patterns.

The commission set up after fires in Istanbul also determined the construction properties of residence areas and the new fabric of some quarters. The determining characteristic of the new fabric of this settlement area was the orthogonal and regular road system, norms establishing the width of roads as well as the square and rectangular housing plots and blocks created in this road fabric. The use of brick and stone in construction was encouraged in addition to all this.

By the end of the century, Istanbul had become a city with maps and plans. Central areas had increased in density and spread out towards the newly developing and urbanized areas. The city had started to use Western products in housing materials and technology as well as in its commercial structure and especially in urban equipment. Urban mobility increased and the city tended to become a social organism developing towards broader capitalistic principles and norms as compared to those of the traditional, closed communal / local structure. The density and the population increased immensely.

Western Effects on Architecture

Westernization had also great effects on architecture education parallel to this situation. The traditionally educated Ottoman architects at the Imperial Guild of Ottoman Architects (Hassa

Mimarlar Ocagi) did not satisfy the demand to the Western architectural forms and lifestyle and ended its architecture education in 1831. Thus the 19th Century witnessed the gradual decline of the traditional Turkish architect and a break in the evolution of traditional architecture. European, Levantine architects and non-Muslim minority architects who had been educated in Europe became dominant on the architectural arena. The Academy of Fine Arts, known firstly as "Sanayi-i Nefise Mekteb-i Alisi" opened in 1883. The majority of the teaching staff of this new school, which was modeled after the Ecole Nationale des Beaux Arts of Paris, consisted of foreign instructors, from France in particular. Thus, during the last quarter of the 19th century, the new School of Fine Arts in Istanbul had become a center for disseminating French taste and ideas in arts and architecture. On the other hand, the School of Civil Engineering (Hendese-i Mülkiye Mektebi) which had been opened in 1884 came under German influence since many of the instructors were from Germany and Austria.

Fig.2. Dolmabahçe Palace

19th century architects brought the eclecticist and revivalist forms of Europe together with Orientalism and Art Nouveau. Balyan family, Raimondo d'Aronco and Alexandre Vallaury were the most famous court architects during this period. New types of buildings had come into scene in the 19th century architecture. Public buildings such as military buildings, university buildings, train and boat stations, hotels, post office, bank and office buildings with passages; and new types of housing such as row houses, apartment blocks and summer houses came into scene at this period. The new western-style seaside palaces, mansions and the imperial pavilions had an important pioneering role on internalizing Westernization by general public.

New Types of Housing

Cultural change that went beyond spatial relationships encompassed a series of components that made up and influenced daily life. Therefore, housing space and forms had their share of the new gusto, style and value system. The rise in the break-up of large families and the necessity for smaller scale in housing design led to new household profiles. The patterns of customs and laws concerning the family and community life, and especially the status of women also broke away from their traditional cages; such characteristics as privacy, spatial secrecy and introversion began to gradually dissolve on all scales.

Typological and stylistic changes in urban housing architecture started to take place in the mid-18th Century, and kept expanding throughout the 19th Century. These new types of housing were never witnessed before in the urban space of Istanbul. Although the housing

forms and typologies evolving in time and started to replace the old, traditional models, older forms and traditional types continued their existence besides the new types of housing. Some secondary differences were added to the original forms within this continuity. The new social developments and the cultural-stylistic alternatives of the time began to exert on the traditional fabric and typology. Ground floors came into use, and were arranged according to plan schemes which were the same as the upper floors. In the urban examples, some entrances began to face the street and windows became larger. Alongside the basic typology and the traditional Ottoman formal characteristics, the facades began to be equipped with Neo-Classical and Neo-Baroque profiles, decorations and elements as well. However, specific housing types that marked the century and became an integral part of its social / institutional development were the new and original housing types.

The basic formal categories of the new types of housing can be classified under the following headings:

1. The transformed types which can be witnessed in the traditional wooden houses of different neighbourhoods: The medium and small-scale houses which were located in adjacent rows on the new road fabric offer the first example of the new typological change. Although they maintained the traditional characteristics such as wooden construction system, bay windows, certain facade proportions and window arrangements, they were influenced by changes in the urban structure and organization as well as social differences. Adjacency, location on small, narrow lots, continuity in the facade-road line, anti-fire walls in the adjacent parts, generally elevated main doors directly facing the street, use of the ground floors, equal accessibility to the street and the garden and the addition of Western style elements to the formal structure.
2. Row houses: They were located in the quarters inhabited by moderate income groups on the narrow plots and built of different materials. They had stylistic properties such as Neo-Classical, Neo-Baroque, Art Nouveau and eclectic ones. They were in close similarity with the Aegean shore row-houses. Their plan schema and facades were different than the traditional houses with their specialized rooms for each function, small bay windows and balconies.

Fig.3. Akaretler Row Houses

3. Apartment blocks: Apartment houses began to be built in some parts of the city where real estate had gained excessive value. Different sized flats were shortly followed by larger and spectacular examples with tennis courts in their gardens, shared laundries and personnel rooms in their attics, elevators and courtyards. There were also examples with shops and offices on the ground floors and workshops and residences higher up. Moreover, they could be built side by side and on the same urban scale with the other new construction types built in the same urban environment. They exhibited all kinds of stylistic variations. The apartment house took its place in the city's growing process as the basic housing model of the next century.

Fig.4. Botter Apartment

Fig.5. Yali House at Bosphorus

4. Summer houses, mansions, etc.: They were a new trend manifested itself along the shores of the town and the Bosphorus, parallel to the railroad and on the Princess Islands during the late 19th and early 20th Century. These houses located inside gardens were two or three-storey wooden houses. While they exhibited some formal and spatial characteristics of traditional Ottoman housing schemes architectural elements, they also carried characteristics of Western vacation houses and mansions. It is possible to see stylistic variety and new architectural elements such as towers, tower terraces, decorated and exaggerated balconies supported by columned entrance porticoes, wide windows, shelters, picturesque supplements and greenhouses in these buildings and in garden pavilions beside them.

Westernization of Interior Spaces

Socio-cultural changes could also be witnessed in the use of housing during Westernization process of Ottoman people. Western style furniture, kitchen equipment, heating, lighting and communication systems started to come into use from the middle of the century on, first in the Western residences of the town, then slowly in all the others in Istanbul. It resulted in changes in the organization of housing space, the interior and exterior design of the dwelling. Signs of Modernization and Westernization of Muslim and non-Muslim groups in metropolis began at about the same time. On the other hand, the rate of change among non-Muslim groups was higher. For the Ottoman Turk, Modernity was defined in terms of western artefact. For the

highest Ottoman social group, as the artefacts of European Wohnkultur was mere contributions to their emerging exotic tastes at the beginning, it turned out to a cultural message and a symbol of status later on. Western artefacts played an important role in the domestic scene and were of value as signs for public presentation or exhibition. As one moved into the more private domain, the inner sanctum of the Ottoman life, they ceased to exist. The member of the upper crust would mostly exhibit an artefact as a sign of his changed cultural preferences and as a status symbol in accordance with the dictates of the system of traditional social relationships. The years from 1870's through the first few decades of the Republic, witness a new phase in the process of Westernization of the Wohnkultur. For the higher social groups, the process seems to have been completed. For the others, the change encompasses a broader area and the tempo is the faster.

Nationalism versus Westernization

The creation of new states on Ottoman lands with the influence of French Revolution and loss of lands with wars had prompted formation of nationalist ideologies. Pan-Ottomanism, pan-Islamism and nationalism were proposed. Turkish nationalism, which evolved out of pan-Ottomanism, had been reinforced by pan-Turkism, which stressed cultural and linguistic unity. The nationalism ideology started to arrive on the scene at the end of the 19th Century and became dominant at the beginning of the 20th Century. The Western-educated Ottoman middle classes supported the nationalist program formulated after 1908 which became the blueprint for the Turkish Republic established in 1923. A parliamentary government was instituted by the Young Turk Revolution (1908–9), generating a fervent sense of Turkish nationalism. The emergence of a new political, social, and cultural identity also led to the development of new trends in art and architecture.

Fig.6. 4th Vakif Han

Nationalist ideology rejected Western forms in architecture. On the other hand, Orientalism, which was the imitation of the East by the West, had been accepted as the symbol of cultural identity. It can be defined as the imitation of the imitation, because many forms of Orientalism fantasized as Ottoman by the West were not real. “First Nationalist Architecture” period current between the years of 1910-1930, was inspired from Orientalism. The main

characteristic of the First Nationalist Architecture period was based on the monumental and religious forms of Seljuk, Ottoman and Islamic architecture. The plan schemas of this period were parallel to the European Neoclassicism with the proportions and compositions of mass and dimensions of spaces. They had symmetrical and axial plan and mass ordering. Although the buildings of this style had the main characteristics from Western architecture, Nationalist character was represented only on the facades. The architectural elements of the past were used different than their original functions. These elements were portals, pointed arches, wide eaves and angle braces, stone ornamentation and traditional tiles on parts of the wall surfaces. There were also bulbous domes at some examples which had never been a characteristic of Ottoman architecture but derived from Orientalism. It can be defined as a superficial approach without questioning its meaning. The pioneering architects were Kemalettin Bey and Vedad Bey. The First Nationalist Architecture praxis continued also after the collapse of the empire in 1922, during the early years of the new Republic of Turkey established in 1923, with the strong nationalist and introverted feelings of ten years long war period. On the other hand, it was an ideology inherited from the empire and it was a contradiction that the architectural forms of the modern and young republic took its references from the past that was rejected ideologically.

Conclusion

Meeting of Ottoman Empire with the West from Tulip Period until its collapse in 1918 was a 200 years of experience of change in culture and lifestyle. Westernization of Ottoman Empire affected it in terms of changes in institutions, social organizations, urban structure, life style, world view, family structure, new building and housing types, architects and architectural styles. It caused different degrees of Westernization at various layers of society. The initialization of Western culture depended on political, economical, administrative conditions, situation of social layers and time. It had been initialized by some layers as others hadn't. The distance between opposite points of these layers grew away from each other by time and turned out discussions of identity between being Eastern or Western. Reflection of Westernization on architecture was both functional and stylistic. As the functional side of Western effects had never been discussed, Western style architecture had always been the main subject of identity discussions. When these discussions had been made in terms of formal context, the counterview to the arguments had also been produced in formal way. Discussions of identity between being Eastern or Western would continue also during the Republic period. Modern architecture became the representation of Western culture. Counterviews were not completely against the Modern architecture and Westernization, but in the way of adopting traditional architecture to the Modern.

Transgressing the boundaries to install within marginality. Zhai Yongming's lyrical voice¹

¹ I am grateful to the University of Zurich UPRR *Asia and Europe* for the support during my research.

Justyna Jaguscik

University of Zurich URPP Asia and Europe

Many Chinese literary critics see women's poetry (女性诗歌) of the 1980s as the departure point for further development of the so-called "women's writing" (女性写作) in the People's Republic of China (PRC). Despite the fact that poetry was always considered a suitable genre for women in the classical tradition, women poets occupied a peripheral position in the literary canon.² In the *Introduction* to their comprehensive anthology of women's poetry and criticism *Women Writers of Traditional China*, the editors Kang-i Sun Chang and Haun Saussy claim however that 'Chinese literature can boast of an exceptional number of women writers before the twentieth century, and that, of course, deserves bringing to notice; it is also interesting and important that these women were read, discussed, and ranked by intelligent people of both sexes. Women writers are very much part of Chinese literature. Though their place has been contested, though they have encountered the usual sorts of peremptory dismissal and trivialization, and though the benefits of a literary reputation typically eluded them, they did participate in the vast conversation.'³ This statement has yet remained controversial. Prevailing opinion on women poet's writing in the Chinese literary canon might rather sound alike: 'These few recognized pre-modern women poets [Zhuo Wenjun 卓文君, Ban Jieyu 班婕妤, Cai Yan 蔡琰, Xie Daoyun 谢道蕴, Zhu Shuzhen 朱淑真, and Li Qingzhao 李清照] were traditionally portrayed as positing sentimental verses while confined to their boudoirs. Women's subject position was inconspicuous or non-existent.'⁴ Michelle Yeh analogically speaks of contemporary women poets' voices as a 'marginal discourse', positioning them on the margins of the margins.⁵

Chinese and western literary critics preoccupied with contemporary Chinese women's poetry place this heterogeneous category at the intersection of influences of western feminism, indigenous tradition and the output of social and political changes, which took place in the Post – Mao Period. They led to an ongoing deconstruction of various sets of images of "modern women" which had emerged in the Republic of China and in Maoist iconography. Female subjectivity and agency have been reconceptualised by female authors in a process of self-questioning. Tang Xiaodu's (唐晓渡) article *Women's poetry: from the dark night into daytime* from the year 1987 is probably the very first attempt to define this literary phenomenon. Written as a reaction to Zhai Yongming's (翟永明) literary debut *Women*

[女人]⁶, it describes the essence of ‘true’ women’s poetry as ‘not only in bringing into light the other world hidden from view by male prejudices, but even more the possibility of the reinterpretation and creation of a completely new world order on different terms.’⁷ Chinese authors usually consider the distinctiveness of women’s writing as writing produced by women frequently caught up in a form of biological determinism and essentialism. As Maghiel van Cravel points out: ‘The theoretical possibility of a definition of women’s poetry that allows for inclusion of male-authored texts has not been seriously explored.’⁸

Zhai Yongming has personally been publishing self-reflective comments and essays since the 1980s. In 1989, she was one of the poetesses who participated in a discussion on women’s poetry published in the poetry journal *Shikan*. Although a significant shift in her view on women’s creativity and feminism can be observed, almost twenty years later she repeated some of her previous statements: ‘I hope one day women will enter the literary canon not only relaying on their sex, however, due to the fact of them being women, they should not be stripped of even the possibility of taking an equal place next to the poets in the first row.’⁹ She is writing against attempts to position women’s poetry only within political or sociological spaces, depriving it of a literary room of its own: ‘But now critics look at women’s poetry from the sociological point of view or from the perspective of the women’s movement. Or from the psychological standpoint, focusing on the feminine introspection and other points. Reviewers rarely undertake a close reading of the lyrical text written by a woman discussing it as pure poetry, analyzing it as a piece of art. For these reasons, there are no standards in the so-called women’s poetry and the whole idea remains a rather confusing one.’¹⁰ Being somewhat pessimistic in her opinions about the imaginative landscapes of women’s poetry in the late 1980s, she currently praises the younger generations’ poetical achievements, giving the examples of authors born in the 1970s and 1980s: Yin Lichuan (尹丽川), Zhou Zan (周瓚), Tang Danhong (唐丹鸿), Lü Yue (吕约), Lan Lan (蓝蓝), etc.

Zhai Yongming’s early nocturnal lyrical creations were read as a sinophonic answer to the concept of *écriture féminine*¹¹, which had reached China with the translation (1992) of Hélène

⁶ *Women* was written in 1984 and poems in the series appeared in Sichuan’s unofficial poetry journals and others outside the province in 1985. The series was officially published in book form (with other poems) in 1989.

¹¹ ‘If normative language can be seen as in some way male-oriented, the question arises of whether there might be a form of language which is free from this bias, or even in some way oriented towards a female. French theorists, therefore, have posited the existence of an *écriture féminine*, (the term is that of the French theorist

Cixous's *The Laugh of the Medusa*. In her lyrical passionate style, Cixous encouraged women to 'write her self'¹² and this is what Zhai Yongming and many other female authors did in the 1980s, launching a discussion about the possibility of Chinese *body writing* (身体写作). They opened the Pandora's box containing the mysteries of women's sensuality (in Anais Nins words) to invent the language of sex, so very different from the male counterpart. Rebelling against the hegemonic power of the somatophobic Chinese highbrow culture, they explored the tabooed realms of women's bodies and women's sexuality.

Here I would like to problematize the parallel reading of Cixous's *The Laugh of the Medusa* and Zhai Yongming's *écriture* using the example of the preface to her 20-poem cycles *Women*. This short essay titled *Nocturnal Consciousness* [黑夜的意识] was written in 1984 and officially published in 1993.

The alternative translation of the essay's title might be *Black Night Consciousness*. In Chinese tradition, the colour black, which overshadows the initial phase of Zhai Yongming's writing, evokes various associations. However, unlike in the West, till the late 19th century there is no equivalence of black with the evil. Only later, it will be ideologized through incorporation into the body of political or religious vocabulary. After 1949, "old, feudal" China has been linked with darkness which has transformed into brightness with the new political establishment.

Traditionally the colour black, which is so prominent in Zhai's poetry, has been associated with water, the North and a salty taste. In terms of cosmology, darkness has been linked with the Yin pattern: '[...] Yin and Yang, whose earliest identifiable meanings appear to be 'the dark (northern) side of a hill' and 'the sunny (southern) side of a hill.'¹³ It is of great importance that in cosmological thinking, the dominant patterns were clearly of correlative type and that nothing is Yin or Yang in itself and outside the context of a relationship: without Yin there is no Yang and vice versa.¹⁴ Finally, the colour black also stands for darkness, death and honour.

The two feminine manifests, Cixous's *Laugh of the Medusa* and Zhai's *Nocturnal Consciousness*, if read parallel, seem to operate with equivalent terminology. However,

Hélène Cixous, from her essay *The Laugh of the Medusa*, associated with the feminine, and facilitating the free play of meanings within the framework of loosened grammatical structures.' (Barry, 2002).

¹² H. Cixous, *The Laugh of the Medusa*, IN: E. Marks and I. de Courtivron (ed.), *New French Feminism: An Anthology*, New York: University of Massachusetts Press, 1980, pp. 245–263.

¹³ Ch. Cullen, *Cosmology*, IN: F. Pregadio (ed.), *The Encyclopedia of Taoism*. London and New York: Routledge, 2008, Vol. I, p. 51.

¹⁴ The notions of Yin and Yang were applied to various complementary entities and phenomena, building a relative categorization, as, for instance, a minister was in Yin relation to his ruler, but Yang in relation to his subordinates. Moreover, Yin and Yang are not absolute, since each contains the seed of the other.

culturally different philosophical backgrounds make the visible likeness questionable. In Cixous's text, the following binary oppositions appear: 1. symbolic order/ imaginative melting, 2. Law of the Father/ voice of the Mother, 3. masculine hegemony/ feminine plurality, 4. masculine libido/ *jouissance*, 5. rationality/ poetical expression. In Zhai's early poems, binary oppositions can be found as well: 1. birth/ death, 2. night/ day, 3. body/soul and 4. darkness/ light. Not only in *The Laugh of the Medusa*, but also in *Sorties*, Cixous challenges the patriarchal system that sets up aforementioned binary oppositions, privileging the first term and tending to associate the female with the negative second term. Nevertheless, Zhai refers to the complementary or correlative principles of Yin and Yang.

Cixous' main point is that feminine writing or writing by women (since the French word feminine designates both "female" and "feminine") is linked to the body. She claims for a language emerging from the female body, for writing with the *white ink* of the mother's milk. The almost ecstatic act of writing as emanation of feminine lust in Cixous words, is seen as a painful torture by another authors. In Zhai's *Nocturnal Consciousness*, the poetess is damned to dwell from birth to death, torn between the will to live and self-destruction. Her life might be seen as a persistent experience of an in-betweenness: 'In a women's body an inborn inner fear and destructive premonition are hidden. It is this presentiment that eventually let us being absorbed by a predestination. In a reality that bears all possibilities there is no redemption. For this reason, the poetess expands her own mythical world, linked to the moment of delivering as well as connected to the netherworld kingdom. On this increasingly blurred boundary it is the keeping to the truth of the inner darkness that allows you after being painfully enlightened to discover the nocturnal consciousness. Only this is the destruction of your personal anxiety.'¹⁵

Awaking into the nocturnal consciousness grants access to a specific feminine insight: 'The nocturnal consciousness allowed me to free myself to a state of pure knowledge and experience of my Self, society and the human kind.'¹⁶ In medieval Europe, the term for describing the mysterious feminine knowledge connected with pregnancy and childbirth, was – *occulta corporis, secretis mulierum* – similar to that one hidden in the black night. The nocturnal consciousness brings the poetess across the border of a women's world with its own time and mythology. She rediscover herself as a prodigy of a feminine genealogy founded by Nüwa, the Creatrix.

Zhai Yongmings illusive poetical language reminds one of two another women; Helene Cixous's and Julia Kristeva's remarks, whose psycholinguistic theories provide a way of approaching women's writing and the poetical language. Zhai writes: 'Being born into this world we are immediately bond to the black night in a mysterious way. A hidden invisible language-speech matures with-in us, embracing soul and body, being there like a cloud in the sky, being in and out of awareness.'¹⁷ The connection of a mythical preverbal musical energy,

¹⁵ Zhai Yongming, *Heiye de yishi*, IN:Zhang Qinghua (ed.), *Zhongguo xin shiqi nüxing yanjiu ziliao*. Jinan: Shandong Wenyi Chubanshe, p. 70.

¹⁶ Ibid, p.70.

¹⁷ Zhai Yongming, *Heiye de yishi...*, p. 70.

pulsation and rhythm reminds of Julia Kristeva's notion of a 'semiotic chora' and of the mythical Nüwa's link to music. The earliest references to Nüwa are sparse and enigmatic¹⁸, nevertheless in *The Book of Rites* [礼记], she is mentioned as the inventor of the musical instrument – the "Nüwa organ."¹⁹ Following Kristeva's terminology, Zhai Yongming's invisible language that originates from the nocturnal experience builds the *genotext* of women's poetry. It includes 'drives, their disposition, and their division of the body, plus the ecological and social system surrounding the body, such as objects and pre-Oedipal relations with parents.'²⁰

Since the beginning of the 20th century the dark, cold black night gradually turned into a recognisable metaphor of the misery of the Chinese society. Adequate examples of this rhetorical shift can be found in Lu Xun's (鲁迅), Mao Dun's (茅盾) and Ba Jin's (巴金) works. Qiu Jin (秋瑾), who launched her own journal *Chinese Women's Journal* at the end of 1906, wrote in foreword to the premiere issue: 'The Darkness. Darkness is when there is no truth, no knowledge, nor any proper human thought or action. In the chilling context of the darkness, there are a million unthinkable dangers. But the truest danger is the oblivion to danger; oblivion is the great danger.'²¹ As Any D. Dooling notice: 'For the great majority of late Qing feminist writers including Qiu Jin, the "darkness" carried a dual significance: it referred both to the specific gendered experiences of women, and to their immediate plight as members of what was increasingly perceived to be a nation encumbered by decaying culture, official corruption and, above all, mounting foreign colonial aggression.'²²

In the year 1985, Zhai Yongming finished the essayistic *Nocturnal Consciousness* in which she imagines the feminine consciousness as nocturnal consciousness. It was a gesture of great significance if a women voluntary writes herself back into the realm of darkness in a social world yearning for secular enlightenment. Not to forget, it is the same society which heliotropic desires have been fulfilled by only one Sun-Man for many years.

Here I would like to propose a reading of this dense hermeneutic essay and *Women* poem cycles as an attempt to create a fantastic womenscape, which can be seen as both - a

¹⁸ See e.g.: A. Birrell, *Chinese Mythology. An Introduction*, Baltimore and London: The Johns Hopkins University Press, 1993, pp. 163-165; E. H. Schafer, *The Divine Woman: Dragon Ladies and Rain Maidens in T'ang Literature*. Berkeley and Los Angeles: University of California Press, 1973, p. 29. It is significant that according to Schafer's interpretation the goddess Nüwa might be seen as the first victim of the increasing domination of masculinity in the elite social doctrine.

continuation and transgression of early feminist fantasies, which emerged at the turn of the century.

In Rosemary Jackson's words, the literature of fantasy features 'the basics upon which cultural order rests, for it opens up, for a brief moment, on to disorder, on to illegality, on to that which lies outside the law, that which is outside dominant value system.'²³ Chinese feminist writers who implemented the fantasy mode in their artistic production stressed following the target of generating desire for social change. Zhai Yongmin's dark feminine utopia seems to provide the outlet for subversive social desire that means desires for a woman's space on their own where she can be and live her body, her *jouissance* in a way not colonized by the national group's discourse. As she writes in the *Nocturnal Consciousness*: 'As on half of the human race, starting at birth, the female sex is faced with an entirely different world. [...] The initial night, upon its rise, leads us to a unique world belonging only to the female sex, with a brand-new, specially laid-out angle.'²⁴ Unlikely their predecessors whose aim was to escape from the darkness, Zhai Yongming creates her own dark world to subvert the former one, which is not hers. For her nocturnal consciousness is synonymous to the awakening of the gender consciousness.

Women and the Nocturnal Consciousness are representative for Zhai Yongming's early writing, which has been characterized as influenced by Sylvia Plath's confessional poetry and French *écriture féminine*.²⁵ Later on, she gradually abandoned the confessional tone transgressing the borders of her own dark female-centred world to re-enter the reality of the external world. She got increasingly interested in the real-life scene and objects on the one hand and in the past world of historical figures. The linguistic transition in her writing follows the boarder-crossing experience of two years in New York (1990-92).

That time, being the Other of man in the Chinese society, Zhai Yongming experienced the feeling of being the Other of the West. In her essayistic creations, she reflects on it as a period of almost aphasic silence. Only later did *The café song* [咖啡馆之歌] become the poetic expression of a subaltern spectators encounter with the foreign city and its citizens. Furthermore, this poem marked a stylistic shift in her writing towards a less confessional and more dialogic, heteroglossic lyrical voice. From that time on, travelling became part of her life and writing, which can be read as a post-colonial subjects travelogue.

The café song is divided into three section differentiated by three time elements: "in the afternoon," "in the evening," and "at dawn". It is about the narrator's relatively obscure encounter with a city and its inhabitants in a typical metropolitan setting – a "no name" café.

Sipping the bald barista's coffee on Fifth Avenue, (s)he enjoys the outsider's position and listens to the sound of the city. The poem is a patchwork of popular songs, casual talk and narration. Nevertheless, traces of the sensory-embodied approach to the world linked to Zhai Yongming's early *écriture féminine* still can be found. However, these are no longer the vibration and pulsation of her inner world or the mother earth, which the poetess perceives. They have been replaced by the outer world popcultural cacophony. The Café-scene reminds Hollywood filmic productions and it ends with a familiar sounding filmic dialogue: 'Rain. You ask me in a lowered voice:/ "Shall we go to my place?/ Or to your place?" The car crossed Manhattan.'²⁶

The *The café song* and other collection of essays titled *Constructions on paper* [纸上建筑] build the core of what may be called Zhai Yongming's micro-history of Chinese diasporic experience. Probably unintentionally, she documented the shift in her own position and that of her bohemian counterparts.²⁷ Chinese artists and intellectuals who left the People's Republic in the beginning of the 1990's entered the New York's landscape as marginalized outlaws, trying to make their living by portraying "the Whites" in Central Park or chasing underpaid jobs in order to "succeed". Only a few years later in 2006, they occupied an entirely unlike position: 'Four men two women discussing/ international matters traverse East and West/ Artist, Critic/ Architect, Art gallery's boss/ Museum's director/ These probably are the trendy jobs [...].'²⁸ Making allusions to the rocketing prices of Chinese artifacts on Sotheby's auctions Zhai Yongming registers the shift in the place occupied by the diasporic and once marginal cultural production on the global market.

After the millennium, she repeatedly questioned the presence of China and the "Third World" in the "First world", reflecting the fever over contemporary Chinese art and continuous commoditization of artistic production. Another example is the Berliner poem²⁹ *Chinese bald heads* [中国光头], in which she refers to the omnipresence of the art motive that opened the door of international galleries' to the Chinese artist in the early 1990s.

A visible intertextual connection make itself noticeable while reading *The Café Song* and *New York 2006*. The latter poem is similarly divided into three section: 'Downtown', 'Midtown' and 'Uptown'. The ordering principle is not diachronic but a spatial one. This can be seen as a reflection of the poetess's shifting interests and her intensifying preoccupation with space and architecture. First of all, the palimpsestic relation between this two poems reveals itself by the repetition of some phrases from *The Café Song* in *New York 2006*. This act of iteration is accompanied by a partial erasure and rewriting of the former text's elements. As post-colonial discourse has shown place (as the objective word) is not separated from the viewing subject, but it is much more a complex interaction of language, history and

²⁹ Zhai Yongming received in 2000 a scholarship from the DAAD (Deutscher Akademischer Austauschdienst). The title of the poem is probably an allusion to Yue Mingjun's (岳敏君) famous "bare head" paintings.

environment: ‘The theory of places [...] rather indicates that in some sense place is language, something in constant flux, a discourse in process.’³⁰ The melancholic narrator of the former poem posited her or himself in the past, as this is the dimension her or his lost country belongs to. The time of 2006 is ‘today’. It is still the visual-auditory approach of a distant, rather cynical, than dejected narrator that remains the same. The café of the past was a private space and stage for a melodrama, while the contemporary city acts as a setting for the political vocalization of the ‘protestant ethnic’. Global market and politics replaced the idle chat. Before it was the native speaker who was envied: ‘And you still talking about the garden of Eden of your neighbourhood/ Your son/ Noble vocation/ And your pure local accent’³¹, now the subaltern can speak: ‘And here the CHINA TOWN/ some say it is a disdainful name/ “The proper name shall be CHINESE TOWN”/ Only yesterday I heard about it.’³² New York in the year 2006 is a place where people live on the ‘borderline of history and language, on the limits of race and gender.’³³ The city itself reveals its new palimpsestic features, as architects imply palimpsest as a ghost – an image of what ones was. The narrator passed by the place where the proud World Trade Center was. The souvenir of the Twin Tower’s unchangeable shape has its place on his desk. What remained is a simulacrum of hegemonic power, questionable after the city has been effeminized by the oriental Other’s striking back. This “lack of” is a sign of vulnerability. Whenever spaces are shuffled, rebuilt or remoulded, shadows remain. A spectre is haunting the US – a spectre of ethnical terrorism.

Since early 1990s, nomadic lifestyle belongs to Zhai Yongming’s public image. In a picture published in her newest poetry collection *The most tactful words*, she stands alone looking the reader straight in the eye, with a professional camera in her hand. Nevertheless, 1997 she eventually fulfilled the dream of her own space, establishing a bar called “White Nights” in the city of Chengdu. What had been dreamt of and inspired by Alice Walker’s “Colour of Purple” and Yi (彝) minorities women’s dyed folk costumes³⁴ as a purple feminine margin, was finally designed in utterly minimalistic white. Moreover, it is not a space of her own, but an meeting point for intellectuals, avant-garde artists, belonging to the alternative cultural scene of the city. Just as it is said in one of her poems: ‘the whiteness installs us.’³⁵

Viewed from this angle, Zhai Yongmin’s creativity as a writer, art curator and owner of an artistic open space, may be described as *intellectual dissidence* in Julia Kristeva’s words. As an experimental writer she has been undermining the law of symbolic language. Moreover, as

When Mandarin Color Vocabulary Meets Lakoff's Gender Differences

Ph.D. Graduate Student
Yi-Chien Wang
Department of English, National Kaohsiung Normal University

Introduction

Background and Motivation

“Oh, look at that peach sweater! It’s so cute. Do you think it will look good on me?”
“Uhm? Which one? Oh, you mean the pink one?” The conversation was overheard from a couple who were trying on a new shirt in a shopping mall. Guess, who said the first sentence? Yes, the woman did. The difference between *peach* and *pink* in this conversation does not lie in color description only but illustrates interestingly the gender difference. Men and women are different in many ways; language is one of the aspects.

Men and women use language differently. A large number of evidences show that the language of women is not always same as the language of men. According to Robin Lakoff’s (1975) provocative book, *Language and Woman’s Place*, she argued the six characteristics of women’s language in her times: special lexical choice, question intonation in statements, hedges, emphatic modifiers and intonational emphasis, hypercorrect grammar and pronunciation, and superpolite forms. Among these characteristics, one of the interesting features in the special lexical choice is the color terms. As for the women’s color vocabulary, Lakoff asserted that

“Women make far more precise discrimination in naming colors than do men; words like *beige*, *ecru*, *aquamarine*, *lavender*, and so on are unremarkable in a woman’s active vocabulary, but absent from that of most men.” (pp. 8-9)

Although Lakoff’s claims about women’s language are challenging, the data contributing to her conclusions of women talk are intuitive based on her introspection of her own speech and observation of media but not on any empirical findings. In other words, her hypotheses of women’s language are not backed up with any statistical numbers so that people nowadays still have different opinions toward Lakoff’s claims. Thus, her claim that women have larger size of color vocabulary than do men deserves further scientific experiments to verify. In addition, Lakoff’s claims are resulted from the analysis of English in American society. Few studies have been done to examine whether Lakoff’s hypothesis can be generalized to all societies in the world. Therefore, further studies done in different cultural backgrounds are needed to test her hypotheses.

In view of the problem mentioned above, the researcher decided to justify Lakoff’s hypothetical claims about peculiarity of women’s language by conducting a scientific

experiment to examine men and women's performance in color naming. Additionally, in order to test the generalizability of Lakoff's hypotheses from the West, the researcher carried out this experiment in the East to check whether women have larger size of Mandarin color vocabulary than do men in northern Taiwan. What is more, to avoid the bias that women seem to be more sensitive to color than do men because women are interested in fashion in nature, in this study both male and female recruited subjects majored in art-related departments. With the same interest in art, the subjects' gender difference in color-naming performance can be clearly illustrated.

Purposes of the Study

The purposes of this study are to investigate the differences in the use of Mandarin color vocabulary between male and female university students in art-related departments in northern Taiwan, and to discuss what specific gender differences are in Mandarin color-naming performance. By conducting a scientific experiment, the researcher tried to test the validity and generalizability of Lakoff's hypothesis that women had larger color vocabulary than did men.

Research Questions

This study was carried out to explore the differences between men and women's Mandarin color vocabulary in northern Taiwan. Specifically, two research questions in this study were addressed, as follows:

1. Is there any significant difference of Mandarin color-naming performance between the male and female art-major university students?
2. What are the specific gender differences of Mandarin color vocabulary among the art-major university students?

Limitations of the Study

The scope of the present study is limited in the following respects. First, restricted to the feasibility of this study, the number of the subjects is confined. There were about 80 subjects in this study that may not be large enough to be generalized to the performance of art-major male and female university students in Mandarin color naming in northern Taiwan. In addition, the other limitation is that the subjects were university students whose high level of education may affect the results of the study. That is, the subjects might possess the ability to describe color terms with greater specificity than lower educational groups. Thus, the results may not be generalized to the lower educational groups. Moreover, the research method chosen in this study may produce a bias because the subjects' awareness of color naming could be raised during the process of the experiment. However, such a situation is necessary to elicit the

subjects' responses to color naming. It is difficult to conduct an experiment in which people are asked to name color implicitly. Nevertheless, this bias was constant across all groups of subjects in the experiment and should not affect the relative scores of groups.

Literature Review

Research into language and gender has not been really taken into serious considerations until the early 1970s (Wolfson, 1989). However, it does not mean that this field was not touched upon before. Early in the 1920s, Jespersen (1922) devoted an entire chapter to "The Woman" in his book, *Language: Its Nature, Development, and Origin*. Jespersen studied the differences between men's and women's speech in both exotic non-western societies and western European societies, particularly English-speaking countries. He indicated that women did use some special linguistic forms more often than men did, such as euphemistic words, emotionally loaded adverbs and adjectives, and rapidity of reading and thinking.

In the light of the differences between men' and women's language, more and more sociolinguists have been motivated to investigate the reasons behind. In general, the gender differences in speech are found to be resulted from age, socialization practices, education and social status (Holmes, 1992; Wardhaugh, 2002). Men and women's age, growing processes, educational levels, and status in a society will more or less affect their uses of a particular language. To be specific, Lakoff (1975) claimed that women's speech was affected by their social status. She proposed her argument by giving examples of women's language from her introspection and observation of American society. She found women had special lexicon, such as color terms, varied their intonation in statements, used hedges to be polite, and paid attention to their grammar and pronunciation. According to Lakoff, women were using the language to strengthen their subordinate status in the society. That is, cultural assumptions are implied in language, so language reflects and even reinforces the order of societies. Differing from Lakoff's viewpoints, Labov (2001), in his discussion of language change in Philadelphia, indicated that women intended to use the standard speech form to elevate their social status. The fierce debate that women's speech is different from that of men's will continue as long as the two genders exist.

In terms of gender differences in color naming, a great deal of previous research has been conducted on color perception and its representation in language. For example, the female advantage at speeded color naming was first reported by Woodworth and Wells (1911). Their research unveiled the fact that the females completed the

Woodworth-Wells color naming test faster than the males. Ligon (1932) expanded on the result by administering the same test and another experimental task to a larger sample of 638 students. He obtained a similar result to Woodworth and Wells that females performed better on the speeded color naming task than males, but no sex difference for the special factor of color naming. Similarly, Saucier, Elias, and Nylen (2002) also proved that women named colors faster than men did. In addition, Chapanis (1965) reported that females were able to assign names more consistently to a wide range of colors than males. Moreover, Conley and Cooper (1981), in testing for preferences in ordering conjoined color terms (e.g., black and white), concluded that females showed stronger ordering tendencies than males.

Aside from the studies mentioned above, a few of scholars have conducted empirical research to examine the gender difference in the size of color vocabulary. The findings of their studies support Lakoff's claims regarding women's precision in naming colors. For example, Nowaczyk (1982) found that women had more elaborate descriptions of color than men. In addition, both Rich (1977) and Machen (2002) studied the gender and age differences in color naming. Yet, their results were contradictory to each other. Rich found that younger men had larger color vocabulary than older men, while Machen found that women aged over 16 years-old showed a more elaborate color vocabulary than men. Among the 14 to 16 years-old subjects, there was no significant difference in color naming. Similar to Machen's findings, Simpson and Tarrant (1991) indicated that the older subjects of both genders had more elaborate color description than the younger subjects. They claimed that color vocabulary continued to increase with age. Moreover, they believed that men's color vocabulary could be enhanced by color-related hobbies, but not for women. It is believed that this field deserves further studies.

In short, the differences between men and women are not restricted to physical appearances but are reflected in their language use. From the above studies, women's special lexicon of color terms and the related experiments are reviewed. It is hoped that the discussion provides the theoretical basis for this study.

Methodology

Subjects

In order to explore the gender differences of using Mandarin color vocabulary, the researcher conducted a color-naming experiment to have valid evidences. About 80 participants were involved in this experiment; they were university students, aged 19 to 22, randomly selected from National Taiwan University of Arts (NTUA). The reason

of targeting NTUA to select the subjects for this research was to ensure that all subjects of both genders were interested in art-related fields. In other words, to avoid the bias that women are better at color terms because they are more interested in fashion and arts than are men, in this study, the subjects of both genders were all recruited with majors in art-related departments, such as Department of Visual Communication Design, Sculpture Department, Fine Arts Department, and Department of Painting and Calligraphy Arts. Among the subjects, they were half male and half female. Moreover, the subjects were all native speakers of Mandarin who were not color blind.

Instrument

The instrument applied in this experiment followed the one used in Rich's (1977) study. A set of 25 cards was constructed by coloring a two-inch square in the center of each of 25 3x5 cards. The 25 colors were random selected from Pantone color chart. No color was repeated.

Along with the 25 color cards, a questionnaire (Appendix) was designed for the subjects to write down the name of the colors. In the *Questionnaire of Color-naming Performance*, in order to help subjects name the colors, the researcher told them to imagine themselves in the following situation:

You bought a shirt yesterday, and now you are going to buy a pair of pants to match the shirt. You enter a shop but forget to bring the shirt with you. Then, you tell the clerk, "I have already bought a _____ shirt. Could you show me a pair of pants to match it?"

Before answering the questionnaire in the experiment, subjects were well informed not to check answers with others and could give the same answers to different color cards.

Later on, the subjects' responses to the 25 color cards collected by the questionnaires in the experiment would be categorized on the basis of the criteria modified from Rich's (1977) four color descriptor categories:

- A. Basic: one of the following basic Mandarin color words: 紅 'hong' (red), 橘 'ju' (orange)¹, 黃 'huang' (yellow), 綠 'lu' (green), 藍 'lan' (blue), 紫 'zi' (purple), 白 'bai' (white), 黑 'hei' (black), 咖啡 'ka fei' (brown)², 灰 'hui' (grey), 銀 'yin' (silver), 金 'jin' (gold).
- B. Qualified: a basic word qualified by words such as 粉 'fen' or 淡 'dan' (light) and 深 'shen' or 暗 'an' (dark), such as 粉紅 'fen hong' (pink), 淡藍 'dan lan' (light blue), 深紫 'shen zi' (dark purple), 暗灰 'an hui' (dark grey), or by another basic word, such as 黃綠 'haung lu' (yellowish green).

- C. Qualified Fancy: a basic word qualified by special words, such as 天空藍 ‘tian kong lan’ (sky blue), 檸檬黃 ‘ning meng huang’ (lemon yellow), etc.
- D. Fancy: color words not in the basic category but by adopting real-world objects, such as 皮膚 ‘pi fu’ (skin), 米 ‘mi’ (rice), or professional color terms such as 朱紅 ‘zhu hong’ (vermeil), 普魯士藍 ‘pu lu shi lan’ (Prussian blue), etc.

The subjects’ responses which were categorized based on the criteria above were given different points to each category to calculate the total score. One point was given for use the basic words in category one, two points for qualified words in category two, three points for qualified fancy words in category three, and four points for fancy words in category four. Because 25 cards were displayed in the experiment, the possible scores for the subjects were ranged from 25 to 100.

Study Procedures

The researcher of this study conducted an experiment to elicit the randomly-selected subjects’ responses to color naming. The study was conducted in three stages. In the first stage, the preparation stage, the instrument for the experiment was developed, including the questionnaire and structure of the experiment.

Then, in the second stage of this study, the subjects were randomly selected on campus of NTUA and the experiments were conducted for them. The experiments were held in a quiet and bright classroom to make sure that the subjects felt at ease. At the beginning of the experiment, the instructions of what the color-naming experiment was and how to complete the questionnaire were given to the subjects. After the researcher made sure that every subject understood what they should do in the following experiment, the experiment began. The 25 color cards were shown to the subjects one at a time in sequence to let them name the color. The subjects had to write down the word or phrase they would use to name the 25 colors on the provided questionnaire. The duration of the experiment was about 20 to 30 minutes. It was assumed that the subjects responded with the best of their ability.

Finally, in the last stage of the study, the subjects’ responses were collected. The data were transformed to scores based on the designed criteria and analyzed quantitatively.

Data Analysis

Statistical analysis was applied to analyze the subjects’ scores in this study. Specifically, the collected data in this study were computed and analyzed by Reliability Statistics in Scale of SPSS 15.0. In order to illustrate the gender difference of Mandarin

color naming performance in responding to total 25 colored cards, an independent samples t-test analysis was employed. A significant level .05 ($p = .05$) was established. The data helped to explain the gender differences of Mandarin color lexicon.

Results and Discussion

The collected data of this study were analyzed by statistics to investigate the existence and extent of relationships among selected variables: gender and performance of color naming. Although there were about 80 subjects in the study, half male and half female, not every subject's responses could contribute to the conclusion of this study because some of them left one or two items unanswered or others misunderstood the experiment by writing down the items associated with the colors. Take one subject for example, when the red color card was presented to him, he wrote "my high school" as the response. Therefore, only 38 female responses and 35 male responses to the questionnaire were valid to the study analysis.

Gender Differences of Color-Naming Performance

The male and female subjects' responses to *Questionnaire of Color-naming Performance* (Appendix) were analyzed by an independent samples t-test. The results provide answers and explanations for the first research question regarding the gender differences of Mandarin color-naming performance. The results of the independent sample t-test are illustrated in Table 1.

Table 1

Independent Samples t-test Results of the Male and Female Subjects' Color-naming Performance

Gender	N	Mean	SD	t	p
Male	35	61.97	8.995	-2.176	.033*
Female	38	66.11	7.195		

Note. N= Number; SD= Standard Deviation; * $p < .05$

As shown in Table 1, there is a significant difference of Mandarin color-naming performance between the male and female art-major university students ($t = -2.176$; $p = .033 < .05$). The mean score of the female subjects is higher than that of the male subjects ($66.11 > 61.97$), which suggests that the female subjects significantly outperformed the male subjects in Mandarin color naming. This result was in accordance to Lakoff's (1975) hypothesis that men's and women's languages were different in color vocabulary. Women tend to have larger size of color vocabulary than

do the men. Thus, Lakoff’s hypothesis is scientifically proved by this study and is generalized to the use of Mandarin rather than being restricted to English.

Specific Gender Differences of Mandarin Color Vocabulary

In addition to the finding that the male and female art-major university students whose performance of color naming in Mandarin was significantly different, their uses of Mandarin color vocabulary in the four categories defined above were examined for answering the second research question. For each category of Mandarin color vocabulary, the male and female subjects’ responses were compared and analyzed by employing an independent samples t-test. The results of each independent samples t-test for the male and female subjects’ use of Mandarin color vocabulary in the four categories are shown in Table 2.

Table 2

Independent Samples t-test Results of the Male and Female Subjects’ Use of Mandarin Color Vocabulary in the Four Categories

Category	Gender	N	Mean	SD	t	p
1: Basic	Male	35	5.09	3.230	3.751	.000***
	Female	38	2.63	2.318		
2: Qualified	Male	35	8.06	3.019	-.675	.500
	Female	38	8.58	3.508		
3: Qualified Fancy	Male	35	6.66	4.311	-2.037	.045*
	Female	38	8.74	4.409		
4: Fancy	Male	35	5.20	2.553	.289	.774
	Female	38	5.03	2.584		

Note. N= Number; SD= Standard Deviation; * $p < .05$

Table 2 presents several specific differences of the use of color terms between two genders. To begin with, based on the descriptive statistical analyses, it is found that the male and female subjects had different preferences for using Mandarin color vocabulary. The highest mean score of the female subjects is in the third category (8.74) and their lowest mean score is in the first category (2.63). These results suggest that the female subjects tended to use the qualified fancy color words most and the basic color words least. On the other hand, the highest and lowest mean scores of the male subjects are in the second (8.06) and first category (5.09) respectively. These results show that the male subjects used the qualified color words most and the basic color words least. That is to say, the female subjects were good at describing color by using a basic color word modified by a special term, while the male subjects excelled in using basic color words in combination with particular modifier or with the other basic color words.

Despite the fact that both female and male subjects seldom used basic color vocabulary in Mandarin, from the perspective of inferential statistical analysis, there is a significant difference for both genders in using this category of color words ($t = 3.751$; $p = .000 < .05$). Specifically, the mean score of the male subjects is higher than that of the female subjects ($5.09 > 2.63$). The result suggests that the male subjects used far more basic color terms than do the female subjects. In other words, men may incline to use basic Mandarin color vocabulary.

Additionally, according to Table 2, not only the first category of color words but also the third category is found to show a significant difference between the male and female subjects. In other words, there is a significant difference for the subjects of both genders in using the qualified fancy color vocabulary of category three ($t = -2.037$; $p = .045 < .05$). Specifically, compared with the female subjects, the male subjects' mean score is lower ($6.66 < 8.74$), which suggests that the male subjects used much less qualified fancy color vocabulary than did the female. That is, women indeed like to use fancier words in naming color more than men did.

Furthermore, as for the other two categories of color vocabulary, there are no significant differences between the two genders of subject groups. Both genders of subjects demonstrated similar use in the second and fourth categories. However, what deserves to be noticed is the male subjects' performance in the fourth category. The mean score of the male subjects in the fourth category, fancy color vocabulary, is higher than that of the female subjects ($5.20 > 5.03$). Contrary to Lakoff's argument that women are good at using professional words to describe color, the male subjects in this study used more specific fancy color vocabulary in Mandarin than did the female subjects.

In sum, the results of the two significant differences of using Mandarin color lexicon between the subjects of two genders show that the male subjects tended to use basic color vocabulary, which were single words with complete meaning, while the female subjects were prone to use qualified fancy color vocabulary, which were compound words in naming color. In fact, these results reflected the nature of men and women. As Lakoff argued, men's language was direct and women's language was nonassertive. Men tend to be direct with their language; therefore, when they are asked to name color, they use more basic color vocabulary which is simple and direct in meaning than the qualified fancy words. On the other hand, women incline to be indirect with their language; they prefer using modified words, such as qualified fancy color vocabulary, to direct basic color vocabulary.

Yet, the similar use of color vocabulary in the fourth category should not be neglected. In spite of the fact that the male subjects used less qualified fancy color vocabulary than the female subjects, both male and female subjects performed equivalent ability in using fancy color vocabulary. Although the male subjects were with fewer tendencies to use modified color vocabulary, they were still capable of using professional fancy color vocabulary, which were single words to show their directness.

5. Conclusion

This study aims to examine the gender differences of color vocabulary in Mandarin. The subjects in this study were randomly selected from the art-related departments at NTUA in northern Taiwan in order to avoid the bias that men are weaker at color terms because they are not interested in arts. All subjects were involved in the experiment to name the color of 25 presented color cards. Based on the results of the experiment, the male and female subjects did have significantly differences of color-naming performance. The female subjects tended to have larger size of Mandarin color vocabulary than did men, as hypothesized by Lakoff (1975). In addition, this study also investigated the detailed gender differences of Mandarin color vocabulary in the designed four categories. The results indicate that there are significant differences of using Mandarin color vocabulary in the first and third categories. The male subjects tended to use direct basic color vocabulary to describe colors but the female subjects inclined to adopt qualified fancy color vocabulary to name colors in a less assertive way.

However, this study is limited by the small sample size of the subjects. Further studies that collect data from a larger size of subjects are strongly recommended. Additionally, the subjects in this study were selected from NTUA in northern Taiwan. Future studies should include subjects from different backgrounds and in different areas to make the results be generalized as much as possible.

In conclusion, this experiment conducted in the East confirms the western Lakoff's hypothesis and finds that women have more extensive Mandarin color vocabulary than do men. It also indicates that the nature of men and women affects their performance on Mandarin color naming. That is, gender differences of using color vocabulary exist across cultural differences.

Notes

- 1 It is observed that 橘 'ju' is used much more commonly and often among people in Taiwan to describe color orange than is 橙 'cheng.' So, here in this study 橘 'ju' is classified as the basic category of color vocabulary instead of 橙 'cheng.'
- 2 It is observed that 咖啡 'ka fei' is used much more commonly and often among people in Taiwan to describe color brown than is 棕 'zong' or 褐 'he.' So, here in this study 咖啡 'ka fei' is classified as the basic category of color vocabulary instead of 棕 'zong' or 褐 'he.'

Appendix

Questionnaire of Color-Naming Performance

Gender: _____

Date: _____

Grade: _____

Department: _____

Thank you for participating in this study. The researcher will show you 25 color cards in sequence. Please follow the order and name the color you see by writing them down on the provided lines in this questionnaire. In order to help you name the colors, you can imagine you were in the following situation:

You bought a shirt yesterday, and now you are going to buy a pair of pants to match the shirt. You enter a shop but forget to bring the shirt with you. Then, you tell the clerk, "I have already bought a _____ shirt. Could you show me a pair of pants to match it?"

Note. *You can give same answers to name different color cards.

*Do NOT check your answers with others.

The New Rugged Individualism: Modernity & Countersystem in Postwar Fiction
Andrew Madigan, UAE University

I. Preamble

Today, we find ourselves at the receiving end of the 19th-century “revolution”¹ in thought. Darwin questioned god’s monopoly in the species-manufacturing industry while Spencer pitted us against one other in an anthro-genetic cage match. Marx, the contrarian’s contrarian, inverted the discourse, claiming that our hunt for prosperity, even capital itself, was wrong. Nietzsche concisely reported that god had died. In the novel, Dostoevsky, Poe and Henry James, among others, turned away from the linear domestic romance and looked inward, creating a fiction of psychology, sociology and theology, a curriculum that would be essential to the proleptic works of high modernism. In the visual arts, too, the past became an illness to bleed, a superstition to reject. Impressionists, postimpressionists, synthetists and others no longer concerned themselves with the realistic depiction of external reality; the flat and figurative Mirror of Nature was replaced with the funhouse Prism of the Psyche.

This presumptive rebellion in science, art and philosophy was a fin de siècle party that continued into the groggy morning of the 20th century. If anything, the partygoers became more noisy and raucous, breaking champagne flutes and spilling red wine on the carpet. Freud insisted it was just a matter of sex, family and childhood trauma, something to lie down and discuss. Duchamp painted a woman walking downstairs, but there was more than one of her and she didn’t look very much like a woman.

The 20th century, it’s been said, was a time of anomie, loneliness and despair, a frantic quest for meaning, purpose, god. Thinkers and artists were busy slaying the old gods—Reason, Religion, Patriotism, Capitalism, Democracy—and after the war this disillusionment became more widely dispersed. Charles Glicksberg maintains that the modern person is “altogether alone, a character in search of his lost self, living from moment to moment in the flux of immediacy” (28). It’s not difficult to see how this plays itself out among the celebrities of modernism. Stephen Dedalus can neither believe nor disbelieve. Jake Barnes thinks that Catholicism is a grand religion; he wishes he could believe in it. Vladimir and Estragon walk in circles, finding nothing.

The modernist stage is filled with lunatics and suicides, hedonists and heretics. It’s obsessively preoccupied with the quest for meaning and self-definition in a world of nihilism, materialism, global war and relativism. The religious journey, though often disguised in secular garb, is the central concern. Glicksberg notes that “all literature today which deals with the spiritual dimension... must be a dialectical struggle between affirmation and denial, the divine and the human, the Absolute and Nothingness” (11). Jake Barnes may have lacked faith, but he believed in the possibility of faith, which is why he wandered restlessly around Europe searching for a sign. Julien Sorel, on the other hand, may not have openly, or consciously, questioned the Catholic orthodoxy, but he wasn’t going to waste his time worrying about faith, dogma or ecclesial practices. He was too busy trying to get rich.

If modern humanity is indeed suffering through a grave illness, then what’s the cause? Karl Lowith points his finger at Continental philosophy, arguing that “[w]e are all existentialists,

some consciously, some willy-nilly, and some without knowing it, because we are all more or less caught in the predicament of being ‘modern’ by living in an epoch of dissolution of former beliefs and uncertainties” (346). We’ve been condemned by the grim force of European thought. Leo Strauss writes:

The crisis of modernity reveals itself in the fact, or consists in the fact, that modern man no longer knows what he wants—that he no longer believes that he can know what is good and bad, what is right and wrong, what is the just or the good or the best order of society. (81)

For Strauss, the issue is primarily epistemological. By some computational wrongfoot, we’ve lost the capacity to think clearly about fundamental topics, a malfunction that’s resulted in metaphysical and ethical crisis.

I wonder if we’re overstating the point, however, and missing another. Despite the profound effect of “ideas” on literature, on what amounts to a tiny set of intellectuals, the common man seems to go about his business without any reference to Nietzsche, Hegel, Marx or Wittgenstein. Darwinism, as an example, made all the tabloids when John Scopes taught it, but the concepts of evolution and natural selection were, on the whole, innocuous to the majority of Americans. “Most of the faithful,” according to Tindall and Shi, “came to reconcile science and religion. They viewed evolution as the Divine Will, as one of the secondary causes through which god worked” (902).

Newfangled ideas, in the abstract, don’t seem to have much impact on society at large. The crisis of modernity is more closely related to economics than philosophy. The industrial revolution, along with the continued rise of the middle class, meant that by 20th century most people had everything they needed to survive. This is the thesis of Galbraith’s *The Affluent Society* (1958), that economic reality, and thus human history, has metamorphosed from scarcity to affluence. Nietzsche and Darwin didn’t change the way people thought and lived, but rather Whitney, Bessemer and Fulton (admittedly, Marx had a foot in both worlds). As Galbraith points out, “the enemy of the conventional wisdom is not ideas, but the march of events” (11).

Industrialization, that fertile mother, always begets urbanization as well as economic growth. As people leave their towns and villages for the city, they leave behind agriculture, family, tradition and, perhaps most importantly, the values, attitudes and beliefs with which they were raised. The transvaluation of values does not come from exegesis of Nietzsche’s texts but from interaction with strangers, in a strange place, who have different ideas and practices. In the 19th-century realist novel, the young man moves to the city in search of wealth, career, fame and difference; he is also escaping from the provinces, which represent scarcity, simplicity, boredom and homogeneity. Julien Sorel is enjoying (and later suffering from) the early fruits of industrialization. Stendhal reveals Julien’s interior life, his misgivings about the ethics of his new community, but this isn’t central to the novel. *The Red and the Black* is about a young man’s economic and romantic hopes, his disillusionment, the perils of urban life, and provincial virtue. Julien lives in an economy of need, as does Stendhal, so the novel centers on satisfying this need.

Jakes Barnes, on the other hand, is completely unconcerned with money. He, and

Hemingway, grew up in an economy of plenty. It would be absurd to explore the quest for something that the protagonist already has so the novel switches focus from the external to the internal, from the hunt for money to the quest for meaning. World War I and the Great Depression also shook our belief in the old gods; a world of stability, security and predictability was beginning to look like chaos. This should explain why some novels were now narrated by multiple contradictory tellers and why a woman's nose might be painted on the side of her head.

II. Countersystem Analysis

Modernist fiction is grim, a futile and static journey towards nothing. The erosion of god, meaning and shared values had everyone frightened, if also hopeful that something new would come around. Postmodernity is the inverse. There is no faith in the possibility of faith, no spiritual quest, no despair. As Alan Bilton writes, postmodernity is an "age of cultural exhaustion and glazed indifference" in which "we must content ourselves with pastiche, quotation and parody—a kind of decadent knowingness" (1). The postmodern novel inhabits a world in which we assume that life is pointless, and everyone's okay with that. Bathos is the dominant mode. The Holocaust and Atomic Bomb are scary, yes, but the postmodern character hardly notices them anymore: they're just white noise. The West is now even more affluent, the government and its intelligence network even more intrusive. The old gods weren't dying anymore; they were dead and long forgotten. The only prayers are litanies of consumer goods and brand names. Our Coke who art in TV, hallowed be thy market share.

I'm going to examine two postwar writers—Salinger and Kerouac—whose work diverges, in many ways, from modernism and postmodernism. I'd like to quickly point out that my analysis will involve substance, not stylistics. In terms of prose technique, Salinger began as a realist and ended, if that's the correct verb, as a postmodernist; *Raise High the Roof Beam, Carpenters and Seymour: An Introduction* is, on the surface, a classic deconstructive "novel" whose only subject is its own writing. Kerouac also began as a realist, dabbled in stream-of-consciousness, and returned to realism. Regardless, I'm approaching modernism and postmodernism as categories that engender philosophical norms, rather than as technical or stylistic modes, so prose technique is not the issue.

Like the modernists and postmodernists, Salinger and Kerouac are horrified by the human condition. They see a world of chaos, anomie, despair. They get drunk, travel, sleep around, and hide from spiritual poverty. However, for the myriad normative values rejected or devalued by these writers, alternatives are implied or explicitly formulated. Despite the conventional wisdom, they are keen social critics in the tradition of Edward Bellamy, Upton Sinclair, Jack London, Richard Wright, Dos Passos and others. They haven't designed fully-functioning utopian communities, but they have portrayed fictive realms in which the dominant social ideals, and modern nothingness, are replaced with their own values, beliefs and practices.

Because Salinger and Kerouac offer alternatives to the existing social order and prevailing value system, they are builders of "countersystem" models. Countersystem, a paradigm designed by Gideon Sjoberg and Leonard Cain,

represents the *analytical* negative of, and *logical* alternative to, the system...under examination. It...is a tool for analysis rather than a weapon for attacking the system. Because actors can adopt an antisystem orientation without necessarily recognizing viable alternatives, the countersystem model invites social scientists to cope rationally and scientifically with alternatives to existing social systems. (224)

Countersystem offers an “external standard by which to examine a social order” and “heuristic devices for predicting, or understanding, the possible range of alternatives” (225). “Antisystem,” however, posits “the existing system as beyond repair” (222). This mechanism is used to evaluate the value-judgments of social systems; social scientists, or in our case novelists, challenge the assumptions that label certain values “positive” or “negative.”

Sjoberg and Cain argue that negative values “help to establish norms” and “serve to maintain or reinforce the existing norms” (214-16). That is, from the perspective of ethical gatekeepers, the negative, by serving as specific concrete examples of what is unacceptable, helps define the positive. From the perspective of the countersystem creator, the negative is offered as a replacement for the positive. While modernism and postmodernism entail a rejection of values, an antisystem, Salinger and Kerouac create countersystems, which means they offer new gods to replace the old.

III. Salinger, Kerouac

For the heroes of modernism, the spiritual quest was largely implicit. Jake Barnes steps into a church and wishes he could believe, but the religious story ends there. For Salinger, the quest is explicit. His characters find solace in mystic religion, especially Zen Buddhism. The dominant American system would embrace the Judeo-Christian tradition, the modernist antisystem would be agnosticism, the postmodernist wouldn't bother to raise the issue, and the countersystem model, represented by Salinger, suggests an alternative belief.

There's little direct evidence in *Catcher* of eastern thought, but his subsequent writings are saturated with it. This is most prominent in the Glass stories: “A Perfect Day for Bananafish,” “Franny,” “Raise High the Roof Beam, Carpenters,” “Zooey,” “Seymour: An Introduction” and “Hapworth 16, 1924.” Although written over a period of 20 years and never collected together, these pieces adhere to a single vision and constitute one continuous volume.

In “Roof Beam” Buddy Glass excerpts a letter from his brother Seymour, the oldest sibling and religious mentor to the others.

Is it so bad that we sometimes sound like each other? The membrane is so thin between us. Is it so important for us to keep in mind which is whose?...you and Z. and I have been brothers for no fewer than four incarnations....doesn't each of our individualities begin right at the point where we own up to our extremely close connections and accept the inevitability of borrowing one another's jokes, talents, idiocies? (158)

Salinger is dramatizing the Buddhist/Hindu ideal of submerging the individual ego-self into the collective ego-self, an idea that runs counter to the core American value of rugged individualism. The Glass-Salinger quest is for egolessness, transcendence, enlightenment. The path is Taoism, Confucianism, Freudianism, Kafkaism and especially Zen, which teaches

how to live within society while also being detached from it. Tae discusses this “non-dualistic” motif in Salinger. According to Zen, $A = A$ and $A = \text{not-}A$. The negative should be embraced along with the positive in order to achieve a fully-realized whole. Discrimination, $A = \text{not-}B$, is the source of our disharmony. In terms of countersystem, this non-dualism would be embraced by society, not just the individual; negative values shouldn’t be ignored or rejected outright, but rather considered as a necessary, and potentially beneficial, part of the social structure.

Tae analyzes Seymour Glass and the “problem” of discrimination: “Seymour as an ordinary man craves for the world beyond good and evil, beautiful and ugly, but on the other hand his instinct as a poet denies an indiscriminate view of art. Thus, Seymour is torn between the necessity to be a discriminative poet and the longing to be a non-discriminative person in society” (24). This ostensible paradox is not, according to Zen, a logical inconsistency, because Zen doesn’t place much value on logic or consistency. Enlightenment comes after one discovers the truth of non-dualism (or “suchness”) and returns to the phenomenal plane of dualism. As humans, we live in the practical world of dualistic necessity; discrimination is needed in order to make ethical, or aesthetic, decisions.

Seymour, who kills himself, clearly struggles with this return. The same could be said of Salinger. In the 1950s he moved into a secluded home in Cornish, New Hampshire where he still lives today, with no telephone and little contact with others. For Salinger, physical isolation is the answer to a social system he can’t abide, a world of commercialism, uniformity and insincerity. He equates modernity with the loss of privacy, which in turn means loss of the self.

The Glass children are intellectual prodigies who’ve appeared on the TV game show “It’s a Wise Child,” an experience that made them feel freakish, commoditized, depressed. Salinger explores this for two reasons. He’s examining the idea that we’ve replaced religion and other system values with technology, celebrity and entertainment. He’s also addressing the loss of the self. In “Zooey” the narrator discusses this:

...Zooey had been...the most voraciously examined, interviewed, and poked at. Very notably, with no exceptions that I know of, his experiments in the apparently divergent fields of clinical, social, and newsstand psychology had been costly for him, as though the places where he was examined had been uniformly alive with either highly contagious trauma or just plain old-fashioned germs. (54-5)

The Glass children have been objectified with great frequency and intensity, which has led to emotional and psychological damage. The scientific and media community treated them not as individuals but as specimens. Salinger’s objective is ultimately moralistic. If we treat people as mass-produced objects, they will act accordingly. If people dress and act and speak the same, they’ll eventually think the same, which is the death of moral judgment. As discussed earlier, the objective of Zen is first to achieve non-dualism and return to the dualistic world, but in Salinger’s countersystem there’s often no return.

Another facet of Salinger’s countersystem is his rejection of the scientific, the rational, the technocratic. In their place, he offers the human, the personal, the intuitive. These values are obviously correlative to Buddhism and eastern thought more generally, and they explain his

antipathy toward psychoanalysis and the adult world. Salinger has great respect for Freud and his theories, but he's suspicious of psychology in practice. Several of the Glasses have been through analysis, but the experience leaves them cold and practically victimized. The psychological community symbolizes the dehumanizing function of mass society. Salinger views psychoanalysis as a mediated or second-hand meditation and is wary of the psychologist who fails to recognize the spiritual nature of the process. Zooey claims that a truly good analyst would "have to believe that it was through the grace of God that he'd been inspired to study psychoanalysis in the first place (*Franny and Zooey* 108-09).

Childhood, innocence, idealism and sincerity—as opposed to “the hostile adult world” (Tae 21)—are defined as positive in Salinger's countersystem. *Catcher* is of course a monograph on the phoniness of adulthood. The Glass works, too, dwell in the notionally pure world of childhood; adults are shadowy figures lurking around the periphery while children take center stage. In “Roof Beam,” for instance, Buddy idealizes a (childishly) tiny old man who sits quietly and smiles while the other adults argue, gossip and complain. The old man is a deaf-mute—which Holden used to dream about pretending to be, because it would excuse him from participating in fatuous conversations—and sometimes “behaves like a fool, even an imbecile” (109). He represents childhood, idealism and purity.

In the modernist antisystem, innocence doesn't exist, and postmodern works are composed in the key of irony, but Salinger's countersystem embraces a non-ironic, optimistic worldview. Of course, many of his characters are unable or unwilling to go along with the program, so they turn to exile or suicide, which tells us that Salinger may have been idealistic but he wasn't naïve; the real world is often stronger than our ideals. Salinger's countersystem is caught between western individualism and eastern selflessness, escaping from society or becoming one with it.

Kerouac's countersystem exists within the tensions, never resolved, between East and West, society and self, asceticism and experience. He would rush frenetically across the country to devour as much life as possible, then rush back home to backpack in the woods, write in solitude, meditate, avoid human contact. He was quick to share communal apartments with Ginsberg, Burroughs and others, but he invariably tired of these arrangements and ran back home to *mémère*, his beloved French-Canadian mother. He dreamed of living in a small community surrounded by friends. In a 1951 letter to Cassady he discusses this: “I would also be completely befriended and need nothing; we'd live on the same street and meet in the dusty alley” (Charters 211). In this respect, his countersystem echoes the late-19th century utopian communities such as Brook Farm, Oneida and Amana; these enterprises were a retreat, from the sprawling industrial republic, to a more independent and agrarian age. Kerouac, too, sought a bucolic, mythopoeic, perhaps nonexistent America. He wanted to be Hawthorne sharing the workload at Brook Farm, but he also wanted to be Thoreau alone in his cabin. Kerouac may have wavered in his countersystem, but the point is that he didn't construct an antisystem; instead, he posited that peace and enlightenment, his positive values, could exist in the modern world.

Like Salinger, Kerouac was a student of Buddhism, but he followed the Mahayana tradition. *The Dharma Bums*, his most Buddhistic novel, follows the journey of Ray Smith, who wants

to break his inordinately strong attachments to the dualistic world. Smith spends his time meditating alone on a mountaintop. He's trying to achieve the non-dualistic state we discussed earlier, and he has the same difficulty as Salinger: how to bring this awareness back to the dualistic world. Eastern religious and philosophic systems tend to recognize no barrier between self and other, while in the West we see a distinction between the two. This may be why Salinger and Kerouac had trouble embodying their countersystems: the conflict between western upbringing and eastern ideas.

In Kerouac's countersystem, the world should be embraced joyously, despite the intrinsic pain and suffering, whereas the antisystems of modernism and postmodernism dwell on the world's imperfection. A well-known passage from *On the Road* exemplifies this:

The only people for me are the mad ones, the ones who are mad to live, mad to talk, mad to be saved, desirous of everything at once, the ones who never yawn or say a commonplace thing, but burn, burn, burn like fabulous yellow roman candles exploding like spiders against the stars... (9)

This is consistent with the life-affirming nature of Mahayana. According to Heinrich Zimmer, Mahayana Buddhism, a reaction to the earlier world-renouncing orthodoxies, teaches that everything in the physical world is sacred and should be embraced; we should take pleasure in, rather than reject, the physical world (508). Of course, this tenet only holds true to the extent that we take pleasure in things without becoming engrossed by them, without forgetting the spiritual nature of the physical world. The heroes of Kerouac's novels are never the main characters, who are plagued by insecurity and philosophical inconsistency; the hero is his best friend, who acts without thinking, who accepts everything equally, who is at peace in the world. Dean Moriarty, the frantic hero of *On the Road*, "digs everything." Japhy Ryder, the "Big Buddhist" of *The Dharma Bums*, is just as comfortable hiking and composing haiku as during nights of "free love lunacy" (30). Ray Smith, the main character, is tortured by this ostensible contradiction but, as Zimmer indicates, Ryder isn't sinning (the relevant Buddhist concept is ignorance, not sin): "The Buddhist idea of the progress to purity, self-detachment, and final enlightenment is based on a principle of basically moral watchfulness over one's feelings and propensities. Not the fact but the attitude toward it is the thing that counts" (255).

Kerouac never completely abandoned his parents' Catholicism. As he grew older, in fact, his attachment to tradition and the past became more acute. He strongly re-identified with Church myth and ritual. The young Kerouac, in life and art, was committed to experimentation and discovery. With age, however, rebellion lost its gravitational pull and Kerouac began to feel more attached to home, Mother, the town, patriotism. Though Kerouac and Salinger were instrumental in popularizing Buddhism and shaping the youthful rebellion against traditional values, both were strongly opposed to the counterculture. The older Kerouac even aligned himself with conservative politics, which pits him against virtually every modernist and postmodernist writer/text. This is perhaps the most pronounced element in his fictive countersystem.

IV. New Rugged Individualism

In the previous section, *On the Road's* Dean Moriarty was described as the novel's hero: what

could be more old-fashioned? You can't have a hero within the context of a meaningless or solipsistic world; you can't have a hero in the antisystems of modernism and postmodernism. Though Kerouac and Salinger did experiment with "modern" narrative technique, this was never more than formal innovation; from a substantive perspective, their work is retrograde. In the final analysis, they are not *modern* writers.

The hero is a prelapsarian figure from the premodern world, which is exactly where Kerouac and Salinger belong. They rebel against bourgeois values and practices, but they also rebel against the conventional rebellion. Whereas Holden Caulfield rants adolescently about "the system," Buddy Glass tries to construct a new system; whereas Vladimir and Estragon don't bother to move, in response to a God(ot)less world, Sal Paradise obsessively searches for enlightenment (I'm not expressing a moral or aesthetic preference for this countersystem orientation, but merely examining it).

Salinger and Kerouac served in the military and began publishing directly after World War II; they wrote during Korea and Vietnam, the King and Kennedy assassinations, the feminist and civil rights movements, the counterculture, the cold war and the atomic age. However, both writers manage, quite successfully, to avoid writing about these historical events. History is pushed aside, insofar as war, politics and social trends constitute History. This is an obvious sign that Salinger and Kerouac occupy a distinct conceptual space from their contemporaries. For the modernists, World War I was the shadow under which every line was composed. For the postmodernists, History was equally poignant and ubiquitous. The characters of DeLillo and Pynchon can't speak without reference to brand names and advertising slogans, without feeling the weight of rock lyrics forming trite platitudes in their mouths; they can't look up without seeing the arcing vector of a nuclear warhead.

For Salinger and Kerouac the self is a retreat from the fear, confusion and self-obfuscation of mass society. Redemption is portrayed as a self-effort system, an event that may happen in spite of society. Friends, family and community might help, but the individual is responsible for his own salvation, happiness, meaning. The work of Salinger and Kerouac (as well as Bukowski, Harry Crews, Douglas Coupland and others) occurred simultaneously with postmodernism but is not a part of that tradition; we can refer to this fictive strain as New Rugged Individualism.

The new rugged individualist is a premodern character in a postmodern society. He has more in common with Huck Finn, Hester Prynne and Captain Ahab than with Camus's stranger or Dostoevsky's underground man. Twain didn't shoehorn the story of Huck Finn into a novel about the Civil War. Instead he focused on Huck and his struggle to define himself in a world of moral uncertainty, against a world hostile to individuality, in a nation struggling to rebuild itself in the fallout of politics, war, social upheaval. The tone is light, but the mode is tragic. Salinger and Kerouac are doing precisely the same thing, in response to a social system that was working through a similar identity-crisis. The new rugged individualist knows the world is chaotic, but his response is not irony, nihilism or despair. The text may be playful, experimental and darkly humorous, but it's not steeped in paranoia, pastiche, technoculture, hyperreality or temporal distortion. Most tellingly, the world is not perceived, in this tradition, as an assembly line of thoughts, behaviors and moral (anti-)choices; or rather it is,

but the individual self is allowed to escape from and prevail over the simulations and simulacra of mass society. The new rugged individualist makes his own moral decisions; he doesn't refuse to move or act; the cogs of mass society do not choose for him; admen don't write his lines; he pulls himself up by his own bootstraps and resolves the problems of modernity as best he can; he is a self rather than a blurry xerox of a self.

It's important to remember that, to Huck Finn, the world looked just as moribund as it did to Jake Barnes and Tyrone Slothrop. Modernity didn't invent the abyss. Literary movements aren't created so much as recycled. Salinger and Kerouac embody a return to the classic themes, characters and conflicts of American literature. Alan Bilton addresses this return:

...the longing to escape an overly complex and materially corrupt civilisation, to "light out of the territories" and thereby rescue a sense of selfhood amongst the solitude of Nature—is, in a sense, *the* great American theme; indeed, the essential origin-myth of America itself. (220)

This passage perfectly encapsulates the new rugged individualism. Huck's countersystem involved physical escape from his society but, more importantly, a moral and spiritual escape. Hester also rebelled against the socio-religious values of her society. The heroes of Salinger and Kerouac are equally defiant and individualistic as they rebut the arguments of modernity and cross-examine every available witness.

Note

1 The "radical new" ideas of science, philosophy and literature are, in almost every instance, a gradual evolution rather than an instantaneous reinvention. Examples: Lawrence Sterne's postmodernism; Lady Murasaki Shikibu's psychological realism, which predates the European equivalent by 900 years; Darwin's theory of evolution, an idea originally formulated in the 6th century BCE by the Greek philosopher Anaximander.

West Runs Over East: Belief, Confrontation and Globalization in Taiwanese Nativist Fiction

Pao Chai Chiang and J. B. Rollins
National Chung Cheng University, Taiwan

The ongoing process of globalization and its implications is a major theme of Taiwanese Nativist fiction, particularly in the work of Huang Chun-ming(黃春明), "widely recognized as the best Nativist writer" and over the past twenty or so years "elevated to the status of a Nativist cultural hero" (Sung-shen Yvonne Chang 153). His fame on the island has reached such a point that he was recently (2010) honored with the 29th Culture Award by the Taiwanese Executive Yuan. Such distinction comes for his role in not merely preserving his people's collective memory but also for focusing so clearly on something akin to what Fredric Jameson discusses in his comments on the rise of the postmodern as in part a result of "some radical break or coupure, generally traced back [in the West] to the end of the 1950s or the early 1960s." For Huang, this "break" can be traced to the emergence of the big Taiwanese cities in the 1970's, leading to a distinctly modern urban lifestyle sharply different from that of the traditional Taiwanese village and countryside.

To dramatize this break, Huang developed a highly effective use of Taiwanese vernacular and other details of traditional everyday life in stories focused on confrontation between East and West, city and country, local and global culture in the post World War II era. Such writing appeals to the growing sense of cultural loss and the realization that once gone, precious cultural values and beliefs can never be fully regained. Nothing could explain this "break" more clearly than "The Drowning of an Old Cat"¹ in which Huang dramatizes the cultural break the elder inhabitants of Clear Spring Village must suffer as a result of modern collaboration between business and government regardless of local custom and belief. At first these older villagers are sublimely confident of the inviolability of their way of life based on the blessing of a "pure and simple" flow of spring water that feeds the surrounding land tilled by local farmers. The spring has been revered for countless generations as "the source of the people's pure and simple nature" (13), but when some city-dwellers discover the spring as ideal for recreational swimming, the rage for modernization and capitalistic greed lead inexorably to government subsidized construction of a swimming pool at the spring. For the older generation, any hole dug in or around the spring would destroy the land's fongshui. But their voices are ignored, and the old life in that small part of Taiwan is destroyed forever, dramatized in the suicide-drowning, fittingly in the new pool itself, of Uncle Ah-sheng who simply cannot live the new life.

"The Drowning of an Old Cat" demonstrates Huang's understanding that traditional societies have been historically self-sustaining by ensuring the inheritance of ancestral values. Highly conservative, local, stable societies their inhabitants are bonded to a particular geographical

1 As translated by Howard Goldblatt in *The Taste of Apples*. New York: Columbia U P, 2001.

territory essential to the formation of their identity. Their languages and other customs rise out of that land just as indigenous flora and fauna do. Everyone knows precisely what to do, how to act, and behaves accordingly, never having to confront an unfamiliar face. The life of these old societies creates a wholeness, a firmness that modern life cannot while urbanization destroys stability and wholeness. Walter Benjamin famously likened modern progress to a violent storm: the "Angel of History" turns his face "towards the past. Where we see the appearance of a chain of events, he sees one single catastrophe, which unceasingly piles rubble on top of rubble and hurls it before his feet. He would like to . . . piece together what has been smashed. But a storm is blowing from Paradise, it has caught itself up in his wings and so [sic] strong that the Angel can no longer close them. The storm drives him irresistibly into the future, to which his back is turned, while the rubble-heap before him grows sky-high. That which we call progress, is this storm" (quoted in Dencik).

We especially see such cultural devastation in the effects of technology that makes the daily affairs of living easier but in the process profoundly changes people's everyday lives, sometimes more for the worse than the better. Focusing more specifically on such technology, "The Gong" follows "the only remaining practitioner of the unique profession of gong beating" (55) as Han Qinzai finds himself and his brass gong replaced by a three-wheeled, loudspeaker-equipped vehicle. The jobless Han Qinzai therefore spends more and more of his time with a group of young men best described as "hangers-on" associated with the local funeral industry. They have no fixed jobs but merely "help out" whenever there's a local funeral. As it becomes known in the community that Han-Qinzai has become part of this group, however, his social prestige, which was relatively high when he was a gong beater, begins to seriously suffer. As nobody dies for quite a long time there is no work for his new associates, so Han-Qinzai reminds them of the traditional superstition that, when no one dies and the coffin sellers are about to become bankrupt, if someone strikes a coffin with a broom handle three times there will be a death. Accordingly, he performs this coffin-striking ceremony thinking his friends will thank him for it, but then he feels guilty: "*Ai! I hope I haven't killed anybody, and I wish I hadn't done that stupid thing.*" The feeling that his heart was bobbing around in a deep, dark abyss would not go away" (84). People who live in such a society and time cannot forget their conscience. This is Huang's memory of the old Taiwanese society, yet it is also the collective memory of villagers who remain untouched by modern degradation. Such collective memory lives on through story telling as it travels through a culture to the individual human heart.

An especially effective technique that Huang uses to express his fear of the negative effects of modernization and globalization on traditional Taiwanese culture is the foregrounding of local beliefs of country folk within a context of misunderstanding, loss and denial in these folks' interactions with urban "foreigners" from Taipei or other urban areas of Taiwan as well as the West. These interactions are often presented through a contrapuntal narrative strategy using multilingual dialogue and cultural confrontation in which the older generation/rural/local/Taiwanese must inevitably make way for the younger generation/urban/global/Mandarin. Between the lines of these narratives there also often lurk clear ideological messages, sometimes even political satire.

"During the early 1970's," Fangming Chen explains, "the political premise that the Nationalist government 'represents China' came under unprecedented attack in international circles, and, as a result, the colonial system in Taiwan, which had previously stood tall, also began to crumble. At this juncture, when the entire system of dominance was beginning to fall apart, Taiwanese authors began to use the political fissures to articulate their concern for the territory of Taiwan"

(37). Chen's statement, however, accounts only for changes in Chinese (as embodied in the KMT) colonial dominance without taking into consideration the increasingly looming dominance of America and the West. As David Der wei Wang and Carlos Rojas have put it, Huang, along with other new Taiwanese writers of the 1970's who were trying to establish a "nativist aesthetic" for their work, "used realist description and rural subject matter to advance veiled critiques of Nationalist politics and of a hegemonizing Western culture" (91).

"The Taste of Apples," the title story in Huang's 2001 English-language collection, uses a highly effective dialectical narrative strategy to dramatize Huang's Nativist concerns. The story features characters from differing cultural and linguistic backgrounds who talk past each other incomprehensively in conversations embodying conflicts too subtle to be fully understood by those most caught up within them and yet so pervasive and profound that the lives of the Taiwanese central characters are changed forever. The inevitable result of the cultural confrontation is that characters whose lives have heretofore been dominated by traditional Taiwanese values and beliefs find themselves and their lives permanently altered as essentials of their native culture are diluted, or even entirely replaced, by modern Western values and beliefs as a result of changing physical conditions.

The story opens with a violent confrontation between an automobile and a bicycle when construction worker Ah-fa is badly injured in an accident at an intersection leading from the suburbs to Taipei City. The ferocity of the collision, and what the reader soon discovers to be that of the cultural confrontation about to take place for Ah-fa and his family, is made shockingly clear in the story's second sentence: "A dark green sedan with a foreigner's license plate crashed into a rickety old bicycle like a wild animal pouncing on its prey, crushing it on the other side of the yellow dividing line of the two-lane highway" (135). Thus Huang loses little time in providing his readers with symbols central to the story's dialectical opposition of local and foreign, country and city, poor and rich, weak and powerful, old and new from which only one side can emerge fully intact. The force of the collision breaks both Ah-fa's legs, forcing him to undergo surgery. Because he is his family's principal bread-winner, the possibility that he may not be able to work as before creates consternation in his dependents as well as himself. However, wishing to compensate the family for its loss, Colonel Grant, the American whose car hit Ah-fa, offers NT 20,000 dollars and more to come, a fortune to the heretofore impoverished family, along with other forms of material aid, ironically raising the family's standard of living beyond anything they could ever have expected.

As a common laborer before the accident, Ah-fa made just enough money to cover his family's basic needs. Accordingly, when she hears of the accident, Ah-fa's wife, Ah-gui, who has been desperately struggling to make a decent life for her family in foresees a bleak future of miserable penury. Ironically, to the Taiwanese reader, her name refers to the laurel, a highly esteemed flowering tree suggesting upper-class status even as Ah-gui's social and economic situation seems to be deteriorating by the minute. The elder daughter, Ah-zhu, whose name means "pearl" while her life is dominated by household chores and caring for her younger sister and brother, imagines herself being sold in order to pay the family's debts. Given the Taiwanese significance of Ah-fa's name, so popular among Taiwanese for its ability to express the hopes of the named individual's parents' for good luck and prosperity, the family's situation seems even more cruelly ironic until they find themselves at an American hospital where Ah-fa is undergoing treatment and where Ah-gui and Ah-zhu's fears, at least in purely material terms, begin to dissipate.

The importance and delicacy of Huang's focus on language becomes apparent early in the story. In the third section, appropriately entitled "The Labyrinth,"² A young foreign affairs policeman acts as guide for the American colonel whose car injured Ah-fa while he searches for the family in the illegal "squatter's district" (139) on the outskirts of Taipei. The policeman's job is to act as intermediary between the American and the Taiwanese, but he is poorly prepared for such duty culturally and emotionally as well as linguistically. Finding themselves "meandering through a labyrinth" (136), the policeman wonders if the American is "questioning his qualifications. He was stung by the injustice of it all," he, trained only to deal with local incidents involving foreigners (read "not involving native Taiwanese") now "in the position of having to find his way through all this confusion" (136). To alleviate his sense of shame, the policeman lies that new accommodations for the inhabitants of the slum "are nearly completed," that once the inhabitants are moved out, a "high-rise" will replace the tin shacks. The American's habitual response, "mm-hm," is "pregnant with ambiguities and dubious connotations" (137) so that the policeman finds himself more concerned with determining the American's true thoughts than with finding Ah-fa's house. Although his English is quite good, he does not possess the special linguistic knowledge such American expressions require for full comprehension. When he and Colonel Grant finally find someone to ask for directions, she turns out to be mute. The American's reaction to finding such a child in such a place introduces the religious issue for the first time as he intones "a muffled 'Oh, my God!'" (137), but perhaps even more importantly it provides an answer to Gayatri Spivak's famous question: "Can the Subaltern Speak?" The answer in this case being, "No, she literally cannot." "The Other," for the American Colonel, is in this instance Ah-fa's younger daughter, who could hardly be more subaltern in the social context of the story given her identity as a mute female Taiwanese minor, an embodiment of Spivak's "silent, silenced center" (25). If Huang means to dramatize something akin to what Benita Parry has described as "Spivak's decree that imperialism's linguistic aggression obliterates the inscription of a native self" (39), he could hardly have chosen a more effective human signifier.

Shifting our focus back to the American Colonel, we can interpret his invocation of God, as does Chang, as an ironic reference to the Colonels' "first-world humanitarianism" leading to an "altruistic attempt to help the family" (158). Of course his "help," as we will see, perhaps even more than the instigating accident, has the effect of breaking up the family when the the mute daughter is sent off to America to a special school for the handicapped. The most important function of this "Labyrinth" section of the story, then, is to emphasize that communication between men of power and those unfortunate enough to be relegated to the illegal squatter's district, where in effect they do not officially exist, is very nearly impossible because of cultural and linguistic barriers.

As the story continues we come to realize that the policeman's first language is Mandarin, his second is apparently English, and his third is a slap-dash Taiwanese capable of little beyond the most basic communications. Thus this tandem of foreign affairs policeman and American military man becomes an embodiment of the demarcation in power relations among languages in Taiwan after World War II with English at the top and Taiwanese at the very distant bottom.³ The policeman means well, but when he and the American finally find Ah-gui, who knows

2 Sung-sheng Yvonne Chang writes of Huang's "ingenious use of section subtitles to convey sarcasm. The interplay of such subtitles with the content of a story gives his works an extra thematic dimension" (66).

3 This realization is reinforced in the "Civics Class" section in which Ah-fa's son, Ah-ji, is being taught in Mandarin rather than Taiwanese.

neither Mandarin nor English, his efforts to calm her do more harm than good because his Taiwanese is so poor. Thus it is the Catholic nun at the American hospital who comes to the rescue with her excellent command of the local language. Ironically, a woman who bears no racial or ethnic similarity to Ah-fa's family communicates with them much more effectively than a policeman of their own race and nationality. How comical! And yet how disconcerting. The family finds itself even more culturally disoriented by this linguistic disconnect than by the mystifyingly modern American hospital surrounding them. They are accustomed to people talking the way they look, a linguistic stereotype upon which every traditional culture builds its ethnic-linguistic edifice.

As the story continues, Huang adds increasing levels of dialectical confrontation, confusion and surprise. Underlying those concerned with language is what Howard Goldblatt in his "Translator's Note" terms "the language gap among people in Taiwan" (x). He also points out that most rural Taiwanese of the time lacked education and spoke only "their native Taiwanese dialect" (ix). We may add that, although Taiwan may be seen as an emerging polyglossic or polydialectal society, it is so in a very different sense from what Ashcroft, Williams and Tiffin describe in *The Empire Writes Back* as a community "where a multitude of dialects interweave to form a generally comprehensible linguistic continuum" (39). Much of the power of Taiwanese Nativist literature resides in the fact that the island's dialects, especially if we include Hakka and any number of local aboriginal tongues, and certainly in situations like that described in Huang's story, have not hybridized to become generally comprehensible.

Such a linguistic situation, in which the foreign affairs policeman can hardly communicate with the locals in their sole language exemplifies the political reality that Taiwanese culture, after fifty years of Japanese colonization followed by the domination of the Chinese republicans who fled the Mainland before the Communist onslaught and established their base of operations in Taipei, is weak to the point of being almost entirely ignored. The policeman has achieved his status by learning Mandarin and English--considered educated languages--while learning just enough Taiwanese to get along in those distasteful situations in which he finds himself confronted with such backward people as Ah-fa and his wife. This weakness of the local traditional culture is a result of the geopolitical situation confronting Taiwan. Under Japanese colonial domination, Taiwan had seen Japanese displace both Mandarin and Taiwanese as the language of power. The island had then been transferred by treaty after the Japanese defeat in World War II to the Republic of China, which installed Mandarin as the language of power. The ultimate geopolitical power in the transfer, however, was the United States whose military acted as guarantor. Thus the supremacy of English as embodied in the American Colonel whose automobile and money are the chief instruments of Ah-fa's transformation from poverty-stricken laborer to ward of the American military. In essence, then, the story dramatizes the pecking-order of linguistic-cultural-political reality in post-war Taiwan: America and English at the top, the republican Chinese and Mandarin in the middle, the Taiwanese and their local dialect at the bottom.

The scene in which this political-economic-cultural order is most apparent is that in the section "Blessed are the Believers" in which Ah-fa, unable to understand the policeman's Mandarin explanation that the Colonel was taking responsibility for the accident but nevertheless realizing it must have been Colonel Grant's car that hit him, declares accusingly in Taiwanese: "Aha! So it was you. . . . I pulled over to let you pass--I never thought you'd come right at me. Aiya! When you smashed into me, you also smashed my family to pieces" (153). The Colonel, mystified by Ah-fa's Taiwanese, seeks the policeman's help, but that young man has

himself been unable to follow, so again it is the Catholic nun who translates and from that point on acts as intermediary between the Colonel and Ah-fa. Thus the policeman becomes a mere spectator, and the Americans take complete control as the Colonel tells Ah-fa how everything will work. Not only will he make sure Ah-fa and his family do not suffer financially, but he will send their mute daughter to "a special school in the United States" (153). Ah-fa's reaction, intensified by an envelope containing twenty thousand NT dollars, is "the uneasy feeling that they'd [he and his family] done something wrong and offended someone" (154). The tables have been turned: the victim has become guilty of the crime.

At this juncture we should point out that Ah-fa and Ah-gui can be read as representatives of the pre-colonial linguistic stage in the history of twentieth-century Taiwanese globalization under American geopolitical economic/military domination because Taiwanese is their only language. Their children, on the other hand, represent the first generation of Taiwanese being educated under the KMT language policy explicitly forbidding instruction in any of the island's native languages while requiring a high level of competence in Mandarin. For Nativist writers such as Huang, this policy was a naked attempt to destroy Taiwanese culture, consciousness, and identity. Ah-fa's mute daughter thus takes on special significance as a living symbol of the voicelessness and resulting loss of subjectivity and identity of Taiwanese. Because she'll be sent to America, she'll presumably learn to read and write English to the exclusion of even Mandarin, much less Taiwanese, a language with no "native" reading/writing system.⁴ She will literally have no Taiwanese voice at all no matter how well she learns to read and write. We can also assume that her "special school" will teach her to be culturally American, certainly not Taiwanese, and very likely not Chinese, either.

Even so, Huang has not completed his irony. The foreign affairs policeman, continually concerned with losing face before the American Colonel, finds a way to reinsert himself into the action by attempting to lecture Ah-fa on his good fortune: "This has been a stroke of good luck for you, . . . being run down by an American's car" (154). Ah-fa's reaction, "through tears of emotion," is "Thank you! Thank you! I'm sorry, I'm so sorry. . ." (154). He has achieved material well-being not by selling his soul but by being sold in effect by his own government for the sake of the geopolitical security and "modernization," "globalization" offered by America. And yet he still must apologize, taking the lowest position not only socially but spiritually. None of the situation in which he finds himself has come about as a result of Ah-fa's desires or will but rather as an inevitable outcome of being caught up in the machinations of overwhelmingly powerful forces over which he, and traditional Taiwanese culture, has no control. As Chang puts it, Ah-fa has lost his "self-respect as a result of overpowering external conditions--the American and Japanese imperialist presence. . ." (157). We can link this loss of pride to loss of identity and subjectivity. Chang interprets "The Taste of Apples" as one of Huang's "later stories" in which "the poor are no longer able to sustain their pride," and in which the writer shifts focus "from the individual to the environment, to the collective fate of the group as united by class or nation" (157). Thus the American Colonel becomes the family god, displacing Ah-fa as breadwinner and protector. The American hospital becomes a heaven, its whiteness in Ah-fa's mind transformed from the traditional Chinese/Taiwanese connection with death to a symbol of American materialist purity and sterility.

The importance of religion and the pressures being applied to the traditional systems of belief according to which Ah-fa and his family have lived until the accident become increasingly

4 See Victor H. Mair. "How to Forget Your Mother Tongue and Remember Your National Language."

pervasive as the tale develops. Redemption for Ah-fa and his family in their seemingly impossible material situation comes through the intermediary of the Catholic Church, the modern hospital it has built and the Taiwanese-speaking nun from the West. The secular power represented by the Taiwanese policeman and the American military are certainly important, but it is the Church that renders essential communication possible between the American Colonel and Ah-fa and his wife. This religious theme is developed even further by the explicit linking, in the final sentence of the story, of "temptation" with the apples brought to the hospital for Ah-fa's family. Huang seems to want his readers to associate the apples to the fruit of the Tree of the Knowledge of Good and Evil in The Garden of Eden.⁵ Tempted by the fruit, Eve eats of it, and her eyes are opened to a new world as are Ah-fa's and those of his family by their experience after the accident. Their apparent good fortune, like Eve's knowledge, however, comes at an impossibly high price--their Taiwanese subjectivity and identity as embodied in their heretofore simple, traditional Taiwanese life. Nothing for them will ever be the same. Ah-fa loses his traditional position as his family god, his identity, as provider and protector for his family, an effacement symbolic of Taiwan's loss of sovereignty to American economic, political, and military power.

In the end, then, Ah-fa's name proves prophetic, if in a most ironical manner. He comes to see himself in a new light, as a man of leisure. His wife finds him far more attractive than ever before, thinking, "*Today he really looks like a human being*" (154) and stops criticizing him for insisting on moving north to try their luck. We can read her new emerging relationship with her husband as a loss of love and respect for him as a Taiwanese. Thus she represents a critical stage in the transformation of the colonized as they learn to devalue their native cultural heritage. Ah-fa's construction worker colleagues, taken to the hospital by the colonel for a visit, joke about his new, lucky life while they themselves must continue "working like animals" (155).

And so Ah-fa and his family enter their new life by struggling to learn how to eat the apples provided by the colonel, each worth four catties of rice. The beauty and expense of the apples, however, does not hide the reality of their being not "quite as sweet as they [the family] had imagined; rather, they were a little sour and pulpy . . . and not quite real" (156). For Chang, these "precise symbolic implications of the apple" suggest "Taiwanese people's feelings about American aid in the postwar years," therefore conveying a much clearer ideological message than anything in Huang's earlier stories, which tended to be more "mysterious," full of "richly suggestive images" but relatively unresponsive to "reasonable analysis" (158). Ah-fa himself, as he quietly muses over his situation in "The White House," Chang concludes, suffers from an "ineffable, . . . existentialist fear of loss of identity" (156). He literally doesn't know who he is anymore.

Thus we see the thematic importance and technical use of the ongoing process of globalization and its implications in late 20th-century Taiwan in the stories of Huang Chun-ming. By so masterfully developing his dialectical narrative technique to dramatize how the older generation of rural/local/Taiwanese must inevitably make way for the younger generation of urban/global/Mandarin/English, he has firmly established himself as perhaps the island's foremost Nativist author. His use of Taiwanese vernacular in dialogue, his careful delineation of the details of everyday life as well as his loving, though resigned, depiction of a passing

5 *Genesis* does not identify the fruit of the Tree of the Knowledge of Good and Evil as an apple, but popular belief among many Christians holds that it is.

generations' most cherished beliefs fading before the overwhelming onslaught of Mainland Chinese and globalizing Western culture have reserved him an enduring place in the pantheon of Taiwan's most revered and beloved contemporary writers. His fears that the old Taiwan, with all of its unique local dialects and beliefs, will slide inexorably into oblivion by the end of the present century may turn out to have been well-founded, but his works, much like those of Mark Twain for the old American Southwest or those of Honore de Balzac for the now defunct alleyways of early 19th-century Paris, will forever remain an invaluable repository of local social and cultural history for those who hope to understand and appreciate the human history of their local ancestors.

Human Sustainability in the Face of Incidents of Mass Violence: The Psychological Dynamics and Effects on Trauma on Emergency Response Interventions

by

Patricia Levy, PhD, Fort Hays State University

Introduction

When a traumatic event occurs that is out of our control and through which we become impacted by others' violent intentions and actions, survivors may spend much time making attempts to recover their balance along with recovering a sense of well being. At the same time, they may also be grieving and feeling overwhelmed by their losses. This is what fear and terror can do to people.

This paper will present a theoretical framework from which to understand the aims of terror. For example, the psychological and cultural dynamics of terrorism will be discussed, with a particular focus on "holy terror." By understanding the intended psychological and social outcomes of terror attacks, emergency responders may be better able to prepare and put into operation strategies for successful and effective responder interventions towards the aim of amelioration of immediate survivor traumatic reactions when facing and enduring incidents of mass.

A Socially Constructed and Hermeneutic View of Sustainability

Social systems theory speaks to the importance of the dynamics and function of interactions between the relationships of people to the social, physical, and political contexts in which they live. In addition, cultural adaptation can be seen as creating the definitions and parameters of social functioning on micro, mezzo, and macro levels. As Cushman (1995) has stated, we must find a "way of conceiving of the self and of arranging ourselves socially and politically" (p.3).

In further explanation, the process of configuration of self can be the result of an engagement and interaction within unique cultural frameworks that configure our sense of moral understandings experienced within the politics of a local society. Thus, through everyday living, people repetitively experience the contexts of their individual environments whether they are family, neighborhood, school, and community. Consequently, expected behavioral patterns become created through prescribed and accepted understandings of societal values that are acted upon through a framework of agreed upon social beliefs and ethics. These form the foundation for the manner in which commitment and conduct to oneself, to others, to one's community, to one's country, and to one's place in history are bound. In the process, people while being socially constructed on the one hand by their social environments are at the same time involved in an activity of reconstructing their own present realities.

Thus, Cooley's concept of the "looking-glass self" can play out as a self internalization that "I am how others think that I am" (Cooley as cited in Norlin & Chess, 1997, p. 197). In addition, "language, symbols, moral understandings, rituals, rules, institutional arrangements of power and privilege, origin myths and explanatory stories" (Cushman, 1995, 16) reflect the functional

coverings through which communities operate and assign definitions of social meaningfulness to their activities.

While social systems theory tracks the input, output, and conversion of people's daily operations in interchange with social ecological environments (Chess & Norlin, 1997), the impact of cultural factors do not seem to have been taken into consideration. The role of traditions and customs can symbolize citizens' sense of people hood and destiny. Thus, sociopolitical contexts of nationality provide symbols of identification and worldview perceptions containing a volume of historical transcendent religious beliefs and commitment to spiritual destiny. In contrast, the social roles of victims and those deemed to be of less equality are also posited within established societal values. Therefore, how power is perceived and the tools employed to convey its authority, and how deviancy to particular moral truths are socially digested and incorporated may often contain a range of positive and negative racial stereotypes and gender imperatives.

Martin Heidegger and Hans-George Gadamer's hermeneutic, interpretive view reminds us that "a particular culture is created by the components of its conceptual systems" that can be passed down between generations through a "clearing" (as cited in Cushman, 1995, 20). This concept provides a way of seeing and experiencing the world. A person only knows what he or she knows. A person cannot know what he or she does not know. The ramifications of this view are that people cannot see past their own vision of what is and consequently, may experience difficulty in attempting to adjust to what lies outside of the borders of their own observations and encounters. As Cushman has pointed out (1995) cultural societies have their own significant and characteristic way of projecting their particular perception of what is true and sustainable in the world. In an extreme form, this "clearing" can become one that conceives of, legitimizes, and has the ability to rationalize acts of war and acts of terrorism. Such a worldview may have one major goal; that is in an outcome of death, personal injury, and environmental destruction to others.

From a functionalist perspective, social systems are comprised of parts whose effectiveness of function serves the overall purpose of an entire system. In democratic sociopolitical systems, these elements are contained within humanistic principles that emphasize individual creativity, uniqueness, and growth. As a primary requirement for successful operation of an open system, a network of flexible boundaries need to be in place for an exchange of inputs and outputs that enable a fluid conversion process within and between micro, mezzo, and macro levels. Central to this process are the enactment of social controls based on individual choice and human "behavior that is directed towards certain goals of self-realization" (LaPoint, 1998, p. 196).

The Moral and Psychological Dynamics of Terrorism: Values and Definitions

Terrorism and terror are defined here in two ways: on the one hand, "...as a strategy of violence designed to promote desired outcomes by instilling fear in the public at large" (Bandura, 1998, p. 162), and on the other, as "the revival of terrorist activities to support religious purposes in theological terms, a phenomenon that might be called 'holy' or 'sacred' terror (Rapoport, 1998, p. 1093). The former definition speaks to the psychological effects and impact of terrorism on its victims. The latter speaks to the issue of terrorism driven by religious rhetoric and for the spoken motivational legitimacy that, for example, produced the 9/22 attack on the United States by Osama Bin Laden.

From a social constructionist perspective, as Kushner (1989) states:

“Religion is first and foremost a way of seeing. It cannot change the facts about the world we live in, but it can change the way we see those facts, and that in itself can often make a real difference” (p. 21).

However, terrorist ideologies derived from a “messianic” and “apocalyptic genre,” propose that followers maintain their conviction that they are the “only ‘enlightened’ people” who have a duty to “liberate the blind people of this world from the rule of the unjust” (Amon, 1982, p.69) through the use of terror. An extreme interpretation of Islam has been a given central role in providing a source of social sanction for perpetrators of terror. As such, a terrorist may give him or herself self-sanction to psychologically disengage from non-believers who have been targeted for acts of terror (Bandura, 1998).

Earlier in this paper, it was stated that people are culturally constructed by their social reality through which they reconstruct their behaviors. One example is Ayman Al Zuwahri, a Bin Laden’s advisor. As a young man from a known and respected family of privilege, he joined a revolutionary group called *Al-Jihad*, “The Islamic Group of Egypt.” This group was associated with the President Anwar Sadat’s assassination in 1981 (Rapoport, 1998). During his resulting imprisonment, Zuwahri became a major spokesman for the group. He was deported and continued his terrorist activities outside of Egypt, eventually joining up with Bin Laden.

Al-Jihad’s leader in Egypt was Abd Al-Salam Faraj. The Egyptian government later executed him but not before he had written a manifesto called “The Neglected Duty” which interpreted the *QU’an* as encouraging *jihad* or holy war against non-Muslim communities (Rapoport, 1998). Faraj strategically advocated that “successful assassinations depend on infiltrating the apostate’s retinue and pretending to join his forces, even if this means publicly denying one’s one commitment as a believer.” Further that “one should, if possible – and this is quite important) – “humiliate the victim.” (114). Stark images of airline passengers who were encouraged to call their families, suffered at the hands of the terrorists who took control of their flights is one example.

Bandura (1998) states that groups that claim to be responsible for their terrorist acts, that their aim is to radicalize the masses, thus diverting focus from the carnage that they have inflicted on their victims. Self-sanction by terrorists to commit acts of terror become morally distorted in justifying terrorism as socially acceptable in light of their acts being performed “in the service of moral purposes” (Bandura, 1998, 163). Viewing the killing of humans as objects allows for the psychological “disengagement” of the perpetrator from his or her act of obedience. This approach allows for psychological disconnection of responsibility from the consequences. In the terrorist’s mind, the victims have brought their death on themselves.

One asks if this behavior can be explained as a mental illness? Prior research studies carried out with members of German and Italian terror groups have shown that the proportion of terrorists who are mentally ill is not likely (Reich, 1998). In fact, the use of language such as “hatred,” “revulsion,” and revenge” have described motivation to perform terror acts. In other words, as Bandura (1998) has pointed out, “one person’s victim is another person’s victimizer” (p. 184) and one person’s terrorist may culturally be emulated to be another person’s freedom fighter according to an interpretation of the *Qu’an* by Faraj.

Not only does cultural determination according to social constructionist theory play a large part in understanding the makings of a terrorist but it also defines what are considered “civilized” and oral behaviors. In the Western world, the value of individual life as expressed through social justice systems is one to be held as of the utmost importance. In addition, terrorism disallows for the use of a peaceful means of intervention as an act of resolution. Emergency managers and emergency responders alike must take steps to understand the dynamics of terror, to intervene at the appropriate and critical time of crisis, and to advocate for social justice against environments, conditions, and groups that produce terrorism.

The Psychology Behind Terror

In order to understand the means by which terrorists aim to impact their victims on an individual, community and societal level, professional emergency personnel need to be aware of four main immediate outcomes of a mass violence attack. In 1998, Bandura produced a list of potential aspects of terrorist intimidations (1998, p. 167). These were:

1. “The unpredictability of terrorist acts.” This aspect emphasizes the use of surprise while the targeting of innocent civilians promotes and intensifies feelings of vulnerability and fear.
2. “The gravity of the consequences.” The aim of terrorist attacks is to “maim and kill” as many victims as possible.
3. “The sense of uncontrollability that they [terrorist acts] instill.” Feelings of powerlessness and helplessness contributes to a rising level of fear that the general public experiences. Bandura reminds us that “The combination of unpredictability, gravity, and perceived self-inefficacy is especially intimidating and socially constraining” (1998, p. 168) The American public may have strong feelings of control over domestic incidents of violence and the possible risks involved when driving their cars.
4. “The high centralization and interdependency of essential service systems in modern-day life.” After the September 11th attack, as the number of people willing to fly initially lessened, the airline industry suffered large financial losses while numerous connected industries also, as a consequence, laid off vast numbers of workers. The concurrent anthrax scare pointed out the vulnerability of the national postal service, its employees, and of any American having the potential receive infected mail.

Those having lost loved ones, friends, and associates who died or were maimed from terrorist attacks have suffered the greatest losses and may experience longer-lasting psychological, social, and emotional effects of all. Emergency responders including professional social workers, firemen, and police are often the first-line of response to terrorist incidents and their victims.

Survivors and Psychological First Aid

Trauma has been defined as “...an external event causing a severe psychical upheaval with lasting consequences” (Balint, 1969, p.429). The dynamics of this phenomenon can impact not only the internal state of the affected individual but also can produce a ripple effect on the micro, mezzo, and macro levels that may intersect with the trauma at the same time. During that

process, the steady state or “well-being” of those relationships and the ecological environment that contextually supports them also become temporarily unsteady at the point of initial contact.

Survivors needing help often exhibit Acute Stress Reaction (ACR), presenting a symptomatic range of behaviors including feelings of “confusion, fear, anger, guilt, lack of insight, and feelings of powerlessness” (Rackley, 1982, p. 94). This sense of internal disruption and an inability to activate normal coping methods to reduce stress may derive from an initial reaction of intensified emotional shock and physical suffering in the initial period following an attack (Tanelian & Jaycox, 2008). Shalev and Ursano (2008) have described this phenomenon in the following way as:

“A mismatch between situational demands, personal resources and survival mechanisms is one reason for failure (e.g., when withdrawal is used as survival mechanisms in a situation from which one can escape or vice versa when scarce resources are wasted in fighting against uncontrollable dimensions of a stress.” (p. 1)

In the immediate aftermath of a mass violence attack, survivors must seek some way to make immediate “sense out of chaos” (Antonovsky, 1987, p. xvii). Integrating this happening into a logical, conscious understanding requires conscious cognitive efforts at adaptation to sort through the psychological and emotional side effects of such an event. These may include intrusive images flashing through the mind accompanied by a kaleidoscope of feelings of sadness, helplessness, confusion, and fear of death.

Resiliency theories in overcoming threat and stress have varied in their approaches. Lazarus’ transactional model has emphasized levels of awareness dependent upon one’s “cognitive appraisal” (as cited in Ell and Northen, 1990, p. 8) of a situation and, at the same time, in connection with one’s own resources. Similarly, Druss (1995) has focused discussion on hardiness and displays of “courage” to face adversity such as dealing with a health crisis. Thus, individuals may facilitate an internal locus of control that allows them to respond with self-affirmative and effective decision-making strategies to produce positive coping mechanisms.

Concentrating on the details of methods of positive adaptation, Aaron Antonovsky (1987) created a descriptive model of coping by people in their efforts to assimilate critical life stressors. Broken down into three major interactive components, that of “Comprehensibility,” “Manageability,” and “Meaningfulness,” a “Sense of Coherence” or SOC construct is created measuring the degree to which successful coping can take place. Subjective internal perception is portrayed as a key concept in precipitating a behavioral response to the stressor. More specifically SOC is defined as:

“The sense of coherence is a global orientation that expresses the extent to which one has a pervasive, enduring though dynamic feeling of confidence that (1) the stimuli deriving from one’s internal and external environments in the course of living are structured, predictable, and explicable; (2) the resources are available to one to meet the demands posed by these stimuli; and (3) these demands are challenges that are worthy of investment and engagement.” (Antonovsky, 1987, p. 19)

The meaningfulness component energizes the other two components and is viewed as the most impactful and significant factor in the combination of elements. The higher the level of internalized sources of meaningfulness, the higher the levels of coping are. Thus the locus of control for the individual is formulated by attitudes from the past and the present comprised of particular values, beliefs and coping behaviors that serve as mediators of externally derived stimuli.

Emergency responders dealing with the immediate effects of trauma need to be knowledgeable of the manner in which critical stressors may be experienced by survivors suffering from acute stress reactions. In addition, family and friends seeking their loved ones may also exhibit symptoms of vicarious trauma in responding to and adapting to the stress produced by the crisis. Re-traumatized individuals expressing ongoing posttraumatic stress disorder symptoms may appear at emergency centers and hospitals with the occurrence of additional attacks.

Emergency management and response strategies need to take into account that signs of impact, recovery and rehabilitation in communities, families, and individuals may depend upon social constructions of prior interpersonal relational structures placed within cultural contexts of “socially-determined systems” (Durst, 1994, p. 32). Therefore, provision of uniquely adapted support interventions by professional emergency personnel need to demonstrate an understanding and acceptance of the diversity of the social structures of the impacted populations in a community that has experienced a terror attack.

Psychological First Aid

Research has shown that in comparison to natural disasters, the effects of a mass violence attack have been known to produce higher levels of psychological distress (Friedman, Ritchie, & Watson, 2006). This phenomenon may be due to the unpredictable nature of terrorist attacks on vulnerable innocent victims overwhelmed by feelings of helplessness. The inexplicability of being purposefully targeted can have devastating emotional and psychological impact, incapacitating people’s ability to draw upon normal coping abilities and coping resources (James & Gilliland, 2005). Anything can happen during a life-threatening incident of terrorism producing the likelihood of unexpected reactions.

Thus, the delivery of Psychological First Aid (PFA) intervention services performed by emergency responders becomes critical. PFA’s primary goal has been described as:

“...aiding the adaptive coping and problem-solving processes of survivors who appear at risk for being unable to regain sufficient functioning equilibrium on their own...” (Griffin, 2007, p. 138)

Consequently, the necessity to reduce a sense of threat for the survivors is of first priority. This task is met through the provision of a physical and emotional safe location for the rendering of emergency services (Griffin, 2007). Then, initially a strategy of defusion (Ritchie, Watson, & Friedman, 2006), is used to allow for the ventilation of victims’ thoughts, and feelings of disruption (Rackley, 1982). Shalev and Ursano (2008) have pointed out that survivors in an effort to make sense of their memories may often find it necessary to tell and retell their stories, subtly changing their narratives of their experiences of shock, horror, and fear that they have gone through. Therefore, a main goal of terror management is to aid survivors to undergo a

slowly evolving sense of control and a regaining of equilibrium through a process of reconfiguration of the events that they underwent. During this “rescue phase” (Shalev & Ursano, 2008, p.5), emergency responders attempt to facilitate a de-escalation of the traumatic effects on survivors of the acute stress reactions that they are experiencing.

Emergency responders will need to be aware of individual survivor styles of coping, personal worldview perspectives, and culturally appropriate modes of interpretive meanings assigned to the incidence of terror. Using a Sense of Coherence approach, supportive strategies to empower survivors will need to be focused upon. This will involve discussion regarding ways on how to make sense of unthinkable events, on how to employ coping mechanisms that will manage the short and possibly long term post traumatic effects such as depression and lack of concentration, and the assigned meanings that each person will attribute to his or her experience of what happened, and the manner in which the terror incident took place. Additionally, responders will be evaluating survivors to determine those who may be most at risk for long-term posttraumatic effects such as continuing episodes of dissociation and hyperarousal (Griffin, 2007) requiring possible hospitalization, medical treatment or continued sources of psychological support.

Members of the emergency team that are working with survivors may themselves require PFA interventions. Witnessing stressful horrific conditions during and following a terrorist attack may culminate in feelings of shock, burnout and overwhelming sadness. Provision of emotional and psychological support may also be rendered through the use of defusion techniques such as voluntary ventilation of what happened, where they were when it happened, and what personal and professional coping strategies were employed. By strengthening group cohesion, the overall psychological and emotional health of the team may be strengthened and made sustainable over time to meet the further demands of ongoing emerging conditions of the attack.

Conclusion

Mass violence terror attacks are continuing around the world. Hermeneutics proposes that the “horizon is always moving” (Cushman, 1995, p. 318). Through the reflections of Cooley’s “looking glass self” against the backdrop of terrorism’s psychological aims and the consequent traumatic effects on the survivor, emergency responders’ interventions have been shown to be grounded in the rubble of incidents of mass violence activity, fear, and social constructions of religious distortion and fanaticism. However, even when faced with the human costs of terror, emergency responders trained in rendering psychological first aid interventions may aid survivors to overcome the obstacles they are facing while building paths to increased resiliency and renewed hope to carry on with their lives.

Discussion paper

Sustainability: What Should *We* Do?

H.N.M. (Rick) Hölsgens

Introduction

‘There is little doubt about the prominence of the term “sustainable development” in contemporary debates about environmental and resources policy specifically and development policy more generally. Indeed, if anything the term itself has suffered from overuse alternatively as a panacea for all modern ills or as a meaningless catch-all theme to which all policy challenges (no matter of what complexion) are somehow inextricably linked. Nor is there consensus about what sustainable development is, (...)’ (Atkinson, Dietz and Neumayer, 2007, p. xiii).

‘There is consensus that there is no consensus on the meaning of the term “Sustainability”.’
(Eichler, 1999, p. 182).

Sustainability is a real buzzword nowadays, one can hear it a lot and it is used in a large variety of places and occasions. As the quote by Atkinson et al. (taken from the ‘*Handbook of Sustainable Development*’, emphasis added) makes clear, the concepts of sustainability and sustainable development do not have clear-cut meanings. Even for policy-makers and otherwise engaged professionals the meaning of sustainability is unclear and its use is contested (Atkinson et al., 2007).

At the same time another trend can be identified in which the role of the general public in sustainability debates is increasing. As a matter of fact, sustainability seems to be one of the most favourite topics with regards to public engagement¹ projects (see among academic publications on this (e.g. Kasemir, Jäger, Jaeger and Gardner, 2003, Kørnø, 2007) also the UNECE² Convention on Access to Information, Public Participation in Decision-making and Access to Justice in Environmental Matters, better known as the Aarhus Convention (UNECE 1998)).

But the public does not only get involved in sustainability issues by means of public engagement; they can obtain different roles. This discussion paper will shortly address four different roles the public can have with regards to sustainability: the public as *consumer*, *user*, *participant*, or as *bystander*.

Since the concepts of sustainability and sustainable development do not have real clear-cut meanings it is necessary before going into the different roles the public might take up, to first have a

¹ Most authors in this field use the concept of public *participation* rather than public *engagement*; however in an earlier work I have shown how the term participation can be misleading (Hölsgens, 2009). I therefore prefer to use the term public engagement as an overall covering concept.

² United Nations Economic Commission for Europe

look at where sustainability originates from, and what sustainability is actually about. From thereon the different roles of the public can be examined. I will end this paper by reflecting on directions for further research which, in my view, should take a closer look at the different roles that the public is assumed to take. Since the meaning of the concept of sustainability is not very clear and restricted, while at the same time the public is expected to get more and more involved, I will argue that more research will be necessary. This research should address what the consequences of this wide open definition of sustainability are for the different roles the public can have.

Origin of sustainability

The term *sustainability*, or even more prominent *sustainable development*, got well-known to the world through the 1987 United Nations' report 'Our Common Future' (best known as the Brundtland Report). The UN World Commission on Environment and Development defines sustainable development in their report as development that 'meets the needs of the present without compromising the ability of future generations to meet their own needs' (WCED, 1987, p. 8). The origin of the concept of sustainability as we currently know it can be traced back to 1974 though, when the World Council of Churches brought it up (Dresner, 2002). According to Dresner the term sustainability was coined by Western environmentalists as a rhetorical tool to counter 'objections to worrying about the environment when human beings in many parts of the world suffer from poverty and deprivation' (2002, p. 1). Despite the fact that the term *sustainability* is rather new, the concerns it addresses are by no means new, nicely illustrated by Wall's reader containing various old essays: Green History (1994).

In these two short views on sustainability a few elements that constitute the broad meaning of the term can already be identified. First of all the environmentalists have been mentioned; for them one of the key elements of sustainability had to do with the preservation of nature and wildlife (see for example the beautiful documentary *Earth* by Fothergil and Linfield (2007)). Second it was mentioned that environmentalists introduced the term to counter objections that they ignored human beings who live in 'poverty and deprivation'; therewith touching also upon the social considerations that have become part of the meaning of sustainability (this social aspect can also be found a lot in feminists' approaches, e.g. Eichler, 1999). And thirdly the view of the UN WCED has an economic aspect inherent in its definition in the sense that they see sustainability as a sort of non-decreasing welfare³.

³ Herewith I do not mean to say that environmentalists do not look at economic issues, on the contrary, but their view on the conventional economic model of development is rather different, see Baker (2006).

These three issues are summarized also as the main objectives of the Brundtland report by Kirkby, O'Keefe and Timberlake (1995) as: *Environment, Equity and Growth*.

Why sustainability?

Before taking a closer look at what sustainability actually is about, and what its implications are for the general public, it is important to first take a look at why the concept of sustainability has taken off to become such a hype. In the words of Dresner (2002), quoted above, sustainability originates from the side of environmentalists who used the term to counter critiques of not caring for the poverty of other human beings, but focusing all too much on the environment. Nowadays sustainability has, in that sense picked up on three main issues. First, the environment is still a major issue. Second, sustainability has taken up a social aspect in fighting poverty. And third, sustainability is now also directed towards future generations (for which the before mentioned *growth* is assumedly important, however the traditional Western economic model of growth and development is also criticized (e.g. Baker, 2006)).

Within the scope of this paper I can not get into a too detailed level of describing why sustainability has become such a vital issue and many of these, with global climate change and resource depletion as some of the main arguments, are well known. What is interesting to touch upon here though, is what might happen if we do not adjust to a more sustainable way of living. In the view of many the warming of the earth, or the extinction of an animal such as the polar bears might seem rather trivial, but the work of Diamond (2005) and Ponting (1992, 1993, 2007) shows an a lot worse view of what might happen if we continue the decadent lifestyle of over-consumption we (and by we I mainly address the West) have gotten into.

Both Ponting and Diamond use a historical perspective to look at the collapse of past civilizations such as that of Easter Island and the Maya culture. Both authors make clear that, among other issues, the human influence on the eco-system has played a large role in the destruction of once flourishing civilizations. One of the main ways in which humans have destructed their environment has always been over-consumption, often shown in augmented deforestation. The authors warn that if our current civilization will not find a better way of dealing with the environmental resources at hand, in other words, will not become more sustainable, we might run the risk of ending up just like those past societies (Diamond increases the fear of loosing our civilization by pointing out that diminishing past societies often fell into cannibalism to provide the required food). A similar concern regarding over-consumption was already brought up in 1972 when The Club of Rome presented 'Limits to Growth' (Meadows, Meadows, Randers and Behrens, 1974), and although highly criticized (e.g. Cole,

Freeman, Jahoda and Pavitt (Eds.), 1973), the main ideas still remain and have been confirmed in later updates (Meadows, Meadows and Randers, 1992, Meadows, 2004).

Contemporary views on sustainability

What is sustainability? In the most general view the overall goal of sustainability can be seen as a strive to protect our planet. This of course leaves a lot of possibilities for different interpretations. What is it that we need to protect? Is it the planet's wildlife? Is it our civilization? Is it mankind in a more global approach? And even if these questions could be answered unanimously; from what do we need to protect it? What is causing the problem? Is there even a problem? Evidently these questions call for new questions: How can we solve our problems? What needs to change? What is more important, economic growth, fighting poverty, climate change, protecting endangered species?

It may be clear that it is impossible to answer all these enormous questions. And not only is it hard to try to develop an answer to them, but people with different backgrounds will have different views and different focus areas in attempting to find an answer. According to Sikor and Norgaard (1999) providing one clear answer to the questions above would be impossible, they argue that sustainability can not be defined because of a lack of 'objectivity' in its goal. They do not consider this a real problem, but rather argue that it is necessary to recognize this and they propose to see sustainability as 'an on-going outcome of appropriate social processes' (Sikor and Norgaard, 1999, p. 53). The social processes hinted at here concern interactions among people involved in working on sustainability (often in interdisciplinary modes). They argue that 'appropriate goals can be constantly assessed and worked toward by the people involved' (p. 53), thus leaving the definition of sustainability wide open and subject to interpretation and contextual assessment. Whether it is actually possible to set sustainable goals, *co-created* by different stakeholders I find questionable because economic influences tend to be very strong (consider for the example Paine's (2006) question: 'Who Killed the Electric Car?').

The definition that is worked with mostly (albeit sometimes slightly altered) is the one from the Brundtland Report (Baker, 2006, Baker, Kousis, Richardson and Young, 1997), but with its focus on *needs* it has a more social and economic than environmental connotation. Within this paper I will now move towards the different implementations of sustainability with a concrete focus on the general public. Let me start here by taking an economical view on sustainability, followed by the interpretations of the concept from a technological point of view and from the side of the natural sciences and politics which surprisingly share a role for the public in *participation*. Finally contemporary arts also influences the public's view on sustainability. Since an elaborate discussion of all the different views one can find would go far beyond the scope of this paper I will limit myself

here to a rather superficial level and I will mainly focus my attention towards those elements relevant for the general public; the elements of *environment*, *equity*, and *growth* can to various degrees be found in the different roles of the public though.

Sustainability and the general public

The Consumer

From an economical point of view the term *sustainable development* is most interesting. The traditional Western view on economy is based on development and growth (cf. Hunt, 1989, Sundar, 2006), and the economists view on sustainability fits within this focus on growth (e.g. Islam, 2001), even though various interpretations of sustainability and for sustainable development exists also within economy (see Rao, 200). Some free-market economists suggest that the market forces will autonomously create feedback loops to adjust itself to a more sustainable direction (cf. Sikor and Norgaard, 1999), others, like Rao (2000) advocate a more active approach. However based on economic principles sustainable development will largely depend on consumer behaviour, in other words on market forces.

Since environmental problems have largely been caused by over-consumption consumer behaviour shall have to change in order to reach a more sustainable society (Jager, van Asselt Rotmans and Vlek, 1999, Hinterberger, Femia, Fischer, Luks and Yavuz, 1999). It is assumed that consumer behaviour can be steered if the proper incentives are created (Jager et al., 1999), but consumer's perceptions of sustainability can also be used to create marketing strategies (McDonald and Oates, 2006). But regardless whether the focus is on changing behaviour, or on using users' perceptions of sustainability, this is the first way in which the general public can get involved in the debate: namely as *consumers*.

The User

Within product design and engineering the public is not so much seen as consumer, but rather as user. To increase the sustainability (which in the context of engineering mainly means being environmentally friendly) the first trend which could be identified was the so-called end-of-pipe solutions (cf. Tarime, 2003). This means that factories were modified, often by using filters to minimise their pollution, this is a common reaction of manufacturers to emission standards; it has no influence on the public (at least not as participating users/consumers) (Kemp, 1997). It has been shown however that cleaner production can be more advantageous and is also used more often nowadays (at least with OECD countries) (Frondel, Horbach and Rennings, 2007). A more recent trend, (which can also be seen within the field of industrial design in which I had my training) is the product life cycle

assessment (LCA) (Lambert, 2008). This LCA has the advantage that it looks at the entire process a product goes through and it examines its environmental impact at each stage. Therefore not only the pollution from the factory is taken into account, but also the use of resources, the transportation of both resources and (semi-finished) products, the impact of the product's disposal, and for this paper most important the environmental impact during use (Guidice, 2008).

Within product design it has thus become important what the impact of a product on the environment is during the use-phase. This implies that the way in which the general public uses the products is also essential, thus leading to the second role of the public, that of the *user*. People are not only assumed to *consume* sustainable, but also to *use* sustainable, after all 'while engineering advances permit increased efficiency of product operation, the user's decisions and habits ultimately have a major effect on the energy or other resources used by the product' (Lockton, Harrison and Stanton, 2008). Therefore user's behaviour will have to be altered. Lockton et al. (2008) and Wever, van Kuijk and Boks (2008) both present a number of ways in which the user's behaviour can be influenced through the design of the product. Here we see that the role of the public as a user, just like as a consumer, can be under pressure of the manufacturers to change to become more sustainable.

The Participant

The public can also be involved in sustainability in a very direct way, namely as a *participant* in public engagement projects, this is the third role I want to present here. The role of the public as participants can be steered from a variety of perspectives. To stay within the field of engineering, people can be asked to participate in technology assessments (cf. Remmen, 1995), in the case various stakeholders (and this can include citizens (Remmen, 1995) are brought together to publicly assess 'the potential risks, hazards, costs and benefits of developing some new technologies' (Freeman, 1995). The public can get involved in scientific issues concerning sustainability in a very similar way. Kasemir et al. for example describe a 'grand experiment in how lay publics might be more effectively engaged in linking science and technology to the quest for sustainable development' (Clark, 2003, p. xvii). They claim that, for sustainability science to become successful, it needs public participation (Kasemir et al., 2003). And third the public can be involved as a participant in a political manner. In my ESST master thesis I have examined how this public participation can look like by means of a case study of the planned windmill park in the Noordoostpolder (The Netherlands). It became clear that public participation is a vague and broad concept (therefore I rather use the term public engagement) and that the actual role of the public in this way can still be very diverse and unclear (cf. Hölsgens, 2009). However, for the scope of this paper we can consider the role of the public as a

participant; with its broad implications captured under the umbrella of engagement, as one of the roles the public can obtain in the debate around sustainability.

The public as a participant has one major distinction from the other roles described in this paper though, namely that it, in general does not address every individual. The public as consumer, user, or, as we will see next, *bystander*, captures all individuals together as *the society*, but in deliberate participatory projects the number of people is usually limited and the participants are selected (e.g. only 10-16 in a consensus conference (Joss and Durant, 1995)). In public engagement procedures more related to public information or consultation a larger share of society might be involved though (for the distinction between different levels of engagement please see Hölsgens, 2009, Rowe and Frewer, 2005, or OECD 2001a, 2001b, 2003).

The Bystander

Finally the public can be seen as a rather ‘innocent’ *bystander* being influenced by various factors. Two of these factors that address sustainability and that have an influence, even though the public is not directly involved as a consumer, user or participant are the visual arts and film.

Films are of particular interest here because they can reach a very large audience. Films have also often been used to raise the public awareness of issues concerning sustainability ranging from subtle hints at the needs for a sustainable development (such as Pixar’s animation movie WALL-E by Stanton (2008)) to very concrete and direct calls for behavioural change (see Al Gore’s *An Inconvenient Truth* by Guggenheim (2006)). And while narrator James Earl Jones directly addressed the viewer in the last sentence of *Earth* (Fothergill and Linfield, 2007) with the words: ‘if we are ‘to preserve its [the earth’s] fragile balance, it is in our hands’. The actual impact that these kinds of movies have on people behaviour, or even attitude, is hard to tell.

Within the visual arts a trend towards environmental and sustainable arts can also be seen. Sustainable arts distinguished itself from environmental arts because it does not only address topics concerned with the environment, but it also engages with the social side of sustainability (Fowkes and Fowkes, 2007). While Maja and Reuben Fowkes in an interview with *Antennae* indicate that for them arts should not be made to inform/persuade the public, in their words: they ‘do not envisage art to have utility’ (*Antennae*, 2009, p. 23), forms of sustainable arts will have an influence on the people that see it, and artists do have a message they want to spread.

Conclusion

In this paper I have argued first of all that sustainability (or sustainable development) is not a clearly defined concept; its boundaries are vague and different people have different interpretations of its meaning. It also does not seem likely that a single clear-cut definition can be formed (although the one from the Brundtland report is most often quoted) and I leave the question whether we should attempt to do so open. What I have also observed though is that there is an increasing responsibility for the general public in the sustainability debate. Within contemporary discussions about sustainability I have identified four distinct roles for the public: as consumer, as user, as participant, or as bystander.

It is my believe that for each of those roles the people attitude towards sustainability will be slightly different; just like the actions they are assumed to take will differ. These different roles, combined with the wide open character of the concept of sustainability can, I am afraid, lead to a situation in which it is no longer clear for the pubic what is expected of them. I therefore want to propose more research into the different roles of the public in the sustainability debate, and I consider it necessary to investigate how the openness of the concept influences these various roles. The public will indeed by an important player in the search for a more sustainable society in which we can meet 'the needs of the present without compromising the ability of future generations to meet their own needs' (WCED, 1987, p. 8), but the variety of ways in which 'we' can contribute will have to become more feasible.

Corporate Social Responsibility, Sustainable Development and Tourism; A Bridging Effort

Muhammad Arif, Bodø Graduate School of Business, Bodø

Abstract: The debate on Corporate Social Responsibility (CSR) and its contribution for the society remained indecisive. However, development in CSR literature like concept of Sustainable Development (SD) brings hope that the debate can be concluded. It is because of the fact that integration of SD concept into CSR revealed that an option can be explored which may be a win-win situation i.e., symbiotic development/SD for both i.e., business and society. Management literature in traditional manufacturing industries is substantially rich on this however; the area remained under-researched in service industries like tourism. Therefore, the paper explored these concepts in tourism industry while heavily drawing ideas from cross disciplinary areas and debated that tourism industry players like Tour Operators (TOs) have this responsibility to manage tourism deleterious impacts and contribute towards the sustainability of the destination stakeholders. Further, it has also been argued that delivering on such responsibility effectively will serve the interest of these TOs as well in the form of sustainable tourism (ST) or corporate sustainability (CS).

Key words: Corporate Social Responsibility (CSR), Sustainable Development (SD), Symbiotic Development, sustainable tourism (ST), Stakeholders

1. Introduction

“Support tourism, support your economy” 2008 theme of United Nations World Tourism Organization (WTO, 2008) is the contemporary as well as historical role expected from and performed by tourism which ranked it among the largest industries of the world (UNWTO, 2009). The larger industry also faced the toughest challenges as well, one of these is sustainable development (SD) of the destination stakeholders¹ (resources/attractions, local service suppliers –LSS² and communities³) which also supports this industry.

Management of impacts of its operations and relationship with the society under the concept of corporate social responsibility (CSR) is an old tradition of traditional industries like manufacturing. Therefore, substantive literature on CSR extended our conceptual and theoretical understandings about the field.

¹ Freeman referred to stakeholders as “those groups without whose support the organization would cease to exist” as defined by Stanford Research Institute SRI 1963 and quoted by Freeman (1984). Donaldson and Preston (1995) defined stakeholders as all who can get potential benefit or harm due to actions or inactions of the firm. Mitchell, Agle and Wood (1997) suggested the criteria’s of power, legitimacy and urgency as the defining attributes which define the salience of a stakeholder which may change over the lifecycle of the organization.

² Local service suppliers referred to businesses at destinations, owned and managed by locals, which are facilitating tourism in their area – one of the possible way to define LSS.

³ Richards and Hall (2000) while admitting the problem of defining the term community, quoted the extended definition by John Urry (1995), who defined community in context having four different uses of the term. The term community includes a specific topographical location, association with a local social system, people having feelings of togetherness and sharing the ideology. This author intends to use this definition in this paper.

However, the tradition of CSR and our understanding about its contribution for the development of destination stakeholders in tourism industry is at embryonic stages. Author's this understanding developed from two sources:

1. No or poor reflection on their social contribution by the tourism industry players including Tour Operators (TOs) on their websites as compare to their counterparts in traditional industries⁴
2. Search with key terms like CSR & Tourism in tourism journals generated fewer entries.

Based on this theoretical as well as empirical gap, this theoretical paper will:

- Look at the historical development of the concept CSR and trace how SD thought emerged into CSR
- Reflect on how they can complement each other
- Draw their implications in tourism industry which need to pursue the paradigm like SD for its own reasons i.e., sustainable tourism.
- Look at tourism industry at micro level in a way how industry players like TOs can play a role in this context.

Scope of the paper: The paper is based on extensive review of literature but in no way the author claims that the search and review is the exhaustive one. Any such claim is substantially obscured by the fact that the paper draws insights from the concepts and field of studies like tourism, SD, and CSR which are researched and reflected extensively. In this situation, selection of the articles was also a problem therefore, the selection was based on breakthrough contribution of these articles in their respective areas. However, the discussion in paper contributes towards a new way of understanding the relationship among these concepts.

2. Corporate Social Responsibility (CSR)

The idea of taking care of society by the business rooted in ethical domain of philosophy can be traced back to the 19th century in the form of corporate philanthropy though the usage of the term CSR emerged in 1920s (Fredrick, 1978). This care is generally reflected in business efforts to manage not only impacts of its operations but also its relationships with its stakeholders.

Since the emergence of CSR concept it developed its theoretical rigor over the time by extending the field of study in the direction of CSR (Carroll, 1974; Chrisman and Carroll, 1984; Schwartz and Carroll, 2003) Corporate Social Responsiveness (CSR₂) (Fredrick, 1978), Corporate Social Performance (CSP) (Carroll, 1979; Jones, 1980; Wood, 1991; Carroll 2000;

⁴ This impression of weak tradition of CSR in tourism industry also substantiated by this author as well who found catchy words like CSR, business social responsibility, sustainability, SD, social contribution, and corporate citizenship (CC) etc. on the websites of the companies like Fast Moving Consumer Goods (FMCGs) and Energy sector, as compare to "socially barren" websites (visited more than 100 websites) of Tour Operators (TOs) based in UK, Germany and Norway – the industry players running most of tourism show particularly in Europe and from Europe to rest of the world.

Clarkson, 1995), Theory of Stakeholders (Freeman, 1984; Donaldson and Preston, 1995; Mitchell et. al., 1997) SD and Corporate Citizenship (DeBekker, et. al., 2005; Blowfield, 2004,2005). Authors like Maignan and Ralston (2002); Chapple and Moon (2005); Eweje (2006); Kolk and Tulder (2006); Flanagan and Whiteman (2007); Jamali and Mirshak (2007); and Gjørber (2009) researched the field empirically.

However, this long history of research in CSR could not give the concept a single conceptual definition which may facilitate its operationalization and measurement. Use of 37 definitions in CSR related literature as identified by Dahlsrud (2008) reflected that CSR is a multidimensional concept, therefore, attempts to define the concept has colored the literature with many shades. The shades emerged from the fact that the concept shared boundaries with many disciplines like, ethics, marketing, management, economics, power and politics, psychology, theory of the firm, voluntary or regulatory approaches, sociology and cultural studies (Gjørber, 2009).

This diversity in definitions also indicated towards the diverse perspectives individuals and organizations associated with CSR which gave emergence to different set of questions. Some of these questions as raised by literature are; why the business should be concerned about the society? What the business will get if it protects the interest of the society (with or without its own)? What will happen if business doesn't bother about these? And whether CSR deliver more to the society or to the business itself? CSR literature has produced many plausible explanations as well for these questions.

For a theoretical soundness of the framework discussed in this paper, the following part intends to elaborate on these questions while focusing on the motivations behind CSR.

2.1. Instrumental view: Doing good because it's good for us (business)!

Social spending for business enjoyed the support⁵ from early opponents of CSR like Friedman (1970) to the contemporary supporters like Porter and Kramer (2006); Schwartz and Carroll (2003); Garriga and Mele (2004); Kottler and Lee (2005) and Prout (2006).

2.2. Ethical View: Doing good because it's good for others!

Philanthropic thought by Carroll (1979), concept of Social Contract by Wartick and Cochran (1985) and the implied responsibility of business as one of the most powerful institutions in the world (Macleod and Lewis, 2004) partially support ethical view of delivering to the society.

2.3. Institutional View: Doing good because we (business) have to!

Concept of Iron law of responsibility given by Davis (1973) which empirically observed by Yaziji (2004) as according to him business inability or unwillingness to deliver on its responsibilities associated with power given by the society to this institution, NGOs emerged as one of such powers trying to regulate the business behavior across the world through its community power.

⁵ One of the main reasons behind this can be to justify the early underdog position of the area of study, where business needs business reasons to justify this (non) business spending.

Further, to avoid threats for non-compliance along with incentives for compliance (Frederick, 1978), increased pressure on government/multilateral institutions and resultant legislation to protect the interest of citizens (Harrison and Freeman, 1999; Macleod and Lewis, 2004; Flanagan and Whiteman, 2007), and the costly compliance to those regulations (Prout 2006) also forced the companies to behave more responsibly.

However, individual motivation in 2.2 and 2.3 can also be linked to 2.1 i.e., business interest as well, as the purpose behind response to social expectations may also resulted into business benefits like responsible corporate image, this argument lead us to the concept of Symbiotic Development.

2.4. Symbiotic Development View: Doing good because it's good for everyone!

Schwartz and Carroll (2003) acknowledgement that philanthropic responsibilities will not be delivered just because of philanthropic concern of the business, rather, there may be economic, legal or ethical concerns (one or more than one) associated with this, reflected this symbiotic development view. Wood (1991) can be considered as the pioneer for this argument lately Hart (1995) and Wheeler et. al. (2003) claimed that principle of societal interest will ultimately protect the mutual/symbiotic (along with business) interest. This development in thought also reflected in definitions of CSR as referred by Blowfield (2004).

This is the perspective this author assumes which will also serve the overall structure for this paper. This framework is in line with Garriga and Mele (2004) who categorized CSR theories into Instrumental, Political, Integrative (last two are close to institutional view), and Ethical Theories (Ethical and Symbiotic Developmental view as referred in this paper).

Overall, section 2 revealed that development in CSR thought brought in the concept of symbiotic development i.e., Development/SD⁶ of the stakeholders will also lead to Corporate Sustainability (CS)⁷.

⁶ Wadham (2009) quoted Parris and Kates 2003; Hopwood et al. 2005 according to these the terms can be used interchangeably.

⁷ For a representative definition of SD see Gladwin, Kennelly, and Krause (1995: 877) and Montiel (2008). Montiel also discussed CS in context of SD or there's no difference between CS and SD.

3. Development + Sustainability = Sustainable Development (SD):

Sharpley (2000) used this equation (originally given by Lele, 1991) to structure his theoretical debate about tourism and SD. The equation concept reflects the solution proposed by the academics to deal with the ambiguity arises from the variety of ways SD can be defined. The equation also expressed the evolution of thought in this area as provided in table 1.

Table 1: Representative Literature on Development, Sustainability and SD

Author	Contribution
Rao (2000)	Development found its source in economic growth
Williams (2004)	Development is a state and a process
Sharpley (2000)	Development is a process as well as goal Sustainability referred as “capacity for continuance”.
WECD, Brundtland Report (1987)	“Sustainable Development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs”
Gladwin et. al., (1995)	“SD is a process of achieving human development (widening or enlarging the range of people's choices; United Nations Development Program – UNDP, 1994) in an inclusive, connected, equitable, prudent, and secure manner”

However, different authors like Saarinen (2006) reflected that SD is a social concept which may have different meaning in different societies depending upon the need of the society, implying different paradigm in SD i.e., strong vs weak positions on SD. Authors like Gladwin et. al., (1995); Martens and Rotman (2005) also shared the same and supported not very strong SD paradigm.

Under this paradigm earth is considered as life supporting system and has mutual interdependence with humans. The primary objective of this interdependence is to improve quality of life which includes the achievement of and through green economy and human rights etc. It also considered human vs natural capital as partial substitutes, hence only non-substitutable need to remain intact or preserved. However, authors like Hunter (1995); Johnston and Tyrrell (2005) while assuming the strong position on SD opposed any such substitution.

This author aligned with the definition as given by UNDP 1994 and used by Gladwin et al. (1995) as a personal belief that what should be the purpose of development efforts therefore, this definition will further be integrated as the goal behind what already referred as symbiotic development. This integrated framework will direct further reflection in this paper. This belief of the author also supported by the literature as well as observation that it's what business is trying to do under its CSR i.e., widening the people's choices. However, as

referred earlier the question remained unanswered whether CSR really contributed towards “widening people’s choices”?

4. Corporate Social Responsibility (CSR) and Sustainable Development (SD): path towards Symbiotic Development

4.1. Did CSR really deliver?

The authors like Carroll (2000); Wood (1991); Porter and Kramer (2006); Banerjee (2008) expressed their concern over the contribution of CSR for the intended beneficiaries’ as claimed by the business.

One of the possible solutions for these concerns is suggested by Schwartz and Carroll (2003) who proposed that the contribution of the business for the society can become effective if it linked to the business interest itself. Authors used *bottom of the pyramid*⁸ as the example where business is meeting its profit need along with delivering on legal and ethical/philanthropic responsibilities. Blowfield (2004), and Fritsch (2008) also supported this idea along with Porter and Kramer (2006) who while focusing the interdependence of economic and social system, suggested the selection of CSR that should be mutually beneficial for community as well as business. Nestle collaboration with the milk farmers in developing countries used as case example by these authors, to highlight the point of symbiotic development. Hart (1995) presented this idea from the perspective of taking care of the environment by the organizations. The care which will help the organization to develop sources of competitive advantage those will be valuable, and costly to copy.

Along with this theoretical justification, symbiotic development view can be substantiated ethically as well. Ethical theories like Utilitarianism and Universability Test as discussed by Holden (2006) support this view of doing good because its good for every one.

The previous debate highlighted that the debate of CSR and SD is converging. Montiel (2008) also recommended to study CSR and Corporate Sustainability/SD (the author identified CS in context of SD in management literature)⁹ collectively as concepts and measures of both are converging¹⁰.

Cross disciplinary ideas can be synthesized to reflect on how a symbiotic development can be operationalized specially through the concept of networking.

4.2. Approaches for Symbiotic Development

The authors like Williamson (1990); Reve (1990); Hall (1999); and Wheeler et. al. (2003) used different terms to express the idea of partnership. This diversity indicates that the

⁸ Bottom of the pyramid is the term used to reflect business efforts to meet the needs of poor class of global society.

⁹ For different definitions of SD and how CS defined in context of SD see Montiel (2008:256)

¹⁰ CSR Issues identified theoretically by Carroll (1999); (Egri and Ralston , 2008:319); Clarkson (1995); Davenport (2000); Porter and Kramer (2006); Observed practically by Chapple and Moon (2005); Jamali and Mirshak (2007) Eweje (2006:118) and contemporary practices by different corporations like Nestle and Unilever under their sustainability and or development slogan also reflect this convergence.

concept of partnership can be not only defined from different perspectives but also the concept can be put on a continuum ranging from very weak to very strong concept of partnership. One of the definitions (which also serve the purpose of the paper) is given by Bramwell and Lane (2009:179) according to them “ regular, cross-sectoral interactions between parties based on at least some agreed rules or norms, intended to address a common issue or to achieve a specific policy goal or goals”.

Use of partnerships for business reasons researched substantially by the authors like Aoki et. al. (1990); Gulati et. al. (2000); Castells (2001); along with Williamson (1990) and Reve (1990). Use of partnership for both business and (apparently) non-business reasons also remained in academic focus as reflected by Harrison and John (1993), Hart (1995) and Wheeler et. al. (2003)

Wheeler et. al. (2003) while quoting examples from the contemporary corporate world reflected that by defining value/goal/objective collectively and by establishing Value Based Networks (VBN) with the stakeholders, how the companies successfully managed stakeholders on which companies depend to deliver. Hart (1995) referred these collaborative efforts as the characteristics of resources required for sustainable competitive advantage of the firm. Harrison and John (1993) also emphasized the importance of defining common goals by the corporations and their stakeholders, and then building partnership referred as *bridging* to attain those common goals. Bramwell and Lane (2009) saw the use of partnership recommended by Brundtland Report, in order to follow the route for SD.

So far the synthesis efforts to create a link between CSR, SD and CS reflect that the concepts are not only converging theoretically but operationally feasible as well through the concept of partnership. Beyond literature companies efforts to deliver on their CSR under SD slogan¹¹ also indicate about such convergence. The rest of the paper will see implications of these concepts in tourism industry as the area of study is taken as context for this paper.

5. Traditions of CSR and Sustainable Development in Tourism

5.1. Tourism:

With reference to Jafari (1990) travel is centuries old practice. This old practice as experienced by different actors/groups developed the differences (among and within the group) in definition of tourism, which over the time diverge instead of converge.

Among the variety of definitions one of the definitions (which addresses the SD and tourism issues the paper is intending to explore theoretically) is given by Jafari (1977:06) according to him “tourism is the study of man away from his usual habitat, of the industry which responds to his needs, and of the impacts that both he and the industry have on the host’s socio-cultural, economic, and physical environments”.

¹¹ Website of MNCs like Nestle, Proctor & Gamble and Unilever reflect that they are using the CSR and SD terms alternatively to educate its stakeholders about their efforts to bring a change in society

The need to study these impacts is highlighted under knowledge based platform as suggested by Jafari (1990) who recommended to take the study of tourism as a whole. This platform focused the need to produce scientific knowledge to develop any opinion regarding development in tourism. Concept of SD in tourism reflects the intention to develop this scientific knowledge.

5.2. SD Traditions in Tourism

The opinion of the authors like Buttler (1991); Weaver (2000); Hall et al. (2004) and Saarinen (2006) differ over the history of sustainable management of tourism. Traditionally the industry was considered as environment friendly as compare to its counterpart manufacturing industry. However, authors like Butler (1991); Fyall and Garrod (1997); Tribe (1997); Saarinen (2006); Lu and Nepal (2006) believed that tourism due to its voracious use of natural resources is posing a major threat to the environment of destinations therefore, becoming a challenge for tourism stakeholders. Hunter (1995:858) also added that “In reality, it is impossible to imagine any kind of tourism activity being developed and then operating without in some way reducing the quantity and/or quality of natural resources”, the point expressed by Jaffari (1977;1990) as well. Sustainability of community at destinations along with natural resources sustainability is emphasized by Richards and Hall (2000). Therefore, popularity of the term SD developed the expectations that the philosophy will serve the base upon which sustainable tourism can be developed.

SD in tourism also gave emergence to alternative tourism thought referred as adaptancy platform by Jafari (1990), concept emerged in the backdrop of mass tourism. The debate on mass vs alternative tourism has implication for sustainability of the industry itself.

5.3. Mass vs. Alternative Tourism

Tourism experienced the era when it was believed that a certain type of tourism activity like mass tourism is injurious to the environment and destination sources. Mass tourism shares the following characteristics (Vanhove, 1997:51):

1. “The participation of large numbers of people in tourism, whatever the tourist activity may be;
2. The holiday is mainly standardized, rigidly packaged and inflexible.”

Mass tourism is driven by Tour Operators (TOs) through package tours which is believed to constitute more than 80% of the tourism industry.

Authors like Buttler (1991); Cavlek (2002) highlighted the negative impacts of mass tourism. These negative externalities under mass tourism developed the idea of alternative tourism. Though alternative tourism also faced the challenge of defining the phenomenon precisely as the term enjoyed different terms as defined by Smith (1988); Williams (2004) and Saarinen (2006) but one of the representative definitions is given by Holden (2006:130), according to him “ecotourism is characterized by being low-scale and low-impact, with a high degree of local involvement in development decision making, and a high level of local ownership of tourism facilities”.

While considering the massive impacts of mass tourism, alternative tourism emerged as a more sustainable tourism, but Cohen (1994); Jafari (1990); Weaver (2000); Lu and Nepal (2009) rejected this idea.

If this is the case with both alternative and mass tourism then the question arises who is responsible in tourism industry to manage these negative externalities?

5.4. The Question of Responsibility

The responsibility to manage impacts of business operations along with community development is the foundation of CSR thoughts as reflected in part 2. Tourism industry players can not be an exception to this tradition. This acceptance of responsibility also acknowledged by Federation of Tour Operators (FTO) and Tour Operators Initiatives for Sustainable Tourism Development –TOI along with emphasis laid down by UNWTO (1994) recommendations on tourism.

The responsibility of tourism industry players came into limelight in tourism literature as well like Fyall and Garrod (1997); Tribe (1997); Cavlek (2002); Miller et al. (2005) Budeanu (2007); Saarinen (2006), Jamal and Stronza (2009) along with Bramwell et. al. (2008:253) who expressed this as “resurgence of research interest in the idea that tourism-related actors can develop a sense of ethical and moral responsibility that has resonance beyond self interest, and that there is at least a possibility that this could change behaviors and contribute to more sustainable development”.

While commenting on justification/rationality for responsibility apart from these individual (ethical/moral by Bramwell et. al., 2008 and business by Tribe, 1997) justifications, the justification of symbiotic development can also be traced from the studies like Butler (1991); Jamal and Stronza (2009) etc.

The question of this responsibility for SD efforts in tourism leads us to the debate between Sustainable Development of Tourism (SDT) and Sustainable Tourism (ST). SD is considered as the parental paradigm of ST (Williams, 2004; Sharpley, 2000), though some authors like Hardy et. al (2002) debated about its separate identity. The debate about STD and ST is also interesting to reflect because it has implication for weak vs strong SD and their application in tourism.

5.5. Sustainable Tourism (ST) AND Sustainable Tourism Development (STD):

The initial ST demands were met by showing and doing (though to a limited extent) with the environmental concern via ecotourism (Budeanu, 2007). However, authors like Johnston and Tyrrell (2005) established that environmental sustainability at the cost of economic sustainability of the business or the destination stakeholders is not the value even environmentally sustainable in long term - an idea backed by a strong position on SD also supported by Hunter (1995).

Apart from this strong position, other tourism researchers supported a weak position on SD i.e., tourism focused. Saarinen (2006) quoted the definition of ST (tourism centered) given by WTO (1993) as the landmark need to be achieved by tourism industry. The author (2006:1133) expressed that “from the sustainable development perspective, the sustainable use of resources and the environment and the well-being of communities are goals to which sustainable tourism could and should contribute – if the industry’s role is also seen to be beneficial to that process by groups other than the industry itself”. This concept of

adaptability of ST also emphasized by Hunter (1997:855) as well, according to him “the potential of tourism to contribute to sustainable development (however defined) from local to global scale is substantial”

Other authors like Sharpley (2000); Weaver (2000); Fyall and Garrod (1997); Saarinen (2006); Lu and Nepal (2009) and Jamal and Stronza (2009) also supported the idea of adapted/weak or different interpretations of SD are possible, depending upon the circumstances with different set of trade-off among the three components of sustainability i.e., environment, economic and socio-cultural.

Under this adapted SD paradigm and using CSR as tool a case for the development of destination stakeholders (Resources, LSS and Community) can be constructed which is the core contribution this paper is looking for. This adapted SD may also contribute towards the sustainability of tourism as well.

6. Symbiotic Development: Destination Stakeholders and Tourism

There are certain inevitable interdependencies between/among tourism stakeholders because of fragmentation of the industry and industry's dependence on destination stakeholders. This interdependence expressed by different authors like Buttler (1991), Budeanu (2007) between environment and tourism industry; Sharpley (2000), Richard and Hall (2000), Jamal and Stronza (2009) and Jensen (2010) between community and tourism; and Saarinen (2006) between community, resources, environment and sustainability of tourism. This interdependence between/among tourism industry stakeholders make every stakeholder's sustainability vital for others. This common interest can motivate them for symbiotic development.

Therefore, authors including Saarinen (2006) and others like Hunter (1997); Sharpley (2000); Weaver (2000); Jamal and Stronza (2009) believed that tourism can play a vital role in the development of destination areas. Other authors like Nicolau (2008); Tapper (2001); and Budeanu (2007) reported that such contribution also contribute towards the sustainability of the tourism as well. These mutual interests from one another make them inevitable stakeholders for one another thus leading the way towards partnership or alliances to pursue the goal of symbiotic development.

Theoretical literature on collaboration in tourism is also quite rich. Crofts et. al (2000) traced the tradition of alliances between the tourism enterprises since 1841 but acknowledged that the area remained widely unattended by the tourism researchers or remained focused on larger companies ignoring alliances with and between smaller firms (Telfer, 2000). The idea of collaborations between or among the different tourism stakeholders forwarded for different reasons like Tremblay (1998) to manage destination resources and negative externalities of business operations; Hall (1999) to counterbalance only business interest in tourism; Crofts et. al. (2000) for strategic advantage or competitive response; Telfer (2000) to avoid leakages associated with tourism; Li and Petrick (2008) as the new paradigm shift in tourism marketing; and Jensen (2009b, 2010) to serve the goals of different stakeholders. The diversity of reasons for collaboration indicate towards the strong traditions of this practice in tourism.

Furthermore, authors like Tremblay (1998) highlighted that these collaborations can be of different scale, structure and scope. Like with respect to scale one of the collaborations type is local-international collaboration for local level sustainability.

Under this interdependence and collaboration thought, TOs became the focus of responsibility discussion in tourism literature. Like for protection and conservation of resources at destinations Cavlek (2002) and Bundeau (2007) stressed the responsibility of TOs who has been earning profit from this industry for quite a long time. Similarly for the development of destination community stakeholders like (LSS) Jensen (2000, 2004, 2009 a,b, 2010) researched substantially these stakeholders relationship with TOs. It is under this mutual interdependence and the type of collaboration as suggested by Tremblay (1998) which may ensure symbiotic development of tourism stakeholders.

However, along with Jensen (2009b), other researchers also indicated that such collaboration remained at operational level i.e., TOs keep these relationship to lower level of task not at strategic level.

7. Discussion

The importance of managing relationships effectively with the stakeholders (not necessarily under CSR) and management of business operation's impacts can't be that much crucial in any other industry than it should have been in tourism industry because of its inevitable dependence on destination and its resources. Further, fragmented nature of the industry also stretched the value chain required to assemble and to deliver a tourism product increasing the interdependence among the players further. This mutual interdependence expressed by different tourism authors like Buttler (1991); Budeanu (2007); Sharply (2000); Richard and Hall (2000); Jamal and Stronza (2009); Jensen (2010) Scheyvens (2003); and Saarinen (2006).

Among these the case of Noah; a local guide running a micro business in Zimbabwe who is contributing financially to meet the community needs like education and medical (Scheyvens, 2003), in Poper's term can be referred as 'white swan'. It is because; the case has shaken the myth that CSR is the 'responsibility' of the 'corporations' only. Or 'corporations' can be given exemption on this responsibility because they are delivering on other responsibilities like generating employment and paying taxes. Or the corporations' argument that development responsibility of destinations lies majorly on host governments (Curtin and Busby, 1999). The case has also weakened the arguments of Small and Medium Enterprises (SMEs) that they don't have resources to contribute for this purpose.

Noah is contributing because he knows the cooperation of the community is important for his business, this investment will contribute towards the development of the community which will increase his personal/business acceptability in this community. CSR shift from only a face saving PR activity to its measurement in the form of CSP, and linking it to the SD of the society reflect evolution of accountability thought in business with the concern that CSR should also deliver to the society as well as referred by De Bakker et. al. (2005); Blowfield (2004,2005) and Montiel (2008) along with delivering to the business.

Carroll (2000); Wood (1991); Porter and Kramer (2006); and Banerjee (2008) dissatisfaction from company's CSR behavior reflected the academic concern about the true contribution of these (claimed) social efforts. Integration of SD concept in CSR has actually limited the liberty of the business to choose CSR issues, for its own good as the case of Nestle highlighted by Porter and Kramer (2006). Such empirical examples demonstrated that CSR can be used (as a tool) to increase the choices for the people i.e., development/SD which will contribute towards CS as well – a path towards symbiotic development.

Wadham (2009); Wheeler et. al. (2003); Porter and Kramer (2002); Hart (1995); and Gladwin et. al. (1995); concept of interdependence between nature/environment/society and business can be used to construct debate for partnership to materialize the symbiotic development i.e., the common goal/value.

Industrial fragmentation in tourism industry makes industry's players mutually interdependent as well dependent on destination stakeholders. Destination stakeholders also depend on tourism in one way or the other as highlighted by Buttler (1991), Budeanu (2007); Sharply (2000), Richard and Hall (2000), Jamal and Stronza (2009) and Saarinen (2006); and Jensen (2010). Figure 1 expressed the idea of this mutual interdependence.

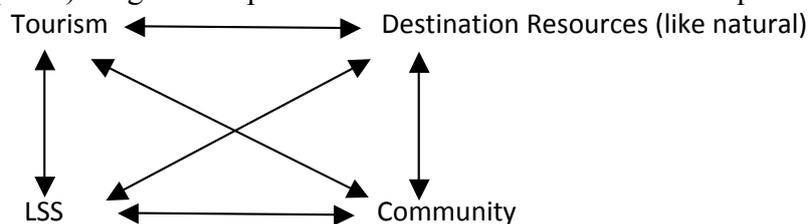

Figure 1: Interdependence between tourism stakeholders

As reflected by figure 1, this interdependence makes destination community, its resources/attractions (including environment), LSS and other industry players generally and especially TOs as inevitable stakeholders for one another. Developing collaborative arrangements to pursue the common goal of symbiotic development make strong business as well as social sense. It's not the business need (instrumental as well as institutional perspective of CSR) which may force these TOs to establish partnership with stakeholders at destinations rather the practice of marketing and making money from a product not owned by these TOs (natural resources) or owned by others (local culture) put a moral/ethical responsibility (ethical perspective of CSR) on these TOs to take care of local stakeholders interest along with their own (symbiotic development perspective).

Symbiotic Development can be the objective of collaborations as highlighted by Tremblay (1998) Hall (1999) Crotts et. al. (2000) Telfer (2000) Li and Petrick (2008) and Jensen (2009b, 2010) wholly or partially.

This interdependence is also the hallmark of adaptive SD paradigm which is the prevalent paradigm in tourism. In tourism this paradigm can be referred as tourism centric development i.e., tourism is taken as a tool for development; the notion will remain for indefinite period of time. Author's this understanding is based on different ground realities like:

- Both SD and CSR are socially driven concept therefore, can be defined while considering the society's needs. Like tourism in remote areas can meet the

economic needs of the area while giving second consideration to environment which may not be in dire need of attention.

- Tourism industry is at the initial stages of responsibility debate therefore, support for strong SD will be difficult to get from tourism industry players like TOs, a business case has to be there to motivate them.

So while summing up in a way its collective interest /common goal / value i.e., symbiotic development to establish and nurture relationships not only with the other firms in this industry but also with the local stakeholders consisting of LSS and community. This partnership will motivate all these stakeholders to work for the passive stakeholder i.e., resources at destinations upon which both community stakeholders and tourism industry are depending. Partnership will also have implications for knowledge creation and sharing, vital for future tourism product development.

8. Conclusion

The objective of the article was to synthesis literature from different field of studies to develop support for SD responsibilities in tourism industry by industry players like TOs who are otherwise (apparently) seems less inclined to assume and deliver.

In tourism, fragmentation of the industry created natural interdependencies between or among the industry players to deliver a memorable experience to the tourists. This player list is diversified with respect to size, scale, scope and spread (geographical). Therefore, TOs sitting in skyscrapers of metropolitans like London and Berlin are able to claim an awesome experience to the tourists in the mountain region of High North Norway because of their confidence that from large (air carriers) to micro (local guides) businesses partners in their value chain will be able to deliver. Further, they also need confidence that the communities at such remote destination will also give a neutral (if not welcoming) response to the tourists they are directing and the attractions at these destinations are still in a condition that they can deliver what tourists were charged for.

This dependence make destination stakeholders i.e., attractions, LSS and community as the vital stakeholders who may affect the objective of the TOs to send tourists profitably to these areas. Getting tourists is also in the interest of these destination stakeholders though for different reasons. Both TOs and destination stakeholders will be eager to promote tourism until it contributes towards their symbiotic development. All this requires to have an approach i.e., taking care of what has to take care of you (tourism industry).

However, despite this correlation literature revealed that such partnership remained limited to operational level i.e., not contributing towards the development of stakeholders like LSS at strategic level. Such limited scope also has other implications like interest of other stakeholders e.g., attraction/resources and community will also be uncertain as it would be difficult to materialize this without LSS support. Therefore, there's gap of understanding how collaboration between LSS and TOs can contribute towards the SD at local destinations, do they? If not what restricts the development of these strategic relationships to the extent that it

can deliver to these local stakeholders on SD basis? Such questions require empirical studies to extend the much needed theoretical foundation in this cross field area of study.

The wisdom of Chinese Calligraphy Imagery

Suoqiang Yang

Associate Professor, Chinese Calligraphy Department,
School of Humanities and Social Science, Xi'an Jiaotong University,

No.28, Xianning West Rd. Xi'an, Shaanxi 710049, P. R. China

E-mail: yangsuoqiang@163.com

Abstract: By study on the origin and culture of imagery I pointed out that the "imagery" is based on "farming culture". It is perception of nature of human beings. I also discussed the similarities and differences of image's theory development of Chinese and Western. "Obtaining meaning while forgetting image" is the key factor to the acquisition of imagery from the analysis of book discussion, it mostly expresses in "xing", "li" and "shen" of calligraphy which derive from nature, from the understanding of nature, and experienced a complicated process which is from "xing" of imagery, "li" of imagery to "shen" of imagery. The six scripts of Chinese character is the foundation for the text; the emergence of six styles of calligraphy is derived from imagery; the wisdom of the Chinese calligraphy creation imagery is "The unity of calligraphy and humanity." The performance of calligraphy imagery is in nature; man and the perfect combination of calligraphy is one of the features of calligraphy imagery; calligraphy imagery is in the perfect combination of Heaven and Man. The paper reveals the law of Chinese calligraphy images from the subject to object, to subject-object relationship of calligraphy creation. The imagery of Chinese Calligraphy Appreciation imagery lies in "view of the calligraphy is a soul calligrapher". Appreciation of Chinese calligraphy imagery have three levels that is eye appreciation, heart appreciation and spirit appreciation, which correspond to the concept of the formation of visual concept, illumination of the heart and the spiritual agreement.

Keywords: Calligraphy imagery; Imagery theory; Chinese calligraphy; Imagery;

Introduction

The "imagery" is a basic creed of Chinese arts and discriminative culture root of China arts and West arts. Chinese "imagery" had been put forward in 3000 years ago from *the book of Changes*. In the long history, after the formation and development and improvement of the course, the "imagery" theory have formed a unique Chinese characteristics "imagery" theory and art practice system, and produced the ancient Chinese art Classic in the "imagery". Whether from the "image" of the birth, formation and characterization Chinese calligraphy have the most direct and most practical, the most extensive and most in-depth features, and which make calligraphy imagery is representative of personalized and practice of the image theory. Which reveals and explore calligraphy "images" theory of origin, and cultural foundation and the similarities and differences between Chinese and Western imagery, the wisdom of calligraphy image acquisition, creation and appreciation, it has important theoretical

significance and practical value to inherit and carry forward and develop the wisdom of Chinese calligraphy imagery.

The origin and culture of Chinese calligraphy imagery

"Imagery" originated from of image to make meaning of Guaxiang divination of "Book of Changes".⁽¹⁾ Obviously, "image" in the "The Book of Changes" is Guaxiang. The "meaning" refers to God. If we investigate the relationship of the "meaning" and "image" in "The Book of Changes", the establishment of "image" aim of best "meaning" expression, and the "image" as the carrier is only used to convey his "meaning". The meaning of "imagery" has the implications of mutual tolerance and interoperability of heaven, earth and human. Not only "image" both the spirit and understanding of subjective expression, but also it stems from the objective things. This is the originator of the "Heaven and Man" thinking. How did this "imagery" concept of the philosophy and aesthetics bring forward? We can review it from the origins of Chinese culture contrast of West culture.

The geographical distribution in China has laid a Chinese traditional culture is characterized by small-scale peasant "farming culture", which form a clear contrast in the West to ancient Greece as the representative of "the sea culture". The "farming culture" has given Chinese tremendous appetency between man and nature. But the "sea culture" is mainly manifested in confrontation and antagonism of human beings and nature. From the human visual point of view, the "farming culture" is really brought a sense of the land that seeing is believed, while Western culture is remote sense of seeing mostly virtual in the sea. While human nature determines the human consciousness of the soul is housed in the place that the six consciousnesses can not reach to, which not only makes the soul to soar, but also which got soul comfort and relief from the place that six consciousnesses can not reach to. This is precisely the existence significance of cultural and arts. Therefore, the Chinese culture have the character of seeing real and heart seeking ethereal and fill with a romantic sense fully, and which pursue its "meaning" and seek "Mind". But the west culture is that seeing ethereal and heart seeking "real", so it fill with a sense of quest and go after "law" and seek "science". Therefore, the Oriental culture sees the world with the soul, while West culture looks at the world with science. This is the most fundamental difference of Chinese and Western arts and roots that Chinese culture emphasizes "from the outside and inside" and the West culture emphasize "from the inside out". Therefore, the Chinese arts seek freehand, the Western arts seek realism.

Research on the relationship between man and nature, the "farming culture" makes the Chinese culture to show a converted and non-confrontational sense of man and nature and pursue the harmony and emphasizes people's own capacity is limited, but with limited blending unlimited. The "sea culture" makes Western civilization advocating defeat, stressing man's own ability to infinite upgrade to meet the infinite desires of people. Obviously, we can clearly see that the Oriental culture in the East and Western culture in the West are inevitable historical choice in dealing with the relationship between man and nature and emit the wisdom of East and West, and

which also produced the distinctive classic arts of the West and East. The "imagery" is an inevitable choice and wisdom that Chinese people realize nature and dispose the relationship between people and nature.

On the similarities and differences of "imagery" in Chinese and the west

If we look back and reflect the history of the theory of imagery, Chinese "imagery" theory has gone through a long development process and formed a complete theoretical system. The *"Book of Changes"* as the representative in Zhou Dynasty put forward the theory that "meaning" and "image" is coessential and "speech depict image and image express meaning". Lao-tzu is representative in the Spring and Autumn Period. He stressed hominine initiative and meaning value and proposed "obtaining meaning while forgetting image" and "obtaining image while forgetting speech". "Meaning expressed by symbol and image" was brought forward by Yan Yanzhi in Southern Dynasties. He Yan, Wang Bi and Han kangbo brought forward "obtaining image while forgetting meaning" and "obtaining meaning while forgetting image". "Six Ways Theory" was put forward by Xie Hei in Southern and Northern Dynasties and aspired after "extravagant shape, gorgeous novel". Zhu Xi and Zhang Zai in Tang & Song Dynasties brought forward "Li Qi unity, out of image". Wang Ting-xiang and Hu Ying-lin is the representative in Ming Dynasty, and they brought forward the theory of "Li out of Qi, spirit expression by image". Wang Fuzi in Qing Dynasty put forward "scene and feeling unity, feeling out of scene". Chinese "imagery" theory in its development has formed two schools of thought of "Soul Communication" and "Six Methods Theory". The main differences reflect in two different understanding of values in the key issues how to use image to show meaning.

⁽²⁾ Taoism as a cultural support for the "Spirit Image" emphasis on subject-object unity, "action without action" divine encounter under the "image", "meaning" and "spirit" unity; But the "Six Law Theory" in the Confucian culture emphasizes subject-object dichotomy, the conscious process and implementation of "promising for the promising".

But the Western "imagery" theory was put forward in modern times. British esthetician Shaftsbury (1671-1713) thought that the image is "to give people in the form of" and "spiritual shape." Kant put forward the "purpose of the aesthetic image together" and "direct integration" is the main reasons of aesthetic image for non-utilitarian. Italy esthetician Croce deemed that the feeling is higher than intuitive sense, we will be able to feel something imagery. Aesthetic Imagery produced by a process which is the process of expressing emotions. United States esthetician Susan Langer believes that the aesthetic imagery originated in appearance of the perception, the appearance appeals to imagination, and become "imbued with emotional appearance" through recycling, which is image. In the aesthetic image, the emotion is the formalization of the emotions, the form of emotion in the form of its own, the two merged inextricably. Aesthetic images come from the appearance of life. The appreciation of works of art is achieved through the aesthetic image.

If we compare the Chinese and Western's "image" theory, its same point is that they

all acknowledge the existence of a relationship between image and meaning in natural way. Feeling and image, meaning and image have natural unity. The aesthetic imagery possesses illusoriness character. And the aesthetic characteristics of images have the same view: Chinese imagery is that "feeling" and "image" blending and produces aesthetic images; the Western imagery is that "emotional" integrate into "form".⁽³⁾ The different points are mainly reflected in the following three aspects:

A. From a philosophical perspective, Chinese "imagery" emphasizes one subject and object of "monism"; the Western Philosophy is a subject-object dichotomy of "dualism."

B. In the creation of imagery, the Chinese "imagery" emphasizes the combination of emotion and scenery, subjective meaning and objective image; and the Western "imagery" tend to the manifestation of subjective experience.

C. In the imagery acquisition, the Chinese "imagery" stresses comprehending and experiencing, specializes in integrative, focus on "meaning out of the image". The "Xing xiang theory" is the representative; but the Western imagery emphasize philosophical and specializes in analysis; focus on feeling form. The "symbolic theory" is the representative.

D. In the relationship between language and imagery, Chinese imagery emphasizes "obtaining image while forgetting speech" and "obtaining meaning while forgetting image". The Western "imagery" place emphasis on the creation role of language.

The wisdom of Chinese calligraphy image acquisition, creation and appreciation

(1) the wisdom and way of Chinese calligraphy images: obtaining meaning while forgetting image

A. The imagery of calligraphy elements come from nature, derived of understanding of nature by development process of "meaning of xing", "meaning of li" and "meaning of shen"

Cai Yong said that "the calligraphy derive from natural, the natural has established, Yin and Yang produce. If the yin and yang produce, the posture turns out". He pointed out that the calligraphy imagery comes from the natural, and attribute the yin and yang, and yin and yang is the roots of the situation.

On the form of calligraphy imagery, Cai Yong in the "pen" theory, said: "calligraphy font, like people's attitude, and some like sitting there want to go, and some like flying or like a move, if it come to that if, like lying still since, like the unhappy once like joy, like the insects eat the leaves, like the sharp sword spear, like a strong bow and arrow, like fire and water, like clouds, like the sun and the moon, whether it is from every aspect, has a unique image, so as to known as calligraphy. " Obviously, Cai Yong deemed that the grasp of calligraphy shape is by no means a simple form of simulation, but rather are fusion of meaning. And they make calligraphy joined the emotional element in "like the unhappy once like joy".

Cui Yuan in the "grass hand potential" pointed out the "potential" understanding of the calligraphy: "Appreciate of the cursive art image, we can observe that the calligraphy have pitching their own state", "Pen income trend is stroke tangled, like a

jumping snake to go to cave, his head into the cave but the tail remained outside, the pen is twists and turns, swing and smooth. This is the result of a distance. If we approach observation, the cursive have own law, and have the rules and regularities that "a painting can not be moved". Obviously, this calligraphy "potential" is also on the natural tendency of the meaning of all things, and contains the natural potential of reason. In fact, the calligraphy "potential" has been shaped up to the level of "reasonable" level, the "meaning "and" meaning-shaped "to" meaning truth ", which in itself is a big step progress of calligraphic image theory. And this by the "meaning-shaped" to "meaning reason" to upgrade, as Suojing in "*cursive-like*" in talks that "clever modifications make meaning clever breed". Obviously, this "meaning" is "image" philosophy thinking and flexible results.

The Wei Shuo in the "*pen array map*" has discussed the imagery of the seven stroke and 6 kinds of pen. Not only from image of meaning and truth of meaning, but also from the spirit of meaning tells the essence of calligraphy imagery. It completed the development process of the theory of Chinese calligraphy imagery shaped from image of meaning to truth of meaning and to spirit of meaning. This is not only concerned about the leap of calligraphy imagery of objects and the level, but also the free bailment and the image of the spirit of the Chinese people.

B. The law of calligraphy was obtained from meaning out image

The law of calligraphy comes from nature and a sense of enlightenment in the heart, which take meaning as derived from image completely. Such as the Ge-law of the calligraphy, Wang Xizhi in the "*The fifth chapter of dealing with the law of Ge*" said: "The law of the Ge hook likes as nagatake ramp ups and downs, a long pine in the valley according to the side of valley, it may be inverted and firm, and tightened the strings at once like the wings on the bow and arrow. The artistic conception of Ge hook is wonderful infinity ". It can be said that the Ge-shaped state with God to take care of the natural state of imagery is vividly depicted and infinitude meaning. The ancients for the treatment of water, ink and paper of the relations derived from a natural phenomenon. It condensed the wisdom of changes in rigid pushing soft born. Lu Xie in the "*facsimile tips*" put it: "If the paper must be relatively rigid to use soft pen in order to Pie-La can be finished in brushstroke. If the paper is soft, we must sue the rigid brush in order to the Hen-Shu-Gou-Zhe can be finished naturally".

With regard to hand, heart and mouth imagery in calligraphy on the function of level, Xu Wei in the "*Xuan chao lei zhai preface*" said: "From the beginning to learn calligraphy skill with a brush, all aimed to test the manual skills. From writing neat to master calligraphy method is rely heart go comprehend. The principle of Calligraphy is observed by eyes. The comment of calligraphy is talked by word of mouth. Comprehend is the highest realm of intentions. Manual skills are secondary, and the eyes and mouth to comment on the observation is the most basic skill". While for the understanding of the ancient brush law that obtained from meaning out image, Xu Wei's discussion is even more incisive: "Until I see the big lightning and simple white clouds, and heard the voice of big waves to comprehend brush style and make progress, and then I came to realize that the ancients said that snakes fighting is not talking about stippling and the font, but stresses calligraphy pen moves".

Obviously, the law of calligraphy imagery has a clear relation with the "image". If we assess the image of the ancients obtained, the ancients had not exhausted all of all natural "image", and imitate the "image" are often derived through the ancient spiritual choices, and obtained the different "meaning" because of different psychological insights. Therefore it also determines the development of the law of the calligraphy. This is exactly an important breakthrough innovation for the technique of contemporary calligraphy.

C. The six scripts of Chinese character is the foundation for the text

The generation of Chinese character such as Lee Si-zhen in *"Shu Hou Pin"* has said, "Cang Jie made Chinese character in the past, rain millet, ghosts night crying, some sense of carry on. Tak-sing in the previous is called benevolence, righteousness, rites, intelligence, and fidelity. Art-sing in the downward is called rites, music, archery, riding, writing, arithmetic. Making the Chinese character by Cang Jie are all derived from nature, and is a natural sense the result of supernatural powers. Therefore, there are "the rain millet, ghosts night crying". This has laid the obvious imagery features of Chinese characters since the generation. It is definitely not a simple record of information symbols, but is the ancestors' philosophizing for nature awareness, perception, and is the Heaven, Earth, mixed into a product. Chinese is not only record the information symbols, but also the spirit of man and heaven and earth communication medium. Therefore, the Chinese dynasties such as the gods for the worship of words like awe. This wisdom of condensation and unsealing in writing system in the world is unique. This is a major contribution of the Chinese nation to the world writing systems.

D. The emergence of six styles of calligraphy is derived from imagery

The emergence of six styles of calligraphy is derived from imagery. In today's perspective, the calligraphy division of the body just under the natural state of motion is character writing of imagery. Therefore, the ancients have the theory of "Zhen-calligraphy such as standing, Xing-calligraphy such as rows, draft calligraphy like walking on". If we put aside the academic arguments of Bafen and Li calligraphy to define, ZHANG Huai-Gwan had a imagery comparison of in respect of the six styles of calligraphy in the *"six styles of calligraphy theory"*, we can conclude that the six styles of calligraphy have their own characteristics in image and Shi and shape and gas. If we generalize the imagery law of the six styles of calligraphy, we can have a conclusion that the big-seal style obtains the meaning out of signs image and takes attention to changes, the lesser seal obtains the meaning out of whisht image and takes attention to logos, Bafen style obtains the meaning out of moving image and takes attention to Qi Yi, script obtains the meaning out of whisht image and takes attention to implication, running script obtains the meaning out of moving image and takes attention to spirit and attitude, cursive script obtains the meaning out of all image and takes attention to temperament.

(2) The wisdom of the Chinese calligraphy creation imagery is "the unity of calligraphy and humanity"

A. The performance of calligraphy imagery is in nature; man and the perfect combination of calligraphy is one of the features of calligraphy imagery

Imagery in the performance of calligraphy, the deal with God, heart, Qi, hand relationship is a primary issue. About "God" is the "fine soul" of the calligraphy, such as Li Shimin in "*Zhi Yi*" and said, "if God do not know, the word is not the attitude," while "God" is "Heart to use also". He pointed out "Heart" and "God" relationship. Yu Shinan in the "*pen soul theory*" proposed that the calligrapher must "reach viewing anti-listen with rapt attention and appear the spirit", which tells the key of calligraphy out of "God". This "anti-listening audience, and must consider with rapt attention" approach is the Taoist "mind fasting" and the Buddhist "inside view", which all demands that we cleaned up the soul, the heart no cared, can only fit with the Tao and highlight the spirit.

B. Calligraphy imagery has the unity character of people and calligraphy

Imagery of Calligraphy in the process of meaning are all mixed with emotional factors. To some extent, the process of meaning is the process of "feeling". But the expression and extent of "feeling" is different. This also determines that the calligraphy imagery has the characteristics of the lovemaking and expressing feeling. A variety of emotional sustenance is appeared in calligraphy by Zhang Xu in the process of meaning of image. Calligraphy has become a carrier of feeling. We turn the matter into the calligraphy, it passes through a feeling process of some "pleased and amazement". Therefore, we can see that lovemaking of calligraphy imagery get across of "natural image to feeling to meaning to spirit to feeling to meaning to calligraphy image". Among of them the feeling is premise of meaning. If there are not the "feeling" for "meaning", we can't talk with "meaning" for "image". The end-result of "feeling" and "meaning" of "image" is "spirit". But the explanation of spirit must recur to "image" and pass through feeling to meaning to image. If there are not the feeling and meaning for "image" and "spirit", the image of calligraphy can not have a lovemaking and meaning. Before a "feeling" is for "image", and only touch "feeling" before they can have "meaning". When we increase the meaning to spirit, its must touch off the meaning and make the feeling to meaning. This is a precise law of relationship and reciprocity of meaning and feeling and image of calligraphy arts. It's also a reason that the ancient Chinese scholars used calligraphy to express emotions, spiritual sustenance reasons.

(3) The wisdom of Chinese calligraphy appreciation –"view of the calligraphy is a soul of both calligrapher and my self"

Chinese Calligraphy features the unity of people and calligraphy makes that view of the calligraphy is a soul of both calligrapher and my self. Liu Xizai (1813-1881) said "calligraphy is a mirror, reflect calligrapher's knowledge and literary talent and ambition, in a word like himself". Appreciator of Chinese calligraphy makes his own mind reflected in the taste of the calligrapher's spiritual realm. Appreciation of Chinese calligraphy images can be divided into three stages: concept of calligraphy is the calligraphy, to the shape; concept of the calligraphy is not calligraphy, to the beauty; concept of the calligraphy is also calligraphy, to the Tao. We feel the Chinese calligraphy aesthetic realm in calligraphy appreciation, settle down and fly our tired minds, and make personality purifying and upgrading.

The method of calligraphy appreciation is the way of "obtaining meaning by

looking image". Southern • Song • Zong Bing had the words of "Observation", "Understanding" and "Joyful Expression". Calligrapher Xiang Mu in Ming Dynasty had the theory of "ear appreciation, eye appreciation and heart appreciation." The Eastern Han Dynasty thinkers Yang Xiong had these words that "calligraphy is the painting in our minds" in *Yang Zi Fa Yan • Ask God to Speak*. And the eye appreciation and heart appreciation is intuitional and illumination of the heart. Xiang Mu's words cut into the level of specific methods of the calligraphy appreciation, but he ignored the highest ideal of spirit appreciation. LI Zehou separated the art aesthetic appreciation into three kinds of taste modality, "pleasing ears and eyes", "pleasing mind and emotion", "pleasing will and spirit". This is actually precise and appropriate generalization in standing in a function of the arts for the person-level discussion.

If the combination of the past appreciation of calligraphy methods and function to the main body of calligraphy appreciation of view, I think the appreciation of calligraphy imagery should include eye appreciation, heart appreciation and spirit appreciation. By contrast, the specific methods should be compared with visual, satori and god.

A. Eye appreciation - visual concept

Visual concept, this is the first step in appreciation of calligraphy. The appreciation of calligraphy works by the first objective "view" access to a work of calligraphy "image" information, that is the form of calligraphic works, including writing movement, Knot words, art of composition and ink style. Attributed to the visual arts to the art of calligraphy is from this level to inspection. Visual concept is an intuitive way that is the appreciation of the "image in the image", with the sensory immediacy, emotional participation, feelings of transient features. Wang Guowei said in *"Commentaries on Lyrical Work"*: "observes scenery from his own angle and makes it have his own emotional colouring". Liu Xie said "to find the movement, the heart is also shaking" in *"The Literary Mind and the Carving of Dragons"*, which is all precise and appropriate words in describing the eyes concept. Eyes concept that obtain the visual stimulation and its shape and vision of pleasure is the low level of appreciation, but it's a basis of heart appreciation and spirit appreciation.

B. Heart appreciation – illumination of the heart

Illumination of the heart is a intuition to "meaning out of image" on basis of eyes concept. We can obtain the beauty and soul of pleasure. Li Zehou said "from the limited, accidental, and the specific image, realizing the infinite and inevitable contents that embody the essence of the life, thus enhancing the state of our mind." Tang Dynasty calligrapher Yu Shinan said in the *"Brush quintessence on • Qi Miao"*: "ingenuity must be illumination of the Heart, and not obtain through the eyes". Tang Dynasty Zhang Huaiguan had the theory that those who deeply understand the calligraphy have only seen in high spirits, but can not see font, which is precisely reveal the features of heart appreciation. The Qiyun and strength and expression look of calligraphy is obtained through satori and meaning.

C. Spirit appreciation – the spiritual agreement

The spiritual agreement is the highest stage of appreciation of calligraphy.

Appreciator can reach the realm of the unity of calligraphy and humanity and direct access to the realm of heaven and earth, and obtain the pleasure of Tao and will and spirit. "This is an infinite field, speech broken, never mind road, the main feeling from top to bottom with heaven and earth to experience the freedom and swim with the stream of mind on the matter at the beginning of the fun ",⁽⁴⁾ as Zhang Yan Yuan in the "*Chronicles painting in mind*" to describe the aesthetic process and the aesthetic realm: "soar reverie, Miao Wu nature, two things that I forgot from the shape to the intellectual." This soul deep joy brings people into the realm of Tao and spiritual liberation to be obtained happy and freedom. For thousands of years, ancient calligraphy and appreciation of those who admire the classic reason to make them and can not extricate itself, that is due to appreciation of Chinese calligraphy into the realm of Tao and brings charm and enjoyment of the endless to them.

Calligraphy appreciation process that is around the eye appreciation and heart appreciation and spirit appreciation these three methods has formed the three calligraphy appreciation programs of visual concept and illumination of heart and the spiritual agreement. In fact, in calligraphy appreciation process, the appreciator of those who view from the visual concept to the illumination of the heart then the spiritual agreement will be never-ending process and repeated pondering and gradually in-depth, then they can enter sublimity - appreciator and calligraphy will turn back into one. It is worth noting that knowing why is the deepening of "image" based on visual concept level and in view of the image. We are likely to have deep illumination of the heart and the spiritual agreement for "meaning".

Results & Discussion

Through the research of the origin and culture of Chinese calligraphy imagery, the analysis of compression to the similarities and differences between Chinese and Western, and the study of Chinese imagery acquisition, creation and appreciation, we can draw the following main conclusions:

A. The "imagery" originated from of "*Book of Changes*". The "image" of "image for meaning" is a way for meaning. The asymmetry in information of the "image" and "meaning" decides "end of the image can not express views". The Chinese ancient "farming culture" is a culture basement of Chinese calligraphy imagery. The "imagery" is an inevitable choice and wisdom that Chinese people realize nature and dispose the relationship between people and nature.

B. Imagery is admitted by the entire world. Chinese "imagery" emphasizes the comprehending imagery of one subject and object of "monism", but the Western Philosophy is a feeling form imagery of subject-object dichotomy of "dualism." Therefore, the Chinese "imagery" stresses comprehending and experiencing, specializes in integrative, but the Western imagery emphasize philosophical and specializes in analysis.

C. The wisdom and way of Chinese calligraphy images is "obtaining meaning while forgetting image". The imagery of calligraphy elements come from nature, derived of understanding of nature by development process of "meaning of xing",

"meaning of li" and "meaning of shen"; The law of calligraphy is obtained from meaning out image; The six scripts of Chinese character is the foundation for the text; the emergence of six styles of calligraphy are derived from imagery.

D. The wisdom of the Chinese calligraphy creation imagery is "the unity of calligraphy and humanity." The performance of calligraphy imagery is in nature; man and the perfect combination of calligraphy is one of the features of calligraphy imagery; calligraphy imagery is in the perfect combination of Heaven and Man and etc. The paper reveals the law of Chinese calligraphy images from the subject and object and subject-object relationship of calligraphy creation.

E. Appreciation of Chinese Calligraphy imagery lies in "view of the calligraphy is a soul of both calligrapher and us." Appreciation of Chinese calligraphy imagery have three levels that is eye appreciation, heart appreciation and spirit appreciation, which correspond to the concept of the formation of visual concept, illumination of the heart and the spiritual agreement.

Imagery makes Chinese calligraphy become the Garden of Eden of Chinese Spiritual sustenance and pursuit. We feel the realm of heaven and earth in the soul and the spirit of the great ease, which enhance our spiritual realm and make us not feel lonely in the course of life.

West Meets East: Cross-cultural Art from the Western Perspective

Author: Christin Bolewski, School of the Arts, Loughborough University, Loughborough LE11 3TU, Leicestershire UK, C.Bolewski@lboro.ac.uk

Abstract: Is it possible today in the age of globalization to create new modes of cross-cultural art based on a comprehensive understanding of the other culture without being accused of mimicking or exploiting the other? - This paper includes an example of Western art that attempts to incorporate Eastern aesthetics and to discuss these issues. Proceeding from Chinese thought and aesthetics the traditional concept of landscape painting 'Shan-Shui-Hua' is recreated in modern Western video art.

Introduction

This paper explores new modes of cross-cultural art within the current debate of a global art history. It looks specifically at the Western position - where the West meets the East - and deals with difficulties of a post-colonial, post-imperialistic world where Western paradigms seem to dominate the creation and debate of contemporary art worldwide. The author of the paper is a Western art practitioner. The paper is a result of a practice-based research project that investigates analogies between traditional Chinese landscape painting and modern Western film and visualisation techniques. During the practical process it became obvious that it is impossible to create such a work without encountering difficulties of translation between Eastern and Western art tradition and without engaging in a debate on post-colonial issues. The text is not aiming to deliver a comprehensive in-depth research into the comparison of different cultural modes and global art issues, it rather highlights some aspects and presents a single example of Western video art that reveals some observations and offers opportunities for further discussion. It invites engaging in alternative, competing and opposing cultural perspectives in the light of a multi-cultural globalized world where the understanding of other (visual) cultures becomes increasingly important.

East meets West meets East

In recent years China emerged as the most influential Eastern country on the global art market. With the rise of the international attention on the political and social impact of China it has also created a strong impact on the Western art world. In the past ten to fifteen years it has become quite common for Eastern contemporary artists to incorporate aspects of Western art into their practice, and there is evidence of its worldwide success in various exhibitions in major museums and galleries. In the short time contemporary Chinese art has had to establish itself - often accused by Western and Chinese critics of continuing to mimic Western art historical movements. Meanwhile a more complex relationship of influences has developed, and Chinese artists are reworking traditional Eastern concepts combined with Western ideas in a more independent way, which the Chinese art critic and curator Fei Dawei describes as 'gradually placing issues brought from Chinese context into the larger cultural background of the world, in a

lively and creative way, so that it can set in motion a process of becoming ‘common’ and ‘extensive’.’ (Dawei in Lu, 2009)

But the adventure of mixing aspects of both cultures is rarely been undertaken in the other direction from the West to the East. Although the incorporation of Eastern aesthetics into Western art has long precedent in modern art, it is today often still regarded as ‘esoteric’ or criticized as a ‘post-colonial attitude’. It seems to be quite difficult for a contemporary Western artist to create ‘non-imperialistic’ artwork that is originated by Eastern influences in the current ‘minefield’ where ‘according to some voices, globalization is the new guise under which colonialism has returned.’ (Singh, 2010)

So there is a crucial question: Is it possible today in the age of globalisation to create new modes of cross-cultural art based on a comprehensive understanding of the other culture and without being accused of mimicking or exploiting the other? Is it possible to have an equal exchange between West, East and other parts of the world within a world that is dominated by Western paradigms and its imperialistic history?

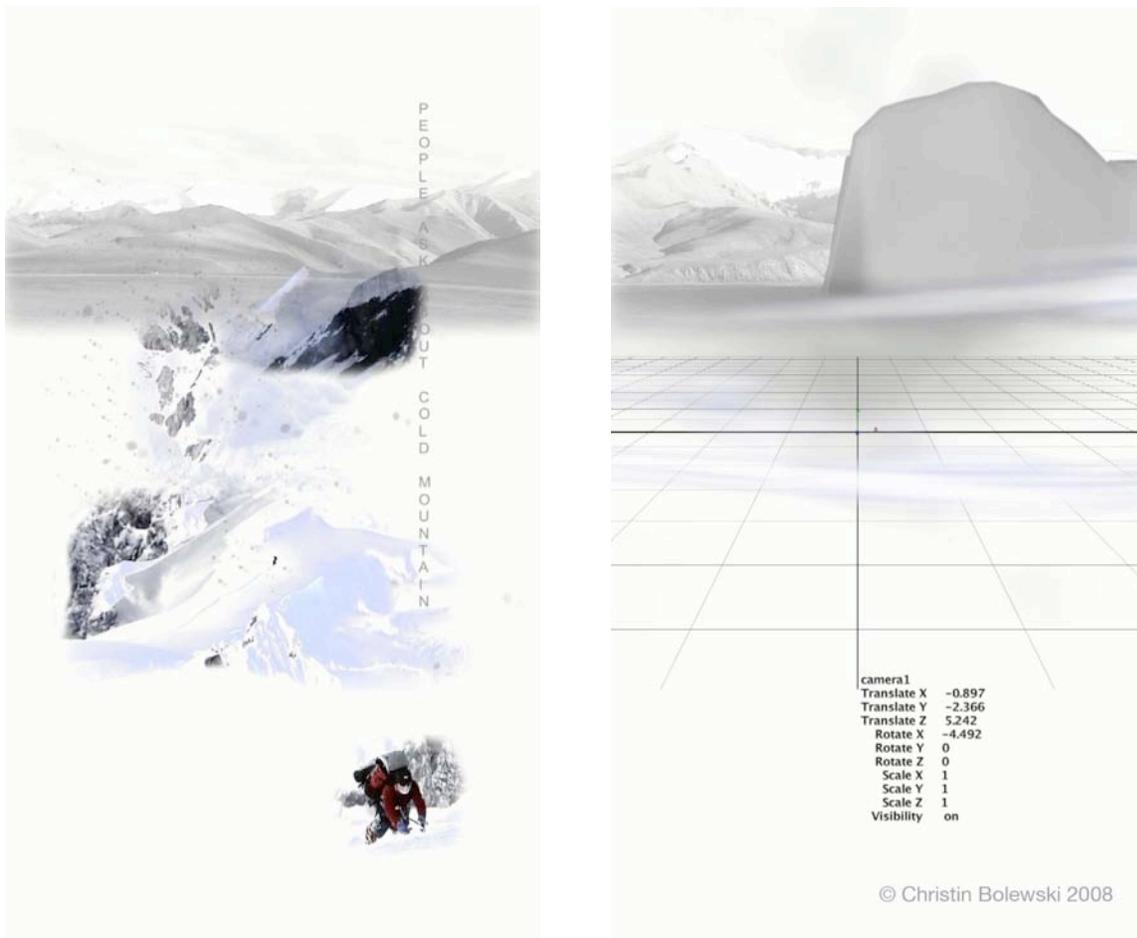

Figure 1 + 2: video still from video scroll ‘Shan-Shui-Hua’, © Christin Bolewski 2008; single screen video installation, 2D/3D Animation, HDV-PAL, Color, 15,19 min video loop

This paper includes the presentation of an example of contemporary Western video art that attempts to explore cross-cultural influences between the West and the East and discusses these issues from the Western perspective. It investigates how East Asian traditions of landscape art can be understood through reference to the condition of Western contemporary video art. Proceeding from Chinese thought and aesthetics the traditional concept of landscape painting 'Shan-Shui-Hua' ('mountain-water-painting') is recreated within the new Western genre of the 'video-painting' as a single (flat) screen video installation.

Global Art (History)

In recent years numerous publications on the globalization of contemporary art have been published worldwide. Most of them commonly agree that global art practice and history is mainly based on Western principles.

- The German art historians Hans Belting and Andrea Buddensieg report in the publication 'The global art world, audiences, market and museums' about a paradox situation where now in the 21st century the 'de-colonial re-writing' of art history is initiated by the West - dictating their post modern vocabularies to the rest of the world. (Belting and Buddensieg, 2009)
- The book 'Is Art History Global?' by James Elkins includes contributions of international art historians and critics discussing the practice and responsibility of global thinking within the discipline. Elkins argues that art history depends on Western conceptual schemata. 'Perhaps the most surprising fact about worldwide practices of art history is that there may be no conceptually independent national or regional traditions of art historical writing. Chinese art history, for example, demands expertise in very different kinds of source materials and formal concepts, but its interpretive strategies remain very Western. Chinese art historians, both in China and in universities in the West, study Chinese art using the same repertoire of theoretical texts and sources - psychoanalysis, semiotics, iconography, structuralism, anthropology, identity theory.' Elkins concludes that 'it can be argued that there is no non-Western tradition of art history, if by that is meant a tradition with its own interpretive strategies and forms of argument.' He finally comes to the conclusion that 'globalism means the use of Western forms, ideas, and institutions.' (Elkins, 2007)
- Jim Supangkat, an Indonesian artist and curator, talks about art 'with an accent' and explains that since the beginning of the nineteenth century art in Indonesia has interpreted 'art in the Western sense'. 'The art in the Western sense can be viewed as analogous to the development of English. Considering this analogy, the understanding of art in Asia can be viewed as 'art with an accent'.' (Supangkat, 2009)
- Carol Lu, a Chinese curator, critic and writer based in Beijing offers in her essay 'Back to Normal', a diagnosis of the Chinese contemporary art scene. 'Many of the 'exiled' artists who left China to live and work abroad in the 1980s and 1990s have gradually returned to major cities in China, and these people brought back not only their updated practice and artistic

thinking shaped by their overseas residence but have also presented formidable possibilities and influences on the art scene within China.’ (Lu, 2009)

These are just a few references demonstrating that contemporary art is mainly a Western construct that is incorporated in global or cross-cultural art forms; and there seems to be no easy escape to develop original contemporary artwork or art writing of worldwide recognition which is not based on Western principles.

Detour via China

But how to proceed as a Western artist when attempting to learn and understand Eastern traditions and to incorporate aspects of Eastern art into own practice, if in the East-West direction artist cannot create internationally recognised artwork without using Western strategies and which has to persist in the Western art historical discourse? How can then a Western artist create artwork containing Eastern elements without not exploiting and using it as a foreign and ‘exotic’ attribute that gets translated, reshaped, adopted, attached or incorporated into Western concepts?

At first East Asian aesthetic and philosophy is difficult to understand for the Western mind. There is a difficulty involved in bridging the gaps of understanding when viewing and understanding Chinese art. The reception of the art is passed through filters of language and culture and we in the West often realize that we cannot always grasp the full meaning. In her essay ‘Another kind of global thinking’ published in ‘Is art history global?’ Barbara Maria Stafford points out that translation and interpretation always involve transformation. ‘The pristine distinctiveness of other cultures cannot be maintained through the process of interpretation. It involves assimilation to the conceptual vocabulary and values of the other culture and does not overcome the basic fact that they are still being removed from the specific cultural context to which they belong, translated into an alien context and idiom - Anglo-American art history - and set into a network of concepts and comparisons which transform their significance.’ (Stafford, 2007)

There are some contemporary writers such as the French philosopher and sinologist Francois Jullien or the Chinese French writer Francois Cheng who ‘translate’ Chinese aesthetics for Western understanding offering some insights and interesting alternatives to compare and rethink Western traditions. (Jullien, 2005) (Cheng, 1994) Francois Jullien is one of the most important contemporary writers working in the cross-cultural field between the East and the West, although it has to be mentioned that some other sinologists criticize his method. Jullien has found his own way of dealing with the difficulties of transformation and translation between the cultures, and it is more a philosophical approach. Pointing out that it seems intellectually and politically imperative today to reinvigorate Western thought with ideas from the East, Jullien seeks to create a space of mutual inquiry that maintains the integrity of both Eastern and Western thinking. Moving between the traditions of ancient Greece and China, Jullien does not attempt a simple comparison of the two civilizations. In his book ‘The detour via China’ (original title: ‘Un detour par la Chine’) Jullien attempts to create a new approach to Western culture. He explains it as a ‘local change of thinking’, a process of distancing from Western thinking as an effective strategy

where Chinese philosophy functions as an ‘outside’ from which to see more clearly the values and preoccupation of Western culture. (Jullien, 2000) His detours about China always emanate from European philosophy with its Greek origins, and lead back there to reveal the contingencies of their principles and conditions. Jullien talks about the impossibility to compare the two separate cultures. Instead, he uses the perspective provided by each to gain access into the other culture. Eastern and Western concepts are often not in opposition; instead they are based on different categories and different pattern of thought, which make a direct comparison impossible, and he suggests distancing and reflecting each others preoccupations.

The Western video scroll ‘Shan-Shui-Hua’

The philosophical approach of Jullien offers an interesting possibility for a Western contemporary artist, who also struggles with the difficulties of bridging the gaps of understanding and translation when approaching Chinese art tradition. Julliens ideas have been used as a starting point for a practice-based art project and tested and applied for the creation of the Western video scroll ‘Shan-Shui-Hua’ which is reworking Chinese landscape traditions. The video work ‘Shan-Shui-Hua’ is not the research of an art historian or a specialist in Chinese art or a sinologist. It is an individual response of a contemporary Western artist and includes artistic freedom and subjective interpretations. In the sense of Francois Jullien the artwork is a ‘detour via China’. The methodology of the work process for the creation of the video scroll derives from Julliens philosophical approach. The subject of study is Western film and digital visualisation practice, but the access is through Eastern aesthetics. Emphasizing to some extent pictorial concepts and practical aspects of the Chinese painting process enables the artist to create distance, in order to take a fresh approach to Western visualisation practice. But at the same time using software tools that generally have been devised to create 2D and 3D artefacts from a Western cultural perspective avoids the pitfalls of echoing and imitating Chinese landscape painting too closely. The concept of multi-perspective and the endless scroll of the Chinese landscape are explored through digital filmmaking, video compositing and virtual camera, depths and particle systems. The main features of the original ‘Shan-Shui-Hua’ merges with Western moving image practice and one of its aims is to question Western digital visualisation practice that intends to represent realistic space.

Prof. Paul Wells, Director of the Animation Academy UK, talks in ‘Aspect Magazine – The Chronicle of New Media Art’, Volume 15: Influence and Reference, about the video scroll ‘Shan-Shui-Hua’: ‘Bolewski preoccupations are about the ways in which digital technologies – primarily geared to Western applications - can facilitate exploration of spatial terrain, and how this revises aesthetic orthodoxies, Chinese or otherwise. Western perspective underpins the implied desire to create plausibly realistic representations of the material world, and that this in turn authenticates an accountable ‘truth’. ‘Truth’ self-evidently, is a relative thing, and in encouraging a different way of seeing – aesthetically and culturally – Bolewski insists upon a re-interrogation of how tools help to define creative practice, and how our perceptual sense can be re-orientated by a different technical construction of pictorial elements.’ (Wells, 2010)

The Video Scroll: Appropriation? Cultural Hybridization?

The video scroll ‘Shan-Shui-Hua’ is a combination of a traditional Chinese hanging and hand scroll. The horizontal scroll of the video unrolls in time and space, but only in the moment of projection and is composed and animated from right to left in analogy to the East Asian principle. It presents a permanent virtual camera movement gliding through an indefinite landscape containing original 2D video recordings as well as 2D / 3D computer generated images and animations of landscapes. It is presented on a large high-resolution flat screen monitor, wall-mounted in vertical position as a ‘video painting’. It is simultaneously an exploration of ancient Chinese art practices and highly contemporary digital experiments in revising Western frame aesthetics and moving image construction. The exploration of the Chinese scroll as a moving image practice has long precedent, but is seen afresh through the digital intervention. Confronting the tools of modern computer visualisation with the East Asian concept creates an artistic artefact counter-pointing and reflecting both positions.

Appropriation has a long tradition in Western art. In the visual arts, to appropriate means to adopt, borrow, recycle or sample aspects or the entire form of man-made visual culture. In fact, appropriation of visual culture and art, in some form or another, has always been part of human history. Inherent in the process of appropriation is the fact that the new work re-contextualizes whatever it borrows to create the new work.

The video scroll 'Shan-Shui-Hua' specifically re-contextualises aspects of Eastern landscape tradition in the following areas:

- The use of time and temporality: This is an important feature for both Chinese aesthetics and the medium film. The Chinese horizontal hand scroll is often referred to as the first motion picture: it unrolls in time and space and is enjoyed as a progression while the painting is revealed foot by foot.
- The use of space and perspective: Based on the Renaissance tradition the achieving the effect of realistic space by the employment of linear perspective is a major preoccupation of Western visual culture, whereas the Eastern concept of using multiple vanishing points never aimed to create a realistic space.
- Chinese philosophy: The video painting plays with absence and presence, totality and emptiness, materiality and transcendence. 3D computer generated forms and wire frame grids of mountain models mix with 2D video recordings; illusionism meets reality. The principle of transformation so central to Taoist thought becomes the transformation of an imaginary digital landscape.
- Relation of man and nature: The video scroll transposes the traditional Eastern relation of man and nature into a more contemporary Western manner: it uses the figure of the Western mountaineer equipped with special tools and protective clothing to vanquish the highest peaks in order to conquer nature rather than searching for harmonious existence, thus counter-pointing Eastern and Western ideals.

And there is an important historical reference to make: Once the Russian avant-garde filmmaker Sergej Eisenstein was inspired by the commonality between the medium film and the Eastern art tradition in the development of his theory of film montage. (Eisenstein, Leda, 1996) He studied Japanese language and art and concluded that all the various branches of Japanese art were permeated by the same cinematic element, so that it was appropriate that the cinema should learn from other forms of Japanese artistic practice. Besides extracting techniques from Chinese characters and the Kabuki theatre, Eisenstein had also drawn on traditional scroll paintings that fused in his mind a combined image of close-ups and composition in depth.

Unfortunately the link between film and Chinese art is not very prominent today, so that it is very challenging - from the perspective of a contemporary digital media artist and film maker - to look closer to this relation and to consider the early observations of Eisenstein specifically in an approach to digital film practice, nearly 100 years later. The video painting 'Shan-Shui-Hua' follows the idea of Eisenstein and introduces the new genre of the digital 'video painting' as a suitable form for development. The video painting is a new artefact in Western contemporary moving image practice. It is a hybrid concept between the still and the moving image using traditional patterns of film narration and painting practice. It emerges as a supremely pictorial form and due to its ambient and meditative character the video painting seems to be privileged to

represent the conceptual and philosophical ideas of the traditional Shan-Shui-Hua.

But also Eastern artists appropriate and translate the traditional Chinese scroll into modern forms. In his book 'The Tao of Chinese Landscape Painting' the contemporary artist Wucius Wong creates an interesting analogy to digital visualisation practice: 'But as he paints, the Chinese artist prefers to rely on his own imagination, and arranges the elements as though he were building a model. From his mind-heart he selects mountains, which he can then rotate and re-shape;...through acquaintance with the elements, the artist will be able to visualize at will in fabricating his scene. Through understanding of the laws, the artist will position the elements in appropriate positions, directions, and proportions, with transitions, extensions, and overlaps conforming to a definite order'.' (Wong, 1991) Wong uses terminology that sounds more familiar describing the construction of a virtual landscape within a digital software application rather than the traditional Chinese painting process. Here it becomes obvious that the exchange between different cultures, visual tools and aesthetics continues to create a 'unique global (visual) culture and language'.

And the new technical genre of the high-resolution flat screen display wall-mounted as a video painting inspires also Eastern artist to set their traditions into motion. The Korean artist Lee Lee Nam is internationally very successful and transcends traditional Eastern forms into digital sculptures and video paintings. And a very prominent example was presented at the Opening Ceremony of Beijing 2008 Olympics. Here a mega scroll was displayed and set in motion on probably one of the world's biggest LED screens: 22 meters wide and 147 meters long. As usual, the painting was a still image. It was not temporal art, but the scroll's dynamic display set the painting in motion and was able to show both the still image and dynamic one.

So is there now a difference if Eastern artists rework their own traditions or if a Western artist does it?

Altermodern - Creolisation

An interesting framework for the cross-cultural approach of the video scroll 'Shan-Shui-Hua' and the Eastern examples delivers the Tate Triennial 2009 exhibition at Tate Britain UK curated by the French art critic Nicolas Baurriand. This exhibition provided a framework for a new modernity that is emerging, reconfigured to an age of globalization, which Baurriand describes as 'altermodern' culture. This 'altermodern' culture is based on increased communication, travel and migration. Multiculturalism and identity is being overtaken by creolisation and artists are now starting from a globalized state of culture. This new universalism is based on translations, subtitling and generalized dubbing. He says: 'If twentieth-century modernism was above all a Western cultural phenomenon, 'altermodernity' arises out of planetary negotiations, discussions between agents from different cultures. Stripped of a centre, it can only be polyglot. 'Altermodern' art is thus read as a hypertext; artists translate and transpose information from one format to another, and wander in geography as well as in history.' (Baurriand, 2009)

Another framework delivers Kavita Singh, one of the curators of the exhibition 'Where in the world' at Devi Art Foundation Delhi India in an essay published in 2009 in the catalogue of the

exhibition. He suggests one formula for international success as an artist, which is 'national content' housed in 'post-modern forms'. 'That is, artists might use new genres, media and technologies of spectacle to reiterate icons from their own cultures, or to address current issues relating to their contexts that have already been made familiar by news. The artists can thus ensure that they appear 'contemporary' in their art-language while remaining 'authentic cultural insiders' in their content.' He continues: 'Observers have pointed out that this leads to 'self-ethnologizing' or presenting ourselves as others would wish to see us. Some even sharper critiques suggest that the nomadic contemporary artists of today are the 21st century equivalent of the living ethnographic specimens who toured with 19th century World's Fairs.' (Singh, 2010)

So here we have two different voices: the one of Kavita Singh is quite critical and the other one of Nicolas Baurriand does not even consider issues of power play between East and West, colonial and colonised countries and the use of Western paradigms as a basis for the 'creolisation' of contemporary art. He speaks about 'dubbing and translation in a polyglot world stripped of a centre', with equal access and knowledge and without all the worries of many art historians. - But it can be argued that his 'polyglot' world is today still based on Western paradigms and then 'polyglot' becomes another metaphor for what Dan Karlholm describes in his essay 'Does it work? - A note on pragmatic part and global wholes': 'Global seems to be the latest incarnation of 'universal' and is a quintessentially Western preoccupation. The anxiety to meet the standards of a global account (or narrative, or history) is certainly a product of the Western aspiration of conquering the world both literally and symbolically.' (Karlholm, 2007)

What to conclude?

Stafford concludes in her essay 'Another kind of global thinking' that 'the only way one might mitigate such transformations (between cultures) would be to attempt to become assimilated to the culture of the other, and some have followed this course.' (Stafford, 2007) One example is the French philosopher Francois Jullien who has spent many years of studies in China to gain access to the other culture. Carol Lu reports on the Chinese art historian and critic Leng Lin who is widely considered one of the most influential players on the Chinese contemporary art scene. After being away in Berlin for two years he returned to Beijing and manages and directs there one of the most important galleries in the world. 'Leng has a deep understanding of and experience in both worlds and clearly stated that these are two completely different systems: 'I need to develop two methodologies and languages to deal with these two worlds.' As he brings his full grasp of both worlds into his practice, they definitely show mutual influences on each other and possibly will give shape to a new model that makes the best of both systems.' (Leng in Lu, 2009)

Global, cross-cultural art or hybridisation and creolisation of art - all these concepts cannot be seen apart from the historical and political background of a Western world dominance within the last centuries. In the 21st century single individuals, who traverse between the cultures and get assimilated to different cultures, might be able to develop more authentic strategies. But the dominance of the Western art historical discourse might still remain a standard for the worldwide appreciation and reception of art. Hans Belting who has been thinking around concepts of 'universal art' since more than 10 years, says that the 'global' in art has yet no definite meaning,

but he speaks about a ‘turning point’ where in the moment the concept of art is shifting and he expects that in the time to come it will change more than we ever would expect. (Belting, 2006)

But meanwhile for a single Western visual artist using modern Western visualisation tools day-to-day for the creation of own imagination and views of the world, it is fundamental to be remembered of the restriction that lie within own cultural concepts, to be aware of a (self-) limitation within own practice and thinking, which is dictated by own culture and soft- and hardware tools, which are designed to serve Western preoccupations. It is important to be remembered of alternative modes of expression through this ‘detour via China’ to be able to expand ones own imagination.

Critique and Reconstruction

— The Reflection on Preservation of War Landscapes in Kinmen-Matsu Areas

Chen, Chien-chung*、Fu, Chao-ching**

ABSTRACT

This article tries to analyze after 1949 - when a united “one China” has separated-how the traditional dwellings of Kinmen(金門) and Matsu(馬祖) were influenced by the state and gradually turn into military bases under the Cold War and “ROC vs. PRC” military confrontation across Taiwan Strait. I will try to point out how military power forms the space and society of local people, reflecting on the landscapes and lifestyle there. Furthermore, the historical meaning and value of preserving the battlefield Kinmen-Matsu as World Heritage will be discussed.

Although the military deployment has ensured the safety of Taiwan, the decade-long military control also seriously confined local people’s rights. Everything was under monitor and discipline of government authority. Kinmen and Matsu were not only the front base of the “anti-communism and national recovery” policy, but also the first Asian island chain in the “Containment Policy”. They are spatial symbols of the military confrontation during the Cold War, just like Berlin Wall in Germany, Panmunjom in Korea, Cu Chi tunnel in Vietnam. Particularly the long confrontation state across the Taiwan strait with no real fighting has peculiarly become a unique landscape in the world history of war worthy of preservation.

In 2003, Taiwan’s government has listed Kinmen-Matsu’s military cultural landscapes as a potential site for World Heritage. In recent years, these military buildings has lost their original functions and turn to be local tourist resources to attract visitors, a kind of war landscapes were created under special time frame.

1. The Historical Changes of Kinmen and Matsu in Modern Times

The geography scope of Kinmen includes Greater Kinmen, Lesser Kinmen, and some islets. Administratively, it is Kinmen County of Fujian Province, Republic of China. The total land area of Kinmen is 150 square kilometers. In 1915, Kinmen was assigned as a county. After the second civil war in 1949, Kinmen is administrated by Taiwan Government.

** Professor, National Cheng Kung University Department of Architecture, Taiwan. E-mail : ccfu@mail.ncku.edu.tw

The immigrant society of Kinmen had already existed since the fourth century. The immigrant increased after the Ming Dynasty and became prosperous since then. In 1949, the Kuomintang (KMT) government moved from Mainland China to Taiwan, and Kinmen was forced to become the battlefield of the civil war. After The ROC armed forces had been assigned to Kinmen, they undertook serious battles of Kuningtou(古寧頭) and Dadan(大膽) island with P.R.C Military which thousands of R.O.C armed forces were dead or wounded. Moreover, battles such as “93 Artillery Bombardment” in 1954, “823 Artillery Bombardment” in 1960, and “617 Artillery Bombardment” in 1960 made Kinmen the island with the most battles and artillery shells. Although the military shelter of Kinmen ensured the security of Taiwan during the Cold War period, the result of “full military operations” had changed the scenes of Kinmen, and made the daily lives of people restrained and inconvenient.

Matsu is namely Lienchiang (連江) County. After the second civil war in 1949, the R.O.C government had combined five major islands such as Nangan (南竿), Beigan(北竿), Dongyin (東引) and other 36 minor islands as Matsu islands. The total land area of Matsu is 28.8 square kilometers. The historical records of

Figure1: Map of Kinmen, Matsu and Taiwan.

Yuan-Ming had mentioned little about Matsu islands: Matsu was a small and barren fishing village as a shelter for the fishing men from Fujian, and gradually becoming a village with kinship. According to the documents, Matsu as the “anti-communism fort” also had encountered thousands of artillery shells from P.R.C. in the period of Taiwan and China split, although it wasn’t as serious as the tens of thousands of artillery shells in Kinmen area, Matsu was still under the control of military administration for decades, and battlefield facilities such as military bunkers, underground tunnels, battlefields, and field batteries were everywhere in the islands.

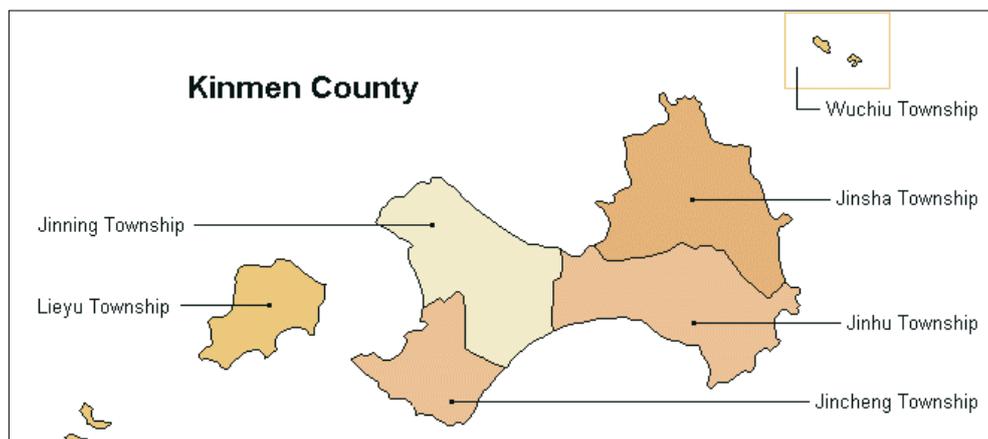

Figure2: Map of Kinmen County.

In the early 1950s, the United States had declared not to involve in Chinese Civil War. Until the Korean War broke out in June 1950, the situation of Taiwan Strait had changed fundamentally. The supportive military actions from the communist party to North Korea reminded the United States of the spread of the communist forces in Pacific region. After the end of Korean War in July 1953, Zhou Enlai reaffirmed the determination of “The Liberation of Taiwan” with Taiwan, and reassembled the armed forces to bombard Kinmen. Considering the red crisis, the United States determined to sign “Sino-American Mutual Defense Treaty” for ensure the security of Pacific region by providing defensive military in the Taiwan strait. The structure of military bases in Kinmen and Matsu had gradually changed from “conquering the mainland” to “defending Taiwan”.

Under the circumstances, Kinmen and Matsu as the islands dominated by farming and offing fishing had entered the military blockade period with the history trends. In all industries, military needs took precedence over others under the condition of military administration. The local economic development was forced to rest on the position of the primary industry. The industries enough to be called “the secondary industries” were those supported by the military such as distilleries, ceramics factories, granite fields and so on. After relieved from the

Figure3: Map of Matsu area.

military administration, Kinmen and Matsu had gradually returned to local autonomy. Since parts of the garrison evacuated, the abundant military facilities were no more mysterious and grim but became the popular sites of tourism as the cultural landscapes of battlefields.

2. The Villages Restructure of the Military Administration: The Space Control of the De-contextualization

2.1 The Military Administration in Kinmen and Matsu

The military administration refers to the particular administration established for unifying civil administration, finances, construction projects, education, police administration and intelligence work. R.O.C armed forces had been assigned to Kinmen and Matsu after 1949, but the military organizations were too complicated to manage, R.O.C government, therefore, had classified Kinmen and Matsu areas as the military administration for the military uniform and the battlefield defense in 1956. Defense Department, after a short time, had enacted “Experimental Methods of the Military Administration of Kinmen and Matsu,” and had established “Battlefield Government Affairs Committee” in both Kinmen and Matsu area. The military units were assigned to assist the experimental work. The military government period started with the systems of the military administration such as “fully military operations” and “military and political integration”, and last for nearly 40 years.

The battlefield government affairs committee was directly under Defense Department, and all affairs were conducted by Defense Department in this region. The battlefields commander also the chairman of the military administration committee. Kinmen and Lianjian county governments must obey the command and supervision of their military administration committees respectively. The county heads were assigned by Defense Department, the county governments had become the domination of the military administration committee for dealing with normal civil affairs. The military administration committee was an institution with the highest authority, meanwhile, it was the agent of country for information filtration and elimination and resources distribution and conformity. So the military administration committee shaped the battlefield impression for Taiwanese people and the self-identify for people in Kinmen and Matsu.

The martial law in Taiwan and “Period of Communist Rebellion” were terminated on July 15, 1987 and May 1, 1991 respectively. However, Kinmen, Matsu, Dongsha (東沙), Nansha (南沙) and other outlying islands were still under the temporary martial law based on the military consideration, and people’s rights were restrained with “The Safety and Counseling Regulations of Kinmen, Matsu, Dongsha, and

Nansha Region”. Until the termination of this regulation in 1998, the history of the military administration for 36 years was finally and completely terminated and returned to the normal operations of the constitutional government, the local authority and the democracy.

The result of the Chinese civil war in 1949 was the key of “full militarization” in Kinmen and Matsu. The main task of the military administration was to reinforce the combat readiness and the mobilization of the military and the civil. The long-term objective was to strengthen the consciousness of patriotism and anti-communist, and to establish a system of battlefield organizations, sources supply and health care for building “**the model county of Three Principles of the People**”. However, the long military administration also caused negative influence which made people in Kinmen and Matsu live in a different situation from people in Taiwan with the Implementations of curfew, blackouts, military law judgments, entrance and exit administrations, and telecommunication, financial and electronic appliances administrations.

2.2 The Military Reorganization of Village Community – Civil Defense Organizations

Michel Foucault’s perspective is worth learning from regarding the discussion of space and authority. He argues the principle of discipline is to assign everyone to a position, and assign every position to a person. It terminates the blurring distribution and people who are not under control, and ensure the present and absent ones to supervise the performance of everyone, make evaluation and adjudication constantly. The nature of military administration is a sort of disciplines with gentle methods and force. It implemented four systems: “the civil defense organizations”, “the village autonomy organizations”, “the village joint protection organizations”, and “the uniform system which combined the police and the household” to distribute people in the villages as units and control them with the military administration. By implementing the top-down “pyramid” military leadership, “only people in Kinmen

Figure 1 (left) past Kinmen and Matsu, and (right) present Kinmen (the village was the model of “The Three Principles of the People.”)

military and the villages. The field officers were assigned as the vice chiefs of townships and the company officers were assigned as the vice village chiefs to control and monitor everything in the villages. The vice chiefs reported every detail to the superiors for ceasing the tendencies of the residents. On the other side, the military cadres located in the villages would supervise the residents to execute the demands from the military which made the social organizations militarize fully. The local officials were just dummies for conveying and implementing demands with no real authority.

The civil defense organizations classified the residents by their age, gender and profession, and then assigned tasks such as military operations, garrisons, logistics supply, injure aid and intelligence delivery to them. The principle of classification was to assign every resident a combat position with a particular task and cooperate with others. "Everybody is an element to be settled and shifted." This classification must consider the continuity of time and ensure every resident in any age was assigned to a military position and a task. From children to elders, the residents must change their identities to be a military man to meet the needs of the country. Besides, the self defenders of civil organizations would provide their labors without payments. Under the banner of country battlefields, the labors were the properties of the country.

Moreover, the system of the household co-punishment prescribed the residents to ensure the co-punishment for combining at least 2 households and 5 households at most. The co-punishment system became a filter for preventing outsiders from entering Matsu, meeting the effect of mutual monitoring, and controlling the flow and amount of the residents.

The Task Distribution Units of Civil Defense in Kinmen and Matsu		
Unit	Identity	Task
Young Lions	Students above 11 years old.	Command by the garrison units of each village.
Youth Zone	Young men and women from 11 to 16 years old	Intelligence collection and communication.
Feminine Unit	Women from 18 to 35 years old	Counseling, guiding, aid, intelligence and defense.
Feminine Preparation	People with over 5 month pregnancy and babies under 2 years old, people who support the families singly, and those who are poor or disable.	
Maneuver Unit	Men and military men from 17-35 years old.	The main force of the civil defense organizations.

Garrison	Mainly men from 36-48 years old	The garrison and the patrol of strategic locations and traffic.
Logistics Supply	Retired men from 44-55 years old	The supplemental support.
Cooperation	The weak under 11 and over 55 years old.	Cooking and assisting the supply work.

3. Recontextualizing the Villages: Reconstructive Projects of the Military Spaces

The objective of implementing the military administration was to define Kinmen and Matsu as “spring boards of anti-communist”. The results of full militarization simplified the scenes. To build the military roads and green planting for defense, the original ecological system and geography had been destroyed. Controlling the dominance of passing in and out of the space can reorganize the social order and weed out the suspects. However, the long-term blockade policy for commanding the military mobilization and resource management had caused the decline of local economic industries and social development. The present cultural landscapes of battlefield are the metaphor of the “the authority of military administration”, “land exploitation”, “the ignorance of local lives and geography” in the past. The declaration of “the priority of military status” by monitoring and disciplining local residents from the military was reflected on the allocation of local space.

3.1 The Combat Villages

Kinmen and Matsu were positioned as a blockade space out of military consideration. Each island was independent, and the military bases on the mountains were monitoring the residents of traditional villages. At the time the military decontextualizing the region, they were also recontextualizing the spaces such as the constructions of “combat villages”, “military bunkers”, “ underground tunnels”, “bomb shelters”, “military roads” and “spiritual slogans” everywhere. The “combat villages” were constructed in 1960s which combined the combat villages with the civil defense organizations. “Everyone is a combatant, and every village is a combat village” is the best explanation of the combat villages. The policy of “everyone is in the organization, and everyone can combat” proposed by General Hu Lien(胡璉), the commander of Defense Department in Kinmen had combined the military and the residents to reinforce the combat capabilities.

“The combat villages” required every village larger than medium size to be able to conduct instant military operations. Make villages as a “combat plane”, and the whole island as a “combat body”. There were foxholes outside the villages, guards in each intersection, shooting windows in every house of villages, and machine guns and lookout posts on the roofs. Normally, every house was for residence use until the

exploding of war, it turned into a military blindage and a bunker for armed forces to enter. Thus, almost every house was a bunker and the villages were all independent military units.

3.2 The Underground Tunnels

The famous “underground tunnels” system in Kinmen and Matsu is another remodeling project of military space. Although many underground tunnels are still the districted military area, and the tourist is not allowed, we can still understand the property value by the open battlefield tunnels such as “Cingtian Hall” in Kinmen, “88 tunnel” in Matsu and so on. It took limitless labor, physical resources, and financial resources and sacrificed to build the “maritime blockhouses” in Kinmen and Matsu.

Figure 6, 7, 8 & 9: the Da-han(大漢) military stronghold is located on the Tieban (鐵板) coast of southern Nagasaki.

For the garrison of hundreds of thousands of the armed forces, the soldiers scooped every single tunnel out and exploding every mountain block house with their hands in this granite-based island. The dozens of kilometers battlefield tunnel system is connected to various underground blockhouses and combat strongpoints all over the island. The density of the tunnels is unique and the first in the world.

4. Preliminary Observation of the Implication of Reservation and the History Value of Battlefield Landscapes

During Chinese Civil War, Kinmen and Matsu were forced to involve the History. The past strategically policy “the family of the military and the residents, the life of the whole island” was the discipline to the residents for the integration of the military and the politics and the tight defense of the island. Moreover, with the shift of the battlefield between Kuomintang (KMT) and the communist party, Kinmen and Matsu had become the focusing point of the Chinese political history and the blueprint of anti-communist policy in Asia for the United States. However, as for the residents, they had nothing to do with wars were now forced to involve in the system of the military administration. Their survivals were tied with the armed forces, and the lifeblood of the island could only live or die together with the country.

The special battlefield landscapes in Kinmen and Matsu were caused by the context of cross-strait political development after World War II. The role of “battlefield” in Kinmen and Matsu was an imaginary mirror for reminding the United States and Taiwan of the security of the Pacific region must depend on Kinmen and Matsu as the battlefronts. Thus, the space organization of Kinmen and Matsu must be constructed with the image of militarization and became the famous battlefields. The value of the battlefield landscapes in Kinmen and Matsu could be parts of World Cultural Heritage might be highlighted from the following explanations.

4.1 The “Historical Altar” among the United States, Mainland China and Taiwan under the Global Cold War Structure

Since Kuomintang (KMT) and the communist party shifted their battle to Taiwan Strait in 1949, Kinmen had become the famous battlefield in the Chinese modern history for undertaking countless artillery actions from the communist party. After the dividing administration, Taiwan and Mainland China had ceased the fire but still couldn't put it an end for unwilling to accept the fact of the split from both sides.

Under this circumstance, Kinmen and Matsu had changed into instant combat blockhouses for providing military services at anytime.

The battlefield of Kinmen started with Kuningtou (古寧頭) Bombardment. After Kuningtou Bombardment, Mao Zedong had decided to process the domestic affairs for stabilizing his own politic authority, and stopped the invasion to Kinmen and Matsu. However, the attitude of the United States became the key of influencing the history of cross-strait situation. After the Korean War in 1950s, Taiwan had become part of “Pacific Defense Alignment of Anti-Communist”. Kinmen and Matsu soon turned into the center of the military confrontation, and their important roles had been highlighted under the global cold war structure. The global cold war headed by the

United States and Soviet Union had formed, and Taiwan had join the side of the United States gradually caused Mao Zedong to process the situation of Taiwan with different ideas. He no longer wanted to conquer Kinmen but proposed the so called “Hands Theory” which takes Kinmen and Matsu as hands to choke Taiwan, he argues: Kinmen and Matsu are two dots which connect Taiwan and us. Without the two dots, we are no longer related to Taiwan. Every man has two hands, and Kinmen and Matsu are our hands for holding Taiwan. The two islands can also be a baton to fool Khrushchev and Eisenhower around.

As for Kuomintang (KMT), it must depend on the proposal of “reconquer Mainland China, and restore the system of justice” to maintain the administrative legitimacy for stabilize the internal authority and hundreds of thousands of external armed forces after retreated to Taiwan. Although the opportunities and capabilities of reconquering Mainland China gradually become impossible with the containment of the United States, the garrison in Kinmen and Matsu as “the spring board of reconquering Mainland China” could manifest the intention and determination of reconquering Mainland China for Kuomintang (KMT). “Kinmen is the bridgehead of reconquering Mainland China. The existence of Kinmen allows Kuomintang (KMT) to express the determination without truly engaging in reconquering Mainland China.” Therefore, defending Kinmen could not only protect Taiwan and as the spring board of reconquering Mainland China and also represent the administrative legitimacy of Kuomintang (KMT) in Taiwan. Nominally, Kinmen and Matsu are the only politic link between Taiwan and Mainland China which belong to Fujian Province of Republic of China. Although Republic of China is located in Taiwan, it possesses Kinmen and Matsu of the other side as a presentation of not abandoning the only legal regime in Mainland China. Internationally, Taiwan authority won’t abundant the authority in Kinmen and Matsu presented the uniqueness of Chinese law system.

The cold war between the United States and Soviet Union made Taiwan the first chain in the anti-communist military island chains of the United States. Kinmen and Matsu were the advance bases for Containment. Mao Zedong’s intention of bombarding Kinmen was apparently a declaration of the liberation of Taiwan but actually trying to shift the focus on the political infighting in Zhongnanhai (中南海); Chiang Kai-shek assigned a large numbers of military to Kinmen and Matsu for reconquering Mainland China and saving the fellow citizen; the United States contained Kuomintang (KMT) through Kinmen and Matsu for preventing Soviet communist party from extending to Pacific and maintaining the security and benefits of the United States. Kinmen and Matsu were always a stage for the leaders of the United States, Mainland China and Taiwan to deliver strategic intentions. Under the anti-communist and the communist-phobia atmosphere, Kinmen and Matsu turned out

to be a “historical altar”.

4.2 The Historical Reference as a World Cultural Heritage

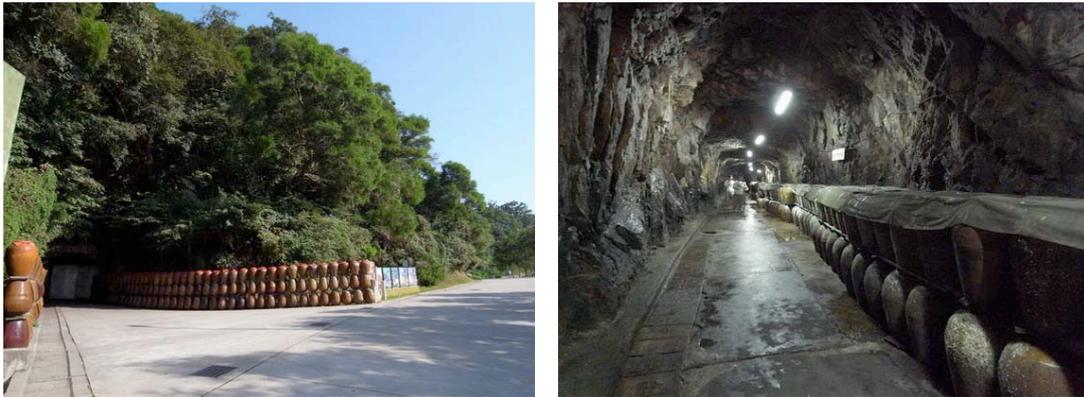

Figure 10 &11: “Tunnel 88”, the famous distillery in Matsu, it was transferred from military tunnel.

In 1990s, with the disruption of Soviet communist party and the termination of the material law in Taiwan, the cold war had become parts of the history. Soon after that, the military administration of Kinmen and Matsu was also terminated. People in Taiwan, Kinmen and Matsu had started to repair the lost lives and years since then.

With the reconciliation between cross-strait relations at present, the battlefield had turned into a “cultural heritage of battlefields” which represents the cold war period and the Chinese civil war. Chiang Kai-shek used to believe that: “Kinmen in southeast Asia is comparable with west Berlin in Europe, Malda islands during World War II as an anti-communist blockhouse.” Thus, the position of Kinmen and Matsu was no less than “Panmunjeom” in the confrontation between North and South Korea, “Cu Chi Tunnel” in Vietnam War, “Berlin Wall” in the split of East and West Germany, and “the Great Wall” in ancient military history. Kinmen and Matsu not only appeared on the Cold War history in such a history context but also became parts of the Cold War history. Kinmen and Matsu possess an unique value of battlefields in the history of Asian region and even the global history. They played a role as “Omaha Beach” in Normandy Invasion in 1944, “Auschwitz” in World War II, “Hiroshima Atomic Bomb Museum” in Japan, and “Choeung Ek Massacre Museum” for remembering the victims during Khmer Rouge as historical references and terror landscapes to remind people of the unwise actions in the past. Furthermore, the landscapes of battlefields in Kinmen and Matsu are sufficient to represent the complete history reservation of special battlefield sites.

4.3 The Fantasy Landscapes of the Global Military History

“That was a strange war; the unique war must combine with many unusual historical factors”. After “93 Artillery Bombardment” and “823 Artillery Bombardment”, a war unprecedented also no latecomers had started between

Kuomintang (KMT) and the communist party. They bombarded each other but never made bench landings. The encounters had gradually turned into a strange war scene so called “only attack on even days”. “Afterwards, the bombardment is just like a routine, you can even predict the date and location.” The reasons of the special military actions are due to Chiang Kai-shek’s inability of reconquering Mainland China from the battlefronts in Kinmen and Matsu, and the communist party was no hurry on occupying Kinmen and Matsu out of plans for the unity and the international situation.

Therefore, the destiny of Kinmen and Matsu were operated among the benefits of the United States, the authority of the communist party, and Kuomintang (KMT). The result of fully militarization was another formation of Asian “Phony War” which lasted for 40 years in Kinmen and Matsu and changed the social spaces, the appearances of the villages and the life experiences of the residents. “The 20-years counterattack of “only attack on even days” had made many “Phoney War” relics in Kinmen.” The relics were the unique landscapes in the global military history.

5. Conclusion

Since the Kuomintang (KMT) government moved from mainland China to Taiwan, the task of Kinmen and Matsu had played a role as front guards. The long military administration and blockade had blocked the normal development of local democracy and finance. Kinmen and Matsu turned into the boundary islands behind Taiwan. Until now, there are still many land disputes, landmine removal tasks, military casualties, unjust charge reparations and other historical issues to be solved. However, just as Mr. Chao-Ching Fu (傅朝卿) had said about the future of Kinmen and Matsu: “the future of Taiwanese culture is not about the conservative retention but how it becomes parts of the world culture.”

Kinmen and Matsu were under the state of combat readiness for a long time, and the villages were another space formation of battlefields. The villages were undertook oppression and reservation. Take the traditional South Fuchien (福建) buildings and western buildings as an example, there were hundreds of natural villages could be reserved due to the military administration. The changing history of traditional buildings of Southern China could be tracked down. Meanwhile, the traditional buildings in Taiwan were destroyed due to the overdeveloping modernization. Besides, the military relics such as squares of review stands, bomb shelters, spiritual slogans and so on. The military relics could reflect the unique history context of Kinmen and Matsu. Both the buildings built by the military and the residents could represent a historical product under a special condition of time and space—A heterotopias created the hostile authorities and international situations. The buildings are not only what

they are apparently, they are a mirror to reflect the ugliness of the nature of wars and the oppression of totalitarian rule. At present, the battlefield relics in Kinmen and Matsu could be the important cultural properties which lead the world.

Last but not the least, the previous battlefield tunnels are now famous distilleries, the military bunkers have become the art museums. While modern Kinmen and Matsu have turned into the international tourist sites, the day that “the cultural landscape of battlefield” log into World Cultural Heritage might be just around the corner.

1. Short summary of the European monetary history¹

1.1 Antiquity

The creation of coins has been preceded by a long period when monetary instruments were metal objects.

The birth of the coins in the years 625 BC is the result of the decision of a king. It is an administrative creation and not the result of commercial developments.

From the beginning, the currencies used the most precious metal: gold and silver, often a mixture of both. The creation of money was not the result of a desire to facilitate the daily small exchanges, but the very important trade, between kings or between rich notables.

The choice of metal was an important element in monetary history. The precious metal has always (it is a constant) been linked to the deities. Gold is the physical representation of the flesh of the gods and silver has been a favorite metal of the gods. It is to the gods that people offered gold and silver and temples retained reserves.

This is an important part of the history of money. This relationship between the metal and the sacred is the basis of legislation concerning currency and was a very important point in the development of coinages.

Another point is important, the relation between the coin and its weight. Nearly all the coins were struck and the individual weight was more or checked. The system allowed the verification and the checking of the weights.

During the fifth century BC, the war has necessitated the development of monetary emission to pay the soldiers and the mercenaries, including the weapons. The Greek cities which proceeded emissions used then metal from the temples for hitting increasingly important quantities of coins. To mark the sacred character of issues and metal, they have figured the portrait of the deity on the coins.

This initial confusion explains that counterfeiting was treated as a breach of gods and that the emissions have engraved on one side of the coin the divine figure. Note that this divine figure can be replaced by another sacred figure, the emperor or the king, or the personification of the state. In all cases, this is not the figure of a man, but of a holy man. In the Middle-Ages, artists have preferred to represent the Christian cross representing God.

For a long time, emissions have been precious metal issues. The divisional emissions are occurring only later, when the entire society has been monetized, during the fourth century BC

In Greece the monetary system has slowly developed in cities and between cities and colonies. The construction of colonies far from the cities has been a factor in the dissemination of Greek coinages throughout the Mediterranean basin.

¹ Depeyrot, G., 1995-1996.

After the conquests of Alexander the Great, the arrival of gold and silver taken in Persia, and estimated at 3,000 tons of silver, gave the Greek mints an opportunity to significantly increase the monetary production. These strikes were circulating in large quantities and allowed to shift from the nonmonetary economy to the monetary economy.

Thanks to the colonies, the Greek monetary habits spread throughout the world, both in the Mediterranean world in the world of Central and Northern Europe.

Finally, the incessant wars between peoples and between cities and empires have forced people to recruit mercenaries who were paid in coins. Those mercenaries returned home and often imitated the gold and silver coins.

The currency developed with significant emissions, either through colonies or via currency given to mercenaries. The growth of money stock in the fourth century BC has led to increased emissions of bronze coins. Thus following the conquests of Alexander, or the late fourth century BC, coins of gold, silver and bronze had become common.

The conquest of Greece by the Roman armies changed the situation. The booty taken by the Roman legions to Rome was, more or less, the amount of silver and gold taken by Alexander the Great in Persia. This very important amount of silver that arrived gradually in Rome, according to the rhythm of the tribute paid by the Greek, gave to the Roman mint the means to produce a very large amount of silver coins that were used in the whole western world. Millions of denarii very produced completed by a very large quantity of copper coins.

During the Republic (3rd c. BC-1st c. BC), Rome took the control of many nations and countries, exporting its monetary system. The consequence of the integration in the Roman Republic of all the invaded nations was the change toward an urban style of life and integration in a monetary society. The coinage was a necessity to pay for the armies, the administrators and to collect the taxes.

With the creation of the Roman Empire, at the turning of BC/AD, the monetary system was changed and unified, with a complete series of gold, silver and bronze coins. All these coins were linked by a fixed relation of value. Several mints were opened in the Empire and in the Eastern and traditional mints continued to produce coins. Several millions of coins were in circulation in the Roman world. During the crisis of the 3rd century, the quantity of coins increased up to several millions of coins/year.

1.2 Middle-Ages and Modern period

During the first part of the Middle-Age, the copper slowly disappeared. The gold, then the silver coinage continued some years and disappeared.

After the end of the 7th century, the rare issues were in silver. There were a lot of small mints producing very few coins. The coinage of the silver continued in various regions, but the development of the society in the 11th – 12th c. needed large amount of coined silver. At this moment the outputs of the main mints increased and get again a status of real important coin producer.

The conquest of the Eastern Mediterranean Sea obliged the kings and the nations to change the monetary system, to introduce again gold that was used in the Islamic regions, then to adopt again a coin in good silver. In some years between the 12th and the 13th centuries the economic world of Europe changed from a very Northern one to a Mediterranean one.

At the same moment the development of trade obliged the development of the bank system and relations.

So the Silver renaissance of the 12th c. was followed by a gold renaissance in the 13th and 14th c.

The 15th century was a period of gold and silver famine. This "famine" continued up to the arrival of the metal of the Americas.

So the 16th century was marked by an arrival of gold, then by a huge arrival of silver that flew the complete world. After the end of the 16th century, Europe endured a new period of famine linked to the decrease of the arrival of metal and on the other side to the massive exportation of silver towards the Eastern regions.

However, the quantities available for the mints were so important that the mints change for a new system of strike. The traditional one, with hammer was replaced by the system of the press. The banks and the banknotes appeared soon after.

2. Summary of the Chinese monetary history

2.1 From Antiquity to the Three kingdoms, 5th c. BC – AD 265

Qin Shi Huang Di (221-207 BC) is supposed to be the creator of a round copper coin with a hole in the center *ban liang qian* (half *liang* coin)². Actually the date of the first issues seems to be close to 378 BC. Qin period is characterized by the extension of the coinage to the complete China³. The coins were produced with a total absence of uniformity⁴. As far as the purity of the coinage is concerned, there is no way to establish any sort of standard⁵. Private minting was permitted, but with strict regulation of the weight and alloy.

The emperor Han Wu Di (118 BC) created a new copper coin *wu zhu* that was utilized until the Sui dynasty (581-618)⁶.

In around BC 100: the *wu zhu qian* (*wu zhu* coin) was annually produced at 500 million coins. At the same time, gold was used⁷. After the collapse of the Western Han, China only kept gold as treasure and no more as coin⁸.

2.2 Western Jin to Ten Kingdoms Dynasties, 265 - 960

During the Jin Dynasties, the production seems to be stopped. In the south, the production continued with fluctuations in the weights. In 465, permission was granted for the people to mint coins. The part of the natural economy was important: silk was used as money⁹, silver or gold was also used in ingots¹⁰.

Tang Gao Zu (618-626) replaced the *wu zhu* coin by the *kai yuan tong bao*¹¹. Many private mints were active and producing light coins.

During the period 742-756, the annual production was about 320/330.000 strings (320/330 million coins)¹². After 834 the annual production was 100,000 strings a year. The paper money was a way to avoid bringing heavy strings of coins¹³.

2.10 Northern & Southern Song Dynasty, 960 – 1127/1279

The period of the Song dynasty is one of the most important in the history of China, with the first development of silver.¹⁴ During the period, China entered a period of development of money supply, bill of exchanges, credit and paper money.¹⁵ The transition to a silver economy was underway by the time of the Mongol conquest of the Song in 1276.

In 996 Song cast 800.000 strings of bronze, far from the maximum output of 370.000 strings during the Tang. By 1007, the issues of the Song mints reached 1.83 million of strings. In 1021, the court settled on a quota of 1.05 million strings. Copper production jumped from 4.580 tons annually in the 1060s to 9.606 tons in 1075¹⁶; the output of coins quadrupled from 1.2/1.3 million strings over 5.600.000 string per year¹⁷. The total issue of bronze coin for the Northern Song period has been estimated at 262 million *guan*¹⁸.

In 1005, 4 mints in Sichuan produced over 500,000 strings of iron coins. This declined to 210,000 strings by 1041. By 1056, casting was down to 100,000 strings a year, and in 1059 the production was 30,000 strings a year. In the *Yuanfeng* period (1078-1085) about 1.139.234 strings of iron coins were produced per year¹⁹.

The paper money was used everywhere: there were up to 416 places with either own monetary units²⁰.

The increase of the role of silver can be explained by the taxes to be paid to the neighboring people and because of the development of the international trade²¹. A very large proportion of silver and gold was exported, as tribute²². In the Song dynasty the value of silver rose at its maximum but the relation gold/silver was low (1/10-12). It increased when the value of the silver increased up to 1/4-5²³.

Complaints about hoarding in the 1150s became a key argument in favor of creating the new *huizi* paper currency in 1161²⁴.

2.12 Liao, Jin, Yuan Dynasties, 916 – 1368

The acquisition of a huge quantity of silver during the conquest of the Southern Song may thus have prompted the Yuan to abandon silver coinage forever²⁵. These abundant silver ingots could easily be released for transport beyond Chinese territory and could circulate freely along Eurasian trade routes²⁶.

The consequence of the strong demand of silver was the decrease of the ratio gold/silver from about 1/10 in 1100/1350 to 1/5 in about 1380/1450, and then increased again to about 1/10 after 1450²⁷. This "decrease" was an increase of the value of silver.

This period is the age of official paper monies (11-14th centuries)²⁸ as the major change was the issuance of official paper currency²⁹. The issues of paper money represented about 7/10 million ingots/year, up to 36 million³⁰.

2.13 Ming Dynasty, 1368 – 1644

The demand for petty coins increased after the closing of the imperial mints in the 1430s. The debasement of the bronze coins occasioned a sharp rise in the nominal prices. The ratio was in 1478 of 1/1.550 or even 1/1.300 copper coin for one *tael* of silver instead of the official price of 1/1.800³¹.

After the 1530's Japan became exporter of silver³² and after the 1570s, the influx in China of silver from Japan was complemented by the arrival of silver from the New World³³.

The Ming tried to supplement the costly copper coins with state-issued paper certificate³⁴. In 1425, the tribute emissary from Ceylon was given 159.050 ingots worth of certificates. Later, the King of Manshujia was given a total of 500-600.000 stings of certificates³⁵.

2.14 Qing Dynasty, 1644 – 1912

In 1647, the output was 1.7 billion coins, but in 1651 all the mints were closed³⁶. Around 1760: the annual production of coins was 3,000,000,000³⁷

In the 19th century the mints decided to change for the minting machines, and in 1887, the government adopted the machine-made coinage³⁸.

With the uncoined metal arrived the foreign silver dollars and other coins³⁹. These were introduced at the very end of the 18th century, and joined the European coins already in use since the beginning of the same century⁴⁰.

The monetary development of the economy was supported by a growing use of the paper money. To the official ones, private local paper notes were added⁴¹.

Dynasties	Monetary facts
Western Zhou, 770 - 256 BC	Creation of the currency (objects), then round coin (about 378 BC?).
Qin, 221 - 206 BC	Creation of the round coin according to the tradition.
Western Han, 206 BC - 9 AD	Creation of the <i>wu zhu</i> coin. Large issues of coins, up to 500 million/year. Large use of gold for the gifts.
Xin, 9 - 23, Eastern Han, 25 – 220 Three kingdoms, 220 - 265	Monetary reforms. <i>Wu zhu</i> coins continue to be minted. Period of political and monetary instability.
Western Jin, 265 - 317, Eastern Jin, 317 - 420	Instability in the South, with fluctuations of weights. No official production registered. Local independent coinage in the North.
North and South, 420 – 589 Sui, 581 - 618	<i>Wu zhu</i> coins continue to be minted. Development of local and private issues.
Tang Dynasty, 618 - 907	The <i>wu zhu</i> coin replaced by the <i>kai yuan tong bao</i> . Private production of low quality. In 742/56, the production was of 320/330 million coins/yr. After 830s it was reduced to 100 m/yr due to a shortage of copper. Silver and gold used as money. Development of paper money to avoid transportation of coins.
Five Dynasties and Ten Kingdoms, 907 - 960	Lack of copper in the North. Mints still active in the South.
Northern Song, 960 – 1127	Development of silver, mainly for military and external purposes. Enormous production of copper up to nearly 6 billion/year Production of more than 1 billion/yr of iron coins. Development of paper money.
Southern Song, 1127 - 1279	Continuous development of silver. Stop in the production of copper coins. Development of the paper money from the 1150s to 1210s.
Liao, 916 – 1125, Jin, 1115 – 1234, Yuan, 1271 – 1368	Continuous development of silver. Increase of the value of silver. Development of paper money up to the end of the 14 th c.
Ming, 1368 – 1644	Flux of silver from Japan and from America. Decrease of the value of silver. Important issues of paper money, but replaced by silver. Decrease of the role of cash.
Qing, 1644 – 1912	Important issues of copper, but decrease of the role of cash. Flux of silver from Japan and from America. Arrival of silver coins from America/Europe. Decrease of the value of silver. Important issues of paper money, replaced by silver. Adoption of machines to strike the coins.

Dynasties	Gold	Silver	Copper	Paper		
Western Zhou, 770 - 256 BC	Ingot	Ingot	Issues	-		
Qin, 221 - 206 BC			Very important issues			
Western Han, 206 BC - 9 AD			Very small issues			
Xin, 9 - 23, Eastern Han, 25 - 220 Three kingdoms, 220 - 265			Used as money		Important issues	Production

Ming, 1368 - 1644			Coins		Silver flow Very important issues	Very important issues
Qing, 1644 - 1912						

3. Differences and similarities

3.1 Precious coins and the unit of account

One of the main differences was the use of precious metal as money since the very beginning of the coinage in Europe. The gold coin was the first coin produced and the issues of gold were completed by new coins in silver and in copper. During wartimes, for the main commercial exchanges gold and silver coins were produced in large quantities. Of course in period of peace, the metal was kept in the Treasures.

In Eastern Asia, the role of the silver was reduced and limited. The silver, and sometimes, gold was preserved in the Treasure and used as ingots as was as coin. This double use, as commodity and coin differed from the European tradition.

Of course, silk was never used in Europe as commodity money. In some cases, grain could be utilized in a kind of barter system.

So in Europe, considering the metal used in the coining process, the monetary system was up > bottom as in Orient the system was bottom > up.

One of the differences was also the relation between the coin and the unit of account. In the system during the Antiquity, the relation between the coin and the number of units was stable and public. In case of increase of prices, this relation was destroying the monetary system: the cost of the minting of coins was more expensive than the cost of the metal.

The floating system of evaluation of the value of the coins in units of account appeared only after the end of the 16th c. when the amount of coins was so important than the standard relation was impossible to maintain: the regular arrival of metal destabilized the value of the metal and so made impossible any stability.

This relation UC/coins obliged all the elements involved in the monetary stability to control every coin in circulation. The forgers must be prosecuted and the forgeries destroyed.

The stability of the relation units of account/coin was possible only because the coins were struck one by one with dies and not cast. If the coins were cast, the variation of the weight of metal would be so important between the heaviest and the lightest that the stability could not be applied.

The system of production of the coins in China was different. The coins were mainly produced by casting. With such a system the metallic value of each coin cannot be preserved.

The dissociation between the unit of account and the coin give the possibility to reevaluate the value of the coins. The circulation of coins in strings diminishes the potential consequence of the weights of the individual coins.

3.2 Paper money

The question of the banknotes (and in general notes) in Ancient Europe is a complex and difficult problem. Of course, the question of the absence of banknotes in Ancient times can find a trivial answer "there is no banknote because there is no printing machine". The question and the answer are more complicated and more difficult than at a first glance.

The Roman Empire (as the Greek one) had coin-changers and sometimes a network of coin-changers; a system of account for private and public accounts; the possibility to transfer money from one account to another; a network of representatives in each province; a centralized administration; a network of specialized representative able to check the coins (and why not bank-notes?)

The Roman Empire could have a bank-note system (as all the centralized empires could have), But the Roman Empire (as the Greek one) had no banknotes. This reason is not linked to the administration, not linked to the absence of printing system, not linked to any impossibility.

The technical reason is not pertinent. The absence of paper could be solved in using parchment, wood, even skin of animal more or less prepared (leather), or even tissues. All these material were used at one moment.

We have to go back to the status of the coin in Ancient Europe: a coin is made from the metal kept in temples; it bears the representation of Gods; on a legal point of view, forgeries are assimilated to a crime against the Gods; on a religious point a view, gold is the flesh of the Gods.

There is no discussion concerning the existence of bank-account during the Middle-Ages and the Modern period.

What is the problem with the notes in Ancient Europe? We have to go back to the status of the coin in Ancient Europe: a coin bears the representation of Gods; on a legal point of view, forgeries are assimilated to a crime against the Gods; on a religious point a view, Gold is the flesh of the Gods.

The only reason that can explain the absence of "bank-notes" in Ancient Europe is not a technical reason, but the impossibility for the Ancient world to dissociate "value", "power", and "wealth" from something linked to the Gods. The Ancients were always in relation with the Gods. Even the coinage (Moneta) was a goddess.

Wearing the face of the God, of the emperor, the coin is something sacred. To imitate it, to destroy it was a crime against the divinities. On the other side, the Gods were the guaranties of the strict intrinsic and facial value of the coin.

So it was a complete impossibility to imagine an anonymous mean of payment that was not guaranteed by the metal of a god. It was not imaginable to have a secular way, aside the religious one, to transfer wealth. The bank note was not yet imaginable in scholastic Europe: its development is linked to the decrease of the religion.

During the Middle-Age, the tradition was to use gold for the main expenses. For the larger sums, the way to pay was to use the bank or to use barrels of coins or bags of coins. In any case, even through the bank, the sum has to be paid in cash in a way or another.

In this way, the medieval and modern Europe stayed in the old ancient Greek and Roman tradition. The value of a coin was a mixture of its metallic value increased of the seignuriage and the value given by the minting operation (including the decision of the king to increase the value of the coins).

The gold/silver coin was in fact the unit of account and all the other coins were understood as parts of the gold/silver coin. In this situation, there was no place for a banknote.

3.3 Export of coins

One of the most common explanations concerning the change in the monetary stock is linked to the question of import/export of the metal⁴².

The influx of gold and silver changed completely the monetary system during the 16th century. A large part of this metal flew from Europe or Mexico to East Asia. This phenomenon is largely documented and analyzed even by the writers of the 16th century (Bodin, Malestroict, etc.).

On the contrary there are very few analyses of the "smooth export" of the precious metals during the other periods.

Appearance and disappearance of metal are common in the monetary history in all the civilizations. If it is easy to understand the appearance of new metal or the development of new strikes, but the slow decrease is uneasy to explain. There is, in general, no special event to explain the diminution, although there are, in general, many facts that can explain the development of the minting: mines, imports, and booties.

The most current explanation is to say that the decrease of the stock of metal that can be used for the mints is linked to an exportation of metal. The reasons of this export are the tribute paid to the invaders (to "buy" the peace), the tribute or the booty taken by enemies during wars, the deficit of the "commercial balance".

All these explanations are very coherent, but partial, explanations. In the case of the tribute paid to the enemies to avoid an invasion, we have to balance the cost of the tribute with the possible cost of the war: salaries for the soldiers, pays of the mercenaries, weapons, foods, destructions, etc.

When it is possible to compare the cost of the tributes and the cost of the wars, the impression is that the cost of the tribute is cheaper than the cost of the war⁴³. On the contrary the expensive dues to the wars are mainly internal expenses: the sums are given to the merchants, soldiers (exception of the mercenaries).

Concerning the commercial deficit, this interpretation is a consequence of the bullionist or mercantilist analysis of the commercial exchanges. It means that the general balance is in deficit, whatever is the importance of the imports and exports. Unfortunately, we only have

⁴² Peng, X., 1994, *passim*.

⁴³ Iluk, J., 2007, *Aspects économiques et politiques de la circulation de l'or au Bas-Empire*, Wetteren.

information from the countries that imported goods. The complaints are the same, describing merchants wanting to be paid in precious metal and selling a huge amount of goods.

In general, I consider that this possibility to accept a relation between the possible export of precious metal and the diminution of the precious monetary stock as non probable. This analysis belongs, to my point of view, more to a kind of nationalist literature than to the reality of the economic facts⁴⁴.

Reviewing the reformed welfare system in Indonesia
Sitta Izza Rosdaniah
Australian National University

1. INTRODUCTION

The 1945 Constitution as the basic law of the Indonesian state contains key doctrines and concepts of the role and responsibilities of the State towards “the people”. Apart from the mention in the Preamble regarding “advancing general prosperity”, there is very little indication as to how it should go about doing so.

To observe how the welfare provision—including health, education and social security—works in Indonesia, this paper is aimed to examine these main questions: What are the constitutional requirements for such provision? Are they sensible or feasible? What key factors and issues should be considered in the future development of welfare policies to be effective? The answers should encourage the skepticism of the general public over policies, which is likely to be valuable for obtaining a better policy-making process in the future.

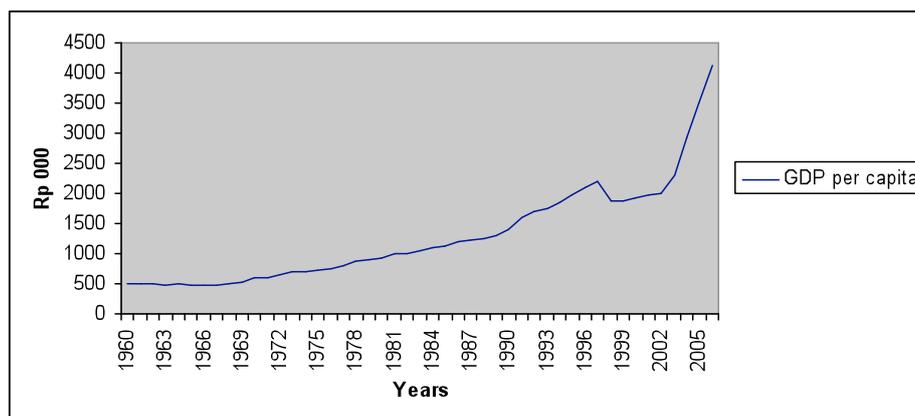

This paper begins with a brief illustration on the long-run growth and equity in Indonesia. Section 3 reviews of the Constitution requirements for the welfare provision in Indonesia. Section 4 discusses the welfare provision policies and the outcomes obtained by policies. Section 5 compares concisely features of the education and health reforms in Indonesia, Thailand and the Philippines. The final section summarises the key findings.

2. GROWTH AND POVERTY IN INDONESIA: LONG-RUN TREND

Since the beginning of the “New Order” era in 1966 up until the 1997 economic crisis, Indonesia experienced an impressive economic transformation with per capita GDP grew by almost for times (as demonstrated in Figure 1). The growth provided the benefits in reducing the poverty (as depicted in Figure 2). The national poverty rate declined from 40% in 1976 to 11.3% in 1996. The Asian financial crisis period (1997-98) caused highly negative growth of GDP per capita. It generated a huge, albeit temporary, increase in the national poverty rate, from about 12% in 1997 to 23% in 1998. Apart from the social welfare programmes that have been implemented, the governments also introduced safety net programmes to mitigate the social impact of the crisis.

After the crisis period, GDP per capita increased averagely at about 2% per year until 2003, when it started to grow significantly (with average growth approximately more than 15% per year) until 2006. We also can see a gradual reduction in the poverty during these periods.

3. THE CONSTITUTION AND SOCIAL WELFARE PROVISION

Three of the most popular ways of welfare provision—i.e. subsidised education, health and social security—are provided for explicitly in the Constitution, to which dramatic changes have been made by way of the Second and Fourth Amendments. Clause 3 of Article 28H—within the chapter on human rights—was added as part of the Second Amendment in 1999, stating that “every person has the right to social security in order to develop him fully as a dignified human being”. Article 34 is explicitly concerned with the people’s welfare, and clearly spells out the obligations of the state toward its citizens. In its original form, Article 34 simply mentioned that “destitute persons and abandoned children were to be taken care of by the state”. But in the Fourth Amendment of the Constitution in 2002, two further clauses were added to this Article to make the state’s responsibilities more explicit, and to extend dramatically its social welfare function.

These new two clauses as well as the new Clause 28H(3) raise two main concerns, regarding the state’s role in redistributing income. First, the state’s duty becomes incalculably bigger, since it is now responsible for providing a social security system for *every* citizen rather than merely the relatively few—presumably less than 5% of the total population—severely disadvantaged people. Prior to enactment of the Fourth Amendment, the state was responsible for taking care of only the *fakir miskin* (who are not just poor, but rather in a state of chronic incapacity to meet basic needs), whose total number is far below the proportion of the population living below the official poverty line (about 15.4% of the total population in 2008).¹ Yet the Fourth Amendment now requires the state to provide a social security system for 100% of the population. Second, there is lack of clarity in relation to coverage of *health* and *general service facilities*. There is no explicit statement mentions *to whom* the state should provide appropriate health and general service facilities. It is quite unclear whether it is intended that *everybody* should receive those services or, if not, to whom they should extend. There is no obvious reason why coverage should be complete, since wealthy people are more than able to take care of their own health and medical concerns

The only other article of the Constitution that is concerned with the responsibility of the state in relation to the people’s welfare is that concerning education, i.e. Article 31. The original text of the Constitution stated that every citizen has a right to education and the government shall manage and conduct a national educational system that shall be regulated by law. The text of Article 31 was amended in 2002 to stipulate more concretely the government’s role in provision of education. The implication is that the government should provide *free* educational services to *all* citizens aged 7-15 years. In reality, students both in private and government primary schools still pay part of their education costs. Funds provided by the government—to private and government primary schools—

¹ According to the data from the Statistics Indonesia (*Badan Pusat Statistik*) cited in on “The Evaluation of the Economy of 2008 and the Outlook of 2009,” *the Press Release of Coordinating Ministry for Economic Affairs*, 5 January 2009.

to meet the cost of education are often not sufficient to cover the fees actually charged by schools. This leads to the emergence of a disparity in the quality of education for the poor and the rich, since the poor will be concentrated in schools that charge very little but can therefore only afford to provide a low quality of education (Lie, 2004). It follows that the government is failing to fulfil the requirement of Article 5(1) of the Education Law that “all citizens have the same right to obtain a quality education”.

The amendment requires the state to give priority to the education budget by allocating at least 20% of the state’s as well as regional governments’ budgets to meet the requirements national education. The implication is for a huge expansion of budget funds going to education, at the expense of other important areas, including health and infrastructure. Somewhat surprisingly, the 20% budget allocation is subject to various interpretations. Article 49 of the Education Law limits the range of spending items that count toward the 20% target by excluding salaries of educators, stating that “education funds, excluding salaries of educators and service education expenditure, are allocated at a minimum 20% of the central government budget and a minimum 20% of the regional government budget”. Obviously, teachers’ salaries account for a very large proportion of total spending on education. If the salaries of educators are excluded, central government spending on education accounted only for 7.4% of the 2006 state budget (World Bank 2007a).

4. THE WELFARE PROVISION POLICIES AND THE OUTCOMES

I turn now to discuss to what extent some policies implemented in education, social security, and health serving to increase the standard of living for Indonesians.

4.1. Education

In the early years after independence and during the Old Order, the government conducted several programmes for developing human resources and complying with Article 31 of the Constitution. In this period, education became more accessible, although remaining far from universal. The government focused on literacy in national educational development, since more than 95% of the population were illiterate in 1945 (Brojonegoro 2001, cited in Kristiansen and Pratikno 2006). In 1951 the government formulated a “10 year Community Education Plan” aimed to overcome illiteracy within the next 10 years, and the programme successfully decreased the illiteracy rate to 40% in 1960 (Jalal and Sardjunani 2005). In this period, more private schools rather than government schools were established, as the government faced financial constraints resulting from political instability and economic decline (Kristiansen and Pratikno 2006).

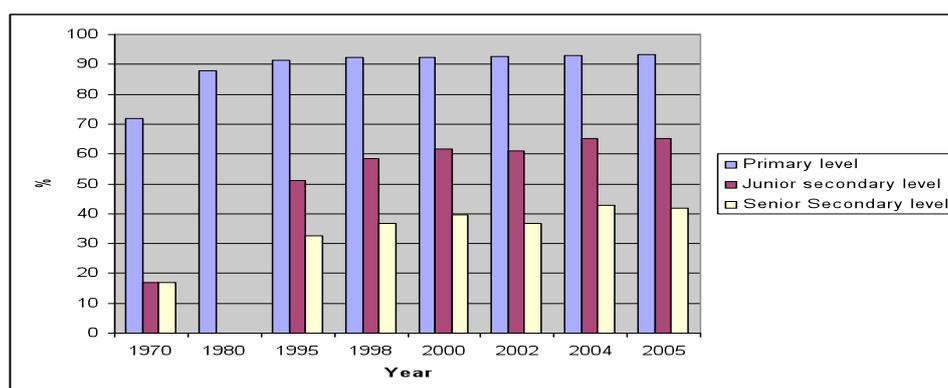

The government enacted the first basic education law, i.e. Law No. 4/1950 on education and teaching, later to be replaced by Law No. 12/1954 about the national education system. This Law made a clear commitment to universal education, by stating that all children from age six had the right to study at schools for at least six years and that by age eight they were obliged to do so. The government also adopted a policy of building at least one public university in each province. Some 23 higher education institutions were built during the 1960s in Indonesia’s 26 provinces (Nizam 2006, cited in Wicaksono and Friawan 2008).

The New Order established a fully centralised education system that succeeded in increasing the level of national educational attainment. Relying on burgeoning oil revenues, in 1973 Soeharto issued a Presidential Instruction (*Inpres*) on basic education, which provided block grants for the construction of new primary schools, such that the number of primary schools doubled from 65,000 in 1973 to 130,000 in 1984, while the number of children enrolled also doubled, to 26 million (Ministry of Education 1996, cited in Kristiansen and Pratikno 2006). This *Inpres* played a significant role in moving toward universal primary education, which was achieved in the mid-1980s. Subsequently the government extended basic schooling from 6 to 9 years by enacting a new Education Law (No. 2/1989), and introducing a nine-year “compulsory” education programme in 1994. Figure 3 showed the result of those programmes, since 1970s enrolment rates at the national level have increased significantly: the net primary school enrolment rate increased from 72% to

93.2% by 2005, while the net enrolment rate for junior high school has experienced a more marked increase from 17% to 65.2% in 2005 (World Bank Education Sector Review, 2005 cited in World Bank 2007b).

Despite the impressive improvement in access to education, there is still a problem of social disparity at most levels. Lanjouw *et al.* (2001) identified significant disparities in high school enrolments between children from poor versus rich families, between children in urban and rural areas, and between children in the western and eastern parts of Indonesia. They also argued that the poor are not the first group to benefit from the government spending on education, which can be seen from several facts, including the fact that gross enrolment rates at secondary school level were higher for children from richer consumption group—with the 40% lowest group accounted for less than 30% of the total enrolments in junior and senior high schools. World Bank (2007b) noted that a poor child was 20% less likely to be enrolled in junior secondary than a non-poor (Figure 4). This implied that the benefits accrue disproportionately to wealthier families.

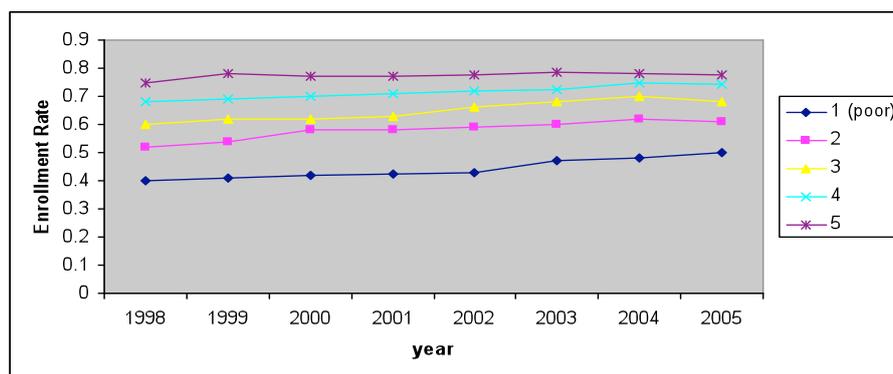

Figure-3. Net Enrollment Rates, 1970-2005

Source: World Bank (2007b)

Note: data for junior and senior secondary level in 1980 was not provided.

Figure-4. Net Enrollment Rates by Income Groups for Junior Secondary Education

Source: World Bank (2007b)

The government mitigated the Asian financial crisis impact by establishing new social protection programmes, including assistance in the education area. Sumarto and Suryahadi (2002) found that though scholarships and block grants were not perfectly targeted to the poor, at the national level the programme covered more poor than non-poor families.

After enactment of the regional autonomy laws in 1999, the education system changed dramatically, from highly centralised to much more decentralised, with local governments becoming responsible for education provision. Despite the increase in funding from the central government for education, this devolution of responsibility has not been able to eliminate discrepancies in education provision among provinces, and has even caused disparities to become greater within provinces than among provinces (World Bank 2007a). The World Bank (2007a) also

criticised the requirement for a 20% allocation for education in the central government budget, as increasing the central level of spending in decentralised sectors such as education appeared to contradict the logic of decentralisation. The World Bank (2007a) suggested that increased resources at the central level should be utilised appropriately and effectively to improve the spending at all levels of education, to make education expenditure more equitable, and to increase the efficiency of education expenditure.

4. 2. Social Security System

The social security system as mandated in the Constitution was not a new concept. An early social security system was introduced as a form of an employer funded pension fund for private sectors worker in the 1920s (Ramesh and Asher 2000), and the Dutch colonial government issued a regulation on work injury benefits in 1940 (Queisser 1991). When Indonesia became independent in 1945, the government's role in social security provision was not stipulated explicitly in the Constitution until the Fourth Amendment in 2002—though the definition of social security remained unclear.

Indonesia—like many Asian societies—continues largely to rely on traditional social security provided by families or communities, based on the principle of *gotong royong* (the term used for mutual self help). World Bank (1994, cited in Whiteford and Forster 2002) reported that more than 76% of people over 60 years in Indonesia live with their children, while 63% of them receive income transfers from their extended family.

From the 1960s the social security system covered civilian government employees, members of the military forces, and private employees in the formal sector. The coverage included health care services, compensation for work-related injuries, and cash benefits or pensions from retirement age. There was also an assistance scheme for victims of natural disasters and social unrest, and for those who lack the capacity to earn a living—in particular, invalids and orphans.

For government employees, a “compulsory” social health insurance scheme—*Askes*, provided by a state-owned enterprise (PT Askes). Two other income maintenance programmes for civilian government employees are a pension fund scheme and a social insurance scheme. A social insurance scheme consisting of the government civilian employees' saving and insurance (*Taspen*) for civil servants, while the armed forces social insurance (*Asabri*) for military personnel, civilian personnel in the Ministry of Defence and the police. Until now, both *Taspen* and *Asabri* provide lump sum cash benefits on retirement and are managed by state-owned enterprises PT *Taspen* and PT *Asabri*, respectively.

In 1977, the employees' social insurance (*Astek*)—provided by a state-owned enterprise, Perum *Astek*—was introduced as a “compulsory” social security insurance for private sector employees in firms with at least 10 employees or a monthly payroll of more than Rp 1 million. This implied that the *Astek* scheme excluded informal sector workers, self-employed individuals, and formal sector workers employed by small businesses with less than 10 employees. *Astek* was changed to become *Jamsostek* in 1992, based on Law on workforce social security. *Jamsostek* provides insurance on health, accident and life insurance as well as a provident fund.

However, the participation rate in *Jamsostek* has been low, and the scheme has been criticised for some important shortcomings. First, as Indonesia's workforce is largely informal, almost 80% of the total workforce cannot feasibly be covered by this scheme. Moreover, the Ministry of Manpower and Transmigration claimed that only about one fifth of the population employed in the formal sector was enrolled with *Jamsostek* in 2002 (OECD 2008). Second, members of *Jamsostek* obtain little actual benefit from their participation because of PT *Jamsostek* management to provide adequate funds to meet workers' claims as a result of a very low net return on investment. This failure is mainly due to poor management, with low real investment returns (about 0-1.3% per annum in 1994), weak governance and high administrative expenses (Leechor 1996).

The Law No. 40/2004 on the National Social Security System provides a basic framework for the development of social security for all Indonesians. It defines social security as a form of social protection to ensure that all citizens are able to provide for their minimum basic living needs, and covers five social security programmes, namely: health insurance, compensation for work-related injuries, old-age saving (provident fund), pensions, and death benefits. It requires the eventual expansion of social security coverage to the informal sector, the unemployed and the poor. Although it states that it is mandatory for employers to enrol their employees in the social security programme and that the government will provide social assistance to the poor, its explanatory notes state that implementation of the law will be subject to the economic capacity of the people and the government as well as the feasibility of the programme. Realistically speaking, however, it is hard to take all of this seriously, as there is no obvious means by which the programme could be extended to cover workers in the informal sector, much less individuals who are unemployed. In other words, the very poor people most in need of social security are precisely those who will not have access to it. There is nothing in the Law that gives any indication of how the scheme could be extended beyond the small minority of better-off workers in the formal sector.

Four state-owned enterprises— PT Jamsostek, PT Askes, PT Taspen, and PT Asabri, the existing agencies for social security provision—are appointed as social security providers. This policy maintains the existing state monopoly of social security, despite poor performance in the past. Setting a monopolistic arrangement for an organisation to deliver subsidies in kind to the poor will almost certainly be inefficient, due to lack of incentives to act in its clients' interests.

4.3. Health

The Law on the National Social Security System also covers access to health and medical services, presumably to fulfil the government's task as mandated in the Constitution. In reality, implementation has been inadequate. Only 21.3% of the total population was covered by any kind of health insurance in 2003 and the proportion decreased to 19.8% in 2005 (World Bank 2007b, 62). In 2007, Indonesia's expenditure on health was 2.8% of GDP, and with total public health spending only 5% of total government expenditures, this was below its East Asian neighbours, such as The Philippines (with a similar per capita income) and Cambodia (with a far lower per capita income), whose spending on health was about 3.4% and 6.7% of GDP, respectively, while total public health spending accounted for 6.3% and 11.4% of total government expenditures (World Bank 2007b, 43). According to World Health Report (2006 cited in World Bank 2007b, 67), the density of physicians and nurses in Indonesia is far lower than in the Philippines, at only 130 per 1000 population, compared with 580 per thousand. Presumably as a consequence, Indonesia still underperforms its neighbours—even those with lower per capita incomes—on most conventional measures of health outcomes, as can be seen in the Table 1.

Table-1. Regional comparison of health expenditures and measures of health outcomes, 2004

Country	Annual GDP per capita (USD)	Health expenditures as % of GDP (%)	Total public health expenditures as % of total public expenditures (%)	Life Expectancy (years)	Crude Death Rate	Infant Mortality Rate	Under-five Mortality Rate
Malaysia	4,970	3.8	7.5	73.7	4.7	10.0	n.a.
Thailand	2,720	3.5	11.2	70.9	7.2	18.0	21.2
China	1,740	4.7	10.1	71.8	6.5	23.0	31
Philippines	1,290	3.4	6.3	71.0	4.9	25.0	39.9
Indonesia	1,260	2.8	5.0	67.8	7.3	28.0	45.7
Vietnam	620	5.5	5.0	70.7	6.0	16.0	66.7
Cambodia	430	6.7	11.4	57.0	10.4	68.0	124.4

Source: World Bank (2007b)

The government generally provides financing for an extensive network of primary health care centres (*Puskesmas*) and public hospitals for preventive and promotional health measures. However, most Indonesians still have to pay a large part of the cost, since both public and private providers of health services charge fees for service, while insurance coverage is very limited. It is estimated that out-of-pocket payments constitute about 50% of the total health care expenditures by families (World Bank 2007b, 61).

The World Bank (2008) observed that inequality of access is one of two main problems in Indonesia's health sector, alongside inefficiency. The latter is not our primary concern here. In relation to the former, greater benefits from public health spending accrue to richer income groups than to the poor. With primary health care—which is mostly provided through *Puskesmas*, and focuses on services provided predominantly by general practitioners and paramedics—the lowest income group receives a reasonable share, as the benefits of primary health care are relatively evenly distributed among income groups. However, with secondary health care (i.e. that requiring hospitalisation), the poor receive little benefit since, in practice, they have very little access to public hospitals. The direct cost of hospital treatment, even though it is heavily subsidised, is still typically unaffordable for the poor, many of whom also face substantial transport and opportunity costs by virtue of living in rural areas very distant from the nearest hospital.

The government allocates about 40% of its public health care spending to public hospitals, but lack of access to them on the part of the poor means that the poorest 20% of the population is estimated to account for less than 10% of total public health subsidies, while the richest quintile capture almost 40% (World Bank 2008, 2). Despite lip service to the contrary, therefore, actual outcomes again reflect the government's failure to ensure a pro-poor orientation of this important category of spending (World Bank 2006, cited in World Bank 2007b).

In 1998-2001, the government provided free health support to the poor through the social safety net programme established as a response to the financial crisis at 1997-98. In 2005, it introduced a huge programme to offset the negative impact on the poor of the reduction in fuel subsidies to improve access and quality of services to the poor by providing health insurance for 60 million poor through *Askeskin* (health insurance for the poor), under which the poor receive free basic outpatient health care and third class hospital care. This programme covered 25 million people within a year—with 70% of the recipients are with the poorest 40% of the population—nevertheless, these efforts have not had a significant effect in improving the utilisation rate of the health services by the poor, because of three main problems as observed by Suryahadi and Sparrow (2008): the existence of additional costs for the poor to obtain the services such as the cost of photographs as a requirement to get the *Askeskin* card and the travel cost to hospitals; evidence of considerable leakage to the non-poor; and difficulties on the mechanism of the compensation and reimbursement by the government to service providers.

5. THE HEALTH AND EDUCATION REFORM IN INDONESIA, THAILAND, AND THE PHILIPPINES

This session briefly compares the education and health reforms in Indonesia, Thailand and the Philippines, in terms of the constitutional requirement, policy, process and impact. These three countries are different in many ways, but have several similarities in the ways of reforming health and education provision.

a. Constitutional requirements for the education and health provision

The rights of all citizens to receive education are explicitly stated in the Constitutions in these three countries. Beside this right, the Indonesians have the obligations to attend the primary education. In Thailand and the Philippines, the Constitution clearly requires the governments to provide free education in the elementary and high school levels, while the Indonesian Constitutions does not mention explicitly about it. Another difference between Indonesia, Thailand and the Philippines is in the allocation of state budget for education. Whereas the Constitution obliges the Indonesian

governments—in both central and regional levels—to allocate at least 20% of their budget for education, there is no such constitutional requirement in Thailand and the Philippines.

For the health provision, it is clear that in all three countries the Constitutions warrant and protect the people’s right to receive health service, and oblige the governments to provide health services and facilities. The Indonesian Constitution does not clearly mention the provision of free medical care for the poor like what it is stated in Thailand and the Philippines.²

b. The policy and process in the reforms

Education

All the three countries have faced the same challenges in education, that are, managing their education systems to reduce disparities within and between regions as well as between the relatively wealthy and poor group in the society, and to improve the overall quality of education. These goals have been pursued by decentralizing the education systems in these countries. The decentralization in the education system in Thailand and Indonesia have been related with and intensified by the rise of greater democracy support in 1997, whereas the decentralization of education in the Philippines was initiated since 1975, as a part of the integrated reorganization plan of the government (Guzman 2006). In all three countries, the central governments retain the responsibility of core curricula policies, design, implementation, and evaluation procedures.

Financing for education in all three countries are derived from both public and private sources, with public resources come from the central and regional governments. Each country has its own system for sharing responsibilities in education financing between the central and regional authorities. In the Philippines, for example, education financing is more centralized since public education is not formally decentralized (Guzman 2006). The size of the education shares of the state budget in Thailand and the Philippines have been significant—ranging from 15-26% (Office of Education Council Thailand 2004, Manasan *et al.* 2008). As seen in Table 2, Indonesia spent less than two countries for education. During 2005-2008, however, significant rises occurred in education spending ranging from 16.7% to 22.4% of the total central government budget (State Secretariat Republic of Indonesia 2009). This increase was presumably aimed to fulfill the requirement of 20% budget allocation in the Constitution.

Table-2. Education expenditure in Indonesia, the Philippines and Thailand

	Indonesia	Philippines	Thailand
Education Public Expenditure % of Total Expenditure (2003)*	14.20	16.00	27.00
Education Public Expenditure % of GNP (2003)*	2.80	3.10	4.60
Central government Education Expenditures % of GNP **			
1995	1.04	2.90	3.59
2000	1.01	3.28	4.55
2003	1.28	2.77	4.13

**) Manasan *et al.* (2008)

Health

The health reforms in all three countries were initiated in late 1990s and early 2000s, with two main goals, namely achieving the universal health coverage and decentralizing the health reform. The Philippines has initiated the reform in 1999 by establishing a comprehensive plan known as the health sector reform agenda 1999-2004, with a key policy to expand coverage and to improve benefits of the National Health Insurance Program (Solon *et al.* 2003). The universal health coverage policy in Thailand was successfully introduced in 2002—facilitated by strong political imperative and previous experience from existing health schemes. This scheme is financed by the

² The Thai Constitution clearly mentions that the free medical treatment for the indigent is provided by the state’s infirmary, but the Philippines Constitution does not.

government taxation system and requires the insured to contribute a co-pay of 30 Baht per visit, except for the poor (Towse *et al.* 2004). Indonesia has formally introduced the first phase of universal health coverage policy in 2004, by increasing care and financial protection for the poor through the health insurance for poor population.

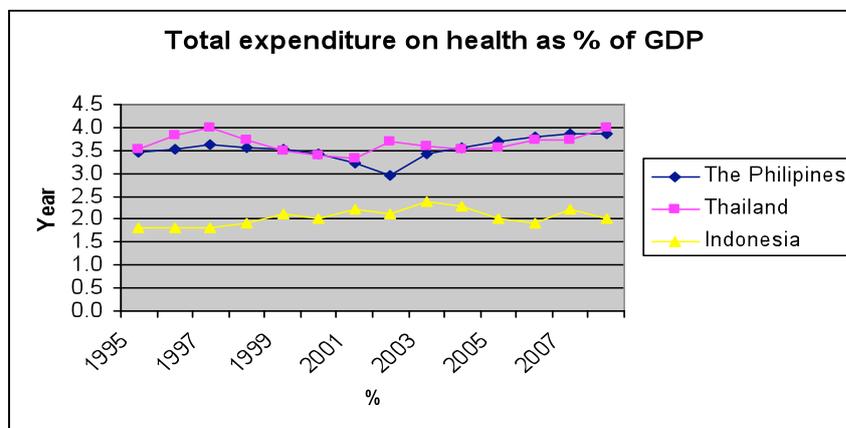

Comparing the health expenditure, the Thai government had spent more moneys in health than the governments in the Philippines and Indonesia, as seen in Table 3. As seen in Figure 2, the overall trends of health expenditure as a percentage of GDP in all three countries show an increase, but Indonesia's health spending has been the lowest compared to other two countries. While the public share in total health expenditure in Thailand has been greater than the private (averaged 60%), about 60% of the total health spending in the Philippines has come from the private spending (WHO 2008). In Indonesia, the private health expenditure remained greater than the public spending until 2006, when public health spending marginally exceeded private health expenditure (Figure 5).

Table-3. Health expenditure in Indonesia, the Philippines and Thailand

Public Expenditure for Health % of Total Central Government Expenditure	Indonesia	Philippines	Thailand
1972-9	2.28	4.30	4.09
1980-9	2.18	4.87	5.41
1990-2000	3.29	3.07	7.58

c. Impact of the reforms

The reforms tend to bring positive changes in the education and health provision in three countries, though countries vary in the extent to which they achieve the progress. The problems and challenges in completing the reforms in these countries are also quite similar.

Education

Significant increases in net enrolment rates in all level of education occurred in all three countries after the reform took place. However, the inequality of education access and provision still becomes the main problem in all three countries. Large disparities occurred due to inequalities in the distribution of resources among and within geographical regions. There were educational gaps between areas with a strong revenue base and those that are less wealthy. Social disparities also exist in education, for example Lanjouw *et al.* (2001) found a very regressive distribution of subsidised education in Indonesia, with the total transfer to the richest quintile more than three times that to households in the poorest quintile. But at the basic education level, the poor benefit more from government subsidies in all three countries (Lanjouw *et al.* 2001, Manasan *et al.* 2007, Office of Education Council Thailand 2004).

Health

Almost all conventional measures of health outcomes showed an upward trend in three countries after the reforms implemented.³ The health reform in Thailand also helped to reduce relative economic inequality in the society—for instance, the low income group received higher subsidy than the high-income group in tertiary and provincial hospital (Ministry of Health Thailand 2009). The remaining challenges and critical issues are how to deal with transitional arrangements—from the previous condition to the new system—which consider the funding sufficiency and managements, supply-side constraints on human resources and physical infrastructure, as well as governance and administration system.

6. CONCLUSION

The Second and the Fourth amendment of 1945 Constitution contain several requirements in relation to the social welfare provision, namely education, health and social security. To make these requirements successfully fulfilled, two main issues should be considered. First, the presence of ambiguity or vagueness in several words of the Constitution should be resolved properly by the authorities, so as reducing potential complexities or misleading interpretation in legislation that renders the Constitution. Second, the impact of dramatic changes regarding the welfare provision—as results from the amendments—should be appropriately addressed and prepared, by carefully designing effective, well-targeted and fiscally sound policies. Also, the implementation of these policies requires a coordination across government agencies at all levels.

Comparing the reform in Indonesia, the Philippines and Thailand, two main points can be highlighted. First, inequalities in access and quality of the health and education provision across the country's regions and within the society. However, implementing an equalization scheme is indeed a political challenge: to what extent the arrangement can redistribute from the relatively richer area or group of people to relatively poorer ones. Second, the quantitative targets, which seemingly have been prioritised to be achieved in the reforms, are not sufficient without the improvement in the quality and sustainability. Hence, underlying these important issues will facilitate the reform process move forward successfully.

y Miyazaki@syr.edu

Abstract

This paper investigates the assumptions behind the definitions of *hattatsu shōgai* in several kinds of documents in Japan. The analysis relies on two methods from separate theoretical frameworks: (1) the historical analysis of the themes of policy documents and medical journal articles in recent decades and (2) Critical Discourse Analysis (Fairclough 1995, 2001, 2004; Gee 2004), especially cultural models (D'Andrade 1987; Danforth 2008; Gee 2004; Quinn and Holland 1987), a concept of innate ideas in language speakers or writers. Regarding themes, the definition of *hattatsu shōgai* formerly encompassed a wide range of impairments regarding human development, but it later narrowed into several specific disorders. This paper will investigate the factors which differentiated the definition, including scientific knowledge and human rights advocacy. Regarding news reports, education and crime dominate the topics of news stories. Definitions in news stories tended to be based on the definition of *hattatsu shōgai* in the specific law for persons with *hattatsu shōgai*. The research also reveals that the definitions are sometimes confusingly used as synonyms for one type of developmental disability, and that negative factors, such as communication difficulties and the possibility of criminality, are embedded sentences using the term *hattatsu shōgai*. In the final part of this paper, the author considers the dynamics behind the definitions of this imported medical term and its transformation into a term of general bureaucracy.

Introduction

This paper aims to investigate the assumptions behind historical understandings of the Japanese term *hattatsu shōgai* (developmental disabilities or developmental disorders), as reflected in medical literatures, policy documents, and Japanese newspaper articles. Literally, *hattatsu* means “development,” and *shōgai* means “disorder,” “disability,” “handicap,” or “impairment.” “Developmental Disabilities,” the basis of *hattatsu shōgai*, has been present in medical discourse in the United States since the 1960s, introduced by a committee for mental retardation, gathered by John F.

¹ In this paper, Japanese term “*hattatsu shōgai*” is used unless specified, rather than using English term, in order to clarify that *hattatsu shōgai* has become different concept from developmental disorders or developmental disabilities.

² In this paper Japanese terms, clauses, and sentences are basically spelled with *italic*, and are translated in English by the author.

Kennedy Jr., the president of United States of America (Takeshita, 1999, p. 4). In Japan, scholars and professionals introduced this term by translating it as “*hattatsu shōgai*.” (Hara, 2004). In old time periods, *hattatsu shōgai* used to mean “the development of permanent physical and mental dysfunction occurring by age 18 years which, since it is life-long, limits people in daily life and requires treatment.” (Ichikawa, 2008, p.7). It included a wide range of physical handicaps, such as orthopedically impaired, visual and hearing impairment, and intellectual disability. (Ibid.) However, recently, with the introduction of *Tokubetsu Shien Kyōiku* (Special Needs Education) policy and *Hattatsu Shōgaisha Shienhō* (December 10, 2004, Law No., 167; Persons with Developmental Disabilities Support Act), the concept of “*hattatsu shōgai*” has narrowed into only a few types of diagnosis. In this paper, by reviewing the historical change of the definition of this term, which is not simply transferred into medical discourse from outside of Japan, I will reveal the dynamics of transformation of the definition of *hattatsu shōgai* as an imported medical concept. Beyond a review of medical and other professional literature, I discuss the complexity behind the definition of this term in Japanese newspapers, because of the strong influence of newspapers on public opinion. Although I use “developmental disabilities” as a translation for *hattatsu shōgai*, I will argue that neither developmental disabilities nor developmental disorders is a proper translation for *hattatsu shōgai*, and I will argue that stakeholders and scholars should use this term in international contexts across “East” and “West” with utmost care.

Hattatsu Shōgai in Japan

As I noted above, Japanese government has developed policies on *hattatsu shōgai*. *Hattatsu Shōgaisha Shienhō* (Persons with Developmental Disabilities Support Act) was passed in the parliament in December 2004 and took effect in April 2005. This act aims to support the independence and social participation by persons with *hattatsu shōgai* and to contribute to the growth of social welfare by promoting early intervention for children with developmental disabilities, clarifying the responsibility of governments, and to state the responsibilities of educational institutions, employers and persons with developmental disabilities, and developmental disability support centers (*Hattatsu Shōgaisha Shienhō*, 2004, Article 1). In addition, the government enacted a new special education policy named *Tokubetsu Shien Kyōiku* (Special Needs Education), which is aimed at students with disabilities including those who with developmental disabilities such as Asperger’s Syndrome, High-functioning Autism, Learning Disabilities, Attention Deficit Hyperactivity Disorder (ADHD). Children with those disabilities had been excluded from the special education system in Japan. The Ministry of Education, Culture, Sports, Science and Technology (n.d.) of the Japanese national government is going to provide special support to these children through schools in local communities.

These policies reflect governmental effort to improve the living of persons with developmental disabilities previously neglected by social welfare policy in Japan. In fact, the old law upon disability in Japan, *Shōgaisha Kihonhō* (The Basic Law for Persons with Disabilities), categorized people with disabilities into three categories (physical, intellectual and psychiatric) and most people with developmental disabilities were segregated from social welfare services. For instance, there is an argument that “A common perception among psychiatrists is that the Persons with Developmental

Disabilities Support Act has made it easier for persons with developmental disabilities³ without mental retardation to get welfare benefits from municipalities.” (Miyazaki and DeChicchis, forthcoming). Those people with developmental disabilities fell in the virtual gap called *seido no tanima* (institutional cleavage), according to the statement by Ministry of Health, Labour and Welfare (n. d.). *Seido no tanima* means a particular area any social institution fails to cover. In Japan, after the wartime, social services for persons with disabilities have been provided depending on if each individual has *shōgaisha techō* [disability certificate]. As disabilities are divided into three categories, physical, intellectual, and mental, local governments issue these booklets in accord with a screening by at the request of a disabled person or family member for any of those three categories. In “Definition,” section 2 of the *Shōgaisha Kihonhō (the Basic Law for Persons with Disabilities)*, the term *Shōgaisha* (persons with disabilities) is defined as follows:

The term “persons with disabilities” in this Law means individuals whose daily life or social life is substantially and continuously limited due to physical, intellectual, or mental disability (hereinafter referred to as “disability”).

A juvenile psychiatrist, Shimizu (2005), argues that there used to be good professionals, such as craftsmen, those who were regarded as being not good at interpersonal communication. A professional of university disability service, Goto (2008), suggests that recent policies regarding developmental disabilities are encouragement for surveillance by the public. N., Ishikawa (2005) argues that policy justified by *Hattatsu Shōgaisha Shienhō* is suspected to be the key to increasing psychiatric drugs for children. The social change in Japan possibly also influenced the cultural understanding on definitions of *hattatsu shōgai*.

Definitions Problem

Public awareness on developmental disabilities in Japan seems to be questioned regarding whether the above new institutions positively affect people living with developmental disabilities. The definition of developmental disabilities is still vague. As a psychiatrist, G., Ishikawa (2007), noted that different practitioners have different definitions of developmental disabilities, based on different interpretations of imported concepts.

The ambiguity of definition is problematic, because it is possible that different stakeholders use the same term with different definitions. This causes miscommunication between stakeholders and results in ineffective treatment, therapy and social services coordination. The person with *hattatsu shōgai* himself or herself gets left behind from a confusion of treatments. In particular, regarding the influence of newspaper on the public opinion, definitions for new terms like *hattatsu shōgai* should be discussed critically. This paper is aimed at contributing to those discussions. More concretely, I address the following research questions. First, what are the historical development and current definitions of developmental disabilities in the Japanese newspapers? Second, what factors affect those definitions?

Research Review

³At the time the authors wrote the quoted paper, they used “developmental disabilities” as an actual English Japanese translation of “*Hattatsu Shōgai*.”

In this section I review the research on how disabilities are described in the media and in language, primarily in Japanese contexts. In terms of media, Stibbe (2004) has investigated the depiction of the woman with disabilities in Japanese television drama. In particular with developmental disabilities, Nozawa and Kitamura (eds., 2006) have gathered critical insights on media reporting from persons with developmental disabilities: a mother of a person with Autism, journalists, a lawyer and a psychiatrist. Regarding the research on situations outside of Japan, O'Dell and Brownlow (2005) has investigated one of the controversial issues on Autism, the media reporting on MMR vaccine as a suspected cause of Autism. Danforth and Navarro (2001) have done a discourse study on the power behind narratives and news reporting regarding ADHD.

In terms of language, there are some precedents. Gottlieb (2001) has reviewed the transition of Japanese words that describe disabilities. Based on their survey research to higher education students, Toya et al (2004) suggests that, particularly with developmental disabilities, the quality of person's existing knowledge about Autism varies depending on the person's contacts to media and first-hand experience with persons with disabilities. Aside from these, Miyazaki (2007) has discussed the existence of unspoken normalcy behind the depiction of communication behavior of persons with developmental disabilities in medical and communication science articles. Reviewing those works, there are still spaces for discussing the Japanese media depictions on developmental disabilities.

Discourse analysis on newspaper articles

Data Collection

Because data collection should be identified strictly more about newspaper corpus, I describe mainly the methods about Discourse Analysis on the newspaper articles. In respect to traditional influences on the formation of public opinion, this research uses electronic texts of newspaper articles. For this study I choose the *Yomiuri Shinbun*, one of the five nationwide newspapers in Japan. The reason for choosing this source is its large circulation and estimated strong influence on public opinion. *Yomiuri Shinbun* identifies itself as a newspaper with the largest circulation among five nationwide newspapers in Japan, with 10,047,992 in January 2008 based on the statistics conducted by Japan's ABC association (The Yomiuri Shimbun, n.d.). In this research I use its online electronic article database *Yomidas Bunshokan*. I limited the article search to one year, from November 1, 2007 to October 30, 2008. For this study I use the Japanese phrases *hattatsu shōgai* (developmental disabilities), *jiheishō* (Autism), *Asuperugā* (Asperger), ADHD (Attention Deficit Hyperactivity Disorder) and *gakushū shōgai* (learning disorders or learning disabilities). Although I also used the term AD/HD, which stands for Attention Deficit / Hyperactivity Disorder in the actual name listed on Diagnostic and Statistical Manual of Mental Disorders 4 th. Edition text revision (*DSM-IV-TR*, American Psychiatric Association: 2000), no results were found by the keyword AD/HD.

Using this database, I stated several criteria in addition. On the *Chīki ban sentaku* (choosing the region) criteria, I choose *zenkoku ban* (national edition) and excluded articles on local editions (*chīki ban*), a few pages per day which are edited and published exclusively for particular local areas (e.g., prefecture) and compiled with *zenkoku ban* pages. *Zenkoku ban* were divided into the larger area which Yomiuri set up into several larger news areas, such as Tokyo, Chubu, Osaka and Seibu. On the *Bunrui sentaku* (choosing the category) criteria, I covered all articles including politics, economics, social,

sports, culture, life, crime / accident, science, international, and imperial household (the news on family of emperor named *kōshitsu* in Japanese). In addition, the search query included both *chōkan* (morning edition; which is sold in the morning) and *yūkan* (evening edition, which is sold in the evening). This search found the following numbers of articles for each keyword, originally spelled in Japanese ethnic alphabet:

- Hattatsu shōgai (Developmental Disabilities): 72
- Jiheishō (Autism): 31
- Asuperugā (Asperger): 8
- ADHD (ADHD): 23
- Gakushū shōgai (Learning Disorder): 30

In this paper, I decided to further analyze only the articles which were retrieved with the keyword *hattatsu shōgai*. I retrieved those full-text articles and put them into an electronic plain text document. Next, I made a list of articles according to the date, headline, region, edition, category, number of characters and number of *dan* (columns).

Analytical Procedures

I employed the following procedures for two types of analyses as follows. First, I did analysis of the articles for the extent of topics in order to investigate the tendency of the newspapers to cover it. I then made categorization analysis on the topics of those articles. I divided the articles into several categories (see the next chapter) according to the headlines. This categorization was modified after I read the full-text of all of the articles, because I found some misunderstanding on estimating the main topic of a few of the articles. Second, in order to investigate the definition of *hattatsu shōgai* in Japanese newspaper, I searched sentences including *hattatsu shōgai* among the full-text article corpus. I used the ‘search’ command of the plain word text editor to find those sentences, including the headlines of articles. This search retrieved twenty-six sentences. Because I estimated that *hattatsu shōgai* was followed by or follows the definition or a characteristic of the phrase, I extracted those expressions.

Theoretical Framework

In my analysis on newspaper articles, I employ Critical Discourse Analysis, such as discussed by Fairclough (1995, 2001, 2004) and Gee (2004). I consider this research method and field as a way to critically analyze language use in the social and power contexts. The objects of study for this research are various; these include written texts on fiction books, newspapers, magazines, interview scripts and also include visual expressions such as television programs. Japanese scholarship in news media studies provides relatively small numbers of analysis under using Discourse Analysis or Critical Discourse Analysis (e.g. Murata 2007; Saito 1998; Satoh 2001).

The meaning of Critical Discourse Analysis needs clarifying. From the linguistic perspective, Gee (2004) clarifies the term Discourse by distinguishing capital ‘D’ discourse from discourse with a lower case ‘d’:

A person cannot enact a particular kind of person all by themselves and by using only language. A Discourse (with a capital “D” - I use “discourse” with a little “d” just to mean language in use) is a distinctive way to use language integrated with “other stuff” so as to enact a particular type of (however ne-gotiable and contestable) socially situated identity (type of person). (p. 46)

His idea on Discourse with capital ‘D’ fits nicely with this paper’s agenda to track the definitions of *hattatsu shōgai* in Japanese newspapers and investigate the ideology and culture behind those definitions.

I specifically investigate on the idea of cultural model(s). Several scholars including Gee (2004) have different definitions. D’Andrade (1987, p. 112), as cited in Danforth (2008, p. 387), defines as ‘A cultural model is a cognitive schema that is intersubjectively shared by a social group’. Quinn and Holland (1987), as cited in Danforth (2008, p. 387), offers a more macro level definition:

Cultural models are presupposed, taken-for-granted models of the world that are widely shared (although not necessarily to the exclusion of other, alternative models) by the members of a society and that play an enormous role in their understanding of their world and their behavior in it. (p. 4, italics in original)

In simple words, the idea is aimed at analyzing the assumptions of the language a person uses and the society in which that person resides. This paper investigates the cultural models of news writers and other sectors around them in respect to topic choices and word choices for definitions of *hattatsu shōgai*.

Findings

In this section I review the findings of the newspaper corpus for definitions of *hattatsu shōgai* according to the words and phrases which are followed by or which follow the term. Here I cite my English translation from Japanese text examples. Respecting the opinion by Fairclough (1995) who argues that the examples in discourse analysis papers should be indicated with original language, I indicate the texts in Japanese and English translation in parallel, with the Japanese texts spelled in the roman alphabet and not Japanese ethnic characters.

Definitions in the Glossary

First of all, I employ the analysis of *hattatsu shōgai* in the *kaisetsu* (glossary) column. *Kaisetsu* is a small section for definitions of key terms with which readers may not be familiar. This is sometimes attached with other articles, and sometimes listed as separate article in on-line databases. In the corpus, 4 *kaisetsu* stories for *hattatsu shōgai* were found. There were two types of similar texts which are written twice for each. Here I review both of these definitions.

Example 1:

<*Hattatsu shōgai*>

Besides not having a delay of intellectual level in general, the learning disorders (LD), (difficulty in the learning and use of particular skills such as reading, writing and calculation), Attention Deficit Hyperactivity Disorder (ADHD) (characterized by motion and hyperactivity that does not match with development), and high-functioning Autism (characterized by having strong for a specific phenomenon, but not delayed intellectual development) are included. In 2004, the Persons with Developmental Disabilities Support Act, that demanded wide support from the national and local governments, passed at the parliament. (*Yomiuri Shinbun* December 12, 2007)

(Excerpted from the article about specialized school for children with developmental disabilities)

Example 2:

<*hattatsu shōgai*>

The collective term which houses Attention Deficit Hyperactivity Disorder (ADHD), learning disorders (LD), Asperger's syndrome, etc. These generally cause problems with learning, language and interpersonal relations. (*Yomiuri Shinbun* February 23, 2008)

(Excerpted from the article about influence of body movement to brain development)

Two facts were found in the above two samples. First, both definitions have sentences listing the particular names of disabilities and each of those definitions had a different list. Example 1 listed LD, ADHD and high-functioning Autism. Example 2 listed ADHD, LD and Asperger's Syndrome. Further, these list-up definitions are close to those in Article 2 of *Hattatsu Shōgaisha Shienhō* (2004):

In this law Developmental Disabilities means Autism, Asperger's Syndrome, other kinds of developmental disorders, learning disorders, attention deficit hyperactivity disorder, and other kinds of disorders of brain function, and the symptoms should be designated by cabinet order as what appears primarily in early age.

One possible assumption about these list-up definitions is that news writers relied on the law texts as the source of definition for the unfamiliar terms. If so, they might assume that discussing the topic based on the law's definitions is a perfectly correct way to address the social problem of developmental disability. The truth is that the definition of the term *hattatsu shōgai* is controversial, as is discussed in the next chapter.

Second, those newspaper definitions did not mention the general notions of the *hattatsu shōgai* as an umbrella term. In other words, those definitions did not state the general concept of brain function, neurology, or social relations regarding the person with the disabilities. The articles in the corpus mainly discussed the *hattatsu shōgai* topic based on fragments of facts on persons with *hattatsu shōgai*, without presenting the big picture of the umbrella term to their readers.

Defining hattatsu shōgai by the Words Before / After the Term.

In this section I investigate how *hattatsu shōgai* is described in words before and/or after the term. Although rarely being regarded as an official definition, it gives an idea of the cultural models operating in the minds of news writers, speakers of comments which were cited in the articles, and the ideology of organizations which are related to the article (e.g. a newspaper company or the organization which gave the information on the topic to news writers). Twenty-six sentences which included characteristics or definitions of *hattatsu shōgai* were extracted. I discuss those sentences regarding the following points: umbrella term and interpersonal relations.

As an umbrella term in these articles, *hattatsu shōgai* has a confusion of employed terms and branch categories. This is the introductory paragraph of the article featuring a school teacher who invented a card game that enables children to learn *kanji* (Chinese characters). A lot of Japanese elementary school children have difficulty learning those characters in order to write ordinary Japanese texts; among the Japanese writing system, *kanji* have more strokes than do other types of Japanese characters (*hiragana* and *katakana*).

Example 3:

Children with *hattatsu shōgai* worries about ‘not being able to write Chinese characters.’ An elementary school teacher in Sakai City, Mr. Mitsuru Yamada, age 51, produced educational cards which contain illustrations to remind children of the pronunciation and meanings of Chinese characters. (*Yomiuri Shinbun* May 21, 2008)

In this excerpt, *hattatsu shōgai* might have been used as a synonym for one particular type of developmental disabilities, not as an umbrella term, using the expression “Children with developmental disabilities those who have worries, such as ‘not able to write Chinese characters’” (Ibid.) These symptoms such as ‘being not able to write Chinese characters’ are mainly associated with learning disorders (LD). Not all persons labeled as developmentally disabled have difficulty writing difficult characters.

Regarding the findings on interpersonal relations, nine sentences in the corpus mentioned difficulties with interpersonal relations of persons with developmental disabilities. Here are three excerpts on interpersonal relations. The first one is cited from a news story about study tutors for a second-year elementary school student in a general education classroom.

Example 4:

Takuya, a boy with pervasive developmental disorders, has difficulty establishing interpersonal relationships and is not good at learning Chinese characters. (*Yomiuri Shinbun* May 27, 2008)

This article is primarily about the academic learning support which the school provided to a boy, Takuya. The developmental disability label is embedded by the clause “has difficulty on establishing interpersonal relationships” (Ibid.). In parallel with another clause “is not good at learning Chinese characters” (Ibid.), that mentions his academic performance.

Another example is a sentence on the employment obstacles of a man with LD. He was diagnosed as LD just before the 4th grade at elementary school. After finishing vocational school, he

was hired as an auto mechanic. However, he quit the job in a year. Here is a sentence which stated the fact.

Example 5:

Although having been hindered by his developmental disabilities, failing to read others' faces, he withdrew from the company approximately in a year. (*Yomiuri Shinbun* May 31, 2008)

In this example this sentence connotes the relation of the suspected characteristics of persons with some type of developmental disability. The phrase "failing to read others' faces" (Ibid.) is a crucial part of interpersonal communication, particularly in terms of non-verbal communication. Connections of this phrase and another phrase, "withdrew from the company approximately in a year" (Ibid.), might connote relation of one's ability for reading other's feeling and that for continuing job.

The next example is related to a crime case in which an eighteen-years old boy rushed into a high school and slashed down a teacher. The teacher was a former homeroom teacher of the boy's class. At the bottom of the story, two psychologists stated their insights on this incident. Here is one of the comments by Dr. Toshiaki Inoue, a professor specialized in clinical psychology at Ashiya University Graduate School in Hyogo prefecture in the Western part of Japan:

Example 6:

Inoue Toshiaki, a professor of clinical psychology at Ashiya University graduate school says 'Looking at the point that he was attempting to work off a grudge for several years, it could be that he has developmental disabilities, which create difficulty in establishing interpersonal relationships. (*Yomiuri Shinbun* July 30, 2008)

Despite the fact that it was not officially reported that the criminal had developmental disabilities, Dr. Inoue suggests that he had developmental disabilities. In addition, Dr. Inoue suggested that *hattatsu shōgai* makes the persons "have difficulty establishing interpersonal relationships" (Ibid.). Even if neither news reporter nor Dr. Inoue attempted the cohesion between difficulties on interpersonal relationships and criminology of persons with developmental disabilities, the possibility of existence of a hidden agenda among them regarding the cohesion cannot be completely denied: by placing both ideas in the same frame, the article infers that developmental disabilities are one possible factor of severe crime.

In this section, after understanding that main agendas on *Yomiuri Shinbun* reporting *hattatsu shōgai* are education and crime, I reviewed the defining practice of *hattatsu shōgai* on Japanese news stories through two elements: Definitions in Glossary and Defining *hattatsu shōgai* by the words before / after the Term. There I found that definitions on those news stories have reliance on the law text, a confusion of umbrella term usage and concerns about interpersonal communication.

Discussion

Here I discuss the possible ideology behind the definitions on *hattatsu shōgai* in *Yomiuri Shinbun*. First, the strong cultural models regarding the meaning of *hattatsu shōgai* among news writers

and informants for articles (e.g. interviewee) is that ‘the greatest weakness for persons with developmental disabilities is interpersonal communication’. Moreover, the ‘weakness’ of interpersonal communication skills embeds a lot of obstacles, according to the sentences in *Yomiuri Shinbun*, such as example 5 which embeds job difficulty and example 6 which embeds merely suspected cohesion with crime. These expressions could be a sign of the poorness of discussion on developmental disabilities in Japan; these might encourage stigmatization of persons with developmental disabilities and might let the persons around them to treat them negatively.

Second, regarding the definition of *hattatsu shōgai* in general, the coverage is still vague. It is true that Japan is one of the countries where *DSM* is dominant in manuals of psychiatric diagnosis. Aside from these, *hattatsu shōgai* as umbrella term makes a different type of categorization than *DSM* does. ‘Pervasive developmental disorders’ on *DSM-IV-TR*, translated into Japanese as *kōhansei hattatsu shōgai*, houses Autistic Disorder, Rett’s Disorder, Childhood Disintegrative Disorder, Asperger’s Disorder and Pervasive Developmental Disorder Not Otherwise Specified (*DSM-IV-TR*, 2000, pp. 69-84). This extent is different from that of *Hattatsu Shōgaisha Shienhō*, which includes “Autism, Asperger’s Syndrome, other kinds of developmental disorders, learning disorders, attention deficit hyperactivity disorder and other kinds of disorder, which are brain function, and the symptoms should be designated by cabinet order as what appears primarily in early age.” (*Hattatsu Shōgaisha Shienhō*, article 2, 2004, my translation). If we use Japanese terms for other terms on *DSM-IV-TR* and the Japanese law, those terms look similar: *kōhansei hattatsu shōgai* for the former and *hattatsu shōgai* for latter. Persons with diagnosis of any in *hattatsu shōgai* and their stakeholders should be careful about confused use of the term, that different stakeholders use with different definitions.

Discussed were three factors: cultural models and vagueness of categorization. In sum, many analyses tell us that both the thoughts of participants of news stories and the context of news stories affect the definition of the subject: *hattatsu shōgai*.

Conclusion

In this paper I have discussed the nature of the definition of *hattatsu shōgai*, a recently popular concept in Japanese social policy and news media reports, and the historical variation of its definition. Such dynamics may sometimes cause confusion, and G. Ishikawa (2007) describes the distortion problem of introducing the concepts of developmental disabilities in Japan and translating that vocabulary into Japanese. Furthermore, confusion in the public sphere regarding a new concept can result in diverse definitions which effect the interaction of several sectors, such as the media, policy makers, medical doctors, and education professionals. Currently, *hattatsu shōgai* is promoted with a bureaucratic meaning, with assimilation into common language via news reports.

For further insight into the definitions which I have discussed here, we need a historical survey of the transition of the concepts of *hattatsu shōgai* and developmental disabilities. Such a study would enable us to fully describe the vagueness and confusion in these definitions. Furthermore, there is still need to discuss the social change which may have made *hattatsu shōgai* visible in Japanese society, as Shimizu (2005), Goto (2008) and N. Ishikawa (2005) argue.

Acknowledgements

I would like to thank the Dr. Steven Taylor (Syracuse University) for direct suggestion on my work. I thank professors and students at Syracuse University for a lot of inspiration which affected my work. A special thanks to Dr. Paul Midford (Norwegian University of Science and Technology) and Dr. Joseph DeChicchis (Kwansei Gakuin University) for their encouragement to write this paper. In addition, I would thank Dr. Akihiro Sugino (Kwansei Gakuin University) for his direct comment. I also thank some other persons who read and reviewed this paper for possible improvement.

Cultural Networks: Abu Dhabi's emergence as a global city

Yasser Elsheshtawy
Associate Professor
United Arab Emirates University – Dept. of Architecture
Al-Ain, PO 17555

e-mail: sheshtawi@uaeu.ac.ae

The Gulf region in the past few years has clearly established economic dominance among its neighbors. It is now setting its sight on loftier aims – namely creating a cultural Mecca that will replace the traditional centers of the Middle East. This is done through acquisition of major works of art and artifacts¹, the construction of museums designed by world-class architects, and the buying of brand names such as the Louvre and Guggenheim. Such efforts should, once and for all remove the “tribes with flags” stigma.² The seductive allure of the Tabula Rasa allows for the use of a plethora of contextual references, each serving the purpose of communicating these objectives. This clean slate approach, the new beginning as it were, enables rulers to transplant various forms and activities into the desert.

The city of Abu Dhabi, capital of the United Arab Emirates seems to be particularly suited for examining these developments. My focus will be on its Saadiyat Island cultural district development, a barren island which will be populated by a series of ‘iconic’ structures designed by world class architects. My aim is to situate these projects within the city’s ‘urban imaginary’ – using a conflation of fiction, perception and reality. I will conclude by elaborating on the role of global cultural networks in developing these projects and how this serves the larger political purpose of creating a new Middle East, which hopes to replace the regions traditional centers.

Imaginary & Real Cities

I will in this section use the case of Abu Dhabi – a typical Gulf city owing its existence to oil and rapid urbanization within the last three decades. While it seems to lack any substantive context, a more thorough examination reveals complex layers of history and memory. As in any city there are different versions or perceptions. Similar to Italo Calvino’s *Invisible Cities* I will be looking at the city from different perspectives: the *imaginary city*, defined by the perceptions of its inhabitants, evoking its transience and ultimately alienation; the *perceived city*, as propagated by outside visitors – journalists and travel writers – suggesting suddenness as well as exoticism; and finally the city of the *present* and the *future* – the real city inhabited and lived by its residents. Taken together they constitute an *urban imaginary* which defines any city – even sudden cities such as Abu Dhabi.

The mythical city: Munif's Cities of Salt

Abdelrahman Munif's Pentology "Cities of Salt" represents an appropriate starting point for examining the city of Abu Dhabi. His settings are fictional, yet they are an amalgamation of sorts of cities in the Arabian peninsula which in their encounter with modernity undergo a process of upheaval and transformation thus forming a narrative thread in the series. The second part titled "The Trench" is particularly relevant as it examines the impact of modernization, influx of foreigners, as well as the consolidation and ubiquity of the state's power.³ The title itself – particularly the original Arabic word *Al Ukhduh* – suggests a hole that one is likely to fall into, some sort of undersea geological formation. This is evocative of massive social and economic changes which have opened wide *chasms* subjecting its inhabitant to great danger.

His novel evokes the transient character of nomadic settlements which are nothing but a "cluster of continuing mud houses" inhabited by Bedouins who kept their way of life – thus providing a key insight into understanding the urban and social character of these places. His depiction of the fictional city of Mooran is quite typical of the alienation and the sense of loss accompanying massive urban transformation. His narrative of a city being transformed, and in the process alienating its citizens, offers a rare look into the mindset of Arabia's citizens (even though they are fictional). Modernity created a city that no longer resonated with its occupants. While this process was not the same everywhere it nevertheless enables us to situate contemporary urban developments within cities in the Arabian Peninsula. The notion for desire and change – the constant changing and questioning of identity and history, play a central role in the consciousness of its citizenry. Yet there is also resistance, the "mound of debris that rose higher every day" leading people to wish that they can "get this all over with."⁴

Munif underscores the pristine beauty of its unspoiled past, its romantic desert settlements and sense of community among its inhabitants – spoiled by the arrival of modernity. The city is described as *harsh* and *repulsive*; its rapid change and the introduction of buildings that were "a mélange of styles." Yet "in hidden places, behind the wide streets and the tall new buildings, lay the low mud-houses." Thus the bedouin past is still very much part of the urban fabric. The novel's protagonist – a Syrian doctor – proclaims "he did not like this city and still was not used to it."⁵ Behind that veneer of modernity "Mooran's neighborhoods were tortuous and overlapping, their narrow streets crowded with dust, children and flies ...". Munif repeatedly stresses the Bedouin connection and that in spite of being transformed into a modern environment, they were still clinging to their old ways to the extent that "Camels roamed the small squares and were tied by the doorways, tents were set up by the mud room."

Thus the present and the past coexist, yet there is also tension and friction between them. Furthermore what this brief review illustrates is that the desire to move away from a past – a Bedouin past – to a modern present, but not quite being able to escape from it, is key to understanding the mindset of Arabia's citizens. It also demonstrates in my view – that the notion of an absolute *tabula rasa* is fictitious. A similar theme is echoed at times by outsiders, although for the most part the complete absence of any sense of history

dominates the discussion as I will illustrate in the following section – another conceptualization of the city: the city as perceived by strangers.

The perceived city: Abu Dhabi through strangers eyes.

Our understanding of cities in the region, to a large degree, is shaped by travelers writings, journalists, and movies. A certain assumption is put forth about Arab's likes and dislikes. In some instances clouded by an *orientalist* mentality in which the region is viewed as a primitive, exotic place waiting to be discovered by *westerners*. Clearly the limitation of an orientalist mindset have been exposed – showing that there are subversive directions undermining and critiquing some main tenets of this discourse.⁶ With that in mind I shift my focus to the city of Abu Dhabi starting with its early beginnings.

Early accounts of life in the settlement were based on travelers notes and visits by missionaries which taken together comprise a fascinating view of a primitive town which lasted until the early 1960s⁷. Following the succession of Sheikh Zayed in 1966 as ruler of Abu Dhabi, urban development began in earnest . Consequently a number of western reporters were dispatched to describe the changes that were taking place. A typical account by Gloria Emerson from the New York Times, suggests that "...The big, thick, glooming banks make a mockery out of the squat, peeling buildings next door." The airport terminal "...consists of two bare rooms where passengers cannot sit or find a glass of water."⁸ It is also noted that the ruler, strongly influenced by the British began to display an attitude of tolerance towards foreigners – officially opening a church for example.⁹ In another article she writes that "... the town of Abu Dhabi itself is not more than a village built on sand, where men squat to urinate in the streets and where the roads are full of lumps and holes." She also notes that there are only two hotels in the city, there is no cinema and restaurants are only in the two hotels. Thus, "Europeans must learn to waste time."¹⁰
